

FEDERAL REGISTER

Vol. 89 Wednesday,
No. 90 May 8, 2024

Pages 38837–39530

OFFICE OF THE FEDERAL REGISTER

The **FEDERAL REGISTER** (ISSN 0097-6326) is published daily, Monday through Friday, except official holidays, by the Office of the Federal Register, National Archives and Records Administration, under the Federal Register Act (44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). The Superintendent of Documents, U.S. Government Publishing Office, is the exclusive distributor of the official edition. Periodicals postage is paid at Washington, DC.

The **FEDERAL REGISTER** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders, Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress, and other Federal agency documents of public interest.

Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless the issuing agency requests earlier filing. For a list of documents currently on file for public inspection, see www.federalregister.gov.

The seal of the National Archives and Records Administration authenticates the **Federal Register** as the official serial publication established under the Federal Register Act. Under 44 U.S.C. 1507, the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper and on 24x microfiche. It is also available online at no charge at www.govinfo.gov, a service of the U.S. Government Publishing Office.

The online edition of the **Federal Register** is issued under the authority of the Administrative Committee of the Federal Register as the official legal equivalent of the paper and microfiche editions (44 U.S.C. 4101 and 1 CFR 5.10). It is updated by 6:00 a.m. each day the **Federal Register** is published and includes both text and graphics from Volume 1, 1 (March 14, 1936) forward. For more information, contact the GPO Customer Contact Center, U.S. Government Publishing Office. Phone 202-512-1800 or 866-512-1800 (toll free). E-mail, gpocusthelp.com.

The annual subscription price for the **Federal Register** paper edition is \$860 plus postage, or \$929, for a combined **Federal Register**, **Federal Register** Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the **Federal Register** Index and LSA is \$330, plus postage. Six month subscriptions are available for one-half the annual rate. The prevailing postal rates will be applied to orders according to the delivery method requested. The price of a single copy of the daily **Federal Register**, including postage, is based on the number of pages: \$11 for an issue containing less than 200 pages; \$22 for an issue containing 200 to 400 pages; and \$33 for an issue containing more than 400 pages. Single issues of the microfiche edition may be purchased for \$3 per copy, including postage. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA, MasterCard, American Express, or Discover. Mail to: U.S. Government Publishing Office—New Orders, P.O. Box 979050, St. Louis, MO 63197-9000; or call toll free 1-866-512-1800, DC area 202-512-1800; or go to the U.S. Government Online Bookstore site, see bookstore.gpo.gov.

There are no restrictions on the republication of material appearing in the **Federal Register**.

How To Cite This Publication: Use the volume number and the page number. Example: 89 FR 12345.

Postmaster: Send address changes to the Superintendent of Documents, Federal Register, U.S. Government Publishing Office, Washington, DC 20402, along with the entire mailing label from the last issue received.

Rules and Regulations

Federal Register

Vol. 89, No. 90

Wednesday, May 8, 2024

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents.

15 CFR Part 738

[Docket No. 240503–0126]

RIN 0694–AJ58

Export Control Revisions for Australia, United Kingdom, United States (AUKUS) Enhanced Trilateral Security Partnership; Correction

AGENCY: Bureau of Industry and Security, Department of Commerce.

ACTION: Correcting amendment.

SUMMARY: On April 19, 2024, BIS published in the **Federal Register** an interim final rule (IFR), “Export Control Revisions for Australia, United Kingdom, United States (AUKUS) Enhanced Trilateral Security Partnership.” The April 19 IFR removed license requirements, expanded the availability of license exceptions, and reduced the scope of end-use and end-user-based license requirements for exports, reexports, and transfers (in-country) to or within Australia and the United Kingdom (UK) to enhance technological innovation among the three countries and support the goals of the AUKUS Trilateral Security Partnership. This correction revises a footnote included in the April 19 IFR to add greater specificity for the Export Control Classification Numbers (ECCN) referenced, so only portions of those 0x5zz ECCNs in the footnote that were previously controlled for national security column 1 (NS1) or regional stability column 1 (RS1) reasons for control for the destinations of Australia and the United Kingdom will continue to require a license to Australia and the United Kingdom based on the license requirements specified in this footnote.

DATES:

Effective date: This rule is effective May 6, 2024.

Comment due date: Comments for the correction in this rule must be received by BIS no later than June 3, 2024.

ADDRESSES: Comments on this rule may be submitted to the Federal rulemaking portal (www.regulations.gov). The *regulations.gov* ID for this rule is: BIS–2024–0019. Please refer to RIN 0694–AJ58 in all comments.

FOR FURTHER INFORMATION CONTACT: For questions on this rule, contact Philip Johnson at RPD2@bis.doc.gov or (202) 482–2440.

SUPPLEMENTARY INFORMATION:

Background

On April 19, 2024, BIS published in the **Federal Register** the interim final rule (IFR), “Export Control Revisions for Australia, United Kingdom, United States (AUKUS) Enhanced Trilateral Security Partnership” (89 FR 28594). This correction makes corrections to footnote 9 of the April IFR for the entries for Australia and the UK, for consistency with the description of the regulatory changes included in the April 19 IFR.

BIS noted in the April 19 IFR that one particular license requirement remained unchanged as a result of that rule. Under the EAR, firearms-related items and other CC controlled items in ECCNs 0A501 (except 0A501.y), 0A502, 0A503, 0A504, 0A505.a, .b, and .x, 0A981, 0A982, 0A983, 0D501, 0D505, 0E501, 0E502, 0E504, 0E505, and 0E982 continue to require a license when destined to and among the UK and Australia. That license requirement mirrors the license requirement for firearms-related items in ECCNs 0A501 (except 0A501.y), 0A502, 0A504 (except 0A504.f), and 0A505 (except 0A505.d) destined to Canada.

Prior to the April 19 IFR, license requirements for these items to the UK and Australia were implemented through NS1/RS1 reasons for control. Since these license requirements were removed for the UK and Australia in the April 19 IFR, that IFR also added a footnote 9 to the Commerce Country Chart for the UK and Australia, which indicated that a license is still required for these 0x5zz firearms-related items to those two countries. The April 19 IFR specified that the license requirement specified in footnote 9 did not change the scope of the license requirements for these items to the UK and Australia that

applied prior to the effective date of that IFR.

Corrections

This correction revises footnote 9 to the Commerce Country Chart in supplement no. 1 to part 738, which was added in the April 19 IFR, so that only those portions of 0x5zz ECCNs referenced in footnote 9 that were previously controlled for NS1 or RS1 reasons for control for the destinations of Australia and the UK will continue to require a license to Australia and the UK based on the license requirement specified in this revised footnote.

In the Commerce Country Chart, this correction revises six of the ECCNs (0A502, 0A504, 0A505, 0D501, 0D505, and 0E505) and removes one ECCN (0E502) referenced in footnote 9. This greater specificity for the portions of the ECCNs referenced in footnote 9 is needed to ensure that the license requirement specified in footnote 9 does not change the scope of the license requirements for these items to the UK and Australia that applied prior to the effective date of the April 19 IFR. This correction makes the following corrections to the ECCNs referenced in footnote 9:

ECCN 0A502. For the reference for 0A502, this correction specifies that the license requirement in footnote 9 is limited to 0A502 for shotguns with a barrel length less than 18 inches (45.72 cm).

ECCN 0A504. For the reference for 0A504, this correction specifies that the license requirement in footnote 9 is limited to 0A504.i commodities.

ECCN 0A505. For the reference for 0A505, this correction removes the reference to 0A505.b because the license requirement under footnote 9 only extends to 0A505.a and .x.

ECCN 0D501. For the reference for 0D501, this correction adds the parenthetical phrase “(except “software” for commodities in ECCN 0A501.y or “equipment” in ECCN 0B501 for commodities in ECCN 0A501.y)” to specify that this “software” or “equipment” does not require a license under footnote 9.

ECCN 0D505. For the reference for 0D505, this correction specifies that the license requirement in footnote 9 for 0D505 is limited to “software” for commodities in ECCN 0A505.a and .x and “equipment” in ECCN 0B505.a and .x.

ECCN 0E502. For the reference for 0E502, this correction removes this ECCN from footnote 9 because none of the technology under this ECCN formerly required a license to Australia or the United Kingdom for NS1 or RS1 reasons for control.

ECCN 0E505. For the reference for 0E505, this correction specifies that the license requirement in footnote 9 for 0E505 is limited to “technology” for “development,” “production,” operation, installation, maintenance, repair, overhaul, or refurbishing commodities in 0A505.a and .x; for “equipment” for those commodities in 0B505; and for “software” for that equipment and those commodities in 0D505.

Export Control Reform Act of 2018

On August 13, 2018, the President signed into law the John S. McCain National Defense Authorization Act for Fiscal Year 2019, which included the Export Control Reform Act of 2018 (ECRA), 50 U.S.C. 4801–4852. ECRA, as amended, provides the legal basis for BIS’s principal authorities and serves as the authority under which BIS issues this rule.

Rulemaking Requirements

1. This correction has not been designated a “significant regulatory action” under Executive Order 12866.

2. Notwithstanding any other provision of law, no person may be required to respond to, or be subject to a penalty for failure to comply with, a collection of information, subject to the requirements of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*) (PRA), unless that collection of information displays a currently valid Office of Management and Budget (OMB) Control Number. This regulation involves a collection currently approved by OMB under control number 0694–0088, Simplified Network Application Processing System.

3. This rule does not contain policies with federalism implications as that term is defined under Executive Order 13132.

4. Pursuant to Section 1762 of ECRA (50 U.S.C. 4821), this action is exempt from the Administrative Procedure Act (APA) (5 U.S.C. 553) requirements for notice of proposed rulemaking, opportunity for public participation and delay in effective date. Additionally, this rule is exempt from the ordinary rulemaking requirements of the APA pursuant to 5 U.S.C. 553(a)(1) as a military or foreign affairs function of the United States Government.

5. Because neither the APA nor any other law requires that notice of

proposed rulemaking and an opportunity for public comment be given for this rule, the analytical requirements of the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) are not applicable. Accordingly, no Final Regulatory Flexibility Analysis is required and none has been prepared.

List of Subjects in 15 CFR Part 738

Administrative practice and procedure, Exports, Reporting and recordkeeping requirements.

Accordingly, part 738 of the Export Administration Regulations (15 CFR parts 730 through 774) is amended as follows:

PART 738—COMMERCE CONTROL LIST OVERVIEW AND THE COUNTRY CHART

■ 1. The authority citation for 15 CFR part 738 continues to read as follows:

Authority: 50 U.S.C. 4801–4852; 50 U.S.C. 4601 *et seq.*; 50 U.S.C. 1701 *et seq.*; 10 U.S.C. 8720; 10 U.S.C. 8730(e); 22 U.S.C. 287c; 22 U.S.C. 2151 note; 22 U.S.C. 3201 *et seq.*; 22 U.S.C. 6004; 42 U.S.C. 2139a; 15 U.S.C. 1824; 50 U.S.C. 4305; 22 U.S.C. 7201 *et seq.*; 22 U.S.C. 7210; E.O. 13026, 61 FR 58767, 3 CFR, 1996 Comp., p. 228; E.O. 13222, 66 FR 44025, 3 CFR, 2001 Comp., p. 783.

■ 2. In supplement no. 1 to part 738, revise footnote 9 to read as follows:

BILLING CODE 3510–33–P

DEPARTMENT OF LABOR

Employment and Training Administration

20 CFR Part 655

[DOL Docket No. ETA–2021–0006]

Adverse Effect Wage Rate Methodology for the Temporary Employment of H–2A Nonimmigrants in Non-Range Occupations in the United States; Ratification of Department’s Actions

AGENCY: Employment and Training Administration, Department of Labor.

ACTION: Ratification.

SUMMARY: The Department of Labor is publishing notification of the Assistant Secretary for Employment and Training’s ratification of the rule published February 28, 2023, titled *Adverse Effect Wage Rate Methodology for the Temporary Employment of H–2A Nonimmigrants in the Non-Range Occupations in the United States*.

DATES: This ratification was signed on May 3, 2024.

FOR FURTHER INFORMATION CONTACT: Brian Pasternak, Administrator, Office of Foreign Labor Certification, Employment and Training Administration, U.S. Department of Labor, 200 Constitution Avenue NW, Room N–5311, Washington, DC 20210, telephone: (202) 693–8200 (this is not a toll-free number). For persons with a hearing or speech disability who need assistance to use the telephone system, please dial 711 to access telecommunications relay services.

SUPPLEMENTARY INFORMATION:

I. Background

On December 1, 2021, the Department of Labor (“DOL” or “Department”) issued a notice of proposed rulemaking (“NPRM”) in the **Federal Register** to amend the regulations governing the methodology to determine the Adverse Effect Wage Rate (“AEWR”) for H–2A occupations other than herding and production of livestock on the range (*i.e.*, non-range occupations). See *Adverse Effect Wage Rate Methodology for the Temporary Employment of H–2A Nonimmigrants in Non-Range Occupations in the United States*, 86 FR 68174 (Dec. 1, 2021) (“NPRM”). The NPRM was open for public comment for 60 days from December 1, 2021 until January 31, 2022. See *id.* at 68174, 68185.

On February 28, 2023, after having considered the public comments, DOL published a final rule in the **Federal**

Register that amended the methodology to establish the AEWR, largely adopting the proposals from the NPRM with some technical changes. *Adverse Effect Wage Rate Methodology for the Temporary Employment of H-2A Nonimmigrants in the Non-Range Occupations in the United States*, 88 FR 12760 (Feb. 28, 2023) (“Final Rule”). The Final Rule went into effect on March 30, 2023.

The Final Rule has become the subject of litigation in which it has been asserted that the Final Rule was improperly issued. Specifically, a question has been raised in litigation concerning whether the Final Rule was approved by the Attorney General in consultation with the Secretary of Labor and the Secretary of Agriculture. 8 U.S.C. 1188, Statutory Note.¹ On April 29, 2024, the Secretary of Homeland Security, in consultation with the Secretary of Labor and Secretary of Agriculture, approved the Final Rule. Prior to its issuance in February 2023, the Final Rule was provided to the Departments of Homeland Security and Agriculture through the interagency review process prescribed by Executive Order 12866.

To resolve any possible uncertainty, the Department, through its Assistant Secretary for Employment and Training, is ratifying the Final Rule. Under established case law, an agency may, through ratification, “purge[] any residual taint or prejudice left over from” a potential defect in a prior governmental action.² The Department is issuing this ratification out of an abundance of caution, and this ratification is not a statement that the Final Rule is invalid absent this ratification.

II. Ratification

By virtue of the authority vested in Secretary of Labor by law, including by the Immigration and Nationality Act of 1952, as amended, 8 U.S.C. 1101 *et seq.* (“INA”), and as delegated to the Assistant Secretary for Employment and Training, 75 FR 66268, I am affirming and ratifying a prior action by Brent Parton, Principal Deputy Assistant Secretary, who was then serving as Acting Assistant Secretary for Employment and Training before the current Assistant Secretary of Labor for Employment and Training assumed office. On February 28, 2023, the Employment and Training

Administration published in the FR the Final Rule codifying amendments to the regulations governing the methodology to determine the AEWR for non-range H-2A occupations (all H-2A occupations other than herding and production of livestock on the range). 88 FR 12760 (Feb. 28, 2023).

The Final Rule was signed by Acting Assistant Secretary Parton. I have full and complete knowledge of the Final Rule action taken by former Acting Assistant Secretary Parton. Subsequent to the Secretary of Homeland Security’s documented approval of the Final Rule dated April 29, 2024, and out of an abundance of caution and to avoid any doubt as to its validity, I have independently evaluated the Final Rule and the basis for adopting it. I have determined that the amendments to the AEWR methodology in the Final Rule are consistent with the Secretary of Labor’s statutory responsibility to certify that the employment of H-2A workers will not adversely affect the wages and working conditions of workers in the United States similarly employed, and that the changes adopted in the Final Rule best strike the balance between the statute’s competing goals of providing employers with an adequate supply of legal agricultural labor and protecting the wages of workers in the United States similarly employed. I also agree with the Department’s certification that the Final Rule does not have a significant economic impact on a substantial number of small entities. *See* 88 FR 12760, 12799, 12802.

Therefore, pursuant to my authority as the Assistant Secretary for Employment and Training and based on my independent review of the action and the reasons for taking it, I hereby affirm and ratify the Final Rule, as of May 3, 2024, including all regulatory analysis certifications contained therein. This action is taken without prejudice to any right to litigate the validity of the Final Rule as approved and published on February 28, 2023. Nothing in this action is intended to suggest any legal defect or infirmity in the approval or publication of the Final Rule.

José Javier Rodríguez,

Assistant Secretary for Employment and Training, Labor.

BILLING CODE 4510–FP–P

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

33 CFR Part 165

[Docket No. USCG–2024–0194]

Safety Zone; Fireworks Display; Elizabeth River, Town Point Reach, Norfolk, VA

AGENCY: Coast Guard, DHS.

ACTION: Notification of enforcement of regulation.

SUMMARY: The Coast Guard will enforce a safety zone regulation for Norfolk’s 42nd Annual Independence Day Fireworks on July 4th, 2024, to provide for the safety of life on navigable waterways of the Elizabeth River, at Town Point Reach during this event. Our regulation for marine events within the Fifth Coast Guard District identifies the regulated area for this event in Norfolk, VA. During the enforcement period, entry of vessels or persons into this zone is prohibited unless specifically authorized by the Captain of the Port Virginia.

DATES: The regulations in 33 CFR 165.506 will be enforced for the location identified as item 13 in table 3 to paragraph (h)(3) from 9 p.m. until 10 p.m. on July 4th, 2024.

FOR FURTHER INFORMATION CONTACT: If you have questions about this notification of enforcement, call or email LCDR Ashley Holm, Chief, Waterways Management Division, Sector Virginia, U.S. Coast Guard; telephone 757–668–5580 email Ashley.E.Holm@uscg.mil.

SUPPLEMENTARY INFORMATION: As noted in paragraph (c) of § 165.506, the enforcement period(s) for each safety zone identified in paragraph (h) of this section is subject to change, and the enforcement period announced here differs from the enforcement period noted in item 13 of table 3 to paragraph (h). The Coast Guard will enforce the safety zone in 33 CFR 165.506 for Norfolk’s 42nd Annual Independence Day Fireworks regulated area from 9 p.m. to 10 p.m. on Thursday, July 4th, 2024, rather than on one of the days of the first or second weekend of July. This action is being taken to provide for the safety of life on navigable waterways during this event. Section 165.506, specifies the location of the regulated area, which encompasses portions of the Elizabeth River and Town Point Reach. During the enforcement period, the entry of vessels or persons into this zone is prohibited unless specifically

¹ Although this provision vests approval authority in the “Attorney General,” the Secretary of Homeland Security now may exercise this authority. *See* 6 U.S.C. 202(3)–(4), 251, 271(b), 291, 551(d)(2), 557; 8 U.S.C. 1103(c) (2000).

² *Guedes v. Bureau of Alcohol, Tobacco, Firearms & Explosives*, 920 F.3d 1, 13 (D.C. Cir. 2019).

authorized by the Captain of the Port, Sector Virginia. In addition to this notification of enforcement in the Federal Register , the Coast Guard plans to provide	notification of this enforcement period via the Local Notice to Mariners and marine information broadcasts.	Dated: April 16, 2024. Jennifer A. Stockwell , <i>Captain, U.S. Coast Guard, Captain of the Port, Sector Virginia.</i> [FR Doc. 2024–10022 Filed 5–7–24; 8:45 am] BILLING CODE 9110–04–P

Proposed Rules

Federal Register

Vol. 89, No. 90

Wednesday, May 8, 2024

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. FAA-2024-0768; Project Identifier AD-2022-00504-R]

RIN 2120-AA64

Airworthiness Directives; Bell Textron Inc., Helicopters

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: The FAA proposes to adopt a new airworthiness directive (AD) for certain Bell Textron Inc., Model 212, 412, 412CF, and 412EP helicopters. This proposed AD was prompted by reports of cracked tail boom attachment barrel nuts (barrel nuts). This proposed AD would require replacing all steel alloy barrel nuts with nickel alloy barrel nuts and, replacing or inspecting other tail boom attachment point hardware and depending on the results, replacing hardware, stabilizing torque, and applying torque stripes. This proposed AD would also require repetitively inspecting torque and, depending on the results, corrective action. This proposed AD would require repetitively replacing the upper left-hand (LH) tail boom attachment bolt (bolt) and repetitively inspecting the other tail boom attachment point bolts. Lastly, this proposed AD would prohibit installing steel alloy barrel nuts. The FAA is proposing this AD to address the unsafe condition on these products.

DATES: The FAA must receive comments on this proposed AD by June 24, 2024.

ADDRESSES: You may send comments, using the procedures found in 14 CFR 11.43 and 11.45, by any of the following methods:

- *Federal eRulemaking Portal:* Go to [regulations.gov](https://www.regulations.gov). Follow the instructions for submitting comments.
- *Fax:* (202) 493-2251.

- *Mail:* U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, Washington, DC 20590.

- *Hand Delivery:* Deliver to Mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

AD Docket: You may examine the AD docket at [regulations.gov](https://www.regulations.gov) under Docket No. FAA-2024-0768; or in person at Docket Operations between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this NPRM, any comments received, and other information. The street address for Docket Operations is listed above.

Material Incorporated by Reference:

- For service information identified in this NPRM, contact Bell Textron, Inc., P.O. Box 482, Fort Worth, TX 76101, United States; phone (450) 437-2862 or 1-800-363-8023; fax (450) 433-0272; email: productsupport@bellflight.com; website: bellflight.com/support/contact-support.

- You may view this service information at the FAA, Office of the Regional Counsel, Southwest Region, 10101 Hillwood Parkway, Room 6N-321, Fort Worth, TX 76177. For information on the availability of this material at the FAA, call (817) 222-5110.

FOR FURTHER INFORMATION CONTACT:

Jacob Fitch, Aviation Safety Engineer, FAA, 1801 S Airport Road, Wichita, KS 67209; telephone (817) 222-4130; email jacob.fitch@faa.gov.

SUPPLEMENTARY INFORMATION:

Comments Invited

The FAA invites you to send any written relevant data, views, or arguments about this proposal. Send your comments to an address listed under **ADDRESSES**. Include "Docket No. FAA-2024-0768; Project Identifier AD-2022-00504-R" at the beginning of your comments. The most helpful comments reference a specific portion of the proposal, explain the reason for any recommended change, and include supporting data. The FAA will consider all comments received by the closing date and may amend this proposal because of those comments.

Except for Confidential Business Information (CBI) as described in the following paragraph, and other

information as described in 14 CFR 11.35, the FAA will post all comments received, without change, to [regulations.gov](https://www.regulations.gov), including any personal information you provide. The agency will also post a report summarizing each substantive verbal contact received about this NPRM.

Confidential Business Information

CBI is commercial or financial information that is both customarily and actually treated as private by its owner. Under the Freedom of Information Act (FOIA) (5 U.S.C. 552), CBI is exempt from public disclosure. If your comments responsive to this NPRM contain commercial or financial information that is customarily treated as private, that you actually treat as private, and that is relevant or responsive to this NPRM, it is important that you clearly designate the submitted comments as CBI. Please mark each page of your submission containing CBI as "PROPIN." The FAA will treat such marked submissions as confidential under the FOIA, and they will not be placed in the public docket of this NPRM. Submissions containing CBI should be sent to Jacob Fitch, Aviation Safety Engineer, FAA, 1801 S Airport Road, Wichita, KS 67209; telephone (817) 222-4130; email jacob.fitch@faa.gov. Any commentary that the FAA receives which is not specifically designated as CBI will be placed in the public docket for this rulemaking.

Background

The FAA received reports of cracked barrel nuts involving Model 412EP helicopters. According to Bell Textron Inc., the root cause for cracking can vary from corrosion damage, high time in service, or hydrogen embrittlement. Barrel nut cracking can also cause loss of torque on the associated bolt and subsequent bolt cracking. Due to design similarities, Model 212, 412, and 412CF helicopters are also affected by the same unsafe condition. This condition, if not addressed, could result in increased fatigue loading and subsequent failure of the bolts, which could lead to separation of the tail boom from the helicopter and subsequent loss of control of the helicopter.

FAA's Determination

The FAA is issuing this NPRM after determining that the unsafe condition described previously is likely to exist or

develop on other products of these same type designs.

Related Service Information Under 1 CFR Part 51

The FAA reviewed the following Bell alert service bulletins (ASBs), each Revision A, and each dated February 23, 2022. This service information specifies procedures for replacing the steel alloy barrel nuts with nickel alloy barrel nuts, inspecting and replacing the tail boom attachment hardware, stabilizing the tail boom attachment hardware torque, applying torque seals, and inspecting the torque.

- ASB 212–21–166 for Model 212 helicopters,
- ASB 412–21–187 for Model 412/412EP helicopters, and
- ASB 412CF–21–72 for Model 412CF helicopters.

This service information is reasonably available because the interested parties have access to it through their normal course of business or by the means identified in **ADDRESSES**.

Proposed AD Requirements in This NPRM

This proposed AD would require, for certain serial-numbered Bell Textron Inc., Model 212, 412CF, 412, and 412EP helicopters, removing the upper LH steel alloy barrel nut and bolt from service and replacing them with a new nickel alloy barrel nut, retainer, and bolt. For certain other serial-numbered Bell Textron Inc., Model 412 and 412EP helicopters, this proposed AD would require removing the upper LH steel alloy barrel nut from service, visually inspecting the removed upper LH steel alloy barrel nut and replacing it with a nickel alloy barrel nut and retainer, and either visually inspecting or replacing the upper LH bolt. For those serial-numbered Bell Textron Inc., Model 212, 412, 412CF, and 412EP helicopters, this proposed AD would also require removing the upper right-hand (RH), lower LH, and lower RH steel alloy barrel nuts, visually inspecting those removed steel alloy barrel nuts, and replacing them with new nickel alloy barrel nuts and retainers, and either visually inspecting or replacing the upper RH, lower LH, and lower RH bolts. Thereafter for those helicopters, as well as for one additional serial-numbered Model 412/412EP helicopter, this proposed AD would require, inspecting the torque applied on each bolt to determine if the torque has stabilized and, depending on the results, replacing and inspecting certain tail boom attachment point hardware and repeating the torque inspections, or applying torque stripes.

For all applicable helicopters, this proposed AD would require repetitively inspecting the torque applied on each bolt within a longer-term compliance time interval and, depending on the results, replacing and inspecting certain tail boom attachment point hardware and repeating the torque inspections and stabilization, or applying torque stripes.

Additionally, for all applicable helicopters, this proposed AD would require repetitively replacing the upper LH bolt within a longer-term compliance time interval by requiring removal of it from service and replacing it with a new upper LH bolt. This proposed AD would also require, for all applicable helicopters, visually inspecting the other three bolts within a longer-term compliance time interval and, depending on the results, corrective action. Following accomplishment of those actions, this proposed AD would require inspecting the torque applied on each bolt to determine if the torque has stabilized and, depending on the results, replacing and inspecting certain tail boom attachment point hardware and repeating the torque inspections, or applying torque stripes.

Lastly, this proposed AD would prohibit installing steel alloy barrel nuts on any helicopter.

Differences Between This Proposed AD and the Service Information

The service information specifies checking torque, whereas this proposed AD would require inspecting torque because that action must be accomplished by persons authorized under 14 CFR 43.3.

When stabilizing the tail boom attachment hardware torque, the service information does not specify what to do if the torque on a bolt is below the minimum allowable torque limit, whereas this proposed AD would require replacing and inspecting certain tail boom attachment point hardware, stabilizing the torque of the replaced hardware set, and applying a torque stripe.

This proposed AD would require replacing each upper LH bolt with a new (zero total hours time-in-service (TIS)) bolt within a 5,000 hours TIS or 5 year threshold, whereas the service information does not specify that action. This proposed AD would also require visually inspecting the upper RH, lower LH, and lower RH bolts within a 5,000 hours TIS or 5 year threshold, whereas the service information does not specify those actions.

Costs of Compliance

The FAA estimates that this AD, if adopted as proposed, would affect 105 helicopters of U.S. registry. Labor rates are estimated at \$85 per work-hour. Based on these numbers, the FAA estimates the following costs to comply with this proposed AD.

For the initial requirements for certain helicopters, replacing the four steel alloy barrel nuts with new nickel alloy barrel nuts, inspecting or replacing up to four bolts, inspecting and stabilizing the torque, and applying torque stripes would take up to approximately 8.5 work-hours for an estimated labor cost of up to \$723. The parts cost for the four new nickel alloy barrel nuts (including retainers) would be approximately \$680. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt. The parts cost to apply torque stripes would be a nominal amount. The estimated cost for these actions would be up to approximately \$1,866 per helicopter.

For all applicable helicopters, inspecting the torque applied on each bolt would take approximately 1 work-hour for an estimated cost of \$85 per helicopter and \$8,925 for the U.S. fleet, per inspection cycle.

For all applicable helicopters, replacing an upper LH bolt, stabilizing the torque, and applying a torque stripe would take up to approximately 5 work-hours. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost to apply a torque stripe would be a nominal amount. The estimated cost for these actions would be up to approximately \$621 per helicopter and \$65,205 for the U.S. fleet, per replacement cycle. Inspecting one of the other bolts, stabilizing the torque, and applying a torque stripe would take up to approximately 3.5 work-hours for an estimated cost of \$298 per other bolt and \$31,290 for the U.S. fleet, per inspection cycle. If required, replacing a bolt following that inspection would take a minimal amount of additional time and the parts cost would be approximately \$89.

If required as a result of failing a torque inspection, visually inspecting a barrel nut, replacing a bolt, stabilizing the torque, and applying a torque stripe would take up to approximately 5.5 work-hours per failed hardware set. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt. The parts cost to apply a torque stripe would be a nominal amount. The estimated cost for these actions would be \$664 (upper

LH bolt) or \$557 (other bolts), per failed hardware set. If required, replacing a barrel nut following that inspection would take a minimal amount of additional time and the parts cost for a barrel nut (including retainer) would be approximately \$173.

If required as a result of failing a torque stabilization, replacing a barrel nut, visually inspecting a bolt, stabilizing the torque, and applying a torque stripe would take up to approximately 5.5 work-hours and the parts cost for a barrel nut (including retainer) would be approximately \$73. The estimated cost for these actions would be \$541. If required, replacing the bolt following that inspection would take a minimal amount of additional time and the parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt.

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. Subtitle VII: Aviation Programs, describes in more detail the scope of the Agency's authority.

The FAA is issuing this rulemaking under the authority described in Subtitle VII, Part A, Subpart III, Section 44701: General requirements. Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

The FAA determined that this proposed AD would not have federalism implications under Executive Order 13132. This proposed AD would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify this proposed regulation:

- (1) Is not a "significant regulatory action" under Executive Order 12866,
- (2) Would not affect intrastate aviation in Alaska, and
- (3) Would not have a significant economic impact, positive or negative, on a substantial number of small entities

under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

The Proposed Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA proposes to amend 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

- 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

- 2. The FAA amends § 39.13 by adding the following new airworthiness directive:

Bell Textron Inc.: Docket No. FAA–2024–0768; Project Identifier AD–2022–00504–R.

(a) Comments Due Date

The FAA must receive comments on this airworthiness directive (AD) by June 24, 2024.

(b) Affected ADs

None.

(c) Applicability

This AD applies to the Bell Textron Inc., helicopters, certificated in any category, that are identified in paragraphs (c)(1) through (5) of this AD.

(1) Model 212 helicopters, serial numbers (S/N) 30501 through 30999 inclusive, 31101 through 31311 inclusive, 32101 through 32142 inclusive, and 35001 through 35103 inclusive;

(2) Model 412CF helicopters, S/N 46400 through 46499 inclusive;

(3) Model 412 and 412EP helicopters, S/N 33001 to 33213 inclusive, 34001 through 34036 inclusive, 36001 through 36687 inclusive, 36689 through 38999 inclusive, 37002 through 37018 inclusive, 37021 through 37051 inclusive, 38001, and 39101 through 39103 inclusive;

(4) Model 412 and 412EP helicopter, S/N 37052; and

(5) Model 412 and 412EP helicopters, S/N 36688, 37019, 37020, 37053 through 37999 inclusive, 38002 through 38999 inclusive, and 39104 through 39999 inclusive.

(d) Subject

Joint Aircraft System Component (JASC) Code: 5302, Rotorcraft Tail Boom.

(e) Unsafe Condition

This AD was prompted by reports of cracked tail boom attachment barrel nuts (barrel nuts). The FAA is issuing this AD to address fatigue cracking of barrel nuts, damage to the tail boom attachment bolts (bolts), and certain bolts remaining in service

beyond fatigue limits. The unsafe condition, if not addressed, could result in increased fatigue loading and subsequent failure of the bolts, which could lead to separation of the tail boom from the helicopter and subsequent loss of control of the helicopter.

(f) Compliance

Comply with this AD within the compliance times specified, unless already done.

(g) Required Actions

(1) Within 300 hours time-in-service (TIS) or 90 days after the effective date of this AD, whichever occurs first, accomplish the actions required by paragraphs (g)(1)(i) through (iv) of this AD, as applicable. For purposes of this AD, the word "new" is defined as having zero total hours TIS.

(i) For all helicopters identified in paragraphs (c)(1) and (2) of this AD; and for helicopters identified in paragraph (c)(3) of this AD that have accumulated 5,000 or more total hours TIS or 5 or more years since new, or if the total hours TIS or age of the helicopter is unknown, remove the upper left-hand (LH) steel alloy barrel nut part number (P/N) NAS577B9A and upper LH bolt from service and replace them with a new nickel alloy barrel nut P/N NAS577C9A, new retainer P/N NAS578C9A, and a new bolt in accordance with the Accomplishment Instructions, part I, paragraphs 4 through 7, of Bell Alert Service Bulletin 212–21–166, Revision A, dated February 23, 2022 (ASB 212–21–166 Rev A), Bell Alert Service Bulletin 412CF–21–72, Revision A, dated February 23, 2022 (ASB 412CF–21–72 Rev A), or Bell Alert Service Bulletin 412–21–187, Revision A, dated February 23, 2022 (ASB 412–21–187 Rev A), as applicable to your helicopter model, except you are not required to discard parts.

(ii) For helicopters identified in paragraph (c)(3) of this AD that have accumulated less than 5,000 total hours TIS and less than 5 years since new, remove the upper LH steel alloy barrel nut P/N NAS577B9A, the upper LH bolt, countersunk washer, and plain washers, and visually inspect the removed upper LH steel alloy barrel nut for cracking. If there is any cracking in the upper LH steel alloy barrel nut, before further flight, remove the upper LH bolt from service. If the upper LH bolt was not removed from service as a result of the upper LH steel alloy barrel nut inspection, visually inspect the upper LH bolt for any corrosion, damaged threads, wear, and fatigue cracking. If upper LH bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the upper LH bolt from service. Regardless of the result of the upper LH steel alloy barrel nut inspection, remove the upper LH steel alloy barrel nut from service and replace it with a new nickel alloy barrel nut P/N NAS577C9A and new retainer P/N NAS578C9A. Install a new upper LH bolt or reinstall the existing upper LH bolt, as applicable, by following the Accomplishment Instructions, part I, paragraphs 6 and 7, of ASB 412–21–187 Rev A.

(iii) For helicopters identified in paragraphs (c)(1) through (3) of this AD, remove the upper right-hand (RH) steel alloy

barrel nut P/N NAS577B8A, the upper RH bolt, countersunk washer, and plain washers, and visually inspect the removed upper RH steel alloy barrel nut for cracking. If there is any cracking in the upper RH steel alloy barrel nut, before further flight, remove the upper RH bolt from service. If the upper RH bolt was not removed from service as a result of the upper RH steel alloy barrel nut inspection, visually inspect the upper RH bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the upper RH bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the upper RH bolt from service. Regardless of the result of the upper RH steel alloy barrel nut inspection, remove the upper RH steel alloy barrel nut from service and replace it with a new nickel alloy barrel nut P/N NAS577C8A and new retainer P/N NAS578C8A. Install a new upper RH bolt or reinstall the existing upper RH bolt, as applicable, by following the Accomplishment Instructions, part I, paragraphs 11 and 12, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model.

(iv) For helicopters identified in paragraphs (c)(1) through (3) of this AD, remove one of the lower steel alloy barrel nuts P/N NAS577B6A, its lower bolt, countersunk washer, and plain washers, and visually inspect the removed lower steel alloy barrel nut for cracking. If there is any cracking in the lower steel alloy barrel nut, before further flight, remove the lower bolt from service. If the lower bolt was not removed from service as a result of the lower steel alloy barrel nut inspection, visually inspect the lower bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the lower bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the lower bolt from service. Regardless of the result of the lower steel alloy barrel nut inspection, remove the lower steel alloy barrel nut from service and replace it with a new nickel alloy barrel nut P/N NAS577C6A and new retainer P/N NAS578C6A. Install a new lower bolt or reinstall the existing lower bolt, as applicable, by following the Accomplishment Instructions, part I, paragraphs 16 and 17, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model. Repeat the actions required by this paragraph for the other lower tail boom attachment point.

(2) For helicopters identified in paragraphs (c)(1) through (3) of this AD, after accumulating 1 hour TIS, but not to exceed 5 hours TIS after accomplishing the actions required by paragraph (g)(1) of this AD, using the torque value information in the Accomplishment Instructions, part II, paragraph 1, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model, inspect the torque applied on each bolt. Thereafter, repeat the torque inspection of each bolt after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for each bolt and accomplish the actions required by paragraphs (g)(2)(i) and (ii) of this AD.

Note 1 to the introductory text of paragraph (g)(2): This note applies to the introductory text of paragraph (g)(2), the introductory text of paragraph (g)(2)(i), paragraph (g)(2)(i)(B), and paragraph (g)(2)(ii) of this AD. The Accomplishment Instructions, part II, paragraph 1, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, and ASB 412CF-21-72 Rev A each refer to part I for allowable torque limits; part I of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, and ASB 412CF-21-72 Rev A specify the different torque limits for the different bolts.

(i) If the torque on a bolt is below the minimum allowable torque limit as a result of any instance of the torque inspection or if after three torque inspection attempts, the torque on any bolt has not stabilized, before further flight, accomplish the actions required by paragraphs (g)(2)(i)(A) and (B) of this AD.

(A) Remove the hardware set of one failed tail boom attachment point (barrel nut, retainer, bolt, countersunk washer, and plain washers). Remove the barrel nut and retainer from service as applicable to the affected tail boom attachment point. Visually inspect the removed bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the bolt from service.

(B) Install a new bolt or reinstall the existing bolt, as applicable, and a new nickel alloy barrel nut P/N NAS577C9A, NAS577C8A, or NAS577C6A, and new retainer P/N NAS578C9A, NAS578C8A, or NAS578C6A, with the P/N of the new nickel alloy barrel nut and the P/N of the new retainer being as applicable to the affected tail boom attachment point by following the Accomplishment Instructions, part I, paragraphs 6 and 7, paragraphs 11 and 12, or paragraphs 16 and 17, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model and with the paragraphs as applicable to that bolt. Repeat the actions required by paragraphs (g)(2)(i)(A) and (B) of this AD for each failed tail boom attachment point, one hardware set at a time. Then repeat the actions required by paragraph (g)(2) of this AD just for each newly installed or reinstalled bolt until the torque for all four tail boom attachment points stabilizes.

(ii) If the torque for all four tail boom attachment points has stabilized, before further flight, apply a torque stripe to all four bolts.

(3) For the helicopter identified in paragraph (c)(4) of this AD, within 5 hours TIS after the effective date of this AD, inspect the torque applied on each bolt in accordance with the Accomplishment Instructions, part II, paragraphs 1 and 2, of ASB 412-21-187 Rev A. Thereafter, repeat the torque inspection of each bolt after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for each bolt and accomplish the actions required by paragraphs (g)(2)(i) and (ii) of this AD.

Note 2 to paragraph (g)(3): The Accomplishment Instructions, part II, paragraph 1, of ASB 412-21-187 Rev A refers

to part I for allowable torque limits; part I of ASB 412-21-187 Rev A specifies the different torque limits for the different bolts.

(4) For helicopters identified in paragraphs (c)(1) through (4) of this AD, within 600 hours TIS or 12 months, whichever occurs first after applying torque stripes to all four bolts as required by paragraph (g)(2)(ii) of this AD, and thereafter within intervals not to exceed 600 hours TIS or 12 months, whichever occurs first; and for helicopters identified in paragraph (c)(5) of this AD, within 600 hours TIS or 12 months after the effective date of this AD, whichever occurs first, and thereafter within intervals not to exceed 600 hours TIS or 12 months, whichever occurs first, using the torque value information in the Accomplishment Instructions, part II, paragraph 1, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model, inspect the torque applied on each bolt. If the torque on any bolt is below the minimum allowable torque limit, accomplish the actions required by paragraphs (g)(4)(i) and (ii) of this AD.

(i) Before further flight, remove the hardware set of one failed tail boom attachment point (barrel nut, retainer, bolt, countersunk washer, and plain washers). Visually inspect the removed barrel nut for cracking, corrosion, and loss of tare torque. If the barrel nut has any cracking, corrosion, or has lost any tare torque, before further flight, remove the barrel nut and retainer from service and replace them with a new nickel alloy barrel nut P/N NAS577C9A, NAS577C8A, or NAS577C6A, and new retainer P/N NAS578C9A, NAS578C8A, or NAS578C6A, with the P/N of the new nickel alloy barrel nut and the P/N of the new retainer being as applicable to the affected tail boom attachment point. Regardless of the result of the barrel nut inspection, remove the bolt from service and replace it with a new bolt by following the Accomplishment Instructions, part I, paragraphs 6 and 7, paragraphs 11 and 12, or paragraphs 16 and 17, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model and with the paragraphs as applicable to that bolt. Repeat the actions required by this paragraph for each failed tail boom attachment point, one hardware set at a time.

(ii) After accumulating 1 hour TIS, but not to exceed 5 hours TIS after accomplishing the actions required by paragraph (g)(4)(i) of this AD, using the torque value information in the Accomplishment Instructions, part II, paragraph 1, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, or ASB 412CF-21-72 Rev A, as applicable to your helicopter model, inspect the torque applied on each newly installed bolt. Thereafter, repeat the torque inspection of those bolts after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for those bolts and accomplish the actions required by paragraphs (g)(2)(i) and (ii) of this AD.

Note 3 to paragraph (g)(4): The Accomplishment Instructions, part II, paragraph 1, of ASB 212-21-166 Rev A, ASB 412-21-187 Rev A, and ASB 412CF-21-72

Rev A, each refer to part I for allowable torque limits; part I of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, and ASB 412CF–21–72 Rev A, specify the different torque limits for the different bolts.

(5) Within the compliance times specified in Table 1 to the introductory text of paragraph (g)(5) of this AD, accomplish the actions required by paragraphs (g)(5)(i) through (iv) of this AD.

Table 1 to the Introductory Text of Paragraph (g)(5)

BILLING CODE 4910–13–P

Helicopter Groups	Compliance Times
For helicopters identified in paragraphs (c)(1) and (2) of this AD, and helicopters identified in paragraph (c)(3) of this AD that accomplished paragraph (g)(1)(i) of this AD.	Within 5,000 hours TIS or 5 years after accomplishing the actions required by paragraph (g)(1) of this AD, whichever occurs first, and thereafter, within intervals not to exceed 5,000 hours TIS or 5 years, whichever occurs first.
For helicopters identified in paragraph (c)(3) of this AD that accomplished paragraph (g)(1)(ii) of this AD.	Before the helicopter accumulates 5,000 total hours TIS or 5 years since new, whichever occurs first, and thereafter, within intervals not to exceed 5,000 hours TIS or 5 years, whichever occurs first.
For helicopters identified in paragraphs (c)(4) and (5) of this AD.	Before the helicopter accumulates 5,000 total hours TIS or 5 years since new, whichever occurs first, or if the total hours TIS or age of the helicopter is unknown, before further flight, and thereafter, within intervals not to exceed 5,000 hours TIS or 5 years, whichever occurs first.

BILLING CODE 4910–13–C

(i) Remove the upper LH bolt from service and replace it with a new upper LH bolt by following the Accomplishment Instructions, part I, paragraphs 6 and 7, of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, or ASB 412CF–21–72 Rev A, as applicable to your helicopter model. Then accomplish the actions required by paragraph (g)(5)(v) of this AD.

Note 4 to paragraph (g)(5)(i): This note applies to paragraphs (g)(5)(i) through (v) of this AD. The Accomplishment Instructions, part II, paragraph 1, of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, and ASB 412CF–21–72 Rev A, each refer to part I for allowable torque limits; part I of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, and ASB 412CF–21–72 Rev A, specify the different torque limits for the different bolts.

(ii) With the upper RH bolt removed, visually inspect the upper RH bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the upper RH bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the upper RH bolt from service. Install a new upper RH bolt or reinstall the existing upper RH bolt, as applicable, by following the

Accomplishment Instructions, paragraphs 11 and 12 of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, or ASB 412CF–21–72 Rev A, as applicable to your helicopter model. Then accomplish the actions required by paragraph (g)(5)(v) of this AD.

(iii) With the lower LH bolt removed, visually inspect the lower LH bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the lower LH bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the lower LH bolt from service. Install a new lower LH bolt or reinstall the existing lower LH bolt, as applicable, by following the Accomplishment Instructions, paragraphs 16 and 17 of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, or ASB 412CF–21–72 Rev A, as applicable to your helicopter model. Then accomplish the actions required by paragraph (g)(5)(v) of this AD.

(iv) With the lower RH bolt removed, visually inspect the lower RH bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the lower RH bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the lower RH bolt from service. Install a new lower RH bolt or reinstall the existing lower

RH bolt, as applicable, by following the Accomplishment Instructions, paragraphs 16 and 17 of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, or ASB 412CF–21–72 Rev A, as applicable to your helicopter model. Then accomplish the actions required by paragraph (g)(5)(v) of this AD.

(v) After accumulating 1 hour TIS, but not to exceed 5 hours TIS after accomplishing the actions required by paragraph (g)(5)(i), (ii), (iii), or (iv) of this AD, using the torque value information in the Accomplishment Instructions, part II, paragraph 1, of ASB 212–21–166 Rev A, ASB 412–21–187 Rev A, or ASB 412CF–21–72 Rev A, as applicable to your helicopter model, inspect the torque applied on each bolt. Thereafter, repeat the torque inspection of those bolts after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for those bolts and accomplish the actions required by paragraphs (g)(2)(i) and (ii) of this AD.

(6) For helicopters identified in paragraph (c) of this AD, as of the effective date of this AD, do not install a steel alloy barrel nut P/N NAS577B9A, P/N NAS577B8A, or P/N NAS577B6A on any helicopter.

(h) Special Flight Permit

A one-time special flight permit may be issued in accordance with 14 CFR 21.197 and 21.199 in order to fly to a maintenance area to perform the required actions in this AD.

(i) Alternative Methods of Compliance (AMOCs)

(1) The Manager, Central Certification Branch, FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. In accordance with 14 CFR 39.19, send your request to your principal inspector or local Flight Standards District Office, as appropriate. If sending information directly to the manager of the certification office, send it to the attention of the person identified in paragraph (j) of this AD. Information may be emailed to fwaco@faa.gov.

(2) Before using any approved AMOC, notify your appropriate principal inspector, or lacking a principal inspector, the manager of the local flight standards district office/certificate holding district office.

(j) Related Information

For more information about this AD, contact Jacob Fitch, Aviation Safety Engineer, FAA, 1801 S Airport Road, Wichita, KS 67209; telephone (817) 222-4130; email jacob.fitch@faa.gov.

(k) Material Incorporated by Reference

(1) The Director of the Federal Register approved the incorporation by reference of the service information listed in this paragraph under 5 U.S.C. 552(a) and 1 CFR part 51.

(2) You must use this service information as applicable to do the actions required by this AD, unless the AD specifies otherwise.

(i) Bell Alert Service Bulletin 212-21-166, Revision A, dated February 23, 2022.

(ii) Bell Alert Service Bulletin 412-21-187, Revision A, dated February 23, 2022.

(iii) Bell Alert Service Bulletin 412CF-21-72, Revision A, dated February 23, 2022.

(3) For service information identified in this AD, contact Bell Textron, Inc., P.O. Box 482, Fort Worth, TX 76101, United States; phone (450) 437-2862 or 1-800-363-8023; fax (450) 433-0272; email: productsupport@bellflight.com; or website: bellflight.com/support/contact-support.

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION**Federal Aviation Administration****14 CFR Part 39**

[Docket No. FAA-2022-0600; Project Identifier AD-2021-01160-R]

RIN 2120-AA64

Airworthiness Directives; Bell Textron Inc., Helicopters

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Supplemental notice of proposed rulemaking (SNPRM).

SUMMARY: The FAA is revising a notice of proposed rulemaking (NPRM) that would have applied to all Bell Textron Inc., Model 204B, 205A, 205A-1, 205B, and 210 helicopters. This AD was prompted by an accident and incidents involving failure of the tail boom attachment structure. This action revises the NPRM by changing the proposed required actions and adding a special flight permit limitation. The FAA is proposing this airworthiness directive (AD) to address the unsafe condition on these products. Since these actions would impose an additional burden over those in the NPRM, the agency is requesting comments on this SNPRM.

DATES: The FAA must receive comments on this SNPRM by June 24, 2024.

ADDRESSES: You may send comments, using the procedures found in 14 CFR 11.43 and 11.45, by any of the following methods:

- **Federal eRulemaking Portal:** Go to regulations.gov. Follow the instructions for submitting comments.

- **Fax:** 202-493-2251.

- **Mail:** U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, Washington, DC 20590.

- **Hand Delivery:** Deliver to Mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

AD Docket: You may examine the AD docket at regulations.gov by searching for and locating Docket No. FAA-2022-0600; or in person at Docket Operations between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains the NPRM, this SNPRM, any comments received, and other information. The street address for Docket Operations is listed above.

Material Incorporated by Reference:

- For Bell material, contact Bell Textron Inc., P.O. Box 482, Fort Worth, TX 76101; phone (450) 437-2862 or (800) 363-8023; fax (450) 433-0272;

email productsupport@bellflight.com; website: bellflight.com/support/contact-support.

- You may view this service information at the FAA, Office of the Regional Counsel, Southwest Region, 10101 Hillwood Pkwy., Room 6N-321, Fort Worth, TX 76177. For information on the availability of this material at the FAA, call (817) 222-5110.

Other Related Service Information: For other service information identified in this SNPRM, contact Bell Textron Inc., P.O. Box 482, Fort Worth, TX 76101; phone (450) 437-2862 or (800) 363-8023; fax (450) 433-0272; email productsupport@bellflight.com; website: bellflight.com/support/contact-support.

FOR FURTHER INFORMATION CONTACT:

Michael Perrin, Aviation Safety Engineer, FAA, 1801 S Airport Road, Wichita, KS 67209; phone: (562) 627-5362; email: Michael.j.perrin@faa.gov.

SUPPLEMENTARY INFORMATION:**Comments Invited**

The FAA invites you to send any written relevant data, views, or arguments about this proposal. Send your comments to an address listed under the **ADDRESSES** section. Include "Docket No. FAA-2022-0600; Project Identifier AD-2021-01160-R" at the beginning of your comments. The most helpful comments reference a specific portion of the proposal, explain the reason for any recommended change, and include supporting data. The FAA will consider all comments received by the closing date and may again revise this proposal because of those comments.

Except for Confidential Business Information (CBI) as described in the following paragraph, and other information as described in 14 CFR 11.35, the FAA will post all comments received, without change, to regulations.gov, including any personal information you provide. The agency will also post a report summarizing each substantive verbal contact received about this SNPRM.

Confidential Business Information

CBI is commercial or financial information that is both customarily and actually treated as private by its owner. Under the Freedom of Information Act (FOIA) (5 U.S.C. 552), CBI is exempt from public disclosure. If your comments responsive to this SNPRM contain commercial or financial information that is customarily treated as private, that you actually treat as private, and that is relevant or responsive to this SNPRM, it is important that you clearly designate the

submitted comments as CBI. Please mark each page of your submission containing CBI as "PROPIN." The FAA will treat such marked submissions as confidential under the FOIA, and they will not be placed in the public docket of this SNPRM. Submissions containing CBI should be sent to Michael Perrin, Aviation Safety Engineer, FAA, 1801 S Airport Road, Wichita, KS 67209; phone: (562) 627-5362; email: Michael.j.perrin@faa.gov. Any commentary that the FAA receives which is not specifically designated as CBI will be placed in the public docket for this rulemaking.

Background

The FAA issued AD 2021-15-14, Amendment 39-21661 (86 FR 39942, July 26, 2021) (AD 2021-15-14) for various restricted category helicopters. AD 2021-15-14 was prompted by an accident involving a Model UH-1B helicopter and two forced landings involving Model UH-1H and UH-1F helicopters, due to tail boom attachment structure failures. Each of the three events involved a failure of the upper left-hand (LH) tail boom attachment fitting, which is the most heavily loaded at the four tail boom attach points. The FAA issued AD 2021-15-14 to address fatigue cracking of tail boom attachment fittings, cap angles, longerons, and bolts.

Due to their similarity to the Model UH-1B, UH-1H, and UH-1F helicopters, the FAA determined that Bell Textron Inc., Model 204B, 205A, 205A-1, 205B, and 210 helicopters are also affected by the same unsafe condition and issued an NPRM to propose the same actions as those required in AD 2021-15-14. The NPRM published in the **Federal Register** on June 7, 2022 (87 FR 34587) to amend 14 CFR part 39, and would have applied to Bell Textron Inc., Model 204B, 205A, 205A-1, 205B, and 210 helicopters. The NPRM proposed to require revising the helicopter's existing rotorcraft flight manual (RFM) to incorporate pre-flight checks; removing excess paint and sealant, and cleaning certain parts; and repetitive inspections of structural components that attach the tail boom to the fuselage. Depending on the inspection results, the NPRM proposed to require repairing or replacing components, or re-bonding the structure.

Actions Since the NPRM Was Issued

Since the FAA issued the NPRM, the FAA has determined changes to the proposed required actions are necessary, primarily based on comments received from several commenters and additional review. The FAA has also determined to

require a special flight permit limitation as proposed in this SNPRM.

Comments

The FAA received comments from four commenters. The following discussion presents the comments received on the NPRM and the FAA's response.

Requests To Withdraw the NPRM

Request: Delta Helicopters Ltd. (DHL) and Remote Helicopters Ltd. (RHL) stated that because Bell service information and established maintenance programs already provide the needed requirements to address the unsafe condition, the proposed AD is not necessary. Additionally, an individual commenter stated the proposed requirements will not prevent a sudden failure and stated that daily nut and bolt inspections, replacement of bolts and nuts at scheduled intervals, and maintaining proper torque would be just as effective as the requirements proposed in the NPRM.

DHL stated that although damage does occur, sudden failures will not occur unless the helicopter is being operated outside of its capabilities and not being inspected properly as already prescribed by Bell in related alert service bulletins (ASBs). RHL stated that the proposed requirements in the NPRM are not necessary because properly accomplishing the service information from Bell and operating the helicopter within the appropriate parameters are sufficient. The FAA infers that these commenters are requesting that the FAA withdraw the NPRM.

FAA Response: The FAA disagrees. While an operator may incorporate into its maintenance program the inspections in the manufacturer's service bulletins referenced by the commenters, not all operators are required to do so. In order for these inspections to become mandatory, and to correct the unsafe conditions identified in the NPRM, the FAA must issue an AD.

Request: DHL, RHL, and one individual commenter each stated that the restricted category helicopters and the Bell Textron Inc., Model 204 and 205 helicopters have significant dissimilarities. DHL stated that the comparison between restricted category and Bell Textron Inc., Model 204B and 205A-1 helicopters is not accurate, and the Model 205 structure has more in common with the structure of a Model 212 helicopter.

RHL stated that the tail boom inspection for the Model UH-1 helicopter is more difficult because of lack of access to the inspection areas. Accordingly, RHL stated that lack of

access to the inspection areas is not a problem for Bell Textron Inc., Model 205 helicopters, and because of this, the inspection areas for these helicopters are inspected on a regular basis.

Additionally, one individual commenter stated the structural design of the tail boom and the fuselage attachment structure is different when comparing Model UH helicopters to Bell Textron Inc., Model 205A, 205A-1, 205B, and 210 helicopters, and that these helicopters are more robust than the Model UH helicopter. The individual commenter also stated the failures mentioned in the NPRM occurred only on Model UH helicopters used during heli-logging, and heavy lift activities, but that commenter has never seen these failures during heavy lift activities in the Bell Textron Inc., Model 205A-1 helicopter. Finally, the individual commenter stated the proposed AD is unwarranted and without basis to include the Bell Textron Inc., Model 205A, 205A-1, 205B, and 210 helicopters in the applicability as they are closer in similarity to the Bell Textron Inc., Model 212 helicopter. The FAA infers that these commenters are requesting that the FAA withdraw the NPRM.

FAA Response: The FAA disagrees. An examination of the structures of both the Model UH-1 helicopters and the Bell Textron Inc., Model 204 and 205 helicopters indicated no significant differences between the commercial and military model helicopters. Furthermore, there have been reported tail boom attachment failures involving the Bell Textron Inc., Model 205 helicopter. Additionally, performing heavy lift operations such as logging could accelerate failures in the tail boom attachment region. The FAA expects that the number of tail boom attachment failures will increase over time and will also include those aircraft not involved in heavy lift operations.

Request for Changes to the Required Actions

Request: DHL commenter stated that stripping paint is not necessary to detect damage during routine maintenance.

FAA Response: The FAA agrees and has revised this SNPRM accordingly.

Request: One individual commenter stated inspection requirements are part of the Instructions for Continued Airworthiness and should not be included in a flight manual. The individual commenter stated a mandatory inspection is a stand-alone inspection and is not related to the operation of an aircraft, which is the main reason for a flight manual. Furthermore, the commenter stated

maintenance personnel would not review or reference a flight manual for inspection requirements.

FAA Response: The FAA agrees and has revised this proposed AD accordingly by removing the requirement of revising the rotorcraft flight manual from the required actions.

Comment Regarding an Alternative Method of Compliance (AMOC) Request

Request: One individual commenter requested the ability to submit a request for an AMOC for the tail boom sensor supplemental type certificate.

FAA Response: The FAA agrees that operators may request approval of an AMOC under the provisions of paragraph (j) of this SNPRM.

FAA's Determination

The FAA is proposing this AD after determining the unsafe condition described previously is likely to exist or develop in other products of the same type design. Certain changes described above expand the scope of the NPRM. As a result, it is necessary to reopen the comment period to provide additional opportunity for the public to comment on this SNPRM.

Related Service Information Under 1 CFR Part 51

The FAA reviewed Bell Alert Service Bulletin (ASB) 210–21–15, Revision A, dated February 23, 2022 (ASB 210–21–15, Rev A). This service information specifies procedures for replacing the steel alloy barrel nuts with nickel alloy barrel nuts, inspecting, and replacing the tail boom attachment hardware, stabilizing the tail boom attachment hardware torque, applying torque seals, and subsequently checking the torque.

This service information is reasonably available because the interested parties have access to it through their normal course of business or by the means identified in the **ADDRESSES** section.

Other Related Service Information

The FAA reviewed Bell ASB 205–21–118, Bell ASB 204B–21–75, and Bell ASB 205B–21–72, each Revision A and dated February 23, 2022. This service information specifies the same procedures as ASB 210–21–15, Rev A.

Proposed AD Requirements in This SNPRM

This proposed AD would require for Bell Textron Inc., Model 204B helicopters, with the tailboom assembly removed, removing the upper left-hand (LH) bolt from service and inspecting the bolt's associated attachment hardware, and depending on the inspection results, removing the

associated nut from service. This proposed AD would also require visually inspecting each bulkhead, bolt hole, attachment fitting, the three other nuts, the upper right-hand bolt, and two lower bolts, including the bolt shank and head radii. Depending on inspection results, this proposed AD would require repairing or replacing an affected bulkhead or affected fitting, removing certain part-numbered nuts, removing any affected nut and its associated bolt from service, and removing any affected bolt from service.

This proposed AD would require for Bell Textron Inc., Model 205A, 205A–1, and 205B helicopters, with the tail boom assembly removed, removing the upper LH bolt from service, and inspecting its associated barrel nut and retainer, and depending on the inspection results, removing barrel nut and retainer from service. This proposed AD would also require visually inspecting each bulkhead, bolt hole, attachment fitting, the three other barrel nuts, associated retainers, the upper right-hand bolt, and two lower bolts, including the bolt shank and head radii. Depending on inspection results, this proposed AD would require repairing or replacing an affected bulkhead or affected fitting, removing certain part-numbered barrel nuts and retainers, removing any affected barrel nuts and its associated bolt from service, and removing any affected bolt from service.

This proposed AD would require for Bell Textron Inc., Model 210 helicopters, with the tail boom supported, removing the upper LH steel alloy barrel nut, retainer, and bolt from service. This proposed AD would also require removing the countersunk washer and plain washers, and replacing them with a new certain part-numbered nickel alloy barrel nut, new retainer, new bolt, an airworthy countersunk washer, and airworthy plain washers. This proposed AD would also require visually inspecting the upper RH bolt and its associated hardware, and depending on the inspection results, removing the upper RH bolt and barrel nut from service. Additionally, this proposed AD would require visually inspecting the two lower bolts and the associated barrel nuts, and depending on the inspection results, removing any affected barrel nut and its associated bolt from service, and removing any affected bolt from service.

Additionally, this proposed AD would require for all applicable helicopters, after the initial inspections have been completed, applying a coating of grease to each bolt shank only, installing the applicable hardware, and torquing each bolt by using the

torque value information identified in this proposed AD or identified in ASB 210–21–15, Rev A as applicable.

Thereafter, for all applicable helicopters, this proposed AD would require inspecting the torque applied on each bolt to determine if the torque has stabilized and, depending on the results, replacing and inspecting certain tail boom attachment point hardware and repeating the torque inspections, or applying torque stripes.

Lastly, this proposed AD would prohibit installing certain part-numbered steel alloy nuts on any Model 204B helicopters; and would prohibit installing certain part-numbered steel alloy barrel nuts on any Model 205A, 205A–1, 205B, and 210 helicopters.

Differences Between This SNPRM and the Service Information

The service information specifies checking torque, whereas this proposed AD would require inspecting torque because that action must be accomplished by persons authorized under 14 CFR 43.3.

When stabilizing the tail boom attachment hardware torque, the service information does not specify what to do if the torque on a tail boom attachment bolt is below the minimum allowable torque limit, whereas this proposed AD would require replacing and inspecting certain tail boom attachment point hardware, stabilizing the torque of the replaced hardware set, and applying torque stripes.

Costs of Compliance

The FAA estimates that this proposed AD would affect 62 (five Model 204B helicopters, fifty-three Model 205A, 205A–1, and 205B helicopters, and four Model 210 helicopters) of U.S. registry. Labor costs are estimated at \$85 per work-hour. Based on these numbers, the FAA estimates the following costs to comply with this proposed AD.

For the initial requirements for Model 204B helicopters, inspecting or replacing up to four bolts (which includes applying a coating of grease), inspecting each bulkhead, inspecting each fitting and bolt hole, inspecting and stabilizing the torque, and applying torque stripes would take up to approximately 8.5 work-hours for an estimated labor cost of up to \$723. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt. The parts cost for four new nuts would be approximately \$680. The parts cost to apply torque stripes would be a nominal amount. The estimated cost for these actions would be up to approximately

\$1,866 per helicopter and \$9,330 for the U.S. fleet.

For the initial requirements for Model 205A, 205A-1, and 205B helicopters, replacing the four steel alloy barrel nuts with new nickel alloy barrel nuts, inspecting or replacing up to four bolts (which includes applying a coating of grease), inspecting each bulkhead, inspecting and stabilizing the torque, and applying torque stripes would take up to approximately 8.5 work-hours for an estimated labor cost of up to \$723. The parts cost for the four new nickel alloy barrel nuts (including retainers) would be approximately \$680. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt. The parts cost to apply torque stripes would be a nominal amount. The estimated cost for these actions would be up to approximately \$1,866 per helicopter and \$98,898 for the U.S. fleet.

For the initial requirements for Model 210 helicopters, replacing the four steel alloy barrel nuts with new nickel alloy barrel nuts, inspecting or replacing up to four bolts (which includes applying a coating of grease), inspecting and stabilizing the torque, and applying torque stripes would take up to approximately 8.5 work-hours for an estimated labor cost of up to \$723. The parts cost for the four new nickel alloy barrel nuts (including retainers) would be approximately \$680. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt. The parts cost to apply torque stripes would be a nominal amount. The estimated cost for these actions would be up to approximately \$1,866 per helicopter and \$7,464 for the U.S. fleet.

For all applicable helicopters, inspecting the torque applied on each bolt would take approximately 1 work-hour for an estimated cost of \$85 per helicopter and \$5,270 for the U.S. fleet, per inspection cycle.

For all applicable helicopters, replacing an upper LH bolt, stabilizing the torque, and applying a torque stripe would take up to approximately 5 work-hours. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost to apply a torque stripe would be a nominal amount. The estimated cost for these actions would be up to approximately \$621 per helicopter and \$38,502 for the U.S. fleet, per replacement cycle. Inspecting one of the other bolts, stabilizing the torque, and applying a torque stripe would take up to approximately 3.5 work-hours for an estimated cost of \$298 per other bolt

and \$18,476 for the U.S. fleet per other bolt per inspection cycle. If required, replacing a bolt following that inspection would take a minimal amount of additional time and the parts cost would be approximately \$89.

If required as a result of failing any torque inspection required by this proposed AD, visually inspecting a nut or a barrel nut, replacing a bolt, stabilizing the torque, and applying a torque stripe would take up to approximately 5.5 work-hours per failed hardware set. The parts cost for an upper LH bolt would be approximately \$196 and the parts cost for the other bolts would be approximately \$89 per bolt. The parts cost to apply a torque stripe would be a nominal amount. The estimated cost for these actions would be \$664 (upper LH bolt) or \$557 (other bolts), per failed hardware set. If required, replacing a nut following that inspection would take a minimal amount of additional time and the parts cost for a nut would be approximately \$89 per nut, and if required, replacing a barrel nut following that inspection would take a minimal amount of additional time and the parts cost for a barrel nut (including retainer) would be approximately \$173 per barrel nut.

The corrective action that may be needed as a result of the bulkhead inspection could vary significantly from helicopter to helicopter. The FAA has no data to determine the costs to accomplish the corrective action or the number of helicopters that may require corrective action.

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. Subtitle VII: Aviation Programs describes in more detail the scope of the Agency's authority.

The FAA is issuing this rulemaking under the authority described in Subtitle VII, Part A, Subpart III, Section 44701: General requirements. Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

The FAA determined that this proposed AD would not have federalism

implications under Executive Order 13132. This proposed AD would not have a substantial direct effect on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify this proposed regulation:

(1) Is not a "significant regulatory action" under Executive Order 12866,

(2) Would not affect intrastate aviation in Alaska, and

(3) Would not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

The Proposed Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA proposes to amend 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

■ 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

■ 2. The FAA amends § 39.13 by adding the following new airworthiness directive:

Bell Textron Inc.: Docket No. FAA-2022-0600; Project Identifier AD-2021-01160-R.

(a) Comments Due Date

The FAA must receive comments on this airworthiness directive (AD) by June 24, 2024.

(b) Affected ADs

None.

(c) Applicability

This AD applies to Bell Textron Inc., Model 204B, 205A, 205A-1, 205B, and 210 helicopters, certificated in any category.

(d) Subject

Joint Aircraft System Component (JASC) 5302, Rotorcraft Tail Boom.

(e) Unsafe Condition

This AD was prompted by an accident and incidents involving failure of the tail boom attachment structure. The FAA is issuing this AD to address fatigue cracking of tail boom attachment fittings, cap angles, longerons, and bolts. The unsafe condition, if not addressed, could result in separation of the tail boom from the helicopter and subsequent loss of control of the helicopter.

(f) Compliance

Comply with this AD within the compliance times specified, unless already done.

(g) Allowable Torque Values (in-lbs)

Tail boom attachment point	Model 204B	Model 205A/ 205A-1	Model 205B	Model 210
Upper left-hand bolt	570–610	1000–1200	1000–1200	1300–1600
Upper right-hand bolt	360–380	1000–1200	1000–1200	1000–1200
Lower left-hand bolt	360–380	400–430	400–430	400–430
Lower right-hand bolt	360–380	400–430	400–430	400–430

(h) Required Actions

(1) Within 300 hours time-in-service (TIS) or 90 days after the effective date of this AD, whichever occurs first, accomplish the actions required by paragraphs (h)(1)(i), (ii), or (iii) of this AD as applicable to your model helicopter. For purposes of this AD, the word “new” is defined as having zero total hours TIS.

(i) For Model 204B helicopters, accomplish the actions required by paragraphs (h)(1)(i)(A) through (C) of this AD.

(A) With the tail boom assembly removed, remove the upper left-hand (LH) tail boom attachment bolt (bolt) from service and inspect its associated tail boom attachment nut (nut) for mechanical damage, corrosion, a crack, damaged threads, and wear, and to determine whether it is a steel alloy part number (P/N) NAS679A, NAS1291, or MS21042. If there is any mechanical damage, corrosion, a crack, a damaged thread, or wear, or if nut P/N NAS679A, NAS1291, or MS21042 is installed, before further flight, remove the nut from service.

(B) Visually inspect each bulkhead (FS 195.00 and FS 195.03) and the bolt holes for mechanical damage, corrosion, and cracks; visually inspect each attachment fitting for mechanical damage, corrosion, cracks, and loose fasteners; determine if any of the three other nuts are a steel alloy P/N NAS679A, NAS1291, or MS21042; and visually inspect the other three nuts, the upper right-hand (RH) bolt, and two lower bolts for mechanical damage, corrosion, cracks, damaged threads, and wear, including the bolt shank and head radii of the bolts for a damaged thread, wear, and mechanical damage.

(1) If there is any mechanical damage, corrosion, or cracks on any bulkhead (FS 195.00 or FS 195.03), or any mechanical damage, corrosion, or cracks on any bolt holes, or if there is any mechanical damage, corrosion, cracks, or loose fasteners on any attachment fitting, before further flight, repair or replace the affected bulkhead or the affected attachment fitting, as appropriate, in accordance with FAA-approved procedures.

(2) If there is any mechanical damage, corrosion, a crack, a damaged thread, or wear on any nut, or if nut P/N NAS679A, NAS1291, or MS21042 is installed, before further flight, remove the affected nut from service. If there is a crack on any nut, before further flight, also remove its associated bolt from service.

(3) If there is any mechanical damage, corrosion, a crack, a damaged thread, or wear on the upper RH bolt or two lower bolts, which includes the bolt shank or head

radii, before further flight, remove the affected bolt from service.

(C) Apply a coating of Aerial Thixo #2 (3810–0) or Aerial Thixo SYN (3820–0) aviation grease to each bolt shank only. Install the hardware set of each tail boom attachment point (nickel alloy nut P/N 90–132L7 or 90–132L6, as applicable to the affected tail boom attachment point, new upper LH bolt P/N NAS627–21, upper RH and two lower bolts P/N NAS626–20, countersunk washer, and plain washers). Torque each bolt by using the torque value information identified in paragraph (g) of this AD.

(ii) For Model 205A, 205A–1, and 205B helicopters, accomplish the actions required by paragraphs (h)(1)(ii)(A) through (C) of this AD.

(A) With the tail boom assembly removed, remove the upper LH bolt from service and inspect its associated tail boom attachment barrel nut (barrel nut) and retainer for mechanical damage, corrosion, a crack, damaged threads, and wear, and to determine whether it is a steel alloy barrel nut P/N NAS577B8A. If there is any mechanical damage, corrosion, a crack, a damaged thread, or wear, or if barrel nut P/N NAS577B8A is installed, before further flight, remove the barrel nut and its associated retainer from service.

(B) Visually inspect each bulkhead (BS 17.31 and FS 243.89) and the bolt holes for mechanical damage, corrosion, and cracks; visually inspect each attachment fitting for mechanical damage, corrosion, cracks, and loose fasteners; determine if any of the three other barrel nuts are steel alloy P/N NAS577B8A or P/N NAS577B6A; and visually inspect the other three barrel nuts and the associated retainers, the upper RH bolt, and two lower bolts for mechanical damage, corrosion, cracks, damaged threads, and wear, including the bolt shank and head radii of the bolts for a damaged thread, wear, and mechanical damage.

(1) If there is any mechanical damage, corrosion, or cracks on any bulkhead (BS 17.31 or FS 243.89), or any mechanical damage, corrosion, or cracks on any bolt holes, or if there is any mechanical damage, corrosion, cracks, or loose fasteners on any attachment fitting, before further flight, repair or replace the affected bulkhead or the affected attachment fitting, as appropriate, in accordance with FAA-approved procedures.

(2) If there is any mechanical damage, corrosion, a crack, a damaged thread, or wear on any barrel nut or retainer, or if barrel nut P/N NAS577B8A or NAS577B6A is installed,

before further flight, remove the affected barrel nut and retainer (as a pair) from service. If there is a crack on any nut, before further flight, also remove its associated bolt from service.

(3) If there is any mechanical damage, corrosion, a crack, a damaged thread, or wear on the upper RH bolt or two lower bolts, which includes the bolt shank or head radii, before further flight, remove the affected bolt from service.

(C) Apply a coating of Aerial Thixo #2 (3810–0) or Aerial Thixo SYN (3820–0) aviation grease to each bolt shank only. Install the hardware set of each tail boom attachment point (nickel alloy barrel nut P/N NAS577C6A or P/N NAS577C8A and retainer P/N NAS578C6A or P/N NAS578C8A, as applicable to the affected tail boom attachment point, new upper LH bolt P/N NAS628–22, upper RH and two lower bolts P/N NAS628–22 or NAS626–18, as applicable to the affected tail boom attachment point, countersunk washer, and plain washers). Torque each bolt by using the torque value information identified in paragraph (g) of this AD.

(iii) For Model 210 helicopters, accomplish the actions required by paragraphs (h)(1)(iii)(A) through (C) of this AD.

(A) With the tail boom supported, remove the upper LH bolt, and the steel alloy barrel nut P/N NAS577B9A, including the retainer, from service. Remove the countersunk washer, and plain washers, and install new nickel alloy barrel nut P/N NAS577C9A, new retainer P/N NAS578C9A, airworthy countersunk washer, airworthy plain washers, and a new bolt in accordance with the Accomplishment Instructions, Part I, paragraphs 5 through 7 of Bell Alert Service Bulletin (ASB) 210–21–15, Revision A, dated February 23, 2022 (ASB 210–21–15, Rev A).

(B) Remove the upper RH bolt, steel alloy barrel nut P/N NAS577B8A, countersunk washer, and plain washers. Visually inspect the upper RH bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the upper RH bolt has any corrosion, damaged threads, wear, or fatigue cracking, before further flight, remove the upper RH bolt from service. Visually inspect the removed barrel nut for cracking. If there is any cracking in the barrel nut, before further flight, remove the upper RH bolt from service. Regardless of the result of the upper RH steel alloy barrel nut inspection, replace the barrel nut with a new nickel alloy barrel nut P/N NAS577C8A and new retainer P/N NAS578C8A. Install a new upper RH bolt or reinstall the existing upper RH bolt (if no cracks in the barrel nut,

and no corrosion, damaged threads, wear, or fatigue cracking in the bolt were identified), by following the Accomplishment Instructions, part I, paragraphs 11 and 12, including the caution above paragraph 11, of ASB 210–21–15, Rev A.

(C) Remove one of the lower bolts, its lower steel alloy barrel nut P/N NAS577B6A, countersunk washer, and plain washers. Visually inspect that lower bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the lower bolt has any corrosion, damaged threads, wear, or fatigue cracking, before further flight, remove the lower bolt from service. Visually inspect the removed lower barrel nut for cracking. If there is any cracking in the lower barrel nut, before further flight, remove the lower bolt from service. Regardless of the result of that lower steel alloy barrel nut inspection, replace the barrel nut with a new nickel alloy barrel nut P/N NAS577C6A and new retainer P/N NAS578C6A. Install a new lower bolt or reinstall the existing lower bolt (if no cracks in the barrel nut, and no corrosion, damaged threads, wear, or fatigue cracking in the bolt were identified), by following the Accomplishment Instructions, part I, paragraphs 16 through 17, including the caution above paragraph 16, of ASB 210–21–15, Rev A. Repeat the actions required by this paragraph for the other lower attachment point.

(2) For helicopters identified in paragraph (c) of this AD, after accumulating 1 hour TIS, but not to exceed 5 hours TIS, after accomplishing the actions required by paragraph (h)(1) of this AD, using the torque value information identified in paragraph (g) of this AD, as applicable to your model helicopter, inspect the torque applied on each bolt. Thereafter, repeat the torque inspection of each bolt after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for each bolt, and accomplish the actions required by paragraphs (h)(2)(i) and (ii) of this AD.

(i) If the torque on a bolt is below the minimum allowable torque limit as a result of any instance of the torque inspection or if after three torque inspection attempts, the torque on any bolt has not stabilized, before further flight, accomplish the actions required by paragraphs (h)(2)(i)(A) and (B) of this AD.

(A) Remove the hardware set of one failed tail boom attachment point (nut, bolt, countersunk washer, and plain washers for Model 204B helicopters, and barrel nut, bolt, retainer, countersunk washer, and plain washers for Model 205A, 205A–1, 205B, and 210 helicopters). For Model 204 helicopters, remove the nut from service and for Model 205A, 205A–1, 205B, and 210 helicopters remove the barrel nut and retainer from service as applicable to the affected tail boom attachment point. Visually inspect the removed bolt for any corrosion, damaged threads, wear, and fatigue cracking. If the bolt has any corrosion, a damaged thread, wear, or fatigue cracking, before further flight, remove the bolt from service.

(B) Apply a coating of Aerial Thixo #2 (3810–0) or Aerial Thixo SYN (3820–0) aviation grease to the bolt shank only. Install

a new bolt or reinstall the existing bolt (if no corrosion, damaged threads, wear, or fatigue cracking in the bolt were identified), and the hardware set of the affected tail boom attachment point (new nut P/N 90–132L6 or 90–132L7, countersunk washer, and plain washers for Model 204B helicopters, and new nickel alloy barrel nut P/N NAS577C6A, NAS577C8A or P/N NAS577C9A and new retainer P/N NAS578C6A, NAS578C8A, or P/N NAS577C9A, countersunk washer, and plain washers for Model 205A, 205A–1, 205B, and 210 helicopters) as applicable to the affected tail boom attachment point. Torque the bolt by using the torque value information identified in paragraph (g) of this AD. Repeat the actions required by paragraphs (h)(2)(i)(A) and (B) of this AD, for each failed tail boom attachment point, one hardware set at a time. Then repeat the actions required by paragraph (h)(2) of this AD just for each newly installed or reinstalled bolt until the torque for all four tail boom attachment points stabilize.

(ii) If the torque for all four tail boom attachment points has stabilized, before further flight, apply a torque stripe to all four bolts.

(3) For helicopters identified in paragraph (c) of this AD, within 600 hours TIS or 12 months, whichever occurs first, after applying torque stripes to all four bolts as required by paragraph (h)(2)(ii) of this AD, and thereafter within intervals not to exceed 600 hours TIS or 12 months, whichever occurs first, inspect the torque applied on each bolt using the torque value information identified in paragraph (g) of this AD, as applicable to your model helicopter. If the torque on any bolt is below the minimum allowable torque limit, accomplish the actions required by paragraphs (h)(3)(i) and (ii) of this AD.

(i) Before further flight, remove the hardware set of one failed tail boom attachment point (nut, bolt, countersunk washer, and plain washers for Model 204B helicopters, and barrel nut, retainer, bolt, countersunk washer, and plain washers for Model 205A, 205A–1, 205B, and 210 helicopters) and then accomplish the actions required by paragraphs (h)(3)(i)(A), (B), or (C) of this AD as applicable to your model helicopter.

(A) For Model 204B helicopters, visually inspect the removed nut for cracking, corrosion, and loss of tare torque. If the nut has any cracking, corrosion, or loss of tare torque, before further flight, remove the nut from service and replace with a new nut P/N 90–132L7 or 90–132L6 as applicable to the tail boom attachment point. Regardless of the result of the nut inspection, remove the bolt from service and replace it with a new bolt by applying a coating of Aerial Thixo #2 (3810–0) or Aerial Thixo SYN (3820–0) aviation grease to the bolt shank only, and install the hardware set of the tail boom attachment point (nut, bolt, and countersunk washer, and plain washers). Torque each bolt by using the torque value information identified in paragraph (g) of this AD. Repeat the actions required by this paragraph for each failed tail boom attachment point, one hardware set at a time.

(B) For Model 205A, 205A–1, and 205B, helicopters, visually inspect the removed

barrel nut for cracking, corrosion, and loss of tare torque. If the barrel nut has any cracking, corrosion, or loss of tare torque, before further flight, remove the barrel nut and retainer from service and replace them with a new nickel alloy barrel nut P/N NAS577C6A, or NAS577C8A, and new retainer P/N NAS578C6A, or NAS578C8A, with the P/N of the new nickel alloy barrel nut and the P/N of the new retainer being as applicable to the affected tail boom attachment point. Regardless of the result of the barrel nut inspection, remove the bolt from service and replace it with a new bolt. Apply a coating of Aerial Thixo #2 (3810–0) or Aerial Thixo SYN (3820–0) aviation grease to each bolt shank only. Install the hardware set of each tail boom attachment point (nickel alloy barrel nut, retainer, bolt, countersunk washer, and plain washers). Torque each bolt by using the torque value information identified in paragraph (g) of this AD. Repeat the actions required by this paragraph for each failed tail boom attachment point, one hardware set at a time.

(C) For Model 210 helicopters, visually inspect the removed barrel nut for cracking, corrosion, and loss of tare torque. If the barrel nut has any cracking, corrosion, or loss of tare torque, before further flight, remove the barrel nut and retainer from service and replace them with a new nickel alloy barrel nut P/N NAS577C6A, NAS577C8A, or NAS577C9A, and new retainer P/N NAS578C6A, NAS578C8A, or NAS578C9A, with the P/N of the new nickel alloy barrel nut and the P/N of the new retainer being as applicable to the affected tail boom attachment point. Regardless of the result of the barrel nut inspection, remove the bolt from service and replace it with a new bolt, apply a coating of Aerial Thixo #2 (3810–0) or Aerial Thixo SYN (3820–0) aviation grease to each bolt shank only, and torque each bolt by using the torque value information identified in paragraph (g) of this AD. Repeat the actions required by this paragraph for each failed tail boom attachment point, one hardware set at a time.

(ii) After accumulating 1 hour TIS, but not to exceed 5 hours TIS after accomplishing the actions required by paragraph (h)(3)(i) of this AD, using the torque value information identified in paragraph (g) of this AD as applicable to your model helicopter, inspect the torque applied on each newly installed bolt. Thereafter, repeat the torque inspection of those bolts after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for those bolts and accomplish the actions required by paragraphs (h)(2)(i) and (ii) of this AD.

(4) For helicopters identified in paragraph (c) of this AD, within 5,000 hours TIS or 5 years after accomplishing the actions required by paragraph (h)(1) of this AD, whichever occurs first, and thereafter, within intervals not to exceed 5,000 hours TIS or 5 years, whichever occurs first, accomplish the actions required by paragraphs (h)(4)(i) and (ii) of this AD.

(i) Accomplish the actions required by paragraphs (h)(1)(i), (ii), or (iii) of this AD, as applicable to your model helicopter.

(ii) After accumulating 1 hour TIS, but not to exceed 5 hours TIS after accomplishing the

actions required by paragraph (h)(4)(i) of this AD, using the torque value information identified in paragraph (g) of this AD as applicable to your model helicopter, inspect the torque applied on each bolt. Thereafter, repeat the torque inspection of those bolts after accumulating 1 hour TIS, but not to exceed 5 hours TIS, to determine if the torque has stabilized. Do not exceed three torque inspections total for those bolts and accomplish the actions required by paragraphs (h)(2)(i) and (ii) of this AD.

(5) As of the effective date of this AD, do not install the following parts identified in paragraphs (h)(5)(i) and (ii) of this AD on any helicopter.

(i) For Model 204B helicopters; steel alloy nut P/N NAS679A, NAS1291, or MS21042.

(ii) For Model 205A, 205A-1, 205B, and 210 helicopters; steel alloy barrel nut P/N NAS577B9A, P/N NAS577B8A, or P/N NAS577B6A.

(i) Special Flight Permit

A one-time special flight permit may be issued in accordance with 14 CFR 21.197 and 21.199 in order to fly to a maintenance area to perform the required actions in this AD.

(j) Alternative Methods of Compliance (AMOCs)

(1) The Manager, Central Certification Branch, FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. In accordance with 14 CFR 39.19, send your request to your principal inspector or local Flight Standards District Office, as appropriate. If sending information directly to the manager of the certification office, send it to the attention of the person identified in paragraph (k) of this AD. Information may be emailed to fwaco@faa.gov.

(2) Before using any approved AMOC, notify your appropriate principal inspector, or lacking a principal inspector, the manager of the local flight standards district office/certificate holding district office.

(k) Related Information

For more information about this AD, contact Michael Perrin, Aviation Safety Engineer, FAA, 1801 S Airport Road, Wichita, KS 67209; phone: (562) 627-5362; email: Michael.j.perrin@faa.gov.

(l) Material Incorporated by Reference

(1) The Director of the Federal Register approved the incorporation by reference (IBR) of the service information listed in this paragraph under 5 U.S.C. 552(a) and 1 CFR part 51.

(2) You must use this service information as applicable to do the actions required by this AD, unless the AD specifies otherwise.

(i) Bell Alert Service Bulletin 210-21-15, Revision A, dated February 23, 2022.

(ii) [Reserved]

(3) For service information identified in this AD, contact Bell Textron Inc., P.O. Box 482, Fort Worth, TX 76101; phone (450) 437-2862 or (800) 363-8023; fax (450) 433-0272; email productsupport@bellflight.com; or website: bellflight.com/support/contact-support.

(4) You may view this service information at the FAA, Office of Regional Counsel, Southwest Region, 10101 Hillwood Pkwy., Fort Worth, TX 76177. For information on the availability of this material at the FAA, call (817) 222-5110.

(5) You may view this material at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, visit www.archives.gov/federal-register/cfr/ibr-locations or email fr.inspection@nara.gov.

Issued on April 26, 2024.

James D. Foltz,

Deputy Director, Compliance & Airworthiness Division, Aircraft Certification Service.

Office of the Secretary

14 CFR Part 382

[Docket No. DOT-OST-2022-0144]

RIN 2105-AF14

Ensuring Safe Accommodations for Air Travelers With Disabilities Using Wheelchairs

AGENCY: Office of the Secretary (OST), Department of Transportation (DOT or the Department).

ACTION: Proposed rule; extension of comment period.

SUMMARY: The Department is extending through June 12, 2024, the period for interested persons to submit comments to its proposed rule on Ensuring Safe Accommodations for Air Travelers with Disabilities Using Wheelchairs.

DATES: The comment period for the proposed rule published March 12, 2024, at 89 FR 17766, is extended. Comments should be filed by June 12, 2024. Late-filed comments will be considered to the extent practicable.

ADDRESSES: You may file comments identified by the docket number DOT-OST-2022-0144 by any of the following methods:

- *Federal eRulemaking Portal:* Go to <https://www.regulations.gov> and follow the online instructions for submitting comments.
- *Mail:* Docket Management Facility, U.S. Department of Transportation, 1200 New Jersey Ave. SE, West Building Ground Floor, Room W12-140, Washington, DC 20590-0001.
- *Hand Delivery or Courier:* West Building Ground Floor, Room W12-140, 1200 New Jersey Ave. SE, Washington, DC, between 9 a.m. and 5 p.m. ET, Monday through Friday, except Federal holidays.

- *Fax:* (202) 493-2251.

Instructions: You must include the agency name and docket number DOT-OST-2022-0144 or the Regulatory Identification Number (RIN 2105-AF14) for the rulemaking at the beginning of your comment. All comments received will be posted without change to <https://www.regulations.gov>, including any personal information provided.

Privacy Act: Anyone can search the electronic form of all comments received in any of our dockets by the name of the individual submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). You may review DOT's complete Privacy Act statement in the **Federal Register** published on April 11, 2000 (65 FR 19477-78), or you may visit <https://www.transportation.gov/privacy>.

Docket: For access to the docket to read background documents and comments received, go to <https://www.regulations.gov> or to the street address listed above. Follow the online instructions for accessing the docket.

FOR FURTHER INFORMATION CONTACT:

Christopher Miller, Staff Attorney, Office of Aviation Consumer Protection, U.S. Department of Transportation, 1200 New Jersey Ave. SE, Washington, DC 20590, 202-366-9342 (phone), 202-366-7152 (fax), christopher.miller1@dot.gov.

SUPPLEMENTARY INFORMATION: On February 29, 2024, the Department publicly announced and posted to its website a notice of proposed rulemaking (NPRM) to ensure airline passengers who use wheelchairs can travel safely and with dignity. In the NPRM, which was published in the **Federal Register** on March 12, 2024, the Department proposed to change the way airlines provide accommodations for individuals who use wheelchairs. The NPRM proposed to set new standards for prompt, safe, and dignified assistance, to mandate enhanced training for airline employees and contractors who physically assist passengers with disabilities and handle passengers' wheelchairs, and to specify actions that airlines must take to protect passengers when a wheelchair is damaged during transport. The proposed rulemaking also clarified that any mishandling of a passenger's checked wheelchair or other assistive device is a violation of the Air Carrier Access Act (ACAA) and proposed to make the mishandling of a wheelchair or other assistive device a per se violation. In addition, the Department solicited comment on various issues including the size standards for

lavatories on twin-aisle aircraft and reimbursements of the fare difference when the fare on a flight a wheelchair user took and the fare on a flight that a wheelchair would have taken if the wheelchair had been able to fit in the aircraft differ. The NPRM provided for a comment period of 60 days after publication of the NPRM in the **Federal Register**, *i.e.*, May 13, 2024.

On March 20, 2024, Airlines for America, the International Air Transport Association, the National Air Carriers Association, the Regional Airline Association, and the Airline Service Providers Association (collectively “Associations”) filed a joint request to extend the public comment period for an additional 90 days. The Associations state that this additional time is needed because of the number of questions and requests for comment posed in the NPRM and the significance of the proposed changes to the accessibility obligations of airlines and airlines’ service providers. The Associations also ask questions regarding the proposal and assert that answers to these questions are necessary to understand the NPRM’s benefits and impact. The Department’s responses to the questions raised in the joint request are posted in the rulemaking docket at <https://www.regulations.gov/docket/DOT-OST-2022-0144>.

On April 26, 2024, 16 disability rights organizations filed a joint comment urging the Department to deny the Associations’ requests for an extension to the comment period for the NPRM. These organizations are: Access Living, American Association of People with Disabilities, The Arc of the United States, Blinded Veterans Association, Christopher & Dana Reeve Foundation, Cure SMA, Disability Rights Education & Defense Fund, Epilepsy Foundation, I AM ALS, Muscular Dystrophy Association, National Council on Independent Living, National Disability Rights Network, National MS Society, Paralyzed Veterans of America, Parent Project Muscular Dystrophy, and United Spinal Association. The disability rights organizations assert the Department has provided a sufficient time for relevant stakeholders to review and comment on the NPRM considering the multiple years’ effort to improve the air travel experience of passengers who are wheelchair users, and the significant concerns for their safety and dignity in air travel.

The Department has carefully considered the request for extension of the comment period and the request to deny the extension and has determined to extend the comment period for the proposed rule for 30 days from May 13,

2024, to June 12, 2024. The Department believes that granting a one-month extension of the original comment period is sufficient to allow stakeholders to review potential impacts, to assess the Department’s responses to the clarification requests, and to prepare comments.

Given the request from the disability rights organizations to deny the request to extend the comment period, the Department encourages all persons to submit comments when ready rather than waiting until the end of the extended period.

Signed in Washington, DC, on or around this 1st day of May 2024, under authority delegated at 49 CFR 1.27(n).

Blane A. Workie,

Assistant General Counsel DOT’s Office of Aviation Consumer Protection.

RIN 1625–AA01

Establish Anchorage Ground; Port Westward Anchorage, Columbia River, Oregon and Washington

AGENCY: Coast Guard, DHS.

ACTION: Notice; reopening of comment period.

SUMMARY: The Coast Guard is reopening the comment period for the notice of proposed rulemaking (NPRM) entitled “Establish Anchorage Ground; Port Westward Anchorage, Columbia River, Oregon and Washington,” published on December 28, 2023. Reopening the comment period will allow additional time for the public to review and submit comments on the proposed rule.

DATES: The comment period for the notice of proposed rulemaking published on December 28, 2023 (88 FR 89644) is reopened. Comments and related material must be submitted to the docket by June 7, 2024.

ADDRESSES: You may submit comments identified by docket number USCG–2023–0749 using the Federal Decision Making Portal at <https://www.regulations.gov>. See the “Public Participation and Request for Comments” portion of the **SUPPLEMENTARY INFORMATION** section for further instructions on submitting comments.

FOR FURTHER INFORMATION CONTACT: For information about this document call or email LT Carlie Gilligan, Sector Columbia River Waterways Management Division, U.S. Coast Guard; telephone 503–240–9319, email SCRWWM@uscg.mil.

SUPPLEMENTARY INFORMATION:

Public Participation and Request for Comments

The Coast Guard views public participation as essential to effective rulemaking and will consider all comments and material received on this notice of proposed rulemaking during the comment period. Your comment can help shape the outcome of this rulemaking. If you submit a comment, please include the docket number for this proposed rule, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation.

Submitting comments. We encourage you to submit comments through the Federal Decision Making Portal at <https://www.regulations.gov>. To do so, go to <https://www.regulations.gov>, type USCG–2023–0749 in the search box and click “Search.” Next, look for this document in the Search Results column, and click on it. Then click on the Comment option. If you cannot submit your material by using <https://www.regulations.gov>, call or email the person in the **FOR FURTHER INFORMATION CONTACT** section of this proposed rule for alternate instructions.

Viewing material in docket. To view documents mentioned in this as being available in the docket, find the docket as described in the previous paragraph, and then select “Supporting & Related Material” in the Document Type column. Public comments will also be placed in our online docket and can be viewed by following instructions on the <https://www.regulations.gov> Frequently Asked Questions web page. We review all comments received, but we will only post comments that address the topic of the document. We may choose not to post off-topic, inappropriate, or duplicate comments that we receive.

Personal information. We accept anonymous comments. Comments we post to <https://www.regulations.gov> will include any personal information you have provided. For more about privacy and submissions to the docket in response to this document, see DHS’s eRulemaking System of Records notice (85 FR 14226, March 11, 2020).

Public meeting. We are not planning to hold a public meeting but will consider doing so if we determine from public comments that a meeting would

be helpful. We would issue a separate **Federal Register** notice to announce the date, time, and location of such a meeting.

Dated: April 29, 2024.

Charles E. Fosse,
*Rear Admiral, U.S. Coast Guard Commander,
Thirteenth Coast Guard District.*

RIN 1625–AA00

Safety Zone; 2024 Duluth Air Spectacular, Lake Superior, Duluth, MN

AGENCY: Coast Guard, DHS.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Coast Guard is proposing to establish a temporary safety zone for certain waters of Lake Superior. This action is necessary to provide for the safety of life on these navigable waters near Canal Park in Duluth, MN during an air show on July 31, 2024. This proposed rulemaking would prohibit persons and vessels from being in the safety zone unless authorized by the Captain of the Port Marine Safety Unit Duluth or a designated representative. We invite your comments on this proposed rulemaking.

DATES: Comments and related material must be received by the Coast Guard on or before June 7, 2024.

ADDRESSES: You may submit comments identified by docket number USCG–2024–0222 using the Federal Decision-Making Portal at <https://www.regulations.gov>. See the “Public Participation and Request for Comments” portion of the

SUPPLEMENTARY INFORMATION section for further instructions on submitting comments. This notice of proposed rulemaking with its plain-language, 100-word-or-less proposed rule summary will be available in this same docket.

FOR FURTHER INFORMATION CONTACT: If you have questions about this proposed rulemaking, call or email Chief Petty Officer Kyle Weitzell, Marine Safety Unit Duluth, Waterways Management Division, U.S. Coast Guard; telephone 218–725–3825, email Kyle.W.Weitzell@uscg.mil.

SUPPLEMENTARY INFORMATION:

I. Table of Abbreviations

CFR Code of Federal Regulations
DHS Department of Homeland Security
FR Federal Register

NPRM Notice of proposed rulemaking
§ Section
U.S.C. United States Code

II. Background, Purpose, and Legal Basis

On October 10, 2023, the Coast Guard was notified of an air show that will take place over the waters of Lake Superior near Canal Park in Duluth, MN from 3 p.m. to 6 p.m. on July 31, 2024. During this air show, planes will be flying low over the water within the boundary of a zone marked by buoys and small boat on scene. Hazards from this air show include low flying aircraft and jet exhaust produced by the engines and distraction to the pilots if general boating traffic were to be present within this area. The Captain of the Port Marine Safety Unit Duluth (COTP) has determined that potential hazards associated with the air show at this location would be a safety concern for anyone within an area defined by the following positions, beginning at N 46°47'34.81", W 092°03'46.70", then proceeding southwest to N 46°46'52.73", W 092°05'05.47", then proceeding southwest to N 46°46'48.00", W 092°05'28.02", the following the shoreline northward to N 46°48'1.98", W 092°04'16.02", and then returning to the starting point.

The purpose of this rulemaking is to ensure the safety of vessels and the navigable waters within this area before, during, and after the scheduled event. The Coast Guard is proposing this rulemaking under authority in 46 U.S.C. 70034.

III. Discussion of Proposed Rule

The COTP is proposing to establish a safety zone from noon to 9 p.m. on July 31, 2024. The safety zone would cover all navigable waters of Lake Superior within an area defined by the following positions, beginning at N 46°47'34.81", W 092°03'46.70", then proceeding southwest to N 46°46'52.73", W 092°05'05.47", then proceeding southwest to N 46°46'48.00", W 092°05'28.02", the following the shoreline northward to N 46°48'1.98", W 092°04'16.02", and then returning to the starting point near Canal Park in Duluth, MN. The duration of the zone is intended to ensure the safety of vessels and these navigable waters before, during, and after the scheduled 3 p.m. to 6 p.m. air show. No vessel or person would be permitted to enter the safety zone without obtaining permission from the COTP or a designated representative. The regulatory text we are proposing appears at the end of this document.

IV. Regulatory Analyses

We developed this proposed rule after considering numerous statutes and Executive orders related to rulemaking. Below we summarize our analyses based on a number of these statutes and Executive orders, and we discuss First Amendment rights of protestors.

A. Regulatory Planning and Review

Executive Orders 12866 and 13563 direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits. This NPRM has not been designated a "significant regulatory action," under section 3(f) of Executive Order 12866, as amended by Executive Order 14094 (Modernizing Regulatory Review). Accordingly, the NPRM has not been reviewed by the Office of Management and Budget (OMB).

This regulatory action determination is based on the short duration and small size of the safety zone as well as the ability for most boats to transit between the Duluth Shipping Canal and Lake Superior without entering the zone.

B. Impact on Small Entities

The Regulatory Flexibility Act of 1980, 5 U.S.C. 601–612, as amended, requires Federal agencies to consider the potential impact of regulations on small entities during rulemaking. The term "small entities" comprises small businesses, not-for-profit organizations that are independently owned and operated and are not dominant in their fields, and governmental jurisdictions with populations of less than 50,000. The Coast Guard certifies under 5 U.S.C. 605(b) that this proposed rule would not have a significant economic impact on a substantial number of small entities.

While some owners or operators of vessels intending to transit the safety zone may be small entities, for the reasons stated in section IV.A above, this proposed rule would not have a significant economic impact on any vessel owner or operator.

If you think that your business, organization, or governmental jurisdiction qualifies as a small entity and that this proposed rule would have a significant economic impact on it, please submit a comment (see **ADDRESSES**) explaining why you think it qualifies and how and to what degree this rule would economically affect it.

Under section 213(a) of the Small Business Regulatory Enforcement Fairness Act of 1996 (Pub. L. 104–121), we want to assist small entities in understanding this proposed rule. If the

proposed rule would affect your small business, organization, or governmental jurisdiction and you have questions concerning its provisions or options for compliance, please call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section. The Coast Guard will not retaliate against small entities that question or complain about this proposed rule or any policy or action of the Coast Guard.

C. Collection of Information

This proposed rule would not call for a new collection of information under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520).

D. Federalism and Indian Tribal Governments

A rule has implications for federalism under Executive Order 13132 (Federalism), if it has a substantial direct effect on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. We have analyzed this proposed rule under that Order and have determined that it is consistent with the fundamental federalism principles and preemption requirements described in Executive Order 13132.

Also, this proposed rule does not have tribal implications under Executive Order 13175 (Consultation and Coordination with Indian Tribal Governments) because it would not have a substantial direct effect on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. If you believe this proposed rule has implications for federalism or Indian Tribes, please call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

E. Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1531–1538) requires Federal agencies to assess the effects of their discretionary regulatory actions. In particular, the Act addresses actions that may result in the expenditure by a State, local, or Tribal government, in the aggregate, or by the private sector of \$100,000,000 (adjusted for inflation) or more in any one year. Though this proposed rule would not result in such an expenditure, we do discuss the potential effects of this proposed rule elsewhere in this preamble.

F. Environment

We have analyzed this proposed rule under Department of Homeland Security Directive 023–01, Rev. 1, associated implementing instructions, and Environmental Planning COMDTINST 5090.1 (series), which guide the Coast Guard in complying with the National Environmental Policy Act of 1969 (42 U.S.C. 4321–4370f), and have made a preliminary determination that this action is one of a category of actions that do not individually or cumulatively have a significant effect on the human environment. This proposed rule involves a safety zone lasting not more than 9 hours that would prohibit entry within an area under the flight path of aircraft participating in an air show. Normally such actions are categorically excluded from further review under paragraph L60(a) of Appendix A, Table 1 of DHS Instruction Manual 023–01–001–01, Rev. 1. A preliminary Record of Environmental Consideration supporting this determination is available in the docket. For instructions on locating the docket, see the **ADDRESSES** section of this preamble. We seek any comments or information that may lead to the discovery of a significant environmental impact from this proposed rule.

G. Protest Activities

The Coast Guard respects the First Amendment rights of protesters. Protesters are asked to call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section to coordinate protest activities so that your message can be received without jeopardizing the safety or security of people, places, or vessels.

V. Public Participation and Request for Comments

We view public participation as essential to effective rulemaking and will consider all comments and material received during the comment period. Your comment can help shape the outcome of this rulemaking. If you submit a comment, please include the docket number for this rulemaking, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation.

Submitting comments. We encourage you to submit comments through the Federal Decision-Making Portal at <https://www.regulations.gov>. To do so, go to <https://www.regulations.gov>, type USCG-2024–0222 in the search box and click “Search.” Next, look for this document in the Search Results column, and click on it. Then click on the

Comment option. If you cannot submit your material by using <https://www.regulations.gov>, call or email the person in the **FOR FURTHER INFORMATION CONTACT** section of this proposed rule for alternate instructions.

Viewing material in docket. To view documents mentioned in this proposed rule as being available in the docket, find the docket as described in the previous paragraph, and then select “Supporting & Related Material” in the Document Type column. Public comments will also be placed in our online docket and can be viewed by following instructions on the <https://www.regulations.gov> Frequently Asked Questions web page. Also, if you click on the Dockets tab and then the proposed rule, you should see a “Subscribe” option for email alerts. The option will notify you when comments are posted, or a final rule is published.

We review all comments received, but we will only post comments that address the topic of the proposed rule. We may choose not to post off-topic, inappropriate, or duplicate comments that we receive.

Personal information. We accept anonymous comments. Comments we post to <https://www.regulations.gov> will include any personal information you have provided. For more about privacy and submissions to the docket in response to this document, see DHS’s eRulemaking System of Records notice (85 FR 14226, March 11, 2020).

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Reporting and recordkeeping requirements, Security measures, Waterways.

For the reasons discussed in the preamble, the Coast Guard is proposing to amend 33 CFR part 165 as follows:

PART 165—REGULATED NAVIGATION AREAS AND LIMITED ACCESS AREAS

- 1. The authority citation for part 165 continues to read as follows:

Authority: 46 U.S.C. 70034, 70051, 70124; 33 CFR 1.05–1, 6.04–1, 6.04–6, and 160.5; Department of Homeland Security Delegation No. 00170.1, Revision No. 01.3.

- 2. Add § 165.T09–0222 to read as follows:

§ 165.T09–0222 Safety Zone; 2024 Duluth Air Spectacular, Lake Superior, Duluth, MN.

(a) **Location.** The following area is a safety zone: All navigable waters of Lake Superior within an area defined by the following positions, beginning at N 46°47′34.81″, W 092°03′46.70″, then proceeding southwest to N 46°46′52.73″, W 092°05′05.47″, then proceeding

southwest to N 46°46′48.00″, W 092°05′28.02″, the following the shoreline northward to N 46°48′1.98″, W 092°04′16.02″, and then returning to the starting point near Canal Park in Duluth, MN.

(b) **Enforcement period.** July 31, 2024, from noon to 9 p.m. The specific time frame for waterway closure will be announce via Broadcast Notice to Mariners.

(c) **Definitions.** The following definitions apply to this section:

(1) **On-scene representative** means any Coast Guard commissioned, warrant, or petty officer designated by the Captain of the Port Duluth to monitor a safety zone, permit entry into the zone, give legally enforceable orders to persons or vessels within the zones, and take other actions authorized by the Captain of the Port.

(2) **Public vessel** means vessels owned, chartered, or operated by the United States, or by a State or political subdivision thereof.

(d) **Regulations.** (1) In accordance with the general regulations in § 165.23, entry into, transiting, or anchoring within this safety zone identified in paragraph (a) of this section is prohibited unless authorized by the Captain of the Port Duluth or his designated on-scene representative.

(2) The safety zone identified in paragraph (a) of this section is closed to all vessel traffic, except as may be permitted by the Captain of the Port Duluth or his designated on-scene representative.

(3) Vessel operators desiring to enter or operate within the safety zone must contact the Captain of the Port Duluth or his on-scene representative to obtain permission to do so. The Captain of the Port Duluth or his on-scene representative may be contacted via VHF Channel 16. Vessel operators given permission to enter or operate in the safety zone must comply with all directions given to them by the Captain of the Port Duluth, or his on-scene representative.

(e) **Exemption.** Public vessels, as defined in paragraph (c) of this section, are exempt from the requirements in this section.

(f) **Waiver.** For any vessel, the Captain of the Port Duluth or his designated representative may waive any of the requirements of this section, upon finding that operational conditions or other circumstances are such that application of this section is unnecessary or impractical for the purposes of public or environmental safety.

Dated: May 2, 2024.

Sean V. Murphy,

*Lieutenant, U.S. Coast Guard, Acting Captain
of the Port Marine Safety Unit Duluth.*

BILLING CODE 9110–04–P

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

33 CFR Part 165

[Docket Number USCG–2024–0261]

RIN 1625–AA11

Safety Zones, Lake Erie and Cuyahoga River, Cleveland, OH

AGENCY: Coast Guard, DHS.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Coast Guard is proposing to establish temporary safety zones for certain waters of Lake Erie, Cleveland Harbor, and the Cuyahoga River. This action is necessary to provide for the safety of life on these navigable waters near Cleveland, Ohio during the 2024 Pan-American Masters Games (Aquatic Sporting Events) from July 12 through July 15, 2024. This proposed rulemaking would prohibit persons and vessels from entering these safety zones unless authorized by the Captain of the Port Sector Eastern Great Lakes or a designated representative. We invite your comments on this proposed rulemaking.

DATES: Comments and related material must be received by the Coast Guard on or before June 7, 2024.

ADDRESSES: You may submit comments identified by docket number USCG–2024–0261 using the Federal Decision-Making Portal at <https://www.regulations.gov>. See the “Public Participation and Request for Comments” portion of the

SUPPLEMENTARY INFORMATION section for further instructions on submitting comments. This notice of proposed rulemaking with its plain-language, 100-word-or-less proposed rule summary will be available in this same docket.

FOR FURTHER INFORMATION CONTACT: If you have questions about this proposed rulemaking, contact LT Jared Stevens, Waterways Management Division, MSU Cleveland, U.S. Coast Guard; via telephone at 216–937–0124, or by email at Jared.M.Stevens@uscg.mil.

SUPPLEMENTARY INFORMATION:

I. Table of Abbreviations

CFR Code of Federal Regulations

DHS Department of Homeland Security
FR Federal Register
NPRM Notice of proposed rulemaking
§ Section
U.S.C. United States Code

II. Background, Purpose, and Legal Basis

On January 22, 2024, the Greater Cleveland Sports Commission notified the Coast Guard that it will be hosting the 2024 Pan-American Masters Games (Aquatic Sporting Events) from July 12 through July 15, 2024. The five (5) Aquatic Sporting Events will be: Sailing, Triathlon (swim portion), Stand Up Paddleboard—Technical, Stand-Up Paddleboard—Distance, and Rowing. These events are to take place in Lake Erie, Cleveland Harbor’s East Basin Channel, Edgewater Beach, and the Cuyahoga River in Cleveland, Ohio. The Captain of the Port Sector Eastern Great Lakes has determined that safety zones covering certain navigable waters of Lake Erie, the Cleveland Harbor East Basin, and the Cuyahoga River in Cleveland, Ohio, are needed to protect participants during the 2024 Pan-American Masters Games’ Aquatic Events.

The purpose of this rulemaking is to ensure the safety of participants, vessels, and the navigable waters before, during, and after the scheduled events. The Coast Guard is proposing this rulemaking under its authority granted in 46 U.S.C. 70034.

III. Discussion of Proposed Rule

The Captain of the Port Sector Eastern Great Lakes (COTP) is proposing to establish the following safety zones covering certain navigable waters of Lake Erie, including the Cleveland Harbor East Basin Channel, Edgewater Beach, and the Cuyahoga River. The duration and location of these zones are intended to ensure the safety of participants on these navigable waters before, during, and after each of the 2024 Pan-American Masters Games’ aquatic sporting events. The zones may require enforcement beyond the stated times if the marine events run into unforeseen delays. No vessel or person would be permitted to enter the safety zones listed directly below without permission from the COTP or a designated representative. The regulatory text we are proposing appears at the end of this document.

(1) *Sailing:* The boundaries of the four (4) sailing race course safety zones are: “Area 1” centered on 41°30′50.4″ N, 081°45′00.0″ W with a radius of 2,700 yards, “Area 2” centered on 41°33′00.0″ N, 081°45′00.0″ W with a radius of 2,700 yards, “Area 3” centered on 41°34′01.2″

N, 081°38′24.0″ W with a radius of 2,700 yards, and “Area 4” which forms a rectangle of which the four corners of the polygon would be located in positions: (1) 41°30′49.64″ N, 081°42′9.81″ W; (2) 41°32′37.78″ N, 081°39′33.01″ W, (3) 41°32′20.99″ N, 081°38′49.79″ W, (4) 41°30′42.27″ N, 81°42′01.59″ W. The COTP is proposing to establish the safety zones for Areas 1, 2, and 3 from 7:30 a.m. to 5:00 p.m. on July 12 through July 14, and the safety zone for Area 4 from 11:30 a.m. to 3:30 p.m. on July 13, 2024.

(2) *Triathlon:* The boundaries of the safety zone would form a rectangle of which the four corners of the polygon would be located in the following positions: The boundaries of the safety zone form a rectangle with the four corners of the polygon located in the following positions: (1) 41°29′15.76″ N, 081°44′46.34″ W; (2) 41°29′27.96″ N, 081°44′49.87″ W, (3) 41°29′31.98″ N, 081°44′24.01″ W, (4) 41°29′27.46″ N, 81°44′22.51″ W. The COTP is proposing to establish this safety zone from 1:30 p.m. to 4:30 p.m. on July 13, 2024, and again from 5:30 a.m. to 9:30 a.m. on July 14, 2024.

(3) *Stand Up Paddleboard—Technical:* The boundaries of the safety zone form a rectangle with the four corners of the polygon located in the following positions: (1) 41°29′15.76″ N, 081°44′46.34″ W; (2) 41°29′27.96″ N, 081°44′49.87″ W, (3) 41°29′31.98″ N, 081°44′24.01″ W, (4) 41°29′27.46″ N, 81°44′22.51″ W. The COTP is proposing to establish the safety zone from 5:30 a.m. to 12:30 p.m. on July 13, 2024, with a back-up rain day from 5:30 a.m. to 12:30 p.m. on July 15, 2024.

(4) *Stand Up Paddleboard—Distance:* The safety zone would cover all navigable waters of the Cuyahoga River in Cleveland, Ohio between the following two boundaries, which are formed by lines extending perpendicular from bank to bank, centered on: (1) 41°29′55.37″ N, 081°42′21.26″ W (near the Route 2 Bridge), and (2) 41°29′14.79″ N, 081°40′47.87″ W (near Marathon Bend). The COTP is proposing to establish the safety zone from 12:30 p.m. to 5:30 p.m. on July 14, 2024.

(5) *Rowing:* The safety zone would cover all navigable waters of the Cuyahoga River in Cleveland, Ohio between the following two boundaries, which are formed by lines extending perpendicular from bank to bank, centered on: (1) 41°29′35.09″ N, 081°42′14.19″ W (near Center Street Bridge), and (2) 41°29′23.64″ N, 081°41′37.28″ W (near Carnegie Avenue Bridge). The COTP is proposing to

establish the safety zone from 5:30 a.m. to 1:30 p.m. on July 14, 2024.

IV. Regulatory Analyses

We developed this proposed rule after considering numerous statutes and Executive Orders related to rulemaking. Below we summarize our analyses based on a number of these statutes and Executive Orders, and we discuss First Amendment rights of protestors.

A. Regulatory Planning and Review

Executive Orders 12866 and 13563 direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits. This NPRM has not been designated a “significant regulatory action,” under section 3(f) of Executive Order 12866, as amended by Executive Order 14094 (Modernizing Regulatory Review). Accordingly, the NPRM has not been reviewed by the Office of Management and Budget (OMB).

This regulatory action determination is based on size, location, and duration of the proposed rule. These safety zones would restrict navigation through the five (5) Aquatic Sports areas: (1) Sailing for eight (8) hours on one day, and nine and one-half (9.5) hours on three (3) days; (2) Triathlon for three (3) hours on one day, and four (4) hours on one day; (3) Stand Up Paddleboard—Technical for seven (7) hours on one day; (4) Stand Up Paddleboard—Distance for five (5) hours on one day; and (5) Rowing for eight (8) hours on one day.

B. Impact on Small Entities

The Regulatory Flexibility Act of 1980, 5 U.S.C. 601–612, as amended, requires Federal agencies to consider the potential impact of regulations on small entities during rulemaking. The term “small entities” comprises small businesses, not-for-profit organizations that are independently owned and operated and are not dominant in their fields, and governmental jurisdictions with populations of less than 50,000. The Coast Guard certifies under 5 U.S.C. 605(b) that this proposed rule would not have a significant economic impact on a substantial number of small entities.

While some owners or operators of vessels intending to transit the safety zone may be small entities, for the reasons stated in section IV.A above, this proposed rule would not have a significant economic impact on any vessel owner or operator.

If you think that your business, organization, or governmental jurisdiction qualifies as a small entity and that this proposed rule would have

a significant economic impact on it, please submit a comment (see **ADDRESSES**) explaining why you think it qualifies and how and to what degree this rule would economically affect it.

Under section 213(a) of the Small Business Regulatory Enforcement Fairness Act of 1996 (Pub. L. 104–121), we want to assist small entities in understanding this proposed rule. If the proposed rule would affect your small business, organization, or governmental jurisdiction and you have questions concerning its provisions or options for compliance, please call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section. The Coast Guard will not retaliate against small entities that question or complain about this proposed rule or any policy or action of the Coast Guard.

C. Collection of Information

This proposed rule would not call for a new collection of information under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520).

D. Federalism and Indian Tribal Governments

A rule has implications for federalism under Executive Order 13132 (Federalism), if it has a substantial direct effect on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. We have analyzed this proposed rule under that Order and have determined that it is consistent with the fundamental federalism principles and preemption requirements described in Executive Order 13132.

Also, this proposed rule does not have tribal implications under Executive Order 13175 (Consultation and Coordination with Indian Tribal Governments) because it would not have a substantial direct effect on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. If you believe this proposed rule has implications for federalism or Indian Tribes, please call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

E. Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1531–1538) requires Federal agencies to assess the effects of their discretionary regulatory actions. In particular, the Act addresses actions that may result in the expenditure by a State, local, or Tribal government, in the

aggregate, or by the private sector of \$100,000,000 (adjusted for inflation) or more in any one year. Though this proposed rule would not result in such an expenditure, we do discuss the potential effects of this proposed rule elsewhere in this preamble.

F. Environment

We have analyzed this proposed rule under Department of Homeland Security Directive 023–01, Rev. 1, associated implementing instructions, and Environmental Planning COMDTINST 5090.1 (series), which guide the Coast Guard in complying with the National Environmental Policy Act of 1969 (42 U.S.C. 4321–4370f), and have made a preliminary determination that this action is one of a category of actions that do not individually or cumulatively have a significant effect on the human environment.

This proposed rule involves the following safety zones:

(1) *Sailing*: (1) safety zones lasting 9.5 hours each day that would prohibit entry in, out or thorough the Lake Erie sailing race Areas 1–3 north of Cleveland, Ohio on July 12 through July 14, 2024, and (2) a safety zone lasting 4.0 hours that would prohibit entry in, out, or through the Cleveland Harbor East Basin.

(2) *Triathlon*: safety zone lasting 3.0 hours that would prohibit entry in, out, or through waters of Lake Erie adjacent to Edgewater Beach in Cleveland, Ohio on July 13, 2024, and then again for 4.0 hours on July 14, 2024.

(3) *Stand Up Paddleboard—Technical*: safety zone lasting 7.0 hours that would prohibit entry in, out, or through waters of Lake Erie adjacent to Edgewater Beach in Cleveland, Ohio on July 13, 2024.

(4) *Stand Up Paddleboard—Distance*: safety zone lasting 5.0 hours that would prohibit entry in, out, or through the Cuyahoga River near the Route 2 Bridge (adjacent to Great Lakes Water Sports) to Marathon Bend on July 14, 2024.

(5) *Rowing*: safety zone lasting 8.0 hours that would prohibit entry in, out, or through the Cuyahoga River from the Center Street Bridge to the Carnegie Avenue Bridge on July 14, 2024.

Normally such actions are categorically excluded from further review under paragraph L63a of Appendix A, Table 1 of DHS Instruction Manual 023–01–001–01, Rev. 1. A preliminary Record of Environmental Consideration supporting this determination is available in the docket. For instructions on locating the docket, see the **ADDRESSES** section of this preamble. We seek any comments or information that may lead to the

discovery of a significant environmental impact from this proposed rule.

G. Protest Activities

The Coast Guard respects the First Amendment rights of protesters. Protesters are asked to call or email the person listed in the **FOR FURTHER INFORMATION CONTACT** section to coordinate protest activities so that your message can be received without jeopardizing the safety or security of people, places, or vessels.

V. Public Participation and Request for Comments

We view public participation as essential to effective rulemaking and will consider all comments and material received during the comment period. Your comment can help shape the outcome of this rulemaking. If you submit a comment, please include the docket number for this rulemaking, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation.

Submitting comments. We encourage you to submit comments through the Federal Decision-Making Portal at <https://www.regulations.gov>. To do so, go to <https://www.regulations.gov>, type USCG–2024–0261 in the search box and click “Search.” Next, look for this document in the Search Results column,

and click on it. Then click on the Comment option. If you cannot submit your material by using <https://www.regulations.gov>, call or email the person in the **FOR FURTHER INFORMATION CONTACT** section of this proposed rule for alternate instructions.

Viewing material in docket. To view documents mentioned in this proposed rule as being available in the docket, find the docket as described in the previous paragraph, and then select “Supporting & Related Material” in the Document Type column. Public comments will also be placed in our online docket and can be viewed by following instructions on the <https://www.regulations.gov> Frequently Asked Questions web page. Also, if you click on the Dockets tab and then the proposed rule, you should see a “Subscribe” option for email alerts. The option will notify you when comments are posted, or a final rule is published.

We review all comments received, but we will only post comments that address the topic of the proposed rule. We may choose not to post off-topic, inappropriate, or duplicate comments that we receive.

Personal information. We accept anonymous comments. Comments we post to <https://www.regulations.gov> will include any personal information you have provided. For more about privacy and submissions to the docket in

response to this document, see DHS’s eRulemaking System of Records notice (85 FR 14226, March 11, 2020).

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Reporting and recordkeeping requirements, Security measures, Waterways.

For the reasons discussed in the preamble, the Coast Guard is proposing to amend 33 CFR part 165 as follows:

PART 165—SAFETY OF LIFE ON NAVIGABLE WATERS

■ 1. The authority citation for part 165 continues to read as follows:

Authority: 46 U.S.C. 70034, 70051; 70124, 33 CFR 1.05–1, 6.04–1, 6.04–6, and 160.5; Department of Homeland Security Delegation No. 00170.1, Revision No. 01.3.

■ 2. Add § 165.T09–0261 to read as follows:

§ 165.T09–0261 Safety Zones, Lake Erie and Cuyahoga River, Cleveland, OH.

(a) *Location and enforcement period.* The following safety zones will be enforced from July 12, 2024, through July 15, 2024, as described in paragraphs (a)(1) through (5) of this section within the Captain of the Port Zone Eastern Great Lakes (COTP) in the vicinity of Cleveland, Ohio.

Event	Location ¹	Enforcement dates and times ²	
(1)	Sailing	(i) Lake Erie: All navigable waters within a 2,700 yd radius centered on the following points: “Area 1” centered on 41°30’50.4” N, 081°45’00.0” W, “Area 2” centered on 41°33’00.0” N, 081°45’00.0” W, and “Area 3” centered on 41°34’01.2” N, 081°38’24.0” W; and. (ii) Cleveland Harbor East Basin: “Area 4” All navigable waters within a rectangle with the four corners of the polygon located in the following positions: (1) 41°30’49.64” N, 081°42’9.81” W; (2) 41°32’37.78” N, 081°39’33.01” W, (3) 41°32’20.99” N, 081°38’49.79” W, (4) 41°30’42.27” N, 81°42’01.59” W.	“Areas 1–3” July 12–14 from 7:30 a.m. to 5 p.m. “Area 4” July 13 from 11:30 a.m. to 3:30 p.m.
(2)	Triathlon	All navigable waters of Lake Erie adjacent to Edgewater Beach in Cleveland, Ohio, within a rectangle of which the four corners of the polygon are located in the following positions: (1) 41°29’15.76” N, 081°44’46.34” W; (2) 41°29’27.96” N, 081°44’49.87” W, (3) 41°29’31.98” N, 081°44’24.01” W, (4) 41°29’27.46” N, 81°44’22.51” W.	July 13, from 1:30 p.m. to 4:30 p.m. and again on July 14 from 5:30 a.m. to 9:30 a.m.
(3)	Stand Up Paddleboard—Technical..	All navigable waters of Lake Erie adjacent to Edgewater Beach in Cleveland, Ohio, within a rectangle of which the four corners of the polygon are located in the following positions: (1) 41°29’15.76” N, 081°44’46.34” W; (2) 41°29’27.96” N, 081°44’49.87” W, (3) 41°29’31.98” N, 081°44’24.01” W, (4) 41°29’27.46” N, 81°44’22.51” W.	July 13 from 5:30 a.m. to 12:30 p.m. with a back-up rain day on July 15 from 5:30 a.m. to 12:30 p.m.
(4)	Stand Up Paddleboard—Distance.	All navigable waters of the Cuyahoga River in Cleveland, Ohio between the following two boundaries, which are formed by lines extending perpendicular from bank to bank, centered on: (1) 41°29’55.37” N, 081°42’21.26” W (near the Route 2 Bridge), and (2) 41°29’14.79” N, 081°40’47.87” W (near Marathon Bend).	July 14 from 12:30 p.m. to 5:30 p.m.

Event	Location ¹	Enforcement dates and times ²	
(5)	Rowing	All navigable waters of the Cuyahoga River in Cleveland, Ohio between the following two boundaries, which are formed by lines extending perpendicular from bank to bank, centered on: (1) 41°29'35.09" N, 081°42'14.19" W (near Center Street Bridge), and (2) 41°29'23.64" N, 081°41'37.28" W (near Carnegie Avenue Bridge).	July 14 from 5:30 a.m. to 1:30 p.m.

¹ All coordinates listed in paragraphs (a)(1) through (5) reference Datum NAD 1983.

² The enforcement dates and times for each of the listed safety zones are subject to change. In the event of a change, the COTP will provide notice to the public by issuing a Broadcast Notice to Mariner and by updating the Local Notice to Mariners (if practicable).

(b) *Definitions. Official Patrol Vessel* means a Coast Guard Patrol Commander, including a Coast Guard coxswain, petty officer, or other officer operating a Coast Guard vessel and a Federal, State, and local officer designated by or assisting the COTP, in the enforcement of the regulations in this section. *Participant* means all persons and vessels attending the event.

(c) *Regulations.* (1) The Coast Guard may patrol the event areas under the direction of a designated Coast Guard Patrol Commander. The Patrol Commander may be contacted on Channel 16 VHF–FM (156.8 MHz) by the call sign “PATCOM.”

(2) All persons and vessels not registered with the sponsor as participants or official patrol vessels are considered spectators. The “official patrol vessels” consist of any Coast Guard, state or local law enforcement

and sponsor provided vessels designated or assigned by the Captain of the Port Sector Eastern Great Lakes, to patrol the event.

(3) Spectator vessels desiring to transit the regulated area may do so only with prior approval of the Patrol Commander and when so directed by that officer; spectator vessels will be operated at a no-wake speed in a manner which will not endanger participants in the event or any other craft.

(4) No spectator shall anchor, block, loiter, or impede the through-transit of official patrol vessels in the regulated area during the effective dates and times, unless cleared for entry by or through an official patrol vessel.

(5) The Patrol Commander may forbid and control the movement of all vessels in the regulated area. When hailed or signaled by an official patrol vessel, a vessel shall come to an immediate stop

and comply with the directions given. Failure to do so may result in expulsion from the area, citation for failure to comply, or both.

(6) Any spectator vessel may anchor outside the regulated areas specified in this chapter, but may not anchor in, block, or loiter in a navigable channel.

(7) The Patrol Commander may terminate the event or the operation of any vessel at any time it is deemed necessary for the protection of life or property.

(8) The Patrol Commander will terminate enforcement of the special regulations at the conclusion of each individual event.

Dated: May 2, 2024.

M.I. Kuperman,
Captain, U.S. Coast Guard, Captain of the Port Eastern Great Lakes.

Wednesday, May 8, 2024

This section of the FEDERAL REGISTER contains documents other than rules or proposed rules that are applicable to the public. Notices of hearings and investigations, committee meetings, agency decisions and rulings, delegations of authority, filing of petitions and applications and agency statements of organization and functions are examples of documents appearing in this section.

DEPARTMENT OF AGRICULTURE

Submission for OMB Review; Comment Request

The Department of Agriculture has submitted the following information collection requirement(s) to OMB for review and clearance under the Paperwork Reduction Act of 1995, Public Law 104–13. Comments are requested regarding; whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; the accuracy of the agency's estimate of burden including the validity of the methodology and assumptions used; ways to enhance the quality, utility and clarity of the information to be collected; and ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Comments regarding this information collection received by June 7, 2024 will be considered. Written comments and recommendations for the proposed information collection should be submitted within 30 days of the publication of this notice on the following website www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting "Currently under 30-day Review—Open for Public Comments" or by using the search function. An agency may not conduct or sponsor a collection of information unless the collection of information displays a currently valid OMB control number and the agency informs potential persons who are to respond to the collection of information that such persons are not required to respond to the collection of information unless it displays a currently valid OMB control number.

Food and Nutrition Service

Title: FNS Quick Response Surveys (QRS).

OMB Control Number: 0584–0613.

Summary of Collection: This information collection request is for a revision to the currently approved Special Nutrition Programs Quick Response Surveys (SNP QRS). This revision makes some changes to the information collection as previously approved. The Food and Nutrition Service (FNS) intends to request the renewal of a generic clearance that allows FNS to conduct short, quick-turnaround surveys of State, local, and Tribal agencies and businesses that receive food, funds, and nutrition information through programs administered by FNS. Section 28 (42 U.S.C. 1769i) of the Richard B. Russell National School Lunch Act (as amended through Pub. L. 113–79, enacted February 07, 2014, sec. 28) mandates programs under its authorization, including the Child Nutrition programs and WIC, to cooperate with USDA program research and evaluation activities. This generic clearance also enables FNS to better meet the goals of Executive Order 14058, Transforming Federal Customer Experience and Service Delivery to Rebuild Trust in Government, by allowing FNS to expeditiously gather information from program operators to improve and refine customer experience and service delivery.

Need and Use of the Information:

This collection is necessary to collect and analyze specific information from State and local administrators of FNS Nutrition Assistance Programs in a timely way. Traditionally, FNS conducts large, program-specific studies to collect information on numerous features of each program. Such studies often take several years to complete. The quick response surveys (QRS) provide a mechanism for succinct, quick-turnaround studies to complement the larger FNS studies and to answer policy and implementation questions that result from the larger studies. The FNS QRS information collection enables FNS to administer the programs more effectively by facilitating rapid collection of current information on specific and time-sensitive topics.

Description of Respondents: State, Local and Tribal Governments, Businesses.

Number of Respondents: 58,878.
Frequency of Responses: Reporting: On Occasion.

Total Burden Hours: 27,406.

Rachelle Ragland-Greene,

Acting Departmental Information Collection Clearance Officer.

Natural Resources Conservation Service

[Docket No. NRCS–2024–0006]

Notice of Intent To Prepare an Environmental Impact Statement for the Pleasant Creek Supplemental Watershed Plan in Sanpete County, Utah

AGENCY: Natural Resources Conservation Service, USDA.

ACTION: Notice of intent (NOI) to prepare an environmental impact statement (EIS).

SUMMARY: The Natural Resources Conservation Service (NRCS) Utah State Office announces its intent to prepare an EIS for the Pleasant Creek watershed in Sanpete County, Utah. The proposed EIS will examine alternative solutions to address watershed structure rehabilitation, flood damage prevention and reduction, agricultural water management, water conservation, and public recreational efforts in Mt. Pleasant City and portions of unincorporated Sanpete County. The Pleasant Creek watershed includes Mt. Pleasant City; existing water resource facilities, including the Upper Debris Basin, Lower Debris Basin, the Surge Pond, and the Agricultural Reservoir; private agricultural land; and U.S. Forest Service-managed land in the upper watershed. NRCS is requesting comments to identify significant issues, potential alternatives, information, and analyses relevant to the proposed action from all interested individuals, Federal and State agencies, and Tribes.

DATES: We will consider comments that we receive by June 7, 2024. We will consider comments received after close of the comment period to the extent possible.

ADDRESSES: We invite you to submit comments in response to this notice.

You may submit your comments through one of the methods below:

- **Federal eRulemaking Portal:** Go to <http://www.regulations.gov> and search for docket ID NRCS-2024-0006. Follow the online instructions for submitting comments; or

- **Mail or Hand Delivery:** Derek Hamilton, Water Resources Coordinator, USDA, NRCS, Utah State Office, 125 S State Street, #4010, Salt Lake City, Utah 84138. In your comments, specify the docket ID NRCS-2024-0006.

All comments received will be posted without change and made publicly available on www.regulations.gov.

FOR FURTHER INFORMATION CONTACT:

Derek Hamilton; telephone: (801) 524-4560; email: derek.hamilton@usda.gov. Individuals who require alternative means for communication should contact the U.S. Department of Agriculture (USDA) Target Center at (202) 720-2600 (voice and text telephone (TTY)) or dial 711 for Telecommunications Relay service (both voice and text telephone users can initiate this call from any telephone).

SUPPLEMENTARY INFORMATION:

Purpose and Need

The primary purpose for the supplemental watershed plan is to rehabilitate debris basins and holding ponds in the watershed to prevent flooding and reduce flood damage; improve agricultural water delivery, supply, and conservation; and provide public recreation opportunities. Watershed planning is authorized under the Watershed Protection and Flood Prevention Act of 1954 (Pub. L. 83-566), as amended, and the Flood Control Act of 1944 (Pub. L. 78-534).

This supplemental watershed plan is sponsored by Mt. Pleasant City and cosponsored by Pleasant Creek Irrigation Company and Twin Creek Irrigation Company. The proposed action is needed to address flood prevention in Mt. Pleasant City and portions of unincorporated Sanpete County and reduce flood damage now that existing facilities and infrastructure are beyond their useful design life. The existing facilities do not provide adequate flood protection for Mt. Pleasant City and surrounding areas and do not meet NRCS and Utah Dam Safety standards. The current pipe network for Mt. Pleasant City has aged and is in constant need of costly maintenance and repair. The system was installed in the 1980s, experiences significant water losses, and no longer functions effectively as a shared system for agricultural and residential irrigation users. Drought, city growth, water

shortages, and operations and maintenance challenges have caused strain to the system. Pressure surges and pipe failure often occur during system filling operations and inadequate valving requires large segments or the entire system to be shut down for essential repairs.

Estimated federal funds required for the construction of the proposed action may exceed \$25 million and the proposed action will, therefore, require congressional approval per the 2018 Agriculture Appropriations Act amended funding threshold. In accordance with the regulation in 7 CFR 650.7(a)(2), an EIS is required for projects requiring congressional approval.

Preliminary Proposed Action and Alternatives, Including No Action

The EIS objective is to formulate and evaluate alternatives for flood control and prevention, agricultural water management, and recreational opportunities in the approximately 84,180 acre Pleasant Creek watershed area. The EIS is expected to evaluate three alternatives: two action alternatives, and one no action alternative. The alternatives that may be considered for detailed analysis include:

- **Alternative 1—No Action Alternative:** Taking no action would consist of activities conducted if no federal action or funding were provided. If the No Action Alternative is selected, the existing infrastructure would not be improved, and no capital investment would be required. Sediment would continue to accumulate and water storage volumes would continue to decrease. The existing water storage structures would continue to operate in their current condition, providing inadequate flood protection and overflow during large runoff events. The existing agricultural water infrastructure would continue to incur large water losses resulting in conflicts between agricultural and residential users. The existing infrastructure does not meet the purpose and need to prevent flooding; to reduce flooding risks; to improve agricultural water delivery, supply and conservation; or to provide recreational opportunities.

- **Alternative 2—Proposed Action—Existing Structure Improvement Alternative:** The proposed action would rehabilitate and enlarge the Upper Debris Basin for a total water storage capacity of 840 acre-feet to provide additional flood protection capacity and 50–80 days of irrigation water storage; decommission the Lower Debris Basin; rehabilitate the Agricultural Reservoir and Surge Pond to address current dam

safety deficiencies and add dedicated irrigation water storage for residential secondary water users; construct a new 20 acre-foot Twin Creek Irrigation Storage Reservoir to provide additional dedicated residential secondary water storage; replace the existing secondary irrigation water pipeline system within Mt. Pleasant City to separate residential secondary water and agricultural water; install meters on the agricultural and residential secondary water system for more accurate usage calculations and billing; and construct a day use recreational facility and trail for additional recreational opportunities.

- **Alternative 3—Proposed Action—Twin Creek Reservoir Alternative:** The proposed action would include the measures outlined in Alternative 2 and would also construct a new 1,000 acre-foot Twin Creek Flood Control and Storage Multi-Purpose Reservoir to manage floodwater; provide additional water storage; and assist in ongoing water conservation efforts. This proposed action would also replace the existing, deteriorated Agricultural Transmission Pipeline to provide reliable agricultural water supply and pipe the existing Northwest Irrigation Ditches to reduce water losses, decrease maintenance costs, and improve public safety.

Summary of Expected Impacts

As mentioned above, the estimated Federal contribution to construction cost will exceed \$25 million.

The EIS will be prepared as required by section 102(2)(C) of the National Environmental Policy Act of 1969 (NEPA); the Council on Environmental Quality Regulations (40 CFR parts 1500–1508); and NRCS regulations that implement NEPA in 7 CFR part 650.

Resource concerns for scoping were identified and categorized as relevant or not relevant to the proposed action. Mt. Pleasant City, Pleasant Creek Irrigation Company, Twin Creek Irrigation Company, and NRCS evaluated the current condition of watershed structures, flood risk, agricultural water management, water conservation efforts, and recreational opportunities in the Pleasant Creek watershed along with relevant resource concerns for each proposed solution. Environmental resources in the project area consist of the natural and man-made resources. Resource concerns to be identified and addressed in the Supplemental Watershed Plan-EIS include: wetland and channel alteration, disturbances to wildlife and riparian areas during construction, land use changes, and impacts to visual resources.

Anticipated Permits and Authorizations

The following permits and authorizations are anticipated to be required:

- *Dam Safety*. Coordination with the State Engineer and the Utah Division of Water Rights would be required to ensure all development and engineering requirements for the design and construction of the Upper Debris Basin, Agricultural Reservoir and Surge Pond, and Twin Creek Reservoir are implemented.

- *Stream Alteration Permit*. The proposed action would require coordination and permits with the Utah Division of Water Rights for the proposed improvements.

- *Federal Emergency Management Agency (FEMA) Floodplain Development Permit*. Implementation of the proposed action would require coordination with the local floodplain administrator and may require a Floodplain Development Permit to ensure all development and engineering requirements for construction within the Special Flood Hazard Areas are implemented. Additionally, a Letter of Map Revision from FEMA would be required prior to construction.

- *Clean Water Act (CWA) and National Pollutant Discharge Elimination System (NPDES)*. The proposed action may require water quality certification under section 401 of the CWA, permitting under section 402 of the NPDES, and section 404 of the CWA for potential impacts to wetlands and Waters of the United States.

- *National Historic Preservation Act (NHPA) Section 106*. Consultation with Tribal Nations and interested parties would be conducted as required by the NHPA.

- *Local Encroachment*. Consultation and potential encroachment permits would be required with Mt. Pleasant City and Sanpete County for all construction work within the local roadway rights-of-way.

Schedule of Decision-Making Process

A Draft EIS (DEIS) will be prepared and circulated for review and comment by agencies, Tribes, consulting parties, and the public for 45 days as required by the regulations in 40 CFR 1503.1, 1502.20, 1506.11, and 1502.17, and 7 CFR 650.13. The DEIS is anticipated to be published in the **Federal Register**, approximately 24 months after publication of this NOI. A Final EIS is anticipated to be published within 8 months of completion of the public comment period for the DEIS.

NRCS will decide whether to implement one of the action alternatives

as evaluated in the EIS. A Record of Decision will be completed after the required 30-day waiting period and will be publicly available. The responsible Federal official and decision maker for NRCS is the Utah State Conservationist.

Public Scoping Process

A public scoping meeting was held on April 11, 2019. Comments received, including the names and addresses of those who commented, are part of the public record. Scoping meeting presentation materials were available for review and comment for 30 days from Thursday, March 28, 2019, through Friday, April 26, 2019. The date, time, and location for a second meeting will be announced on the project website.

Federal, State, Tribal, local agencies and representatives, and the public were invited to take part in the watershed plan scoping period. Mt. Pleasant City, Pleasant Creek Irrigation Company, Twin Creek Irrigation Company, and NRCS organized the public scoping meeting to provide an opportunity to review and evaluate the project alternatives, express concern, or support, and gain further information regarding the project. To determine the most viable alternatives to carry forward to the EIS, Mt. Pleasant City, Pleasant Creek Irrigation Company, Twin Creek Irrigation Company, and NRCS used input obtained during public scoping discussions to focus on relevant resource concerns and issues and eliminated those that were not relevant from further detailed study.

NRCS will coordinate the scoping process to correspond with section 106 of the NHPA (54 U.S.C. 306108), as allowed in the regulations in 36 CFR 800.2(d)(3) and 800.8.

Identification of Potential Alternatives, Information, and Analyses

NRCS invites agencies, Tribes, consulting parties, and individuals that have special expertise, legal jurisdiction, or interest in the Pleasant Creek Supplemental Watershed Plan to provide written comments concerning the scope of the analysis and identification of potential alternatives, information, and analyses relevant to the Proposed Action.

Information about historic and cultural resources within the area potentially affected by the proposed project will assist NRCS in identifying and evaluating impacts to such resources in the context of both NEPA and NHPA.

NRCS will consult with Native American Tribes on a government-to-government basis in accordance with the regulations in 36 CFR 800.2 and

800.3, Executive Order 13175, and other policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources and historic properties, will be given due consideration.

Authorities

This document is published as specified by the NEPA regulations regarding publication of an NOI to issue an EIS (40 CFR 1501.9(d)). Watershed planning is authorized under the Watershed Protection and Flood Prevention Act of 1954, as amended and the Flood Control Act of 1944.

Federal Assistance Programs

The title and number of the Federal Assistance Program as found in the Assistance Listing¹ to which this document applies is 10.904, Watershed Protection and Flood Prevention.

Executive Order 12372

Executive Order 12372, "Intergovernmental Review of Federal Programs," requires consultation with State and local officials that would be directly affected by proposed Federal financial assistance. The objectives of the Executive order are to foster an intergovernmental partnership and a strengthened federalism, by relying on State and local processes for State and local government coordination and review of proposed Federal financial assistance and direct Federal development. This project is subject to the provisions of Executive Order 12372, which requires intergovernmental consultation with State and local officials.

USDA Non-Discrimination Policy

In accordance with Federal civil rights law and USDA civil rights regulations and policies, USDA, its agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family or parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Individuals who require alternative means of communication for program information (for example, braille, large

¹ See <https://sam.gov/content/assistance-listings>.

print, audiotope, American Sign Language, etc.) should contact the responsible Agency or USDA TARGET Center at (202) 720-2600 (voice and telephone) or dial 711 for Telecommunications Relay Service (both voice and text telephone users can initiate this call from any phone). Additionally, program information may be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD-3027, found online at: <https://www.usda.gov/oascr/how-to-file-a-program-discrimination-complaint> and at any USDA office or write a letter addressed to USDA and provide in the letter all the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by: (1) mail to: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue SW, Washington, DC 20250-9410; (2) Fax: (202) 690-7442; or (3) email: program.intake@usda.gov.

USDA is an equal opportunity provider, employer, and lender.

Travis Mote,

Acting Utah State Conservationist, Natural Resources Conservation Service.

BILLING CODE 3410-16-P

DEPARTMENT OF AGRICULTURE

Natural Resources Conservation Service

[Docket No. NRCS-2024-0003]

Notice of Intent To Prepare an Environmental Impact Statement for the Wellsville Canyon Watershed Plan, Cache County, Utah

AGENCY: Natural Resources Conservation Service, USDA.

ACTION: Notice of intent (NOI) to prepare an environmental impact statement (EIS).

SUMMARY: The Natural Resources Conservation Service (NRCS) Utah State Office, in cooperation with the U.S. Bureau of Reclamation (USBR), the Environmental Protection Agency (EPA), and Cache Water District (project sponsor), announces its intent to prepare an EIS for the Wellsville Canyon Watershed Plan located within the Little Bear River Watershed in Cache County, Utah. The proposed Wellsville Canyon Watershed Plan will examine alternative solutions to provide flood

protection and conveyance infrastructure, reduce irrigation water loss, enhance recreational facilities, and reduce erosion and nutrient loading to the Little Bear River in Wellsville and Mendon cities and portions of unincorporated Cache County. NRCS is requesting comments to identify significant issues, potential alternatives, information, and analyses relevant to the proposed action from all interested individuals, Federal and State agencies, and Tribes.

DATES: We will consider comments received by June 7, 2024. We will consider comments received after close of the comment period to the extent possible.

ADDRESSES: We invite you to submit comments in response to this notice. You may submit your comments through one of the methods below:

- **Federal eRulemaking Portal:** Go to <http://www.regulations.gov> and search for docket ID NRCS-2024-0003. Follow the online instructions for submitting comments; or
- **Mail or Hand Delivery:** Derek Hamilton, Water Resources Coordinator, USDA, NRCS, Utah State Office, 125 S State Street, #4010, Salt Lake City, Utah 84138. In your comments, specify the docket ID NRCS-2024-0003.

All comments received will be posted without change and made publicly available on www.regulations.gov.

FOR FURTHER INFORMATION CONTACT:

Derek Hamilton; telephone: (801) 524-4560; email: derek.hamilton@usda.gov. Individuals who require alternative means for communication should contact the U.S. Department of Agriculture (USDA) Target Center at (202) 720-2600 (voice and text telephone (TTY)) or dial 711 for Telecommunications Relay service (both voice and text telephone users can initiate this call from any telephone).

SUPPLEMENTARY INFORMATION:

Purpose and Need

The purpose of this watershed plan is to prevent or reduce potential flooding in Wellsville, Mendon, and other unincorporated areas of Cache County, Utah; to provide more reliable management of agricultural water in the area; and to increase opportunities for public recreation in the watershed. Watershed planning is authorized under the Watershed Protection and Flood Prevention Act of 1954 (Pub. L. 83-566), as amended, and the Flood Control Act of 1944 (Pub. L. 78-534).

The Wellsville Canyon Watershed Plan will reduce flood risks and improve public safety in the Wellsville Canyon watershed. It will greatly reduce

flooding concerns associated with intense rain-on-snow and frozen ground events within the Wellsville Canyon Watershed Plan project area. More dependable floodwater management will benefit homes, businesses, agricultural fields, roads, and public utilities in the Wellsville Canyon Watershed Plan project area.

The Wellsville Canyon Watershed Plan will implement improved culinary and agricultural water conservation techniques in the Wellsville Canyon watershed. A more efficient irrigation delivery system within Mendon City and Wellsville City will help mitigate the heavy seepage losses experienced by the current earthen canal irrigation distribution systems. The Wellsville Canyon Watershed Plan improvements will also reduce demand for the existing culinary water systems within the watershed and capital expenditures to meet peak summer irrigation demands.

The Wellsville Canyon Watershed Plan will address limited public recreational facilities and opportunities within the Wellsville Canyon watershed available for the growing population of Cache County. Recreational improvements will provide residents with a higher quality of life and will increase the public's well-being by providing new opportunities for leisure and enjoyment.

Preliminary Proposed Action and Alternatives

The objective of the EIS is to formulate and evaluate alternatives for the flood control, agricultural water management, and public recreation needs in the approximately 70,845-acre Wellsville Canyon Watershed-focused planning area. The EIS is expected to evaluate three alternatives: two action alternatives, and one no action alternative. The alternatives that may be considered for detailed analysis include:

- **Alternative 1—No Action**
Alternative: Taking no action would consist of activities carried out if no federal action or funding were provided. This alternative would not address flooding into the canals. The canals would continue to overtop during rain-on-snow events, and flooding in the Wellsville Canyon Watershed Plan area would continue. The canals would be maintained in their existing condition as earthen channels, and irrigation conveyance within the communities of Wellsville and Mendon would be unchanged. The additional recreational access to Wellsville Reservoir would not be built, and erosion and sedimentation from the alluvial plains above the canals would continue unaltered under this alternative. The existing infrastructure

would continue to operate in its current condition and would not improve flood control, conserve irrigation water, improve recreational access, or reduce watershed erosion as described above. Residents would continue to use culinary water for irrigation (that is, watering lawns and gardens), putting stress on existing water supply and infrastructure.

- **Alternative 2—Proposed Action—Pipe the Canals and Improve the Lower Canal for Flood Flows:** The proposed action is to enclose the Wellsville-Mendon Canal (Lower Canal) and convey water through piping in Wellsville and Mendon cities and part of unincorporated Cache County, Utah. The existing Wellsville-Mendon Canal would be improved with the addition of open channel overflow systems at 2900 South (Unincorporated Cache County) and 200 South (Mendon City). This would be accomplished through a combination of conduits and channels to convey floodwaters from the west side of Cache Valley between Wellsville and Petersboro to the natural floodplain of the Little Bear River east of the communities. This proposed action would continue to divert the water for the Wellsville-Mendon Conservation District from below Hyrum Reservoir at the existing diversion points. This proposed action would enclose and pipe a portion of the Wellsville Eastfield Canal beginning at the existing diversion at the base of Hyrum Dam and passing through Hyrum and ending in unincorporated Cache County, Utah. This proposed action would pressurize Wellsville City Irrigation Company's irrigation system within Wellsville City and within Mendon City's irrigation system managed by the Mendon North, Mendon Central, Mendon South, Mendon Second North, and Greater Mendon Irrigation companies. This proposed action would also install regulating ponds to stabilize peak demands on the pressurized irrigation systems. A new access ramp limited to non-motorized personal watercraft would be constructed at Wellsville Reservoir for recreational activities.

- **Alternative 3—Line the Canal and Improve the Lower Canal for Flood Flows:** All Wellsville Canyon Watershed Plan project measures would be the same as Alternative 2 with the following exceptions. Alternative 3 would line and increase the capacity of the Wellsville-Mendon Canal (Lower Canal) to carry both irrigation and flood water from the west alluvial plains between Wellsville and Petersboro in Cache County instead of enclosing and piping. This would include the reconstruction of the existing Murray Spring overflow

structure and the addition of overflow structures at 2900 South in unincorporated Cache County and 200 South in Mendon City.

Summary of Expected Impacts

The EIS will be prepared as required by section 102(2)(C) of the National Environmental Policy Act of 1969 (NEPA); the Council on Environmental Quality Regulations (40 CFR parts 1500–1508); and NRCS regulations that implement NEPA in 7 CFR part 650.

An NRCS evaluation of this federally assisted action indicates that the proposed alternatives may have significant local, regional, or national impacts on the environment. Potential resource impacts include alteration or disturbance of wetlands and riparian zones, disruptions to wildlife, compaction or displacement of soils, and temporary disturbances to air quality, migratory birds, transportation routes, aesthetic resources, and water quality.

The proposed alternatives may have long-term environmental benefits, such as reduction of long-term carbon emissions due to pumping, improvement of public health and safety, increased recreational opportunities, reduction of erosion and nutrient loading into the Little Bear River, improved surface water quality, and increased surface water quantity as a result of water conservation measures. The proposed alternatives would minimize flooding by reducing flood risks and flood damages from runoff, erosion, and sediment deposition to areas downstream of the sub-basin, as well as improving agricultural water management by reducing seepage losses. It would also create new recreational opportunities for public use by providing reservoir access for non-motorized personal watercraft.

Anticipated Permits and Authorizations

The following permits and other authorizations are anticipated to be required:

- **Federal Emergency Management Agency Floodplain Development Permit.** Implementation of the proposed action would require coordination with the local floodplain administrator and may require a Floodplain Development Permit to ensure all development and engineering requirements for construction within the Special Flood Hazard Areas are implemented. The proposed action will require a Conditional Letter of Map Revision (CLOMR) and a Letter of Map Revision (LOMR) since the floodplain maps include the canal and flows from the benches in Zone A.

- **Clean Water Act (CWA) and National Pollutant Discharge Elimination System (NPDES) Permits.** The proposed action would require water quality certification under section 401 of the CWA, permitting under section 402 of the NPDES, and Section 404 of the CWA for potential Waters of the United States impacts.

- **Encroachment Permit.** The proposed action would require coordination and permitting with Utah Department of Transportation for temporary construction work within State and federal roadway rights-of-way.

- **Utah Pollutant Discharge Elimination System (UPDES) Construction Permit.** A construction permit would be required through the UPDES.

- **Railroad Permits.** The proposed action may require railroad permits to allow for the right of entry and crossings of the railroad.

- **Stream Alteration Permit.** The proposed action would require coordination and permits with the Utah Division of Water Rights for potential crossings of the Little Bear River and other natural water ways.

- **National Historic Preservation Act (NHPA) Section 106.** Consultation with Tribal Nations and interested parties would be conducted as required by the NHPA.

- **Local Encroachment.** Consultation and potential encroachment permits would be required with Wellsville City, Mendon City, and Cache County for all construction work within the local roadway rights-of-way.

Schedule of Decision-Making Process

A Draft EIS (DEIS) will be prepared and circulated for review and comment by agencies, Tribes, consulting parties, and the public for at least 45 days as required by 40 CFR 1503.1, 1502.20, 1506.11, and 1502.17, and 7 CFR 650.13. The DEIS is anticipated to be published in the **Federal Register**, approximately 21 months after publication of this NOI. A Final EIS is anticipated to be published within 3 months of completion of the public comment period for the DEIS.

NRCS will decide whether to implement one of the action alternatives as evaluated in the EIS. A Record of Decision will be completed after the required 30-day waiting period and will be publicly available. The responsible Federal official and decision maker for NRCS is the Utah State Conservationist.

Public Scoping Process

A virtual scoping meeting was held on May 10, 2021, at 9:00 a.m. MST. Scoping meeting presentation materials

are available on NRCS' website, along with Wellsville Canyon Watershed Plan background information at <https://www.nrcs.usda.gov/wellsville-mendon-watershed-sponsor-cache-water-district>. The meeting included a Wellsville Canyon Watershed Plan presentation followed by a group question and answer period. Wellsville Canyon Watershed Plan team members were also available to address individual questions. Comments received, including the names and addresses of those who commented, were part of the public record.

NRCS invited Federal, State, Tribal, local agencies and representatives and the public to take part in the scoping period for the Wellsville Canyon Watershed Plan. Based on funding limitations and project scope, NRCS determined an EIS was necessary, and is seeking further public comment to help determine the range of actions, alternatives, and impacts to be evaluated and included in the EIS. NRCS will include the comments received from the previous scoping efforts into the EIS analysis.

NRCS will coordinate the scoping process to correspond with Section 106 of the NHPA (54 U.S.C. 306108), as allowed in 36 CFR 800.2(d)(3) and 800.8.

Identification of Potential Alternatives, Information, and Analyses

NRCS invites agencies, Tribes, consulting parties, and individuals that have special expertise, legal jurisdiction, or interest in the Wellsville Canyon Watershed Plan to provide written comments concerning the scope of the analysis and identification of potential alternatives, information, analyses relevant to the Proposed Action.

The information about historic and cultural resources within the area potentially affected by the proposed Wellsville Canyon Watershed Plan will assist NRCS in identifying and evaluating impacts to such resources in the context of both NEPA and NHPA.

NRCS will consult with Native American Tribes on a government-to-government basis in accordance with 36 CFR 800.2 and 800.3, Executive Order 13175, and other policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources and historic properties, will be given due consideration.

Authorities

This document is published pursuant to the NEPA regulations regarding publication of an NOI to issue an EIS

(40 CFR 1501.9(d)). Watershed planning is authorized under the Watershed Protection and Flood Prevention Act of 1954, as amended, and the Flood Control Act of 1944.

Federal Assistance Programs

The title and number of the Federal Assistance Program as found in the Assistance Listing¹ to which this document applies is 10.904, Watershed Protection and Flood Prevention.

Executive Order 12372

Executive Order 12372, "Intergovernmental Review of Federal Programs," requires consultation with State and local officials that would be directly affected by proposed Federal financial assistance. The objectives of the Executive Order are to foster an intergovernmental partnership and a strengthened federalism, by relying on State and local processes for State and local government coordination and review of proposed Federal financial assistance and direct Federal development. This Wellsville Canyon Watershed Plan is subject to the provisions of Executive Order 12372, which requires intergovernmental consultation with State and local officials.

USDA Non-Discrimination Policy

In accordance with Federal civil rights law and USDA civil rights regulations and policies, USDA, its Agencies, offices, and employees, and institutions participating in or administering USDA programs are prohibited from discriminating based on race, color, national origin, religion, sex, gender identity (including gender expression), sexual orientation, disability, age, marital status, family or parental status, income derived from a public assistance program, political beliefs, or reprisal or retaliation for prior civil rights activity, in any program or activity conducted or funded by USDA (not all bases apply to all programs). Remedies and complaint filing deadlines vary by program or incident.

Individuals who require alternative means of communication for program information (for example, Braille, large print, audiotape, American Sign Language, etc.) should contact the responsible Agency or USDA TARGET Center at (202) 720-2600 (voice and text telephone) or dial 711 for Telecommunications Relay Service (both voice and text telephone users can initiate this call from any phone). Additionally, program information may

be made available in languages other than English.

To file a program discrimination complaint, complete the USDA Program Discrimination Complaint Form, AD-3027, found online at <https://www.usda.gov/oascr/how-to-file-a-program-discrimination-complaint> and at any USDA office or write a letter addressed to USDA and provide in the letter all the information requested in the form. To request a copy of the complaint form, call (866) 632-9992. Submit your completed form or letter to USDA by: (1) mail to: U.S. Department of Agriculture, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue SW, Washington, DC 20250-9410; (2) fax: (202) 690-7442; or (3) email: program.intake@usda.gov.

USDA is an equal opportunity provider, employer, and lender.

Foreign-Trade Zones Board

[B-2-2024]

Foreign-Trade Zone (FTZ) 134; Authorization of Production Activity; Volkswagen Group of America, Inc.; (Passenger Motor Vehicles); Chattanooga, Tennessee

On January 4, 2024, Volkswagen Group of America, Inc., submitted a notification of proposed production activity to the FTZ Board for its facility within FTZ 134, in Chattanooga, Tennessee.

The notification was processed in accordance with the regulations of the FTZ Board (15 CFR part 400), including notice in the **Federal Register** inviting public comment (89 FR 1520, January 10, 2024). On May 3, 2024, the applicant was notified of the FTZ Board's decision that no further review of the activity is warranted at this time. The production activity described in the notification was authorized, subject to the FTZ Act and the FTZ Board's regulations, including section 400.14.

Dated: May 3, 2024.

Elizabeth Whiteman,

Executive Secretary.

DEPARTMENT OF COMMERCE**International Trade Administration****[A-823-815]****Oil Country Tubular Goods From Ukraine: Notice of Amended Final Results of Antidumping Duty Administrative Review Pursuant to Settlement**

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: The U.S. Department of Commerce (Commerce) is issuing these amended final results pursuant to a settlement agreement with Interpipe Ukraine LLC and North American Interpipe Inc. with respect to the final results of the administrative review of oil country tubular goods (OCTG) from Ukraine during the period of review (POR) July 10, 2019, through June 30, 2020.

DATES: Applicable May 8, 2024.

FOR FURTHER INFORMATION CONTACT: Toni Page, AD/CVD Operations, Office VII,

Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230; telephone: (202) 482-1398.

SUPPLEMENTARY INFORMATION:**Background**

On February 10, 2022, the Department of Commerce (Commerce) published the final results of its administrative review of the antidumping duty order on OCTG from Ukraine.¹ The POR is July 10, 2019 through June 30, 2020.

The administrative review covers Interpipe,² a producer and exporter of OCTG from Ukraine to the United States. In the *Final Results*, Commerce assigned to Interpipe a weighted-average dumping margin of 27.80 percent for the POR.³

Following the publication of the *Final Results*, Interpipe filed a lawsuit with the U.S. Court of International Trade (CIT) challenging certain aspects of Commerce's *Final Results* including Commerce's decision not to grant a constructed export price offset to Interpipe and Commerce's decision to include Section 232 duties in the U.S. price when calculating the margin.

On April 30, 2024, the United States and Interpipe entered into an agreement to settle this dispute. Pursuant to the terms of settlement and the stipulation for entry of judgment, the amended final weighted-average dumping margin for Interpipe is 0.01 percent. The CIT issued its order of judgment by stipulation on May 2, 2024.⁴

Assessment Rates

Consistent with the settlement agreement and May 2, 2024, order of judgment by stipulation, Commerce will instruct U.S. Customs and Border Protection (CBP) to liquidate all unliquidated entries of OCTG from Ukraine produced and exported by Interpipe, and entered, or withdrawn from warehouse, for consumption in the United States during the POR at the importer-specific per-unit assessment rates determined by setting Interpipe's weighted-average dumping margin at 0.01 percent (*de minimis*). Pursuant to section 751(a)(2)(C) of the Tariff Act of

¹ See *Oil Country Tubular Goods from Ukraine: Final Results of Antidumping Duty Administrative Review; 2019-2020*, 87 FR 7801 (February 10, 2022) (*Final Results*).

² Commerce has previously determined that Interpipe Europe S.A.; Interpipe Ukraine LLC; PJSC Interpipe Nizhnedneprovsky Tube Rolling Plant; and LLC Interpipe Niko Tube are affiliated and treated as a single entity (*i.e.*, Interpipe).

³ See *Final Results* at 87 FR 7801.

⁴ See *Interpipe Ukraine LLC and North America Interpipe, Inc. v. United States*, Court No. 22-00066, Doc. No. 36 (May 2, 2024).

1930, as amended (the Act), and 19 CFR 351.212(b)(1), Commerce has determined, and U.S. Customs and Border Protection (CBP) shall assess, antidumping duties on all appropriate entries of subject merchandise in accordance with these revised final results of review.⁵ For Interpipe, we will calculate importer-specific assessment rates on the basis of the ratio of the total amount of antidumping duties calculated for each importer's examined sales and the total entered value of the sales, in accordance with 19 CFR 351.212(b)(1). Because Interpipe's weighted average dumping margin is zero or *de minimis* within the meaning of 19 CFR 351.106(c)(1), we will instruct CBP to liquidate the appropriate entries without regard to antidumping duties.

Consistent with Commerce's assessment practice, for entries of subject merchandise during the POR produced by Interpipe for which it did not know that the merchandise was destined for the United States, we will instruct CBP to liquidate unreviewed entries at the all-others rate if there is no rate for the intermediate company(ies) involved in the transaction.⁶

Cash Deposit Requirements

Because Interpipe has a superseding cash deposit rate, *i.e.*, there have been final results published in a subsequent administrative review, we will not issue revised cash deposit instructions to CBP. This notice will not affect the current cash deposit rate for Interpipe.

Notification to Interested Parties

We are issuing this determination and publishing these amended final results and notice in accordance with section 516a(e) of the Act.

Dated: May 2, 2024.

Ryan Majerus,

Deputy Assistant Secretary for Policy and Negotiations, performing the non-exclusive functions and duties of the Assistant Secretary for Enforcement and Compliance.

BILLING CODE 3510-DS-P

DEPARTMENT OF COMMERCE**International Trade Administration****Initiation of Antidumping and Countervailing Duty Administrative Reviews**

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

⁵ See *Antidumping and Countervailing Duty Proceedings: Assessment of Antidumping Duties*, 68 FR 23954 (May 6, 2003).

SUMMARY: The U.S. Department of Commerce (Commerce) has received requests to conduct administrative reviews of various antidumping duty (AD) and countervailing duty (CVD) orders with March anniversary dates. In accordance with Commerce's regulations, we are initiating those administrative reviews.

DATES: Applicable May 8, 2024.

FOR FURTHER INFORMATION CONTACT: Brenda E. Brown, AD/CVD Operations, Customs Liaison Unit, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230, telephone: (202) 482-4735.

SUPPLEMENTARY INFORMATION:

Background

Commerce has received timely requests, in accordance with 19 CFR 351.213(b), for administrative reviews of various AD and CVD orders with March anniversary dates.

All deadlines for the submission of various types of information, certifications, or comments or actions by Commerce discussed below refer to the number of calendar days from the applicable starting time.

Respondent Selection

In the event that Commerce limits the number of respondents for individual examination for administrative reviews initiated pursuant to requests made for the orders identified below, Commerce intends to select respondents based on U.S. Customs and Border Protection (CBP) data for U.S. imports during the period of review (POR). We intend to place the CBP data on the record within five days of publication of the initiation notice and to make our decision regarding respondent selection within 35 days of publication of the initiation **Federal Register** notice. Comments regarding the CBP data and respondent selection should be submitted within seven days after the placement of the CBP data on the record of this review. Parties wishing to submit rebuttal comments should submit those comments within five days after the deadline for the initial comments.

In the event that Commerce decides it is necessary to limit individual examination of respondents and conduct respondent selection under section 777A(c)(2) of the Tariff Act of 1930, as amended (the Act), the following guidelines regarding collapsing of companies for purposes of respondent selection will apply. In general, Commerce has found that determinations concerning whether

particular companies should be "collapsed" (e.g., treated as a single entity for purposes of calculating AD rates) require a substantial amount of detailed information and analysis, which often require follow-up questions and analysis. Accordingly, Commerce will not conduct collapsing analyses at the respondent selection phase of this review and will not collapse companies at the respondent selection phase unless there has been a determination to collapse certain companies in a previous segment of this AD proceeding (e.g., investigation, administrative review, new shipper review, or changed circumstances review). For any company subject to this review, if Commerce determined, or continued to treat, that company as collapsed with others, Commerce will assume that such companies continue to operate in the same manner and will collapse them for respondent selection purposes. Otherwise, Commerce will not collapse companies for purposes of respondent selection.

Parties are requested to (a) identify which companies subject to review previously were collapsed, and (b) provide a citation to the proceeding in which they were collapsed. Further, if companies are requested to complete the Quantity and Value (Q&V) Questionnaire for purposes of respondent selection, in general, each company must report volume and value data separately for itself. Parties should not include data for any other party, even if they believe they should be treated as a single entity with that other party. If a company was collapsed with another company or companies in the most recently completed segment of this proceeding where Commerce considered collapsing that entity, complete Q&V data for that collapsed entity must be submitted.

Notice of No Sales

With respect to AD administrative reviews, we intend to rescind the review where there are no suspended entries for a company or entity under review and/or where there are no suspended entries under the company-specific case number for that company or entity. Where there may be suspended entries, if a producer or exporter named in this notice of initiation had no exports, sales, or entries during the POR, it may notify Commerce of this fact within 30 days of publication of this notice in the **Federal Register** for Commerce to consider how to treat suspended entries under that producer's or exporter's company-specific case number.

Deadline for Withdrawal of Request for Administrative Review

Pursuant to 19 CFR 351.213(d)(1), a party that has requested a review may withdraw that request within 90 days of the date of publication of the notice of initiation of the requested review. The regulation provides that Commerce may extend this time if it is reasonable to do so. Determinations by Commerce to extend the 90-day deadline will be made on a case-by-case basis.

Deadline for Particular Market Situation Allegation

Section 504 of the Trade Preferences Extension Act of 2015 amended the Act by adding the concept of a particular market situation (PMS) for purposes of constructed value under section 773(e) of the Act.¹ Section 773(e) of the Act states that "if a particular market situation exists such that the cost of materials and fabrication or other processing of any kind does not accurately reflect the cost of production in the ordinary course of trade, the administering authority may use another calculation methodology under this subtitle or any other calculation methodology." When an interested party submits a PMS allegation pursuant to section 773(e) of the Act, Commerce will respond to such a submission consistent with 19 CFR 351.301(c)(2)(v). If Commerce finds that a PMS exists under section 773(e) of the Act, then it will modify its dumping calculations appropriately.

Neither section 773(e) of the Act nor 19 CFR 351.301(c)(2)(v) set a deadline for the submission of PMS allegations and supporting factual information. However, in order to administer section 773(e) of the Act, Commerce must receive PMS allegations and supporting factual information with enough time to consider the submission. Thus, should an interested party wish to submit a PMS allegation and supporting new factual information pursuant to section 773(e) of the Act, it must do so no later than 20 days after submission of initial responses to section D of the questionnaire.

Separate Rates

In proceedings involving non-market economy (NME) countries, Commerce begins with a rebuttable presumption that all companies within the country are subject to government control and, thus, should be assigned a single AD deposit rate. It is Commerce's policy to assign all exporters of merchandise subject to an administrative review in

¹ See Trade Preferences Extension Act of 2015, Public Law 114-27, 129 Stat. 362 (2015).

an NME country this single rate unless an exporter can demonstrate that it is sufficiently independent so as to be entitled to a separate rate.

To establish whether a firm is sufficiently independent from government control of its export activities to be entitled to a separate rate, Commerce analyzes each entity exporting the subject merchandise. In accordance with the separate rates criteria, Commerce assigns separate rates to companies in NME cases only if respondents can demonstrate the absence of both *de jure* and *de facto* government control over export activities.

All firms listed below that wish to qualify for separate rate status in the administrative reviews involving NME countries must complete, as appropriate, either a Separate Rate Application or Certification, as described below.

For these administrative reviews, in order to demonstrate separate rate eligibility, Commerce requires entities for whom a review was requested, that were assigned a separate rate in the most recent segment of this proceeding in which they participated, to certify that they continue to meet the criteria for obtaining a separate rate. The Separate Rate Certification form will be available on Commerce's website at <https://access.trade.gov/Resources/nme/>

[nme-sep-rate.html](#) on the date of publication of this **Federal Register** notice. In responding to the certification, please follow the "Instructions for Filing the Certification" in the Separate Rate Certification. Separate Rate Certifications are due to Commerce no later than 30 calendar days after publication of this **Federal Register** notice. The deadline and requirement for submitting a Separate Rate Certification applies equally to NME-owned firms, wholly foreign-owned firms, and foreign sellers who purchase and export subject merchandise to the United States.

Entities that currently do not have a separate rate from a completed segment of the proceeding² should timely file a Separate Rate Application to demonstrate eligibility for a separate rate in this proceeding. In addition, companies that received a separate rate in a completed segment of the proceeding that have subsequently made changes, including, but not limited to, changes to corporate structure, acquisitions of new companies or facilities, or changes to their official company name,³ should timely file a Separate Rate Application to demonstrate eligibility for a separate rate in this proceeding. The Separate Rate Application will be available on Commerce's website at <https://>

access.trade.gov/Resources/nme/nme-sep-rate.html on the date of publication of this **Federal Register** notice. In responding to the Separate Rate Application, refer to the instructions contained in the application. Separate Rate Applications are due to Commerce no later than 30 calendar days after publication of this **Federal Register** notice. The deadline and requirement for submitting a Separate Rate Application applies equally to NME-owned firms, wholly foreign-owned firms, and foreign sellers that purchase and export subject merchandise to the United States.

Exporters and producers must file a timely Separate Rate Application or Certification if they want to be considered for individual examination. Furthermore, exporters and producers who submit a Separate Rate Application or Certification and subsequently are selected as mandatory respondents will no longer be eligible for separate rate status unless they respond to all parts of the questionnaire as mandatory respondents.

Initiation of Reviews

In accordance with 19 CFR 351.221(c)(1)(i), we are initiating administrative reviews of the following AD and CVD orders and findings. We intend to issue the final results of these reviews not later than March 31, 2025.

Duty Absorption Reviews

During any administrative review covering all or part of a period falling between the first and second or third and fourth anniversary of the publication of an AD order under 19 CFR 351.211 or a determination under 19 CFR 351.218(f)(4) to continue an order or suspended investigation (after sunset review), Commerce, if requested by a domestic interested party within 30 days of the date of publication of the notice of initiation of the review, will

⁴ Commerce also received a request for review of “Suzano Papel e Celulose S.A.” However, prior to the period of review, Commerce determined that Suzano S.A. is the successor-in-interest to Suzano Papel e Celulose S.A. See *Certain Uncoated Paper from Brazil: Final Results of Antidumping Duty Administrative Review; 2019–2020*, 86 FR 55820 (October 7, 2021). Therefore, we are initiating this review on Suzano S.A.

⁵ Subject merchandise produced and exported by Balkrishna Industries Ltd. (BKT) was excluded from the order. See *Certain New Pneumatic Off-the-Road Tires from India: Notice of Correction to Antidumping Duty Order*, 82 FR 25598 (June 2, 2017). Accordingly, Commerce is initiating this administrative review with respect to BKT only for subject merchandise produced in India where BKT acted as either the manufacturer or exporter (but not both).

⁶ Commerce previously found Anhui Trust Chem Co., Ltd; Nanjing Trust Chem Co., Ltd.; and Jiangsu Trust Chem Co., Ltd. to be cross-owned. See *Certain Corrosion Inhibitors from the People's Republic of China: Preliminary Results of Countervailing Duty Administrative Review and Rescission of Review, in Part; 2020–2021*, 88 FR 20475 (April 6, 2023) (*Corrosion Inhibitors from China 2020–2021 Preliminary Results*), and accompanying Preliminary Decision Memorandum (PDM) at 10, unchanged in *Certain Corrosion Inhibitors from the People's Republic of China: Final Results and Partial Rescission of Countervailing Duty Administrative Review; 2020–2021 (Corrosion Inhibitors from China 2020–2021 Final Results)*, 88 FR 69122 (October 5, 2023).

⁷ Commerce previously found Nantong Botao Chemical Co., Ltd; Nantong Yutu Group Co., Ltd.; Rugao Connect Chemical Co., Ltd.; and Rugao Jinling Chemical Co., Ltd. to be cross-owned. See *Corrosion Inhibitors from China 2020–2021 Preliminary Results*, and accompanying PDM at 10, unchanged in *Corrosion Inhibitors from China 2020–2021 Final Results*.

determine whether ADs have been absorbed by an exporter or producer subject to the review if the subject merchandise is sold in the United States through an importer that is affiliated with such exporter or producer. The request must include the name(s) of the exporter or producer for which the inquiry is requested.

Gap Period Liquidation

For the first administrative review of any order, there will be no assessment of antidumping or countervailing duties on entries of subject merchandise entered, or withdrawn from warehouse, for consumption during the relevant “gap” period of the order (*i.e.*, the period following the expiry of provisional measures and before definitive measures were put into place), if such a gap period is applicable to the POR.

Administrative Protective Orders and Letters of Appearance

Interested parties must submit applications for disclosure under administrative protective orders in accordance with the procedures outlined in Commerce’s regulations at 19 CFR 351.305. Those procedures apply to administrative reviews included in this notice of initiation. Parties wishing to participate in any of these administrative reviews should ensure that they meet the requirements of these procedures (*e.g.*, the filing of separate letters of appearance as discussed at 19 CFR 351.103(d)).

Factual Information Requirements

Commerce’s regulations identify five categories of factual information in 19 CFR 351.102(b)(21), which are summarized as follows: (i) evidence submitted in response to questionnaires; (ii) evidence submitted in support of allegations; (iii) publicly available

information to value factors under 19 CFR 351.408(c) or to measure the adequacy of remuneration under 19 CFR 351.511(a)(2); (iv) evidence placed on the record by Commerce; and (v) evidence other than factual information described in (i)–(iv). These regulations require any party, when submitting factual information, to specify under which subsection of 19 CFR 351.102(b)(21) the information is being submitted and, if the information is submitted to rebut, clarify, or correct factual information already on the record, to provide an explanation identifying the information already on the record that the factual information seeks to rebut, clarify, or correct. The regulations, at 19 CFR 351.301, also provide specific time limits for such factual submissions based on the type of factual information being submitted. Please review the *Final Rule*,⁸ available at <https://www.govinfo.gov/content/pkg/FR-2013-07-17/pdf/2013-17045.pdf>, prior to submitting factual information in this segment. Note that Commerce has amended certain of its requirements pertaining to the service of documents in 19 CFR 351.303(f).⁹

Any party submitting factual information in an AD or CVD proceeding must certify to the accuracy and completeness of that information using the formats provided at the end of the *Final Rule*.¹⁰ Commerce intends to

⁸ See *Certification of Factual Information To Import Administration During Antidumping and Countervailing Duty Proceedings*, 78 FR 42678 (July 17, 2013) (*Final Rule*); see also the frequently asked questions regarding the *Final Rule*, available at https://enforcement.trade.gov/tlei/notices/factual_info_final_rule_FAQ_07172013.pdf.

⁹ *Administrative Protective Order, Service, and Other Procedures in Antidumping and Countervailing Duty Proceedings; Final Rule*, 88 FR 67069 (September 29, 2023).

¹⁰ See section 782(b) of the Act; see also *Final Rule*; and the frequently asked questions regarding the *Final Rule*, available at <https://>

reject factual submissions in any proceeding segments if the submitting party does not comply with applicable certification requirements.

Extension of Time Limits Regulation

Parties may request an extension of time limits before a time limit established under Part 351 expires, or as otherwise specified by Commerce.¹¹ In general, an extension request will be considered untimely if it is filed after the time limit established under Part 351 expires. For submissions which are due from multiple parties simultaneously, an extension request will be considered untimely if it is filed after 10:00 a.m. on the due date. Examples include, but are not limited to: (1) case and rebuttal briefs, filed pursuant to 19 CFR 351.309; (2) factual information to value factors under 19 CFR 351.408(c), or to measure the adequacy of remuneration under 19 CFR 351.511(a)(2), filed pursuant to 19 CFR 351.301(c)(3) and rebuttal, clarification and correction filed pursuant to 19 CFR 351.301(c)(3)(iv); (3) comments concerning the selection of a surrogate country and surrogate values and rebuttal; (4) comments concerning CBP data; and (5) Q&V questionnaires. Under certain circumstances, Commerce may elect to specify a different time limit by which extension requests will be considered untimely for submissions which are due from multiple parties simultaneously. In such a case, Commerce will inform parties in the letter or memorandum setting forth the deadline (including a specified time) by which extension requests must be filed to be considered timely. This policy also requires that an extension request must be made in a separate, stand-alone submission, and clarifies the circumstances under which Commerce will grant untimely-filed requests for the extension of time limits. Please review the *Final Rule*, available at <https://www.gpo.gov/fdsys/pkg/FR-2013-09-20/html/2013-22853.htm>, prior to submitting factual information in these segments.

These initiations and this notice are in accordance with section 751(a) of the Act (19 U.S.C. 1675(a)) and 19 CFR 351.221(c)(1)(i).

Dated: May 2, 2024.

James Maeder,

Deputy Assistant Secretary for Antidumping and Countervailing Duty Operations.

National Oceanic and Atmospheric Administration

[RTID 0648-XD937]

Endangered and Threatened Species; Notice of Initiation of a 5-Year Review for the Non-U.S. Distinct Population Segment of Smalltooth Sawfish (*Pristis pectinata*)

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice of initiation; request for information.

SUMMARY: NMFS announces the initiation of a 5-year review for the non-U.S. distinct population segment (DPS) of smalltooth sawfish (*Pristis pectinata*). NMFS is required by the Endangered Species Act (ESA) to conduct 5-year reviews to ensure that the listing classifications of species are accurate. The 5-year review must be based on the best scientific and commercial data available at the time of the review. We request submission of any such information on the non-U.S. DPS of smalltooth sawfish, particularly information on the status, threats, and recovery of the species, that has become available since it was listed in 2015.

DATES: To allow us adequate time to conduct this review, we must receive your information no later than July 8, 2024.

ADDRESSES: You may submit information on this document, identified by NOAA-NMFS-2024-0062, by the following method:

- **Electronic Submission:** Submit electronic information via the Federal e-Rulemaking Portal. Go to <https://www.regulations.gov> and enter NOAA-NMFS-2024-0062 in the Search box. Click on the "Comment" icon, complete the required fields, and enter or attach your comments.

Instructions: Information sent by any other method, to any other address or individual, or received after the end of the specified period, may not be considered by NMFS. All information received is a part of the public record and will generally be posted for public viewing on <https://www.regulations.gov> without change. All personal identifying information (e.g., name, address, etc.), confidential business information, or otherwise sensitive or protected information submitted voluntarily by the sender will be publicly accessible. NMFS will accept anonymous submissions (enter "N/A" in the

required fields if you wish to remain anonymous).

FOR FURTHER INFORMATION CONTACT:

Adrienne Lohe, Office of Protected Resources, (301) 427-8442, Adrienne.Lohe@noaa.gov.

SUPPLEMENTARY INFORMATION: This notice announces our review of the non-U.S. DPS of smalltooth sawfish (*Pristis pectinata*) listed as endangered under the ESA. Section 4(c)(2)(A) of the ESA requires that we conduct a review of listed species at least once every 5 years. This will be the first review of this species since it was listed in 2015 under the ESA (79 FR 73977, December 12, 2014). The regulations in 50 CFR 424.21 require that we publish a notice in the **Federal Register** announcing species currently under active review. On the basis of such reviews under section 4(c)(2)(B), we determine whether any species should be removed from the list (i.e., delisted) or reclassified from endangered to threatened or from threatened to endangered (16 U.S.C. 1533(c)(2)(B)). As described by the regulations in 50 CFR 424.11(e), a species will be delisted if the Secretary determines, based on consideration of the factors and standards set forth in 50 CFR 424.11(c), that the best scientific and commercial data available substantiate that: (1) the species is extinct; (2) the species has recovered to the point at which it no longer meets the definition of an endangered species or a threatened species; (3) new information that has become available since the original listing decision shows the listed entity does not meet the definition of an endangered species or a threatened species; or (4) new information that has become available since the original listing decision shows the listed entity does not meet the definition of a species. Any change in Federal classification would require a separate rulemaking process.

Background information on the species is available on the NMFS website at: <https://www.fisheries.noaa.gov/species/smalltooth-sawfish>.

Public Solicitation of New Information

To ensure that the review is complete and based on the best available scientific and commercial information, we are soliciting new information from the public, governmental agencies, tribes, the scientific community, industry, environmental entities, and any other interested parties concerning the status of the DPS. Categories of requested information include: (1) species biology including, but not limited to, population trends,

distribution, abundance, demographics, and genetics; (2) habitat conditions including, but not limited to, amount, distribution, and important features for conservation; (3) status and trends of threats to the DPS and its habitats; (4) conservation measures that have been implemented that benefit the DPS, including monitoring data demonstrating effectiveness of such measures; and (5) other new information, data, or corrections including, but not limited to, taxonomic or nomenclatural changes and improved analytical methods for evaluating extinction risk.

If you wish to provide information for the review, you may submit your information and materials electronically (see **ADDRESSES** section). We request that all information be accompanied by supporting documentation such as maps, bibliographic references, or reprints of pertinent publications.

Authority: 16 U.S.C. 1531 *et seq.*

Dated: May 3, 2024.

Angela Somma,

Chief, Endangered Species Conservation Division, Office of Protected Resources, National Marine Fisheries Service.

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

[RTID 0648-XD901]

Pacific Fishery Management Council; Public Meeting

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice of public meeting.

SUMMARY: The Pacific Fishery Management Council's (Pacific Council) Ad Hoc Ecosystem Workgroup (EWG) will hold an online meeting, which is open to the public.

DATES: The online meeting will be held Friday, May 24, 2024, from 10 a.m. to 2 p.m. or until business for the day is completed.

ADDRESSES: This meeting will be held online. Specific meeting information, including directions on how to join the meeting and system requirements will be provided in the meeting announcement on the Pacific Council's website (see www.pcouncil.org). You may send an email to Mr. Kris Kleinschmidt (kris.kleinschmidt@noaa.gov) or contact him at (503) 820-2412 for technical assistance.

Council address: Pacific Fishery Management Council, 7700 NE Ambassador Place, Suite 101, Portland, OR 97220-1384.

FOR FURTHER INFORMATION CONTACT: Kit Dahl, Staff Officer, Pacific Council; telephone: (503) 820-2422.

SUPPLEMENTARY INFORMATION: During this meeting the EWG will (1) review progress on Fishery Ecosystem Plan Initiative 4 and (2) discuss the contents of reports on agenda items for the June 2024 Pacific Council meeting.

In March 2024, the Pacific Council provided guidance on the further development of risk assessment methodologies, as part of Initiative 4, to bring climate and ecosystem information into harvest specification processes. Proposed methodologies will be reviewed by the Scientific and Statistical Committee Ecosystem-Based Management Subcommittee on August 5, 2024, and considered by the Pacific Council at its September 2024 meeting.

At its June meeting, the Pacific Council will discuss and provide guidance on potential changes to Council operations. The EWG may provide recommendations on recommended changes and other agenda topics, as appropriate. Other matters related to the work of the EWG may also be discussed.

Although non-emergency issues not contained in the meeting agenda may be discussed, those issues may not be the subject of formal action during this meeting. Action will be restricted to those issues specifically listed in this document and any issues arising after publication of this document that require emergency action under section 305(c) of the Magnuson-Stevens Fishery Conservation and Management Act, provided the public has been notified of the intent to take final action to address the emergency.

Special Accommodations

Requests for sign language interpretation or other auxiliary aids should be directed to Mr. Kris Kleinschmidt (kris.kleinschmidt@noaa.gov; (503) 820-2412) at least 10 days prior to the meeting date.

Authority: 16 U.S.C. 1801 *et seq.*

Dated: May 3, 2024.

Rey Israel Marquez,

Acting Deputy Director, Office of Sustainable Fisheries, National Marine Fisheries Service.

North Pacific Fishery Management Council; Public Meeting

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice of web conference.

SUMMARY: The North Pacific Fishery Management Council (Council) Pacific Northwest Crab Industry Advisory Committee (PNCIAC) will meet May 22, 2024.

DATES: The meeting will be held on Wednesday, May 22, 2024, from 9 a.m. to 11 a.m., Alaska Time.

ADDRESSES: The meeting will be a web conference. Join online through the link at <https://meetings.npfmc.org/Meeting/Details/3050>.

Council address: North Pacific Fishery Management Council, 1007 W 3rd Ave, Suite 400, Anchorage, AK 99501-2252; telephone: (907) 271-2809. Instructions for attending the meeting via video conference are given under **SUPPLEMENTARY INFORMATION**, below.

FOR FURTHER INFORMATION CONTACT: Sarah Marrinan, Council staff; phone: (907) 271-2809; email: sarah.marrinan@noaa.gov. For technical support, please contact our admin Council staff, email: npfmc.admin@noaa.gov.

SUPPLEMENTARY INFORMATION:

Agenda

Wednesday, May 22, 2024

The Committee will discuss (a) crab rationalization program review; and (b) other business. The agenda is subject to change, and the latest version will be posted <https://meetings.npfmc.org/Meeting/Details/3050> prior to the meeting, along with meeting materials.

Connection Information

You can attend the meeting online using a computer, tablet, or smart phone, or by phone only. Connection information will be posted online at: <https://meetings.npfmc.org/Meeting/Details/3050>.

Public Comment

Public comment letters will be accepted and should be submitted electronically to <https://meetings.npfmc.org/Meeting/Details/3050>.

COMMISSION OF FINE ARTS

Notice of Meeting

Per 45 CFR chapter XXI section 2102.3, the next meeting of the U.S. Commission of Fine Arts is scheduled for May 16, 2024, at 9 a.m. and will be held via online videoconference. Items of discussion may include buildings, infrastructure, parks, memorials, and public art.

Draft agendas, the link to register for the online public meeting, and additional information regarding the Commission are available on our website: www.cfa.gov. Inquiries regarding the agenda, as well as any public testimony, should be addressed to Thomas Luebke, Secretary, U.S. Commission of Fine Arts, at the above address; by emailing cfastaff@cfa.gov; or by calling 202–504–2200. Individuals requiring sign language interpretation for the hearing impaired should contact the Secretary at least 10 days before the meeting date.

Dated May 3, 2024 in Washington, DC.

DEPARTMENT OF EDUCATION

Federal Need Analysis Methodology for the 2024–25 Award Year—Federal Pell Grant, Federal Work-Study, Federal Supplemental Educational Opportunity Grant, William D. Ford Federal Direct Loan, and TEACH Grant Programs

AGENCY: Federal Student Aid, Department of Education.

ACTION: Notice.

SUMMARY: The Secretary announces the annual updates to the tables used in the statutory Federal Need Analysis Methodology that determines a student’s Student Aid Index (SAI) for award year (AY) 2024–25 for student

financial aid programs, Assistance Listing Numbers (ALN) 84.063, 84.033, 84.007, 84.268, and 84.379. The intent of this notice is to alert the financial aid community and the broader public to these required annual updates used in the determination of student aid eligibility.

FOR FURTHER INFORMATION CONTACT: Heather Hall Lewis. Telephone: (202) 417–1981. Email: heather.halllewis@ed.gov.

If you are deaf, hard of hearing, or have a speech disability and wish to access telecommunications relay services, please dial 7–1–1.

SUPPLEMENTARY INFORMATION: Part F of title IV of the Higher Education Act of 1965, as amended (HEA), specifies the criteria, data elements, calculations, and tables the Department of Education (Department) uses in the Federal Need Analysis Methodology to determine the SAI.

Enacted into law as part of the Consolidated Appropriations Act, 2021, Division FF, Title VII (116 Pub. L. 260), the FAFSA Simplification Act makes many significant changes to the Higher Education Act of 1965, as amended (HEA), regarding Federal Need Analysis Methodology, including how the Secretary must update the tables used in the formula. Due to the magnitude of these (and other) changes and to ensure that both the Department and the higher education community were prepared to fully implement the FAFSA Simplification Act, in June 2021, Federal Student Aid (FSA) announced a phased approach to implementation. As part of this approach, in the FAFSA Simplification Act Technical Corrections Act, Division R (Pub. L. 117–103) of the Consolidated Appropriations Act, 2022 (CAA 2022), Congress extended the full implementation of the FAFSA Simplification Act until the 2024–25 award year.

Section 478 of the HEA, as amended by the FAFSA Simplification Act, requires the Secretary to annually update the following five tables for inflation—the Income Protection Allowance (IPA), the Adjusted Net Worth (NW) of a Business or Farm, the Asset Protection Allowance, the Assessment Schedules and Rates, and the Employment Expense Allowance. The updates are based, in general, upon increases in items such as, but not limited to, the Consumer Price Index (CPI).

The Secretary is charged with updating the IPA, adjusted NW of a business or farm, the asset protection allowance, the assessment schedules

and rates, and the employment expense allowance to account for inflation that took place between April 2020 and April in the year prior to the beginning of each award year. The increases in the tables must be based on a percentage equal to the percentage increase in the Consumer Price Index for All Urban Consumers (CPI-U) for April of the applicable year.

This notice includes the new 2024–25 AY values for the five tables listed above, which reflect the FAFSA Simplification Act amendments. The updated tables are in sections 1 (Income Protection Allowance), 2 (Adjusted Net Worth of a Business or Farm), 3 (Asset Protection Allowance), 4 (Assessment Schedules and Rates), and 5 (Employment Expense Allowance) of this notice.

The HEA requires the following annual updates:

1. Income Protection Allowance. This allowance is the amount of living expenses associated with the maintenance of an individual or family that may be offset against the family's income. The allowance varies by family size and marital status. The IPA for dependent students is \$11,130. The IPAs for parents of dependent students and independent students are listed in the tables below.

PARENTS OF DEPENDENT STUDENTS

Family size	Income protection allowance
2	\$27,600
3	34,350
4	42,430
5	50,060
6	58,560

For each additional family member add \$6,610.

MARRIED INDEPENDENT STUDENTS WITH DEPENDENTS OTHER THAN A SPOUSE

Family size	Income protection allowance
3	\$54,580
4	67,400
5	79,530
6	93,010

For each additional family member add \$10,510.

SINGLE INDEPENDENT STUDENTS WITH DEPENDENTS OTHER THAN A SPOUSE

Family size	Income protection allowance
2	\$51,960
3	64,700
4	79,880
5	94,260
6	110,230

For each additional family member add \$12,460.

INDEPENDENT STUDENTS WITHOUT DEPENDENTS OTHER THAN A SPOUSE

Marital status	Income protection allowance
Single	\$17,310
Married	27,750

2. Adjusted Net Worth of a Business or Farm. A portion of the full NW (assets less debts) of a business or farm is excluded from the calculation of a SAI because (1) the income produced from these assets is already assessed in another part of the formula; and (2) the

formula protects a portion of the value of the assets.

The portion of these assets included in the contribution calculation is computed according to the following schedule. This schedule is used for parents of dependent students, independent students without dependents other than a spouse, and independent students with dependents other than a spouse.

ADJUSTED NET WORTH OF A BUSINESS OR FARM

If the NW of a business or farm is	Then the adjusted NW is
Less than \$1	\$0.
\$1 to \$165,000	\$0 + 40% of NW.
\$165,001 to \$490,000	\$66,000 + 50% of NW over \$165,000.
\$490,001 to \$820,000	\$228,500 + 60% of NW over \$490,000.
\$820,001 or more	\$426,500 + 100% of NW over \$820,000.

3. Asset Protection Allowance. This allowance protects a portion of NW (assets less debts) from being considered available for postsecondary educational expenses. There is one asset protection allowance table for parents of dependent students, independent students without dependents other than a spouse, and independent students with dependents other than a spouse.

PARENTS OF DEPENDENT STUDENTS, INDEPENDENT STUDENTS WITH DEPENDENTS OTHER THAN A SPOUSE, AND INDEPENDENT STUDENTS WITHOUT DEPENDENTS OTHER THAN A SPOUSE

If the age of the older parent or the independent student is	And the older parent or the independent student is	
	Married	Single
Then the allowance is		
25 or less	0	0
26	0	0
27	0	0
28	0	0
29	0	0
30	0	0
31	0	0
32	0	0
33	0	0
34	0	0

61	0	0
62	0	0
63	0	0
64	0	0
65 or older	0	0

4. Assessment Schedules and Rates.

Two schedules that are subject to updates—one for parents of dependent students and one for independent students with dependents other than a spouse—are used to determine the SAI from family financial resources toward educational expenses. For dependent

students, the SAI is derived from an assessment of the parents' adjusted available income (AAI). For independent students with dependents other than a spouse, the SAI is derived from an assessment of the family's AAI. The AAI represents a measure of a

family's financial strength, which considers both income and assets.

The contribution of parents of dependent students, and independent students with dependents other than a spouse, is computed according to the following schedule:

ASSESSMENT OF AVAILABLE INCOME

If AAI is	Then the contribution is
Less than – \$6,820	– \$1,500,
– \$6,820 to \$20,600	22% of AAI.
\$20,601 to \$25,800	\$4,532 + 25% of AAI over \$20,600.
\$25,801 to \$31,000	\$5,832 + 29% of AAI over \$25,800.
\$31,001 to \$36,300	\$7,340 + 34% of AAI over \$31,000.
\$36,301 to \$41,500	\$9,142 + 40% of AAI over \$36,300.
\$41,501 or more	\$11,222 + 47% of AAI over \$41,500.

5. Employment Expense Allowance.

This allowance for employment-related expenses recognizes additional expenses incurred by working individuals. For parents of dependent students, the employment expense allowance is the lesser of \$4,730 or 35% of the total earned income of the

student's parent and parent's spouse, if applicable. The employment expense allowance for independent students is zero if the student is not married (single, separated or divorced/widowed) or the lesser of \$4,730 or 35% of the combined earned income for the student and student spouse if the student is married.

DEPARTMENT OF ENERGY

Advanced Scientific Computing Advisory Committee

AGENCY: Office of Science, Department of Energy.

ACTION: Notice of open meeting.

SUMMARY: This notice announces an open meeting of the DOE Advanced Scientific Computing Advisory Committee (ASCAC). The Federal Advisory Committee Act requires that public notice of these meetings be announced in the **Federal Register**.

DATES: Wednesday, May 29, 2024; 10 a.m. to 5 p.m. EDT.

ADDRESSES: The Pitch at the Wharf, the Penthouse Room, 800 Maine Ave SW, Washington, DC 20024. Teleconference: Remote attendance of the ASCAC meeting will be possible via Zoom. Instructions will be posted on the ASCAC website at <https://science.energy.gov/ascr/ascac/> prior to the meeting and can also be obtained by contacting Christine Chalk by email at christine.chalk@science.doe.gov or by telephone at (301) 903-7486. Advanced registration is required.

FOR FURTHER INFORMATION CONTACT: Christine Chalk, Office of Advanced Scientific Computing Research; SC-ASCR/Germantown Building; U.S.

Department of Energy; 1000 Independence Avenue SW, Washington, DC 20585-1290; Telephone (301) 903-7486; email at christine.chalk@science.doe.gov.

SUPPLEMENTARY INFORMATION:

Purpose of the Committee: The purpose of the committee is to provide advice and guidance on a continuing basis to the Office of Science and the Department of Energy on scientific priorities within the field of advanced scientific computing research.

Purpose of the Meeting: This meeting is the semi-annual meeting of the Committee.

Tentative Agenda:

- View from Germantown
- Completion of the Exascale Computing Project
- Update on ASCR Facilities
- Report from SIAM on the Future of Computational Science
- Update on Frontiers in Artificial intelligence for Science Security and Technology (FASST)
- Report from Subcommittee on Facilities of the Future
- Technical presentations
- Public Comment (10-minute rule)

The meeting agenda includes an update on the budget, accomplishments, and planned activities of the Advanced Scientific Computing Research program and the exascale computing project; technical presentations from funded researchers and industry collaborations; updates from subcommittees, and there will be an opportunity for comments from the public. The meeting will conclude at 5 p.m. (eastern time) on May 29, 2024. Agenda updates and presentations will be posted on the ASCAC website prior to the meeting: <https://science.osti.gov/ascr/ascac>.

Public Participation: The meeting is open to the public in-person and virtually. Individuals and representatives of organizations who would like to offer comments and suggestions may do so during the meeting. Approximately 30 minutes will be reserved for public comments. The time allotted per speaker will depend on the number who wish to speak but will not exceed 10 minutes. If you have any questions or need a reasonable accommodation under the Americans with Disabilities Act for this event, please send your request to Christine Chalk at Christine.chalk@science.doe.gov two weeks, but no later than 48 hours, prior to the event. Closed captions will be enabled. The Designated Federal Officer is empowered to conduct the meeting in a fashion that will facilitate the orderly conduct of business. Those wishing to

speak should submit their request at least five days before the meeting. Those not able to attend the meeting or who have insufficient time to address the committee are invited to send a written statement to Christine Chalk, U.S. Department of Energy, 1000 Independence Avenue SW, Washington, DC 20585, email to Christine.Chalk@science.doe.gov.

Minutes: The minutes of this meeting will be available within 90 days on the Advanced Scientific Computing website at <https://science.osti.gov/ascr/ascac>.

Signing Authority: This document of the Department of Energy was signed on May 2, 2024, by David Borak, Deputy Committee Management Officer, pursuant to delegated authority from the Secretary of Energy. That document with the original signature and date is maintained by DOE. For administrative purposes only, and in compliance with requirements of the Office of the Federal Register, the undersigned DOE Federal Register Liaison Officer has been authorized to sign and submit the document in electronic format for publication, as an official document of the Department of Energy. This administrative process in no way alters the legal effect of this document upon publication in the **Federal Register**.

Signed in Washington, DC, on May 3, 2024.

Treena V. Garrett,

Federal Register Liaison Officer, U.S. Department of Energy.

AGENCY: National Nuclear Security Administration, Department of Energy.

ACTION: Notice of update to advance consent list.

SUMMARY: The Department of Energy's National Nuclear Security Administration is providing notice of an update to the advance consent list of countries eligible to receive retransfers from the European Atomic Energy Community ("Euratom") of low enriched uranium, non-nuclear material, equipment, and source material transferred pursuant to Article 8.1(C)(i) of the Agreement for Cooperation in the Peaceful Uses of Nuclear Energy between the United States of America and the European Atomic Energy Community, signed at

Brussels November 7, 1995 and March 29, 1996, entered into force April 12, 1996 (“U.S.-Euratom 123 Agreement”).

FOR FURTHER INFORMATION CONTACT: Ms. Andrea Ferkile, Director, Office of Nonproliferation Policy, National Nuclear Security Administration, Department of Energy, 1000 Independence Avenue SW, Washington, DC 20585, telephone: (202) 586–8868 or email: andrea.ferkile@nnsa.doe.gov.

SUPPLEMENTARY INFORMATION: Article 8.1(C)(i) of the U.S.-Euratom 123 Agreement permits retransfers of the following to third countries: low enriched uranium, non-nuclear material, equipment, and source material transferred pursuant to the U.S.-Euratom 123 Agreement or of low enriched uranium produced through the use of nuclear material or equipment transferred pursuant to the U.S.-Euratom 123 Agreement, for nuclear fuel cycle activities other than the production of high enriched uranium. Paragraph B.2 of the Agreed Minute to the U.S.-Euratom 123 Agreement requires the United States and Euratom to exchange lists of third countries to which retransfers pursuant to Article 8.1(C)(i) of the Agreement may be made (“advance consent lists”). To be eligible for inclusion on the advance consent lists, third countries must have made effective non-proliferation commitments and, for countries on the U.S. advance consent list, must be a party to a civil nuclear cooperation agreement with the United States. Such agreements are entered into under the authority of section 123 of the Atomic Energy Act of 1954, as amended (“123 Agreement”). Paragraph B.4 of the Agreed Minute provides that either the United States or Euratom may delete third countries from its lists following consultations with the other Party.

The Agreement for Cooperation between the Government of the United States of America and the Government of the Arab Republic of Egypt Concerning Peaceful Uses of Nuclear Energy (with annex and agreed minute), signed at Washington June 29, 1981, expired December 29, 2021. The Agreement for Cooperation between the United States of America and the Republic of South Africa Concerning Peaceful Uses of Nuclear Energy, done at Pretoria August 25, 1995, entered into force December 4, 1997, expired December 4, 2022. In the absence of 123 agreements with Egypt and South Africa, these countries are being deleted from the advance consent list of countries eligible to receive retransfers from Euratom of low enriched uranium, non-nuclear material, equipment, and

source material transferred, and low enriched uranium produced through the use of nuclear material or equipment transferred for nuclear fuel cycle activities other than the production of high enriched uranium.

Signing Authority

This document of the Department of Energy was signed on April 29, 2024, by Corey Hinderstein, Deputy Administrator for Defense Nuclear Nonproliferation, National Nuclear Security Administration, pursuant to delegated authority from the Secretary of Energy. That document with the original signature and date is maintained by DOE. For administrative purposes only, and in compliance with requirements of the Office of the Federal Register, the undersigned DOE **Federal Register** Liaison Officer has been authorized to sign and submit the document in electronic format for publication, as an official document of the Department of Energy. This administrative process in no way alters the legal effect of this document upon publication in the **Federal Register**.

Signed in Washington, DC, on May 2, 2024.

Treena V. Garrett,

Federal Register Liaison Officer, U.S. Department of Energy.

BILLING CODE 6450–01–P

DEPARTMENT OF ENERGY

National Nuclear Security Administration

Notice of Update to Advance Consent List

AGENCY: National Nuclear Security Administration, Department of Energy.

ACTION: Notice of update to advance consent list.

SUMMARY: The Department of Energy’s National Nuclear Security Administration is providing notice of an update to the advance consent list of countries or destinations eligible to receive retransfers from the Republic of Korea (ROK) of unirradiated low enriched uranium, unirradiated source material, equipment, and components subject to paragraph 2 of Article 10 of the Agreement for Cooperation between the Government of the United States of America and the Government of the Republic of South Africa Concerning Peaceful Uses of Nuclear Energy, done at Washington June 15, 2015, entered into force November 25, 2015 (“U.S.-ROK 123 Agreement”).

FOR FURTHER INFORMATION CONTACT: Ms. Andrea Ferkile, Director, Office of Nonproliferation Policy, National Nuclear Security Administration, Department of Energy, 1000 Independence Avenue SW, Washington, DC 20585, telephone: (202) 586–8868 or email: andrea.ferkile@nnsa.doe.gov.

SUPPLEMENTARY INFORMATION: Paragraph 2 of Article 10 of the U.S.-ROK 123 Agreement permits retransfers of the following to areas beyond the territorial jurisdiction of the receiving party if the United States and the ROK agree: nuclear material, moderator material, equipment, and components transferred pursuant to the U.S.-ROK 123 Agreement, and any special fissionable material produced through the use of any such nuclear material, moderator material, or equipment. Subsection 1.a. of Section 3 of the Agreed Minute to the U.S.-ROK 123 Agreement permits the United States and the ROK to retransfer unirradiated low enriched uranium, unirradiated source material, equipment, and components subject to paragraph 2 of Article 10 of the U.S.-ROK 123 Agreement to third countries or destinations. The United States and ROK exchanged lists of third countries or destinations for which retransfers of unirradiated low enriched uranium, unirradiated source material, equipment, and components subject to paragraph 2 of Article 10 of the U.S.-ROK 123 Agreement could be made by the other Party (“advance consent lists”). Subsection 1.a. of Section 3 permits either the United States or the ROK to delete third countries or destinations from either list temporarily or permanently following consultations with and written notice to the other Party.

The Agreement for Cooperation between the Government of the United States of America and the Government of the Arab Republic of Egypt Concerning Peaceful Uses of Nuclear Energy, signed at Washington June 29, 1981, expired December 29, 2021. The Agreement for Cooperation between the United States of America and the Republic of South Africa Concerning Peaceful Uses of Nuclear Energy, done at Pretoria August 25, 1995, entered into force December 4, 1997, expired December 4, 2022. In the absence of 123 agreements with Egypt and South Africa, these countries are being deleted from the advance consent list of countries or destinations eligible to receive retransfers from the ROK of unirradiated low enriched uranium, unirradiated source material, equipment, and components subject to

paragraph 2 of Article 10 of the U.S.-ROK 123 Agreement.

Signing Authority

This document of the Department of Energy was signed on April 16, 2024, by Corey Hinderstein, Deputy Administrator for Defense Nuclear Nonproliferation, National Nuclear Security Administration, pursuant to delegated authority from the Secretary of Energy. That document with the original signature and date is maintained by DOE. For administrative purposes only, and in compliance with requirements of the Office of the Federal Register, the undersigned DOE **Federal Register** Liaison Officer has been authorized to sign and submit the document in electronic format for publication, as an official document of the Department of Energy. BILLING CODE 6450-01-P

DEPARTMENT OF ENERGY

National Nuclear Security Administration

Notice of Update to Advance Consent List

AGENCY: National Nuclear Security Administration, Department of Energy.

ACTION: Notice of update to advance consent list.

SUMMARY: The Department of Energy's National Nuclear Security Administration is providing notice of an update to the advance consent list of countries or destinations eligible to receive retransfers from the United Kingdom of Great Britain and Northern Ireland of byproduct material, non-nuclear material, unirradiated low enriched uranium, unirradiated source material, and equipment subject to Article 6 of the Agreement between the Government of the United States of America and the Government of the United Kingdom of Great Britain and Northern Ireland for Cooperation in Peaceful Uses of Nuclear Energy, done at Washington May 4, 2018, entered into force December 31, 2020 ("U.S.-UK 123 Agreement").

FOR FURTHER INFORMATION CONTACT: Ms. Andrea Ferkile, Director, Office of Nonproliferation Policy, National

Nuclear Security Administration, Department of Energy, 1000 Independence Avenue SW, Washington, DC 20585, telephone: (202) 586-8868 or email: andrea.ferkile@nnsa.doe.gov.

SUPPLEMENTARY INFORMATION: Article 6 of the U.S.-UK 123 Agreement permits retransfers of the following beyond the territory, jurisdiction, or control of the recipient party if the U.S. and the UK agree in writing: material, equipment, sensitive nuclear facilities, or major critical components transferred pursuant to the U.S.-UK 123 Agreement, and special fissionable material produced through the use of nuclear material, non-nuclear material, equipment, sensitive nuclear facilities, or major critical components so transferred. Subsection A of Section 4 of the Agreed Minute of the U.S.-UK 123 Agreement permits the United States and the UK to retransfer material, other than irradiated nuclear material, and equipment subject to Article 6 of the Agreement to third countries or destinations identified in advance ("advance consent lists"). To be eligible for inclusion on the advance consent lists, third countries or destinations must have made effective non-proliferation commitments and, for countries on the U.S. advance consent list, must be a party to a civil nuclear cooperation agreement with the United States. Such agreements are entered into under the authority of section 123 of the Atomic Energy Act of 1954, as amended ("123 agreement"). Subsection C of Section 4 permits either the United States or the UK to delete third countries or destinations from either list temporarily or permanently following consultations with the other Party.

The Agreement for Cooperation between the Government of the United States of America and the Government of the Arab Republic of Egypt Concerning Peaceful Uses of Nuclear Energy, signed at Washington June 29, 1981, expired December 29, 2021. The Agreement for Cooperation between the United States of America and the Republic of South Africa Concerning Peaceful Uses of Nuclear Energy, done at Pretoria August 25, 1995, entered into force December 4, 1997, expired December 4, 2022. In the absence of 123 agreements with Egypt and South Africa, these countries are being deleted from the advance consent list of countries or destinations eligible to receive retransfers from the United Kingdom of Great Britain and Northern Ireland of byproduct material, non-nuclear material, unirradiated low enriched uranium, unirradiated source

material, and equipment subject to Article 6 of the U.S.-UK 123 Agreement.

Signing Authority

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

Combined Notice of Filings #1

Take notice that the Commission received the following electric corporate filings:

Docket Numbers: EC24-75-000.

Applicants: Happy Solar 1, LLC, Oxbow Solar Farm 1, LLC.

Description: Joint Application for Authorization under Section 203 of the Federal Power Act of Happy Solar 1, LLC, et al.

Filed Date: 5/1/24.

Accession Number: 20240501-5421.

Comment Date: 5 p.m. ET 5/22/24.

Take notice that the Commission received the following exempt wholesale generator filings:

Docket Numbers: EG24-172-000

Applicants: Morris Ridge Solar Energy Center, LLC.

Description: Morris Ridge Solar Energy Center, LLC submits Notice of Self-Certification of Exempt Wholesale Generator Status.

Filed Date: 5/1/24.

Accession Number: 20240501-5415.

Comment Date: 5 p.m. ET 5/22/24.

Take notice that the Commission received the following electric rate filings:

Docket Numbers: ER10-2727-009; ER10-1451-011; ER10-1467-012; ER10-1269-002; ER10-1473-012; ER10-1474-012; ER10-1478-014; ER10-2687-011; ER10-2688-014; ER10-2689-015; ER10-2728-013; ER11-3907-005.

Applicants: The Toledo Edison Company, Green Valley Hydro, LLC, West Penn Power Company, The Potomac Edison Company, Monongahela Power Company, Pennsylvania Electric Company, Metropolitan Edison Company, Pennsylvania Power Company, The Cleveland Electric Illuminating Company, Ohio Edison Company, Jersey Central Power & Light, Allegheny Energy Supply Company, LLC.

Description: Notice of Non-Material Change in Status of Allegheny Energy Supply Company, LLC, et al.

Filed Date: 4/30/24.

Accession Number: 20240430-5641.

Comment Date: 5 p.m. ET 5/21/24.

Docket Numbers: ER11-3859-025; ER14-1699-015; ER17-436-011; ER21-1810-002.

Applicants: Marco DM Holdings, L.L.C., Marcus Hook Energy, L.P., Milford Power, LLC, Dighton Power, LLC.

Description: Notice of Change in Status of Dighton Power, LLC, et al.

Filed Date: 4/30/24.

Accession Number: 20240430-5639.

Comment Date: 5 p.m. ET 5/21/24.

The filings are accessible in the Commission's eLibrary system (<https://elibrary.ferc.gov/idmws/search/fercsearch.asp>) by querying the docket number.

Any person desiring to intervene, to protest, or to answer a complaint in any of the above proceedings must file in accordance with Rules 211, 214, or 206 of the Commission's Regulations (18 CFR 385.211, 385.214, or 385.206) on or before 5:00 p.m. Eastern time on the specified comment date. Protests may be considered, but intervention is necessary to become a party to the proceeding.

eFiling is encouraged. More detailed information relating to filing requirements, interventions, protests, service, and qualifying facilities filings can be found at: <http://www.ferc.gov/docs-filing/efiling/filing-req.pdf>. For other information, call (866) 208–3676 (toll free). For TTY, call (202) 502–8659.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502–6595 or OPP@ferc.gov.

Dated: May 2, 2024.

Debbie-Anne A. Reese,

Acting Secretary.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 1333–068]

Tule Hydro, LLC; Notice of Application for Non-Capacity Amendment of License Accepted for Filing, Soliciting Comments, Motions To Intervene, and Protests

Take notice that the following hydroelectric application has been filed with the Commission and is available for public inspection:

a. *Application Type:* Non-Capacity Amendment of License.

b. *Project No:* 1333–068.

c. *Date Filed:* June 5, 2023.

d. *Applicant:* Kern and Tule Hydro, LLC.

e. *Name of Project:* Tule River Hydroelectric Project.

f. *Location:* The project is located on the North Fork of the Middle Fork Tule River, Hossack Creek, and Doyle Springs in Tulare County, California. The project occupies lands of the Sequoia National Forest.

g. *Filed Pursuant to:* Federal Power Act, 16 U.S.C. 791a–825r.

h. *Applicant Contact:* Ted Sorenson, Manager, Tule Hydro, LLC, 711 Turtle Point Drive, Ivins, UT 84738, 208–589–6908.

i. *FERC Contact:* Gregory Morris, (202) 502–8116, gregory.morris@ferc.gov.

j. *Deadline for filing comments, motions to intervene, and protests:* June 3, 2024.

The Commission strongly encourages electronic filing. Please file comments, motions to intervene, and protests using the Commission's eFiling system at <http://www.ferc.gov/docs-filing/>

[efiling.asp](http://www.ferc.gov/docs-filing/ecomment.asp). Commenters can submit brief comments up to 6,000 characters, without prior registration, using the eComment system at <http://www.ferc.gov/docs-filing/ecomment.asp>. You must include your name and contact information at the end of your comments. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov, (866) 208–3676 (toll free), or (202) 502–8659 (TTY). In lieu of electronic filing, you may submit a paper copy. Submissions sent via the U.S. Postal Service must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 888 First Street NE, Room 1A, Washington, DC 20426. Submissions sent via any other carrier must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 12225 Wilkins Avenue, Rockville, Maryland 20852. The first page of any filing should include the docket number P–1333–068. Comments emailed to Commission staff are not considered part of the Commission record.

The Commission's Rules of Practice and Procedure require all intervenors filing documents with the Commission to serve a copy of that document on each person whose name appears on the official service list for the project. Further, if an intervenor files comments or documents with the Commission relating to the merits of an issue that may affect the responsibilities of a particular resource agency, they must also serve a copy of the document on that resource agency.

k. *Description of Request:* Tule Hydro, LLC proposes to: (1) designate the existing secondary 12kV interconnection, spanning from the Project's switchyard to a point of interconnection with Southern California Edison's 12kV Soda Springs distribution line, as the Project's "primary" line; (2) perform minor construction activities, including replacing a span of approximately 500 feet of 12-kV distribution line within the project boundary, replacing in-kind three existing poles, and installing three new poles, two of which are within the alignment of the existing distribution line, and one of which would be within the existing fenced switchyard needed to install the Project's new primary line; and (3) remove from the license certain lands and Project works, including the Doyle Springs 12kV line, that would no longer be needed for Project purposes.

The proposed maintenance activities would involve minimal ground disturbance on already disturbed lands.

l. *Locations of the Application:* This filing may be viewed on the

Commission's website at <http://www.ferc.gov> using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. You may also register online at <http://www.ferc.gov/docs-filing/esubscription.asp> to be notified via email of new filings and issuances related to this or other pending projects. For assistance, call 1-866-208-3676 or email FERCOnlineSupport@ferc.gov, for TTY, call (202) 502-8659. Agencies may obtain copies of the application directly from the applicant.

m. Individuals desiring to be included on the Commission's mailing list should so indicate by writing to the Secretary of the Commission.

n. *Comments, Protests, or Motions to Intervene:* Anyone may submit comments, a protest, or a motion to intervene in accordance with the requirements of Rules of Practice and Procedure, 18 CFR 385.210, .211, .214, respectively. In determining the appropriate action to take, the Commission will consider all protests or other comments filed, but only those who file a motion to intervene in accordance with the Commission's Rules may become a party to the proceeding. Any comments, protests, or motions to intervene must be received on or before the specified comment date for the particular application.

o. *Filing and Service of Documents:* Any filing must (1) bear in all capital letters the title "COMMENTS", "PROTEST", or "MOTION TO INTERVENE" as applicable; (2) set forth in the heading the name of the applicant and the project number of the application to which the filing responds; (3) furnish the name, address, and telephone number of the person commenting, protesting or intervening; and (4) otherwise comply with the requirements of 18 CFR 385.2001 through 385.2005. All comments, motions to intervene, or protests must set forth their evidentiary basis. Any filing made by an intervenor must be accompanied by proof of service on all persons listed in the service list prepared by the Commission in this proceeding, in accordance with 18 CFR 385.2010.

p. The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as

interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502-6595 or OPP@ferc.gov.

Dated: May 2, 2024.

Debbie-Anne A. Reese,
Acting Secretary.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

Combined Notice of Filings #1

Take notice that the Commission received the following exempt wholesale generator filings:

Docket Numbers: EG24-171-000.

Applicants: Yum Yum Solar LLC.

Description: Yum Yum Solar LLC submits Notice of Self-Certification of Exempt Wholesale Generator Status.

Filed Date: 4/30/24.

Accession Number: 20240430-5577.

Comment Date: 5 p.m. ET 5/21/24.

Take notice that the Commission received the following electric rate filings:

Docket Numbers: ER10-1823-005; ER10-2498-007; ER13-412-006; ER10-1410-008; ER16-1750-011; ER16-2601-009; ER17-339-002; ER17-1037-005; ER17-2292-009; ER17-2381-008; ER19-1656-008; ER20-2123-006; ER20-2768-006; ER23-666-002.

Applicants: Foxhound Solar, LLC, Greenville County Solar Project, LLC, Hardin Solar Energy LLC, Wilkinson Solar LLC, Scott-II Solar LLC, Southampton Solar, LLC, Innovative Solar 37, LLC, 96WI 8ME, LLC, Summit Farms Solar, LLC, Eastern Shore Solar LLC, Virginia Electric and Power Company, Dominion Nuclear Connecticut, Inc., South Carolina Electric & Gas Transmission, Dominion Energy Marketing, Inc.

Description: Notice of Change in Status of Dominion Energy Marketing, Inc., et al.

Filed Date: 4/30/24.

Accession Number: 20240430-5603.

Comment Date: 5 p.m. ET 5/21/24.

The filings are accessible in the Commission's eLibrary system (<https://elibrary.ferc.gov/idmws/search/fercgensearch.asp>) by querying the docket number.

Any person desiring to intervene, to protest, or to answer a complaint in any of the above proceedings must file in accordance with Rules 211, 214, or 206 of the Commission's Regulations (18 CFR 385.211, 385.214, or 385.206) on or

before 5:00 p.m. Eastern time on the specified comment date. Protests may be considered, but intervention is necessary to become a party to the proceeding.

eFiling is encouraged. More detailed information relating to filing requirements, interventions, protests, service, and qualifying facilities filings can be found at: <http://www.ferc.gov/docs-filing/efiling/filing-req.pdf>. For other information, call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502-6595 or *OPP@ferc.gov*.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. ER24-1901-000]

Yum Yum Solar LLC; Supplemental Notice That Initial Market-Based Rate Filing Includes Request for Blanket Section 204 Authorization

This is a supplemental notice in the above-referenced proceeding of Yum Yum Solar LLC's application for market-based rate authority, with an accompanying rate tariff, noting that such application includes a request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability.

Any person desiring to intervene or to protest should file with the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant.

Notice is hereby given that the deadline for filing protests with regard to the applicant's request for blanket

authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability, is May 21, 2024.

The Commission encourages electronic submission of protests and interventions in lieu of paper, using the FERC Online links at <http://www.ferc.gov>. To facilitate electronic service, persons with internet access who will eFile a document and/or be listed as a contact for an intervenor must create and validate an eRegistration account using the eRegistration link. Select the eFiling link to log on and submit the intervention or protests.

Persons unable to file electronically may mail similar pleadings to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426. Hand delivered submissions in docketed proceedings should be delivered to Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502-6595 or *OPP@ferc.gov*.

Dated: May 1, 2024.

Comment Date: 5 p.m. ET 5/22/24.
 The filings are accessible in the Commission's eLibrary system (<https://elibrary.ferc.gov/idmws/search/fercensearch.asp>) by querying the docket number.

Any person desiring to intervene, to protest, or to answer a complaint in any of the above proceedings must file in accordance with Rules 211, 214, or 206 of the Commission's Regulations (18 CFR 385.211, 385.214, or 385.206) on or before 5:00 p.m. Eastern time on the specified comment date. Protests may be considered, but intervention is necessary to become a party to the proceeding.

eFiling is encouraged. More detailed information relating to filing requirements, interventions, protests, service, and qualifying facilities filings can be found at: <http://www.ferc.gov/docs-filing/efiling/filing-req.pdf>. For other information, call (866) 208–3676 (toll free). For TTY, call (202) 502–8659.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502–6595 or OPP@ferc.gov.

Dated: May 1, 2024.

Debbie-Anne A. Reese,
Acting Secretary.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. ER24–1863–000]

BCD 2024 Fund 3 Lessee, LLC; Supplemental Notice That Initial Market-Based Rate Filing Includes Request for Blanket Section 204 Authorization

This is a supplemental notice in the above-referenced proceeding of BCD 2024 Fund 3 Lessee, LLC's application for market-based rate authority, with an accompanying rate tariff, noting that such application includes a request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability.

Any person desiring to intervene or to protest should file with the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice

and Procedure (18 CFR 385.211 and 385.214). Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant.

Notice is hereby given that the deadline for filing protests with regard to the applicant's request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability, is May 21, 2024.

The Commission encourages electronic submission of protests and interventions in lieu of paper, using the FERC Online links at <http://www.ferc.gov>. To facilitate electronic service, persons with internet access who will eFile a document and/or be listed as a contact for an intervenor must create and validate an eRegistration account using the eRegistration link. Select the eFiling link to log on and submit the intervention or protests.

Persons unable to file electronically may mail similar pleadings to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426. Hand delivered submissions in docketed proceedings should be delivered to Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502-6595 or OPP@ferc.gov.

Dated: May 1, 2024.

Combined Notice of Filings

Take notice that the Commission has received the following Natural Gas Pipeline Rate and Refund Report filings:

Filings Instituting Proceedings

Docket Numbers: PR24-68-000.
Applicants: TC Louisiana Intrastate Pipeline LLC.
Description: § 284.123 Rate Filing: TC Louisiana Intrastate Pipeline LLC Petition for Rate Approval and SOC Baseline to be effective 5/1/2024.
Filed Date: 5/1/24.
Accession Number: 20240501-5303.
Comment Date: 5 p.m. ET 5/22/24.
Docket Numbers: RP24-738-000.
Applicants: Portland Natural Gas Transmission System.

Description: § 4(d) Rate Filing: Revised Fuel Allocation for PXP and WXP to be effective 6/1/2024.

Filed Date: 5/1/24.

Accession Number: 20240501-5213.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24-739-000.

Applicants: Rover Pipeline LLC.

Description: § 4(d) Rate Filing:

Summary of Negotiated Rate Capacity Release Agreements 5-1-2024 to be effective 5/1/2024.

Filed Date: 5/1/24.

Accession Number: 20240501-5228.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24-740-000.

Applicants: ANR Pipeline Company.

Description: Compliance filing: 2024 Operational Purchases and Sales Report to be effective N/A.

Filed Date: 5/1/24.

Accession Number: 20240501-5229.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24-741-000.

Applicants: El Paso Natural Gas

Docket Numbers: RP24–749–000.
Applicants: Gulf Run Transmission, LLC.

Description: § 4(d) Rate Filing: Transporter's Use Filing—Effective 6–1–2024 to be effective 6/1/2024.

Filed Date: 5/1/24.

Accession Number: 20240501–5397.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24–750–000.
Applicants: Double E Pipeline, LLC.

Description: Annual System Balancing Adjustment of Double E Pipeline, LLC.

Filed Date: 5/1/24.

Accession Number: 20240501–5447.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24–751–000.
Applicants: BBT Midla, LLC.
Description: Annual Unaccounted for Gas Retention Percentage of BBT Midla, LLC.

Filed Date: 5/1/24.

Accession Number: 20240501–5450.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24–752–000.
Applicants: Ozark Gas Transmission, L.L.C.

Description: Annual Fuel Filing of Ozark Gas Transmission, L.L.C.

Filed Date: 5/1/24.

Accession Number: 20240501–5453.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24–753–000.
Applicants: PDC Permian, Inc., Chevron U.S.A. Inc.

Description: Joint Petition for Temporary Waiver of Capacity Release Regulations, et al. of PDC Permian, Inc., et al.

Filed Date: 5/1/24.

Accession Number: 20240501–5487.

Comment Date: 5 p.m. ET 5/13/24.

Docket Numbers: RP24–754–000.

Applicants: Equitrans, L.P.

Description: § 4(d) Rate Filing: Formula Based Negotiated Rate Agreement—6/19/2024 to be effective 6/19/2024.

Filed Date: 5/2/24.

Accession Number: 20240502–5039.

Comment Date: 5 p.m. ET 5/14/24.

Docket Numbers: RP24–755–000.
Applicants: Dauphin Island Gathering Partners.

Description: § 4(d) Rate Filing: Chevron—Negotiated Rate effective 5–1–24 to be effective 5/1/2024.

Filed Date: 5/2/24.

Accession Number: 20240502–5082.

Comment Date: 5 p.m. ET 5/14/24.

Any person desiring to intervene, to protest, or to answer a complaint in any of the above proceedings must file in accordance with Rules 211, 214, or 206 of the Commission's Regulations (18 CFR 385.211, 385.214, or 385.206) on or before 5:00 p.m. Eastern time on the specified comment date. Protests may be considered, but intervention is necessary to become a party to the proceeding.

Filings in Existing Proceedings

Docket Numbers: RP24–744–001.

Applicants: Southern Natural Gas Company, L.L.C.

Description: Tariff Amendment: Amendment RP24–744 SNG Rate Case—2024 to be effective 6/1/2024.

Filed Date: 5/2/24.

Accession Number: 20240502–5112.

Comment Date: 5 p.m. ET 5/14/24.

Any person desiring to protest in any the above proceedings must file in accordance with Rule 211 of the Commission's Regulations (18 CFR 385.211) on or before 5:00 p.m. Eastern time on the specified comment date.

The filings are accessible in the Commission's eLibrary system (<https://elibrary.ferc.gov/idmws/search/fercgensearch.asp>) by querying the docket number.

eFiling is encouraged. More detailed information relating to filing requirements, interventions, protests, service, and qualifying facilities filings can be found at: <http://www.ferc.gov/docs-filing/efiling/filing-req.pdf>. For other information, call (866) 208–3676 (toll free). For TTY, call (202) 502–8659.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice

communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502–6595 or OPP@ferc.gov.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 2735–104]

Pacific Gas and Electric Company; Notice of Application Tendered for Filing With the Commission and Soliciting Additional Study Requests and Establishing Procedural Schedule for Relicensing and a Deadline for Submission of Final Amendments

Take notice that the following hydroelectric application has been filed with the Commission and is available for public inspection.

a. *Type of Application:* New Major License.

b. *Project No.:* 2735–104.

c. *Date Filed:* April 18, 2024.

d. *Applicant:* Pacific Gas and Electric Company (PG&E).

e. *Name of Project:* Helms Pumped Storage Project.

f. *Location:* About 50 miles northeast of the city of Fresno, on the North Fork Kings River and Helms Creek, in Fresno and Madera Counties, California. The project occupies 3,346.6 acres of National Forest Service land, 28.36 acres of Bureau of Reclamation land, 0.07 acre of Bureau of Land Management land.

g. *Filed Pursuant to:* Federal Power Act, 16 U.S.C. 791(a)–825(r).

h. *Applicant Contact:* Dave Gabbard, Vice President Power Generation, Pacific Gas and Electric Company, 300 Lakeside Drive, Oakland, CA 94612; telephone at (650) 207–9705; email at David.gabbard@pge.com.

i. *FERC Contact:* Evan Williams, Project Coordinator, West Branch, Division of Hydropower Licensing; telephone at (202) 502–8138; email at Evan.Williams@ferc.gov.

j. Cooperating agencies: Federal, state, local, and tribal agencies with jurisdiction and/or special expertise with respect to environmental issues

that wish to cooperate in the preparation of the environmental document should follow the instructions for filing such requests described in item l below. Cooperating agencies should note the Commission's policy that agencies that cooperate in the preparation of the environmental document cannot also intervene. *See* 94 FERC ¶ 61,076 (2001).

k. Pursuant to section 4.32(b)(7) of 18 CFR of the Commission's regulations, if any resource agency, Indian Tribe, or person believes that an additional scientific study should be conducted in order to form an adequate factual basis for a complete analysis of the application on its merit, the resource agency, Indian Tribe, or person must file a request for a study with the Commission not later than 60 days from the date of filing of the application, and serve a copy of the request on the applicant.

l. *Deadline for filing additional study requests and requests for cooperating agency status:* June 17, 2024.

The Commission strongly encourages electronic filing. Please file additional study requests and requests for cooperating agency status using the Commission's eFiling system at <https://ferconline.ferc.gov/FEROnline.aspx>. For assistance, please contact FERC Online Support at FEROnlineSupport@ferc.gov, (866) 208-3676 (toll free), or (202) 502-8659 (TTY). In lieu of electronic filing, you may submit a paper copy. Submissions sent via the U.S. Postal Service must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 888 First Street NE, Room 1A, Washington, DC 20426. Submissions sent via any other carrier must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 12225 Wilkins Avenue, Rockville, MD 20852. All filings must clearly identify the project name and docket number on the first page: Helms Pumped Storage Project (P-2735-104).

m. The application is not ready for environmental analysis at this time.

n. *Project Description:* The Helms Pumped Storage Project (project) includes: (1) a 132-foot-long, by 89-foot-wide, by 58.5-foot-high concrete intake-discharge structure (Courtright Intake-Discharge Structure), with metal trash racks, in Courtright Lake; (2) one 4,243-foot-long tunnel (Tunnel 1) composed of two sections: (a) a 3,312-foot-long, 27-foot-diameter concrete-lined section; and (b) a 931-foot-long, 22-foot-diameter steel-lined section; (3) a 32.5-foot-long, by 38-foot-wide, by 45-foot-high gatehouse; (4) a 206-foot-long, 22-foot-

diameter, above-ground steel pipe that connects Tunnel 1 and Tunnel 2; (5) one 9,016-foot-long tunnel (Tunnel 2) composed of two sections: (a) a 764-foot-long, 22-foot-diameter steel-lined section; and (b) a 8,252-foot-long, 27-foot-diameter concrete-lined section; (6) a 600-foot-long adit of an unknown diameter, with an adit plug with frame and gate; (7) a 535-foot-high, vertical shaft surge chamber for Tunnel 2 with a 47-foot-diameter lower section and 60-foot-diameter upper section, with 12 feet of the chamber exposed above grade; (8) a 2,205-foot-long penstock composed of three sections: (a) a 1,070-foot-long, 27-foot-diameter concrete-lined section; (b) a 300-foot-long, 27-foot-diameter concrete-lined section; and (c) a 330-foot-long, 27-foot-diameter concrete-lined manifold section, that branches into three, 505-foot-long steel-lined penstocks, that reduce in diameter from 15.5 feet, to 11.5 feet, to 10.5 feet until connecting to the turbine-generator; (9) a 336-foot-long, by 83-foot-wide, by 125-foot-high excavated rock chamber underground powerhouse that includes three, 360-megawatt (MW) vertical Francis-type pump-turbine units, for a total installed capacity of 1,080 MW, and three, vertical indoor generators with an approximate total nameplate capacity of 1,212 MW; (10) a 3,727-foot-long, 27-foot-diameter concrete-lined tunnel (Tunnel 3); (11) a 984-foot-tall, vertical shaft surge chamber for Tunnel 3 with a 27-foot-diameter lower section and a 44-foot-diameter upper section that transitions into a 10-foot-diameter air shaft topped by a 10-foot-tall, 14-foot-diameter protective device above grade; (12) an 88-foot-long, by 78-foot-wide, by 51-foot-high concrete intake-discharge structure (Wishon Intake-Discharge Structure), with metal trash racks, in Lake Wishon; (13) a 220-foot by- 265-foot above ground, fenced switchyard; (14) an underground transformer bank of 10 transformers with a capacity of 150,000 kilo-volt-amperes each; (15) a 3,723-foot-long, 30-foot-wide, 25-foot-high powerhouse access tunnel; and (16) appurtenant facilities.

Although the project facilities do not include any dam or reservoir, PG&E operates the project for power generation using Courtright Lake (upper reservoir) and Lake Wishon (lower reservoir), impounded by Courtright Dam and Wishon Dam, respectively, which are licensed project facilities of the Hass-Kings River Hydroelectric Project (Project No. P-1988). Courtright Lake has a usable storage area of approximately 123,184 acre-feet and normal maximum and minimum water

surface elevations of 8,184 feet and 8,050 feet, respectively. Lake Wishon has a usable storage area of approximately 128,606 acre-feet and normal maximum and minimum water surface elevations of 6,550 feet and 6,428.9 feet, respectively. To generate power, water is released from Courtright Lake through the Courtright Intake-Discharge Structure, Tunnel 1, Tunnel 2, and the penstock, into the powerhouse and is discharged through Tunnel 3 and the Wishon Intake-Discharge Structure into Lake Wishon. During periods of low energy demand, water is pumped through these project facilities in reverse (*i.e.*, from Lake Wishon to Courtright Lake).

The project generators are connected to the regional electric grid by: (1) an underground transformer bank of 10 transformers with a capacity of 150,000 kilo-volt-amperes each; (2) a 220-foot by- 265-foot above ground, fenced switchyard; and (3) a 60.7-mile-long, double-circuit 230-kilovolt (kV) transmission line that connects the Helms switchyard to PG&E's interconnection point with the grid at the non-project Gregg Substation. The project also includes an approximately 1.8-mile-long, 21-kV distribution line from the non-project Woodchuck Substation to the Helms Headquarters and Helms Powerhouse and an approximately 2-mile-long, 21-kV distribution line from the non-project Woodchuck Substation to the Helms Support Facility and non-project Wishon Village Recreational Vehicle Park.

The project also includes: (1) the Helms Headquarters facility with ancillary facilities; (2) the Helms Support Facility with ancillary facilities; (3) project recreation facilities including the: (a) Courtright Boat Launch; (b) Trapper Springs Campground; (c) Marmot Rock Campground; (d) Wee-Mee-Kute Fishing Access; (e) Wishon Boat Launch; (f) Lily Pad Campground; (g) Upper Kings River Group Campground; (h) Wishon Dam Fishing Access; (i) Short Hair Creek Fishing Access; (j) Coolidge Meadow Fishing Access; (k) Helms Picnic Area; (l) Upper Kings River Fishing Access, and their ancillary facilities and amenities; (3) an approximately 80-acre Wildlife Habitat Management Area; (4) three, approximately 87-foot-diameter asphalt-surfaced helicopter landing pads; (5) 36.45 miles of non-recreation, vehicular project roads and trails; and (6) 1.08 miles of non-recreation, pedestrian project trails.

In generating mode, each pump-turbine unit has a rated capacity of 3,400 cubic feet per second (cfs), at the

design head of 1,625 feet. The maximum hydraulic capacity of the powerhouse in generating mode when all three units are operating at or near full load is 10,500 cfs. In pumping mode, each pump-turbine has a rated capacity of 2,400 cfs at a design head of 1,500 feet, with a total maximum capacity of 7,350 cfs and 7,530 cfs. The average annual energy production of the project from 2015 through 2020 was 736.6 gigawatt-hours.

The current license requires PG&E to maintain water levels as high as possible, to the extent consistent with efficient project operation, in Courtright Lake on weekends during the recreation season for the benefit of recreational use at the lake, and to coordinate operational use of Courtright Lake and Lake Wishon with its Haas-Kings River Hydroelectric Project No. 1988 (Haas-Kings River Project). PG&E currently maintains the surface elevation of the impoundment between 363.5 feet and 364.0 feet BCD, with a normal impoundment elevation of 363.8 feet BCD. PG&E currently coordinates operation of the project with its Haas-Kings River Hydroelectric Project No. 1988 and Balch Hydroelectric Project No. 175.

PG&E proposes to continue operating the project in a manner that is consistent with current operation. Additionally, PG&E proposes the following plans and measures to protect and enhance environmental resources: (1) Recreation Management Plan; (2) Coordination Between P-2735 and P-1988; (3) Biological Resources Management Plan; (4) Hazardous Substance Plan; (5) Ownership of P-2735 and/or P-1988; (6) Visual Resources Management; (7) Fire Management and Response Plan; (8) Transportation System Management; (9) Historic Properties Management Plan; and (10) Supplemental Fish Stocking.

PG&E proposes to modify the existing project boundary to encompass all facilities necessary for operation and maintenance of the project. Conversely, PG&E proposes to modify the boundary to remove lands and facilities from the existing project boundary that are not necessary for operation and maintenance of the project. PG&E proposes to modify the project boundary around the Haas-Kings River Project's Courtright Lake and Lake Wishon to remove land from the boundary around the reservoirs that is not required for project operations and maintenance. PG&E also proposes to modify the project boundary around: Trapper Springs Campground; Marmot Rock Water Pipe Access Road; Lost Canyon Pipe; Lost Canyon Crossing Road; Helms

Switchyard; Haas 21-kV distribution line #1; Helms Headquarters, including water tank and water tank access road; Lily Pad Campground; and numerous project access roads and trails. With these proposed changes, the area of PG&E-owned land within the project boundary will decrease to 807.74 acres, and federal lands will decrease to 2,918.42 acres. The area of private lands encompassed by the project boundary will increase to 583.1 acres.

o. In addition to publishing the full text of this notice in the **Federal Register**, the Commission provides all interested persons an opportunity to view and/or print the contents of this notice, as well as other documents in the proceeding (e.g., license application) via the internet through the Commission's Home Page (<http://www.ferc.gov>) using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document (P-4113). For assistance, contact FERC at FERCOnlineSupport@ferc.gov, (866) 208-3676 (toll free), or (202) 502-8659 (TTY).

You may also register online at <https://ferconline.ferc.gov/FERConline.aspx> to be notified via email of new filings and issuances related to this or other pending projects. For assistance, contact FERC Online Support.

p. The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202)502-6595 or OPP@ferc.gov.

q. *Procedural Schedule*: The application will be processed according to the following preliminary schedule. Revisions to the schedule will be made as appropriate.

Issue Deficiency Letter and Request Additional Information—June 2024
Issue Scoping Document 1 for comments—August 2024
Request Additional Information (if necessary)—September 2024
Issue Acceptance Letter—September 2024
Issue Scoping Document 2 (if necessary)—November 2024
Issue Notice of Ready for Environmental Analysis—November 2024
r. Final amendments to the application must be filed with the

Commission no later than 30 days from the issuance date of the notice of ready for environmental analysis.

Dated: May 2, 2024.

Debbie-Anne A. Reese,
Acting Secretary.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 2300-052]

Great Lakes Hydro America, LLC; Notice of Availability of Draft Environmental Assessment

In accordance with the National Environmental Policy Act of 1969 and the Federal Energy Regulatory Commission's (Commission) regulations, 18 CFR part 380, the Office of Energy Projects has reviewed the application for license for the Shelburne Hydroelectric Project, located on the Androscoggin River in Coos County, New Hampshire and has prepared a Draft Environmental Assessment (DEA) for the project. No Federal land is occupied by project works or located within the project boundary.

The DEA contains staff's analysis of the potential environmental impacts of the project and concludes that licensing the project, with appropriate environmental protective measures, would not constitute a major federal action that would significantly affect the quality of the human environment.

The Commission provides all interested persons with an opportunity to view and/or print the DEA via the internet through the Commission's Home Page (<http://www.ferc.gov/>), using the "eLibrary" link. Enter the docket number, excluding the last three digits in the docket number field, to access the document. For assistance, contact FERC Online Support at FERCOnlineSupport@ferc.gov, or toll-free at (866) 208-3676, or for TTY, (202) 502-8659.

You may also register online at <https://ferconline.ferc.gov/eSubscription.aspx> to be notified via email of new filings and issuances related to this or other pending projects. For assistance, contact FERC Online Support.

Any comments should be filed within 30 days from the date of this notice.

The Commission strongly encourages electronic filing. Please file comments using the Commission's eFiling system at <https://ferconline.ferc.gov/>

FERCOnline.aspx. Commenters can submit brief comments up to 6,000 characters, without prior registration, using the eComment system at <https://ferconline.ferc.gov/> *QuickComment.aspx*. For assistance, please contact FERC Online Support. In lieu of electronic filing, you may submit a paper copy. Submissions sent via the U.S. Postal Service must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 888 First Street NE, Room 1A, Washington, DC 20426. Submissions sent via any other carrier must be addressed to: Kimberly D. Bose, Secretary, Federal Energy Regulatory Commission, 12225 Wilkins Avenue, Rockville, Maryland 20852. The first page of any filing should include docket number P-2300-052.

Any questions regarding this notice may be directed to Ryan Hansen at (202) 502-8074 or ryan.hansen@ferc.gov.

Dated: May 1, 2024.

Debbie-Anne A. Reese,
Acting Secretary.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. ER24-1862-000]

Kimmel Road Solar, LLC; Supplemental Notice That Initial Market-Based Rate Filing Includes Request for Blanket Section 204 Authorization

This is a supplemental notice in the above-referenced proceeding of Kimmel Road Solar, LLC's application for market-based rate authority, with an accompanying rate tariff, noting that such application includes a request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability.

Any person desiring to intervene or to protest should file with the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant.

Notice is hereby given that the deadline for filing protests with regard to the applicant's request for blanket authorization, under 18 CFR part 34, of future issuances of securities and

assumptions of liability, is May 21, 2024.

The Commission encourages electronic submission of protests and interventions in lieu of paper, using the FERC Online links at <http://www.ferc.gov>. To facilitate electronic service, persons with internet access who will eFile a document and/or be listed as a contact for an intervenor must create and validate an eRegistration account using the eRegistration link. Select the eFiling link to log on and submit the intervention or protests.

Persons unable to file electronically may mail similar pleadings to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426. Hand delivered submissions in docketed proceedings should be delivered to Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202) 502-6595 or OPP@ferc.gov.

Dated: May 1, 2024.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 175-032]

Pacific Gas and Electric Company; Notice of Application Tendered for Filing With the Commission and Soliciting Additional Study Requests and Establishing Procedural Schedule for Relicensing and a Deadline for Submission of Final Amendments

Take notice that the following hydroelectric application has been filed with the Commission and is available for public inspection.

a. *Type of Application:* New Major License.

b. *Project No.:* 175-032.

c. *Date Filed:* April 18, 2024.

d. *Applicant:* Pacific Gas and Electric Company (PG&E).

e. *Name of Project:* Balch Hydroelectric Project.

f. *Location:* On the North Fork Kings River in Fresno County, California. The project occupies 506.28 acres of Federal land managed by the U.S. Forest Service.

g. *Filed Pursuant to:* Federal Power Act, 16 U.S.C. 791(a)-825(r).

h. *Applicant Contact:* Dave Gabbard, Vice President, Power Generation, Pacific Gas and Electric Company, 300 Lakeside Drive, Oakland, California 94612; telephone at (620) 207-9705; email at david.gabbard@pge.com.

i. *FERC Contact:* Benjamin Mann, Project Coordinator, West Branch, Division of Hydropower Licensing; telephone at (202) 502-8127; email at benjamin.mann@ferc.gov.

j. *Cooperating agencies:* Federal, State, local, and Tribal agencies with jurisdiction and/or special expertise with respect to environmental issues that wish to cooperate in the preparation of the environmental document should follow the instructions for filing such requests described in item l below. Cooperating agencies should note the Commission's policy that agencies that cooperate in the preparation of the environmental document cannot also intervene. See 94 FERC ¶ 61,076 (2001).

k. Pursuant to section 4.32(b)(7) of 18 CFR of the Commission's regulations, if any resource agency, Indian Tribe, or person believes that an additional scientific study should be conducted in order to form an adequate factual basis for a complete analysis of the application on its merit, the resource agency, Indian Tribe, or person must file a request for a study with the Commission not later than 60 days from the date of filing of the application, and serve a copy of the request on the applicant.

l. *Deadline for filing additional study requests and requests for cooperating agency status:* June 17, 2024.

The Commission strongly encourages electronic filing. Please file additional study requests and requests for cooperating agency status using the Commission's eFiling system at <https://ferconline.ferc.gov/ferconline.aspx>. For assistance, please contact FERC Online Support at FERCOnlineSupport@ferc.gov, (866) 208-3676 (toll free), or (202) 502-8659 (TTY). In lieu of electronic filing, you may submit a paper copy. Submissions sent via the U.S. Postal Service must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 888 First Street

NE, Room 1A, Washington, DC 20426. Submissions sent via any other carrier must be addressed to: Debbie-Anne A. Reese, Acting Secretary, Federal Energy Regulatory Commission, 12225 Wilkins Avenue, Rockville, MD 20852. All filings must clearly identify the project name and docket number on the first page: Balch Hydroelectric Project (P-175-032).

m. The application is not ready for environmental analysis at this time.

n. *Project Description:* The Balch Hydroelectric Project (project) consists of the following facilities: (1) a 135-foot-high, 396-foot-long diversion dam with a crest elevation of 4,098 feet that includes a 364-foot-long spillway and is located on the North Fork Kings River 9.9 miles upstream of the confluence with Kings River; (2) the 35-acre Black Rock Reservoir with a usable storage capacity of 1,260 acre-feet at a normal water surface elevation of 4,097 feet; (3) an 11-foot-high, concrete tunnel intake; (4) a water conveyance system consisting of: (a) a 19,336-foot-long tunnel with a maximum hydraulic capacity of 760 cubic feet per second (cfs) that includes the 308-foot-long Black Rock Adit, the 350-foot-long Weir Creek Adit, an unlined surge chamber, and two sluice channels; (5) a 4,905.6-foot-long penstock leading to the Balch No. 1 Powerhouse and a 4,933.3-foot-long penstock leading to the Balch No. 2 Powerhouse; (6) the 65.5-foot-long, 80.5-foot-wide Balch No. 1 Powerhouse housing one turbine-generator unit with an authorized installed capacity of 31.02 megawatts (MW) and a maximum hydraulic capacity of 213 cfs; (7) the 149-foot-long, 84-foot-wide Balch No. 2 Powerhouse housing two turbine-generator units with a total authorized installed capacity of 105 MW and a maximum hydraulic capacity of 315 cfs; (8) a 165-foot-high, 238-foot-long afterbay dam with a crest elevation of 1,704 feet that includes a 238-foot-long spillway; (9) a 7-acre afterbay with a usable storage capacity of 135 acre-feet; (10) project roads and trails; (11) recreation facilities; (12) a 22-mile-long, 115-kilovolt (kV) transmission line connecting the project with the grid at Piedra Junction; (13) the 76-acre Balch Camp, which is the project operating headquarters and includes personnel housing; (14) a 6.2-mile-line, 12-kV distribution line connecting Balch Camp with the project's diversion dam; and (15) appurtenant facilities.

The Balch Project is located downstream of PG&E's Haas-Kings River Hydroelectric Project No. 1988 and Helms Pumped Storage Project No. 2735, which use the same reservoirs (Courtright Lake and Lake Wilshon) for

operation. The project is operated as a peaking facility to generate power that is released from upstream storage to meet power demand and for irrigation purposes. Project operation is coordinated with Project No. 1988, whose releases from Lake Wilshon largely control inflow to Black Rock Reservoir; however, spill fluctuations at the project are possible at times when inflow exceeds powerhouse capacity and during powerhouse outages.

The current license requires PG&E to maintain the following continuous minimum flows in the North Kings River: (1) during normal water years: (a) from June 1 through November 31, 5 cfs from Black Rock Reservoir, 15 cfs from Balch Afterbay, and 30 cfs of total river flow; and (b) from December 1 through May 31, 2.5 cfs from Black Rock Reservoir, 10 cfs from Balch Afterbay, and 30 cfs of total river flow; (2) during dry water years, as defined by the California Department of Water Resources, year-round flows of 2.5 cfs from Black Rock Reservoir, 10 cfs from Balch Afterbay, and 20 cfs of total river flow.

PG&E proposes to continue operating the project in a manner that is consistent with current operation, with the exception of the following new proposed measures: (1) minimum flows and water year types, (2) a recreation plan, (3) a biological resources management plan, (4) a historic properties management plan, (5) low-level operations, (6) flood period operations, (7) a hazardous substance plan, (8) a gaging plan, (9) visual resources management, (10) a fire management and response plan, and (11) a transportation system management plan.

o. In addition to publishing the full text of this notice in the **Federal Register**, the Commission provides all interested persons an opportunity to view and/or print the contents of this notice, as well as other documents in the proceeding (e.g., license application) via the internet through the Commission's Home Page (<http://www.ferc.gov>) using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document (P-175). For assistance, contact FERC at FERCOnlineSupport@ferc.gov, (866) 208-3676 (toll free), or (202) 502-8659 (TTY).

You may also register online at <https://ferconline.ferc.gov/FERCOnline.aspx> to be notified via email of new filings and issuances related to this or other pending projects. For assistance, contact FERC Online Support.

p. The Commission's Office of Public Participation (OPP) supports meaningful public engagement and participation in Commission proceedings. OPP can help members of the public, including landowners, environmental justice communities, Tribal members and others, access publicly available information and navigate Commission processes. For public inquiries and assistance with making filings such as interventions, comments, or requests for rehearing, the public is encouraged to contact OPP at (202)502-6595 or OPP@ferc.gov.

q. *Procedural Schedule:* The application will be processed according to the following preliminary schedule. Revisions to the schedule will be made as appropriate.

Issue Deficiency Letter and Request Additional Information—June 2024
Issue Scoping Document 1 for comments—August 2024
Request Additional Information (if necessary)—September 2024
Issue Acceptance Letter—November 2024
Issue Scoping Document 2 (if necessary)—November 2024
Issue Notice of Ready for Environmental Analysis—November 2024

r. Final amendments to the application must be filed with the Commission no later than 30 days from the issuance date of the notice of ready for environmental analysis.

Dated: May 2, 2024.

Debbie-Anne A. Reese,
Acting Secretary.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Project No. 3063-029]

Blackstone Hydro Associates; Notice of Effectiveness of Withdrawal of Operations Compliance Monitoring Plan

On August 4, 2023 and supplemented on August 21, 2023, Blackstone Hydro Associates (licensee), filed an Operation Compliance Monitoring Plan for the Central Falls Hydroelectric Project No. 3063. On April 9, 2024, the licensee filed a request to withdraw its Operation Compliance Monitoring Plan.

No motion in opposition to the request for withdrawal has been filed, and the Commission has taken no action to disallow the withdrawal. Pursuant to Rule 216(b) of the Commission's Rules

of Practice and Procedure,¹ the withdrawal of the application became effective on April 24, 2024, and this proceeding is hereby terminated.

Dated: May 2, 2024.

BILLING CODE 6717–01–P

ENVIRONMENTAL PROTECTION AGENCY

[FRL–11925–01–R6]

Clean Air Act Operating Permit Program; Petition for Objection to State Operating Permit for Oxbow Calcining LLC, Jefferson County, Texas

AGENCY: Environmental Protection
Agency (EPA).

ACTION: Notice of final order on petition.

SUMMARY: The Environmental Protection
Agency (EPA) Administrator signed an
Order dated April 12, 2024, denying a
petition dated August 8, 2023, from the
Port Arthur Community Action Network
and Environmental Integrity Project (the
Petitioners). The petition requested that
the EPA object to a Clean Air Act (CAA)
title V operating permit issued by the
Texas Commission on Environmental

Quality (TCEQ) to Oxbow Calcining
located in Jefferson County, Texas.

FOR FURTHER INFORMATION CONTACT:

Jonathan Ehrhart, EPA Region 6 Office,
Air Permits Section, (214) 665–2295,
ehrhart.jonathan@epa.gov. The final
order and petition are available
electronically at: <https://www.epa.gov/title-v-operating-permits/title-v-petition-database>.

SUPPLEMENTARY INFORMATION: The EPA
received a petition from the Port Arthur
Community Action Network and
Environmental Integrity Project dated
August 8, 2023, requesting that the EPA
object to the issuance of operating
permit no. O1493, issued by TCEQ to
Oxbow Calcining in Jefferson County,
Texas. On April 12, 2024, the EPA
Administrator issued an order denying
the petition. The order itself explains
the basis for the EPA's decision.

Sections 307(b) and 505(b)(2) of the
CAA provide that a petitioner may
request judicial review of those portions
of an order that deny issues in a
petition. Any petition for review shall
be filed in the United States Court of
Appeals for the appropriate circuit no
later than July 8, 2024.

Dated: May 2, 2024.

David Garcia,

*Director, Air and Radiation Division, Region
6.*

01–OCSPP]

Agency Information Collection Activities; Proposed Renewal of an Existing ICR Collection and Request for Comment; EPA's Safer Choice Program Product and Partner Recognition Activities (Consolidation)

AGENCY: Environmental Protection
Agency (EPA).

ACTION: Notice.

SUMMARY: In compliance with the
Paperwork Reduction Act (PRA), this
document announces the availability of
and solicits public comment on the
following Information Collection
Request (ICR) that EPA is planning to
submit to the Office of Management and
Budget (OMB): “EPA's Safer Choice
Program Product and Partner
Recognition Activities (Consolidation),”
identified by EPA ICR No. 2692.02 and
OMB Control No. 2070–0221. This ICR
represents a renewal of an existing ICR
that is currently approved through May

31, 2025. Before submitting the ICR to OMB for review and approval under the PRA, EPA is soliciting comments on specific aspects of the information collection that is summarized in this document. The ICR and accompanying material are available in the docket for public review and comment.

DATES: Comments must be received on or before July 8, 2024.

ADDRESSES: Submit your comments, identified by docket identification (ID) number EPA–HQ–OPPT–2021–0245, through the Federal eRulemaking Portal at <https://www.regulations.gov>. Follow the online instructions for submitting comments. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Additional instructions on commenting or visiting the docket, along with more information about dockets generally, is available at <https://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT: Katherine Sleasman, Mission Support Division (7602M), Office of Program Support, Office of Chemical Safety and Pollution Prevention, Environmental Protection Agency, 1200 Pennsylvania Ave., NW, Washington, DC 20460–0001; telephone number: (202) 566–1204; email address: sleasman.katherine@epa.gov.

SUPPLEMENTARY INFORMATION:

I. What information is EPA particularly interested in?

Pursuant to PRA section 3506(c)(2)(A) (44 U.S.C. 3506(c)(2)(A)), EPA specifically solicits comments and information to enable it to:

1. Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information will have practical utility.
2. Evaluate the accuracy of the Agency's estimates of the burden of the proposed collection of information, including the validity of the methodology and assumptions used.
3. Enhance the quality, utility, and clarity of the information to be collected.
4. Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.*, permitting electronic submission of responses. In particular, EPA is requesting comments from very small businesses (those that employ less than 25) on examples of

specific additional efforts that EPA could make to reduce the paperwork burden for very small businesses affected by this collection.

II. What information collection activity or ICR does this action apply to?

Title: EPA's Safer Choice Program Product and Partner Recognition Activities (Consolidation).

EPA ICR No.: 2692.02.

OMB Control No.: 2070–0221.

ICR status: This ICR is currently approved through May 31, 2025. Under the PRA, an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information, unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in title 40 of the Code of Federal Regulations (CFR), after appearing in the **Federal Register** when approved, are displayed either by publication in the **Federal Register** or by other appropriate means, such as on the related collection instrument or form, if applicable. The display of OMB control numbers for certain EPA regulations is consolidated in 40 CFR 9.

Abstract: This ICR renewal covers the information collection activities associated with the reporting and recordkeeping requirements for individuals, businesses, organizations, and government entities participating in or collaborating with EPA's Safer Choice and Design for the Environment (DfE) programs (referred to collectively as "the Safer Choice program" in this document unless otherwise indicated). This ICR also includes additional sections for the Safer Choice cleaning service certification and third-party profiler (TPP) solicitations. These components are designed to:

- Improve data efficiency by electronic data collection via a cloud-based Salesforce system called the Safer Choice Community;
- Monitor the public's awareness of the Safer Choice program and the Safer Choice label and DfE logo;
- Clarify the Safer Choice Partner of the Year Awards application process and form;
- Describe information collected through the new Safer Choice cleaning service certification program; and,
- Clarify the TPP application process and form.

Burden statement: The annual public reporting and recordkeeping burden for this collection of information is estimated to average of 17 to 58 hours per response. Burden is defined in 5 CFR 1320.3(b).

The ICR, which is available in the docket along with other related

materials, provides a detailed explanation of the collection activities and the burden estimate that is only briefly summarized here:

Respondents/affected entities: Entities potentially affected are those that involve a wide range of sectors that participation in the Safer Choice Program including chemical manufactures, paint and coating manufacturing, merchant wholesalers, janitorial services, and environmental consulting firms. The ICR includes a list of potentially affected entities with North American Industrial Classification System (NAICS) codes provided to assist in determining potential applicability.

Respondent's obligation to respond: Voluntary.

EPA Form Numbers: 9600–017, 9600–018, 9600–019, 9600–020, 9600–021, 9600–022, 9600–023, 9600–058, 9600–059, 9600–60, 9600–061.

Frequency of response: On occasion.

Total estimated number of potential respondents: 4,539.

Total estimated average number of responses for each respondent: 1.

Total estimated annual burden hours: 4,511 hours.

Total estimated annual respondent costs: \$854,358, which includes an estimated cost of \$0 for capital investment or maintenance and operational costs.

III. Are there changes in the estimates from the last approval?

There is an increase of 1,279 hours in the total estimated respondent burden compared with that identified in the ICR currently approved by OMB. This change reflects increase in annual consumer online surveys, which increased from 2,000 to 4,000 annually, the inclusion of a new program, the "Safer Choice Cleaning Service Certification," and the inclusion of the TPP solicitation process. These changes qualify as a program change.

IV. What is the next step in the process for this ICR?

EPA will consider the comments received and amend the ICR as appropriate. The final ICR package will then be submitted to OMB for review and approval pursuant to 5 CFR 1320.12. EPA will issue another **Federal Register** document pursuant to 5 CFR 1320.5(a)(1)(iv) to announce the submission of the ICR to OMB and the opportunity to submit additional comments to OMB. If you have any questions about this ICR or the approval process, please contact the person listed under **FOR FURTHER INFORMATION CONTACT**.

Authority: 44 U.S.C. 3501 *et seq.*

Dated: May 2, 2024.

Michal Freedhoff,

Assistant Administrator, Office of Chemical Safety and Pollution Prevention.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

[EPA–R02–OAR–2023–0522; FRL 11887–01–R2]

Issuance of Outer Continental Shelf Air Permit for Empire Offshore Wind, LLC; Notice of Final Action

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of final action.

SUMMARY: This notice announces that the EPA issued a final Outer Continental Shelf (OCS) air permit decision under section 328 of the Clean Air Act (CAA) and the implementing Outer Continental Shelf (OCS) air regulations of the Code of Federal Regulations (CFR) for Empire Offshore Wind, LLC to construct and operate an offshore wind farm. This final permit is for the construction and operation of the Empire Wind Project, an offshore wind farm located on the OCS within Renewable Energy Lease Area OCS–A 0512 about 12 nautical miles south of Long Island, New York, and 17 nautical miles east of Long Branch, New Jersey.

DATES: The EPA issued OCS air permit No. OCS–EPA–R2 NY 01 to Empire Offshore Wind, LLC on February 15, 2024. The permit became effective on March 16, 2024.

FOR FURTHER INFORMATION CONTACT: Viorica Petriman, Environmental Engineer, Air and Radiation Division, EPA, Region 2, at (212) 637–4021 or at petriman.viorica@epa.gov.

SUPPLEMENTARY INFORMATION: Throughout this document whenever “we”, “us”, or “our” is used, we mean EPA. This **SUPPLEMENTARY INFORMATION** section is arranged as follows:

I. How can I get copies of this document and other related information?

Docket. The EPA has established a docket for this action under Docket ID Number EPA–R02–OAR–2023–0522. Publicly available docket materials, including the final OCS air permit, the EPA’s response to comments and all additional related information, are available electronically in the docket at <https://www.regulations.gov>.

II. Background

On December 1, 2023, the EPA Region 2 proposed a draft OCS air permit (draft permit) to Empire Offshore Wind, LLC, to construct and operate an offshore wind farm on Renewable Energy Lease Area OCS–A 0512 and requested public comment on the draft permit. During the public comment period, which ended on January 5, 2024, we received only one comment letter, from Empire Offshore Wind, LLC. The letter’s comments addressed only very specific permit conditions and did not raise any substantial questions. The EPA carefully reviewed the comments from Empire Offshore Wind, LLC and made only minor revisions and/or updates to a limited number of the draft permit conditions, and on February 15, 2024, issued the final OCS air permit in accordance with 40 CFR part 55. The EPA provided to the commenter and all attendees at the January 3, 2024 public hearing, among others, notice of this final permit issuance and information regarding the opportunity to appeal the final OCS air permit administratively by filing a petition with the Environmental Appeals Board (EAB) within thirty (30) days of the EPA’s notice of the final permit decision, consistent with 40 CFR 124.19.

40 CFR 124.19(l)(3)(ii) requires that the EPA provide notice in the **Federal Register** of any final agency action regarding OCS Air Permits issued pursuant to 40 CFR part 55.

Section 307(b)(1) of the CAA provides for judicial review of the final agency action within sixty (60) days from the date on which notice of the action appears in the **Federal Register**. A petition to the EAB for administrative review is a prerequisite to seeking judicial review. 40 CFR 124.19(l). Since no such petitions for administrative review were submitted for the Empire Offshore Wind final OCS air permit, no judicial review for this final OCS air permit may be sought. Under section 307(b)(2) of the CAA, this determination to issue a final OCS air permit shall not be subject to later judicial review in civil or criminal proceedings for enforcement.

III. Effect of This Action

Since changes were made from draft to the final permit, but no petition for review was filed with the EAB, the final OCS air permit became effective on March 16, 2024, consistent with 40 CFR 124.15(b). This final OCS air permit will expire as provided within its permit conditions.

Authority: 42 U.S.C. 7401 *et seq.*

Lisa Garcia,

Regional Administrator, Region 2.

BILLING CODE 6560–50–P

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060–0355; FR ID 218494]

Information Collection Being Reviewed by the Federal Communications Commission Under Delegated Authority

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995, the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission’s burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the PRA that does not display a valid Office of Management and Budget (OMB) control number.

DATES: Written PRA comments should be submitted on or before July 8, 2024. If you anticipate that you will be submitting comments, but find it difficult to do so within the period of time allowed by this notice, you should advise the contact listed below as soon as possible.

ADDRESSES: Direct all PRA comments to Nicole Ongele, FCC, via email PRA@fcc.gov and to nicole.ongele@fcc.gov.

FOR FURTHER INFORMATION CONTACT: For additional information about the information collection, contact Nicole Ongele, (202) 418-2991.

SUPPLEMENTARY INFORMATION:

OMB Control Number: 3060-0355.

Title: Rate-of-Return Reports.

Form Numbers: FCC Form 492.

Type of Review: Extension of a currently approved collection.

Respondents: Business or other for-profit entities.

Number of Respondents and Responses: 35 respondents; 35 responses.

Estimated Time per Response: 10 hours.

Frequency of Response: Annual reporting requirement and recordkeeping requirement.

Obligation to Respond: Required to obtain or retain benefits. Statutory authority for this information collection is contained in 47 U.S.C. 160, 161, 209(b) and 220 as amended by the Communications Act of 1934, as amended.

Total Annual Burden: 350 hours.

Total Annual Cost: No cost.

Needs and Uses: The filing of FCC Form 492 is required by 47 CFR 65.600 of the Commission's rules. The annual filing of FCC Form 492 is required from the National Exchange Carrier Association (NECA) collectively for carriers that participate in both its tariffs and revenue-sharing pools and each local exchange carrier that is subject to section 61.38 of the Commission's Rules and that has filed individual access tariffs during the enforcement period, excluding carriers that elected incentive regulation for business data services (BDS) pursuant to the *Rate-of-Return BDS Order*, WC Docket No. 16-143 et al., Report and Order, 33 FCC Rcd 10403 (2018).

These data provide the necessary detail to enable the Commission to fulfill its regulatory responsibilities. The Commission has granted AT&T, Verizon, legacy Qwest, and other similarly-situated carriers forbearance from FCC Form 492-A. See Petition of AT&T Inc. for Forbearance under 47 U.S.C. 160 from Enforcement of Certain of the Commission's Cost Assignment Rules, WC Docket Nos. 07-21, 05-342, Memorandum Opinion and Order, 23 FCC Rcd 7302 (2008) (AT&T Cost Assignment Forbearance Order).

Federal Communications Commission.

Marlene Dortch,

Secretary, Office of the Secretary.

BILLING CODE 6712-01-P

FEDERAL COMMUNICATIONS COMMISSION

[OMB 3060-0807, OMB 3060-1186, OMB 3060-1259; FR ID 218444]

Information Collections Being Reviewed by the Federal Communications Commission Under Delegated Authority

AGENCY: Federal Communications Commission.

ACTION: Notice and request for comments.

SUMMARY: As part of its continuing effort to reduce paperwork burdens, and as required by the Paperwork Reduction Act (PRA) of 1995, the Federal Communications Commission (FCC or the Commission) invites the general public and other Federal agencies to take this opportunity to comment on the following information collection. Comments are requested concerning: whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; the accuracy of the Commission's burden estimate; ways to enhance the quality, utility, and clarity of the information collected; ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology; and ways to further reduce the information collection burden on small business concerns with fewer than 25 employees. The FCC may not conduct or sponsor a collection of information unless it displays a currently valid control number. No person shall be subject to any penalty for failing to comply with a collection of information subject to the PRA that does not display a valid Office of Management and Budget (OMB) control number.

DATES: Written PRA comments should be submitted on or before July 8, 2024. If you anticipate that you will be submitting comments, but find it difficult to do so within the period of time allowed by this notice, you should advise the contact listed below as soon as possible.

ADDRESSES: Direct all PRA comments to Nicole Ongele, FCC, via email PRA@fcc.gov and to nicole.ongele@fcc.gov.

FOR FURTHER INFORMATION CONTACT: For additional information about the information collection, contact Nicole Ongele, (202) 418-2991.

SUPPLEMENTARY INFORMATION:

OMB Control Number: 3060-0807.

Title: Section 51.803 and Supplemental Procedures for Petitions Pursuant to Section 252(e)(5) of the Communications Act of 1934, as amended.

Form Number: N/A.

Type of Review: Extension of a currently approved collection.

Respondents: Business or other for-profit entities and State, Local or Tribal government.

Number of Respondents and Responses: 60 respondents; 60 responses.

Estimated Time per Response: 40 hours per requirement.

Frequency of Response: On occasion reporting requirement and third party disclosure requirement.

Obligation to Respond: Required to obtain or retain benefits. Statutory authority for this information collection is contained in 47 U.S.C. 252(e)(5) as amended by the Communications Act of 1934, as amended.

Total Annual Burden: 1,600 hours.

Total Annual Cost: No cost.

Needs and Uses: Any interested party seeking preemption of a state commission's jurisdiction based on the state commission's failure to act shall notify the Commission as follows: (1) File with the Secretary of the Commission a detailed petition, supported by an affidavit, that states with specificity the basis for any claim that it has failed to act; and (2) serve the state commission and other parties to the proceeding on the same day that the party serves the petition on the Commission. Within 15 days of filing the petition, the state commission and parties to the proceeding may file a response to the petition. In an OMB-approved Public Notice, DA 97-2540, released December 4, 1997, the Commission set forth procedures for filing petitions for preemption pursuant to section 252(e)(5). Section 252(e)(5) provides that "if a state commission fails to act to carry out its responsibility under this section in any proceeding or other matter under this section, then the Commission shall issue an order preempting the state commission's jurisdiction of the proceeding or matter within 90 days after being notified (or taking notice) of such failure, and shall assume the responsibility of the state commission under this section with respect to the proceeding or matter and act for the state commission." All of the requirements are used to ensure that petitioners have complied with their obligations under the Communications Act of 1934, as amended.

OMB Control Number: 3060-1186.

Title: Rural Call Completion, WC Docket No. 13-39.

Form Number: N/A.

Type of Review: Extension of a currently approved collection.

Respondents: Business or other for-profit entities.

Number of Respondents and

Responses: 56 respondents; 56 responses.

Estimated Time per Response: 1 hour.

Frequency of Response: Third-party disclosure requirement.

Obligation to Respond: Mandatory. Statutory authority for this collection is contained in sections 201, 202, 217, 218, 220(a), 251(a), and 403 of the Communications Act of 1934, as amended, 47 U.S.C. 201, 202, 217, 218, 220(a), 251(a), 403.

Total Annual Burden: 56 hours.

Total Annual Cost: No Cost.

Needs and Uses: The Commission has found that rural call completion is a continuing problem imposing needless economic and personal costs on local communities, and that continued Commission focus on the issue is warranted. The rural call completion contact information will be used to facilitate industry collaboration to address call completion issues.

OMB Control Number: 3060–1259.

Title: Intermediate Provider Registry, WC Docket No. 13–39.

Form Number: N/A.

Type of Review: Extension of a currently approved collection.

Respondents: Business or other for-profit entities.

Number of Respondents and

Responses: 100 respondents; 100 responses.

Estimated Time per Response: 1 hour.

Frequency of Response: Third-party disclosure; one-time reporting requirement; on occasion reporting requirement.

Obligation to Respond: Required to obtain or retain benefits. Statutory authority for this collection is contained in sections 1, 4(i), 201(b), 202(a), 217, and 262 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 154(i), 201(b), 202(a), 217, and 262.

Total Annual Burden: 100 hours.

Total Annual Cost: No cost.

Needs and Uses: The Improving Rural Call Quality and Reliability Act of 2017 (RCC Act), Public Law 115–129, requires the Commission to establish a registry for intermediate providers and requires intermediate providers register with the Commission before offering to transmit covered voice communications. The information that would continue to be collected through this information collection will be used to implement Congress's direction to the Commission to establish an intermediate provider registry.

Federal Communications Commission.

Marlene Dortch,

Secretary, Office of the Secretary.

BILLING CODE 6712–01–P

FEDERAL MARITIME COMMISSION

Notice of Agreements Filed

The Commission hereby gives notice of filing of the following agreements under the Shipping Act of 1984. Interested parties may submit comments, relevant information, or documents regarding the agreements to the Secretary by email at Secretary@fmc.gov, or by mail, Federal Maritime Commission, 800 North Capitol Street, Washington, DC 20573. Comments will be most helpful to the Commission if received within 12 days of the date this notice appears in the **Federal Register**, and the Commission requests that comments be submitted within 7 days on agreements that request expedited review. Copies of agreements are available through the Commission's website (www.fmc.gov) or by contacting the Office of Agreements at (202) 523–5793 or tradeanalysis@fmc.gov.

Agreement No.: 201428.

Agreement Name: ONE/COSCO WIN Slot Charter Agreement.

Parties: COSCO Shipping Lines Co., Ltd.; Ocean Network Express Pte. Ltd.

Filing Party: Joshua Stein; Cozen O'Connor.

Synopsis: The purpose of this Agreement is to authorize ONE to charter space to COSCO in the Trade between India, Pakistan, Sri Lanka, Egypt, the Mediterranean coast of Spain, the United Arab Emirates, and the Red Sea area on the one hand, and the U.S. Gulf and East Coast on the other.

Proposed Effective Date: 04/29/2024.

Location: <https://www2.fmc.gov/FMC.Agreements.Web/Public/AgreementHistory/86564>.

Agreement No.: 201427.

Agreement Name: Seven Seals Co., Ltd./Hyundai Glovis Space Charter Agreement.

Parties: Hyundai Glovis Co., Ltd.; Seven Seals Co., Ltd.

Filing Party: Wayne Rohde; Cozen O'Connor.

Synopsis: The Agreement authorizes Seven Seals to charter space to Hyundai Glovis in the trade between Japan and the U.S. Pacific Coast.

Proposed Effective Date: 04/29/2024.

Location: <https://www2.fmc.gov/FMC.Agreements.Web/Public/AgreementHistory/86563>.

Agreement No.: 201103–017.

Agreement Name: Memorandum Agreement of December 14, 1983

Concerning Assessments to Pay ILWU–PMA Employee Benefit Costs.

Parties: International Longshoremen's and Warehousemen's Union; Pacific Maritime Association.

Filing Party: Robert Magovern; Cozen O'Connor.

Synopsis: The amendment revises the divisor for the man-hour base assessment rate in the agreement, and also accordingly revises various figures set forth in Appendix 1.

Proposed Effective Date: 05/02/2024.

Location: <https://www2.fmc.gov/FMC.Agreements.Web/Public/AgreementHistory/10164>.

Dated: May 3, 2024.

Carl Savoy,

Federal Register Alternate Liaison Officer.

FEDERAL RESERVE SYSTEM

Formations of, Acquisitions by, and Mergers of Savings and Loan Holding Companies

The companies listed in this notice have applied to the Board for approval, pursuant to the Home Owners' Loan Act (12 U.S.C. 1461 *et seq.*) (HOLA), Regulation LL (12 CFR part 238), and Regulation MM (12 CFR part 239), and all other applicable statutes and regulations to become a savings and loan holding company and/or to acquire the assets or the ownership of, control of, or the power to vote shares of a savings association.

The public portions of the applications listed below, as well as other related filings required by the Board, if any, are available for immediate inspection at the Federal Reserve Bank(s) indicated below and at the offices of the Board of Governors. This information may also be obtained on an expedited basis, upon request, by contacting the appropriate Federal Reserve Bank and from the Board's Freedom of Information Office at <https://www.federalreserve.gov/foia/request.htm>. Interested persons may express their views in writing on whether the proposed transaction complies with the standards enumerated in the HOLA (12 U.S.C. 1467a(e)).

Comments received are subject to public disclosure. In general, comments received will be made available without change and will not be modified to remove personal or business information including confidential,

contact, or other identifying information. Comments should not include any information such as confidential information that would not be appropriate for public disclosure.

Comments regarding each of these applications must be received at the Reserve Bank indicated or the offices of the Board of Governors, Ann E. Misback, Secretary of the Board, 20th Street and Constitution Avenue NW, Washington, DC 20551-0001, not later than June 7, 2024.

A. Federal Reserve Bank of Chicago (Colette A. Fried, Assistant Vice President) 230 South LaSalle Street, Chicago, Illinois 60690-1414.

Comments can also be sent electronically to

Comments.applications@chi.frb.org:

1. *The Scott J. Seligman 1993 Long Term Irrevocable Dynasty Trust and the Scott J. Seligman 1993 Irrevocable Dynasty Trust, both of Sioux Falls, South Dakota*; to register as savings and loan holding companies and to retain voting shares of Sterling Bancorp, Inc., and thereby indirectly retain voting shares of Sterling Bank and Trust, FSB, both of Southfield, Michigan.

Board of Governors of the Federal Reserve System.

Michele Taylor Fennell,

Deputy Associate Secretary of the Board.

BILLING CODE P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

Solicitation of Nominations for Appointment to CDC's Advisory Committee to the Director (ACD)

ACTION: Notice.

SUMMARY: In accordance with the Federal Advisory Committee Act, the Centers for Disease Control and Prevention (CDC) is seeking nominations for membership on the Advisory Committee to the Director (ACD). The ACD consists of up to 15 experts knowledgeable in areas pertinent to the CDC mission, such as public health, global health, health disparities, biomedical research, and other fields, as applicable.

DATES: Nominations for membership on the ACD must be received no later than June 7, 2024. Late nominations received after this time will not be considered for the current membership cycle.

ADDRESSES: All nominations (cover letters and curriculum vitae) should be

emailed to ACDDirector@cdc.gov with the subject line: "Nomination for CDC ACD."

FOR FURTHER INFORMATION CONTACT:

Tiffany Brown JD, MPH, Centers for Disease Control and Prevention, Office of the Chief of Staff, 1600 Clifton Road NE, MS H21-10, Atlanta, Georgia 30329-4027. Telephone: (404) 498-6655; Email Address: ACDDirector@cdc.gov.

SUPPLEMENTARY INFORMATION:

Nominations are being sought for individuals who have the expertise and qualifications necessary to contribute to the accomplishments of the committee's objectives. Nominees will be selected based on expertise in the fields of public health, global health, frontline experience and lived experiences relevant to ACD areas, communication science, health systems and prevention research, and public health core capabilities such as data, lab, and workforce. Federal employees will not be considered for membership. Members may be invited to serve for four-year terms. Selection of members is based on candidates' qualifications to contribute to the accomplishment of ACD objectives. To ensure a diverse committee composition, nominees with front line and field experience at the local, state, tribal and territorial levels are encouraged to apply. This includes nominees with experience working for, and with, community-based organizations and other non-profit organizations. Selection of members is based on candidates' qualifications to contribute to the accomplishment of the ACD's objectives (<https://www.cdc.gov/faca/committees/acd.html>). Members will be required to attend ACD meetings at least two times per year (virtually or in-person), and contribute time in between meetings for research, consultation, discussion, and writing assignments.

The U.S. Department of Health and Human Services policy stipulates that committee membership be balanced in terms of points of view represented, and the Committee's function.

Appointments shall be made without discrimination basis of age, race, ethnicity, gender, sexual orientation, gender identity, HIV status, disability, and cultural, religious, or socioeconomic status. Nominees must be U.S. citizens and cannot be full-time employees of the U.S. Government. Current participation on federal workgroups or prior experience serving on a federal advisory committee does not disqualify a candidate; however, HHS policy is to avoid excessive individual service on advisory

committees and multiple committee memberships. Committee members are Special Government Employees, requiring the filing of financial disclosure reports at the beginning of and annually during their terms. CDC reviews potential candidates for ACD membership each year and provides a slate of nominees for consideration to the Secretary of HHS for final selection. HHS notifies selected candidates of their appointment near the start of the term, or as soon as the HHS selection process is completed. Note that the need for different expertise varies from year to year and a candidate who is not selected in one year may be reconsidered in a subsequent year. SGE nominees must be U.S. citizens and cannot be full-time employees of the U.S. Government. Candidates should submit the following items:

- A one-half to one-page cover letter that includes your understanding of, and commitment to, the time and work necessary; one to two sentences on your background and experience; and one to two sentences on the skills/perspective you would bring to the ACD.

- At least one letter of recommendation from person(s) not employed by the U.S. Department of Health and Human Services. (Candidates may submit letter(s) from current HHS employees if they wish, but at least one letter must be submitted by a person not employed by an HHS agency (e.g., CDC, NIH, FDA, etc.).

- Current curriculum vitae which highlights the experience and work history being sought relevant to the criteria set forth above, including complete contact information (telephone numbers, mailing address, email address).

Nominations may be submitted by the candidate him- or herself, or by the person/organization recommending the candidate.

The Director, Office of Strategic Business Initiatives, Office of the Chief Operating Officer, Centers for Disease Control and Prevention, has been delegated the authority to sign **Federal Register** notices pertaining to announcements of meetings and other committee management activities, for both the Centers for Disease Control and Prevention and the Agency for Toxic Substances and Disease Registry.

Kalwant Smagh,

Director, Office of Strategic Business Initiatives, Office of the Chief Operating Officer, Centers for Disease Control and Prevention.

[FR Doc. 2024-10021 Filed 5-7-24; 8:45 am]

BILLING CODE 4163-18-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**Centers for Medicare & Medicaid Services**

[Document Identifiers: CMS–10706]

Agency Information Collection Activities: Submission for OMB Review; Comment Request**AGENCY:** Centers for Medicare & Medicaid Services, Health and Human Services (HHS).**ACTION:** Notice.

SUMMARY: The Centers for Medicare & Medicaid Services (CMS) is announcing an opportunity for the public to comment on CMS' intention to collect information from the public. Under the Paperwork Reduction Act of 1995 (PRA), federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, and to allow a second opportunity for public comment on the notice. Interested persons are invited to send comments regarding the burden estimate or any other aspect of this collection of information, including the necessity and utility of the proposed information collection for the proper performance of the agency's functions, the accuracy of the estimated burden, ways to enhance the quality, utility, and clarity of the information to be collected, and the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

DATES: Comments on the collection(s) of information must be received by the OMB desk officer by June 7, 2024.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting "Currently under 30-day Review—Open for Public Comments" or by using the search function.

To obtain copies of a supporting statement and any related forms for the proposed collection(s) summarized in this notice, please access the CMS PRA website by copying and pasting the following web address into your web browser: <https://www.cms.gov/Regulations-and-Guidance/Legislation/PaperworkReductionActof1995/PRA-Listing>.

FOR FURTHER INFORMATION CONTACT: William Parham at (410) 786–4669.

SUPPLEMENTARY INFORMATION: Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501–3520), federal agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. The term "collection of information" is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. Section 3506(c)(2)(A) of the PRA (44 U.S.C. 3506(c)(2)(A)) requires federal agencies to publish a 30-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension or reinstatement of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, CMS is publishing this notice that summarizes the following proposed collection(s) of information for public comment:

1. *Type of Information Collection Request:* Extension of a currently approved information collection; *Title of Information Collection:* Generic Clearance for the Center for Clinical Standards and Quality IT Product and Support Teams; *Use:* The CMS Center for Clinical Standards and Quality (CCSQ) is responsible for administering appropriate information systems so that the public can submit healthcare-related information. While beneficiaries ultimately benefit, the primary users of CCSQ IT Product and Support Teams (CIPST) systems are healthcare facility employees and contractors. They are responsible for the collection and submission of appropriate beneficiary data to CMS to receive merit-based compensation.

The systems that support CCSQ programs includes but is not limited to: End-Stage Renal Disease Quality Reporting System (EQRS), Enterprise Shared Services (ESS), HCQIS ServiceNow (SNOW), Hospital Quality Reporting (HQR), Quality Improvement and Evaluation System (iQIES), Quality Management and Reporting System (QMARS), and Quality Payment Program (QPP).

The generic clearance will allow CMS to gather information to improve information systems that serve CMS audiences. CMS will gather this information using a mixture of qualitative and quantitative consumer research strategies (including formative research studies and methodological tests). CMS implements human-centered

methods and activities for the improvement of policies, services, and products. This collection of information is necessary to enable CMS to garner customer and stakeholder feedback in an efficient, timely manner, in accordance with our commitment to improving service delivery.

As information systems and technologies are developed or improved upon, they can be tested and evaluated for end-user feedback regarding utility, usability, and desirability. The overall goal is to apply a human-centered engagement model to maximize the extent to which CIPST can gather ongoing feedback from consumers. Feedback helps engineers and designers arrive at better solutions, therefore minimizing the burden on consumers and meeting their needs and goals.

The activities under this clearance involve voluntary engagement with target CCSQ users to receive design and research feedback. The respondents will be voluntary end-users from self-selected customers, as well as convenience samples. It is our intent that selected respondents will either cover a broad range of customers or include specific characteristics related to certain products or services. All collections of information will allow us to continually refine our processes, systems, and services for the benefit of internal and external stakeholders. *Form Number:* CMS–10706 (OMB control number: 0938–1397); *Frequency:* Occasionally; *Affected Public:* Individuals and Private Sector (Business or other for-profit and Not-for-profit institutions); *Number of Respondents:* 54,750; *Total Annual Responses:* 54,750; *Total Annual Hours:* 17,850. (For policy questions regarding this collection contact Brandy Barnette at 410–786–6455.)

William N. Parham, III,

Director, Division of Information Collections and Regulatory Impacts, Office of Strategic Operations and Regulatory Affairs.

[FR Doc. 2024–09998 Filed 5–7–24; 8:45 am]

BILLING CODE 4120–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**Food and Drug Administration****[Docket No. FDA-2024-N-1869]****Peripheral and Central Nervous System Drugs Advisory Committee; Notice of Meeting; Establishment of a Public Docket; Request for Comments—Biologics License Application 761248, for Donanemab Solution for Intravenous Infusion****AGENCY:** Food and Drug Administration, HHS.**ACTION:** Notice; establishment of a public docket; request for comments.

SUMMARY: The Food and Drug Administration (FDA) announces a forthcoming public advisory committee meeting of the Peripheral and Central Nervous System Drugs Advisory Committee (the Committee). The general function of the Committee is to provide advice and recommendations to FDA on regulatory issues. The meeting will be open to the public. FDA is establishing a docket for public comment on this document.

DATES: The meeting will be held on June 10, 2024, from 9 a.m. to 5 p.m. Eastern Time.

ADDRESSES: FDA and invited participants may attend the meeting at FDA White Oak Campus, 10903 New Hampshire Ave., Bldg. 31 Conference Center, the Great Room (Rm. 1503), Silver Spring, MD 20993-0002. The public will have the option to participate via an online teleconferencing and/or video conferencing platform, and the advisory committee meeting will be heard, viewed, captioned, and recorded through an online teleconferencing and/or video conferencing platform.

Answers to commonly asked questions about FDA advisory committee meetings may be accessed at: <https://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm408555.htm>.

FDA is establishing a docket for public comment on this meeting. The docket number is FDA-2024-N-1869. The docket will close on June 7, 2024. Please note that late, untimely filed comments will not be considered. The <https://www.regulations.gov> electronic filing system will accept comments until 11:59 p.m. Eastern Time at the end of June 7, 2024. Comments received by mail/hand delivery/courier (for written/paper submissions) will be considered timely if they are received on or before that date.

Comments received on or before May 24, 2024, will be provided to the Committee. Comments received after that date will be taken into consideration by FDA. In the event that the meeting is cancelled, FDA will continue to evaluate any relevant applications or information, and consider any comments submitted to the docket, as appropriate.

You may submit comments as follows:

Electronic Submissions

Submit electronic comments in the following way:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <https://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <https://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public, submit the comment as a written/paper submission and in the manner detailed (see "Written/Paper Submissions" and "Instructions").

Written/Paper Submissions

Submit written/paper submissions as follows:

- **Mail/Hand Delivery/Courier (for written/paper submissions):** Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Dockets Management Staff, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in "Instructions."

Instructions: All submissions received must include the Docket No. FDA-2024-N-1869 for "Peripheral and Central Nervous System Drugs Advisory Committee; Notice of Meeting; Establishment of a Public Docket; Request for Comments." Received comments, those filed in a timely manner (see **ADDRESSES**), will be placed

in the docket and, except for those submitted as "Confidential Submissions," publicly viewable at <https://www.regulations.gov> or at the Dockets Management Staff between 9 a.m. and 4 p.m., Monday through Friday, 240-402-7500.

- **Confidential Submissions—**To submit a comment with confidential information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states "THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION." FDA will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <https://www.regulations.gov>. Submit both copies to the Dockets Management Staff. If you do not wish your name and contact information be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify the information as "confidential." Any information marked as "confidential" will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <https://www.govinfo.gov/content/pkg/FR-2015-09-18/pdf/2015-23389.pdf>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <https://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the "Search" box and follow the prompts and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852, 240-402-7500.

FOR FURTHER INFORMATION CONTACT:

Jessica Seo, Center for Drug Evaluation and Research, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 31, Rm. 2417, Silver Spring, MD 20993-0002, 301-796-7699, email: PCNS@fda.hhs.gov, or FDA Advisory Committee Information Line, 1-800-741-8138 (301-443-0572 in the Washington, DC area). A notice in the **Federal Register** about last-minute modifications that impact a previously announced advisory committee meeting cannot always be published quickly

enough to provide timely notice. Therefore, you should always check FDA's website at <https://www.fda.gov/AdvisoryCommittees/default.htm> and scroll down to the appropriate advisory committee meeting link, or call the advisory committee information line to learn about possible modifications before the meeting.

SUPPLEMENTARY INFORMATION:

Agenda: The meeting presentations will be heard, viewed, captioned, and recorded through an online teleconferencing and/or video conferencing platform. The Committee will discuss biologics license application 761248, for donanemab solution for intravenous infusion, submitted by Eli Lilly and Co., for the treatment of early symptomatic Alzheimer's disease.

FDA intends to make background material available to the public no later than 2 business days before the meeting. If FDA is unable to post the background material on its website prior to the meeting, the background material will be made publicly available on FDA's website at the time of the advisory committee meeting. Background material and the link to the online teleconference and/or video conference meeting will be available at <https://www.fda.gov/AdvisoryCommittees/Calendar/default.htm>. Scroll down to the appropriate advisory committee meeting link. The meeting will include slide presentations with audio and video components to allow the presentation of materials for online participants in a manner that most closely resembles an in-person advisory committee meeting.

Procedure: Interested persons may present data, information, or views, orally or in writing, on issues pending before the Committee. All electronic and written submissions to the Docket (see **ADDRESSES**) on or before May 24, 2024, will be provided to the Committee. Oral presentations from the public will be scheduled between approximately 1:30 p.m. and 2:30 p.m. Eastern Time and will take place entirely through an online meeting platform. Those individuals interested in making formal oral presentations should notify the contact person and submit a brief statement of the general nature of the evidence or arguments they wish to present, the names and addresses of proposed participants, and an indication of the approximate time requested to make their presentation on or before May 16, 2024. Time allotted for each presentation may be limited. If the number of registrants requesting to speak is greater than can be reasonably

accommodated during the scheduled open public hearing session, FDA may conduct a lottery to determine the speakers for the scheduled open public hearing session. The contact person will notify interested persons regarding their request to speak by May 17, 2024.

For press inquiries, please contact the Office of Media Affairs at fdaoma@fda.hhs.gov or 301-796-4540.

FDA welcomes the attendance of the public at its advisory committee meetings and will make every effort to accommodate persons with disabilities. If you require accommodations due to a disability, please contact Jessica Seo (see **FOR FURTHER INFORMATION CONTACT**) at least 7 days in advance of the meeting.

FDA is committed to the orderly conduct of its advisory committee meetings. Please visit our website at <https://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm111462.htm> for procedures on public conduct during advisory committee meetings.

Notice of this meeting is given under the Federal Advisory Committee Act (5 U.S.C. 1001 *et seq.*). This meeting notice also serves as notice that, pursuant to 21 CFR 10.19, the requirements in 21 CFR 14.22(b), (f), and (g) relating to the location of advisory committee meetings are hereby waived to allow for this meeting to take place both in-person and using an online meeting platform. This waiver is in the interest of allowing greater transparency and opportunities for public participation, in addition to convenience for advisory committee members, speakers, and guest speakers. The conditions for issuance of a waiver under 21 CFR 10.19 are met.

Dated: May 3, 2024.

Lauren K. Roth,

Associate Commissioner for Policy.

BILLING CODE 4164-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2024-N-1938]

Psychopharmacologic Drugs Advisory Committee; Notice of Meeting; Establishment of a Public Docket; Request for Comments—Midomafetamine Capsules

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice; establishment of a public docket; request for comments.

SUMMARY: The Food and Drug Administration (FDA) announces a forthcoming public advisory committee meeting of the Psychopharmacologic Drugs Advisory Committee (the Committee). The general function of the Committee is to provide advice and recommendations to FDA on regulatory issues. The meeting will be open to the public. FDA is establishing a docket for public comment on this document.

DATES: The meeting will be held on June 4, 2024, from 8:30 a.m. to 4:30 p.m. Eastern Time.

ADDRESSES: FDA and invited participants may attend the meeting at FDA White Oak Campus, 10903 New Hampshire Ave., Bldg. 31 Conference Center, the Great Room (Rm. 1503), Silver Spring, MD 20993-0002. The public will have the option to participate via an online teleconferencing and/or video conferencing platform, and the advisory committee meeting will be heard, viewed, captioned, and recorded through an online teleconferencing and/or video conferencing platform.

Answers to commonly asked questions about FDA advisory committee meetings, including information regarding special accommodations due to a disability, visitor parking, and transportation, may be accessed at: <https://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm408555.htm>.

FDA is establishing a docket for public comment on this meeting. The docket number is FDA-2024-N-1938. The docket will close on June 3, 2024. Please note that late, untimely filed comments will not be considered. The <https://www.regulations.gov> electronic filing system will accept comments until 11:59 p.m. Eastern Time at the end of June 3, 2024. Comments received by mail/hand delivery/courier (for written/paper submissions) will be considered timely if they are received on or before that date.

Comments received on or before May 23, 2024, will be provided to the Committee. Comments received after that date will be taken into consideration by FDA. In the event that the meeting is cancelled, FDA will continue to evaluate any relevant applications or information, and consider any comments submitted to the docket, as appropriate.

You may submit comments as follows:

Electronic Submissions

Submit electronic comments in the following way:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the

instructions for submitting comments. Comments submitted electronically, including attachments, to <https://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <https://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public, submit the comment as a written/paper submission and in the manner detailed (see "Written/Paper Submissions" and "Instructions").

Written/Paper Submissions

Submit written/paper submissions as follows:

- *Mail/Hand Delivery/Courier (for written/paper submissions):* Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.
- For written/paper comments submitted to the Dockets Management Staff, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in "Instructions."

Instructions: All submissions received must include the Docket No. FDA-2024-N-1938 for "Psychopharmacologic Drugs Advisory Committee; Notice of Meeting; Establishment of a Public Docket; Request for Comments." Received comments, those filed in a timely manner (see **ADDRESSES**), will be placed in the docket and, except for those submitted as "Confidential Submissions," publicly viewable at <https://www.regulations.gov> or at the Dockets Management Staff between 9 a.m. and 4 p.m., Monday through Friday, 240-402-7500.

- **Confidential Submissions**—To submit a comment with confidential information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states "THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION." FDA

will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <https://www.regulations.gov>. Submit both copies to the Dockets Management Staff. If you do not wish your name and contact information be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify the information as "confidential." Any information marked as "confidential" will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <https://www.govinfo.gov/content/pkg/FR-2015-09-18/pdf/2015-23389.pdf>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <https://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the "Search" box and follow the prompts and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852, 240-402-7500.

FOR FURTHER INFORMATION CONTACT:

Joyce Frimpong, Center for Drug Evaluation and Research, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 31, Rm. 2417, Silver Spring, MD 20993-0002, 301-796-7973, email: PDAC@fda.hhs.gov, or FDA Advisory Committee Information Line, 1-800-741-8138 (301-443-0572 in the Washington, DC area). A notice in the **Federal Register** about last-minute modifications that impact a previously announced advisory committee meeting cannot always be published quickly enough to provide timely notice. Therefore, you should always check FDA's website at <https://www.fda.gov/AdvisoryCommittees/default.htm> and scroll down to the appropriate advisory committee meeting link, or call the advisory committee information line to learn about possible modifications before the meeting.

SUPPLEMENTARY INFORMATION:

Agenda: The meeting presentations will be heard, viewed, captioned, and recorded through an online teleconferencing and/or video conferencing platform. The Committee will discuss new drug application 215455, for midomafetamine (MDMA) capsules, submitted by Lykos

Therapeutics, for the proposed indication of treatment of post-traumatic stress disorder. The Committee will be asked to discuss the overall benefit-risk profile of MDMA, including the potential public health impact.

FDA intends to make background material available to the public no later than 2 business days before the meeting. If FDA is unable to post the background material on its website prior to the meeting, the background material will be made publicly available on FDA's website at the time of the advisory committee meeting. Background material and the link to the online teleconference and/or video conference meeting will be available at <https://www.fda.gov/AdvisoryCommittees/Calendar/default.htm>. Scroll down to the appropriate advisory committee meeting link. The meeting will include slide presentations with audio and video components to allow the presentation of materials for online participants in a manner that most closely resembles an in-person advisory committee meeting.

Procedure: Interested persons may present data, information, or views, orally or in writing, on issues pending before the Committee. All electronic and written submissions to the Docket (see **ADDRESSES**) on or before May 23, 2024, will be provided to the Committee. Oral presentations from the public will be scheduled between approximately 2 p.m. and 3 p.m. Eastern Time and will take place entirely through an online meeting platform. Those individuals interested in making formal oral presentations should notify the contact person and submit a brief statement of the general nature of the evidence or arguments they wish to present, the names and addresses of proposed participants, and an indication of the approximate time requested to make their presentation on or before May 17, 2024. Time allotted for each presentation may be limited. If the number of registrants requesting to speak is greater than can be reasonably accommodated during the scheduled open public hearing session, FDA may conduct a lottery to determine the speakers for the scheduled open public hearing session. The contact person will notify interested persons regarding their request to speak by May 20, 2024.

For press inquiries, please contact the Office of Media Affairs at fdaoma@fda.hhs.gov or 301-796-4540.

FDA welcomes the attendance of the public at its advisory committee meetings and will make every effort to accommodate persons with disabilities. If you require accommodations due to a disability, please contact Joyce

Frimpong (see **FOR FURTHER INFORMATION CONTACT**) at least 7 days in advance of the meeting.

FDA is committed to the orderly conduct of its advisory committee meetings. Please visit our website at <https://www.fda.gov/AdvisoryCommittees/AboutAdvisoryCommittees/ucm111462.htm> for procedures on public conduct during advisory committee meetings.

Notice of this meeting is given under the Federal Advisory Committee Act (5 U.S.C. 1001 *et seq.*). This meeting notice also serves as notice that, pursuant to 21 CFR 10.19, the requirements in 21 CFR 14.22(b), (f), and (g) relating to the location of advisory committee meetings are hereby waived to allow for this meeting to take place both in-person and using an online meeting platform. This waiver is in the interest of allowing greater transparency and opportunities for public participation, in addition to convenience for advisory committee members, speakers, and guest speakers. The conditions for issuance of a waiver under 21 CFR 10.19 are met.

Dated: May 3, 2024.

Associate Commissioner for Policy.

[FR Doc. 2024-10053 Filed 5-7-24; 8:45 am]

BILLING CODE 4164-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Notice for Public Comments on Potential Viral Hepatitis Quality Measures in Medicaid

AGENCY: Office of Infectious Disease and HIV/AIDS Policy, Office of the Assistant Secretary for Health, Office of the Secretary, Department of Health and Human Services.

ACTION: Notice for public comment.

SUMMARY: The Department of Health and Human Services' (HHS) Office of Infectious Disease and HIV/AIDS Policy (OIDP) in the Office of the Assistant Secretary for Health (OASH) invites public comment on potential viral hepatitis quality measures for implementation at the state and territory level. In March 2024, OIDP hosted a technical consultation meeting (<https://youtu.be/YCVC8GwFE7E>) to initiate the process of understanding the needs and developing national consensus on clinically meaningful and feasible viral hepatitis quality measures for proposal to the Medicaid Adult Core Set.

DATES: All comments must be received by 5 p.m. ET on June 7, 2024 to be considered.

ADDRESSES: All comments must be submitted electronically to OIDPViralHepatitis@hhs.gov to be considered.

FOR FURTHER INFORMATION CONTACT: Jessica Deerin, Ph.D., MPH, OIDP, Viral Hepatitis Policy Advisor at Jessica.Deerin@hhs.gov or 202-795-7625.

SUPPLEMENTARY INFORMATION: CDC released updated hepatitis C and hepatitis B screening recommendations to screen all adults aged 18 years and older at least once in a lifetime and all pregnant women during each pregnancy in April 2020 and March 2023, respectively. Screening is an important first step in the viral hepatitis continuum of care and a necessary tool to reach viral hepatitis elimination by 2030.

Additionally, hepatitis C has a life-saving treatment resulting in a cure in >95% of patients. Yet, many patients are not linked to care and complete treatment. Less than 1 in 3 people with health insurance initiated DAA treatment within a year of hepatitis C diagnosis and people with Medicaid were less likely to initiate treatment than those with private insurance. Hepatitis B treatment can reduce hepatitis B viral load, lowering the risk of liver cancer and mortality.

Quality measures are tools to monitor and improve the quality of health care. Scaling up viral hepatitis screening, linkage to care, and access to treatment will ultimately reduce transmission, incidence of new infections, prevent liver cancer and mortality, and allow the U.S. to make strides in reaching viral hepatitis elimination by 2030.

There are currently no viral hepatitis quality measures in the Medicaid Adult Core Set. The Medicaid Adult Core Set is a core set of health care quality measures related to physical and behavioral health for adult Medicaid enrollees. The Adult Core Set encourages standardized reporting by States on a uniform set of measures to drive quality improvement. Since Medicaid provides coverage for a disproportionate number of people with hepatitis B and hepatitis C, OIDP is leading an initiative to develop consensus around clinically meaningful and feasible state level viral hepatitis quality measures to propose to the Medicaid Adult Core Set.

OIDP hosted a Viral Hepatitis Quality Measures Technical Consultation Meeting on March 7, 2024. State panelists from Medicaid and public health departments shared their experience in selection, testing, and implementation of current state viral

hepatitis quality measures, as well as recommendations for measures to propose to the Medicaid Adult Core Set. State panelists reached consensus to prioritize the development, use, and adoption of a hepatitis C screening and treatment initiation measure based on the following rationale:

- Clinical and public health insights are high, leading to an understanding of the cascade of care for infected people who access treatment and cure;
- The measure drives screening and linkage to care by translating recently updated CDC recommendations into routine practice in the health care delivery system;
- Data for a screening and treatment initiation measure is available to state Medicaid programs through administrative claims and encounter data, and is consistent and comparable across states; and
- The method of using administrative data sources to represent hepatitis C treatment through pharmacy claims was explained as an acceptable proxy for receipt of treatment.

HHS hereby requests public comment on the clinical significance, usability, feasibility, and likely uptake of hepatitis C screening and hepatitis C treatment initiation quality measures, as well as recommendations with adequate justifications on other feasible viral hepatitis measures to consider.

Information Needs

HHS is seeking responses with adequate justification to the questions listed below.

1. Are you in support of adopting a hepatitis C screening and treatment initiation measure within state Medicaid programs?

a. If you represent a state Medicaid program, what is the likely uptake of this measure?

2. What other measures should HHS consider for testing and proposal to the Medicaid Adult Core Set (*i.e.*, hepatitis B screening, hepatitis B linkage to care, hepatitis C sustained virological response (SVR))? Please provide support for how that measure is clinically meaningful, feasible, and actionable for state Medicaid programs. What data source or data element can be utilized to calculate the measure?

3. Would it be feasible and clinically meaningful to implement a hepatitis B screening, hepatitis C screening and hepatitis C treatment initiation quality measure within state Medicaid programs? If you represent a state Medicaid program, what is the likely uptake of this measure?

Dated: May 2, 2024.

B. Kaye Hayes,

Deputy Assistant Secretary for Infectious Disease, Department of Health and Human Services.

BILLING CODE 4150–44–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Interagency Coordinating Committee on the Validation of Alternative Methods; Notice of Public Meeting; Request for Public Input

AGENCY: National Institutes of Health, HHS.

ACTION: Notice.

SUMMARY: The Interagency Coordinating Committee on the Validation of Alternative Methods (ICCVAM) will hold a public forum to share information and facilitate direct communication of ideas and suggestions from stakeholders. Interested persons may attend in person or view the meeting remotely by webcast. Time will be set aside for questions and public statements on the topics discussed. Registration is requested for attending in person and required for viewing the webcast. Registration is also required for presenting oral statements, whether in person or online. Information about the meeting and registration are available at <https://ntp.niehs.nih.gov/go/iccvamforum-2024>.

DATES:

Meeting: May 20, 2024, 1 p.m. to approximately 5 p.m. EDT; Tuesday, May 21, 2024, 9 a.m. to approximately 4:30 p.m. EDT.

Registration for Onsite Meeting: Deadline is May 17, 2024.

Registration for Webcast: Deadline is May 21, 2024.

Registration for Oral Statements: Deadline is May 15, 2024.

Registration to attend in person is requested; registration to view the webcast and to present oral public statements (in person or online) is required.

ADDRESSES:

Meeting Location: William H. Natcher Conference Center, National Institutes of Health (NIH), Bethesda, MD 20892.

Meeting web page: Registration and other meeting materials are at <https://ntp.niehs.nih.gov/go/iccvamforum-2024>. A preliminary agenda will be posted on this page by May 3.

FOR FURTHER INFORMATION CONTACT: Dr. Nicole Kleinstreuer, Director, National

Toxicology Program Interagency Center for the Evaluation of Alternative Toxicological Methods (NICEATM), email: nicole.kleinstreuer@nih.gov, telephone: 984–287–3150.

SUPPLEMENTARY INFORMATION:

Background: ICCVAM, a congressionally mandated committee, coordinates the development and validation of alternative testing strategies that protect human health and the environment while replacing, reducing, or refining animal use.

ICCVAM's goals include promotion of national and international partnerships between governmental and nongovernmental groups, including academia, industry, advocacy groups, and other key stakeholders. To foster these partnerships ICCVAM initiated annual public forums in 2014 to share information and facilitate direct communication of ideas and suggestions from stakeholders (79 FR 25136).

This year's meeting will be held on May 20 and 21, 2024. NICEATM and ICCVAM members will give presentations on current activities related to the development and validation of alternative test methods and approaches.

There will be opportunities for participants to ask clarifying or follow-up questions of the ICCVAM members about their presentations. Instructions for submitting these questions will be provided to webcast viewers prior to the event. The agenda will also include time for public oral statements relevant to the ICCVAM mission and current activities from participants who have registered to do so in advance.

Preliminary Agenda and Other Meeting Information: A preliminary agenda will be posted by May 3 at <https://ntp.niehs.nih.gov/go/iccvamforum-2024>. Interested individuals are encouraged to visit this web page to stay abreast of the most current meeting information.

Meeting and Registration: This meeting is open to the public. The public may attend the meeting at NIH, where attendance is limited only by the space available, or view remotely by webcast. Those planning to attend the meeting in person are encouraged to register at <https://ntp.niehs.nih.gov/go/iccvamforum-2024> by May 15, 2024, to facilitate planning for appropriate meeting space. Registration for the webcast is required and is open through 4:30 p.m. EDT on May 21, 2024, at <https://ntp.niehs.nih.gov/go/iccvamforum-2024>. Registrants will receive instructions on how to access and participate in the webcast in the email confirming their registration.

NIH visitor and security information is available at <http://www.nih.gov/about/visitor/index.htm>. Individuals with disabilities who need accommodation to participate in this event should contact Nicole Kleinstreuer at phone: 919–407–1609 or email: nicole.kleinstreuer@nih.gov. TTY users should contact the Federal TTY Relay Service at 800–877–8339. Requests should be made at least five business days in advance of the event.

Request for Oral Public Statements: In addition to time for clarifying or follow-up questions following scheduled presentations, time will be allotted during the meeting for oral public statements with associated slides on topics relevant to ICCVAM's mission. Separate registration for those wishing to provide public statements is required and is open through May 15, 2024, at <https://ntp.niehs.nih.gov/go/iccvamforum-2024>. Any meeting attendee or webcast viewer may ask clarifying questions during the appropriate times in the agenda. The additional registration is only required for those who wish to give separate public statements. The number and length of presentations may be limited based on available time. Submitters will be identified by their name and affiliation and/or sponsoring organization, if applicable. Participants registered to present oral public statements must email their statement to ICCVAMquestions@niehs.nih.gov by May 15, 2024, to allow time for review by NICEATM and ICCVAM and posting to the meeting page prior to the forum. Persons submitting public statements and/or associated slides should include their name, affiliation (if any), mailing address, telephone, email, and sponsoring organization (if any) with the document. Guidelines for public statements are at http://ntp.niehs.nih.gov/ntp/about_ntp/guidelines_public_comments_508.pdf. Persons presenting oral public statements will be contacted to arrange the logistics of their presentations. Presenters should plan for their presentation to run seven minutes or less; each public statement presentation will be followed by up to three minutes to allow for clarifying or follow-up questions. Time allotted for presentations and follow-up questions may be reduced depending on the time available.

Written statements on topics relevant to ICCVAM's mission may be submitted to support an oral public statement or as standalone documents. These should be emailed to ICCVAMquestions@niehs.nih.gov by May 15, 2024. Public statements received prior to the May 15

deadline will be distributed to NICEATM and ICCVAM members before the meeting. Written public statements received after the deadline may be reviewed by NICEATM and ICCVAM at a future date. Materials submitted to accompany oral public statements or standalone written statements should include the submitters name, affiliation (if any), mailing address, telephone, email, and sponsoring organization (if any) with the document. Guidelines for public statements are at http://ntp.niehs.nih.gov/ntp/about_ntp/guidelines_public_comments_508.pdf.

Responses to this notice are voluntary. No proprietary, classified, confidential, or sensitive information should be included in statements submitted in response to this notice or presented during the meeting. This request for input is for planning purposes only and is not a solicitation for applications or an obligation on the part of the U.S. Government to provide support for any ideas identified in response to the request. Please note that the U.S. Government will not pay for the preparation of any information submitted or for its use of that information.

Background Information on ICCVAM and NICEATM: ICCVAM is an interagency committee composed of representatives from 17 Federal regulatory and research agencies that require, use, generate, or disseminate toxicological and safety testing information. ICCVAM conducts technical evaluations of new, revised, and alternative safety testing methods and integrated testing strategies with regulatory applicability. ICCVAM also promotes the scientific validation and regulatory acceptance of testing methods that more accurately assess the safety and hazards of chemicals and products and replace, reduce, or refine animal use.

The ICCVAM Authorization Act of 2000 (42 U.S.C. 285l-3) establishes ICCVAM as a permanent interagency committee of the National Institute of Environmental Health Sciences and provides the authority for ICCVAM involvement in activities relevant to the development of alternative test methods. Additional information about ICCVAM can be found at <https://ntp.niehs.nih.gov/go/iccvam>.

NICEATM administers ICCVAM, provides scientific and operational support for ICCVAM-related activities, and conducts and publishes analyses and evaluations of data from new, revised, and alternative testing approaches. NICEATM and ICCVAM work collaboratively to evaluate new

and improved testing approaches applicable to the needs of U.S. Federal agencies. NICEATM and ICCVAM welcome the public nomination of new, revised, and alternative test methods and strategies for validation studies and technical evaluations. Additional information about NICEATM can be found at <https://ntp.niehs.nih.gov/go/niceatm>.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Rockledge II, 6701 Rockledge Drive, Bethesda, MD 20892 (Virtual Meeting).

Contact Person: Pat Manos, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 5200, MSC 7846, Bethesda, MD 20892, (301) 408–9866, manospa@csr.nih.gov.

Name of Committee: Integrative, Functional and Cognitive Neuroscience Integrated Review Group; Auditory System Study Section.

Date: June 6–7, 2024.

Time: 8:00 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: Hilton Garden Inn, Bethesda, 7301 Waverly Street, Bethesda, MD 20814.

Contact Person: Brian H. Scott, Ph.D., Scientific Review Officer, National Institutes of Health, Center for Scientific Review, 6701 Rockledge Drive, Bethesda, MD 20892, 301–827–7490, brianscott@mail.nih.gov.

Name of Committee: Genes, Genomes, and Genetics Integrated Review Group; Genomics, Computational Biology and Technology Study Section.

Date: June 6–7, 2024.

Time: 8:00 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: Hyatt Regency, Bethesda One, Bethesda Metro Center, Bethesda, MD 20814.

Contact Person: Methode Bacanamwo, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 2200, Bethesda, MD 20892, 301–827–7088, methode.bacanamwo@nih.gov.

Name of Committee: Vascular and Hematology Integrated Review Group; Atherosclerosis and Vascular Inflammation Study Section.

Date: June 6–7, 2024.

Time: 8:00 a.m. to 7:00 p.m.

Agenda: To review and evaluate grant applications.

Place: Gaithersburg Marriott Washingtonian Center, 9751 Washingtonian Blvd., Gaithersburg, MD 20878.

Contact Person: Natalia Komissarova, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 5207, MSC 7846, Bethesda, MD 20892, (301) 435–1206, komissar@mail.nih.gov.

Name of Committee: Healthcare Delivery and Methodologies Integrated Review Group; Clinical Data Management and Analysis Study Section.

Date: June 6–7, 2024.

Time: 8:30 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: Embassy Suites at the Chevy Chase Pavilion, 4300 Military Road NW, Washington, DC 20015.

Contact Person: Shivakumar V Chittari, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Bethesda, MD 20892, (301) 408–9098, chittari.shivakumar@nih.gov.

Name of Committee: Risk, Prevention and Health Behavior Integrated Review Group; Lifestyle Change and Behavioral Health Study Section.

Date: June 6–7, 2024.

Time: 9:00 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Rockledge II, 6701 Rockledge Drive, Bethesda, MD 20892 (Hybrid Meeting).

Contact Person: Pamela Jeter, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 10J08, Bethesda, MD 20892, (301) 827–6401, pamela.jeter@nih.gov.

Name of Committee: Brain Disorders and Clinical Neuroscience Integrated Review Group; Aging Systems and Geriatrics Study Section.

Date: June 6–7, 2024.

Time: 9:00 a.m. to 10:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Rockledge II, 6701 Rockledge Drive, Bethesda, MD 20892 (Virtual Meeting).

Contact Person: Roger Alan Bannister, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 1010–D, Bethesda, MD 20892, (301) 435–1042, bannisterra@csr.nih.gov.

Name of Committee: Oncology 1-Basic Translational Integrated Review Group; Cancer Cell Biology Study Section.

Date: June 6–7, 2024.

Time: 9:00 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Rockledge II, 6701 Rockledge Drive, Bethesda, MD 20892 (Hybrid Meeting).

Contact Person: Charles Morrow, Ph.D., MD, Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 6202, MSC 7804, Bethesda, MD 20892, 301–408–9850, morrowcs@csr.nih.gov.

Name of Committee: Infectious Diseases and Immunology A Integrated Review Group; Pathogenic Eukaryotes Study Section.

Date: June 6–7, 2024.

Time: 9:00 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: Bethesda Marriott, 5151 Pooks Hill Road, Bethesda, MD 20814.

Contact Person: Jennifer Chien Villa, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Bethesda, MD 20892, 301–496–5436, jennifer.villa@nih.gov.

Name of Committee: Healthcare Delivery and Methodologies Integrated Review Group; Interdisciplinary Clinical Care in Specialty Care Settings Study Section.

Date: June 6–7, 2024.

Time: 9:30 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Rockledge II, 6701 Rockledge Drive, Bethesda, MD 20892 (Virtual Meeting).

Contact Person: Abu Saleh Mohammad Abdullah, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Bethesda, MD 20892, (301) 827–4043, abuabdullah.abdullah@nih.gov.

Name of Committee: Molecular, Cellular and Developmental Neuroscience Integrated Review Group; Neurogenesis and Cell Fate Study Section.

Date: June 6, 2024.

Time: 9:30 a.m. to 8:00 p.m.

Agenda: To review and evaluate grant applications.

Place: Canopy by Hilton, 940 Rose Avenue, North Bethesda, MD 20852.

Contact Person: Adem Can, Ph.D., Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 4190, MSC 7850, Bethesda, MD 20892, (301) 435–1042, cana2@csr.nih.gov.

Name of Committee: Endocrinology, Metabolism, Nutrition and Reproductive Sciences Integrated Review Group; Human Studies of Diabetes and Obesity Study Section.

Date: June 6–7, 2024.

Time: 10:00 a.m. to 6:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institutes of Health, Rockledge II, 6701 Rockledge Drive, Bethesda, MD 20892 (Virtual Meeting).

Contact Person: Hui Chen, MD, Scientific Review Officer, Center for Scientific Review, National Institutes of Health, 6701 Rockledge Drive, Room 6164, Bethesda, MD 20892, (301) 435–1044, chenhui@csr.nih.gov.

BILLING CODE 4140–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**National Institutes of Health****National Heart, Lung, and Blood Institute; Notice of Closed Meeting**

Pursuant to section 1009 of the Federal Advisory Committee Act, as amended, notice is hereby given of meeting of the Board of Scientific Counselors of the National Heart, Lung, and Blood Institute.

This meeting will be closed to the public as indicated below in accordance with the provisions set forth in section 552b(c)(6), title 5 U.S.C., as amended for the review, discussion, and evaluation of individual intramural programs and projects conducted by the National Heart, Lung, and Blood Institute, including consideration of personnel qualifications and performance, and the competence of individual investigators, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Name of Committee: Board of Scientific Counselors of the National Heart, Lung, and Blood Institute.

Date: May 31, 2024.

Time: 10:00 a.m. to 6:00 p.m.

Agenda: To review and evaluate personnel qualifications and performance, and competence of individual investigators.

Place: National Institutes of Health, Building 10, 10 Center Drive, Bethesda, MD 20892 (Virtual Meeting).

Date: June 3, 2024.

Time: 10:00 a.m. to 6:00 p.m.

Agenda: To review and evaluate personnel qualifications and performance, and competence of individual investigators.

Place: National Institutes of Health, Building 10, 10 Center Drive, Bethesda, MD 20892 (Virtual Meeting).

Contact Person: Richard Childs, M.D., Scientific Director, Division of Intramural Research, National Heart, Lung, and Blood Institute, National Institutes of Health, 10 Center Drive, Bethesda, MD 20892, 301-827-1396, childs@nhlbi.nih.gov.

Any interested person may file written comments with the committee by forwarding the statement to the Contact Person listed on this notice. The statement should include the name, address, telephone number and when applicable, the business or professional affiliation of the interested person.

Information is also available on the Institute's/Center's homepage: <https://www.nhlbi.nih.gov/about/advisory-and-peer-review-committees/board-scientific-counselors>, where an agenda and any additional information for the meeting will be posted when available.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

National Cancer Institute; Notice of Meeting

Pursuant to section 1009 of the Federal Advisory Committee Act, as amended, notice is hereby given of a meeting of the National Cancer Advisory Board and NCI Board of Scientific Advisors.

This will be a hybrid meeting held in-person and virtually and will be open to the public as indicated below.

Individuals who plan to attend in-person or view the virtual meeting and need special assistance or other reasonable accommodations, should notify the Contact Person listed below in advance of the meeting. The meeting can be accessed from the NIH Videocast at the following link: <https://videocast.nih.gov/>.

A portion of the National Cancer Advisory Board meeting will be closed to the public in accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), Title 5 U.S.C., as amended. The grant applications and the discussions could disclose confidential trade secrets or commercial property such as patentable material, and personal information concerning individuals associated with the grant applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Name of Committee: National Cancer Advisory Board.

Date: June 11, 2024.

Open: 6:00 p.m. to 9:00 p.m.

Agenda: National Cancer Advisory Board Subcommittee Meetings.

Place: Gaithersburg Marriott Washingtonian Center, Room—TBD, 9751 Washington Boulevard, Gaithersburg, MD 20878 (In Person Meeting).

Contact Person: Paulette S. Gray, Ph.D., Director Division of Extramural Activities, National Cancer Institute—Shady Grove, National Institutes of Health, 9609 Medical Center Drive, 7th Floor, Room 7W444, Bethesda, MD 20892, 240–276–6340, grayp@mail.nih.gov.

Name of Committee: National Cancer Advisory Board and NCI Board of Scientific Advisors.

Date: June 12, 2024.

Open: 9:00 a.m. to 3:50 p.m.

Agenda: Joint meeting of the National Cancer Advisory Board and NCI Board of Scientific Advisors, NCI Director's Report and Presentations.

Place: National Cancer Institute—Shady Grove, 9609 Medical Center Drive, Room TE406 & 408, Rockville, MD 20850 (In Person and Virtual Meeting).

Contact Person: Paulette S. Gray, Ph.D., Director Division of Extramural Activities, National Cancer Institute—Shady Grove, National Institutes of Health, 9609 Medical Center Drive, 7th Floor, Room 7W444, Bethesda, MD 20892, 240–276–6340, grayp@mail.nih.gov.

Name of Committee: National Cancer Advisory Board.

Date: June 12, 2024.

Closed: 3:50 p.m. to 5:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Cancer Institute—Shady Grove, 9609 Medical Center Drive, Room TE406 & 408, Rockville, MD 20850 (In Person and Virtual Meeting).

Contact Person: Paulette S. Gray, Ph.D., Director Division of Extramural Activities, National Cancer Institute—Shady Grove, National Institutes of Health, 9609 Medical Center Drive, 7th Floor, Room 7W444, Bethesda, MD 20892, 240–276–6340, grayp@mail.nih.gov.

Name of Committee: National Cancer Advisory Board and NCI Board of Scientific Advisors

Date: June 13, 2024.

Open: 9:00 a.m. to 12:00 p.m.

Agenda: Joint meeting of the National Cancer Advisory Board and NCI Board of Scientific Advisors Concepts Review and Presentations.

Place: National Cancer Institute—Shady Grove, 9609 Medical Center Drive, Room TE406 & 408, Rockville, MD 20850 (In Person and Virtual Meeting).

Contact Person: Paulette S. Gray, Ph.D., Director Division of Extramural Activities, National Cancer Institute—Shady Grove, National Institutes of Health, 9609 Medical Center Drive, 7th Floor, Room 7W444, Bethesda, MD 20892, 240–276–6340, grayp@mail.nih.gov.

Any interested person may file written comments with the committee by forwarding the statement to the Contact Person listed on this notice. The statement should include the name, address, telephone number and when applicable, the business or professional affiliation of the interested person.

In the interest of security, NIH has instituted stringent procedures for entrance onto the NCI-Shady Grove campus. All visitors will be asked to show one form of identification (for example, a government-

issued photo ID, driver's license, or passport) and to state the purpose of their visit.

BILLING CODE 4140–01–P

DEPARTMENT OF HOMELAND SECURITY

Federal Emergency Management Agency

[Docket ID FEMA–2023–0027]

Programmatic/Class Floodplain Review Procedures for Specific Preparedness Grant Projects

AGENCY: Federal Emergency Management Agency, Department of Homeland Security.

ACTION: Final notice.

SUMMARY: On October 4, 2023, FEMA published a notice requesting public comment on its determination that a programmatic/class review is appropriate for six categories of activities, in specific grant programs that do not have an adverse impact, individually or cumulatively, on floodplain values placing property and persons at risk. FEMA received no comments and is now publishing final notice of its determination in compliance with Federal regulations.

FOR FURTHER INFORMATION CONTACT: Frederick Holycross, Coordinator, Grant Programs Directorate, Environmental Planning and Historic Preservation, FEMA, frederick.holycross@fema.dhs.gov, or 202–812–4938.

SUPPLEMENTARY INFORMATION:

I. Background

FEMA's floodplain management regulations are found at 44 CFR part 9. Part 9 sets forth the policy, procedure, and responsibilities to implement and enforce Executive Order 11988, Floodplain Management.¹ Part 9 sets

¹ “This regulation sets forth the policy, procedure, and responsibilities to implement and

forth an eight-step process which FEMA must follow when taking actions in floodplains² which have the potential to affect floodplains or their occupants, or which are subject to potential harm by location in floodplains.³ FEMA completes the eight-step process for each action it is taking in a floodplain as part of the comprehensive environmental and historic preservation (EHP) compliance reviews that are required for all projects funded under its disaster and non-disaster grant programs.⁴

For such actions, FEMA is required to take the following steps: (1) determine whether the proposed action is located in the 100-year floodplain (500-year floodplain for critical actions), and whether it has the potential to affect or be affected by the floodplain;⁵ (2) notify the public at the earliest possible time of the intent to carry out an action in a floodplain, and involve the affected and interested public in the decision-making process; (3) identify and evaluate practicable alternatives to locating the proposed action in a floodplain (including alternative sites, actions and the “no action” option); (4) identify the potential direct and indirect impacts associated with the occupancy or modification of floodplains and the potential direct and indirect support of floodplain development that could result from the proposed action; (5) minimize the potential adverse impacts and support to or within floodplains to be identified under Step 4, restore and preserve the natural and beneficial values served by floodplains; (6) reevaluate the proposed action to determine first, if it is still practicable in light of its exposure to flood hazards, the extent to which it will aggravate the hazards to others, and its potential to disrupt floodplain values and second, if alternatives preliminarily rejected at Step 3 are practicable in light of the information gained in Steps 4 and 5; (7) prepare and provide the public with a finding and public explanation of any final decision that the floodplain is the only practicable alternative; and (8)

enforce Executive Order 11988, Floodplain Management, and Executive Order 11990, Protection of Wetlands.” 44 CFR 9.1.

² The 8-step process set forth in 44 CFR part 9 also governs agency actions that take place in wetlands.

³ 44 CFR 9.5(a)(1).

⁴ See generally FEMA's website at Environmental Planning and Historic Preservation for a description of the EHP process and the applicable regulations, directives, and legal mandates which govern it. (Last accessed on April 12, 2024.)

⁵ Any project considered for streamlined process will also be subject to a determination of whether the proposed action is located in a wetland and/or floodplain.

review the implementation and post-implementation phases of the proposed action to ensure that the minimization requirements are fully implemented.⁶

FEMA completes the eight-step process for each action it is taking in a floodplain as part of the comprehensive environmental and historic preservation (EHP) compliance reviews that are required for all projects funded under its disaster and non-disaster grant programs.⁷ The implementing guidance for E.O. 11988 (Guidelines) allows for an altered or shortened decision-making floodplain evaluation “class review” process for certain routine or recurring actions, known as repetitive actions.⁸ Class reviews or programmatic approaches allow for efficient and effective ways to meet EHP requirements, including floodplain reviews.

In considering whether to undertake such a review, the Guidelines instruct Federal agencies to examine past actions that have been reviewed on an individual basis with public notice and opportunity to comment.⁹ If the individual reviews have indicated uniformly that the actions would not have an adverse impact individually or cumulatively on floodplain values placing property and persons at risk, and little or no public comments to the contrary were received, a class review to streamline agency coordination and processing efforts may be appropriate.¹⁰ Agencies may conduct class reviews of routine or recurring actions when: (1) consideration of whether to locate in a floodplain is substantially similar; (2) there is no practicable alternative(s), consistent with any Executive Orders and applicable agency codes, to siting in a floodplain for each action within the class; and (3) all practical measures to minimize harm to the floodplain are included in the review criteria that, if followed, will minimize any adverse impacts that may be associated with the individual actions covered in the class review.¹¹

FEMA reviewed six project categories from 13 grant programs and determined they were appropriate for the shortened

class review procedures.¹² For the specific project categories, FEMA completed steps 3–6 of the eight-step process by cumulatively considering the potential that the project types might directly or indirectly have adverse impacts to floodplains, might promote floodplain development directly or indirectly, and whether there could be any practicable alternative locations or actions. FEMA determined that the projects would not have direct or indirect adverse impacts to floodplains, would not promote floodplain development directly or indirectly, and that there were no practicable alternatives outside the floodplain. On October 4, 2023, FEMA published an initial notice of its determination; the comment period closed November 3, 2023, with no comments received.¹³

II. Final Notice: Compliance With Step 7 of the Eight-Step Process

Step 7 of the eight-step process requires FEMA to prepare and provide the public with a finding and public explanation of any final decision that the floodplain is the only practicable alternative for the identified actions.¹⁴ The final notice is required to include the following: (1) a statement of why the proposed action must be located in an area affecting or affected by a floodplain or a wetland; (2) a description of all significant facts considered in making this determination; (3) a list of the alternatives considered; (4) a statement indicating whether the action conforms to applicable State and local floodplain protection standards; (5) a statement indicating how the action affects or is affected by the floodplain and/or wetland, and how mitigation is to be achieved; (6) identification of the responsible official or organization for implementation and monitoring of the proposed action, and from whom further information can be obtained; and (7) a map of the area or a statement that such map is available for public inspection, including the location at which such map may be inspected and a telephone number to call for information.¹⁵

FEMA reviewed six project categories that must be located in the floodplain because the project categories involve modifications of structures or features that currently exist in the floodplain.¹⁶

Within these project categories, FEMA conducted a review of 570 project types funded through the Grant Programs Directorate¹⁷(GPD) from 2008 to 2023 that previously received floodplain reviews on an individual basis. The results of those individual reviews indicate that these identified types of activities will not have an adverse impact on floodplain values and that the activities should remain in the floodplain because they support existing facilities or structures. FEMA did not receive public comments suggesting that there would be impacts or that the activities should not be located in the floodplain. FEMA did not consider alternative sites outside of the floodplain because the projects are small-scale security improvements or modifications made to existing facilities or structures. There are no practicable alternatives because the existing facility or structure would need to be relocated outside the floodplain and no alternative actions would serve the same purpose and have less potential to affect or be affected by the floodplain.

FEMA will condition grant funding for the listed activities in accordance with local floodplain ordinances and applicable codes and standards. The activities will not alter floodplain characteristics nor materially extend the life of existing structures or facilities. The activities will not modify the floodplain or increase the risk of flood loss. Construction associated with the listed activities may create short term, direct adverse impacts through the discharge of runoff water containing pollutants and sediment into a floodplain. The installation of temporary structures may create temporary, direct impacts to the floodplain by affecting flow characteristics and by capturing debris. However, mitigation of the short-term, direct adverse impacts associated with construction activities will be achieved through the application of typical construction practices including runoff controls.

For covered activities in participating National Flood Insurance Program

⁶ 44 CFR 9.6.

⁷ See generally FEMA’s website at Environmental Planning and Historic Preservation for a description of the EHP process and the applicable regulations, directives, and legal mandates which govern it. (Last accessed on April 12, 2024).

⁸ See Guidelines for Implementing Executive Order 11988, Floodplain Management, and Executive Order 13690, Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Stakeholder Input at 44.

⁹ *Id.*

¹² See 88 FR 68644.

¹³ 88 FR 68644.

¹⁴ 44 CFR 9.6(b); 9.12.

¹⁵ 44 CFR 9.12(e).

¹⁶ See 88 FR 68644; FEMA’s class review does not apply to actions located in regulatory floodways or coastal high hazard areas, including V/VE Zones; construction of new buildings, structures, infrastructure or facilities.

¹⁷ GPD’s mission is to deliver and support grant programs that help the Nation before, during and after disasters to make the country more resilient. GPD administers and manages FEMA grants to ensure critical and measurable results for customers and stakeholders, while also ensuring transparency in the grant process; consolidates the grant business operations, systems, training, policy and oversight of all FEMA grants; establishes and promotes consistent outreach and communication with State, local, Tribal and territorial (SLTTs) stakeholders; and offers information about FEMA’s preparedness grants funding provided to SLTT governments in the form of non-disaster grants. For more information, please visit <https://www.fema.gov/about/offices/grant-programs>.

(NFIP) communities, FEMA will require a floodplain development permit or documentation from the local floodplain administrator that the work is consistent with NFIP requirements.¹⁸ FEMA will include a condition for all projects located in the floodplain that the Recipient and sub recipient must coordinate with the local floodplain administrator/permitting official to obtain any required permitting. Further information about these activities can be obtained from GPD, at GPDEHPinfo@fema.dhs.gov. When FEMA provides funding for these activities, a map of the location may be available at GPDEHPinfo@fema.dhs.gov.

This serves as FEMA's final public notice that the floodplain is the only practicable alternative for the six categories of activities in the thirteen specified grant programs identified in its October 4, 2023 initial notice.¹⁹ Pursuant to 44 CFR 9.12(f), FEMA will wait 15 days from the date of this determination to carry out any actions subject to this notice.

BILLING CODE 9111–78–P

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

[Docket No. FR–7093–N–01]

60-Day Notice of Proposed Information Collection: HUD FOIAXpress (FMS2) Tracking System FOIA Portal; OMB Control No.: 2501–NEW

AGENCY: Office of Administration,
Freedom of Information Act (FOIA)
Office, HUD.

ACTION: Notice.

SUMMARY: HUD is seeking approval from the Office of Management and Budget (OMB) for the information collection described below. In accordance with the Paperwork Reduction Act, HUD is requesting comment from all interested parties on the proposed collection of information. The purpose of this notice is to allow for 60 days of public comment.

DATES: *Comments Due Date:* July 8, 2024.

ADDRESSES: Interested persons are invited to submit comments regarding this proposal. Written comments and recommendations for the proposed information collection can be sent within 60 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting “Currently under 60-day Review—Open for Public Comments” or by using the search function. Interested persons are also invited to submit comments regarding this proposal and comments should refer to the proposal by name and/or OMB Control Number and should be sent to: Anna Guido, Clearance Officer, REE, Department of Housing and Urban Development, 451 7th Street SW, Room 8210, Washington, DC 20410–5000; email PaperworkReductionActOffice@hud.gov.

FOR FURTHER INFORMATION CONTACT: Anna Guido, Paperwork Reduction Act Compliance Officer, Reports Management Officer, REE, Department of Housing and Urban Development, 451 7th Street SW, Washington, DC 20410; email at Anna.P.Guido@hud.gov, 202–402–5535. This is not a toll-free

number. HUD welcomes and is prepared to receive calls from individuals who are deaf or hard of hearing, as well as individuals with speech or communication disabilities. To learn more about how to make an accessible telephone call, please visit <https://www.fcc.gov/consumers/guides/telecommunications-relay-service-trs>.

Copies of available documents submitted to OMB may be obtained from Anna Guido.

SUPPLEMENTARY INFORMATION: This notice informs the public that HUD is seeking approval from OMB for the information collection described in Section A.

A. Overview of Information Collection

Title of Information Collection:—HUD FOIAXpress (FMS2) Tracking System FOIA Portal.

OMB Approval Number: 2501–Pending.

Type of Request: New Collection.

Description of the need for the information and proposed use: Respondents have the ability to submit their electronic requests through the Public Access Link. HUD accepts electronic submissions from respondents through the Public Access Link, which would reduce the burden on the public.

The Department has used this information to provide appropriate responses specific to the inquiries. In addition, we have been able to create specific template responses for like inquiries to ensure a rapid response.

Information collection/form number	Estimated number of respondents	Frequency of response	Responses per annum	Average burden hour per response	Annual burden hours	Hourly cost per response	Annual cost
Public Access Link	11,510	1	11,510	.33	\$3,798.30	\$29.76	\$113,037.41

B. Solicitation of Public Comment

This notice is soliciting comments from members of the public and affected parties concerning the collection of

information described in Section A on the following:

(1) Whether the proposed collection of information is necessary for the proper performance of the functions of

the agency, including whether the information will have practical utility;

(2) The accuracy of the agency's estimate of the burden of the proposed collection of information;

¹⁸ Created by Congress in 1968, the NFIP provides insurance to help reduce the socio-economic impact of floods. Flood insurance is a separate policy that can cover buildings, the contents in a building, or both. The NFIP provides flood insurance to property owners, renters, and businesses, and having this coverage helps them recover faster when floodwaters recede. The NFIP is a public-private partnership between the Federal Government, the property and casualty insurance industry, States, local officials, lending institutions,

and property owners. The NFIP is administered by FEMA, while insurance policies are sold and serviced by a network of more than 50 insurance companies and the NFIP Direct. For more information, please visit floodsmart.gov.

¹⁹ 88 FR 86844; the non-disaster preparedness grant programs to which FEMA's determination applies are as follows: (1) Assistance to Firefighters Grant Program; (2) Fire Prevention and Safety Grant Program; (3) Staffing for Adequate Fire and

Emergency Response Grant Program; (4) Nonprofit Security Grant Program; (5) Tribal Homeland Security Grant Program; (6) Emergency Management Performance Grant Program; (7) Operation Stonegarden; (8) State Homeland Security Program; (9) Urban Area Security Initiative; (10) Intercity Bus Security Grant Program; (11) Intercity Passenger Rail Program; (12) Port Security Grant Program; and (13) Transit Security Grant Program.

(3) Ways to enhance the quality, utility, and clarity of the information to be collected; and

(4) Ways to minimize the burden of the collection of information on those who are to respond; including through the use of appropriate automated collection techniques or other forms of information technology, *e.g.*, permitting electronic submission of responses.

HUD encourages interested parties to submit comments in response to these questions.

C. Authority

Section 3507 of the Paperwork Reduction Act of 1995, 44 U.S.C. chapter 35.

Kevin McNeely,

General Deputy Assistant Secretary, Office of Administration.

[FR Doc. 2024–10012 Filed 5–7–24; 8:45 am]

BILLING CODE 4210–67–P

DEPARTMENT OF THE INTERIOR

Geological Survey

[GX24GG00995TR00]

Call for Nominations for the Scientific Earthquake Studies Advisory Committee

AGENCY: U.S. Geological Survey, Department of the Interior.

ACTION: Call for nominations.

SUMMARY: The Department of the Interior is seeking nominations to serve on the Scientific Earthquake Studies Advisory Committee (SESAC). The SESAC advises the Director of the U.S. Geological Survey (USGS) on matters relating to the USGS's participation in the National Earthquake Hazards Reduction Program (NEHRP).

DATES: All nominations must be received no later than June 7, 2024.

ADDRESSES: Send nominations electronically to ghayes@usgs.gov or by mail to Dr. Gavin Hayes, U.S. Geological Survey, U.S. Department of the Interior, PO Box 25046, MS–966, Denver, Colorado 80225.

FOR FURTHER INFORMATION CONTACT: Dr. Gavin Hayes, U.S. Geological Survey, U.S. Department of the Interior, P.O. Box 25046, MS–966, Denver, Colorado 80225, ghayes@usgs.gov, 303–273–8421.

SUPPLEMENTARY INFORMATION: The SESAC conducts its operations in accordance with the provisions of the Federal Advisory Committee Act. The SESAC provides recommendations and advice to the Director of the USGS (Director), and functions solely as an

advisory body. The SESAC advises the Director on matters relating to USGS's participation in the NEHRP, including the USGS's roles, goals, and objectives within the NEHRP, its capabilities and research needs, guidance on achieving major objectives, and establishing and measuring performance goals.

The SESAC includes up to 10 members not employed by the Federal Government, who are qualified in the seismic sciences and other appropriate fields involved in national earthquake research activities. Selection of individuals for the SESAC shall be based solely on established records of distinguished service, and the Director shall ensure that a reasonable cross-section of views and expertise is represented. Members are appointed as a special Government employees (SGEs) and will be required, prior to appointment, to file a Confidential Financial Disclosure Report in order to avoid involvement in real or apparent conflicts of interest. You may find a copy of the Confidential Financial Disclosure Report at the following website: <https://www.doi.gov/ethics/special-government-employees/financial-disclosure>. Additionally, after appointment, members appointed as SGEs will be required to meet applicable financial disclosure and ethics training requirements. Please contact 202–208–7960 or DOI_Ethics@sol.doi.gov with any questions about the ethics requirements for members appointed as SGEs.

In selecting individuals to serve on the SESAC, the Director shall seek and give due consideration to recommendations from the National Academy of Sciences, professional societies, and other appropriate organizations. SESAC members are appointed for staggered terms to ensure continuity. Nominations received through this call may be used to fill future vacancies on the SESAC. Nominations will be reviewed by the USGS, and additional information may be requested from nominees. Final selection and appointment of SESAC members will be made by the Director.

The SESAC meets approximately 1–2 times per year. SESAC members will serve without compensation, but travel and per diem costs will be provided by the USGS. The USGS will also provide necessary support services to the SESAC. SESAC meetings are open to the public.

Nominations may come from individuals, employers, associations, professional organizations, or other geospatial organizations. Nominations should include a resume or curriculum vitae providing an adequate description

of the nominee's qualifications sufficient for the USGS to make an informed decision regarding meeting the membership requirements of the SESAC and permit the nominated person to be contacted. Nominations may optionally include supporting letters from employers, associations, professional organizations, and/or other organizations.

Additional information about the SESAC and the nomination process is posted on the SESAC web page.

Authority: 5 U.S.C. ch. 10.

Gary Latzke,

Chief of Staff, Natural Hazards Mission Area, U.S. Geological Survey.

DEPARTMENT OF THE INTERIOR

Office of the Secretary

[19XD4523WS/DWSN0000.000000/DS61500000/DP.61501]

Invasive Species Advisory Committee; Second Request for Nominations

AGENCY: Office of the Secretary, Interior.

ACTION: Notice of second request for nominations.

SUMMARY: The U.S. Department of the Interior, on behalf of the interdepartmental National Invasive Species Council (NISC), proposes to appoint new members to the Invasive Species Advisory Committee (ISAC). The Secretary of the Interior, acting as administrative lead, is requesting nominations for qualified persons to serve as members of the ISAC.

DATES: The deadline for submissions for the notice published February 27, 2024 at 89 FR 14519 has been extended. Nominations must be postmarked by June 7, 2024.

ADDRESSES: Electronic nominations packages are preferred and should be sent to invasive_species@ios.doi.gov. As necessary, hard copy nominations can be sent to Stanley W. Burgiel, Executive Director, National Invasive Species Council (OS/NISC), Regular/Express Mail: 1849 C Street NW (Mailstop 3530), Washington, DC 20240.

FOR FURTHER INFORMATION CONTACT: Kelsey Brantley, NISC Operations Director, at (202) 208–4122, or by email at Kelsey_Brantley@ios.doi.gov.

SUPPLEMENTARY INFORMATION:

Advisory Committee Scope and Objectives

Executive Order (E.O.) 13112 authorized the National Invasive

Species Council (NISC) to provide interdepartmental coordination, planning, and leadership for the Federal Government on the prevention, eradication, and control of invasive species. This authorization was reiterated in E.O. 13751. NISC is currently comprised of the senior-most leadership of twelve Federal Departments/Agencies and four Executive Offices of the President. The Co-chairs of NISC are the Secretaries of the Interior, Agriculture, and Commerce. The Invasive Species Advisory Committee (ISAC) advises NISC. NISC is requesting nominations for individuals to serve on the ISAC.

NISC provides high-level interdepartmental coordination of Federal invasive species actions and works with other Federal and non-Federal groups to address invasive species issues at the national level. NISC duties, consistent with E.O. 13751, are to provide national leadership necessary to coordinate, sustain and expand efforts to safeguard the interest of the United States through the prevention, eradication and control of invasive species through the restoration of ecosystems and other assets impacted by invasive species. These duties and work priorities are further identified and outlined in NISC's annual Work Plans.

ISAC is chartered under the Federal Advisory Committee Act (FACA; 5 U.S.C. ch. 10). At the request of NISC, ISAC provides advice to NISC members on topics related to NISC's duties as described above, and emerging issues prioritized by the Administration. As a multi-stakeholder advisory committee, ISAC is intended to play a key role in recommending plans and actions to be taken in different sectors, geographies, and/or scales to accomplish the activities set forth in NISC Work Plans. It is hoped that, collectively, ISAC will represent the views of the broad range of individuals and communities knowledgeable of and affected by invasive species. NISC is requesting nominations for individuals to serve on the ISAC.

Membership Criteria

Prospective members of ISAC should meet the following criteria:

1. knowledge related to the prevention, eradication, and/or control of invasive species;
2. familiarity with relevant Federal government programs and policy making procedures, as well as their interface with non-federal entities;
3. experience in advising individuals in leadership positions;

4. demonstrated ability to network with and/or represent interests of their peer-community of interest; and

5. teamwork, project management, and communication skills.

ISAC members need not be scientists. Membership from a wide range of disciplines and professional sectors is encouraged. At this time, we are particularly interested in applications from representatives of: non-Federal government agencies (e.g., State, territorial, Tribal, local); academia, research institutions, and scientific societies; the private sector and industry/trade associations; landowners, farmers, ranchers, foresters and other resource users; public health specialists; regional organizations and citizen scientists, recreationists, and other public interest groups. Additionally, ISAC will include one representative from each of the following organizations, serving in a non-voting, "adviser" capacity: the Association of Fish and Wildlife Agencies (AFWA); the National Association of Conservation Districts (NACD); the National Association of State Departments of Agriculture (NASDA); the National Plant Board (NPB); The Native American Fish and Wildlife Society (NAFWS); and the North American Invasive Species Management Association (NAISMA).

After consultation with the other members of NISC, the Secretary of the Interior will appoint members to ISAC. Members will be selected based on their individual qualifications as detailed in their nomination package, as well as the overall need to achieve a balanced representation of viewpoints, subject matter expertise, regional knowledge, and representation of communities of interest. ISAC member terms are limited to two (2) years from their date of appointment to ISAC. Following completion of their first term, an ISAC member may request consideration for reappointment (see *How to Nominate* section below); however, reappointment is NOT guaranteed.

ISAC will hold approximately one or two in-person or virtual meetings per year. Between meetings, ISAC members are expected to participate in committee work via web-based meetings, teleconferences, and email exchanges. Members of the ISAC and its subcommittees serve without pay. However, while away from their homes or regular places of business in the performance of services of the ISAC, members may be reimbursed for travel expenses, including per diem in lieu of subsistence, in the same manner as persons employed intermittently in the government service, as authorized by 5

U.S.C. 5703. Employees of the Federal Government ARE NOT eligible for nomination or appointment to ISAC.

Individuals who are federally registered lobbyists are ineligible to serve on all FACA and non-FACA boards, committees, or councils in an individual capacity. The term "individual capacity" refers to individuals who are appointed to exercise their own individual best judgment on behalf of the government, such as when they are designated special Government employees (SGEs), rather than being appointed to represent a particular interest.

As appropriate, certain ISAC members may be appointed as SGEs. Please be aware that applicants selected to serve as SGEs will be required, prior to appointment, to file a Confidential Financial Disclosure Report, to avoid involvement in real or apparent conflicts of interest. Applicants can access a copy of the Confidential Financial Disclosure Report at: [https://www.oge.gov/web/oge.nsf/0GE%20Forms/2026049D943E0C34852585B6005A23CE/\\$FILE/0GE%20Form%20450%20Dec%202023%20Accessible.pdf?open](https://www.oge.gov/web/oge.nsf/0GE%20Forms/2026049D943E0C34852585B6005A23CE/$FILE/0GE%20Form%20450%20Dec%202023%20Accessible.pdf?open).

Additionally, after appointment, members appointed as SGEs will be required to meet applicable financial disclosure and ethics training requirements. Please contact (202) 208-7960 or DOI_Ethics@sol.doi.gov with any questions about the ethics requirements for members appointed as SGEs.

How To Nominate

Nomination packets should include a resume that provides an adequate description of the nominee's qualifications, which specifically relate to the criteria stated in this notice (see *Membership Criteria* section, para. 1). Included content should enable the Department of the Interior to evaluate the nominee's potential to meet the membership requirements of the Committee. To enable the Department of the Interior to contact a potential member, all nomination packets must include, at a minimum, the nominee's name and a valid email address. Nominees are strongly encouraged to include supporting letters from employers, associations, professional organizations, and/or other organizations that indicate support for the nominee by a meaningful constituency. Nomination packets should be no more than twelve pages.

In addition to submitting the nomination packet as described, *current ISAC members seeking reappointment* must also provide details of their

accomplishments and contributions which support their selection for a second term. Again, reappointment is NOT guaranteed.

All nominations must designate which stakeholder group or community the nominee will represent (see Membership Criteria above, for stakeholder groups and required qualifications). All required documents and any letters of support must be submitted in a SINGLE nomination package. Incomplete packets, packets missing the nominee's contact information, or those with documents submitted separately WILL NOT be considered.

Nominations must be received no later than June 7, 2024. Electronic nomination packages are preferred and should be sent to invasive_species@ios.doi.gov. As necessary, hard copy nominations can be sent to Stanley W. Burgiel, Executive Director, National Invasive Species Council (OS/NISC), Regular Mail: 1849 C Street NW (Mailstop 3530), Washington, DC, 20240.

Authority: 5 U.S.C. ch. 10.

Stanley W. Burgiel,
Executive Director, National Invasive Species Council.

INTERNATIONAL TRADE COMMISSION

[Investigation No. 731–TA–1626 (Final)]

Paper Shopping Bags From Turkey; Determination

On the basis of the record ¹ developed in the subject investigation, the United States International Trade Commission (“Commission”) determines, pursuant to the Tariff Act of 1930 (“the Act”), that an industry in the United States is materially injured by reason of imports of paper shopping bags from Turkey, provided for in subheadings 4819.30.00 and 4819.40.00 of the Harmonized Tariff Schedule of the United States, that have been found by the U.S. Department of Commerce (“Commerce”) to be sold in the United States at less than fair value (“LTFV”).²

Background

The Commission instituted this investigation effective May 31, 2023, following receipt of a petition filed with

¹ The record is defined in § 207.2(f) of the Commission’s Rules of Practice and Procedure (19 CFR 207.2(f)).
² 89 FR 19295 (March 18, 2024).

the Commission and Commerce by the Coalition for Fair Trade in Shopping Bags, a coalition whose members include Novolex Holdings, LLC, Charlotte, North Carolina, and the United Steel, Paper and Forestry, Rubber, Manufacturing, Energy, Allied Industrial and Service Workers International Union, Pittsburgh, Pennsylvania. The Commission scheduled the final phase of the investigation following notification of a preliminary determination by Commerce that imports of paper shopping bags from Turkey were being sold at LTFV within the meaning of § 733(b) of the Act (19 U.S.C. 1673b(b)). Notice of the scheduling of the final phase of the Commission’s investigation and of a public hearing to be held in connection therewith was given by posting copies of the notice in the Office of the Secretary, U.S. International Trade Commission, Washington, DC, and by publishing the notice in the **Federal Register** of January 18, 2024 (89 FR 3424). The Commission conducted its hearing on March 14, 2024.

The Commission made this determination pursuant to § 735(b) of the Act (19 U.S.C. 1673d(b)). It completed and filed its determination in this investigation on May 2, 2024. The views of the Commission are contained in USITC Publication 5504 (May 2024), entitled *Paper Shopping Bags from Turkey: Inv. No. 731–TA–1626 (Final)*.

By order of the Commission.

Issued: May 2, 2024.

Sharon Bellamy,
Supervisory Hearings and Information Officer.

BILLING CODE 7020–02–P

DEPARTMENT OF JUSTICE

Drug Enforcement Administration

[Docket No. DEA–1364]

Importer of Controlled Substances Application: Wedgewood Village Pharmacy, LLC

AGENCY: Drug Enforcement Administration, Justice.

ACTION: Notice of application.

SUMMARY: Wedgewood Village Pharmacy, LLC has applied to be registered as an importer of basic class(es) of controlled substance(s). Refer to **SUPPLEMENTARY INFORMATION** listed below for further drug information.

DATES: Registered bulk manufacturers of the affected basic class(es), and

applicants therefore, may submit electronic comments on or objections to the issuance of the proposed registration on or before June 7, 2024. Such persons may also file a written request for a hearing on the application on or before June 7, 2024.

ADDRESSES: The Drug Enforcement Administration requires that all comments be submitted electronically through the Federal eRulemaking Portal, which provides the ability to type short comments directly into the comment field on the web page or attach a file for lengthier comments. Please go to <https://www.regulations.gov> and follow the online instructions at that site for submitting comments. Upon submission of your comment, you will receive a Comment Tracking Number. Please be aware that submitted comments are not instantaneously available for public view on <https://www.regulations.gov>. If you have received a Comment Tracking Number, your comment has been successfully submitted and there is no need to resubmit the same comment. All requests for a hearing must be sent to: (1) Drug Enforcement Administration, Attn: Hearing Clerk/OALJ, 8701 Morrisette Drive, Springfield, Virginia 22152; and (2) Drug Enforcement Administration, Attn: DEA **Federal Register** Representative/DPW, 8701 Morrisette Drive, Springfield, Virginia 22152. All requests for a hearing should also be sent to: Drug Enforcement Administration, Attn: Administrator, 8701 Morrisette Drive, Springfield, Virginia 22152.

SUPPLEMENTARY INFORMATION: In accordance with 21 CFR 1301.34(a), this is notice that on April 15, 2024, Wedgewood Village Pharmacy, LLC, 7631 East Indian School Road, Suite 201, Scottsdale, Arizona 85251–3607, applied to be registered as an importer of the following basic class(es) of controlled substance(s):

Controlled substance	Drug code	Schedule
Etorphine HCL	9059	II
Thiafentanil	9729	II

The company plans to import the listed controlled substances for distribution to their customers. No other activities for these drug codes are authorized for this registration.

Approval of permit applications will occur only when the registrant’s business activity is consistent with what is authorized under 21 U.S.C. 952(a)(2). Authorization will not extend to the import of Food and Drug Administration-approved or non-

approved finished dosage forms for commercial sale.

Marsha Ikner,

Acting Deputy Assistant Administrator.

Agency Information Collection Activities; Proposed eCollection; eComments Requested; Extension of a Previously Approved Collection; Fee Waiver Request (EOIR–26A)

AGENCY: Executive Office for Immigration Review, Department of Justice.

ACTION: 30-Day notice.

SUMMARY: The Executive Office for Immigration Review (EOIR), Department of Justice (DOJ), will be submitting the following information collection request (ICR) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995.

DATES: Comments are encouraged and will be accepted for 30 days until June 7, 2024.

ADDRESSES: Written comments and recommendations for this information collection should be submitted within 30 days of the publication of this notice on the following website www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting “Currently under 30-day Review—Open for Public Comments” or by using the search function and entering either the title of the information collection or the OMB Control Number 1125–0003.

FOR FURTHER INFORMATION CONTACT: If you have additional comments especially on the estimated public burden or associated response time,

suggestions, or need a copy of the proposed information collection instrument with instructions or additional information, please contact Raechel Horowitz, Chief, Immigration Law Division, Office of Policy, Executive Office for Immigration Review, 5107 Leesburg Pike, Suite 2500, Falls Church, VA 22041, telephone: (703) 305–0473, Raechel.Horowitz@usdoj.gov.

SUPPLEMENTARY INFORMATION: This proposed information collection was previously published in the **Federal Register** on February 27, 2024, allowing for a 60-day comment period. Written comments and suggestions from the public and affected agencies concerning the proposed collection of information are encouraged. Your comments should address one or more of the following four points:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency’s estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and/or
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.*, permitting electronic submission of responses.

Overview of This Information Collection

1. *Type of Information Collection:* Extension of a currently approved collection.

2. *The Title of the Form/Collection:* Fee Waiver Request.

3. *The agency form number, if any, and the applicable component of the Department sponsoring the collection:* The form number is EOIR–26A, Executive Office for Immigration Review, United States Department of Justice.

4. *Affected public who will be asked or required to respond, as well as a brief abstract:* Primary: An individual submitting an appeal or motion to the Board of Immigration Appeals. An individual submitting an application or motion to the Office of the Chief Immigration Judge. Attorneys and qualified representatives representing an alien in immigration proceedings before EOIR. The obligation to respond is required to obtain/retain a benefit (fee waiver).

Abstract: The information on the fee waiver request form is used by the Board of Immigration Appeals and the Office of the Chief Immigration Judge to determine whether the requisite fee for an application, motion or appeal will be waived due to an individual’s financial situation.

5. *An estimate of the total number of respondents and the amount of time estimated for an average respondent to respond:* The estimated number of respondents for the Form EOIR–26A is 2,124. The estimated time per response is 1 hour.

6. *An estimate of the total public burden (in hours) associated with the collection:* The total annual burden hours for this collection is 2,124 hours.

7. *An estimate of the total annual cost burden associated with the collection, if applicable:* There are no capital or start-up costs associated with this information collection. The estimated public cost is zero.

TOTAL BURDEN HOURS

Activity	Number of respondents	Frequency	Total annual responses	Time per response (hour)	Total annual burden (hours)
Form EOIR–26A	2,124	1/annually	2,124	1	2,124
Unduplicated Totals	2,124		2,124		2,124

If additional information is required contact: Darwin Arceo, Department Clearance Officer, United States Department of Justice, Justice Management Division, Policy and Planning Staff, Two Constitution

Square, 145 N Street NE, 4W–218, Washington, DC.

Dated: May 5, 2024.

Darwin Arceo,

Department Clearance Officer for PRA, U.S. Department of Justice.

[FR Doc. 2024–09991 Filed 5–7–24; 8:45 am]

BILLING CODE 4410–30–P

DEPARTMENT OF LABOR**Agency Information Collection Activities; Submission for OMB Review; Quarterly Census of Employment and Wages (QCEW)**

ACTION: Notice of availability; request for comments.

SUMMARY: The Department of Labor (DOL) is submitting this Bureau of Labor Statistics (BLS)-sponsored information collection request (ICR) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995 (PRA). Public comments on the ICR are invited.

DATES: The OMB will consider all written comments that the agency receives on or before June 7, 2024.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting “Currently under 30-day Review—Open for Public Comments” or by using the search function.

Comments are invited on: (1) whether the collection of information is necessary for the proper performance of the functions of the Department, including whether the information will have practical utility; (2) the accuracy of the agency’s estimates of the burden and cost of the collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility and clarity of the information collection; and (4) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

FOR FURTHER INFORMATION CONTACT: Nicole Bouchet by telephone at 202–693–0213, or by email at DOL_PRA_PUBLIC@dol.gov.

SUPPLEMENTARY INFORMATION: Quarterly Census of Employment and Wages (QCEW) data, which are provided to BLS by State Workforce Agencies, are used by BLS as a sampling frame for its establishment surveys; for publishing of accurate current estimates of employment for the US, states, counties, and metropolitan areas; and publishing quarterly census totals of local establishment counts, employment, and wages. The Bureau of Economic Analysis uses the data to produce accurate personal income data in a timely matter for the US, States, and

local areas. Finally, the data is critical to the Employment Training Administration to administer unemployment insurance programs. For additional substantive information about this ICR, see the related notice published in the **Federal Register** on February 7, 2024 (89 FR 8441).

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless the OMB approves it and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid OMB Control Number. See 5 CFR 1320.5(a) and 1320.6.

Agency: DOL–BLS.

Title of Collection: Quarterly Census of Employment and Wages (QCEW).

OMB Control Number: 1220–0012.

Affected Public: State, Local and Tribal Governments.

Total Estimated Number of Respondents: 53.

Total Estimated Number of Responses: 212.

Total Estimated Annual Time Burden: 748,800 hours.

Total Estimated Annual Other Costs Burden: \$0.

(Authority: 44 U.S.C. 3507(a)(1)(D))

Nicole Bouchet,

Senior Paperwork Reduction Act Analyst.

BILLING CODE 4510–24–P

DEPARTMENT OF LABOR**Agency Information Collection Activities; Submission for OMB Review; Comment Request; Trade Adjustment Assistance Administrative Collection of States (TAAACS)**

ACTION: Notice of availability; request for comments.

SUMMARY: The Department of Labor (DOL) is submitting this Employment and Training Administration (ETA)-sponsored information collection request (ICR) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995 (PRA). Public comments on the ICR are invited.

DATES: The OMB will consider all written comments that the agency receives on or before June 7, 2024.

ADDRESSES: Written comments and recommendations for the proposed

information collection should be sent within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting “Currently under 30-day Review—Open for Public Comments” or by using the search function.

FOR FURTHER INFORMATION CONTACT:

Michael Howell by telephone at 202–693–6782, or by email at DOL_PRA_PUBLIC@dol.gov.

SUPPLEMENTARY INFORMATION: This Information Collection Request (ICR) is being submitted for the Department to collect data on state practices pursuant to the Trade Adjustment Assistance (TAA) program under section 239(c) of title II, chapter 2 of the Trade Act of 1974, as amended (19 U.S.C. 2271 *et seq.*). There is currently no comprehensive collection of information regarding the organization and practices of State Workforce Agencies (SWAs) regarding how the TAA Program is administered.

The submissions will be used by Employment and Training Administration (ETA) staff to collect information regarding SWA administration and operations of the TAA Program only to evaluate best practices. Failure to collect this information would prevent the Department from identifying the most effective mechanisms for increasing program efficiency. For additional substantive information about this ICR, see the related notice published in the **Federal Register** on February 13, 2024 (89 FR 10100).

Comments are invited on: (1) whether the collection of information is necessary for the proper performance of the functions of the Department, including whether the information will have practical utility; (2) the accuracy of the agency’s estimates of the burden and cost of the collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility and clarity of the information collection; and (4) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless the OMB approves it and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject

to penalty for failing to comply with a collection of information that does not display a valid OMB Control Number. See 5 CFR 1320.5(a) and 1320.6.

DOL seeks PRA authorization for this information collection for three (3) years. OMB authorization for an ICR cannot be for more than three (3) years without renewal. The DOL notes that information collection requirements submitted to the OMB for existing ICRs receive a month-to-month extension while they undergo review.

Agency: DOL–ETA.

Title of Collection: Trade Adjustment Assistance Administrative Collection of States (TAAACS).

OMB Control Number: 1205–0540.

Affected Public: State, local, and Tribal governments.

Total Estimated Number of

Respondents: 52.

Total Estimated Number of

Responses: 52.

Total Estimated Annual Time Burden: 312 hours.

Total Estimated Annual Other Costs Burden: \$0.

(Authority: 44 U.S.C. 3507(a)(1)(D))

BILLING CODE 4510–FN–P

DEPARTMENT OF LABOR

Occupational Safety and Health Administration

[OSHA–2011–0029]

Underground Construction Standard; Extension of the Office of Management and Budget’s (OMB) Approval of Information Collection (Paperwork) Requirements

AGENCY: Occupational Safety and Health Administration (OSHA), Labor.

ACTION: Request for public comments.

SUMMARY: OSHA solicits public comments concerning the proposal to extend the Office of Management and Budget’s (OMB) approval of the information collection requirements specified in the Underground Construction Standard.

DATES: Comments must be submitted (postmarked, sent, or received) by July 8, 2024.

ADDRESSES:

Electronically: You may submit comments and attachments electronically at <http://www.regulations.gov>, which is the Federal eRulemaking Portal. Follow the instructions online for submitting comments.

Docket: To read or download comments or other material in the docket, go to <https://www.regulations.gov>. Documents in the docket are listed in the <https://www.regulations.gov> index; however, some information (e.g., copyrighted material) is not publicly available to read or download through the websites. All submissions, including copyrighted material, are available for inspection through the OSHA Docket Office. Contact the OSHA Docket Office at (202) 693–2350 (TTY (877) 889–5627) for assistance in locating docket submissions.

Instructions: All submissions must include the agency name and OSHA docket number (OSHA–2011–0029) for the Information Collection Request (ICR). OSHA will place all comments, including any personal information, in the public docket, which may be made available online. Therefore, OSHA cautions interested parties about submitting personal information such as social security numbers and birthdates.

For further information on submitting comments, see the “Public Participation” heading in the section of this notice titled “**SUPPLEMENTARY INFORMATION.**”

FOR FURTHER INFORMATION CONTACT:

Seleda Perryman, Directorate of Standards and Guidance, OSHA, U.S. Department of Labor; telephone (202) 693–2222.

SUPPLEMENTARY INFORMATION:

I. Background

The Department of Labor, as part of the continuing effort to reduce paperwork and respondent (i.e., employer) burden, conducts a preclearance consultation program to provide the public with an opportunity to comment on proposed and continuing information collection requirements in accordance with the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3506(c)(2)(A)). This program ensures that information is in the desired format, reporting burden (time and costs) is minimal, the collection instruments are clearly understood, and OSHA’s estimate of the information collection burden is accurate. The Occupational Safety and Health Act of 1970 (OSH Act) (29 U.S.C. 651 *et seq.*) authorizes information collection by employers as necessary or appropriate for enforcement of the OSH Act or for developing information regarding the causes and prevention of occupational injuries, illnesses, and accidents (29 U.S.C. 657). The OSH Act also requires that OSHA obtain such information with minimum burden upon employers,

especially those operating small businesses, and to reduce to the maximum extent feasible unnecessary duplication of effort in obtaining information (29 U.S.C. 657).

The following sections describe who uses the information collected under each requirement, as well as how they use it.

Seven paragraphs in the Underground Construction Standard (“the Standard”), 29 CFR 1926.800, require employers to post warning signs or notices during underground construction; these paragraphs are (b)(3), (i)(3), (j)(1)(vi)(A), (m)(2)(ii), (o)(2), (q)(11), and (t)(1)(iv)(B). The warning signs and notices required by these paragraphs enable employers to effectively alert workers to the presence of hazards or potential hazards at the job site, thereby preventing worker exposure to hazards or potential hazards associated with underground construction that could cause death or serious harm.

Paragraph (t)(3)(xxi) of the Standard requires employers to inspect and load test hoists when they install them, and at least annually thereafter. They must also inspect, and load test a hoist after making any repairs or alterations to it that affect the structural integrity, and after tripping a safety device on the hoist. Employers must also prepare a certification record of each inspection and load test that includes specified information and maintain the most recent certification record until they complete the construction project.

Establishing and maintaining a written record of the most recent inspection and load test alerts equipment mechanics to problems identified during the inspection. Prior to returning the equipment to service, employers can review the records to ensure that the mechanics performed the necessary repairs and maintenance. Accordingly, by using only equipment that is in safe working order, employers will prevent severe injury and death to the equipment operators and other workers who work near the equipment. In addition, these records provide the most efficient means for OSHA compliance officers to determine that an employer performed the required inspections and load tests, thereby assuring that the equipment is safe to operate.

Paragraph (j)(3) of the Standard mandates that employers develop records for air quality tests performed under paragraph (j), including air quality tests required by paragraphs (j)(1)(ii)(A) through (j)(1)(iii)(A), (j)(1)(iii)(B), (j)(1)(iii)(C), (j)(1)(iii)(D), (j)(1)(iv), (j)(1)(v)(A), (j)(1)(v)(B), and (j)(2)(i) through (j)(2)(v). Paragraph (j)

also requires that air quality records include specified information, and that employers maintain the records until the underground construction project is complete. They must also make the records available to OSHA compliance officers on request.

Maintaining records of air quality tests allows employers to document atmospheric hazards, ascertain the effectiveness of controls (especially ventilation) and implement additional controls if necessary. Accordingly, these requirements prevent serious injury and death to workers who work on underground construction projects. In addition, these records provide an efficient means for workers to evaluate the accuracy and effectiveness of an employer's exposure reduction program, and for OSHA compliance officers to determine those employers performed the required tests and implemented appropriate controls.

II. Special Issues for Comment

OSHA has a particular interest in comments on the following issues:

- Whether the proposed information collection requirements are necessary for the proper performance of the agency's functions to protect workers, including whether the information is useful;
- The accuracy of OSHA's estimate of the burden (time and costs) of the information collection requirements, including the validity of the methodology and assumptions used;
- The quality, utility, and clarity of the information collected; and
- Ways to minimize the burden on employers who must comply; for example, by using automated or other technological information, and transmission techniques.

III. Proposed Actions

OSHA is requesting that OMB extend the approval of the information collection requirements contained in Underground Construction Standard. The agency is requesting an adjustment increase in burden hours from 77,616 hours to 77,618 hours, a difference of 2 hours. This slight increase is due the result of a rounding inconsistency.

OSHA will summarize the comments submitted in response to this notice and will include this summary in the request to OMB to extend the approval of the information collection requirements.

Type of Review: Extension of a currently approved collection.

Title: Underground Construction Standard.

OMB Control Number: 1218-0067.

Affected Public: Business or other for-profits.

Number of Respondents: 461.

Number of Responses: 1,172,939.

Frequency of Responses: On occasion.

Average Time per Response: Varies.

Estimated Total Burden Hours: 77,618.

Estimated Cost (Operation and Maintenance): \$165,600.

IV. Public Participation—Submission of Comments on This Notice and internet Access to Comments and Submissions

You may submit comments in response to this document as follows: (1) electronically at <https://www.regulations.gov>, which is the Federal eRulemaking Portal; (2) by facsimile (fax), if your comments, including attachments, are not longer than 10 pages you may fax them to the OSHA Docket Office at (202) 693-1648. All comments, attachments, and other material must identify the agency name and the OSHA docket number for the ICR (OSHA-2011-0029). You may supplement electronic submission by uploading document files electronically.

Comments and submissions are posted without change at <http://www.regulations.gov>. Therefore, OSHA cautions commenters about submitting personal information such as social security numbers and dates of birth. Although all submissions are listed in the <http://www.regulations.gov> index, some information (e.g., copyrighted material) is not publicly available to read or download from this website. All submission, including copyrighted material, are available for inspection and copying at the OSHA Docket Office. Information on using the <http://www.regulations.gov> website to submit comments and access the docket is available at the website's "User Tips" link.

Contact the OSHA Docket Office at (202) 693-2350, (TTY) (877) 889-5627 for information about materials not available from the website, and for assistance in using the internet to locate docket submissions.

V. Authority and Signature

James S. Frederick, Deputy Assistant Secretary of Labor for Occupational Safety and Health, directed the preparation of this notice. The authority for this notice is the Paperwork Reduction Act of 1995 (44 U.S.C. 3506 *et seq.*) and Secretary of Labor's Order No. 8-2020 (85 FR 58393).

Signed at Washington, DC, on May 2, 2024.

James S. Frederick,

Deputy Assistant Secretary of Labor for Occupational Safety and Health.

[FR Doc. 2024-09973 Filed 5-7-24; 8:45 am]

BILLING CODE 4510-26-P

NATIONAL ARCHIVES AND RECORDS ADMINISTRATION

[NARA-2024-033]

Agency Information Collection Activities: Proposed Collection; Comment Request

AGENCY: National Archives and Records Administration (NARA).

ACTION: Notice of proposed extension request.

SUMMARY: NARA proposes to request an extension from the Office of Management and Budget (OMB) of a currently approved information collection used by the public and other Federal agencies to use its official seal(s) and/or logo(s). We invite you to comment on this proposed information collection pursuant to the Paperwork Reduction Act of 1995.

DATES: We must receive written comments on or before July 8, 2024.

ADDRESSES: Send comments to Paperwork Reduction Act Comments (MP), Room 4100; National Archives and Records Administration; 8601 Adelphi Road; College Park, MD 20740-6001, or email them to tamee.fechhelm@nara.gov.

FOR FURTHER INFORMATION CONTACT: Contact Tamee Fechhelm by telephone at 301-837-1694 with requests for additional information or copies of the proposed information collection and supporting statement.

SUPPLEMENTARY INFORMATION: Pursuant to the Paperwork Reduction Act of 1995 (Pub. L. 104-13), NARA invites the public and other Federal agencies to comment on proposed information collections. The comments and suggestions should address one or more of the following points: (a) whether the proposed information collections are necessary for NARA to properly perform its functions; (b) NARA's estimate of the burden of the proposed information collections and its accuracy; (c) ways NARA could enhance the quality, utility, and clarity of the information it collects; (d) ways NARA could minimize the burden on respondents of collecting the information, including through information technology; and (e) whether these collections affects small businesses. We will summarize any comments you submit and include the

summary in our request for OMB approval. All comments will become a matter of public record. In this notice, NARA solicits comments concerning the following information collection:

Title: Use of NARA Official Seals and/or Logos.

OMB number: 3095–0052.

Agency form number: N/A.

Type of review: Regular.

Affected public: Business or other for-profit, not-for-profit institutions, Federal Government.

Estimated number of respondents: 37.

Estimated time per response: 15 minutes.

Frequency of response: On occasion.

Estimated total annual burden hours: 9 hours.

Abstract: The authority for this information collection is contained in 36 CFR 1200.8. NARA's three official seals are the National Archives and Records Administration seal; the National Archives seal; and the National Archives Trust Fund Board seal. The official seals are used to authenticate various copies of official records in our custody and for other official NARA business. Occasionally, when criteria are met, we will permit the public and other Federal agencies to use our official seals. A written request must be submitted to use the official seals, which we approve or deny using specific criteria.

Sheena Burrell,

Executive for Information Services/CIO.

BILLING CODE 7515–01–P

NUCLEAR REGULATORY COMMISSION

[Docket Nos. 72–65, 50–352, and 50–353; NRC–2024–0083]

Constellation Energy Generation, LLC.; Limerick Generating Station, Units 1 and 2; Independent Spent Fuel Storage Installation; Environmental Assessment and Finding of No Significant Impact

AGENCY: Nuclear Regulatory Commission.

ACTION: Notice; issuance.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is issuing an environmental assessment (EA) and a finding of no significant impact (FONSI) for an exemption request submitted by Constellation Energy Generation, LLC (Constellation) that would permit the Limerick Generating Station (LGS) to maintain three loaded and to load five new 89 multi-purpose canisters (MPC)

with continuous basket shims (CBS) in the HI–STORM Flood/Wind (FW) MPC Storage System at its LGS Units 1 and 2 Independent Spent Fuel Storage Installation (ISFSI) in a storage condition where the terms, conditions, and specifications in the Certificate of Compliance (CoC) No. 1032, Amendment No. 1, Revision No. 1, are not met.

DATES: The EA and FONSI referenced in this document are available on May 8, 2024.

ADDRESSES: Please refer to Docket ID NRC–2024–0083 when contacting the NRC about the availability of information regarding this document. You may obtain publicly available information related to this document using any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2024–0083. Address questions about Docket IDs in *Regulations.gov* to Stacy Schumann; telephone: 301–415–0624; email: Stacy.Schumann@nrc.gov. For technical questions, contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly available documents online in the ADAMS Public Documents collection at <https://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, at 301–415–4737, or by email to PDR.Resource@nrc.gov. For the convenience of the reader, instructions about obtaining materials referenced in this document are provided in the “Availability of Documents” section.

- *NRC's PDR:* The PDR, where you may examine and order copies of publicly available documents, is open by appointment. To make an appointment to visit the PDR, please send an email to PDR.Resource@nrc.gov or call 1–800–397–4209 or 301–415–4737, between 8 a.m. and 4 p.m. eastern time (ET), Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Christian Jacobs, Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington, DC 20555; telephone: 301–415–6825; email: Christian.Jacobs@nrc.gov.

SUPPLEMENTARY INFORMATION:

I. Introduction

The NRC is reviewing an exemption request from Constellation, dated April 5, 2024. Constellation is requesting an exemption, pursuant to section 72.7 of title 10 of the *Code of Federal Regulations* (10 CFR), in paragraphs 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11), and 72.214 that require Constellation to comply with the terms, conditions, and specifications of the CoC No. 1032, Amendment No. 1, Revision No. 1. If approved, the exemption would allow Constellation to maintain three loaded and to load five new MPC–89–CBS in the HI–STORM FW MPC Storage System at the LGS ISFSI in a storage condition where the terms, conditions, and specifications in the CoC No. 1032, Amendment No. 1, Revision No. 1, are not met.

II. Environmental Assessment

Background

The LGS is located in Limerick Township of Montgomery County, Pennsylvania, 1.7 miles (2.7 kilometers) southeast of the Borough of Pottstown. Unit 1 began operating in 1986 and Unit 2 began operating in 1990. Constellation has been storing spent fuel in an ISFSI at the LGS under a general license as authorized by 10 CFR part 72, subpart K, “General License for Storage of Spent Fuel at Power Reactor Sites.” Constellation currently uses the HI–STORM FW MPC Storage System under CoC No. 1032, Amendment No. 1, Revision No. 1, for dry storage of spent nuclear fuel in a specific MPC (*i.e.*, MPC–89) at the LGS ISFSI.

Description of the Proposed Action

The CoC is the NRC approved design for each dry cask storage system. The proposed action would exempt the applicant from the requirements of 10 CFR 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11), and 72.214 only as these requirements pertain to the use of the MPC–89–CBS in the HI–STORM FW MPC Storage System for the three already loaded systems and the near-term planned loading of five new canisters. The exemption would allow Constellation to maintain loaded and to load five new MPC–89–CBS in the HI–STORM FW MPC Storage System at the LGS ISFSI, despite the MPC–89–CBS in the HI–STORM FW MPC Storage System not being in compliance with the terms, conditions, and specifications in the CoC No. 1032, Amendment No. 1, Revision No. 1.

The HI–STORM FW MPC Storage System CoC provides the requirements,

conditions, and operating limits necessary for use of the system to store spent fuel. Holtec International (Holtec), the designer and manufacturer of the HI-STORM FW MPC Storage System, developed a variant of the design with CBS for the MPC-89, known as MPC-89-CBS. Holtec originally implemented the CBS variant design under the provisions of 10 CFR 72.48, "Changes, tests, and experiments," which allows licensees to make changes to cask designs without a CoC amendment under certain conditions (listed in 10 CFR 72.48(c)). After evaluating the specific changes to the cask designs, the NRC determined that Holtec erred when it implemented the CBS variant design under 10 CFR 72.48, as this was not the type of change allowed without a CoC amendment. For this reason, the NRC issued three Severity Level IV violations to Holtec. Prior to the issuance of the violations, Constellation had already loaded three MPC-89-CBS in a HI-STORM FW MPC Storage System, which are safely in storage on the LGS ISFSI pad. Additionally, Constellation plans to load five new MPC-89-CBS in the HI-STORM FW MPC Storage System beginning in August 2024. This exemption considers the storage of the already loaded systems and the near-term planned loading of the five canisters with the CBS variant basket design.

Need for the Proposed Action

Constellation requested this exemption because Constellation is currently out of compliance with NRC requirements, resulting from the previous loading of spent fuel into a storage system with the CBS variant basket design. This exemption would allow three already loaded MPC-89-CBS in the HI-STORM FW MPC Storage System to remain in storage at the LGS ISFSI. The applicant also requested the exemption in order to allow the LGS to load five new MPC-89-CBS in HI-STORM FW MPC Storage System at the LGS ISFSI for the future loading campaign beginning in August 2024.

Approval of the exemption request would allow Constellation to effectively manage the spent fuel pool margin and capacity to enable refueling and offloading fuel from the reactor. It would also allow Constellation to effectively manage the availability of the specialized workforce and equipment needed to support competing fuel loading and operational activities at the LGS and other Constellation sites.

Environmental Impacts of the Proposed Action

This EA evaluates the potential environmental impacts of granting an exemption from the terms, conditions, and specifications in CoC No. 1032, Amendment No. 1, Revision No. 1. The exemption would allow three loaded MPC-89-CBS in the HI-STORM FW MPC Storage System to remain loaded at the LGS ISFSI. The exemption also would allow a near-term loading of five new MPC-89-CBS in the HI-STORM FW MPC Storage System and allow the MPC-89-CBS to be maintained in storage at the LGS ISFSI.

The potential environmental impacts of storing spent nuclear fuel in NRC-approved storage systems have been documented in previous assessments. On July 18, 1990, the NRC amended 10 CFR part 72 to provide for the storage of spent fuel under a general license in cask designs approved by the NRC. The EA for the 1990 final rule analyzed the potential environmental impacts of using NRC-approved storage casks. The EA for the HI-STORM FW MPC Storage System, CoC No. 1032, Amendment No. 1, Revision No. 1, published in 2015, tiers off of the EA issued for the July 18, 1990, final rule. "Tiering" off earlier EAs is a standard process encouraged by the regulations implementing the National Environmental Policy Act of 1969 (NEPA) that entails the use of impact analyses of previous EAs to bound the impacts of a proposed action where appropriate. The Holtec HI-STORM FW MPC Storage System is designed to mitigate the effects of design basis accidents that could occur during storage. Considering the specific design requirements for the accident conditions, the design of the cask would prevent loss of containment, shielding, and criticality control. If there is no loss of containment, shielding, or criticality control, the environmental impacts would not be significant.

The exemptions requested by Constellation at the LGS site as they relate to CoC No. 1032, Amendment No. 1, Revision No. 1, for the HI-STORM FW MPC Storage System are limited to the use of the CBS variant basket design only for the already loaded three canisters and near-term planned loading of five canisters utilizing the CBS variant basket design. The staff has determined that this change in the basket will not result in either radiological or non-radiological environmental impacts that significantly differ from the environmental impacts evaluated in the environmental assessment supporting the issuance of CoC No. 1032, Amendment No. 1,

Revision No. 1. If the exemption is granted, there will be no significant change in the types or amounts of any effluents released, no significant increase in individual or cumulative public or occupational radiation exposure, and no significant increase in the potential for or consequences from radiological accidents. Accordingly, the Commission concludes that there would be no significant environmental impacts associated with the proposed action.

Alternative to the Proposed Action

The staff considered the no-action alternative. The no-action alternative (denial of the exemption request) would require Constellation to unload spent fuel from the MPC-89-CBS in the HI-STORM FW MPC Storage System to bring it in compliance with the CoC terms, conditions, and specifications in the CoC No. 1032, Amendment No. 1, Revision No. 1. Unloading the cask would subject station personnel to additional radiation exposure, generate additional contaminated waste, increase the risk of a possible fuel handling accident, and increase the risk of a possible heavy load handling accident. Furthermore, the removed spent fuel would need to be placed in the spent fuel pool, where it would remain until it could be loaded into an approved storage cask. Delay in the loading of this spent fuel into other casks could affect Constellation's ability to effectively manage the spent fuel pool capacity and reactor fuel offloading. Not allowing the planned future loading campaign could also affect Constellation's ability to manage pool capacity, reactor fuel offloading, and refueling. It could also pose challenges to spent fuel heat removal and impact the availability of the specialized workforce and equipment needed to support competing fuel loading and operational activities at the LGS and other Constellation sites. The NRC has determined that the no-action alternative would result in undue potential human health and safety impacts that could be avoided by proceeding with the proposed exemption, especially given that the staff has concluded in NRC's Safety Determination Memorandum, issued with respect to the enforcement action against Holtec regarding these violations, that fuel can be stored safely in the MPC-89-CBS canisters.

Agencies Consulted

The NRC provided the Pennsylvania Department of Environmental Protection (PDEP) a copy of this draft EA for review by an email dated April 29, 2024. On May 1, 2024, PDEP provided its concurrence by email.

III. Finding of No Significant Impact

The environmental impacts of the proposed action have been reviewed in accordance with the requirements in 10 CFR part 51, which implement NEPA. Based upon the foregoing environmental assessment, the NRC finds that the proposed action of granting the exemption from the regulations in 10

CFR 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11) and 72.214, which require the licensee to comply with the terms, conditions, and specifications of the CoC, in this case limited to past and specific future loadings of baskets with the CBS variant design, would not significantly impact the quality of the human environment. Accordingly, the NRC has determined

that a FONSI is appropriate, and an environmental impact statement is not warranted.

IV. Availability of Documents

The documents identified in the following table are available to interested persons through ADAMS, as indicated.

Document description	ADAMS accession No. or Federal Register notice
Constellation's request for exemption, dated April 5, 2024	ML24096A137.

NUCLEAR REGULATORY COMMISSION

[Docket Nos. 72–53, 50–254, and 50–265; NRC–2024–0074]

Constellation Energy Generation, LLC.; Quad Cities Nuclear Power Station, Units 1 and 2; Independent Spent Fuel Storage Installation; Exemption

AGENCY: Nuclear Regulatory Commission.

ACTION: Notice; issuance.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) issued an exemption to Constellation Energy Generation, LLC. that permits Quad Cities Nuclear Power Station (QCNPS) to load four model 68M multi-purpose canisters with continuous basket shims beginning June 2024 in the HI–STORM 100 Cask System at its QCNPS Units 1 and 2 independent spent fuel storage installation in a storage condition where the terms, conditions, and specifications in the Certificate of Compliance No. 1014, Amendment No. 8, Revision No. 1 are not met.

DATES: The exemption was issued on April 30, 2024.

ADDRESSES: Please refer to Docket ID NRC–2024–0074 when contacting the NRC about the availability of information regarding this document. You may obtain publicly available information related to this document using any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2024–0074. Address questions about Docket IDs in *Regulations.gov* to Stacy Schumann; telephone: 301–415–0624; email: Stacy.Schumann@nrc.gov. For technical questions, contact the individual listed in the “For Further Information Contact” section of this document.

- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly available documents online in the ADAMS Public Documents collection at <https://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, at 301–415–4737, or by email to PDR.Resource@nrc.gov. The ADAMS accession number for each document referenced (if it is available in ADAMS) is provided the first time that it is mentioned in this document.

- *NRC's PDR:* The PDR, where you may examine and order copies of publicly available documents, is open by appointment. To make an appointment to visit the PDR, please send an email to PDR.Resource@nrc.gov or call 1–800–397–4209 or 301–415–4737, between 8 a.m. and 4 p.m. eastern

time (ET), Monday through Friday, except Federal holidays.

Attachment—Exemption.

NUCLEAR REGULATORY COMMISSION

Docket Nos. 72–53, 50–254, and 50–265

Constellation Energy Generation, LLC; Quad Cities Nuclear Power Station Units 1 and 2; Independent Spent Fuel Storage Installation

I. Background

Constellation Energy Generation, LLC (Constellation) is the holder of Renewed Facility Operating License Nos. DPR–29 and DPR–30, which authorize operation of the Quad Cities Nuclear Power Station, Units 1 and 2 (QCNPS) in Cordova, Illinois, pursuant to Part 50 of Title 10 of the *Code of Federal Regulations* (10 CFR), “Domestic Licensing of Production and Utilization Facilities.” The licenses provide, among other things, that the facility is subject to all rules, regulations, and orders of

the U.S. Nuclear Regulatory Commission (NRC) now or hereafter in effect.

Consistent with 10 CFR part 72, subpart K, “General License for Storage of Spent Fuel at Power Reactor Sites,” a general license is issued for the storage of spent fuel in an Independent Spent Fuel Storage Installation (ISFSI) at power reactor sites to persons authorized to possess or operate nuclear power reactors under 10 CFR part 50. Constellation is authorized to operate nuclear power reactors under 10 CFR part 50 and holds a 10 CFR part 72 general license for storage of spent fuel at the QCNPS ISFSI. Under the terms of the general license, Constellation stores spent fuel at its QCNPS ISFSI using the HI-STORM 100 Cask System in accordance with Certificate of Compliance (CoC) No. 1014, Amendment No. 8, Revision No. 1.

II. Request/Action

By a letter dated March 15, 2024 (Agencywide Documents Access and Management System [ADAMS] Accession No. ML24075A001), Constellation requested an exemption from the requirements of 10 CFR 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11), and 72.214 that require QCNPS to comply with the terms, conditions, and specifications of the CoC No. 1014, Amendment No. 8, Revision No. 1 (ML16041A233). If approved, Constellation’s exemption request would accordingly allow QCNPS to load four Multi-Purpose Canisters (MPC) with an unapproved variant basket design with continuous basket shims (CBS) (*i.e.*, MPC–68M–CBS) in the HI-STORM 100 Cask System, beginning June 2024, and thus, to load the systems in a storage condition where the terms, conditions, and specifications in the CoC No. 1014, Amendment No. 8, Revision No. 1 are not met.

Constellation currently uses the HI-STORM 100 Cask System under CoC No. 1014, Amendment No. 8, Revision No. 1, for dry storage of spent nuclear fuel in MPC–68M at the QCNPS ISFSI. Holtec International (Holtec), the designer and manufacturer of the HI-STORM 100 Cask System, developed a variant of the design with CBS for the MPC–68M, known as MPC–68M–CBS. Holtec performed a non-mechanistic tip-over analysis with favorable results and implemented the CBS variant design under the provisions of 10 CFR 72.48, “Changes, tests, and experiments,” which allows licensees to make changes to cask designs without a CoC amendment under certain conditions (listed in 10 CFR 72.48(c)). After

evaluating the specific changes to the cask designs, the NRC determined that Holtec erred when it implemented the CBS variant design under 10 CFR 72.48, as this is not the type of change allowed without a CoC amendment. For this reason, the NRC issued three Severity Level IV violations to Holtec (ML24016A190).

Constellation’s near-term loading campaign for the QCNPS ISFSI includes loading four MPC–68M–CBS in the HI-STORM 100 Cask System beginning in June 2024. While Holtec was required to submit a CoC amendment to the NRC to seek approval of the CBS variant design, such a process will not be completed in time to inform decisions for this near-term loading campaign. Therefore, Constellation submitted this exemption request to allow for the future loading of four new MPC–68M–CBS beginning in June 2024, at the QCNPS ISFSI. This exemption is limited to the use of four MPC–68M–CBS in the HI-STORM 100 Cask System for the specific near-term planned loading beginning June 2024.

III. Discussion

Pursuant to 10 CFR 72.7, “Specific exemptions,” the Commission may, upon application by any interested person or upon its own initiative, grant such exemptions from the requirements of the regulations of 10 CFR part 72 as it determines are authorized by law and will not endanger life or property or the common defense and security and are otherwise in the public interest.

A. The Exemption Is Authorized by Law

This exemption would allow Constellation to load four MPC–68M–CBS in the HI-STORM 100 Cask System beginning June 2024 at its QCNPS ISFSI in a storage condition where the terms, conditions, and specifications in the CoC No. 1014, Amendment No. 8, Revision No. 1, are not met. Constellation is requesting an exemption from the provisions in 10 CFR part 72 that require the licensee to comply with the terms, conditions, and specifications of the CoC for the approved cask model it uses. Section 72.7 allows the NRC to grant exemptions from the requirements of 10 CFR part 72. This authority to grant exemptions is consistent with the Atomic Energy Act of 1954, as amended, and is not otherwise inconsistent with NRC’s regulations or other applicable laws. Additionally, no other law prohibits the activities that would be authorized by the exemption. Therefore, the NRC concludes that there is no statutory prohibition on the issuance of the requested exemption, and the NRC

is authorized to grant the exemption by law.

B. The Exemption Will Not Endanger Life or Property or the Common Defense and Security

This exemption would allow Constellation to load four MPC–68M–CBS in the HI-STORM 100 Cask System beginning June 2024 at the QCNPS ISFSI in a storage condition where the terms, conditions, and specifications in the CoC No. 1014, Amendment No. 8, Revision No. 1, are not met. In support of its exemption request, Constellation asserts that issuance of the exemption would not endanger life or property because the administrative controls the applicant has in place prevent a tip-over or handling event and that the containment boundary would be maintained in such an event. Constellation relies, in part, on the approach in the NRC’s Safety Determination Memorandum (ML24018A085). The NRC issued this Safety Determination Memorandum to address whether, with respect to the enforcement action against Holtec regarding this violation, there was any need to take an immediate action for the cask systems that were already loaded with non-compliant basket designs. The Safety Determination Memorandum documents a risk-informed approach concluding that, during the design basis event of a non-mechanistic tip-over, the fuel in the basket in the MPC–68M–CBS remains in a subcritical condition.

Constellation also provided site-specific technical information, including information explaining why the use of the approach in the NRC’s Safety Determination Memorandum is appropriate for determining the safe use of the CBS variant baskets at the QCNPS ISFSI. Specifically, Constellation described that the analysis of the tip-over design basis event that is relied upon in the NRC’s Safety Determination Memorandum, which demonstrates that the MPC confinement barrier is maintained, is documented in the updated final safety analysis report (UFSAR) for the HI-STORM 100 Cask System CoC No. 1014, Amendment 8, Revision No. 1, that is used at the QCNPS site. Constellation also described its administrative controls for handling of the HI-STORM 100 Cask System at the QCNPS ISFSI to prevent a tip-over or handling event. Those controls include operational procedures that demonstrate that the system is handled with a single failure proof device, designed in accordance with ANSI N14.6, “Radioactive Materials—Special Lifting Devices for Shipping Containers Weighing 10 000 Pounds

(4500 kg) or More,” for heavy load lifting component, inside of the Reactor Buildings and during transport to the ISFSI. In addition, the transporter employs redundant drop features.

Additionally, Constellation provided specific information from QCNPS’s 72.212 Evaluation Report, Revision 17, indicating that during the design basis event of a non-mechanistic tip-over, QCNPS’s ISFSI would meet the requirements in 10 CFR 72.104, “Criteria for radioactive materials in effluents and direct radiation from an ISFSI or MRS,” and 72.106, “Controlled area of an ISFSI or MRS.” Specifically, Constellation described that, in the highly unlikely event of a tip-over, any potential fuel damage from a non-mechanistic tip-over event would be localized, the confinement barrier would be maintained, and the shielding material would remain intact. Coupled with the distance of the QCNPS ISFSI to the site area boundary, Constellation concluded that compliance with 72.104 and 72.106 is not impacted by approving this exemption request.

The NRC staff reviewed the information provided by Constellation and concludes that issuance of the exemption would not endanger life or property because the administrative controls that Constellation has in place at the QCNPS ISFSI sufficiently minimize the possibility of a tip-over or handling event, and that the containment boundary would be maintained in such an event. The staff confirmed that these administrative controls comply with the technical specifications and UFSAR for the HI-STORM 100 Cask System CoC No. 1014, Amendment 8, Revision No. 1, that is used at the QCNPS site. In addition, the staff confirmed that the information provided by Constellation regarding the QCNPS’s 72.212 Evaluation Report, Revision 17, demonstrates that the consequences of normal and accident conditions would be within the regulatory limits of the 10 CFR 72.104 and 10 CFR 72.106. The staff also determined that the requested exemption is not related to any aspect of the physical security or defense of the QCNPS ISFSI; therefore, granting the exemption would not result in any potential impacts to common defense and security.

For these reasons, the NRC staff has determined that under the requested exemption, the storage system will continue to meet the safety requirements of 10 CFR part 72 and the offsite dose limits of 10 CFR part 20 and, therefore, will not endanger life or property or the common defense and security.

C. The Exemption Is Otherwise in the Public Interest

The proposed exemption would allow Constellation to load four MPC-68M-CBS in the HI-STORM 100 Cask System beginning in June 2024 at the QCNPS ISFSI, even though the CBS variant basket design is not part of the approved CoC No. 1014, Amendment No. 8, Revision No. 1. According to Constellation, the exemption is in the public interest because the inability to load fuel into dry storage in the future loading campaign would impact Constellation’s ability to offload fuel from the QCNPS reactor units, consequently impacting continued safe reactor operation.

Constellation stated that delaying the future loading campaign would impact its ability to effectively manage the margin to full core discharge capacity in the QCNPS Unit 1 and Unit 2 spent fuel pools. The low spent fuel pool capacity would make it difficult to refuel and present potential risks to fuel handling operations during pre- and post-outage. In addition, a crowded spent fuel pool would challenge the decay heat removal demand of the pool and, therefore, increase the consequence of a loss of fuel pool cooling event. The additional fuel moves that would be required to manage the fuel pool loading with extra bundles in the pool would also increase the likelihood of a fuel handling accident. Furthermore, QCNPS planned the cask loading campaign years in advance based on availability of the specialized workforce and equipment that is shared throughout the Constellation fleet. These specialty resources support competing priorities including refueling outages, loading campaigns, fuel pool cleanouts, fuel inspections, fuel handling equipment upgrade and maintenance, fuel sipping, new fuel receipt, and crane maintenance and upgrades. Any delays would have a cascading impact on other scheduled specialized activities.

For the reasons described by Constellation in the exemption request, the NRC agrees that it is in the public interest to grant the exemption. If the exemption is not granted, to comply with the CoC, Constellation would have to delay future loading and keep the spent nuclear fuel in the spent fuel pool. As described by Constellation, this scenario would affect Constellation’s ability to effectively manage the spent pool capacity and reactor fuel offloading at QCNPS. In addition, a crowded spent fuel pool would challenge the decay heat removal demand of the pool increasing the consequence of a loss of fuel pool cooling event; and, because

additional fuel moves would be required, it would also increase the likelihood of a fuel handling accident. Moreover, the rescheduling of the specialized resources for the future loading campaign would impact the operations of QCNPS and other Constellation sites.

Therefore, the staff concludes that approving the exemption is in the public interest.

Environmental Consideration

The NRC staff also considered whether there would be any significant environmental impacts associated with the exemption. For this proposed action, the NRC staff performed an environmental assessment pursuant to 10 CFR 51.30. The environmental assessment concluded that the proposed action would not significantly impact the quality of the human environment. The NRC staff concluded that the proposed action would not result in any changes in the types or amounts of any radiological or non-radiological effluents that may be released offsite, and there would be no significant increase in occupational or public radiation exposure because of the proposed action. The environmental assessment and the finding of no significant impact was published on April 30, 2024 (89 FR 34282).

IV. Conclusion

Based on these considerations, the NRC has determined that, pursuant to 10 CFR 72.7, the exemption is authorized by law, will not endanger life or property or the common defense and security, and is otherwise in the public interest. Therefore, the NRC grants Constellation an exemption from the requirements of §§ 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11), and 72.214 with respect to the future loading in the HI-STORM 100 Cask System of four MPC-68M-CBS beginning in June 2024.

This exemption is effective upon issuance.

Dated: April 30, 2024.

SUPPLEMENTARY INFORMATION:

I. Introduction

The NRC is reviewing an exemption request from Energy Harbor Nuclear Corporation, dated February 27, 2024, and supplemented by VistraOps on March 22, 2024. VistraOps is requesting an exemption, pursuant to section 72.7 of title 10 of the *Code of Federal Regulations* (10 CFR), in paragraphs 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11), and 72.214 that require VistraOps to comply with the terms, conditions, and specifications of the CoC No. 1032, Amendment No. 5. If approved, the exemption would allow VistraOps to load two MPCs which contain the 89-assembly CBS basket (MPC–89–CBS) beginning in August 2024 in the HI–STORM FW Storage System at the Perry ISFSI in a storage condition where the terms, conditions, and specifications in the CoC No. 1032, Amendment No. 5 are not met.

II. Environmental Assessment

Background

Perry is located on a 1,100 acre site on Lake Erie, 40 miles northeast of Cleveland in North Perry, Ohio. Unit 1 began operating in 1987. VistraOps has been storing spent fuel in an ISFSI at Perry under a general license as authorized by 10 CFR part 72, subpart K, “General License for Storage of Spent Fuel at Power Reactor Sites.” VistraOps

currently uses the HI-STORM FW Storage System under CoC No. 1032, Amendment No. 5 for dry storage of spent nuclear fuel in a specific MPC (i.e., MPC-89) at the Perry ISFSI.

Description of the Proposed Action

The CoC is the NRC approved design for each dry cask storage system. The proposed action would exempt the applicant from the requirements of 10 CFR 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11), and 72.214 only as these requirements pertain to the use of the MPC-89-CBS in the HI-STORM FW Storage System for near-term planned cask loadings. The exemption would allow VistraOps to load two MPC-89-CBS in the HI-STORM FW Storage System at the Perry ISFSI, despite the MPC-89-CBS in the HI-STORM FW Storage System not being in compliance with the terms, conditions, and specifications in the CoC No. 1032, Amendment No. 5.

The CoC for the HI-STORM FW Storage System provides the requirements, conditions, and operating limits necessary for use of the system to store spent fuel. Holtec International (Holtec), the designer and manufacturer of the HI-STORM FW Storage System, developed a variant of the design with CBS for the MPC-89, known as MPC-89-CBS. Holtec originally implemented the CBS variant design under the provisions of 10 CFR 72.48, which allows licensees to make changes to cask designs without a CoC amendment under certain conditions (listed in 10 CFR 72.48(c)). After evaluating the specific changes to the cask designs, the NRC determined that Holtec erred when it implemented the CBS variant design under 10 CFR 72.48, as this was not the type of change allowed without a CoC amendment. For this reason, the NRC issued three Severity Level IV violations to Holtec. Perry plans to load two MPC-89-CBS canisters in the HI-STORM FW overpacks beginning in August 2024. This exemption considers the near-term planned loading of the two canisters with the CBS variant basket design.

Need for the Proposed Action

VistraOps requested this exemption in order to allow loading of two MPC-89-CBS in HI-STORM FW Storage System at the Perry ISFSI for the future loading campaign scheduled in August 2024.

Approval of the exemption request would allow VistraOps to effectively manage the spent fuel pool margin and capacity to maintain full core offload capability until its next storage cask loading campaign in 2028. Otherwise, after the refueling outages in 2025 and 2027, Perry would have an insufficient

number of open fuel cells (a deficit of 25 open cells) in the spent fuel pool. It would also allow VistraOps to effectively manage the availability of the specialized workforce and equipment needed to support competing fuel loading and operational activities at the Perry ISFSI.

Environmental Impacts of the Proposed Action

This EA evaluates the potential environmental impacts of granting an exemption from the terms, conditions, and specifications in CoC No. 1032, Amendment No. 5. The exemption would allow two MPC-89-CBS canisters to be loaded in the HI-STORM FW Storage System in the near-term loading campaign scheduled for August 2024.

The potential environmental impacts of storing spent nuclear fuel in NRC-approved storage systems have been documented in previous assessments. On July 18, 1990, the NRC amended 10 CFR part 72 to provide for the storage of spent fuel under a general license in cask designs approved by the NRC. The EA for the 1990 final rule analyzed the potential environmental impacts of using NRC-approved storage casks. The EA for the HI-STORM FW Storage System, CoC No. 1032, Amendment No. 5, published in 2020, tiers off of the EA issued for the July 18, 1990, final rule. “Tiering” off earlier EAs is a standard process encouraged by the regulations implementing the National Environmental Policy Act of 1969 (NEPA) that entails the use of impact analyses of previous EAs to bound the impacts of a proposed action where appropriate. The Holtec HI-STORM FW Storage System is designed to mitigate the effects of design basis accidents that could occur during storage. Considering the specific design requirements for the accident conditions, the design of the cask would prevent loss of containment, shielding, and criticality control. If there is no loss of containment, shielding, or criticality control, the environmental impacts would not be significant.

The exemptions requested by VistraOps at the Perry site as they relate to CoC No. 1032, Amendment No. 5 for the HI-STORM FW Storage System are limited to the near-term planned loading of two storage systems utilizing the CBS variant basket design. The staff determined that this change in the basket would not result in either radiological or non-radiological environmental impacts that significantly differ from the environmental impacts evaluated in the environmental assessment supporting the issuance of CoC No. 1032, Amendment No. 5. If the

exemption is granted, there would be no significant change in the types or amounts of any effluents released, no significant increase in individual or cumulative public or occupational radiation exposure, and no significant increase in the potential for or consequences from radiological accidents. Accordingly, the Commission concludes that there would be no significant environmental impacts associated with the proposed action.

Alternative to the Proposed Action

The staff considered the no-action alternative. The no-action alternative (denial of the exemption request) would require VistraOps to delay the near-term planned loading of spent fuel in the MPC-89-CBS in the HI-STORM FW Storage System at the Perry ISFSI. Delaying the loading of spent fuel into the two casks in August 2024 could affect VistraOps’s ability to effectively manage pool capacity, reactor fuel offloading, and refueling. It could also pose challenges to spent fuel heat removal and impact the availability of the specialized workforce and equipment needed to support competing fuel loading and operational activities at Perry and other VistraOps sites. The NRC determined that the no-action alternative would result in undue potential human health and safety impacts that could be avoided by proceeding with the proposed exemption, especially given that the staff has concluded in NRC’s Safety Determination Memorandum, issued with respect to the enforcement action against Holtec regarding these violations, that fuel can be stored safely in the MPC-89-CBS casks.

Agencies Consulted

The NRC provided the Ohio Emergency Management Agency (OH-EMA) a copy of this draft EA for review by an email dated April 25, 2024. On April 25, 2024, OH-EMA stated via email that it had no comments on the draft EA and FONSI.

III. Finding of No Significant Impact

The environmental impacts of the proposed action have been reviewed in accordance with the requirements in 10 CFR part 51, which implement NEPA. Based upon the foregoing environmental assessment, the NRC finds that the proposed action of granting the exemption from the regulations in 10 CFR 72.212(a)(2), 72.212(b)(3), 72.212(b)(5)(i), 72.212(b)(11) and 72.214, which require the licensee to comply with the terms, conditions, and specifications of the CoC, in this case limited to specific future loading of two

canisters with the 89-assembly CBS variant design basket beginning August 2024, would not significantly impact the quality of the human environment. Accordingly, the NRC has determined

that a FONSI is appropriate, and an environmental impact statement is not warranted.

IV. Availability of Documents

The documents identified in the following table are available to interested persons through ADAMS, as indicated.

Document description	ADAMS accession No. or Federal Register notice
Issuance of order for license transfer, dated September 28, 2023	ML23237B448 (Package).

New Postal Products

AGENCY: Postal Regulatory Commission.

ACTION: Notice.

SUMMARY: The Commission is noticing a recent Postal Service filing for the Commission’s consideration concerning a negotiated service agreement. This notice informs the public of the filing, invites public comment, and takes other administrative steps.

DATES: *Comments are due:* May 9, 2024.

ADDRESSES: Submit comments electronically via the Commission’s Filing Online system at <http://www.prc.gov>. Those who cannot submit comments electronically should contact the person identified in the **FOR FURTHER INFORMATION CONTACT** section by telephone for advice on filing alternatives.

FOR FURTHER INFORMATION CONTACT:

David A. Trissell, General Counsel, at 202–789–6820.

SUPPLEMENTARY INFORMATION:

Table of Contents

- I. Introduction
- II. Docketed Proceeding(s)

I. Introduction

The Commission gives notice that the Postal Service filed request(s) for the Commission to consider matters related to negotiated service agreement(s). The request(s) may propose the addition or removal of a negotiated service agreement from the Market Dominant or the Competitive product list, or the modification of an existing product currently appearing on the Market Dominant or the Competitive product list.

Section II identifies the docket number(s) associated with each Postal Service request, the title of each Postal Service request, the request’s acceptance date, and the authority cited by the Postal Service for each request. For each request, the Commission appoints an officer of the Commission to represent the interests of the general public in the proceeding, pursuant to 39 U.S.C. 505 (Public Representative). Section II also establishes comment deadline(s) pertaining to each request.

The public portions of the Postal Service’s request(s) can be accessed via the Commission’s website (<http://www.prc.gov>). Non-public portions of the Postal Service’s request(s), if any, can be accessed through compliance

with the requirements of 39 CFR 3011.301.¹

The Commission invites comments on whether the Postal Service’s request(s) in the captioned docket(s) are consistent with the policies of title 39. For request(s) that the Postal Service states concern Market Dominant product(s), applicable statutory and regulatory requirements include 39 U.S.C. 3622, 39 U.S.C. 3642, 39 CFR part 3030, and 39 CFR part 3040, subpart B. For request(s) that the Postal Service states concern Competitive product(s), applicable statutory and regulatory requirements include 39 U.S.C. 3632, 39 U.S.C. 3633, 39 U.S.C. 3642, 39 CFR part 3035, and 39 CFR part 3040, subpart B. Comment deadline(s) for each request appear in section II.

II. Docketed Proceeding(s)

1. *Docket No(s).*: MC2024–264 and CP2024–270; *Filing Title:* USPS Request to Add Priority Mail & USPS Ground Advantage Contract 237 to Competitive Product List and Notice of Filing Materials Under Seal; *Filing Acceptance Date:* May 1, 2024; *Filing Authority:* 39 U.S.C. 3642, 39 CFR 3040.130 through 3040.135, and 39 CFR 3035.105; *Public Representative:* Kenneth R. Moeller; *Comments Due:* May 9, 2024.

2. *Docket No(s).*: MC2024–265 and CP2024–271; *Filing Title:* USPS Request to Add Priority Mail & USPS Ground Advantage Contract 238 to Competitive

¹ See Docket No. RM2018–3, Order Adopting Final Rules Relating to Non-Public Information, June 27, 2018, Attachment A at 19–22 (Order No. 4679).

Product List and Notice of Filing Materials Under Seal; *Filing Acceptance Date*: May 1, 2024; *Filing Authority*: 39 U.S.C. 3642, 39 CFR 3040.130 through 3040.135, and 39 CFR 3035.105; *Public Representative*: Kenneth R. Moeller; *Comments Due*: May 9, 2024.

3. *Docket No(s)*: MC2024–266 and CP2024–272; *Filing Title*: USPS Request to Add Priority Mail & USPS Ground Advantage Contract 239 to Competitive Product List and Notice of Filing Materials Under Seal; *Filing Acceptance Date*: May 1, 2024; *Filing Authority*: 39 U.S.C. 3642, 39 CFR 3040.130 through 3040.135, and 39 CFR 3035.105; *Public Representative*: Kenneth R. Moeller; *Comments Due*: May 9, 2024.

This Notice will be published in the **Federal Register**.

SECURITIES AND EXCHANGE COMMISSION

[Investment Company Act Release No. 35184; File No. 813–00398]

F&W Investments LP and Fenwick & West LLP

May 2, 2024.

AGENCY: Securities and Exchange Commission (“Commission” or “SEC”).

ACTION: Notice.

Notice of application for an order (“Order”) under sections 6(b) and 6(e) of the Investment Company Act of 1940 (the “Act”) granting an exemption from all provisions of the Act, except sections 9, 17, 30, and 36 through 53, and the rules and regulations under the Act (the “Rules and Regulations”). With respect to sections 17(a), (d), (f), (g), and (j) of the Act, sections 30(a), (b), (e), and (h) of the Act and the Rules and Regulations and rule 38a–1 under the Act, applicants request a limited exemption as set forth in the application.

SUMMARY OF APPLICATION: Applicants request an order to exempt certain limited liability companies, partnerships, trusts, corporations or other entities (“Investment Funds”) formed for the benefit of eligible employees of Fenwick & West LLP and its affiliates from certain provisions of the Act. Each Investment Fund will be an “employees’ securities company” within the meaning of section 2(a)(13) of the Act.

APPLICANTS: F&W Investments LP and Fenwick & West LLP.

FILING DATES: The application was filed on January 25, 2021, and amended on July 27, 2021, February 24, 2023, and April 23, 2024.

HEARING OR NOTIFICATION OF HEARING:

An order granting the requested relief will be issued unless the Commission orders a hearing. Interested persons may request a hearing on any application by emailing the SEC’s Secretary at Secretaries-Office@sec.gov and serving the Applicants with a copy of the request by email, if an email address is listed for the relevant Applicant below, or personally or by mail, if a physical address is listed for the relevant Applicant below. Hearing requests should be received by the Commission by 5:30 p.m. on May 28, 2024, and should be accompanied by proof of service on applicants, in the form of an affidavit or, for lawyers, a certificate of service. Pursuant to rule 0–5 under the Act, hearing requests should state the nature of the writer’s interest, any facts bearing upon the desirability of a hearing on the matter, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by emailing the Commission’s Secretary at Secretaries-Office@sec.gov.

ADDRESSES: The Commission: Secretaries-Office@sec.gov. Applicants: Katie Lieu, KLieu@fenwick.com and Byron Dailey, BDailey@fenwick.com.

FOR FURTHER INFORMATION CONTACT:

Laura L. Solomon, Senior Counsel, or Kyle R. Ahlgren, Branch Chief, at (202) 551–6825 (Division of Investment Management, Chief Counsel’s Office).

SUPPLEMENTARY INFORMATION: For Applicants’ representations, legal analysis, and conditions, please refer to Applicants’ amendment no. 3 to application, dated April 23, 2024, which may be obtained via the Commission’s website by searching for the file number at the top of this document, or for an Applicant using the Company name search field, on the SEC’s EDGAR system.

The SEC’s EDGAR system may be searched at <http://www.sec.gov/edgar/searchedgar/legacy/companysearch.html>. You may also call the SEC’s Public Reference Room at (202) 551–8090.

For the Commission, by the Division of Investment Management, under delegated authority.

J. Matthew DeLesDernier,
Deputy Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–100048; File No. SR–NSCC–2024–002]

Self-Regulatory Organizations; National Securities Clearing Corporation; Order Approving of Proposed Rule Change To Accommodate a Shorter Standard Settlement Cycle and Make Other Changes

May 2, 2024.

I. Introduction

On March 8, 2024, National Securities Clearing Corporation (“NSCC”) filed with the Securities and Exchange Commission (“Commission”) proposed rule change SR–NSCC–2024–002 (“Proposed Rule Change”) pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (“Act”)¹ and Rule 19b–4 thereunder.² The Proposed Rule Change was published for comment in the **Federal Register** on March 21, 2024.³ The Commission has received no comments on the Proposed Rule Change. For the reasons discussed below, the Commission is approving the Proposed Rule Change.

II. Background

NSCC provides central counterparty services, including clearing, settlement, risk management, and a guarantee of completion, for virtually all broker-to-broker trades involving equity securities, corporate and municipal debt securities, and certain other securities.

NSCC’s Rules⁴ consider the current standard settlement cycle of two business days after the trade date (“T+2”) as “regular way” settlement, and as such, are currently designed to accommodate this settlement cycle. The T+2 settlement cycle has been in place since 2017 when the Commission amended Exchange Act Rule 15c6–1(a)⁵

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b–4.

³ See Securities Exchange Act Release No. 99750 (Mar. 15, 2024), 89 FR 20267 (Mar. 21, 2024) (File No. SR–NSCC–2024–002) (“Notice of Filing”).

⁴ Capitalized terms not defined herein are defined in the Rules and Procedures of NSCC (“Rules”), available at <https://www.dtcc.com/legal/rules-and-procedures.aspx>.

⁵ Exchange Act Rule 15c6–1(a), as amended in 2017, required, with certain exceptions, that a broker or dealer shall not effect or enter into a contract for the purchase or sale of a security (other than an exempted security, government security, municipal security, commercial paper, bankers’ acceptances, or commercial bills) that provides for payment of funds and delivery of securities later than the second business day after the date of the contract unless otherwise expressly agreed to by the parties at the time of the transaction. See 17 CFR 240.15c6–1(a).

to shorten the standard settlement cycle from three business days after the trade date, in an effort to reduce credit, market, and liquidity risk, and as a result, reduce systemic risk for U.S. market participants.⁶ In an effort to further promote investor protection, reduce risk in the financial system, and increase operational and capital efficiency in the securities market, the Commission has adopted a rule change shortening the standard settlement cycle from T+2 to one business day after the trade date (“T+1”) (“Shortened Settlement Cycle”), with a compliance date of May 28, 2024.⁷

NSCC is proposing to amend the Rules to be consistent with this upcoming industry-wide move to the Shortened Settlement Cycle. However, NSCC states that the core functions of NSCC will generally continue to operate in the same way in the Shortened Settlement Cycle.⁸

III. Description of the Proposed Rule Change

NSCC proposes changes to address two categories of rules: (A) rules that have timeframes and/or cutoff times that are tied to the standard settlement cycle, and (B) rules affected by process changes being made to accommodate the Shortened Settlement Cycle. In general, these provisions either directly track the timeframe and/or Settlement Date of the standard settlement cycle, address non-standard settlement cycles, or provide for timeframes and/or cutoff times that are connected to or are affected by the timing of the standard settlement cycle and would need to be changed to accommodate the Shortened Settlement Cycle. The proposed changes to accommodate the upcoming move to the Shortened Settlement Cycle would impact the following NSCC Rules: Definitions (Rule 1 and Procedure XIII); Supplemental Liquidity Deposits (Rule 4A); Trade Comparison and Recording (Procedure II); the Special Representative Service (Procedure IV); the Continuous Net Settlement (“CNS”) System and CNS Accounting Operation (Rule 11 and Procedure VII); the Balance Order Accounting Operation (Procedure V); the Foreign Security Accounting Operation (Procedure VI); the ACATS Settlement Accounting Operation (Procedure XVIII); and the NSCC

Guaranty (Addendum K).⁹ These proposed changes are discussed below.

NSCC is also proposing other technical changes and corrections to the Rules that are not required to accommodate the move to the Shortened Settlement Cycle but would provide additional clarity and accuracy in the Rules.¹⁰

A. Changes to Timeframes and/or Cutoff Times Tied to the Standard Settlement Cycle

The Rules contain certain provisions that refer to “T+2” as the timeframe and Settlement Date of the standard settlement cycle and consider this as “regular way” settlement. These provisions would be updated to reflect the change to “T+1” and that T+1 would be Regular Way settlement under the Shortened Settlement Cycle.¹¹ Similarly, a number of provisions in the Rules refer to timeframes and/or Settlement Dates that are intended to be shorter/earlier or later, as applicable, than the timeframe and/or Settlement Date of the standard settlement cycle. These provisions also must be changed to accommodate the Shortened Settlement Cycle.¹² Likewise, the length and timing of certain cutoff times are based on either a standard settlement cycle or a non-standard settlement cycle. Therefore, when the timeframe and Settlement Date of the standard settlement cycle and nonstandard settlement cycle are changed, these cutoff times would also need to be revised accordingly.¹³

B. Changes to Process Relating to the Shortened Settlement Cycle

Some of the Rules would require process changes to accommodate the Shortened Settlement Cycle, as described below.¹⁴

⁹ For more detailed discussion of each specific edit to the Rules, please refer to the Notice of Filing. See *id.* at 20268–73 (describing specific changes to each of the relevant sections of the Rules).

¹⁰ See *id.* at 20269–72 (Subparagraphs B, C (concerning Index Receipts (Procedure II.F)), E (concerning Consolidated Trade Summary (Procedure VII.B)), and G). See also *infra* note 9.

¹¹ See *id.* (Subparagraphs A, C (concerning Equity and Listed Debt Securities (Procedure II.B)), Debt Securities (Procedure II.C), Index Receipts (Procedure II.F), Reports and Output (Procedure II.G)), E (concerning Consolidated Trade Summary (Procedure VII.B)), and G).

¹² See *id.* (Subparagraphs B, E (concerning CNS System (Rule 11), Consolidated Trade Summary (Procedure VII.B), Controlling Deliveries to CNS (Procedure VII.D)), F, H, and I).

¹³ See *id.* (Subparagraphs C (concerning Debt Securities (Procedure II.C)), and E (concerning CNS System (Rule 11), Consolidated Trade Summary (Procedure VII.B), CNS Dividend Accounting (Procedure VII.G))).

¹⁴ See *infra* note 9.

Changes to Procedure II.F.—Index Receipts (Exchange-Traded Funds)

NSCC proposes to amend its creation/redemption input and settlement procedures for exchange-traded funds (“ETF(s),” also referred to as “index receipts” in the Rules). Aside from proposed changes to reflect that T+1 would be Regular Way settlement under the Shortened Settlement Cycle, NSCC also proposes additional amendments to allow for the creation and redemption of index receipts for same-day settlement. NSCC would add new rule language to allow Index Receipt Agents to include an additional cash collateral amount (“Index Receipt Cash Collateral Amount”) for same-day settling index receipts, which would be subject to limits established by NSCC.¹⁵ NSCC would also report any necessary adjustments to the Index Receipt Cash Collateral Amount based on end of day values (“Collateral Cash Adjustments”) for non-guaranteed payment order or money settlement between the Members on the next business day to “true-up” the Index Receipt Cash Collateral Amount amounts. In addition, NSCC would amend the procedure to provide that any creation and redemption instructions for same-day settling index receipts that exceed the Index Receipt Cash Collateral Amount limitations established by NSCC would be rejected.

NSCC states that these proposed rules for same-day creation/redemption are designed to allow Authorized Participants to cover short positions in ETF shares.¹⁶ The Rules currently allow Index Receipt Agents to elect a Settlement Date of T+1 or later for ETFs. Under the current T+2 settlement cycle, Authorized Participants may address short positions through the submission of creations/redemptions for next-day settlement (*i.e.*, T+1). However, under the Shortened Settlement Cycle, Authorized Participants may need to submit creations/redemptions on a same-day basis to cover short positions scheduled for settlement on T+1.¹⁷ NSCC states that in the absence of the proposed same-day cycle, Authorized Participants would need to process this

¹⁵ NSCC would initially establish this limit at 3% of the contract settlement amount of the order, which would be priced based on the prior night’s net asset value. NSCC will monitor the use and overall collateral buffer amounts over time and may adjust this threshold as needed. Changes to these limits would be announced to Members by Important Notice. See Notice of Filing, *supra* note 3, at 20269.

¹⁶ See *id.*

¹⁷ Currently, NSCC allows for same-day settling cash trades in the secondary market, even in the T+2 environment. The proposed rule change would allow same-day settling trades in the primary market.

⁶ See Securities Exchange Act Release No. 80295 (Mar. 22, 2017), 82 FR 15564 (Mar. 29, 2017).

⁷ See Securities Exchange Act Release No. 96930 (Feb. 15, 2023), 88 FR 13872 (Mar. 6, 2023) (S7–05–22) (Shortening the Securities Transaction Settlement Cycle) (“T+1 Adopting Release”).

⁸ See Notice of Filing, *supra* note 3, at 20268.

activity on an ex-clearing basis, which would result in excess capital expenses.¹⁸ As stated above, the proposed rule change would also provide Index Receipt Agents with the option to require an additional Index Receipt Cash Collateral Amount as part of the creation or redemption to act as a “buffer” and account for potential market moves in the ETF or underlying components between the submission of the creation or redemption earlier in the day (based on the prior day’s closing price which aligns with net asset value) and the settlement of such obligations at the end of the day during NSCC’s end-of-day settlement cycle. These same-day create/redeem transactions would be subject to NSCC’s risk management, consistent with its risk management of other ETF create/redeem orders.

Changes to Procedure II.H.—Consolidated Trade Summaries.

NSCC proposes to update its procedures concerning Consolidated Trade Summaries to reflect processes under the Shortened Settlement Cycle. NSCC’s Consolidated Trade Summary System defines the expected settlement path for each transaction received by the Universal Trade Capture (“UTC”) service as CNS or non-CNS eligible.¹⁹ NSCC would make changes regarding the reporting of Balance Order transactions under the Shortened Settlement Cycle to state, more generally, that each Consolidated Trade Summary would include Receive and Deliver instructions to each Member to settle directly with its counterparties. NSCC states that the proposed change is intended to reflect that the three Consolidated Trade Summaries made available by NSCC will not include the same information on all three reports (e.g., the first two cycles would report next-day settling Balance Order transactions while the third cycle would report same-day settling Balance Order transactions trades).²⁰

Changes to Procedure IV—Special Representative Service

NSCC proposes to delete a provision related to the Correspondent Clearing Service,²¹ which states that transactions

(other than cash, next day fixed-income transactions, or cash equity transactions received after the Corporation’s designated cut-off time) which are accepted by NSCC are then entered into the Balance Order Accounting Operation or CNS Accounting Operation which, when processed through the Balance Order Accounting Operation or CNS Accounting Operation, effectively net the Special Representative out of the original trade. NSCC proposes to delete this statement because (i) under the Shortened Settlement Cycle, there will no longer be next day fixed-income transactions (i.e., such transactions will be Regular Way) and (ii) the statement, more generally, is not a rule or procedural requirement concerning the Correspondent Clearing Service, but rather, is simply a description of an expected outcome of the service.²²

Changes to Procedure VII—CNS Accounting Operation

NSCC proposes changes to Rule 11 and Procedure VII concerning projection reports. Under the Shortened Settlement Cycle, the CNS projection report that will be issued on each Settlement Date will no longer include next day settling positions because it will only cover obligations for a one-day settlement cycle and will be issued during early morning hours on the Settlement Date. NSCC proposes to revise Section 4 of Rule 11 to remove rule text related to positions or obligations due to settle on “the next settlement day.” NSCC proposes to delete subsection D.1. of Procedure VII²³ concerning the CNS projection report and other references to it throughout Procedure VII. Under the Shortened Settlement Cycle, the CNS projection report would no longer be used for the exemption process because it will be distributed at 2:00 a.m. ET on Settlement Date, after the night cycle completes.²⁴ However, NSCC would clarify in the newly renumbered Section D.1(a) that Members may use other position reporting made available by NSCC to set exemptions and control deliveries.

other Members acting as their Special Representative to accommodate (i) a Member with multiple affiliate accounts who wishes to move a position resulting from an “original trade” in the process of clearance from one affiliate account to another or (ii) a Member that relies on its Special Representative to execute a trade in any market on its behalf to enable the resulting position to be moved from the Special Representative to that Member. *Id.*; see also Procedure IV, *supra* note 4.

²² See Notice of Filing, *supra* note 3, at 20270.

²³ Section D of Procedure VII describes the process for Members to control the delivery of securities to satisfy short positions in NSCC’s CNS system. *See id.* at 20271.

²⁴ *See id.*

NSCC also proposes changes to Section H of Procedure VII describing the timeline of actions that must occur in connection with the processing of eligible corporate reorganization events to align with the Shortened Settlement Cycle. While the processing of mandatory reorganizations occurs automatically, the processing of voluntary reorganizations through the CNS Reorganization Processing System requires certain actions to be taken by both NSCC and Members with positions in the subject security during the period of time leading up to and following the expiration of the event. This period of time is referred to in the Rules as the “protect period” and is defined by reference to the expiration date, or “E,” of a voluntary reorganization (e.g., “E+1” is one day past the expiration date of the event). NSCC would remove references to the current standard two business day protect period and replace them with references to the one business day protect period anticipated under the Shortened Settlement Cycle. NSCC also proposes to update the processing timeframes for voluntary reorganizations to reflect the new timeframes under the Shortened Settlement Cycle.²⁵

IV. Discussion and Commission Findings

Section 19(b)(2)(C) of the Act²⁶ directs the Commission to approve a proposed rule change of a self-regulatory organization if it finds that such proposed rule change is consistent with the requirements of the Act and rules and regulations thereunder applicable to such organization. After careful review of the Proposed Rule Change, the Commission finds that the Proposed Rule Change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to NSCC. In particular, the Commission finds that the Proposed Rule Change is consistent with Section 17A(b)(3)(F) of the Act.²⁷

A. Consistency with Section 17A(b)(3)(F) of the Act

Section 17A(b)(3)(F) of the Act requires that the rules of a clearing agency be designed to, among other things, promote the prompt and accurate clearance and settlement of securities transactions and to remove impediments to and perfect the mechanism of a national system for the prompt and accurate clearance and

²⁵ For specific changes in processing timeframes for voluntary reorganizations, please refer to the Notice of Filing. *See id.* at 20272.

²⁶ 15 U.S.C. 78s(b)(2)(C).

²⁷ 15 U.S.C. 78q-1(b)(3)(F).

¹⁸ See Notice of Filing, *supra* note 3, at 20270.

¹⁹ NSCC’s CNS system is NSCC’s core netting, allotting, and fail-control engine in which each security is netted to one position per Member with NSCC as its central counterparty. *See id.* *See also* Rule 11, *supra* note 4.

²⁰ See Notice of Filing, *supra* note 3, at 20270.

²¹ NSCC’s Special Representative Service allows Members that are authorized by one or more other persons to act on their behalf to submit transactions in securities to NSCC. *See id.* As part of this, the Correspondent Clearing Service permits Members to clear and settle transactions executed for them by

settlement of securities transactions.²⁸ The Commission believes that the Proposed Rule Change is consistent with Section 17A(b)(3)(F) of the Act for the reasons stated below.

As discussed in Part II, the Commission has adopted a rule change shortening the standard settlement cycle from T+2 to T+1, with a compliance date of May 28, 2024. The Proposed Rule Change would align NSCC's Rules with this upcoming industry-wide move and update NSCC's Rules to accommodate anticipated processing timelines under a Shortened Settlement Cycle. The Proposed Rule Change would modify the timeframes, cutoff times, and associated outputs for certain processes related to NSCC's clearance and settlement operations for a T+1 environment, including Rules related to: Definitions (Rule 1 and Procedure XIII); Supplemental Liquidity Deposits (Rule 4A); Trade Comparison and Recording (Procedure II); the Special Representative Service (Procedure IV); the Continuous Net Settlement ("CNS") System and CNS Accounting Operation (Rule 11 and Procedure VII); the Balance Order Accounting Operation (Procedure V); the Foreign Security Accounting Operation (Procedure VI); the ACATS Settlement Accounting Operation (Procedure XVIII); and the NSCC Guaranty (Addendum K).

The Commission has reviewed and analyzed the filing materials, and agrees that these changes are necessary for NSCC to clear and settle transactions promptly and accurately under the Shortened Settlement Cycle. As described in Part III.A, the changes to update and modify timeframes and cutoff times to reflect a Shortened Settlement Cycle should help ensure that NSCC's operations and Rules are consistent with the Shortened Settlement Cycle. Similarly, the changes to modify existing processes such that they occur within the Shortened Settlement Cycle, as described in Part III.B, should also help ensure that NSCC's functions are consistent with and accommodate the Shortened Settlement Cycle. Therefore, the Commission finds that the Proposed Rule Change should support NSCC's ability to provide prompt and accurate clearance and settlement of securities transactions and to remove impediments to and perfect the mechanism of a national system for the prompt and accurate clearance and settlement of securities transactions, consistent with Section 17A(b)(3)(F) of the Act.²⁹ Regarding the technical

changes and corrections to the Rules not required to accommodate the move to T+1, as also described in Part III, the Commission finds these changes also consistent with Section 17A(b)(3)(F) of the Act³⁰ because the technical updates would provide additional clarity and accuracy in the Rules for Members that rely on them.

V. Conclusion

On the basis of the foregoing, the Commission finds that the Proposed Rule Change is consistent with the requirements of the Act, and in particular, with the requirements of Section 17A of the Act³¹ and the rules and regulations promulgated thereunder.

It is therefore ordered, pursuant to Section 19(b)(2) of the Act³² that proposed rule change SR–NSCC–2024–002, be, and hereby is, *approved*.³³

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.³⁴

J. Matthew DeLesDernier,

Deputy Secretary.

²⁹ *Id.*

“Commission”) is soliciting comments on the collection of information summarized below. The Commission plans to submit this existing collection of information to the Office of Management and Budget for extension and approval.

Rule 38a–1 (17 CFR 270.38a–1) under the Investment Company Act of 1940 (15 U.S.C. 80a) (“Investment Company Act”) is intended to protect investors by fostering better fund compliance with securities laws. The rule requires every registered investment company and business development company (“fund”) to: (i) adopt and implement written policies and procedures reasonably designed to prevent violations of the federal securities laws by the fund, including procedures for oversight of compliance by each investment adviser, principal underwriter, administrator, and transfer agent of the fund; (ii) obtain the fund board of directors’ approval of those policies and procedures; (iii) annually review the adequacy of those policies and procedures and the policies and procedures of each investment adviser, principal underwriter, administrator, and transfer agent of the fund, and the effectiveness of their implementation; (iv) designate a chief compliance officer to administer the fund’s policies and procedures and prepare an annual report to the board that addresses certain specified items relating to the policies and procedures; and (v) maintain for five years the compliance policies and procedures and the chief compliance officer’s annual report to the board.

The rule contains certain information collection requirements that are designed to ensure that funds establish and maintain comprehensive, written internal compliance programs. The information collections also assist the Commission’s examination staff in assessing the adequacy of funds’ compliance programs.

The Commission staff estimates that 13,628 funds are subject to rule 38a–1. Based on these estimates, the total annual burden hours associated with Rule 38a–1 is 476,980 hours. The estimated total annual burden hours associated with rule 38a–1 have increased 25,572 hours, from 451,408 hours to 476,980 hours and external costs increased from \$19,608,000 to \$23,876,256. These changes in burden hours and external costs reflect changes in the number of affected entities and in the external cost associated with the information collection requirements. These changes reflect revised estimates.

The estimate of average burden hours is made solely for the purposes of the

Paperwork Reduction Act. The estimate is based on communications with industry representatives and is not derived from a comprehensive or even a representative survey or study. Responses will not be kept confidential. Other information provided to the Commission in connection with staff examinations or investigations is kept confidential subject to the provisions of applicable law. If information collected pursuant to rule 38a–1 is reviewed by the Commission’s examination staff, it is accorded the same level of confidentiality accorded to other responses provided to the Commission in the context of its examination and oversight program.

Written comments are invited on: (a) whether the proposed collection of information is necessary for the proper performance of the functions of the Commission, including whether the information shall have practical utility; (b) the accuracy of the Commission’s estimate of the burden of the collection of information; (c) ways to enhance the quality, utility, and clarity of the information collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology. Consideration will be given to comments and suggestions submitted by July 8, 2024.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information under the PRA unless it displays a currently valid OMB control number.

Please direct your written comments to: David Bottom, Chief Information Officer, Securities and Exchange Commission, c/o John Pezzullo, 100 F Street NE, Washington, DC 20549 or send an email to: PRA_Mailbox@sec.gov.

Dated: May 2, 2024.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–100051; File No. SR–CboeEDGA–2024–003]

Self-Regulatory Organizations; Cboe EDGA Exchange, Inc.; Order Instituting Proceedings To Determine Whether To Approve or Disapprove Proposed Rule Change To Amend Rule 11.6(n)(4) and Rule 11.10(a)(4)(D) To Permit the Use of the Post Only Order Instruction at Prices Below \$1.00

May 2, 2024.

I. Introduction

On January 19, 2024, Cboe EDGA Exchange, Inc. (“Exchange”) filed with the Securities and Exchange Commission (“Commission”), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (“Act”)¹ and Rule 19b–4 thereunder,² a proposed rule change to permit the use of the Post Only order instruction (“EDGA Post Only Orders”) at prices below \$1.00. The proposed rule change was published for comment in the **Federal Register** on February 7, 2024.³ On March 19, 2024, pursuant to Section 19(b)(2) of the Act,⁴ the Commission designated a longer period within which to approve the proposed rule change, disapprove the proposed rule change, or institute proceedings to determine whether to disapprove the proposed rule change.⁵ The Commission did not receive any comments. The Commission is instituting proceedings pursuant to Section 19(b)(2)(B) of the Act⁶ to determine whether to approve or disapprove the proposed rule change.

II. Description of the Proposed Rule Change⁷

The Exchange proposes to amend Rule 11.6(n)(4) and Rule 11.10(a)(4)(D) to modify the treatment of EDGA Post Only Orders priced below a dollar on the Exchange. EDGA Post Only Orders priced at or above \$1.00 will only remove liquidity if the value of the execution when removing liquidity equals or exceeds the value of such

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b–4.

³ See Securities Exchange Act Release No. 99458 (February 1, 2024), 89 FR 8460 (“Notice”).

⁴ 15 U.S.C. 78s(b)(2).

⁵ See Securities Exchange Act Release No. 99765, 89 FR 20721 (March 25, 2024) (designating May 7, 2024, as the date by which the Commission shall either approve, disapprove, or institute proceedings to determine whether to disapprove the proposed rule change).

⁶ 15 U.S.C. 78s(b)(2)(B).

⁷ For a more detailed description of the proposed rule change, including examples, refer to the Notice, *supra* note 3.

execution if the order instead posted to the EDGA Book and subsequently provided liquidity, including the applicable fees charged or rebates provided. Currently, all EDGA Post Only Orders priced below \$1.00 are automatically treated as orders that remove liquidity. Under the proposed rule change, EDGA Post Only Orders priced below \$1.00 will be treated in the same manner as EDGA Post Only Orders priced at or above \$1.00 in that EDGA Post Only Orders priced below \$1.00 will only remove liquidity if the value of the overall execution (taking into account all applicable fees and rebates) make it economically beneficial for the order to remove liquidity.

The Exchange also proposes to amend Rule 11.10(a)(4)(D) to permit Non-Displayed Orders⁸ and orders subject to display-price sliding (collectively, “Resting Orders”) which are not executable at their most aggressive price due to the presence of a contra-side EDGA Post Only Order to be executed at one minimum price variation less aggressive than the order’s most aggressive price.⁹ Currently, Rule 11.10(a)(4)(D) states that, for securities priced at or above \$1.00, incoming orders that are Market Orders¹⁰ or Limit Orders¹¹ priced more aggressively than an order displayed on the EDGA Book, the Exchange will execute the incoming order at, in the case of an incoming sell order, one-half minimum price variation less than the price of the displayed order, and, in the case of an incoming buy order, at one-half minimum price variation more than the price of the displayed order. The Exchange proposes

that for securities priced below \$1.00, incoming orders that are Market Orders or Limit Orders priced more aggressively than an order displayed on the EDGA Book, the Exchange will execute the incoming order at, in the case of an incoming sell order, one minimum price variation less than the price of the displayed order, and, in the case of an incoming buy order, at one minimum price variation more than the price of the displayed order.

III. Proceedings To Determine Whether To Approve or Disapprove SR–CboeEDGA–2024–003, and Grounds for Disapproval Under Consideration

The Commission is instituting proceedings pursuant to Section 19(b)(2)(B) of the Act¹² to determine whether the proposed rule change should be approved or disapproved. Institution of such proceedings is appropriate at this time in view of the legal and policy issues raised by the proposed rule change. Institution of proceedings does not indicate that the Commission has reached any conclusions with respect to any of the issues involved. Rather, as described below, the Commission seeks and encourages interested persons to provide additional comment on the proposed rule change to inform the Commission’s analysis of whether to approve or disapprove the proposed rule change.

Pursuant to Section 19(b)(2)(B) of the Act,¹³ the Commission is providing notice of the grounds for disapproval under consideration. As described above, the Exchange proposes to permit the use of EDGA Post Only Orders at prices below \$1.00. In addition, as described above, for securities priced below \$1.00, incoming orders that are Market Orders or Limit Orders priced more aggressively than an order displayed on the EDGA Book, the Exchange will execute the incoming order at one minimum price variation less (more) than the price of the displayed order for sell (buy) orders.¹⁴ In contrast, under the current rule for securities priced above \$1.00, the incoming order would execute at one-half minimum price variation less (more) than the price of the displayed order for sell (buy) orders.¹⁵ The Commission is instituting proceedings

to allow for additional analysis of, and input from commenters with respect to, the proposed rule change’s consistency with the Act, and in particular, Section 6(b)(5) of the Act, which requires, among other things, that the rules of a national securities exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest.¹⁶ In addition, Sections 6(b)(5) and 6(b)(8) of the Act, respectively, prohibit the rules of an exchange from being designed to permit unfair discrimination between customers, issuers, brokers, or dealers¹⁷ or imposing any burden on competition not necessary or appropriate in furtherance of the purposes of the Act.¹⁸

Under the Commission’s Rules of Practice, the “burden to demonstrate that a proposed rule change is consistent with the [Act] and the rules and regulations issued thereunder . . . is on the self-regulatory organization that proposed the rule change.”¹⁹ The description of a proposed rule change, its purpose and operation, its effect, and a legal analysis of its consistency with applicable requirements must all be sufficiently detailed and specific to support an affirmative Commission finding,²⁰ and any failure of a self-regulatory organization to provide this information may result in the Commission not having a sufficient basis to make an affirmative finding that a proposed rule change is consistent with the Act and the applicable rules and regulations.²¹

IV. Procedure: Request for Written Comments

The Commission requests that interested persons provide written submissions of their data, views, and arguments with respect to the issues identified above, as well as any other concerns they may have with the proposal. In particular, the Commission invites the written views of interested persons concerning whether the proposed rule change, is consistent with Sections 6(b)(5) or any other provision of the Act, or the rules and regulations thereunder. Although there do not appear to be any issues relevant to approval or disapproval that would be

⁸ See Rule 11.6(e)(2). A User may attach a “Non-Displayed Order” instruction to an order stating that the order is not to be displayed by the System on the EDGA Book.

⁹ See Securities Exchange Act Release No. 75700 (August 14, 2015), 80 FR 50689 (August 20, 2015), SR–EDGA–2015–33 (“EDGA Order Handling Filing”). See also Securities Exchange Act Release No. 64475 (May 12, 2011), 76 FR 28830 (May 18, 2011), SR–BATS–2011–015 (“Resting Order Execution Filing”). The Resting Order Execution Filing introduced an order handling change for certain Non-Displayed Orders and orders subject to display-price sliding that are not executable at prices equal to displayed orders on the opposite side of the market (the “locking price”) on the Exchange’s affiliate, BZX (BATS) Exchange in 2011 and is incorporated by reference in the EDGA Order Handling Filing. The Resting Order Execution Filing permits Resting Orders priced at or above \$1.00 to be executed at one-half minimum price variation less aggressive than the locking price (for bids) and one-half minimum price variation more aggressive than the locking price (for offers), under certain circumstances.

¹⁰ See Rule 11.8(a). A “Market Order” is an order to buy or sell a stated amount of a security that is to be executed at the NBBO or better when the order reaches the Exchange.

¹¹ See Rule 11.8(b). A “Limit Order” is an order to buy or sell a stated amount of a security at a specified price or better.

¹² 15 U.S.C. 78s(b)(2)(B).

¹³ *Id.*

¹⁴ According to the Exchange, executing an incoming order at the same price as the price as that of a displayed order on the same side of the market would violate the time priority of the displayed order. See Notice *supra* note 3, 89 FR at 8463; see also Exchange Rules 11.9(a) and 11.10(a)(4).

¹⁵ See Exchange Rule 11.10(a)(4)(D).

²¹ See *id.*

facilitated by an oral presentation of data, views, and arguments, the Commission will consider, pursuant to Rule 19b-4 under the Act,²² any request for an opportunity to make an oral presentation.²³

Interested persons are invited to submit written data, views, and arguments regarding whether the proposed rule change should be approved or disapproved by May 29, 2024. Any person who wishes to file a rebuttal to any other person's submission must file that rebuttal by June 12, 2024. The Commission asks that commenters address the sufficiency of the Exchange's statements in support of the proposal, in addition to any other comments they may wish to submit about the proposed rule change.

Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (<https://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include file number SR-CboeEDGA-2024-003 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090.

All submissions should refer to file number SR-CboeEDGA-2024-003. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<https://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be

available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549, on official business days between the hours of 10 a.m. and 3 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. Do not include personal identifiable information in submissions; you should submit only information that you wish to make available publicly. We may redact in part or withhold entirely from publication submitted material that is obscene or subject to copyright protection. All submissions should refer to file number SR-CboeEDGA-2024-003 and should be submitted by May 29, 2024. Rebuttal comments should be submitted by June 12, 2024.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²⁴

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-100052; File No. SR-CboeEDGX-2024-007]

Self-Regulatory Organizations; Cboe EDGX Exchange, Inc.; Order Instituting Proceedings To Determine Whether To Approve or Disapprove Proposed Rule Change To Amend Rule 11.6(n)(4) and Rule 11.10(a)(4)(D) To Permit the Use of the Post Only Order Instruction at Prices Below \$1.00

May 2, 2024.

I. Introduction

On January 19, 2024, Cboe EDGX Exchange, Inc. ("Exchange") filed with the Securities and Exchange Commission ("Commission"), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² a proposed rule change to permit the use of the Post Only order instruction ("EDGX Post Only Orders") at prices below \$1.00. The proposed rule change was published for comment in the **Federal Register** on February 7, 2024.³ On March 19, 2024, pursuant to Section 19(b)(2) of the Act,⁴ the Commission

designated a longer period within which to approve the proposed rule change, disapprove the proposed rule change, or institute proceedings to determine whether to disapprove the proposed rule change.⁵ The Commission did not receive any comments. The Commission is instituting proceedings pursuant to Section 19(b)(2)(B) of the Act⁶ to determine whether to approve or disapprove the proposed rule change.

II. Description of the Proposed Rule Change⁷

The Exchange proposes to amend Rule 11.6(n)(4) and Rule 11.10(a)(4)(D) to modify the treatment of EDGX Post Only Orders priced below a dollar on the Exchange. EDGX Post Only Orders priced at or above \$1.00 will only remove liquidity if the value of the execution when removing liquidity equals or exceeds the value of such execution if the order instead posted to the EDGX Book and subsequently provided liquidity, including the applicable fees charged or rebates provided. Currently, all EDGX Post Only Orders priced below \$1.00 are automatically treated as orders that remove liquidity. Under the proposed rule change, EDGX Post Only Orders priced below \$1.00 will be treated in the same manner as EDGX Post Only Orders priced at or above \$1.00 in that EDGX Post Only Orders priced below \$1.00 will only remove liquidity if the value of the overall execution (taking into account all applicable fees and rebates) make it economically beneficial for the order to remove liquidity.

The Exchange also proposes to amend Rule 11.10(a)(4)(D) to permit Non-Displayed Orders⁸ and orders subject to display-price sliding (collectively, "Resting Orders") which are not executable at their most aggressive price due to the presence of a contra-side EDGX Post Only Order to be executed at one minimum price variation less aggressive than the order's most aggressive price.⁹ Currently, Rule

⁵ See Securities Exchange Act Release No. 99766, 89 FR 20735 (March 25, 2024) (designating May 7, 2024, as the date by which the Commission shall either approve, disapprove, or institute proceedings to determine whether to disapprove the proposed rule change).

⁶ 15 U.S.C. 78s(b)(2)(B).

⁷ For a more detailed description of the proposed rule change, including examples, refer to the Notice, *supra* note 3.

⁸ See Rule 11.6(e)(2). A User may attach a "Non-Displayed Order" instruction to an order stating that the order is not to be displayed by the System on the EDGX Book.

²² 17 CFR 240.19b-4.

²³ Section 19(b)(2) of the Act, as amended by the Securities Acts Amendments of 1975, Public Law 94-29 (Jun. 4, 1975), grants to the Commission flexibility to determine what type of proceeding—either oral or notice and opportunity for written comments—is appropriate for consideration of a particular proposal by a self-regulatory organization. See Securities Acts Amendments of 1975, Senate Comm. on Banking, Housing & Urban Affairs, S. Rep. No. 75, 94th Cong., 1st Sess. 30 (1975).

²⁴ 17 CFR 200.30-3(a)(57).

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b-4.

³ See Securities Exchange Act Release No. 99459 (February 1, 2024), 89 FR 8473 ("Notice").

⁴ 15 U.S.C. 78s(b)(2).

11.10(a)(4)(D) states that, for securities priced at or above \$1.00, incoming orders that are Market Orders¹⁰ or Limit Orders¹¹ priced more aggressively than an order displayed on the EDGX Book, the Exchange will execute the incoming order at, in the case of an incoming sell order, one-half minimum price variation less than the price of the displayed order, and, in the case of an incoming buy order, at one-half minimum price variation more than the price of the displayed order. The Exchange proposes that for securities priced below \$1.00, incoming orders that are Market Orders or Limit Orders priced more aggressively than an order displayed on the EDGX Book, the Exchange will execute the incoming order at, in the case of an incoming sell order, one minimum price variation less than the price of the displayed order, and, in the case of an incoming buy order, at one minimum price variation more than the price of the displayed order.

III. Proceedings To Determine Whether To Approve or Disapprove SR–ChoeEDGX–2024–007, and Grounds for Disapproval Under Consideration

The Commission is instituting proceedings pursuant to Section 19(b)(2)(B) of the Act¹² to determine whether the proposed rule change should be approved or disapproved. Institution of such proceedings is appropriate at this time in view of the legal and policy issues raised by the proposed rule change. Institution of proceedings does not indicate that the Commission has reached any conclusions with respect to any of the issues involved. Rather, as described below, the Commission seeks and encourages interested persons to provide additional comment on the proposed rule change to inform the

(May 12, 2011), 76 FR 28830 (May 18, 2011), SR–BATS–2011–015 (“Resting Order Execution Filing”). The Resting Order Execution Filing introduced an order handling change for certain Non-Displayed Orders and orders subject to display-price sliding that are not executable at prices equal to displayed orders on the opposite side of the market (the “locking price”) on the Exchange’s affiliate, BZX (BATS) Exchange in 2011 and is incorporated by reference in the EDGX Order Handling Filing. The Resting Order Execution Filing permits Resting Orders priced at or above \$1.00 to be executed at one-half minimum price variation less aggressive than the locking price (for bids) and one-half minimum price variation more aggressive than the locking price (for offers), under certain circumstances.

¹⁰ See Rule 11.8(a). A “Market Order” is an order to buy or sell a stated amount of a security that is to be executed at the NBBO or better when the order reaches the Exchange.

¹¹ See Rule 11.8(b). A “Limit Order” is an order to buy or sell a stated amount of a security at a specified price or better.

¹² 15 U.S.C. 78s(b)(2)(B).

Commission’s analysis of whether to approve or disapprove the proposed rule change.

Pursuant to Section 19(b)(2)(B) of the Act,¹³ the Commission is providing notice of the grounds for disapproval under consideration. As described above, the Exchange proposes to permit the use of EDGX Post Only Orders at prices below \$1.00. In addition, as described above, for securities priced below \$1.00, incoming orders that are Market Orders or Limit Orders priced more aggressively than an order displayed on the EDGX Book, the Exchange will execute the incoming order at one minimum price variation less (more) than the price of the displayed order for sell (buy) orders.¹⁴ In contrast, under the current rule for securities priced above \$1.00, the incoming order would execute at one-half minimum price variation less (more) than the price of the displayed order for sell (buy) orders.¹⁵ The Commission is instituting proceedings to allow for additional analysis of, and input from commenters with respect to, the proposed rule change’s consistency with the Act, and in particular, Section 6(b)(5) of the Act, which requires, among other things, that the rules of a national securities exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest.¹⁶ In addition, Sections 6(b)(5) and 6(b)(8) of the Act, respectively, prohibit the rules of an exchange from being designed to permit unfair discrimination between customers, issuers, brokers, or dealers¹⁷ or imposing any burden on competition not necessary or appropriate in furtherance of the purposes of the Act.¹⁸

Under the Commission’s Rules of Practice, the “burden to demonstrate that a proposed rule change is consistent with the [Act] and the rules and regulations issued thereunder . . . is on the self-regulatory organization that proposed the rule change.”¹⁹ The description of a proposed rule change,

¹³ *Id.*

¹⁴ According to the Exchange, executing an incoming order at the same price as the price as that of a displayed order on the same side of the market would violate the time priority of the displayed order. See Notice *supra* note 3, 89 FR at 8475; see also Exchange Rules 11.9(a) and 11.10(a)(4).

¹⁵ See Exchange Rule 11.10(a)(4)(D)

¹⁶ 15 U.S.C. 78f(b)(5).

¹⁷ 15 U.S.C. 78f(b)(5).

¹⁹ Rule 700(b)(3), Commission Rules of Practice, 17 CFR 201.700(b)(3).

its purpose and operation, its effect, and a legal analysis of its consistency with applicable requirements must all be sufficiently detailed and specific to support an affirmative Commission finding,²⁰ and any failure of a self-regulatory organization to provide this information may result in the Commission not having a sufficient basis to make an affirmative finding that a proposed rule change is consistent with the Act and the applicable rules and regulations.²¹

IV. Procedure: Request for Written Comments

The Commission requests that interested persons provide written submissions of their data, views, and arguments with respect to the issues identified above, as well as any other concerns they may have with the proposal. In particular, the Commission invites the written views of interested persons concerning whether the proposed rule change, is consistent with Sections 6(b)(5) or any other provision of the Act, or the rules and regulations thereunder. Although there do not appear to be any issues relevant to approval or disapproval that would be facilitated by an oral presentation of data, views, and arguments, the Commission will consider, pursuant to Rule 19b–4 under the Act,²² any request for an opportunity to make an oral presentation.²³

Interested persons are invited to submit written data, views, and arguments regarding whether the proposed rule change should be approved or disapproved by May 29, 2024. Any person who wishes to file a rebuttal to any other person’s submission must file that rebuttal by June 12, 2024. The Commission asks that commenters address the sufficiency of the Exchange’s statements in support of the proposal, in addition to any other comments they may wish to submit about the proposed rule change.

Comments may be submitted by any of the following methods:

²⁰ See *id.*

²² 17 CFR 240.19b–4.

²³ Section 19(b)(2) of the Act, as amended by the Securities Acts Amendments of 1975, Public Law 94–29 (Jun. 4, 1975), grants to the Commission flexibility to determine what type of proceeding—either oral or notice and opportunity for written comments—is appropriate for consideration of a particular proposal by a self-regulatory organization. See Securities Acts Amendments of 1975, Senate Comm. on Banking, Housing & Urban Affairs, S. Rep. No. 75, 94th Cong., 1st Sess. 30 (1975).

Electronic Comments

- Use the Commission's internet comment form (<https://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include file number SR-CboeEDGX-2024-007 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090.

All submissions should refer to file number SR-CboeEDGX-2024-007. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<https://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549, on official business days between the hours of 10 a.m. and 3 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. Do not include personal identifiable information in submissions; you should submit only information that you wish to make available publicly. We may redact in part or withhold entirely from publication submitted material that is obscene or subject to copyright protection. All submissions should refer to file number SR-CboeEDGX-2024-007 and should be submitted by May 29, 2024. Rebuttal comments should be submitted by June 12, 2024.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²⁴

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–100047; File No. SR–NYSEARCA–2024–34]

Self-Regulatory Organizations; NYSE Arca, Inc.; Notice of Filing and Immediate Effectiveness of Proposed Rule Change To Revise Rule 10.16

May 2, 2024.

Pursuant to Section 19(b)(1)¹ of the Securities Exchange Act of 1934 (“Act”),² and Rule 19b–4 thereunder,³ notice is hereby given that on April 23, 2024, NYSE Arca, Inc. (“NYSE Arca” or the “Exchange”) filed with the Securities and Exchange Commission (“Commission”) the proposed rule change as described in Items I and II below, which Items have been prepared by the self-regulatory organization. The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization’s Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to revise Rule 10.16 to adopt streamlined sanction guidelines for its options marketplace based on NYSE American LLC Rule 601 and make certain conforming changes. The proposed rule change is available on the Exchange’s website at www.nyse.com, at the principal office of the Exchange, and at the Commission’s Public Reference Room.

II. Self-Regulatory Organization’s Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

A. Self-Regulatory Organization’s Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to revise Rule 10.16 (NYSE Arca Sanctioning Guidelines—Options) to adopt

streamlined sanction guidelines for its options marketplace based on NYSE American LLC (“NYSE American”) Rule 601 and make certain conforming changes.

Background and Proposed Rule Change

The current Sanction Guidelines in Rule 10.16 were adopted pursuant to the provisions of Section IV.B.i of the Commission’s September 11, 2000 Order Instituting Administrative Proceedings Pursuant to Section 19(h)(1) of the Act (the “2000 Order”), which required the Exchange to adopt rules establishing, or modifying existing, sanctioning guidelines such that they are reasonably designed to effectively enforce compliance with options order handling rules, including the duty of best execution with respect to the handling of orders after the broker-dealer routes the order to such respondent exchange, limit order display, priority, firm quote, and trade reporting rules.⁴ Like its affiliate NYSE American, which also adopted sanction guidelines in response to the 2000 Order,⁵ the Exchange incorporated fine ranges in its sanctions guidelines for specific rule violations. Unlike NYSE American, the Exchange’s suggested monetary sanctions are very broad (\$10,000–\$100,000 in four instances and \$10,000–\$150,000 in two instances). The current Exchange sanction guidelines are otherwise similar to the sanction guidelines adopted by NYSE American in response to the 2000 Order.

Recently, NYSE American adopted a new Rule 601 incorporating sanctions guidelines similar to Cboe Exchange, Inc. (“Cboe”) Rule 13.11, Supplementary Material .01, in place of those original sanction guidelines.⁶ The

new, streamlined sanction guidelines adopted by NYSE American eliminated specific fine ranges for violations and continued to reflect a principles-based approach to sanctions guidelines applicable to all options rules. The Exchange believes that adopting the same NYSE American sanction guidelines that do not contain specific recommended fine ranges for a subset of rules would similarly modernize and update Rule 10.16 in important respects while continuing to provide flexible guidelines for determining appropriate remedial sanctions consistent with the intention of the original rule.⁷ Further, because both NYSE American Rule 601 and Cboe Rule 13.11 take a more streamlined approach, the Exchange believes the proposed rule would more clearly and succinctly set forth current relevant considerations regarding the adjudication of disciplinary actions.

In addition, the Exchange believes that the proposed rule would be consistent with the 2000 Order. The Exchange’s current sanction guidelines are similar to the guidelines that NYSE American replaced. Moreover, the text of NYSE American Rule 601 was based on Cboe Rule 13.11 that was also adopted to satisfy the 2000 Order. As proposed, the Exchange would reproduce the text of NYSE American Rule 601 almost verbatim. In addition, by modernizing and updating the Exchange’s sanctions guidelines, the Exchange would further enhance its disciplinary processes consistent with the 2000 Order. Finally, the proposed rule would promote regulatory consistency across options exchanges in determining appropriate remedial sanctions for violations of options rules.

As is currently the case, proposed Rule 10.16 would not apply to the equities market.⁸ As such, proposed Rule 10.16 would carry forward the current practice whereby the various bodies with responsibility for the adjudication of disciplinary actions, including Hearing Panels, Hearing Officers, the Committee for Review (“CFR”), and the Board of Directors (“Board”), defined in the proposed Rule collectively as “Adjudicatory Bodies,” would consider relevant Exchange precedent or such other precedent as they deem appropriate in determining sanctions imposed against OTP Holders or OTP Firms and their covered persons as defined in Rule 10.9120(g) of the

⁴ See Securities Exchange Act Release Nos. 45416 (February 7, 2002), 67 FR 6777 (February 13, 2002) (SR–PCX–2001–23) (Notice); 45567 (March 15, 2002), 67 FR 13392 (March 22, 2002) (SR–PCX–2001–23) (Order). See generally Securities Exchange Act Release No. 43268 (September 11, 2000), Administrative Proceeding File No. 3–10282.

⁵ Other exchanges subject to the 2000 Order, however, did not adopt specific fine ranges as part of their sanction guidelines. See, e.g., Securities Exchange Act Release Nos. 45427 (February 8, 2002), 67 FR 6958 (February 14, 2002) (Notice); 45571 (March 15, 2002), 67 FR 13382 (March 22, 2002) (SR–CBOE–2001–71) (Order Granting Accelerated Approval of Proposed Rule Change and Notice of Filing and Order Granting Accelerated Approval of Amendment No. 1 Thereto by the Chicago Board Options Exchange, Inc. To Incorporate Certain Principal Considerations in Determining Sanctions and To Incorporate in the Exchange’s Minor Rule Violation Plan Violations of the Exchange’s Order Handling Rules).

⁶ See Securities Exchange Act Release No. 98798 (October 25, 2023), 88 FR 74544 (October 31, 2023) (SR–NYSEAMER–2023–49) (Notice of Filing and Immediate Effectiveness of Proposed Change To Delete Legacy Disciplinary Rules 475, 476, 476A, and 477 and Make Conforming Changes to Rule 41,

Rules 8001, 8130(d), 8320(d), 9001, 9216(b)(1), 9810(a), and 781 of the Office Rules, Rules 2A, 12E, 3170(a)(3), 902NY and Adopt a New Rule 600 and Make Conforming Changes to Rules 3170(C)(3), and Adopt a New Rule 601).

² 15 U.S.C. 78a.

³ 17 CFR 240.19b–4.

Exchange's disciplinary rules. The proposed definition of Adjudicatory Bodies would be updated to reflect the terms provided for in the current disciplinary rules, including "Hearing Panels" and "Extended Hearing Panels" in place of "Ethics and Business Conduct Committee," and "Committee for Review" and "Chief Regulatory Officer ("CRO")," given the role of each in the disciplinary and settlement processes. In addition, for the avoidance of doubt, the Exchange would include the CRO's delegates in the definition of Adjudicatory Bodies, which corresponds to the current definition of Adjudicatory Bodies as inclusive of Exchange regulatory staff. Similarly for the avoidance of doubt, the Exchange would add letters of acceptance, waiver and consent to the list of ways a disciplinary matter can be resolved as well as summary sanctions in options-related matters governed by Rule 10.13 and appeals of Floor citations and summary sanctions governed by Rule 10.11, which are unique to the Exchange.⁹ The remainder of the proposed Rule would be identical to NYSE American Rule 601.

Finally, the Exchange would conform Rules 10.0 (Legacy Disciplinary Proceedings, Other Hearings and Appeals) and 10.9001 (Effective Date of Rule 10.9000 Series) to reflect the change in the title of Rule 10.16 replacing "Sanctioning" with "Sanctions."

2. Statutory Basis

The Exchange believes that the proposed rule change is consistent with Section 6(b)(5) of the Act,¹⁰ in that it is designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, to remove impediments to and perfect the mechanism of a free and open market and a national market system and, in general, to protect investors and the public interest. In addition, the Exchange believes that the proposed rule change furthers the objectives of Section 6(b)(7) of the Act,¹¹ in particular, in that it provides fair procedures for the disciplining of members and persons associated with members, the denial of membership to any person seeking membership therein,

the barring of any person from becoming associated with a member thereof, and the prohibition or limitation by the Exchange of any person with respect to access to services offered by the Exchange or a member thereof.

Specifically, the Exchange believes that adopting sanction guidelines that are substantively the same as NYSE American Rule 601 would continue to permit the Exchange to impose sanctions consistently and fairly by reference to a streamlined rule, thereby continuing to provide fair procedures for the disciplining of members and persons associated with members, the denial of membership to any person seeking Exchange membership, the barring of any person from becoming associated with a member, and the prohibition or limitation by the Exchange of any person with respect to access to services offered by the Exchange or a member thereof pursuant to Section 6(b)(7)¹² of the Act.

The proposed rule would provide flexible and appropriate principles-based guidelines applicable to all options rules for determining remedial sanctions consistent with the intention of the Exchange's current sanctions guidelines rule.¹³ Moreover, the Exchange believes that by adopting NYSE American Rule 601's more streamlined approach to sanctions guidelines, the Exchange believes the proposed rule would more clearly and succinctly set forth the current relevant considerations regarding the adjudication of disciplinary actions. Further, the Exchange believes that the proposed rule would also be consistent with the 2000 Order because the proposed rule is substantively the same as NYSE American Rule 601, which was in turn based on Cboe Rule 13.11 that was adopted to satisfy the same Commission order. Indeed, the Exchange believes that by modernizing and updating its sanctions guidelines, proposed Rule 10.16 would further enhance its disciplinary processes consistent with the 2000 Order and further ensure that the Exchange implements the most appropriate disciplinary mechanisms for violations and a fair process in determining same. Finally, the proposed rule would promote regulatory consistency and uniformity across options exchanges in determining appropriate remedial sanctions and the imposition of penalties.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Exchange Act. The proposed rule change is not intended to address competitive issues but rather is concerned solely with adopting updated, streamlined sanction guidelines based on the rules of the Exchange's affiliate that are consistent with a previous Commission order and continue to permit the Exchange to impose sanctions consistently and fairly.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not:

- (i) significantly affect the protection of investors or the public interest;
- (ii) impose any significant burden on competition; and
- (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A) of the Act and Rule 19b-4(f)(6) thereunder.¹⁴

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

¹⁴ 17 CFR 240.19b-4(f)(6). In addition, Rule 19b-4(f)(6) requires a self-regulatory organization to give the Commission written notice of its intent to file the proposed rule change at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied this requirement.

⁹ For the further avoidance of doubt, neither the list of ways that a proposed disciplinary matter can be resolved nor the persons and entities comprising the definition of Adjudicatory Bodies in proposed Rule 10.16 are intended to be exhaustive.

¹⁰ 15 U.S.C. 78f(b)(5).

¹¹ 15 U.S.C. 78f(b)(7).

¹² 15 U.S.C. 78f(b)(7).

¹³ See 67 FR at 6771.

Electronic Comments

- Use the Commission's internet comment form (<https://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include file number SR-NYSEARCA-2024-34 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090.

All submissions should refer to file number SR-NYSEARCA-2024-34. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<https://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549, on official business days between the hours of 10 a.m. and 3 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. Do not include personal identifiable information in submissions; you should submit only information that you wish to make available publicly. We may redact in part or withhold entirely from publication submitted material that is obscene or subject to copyright protection. All submissions should refer to file number SR-NYSEARCA-2024-34 and should be submitted on or before May 29, 2024.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.¹⁵

J. Matthew DeLesDernier,
Deputy Secretary.

BILLING CODE 8011-01-P

SMALL BUSINESS ADMINISTRATION

**[Disaster Declaration #20312 and #20313;
Ohio Disaster Number OH-20002]**

**Presidential Declaration of a Major
Disaster for the State of Ohio**

AGENCY: U.S. Small Business Administration.

ACTION: Notice.

SUMMARY: This is a Notice of the Presidential declaration of a major disaster for the State of Ohio (FEMA-4777-DR), dated 05/02/2024.

Incident: Tornadoes.

Incident Period: 03/14/2024.

DATES: Issued on 05/02/2024.

Physical Loan Application Deadline Date: 07/01/2024.

Economic Injury (EIDL) Loan Application Deadline Date: 02/03/2025.

ADDRESSES: Visit the MySBA Loan Portal at <https://lending.sba.gov> to apply for a disaster assistance loan.

FOR FURTHER INFORMATION CONTACT:

Vanessa Morgan, Office of Disaster Recovery & Resilience, U.S. Small Business Administration, 409 3rd Street SW, Suite 6050, Washington, DC 20416, (202) 205-6734.

SUPPLEMENTARY INFORMATION: Notice is hereby given that as a result of the President's major disaster declaration on 05/02/2024, applications for disaster loans may be submitted online using the MySBA Loan Portal <https://lending.sba.gov> or other locally announced locations. Please contact the SBA disaster assistance customer service center by email at disastercustomerservice@sba.gov or by phone at 1-800-659-2955 for further assistance.

The following areas have been determined to be adversely affected by the disaster:

Primary Counties (Physical Damage and Economic Injury Loans): Auglaize, Crawford, Darke, Delaware, Hancock, Licking, Logan, Mercer, Miami, Richland, Union.

Contiguous Counties (Economic Injury Loans Only):

Ohio: Allen, Ashland, Champaign, Clark, Coshocton, Fairfield, Franklin, Hardin, Henry, Huron, Knox, Madison, Marion, Montgomery, Morrow, Muskingum, Perry, Preble, Putnam, Seneca, Shelby, Van Wert, Wood, Wyandot
Indiana: Adams, Jay, Wayne, Randolph

The Interest Rates are:

	Percent
For Physical Damage:	

	Percent
Homeowners with Credit Available Elsewhere	5.375
Homeowners without Credit Available Elsewhere	2.688
Businesses with Credit Available Elsewhere	8.000
Businesses without Credit Available Elsewhere	4.000
Non-Profit Organizations with Credit Available Elsewhere ...	3.250
Non-Profit Organizations without Credit Available Elsewhere	3.250
<i>For Economic Injury:</i>	
Business and Small Agricultural Cooperatives without Credit Available Elsewhere	4.000
Non-Profit Organizations without Credit Available Elsewhere	3.250

The number assigned to this disaster for physical damage is 20312C and for economic injury is 203130.

(Catalog of Federal Domestic Assistance Number 59008)

Francisco Sánchez, Jr.,

Associate Administrator, Office of Disaster Recovery & Resilience.

DEPARTMENT OF STATE

[Public Notice: 12398]

**Notice of Department of State
Sanctions Actions**

ACTION: Notice.

SUMMARY: The U.S. Department of State's Office of Economic Sanctions Policy and Implementation (SPI) is publishing the name of an individual who has been removed from the List of Specially Designated Nationals and Blocked Persons (SDN List) maintained by the Office of Foreign Assets Control (OFAC) and is consequently no longer subject to the prohibitions imposed pursuant to the Executive Order, "Blocking Property With Respect To Specified Harmful Foreign Activities of the Government of the Russian Federation."

DATES: The actions described in this notice were effective on September 14, 2023.

FOR FURTHER INFORMATION CONTACT: Aaron P. Forsberg, Director, Office of Economic Sanctions Policy and Implementation, Bureau of Economic and Business Affairs, Department of State, Washington, DC 20520, tel.: (202) 647 7677, email: forsbergap@state.gov.

SUPPLEMENTARY INFORMATION:

¹⁵ 17 CFR 200.30-3(a)(12).

Electronic Availability

The SDN List and additional information concerning OFAC sanctions programs are available from OFAC's website at <http://www.treasury.gov/ofac>.

Notice of Department of State Actions

On September 14, 2023, OFAC removed from the SDN List the individual listed below, who was subject to prohibitions imposed pursuant to E.O. 14024 of April 15, 2021.

Entity

1. GOLDFINCH, Paul Andrew, Russia; Latvia; DOB Oct 1970; nationality New Zealand; Gender Male (individual) [RUSSIA-EO14024] (Linked To: PUBLIC JOINT STOCK COMPANY BANK FINANCIAL CORPORATION OTKRITIE).

Amy E. Holman,

Principal Deputy Assistant Secretary, Bureau of Economic and Business Affairs, Department of State.

BILLING CODE 4710-07-P

DEPARTMENT OF TRANSPORTATION**Federal Highway Administration**

[Docket No. FHWA-2024-0026]

Emergency Temporary Closure of a Segment of Interstate 695, Including the Francis Scott Key Bridge, in Baltimore, Maryland; Deletion From the National Network

AGENCY: Federal Highway Administration (FHWA), Department of Transportation (DOT).

ACTION: Notice; request for comments.

SUMMARY: The Maryland Transportation Authority (MDTA) closed Interstate 695 (I-695) in both directions over the Patapsco River, which provides access to the Baltimore Harbor and the Port of Baltimore, on March 26, 2024, due to the collapse of the Francis Scott Key Bridge. The MDTA is the owner of the bridge. It is a modal administration under the Maryland Department of Transportation (MDOT). The MDTA is continuing the temporary closure of this

segment of I-695 for an indefinite period of time until the damaged bridge can be reconstructed. The FHWA is providing notice in the **Federal Register** that the FHWA is approving an emergency deletion of this segment of I-695 from the National Network (NN), in accordance with applicable regulations, due to safety considerations and the emergency closure resulting from the bridge and other infrastructure damage, as discussed in this notice. The FHWA is also requesting comments from the public for 30 days on the alternate routes selected by MDTA due to the closure.

DATES: Comments must be received on or before June 7, 2024.

ADDRESSES: To ensure that you do not duplicate your docket submissions, please submit them by only one of the following means:

- **Federal eRulemaking Portal:** Go to www.regulations.gov and follow the online instructions for submitting comments.

- **Mail:** U.S. Department of Transportation, Docket Operations, 1200 New Jersey Avenue SE, Room W12-140, Washington, DC 20590.

- **Hand Delivery or Courier:** U.S. Department of Transportation, Docket Operations, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, Washington, DC, between 9:00 a.m. and 5:00 p.m. ET, except Federal holidays.

Instructions: You must include the agency name and docket number [FHWA-2024-0026] at the beginning of your comments. All comments received will be posted without change to www.regulations.gov, including any personal information provided.

FOR FURTHER INFORMATION CONTACT:

Michael Latuszek, FHWA Office of Operations, 573-616-0415, michael.latuszek@dot.gov; William Winne, Office of Chief Counsel, 202-366-0791, william.winne@dot.gov, FHWA, 1200 New Jersey Avenue SE., Washington, DC 20590; or Valeriya Remezova, FHWA Maryland Division, 410-779-7130, valeriya.remezova@dot.gov.

SUPPLEMENTARY INFORMATION:**Electronic Access and Filing**

This document and all comments received may be viewed online through the Federal eRulemaking portal at www.regulations.gov. The website is available 24 hours each day, 365 days each year. An electronic copy of this document may also be downloaded by accessing the Office of the Federal Register's website at www.federalregister.gov and the U.S.

Government Publishing Office's website at www.govinfo.gov.

Background

The MDTA closed I-695 in both directions over the Patapsco River,¹ which provides access to the Baltimore Harbor and the Port of Baltimore, on March 26, 2024, due to the collapse of the Francis Scott Key Bridge. The MDTA is the owner of the bridge. It is a modal administration under the MDOT.

The FHWA is providing notice in the **Federal Register** that the MDTA is continuing the temporary closure of this segment of I-695 in both directions for an indefinite period of time until the damaged bridge can be reconstructed. The FHWA is requesting comments from the public for 30 days on the alternate routes selected by MDTA due to the closure.

The FHWA is responsible for enforcing the Federal regulations applicable to the NN that can safely and efficiently accommodate the large vehicles authorized by provisions of the Surface Transportation Assistance Act of 1982, as amended and codified at Title 49 of the United States Code (U.S.C.) Chapter 311; designated in accordance with 23 CFR part 658 (Truck Size and Weight, Route Designations—Length, Width and Weight Limitations); and listed in Appendix A to 23 CFR part 658. Under 23 CFR 658.11 (Additions, deletions, exceptions, and restrictions), FHWA may approve deletions of, or use restrictions on, the Interstate System or other NN route based upon specified justification criteria in section 658.11(d)(2). The FHWA is authorized to delete any route from the NN on an emergency basis, based on safety considerations pursuant to 23 CFR 658.11(e), which also requires publishing this notice in the **Federal Register** for comment.

At approximately 1:30 a.m. on March 26, 2024, a cargo ship leaving the Port of Baltimore struck the Francis Scott Key Bridge, which is a component of the segment of I-695 over the Patapsco River. Shortly thereafter, the bridge collapsed. The overall bridge is approximately 8,636 feet in length (or roughly 1.6 miles). The main span is 1,200 feet. The Average Daily Traffic in 2023 was approximately 34,121 vehicles.

As a result, I-695 Outer Loop was closed at Quarantine Road (exit 1), and the I-695 Inner Loop was closed at MD 157/Peninsula Expressway (exit 43); however, the situation is evolving. Maryland State transportation officials are providing public information via their web pages, which are listed at the end of this notice, regarding current closures and recommended detours. Although the recommended detours have been evolving since the onset of the incident, currently traffic on I-695 is being rerouted as follows:

Alternate routes that cross the Baltimore Harbor (Harbor Crossings) are I-95, the Fort McHenry Tunnel, or I-895, the Baltimore Harbor Tunnel. The I-95 Fort McHenry Tunnel prohibits vehicles greater than 14'6" in height and 11'0" in width. The I-895 Baltimore Harbor Tunnel prohibits vehicles greater than 13'6" in height or 8'0" in width. Both tunnels prohibit vehicles transporting hazardous materials. This includes vehicles carrying bottled propane gas in excess of 10 pounds per container (maximum of 10 containers), bulk gasoline, explosives, or significant amounts of radioactive materials. Vehicles prohibited from Harbor Crossings, including vehicles transporting hazardous materials and vehicles over 14'6" high or 11'0" wide, should use the western section of I-695 around the tunnels as an alternative route.

A detour message is being provided on overhead changeable message signs indicating the suggested use of alternate routes. Portable signs are being deployed for local roads. The Port of Baltimore is still open for truck transactions. Vessel (waterway) traffic into and out of the Port of Baltimore was suspended on March 26, 2024, until further notice (see MDTA websites and newsfeeds, listed below, for current status).

For up-to-date information on traffic advisories, commercial truck and hazardous material routing, and the bridge replacement, the MDTA and MDOT established a website at <https://mdta.maryland.gov/keybridgenews>. In addition, MDOT provides traveler information via "Maryland 511" at <https://chart.maryland.gov/>.

Comments are invited on all alternate routes.

Authority: 23 U.S.C. 127 and 315; 49 U.S.C. 31111, 31112, and 31114; 23 CFR part 658.

Shailen P. Bhatt,
Administrator, Federal Highway Administration.

BILLING CODE 4910-22-P

DEPARTMENT OF TRANSPORTATION

National Highway Traffic Safety Administration

[Docket No. NHTSA-2023-0010; Notice 1]

Volvo Bus Corporation, Receipt of Petition for Decision of Inconsequential Noncompliance

AGENCY: National Highway Traffic Safety Administration (NHTSA), Department of Transportation (DOT).

ACTION: Receipt of petition

SUMMARY: Volvo Bus Corporation (VBC) has determined that certain model year (MY) 2009–2023 Volvo 9700 buses do not fully comply with Federal Motor Vehicle Safety Standard (FMVSS) No. 108, *Lamps, Reflective Devices, and Associated Equipment*. VBC filed a noncompliance report dated November 15, 2022, and subsequently petitioned NHTSA (the "Agency") on December 13, 2022, for a decision that the subject noncompliance is inconsequential as it relates to motor vehicle safety. This document announces receipt of VBC's petition.

DATES: Send comments on or before June 7, 2024.

ADDRESSES: Interested persons are invited to submit written data, views, and arguments on this petition. Comments must refer to the docket and notice number cited in the title of this notice and may be submitted by any of the following methods:

- **Mail:** Send comments by mail addressed to the U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, Washington, DC 20590.

- **Hand Delivery:** Deliver comments by hand to the U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, Washington, DC 20590. The Docket Section is open on weekdays from 10 a.m. to 5 p.m. except for Federal Holidays.

- **Electronically:** Submit comments electronically by logging onto the Federal Docket Management System (FDMS) website at <https://www.regulations.gov/>. Follow the online instructions for submitting comments.

- Comments may also be faxed to (202) 493-2251.

Comments must be written in the English language, and be no greater than 15 pages in length, although there is no limit to the length of necessary attachments to the comments. If comments are submitted in hard copy

¹ The portion of I-695 that includes the Francis Scott Key Bridge is a part of the National Highway System (NHS) and was officially incorporated into the Interstate System effective April 29, 2024. In Appendix A to title 23 of the Code of Federal Regulations (CFR) part 658, this route is listed as MD 695 from I-695/MD 3 Glenn Burnie to I-95/695 Kenwood.

form, please ensure that two copies are provided. If you wish to receive confirmation that comments you have submitted by mail were received, please enclose a stamped, self-addressed postcard with the comments. Note that all comments received will be posted without change to <https://www.regulations.gov>, including any personal information provided.

All comments and supporting materials received before the close of business on the closing date indicated above will be filed in the docket and will be considered. All comments and supporting materials received after the closing date will also be filed and will be considered to the fullest extent possible.

When the petition is granted or denied, notice of the decision will also be published in the **Federal Register** pursuant to the authority indicated at the end of this notice.

All comments, background documentation, and supporting materials submitted to the docket may be viewed by anyone at the address and times given above. The documents may also be viewed on the internet at <https://www.regulations.gov> by following the online instructions for accessing the dockets. The docket ID number for this petition is shown in the heading of this notice.

DOT's complete Privacy Act Statement is available for review in a **Federal Register** notice published on April 11, 2000 (65 FR 19477–78).

FOR FURTHER INFORMATION CONTACT:

Leroy Angeles, NHTSA, Office of Vehicle Safety Compliance, (202) 366–5304.

SUPPLEMENTARY INFORMATION: I.

Overview: VBC determined that certain MY 2009–2023 VBC 9700 buses do not fully comply with paragraph S7.7.15.3 of FMVSS No. 108, *Lamps, Reflective Devices, and Associated Equipment* (49 CFR 571.108).

VBC filed a noncompliance report dated November 15, 2022, pursuant to 49 CFR part 573, *Defect and Noncompliance Responsibility and Reports*. VBC petitioned NHTSA on December 13, 2022, for an exemption from the notification and remedy requirements of 49 U.S.C. Chapter 301 on the basis that this noncompliance is inconsequential as it relates to motor vehicle safety, pursuant to 49 U.S.C. 30118(d) and 30120(h) and 49 CFR part 556, *Exemption for Inconsequential Defect or Noncompliance*.

This notice of receipt of VBC's petition is published under 49 U.S.C. 30118 and 30120 and does not represent any agency decision or another exercise

of judgment concerning the merits of the petition.

II. Vehicles Involved: Approximately 958 MY 2009–2023 Volvo 9700 buses, manufactured between February 1, 2008 and May 1, 2022, were reported by the manufacturer.

III. Rule Requirements: Paragraph S7.7.15.3 of FMVSS No. 108 includes the requirements relevant to this petition. Paragraph S7.7.15.3 of FMVSS No. 108 requires that light rays reach all portions of an imaginary plate of the same size at least 25 mm ahead of the actual plate measured perpendicular to the plane of the plate.

IV. Noncompliance: VBC explains that the noncompliance is that the subject vehicles are equipped with license plate lamps that do not reach all portions of the license plate when the license plate is placed 25 mm ahead of its normal position. Therefore, the subject vehicles do not comply with paragraph S7.7.15.3 of FMVSS No. 108.

V. Summary of VBC's Petition: The following views and arguments presented in this section, “V. Summary of VBC's Petition,” are the views and arguments provided by VBC. They have not been evaluated by the Agency and do not reflect the views of the Agency. VBC describes the subject noncompliance and contends that the noncompliance is inconsequential as it relates to motor vehicle safety.

VBC says that although the subject license plate lamps are noncompliant, when the license plate is installed in its normal position, it is fully illuminated by the lamps.¹

VBC states that it has corrected the subject noncompliance in vehicle production and production is currently in compliance with paragraph S7.7.15.3 of FMVSS No. 108. VBC notes that paragraph S7.7.15.3 of FMVSS No. 108 “refers to an imaginary plate in a testing position, and not a real license plate that requires physical testing with measurable test data.”

VBC contends that the subject noncompliance is inconsequential to motor vehicle safety because the noncompliant license plate lamps equipped on the subject vehicles fulfill its main purpose to ensure that law enforcement personnel and the public are able to identify vehicles in low-lighting conditions.

VBC explains that “except for vehicle testing purposes, the license plate is never installed in a position that differs from its original intended one.” Furthermore, VBC says no vehicles were delivered with a license plate in the testing position. Additionally, the

license plates are fixed in the original position and cannot be adjusted. Thus, VBC believes that the license plate equipped on the subject vehicles “will always be fully illuminated under normal vehicle operating conditions.”

VBC says that “test results demonstrate that this noncompliance is imperceptible to road users considering that the license plate is fully illuminated when normally installed, as demonstrated in Attachment 2 ‘VBC Engineering Report ER–684684’.”

VBC says that since 2008, over 900 subject vehicles have been functioning with the noncompliance at issue, and VBC has not received any customer complaints, field reports, or warranty claims related to the subject noncompliance. VBC adds that it is not aware of any accidents, injuries, or death related to the subject noncompliance.

VBC says that NHTSA has granted prior petitions in which a noncompliance involving the license plate lamps “is expected to be imperceptible, or nearly so, to vehicle occupants or approaching drivers.” VBC believes that the subject noncompliance is imperceptible to all road users, therefore, VBC contends that NHTSA should also grant VBC's petition.

VBC concludes by stating its belief that the subject noncompliance is inconsequential as it relates to motor vehicle safety and its petition to be exempted from providing notification of the noncompliance, as required by 49 U.S.C. 30118, and a remedy for the noncompliance, as required by 49 U.S.C. 30120, should be granted.

NHTSA notes that the statutory provisions (49 U.S.C. 30118(d) and 30120(h)) that permit manufacturers to file petitions for a determination of inconsequentiality allow NHTSA to exempt manufacturers only from the duties found in sections 30118 and 30120, respectively, to notify owners, purchasers, and dealers of a defect or noncompliance and to remedy the defect or noncompliance. Therefore, any decision on this petition only applies to the subject vehicles that VBC no longer controlled at the time it determined that the noncompliance existed. However, any decision on this petition does not relieve vehicle distributors and dealers of the prohibitions on the sale, offer for sale, or introduction or delivery for introduction into interstate commerce of the noncompliant vehicles under their control after VBC notified them that the subject noncompliance existed.

¹ See Figure 3 and Figure 4 of VBC's petition.

(Authority: 49 U.S.C. 30118, 30120; delegations of authority at 49 CFR 1.95 and 501.8)

Otto G. Matheke III,

Director, Office of Vehicle Safety Compliance.

BILLING CODE 4910–59–P

DEPARTMENT OF THE TREASURY

Office of Foreign Assets Control

Notice of OFAC Sanctions Actions

AGENCY: Office of Foreign Assets Control, Treasury.

ACTION: Notice.

SUMMARY: The U.S. Department of the Treasury's Office of Foreign Assets

Control (OFAC) is publishing the names of one or more persons that have been placed on OFAC's Specially Designated Nationals and Blocked Persons List (SDN List) based on OFAC's determination that one or more applicable legal criteria were satisfied. All property and interests in property subject to U.S. jurisdiction of these persons are blocked, and U.S. persons are generally prohibited from engaging in transactions with them.

DATES: See **SUPPLEMENTARY INFORMATION** section for applicable date(s).

FOR FURTHER INFORMATION CONTACT: OFAC: Bradley Smith, Director, tel.: 202–622–2490; Associate Director for Global Targeting, tel.: 202–622–2420; Assistant Director for Licensing, tel.: 202–622–2480; Assistant Director for

Regulatory Affairs, tel.: 202–622–4855; or Assistant Director for Compliance, tel.: 202–622–2490.

SUPPLEMENTARY INFORMATION:

Electronic Availability

The SDN List and additional information concerning OFAC sanctions programs are available on OFAC's website (ofac.treasury.gov).

Notice of OFAC Action(s)

On May 2, 2024, OFAC determined that the property and interests in property subject to U.S. jurisdiction of the following persons are blocked under the relevant sanctions authority listed below.

BILLING CODE 4810–AL–P

Individuals

1. AL-ZEIN, Mazen Hassan (Arabic: مازن حسان الزين) (a.k.a. EL ZEIN, Mazen Hassan; a.k.a. "AL-ZAYN, Mazin"; a.k.a. "EL ZEIN, Mazen"), Burj Daman Tower, Apartment 3406, Dubai International Financial Center, Dubai 99573, United Arab Emirates; Al Mustaqbal Street, Iris Bay Building, Apt. No. 2304, Business Bay, Dubai, United Arab Emirates; 51 Route des Valleees, Bis 3, Annemasse 74100, France; 46 Rue des Fontaines, Anthy Sur Lemans 74200, France; DOB 21 Jun 1974; POB Beirut, Lebanon; nationality Lebanon; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Gender Male; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886; National ID No. 784197494718279 (Lebanon); Identification Number 178295160001 (United Kingdom) (individual) [SDGT] (Linked To: MOUKALLED, Hassan Ahmed).

Designated pursuant to section 1(a)(iii)(A) of Executive Order 13224 of September 23, 2001, "Blocking Property and Prohibiting Transactions With Persons Who Commit, Threaten to Commit, or Support Terrorism," 66 FR 49079, as amended by Executive Order 13886 of September 9, 2019, "Modernizing Sanctions To Combat Terrorism," 84 FR 48041 (E.O. 13224, as amended), for having acted or purported to act for or on behalf of, directly or indirectly, HASSAN AHMED MOUKALLED, a person whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

2. MANSUR, Bashir Ibrahim (Arabic: مازن حسان الزين) (a.k.a. MANSOUR, Bashir Ibrahim), Baabda, Lebanon; Borj El Brajneeh, Lebanon; DOB 09 Feb 1980; POB Lebanon; nationality Lebanon; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Gender Male; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886 (individual) [SDGT] (Linked To: CTEX EXCHANGE).

Designated pursuant to section 1(a)(iii)(C) of E.O. 13224, as amended, for having materially assisted, sponsored, or provided financial, material, or technological support for, or goods or services to or in support of, CTEX EXCHANGE, a person whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

3. YOUSSEF, Adnan Mahmoud (a.k.a. YOUSSEF, Adnan; a.k.a. "YUSUF, 'Adnan"), Haret Hreik, Beirut, Lebanon; DOB 06 Jun 1956; POB Beirut, Lebanon; nationality Lebanon; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Gender Male; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886 (individual) [SDGT] (Linked To: MOUKALLED, Hassan Ahmed).

Designated pursuant to section 1(a)(iii)(A) of E.O. 13224, as amended, for having acted or purported to act for or on behalf of, directly or indirectly, HASSAN AHMED MOUKALLED, a person whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

4. MUSHANTAF, Andriyah Samir (Arabic: اندريه سمير مشنت) (a.k.a. MISHANTAF, Andre Samir; a.k.a. MSHANTAF, Andre Samir; a.k.a. MSHANTAF, Andrea Samir; a.k.a. MUCHANTAF, Andreih Samir; a.k.a. MUSHANTAF, Andre Samir), Lebanon; DOB 11 Mar 1966; POB Lebanon; nationality Lebanon; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Gender Male; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886; National ID No. 1694100 (Lebanon) (individual) [SDGT] (Linked To: CTEX EXCHANGE).

Designated pursuant to section 1(a)(iii)(C) of E.O. 13224, as amended, for having materially assisted, sponsored, or provided financial, material, or technological support for, or goods or services to or in support of, CTEX EXCHANGE, a person whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

5. MOUKALLED, Firas Hasan (Arabic: فراس حسن مقلد) (a.k.a. MOUKALLED, Firas; a.k.a. MQALLAD, Firas Hasan; a.k.a. MUQALLID, Firas Hasan), Lebanon; DOB 09 Oct 1990; POB Lebanon; nationality Lebanon; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Gender Male; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886 (individual) [SDGT] (Linked To: MOUKALLED, Hassan Ahmed).

Designated pursuant to section 1(a)(iii)(C) of E.O. 13224, as amended, for having materially assisted, sponsored, or provided financial, material, or technological support for, or goods or services to or in support of, HASSAN AHMED MOUKALLED, a person whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

Entities

1. TELEPORT COMPANY SAL (Arabic: شركة تليپورت ش.م.ل), Sami El Solh Street, Beirut, Lebanon; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886; Organization Established Date 15 Jan 2016; Organization Type: Non-specialized wholesale trade; Commercial Registry Number 1020711 (Lebanon) [SDGT] (Linked To: MUSHANTAF, Andriyah Samir; Linked To: MOUKALLED, Firas Hasan; Linked To: MOUKALLED, Rayyan Hassan).

Designated pursuant to section 1(a)(iii)(A) of E.O. 13224, as amended, for being owned, controlled, or directed by, directly or indirectly, RAYYAN HASSAN MOUKALLED, FIRAS HASAN MOUKALLED, and ANDRIYAH SAMIR MUSHANTAF, persons whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

2. THE CRYSTAL GROUP (a.k.a. THE CRYSTAL GROUP SAL), Beirut, Lebanon; Dubai, United Arab Emirates; Additional Sanctions Information - Subject to Secondary Sanctions Pursuant to the Hizballah Financial Sanctions Regulations; Secondary sanctions risk: section 1(b) of Executive Order 13224, as amended by Executive Order 13886; Organization Established Date 2003; Organization Type: Restaurants and mobile food service activities; Business Registration Number 1008937 (Lebanon) [SDGT] (Linked To: AL-ZEIN, Mazen Hassan).

Designated pursuant to section 1(a)(iii)(A) of E.O. 13224, as amended, for being owned, controlled, or directed by, directly or indirectly, MAZEN HASSAN AL-ZEIN, a person whose property and interests in property are blocked pursuant to E.O. 13224, as amended.

Dated: May 2, 2024.

Bradley T. Smith,

*Director, Office of Foreign Assets Control,
U.S. Department of the Treasury.*

BILLING CODE 4810-AL-C

FEDERAL REGISTER

Vol. 89

Wednesday,

No. 90

May 8, 2024

Part II

Environmental Protection Agency

40 CFR Parts 9 and 257

Hazardous and Solid Waste Management System: Disposal of Coal Combustion Residuals From Electric Utilities; Legacy CCR Surface Impoundments; Final Rule

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Parts 9 and 257**

[EPA–HQ–OLEM–2020–0107; FRL–7814–04–OLEM]

RIN 2050–AH14

Hazardous and Solid Waste Management System: Disposal of Coal Combustion Residuals From Electric Utilities; Legacy CCR Surface Impoundments**AGENCY:** Environmental Protection Agency (EPA).**ACTION:** Final rule.

SUMMARY: On April 17, 2015, the Environmental Protection Agency (EPA or the Agency) promulgated national minimum criteria for existing and new coal combustion residuals (CCR) landfills and existing and new CCR surface impoundments. On August 21, 2018, the United States Court of Appeals for the District of Columbia Circuit vacated the exemption for inactive surface impoundments at inactive facilities (legacy CCR surface impoundments) and remanded the issue back to EPA to take further action consistent with its opinion in *Utility Solid Waste Activities Group, et al. v. EPA*. This action responds to that order and establishes regulatory requirements for legacy CCR surface impoundments. EPA is also establishing requirements for CCR management units at active CCR facilities and at inactive CCR facilities with a legacy CCR surface impoundment. Finally, EPA is making several technical corrections to the existing regulations, such as correcting certain citations and harmonizing definitions.

DATES: This final rule is effective on November 4, 2024.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OLEM–2020–0107. All documents in the docket are listed on the <http://www.regulations.gov> website. Although listed in the index, some information is not publicly available, e.g., CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through <http://www.regulations.gov>.

FOR FURTHER INFORMATION CONTACT: For questions concerning this proposal, contact Michelle Lloyd, Office of

Resource Conservation and Recovery, Materials Recovery and Waste Management Division, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, MC: 5304T, Washington, DC 20460; telephone number: (202) 566–0560; email address: Lloyd.Michelle@epa.gov, or Taylor Holt, Office of Resource Conservation and Recovery, Materials Recovery and Waste Management Division, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, MC: 5304T, Washington, DC 20460; telephone number: (202) 566–1439; email address: Holt.Taylor@epa.gov. I. General Information

A. Does this action apply to me?

This rule applies to and may affect all CCR generated by electric utilities and independent power producers that fall within the North American Industry Classification System (NAICS) code 221112. The reference to NAICS code 221112 is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. This discussion lists the types of entities that EPA is now aware could potentially be regulated by this action. Other types of entities not described here could also be regulated. To determine whether your entity is regulated by this action, you should carefully examine the applicability criteria found in 40 CFR 257.50 of title 40 of the Code of Federal Regulations. If you have questions regarding the applicability of this action to a particular entity, consult the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

B. What action is the Agency taking?

EPA is amending the regulations governing the disposal of CCR in landfills and surface impoundments, codified in subpart D of part 257 of Title 40 of the Code of Federal Regulations (CFR) (CCR regulations). Specifically, the Agency is establishing regulatory requirements for inactive CCR surface impoundments at inactive utilities (“legacy CCR surface impoundment” or “legacy impoundment”). This action is being taken in response to the August 21, 2018, opinion by the U.S. Court of Appeals for the District of Columbia Circuit in *Utility Solid Waste Activities*

Group v. EPA, 901 F.3d 414 (D.C. 2018) (“USWAG decision” or “USWAG”) that vacated and remanded the provision exempting legacy impoundments from the CCR regulations. This action includes adding a definition for legacy CCR surface impoundments and other terms relevant to this rulemaking. It also requires that legacy CCR surface impoundments comply with certain existing CCR regulations with tailored compliance deadlines.

While this action is responsive to the D.C. Circuit’s order, it is also driven by the record, which clearly demonstrates that regulating legacy CCR surface impoundments will have significant quantified and unquantified public health and environmental benefits. As EPA concluded in 2015, the risks posed by unlined CCR surface impoundments are substantial, and the risks from legacy impoundments are at least as significant. EPA’s 2014 Risk Assessment concluded that the cancer risks from unlined surface impoundments ranged from 3×10^{-4} for trivalent arsenic to 4×10^{-5} for pentavalent arsenic. Non-cancer risks from these same units also significantly exceeded EPA’s level of concern, with estimated Hazard Quotients (HQ) of two for thallium, three for lithium, four for molybdenum and eight for trivalent arsenic. In addition, as described in Unit III.A.1 of this preamble, information obtained since 2015 indicates that the risks for legacy CCR surface impoundments are likely to be greater than EPA originally estimated. Finally, based on the demographic composition and environmental conditions of communities within one and three miles of legacy CCR surface impoundments, this final rule will reduce existing disproportionate and adverse effects on economically vulnerable communities, as well as those that currently face environmental burdens. For example, in Illinois the population living within one mile of legacy CCR surface impoundment sites is over three times as likely compared to the State average to have less than a high school education (35.66% compared to 10.10%, see Regulatory Impact Analysis (RIA) exhibit ES.14), and that population already experiences higher than average exposures to particulate matter, ozone, diesel emissions, lifetime air toxics cancer risks, and proximity to traffic, Superfund sites, Risk Management Plan sites, and hazardous waste facilities (see RIA exhibit ES.15). Consistent with the directive in section 4004(a) to ensure that the statutory standard is met at all regulated sites, including the most vulnerable, this final

rule will help EPA further ensure that the communities and ecosystems closest to coal facilities are sufficiently protected from harm from groundwater contamination, surface water contamination, fugitive dust, floods and impoundment overflows, and threats to wildlife.

EPA is also establishing requirements to address the risks from currently exempt solid waste management that involves the direct placement of CCR on the land. EPA is extending a subset of the existing requirements in 40 CFR part 257, subpart D to CCR surface impoundments and landfills that closed prior to the effective date of the 2015 CCR Rule, inactive CCR landfills, and other areas where CCR is managed directly on the land. In this action, EPA refers to these as CCR management units, or CCRMU. The final rule expands the CCRMU requirements to a set of active facilities that were not regulated by the 2015 CCR rule because they had ceased disposing of CCR in their on-site disposal units, and they did not have an inactive surface impoundment. Accordingly, this rule applies to all CCRMU at active CCR facilities and inactive facilities with a legacy CCR surface impoundment.

EPA is also finalizing alternative closure provisions to allow a facility to complete the closure by removal in two stages: first, by completing all removal and decontamination procedures; and second, by completing all groundwater remediation in a separate post closure care period.

Finally, EPA is making a number of technical corrections to the existing regulations, such as correcting certain citations and harmonizing definitions.

EPA intends the provisions of the rule to be severable. In the event that any individual provision or part of the rule is invalidated, EPA intends that this would not render the entire rule invalid, and that any individual provisions that can continue to operate will be left in place. For example, EPA intends that the provisions governing each class of facilities—legacy CCR inactive surface impoundments, CCR management units, other active facility units, and regulated CCR landfills containing waste in contact with groundwater—to be independently severable from one another as each set of requirements operates independently from the other.

Likewise, the provisions regulating existing units at active facilities, including those units at non-fossil-fuel-fired facilities generating energy, are severable from the other substantive requirements—each provision may continue operating even if one of the others is invalidated. EPA also intends

that, within each set of provisions for legacy CCR surface impoundments and for CCR management units, the substantive requirements be severable from each other. For example, if any of the closure requirements were to be set aside (e.g., the requirement that CCRMU initiate closure within 48 months of publication), the groundwater monitoring and corrective action requirements can continue to fully and effectively operate. These requirements function independently from each other, address environmental concerns through different means, and are not dependent on the others; they are therefore severable from each other. Lastly, as set forth below, EPA has deferred the dates by when some units in some circumstances must comply with the substantive standards governing legacy CCR surface impoundments and CCR management units. If any of the deferrals were to be set aside, EPA intends that the substantive standards would remain in place because the rationale for and effectiveness of each set of substantive standards is not dependent on any of the deferrals.

For the reader's convenience, EPA has provided a background description of existing requirements in several places throughout this preamble.

C. What is the Agency's authority for taking this action?

EPA is publishing this notice under the authority of sections 1008(a), 2002(a), 3007, 4004, and 4005(a) and (d) of the Solid Waste Disposal Act of 1970, as amended by the Resource Conservation and Recovery Act of 1976 (RCRA), as amended by the Hazardous and Solid Waste Amendments of 1984 (HSWA) and the Water Infrastructure Improvements for the Nation (WIIN) Act of 2016, 42 U.S.C. 6907(a), 6912(a), 6927, 6944, 6945(a) and (d).

RCRA section 1008(a) authorizes EPA to publish "suggested guidelines for solid waste management." 42 U.S.C. 6907(a). RCRA defines solid waste management as "the systematic administration of activities which provide for the collection, source separation, storage, transportation, transfer, processing, treatment, and disposal of solid waste." 42 U.S.C. 6903(28).

Pursuant to section 1008(a)(3), the guidelines are to include the minimum criteria to be used by the States to define the solid waste management practices that constitute the open dumping of solid waste or hazardous waste and are prohibited as "open dumping" under section 4005. Only those requirements promulgated under the authority of

section 1008(a)(3) are enforceable under section 7002 of RCRA.

RCRA section 4004(a) generally requires EPA to promulgate regulations containing criteria distinguishing "sanitary landfills," which may continue to operate, from "open dumps," which are prohibited. 42 U.S.C. 6944(a); *see id.* 6903(14), (26); 6945(a). The statute directs that, "at a minimum, the criteria are to ensure that units are classified as sanitary landfills only if there is no reasonable probability of adverse effects on health or the environment from disposal of solid wastes at such facility." 42 U.S.C. 6944(a).

RCRA section 4005(a), entitled "Closing or upgrading of existing open dumps," prohibits any solid waste management practices or disposal of solid waste that does not comply with EPA regulations issued under RCRA section 1008(a) and 4004(a). 42 U.S.C. 6945(a). *See also* 42 U.S.C. 6903(14) (definition of "open dump"). This prohibition takes effect "upon promulgation" of any rules issued under section 1008(a)(3) and is enforceable either through a citizen suit brought pursuant to section 7002, or through an EPA enforcement action brought pursuant to section 4005(d)(4)(A). *See* 42 U.S.C. 6945(a), (d)(4)(A) (authorizing EPA to use the authority under RCRA section 3008(a) to enforce the open dumping prohibition for CCR). RCRA section 4005(a) also directs that open dumps (i.e., facilities out of compliance with EPA's criteria), must be closed or upgraded. *See* 42 U.S.C. 6945(a).

RCRA section 4005(d)(3) specifies that the regulations in 40 CFR part 257, subpart D "(or successor regulations promulgated pursuant to sections 6907(a)(3) and 6944(a) of this title), shall apply to each CCR unit" unless a permit issued by an approved State or by EPA is in effect. Similarly, section 4005(d)(6)¹ provides that:

a CCR unit shall be considered to be a sanitary landfill for purposes of this chapter, including subsection (a), only if the coal combustion residuals unit is operating in accordance with [a permit issued by EPA or an approved State] or the applicable criteria for coal combustion residuals units under part 257 of title 40, Code of Federal Regulations (or successor regulations promulgated pursuant to sections 6907(a)(3) and 6944(a) of this title).

1. Regulation of Solid Wastes Under RCRA Subtitle D

Solid wastes that are neither a listed nor characteristic hazardous waste are subject to the requirements of RCRA

subtitle D. Subtitle D of RCRA establishes a framework for Federal, State, and local government cooperation in controlling the management of nonhazardous solid waste. The Federal role is to establish the overall regulatory direction by providing minimum nationwide standards that will protect human health and the environment. States may, but are not required to, adopt these requirements into their State programs.

Under RCRA section 4005(a), upon promulgation of criteria under section 1008(a)(3), any solid waste management practice or disposal of solid waste that constitutes the "open dumping" of solid waste is prohibited. The Federal standards apply directly to the facility (are self-implementing) and facilities are directly responsible for ensuring that their operations comply with these requirements.

RCRA section 4005(d) establishes an additional regulatory structure, applicable exclusively to the solid waste management of CCR, that builds on the provisions in sections 1008(a)(3), 4004, and 4005(a), without restricting the scope of EPA's authority under those sections. *See*, 42 U.S.C. 6945 (d)(7). Under 4005(d), States may seek EPA approval of a State permitting program under which individualized facility permits would "operate in lieu of [EPA] regulation of coal combustion residuals units in the State." 42 U.S.C. 6945(d)(1)(A). EPA is also directed to "implement a permit program," which would operate in absence of an approved State program. 42 U.S.C. 6945(d)(2). However, the statute makes clear that facilities must continue to comply with the Federal regulations until a permit issued by either EPA or an approved State is in effect. 42 U.S.C. 6945(d)(3), (6).

RCRA sections 1008(a)(3) and 4004(a) delegate broad authority to EPA to establish regulations governing the management of solid waste. Under section 4004(a) EPA is charged with establishing requirements to ensure that facilities will be classified as sanitary landfills and not an open dump "only if there is no reasonable probability of adverse effects on health or the environment from the disposal of solid waste" at the facility. Or in other words, under section 4004(a) EPA is charged with issuing regulations to address all "reasonable probabilities of adverse effects" (i.e., all reasonably anticipated risks) to health and the environment from the disposal of solid waste. Section 1008(a)(3) expands EPA's authority to address the risks from any of the activities identified as "solid waste management" in RCRA section

¹ 42 U.S.C. 6945(d)(6).

1004(28). Specifically, EPA is authorized to establish requirements applicable to “storage, transportation, transfer, processing, treatment, and disposal of solid waste.” (42 U.S.C. 6907(a), 6903(28)). Under RCRA, EPA sets these requirements without taking cost into account as a factor. See *USWAG et al. v. EPA*, 901 F.3d at 448–49 (citing RCRA section 4004(a)).

The statute is clear that EPA is authorized to issue regulations to address the current risks from previous solid waste management activities. EPA explained at length the basis for this conclusion as part of the Agency’s rationale for regulating inactive impoundments. See, 80 FR 21344–21347. See also *USWAG*, 901 F.3d at 440. Among other provisions, the statutory definition of an “open dump” conclusively resolves the question. RCRA defines an “open dump” as “any facility or site where solid waste is disposed of” 42 U.S.C. 6903(14). As the D.C. Circuit explained,

Importantly, while the “is” retains its active present tense, the “disposal” takes the form of a past participle (“disposed”). In this way, the disposal itself can exist (it “is”), even if the act of disposal took place at some prior time Properly translated then, an open dump includes any facility (other than a sanitary landfill or hazardous waste disposal facility), where solid waste still “is deposited,” “is dumped,” “is spilled,” “is leaked,” or “is placed,” regardless of when it might have originally been dropped off. See 42 U.S.C. 6903(3), (14). In other words, the waste in inactive impoundments “is disposed of” at a site no longer receiving new waste in just the same way that it “is disposed of” at a site that is still operating.

901 F.3d at 440. See also *In re Consolidated Consol. Land Disposal Regulation Litig.*, 938 F.2d 1386, 1389 (D.C. Cir. 1991) (EPA’s reading of the term “disposal” in RCRA’s subtitle C, 42 U.S.C. 6924, to include “the continuing presence of waste” was reasonable); *USWAG*, 901 F.3d at 453–54 (Henderson, J., concurring) (same). By the same logic, these provisions would authorize EPA to regulate closed units that continue to pose risks to health or the environment, for example by requiring the owners or operators of such units to remediate any contamination from these units, or to take action to prevent such contamination.

The 2016 amendments further confirm EPA’s authority over these activities. In section 4005, Congress referenced the 2015 regulations in the statute, and expressly stated that the amendments in 4005(d) were not intended to limit or restrict the authority already provided under sections 1008(a)(3) and 4004(a). See, 42

U.S.C. 6945(d)(3), (6), (7). By incorporating the rule into the statute without modification, Congress has affirmed the Agency’s authority to impose the kind of requirements established in part 257 (e.g., corrective action to remediate groundwater contamination). Moreover, Congress made clear that EPA retains the authority to modify or expand these requirements as necessary to ensure that the standard in section 4004(a) will continue to be met. See, e.g., 42 U.S.C. 6945(d)(1)(A)(i), (3), (6) (referencing “or successor regulations promulgated pursuant to sections 6907(a)(3) and 6944(a) of this title”).

EPA interprets the standard in section 4004(a) to apply equally to criteria issued under sections 1008(a)(3) and 4004(a); namely that the criteria must ensure that a facility is to be classified as a sanitary landfill, and thus allowed to continue to operate, “only if there is no reasonable probability of adverse effects on health or the environment” from either the disposal or other solid waste management practices at the facility. Thus, under the combined authority conferred by sections 1008(a)(3) and 4004(a), a facility is an “open dump” if it engages in any activity involving the management of solid waste that does not meet the standard in section 4004(a); or in other words, any activity involved with the management of solid waste that presents a reasonable probability of causing adverse effects on health or the environment. EPA also interprets these provisions to authorize the establishment of criteria that define the manner in which facilities upgrade or close, consistent with the standard in section 4004(a), to ensure there will be no reasonable probability of adverse effects on health or the environment.

D. What are the incremental costs and benefits of this action?

As noted previously, EPA establishes the requirements under RCRA sections 1008(a)(3) and 4004(a) without taking cost into account. See, *USWAG*, 901 F.3d at 448–49. The following cost estimates are presented in the RIA and summarized in this preamble for compliance with OMB Circular A–4, E.O. 12866, and E.O. 14094. The requirements in this rule do not rely on these cost estimates.²

² Although EPA did not consider costs in developing this rule, if the Agency had considered costs, the final rule would not have been different. As discussed in greater detail later in this preamble and in the RIA, the monetized benefits are based on only a subset of adverse health effects from a single constituent. EPA monetized the benefit from two additional human health endpoints associated with

The RIA estimates that the annualized monetized costs of this action will be approximately \$214–\$240 million per year when discounting at 2%. Of this, \$123–\$135 million is attributable to the requirements for legacy CCR surface impoundments, which are subject to the D.C. Circuit’s order in *USWAG*, \$79–\$92 million is attributable to the requirements for CCRMU, an additional \$8–\$9 million is attributable to the requirements for CCRMU at Other Active Facilities (OAFUs) (a term used in the RIA) that are discussed in Unit III.C.2.e of the preamble, and \$4 million is attributable to requirements for landfills. The costs of this final rule are discussed further in the RIA and include the costs of unit closure, corrective action, fugitive dust controls, structural integrity inspections, and recordkeeping and reporting.

The RIA estimates that the annualized monetized benefits attributable to this action will be approximately \$53–\$80 million per year when discounting at 2%. Of this, \$43–\$57 million is attributable to the requirements for legacy CCR surface impoundments, \$9–\$21 million is attributable to the requirements for CCRMU, \$1–\$2 million is attributable to the requirements for CCRMU at “other active facilities,” or OAFUs. Requirements for landfills account for a de minimis amount of benefits.

In addition to monetized benefits, the RIA describes ten categories of non-monetized benefits. These include human health effects from lead exposure such as ADHD, cardiovascular mortality, and increased cancer risk. They also include ecosystem benefits from avoided exposure to the heavy metals in CCR effluent. The RIA describes several property-related benefits including increased property values near closed and remediated CCR units, and option values for remediated land. The RIA also contextualizes the final rule within EPA’s broader efforts to regulate air and surface water pollution from coal fired power plants.

Further information on the economic effects of this action can be found in Unit V of this preamble.

that single constituent in a sensitivity analysis and estimated an additional \$19 million per year when discounting at 2% from that single contaminant. The RIA also describes a number of important benefits that cannot currently be quantified or monetized due to data limitations or limitations in current methodologies. Based on these estimates EPA believes that after considering all unquantified and distributional effects, the public health and welfare gains that will result from the proposed alternative would justify the rule’s costs.

II. Background

A. 2015 CCR Rule

On April 17, 2015, EPA finalized national minimum criteria for the disposal of CCR as solid waste under Subtitle D of RCRA titled, “Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities” (80 FR 21302) (2015 CCR Rule). The 2015 CCR Rule, codified in 40 CFR part 257, subpart D, established regulations for existing and new CCR landfills, as well as existing and new CCR surface impoundments (including all lateral expansions of CCR units). The criteria consist of location restrictions, design and operating criteria, groundwater monitoring and corrective action requirements, closure and post-closure care requirements, recordkeeping, notification, and internet posting requirements.

The 2015 CCR Rule also imposed requirements on inactive surface impoundments at active facilities. A CCR surface impoundment is a natural topographic depression, man-made excavation, or diked area, which is designed to hold an accumulation of CCR and liquids, and the unit treats, stores, or disposes of CCR. The 2015 CCR Rule defined an “inactive CCR surface impoundment” as “a CCR surface impoundment that no longer receives CCR on or after October 19, 2015, and still contains both CCR and liquids on or after October 19, 2015.” 40 CFR 257.53. The rule defined “active facility or active electric utilities or independent power producers” as “any facility subject to the requirements of this subpart that is in operation on October 19, 2015. An electric utility or independent power producer is in operation if it is generating electricity that is provided to electric power transmission systems or to electric power distribution systems on or after October 19, 2015. An off-site disposal facility is in operation if it is accepting or managing CCR on or after October 19, 2015.” 40 CFR 257.53.

The 2015 CCR Rule did not impose any requirements on inactive facilities. EPA explained that this was consistent with past decisions under RCRA subtitle C. See, 80 FR 21344 (April 17, 2015). EPA further raised concerns that it would be difficult to identify the owners or other parties responsible for such facilities, as well as concerns that the present owner of the land on which an inactive facility was located might have no connection (other than present ownership of the land) with the prior disposal activities. *Id.* Consequently, EPA exempted those units at § 257.50(e).

B. 2018 USWAG Decision

The 2015 CCR Rule was challenged by several parties, including coalitions of regulated entities and environmental organizations (“Environmental Petitioners”). See *USWAG et al. v. EPA*, 901 F.3d 414 (D.C. Cir. 2018). Environmental Petitioners raised two challenges that are relevant to this final rule. First, they challenged the provision at § 257.101(a)(1) that allowed existing, unlined surface impoundments to continue to operate until they exceeded the groundwater protection standard. They contended that EPA failed to show how continued operation of unlined impoundments met RCRA’s baseline requirement that any solid waste disposal site pose “no reasonable probability of adverse effects on health or the environment.” 42 U.S.C. 6944(a). Second, Environmental Petitioners challenged the exemption at § 257.50(e) for inactive surface impoundments at inactive power plants (*i.e.*, “legacy ponds”). Environmental Petitioners argued that legacy ponds are at risk of unmonitored leaks and catastrophic structural failures.

On August 21, 2018, the U.S. Court of Appeals for the D.C. Circuit upheld most of the 2015 CCR Rule but decided in favor of Environmental Petitioners on these two claims. The Court held that EPA acted “arbitrarily and capriciously and contrary to RCRA” in failing to require the closure of unlined surface impoundments³ and in exempting inactive surface impoundments at inactive power plants from regulation. The Court vacated these provisions and remanded the matter back to the Agency for further action consistent with its opinion.

In overturning the exemption for legacy ponds, the Court evaluated the evidence in the rulemaking record and reached specific conclusions about the risks that legacy ponds pose based on the record for the 2015 CCR Rule. The Court pointed to evidence that legacy ponds are most likely to be unlined and unmonitored and that such units have been shown to be more likely to leak than units at utilities still in operation. 901 F.3d at 432. The Court also determined that legacy ponds:

... pose the same substantial threats to human health and the environment as the riskiest Coal Residuals disposal methods, compounded by diminished preventative and remediation oversight due to the absence of an onsite owner and daily monitoring. See 80 FR at 21343 through 21344 (finding that the

greatest disposal risks are “primarily driven by the older existing units, which are generally unlined”). Notably, this very Rule was prompted by a catastrophic legacy pond failure that resulted in a “massive” spill of 39,000 tons of coal ash and 27 million gallons of wastewater into North Carolina’s Dan River. . . .

[T]here is no gainsaying the dangers that unregulated legacy ponds present. The EPA itself acknowledges the vital importance of regulating inactive impoundments at active facilities. That is because, if not properly closed, those impoundments will “significant[ly]” threaten “human health and the environment through catastrophic failure” for many years to come. 75 FR at 35,177; see also 80 FR at 21,344 n. 40.

The risks posed by legacy ponds are at least as substantial as inactive impoundments at active facilities. See 80 FR at 21,343–21,344 (finding “no [] measurabl[e] differen[ce]” in risk of catastrophic events between active and inactive impoundments). And the threat is very real. Legacy ponds caused multiple human and environmental disasters in the years leading up to the Rule’s promulgation. See 75 FR at 35,147 (proposed rule discusses multiple serious incidents). For example, a pipe break at a legacy pond at the Widows Creek plant in Alabama caused 6.1 million gallons of toxic slurry to deluge local waterways. *Id.* Another legacy pond in Gambrills, Maryland caused the heavy metal contamination of local drinking water. *Id.* And the preamble to the Rule itself specifically points to the catastrophic spill at the Dan River legacy pond in North Carolina. 80 FR at 21,393–21,394.

Id. at 432–433. Relying on this evidence, the Court concluded there was no logical basis for distinguishing between the inactive impoundments at active facilities that were regulated and the legacy impoundments that were exempt. *Id.* at 434. Consequently, the Court vacated the provision of the 2015 CCR Rule (§ 257.50(e)) that specifically exempted inactive impoundments at inactive facilities from regulation and remanded the matter back to EPA for further action consistent with its opinion. Notwithstanding the vacatur of § 257.50(e), until EPA amended the regulations to effectuate the Court’s order, facilities were not legally obliged to take any action to comply with the Federal CCR regulations. This is because, as originally drafted, legacy CCR surface impoundments did not fall within the scope of the rule, as defined in § 257.50. The specific provision in § 257.50(e) exempting legacy impoundments merely identified the units that were not covered by § 257.50(b). Because the vacatur of § 257.50(e) did not amend § 257.50(b), legacy impoundments remained exempt.

³ After the Court’s ruling, the closure of unlined CCR surface impoundments was addressed in a separate regulatory action that was published on August 28, 2020 (85 FR 53516).

C. 2020 Part B Proposed Rule

In the March 3, 2020 proposed rule, Hazardous and Solid Waste Management System: Disposal of CCR; A Holistic Approach to Closure Part B: Alternate Demonstration for Unlined Surface Impoundments; Implementation of Closure (85 FR 12456), EPA proposed revisions to the 2015 CCR Rule, including: procedures to allow facilities to request approval to use an alternate liner for CCR surface impoundments; two alternative proposed options to allow the use of CCR during unit closure; an additional closure option for CCR units being closed by removal of CCR; and requirements for annual closure progress reports. On November 12, 2020, EPA finalized the procedures to allow facilities to request approval to use an alternate liner for CCR surface impoundments. 85 FR 72506. In this final rule, the Agency is taking final action on the proposed closure option for units being closed by removal of CCR, which action is discussed in Unit III.D of this preamble. EPA is still considering provisions from the proposed rule that are not addressed in this rule and may be addressed in a subsequent action.

D. 2020 Advance Notice of Proposed Rulemaking

On October 14, 2020, EPA published an Advance Notice of Proposed Rulemaking (ANPRM) (85 FR 65015). In that action, EPA requested information related to legacy CCR surface impoundments to inform a future rulemaking. The Agency requested input on its regulatory authority, input on a potential definition of a legacy CCR surface impoundment and specific information on the types of inactive surface impoundments at inactive facilities that might be considered legacy CCR surface impoundments. Specifically, EPA requested information on how many of these units exist, the current status of these units (*e.g.*, capped, dry, closed according to State requirements, still holding water), and the names, locations, and closure dates of former power plants that may have these units. Finally, the Agency took comment on which CCR regulations should apply to legacy CCR surface impoundments and on suggestions for compliance deadlines.

During the 60-day public comment period, the Agency received over 15,000 comments from environmental groups, four States, one Tribe, individual utilities, and industry trade associations. The topics raised in comments included a potential definition of a legacy CCR surface

impoundment, EPA's regulatory authority, the scope and applicability of the legacy impoundment rule, and regulatory requirements to propose. Moreover, the comments generally agreed that EPA must prescribe timeframes for coming into compliance with the regulations and they recommended timeframes that are shorter than compliance timeframes in the 2015 CCR Rule.

As noted in the ANPRM, EPA took comment on whether, in light of the Court's opinion in *USWAG*, the Agency could reconsider whether it has the authority to regulate inactive impoundments under RCRA subtitle D. 85 FR 65017–65018 (October 14, 2020). The general consensus from commenters on the ANPRM was that, because the Court resolved the question based on the plain meaning of the statute, EPA does not have the discretion to reinterpret its authority. In addition, no commenter identified a factual basis for not regulating legacy CCR surface impoundments that addressed the Court's concern about the risks these units pose. *Id.* at 65018. Consequently, EPA is not revisiting the question of whether it may regulate inactive or legacy CCR surface impoundments.

E. 2023 Proposed Rule and Comments

On May 18, 2023, EPA proposed revisions to the CCR regulations (88 FR 31982) (“the proposed rule” or “2023 proposed rule”). These revisions included establishing regulations specifying that legacy CCR surface impoundments are subject to 40 CFR part 257, subpart D and specifying that owners or operators of legacy CCR surface impoundments comply with all the appropriate requirements applicable to inactive CCR surface impoundments at active facilities. In addition, EPA proposed to establish requirements to address the risks from currently exempt solid waste management that involves the direct placement of CCR on the land. EPA proposed to extend a subset of the existing requirements in part 257, subpart D to CCRMU, which was proposed to include CCR surface impoundments and landfills that closed prior to the effective date of the 2015 CCR Rule, inactive CCR landfills, and other areas where CCR is managed directly on the land. This proposal would apply to all active CCR facilities and all inactive facilities with legacy CCR surface impoundments. Lastly, EPA proposed to make several technical corrections to the CCR regulations. These are: (1) To clarify the definitions of “feasible” and “technically feasible”; (2) To correct the CFR reference in the

definition of wetlands at § 257.61(a); (3) To correct a reference in the groundwater monitoring scope section; (4) To standardize the references to CCR websites throughout the CCR regulations; and (5) EPA requested comment on extending the period for document retention and posting.

The Agency received over 33,500 comments on the proposed rule, with over 600 unique comments. Commenters included individual electric utilities and independent power producers, national trade associations, State agencies, public interest and environmental groups, private citizens, and entities involved with the beneficial use of CCR. All public comments submitted in response to the proposal can be found in the docket for this action. Most commenters focused on the scope of the proposed rule, definitions, compliance deadlines, and EPA's statutory authority to regulate CCRMU. Most commenters also requested that EPA adopt additional requirements to address the risks from CCR units. EPA's responses to the comments on the proposed rule are addressed either in this preamble or in a response to comment document available in the docket to this final rule.

EPA conducted two public hearings on the proposed rule. EPA held an in-person public hearing in Chicago, Illinois on June 28, 2023. At this hearing there were 87 speakers and a total of 150 registered attendees. EPA also held a virtual public hearing on July 12, 2023, using an internet-based software platform. The platform allowed the public hearing participants to provide oral testimony using a microphone and speakers connected to their computers or using a phone. It provided the ability for any person to listen to the public hearing via their computer. At the virtual hearing, there were 93 speakers and a total of 353 registered attendees. Testimony at both public hearings focused generally on EPA's proposed amendments, and on the following topics: whether to further expand regulation to all CCR, regardless if it was onsite of a regulated facility; whether to regulate structural fill and other beneficial uses; enforcement of the CCR regulations; requests for more engagement with communities; and requests for EPA to amend other regulations to strengthen corrective action and limit the use of alternative source demonstrations (ASD). Finally, some commenters discussed site-specific concerns of facilities near their homes, or health effects witnessed in communities close to CCR sites, and general concerns about the health and environmental risks from CCR.

Transcripts for both public hearings are included in the docket for this action.

F. 2023 Notice of Data Availability

On November 14, 2023, EPA published a notice of data availability (NODA), to solicit comments on additional information and statistics developed in response to comments on the Agency's May 18, 2023 proposed rule. 88 FR 77941. Some of the information contains data or analysis obtained directly from comments submitted during the May 18, 2023 proposed rule's comment period, which might aid in the formulation of the final rule. EPA also solicited comments on a supplemental risk assessment EPA conducted in response to comments raised on the proposed rule. This risk assessment builds on the findings of the previous Human and Ecological Risk Assessment of Coal Combustion Residuals (2014 Risk Assessment)⁴ and better quantifies the specific risks that may result from placement of CCR in legacy CCR surface impoundments and CCRMU. EPA requested comment on all aspects of the assessment including the validity and propriety of relying on the new information, data, and analyses contained in the updated risk assessment to inform the final rule.

EPA also sought further information on legacy CCR surface impoundments and CCRMU, including information on the location, presence, condition, history, and risk associated with any of the potential legacy CCR surface impoundments or any of the potential CCRMU within the docket. EPA also requested any information regarding the presence of water, distance to surface water bodies, proximity to floodplains, unit size, CCR volume, depth to groundwater, date of CCR placement, closure status, any corrective action associated with the unit, and any groundwater monitoring data. EPA also requested comment on the accuracy of the information that was submitted regarding potential legacy CCR surface impoundments or potential CCRMU. Furthermore, EPA sought similar information on any other potential legacy CCR surface impoundments or potential CCRMU of which EPA may not be aware or for which we may have incomplete information.

EPA accepted public comment on the NODA until December 11, 2023. The Agency received over 70 comments on the NODA. Commenters included individual electric utilities and

independent power producers, national trade associations, State agencies, public interest and environmental groups, private citizens, and entities involved with the beneficial use of CCR. All public comments submitted in response to the NODA can be found in the docket for this action. The majority of commenters focused on the supplemental risk assessment; some focused on the request for additional information on the universe of legacy CCR surface impoundments and CCRMU. EPA's responses to comments received on the NODA are addressed either in an updated risk assessment (the 2024 Risk Assessment), this preamble, or in the response to comment document available in the docket to this final rule.

III. What final action is the Agency taking?

In response to the USWAG decision, EPA is finalizing a provision at § 257.50(e), specifying that legacy CCR surface impoundments are subject to 40 CFR part 257, subpart D. EPA is also requiring owners or operators of legacy CCR surface impoundments to comply with the following existing requirements in the CCR regulations: installation of a permanent marker, history of construction, hazard potential classification, structural stability and factors of safety assessments, emergency action plan (EAP), air criteria, inspections, groundwater monitoring and corrective action, closure and post-closure care, recordkeeping, and notification and CCR website requirements. EPA further is establishing new compliance deadlines for these newly applicable regulatory requirements to ensure the owners or operators of these units have time to come into compliance.

In addition to the revisions EPA proposed to address the USWAG decision, EPA is establishing requirements to address the risks from currently exempt solid waste management that involves the direct placement of CCR on the land. EPA is extending a subset of the existing requirements in 40 CFR part 257, subpart D to CCRMU, which are CCR surface impoundments and landfills that closed prior to the effective date of the 2015 CCR Rule, inactive CCR landfills, and other areas where CCR is managed directly on the land. These additional requirements apply to all active CCR facilities, all inactive facilities with legacy CCR surface impoundments subject to this final rule, and those active facilities (*i.e.*, facilities producing electricity for the grid as of October 19, 2015) that ceased placing

CCR in onsite CCR units prior to the effective date of the 2015 CCR Rule.

EPA is also finalizing alternative closure provisions to allow a facility to complete the closure by removal in two stages: first, by completing all removal and decontamination procedures; and second, by completing all groundwater remediation in a separate post closure care period.

Lastly, EPA is finalizing several technical corrections to the CCR regulations. These are: (1) to clarify the definitions of "feasible" and "technically feasible"; (2) to correct the CFR reference in the definition of wetlands at § 257.61(a); (3) to correct a reference in the groundwater monitoring scope section; (4) to standardize the references to CCR websites throughout the CCR regulations; and (5) to extend the period for document retention and posting.

A. Risks From Legacy CCR Surface Impoundments and CCR Management Units

1. Summary of May 2023 Proposal

The proposal largely relied on the model results from the 2014 Risk Assessment, as EPA considered the results were equally applicable to legacy CCR surface impoundments and CCRMU.⁵ This determination was based on the fact that many of these unregulated units are similarly constructed, manage the same types of ash, and are frequently located either at the same or nearby facilities as their regulated counterparts. In particular, some unregulated units are known to be located directly adjacent to or beneath currently regulated units.

The 2014 Risk Assessment concluded that the management practices that EPA believed were generally in use in 2014 at surface impoundments and landfills were likely to pose risks to human health through groundwater exposure within the range that EPA typically considers warrants regulation. For highly exposed individuals, the cancer risks from arsenic due to the operation of surface impoundments were as high as 2×10^{-4} , while noncancer risks were as high as an HQ of 5 for arsenic, 2 for lithium, and 2 for molybdenum. Cancer risks associated with the operation of landfills were estimated to be as high as 5×10^{-6} from the ingestion of arsenic-contaminated drinking water. In 2015, EPA relied on this risk assessment to support the regulation of both active CCR units and inactive CCR surface

⁴ U.S. EPA. 2014. "Human and Ecological Risk Assessment of Coal Combustion Residuals." RIN 2050-AE81. Office of Solid Waste and Emergency Response. Washington, DC. December.

⁵ U.S. EPA. 2014. "Human and Ecological Risk Assessment of Coal Combustion Residuals." RIN 2050-AE81. Office of Solid Waste and Emergency Response. Washington, DC. December.

impoundments at active facilities. The 2014 Risk Assessment reported risks for the units that were anticipated to be subject to the 2015 CCR Rule and therefore drew no conclusions about the older units excluded from the scope of that rule. Nevertheless, information available in the record supports the conclusion that these older units can pose risks at least as high as reported in the 2014 Risk Assessment.

EPA further proposed to find that the risks associated with legacy impoundments and CCRMU may be even higher than EPA modeled on a national scale in the 2014 Risk Assessment for active units. First, the proposal explained that these units have been present onsite for longer and had more time to leak. In addition, EPA explained that there are several management practices that have the potential to result in higher leakage, but that were previously modeled either less frequently for active units—based on a belief that the practices had declined over time—or not at all—due to data constraints on a national scale. These include: (1) The greater prevalence of unlined units; (2) The greater likelihood of co-management of CCR with coal refuse and other wastes in surface impoundments, making the overall waste pH far more acidic and (3) The potential for the units to be constructed below the water table or to have become inundated with groundwater after construction. The proposal estimated that the solid waste management practices associated with legacy impoundments and CCRMU could pose lifetime cancer risks from arsenic as high as 2×10^{-5} to 1×10^{-3} (i.e., 2 to 100 cases of cancer for every 100,000 individuals exposed), and non-cancer risks for cobalt as high as an HQ of 13, mercury up to an HQ of 13, lithium up to an HQ of 3, molybdenum up to an HQ of 4, and thallium up to an HQ of 2, depending on the specific management practice. Finally, EPA explained that each of these practices individually can pose greater risks than those previously modeled for the currently regulated universe of CCR units, and a combination of these practices could push risks even higher.

2. 2023 Draft Risk Assessment

A number of commenters claimed that the 2014 Risk Assessment did not adequately capture various factors associated with legacy CCR surface impoundments and CCRMU that the commenters believed will result in significantly different risks than those posed by currently regulated units. In response to these comments, EPA conducted a supplemental risk

assessment to determine the potential for some of these factors to affect national risks. This risk assessment built on the findings of the 2014 Risk Assessment and better quantified the specific risks that may result from placement of CCR in legacy CCR surface impoundments and CCRMU.

The 2023 draft supplemental assessment consisted of: (1) Additional modeling of inactive and closed CCR landfills and surface impoundments that was actually conducted in 2014 using the same methodology and data. These results were ultimately not included in the original 2014 Risk Assessment because the units were not regulated under the final 2015 rule, and (2) Some further model runs relying on some updated data. In addition, EPA modeled the placement of CCR in smaller quantities than would typically be found in a CCR surface impoundments or landfill (i.e., smaller CCRMU placements or CCRMU fills) to determine the potential for these smaller CCRMU placements to contaminate groundwater. Through this modeling, EPA identified potential for these fills to contaminate onsite groundwater. Model results indicated potential for exceedance of groundwater protection standards (GWPS) at the fill boundary under both high-end and moderate conditions. These results also showed potential for substantial spread of the resulting groundwater plume. Under high-end conditions, these plumes are large and persistent enough to sustain exposures for over a century or more at average risks of 2×10^{-5} or higher.

Finally, EPA assessed the potential for exposure to radiation from CCR remaining in the soil (subsurface). EPA found the amount of radon emitted by CCR is not distinguishable from background soil and so did not retain this pathway for further consideration. EPA also found greater potential for risk from gamma radiation as CCR comes to be located closer to the ground surface due to a reduction in shielding. An additional sensitivity analysis identified potential for further risk if CCR becomes mixed with surface soil. Accumulation of CCR can result in elevated cancer risk from incidental ingestion of arsenic and radium, in addition to direct exposure to gamma radiation from radium. For high-end waste concentrations, an eight percent mixture of CCR in surface soil was found to result in risk on the order of 1×10^{-4} .

The 2023 draft risk assessment was made available for public comment as part of a NODA released on November 14, 2023.

3. Response to Comments on the Proposal and the NODA

The following subsection provides a summary of comments received on either the proposed rule or NODA that are germane to the risk record for legacy impoundments and CCRMU. EPA considered these comments as it worked to finalize the supplemental risk assessment (“2024 Risk Assessment”). The Agency also received a number of general comments, which were either editorial in nature or expressed general support or disapproval for the risk assessment methodology, data, or results. However, these comments did not provide any specific technical recommendations or data that could otherwise be used to update the risk assessment. These general comments did not provide EPA with a basis to alter or otherwise re-evaluate the risk assessment in response.

a. Comments Related to Applicability of 2014 Risk Assessment

Comment: Several commenters generally affirmed the Agency’s risk basis for regulating historical and inactive disposal units. However, other commenters argued the Agency’s risk record is inadequate to support regulation of certain legacy impoundments or any CCRMU. Others contended that because the 2014 Risk Assessment supported regulation of active landfills and surface impoundments, it is not appropriate to apply that record to disposal units that previously ceased receipt of waste. In particular, commenters pointed to the current lack of ponded water and/or the presence of a cap and vegetative cover that would reduce infiltration through certain units. Some commenters noted that State programs may include requirements for unit design, monitoring, and closure that ensure a cover is present. Commenters stated these factors must be accounted for through an updated risk assessment.

EPA Response: Claims that the results of the 2014 Risk Assessment are applicable only to active units represent a fundamental misunderstanding of scope of the 2014 Risk Assessment. EPA did not only model units during operation. Instead, the risk assessment modeled the specific stage of the unit lifecycle anticipated to contribute the most to long-term risk. For surface impoundments this was during operation, but for landfills it was after closure. EPA modeled the leakage that occurred over this one lifecycle stage and tracked the subsequent migration through groundwater over time. The risks to downgradient receptors

resulting from the modeled leakage were used to represent risk over the entire unit lifecycle. Consideration of a single lifecycle stage was necessary because of model constraints and the high computational burden of tracking shifting configurations for every single unit.

Both landfills and surface impoundments progress through similar lifecycle stages from construction to closure. Thus, the fact that some historical and inactive units may no longer contain ponded water or may have installed a soil cover only places these units in a different stage of that lifecycle. That does not differentiate the long-term risks of those units from those previously modeled. In particular, existing groundwater contamination does not vanish once a unit ceases operation. As one State commenter noted, “[g]roundwater contamination is an important aspect to legacy impoundment closure and should not be overlooked simply because the impoundment does not contain liquid or CCR at the date of the final rule.”

By contrast, the 2014 Risk Assessment only modeled landfills after closure; in other words, EPA assumed that no leakage occurred prior to closure, while the landfill was operating. EPA only modeled landfills after closure because based on the assumption that this stage of the landfill lifecycle would have the greatest contribution to long-term risk for offsite receptors because the unit would be filled to capacity and the post closure stage represented the greater period of time over which leakage can occur. EPA modeled unlined units with a soil cap and vegetative cover equivalent to the surrounding native soils and found risks from arsenic as high as 2×10^{-5} for receptors up to a mile away. Even assuming some landfills have been closed in a manner more consistent with the existing CCR regulations (*i.e.*, with some kind of composite cover system), this is unlikely to change the overall conclusions of the risk assessment. This is because, regardless of the cover that is ultimately installed, higher leakage can occur throughout the active life of the unit when the landfill face is open and able to intercept more precipitation. This conclusion is reinforced by the fact that facility monitoring reports document that around 20% of currently active landfills have triggered corrective action. Additionally, EPA has seen no evidence to suggest that the closure of older units has been consistently more protective than EPA modeled in 2014. As discussed in Unit III.B.2.g.iii(a) of the preamble, as part of developing the 2015 CCR Rule, EPA reviewed State

statutes and regulations, with a more detailed focus on the 16 States responsible for approximately 74% of the CCR generated in 2009. See 80 FR 21324. The Agency’s review of State programs prior to 2015 found that oversight of these wastes and the overall protectiveness of particular programs varied widely. For example, EPA estimated that in 2015, approximately 20% of the net disposable CCR was entirely exempt from State regulatory oversight. Similarly, a 2006 joint Department of Energy (DOE) and EPA study reported that only 19% (three out of 19) of the surveyed surface impoundment permits included requirements addressing GWPS (*i.e.*, contaminant concentrations that cannot be exceeded) or closure/post-closure care. Furthermore, some of the photographs and descriptions of these older units provided by commenters indicate extensive growth of trees and other woody vegetation that can compromise the integrity of any cap present and increase the rate of infiltration into the unit. For these reasons, the 2014 Risk Assessment is equally representative of the national risks from historical and inactive landfills.

The 2014 Risk Assessment modeled all surface impoundments during the active stage of their lifecycle. This was based on the presumption that the highest rates of leakage would occur while wastewater is ponded above the ash, because this water creates a large and sustained hydraulic head that serves to drive leachate into the subsurface. Although the current configuration of historical and legacy impoundments may vary, all these units previously held ponded water during the active stage of their lifecycle. And, in the case of legacy impoundments, ponded water may still be present. As a result, the current configuration of the unit is immaterial to the releases that occurred during operation. For this reason, the modeling approach relied upon in the 2014 Risk Assessment is equally applicable to historical and legacy impoundments.

The 2014 Risk Assessment also accurately represents the potential risks that remains for units that were closed consistent with the 2015 CCR Rule. If the cover system is not adequately maintained after closure, degradation over time from human or animal activity, natural settling, freeze-thaw cycles, flooding and other extreme weather events, and other factors can result in greater leakage from the unit than designed. In some cases, groundwater monitoring may provide the only clear evidence the cap is not

performing as designed. Thus, the 2014 Risk Assessment accurately describes the risks that can result if these units are not adequately maintained and monitored in line with regulatory requirements.

Comment: Multiple commenters argued that historical and inactive disposal units will generally have a smaller footprint than those modeled in the 2014 Risk Assessment. For example, some commenters noted the average sizes of landfills and surface impoundments modeled in the 2014 Risk Assessment were around 120 acres and 50 acres, respectively, while the estimated average sizes of CCRMU and legacy impoundments in the proposed rule were both closer to 30 acres. Others cited to the sizes of individual units that at their facilities to contend that these units are much smaller than average. These commenters contended that a smaller footprint would result in a lower mass loading of groundwater and lower associated risk.

EPA Response: EPA disagrees that the referenced data indicate that older disposal units are significantly smaller in size than the units EPA modeled in 2014. The 2014 Risk Assessment relied on data submitted by facilities in the EPA Surveys to estimate an average active landfill size of around 120 acres from over 310 landfills and an average active impoundment size of around 50 acres from over 735 impoundments. The RIA summary referenced by commenters relies only on data that could be independently verified by data from posted facility reports and recent public comments. From the final list of 195 CCRMU and 194 legacy impoundments, EPA identified data for only one landfill with a size of 90 acres and 47 historical or legacy impoundments with an average size of 44 acres. Thus, when CCRMU are separately grouped as landfills and impoundments, the differences in size are not as substantial as indicated by commenters.

EPA also disagrees that any differences that do exist would result in substantially lower risks than previously modeled. As part of the 2014 Risk Assessment, EPA modeled 122 landfills and 163 impoundments that were excluded from the reported risk results because these units were determined to not be subject to that rule. These excluded units represent some combination of legacy impoundments, inactive landfills, and historical disposal units. The average sizes of these previously excluded units are 77 acres for the landfills and 28 acres for the impoundments. These sizes are approximately half the size of the units

identified in the 2014 Risk Assessment or more recent data collection efforts. However, as discussed in Section 3 of the 2024 Risk Assessment, the risks associated with these older units are substantially the same as those for currently regulated units. Therefore, there is no evidence that these differences in size have a meaningful impact on national risks, or that the results of the 2014 Risk Assessment are not equally applicable to legacy impoundments and CCRMU. While there may be individual disposal units at these sites that are smaller than average, the model results summarized in the 2024 Risk Assessment model include landfills as small as 2 acres and impoundments as small as 0.01 acres. Therefore, there is no indication based on the data provided that the overall distribution of unit sizes has not been adequately reflected in the national model.

Finally, EPA notes that individual unit size is not necessarily a reliable metric to draw conclusions about the overall risk from CCR disposal at electric utilities. The 2014 Risk Assessment modeled the risks from each landfill and impoundment separately because it was difficult to confirm the relative locations and orientations of different units with data from the EPA Surveys. However, the Agency is now aware of many sites where multiple units, both landfills and impoundments, are located immediately adjacent to one another. As a result, there is potential the 2014 Risk Assessment underestimated site risk to some degree by not evaluating the combined leakage over the full contributing area of these adjacent disposal units.

Comment: One commenter stated the 2014 Risk Assessment did not specifically characterize the risks from impoundments that do not contain fly ash. This commenter argued that historical and legacy impoundments are more likely to only contain bottom ash or boiler slag, as the process of capturing fly ash was not common prior to the 1970s. Therefore, this commenter concluded that the 2014 Risk Assessment does not adequately characterize the risks for these older units.

EPA Response: EPA disagrees that the 2014 Risk Assessment does not address the risks associated with these impoundments. The risk assessment incorporated porewater data from impoundments that contained only bottom ash, but EPA did not separately break out risks for this subset of units because the amount of data available was inconsistent across the set of modeled constituents. However,

available porewater data show the potential for certain constituents, such as molybdenum, to leach from bottom ash at levels as high as from fly ash.

Additionally, available monitoring reports for currently regulated units posted on facility websites document that these units have a similar potential to contaminate groundwater as units containing other types of CCR. Of the units designated as managing bottom ash, 32% of surface impoundments and 38% of landfills have triggered corrective action. Of the units designated as managing slag, 38% of surface impoundments have triggered corrective action. No landfills were identified as dedicated to slag. For comparison, 48% of remaining surface impoundments and 21% of remaining landfills have triggered corrective action. Therefore, there is no indication that these types of units are overall less likely to result in groundwater contamination.

Comment: One commenter claimed that a nationwide assessment should not be used to make determinations about the risks at individual sites or to support national requirements. This commenter stated that, unlike individual damage cases, the Agency's groundwater model does not adequately represent the specific conditions at each individual unit. However, this commenter provided no data to support their broad claims. One other commenter pointed to data they had identified to contend that the model does not reflect the specific environmental conditions at their facility.

EPA Response: The modeling conducted for both the 2014 and 2024 Risk Assessments utilized a probabilistic, site-based approach that combined site-specific data with more regional and national data sources. The model incorporated data about the specific location, dimensions, and liner status of individual disposal units where available. The aim of this approach is not to assign an exact risk to each individual unit, but to provide an overall accurate picture of the potential risks posed by these types of units on a national scale. Indeed, many of the findings from the 2014 Risk Assessment were supported by available damage cases. The commenters did not articulate why they believe the risks associated with individual units fall far outside the broader distribution of modeled units. But as acknowledged by the one commenter who did submit data, there is overlap between the range of conditions modeled and those they identified as present at their particular facility. EPA does acknowledge that there are some site conditions that the

2014 and 2024 Risk Assessments were not able to adequately model, such as waste below the water table. However, this is why the Agency separately relied on damage cases to identify additional constituents of potential concern for groundwater monitoring.

Comment: One commenter stated that EPA should not rely on the findings of the Environmental Integrity Project's report, "Poisonous Coverup: The Widespread Failure of the Power Industry to Clean Up Coal Ash Dumps" without independently validating the quality of analyses conducted for each site.

EPA Response: EPA recognizes that the method used in the cited report to identify potential exceedances of GWPS is not the same as the regulatory standard for triggering corrective action. For this and other reasons, the Agency does not rely on the report as a primary basis for the current rulemaking or to draw any conclusions about the monitoring status of any individual unit. Instead, EPA previously referenced the report as a supplementary source of information that further supports the findings of the 2014 Risk Assessment. Specifically, the fact that the constituents identified as risk drivers in the 2014 Risk Assessment are the same ones detected most frequently above GWPS indicates that the fate and transport modeling conducted by EPA was able to correctly identify the constituents most likely to be released and migrate at environmentally significant concentrations. While high background concentrations may be present at some of these sites, many have already triggered corrective action and the Agency believes that number will increase as more facilities come into compliance with the rule requirements. Because this report does not form a basis for the rule, it is not discussed further in the preamble to the rule or the 2024 Risk Assessment outside of responses to other comments that cite to the same or similar reports.

b. Comments Related to Draft 2023 Supplemental Risk Assessment Conceptual Model

Comment: Multiple commenters broadly argued that the draft 2023 risk assessment relied on data and assumptions that represent maximum values or otherwise reflect worst-case scenarios that could never occur, and therefore do not represent a "reasonable probability" of adverse impacts and so is not an appropriate basis for regulatory action.

EPA Response: EPA disagrees that the design of the risk assessment is inappropriately conservative. Consistent

with EPA's long-standing practice under RCRA (as well as other agency programs), an individual with *reasonable* maximum exposure (RME) provides the principal basis for evaluating potential human health risks. An RME scenario is intended to be conservative, while remaining within the range of possible high-end exposures.⁶ Specifically, "high end" has been defined as the part of the exposure distribution that falls above the 90th percentile, but below the 99.9th percentile.⁷ Reliance on this type of scenario is intended to protect sensitive populations. Selection of the data and assumptions incorporated in the 2024 Risk Assessment is in line with this objective. Further critiques about the potential for the specific data and assumptions to overestimate risk are addressed in subsequent responses.

Comment: Multiple commenters argued that it was inappropriate for EPA to consider future onsite residential exposures as a basis for evaluating the potential risks associated with onsite CCR disposal. One commenter claimed that the estimates of existing populations living near these facilities used in the 2024 Risk Assessment was both overestimated and inconsistent with estimates from the Agency's RIA. One commenter acknowledged that older units tend to be located closer to population centers. However, others argued that this proximity to existing populations or water bodies would not make them overall more likely to become residential in the future. One commenter stated that EPA should have surveyed the intended land use for facilities or otherwise directly assessed the likelihood of residential land use.

EPA Response: EPA disagrees that consideration of a population within a five-mile radius overstates the likelihood of residential development. Five miles away from a population center is a small distance for residential development to expand, even in the near future. Nevertheless, the Agency has updated the population estimates in the 2024 Risk Assessment to more closely align with reporting in the RIA and to include both one- and three-mile radii. EPA also disagrees that consideration of a future residential land use scenario is inappropriate or unrealistic. The substantial populations

already living near many facilities and the generally higher property value of land near water bodies are two indicators of the potential for land to be attractive for future residential land use. Facilities do not dictate the ultimate use of a property after the land has been sold for redevelopment. These types of facilities can include considerable tracts of land beyond that dedicated to waste disposal that may be considered for a range of different uses. EPA is currently aware of 22 examples in which former electric utilities have been proposed for residential development, 19 of which are known to have burned coal.⁸ Thus, there is evidence of community interest in residential land use at these types of facilities.

Although future residential use is considered as the RME scenario in the 2024 Risk Assessment, that does not mean it is the only scenario EPA considered or on which this final rule is based. Depending on their location, leakage of Appendix IV constituents from individual CCRMU fill may migrate off-site at levels of concern. In addition, even if the constituents from a single CCRMU do not migrate off-site, the modeling conducted in 2024 confirms that smaller CCRMU fills can meaningfully contribute to groundwater contamination across a facility. Concentrations from a single CCRMU can combine with contamination from other CCRMU, currently regulated CCR units, or legacy CCR surface impoundments that are also present on the same site. Although EPA did not model the aggregate or cumulative risk associated with these potential sources of co-located contamination, at a minimum, EPA expects that the presence of multiple sources of potential contamination at the same facility would increase the likelihood of a contaminant plume that could migrate off-site at levels of concern.

Nor is residential use the only scenario where exposures present concern. One commenter described donating property to a local government for recreational uses. Several other commenters described redeveloping sites as nature preserves. Even under these non-residential land uses, there is a reasonable potential for exposure (and consequently risk) to human and ecological receptors if the ash is subsequently disturbed. For example, as discussed in Section 6 the 2024 Risk Assessment, concentrations of certain contaminants may also pose risk to

wildlife if ash becomes intermingled with surface soil.

Comment: Commenters asserted that consideration of residential land use is inconsistent with various EPA guidance documents^{9 10 11} and Agency cleanup programs. These commenters argued such guidance instructs EPA to assume that facilities surrounded by operating industrial facilities will remain industrial unless there is clear evidence otherwise. These commenters further argued that guidance instructs EPA to account for institutional controls, such as State or local zoning laws, that would make residential development or resulting exposures at individual sites unlikely. Some commenters cited to specific State requirements they assert would prevent residential land use or prohibit future use of site groundwater as a source of drinking water. Others claimed that due diligence reviews would be adequate to identify and address any remaining sources of contamination before exposures could occur.

EPA Response: EPA disagrees that consideration of future residential land use at these facilities is inconsistent with applicable guidance and cleanup programs. First, the risk assessment was conducted to establish minimum national criteria rather than to clean up an individual site. To determine whether the section 4004(a) standard will be met at all sites nationwide, as the statute requires, the Agency needs to evaluate the risks associated with full range of reasonable scenarios. As discussed in the previous response, there are numerous examples in the record of instances in which these kinds of sites have been redeveloped for residential use.

Moreover, as the commenters have acknowledged, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and other cleanup programs only address contamination that has already occurred. In contrast, national standards for waste management developed under RCRA section 4004(a) are to prevent environmental releases

before they occur. See, *USWAG*, 901 F.3d at 429–431. As EPA has previously explained, groundwater contamination is a concern, even if the aquifer is not currently used as a source of drinking water. Sources of drinking water are finite, and future users' interests must also be protected. See, 44 FR 53445–53448.

EPA further disagrees that the risk assessment failed to appropriately account for existing State and local requirements for institutional controls that would limit residential exposure. The purpose of a baseline risk assessment is to provide “. . . an analysis of the potential adverse health effects (current or future) caused by hazardous substance releases from a site in the absence of any actions to control or mitigate these releases (*i.e.*, under an assumption of no action).”¹² Thus, the intent of the risk assessment is to characterize the harm that could result if institutional and other controls are not implemented. This provides a consistent basis to understand the risks to be controlled and define appropriate national requirements such as a national requirement for deed restrictions at all sites at which CCRMU fills will remain in place. The Agency did not assume that all facilities will ultimately be used for residential purposes as a consequence of these factors in developing this final rule.

Furthermore, as several commenters have acknowledged, facilities have not historically been required to identify smaller placements of ash as a form of disposal and consequently have not maintained reliable records of where such placements are located. Indeed, most commenters have acknowledged that they are currently unable to identify all CCRMU at their existing facilities. These commenters do not explain how due diligence assessments would reliably identify such placements in the absence of such records, as such assessments typically rely on available site records to guide further investigation. Nor do commenters explain how existing State programs would reliably identify such placements or otherwise prevent exposures, when the facilities themselves cannot identify the presence of the ash on-site. This is reinforced by EPA's review of State programs, which found that the specific requirements, level of oversight over these wastes, and the overall protectiveness of individual programs varied widely among States. See, 80 FR

21324. As a result, EPA currently lacks a record to conclude that currently unidentified CCRMU fills located across a facility would be subject to the same institutional controls that are required for the disposal units the commenters reference. Given the current absence of national requirements, and that commenters have generally acknowledged that they have not reliably kept records of the existence of CCRMU, it is appropriate to evaluate the risks that can reasonably arise in the absence of institutional controls.

Comment: One commenter argued that EPA had already considered the practice of disposal below the water table because it had been discussed in previous risk assessments. Another commenter asserted the Agency's conceptual model assumed all legacy impoundments were in contact with the water table. Another commenter stated that EPA cannot use information about active units to make assumptions about which historical and inactive units at the same sites are in contact with the water table, due to differences in unit construction and location. By contrast, a number of other commenters agreed that because EPA cannot model the effects of waste below the water table, EPA had previously underestimated the risks associated with CCR units. Other commenters argued the conceptual model for surface impoundments did not adequately distinguish between the types of water that may be present in an impoundment. These commenters asserted that any residual water remaining after the unit has been initially drained would not exert the same hydraulic head within the unit that would drive leachate into the subsurface during unit operation, and so leakage would more closely resemble a landfill.

EPA Response: The conceptual models for landfills and surface impoundments in the 2014 and 2024 Risk Assessments did not evaluate contact with groundwater. Although these assessments both acknowledged that this could occur, the scenario could not be incorporated into groundwater fate and transport modeling as a result of data and model constraints. Because the 2014 and 2024 Risk Assessments did not directly model the effects of disposal below the water table, neither assessment incorporates any assumptions about the prevalence of this practice in the conceptual model. EPA has acknowledged that its inability to reliably model the effects of this practice means that its risk estimates on a national scale underestimate the risks associated with higher rates of leaching

and/or formation of strongly reducing conditions.

EPA acknowledges the rates of leakage from surface impoundments will generally decrease after ponded wastewater has been allowed to drain, reducing the overall hydraulic head across the unit. As such, discussion in the 2024 Risk Assessment has been updated to clarify the distinction between water ponded above the ash and porewater within an impoundment. However, any free liquids that remain within the unit can still result in higher leakage than would occur if the unit were fully dewatered. And the amount of “residual water remaining” can sometimes be substantial; in some cases, closed impoundments remain saturated by 20–54 feet of groundwater. See, *e.g.*, 88 FR 31982–31987, 55236.

In addition, regardless of the current configuration of an impoundment, it is appropriate for the conceptual models in the 2024 Risk Assessment to consider the stage of the unit lifecycle anticipated to contribute the most to long-term risk. For surface impoundments, this is when the units are in operation due to the presence of wastewater ponded above the ash. Subsequent draining of the unit does nothing to remediate any adverse impacts that occurred during operation. Furthermore, to the extent that impoundments leak at rates more similar to landfills after ponded wastewater has been drained, EPA notes the 2014 Risk Assessment previously modeled the risks from dry management in landfills and found the potential for unacceptable risk from these units. Therefore, continued leakage from drained units still has the potential to sustain releases.

Comment: One commenter affirmed that “EPA is likely correct in its observations and assumptions that CCRMU fills ‘will remain in place when ownership of the property changes,’ and that, ‘in the absence of land use restrictions, there is no guarantee [that] engineering controls will remain in place when the property is redeveloped.’” However, multiple commenters argued the conceptual model for CCRMU fills does not adequately account for the full diversity of CCRMU that may be present onsite. Various commenters stated that a conceptual model for fills does not adequately address specific types of placements, such as use in the construction or closure of CCR disposal units, storage in waste piles, construction of roadways and railroads, or spreading on roadways for snow and ice control. Another asserted that reliance on the similar conceptual models in the 2014 Risk Assessment to

¹² U.S. EPA. 1989. “Risk Assessment Guidance for Superfund Volume I Human Health Evaluation Manual (Part A).” EPA/540/1–89/002. Prepared by the Office of Emergency and Remedial Response, Washington, DC. December.

evaluate the disposal units and CCRMU fills is inappropriate because the CCRMU fills will tend to be smaller than the disposal units modeled in 2014.

EPA Response: EPA disagrees that the conceptual model for CCRMU fills does not adequately address the configurations of these units. The majority of the units described by commenters have a concentrated footprint, such as placement beneath a parking lot. Some of the specific alternate examples raised by commenters are either already regulated under the existing regulations (*e.g.*, waste piles) or are outside the scope of the current rulemaking. For others, there is little to no information available about the manner or frequency of such placements that could be used to characterize the units. Therefore, these types of placements are not considered as part of the conceptual model for CCRMU fills in the 2024 Risk Assessment.

The commenters do not explain how placement of CCR in a landfill or impoundment in service of construction or closure of that unit would be substantially different than the disposal scenarios previously modeled and found to pose risk. Finally, EPA has proposed and is finalizing the definition of CCRMU to exclude CCR used in roadbed and associated embankments.

There is little data that could be used to develop a conceptual model for diffuse placements, which may occur on a periodic basis. Nor do commenters provide any data on the manner or frequency of such placements. As a result, the 2024 Risk Assessment did not model these types of placements. This represents a source of uncertainty in the assessment. However, EPA notes that even small placements of CCR can contribute to broader leakage and have the potential to leak Appendix III constituents and influence nearby groundwater monitoring. Therefore, it is still necessary to identify where these types of onsite placements have occurred.

EPA also disagrees that applying a similar conceptual model for CCR landfills and CCRMU fills is inappropriate. Specifically, the conceptual model does not make any upfront assumptions regarding the sizes of these fills. As described in Section 4 of the 2024 Risk Assessment, EPA considered a range of potential sizes for these fills that were smaller than landfills reported in the EPA Surveys.

Comment: One commenter stated that it is inappropriate for the 2024 Risk Assessment to rely on similar data sources as the 2014 Risk Assessment to

characterize environmental parameters, claiming these data are outdated.

Another argued that the conceptual model does not adequately account for the presence of alternative liners, such as thick natural clay beneath the units.

EPA Response: First, EPA notes that the 2024 Risk Assessment does incorporate more recent weather data available from the most recent version of the Hydrologic Evaluation of Landfill Performance Model, updated in 2020. As explained in the 2014 Risk Assessment, EPA found the remaining data sources provide the most recent and representative data to characterize environmental conditions on a national basis. Commenters provide no explanation why these data should be considered outdated. For example, why the soil type present at a site would have changed substantially since 2014. EPA notes that to the extent that there is natural clay soil present in the vicinity of a facility, that would already be reflected through the environmental data.

c. Comments Related to Supplemental Risk Assessment Groundwater Model

Comment: Some commenters asserted that modeled leachate concentrations are unrealistically high. One commenter specifically argued that the LEAF data is unable to accurately reflect field leaching concentrations, citing two EPRI reports comparing LEAF and field leachate data both collected from the same units.^{13 14} They separately compared the leachate concentrations modeled in the risk assessment to field samples collected from around a number of different landfills. Based on this comparison, the commenter asserted that the high-end concentrations modeled in the risk assessment were substantially higher than measured in the field and so unrepresentative of actual leaching behavior. For these reasons, this commenter concluded that porewater data provide better representation of leaching in the field and so EPA should rely on that type of data to model leakage from CCRMU fills.

EPA Response: EPA disagrees that leachate concentrations modeled in the 2024 Risk Assessment are unrealistically high. EPA has previously demonstrated that the LEAF laboratory leaching tests are “effective for

estimating the field leaching behavior for a wide range of materials under both disposal and use conditions.”¹⁵ The two studies cited by commenters do not contradict these findings. Indeed, one of the cited reports concludes that LEAF Method 1313 measurements tended to only underestimate porewater concentrations of lithium and molybdenum and did not consistently overestimate or underestimate porewater concentrations of arsenic and thallium. These conclusions are consistent with previous Agency findings that LEAF Method 1313 measurements (1) can underestimate leakage of highly soluble constituents, such as lithium and molybdenum, if not adjusted to properly account for the sample liquid to solid ratio and (2) can over or underestimate leakage of redox sensitive contaminants, such as arsenic, if not further adjusted with geochemical speciation modeling. In response to these findings, the Agency has established general recommendations for how to address these issues.¹⁶ Modeling of highly soluble constituents in both the 2014 and 2024 Risk Assessment are consistent with these recommendations. Sufficient data are not yet available on the prevalence or magnitude of reducing conditions to allow EPA to adequately model the effects of these conditions on leaching behavior at a national scale. However, given that the 2024 Risk Assessment identified potential for extensive groundwater contamination with overall risks as high as 1×10^{-4} for the less mobile pentavalent speciation of arsenic, this uncertainty is unlikely to affect the conclusions of the risk assessment.

EPA also disagrees that the field data presented by commenters demonstrates that the modeled concentrations are unrealistic. As a general matter, these commenters did not make available the underlying data for the graphs presented or the reports from which the graphs were drawn. Therefore, it is not possible to fully evaluate these graphs, as EPA cannot determine how and where these data were collected, how many individual samples are represented, and how the data were compiled. Based on

¹⁵ U.S. EPA. 2014. “Leaching Test Relationships, Laboratory-to-Field Comparisons and Recommendations for Leaching Evaluation using the Leaching Environmental Assessment Framework.” EPA 600/R-14/061. EPA Office of Research and Development. Research Triangle Park, NC. October.

¹⁶ U.S. EPA. 2019. “Leaching Environmental Assessment Framework (LEAF) How-To Guide: Understanding the LEAF Approach and How and When to Use It.” SW-846 Update VII. Prepared by the EPA Office of Land and Emergency Management. Washington, DC. May.

¹³ EPRI. 2020. “Leaching, Geotechnical, and Hydrologic Characterization of Coal Combustion Products from a Closed Coal Ash Impoundment.” Palo Alto, CA. June.

¹⁴ EPRI. 2021. “Leaching, Geotechnical, and Hydrologic Characterization of Coal Combustion Products from an Active Coal Ash Management Unit.” Palo Alto, CA. February.

the limited description provided, it appears that the graphs summarize data on the average leachate concentrations collected from around different landfills. Thus, the cited median values would represent a median of the average measurements from each landfill. This type of summary does not provide a meaningful understanding of the leaching potential of CCR. For example, landfills can contain mixtures of different CCR types and other wastes, which may result in variable leaching profiles over the footprint of the unit. An average of measured leachate concentrations can mask regions of higher leaching potential over many acres. This potential for variable leaching is one reason why groundwater monitoring wells are required to be spaced along the entire downgradient boundary of these units. In contrast, CCRMU fills are smaller in size and more likely to be constructed with a single source of ash. Additionally, there is no indication of how long the waste has been present in these landfills prior to sampling. More soluble constituents can become depleted over time. For example, Modular Three-Dimension Finite-Difference Ground-Water Flow Model (MODFLOW) runs conducted for the 2024 Risk Assessment showed that molybdenum can deplete from the ash anywhere from several years to a few decades after leaching first began. Thus, these graphs could understate the full leaching potential of CCR.

Commenters also mischaracterize the results of the probabilistic analysis. The 90th percentile of all model inputs for leachate concentration is not the same as the 90th percentile of modeled risks. There are a number of other model parameters that will influence contaminant release and subsurface transport. As a result, the model runs with the highest initial leachate concentrations are not always the same as those with the highest downgradient concentrations. EPA reviewed a subset of model runs around the 90th percentile risk result reported in the 2024 Risk Assessment, representing 1% of all model runs at 1,000 feet from the waste boundary. This review found the median leachate concentration representative of these runs was closer to 0.31 mg/L for arsenic and 35 mg/L for molybdenum. There are multiple samples in the record of porewater or leaching tests with concentrations of the same order-of magnitude or higher than these concentrations. Therefore, EPA concludes that the methods used to generate model inputs do not result in unrealistically high leachate concentrations.

EPA maintains that LEAF leachate provides the most realistic estimate of long-term leaching potential from CCR placed in fills. There is little field leachate data for dry-managed CCR available in the record, as it can be difficult to collect representative samples from landfills. Additionally, field samples would reflect the specific waste mixtures and chemistry of these disposal units. Instead, LEAF provides data on the leaching behavior of individual CCR under a range of relevant environmental conditions. EPA did consider using impoundment porewater data to supplement the data on leaching of lithium because of the lack of LEAF data for this contaminant, and because lithium is a highly soluble, monovalent ion expected to be less influenced by specific impoundment chemistry. However, this constituent was not modeled in the 2024 Risk Assessment due to other data limitations. The uncertainties associated with exclusion of lithium are discussed in Section 6 of the 2024 Risk Assessment.

Comment: One commenter asserted that the distribution of leachate pH values used to represent CCRMU fills is unrepresentative. In particular, the commenter took issue with the prevalence at which acidic conditions were modeled within CCR fills. This commenter pointed to field data collected from CCR landfills to assert that leachate from fills would rarely be acidic.

EPA Response: EPA disagrees that the modeled leachate pH is unrepresentative of conditions at smaller CCRMU fills. Modeled leachate pH is based on the natural pH (or “own pH”) of the ash sample measured with LEAF. Thus, these data represent the properties of real ash samples. Landfills can contain a mixture of different CCR types and other related waste streams and so it is reasonable that the average pH of larger landfills may differ from that of individual CCR. At the same time, regions of individual landfills can be more acidic than average, which can be masked by consideration of only average values. The potential for such variations is part of the reason that placement of monitoring wells is required across the full downgradient boundary of these landfills. Smaller CCRMU fills are more likely to be constructed with a single ash type and so it is most appropriate to consider the pH of individual ash samples, rather than broader landfill conditions. The uncertainties associated with the modeling of pH are discussed in Section 6 of the 2024 Risk Assessment.

Comment: One commenter stated that use of a five-mile radius to draw environmental data for purposes of groundwater modeling is not adequately justified and inconsistent with both the 2014 Risk Assessment and Draft 2023 RIA.

EPA Response: EPA has reviewed and updated the sampling radius for environmental and population data. Based on this review, EPA established the sampling radius for environmental data at two kilometers (1.2 miles). This is consistent with the methodology applied in the 2014 Risk Assessment, which the Agency previously found adequately represented the environmental conditions near units for which a more precise location at the facility property could not be determined. EPA established the sampling radii for population data to be consistent with the rationale outlined in the 2024 RIA.

Comment: Multiple commenters criticized the Agency’s use of soil-water partitioning coefficients (*i.e.*, K_d values) to model contaminant sorption in the subsurface. These commenters argued that use of individual K_d values was inappropriate and unable to reflect the variability of subsurface transport conditions. They also stated that the K_d values used in the risk assessment for arsenic were biased low and likely to underestimate retention on soil. These commenters cited field measurements collected at various locations to assert that actual values for arsenic are likely to be higher. One commenter cited an alternative set of K_d values they had calculated to contend that actual values for arsenic would be orders-of-magnitude different than used in the risk assessment.

EPA Response: These commenters are incorrect; EPA did not rely only on individual K_d values for the risk assessment. As part of the 2014 Risk Assessment, EPA previously developed sorption isotherms for each modeled constituent, which represent the distribution of individual K_d values calculated and reflect the range of anticipated subsurface conditions and specific CCR waste characteristics. Each individual model run in the EPA Composite Model for Leachate Migration with Transformation Products (EPACMTP) samples from that distribution based on the key factors for that run (*e.g.*, leachate concentration, pH, ionic strength). No individual model run will precisely represent conditions at a particular site. Instead, the model runs collectively capture the variability of conditions that can occur across sites. Thus, EPA relies on the model runs in aggregate to draw

conclusions about the potential for risk nationwide.

EPA also disagrees that the specific Kd values used in MODFLOW are unrepresentative. The limited number of MODFLOW runs are intended to further characterize the subset of high-end scenarios modeled in EPACMTP. Thus, it is entirely reasonable that these model runs are those more likely to reflect scenarios where pentavalent arsenic is more mobile in the environment.

The field data shared by commenters for specific CERCLA sites or agricultural fields are not representative of conditions at CCR disposal units. As previously noted, the calculated sorption isotherms reflect the properties of CCR leachate, which can be vastly different from precipitation infiltrating through soil. In particular, both the high ionic strength and variable pH of this leachate are expected to result in different sorption behavior. EPA is also unable to fully review the Kd values calculated by commenters or compare them with Agency values because the commenters provided insufficient information regarding whether and how specific key environmental factors were considered. Nevertheless, EPA notes that the range of values presented by commenters falls within the full distribution of Kd values developed for arsenic in 2014. The full distribution of values is summarized in Appendix H of the 2014 Risk Assessment, and is the full range of values EPA sampled from to model groundwater transport in the 2024 Risk Assessment.

Comment: One commenter stated that any CCR material placed beneath the soil would become naturally compacted. Another commenter asserted that the pozzolanic nature of some ash would result in far lower hydraulic conductivity than EPA modeled.

EPA Response: In the absence of periodic inspections and a well-maintained cap, there is no guarantee that any ash placed in the ground will remain undisturbed by human or animal activity, natural settling or freeze-thaw cycles, flooding and other extreme weather events, or other unforeseen factors. Given that such disturbances can result in increased permeability, it was not possible to develop a fixed probabilistic distribution of conductivities. Instead, EPA modeled conductivity based on the dominant soil megatexture as described in Appendix B of the 2014 Risk Assessment. As such, the model assumes the ash has been subjected to a similar degree of compaction as the surrounding soil. EPA acknowledges that some fly ash is pozzolanic in nature. Yet, the commenter provided no information

that would indicate how common it is for this type of ash, which can be marketed for use in concrete, to be placed in CCRMU fills. EPA is also not aware of any information that could be used to represent the long-term conductivity of this ash when left in the field and exposed to the elements.

Comment: One commenter contended that EPA had not adequately demonstrated that consideration of more recent weather data drawn from the latest version of the Hydrologic Evaluation of Landfill Performance model would result in consistently higher infiltration rates than previously modeled in 2014 for CCR landfills.

EPA Response: The 2023 Draft Risk Assessment proposed that the higher rates of infiltration modeled for certain soil types with the new HELP data indicates the potential for higher leaching and risk to groundwater than previously modeled in 2014. However, because EPA found that the model results from the 2014 Risk Assessment are sufficient to support the current rulemaking, the Agency did not conduct the additional modeling that would be necessary to refine this draft analysis. As a result, EPA does not rely on this particular analysis to support the final rule and so it is not included in the 2024 Risk Assessment.

Comment: Several commenters stated that consideration of a limited subset of contaminants for groundwater modeling would result in an underestimation of risk. These commenters further assert that EPA further underestimated risk by not accounting for the effects of cumulative exposure to multiple contaminants.

EPA Response: EPA disagrees that the selection of constituents for groundwater modeling resulted in lower risks than would have otherwise been identified. The constituents selected for groundwater modeling were those found to be risk drivers for unlined surface impoundments in the 2014 Risk Assessment, as these are considered the most likely to also result in the greatest risks for unlined landfills and comparable management units. EPA notes that some of the additional constituents raised by commenters had been previously identified as risk drivers only for specific CCR types, such as flue gas desulfurization (FGD) wastes, which are considered far less likely to be used in CCRMU fills. The commenters presented no new information that could alter the previous model results and so there is no expectation that inclusion of these additional constituents would identify risks higher than those already modeled for the relevant CCR types. Some other

additional constituents raised by commenters lack health benchmarks within the Office of Land and Emergency Management (OLEM) hierarchy and so could not be quantitatively evaluated. See, 85 FR 72526. Uncertainties associated with the selection constituents for modeling is further discussed in Section 6 of the 2024 Risk Assessment.

Comment: Several commenters argued that a modeling horizon of up to 10,000 years was unrealistic. These commenters stated that such a long time frame is not consistent with identifying a reasonable probability of adverse effects because there is no reliable way to predict whether any receptors will exist that far in the future.

EPA Response: EPA ran the groundwater model until either the observed groundwater concentration at the receptor point reached a peak and then fell below a model-specified minimum concentration (1×10^{-16} mg/L), or the model had been run for a time period of 10,000 years. This is the same modeling horizon applied in the 2014 Risk Assessment. The text in the 2024 Risk Assessment has been updated to make it clear that the selection of a maximum 10,000-year time horizon does not mean that it typically took that long for contamination be identified or that all model simulations continue for the full 10,000 years. EPA also notes that the time to first exceedance of selected risk criteria is typically considerably less than the time to the greatest exceedance.

EPA acknowledges that future groundwater use patterns may shift over time as the number and location of receptors changes, and that it is unknown whether or how future shifts in receptor locations and other surface conditions might affect risk. However, EPA notes that all the contaminants associated with CCR are inorganic and so will remain present in the environment over the full modeling horizon. As such, a longer modeling horizon can provide useful information about the potential duration of groundwater contamination in the absence of regulation. EPA found that contaminant plumes modeled in MODFLOW did not fully dissipate for around 2,300 years for arsenic V and 100 years for molybdenum.

Comment: Multiple commenters argued that EPA was inconsistent with the 2014 Risk Assessment and overestimated risks for CCRMU fills by not evaluating the interception of groundwater by surface water.

EPA Response: EPA did not explicitly evaluate interception by surface water on groundwater fate and transport in the

2024 Risk Assessment. As acknowledged by commenters elsewhere, facilities have generally not maintained reliable records about the location or construction of all CCRMU fills. As a result, it is not possible for EPA to develop a representative, probabilistic distribution of the distance from these fills to downgradient water bodies or offsite receptors. However, given the diversity of reasons for such placements listed by commenters, there are few limitations as to where these fills might be located onsite. As a result, there is greater potential for these fills to be located further away from water bodies than disposal units, allowing for further contaminant spread prior to any interception. Therefore, the 2024 Risk Assessment evaluated the potential magnitude and extent of onsite groundwater contamination that could occur in the absence of interception. It is considered unlikely that further quantitative evaluation of interception would affect the conclusions of the 2024 Risk Assessment. The reductions in modeled risks attributed interception in the 2014 Risk Assessment were predominantly for median risks. However, the 2014 Risk Assessment still identified high-end risks to offsite receptors, and it was these risks that formed the basis for the 2015 CCR Rule. Thus, it is similarly unlikely that quantitative evaluation of surface water interception would affect the high-end risks reported in the 2024 Risk Assessment, especially because the current assessment considers onsite groundwater quality prior to discharge to a water body. Furthermore, as discussed in the 2024 Risk Assessment and in response to comments elsewhere, the fact that a contaminant plume that has migrated off-site is intercepted by surface water does not mean that there is no potential for risk or no need for further action to address the presence of groundwater contamination onsite.

Comment: Some commenters requested clarification on the prevalence of different types of liners modeled for the landfills and surface impoundments previously excluded from the 2014 Risk Assessment. Citing to data relied upon in the 2014 Risk Assessment, one commenter asserted that a majority of modeled landfills had some form of liner and that national regulations should be based on the risks for all units, rather than those that are unlined.

EPA Response: The handling of liner status for these units was described in Section 5 of the 2014 Risk Assessment. Of the units evaluated in the 2014 Risk Assessment, approximately 42% of landfills and 65% of surface

impoundments were modeled as having no engineered liner system. Of the previously excluded units summarized in the 2024 Risk Assessment, approximately 71% of landfills and 57% of surface impoundments were modeled as having no engineered liner system. EPA has updated the discussion of this issue in the 2024 Risk Assessment to better distinguish the specific liner status modeled for these different units. Differences in the national risks reported in 2014 and 2024 are largely attributed to the relative prevalence of engineered liners modeled for each. Modeled risks in both assessments are nearly the same for the subset of units with no engineered liner.

Far from being an isolated practice, a substantial fraction of the currently operating landfills across the country have no engineered liner. Although the 2014 Risk Assessment did model a majority of landfills as having some form of engineered liner, data that has become available since then indicates a greater proportion of operating units lack an engineered liner than EPA previously understood. Furthermore, the 2014 Risk Assessment modeled the performance of both clay and composite liners based on the assumption of good construction practices. However, it has become clear since then that some liner systems do not perform as modeled. For example, facility reporting shows that around 10% of composite and alternate-lined units have already entered into corrective action. Therefore, it is considered likely that national risks for both landfills and surface impoundments (including the inactive landfills and legacy impoundments subject to this final rule) are more similar to those unlined units than previously modeled.

Nevertheless, the 2014 and 2024 Risk Assessments, which provided much of the basis for this final rule, modeled the risks associated with both lined and unlined units. Under RCRA sections 1008(a)(3) and 4004(a), EPA establishes national criteria; because the criteria are national in scope EPA must evaluate the full range of conditions. In addition, EPA must establish requirements that will achieve the statutory standard at all sites subject to the criteria—including those that pose the greatest risk. Under these provisions, the criteria may authorize a CCR unit to continue operating “only if there is no reasonable probability of adverse effects on health and the environment from the disposal [or other solid waste management] of solid waste at such facility.” 42 U.S.C. 6903(a)(3), 6944(a). Given the requirement that the standard be met at each facility covered by the regulation,

it is not particularly surprising that the final requirements are driven by the higher end risks associated with unlined units—especially as the overwhelming majority of legacy impoundments and CCRMU are expected to lack the composite liner that would largely mitigate the risks of CCR units. But that does not mean that the national regulations are not based on the risks for all units.

Comment: One commenter argued that modeled groundwater concentrations and associated risk downgradient of smaller CCRMU fills are unrealistic because they are higher than previously modeled for landfills and surface impoundments. Other commenters contended that modeled groundwater concentrations were unrealistic, citing comparisons to monitoring data for all regulated units in a report by the Environmental Integrity Project (EIP)¹⁷ or for some smaller subset of units. These commenters calculated summary statistics from concentrations reported for site groundwater monitoring wells to assert that modeled concentrations were an order of magnitude higher or more than the concentrations that have occurred in the field.

EPA Response: The 2014 Risk Assessment modeled risks from landfills and surface impoundments to receptors located up to a mile away from these units. The 2024 Risk Assessment modeled the magnitude and extent of contamination extending from smaller CCRMU fills, including the likelihood of exceedance of GWPS at the waste boundary of the unit. It is entirely reasonable that concentrations and risk closer to the waste boundary are higher than EPA modeled in 2015 up to a mile away from a unit.

EPA disagrees that the modeled groundwater concentrations are contradicted by available monitoring data. First and foremost, EPA modeled the long-term potential for groundwater contamination that may occur in the absence of regulatory action. Thus, monitoring data from units of variable age and operational status do not represent a one-to-one comparison. Second, field monitoring data can diverge from model results as a result of improper well installation. As just one example, EPA is aware of multiple instances where monitoring wells are located far from the waste boundary, in some cases, hundreds of feet away. See, for example, 88 FR 55239. Third, EPA used EPACMTP to model

¹⁷ EIP. 2022. “Poisonous Coverup: The Widespread Failure of the Power Industry to Clean Up Coal Ash Dumps.”

concentrations along the centerline of the plume and to provide a best estimate of contaminant transport potential to inform further modeling with MODFLOW. Even if all wells in a network were properly installed and spaced, there is no guarantee that any individual well will intersect with the exact point of highest concentration; some wells may not intersect with the plume at all. Finally, the 90th percentile concentration modeled is not intended to correspond precisely to a 90th percentile of well concentrations. Instead, it reflects an RME scenario that is conservative, while remaining within the range of possible high-end exposures. The EIP dataset cited by commenters do show multiple instances of well concentrations at individual landfills of the same order of magnitude as modeled in the 2024 Risk Assessment or even higher. Further, in the case of arsenic, modeled GWPS exceedances between 26 and 19 for arsenic III and V are of a similar magnitude as the exceedance of 16 estimated by one commenter based on the EIP report. Therefore, EPA maintains that the magnitude of modeled groundwater concentrations is realistic.

Comment: Some commenters claimed that EPA had not justified modeling groundwater concentrations at fixed distances along the centerline of the plume or within the upper five feet of the aquifer and had not demonstrated how this approach compares with the 2014 Risk Assessment, which modeled concentrations within the top 30 feet of the aquifer.

EPA Response: The goal of modeling with EPACMTP was to identify the potential magnitude of GWPS exceedances at the waste boundary and potential for contaminant spread to support further modeling with MODFLOW. For both goals, a sampling along the centerline of the plume and to a depth of five feet was determined to be most relevant portion of the aquifer for consideration for the reasons documented in the 2024 Risk Assessment. Because different scenarios were modeled in the two risk assessments, a comparison with the results of 2014 Risk Assessment is not relevant here.

Comment: EPA received several comments regarding a graph from the 2023 Draft Risk Assessment, which summarized modeled risks from the 2014 Risk Assessment for unlined landfills as a function of unit size. Commenters stated that it demonstrated that risks consistently decline below a certain acreage and that smaller units do not warrant regulation because they pose less risk. One commenter stated

that the underlying model runs for the 2014 Risk Assessment were not made available alongside the graph and so its validity could not be confirmed.

EPA Response: One purpose of the referenced graph was to demonstrate that risks remain above levels of concern over a broad range of unit sizes modeled in the 2014 Risk Assessment. However, upon further review, EPA has determined that the graph incorrectly summarized model results for receptors of all age cohorts into one figure. This has the potential to bias the plotted risks low. However, filtering the model runs for only (1) unlined landfills, (2) where drinking wells are located closer than surface water bodies, and (3) where an adult was exposed results in a relatively small number of model runs. EPA is concerned that this number of runs is not sufficient to reflect national variability or support broader conclusions about risk. As such, EPA does not rely on this line of evidence to support the final rule and so it is not included in the 2024 Risk Assessment.

EPA cautions the data presented in the graph was for landfills and so use of this graph to draw conclusions about the risks from surface impoundments is not appropriate. EPA further cautions that it is not appropriate to use the referenced graph to identify a specific unit size below which landfill risks are not possible. The graph summarized the results of the 2014 Risk Assessment, which modeled risks to offsite receptors up to a mile away from the waste boundary. The risks identified based on these receptors provided a robust basis for the 2015 CCR Rule. Yet, this does not mean these are the only relevant risks. EPA's longstanding and consistent policy (across numerous regulatory programs) has been that groundwater contamination is a significant concern that merits regulatory action in its own right, whether or not the aquifer is currently used as a source of drinking water. The 2024 Risk Assessment identifies the potential for CCRMU fills to contaminate groundwater above levels of concern. Where CCR landfills and surface impoundments are located at the same sites even more extensive contamination can occur as a result of their larger size. As such, these disposal units warrant regulation to protect groundwater resources, regardless of their size.

Comment: One commenter questioned why MODFLOW—Unstructured Grid (USG) was used to model groundwater transport, stating that MODFLOW 6 is more commonly used. This commenter also inquired why the model was not run in steady-state mode. They further argued that insufficient information had

been provided to allow for evaluation of the design of MODFLOW model runs. Finally, the commenter identified a potential discrepancy in the reported model inputs for EPACMTP and MODFLOW.

EPA Response: MODFLOW—USG was selected for its ability to: (1) Simulate flow and transport in both the unsaturated and saturated zones without the need for additional modeling packages and (2) Simulate groundwater flow and transport sequentially without the need for reading cell by cell flow and transport. Steady state simulations were not used because they do not provide a time series representation of plume evolution. EPA has reviewed the model documentation to ensure that this and other relevant information raised by commenters was made clear in the 2024 Risk Assessment. However, EPA notes that this and much of the other specific information raised by commenters was previously described in the 2023 Draft Risk Assessment. EPA did not incorporate the full output files for all MODFLOW model runs because the file size would become prohibitively large to manage. The level of documentation of model inputs and outputs is consistent with that provided for EPACMTP. The identified discrepancy between EPACMTP and MODFLOW inputs were the result of a typo, which has been corrected.

Comment: One commenter stated that EPA had not provided sufficient evidence to support its conclusion that the location of legacy facilities that were not modeled in 2014 could result in somewhat higher risks for this subset of units compared to those previously modeled units.

EPA Response: EPA previously found that the locations of legacy facilities were clustered in the eastern half of the country. As a result, the rates of precipitation at these facilities will tend to be higher than modeled for the nation as a whole. Higher precipitation can result in greater vertical infiltration and subsequent leakage down to groundwater. The Agency has not conducted further sensitivity analyses to support this contention, as this argument is not central to the findings of either the risk assessment or the rulemaking. Instead, discussion in the 2024 Risk Assessment has been updated to clarify that the primary finding is that there is no indication based on geography that these additional units would be exposed to substantially different environmental conditions than EPA modeled in 2014.

Comment: Multiple industry commenters argued that modeled

arsenic risks do not warrant regulation because the associated concentrations often fall below the current maximum contaminant limit (MCL). One commenter noted that 70 percent of runs identified peak arsenic concentrations below the MCL at the unit boundary. In contrast, environmental advocacy groups stated that cancer risks within the OLEM risk range can occur at even lower levels. Another asserted it was inappropriate for EPA to identify risk based on modeled concentrations above GWPS because corrective action requires “a statistically significant level exceeding the groundwater protection standard.”

EPA Response: First, EPA notes that arsenic is only one of the contaminants modeled. Molybdenum was found to be above the associated GWPS on a more frequent basis. Indeed, EPA identified exceedances for this contaminant at both the 90th and 50th percentile results. EPA disagrees that risks identified below MCLs do not pose a concern. MCLs are not purely risk-based and can incorporate other considerations, such as the technical feasibility of reliably achieving even lower levels. As environmental commenters have pointed out, the arsenic MCL in particular represents a concentration that can fall outside the OLEM risk range. As such, these standards should be understood as values that corrective action must achieve and not levels that never warrant concern. Indeed, EPA established GWPS at the unit boundary with the intent to limit downgradient transport of contamination above this level and prevent the same magnitude of risk identified in the risk assessment.

EPA also disagrees that a statistically significant increase above GWPS is an appropriate standard for risk modeling. It is not clear, nor do commenters articulate, how such a statistical analysis would be conducted as part of the model. Thus, EPA believes this comment represents a general misunderstanding of both groundwater monitoring programs and probabilistic analysis. Statistical analysis is used in groundwater monitoring programs because factors, such as natural fluctuations in groundwater and uncertainty from sampling or laboratory analysis procedures, can introduce variability into the broader dataset. In this context, statistical analysis allows evaluation of the broader data and identification of an exceedance of GWPS with a specified level of certainty. However, numerical models are not subject to the same constraints. A model tracks the fate and transport of all contaminant mass from the point of

release to the point of exposure. Therefore, no additional steps required to confirm that an identified exceedance of GWPS resulted from leakage from the modeled unit.

Comment: Several commenters stated that the toxicity value used for arsenic underestimated risks from groundwater, citing draft values they assert would increase modeled arsenic risks by an order of magnitude or more.

EPA Response: The Agency’s current risk estimates are based on the same cancer slope factor of 1.5 mg/kg/d^{-1} for arsenic in EPA’s Integrated Risk Information System (IRIS). EPA is currently in the process of reviewing this slope factor and has released a draft toxicological review, which, if finalized without revision, would increase the individual risk estimates for arsenic by a factor of approximately 35. See, 88 FR 71360. However, the Agency has not yet finalized this updated IRIS reassessment, and EPA cannot base a final decision on a draft IRIS value that is subject to revision. Nor did EPA receive any other information during the development of this final rule that would help to resolve this uncertainty. The current IRIS values thus represent the best data available to the Agency until the IRIS reassessment is complete.

d. Comments Related to Supplemental Risk Assessment Soil Model

Comment: One commenter contended that radionuclides and non-radionuclides have different health endpoints and so it is not appropriate to treat the resulting risks as additive.

EPA Response: EPA disagrees that it is inappropriate to consider the cumulative risk from chemical and radiological contaminants. EPA policy is to treat the risk resulting from exposure to multiple carcinogens as additive.¹⁸ Agency policy is also to evaluate the risks from exposure to radionuclides in the same manner as chemical contaminants.¹⁹ Therefore, it is appropriate to evaluate the cumulative cancer risk from chemical and radiation contaminants. However, EPA notes that considering chemical and radiological risks separately would not alter the overall conclusions of the analysis, as each have demonstrated potential to individually result in risk exceeding EPA’s levels of concern.

¹⁸ U.S. EPA. 1989. “Risk Assessment Guidance for Superfund Volume I Human Health Evaluation Manual (Part A).” EPA/540/1–89/002. Prepared by the Office of Emergency and Remedial Response, Washington, DC. December.

¹⁹ U.S. EPA. 2014. “Radiation Risk Assessment at CERCLA Sites: Q&A.” OSWER 9285.6–20. Prepared by the Office of Land and Emergency Response. Washington, DC. June.

Uncertainties associated with cumulative risk is further discussed in Section 6 of the 2024 Risk Assessment.

Comment: EPA received comments that argued the U.S. Geological Survey coal quality (COALQUAL) database does not adequately account for several factors that may affect bulk content of the resulting ash, such as: CCR type, regional variability, coal rank, mining practices, coal preparation prior to combustion, and the presence of unburnt carbon remaining after combustion. Another commenter stated that because the risk assessment addresses historical disposal of CCR, sampling of the COALQUAL database should be updated to reflect production over time, rather than current production. Finally, one commenter argued that differences identified between activity calculated from COALQUAL data and measured elsewhere in the literature demonstrates that handling of COALQUAL data is likely to overestimate concentrations in the ash.

EPA Response: The Agency acknowledges that the bulk contaminant content of specific CCR samples can be influenced by a range of factors, such as the manner in which a coal sample is prepared and combusted. As detailed in Section 6 of the 2024 Risk Assessment, EPA considered the information provided by commenters on the potential for mining practices, residual unburnt carbon, and coal washing to affect estimated ash concentrations and concluded these factors are likely to have a minimal or inconsistent effect on overall distribution of concentrations. EPA did determine that concentrations of some contaminants are sensitive to differences in region and coal rank and so reviewed the Energy Information Administration (EIA) coal production reports referenced by commenters when updating the weighting of available samples.

For purposes of modeling groundwater exposure, EPA did not use the COALQUAL database to estimate the leachable content of CCR in the 2024 Risk Assessment. Previous reviews of EPACMTP summarized in the 2014 Risk Assessment did not identify leachable content as among the sensitive model parameters. Even at lower bulk concentrations, there is often sufficient soluble mass present to support sustained leaching. Instead, EPA represented leachable content using available LEAF data in a manner

consistent with the 2014 Risk Assessment and Agency guidance.²⁰

For purposes of modeling soil exposure, EPA retained use of the COALQUAL database in the 2024 Risk Assessment to calculate the bulk content of thorium and uranium of CCR. In this instance, use of COALQUAL provides information about the relative levels of each contaminant, which allowed for a more refined estimate of cumulative exposure that provides a more direct comparison with relevant benchmarks. As discussed in Section 6 of the 2024 Risk Assessment, EPA also considered available EIA data when updating the calculation of bulk content for these two contaminants and found that concentrations of both are less sensitive than other contaminants to regional geography. Therefore, further efforts to refine these calculations are considered unlikely to result in changes that would affect the overall conclusions of the evaluation.

The bulk contaminant content calculated from COALQUAL represents a mixture of fly ash and either bottom ash or boiler slag, collectively referred to in the 2024 Risk Assessment as the “whole ash.” Because fly ash is generated in the greatest volumes during coal combustion, the calculated bulk content primarily reflects this type of CCR. However, other available data sources indicate that the activity of fly ash and bottom ash are not substantially different. EPA has seen no indication that the activity of boiler slag would differ markedly from that of bottom ash. The whole ash does not include any CCR generated by scrubber systems and similar pollution control technologies. However, these CCR types are not considered relevant to the evaluation of CCRMU fills. EPA further discusses the uncertainties associated with these different types of CCR in Section 6 of the 2024 Risk Assessment.

Based on the comments received, EPA reviewed the available data on radioactivity drawn from the literature. This review led to the removal of several samples that were determined to be duplicative and removed all the data for one study because it was determined to not be representative of the broader ash generated at the facility. Altogether, the data removed represent a small fraction of the overall dataset. This review also identified some inaccuracies in how samples were described and averaged to avoid biasing the overall

dataset toward individual facilities that reported a greater number of samples. This had resulted in more samples being averaged together than was intended. The database presented as part of the 2024 Risk Assessment has been updated along with a summary of these updates. Following these corrections, the updated summary statistics for thorium align more closely with those calculated with COALQUAL. Therefore, there is general agreement between these two datasets. It is inevitable there will be some differences between datasets developed through different methodologies. In particular, any individual study may not reflect the full variability of coal produced over time. However, the magnitude of differences between activities drawn from COALQUAL and the broader literature are small on an absolute basis and consequently would not affect the overall conclusions of the risk assessment. Therefore, EPA concludes that COALQUAL can provide a reasonable estimate of both median and high-end ash activity.

Comment: One commenter critiqued multiple individual model inputs used in RESRAD as likely to overestimate potential for radon exposure. They also stated that the risk assessment should consider an additional scenario with RESRAD of CCR disposed at the ground surface to provide a consistent frame of reference to compare risk results obtained from RESRAD and the preliminary remediation goal (PRG) calculator. Other commenters separately commented that the assumed presence of some soil cover is inappropriate, referencing one CCRMU purported to have been placed with the intent to level out the ground surface and without any additional soil cover.

EPA Response: EPA has not established default parameters for modeling of radon fate and transport. Nor is there currently enough information available on a national scale to develop distributions that could be sampled probabilistically. Instead, EPA previously conducted a deterministic analysis for radon exposure by specifying high, moderate, and/or low values for model inputs to capture the range of potential exposure. EPA first modeled risk with all inputs set to moderate values to identify a baseline risk more representative of the central tendency. From this baseline, EPA adjusted each individual input to lower or higher values to better understand which inputs exert the greatest influence on modeled risks and support development of an RME scenario. However, EPA ultimately concluded that the rate of radon emanation from

CCR is not distinguishable from background soil and so the Agency did not develop this RME scenario or draw final conclusions about risk from radon exposure. For this same reason, EPA did not retain the quantitative evaluation of radon in the 2024 Risk Assessment.

Some CCRMU fills may currently be uncovered, but EPA was not able to confirm the status of the specific unit identified by the commenter based on the information provided. Nevertheless, EPA maintains it is unlikely that future residential construction would occur in the absence of some initial soil cover. It is generally anticipated residential construction sites will cover any exposed land with topsoil or turf to support uniform lawn growth. However, this does not guarantee this soil cover will be adequately maintained by residents into the future. As such, EPA agrees it is appropriate to evaluate a scenario of CCR without any soil cover to provide a bounding estimate of potential risk and a more direct link between the primary and sensitivity analyses. This updated scenario is discussed in Section 6 of the 2024 Risk Assessment.

Comment: Some commenters raised concerns about the sensitivity analysis conducted with the PRG calculator. One commenter asserted that the PRG calculator is intended for use with contaminated soils and is inappropriate for comparison against undiluted CCR. This commenter further argued that the sensitivity analysis conducted with the PRG calculator is overly generic and did not incorporate scenario-specific inputs, such as the potential for greater soil cover, shorter exposure duration, and ability of radon to emanate from CCR. Finally, this commenter stated that the degree of mixing of soil with CCR would not result in activities higher than either background or applicable or relevant and appropriate requirements (ARARs), concluding that the evaluation of radiation risk should consider contributions from background soils when presenting risk results. Another commenter stated that the ARAR was only exceeded around the 90th percentile concentrations and that regulation based on 90th percentile concentrations is not appropriate.

EPA Response: EPA disagrees that the PRG calculator is not applicable to the modeled scenario of CCR intermixed with soil. The commenters provide no rationale for this assertion beyond the fact that the PRG calculator nominally identifies soil as an environmental media of interest. This is reasonable as it would quickly become overwhelming to identify a comprehensive list of sludges, sediments, and other soil-like

²⁰ U.S. EPA. 2019. “Leaching Environmental Assessment Framework (LEAF) How-To Guide: Understanding the LEAF Approach and How and When to Use It.” SW-846 Update VII. Prepared by the EPA Office of Land and Emergency Management. Washington, DC. May.

materials that might be encountered at cleanup sites. EPA notes that the exposure assumptions incorporated into the PRG calculator are equally relevant for CCR intermixed with soil. CCR consist of small particulates that can be readily intermixed with the soil and result in exposures through the exact same routes, specifically incidental ingestion and direct exposure to gamma radiation.

EPA also disagrees that the analysis of exposure to CCR mixed with soil is overly simplistic. First, the presence of additional cover soil is already considered in the main analysis and is not relevant to the types of exposures explicitly considered in the sensitivity analysis. Second, because EPA concluded the rate of radon emanation from CCR and soil were not distinguishable, the sensitivity analysis explicitly does not incorporate risk from inhalation of radon gas. Only a relatively small fraction of the radon generated from fly and bottom ash is expected to escape into the ambient air and these losses can be counteracted by upward migration from deeper ash. Therefore, it is unlikely that further consideration of radon emanation would have substantial impacts on exposures through incidental ingestion or direct gamma exposure. Third, the model parameters used to characterize exposure to gamma radiation in the PRG calculation are generally the same as in RESRAD and other available models. Finally, exposure factors selected for use in the PRG calculator are consistent with Agency policy for characterizing an RME scenario and many of the remaining parameters are based on extensive modeling.^{21 22 23}

EPA generally only considers contributions from disposed wastes to risk when conducting national risk assessments under RCRA. Background concentrations may contribute to risk when present and can sometimes be higher than concentrations modeled in a risk assessment. Although constituent concentrations in undisturbed environmental media can be highly variable, they are often relatively low in concentration. As a result, consideration of these concentrations would generally

have no impact on the overall conclusions of a national risk assessment. Therefore, consideration of background concentrations is more appropriate on a site-specific basis when risk managers are determining the need for and scope of corrective action. EPA recognizes that a focus on background is more common for discussion of radioactivity, particularly when providing context for the associated risks to the broader public. However, as one point of reference, EPA has found that the median activities of fly and bottom ashes already fall close to the standard of 5 pCi/g radium-226+228 above background soil, which has been adopted as an ARAR for some cleanups under Superfund and State programs (*i.e.*, around 4.3 pCi/g higher).²⁴ Additionally, EPA has found that high-end radium-226+228 activity in CCR has the potential to be nearly 10 pCi/g higher than typical background soil. Thus, there is real potential for mixing of CCR with soil to further increase any risk already associated with background.

Commenters are correct that mixing small quantities of CCR with soil may not result in a surface soil activity above the ARAR. For high-end CCR activity, this would require a roughly equal mixture of soil and ash. However, risks are still possible at activities below the ARAR. The PRG calculator estimates that an increase of only 1.13 pCi/g of the thorium-232 decay chain or 1.45 pCi/g of the uranium-238 decay chain in surface soils could increase cancer risk for residential receptors by 1×10^{-4} . Such risks can result from relatively low mixtures of CCR and soil, which are possible if ash beneath the soil surface is disturbed. As a result, EPA has identified ARAR of 5 pCi/g above background as equally applicable to subsurface contamination that may be disturbed in the future and concluded “it would not generally be appropriate to allow backfilling with material with concentration higher than 5 pCi/g.” Uncertainties associated with background concentrations are further discussed in Section 6 of the 2024 Risk Assessment.

Comment: One industry commenter presented an analysis they had conducted comparing the concentrations of certain inorganic constituents in CCR to soil screening levels. The commenter contended this analysis demonstrated that “even daily

direct contact to trace elements in coal ash would not pose a significant risk to human health.”

EPA Response: EPA did not evaluate the potential soil risks for human health associated with many of the constituents considered in the cited analysis. The Agency believes that any risk from additional constituents would be mitigated by the rule requirements that address the risks identified for radionuclides. However, EPA notes that the cited analysis is not sufficient to demonstrate a lack of risk for these additional constituents on a national scale. The ash concentrations reported for some constituents are already near or above the health benchmarks, indicating some potential for risk. Further, the reported ash concentrations are based on samples from a limited number of geographically constrained facilities. As a result, the reported concentrations may not reflect the broader variability of potential concentrations from across the region or country. In particular, EPA notes there is evidence in the regulatory record of arsenic concentrations approaching an order of magnitude higher than considered in this analysis.

Comment: Several commenters argued that EPA underestimated risk by not considering other potential exposure pathways, specifically inhalation of loose CCR.

EPA Response: EPA selected direct exposure gamma radiation and incidental ingestion of soil as the pathways for evaluation because these represent the most direct routes of exposure to contamination in the soil. EPA agrees that inhalation is another pathway through which future receptors could be exposed if CCR becomes intermixed with surface soil. Quantitative evaluation of this pathway would require additional model inputs that could further increase the uncertainty of results on a national scale, such as the degree of vegetative cover and mean wind speed. However, EPA notes the default PRGs for inhalation of the uranium-238 decay chain in secular equilibrium is nearly three orders of magnitude higher than for external exposure to gamma radiation and two orders of magnitude higher than for incidental ingestion of soil. As a result, it is unlikely consideration of this pathway would substantially increase calculated risk. Therefore, this pathway does not represent a major source of uncertainty in the evaluation. EPA acknowledges that there may be other exposure pathways that could occur if CCR is mixed with surface soil. These are further discussed in Section 6 of the 2024 Risk Assessment.

e. Comments Related to Site Monitoring Data

Comment: Some commenters stated that, as part of any further risk assessment efforts, EPA should incorporate data that have been collected as part of the monitoring programs required by either the 2015 CCR Rule or prior State programs. Such data might include site hydrogeology from borings around the units and groundwater quality sampled from monitoring wells. These commenters claimed these data are more recent and more relevant to characterizing the actual nature and extent of contaminant release at individual sites.

EPA Response: There are multiple reasons why it is neither practical nor prudent to incorporate site-specific monitoring data into national fate and transport modeling. First, there are documented concerns about the quality and reliability of these data. For example, EPA has identified significant deficiencies in the monitoring networks at each facility for which the Agency has completed reviews under the Part A (85 FR 53516, August 28, 2020) and Part B (85 FR 72506, November 12, 2020) Rules. It is unlikely such deficiencies are isolated to this specific subset of facilities. Monitoring wells that are located too far apart, installed in the wrong aquifer, or otherwise inadequately installed would result in data that are incomplete or unrepresentative of relevant site conditions. Thus, use of these data would require thorough review prior to use. Much of the site characterization data are not required to be posted on facility websites and so would take substantial time to compile and review for the over 1,000 individual landfills and surface impoundments. Further, it is highly unlikely that any identified deficiencies could be remedied within a reasonable timeframe.

Second, the hydrogeologic data that have been collected in support of well installation can provide an incomplete or erroneous picture of site conditions for the purpose of fate and transport modeling. For example, at sites with lower conductivity soils, EPA has previously raised concerns that collection of hydrogeologic data with a focus on characterizing the predominant soil type can underestimate the prevalence of more localized deposits of higher conductivity soil and other discontinuities that can serve as preferential flow pathways to groundwater. See, 85 FR 72519. Therefore, the current approach to probabilistic characterization of soil and aquifer characteristics using more local

data sources is believed to provide the most reliable means to capture the potential variability of conditions across different facilities and represent contaminant fate and transport on a national scale. Furthermore, EPA notes that consideration of more site-specific data would not be expected to change the fact many units are known to be constructed on relatively permeable soils. As a result, further refinements on the hydrogeology modeled at each individual site is unlikely to alter overall model results, which show contaminants can escape from these units and spread considerable distances through groundwater.

Third, groundwater monitoring only provides a snapshot in time of groundwater concentrations at each well location. It is not obvious, nor do commenters articulate, how these data would be applied to model long-term unit leakage. Factors such as natural fluctuations in background groundwater concentrations make it difficult to apportion measured concentrations from individual sampling events into the specific contributions from background and unit leakage. That is why groundwater monitoring programs rely on statistical analysis of data across numerous sampling events to make a binary determination whether or not contaminant concentrations downgradient of a unit have increased above background and GWPS. Even if it were practical to utilize these monitoring data, groundwater samples do not provide broader information about the progression of leakage over time. Specifically, groundwater samples do not provide information on the magnitude of source leachate concentrations, how long the unit has been leaking, or any indication of the potential magnitude and extent of contamination in the future. EPA modeling previously showed that the magnitude and extent of a plume may not peak until decades or centuries after the unit first begins to leak. As a result, incorporation of groundwater monitoring samples into a model would require a number of additional assumptions about the site characteristics and conditions that could substantially increase the overall uncertainty of model results.

Finally, EPA is not aware of similar site-specific data available for the subset of smaller CCRMU intended for purposes other than disposal. As several commenters have acknowledged, facilities have not typically maintained reliable records of the locations of all these smaller units. Thus, any modeling of these units must, by necessity, draw on other datasets to characterize the

potential for environmental release and subsequent contaminant fate and transport.

f. Comments Related to Additional Risk Drivers

Comment: Multiple commenters asserted that risks higher than those modeled in the 2014 Risk Assessment are unlikely for landfills. One commenter stated that the previous risks modeled for unlined landfills are “only slightly above” the point of departure at 2×10^{-5} and so, even if most CCRMU landfills are unlined, it would not result in risks higher than this value.

EPA Response: The national risks reported in the 2014 Risk Assessment were based on the understanding of relative liner prevalence at the time of that assessment. However, it has since become clear that an even greater proportion of regulated units have no engineered liner and there is no evidence that CCRMU landfills are lined to any greater degree. Additionally, EPA notes that the 2014 Risk Assessment modeled both clay-lined and composite-lined units under the assumption of good construction practices that achieved the regulatory performance standard. However, it has become clear since then that some liner systems do not achieve this standard. For example, facility reporting shows that around 10% of regulated units with composite or alternate liners have already entered into corrective action. Therefore, even for those units that do have some form of engineered liner, there is potential for national risks to be higher than previously modeled. For all these reasons, national risks for both currently regulated and CCRMU landfills are only expected to be more similar to those previously modeled for unlined landfills. Furthermore, EPA has identified additional factors that have the potential to result in even higher risks than modeled, but that could not be fully quantified as part of either the 2014 or 2024 Risk Assessment. These include co-disposal with coal refuse and disposal in contact with the water table. The greater prevalence of unlined units makes it even more likely these additional factors will occur at unlined units. The combination of these factors has the potential to result in national risks even higher than previously modeled.

Comment: One commenter acknowledged that the 2014 Risk Assessment had demonstrated the potential for co-disposal with coal refuse to increase risk from surface impoundments. However, multiple others argued that the same assessment shows that neither co-disposal with coal

refuse nor extreme pH conditions increase risks for landfills. Specifically, commenters pointed to one sensitivity analysis summarized in Table 5–6 of the 2014 Risk Assessment that concluded modeled risks did not exceed the point of departure for any subset of the modeled pH conditions. One commenter argued the Agency's conclusions are not based on actual observations of CCR porewater and groundwater quality at sites where coal refuse is managed. This commenter stated that not all units that accepted coal refuse will contain enough to affect the broader chemistry of the unit and not all coal refuse will contain enough pyrite to influence pH. This commenter further argued that, where acidic conditions and higher leachate concentrations do occur, it will not necessarily result in higher downgradient groundwater concentrations due to other site-specific factors. To support this argument, the commenter summarized findings from multiple EPRI reports that analyzed field samples from around several landfills and surface impoundments believed to have accepted coal refuse.

Response: These commenters misrepresent the findings of the referenced sensitivity analysis. This analysis represents a parsing of groundwater model runs conducted in 2014 as a function of leachate pH. This analysis incorporates model results for a substantial number of lined units, which can mask the effects of leachate pH due to the low overall leakage rates from these units. As such, this sensitivity analysis does not support any conclusions about the impacts of pH on risks from unlined units. Further, very few model runs were conducted at highly acidic pH; the sensitivity analysis did not summarize any results for a pH lower than around 4. Thus, this analysis also does not support any conclusions about the risks associated with highly acidic conditions.

Available LEAF leachate data used to model landfills show that many constituents, including arsenic, can leach at highest concentrations near one or both extremes of the pH scale. The effects of these higher concentrations are reflected in the sensitivity analysis, with higher risks observed around a highly basic pH of 13. Therefore, this sensitivity analysis is consistent with the broader risk record and shows that extreme pH conditions can result in higher risk.

The commenters are also incorrect that the risk record is not based on observations of CCR porewater. EPA relied on empirical measurements of porewater to support modeling of

surface impoundments in 2014, which included samples co-disposed with coal refuse. As acknowledged by some commenters, these data supported identification of higher risks from these co-disposed wastes in impoundments. Corresponding pH data are not available for every porewater sample, but available data do show the potential for highly acidic pH around 1, roughly equivalent to stomach acid. The cited EPRI reports do not contradict the finding that co-disposal can affect CCR leaching behavior. As summarized by the commenter, these reports found that a third of units had impacts to unit pH and porewater chemistry. Individual units had potential or confirmed impacts on groundwater quality, causing at least one to trigger remedial measures by the facility. EPA further notes that these reports provide only a snapshot in time of the environmental impacts associated with disposal in this subset of disposal units. As a result, there remains potential for future releases beyond the waste boundary if these conditions persist.

Comment: Multiple commenters asserted that waste disposed below the water table would not result in higher risks from surface impoundments than previously modeled in the 2014 Risk Assessment. These commenters generally argued the hydraulic head present in an operating impoundment from ponded wastewater will result in greater leakage than groundwater flowing through a unit. One commenter presented a hypothetical comparison of the relative hydraulic flux from a unit due to ponded water, infiltrating precipitation, and contact with groundwater to argue that the presence of a ponded water would result in higher leakage. Others pointed to analyses from the 2014 Risk Assessment, which compared leakage from surface impoundments before and after dewatering, to argue that risks from impoundments remaining in groundwater would be lower. Others further argued that the lower hydraulic conductivity of some ash would limit flow through the impoundment and cause groundwater to preferentially flow around the unit.

Several commenters presented data from groundwater monitoring conducted at individual units to assert that risks are more likely to result from the hydraulic head in active impoundments than the intersection of waste with the water table. The presented data depict concentrations of boron, a highly soluble constituent that one commenter noted was selected for its “insensitivity to redox conditions.” These plots generally show

concentrations of boron to decrease over time after the impoundments were taken out of service, though that pattern was not universal. Some commenters went further, concluding that eliminating the hydraulic head in the unit would allow any prior groundwater contamination to naturally attenuate. Conversely, other commenters pointed to a documented case study where groundwater concentrations increased after ponded water was drained to contend that contact with the water table can result in higher releases.²⁵

EPA Response: A number of the commenters misconstrue the findings of the 2014 Risk Assessment, which did not include any assessment of the effects of CCR disposal within the water table. EPA was unable to quantitatively model the risks associated with this management practice because there was little data on how common the practice was or the extent to which it would affect groundwater chemistry. Instead, these commenters are referring to a comparison of the risks resulting from surface impoundments during operation and post-closure (*i.e.*, after free liquids had been eliminated consistent with § 257.102(d)(2)(i)) that was undertaken to understand if only modeling these units only during operation might underestimate peak risks. EPA only concluded that continued leakage after elimination of free liquids and closure would rarely result in higher peak risks. Thus, this assessment did not consider the effects of disposal below the water table or draw any conclusions about the risks associated with this practice.

When waste is managed above the water table, any leakage out of the unit must first infiltrate down through unsaturated subsurface soils and then mix with groundwater before it can flow beyond the waste boundary. As a result, downgradient groundwater concentrations can end up substantially lower than the original leachate concentration. In contrast, when waste is disposed below the water table, the entire volume of groundwater in contact with the CCR and all water infiltrating from above would become undiluted leachate. As the thickness of CCR below the water table increases, the volume of leachate generated can increase substantially based on the sheer size of these disposal units. There is no evidence the properties of CCR would reliably limit transport of this leachate away from the unit. Rather, the hydraulic gradient of the aquifer will continue to drive continued flow

²⁵ EPRI. 2001. “Evaluation and Modeling of Cap Alternative at Three Unlined Coal Ash Impoundments.”

through the unit. The hydraulic conductivity of different CCR overlaps with that of common aquifer materials. Even in instances where the average conductivity within a unit is lower than the surrounding aquifer, these units often contain different ash types and other wastes. This can lead to stratification within the unit that creates regions of higher conductivity and allows for greater flow. For all these reasons, there is potential for sustained leakage from units when waste is disposed below the water table. Whether or not the magnitude of this continued leakage is greater than from water ponded in an impoundment does not address the potential for such leakage to cause a release or sustain one that began when water was still ponded in the unit. Such comparisons also ignore that the waste would also be in contact with groundwater while the unit operates, greatly increasing the likelihood of groundwater mounding around the impoundment and increased contaminant transport in all directions.

It is not feasible to draw conclusions based on the small and curated sample of units presented by commenters. Various factors can complicate any interpretation of the presented graphs. First, boron is a highly soluble constituent that can washout at high concentrations into small amounts of water. Thus, the extent to which decreases in concentration over timeframes of a long as a decade or more simply represent the depletion of this highly soluble constituent from the ash is unclear. Second, unit geometry may not be uniform and consistently intersect with the groundwater table, resulting in more spatially isolated releases that cause higher concentrations in some wells and not others. Third, at sites with intermittent contact with groundwater, predefined sampling dates may not align with periods when contact with groundwater occurs. Therefore, it is not possible to draw meaningful conclusions, either at these sites or more broadly, based on the data provided. As pointed out by other commenters, there are also examples available where sustained contact with groundwater after a unit is drained resulted in increased groundwater concentrations of other Appendix III constituents.

The fact that downgradient concentrations have decreased at some impoundments after the unit was drained despite ongoing contact with groundwater does not prove such reductions will be sustained or further groundwater releases will not occur. As one EPRI report concluded, “the existence of saturated ash will greatly

reduce the effectiveness of any cap design when the facility is underlain by geologic materials with high hydraulic conductivity, because groundwater will continue to leach ash constituents.”²⁶ Thus, removal of ash from groundwater may be the only reliable means of source control for these units.

Comment: Several commenters agreed that use of porewater to represent leakage from impoundments is appropriate. However, these commenters also raised concerns that available porewater data collected during the active life of an impoundment may underestimate the risks associated with legacy impoundments because it may not accurately reflect leachate concentrations after the unit has ceased operation. As one example, they cited potential for reducing conditions to form through prolonged contact between waste and groundwater.

By contrast, one commenter asserted that elevated arsenic concentrations identified in the two journal articles EPA referenced in the proposal are only representative of that one site and that the majority of available impoundment porewater data have lower concentrations than reported in those articles.^{27 28} The commenter also noted the data presented in the journal articles were collected in support of an EPRI report, which found these concentrations had not translated to exceedances of GWPS in downgradient wells.²⁹ Based on this finding, the commenter concluded leachate concentrations alone are not a reliable indicator of which units will cause groundwater contamination due to variable site geochemistry and hydrogeology.

EPA Response: EPA agrees that porewater samples remain the best available data to represent leakage from operating surface impoundments. These field samples provide empirical data on leakage from various mixtures of CCR

and other wastes managed under consistently saturated conditions. EPA also acknowledges there can be uncertainties associated with field data submitted to the Agency, which might lead to an underestimation of concentrations in the field. One example is the potential for stronger reducing conditions to form after a unit has been closed as a result of less oxygenated water infiltrating through the unit. As acknowledged by commenters, however, there is not sufficient data to characterize the magnitude or extent of such conditions on a national basis. Therefore, the impact of this uncertainty is not known.

EPA disagrees that the arsenic concentrations identified in the referenced studies should be considered an isolated occurrence. These studies clearly demonstrate that: (1) Sustained contact with groundwater can result in stronger reducing conditions than dry management, (2) Reducing conditions can cause higher leaching of arsenic, and (3) LEAF methods can underestimate actual leaching from CCR under reducing conditions by as much as an order of magnitude. Given that disposal beneath the water table is a more common practice than previously understood, there exists the real potential for higher leachate concentrations in the field than previously modeled, particularly at landfills modeled with LEAF data.

EPA does agree that initial leachate concentrations are not the sole determining factor for contaminant fate and transport. As discussed in response to previous comments, this fact is reflected in Agency modeling. Individual model runs with the highest leachate concentrations are not always those with the highest risk. However, factors that will tend to push the overall distribution of leachate concentrations higher will also tend to push modeled nationwide risks higher because of the greater likelihood that higher leachate concentrations will occur at sites where these concentrations can more readily spread. Thus, the greater prevalence of units in contact with groundwater has the potential to result in higher risks on a national scale than previously modeled.

Finally, EPA notes that groundwater monitoring only represents a snapshot in time and does not necessarily provide any indication of the potential for future contamination. In the case of the studied unit, it is not known whether reducing conditions formed during or after operation. As such, there remains potential for future releases if the unit remains in contact with groundwater

and continues to leak such elevated arsenic concentrations.

g. Comments Related to Complete Exposure Pathways

Comment: Multiple commenters asserted that EPA must demonstrate the existence of a complete exposure pathway to justify regulatory action, which some defined as exposures that have already occurred. Specifically, commenters stated that “the presence of groundwater contamination alone does not constitute a risk” and “in many cases no one is drinking the water or contacting the CCR materials.” One commenter presented a summary of analyses that had been conducted across 27 sites, which concluded that groundwater risks do not exist at most sites because no drinking water wells are currently present. Another commenter asserted that the high-end risks identified in the 2014 Risk Assessment assumed that receptors were exposed immediately downgradient of the disposal units. This commenter went on to state that complete exposures would not occur at the many sites adjacent to water bodies because groundwater contamination would be intercepted by surface water first and that the 2014 Risk Assessment found no risks warranting regulation for surface water. Several other commenters also claimed that groundwater quality should be measured at the facility boundary because that would be more representative of a complete exposure pathway.

EPA Response: Section 4004(a) of RCRA requires EPA to establish requirements that will ensure no reasonable probability of adverse effects both to human health and the environment. See, 42 U.S.C. 6944(a). EPA therefore disagrees that only the presence of receptors within the impact sphere of a contaminating facility merits consideration. EPA’s longstanding and consistent policy (across numerous regulatory programs) has been that groundwater contamination is a significant concern that merits regulatory action in its own right, whether or not the aquifer is not currently used as a source of drinking water.

Once a potentially harmful constituent has leached from a disposal unit into groundwater, whether the constituent ultimately causes further damage by migrating into drinking water wells does not diminish the significance of the environmental damage caused to the groundwater under the site, even where it is only a potential future source of drinking water. As EPA explained in the

preamble to the original 1979 subtitle D criteria, EPA is concerned with groundwater contamination even if the aquifer is not currently used as a source of drinking water. Sources of drinking water are finite, and future users’ interests must also be protected. See, 44 FR 53445–53448. (“The Act and its legislative history clearly reflect Congressional intent that protection of groundwater is to be a prime concern of the criterion. . . . EPA believes that solid waste activities should not be allowed to contaminate underground drinking water sources to exceed established drinking water standards. Future users of the aquifer will not be protected unless such an approach is taken.”). See also, 80 FR 21453.

The commenters’ approach is also inconsistent with Agency guidance, which states that a “. . . pathway is complete if there is (1) a source or chemical release from a source, (2) an exposure point where contact can occur, and (3) an exposure route by which contact can occur.”³⁰ The guidance goes on to state that “. . . exposure assessments are concerned with current and future exposures.” Thus, a key consideration in evaluating risk is the potential for future exposure. If it were necessary to wait for exposures to occur as a prerequisite for action, an untold number of receptors could be subject to potential harm. Further, implementation of corrective action is not instantaneous and so this harm could persist for some time after receptor exposures are first identified. Commenters do not explain how such delayed action could be considered protective of human health and the environment, and so meet RCRA’s standard. See, *USWAG*, 901 F3d at 429–431.

Commenters also misrepresent the findings of the 2014 Risk Assessment regarding surface water interception. EPA modeled a distribution of distances for both groundwater wells and surface water bodies, accounting for interception whenever a water body was located closer than a well. Thus, reported high-end risks do not include any assumptions about the proximity of receptors to the units. Even if direct exposure to groundwater from use as a drinking water source is considered unlikely due to the potential for interception by nearby surface water, that does not justify no further action. EPA did identify the potential risks from individual disposal units to ecological receptors present in these

water bodies and human receptors who fish from those water bodies, as well as associated damage cases, which is why constituents, such as cadmium and mercury, were added to the Appendix IV list of constituents. Additionally, surface water bodies are large and highly interconnected systems that are likely to have multiple electric utilities, as well as any number of other industrial sources, located along their banks. If all these facilities were allowed to freely discharge to a water body solely because no individual release posed risk, the cumulative impacts can result in risk to surface water resources and nearby receptors. The 2015 CCR Rule addresses the potential for such risk by specifying corrective action must “remove from the environment as much of the contaminated material that was released from the CCR unit as is feasible.” 40 CFR 257.97(b)(3). Thus, dilution of a groundwater plume into surface water could not be considered a presumptive remedy. This requirement is consistent with guidance for OLEM programs that specify the need to prevent groundwater contamination above GWPS from contaminating other aquifers or environmental media.³¹

EPA also disagrees that a point of compliance at the facility boundary would provide a better estimate of actual risk than the waste boundary. Again, the commenter disregards that the contamination of the aquifer is an adverse effect on the environment, not simply a potential risk to subsequent receptors. Consequently, the regulations require facilities to address the contamination at the first available point, that is, when it first leaves the unit. There are several additional reasons that the waste boundary is the appropriate point of compliance. First, a point of compliance at the facility boundary would result in greater potential for current residences or water bodies immediately adjacent to the facility boundary to be exposed before the presence of contamination can be confirmed. Second, the facility boundary may be a significant distance away from the waste boundary, which would allow contamination to increase and spread for some time before triggering corrective action. The further contamination is allowed to increase and spread, the more difficult it may become to clean it up due to factors such as complex contaminant chemistry and site hydrogeology. This may render

³⁰ U.S. EPA. 1989. “Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part A).” EPA/540/1–89/002. Prepared by the Office of Emergency and Remedial Response. Washington, DC. December.

³¹ U.S. EPA. 2009. “Summary of Key Existing EPA CERCLA Policies for Groundwater Restoration.” OSWER Directive 9283.1–33. Prepared by the Office of Solid Waste and Emergency Response. Washington, DC. June.

large volumes of groundwater unusable for drinking water or other purposes. Finally, EPA has previously documented numerous instances where, once the contaminant plume has migrated off-site and impacted private water wells, a utility has purchased these properties, thereby rendering the off-site contamination, “on-site,” further delaying corrective action. See, 80 FR 21456. For all these reasons, EPA considers the waste boundary to provide the most consistent and protective basis on which to establish evidence of a release.

4. 2024 Final Risk Assessment

EPA identified risks to groundwater from active CCR landfills and surface impoundments, as well as to inactive CCR surface impoundments at active utilities in the 2014 Risk Assessment, which are now regulated under the 2015 CCR Rule. The results of EPA’s further analyses in the final 2024 Supplemental Risk Analysis confirm that the findings on the risk from active units from the 2014 Risk Assessment are equally applicable to units that ceased receipt of waste prior to 2015 and either closed or became inactive. This final rule therefore relies upon the 2014 Risk Assessment, the additional data and analysis presented in the March 2023 proposal indicating that the legacy CCR surface impoundments and CCRMU would be expected to have risks even higher than previously modeled, and the 2024 Supplemental Risk Assessment. Each of these is discussed in turn below.

a. Summary of 2014 Risk Record

In the 2014 Risk Assessment EPA conducted a national-scale, probabilistic analysis that characterized potential risks to human and ecological receptors associated with leakage from CCR surface impoundments and landfills in operation at that time. A combination of models was used to predict fate and transport of contaminants through the environment, receptor exposures, and the resulting risks to human and ecological receptors. The specific exposure routes evaluated were: (1) Human inhalation of particulate matter blown from open management units, (2) Human ingestion of crops and livestock raised on nearby fields, (3) Human ingestion of groundwater used as a source of drinking water, (4) Human ingestion of fish caught from freshwater streams, and (5) Ecological contact with and ingestion of surface water and sediment. Site-specific data were used where available, supplemented by regional and national data to fill data gaps, to capture the variability of waste

management practices, environmental conditions, and receptor behavior. EPA reported risks for both highly exposed individuals and more moderately exposed individuals. Risks to highly exposed individuals represent a reasonable maximum estimate that members of the general population might be exposed to, which were calculated as the 90th percentiles of all probabilistic model results. Risks to moderately exposed individuals represent a more typical estimate that members of the general population might be exposed to, which were calculated as the 50th percentiles of all probabilistic model results.

Under RCRA, EPA typically relies on a risk range to determine the point at which regulation is appropriate. This policy was first developed in the context of determining whether to regulate (or “list”) wastes as hazardous under subtitle C of RCRA. See 80 FR 21449; 59 FR 66075–66077, December 22, 1994. However, over the years EPA has relied on this risk range more broadly to determine whether regulation is warranted under both subtitles C and D of RCRA. See 75 FR 35193 (“Although the statutory standards under subsections C and D differ, EPA has historically interpreted both statutory provisions to establish a comparable level of protection, corresponding to an acceptable risk level ranging between 1×10^{-4} and 1×10^{-6} .”).

Thus, to determine whether there is a reasonable probability of adverse effects on health or the environment from the disposal or other solid waste management of solid waste, EPA typically uses as an initial cancer risk “level of concern” a calculated risk level of 1×10^{-5} (one in one hundred thousand) or an HQ above 1.0 for any noncarcinogenic risks. See, 80 FR 21,449. For example, wastestreams or activities for which the calculated high end individual cancer-risk level is 1×10^{-5} or higher generally are considered candidates for regulation. Wastestreams or activities with risks calculated to be 1×10^{-4} (one in ten thousand) or higher generally will be considered to pose a reasonable probability of adverse effects on health or the environment and generally will be regulated. Wastestreams or activities for which these risks are calculated to be 1×10^{-6} (one in one million) or lower, and lower than 1.0 HQ or environmental risk quotients for any noncarcinogens, generally will be considered not to pose a reasonable probability of adverse effects on health or the environment, and generally will not be regulated. *Id.*

EPA first evaluated national-scale risks in the 2014 Risk Assessment,

which provides a snapshot in time of potential risks across the country. This was accomplished by weighting risks from individual management practices in proportion to the anticipated prevalence of those practices. National-scale risks provide important context as to whether risks are a systemic issue that warrant national regulations or are limited in scope and better addressed through more targeted actions. The Agency’s evaluation found that the management practices that EPA believed were generally in use in 2014 at surface impoundments and landfills were likely to pose risks to human health through groundwater exposure within the range that EPA typically considers warrants regulation. For highly exposed individuals, the cancer risks from arsenic due to the operation of surface impoundments were as high as 2×10^{-4} , while noncancer risks were as high as an HQ of 5 for arsenic, 2 for lithium, and 2 for molybdenum. Cancer risks associated with the operation of landfills were estimated to be as high as 5×10^{-6} from the ingestion of arsenic-contaminated drinking water. In contrast, all risks for moderately exposed individuals fell below EPA’s risk range. This was largely attributed to the fact that many facilities are located next to major water bodies and so contaminant plumes were frequently intercepted by these water bodies before they could reach private wells.

EPA next evaluated the risks associated with individual management practices at surface impoundments and landfills. This was accomplished by filtering the national-scale model runs to focus only on those that included the practice of interest and using the filtered set of runs to calculate risks associated with that specific practice. These individual risks provide important context about the range of contaminants and practices that could pose risk at individual sites. The Agency’s evaluation identified two specific management practices that could lead to risks higher than those identified in the national risk estimates.

The first practice EPA evaluated was the disposal of CCR in unlined and clay-lined units. Management in unlined surface impoundments resulted in cancer risks for arsenic up to 3×10^{-4} , as well as noncancer risks for lithium up to an HQ of 3, molybdenum up to an HQ of 4, and thallium up to an HQ of 2. Management in unlined landfills resulted in cancer risks for arsenic up to 2×10^{-5} . The larger increase in arsenic risks identified for unlined landfills above those for national-scale landfills (2×10^{-5} vs. 5×10^{-6}) compared to unlined and national-scale

impoundments (3×10^{-4} vs. 2×10^{-4}) is because a larger proportion of landfills nationwide were initially modeled as having a liner. Since promulgation of the 2015 CCR Rule, it has become clear that more units are unlined than originally estimated. Thus, it is anticipated that national-scale risks for landfills would actually be closer to those for unlined landfills (2×10^{-5}), rather than the lower nation-wide estimates reported in the 2014 Risk Assessment.

Although clay-lined units tended to have lower risks than unlined units, they still had potential to result in risks within the range that EPA considers for regulation under RCRA. Management in clay-lined impoundments with a liner thickness of three feet resulted in cancer risks for arsenic of up to 7×10^{-6} and noncancer risks for lithium up to an HQ of 2, while management in similarly unlined landfills resulted in cancer risks for arsenic up to the 1×10^{-5} . The larger increase in arsenic risks for unlined impoundments above those for clay-lined impoundments (1×10^{-5} vs. 7×10^{-6}) compared to unlined and clay-lined landfills (2×10^{-5} vs. 1×10^{-5}) is because the layer of low conductivity clay counteracts the hydraulic head in impoundments that would otherwise freely drive greater volumes of leachate into the subsurface.³² In contrast, leachate generation in both types of landfills is limited far more by the rate of precipitation. As a result, EPA further considered how reducing the modeled clay liner thickness of impoundments to the minimum allowable standard of two feet would affect arsenic risk and found it would increase to as high as 2×10^{-5} .

The second practice evaluated was the management of wastes with an extreme pH. In particular, empirical porewater data revealed that co-disposal of CCR with other wastes in surface impoundments had the potential to result in a highly acidic pH, cancer risks for arsenic up to 1×10^{-3} , and noncancer risks for cobalt and mercury up to an HQ of 13 and 5, respectively. Laboratory leaching test data also indicated that highly acidic and basic CCR wastes have the potential to leach similarly high arsenic concentrations, up to an order of magnitude higher than under more neutral conditions. Only a small number of previous landfill model runs considered acidic conditions based on the information available about conditions in active units; identified risks for these units were driven by

more basic conditions. Thus, to the extent that conditions at either extreme of the pH scale are more prevalent than previously estimated, it is likely that overall risks from disposal in both surface impoundments and landfills would be even higher than modeled.

EPA acknowledged in the 2014 Risk Assessment that there were some additional management practices that could result in higher risk at individual sites, but that could not be quantitatively modeled with the data available at the time. One specific example provided was of CCR disposal below the water table. EPA was unable to quantitatively model the associated risks as there was little data on how common this practice was or the extent to which it could affect groundwater chemistry. Because EPA could not quantitatively model these management practices (and because the Agency had no information to indicate that it was a current, widespread management practice), EPA noted only that, based on its review of damage cases, the damage from the placement of CCR in sand and gravel pits was almost always associated with CCR being placed in contact with water, which indicated that the placement of CCR in contact with water can lead to higher risks than from dry disposal. 80 FR 21352. EPA further explained that “in this situation, the sorption that occurs in the unsaturated zone of the risk assessment model does not occur in the field. This and other site-specific risk factors could lead to additional contamination beyond what was modeled nationwide.” 2014 Risk Assessment at pages 5–48. As a consequence, EPA specifically included sand and gravel pits that received CCR in the definition of CCR landfills covered by the regulations. 80 FR 21354.

The above model results from the 2014 Risk Assessment are equally applicable to legacy CCR surface impoundments and CCRMU. Many of these unregulated units are similarly constructed, manage the same types of ash, and are frequently located either at the same or nearby facilities as their regulated counterparts. In particular, some unregulated units are known to be located directly adjacent to or beneath currently regulated units. The fact that some of these unregulated units no longer contain water ponded above the ash surface or have installed some form of cover system does not meaningfully distinguish the long-term risks of these units from those previously modeled. This is because all landfills and surface impoundments progress through similar lifecycle stages. Progression toward closure does not remediate any releases that occurred during operation of the

unit. Furthermore, if a unit is not closed with an effective cover system or remains in contact with the groundwater table, the higher rates of leakage that can result could sustain releases long after the unit has ceased operation. It is expected that legacy impoundments and CCRMU have been present for longer than currently operating units and so would have had more time to leak. As a result, previous and ongoing releases from these units have the potential to be greater and to have migrated further than those from the currently regulated universe of units.

The risks associated with legacy impoundments and CCRMU may be even higher than EPA modeled on a national scale in the 2014 Risk Assessment. The 2014 Risk Assessment aimed to provide a static snapshot of waste management practices at that time based on the available data. As such, it did not reflect the greater prevalence of some practices at older closed and inactive units based on the understanding those practices had declined over time. Nor did it reflect some ongoing practices for which there was not enough data to characterize prevalence on a national scale. The Agency is now aware of several practices that are more common than were modeled in 2014 and have the potential to result in higher leakage. However, because the 2014 Risk Assessment identified baseline risks that warrant regulation, the national risk record does not depend on the greater prevalence of these practices to justify the need for regulation of closed and inactive units. Instead, the potential for even higher risk from these practices at individual units, which are discussed below, only reinforces the basis for regulation.

First, a greater number of units lack an adequate liner system than EPA previously understood. For example, in the 2014 Risk Assessment, EPA estimated that 65% of impoundments had no engineered liner (*i.e.*, do not meet the regulatory standard for either a clay or composite liner) based on surveys conducted by EPA between 2009 and 2010 (“EPA Surveys”).³³ It has since become clear that even fewer impoundments are actually lined. EPA’s review of available liner demonstration documents posted on facilities’ CCR websites indicates closer to 83% of impoundments have no engineered liner. Similar reporting is not available

³² The somewhat higher risks identified for clay-lined landfills compared to similarly lined impoundments are likely related to site-specific conditions, such as where in the country these units are located.

³³ U.S. EPA. 2014. “Human and Ecological Risk Assessment of Coal Combustion Residuals.” RIN 2050–AE81. Office of Solid Waste and Emergency Response. Washington, DC. December.

on the liner prevalence for older units. However, EPA is also not aware of any evidence that these older units have been lined at higher rates, particularly those constructed prior to the promulgation of minimum standards for disposal in RCRA subtitle D landfills in 1991. See, 40 CFR part 257, subpart A and part 258. Indeed, most coal-fired utilities in the United States were constructed before 1990.³⁴ Even when units do report having an engineered liner, they may not perform as well as previously modeled. The 2014 Risk Assessment modeled both clay and composite liners based on the presumption both would achieve regulatory performance standards. Yet, facility reports show that around 10% of landfills and surface impoundments with a composite liner have already entered into corrective action. Thus, many units previously modeled as lined are now believed to either have no engineered liner or to perform more like an unlined unit. For these reasons, EPA anticipates that national risks for both currently regulated units and those newly covered under this rulemaking will be closer to those previously modeled for unlined units. For landfills, this could increase national risks by up to an order of magnitude, as high as 2×10^{-5} for arsenic. That risk is twice the level that EPA typically considers for regulation and is the same level of risk as those associated with the clay-lined CCR surface impoundments that the D.C. Circuit required to close.

Second, a greater number of older units co-disposed CCR with the wastes generated from coal preparation activities, collectively referred to as “coal refuse.” These activities may have included coal handling by conveyor systems, coal washing for removing mineral matter, and coal “sizing” to reduce the average particle size of coal. Co-disposal with coal refuse can have a pronounced effect on the leaching behavior of CCR because of the potential for the refuse to make the overall waste pH far more acidic. Available Leaching Environmental Assessment Framework (LEAF) leaching data considered in the 2014 Risk Assessment show that multiple Appendix IV constituents are most soluble under extreme pH conditions and thus able to leak at higher rates. EPA found modeled risks are highest when CCR was disposed in surface impoundments with coal refuse. The modeled cancer risks for the co-

disposal of ash and coal refuse in surface impoundments ranged between 1×10^{-3} for trivalent arsenic to 4×10^{-4} for pentavalent arsenic. Non-cancer risks were similarly high, ranging between and an HQ of 13 for cobalt and HQ of 14 for pentavalent arsenic to 26 for trivalent arsenic, based on the ingestion of contaminated drinking water.

The practice of co-disposal with coal refuse has declined over time. A survey conducted by Electric Power Research Institute (EPRI) in 1995 showed 34% of unlined landfills and 68% of unlined surface impoundments actively managed CCR with coal refuse.³⁵ In contrast, EPA Surveys indicated that, by 2014 this management practice had declined to around 5% of active units. EPA’s 2014 national-scale modeling was based on the 5% reported in the EPA Surveys, and as a consequence, this practice had minimal influence on the overall nationwide risk estimates in the 2014 Risk Assessment. However, it is clear from the EPRI data that management of CCR with coal refuse used to be far more common prior to 1995. Of the 283 disposal units that were previously excluded from the 2014 Risk Assessment and that reported a start year in the EPA Surveys, around 91% had already begun operation by 1995. Therefore, the risks associated with these older disposal units are likely to be higher than the national scale risks reported in the 2014 Risk Assessment.

Finally, it has become apparent since promulgation of the 2015 CCR Rule that the practice of disposing of CCR below the water table is more common than EPA previously understood. EPA was aware of this practice in 2014 and raised it as an uncertainty in the risk assessment, but had little information about the frequency of this practice. EPA’s review of the location restriction demonstrations posted on facilities’ CCR websites found that approximately 31% of active CCR surface impoundments had waste below the water table. Similar statistics are not currently available for landfills, though it is clear from previously identified damage cases that this practice is not unique to impoundments. Nor is EPA aware of any evidence that would indicate older units are less likely on the whole to have been constructed within the water table. EPA was unable to model the effects of disposal in the water table in 2014 due to constraints on data availability and modeling capabilities.

Disposal beneath the water table, either continuously or intermittently, will result in conditions that mirror those previously found to drive risk from active surface impoundments. Specifically, saturation of disposed CCR provides a larger reservoir of leachate and the hydraulic gradient across the aquifer maintains a hydraulic head that serves to drive this leachate away from the unit. The implications for landfills are particularly significant, as the potential for greater contaminant transport from these units can result in higher risks to groundwater than previously modeled under dry conditions. Further, because these landfills leak directly to groundwater, there is potential for these risks to remain long after the unit has ceased operation. This is equally true for impoundments. Even if the hydraulic head within the aquifer is not as great as from ponded water, it can still sustain higher rates of leakage than if the unit were fully dewatered. As a result, removal of the saturated ash may be the only reliable means to control the source of contamination.

Since promulgation of the 2015 CCR Rule, EPA has identified evidence of another way in which disposal below the water table could result in greater risk. This disposal practice has the potential to alter groundwater chemistry in ways that increase either the solubility or mobility of some CCR contaminants. This is due to the residual, unburnt organic matter in CCR serving as a carbon source (*i.e.*, substrate, electron donor) for bacteria in the soil. Bacteria preferentially use any dissolved oxygen (O_2) for oxidation of organic matter (*i.e.*, electron transfer from the organic matter to oxygen) because this yields the greatest energy returns for the bacteria. With a sufficient source of biodegradable organic matter, bacterial consumption of oxygen can outpace replenishment of dissolved oxygen that occurs through diffusion from the atmosphere and infiltration of precipitation. Depletion of oxygen is more likely to occur in saturated soils because the constant presence of water allows biological activity to proceed unimpeded by periods of drying, the relatively slow flow rate of groundwater does not transport dissolved oxygen from the upgradient side of the unit fast enough to outpace consumption across the footprint of the unit, and sustained saturation of the soil limits oxygen exchange with the atmosphere. In the absence of oxygen, bacteria will instead use nitrate, manganese, iron, sulfate, and other compounds for reduction of organic matter (*i.e.*, electron transfer to

³⁵ EPRI. 1997. “Coal Combustion By-Products and Low-Volume Wastes Comanagement Survey.” Palo Alto, CA. June.

organic matter from other compounds). Such reducing conditions will not affect all constituents equally, serving to mobilize some and immobilize others. However, reducing conditions can mobilize arsenic, the primary source of risks identified in the 2014 Risk Assessment.

Research conducted since the 2014 Risk Assessment has better documented the potential effects of disposal below the water table on leakage from CCR units. Studies published in 2022 examined, among other things, the degree to which environmental conditions can differ within the same closed impoundment, both above and below the water table.^{36 37} Specifically, arsenic concentrations measured in the water intermingled with CCR beneath the water table were as high as 4,100 mg/L due to the presence of reducing conditions and a near neutral pH of 8. That concentration is substantially higher than 20 mg/L, measured from the same ash with LEAF Method 1313 at a similar pH, or 780 mg/L, which is the 90th percentile of all impoundment porewater measurements previously compiled by EPA. This indicates that the porewater and LEAF data relied on the 2014 Risk Assessment may significantly underestimate the magnitude of leakage from CCR units under reducing conditions.

The extent to which the porewater data EPA used to model surface impoundments in 2014 reflect strong reducing conditions is not known, as this information was not commonly reported. Such conditions might occur during operation as a result of sustained saturation or might evolve after an impoundment has been drained of ponded water and capped, thereby decreasing mixing of oxygen within the unit. However, it is known that the LEAF data used to model landfills does not reflect reducing conditions. All standardized leaching tests tend to reflect oxidizing conditions due to contact between the sample and the atmosphere during sample collection and laboratory analysis. As such, it has since been recognized that further analysis of leachate data with

geochemical speciation models may be warranted when field conditions diverge from those present in the laboratory setting (*e.g.*, reducing conditions).³⁸ Therefore, there is clear potential for significantly higher leachate concentrations than modeled if a landfill is in contact with groundwater.

b. 2024 Risk Assessment and Results

As noted above, a number of commenters argued the 2014 Risk Assessment does not adequately capture various factors associated with legacy impoundments and CCRMU that the commenters believe will result in significantly different risks than those posed by currently regulated units. In response, EPA prepared a supplemental risk assessment to determine the potential for some of these factors to affect national risks (“2023 Draft Risk Assessment”). EPA began by reviewing available information about the characteristics and locations of legacy impoundments and CCRMU to determine whether there was any potential for the risks from these units to be meaningfully different from currently regulated units. This included a review of groundwater model results previously excluded from the 2014 Risk Assessment because the units were ultimately not covered by the 2015 CCR Rule.

As part of this review, EPA grouped legacy impoundments and CCRMU disposal units into different categories based on unit type: (1) Historical and inactive landfills and (2) Historical and legacy impoundments. The 2024 Risk Assessment defines historical units as those that have steps taken toward closure, but that may or may not meet all the requirements of § 257.102(d). Additionally, EPA further considered the influence of unit size on risk and conducted additional modeling for the subset of CCRMU that is smallest in size, those used as fill or for similar purposes (hereafter “CCRMU fills”). Because facilities have not historically regarded such placement as disposal units or necessarily maintained associated records, EPA believes there is potential for exposures different than those previously considered for landfills and surface impoundments.

Specifically, EPA evaluated the potential for risk from onsite exposure to contaminated groundwater or CCR accumulations in the soil under a future residential land use scenario.

i. Problem Formulation

EPA first developed conceptual models to illustrate a generalized layout of legacy impoundments and CCRMU, the different pathways through which constituents may be released from CCR and migrate through the environment, and the risks to human health and the environment that could result. The conceptual models for landfills and impoundments were the same as used in the 2014 Risk Assessment/EPA determined that a second model was warranted for CCRMU because some smaller placements have not historically been regarded as disposal by facilities and so have not been reliably tracked or maintained over time. These smaller placements may be disturbed after land use changes, which can result in additional release pathways. Therefore, EPA prepared a second conceptual model for smaller units (*i.e.*, CCRMU fills). These conceptual models provide the basis for subsequent modeling efforts.

When CCR are placed on the ground for any purpose, they may leach metals and other inorganic contaminants to groundwater. Once mixed with groundwater, contamination may migrate downgradient to private wells where it is ingested by receptors who rely on groundwater as their primary source of drinking water. But a receptor does not need to be presently exposed for there to be a reasonable probability of adverse effects on health or the environment. EPA evaluated this exposure pathway in the 2014 Risk Assessment and identified a set of constituents most likely to pose risk to offsite receptors living up to a mile away. The 2024 assessment builds on those model results and identifies arsenic, lithium, molybdenum, and thallium as constituents that warranted further evaluation. These are the constituents found in the 2014 Risk Assessment to pose the greatest risk for unlined surface impoundments and have the greatest demonstrated potential to spread and pose risk on a national scale. These 2014 model results therefore also provide a reasonable screen to identify the most likely risk drivers for receptors living even closer to these types of units.

When CCR is placed in fills and left unmonitored, the ash can be disturbed in the future when land use changes. In the absence of records of the presence of CCR, and in the absence of inspection and maintenance, any engineering controls currently present that might serve to limit exposure cannot reasonably be assumed to remain in place in perpetuity. For this reason, EPA

considered the potential for additional exposure pathways that could occur under a future residential land use scenario. The 2014 Risk Assessment did not evaluate risks from direct placement of CCR in the soil. However, EPA previously identified radium as a constituent of concern in the 2015 CCR Rule and included two radioisotopes on the Appendix IV list for groundwater monitoring, radium-226 and radium-228. These radioisotopes are part of larger, naturally occurring decay chains that begin with uranium-238 and thorium-232, respectively. Even if some form of cover remains over the ash, future receptors who live on or around a fill may be exposed to radiation through direct exposure to gamma radiation or inhalation of radon gas. Therefore, EPA considered potential for exposure to the full decay chains of these radium isotopes as the primary risk driver for this pathway.

ii. Disposal Unit Groundwater Risk

All disposal units pass through the same lifecycle stages, ranging from initial construction to final closure. As a result, there is potential for historical and inactive disposal units to result in the same types of environmental releases as currently regulated units over the course of their lifecycle. The fact some historical and inactive units may have since drained ponded wastewater or installed some form of cover system does nothing to remediate any prior releases. EPA conducted a review of the available data on these historical and inactive units to understand whether the associated risks would be expected to differ from those previously modeled for regulated units.

The 2014 Risk Assessment modeled risks for a total of 122 landfills and 163 impoundments that were ultimately excluded from the final summary of national risks because it was determined that these units fell outside the scope of the 2015 CCR Rule. These units were excluded because they were anticipated to cease receipt of waste prior to the effective date of the rule. Therefore, model results for these previously excluded units directly address the historical and inactive units subject to the current rulemaking. EPA reviewed model results for these previously excluded units to better understand whether the associated risks were any different from those of currently regulated units. For highly exposed individuals, landfills were estimated to pose cancer risks as high as 7×10^{-6} from arsenic III, while surface impoundments were estimated to pose cancer risks as high as 8×10^{-5} from arsenic III and noncancer HQs as high

as 2 for arsenic III, 2 for lithium, and 1 for molybdenum.

Differences between these risks and those for currently regulated units are attributed primarily to differences in the prevalence of engineered liners modeled for the two sets of units. The previously excluded units were modeled as having no engineered liner at 71% of landfills and 57% of impoundments, compared to 42% of landfills and 65% of impoundments for currently regulated units. For unlined units, the arsenic III risk from previously excluded units was 1×10^{-5} for landfills and 2×10^{-4} for surface impoundments, while corresponding risk from regulated units were 2×10^{-5} for landfills and 3×10^{-4} for surface impoundments. Since all of this modeling was completed in 2014, it has been discovered through facility reporting that a greater percentage of regulated units has no engineered liner than EPA previously modeled. For example, in the 2014 Risk Assessment, EPA estimated that 65% of impoundments had no engineered liner based on the EPA Surveys.³⁹ It has since become clear that even fewer impoundments are actually lined. EPA's review of available liner demonstration documents posted on facilities' CCR websites indicates closer to 83% of have no engineered liner. EPA has seen no evidence that would indicate older historical and inactive units would be lined at any greater frequency. Thus, EPA concludes that the national risks for regulated and previously excluded units will fall closer to those modeled for unlined units.

EPA reviewed available data on facility location to understand whether environmental conditions (e.g., precipitation, soil type) at inactive and active facilities could be substantially different than previously modeled. Such conditions can affect the rate of leakage from a unit and subsequent transport of that leachate through the subsurface. This review found that around 80% of the active and inactive facilities that were not subject to the 2015 CCR Rule had already been modeled as part of the 2014 Risk Assessment and so are already reflected in the risk results for those previously excluded units. The remaining 20% of facilities are located an average distance of 26 miles from the nearest modeled facility. Therefore, EPA concludes that the 2014 Risk Assessment adequately captures the effects of facility location on national risk.

³⁹ U.S. EPA. 2014. "Human and Ecological Risk Assessment of Coal Combustion Residuals." RIN 2050-AE81. Office of Solid Waste and Emergency Response. Washington, DC. December.

Commenters stated that the smaller size of historical and inactive disposal units would result in lower volumes of leakage and could not sustain plumes of the same magnitude as from larger regulated units. EPA reviewed data from the EPA Surveys to determine whether the sizes of previously excluded units are substantially different than EPA modeled for currently regulated units. This comparison indicates that excluded units do tend to be somewhat smaller. The average size modeled for excluded units was 77 acres for landfills and 28 acres for impoundments. The average size modeled for regulated units was 107 acres for landfills and 47 acres for impoundments. Despite these differences, there remains a great deal of overlap in the range of sizes for both sets of units. Further, as described above, similar risks were identified for both sets of units. Thus, there is no indication that size differences of this magnitude have any notable effect on national risk. Nor is there any information available about the units not captured in the EPA Surveys that would indicate these remaining units are significantly smaller. Therefore, EPA concludes that the 2014 Risk Assessment adequately captures the effects of unit size on national risk.

iii. CCRMU Fill Groundwater Risk

EPA conducted national-scale modeling of CCRMU fills to understand the potential groundwater risks that could result from these smaller placements of CCR. The exposure route evaluated for was human ingestion of groundwater used as a source of drinking water. The evaluation incorporated many of the same data sources used in the 2014 Risk Assessment to characterize the variability of site conditions. Two models were used to evaluate contaminant fate and transport, EPACMTP and MODFLOW-USG. EPACMTP was run first at specified distances along the centerline of the plume to understand the potential for releases to occur and spread further downgradient. MODFLOW-USG was then run for a subset of the conditions to understand the broader magnitude and extent of these plumes.

Groundwater concentrations modeled with EPACMTP at the waste boundary were first compared to respective GWPS to understand the potential for fills to impact groundwater quality to an extent that would trigger corrective action at regulated landfills. The 90th percentile concentrations exceeded GWPS by factors of 26 for arsenic III, 19 for arsenic V, 156 for molybdenum, and 19 for thallium. The 50th percentile

concentrations exceeded GWPS by a factor of two for molybdenum. Based on these results, EPA finds that CCRMU fills can meaningfully contribute to groundwater contamination across a facility.

Groundwater concentrations modeled with EPACMTP at 500 and 1,000 feet away from the waste boundary were used calculate risks to individual RME receptors exposed to these concentrations. The 90th percentile concentration of each modeled constituent exceeded at least one risk benchmark at 1,000 feet. This indicates potential for leakage from fills to spread at environmentally significant concentrations. However, because these model runs represent concentrations at a fixed location, they do not provide broader information about the magnitude and extent of the plume. As a result, EPA does not rely primarily on these results to draw direct conclusions about overall risk. Instead, the Agency retained a subset of these model runs for both arsenic V and molybdenum from around the 90th percentile concentrations modeled at 1,000 ft. EPA selected pentavalent arsenic because it is the less mobile species and so provides a reasonable bounding on the high-end concentrations that can result for this contaminant. These runs were retained for further modeling with MODFLOW-USG to characterize the full magnitude and extent of each plume over time.

The MODFLOW-USG runs were designed with the same inputs as corresponding EPACMTP runs. Altogether, these model runs reflect a range of conditions that collectively resulted in high-end groundwater concentrations 1,000 feet from the fill. These corresponding placements of CCR range from around 3,500 to 70,000 tons placed over areas between 0.15 to 2.0 acres. EPA calculated the midpoint across these runs to define values representative of the 90th percentile model runs. For arsenic V, the model identified a peak risk of 1×10^{-4} averaged over 32 million gallons (Mgal) of groundwater and a peak volume of 147 Mgal with an average risk of 7×10^{-5} . The same leakage of arsenic V would result in a peak GWPS exceedance of three averaged over a plume volume of 1.2 Mgal and a peak plume volume of 8 Mgal with an average exceedance of 2 times GWPS. It would take around 2,300 years from the time of first exceedance for the plume to fully dissipate. For molybdenum, the peak exceedance of both risk benchmark and GWPS was 10 averaged over a plume volume of 27 Mgal and a peak plume volume of 80 Mgal with an

average exceedance of 4 times GWPS. It would take around 100 years from the time of first exceedance for the plume to fully dissipate. Plumes of these size and duration could readily sustain exposures for typical residential receptors that are anticipated to use around 80 gallons of water a day for all indoor household needs, resulting in less than 0.8 Mgal of use over 26 years of exposure.

iv. CCRMU Fill Soil Risk

EPA modeled of CCRMU fills to understand the potential risks that could result from CCR present in the soil. Exposure routes initially considered for evaluation were human inhalation of radon gas and direct exposure to gamma radiation emitted from the CCR. However, based on a preliminary review of available data, EPA determined that radon emanation from CCR (*i.e.*, fraction of radon able to escape into the surrounding air) is generally lower than from most soils. Despite the higher overall activity of CCR, the resulting radon emanation from the ash is not distinguishable from that of most surface soils. Therefore, EPA did not retain exposure to radon for further consideration.

Modeling of exposure to gamma radiation was conducted with the EPA PRG calculator. EPA evaluated the potential for direct exposure to gamma radiation from CCR under a soil cover ranging in thickness from 60 to 20 cm (2 to 0.66 feet). EPA compared the combined activity of the uranium-238 and thorium-232 decay chains in the CCR to the health benchmarks for each cover thickness to calculate the risks that could result from receptors living on or near the fill. Both 90th and 50th percentile activities have potential to result in cancer risks at or above 1×10^{-5} with a cover of 40 cm. The 90th percentile activity resulted in a cancer risk of 1×10^{-4} with a cover of 20 cm. This indicated the potential for even higher risk if the cover were to be disturbed and the CCR brought to the ground surface. However, evaluation of this scenario would require additional assumptions about the degree of mixing, which could be a major source of uncertainty on a national scale. Therefore, EPA retained this scenario for further consideration as part of a separate sensitivity analysis.

v. Uncertainty and Sensitivity Analyses

EPA reviewed the models used, as well as the data and assumptions input into the models, to better understand the potential sources of uncertainty inherent in the model results. The Agency qualitatively and, to the extent

possible, quantitatively analyzed these sources to understand the potential effects each may have on modeled risks. EPA also conducted further sensitivity analyses to understand how the modeled national risks vary in response to changes in sensitive parameters and to evaluate the potential for risks through exposure pathways that could not be fully modeled on a national scale.

The major source of uncertainty identified for the groundwater model is the potential for greater risk from multiple units located in close proximity. The EPA Surveys did not provide information on the relative location or orientation of different landfills and impoundments at any given facility and so the 2014 Risk Assessment modeled risks from each unit individually. However, the Agency is now aware of many instances where multiple units are located directly adjacent to one another, resulting in a larger total area over which leakage can occur. This could result in greater cumulative risk to offsite receptors than predicted based on contributions from each individual unit. Furthermore, there is potential for legacy impoundments and CCRMU (disposal units and fill) to confound groundwater monitoring programs when located upgradient of a regulated unit. Ongoing leakage from these unregulated units has the potential to skew the characterization of background groundwater quality. Under these circumstances, any leakage from a regulated unit would need to progress even further and faster to be distinguishable from that skewed background. This could delay or entirely prevent a regulated unit from entering into corrective action, resulting in risk to downgradient receptors.

EPA conducted a sensitivity analysis to determine whether there is a unit size below which adverse impacts to groundwater quality are unlikely and monitoring is not warranted. This analysis found exceedances of GWPS are possible for placements below 1,000 tons. Thus, such placements can meaningfully contribute to groundwater contamination at these facilities. It was not possible to identify a limit much lower than this tonnage because of the few model runs conducted at smaller amounts. Extrapolation beyond available model runs could introduce a great deal of uncertainty into any specific limit identified. The extent to which any identified limit could shift higher or lower in response to further modeling around these lowest tonnages is not known. Therefore, the Agency could not identify a lower limit based on the current modeling.

EPA conducted further sensitivity analyses to better characterize the risks to human health that may result from mixing of CCR with the soil. There is little data available to predict the likelihood of different degrees of mixing that could occur across the country. Instead, EPA considered the incremental contributions from CCR through increased mixing with soil to identify the point at which accumulation would raise concern. This analysis focused on radionuclides previously identified as potential risk drivers for soil, but also considered contributions from arsenic that may further contribute to cancer risk. The exposure pathways considered were incidental ingestion of the CCR and soil mixture and direct exposure to gamma radiation. For radionuclides, cancer risks above 1×10^{-4} are possible for residential receptors at mixing of more than 11% for 90th percentile activity and 21% for 50th percentile activity. For arsenic, cancer risks above 1×10^{-4} are possible at mixing of more than 33% for 90th percentile concentration, but would not occur at any degree of mixing for 50th percentile concentration. Both radionuclides and arsenic also occur naturally in soil; however, levels in CCR can be markedly higher than typical background levels. In particular, EPA has identified the potential for CCR to have a combined radium activity nearly 10 pCi/g above typical background soils. This is greater than the ARAR that has been applied at some cleanups for surface and subsurface soils under Superfund and State programs. As such, consideration of the incremental increase above background does not alter the overall results of this analysis. Therefore, EPA concludes that accumulation of CCR within the soil column can result in risks within the range that EPA considers or regulation.

EPA separately considered the potential for risk to ecological receptors that may result from mixing of CCR with the soil based on comments received that a future use for these facilities could be as a nature preserve. EPA calculated the incremental contributions from CCR as described above and compared the resulting concentrations to available ecological benchmarks. This analysis focused on constituents for which ecological soil screening levels are available. This comparison indicates that antimony, selenium, and vanadium are most likely to drive risk and require further evaluation at both high-end and median ash concentrations. In some cases, ecological benchmarks are lower than typical background soil levels. However, consideration of the

incremental increase above background does not alter overall results. Therefore, the potential for risk from accumulation of CCR within the soil column remains even if future residential land use is not anticipated.

vi. Final Conclusions

Based on the analyses summarized in the current risk assessment, EPA concludes that there is a reasonable probability of adverse effects on health and the environment due to leakage from legacy CCR surface impoundments and CCRMU. EPA's assessment estimates that the risks that leakage from these units would adversely impact groundwater quality and pose risk to future receptors fall within the range EPA typically considers warrants regulation under section 4004(a) (*i.e.*, cancer risks greater than 1×10^{-5} and non-cancer risks exceeding an HQ of 1). Older historical and inactive disposal units can pose risks to offsite receptors substantially the same as previously reported for currently regulated units. Smaller CCRMU fills can pose risk to onsite receptors and materially contribute to broader groundwater contamination across the facility. Depending on the location of these fills, they can also pose risk to offsite receptors. The risks identified for CCRMU fills are also believed to provide a bounding estimate on the risks posed by disposal units, as leakage from these larger units would generally be expected to result in more extensive releases than modeled for fills. Risks to human health from groundwater are anticipated to be driven by ingestion of arsenic, lithium, molybdenum, and/or thallium. Health effects associated with arsenic ingestion are an increase in the risk of cancer in the skin, liver, bladder, and lungs, as well as nausea, vomiting, abnormal heart rhythm, and damage to blood vessels. Health effects associated with ingestion of lithium are neurological and psychiatric effects, decreased thyroid function, renal effects, cardiovascular effects, skin eruptions, and gastrointestinal effects. Health effects associated with molybdenum ingestion are higher levels of uric acid in the blood, gout-like symptoms, and anemia. Health effects associated with thallium ingestion are hair loss, ocular effects, and behavioral changes.

EPA also concludes the unmonitored accumulation of CCR in surface and subsurface soils has the potential to result in risk to future human and ecological receptors in the range OLEM typically considers for regulation. Potential human health risks are driven by incidental ingestion of ash mixed

with the soil and direct exposure to gamma radiation from radium and its associated decay chains. Health effects attributed to radium exposure include increased risk of several types of cancer, particularly lung and bone cancer. Potential ecological risks are driven by exposure to antimony for mammals, selenium for plants and mammals, and vanadium for birds from ash mixed with the soil. Health effects attributed to these exposures are decreased reproduction, growth, or survival. EPA did not seek to identify a comprehensive list of other contaminants that might also contribute to risk as part of the current assessment; however, any further risk would be equally addressed by controls put in place to mitigate the identified soil risks.

B. Legacy CCR Surface Impoundment Requirements

The Agency is amending the CCR regulations in 40 CFR part 257, subpart D to require legacy CCR surface impoundments to comply with the same regulations that apply to inactive CCR impoundments at active facilities, except for the location restrictions (at §§ 257.60–257.64) and liner design criteria (at § 257.71). EPA is also establishing new requirements to address issues specific to legacy CCR surface impoundments. Finally, EPA is establishing new compliance deadlines for legacy CCR surface impoundments.

1. Definition of a “Legacy CCR Surface Impoundment”

EPA is finalizing the proposed definition of a “legacy CCR surface impoundment” without revision. A legacy CCR surface impoundment must meet three criteria: (1) The unit meets the definition of a CCR surface impoundment; (2) The unit contains both CCR and liquids on or after October 19, 2015; and (3) The unit is located at an inactive electric utility or independent power producer. An inactive impoundment must meet all three criteria to be a legacy CCR surface impoundment. This definition is codified in § 257.53.

EPA estimates there are 194 legacy CCR surface impoundments located at 85 facilities that will be subject to the requirements of this final rule.⁴⁰ This estimate also takes into account the information received in response to the Agency's lists of potential legacy CCR surface impoundments published in the dockets with the proposed rule and

⁴⁰ An updated list of potential legacy CCR surface impoundments can be found in the docket for this action. See document titled “Universe of Legacy CCR Surface Impoundments. April 2024.”

subsequent notice of data availability. This estimate is an increase from the 127 legacy CCR surface impoundments located at 59 facilities identified in the proposed rule. 88 FR 32028.

The sections below briefly explain what EPA proposed, summarize the public comments received, and provide the Agency's responses.⁴¹ The Agency addresses several aspects of the definition in the following order: (1) Date for determining applicability; (2) The requirement to contain both CCR and liquids; and (3) The requirement to be located at an inactive facility.

a. Legacy CCR Surface Impoundment—Date for Determining Applicability

EPA explained in the proposed rule that the 2015 CCR Rule exempted “inactive surface impoundments at an inactive facility” and codified definitions of an “inactive CCR surface impoundment” and an “active facility or active electric utility.” The Agency further stated that in developing a definition of a “legacy CCR surface impoundment” two separate components need to be addressed: (1) The definition of an “inactive CCR surface impoundment”; and (2) The definition of an “inactive facility or electric utility.” 88 FR 31989.

At proposal, the Agency relied on the existing definitions of an “inactive CCR surface impoundment” and “active facility or active electric utilities or independent power producers,” as well as the 2018 *USWAG* decision to inform the options discussed. Specifically, EPA explained that both terms establish applicability based in part on the effective date of the 2015 CCR Rule—a unit is an “inactive CCR surface impoundment” if it does not receive CCR on or after October 19, 2015, and still contains both CCR and liquids on or after October 19, 2015, and an “active facility or active electric utilities or independent power producers” is only active if it was in operation on or after October 19, 2015. 40 CFR 257.53.

The Agency proposed to define a legacy CCR surface impoundment, in part, as a surface impoundment that contained both CCR and liquids on or after October 19, 2015. EPA explained in the proposed rule, that using October 19, 2015 as the date to determine applicability was most consistent with the *USWAG* decision; first because legacy CCR surface impoundments would be regulated the same as the currently regulated inactive impoundments at active facilities.

Second, an October 19, 2015 applicability date would restore the status quo, as intended by court's decision to vacate the exemption. EPA also concluded that this was the most protective option. 88 FR 31990–31991. However, as an alternative, the Agency also solicited comment on defining a legacy impoundment as a unit that contains both CCR and liquids on or after the effective date of this final rule in 2024. 88 FR 31991–92.⁴²

Several commenters opposed the proposed applicability date of October 19, 2015, stating that the only legally defensible and workable approach is to establish an applicability date based on the effective date of this final rule. Some of these commenters argued that an applicability date of October 19, 2015, would constitute a retroactive rule, which they considered to be both legally impermissible and unreasonable. These commenters stated that establishing an applicability date based on the effective date of this final rule would honor the bedrock administrative principle that “rules should apply prospectively absent express statutory grant” consistent with *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208–09 (1988).

Other commenters stated that EPA was overreading the *USWAG* decision and inappropriately interpreting the court's decision. These commenters stated that the court did not specify how legacy impoundments should be regulated, or the appropriate applicability date and regulatory controls that should apply to the units but remanded those issues to EPA to address through rulemaking. These commenters further stated that the court's ruling was based on the administrative record for the 2015 CCR Rule, which they claimed is very different than the current record for the facilities that would be covered by the proposal. According to these commenters, the court was focused only on those legacy impoundments for which significant risks remained, which they characterized as exclusively CCR surface impoundments with a hydraulic head. These commenters argue that, by contrast, the proposal will also apply to CCR surface impoundments for which EPA has failed to demonstrate any significant level of risk, which they characterized as (1) CCR impoundments that contain “any amount of water,” but no hydraulic head; and (2) CCR

impoundments that are in the process of closing or have completed closure.

Several commenters similarly raised concern that the proposal ignores that there have been numerous changes since the court issued its decision in 2018. For example, some commenters stated that facilities have proactively worked with their States to close these impoundments and have invested substantial resources to close these units in compliance with existing regulatory requirements and thus these units should not be considered legacy impoundments. According to these commenters, the final rule should take into account the significant closure and corrective action work that has been undertaken since the 2015 CCR Rule was promulgated, rather than assuming the landscape has not changed over subsequent years.

In addition, a number of commenters noted that the proposed definition would capture numerous sites where former legacy CCR surface impoundments were closed by removal under then-applicable State regulations and where no CCR remains. These commenters raised concern that EPA lacks jurisdiction under RCRA to impose requirements at a site once all CCR has been removed. Many of these commenters further asserted that EPA should accept such closure as sufficient to protect the environment and not seek to impose an unnecessary set of requirements. Finally, some commenters explained that some of these sites have subsequently been restored and are now home to established natural ecosystems, and thus it would be counterproductive to require them to be disturbed.

By contrast, a number of commenters asserted that the record has not significantly changed since the court issued its opinion. These commenters stated that all legacy impoundments, including those that have been dewatered or completed closure, pose significant risks to human health and the environment that warrant regulation under RCRA. Citing the *USWAG* decision and EPA's findings from the 2015 CCR Rule and the proposal, these commenters stated that the risks associated with legacy impoundments are greater than currently regulated units because they are more likely than regulated ponds to be unlined, more likely not to have been designed by a professional engineer, and more likely to contain a mix of ash and coal refuse, all of which increase the potential for groundwater contamination. The commenters further noted that harm from contaminant releases from legacy ponds worsens as time passes, citing the

⁴¹ EPA's responses to public comments can be found either in this preamble or the Response to Comments document available in the docket.

⁴² EPA also published an ANPRM on October 14, 2020 (85 FR 65015). The Agency solicited input on a potential definition of a legacy CCR surface impoundment in the ANPRM and addressed comments to the ANPRM in the subsequent proposal. 88 FR 31989–91.

finding in EPA's 2014 Risk Assessment that peak contaminant releases from CCR surface impoundments will not occur until 70 years after waste placement.

These commenters also estimated that close to half a million people live within 1 mile of the 417 active and inactive coal-fired power plants in 44 States and Puerto Rico that have reported coal ash units. Using the Council on Environmental Quality's (CEQ) Climate and Economic Justice Screening Tool (CEJST), the commentor estimated that approximately half (213) of the facilities are located within a mile of a disadvantaged community, while over 70% of the facilities (297 of 417) are located near a community that has higher-than-State average levels of low-income populations or populations of color. These commenters also estimated that many of the communities living nearby may experience cumulative impacts from other threats. CEJST offers data at the census tract-level on PM_{2.5} exposure, diesel particulate matter, traffic proximity, abandoned mine land, formerly used defense sites, hazardous waste site proximity, Superfund site proximity, underground storage tanks and releases, wastewater discharge, and Risk Management Plan site proximity. According to the commentor, using CEJST, more than half of the 417 power plants with historic or active ash units (214) are within one mile of a census tract that experiences pollution from at least two of these additional sources to a degree higher than that of 75% of all census tracts in the United States.

The commenters also discussed several individual legacy impoundments with longstanding groundwater contamination, noting that for several plants, due to lack of Federal regulation and oversight, little or no action has been taken to remediate clearly documented contamination. Among those they highlighted were:

- At the Muskingum River Power Plant, where onsite groundwater has exceeded the primary EPA MCLs for barium and gross alpha as well as EPA secondary MCLs (SMCLs) for iron, sulfate, and Total Dissolved Solids. According to the commenter no remediation has occurred to date.
- At the retired Dynevig Vermilion Power Station in Oakwood, Illinois, 70-year-old unstable pits with more than 3 million tons of CCR are leaking CCR constituents into Illinois' only National Scenic River. The pits run along the river for a half-mile where kayaking and other recreational activities are common.
- At American Electric Power's retired Tanners Creek in Lawrenceburg,

Indiana, leaking ash pits at the plant are contaminating groundwater with high levels of boron within 500 feet of public drinking water wells and the Ohio River.

- At Georgia Power's retired Plant Arkwright, the unlined abandoned ash ponds have been leaking chemicals, such as boron, at levels above health standards into the groundwater and nearby Ocmulgee River for nearly 20 years, according to a peer-reviewed study.⁴³

According to these commenters, substantial risks to human health and the environment remain even where the impoundment has been dewatered or closed. In support of this conclusion, the commenters pointed to EPA's explanation in the proposal that even if impoundments have been at least partially dewatered or have undergone some type of closure, the current risks to human health and the environment can still be significant, due to contamination remaining at the site from releases that occurred while the unit was operating. Referencing data that legacy impoundments are, on average, 55 years old, the commenters also pointed to the proposal's explanation that the potential magnitude of releases from older units are greater than for currently regulated CCR units due to a number of factors, including (1) the likely absence of a liner in older impoundments; (2) the mixture of coal ash with coal refuse, which was a common disposal practice in older units; and (3) the older a CCR unit is, the longer it has had to leak and for hazardous constituents to migrate further from the unit. The commenters also discussed the results of a report, "Assessment of Legacy Surface Impoundments" by Gordon Johnson, M.Sc., P.Eng., which examined ten CCR surface impoundments at inactive facilities that were not on EPA's list of potential legacy ponds and do not appear to contain standing water, and concludes that all posed significant risks to health and the environment.

As a consequence, these commenters criticized EPA's proposed definition of a legacy impoundment as one that contains liquid on or after October 19, 2015. These commenters argue that this would exclude surface impoundments at inactive plants that pose a reasonable probability of adverse effects on health and environment, whether or not they contain liquid.

⁴³ J.S. Harkness et al., Evidence for Coal Ash Ponds Leaking in the Southeastern United States. *Environmental Science & Technology*, 50(12): 6583–6592 (2016).

Several commenters also supported EPA's proposal to regulate units at sites that are heavily vegetated or redeveloped on the surface with established natural ecosystems, stating that the possibility that conducting a proper closure might disrupt the current land use is outweighed by the fact that inadequately closed units pose ongoing threats to health and the environment. These commenters also supported coverage of legacy impoundments that had completed or were undergoing closure pursuant to State programs, citing EPA's review of State programs as part of the 2015 CCR Rule, which concluded that significant gaps remain in many State programs, and discussing specific examples of problematic State permits.

Some commenters also stated that the proposed applicability date of October 19, 2015, presents serious practical challenges to implementation because it requires facilities to look back more than eight years to determine the historical status of legacy impoundments. Commenters explained that this extended look-back period could prove to be an impossible task for sites where power plant operations ceased decades ago. Furthermore, the proposed applicability date illegally requires actions by facilities that are physically impossible. For example, operating records, construction and inspection reports, groundwater monitoring data, and employee testimonials may not exist for some facilities that ceased generating power decades ago. In addition, commenters pointed out that historic aerial photography will not inform whether liquids are present beneath the surface of the inactive impoundments. Finally, some commenters stated that EPA's proposed approach is particularly challenging to small public power utilities given their size, staffing levels, and record retention policies once a facility is closed.

After considering the comments and all of the information in the record, this final rule adopts the proposed date of October 19, 2015, for determining applicability for legacy CCR surface impoundments. This applicability date is justified for two independently sufficient reasons. First, it most effectively targets the risks to human health and environment posed by legacy impoundments. Second, it is consistent with the USWAG decision. Accordingly, this final rule specifies that an inactive impoundment at an inactive facility that contained both CCR and liquids on or after October 19, 2015, is a legacy CCR surface impoundment subject to the requirements of this final rule. The

definition of a legacy CCR surface impoundment is codified in § 257.53.

This option best addresses the risks legacy impoundments pose to human health and the environment. EPA's record for this rule, which includes the 2015 rulemaking record, supplemented by new information, establishes that that the environmental risks posed by legacy impoundments are greater than or similar to those posed by operating impoundments. EPA acknowledges that it is not bound by the 2015 rulemaking record that the court reviewed in *USWAG*—and, as just stated, in fact has supplemented that record with new information for this rulemaking. EPA further acknowledges that since the 2015 CCR Rule and the *USWAG* decision some units have closed or have begun to close in accordance with State permits, or on their own initiative in response to the D.C. Circuit's ruling. But EPA disagrees that the record shows that the risks to human health and the environment posed by the legacy impoundments regulated under this final rule are significantly or meaningfully lower than the risks the court found to be unacceptable in *USWAG*. In fact, as described in III.A.4 of this preamble, the record instead demonstrates that the totality of the risks is potentially greater than EPA estimated in 2014.

A subset of legacy impoundments is identical to those described in *USWAG*; the impoundments are structurally unstable and pose significant risk of contaminating groundwater because they are unlined, with a hydraulic head promotes the continual leaching of contaminants from the CCR and drives the resulting leachate into underlying soils and potentially into the underlying aquifer. No commenter disagreed that these legacy impoundments warrant regulation under part 257.

Another subset, on which many of the commenters largely focused, have been fully or partially dewatered, or have completed some form of closure. In response to the proposal, EPA received information that since October 19, 2015, 22 surface impoundments at inactive facilities have closed by removal or are in the process of closing by removal, and 10 surface impoundments have closed with waste in place, either with oversight from a State agency or on their own initiative in response to the *USWAG* decision. These commenters claimed that, as a consequence of dewatering their units, the units no longer pose any appreciable risk.

EPA agrees that once the water in the impoundment has been reduced the likelihood of structural failure will also have been reduced; and if the liquid and

or CCR have been entirely removed there will be no appreciable risk of structural failure. But these units nevertheless continue to present significant risk to human health and the environment as a consequence of existing—and in some cases, continuing—groundwater contamination. This contamination can exist even where CCR has been entirely removed from the disposal unit. First, in many cases facilities have only removed some of the free liquids in the impoundment; that is, have only partially dewatered. As described in Unit III.B.2.g of this preamble, many commenters claimed that under the existing closure regulations they are only required to eliminate free liquids to the extent necessary to support heavy machinery or other construction activities (*i.e.*, to the extent necessary to support the cover system), rather than to eliminate free liquids without qualification, as the regulation requires. Such units present essentially the same environmental and human health risks the *USWAG* court was concerned with. Second, to the extent a unit intersects with groundwater, free liquids will remain (because the groundwater is continually saturating the CCR), and the unit will continue to present significant risks, because the same conditions that promote the rapid leaching of contaminants in operating units are present, and will persist indefinitely. Finally, at many of these sites the existing contamination resulting from when the unlined impoundment was operating has not been addressed. Each of these are discussed further below.

Contrary to the commenters' claims, the partial dewatering they describe does not, as they claim, “eliminate” either the hydraulic head from a unit or the risk of groundwater contamination. Until the water (liquid) is fully removed, gravity will continue to exert downward pressure on the water in the saturated waste until it reaches equilibrium with the water table. Thus, although reducing the water in the unit also reduces hydraulic head, hydraulic head will be present as long as water remains in the unit.

Hydraulic head represents the energy to move a liquid. Liquid flows from locations of higher hydraulic head to locations of lower hydraulic head. A simple illustration of hydraulic head is the water percolating through (*i.e.*, exerting downward pressure on) coffee grounds into the cup below. As the water moves through the solids, particles of the solids combine with the water (create leachate) and drain downward. Even after the water is no longer visible above or among the coffee

grounds, liquids continue to drain into the cup below.

In a diked impoundment located above the water table, after the removal of free standing (or “ponded”) water, the CCR in the unit would still remain saturated with liquids (*i.e.*, the free liquid ⁴⁴ and/or porewater). Once the CCR material is saturated, some liquids may remain bound within the CCR due to retention forces. However, the remaining (free) liquids will drain in response to gravity and hydraulic head. Because the saturated waste is at a higher elevation than the normal water table, the free liquids within the saturated waste would continue to drain toward the normal water table (“exert downward pressure”) even if the unit no longer contained ponded water on top of the CCR. Until the water is eliminated from the CCR, gravity will continue to exert downward pressure on the water in the saturated waste, but at some point, gravity will be insufficient to overcome the retention forces in the CCR. Until that point, free liquids will continue to drain until they reach the water table. Continued contact with free liquids causes the metals and other constituents to leach out of the CCR, and the downward pressure of the hydraulic head drives the resulting leachate toward the bottom and sides of the unit. In an unlined unit, which the overwhelming majority of legacy impoundments are likely to be, any remaining free liquids saturating the CCR in the impoundment will eventually leak out of the unit into the surrounding soil and/or into the aquifer, along with any CCR constituents that have leached from the waste in the interim. As mentioned previously, it is important to note that after this draining occurs, some liquids will remain bound within the pore spaces of the CCR material and will not readily drain under ambient temperature and pressure. Consequently, these residual liquids are not free liquids. Because any remaining residual liquids (*e.g.*, bound porewater or potential leachate) will not continue to drain from the unit absent other forces, further releases of these residual liquids are not likely.

By contrast, when some portion of the unit has been constructed in or below the water table, even if the hydraulic head is reduced by the removal of free-standing or ponded water, hydraulic head remains present as long as groundwater flows through the unit

⁴⁴ Free liquids are any liquids that readily separate from the solid portion of a waste at ambient temperature and pressure. § 257.53. In the example described above, free liquids are the liquids that drain from the coffee into the cup below.

from higher groundwater elevations to lower groundwater elevations. And even where the CCR above the water table in such a unit has been partially or fully dewatered, the “conditions that promote rapid leaching of contaminants” still remain as a consequence of the continued saturation of CCR in the unit from groundwater infiltrating the unit.

As EPA explained in Unit III.A.2 of this preamble, a CCR landfill saturated with water during operation, either continuously or intermittently, would behave more like an operating CCR surface impoundment even though such a unit would not have the level of hydraulic head from ponded water present in an operating impoundment. The same is true of a dewatered legacy impoundment constructed in or below the water table. See also 88 FR 32011. The hydraulic head from the ponded water in an operating impoundment unit allows for continual leaching of contaminants from CCR and drives the resulting leachate into the underlying soils and potentially into the underlying aquifer. However, where any part of the unit is actually constructed below the water table, the conditions caused by the continuous saturation of the CCR by the groundwater flowing in and out of the unit allow the contaminants to continuously leach directly into the nearby ground and surface waters even without any downward pressure from hydraulic head pushing leachate out of the unit. *Id.*

The record shows that significant numbers of the currently regulated CCR surface impoundments were constructed such that the base of the unit intersects with groundwater,⁴⁵ and that many inactive, or even “closed,” impoundments continue to impound water below the water table (*i.e.*, contain liquids).

In any event, even if an impoundment has been completely dewatered, the current absence of impounded water does not remediate the releases that occurred during operation of the unit. In general, legacy impoundments are likely to have been present for longer than the currently operating units: For example, one commenter presented information to demonstrate that legacy impoundments are, on average, 55 years old; by comparison, EPA estimated in 2015 that most currently operating surface impoundments were between 20 and 40 years old. See 80 FR 21327. This is significant in two regards: (1) The

older the impoundment the greater the likelihood it is unlined; and (2) The more time the unlined unit would have to leak and for hazardous constituents to migrate further from the unit.

Consequently, previous and ongoing releases could potentially be greater and have migrated further from the unit than releases from the universe of currently regulated units. In this regard, it is notable that EPA estimated in its 2014 Risk Assessment that peak contaminant releases from CCR surface impoundments will not occur until 70 years after waste placement. This is further confirmed by the modeling originally conducted in 2014 for legacy impoundments.

Furthermore, as described in Unit III.A there are a number of additional reasons to believe that the potential magnitude of releases is even greater than EPA originally estimated in 2014. These include: (1) The likely absence of a liner at older impoundments; and (2) The greater likelihood that coal ash was managed with coal refuse, which was a common disposal practice in older units.

Finally, defining a legacy impoundment as one that contains both CCR and liquid on or after October 19, 2015, retains oversight of units that may have been dewatered but have not yet completed closure. In any unit without an effective cover system, precipitation can continue to freely migrate into the unit, and any leachate generated as a result would be a potential ongoing source of contamination, particularly where the unit is already leaking or in contact with groundwater. Further, significant risks can remain if a unit is not closed properly; for example, a closure that leaves that millions of tons of CCR saturated with groundwater and only a cover system to control downward infiltration of precipitation will not protect human health and the environment. And, as discussed in further detail in the next section, even at sites where the CCR has been completely removed from the impoundment it is possible that, in addition to the likely significant groundwater contamination present at the site, contaminated soil remains, which can serve as a source of further contamination. See, Unit III.B.1.b.ii.(a).

EPA acknowledges that some of these units may be closing pursuant to State laws that provide for a significant degree of State involvement and oversight, but that is not universally the case. As EPA concluded in 2015, there is a wide range of protectiveness in State programs. Clear deficiencies were present in some State regulatory programs, and questions remained with

respect to others. See, 80 FR 21326–21327, 21456 and Unit III.B.g.iii. EPA is aware that some State programs have been substantially revised since 2015, and some individual States provided additional information regarding their programs in their comments, but again this is not universal. For example, some commenters documented recent State approved closures that were deemed complete despite the absence of any groundwater monitoring to determine whether groundwater contamination remained at the site. The absence of a consistent, sufficiently protective approach among all State programs reinforces the need for a single, protective Federal standard.

EPA also continues to believe that an applicability date of October 19, 2015, is the most consistent with the *USWAG* decision. See, 88 FR 31991. The Court expressly found that EPA’s record for the 2015 CCR Rule demonstrated that legacy ponds “pose the same substantial threats to human health and the environment as the riskiest Coal Residuals disposal methods, compounded by diminished preventative and remediation oversight due to the absence of an on-site owner and daily monitoring.” 901 F.3d at 432. EPA agrees with this conclusion that legacy ponds “pose substantial risk to human health and the environment.” *Id.* Consistent with that determination, the final rule imposes essentially the same requirements on legacy CCR surface impoundments that currently apply to inactive impoundments at active facilities. In addition, as EPA explained in the proposed rule, D.C. Circuit’s decision setting aside the exemption for inactive impoundments meant that these impoundments were similarly situated to the impoundments regulated by the 2015 CCR Rule. EPA thus had an obligation to address the substantial environmental risks from those impoundments through regulation. By setting aside, rather than simply remanding the exemption back to the Agency for further explanation, the Court made clear that the existing record was sufficient for these units to be regulated.

Nor is EPA persuaded by the commenters’ remaining objections to the applicability date of October 19, 2015. EPA disagrees that reliance on the effective date of the 2015 CCR Rule would constitute a retroactive application of law. A regulation is impermissibly retroactive where, absent clear Congressional intent, the rule changes the past legal consequences of past conduct. See *Bowen v. Georgetown Univ. Hosp.*, 488 U.S. 204, 208 (1988). This is generally referred to as primary

⁴⁵ EPA’s review of the location restrictions demonstrations posted on facilities’ CCR websites found that approximately 31% of operating impoundments have waste below the water table. There is no reason to believe that this percentage is not also representative of legacy impoundments.

retroactivity. See *Bergerco Canada, a Div. of Conagra, Ltd. v. U.S. Treasury Dep't, Off. of Foreign Assets Control*, 129 F.3d 189, 192 (D.C. Cir. 1997). Rules can also affect the legal rights flowing from past acts. See *Bergerco*, 129 F.3d at 192. This is referred to a secondary retroactivity. *Id.* Such effects are common, and permissible so long as they are not arbitrary or capricious. The D.C. Circuit in *Bergerco* noted that a rule may be arbitrary or capricious if it “makes worthless substantial past investment incurred in reliance upon the prior rule.” *Id.*

Here EPA is merely relying on a past fact to support the future application of regulations. And because EPA has established future compliance dates, no facility would be subject to penalties solely because one of its legacy CCR surface impoundments was out of compliance with the regulatory requirements prior to the effective date of this final rule. Thus, the rule is not primarily retroactive.

To the extent the rule has secondary retroactive effects in upsetting parties' expectations of regulation of legacy CCR surface impoundments and CCMRU, such effects are permissible. First, the D.C. Circuit considered and rejected this same argument in *Util. Solid Waste Activities Grp. v. Env't Prot. Agency*, 901 F.3d 414 (D.C. Cir. 2018). There, industry petitioners argued that EPA lacked statutory authority to regulated legacy CCR surface impoundments because such regulation would be retroactive. The D.C. Circuit held that “straightforward reading of the statute's language allows for the regulation of inactive sites.” *Id.* at 439. In short, as facilities “where solid waste is disposed of,” 42 U.S.C. 6903(14), inactive impoundments are “open dumps,” And no one denies that the EPA has authority to regulate (and to prohibit) “open dumps.” *Id.* at 441.

Moreover, as explained in detail below, EPA rationally explained why regulation was necessary and appropriate here notwithstanding facilities' reliance interests. EPA understands that facilities may have closed legacy impoundments and treated CCMRU in compliance with State law requirements, or otherwise made business decisions premised on the absence of Federal regulation. EPA has taken these reliance interests into account in developing the regulations here. As explained below, EPA surveyed State regulation of legacy impoundments and CCMRU and concluded that, on the whole, such regulations were not sufficiently protective, and did not meet RCRA's standard. Uniform, national regulation

was therefore necessary to ensure adequate protection of human health and the environment. To be sure, EPA recognizes that it is possible that some legacy impoundments, for example, may have been closed in a manner that is protective. But, due to the absence of adequate groundwater monitoring and other data, the adequacy of such closures cannot be verified. EPA has also accounted for other reliance interests, including renewable facilities' use of land containing CCRMU, in establishing compliance deadlines, and allowing for deferrals of additional closure measure where appropriate. EPA also notes that regulated entities have been on notice since the D.C. Circuit's 2018 decision in *USWAG* that Federal regulation of legacy CCR surface impoundments was forthcoming, 901 F.3d at 414.

A number of commenters also claimed that their units are heavily vegetated or developed and that reopening or other removal/remediation activities may disrupt the current use of the site. EPA acknowledges some old units may be heavily vegetated. However, no commenter submitted any data or analysis to demonstrate that, over the short or long term, removal or remediation activities would be more detrimental to health and the environment than either cleaning up the contaminated groundwater or taking measures to prevent the legacy CCR surface impoundment from contaminating groundwater.

Moreover, the fact that some impoundments have become heavily vegetated or redeveloped does not resolve the risks these unlined legacy CCR surface impoundments continue to pose. As discussed above, the risks associated with such units can be substantial. See Unit III.A of this preamble for more information. Consequently, the current record does not support an exemption for units that still contain both liquid and CCR even if the closure or remediation may disrupt the current use of the land.

As discussed in more detail in the subsequent section, EPA also disagrees that the removal of CCR from a disposal unit necessarily demonstrates that EPA lacks jurisdiction over the site. EPA's jurisdiction rests on the presence of solid waste that “is disposed of” at the site, not solely the presence of CCR. To the extent any CCR leachate or CCR constituents remain in the soil or in the aquifer at the site, solid waste remains at the site and EPA retains jurisdiction. However, as EPA stated in the proposal, the Agency agrees that it lacks jurisdiction over a site where the owner or operator can document that it meets

the standard for closure by removal in § 257.102(c). Accordingly, the final rule retains the provision specifying that any facility that documents that this standard has been met will not be subject to any further requirements. See Units III.B.2.b.iii and III.B.2.g of this preamble for further discussion.

The Agency disagrees that adopting an applicability date of October 19, 2015, requires actions that are physically impossible or that the implementation challenges cannot be addressed. The final rule does not require owners and operators to acquire historical operating records, construction and inspection reports, groundwater monitoring data, and employee testimonials where they no longer exist, or where they have never existed. EPA acknowledges that such information will not be available in some situations. Rather, EPA expects owners and operators of inactive impoundments at inactive facilities to develop a strategy to gather readily available and reliable information to determine whether the unit meets the definition of a legacy CCR surface impoundment. If, after making a good faith effort a facility is genuinely unable to obtain information to document that the impoundment contained both CCR and liquids on October 19, 2015, the unit would not be regulated as a legacy impoundment. See Unit III.B.2.b.i of the preamble for an explanation of the actions the Agency expects owners and operators to take to determine whether the inactive impoundment meets the definition of a legacy CCR surface impoundment.

Nevertheless, EPA agrees that the final rule should account for the significant closure work that has taken place at some legacy CCR surface impoundments between October 19, 2015, and the effective date of this final rule. For example, as noted, commenters provided several examples of closures that were completed prior to the effective date of this final rule. The final rule accounts for this not by exempting these units but by modifying the applicable requirements. A facility that can document that it has met the criteria in § 257.102(c) would be subject only to the requirement to document that they had met those standards. Similarly, a facility that completed closure with waste in place before the effective date of this final rule would only be subject to the closure performance standards in § 257.102(d), and the post-closure care requirements (*i.e.*, groundwater monitoring and corrective action, if necessary). In addition, a facility that completed closure under a regulatory authority's oversight and approval, such

as pursuant to a Federal or State cleanup order could be subject to even fewer requirements. Provided certain conditions have been met EPA is deferring a decision on the adequacy of such closures to a subsequent permitting authority to determine on an individual site-specific basis, whether the completed closure meets the Federal performance standards in § 257.102 or is equivalent to (*i.e.*, is as protective as) such a closure. In the interim, these units would be subject only to the requirements of a post closure care permit (*i.e.*, groundwater monitoring and corrective action, if necessary). See Unit III.B.2 of the preamble for further explanations of these provisions. As EPA stated in the proposal, units that contain liquid present different risks than those that do not, and the applicable requirements should differentiate among them accordingly on that basis. See 88 FR 31993. Consistent with that logic, while EPA agrees that legacy impoundments that were dewatered or closed prior to October 19, 2015 can still pose significant risks to human health and the environment, as discussed in the next section, the final rule retains the approach described in the proposal, and requires that an impoundment contain both liquid and CCR on or after October 19, 2015 to be regulated as a legacy impoundment.

b. Legacy CCR Surface Impoundment—Definition of an Inactive Impoundment—Contains Both Liquid and CCR

The final rule requires that to be considered a “legacy CCR surface impoundment” a CCR surface impoundment must have contained both CCR and liquids on or after October 19, 2015. In addition, the final rule further defines what it means to contain both CCR and liquid by reference to § 257.102(d)(2)(i). In this Unit of the preamble, the Agency briefly explains what was proposed, summarizes the public comments received, and provides EPA’s responses. EPA first discusses what it means for an impoundment to “contain liquids” followed by what it means to “contain CCR.”

i. What does it mean to contain liquid?

Consistent with the definition of an inactive CCR surface impoundment at active facilities under the existing regulations, EPA proposed in the May 2023 proposed rule that a legacy impoundment would be required to have contained liquids on or after October 19, 2015, in order to be subject to the requirements of this rule. In the proposed rule, EPA also responded to

comments previously raised in response to the ANPRM, alleging that the phrase “contains both CCR and liquids” was impermissibly vague. These commenters were concerned that the definition might not include those units whose bases are in contact with groundwater or that no longer have visible, standing water at the surface. EPA further responded to questions whether, based on the existing definition of an inactive CCR surface impoundment, the following would be considered a legacy CCR surface impoundment: (1) Where, prior to October 19, 2015, the facility has decanted the surface water, but, because the base of the impoundment intersects with the groundwater, water continues to flow through the impoundment and permeate the waste in the base of the unit; (2) Impoundments that contained both CCR and liquids in the past but are now closed; (3) Impoundments that contained CCR and liquids in the past but are in the process of closing on the effective date of the legacy rulemaking; and (4) Impoundments that once contained CCR and liquids but have been fully dewatered and are now maintained so as to not contain liquid.

EPA explained that the answers to these questions turn on the meaning of the terms “contain” and “liquids” in the definition of an inactive impoundment in § 257.53. Relying on dictionary definitions, EPA explained that the term “liquids” includes the free water, porewater, standing water, and groundwater in the unit, because once any are present in the unit, they have the same potential to create leachate, as well as to contribute to hydraulic head and drive flows propelled by hydraulic gradients. 88 FR 31992. EPA also explained that based on dictionary definitions an impoundment “contains” liquid if there is liquid in the impoundment, that is, it *has* water within it, even if water continues to leak from the unit. EPA also stated that as a factual matter, a surface impoundment that has only decanted the surface water would normally still contain liquid if the CCR was still saturated with water.

Accordingly, EPA explained that to the extent the unit still contains liquids on or after October 19, 2015, it is considered an inactive impoundment under the existing definition in § 257.53. EPA proposed that such units would also be considered legacy CCR surface impoundments, when located at inactive facilities. EPA also explained that under the proposal, such an impoundment would be considered a legacy CCR surface impoundment: (1) Even if it is considered “closed” under State law; (2) It is in the process of

closing on the effective date of this rule; or (3) The unit is only fully dewatered and can no longer impound liquid after October 19, 2015.

EPA further explained that to determine whether an impoundment has been dewatered, EPA relies on the existing requirements in § 257.102(d)(2)(i) (“Free liquids must be eliminated by removing liquid wastes or solidifying the remaining wastes and waste residues”). EPA explained that this provision requires a facility to eliminate both the standing liquid in the surface of the impoundment and the separable porewater in any sediment located in the base of the impoundment, regardless of the source of the standing water or porewater (*i.e.*, whether it was present in the impoundment due to surface water infiltration, intentionally added sluice water, or groundwater intrusion).

EPA also solicited comment on whether to adopt a regulatory definition of the term “liquids” to clarify that the term includes free water, porewater, standing water, and groundwater.

Finally, the Agency explained that under the existing regulations, an impoundment that did not contain liquids prior to October 19, 2015, whether because it was closed in accordance with existing State requirements or for other reasons, is not an inactive impoundment. Similarly, a unit that still contains both CCR and liquid after that date would still be considered an inactive unit even if it was closed in accordance with the requirements in effect at the time (*e.g.*, has a cover). Consistent with this definition, EPA proposed not to expand the definition of a legacy CCR surface impoundment to include units that no longer contained any liquid on October 19, 2015. 88 FR 31993.

(a) Pending Litigation Over EPA’s Regulatory Interpretations

A number of commenters claimed that the interpretation of “liquids” presented in the preamble was first announced in connection with proposed Part A determinations in January 2022, and is currently being litigated in the D.C. Circuit Court of Appeals in multiple cases combined under the name, *Electric Energy, Inc., et al. v. EPA, Case Nos. 22–1056 and 23–1035*.⁴⁶ These

⁴⁶ On January 11, 2022, EPA issued determinations on demonstrations submitted by facilities for extensions to the cease receipt of waste deadline per 40 CFR 257.103(f)(1) and 257.103(f)(2), which the Agency refers to as “Part A determinations” or “Part A”. The CCR Part A Final Rule (85 FR 53516, August 28, 2020), grants facilities the option to submit a demonstration to EPA for an extension to the deadline for unlined

commenters complained that EPA makes no mention of this litigation in the proposed rule, even as it claims that its interpretation is “sufficiently clear that a definition is not necessary.” According to these commenters, EPA must acknowledge (and make a good faith attempt to reconcile) the competing interpretations of key terms of art in the 2015 CCR Rule before extending them into this final rule. One commenter further stated that if EPA ultimately elects to adopt regulatory definitions of those terms, it should wait until the court rules so that the definitions are informed by and consistent with any such ruling.

EPA disagrees that it is necessary to wait until the court issues its decision in the pending litigation (*Electric Energy, Inc., et al. v. EPA, Case Nos. 22–1056 and 23–1035*). The central issue Petitioners raised in that case was exclusively procedural—whether EPA effectively amended the 2015 CCR Rule without going through notice and comment. Even if the D.C. Circuit addresses this procedural question, it would not resolve the substantive question EPA posed in the proposal, of whether the inclusion of a definition for the term “liquids” would provide further clarity.

Finally, EPA considers that it has more than met any obligation to “acknowledge (and make a good faith attempt to reconcile) the competing interpretations of key terms of art in the 2015 regulation,” in the proposal and again in this final rule. EPA has repeatedly explained its construction of the regulations in documents held out for public comment, including in the May 2023 proposal, and most recently, in the proposal to deny Alabama’s application for approval of its CCR permit program. See, e.g., 88 FR 31992–31993, 32025–32026, 55236–55238. EPA has also repeatedly responded to public comments, addressing each of the commenters’ alternative interpretations, and explaining in detail the reasons for the Agency’s disagreement. See, e.g., 88 FR 55237; U.S. EPA. Denial of Alternative Closure Deadline for General James M. Gavin Plant, Cheshire, Ohio. November 18, 2022. pp 14–42, Response to Comments on Proposed Denial (Docket ID No. EPA–HQ–OLEM–2021–0590). November 2022. EPA has again responded to the commenters’ alternative interpretations throughout this preamble and in the Response to Comments document in the docket. And even though EPA remains entirely

unconvinced by the commenters’ alternative interpretations, and without exception, considers that they are inconsistent with the plain language of the provisions at issue, EPA has responded to them by incorporating definitions of “liquids” and “infiltration” that reflect EPA’s existing construction of the regulations. Neither RCRA nor the APA requires anything further.

(b) Comments on the Definition of an “Inactive CCR Surface Impoundment” and the Meaning of “Contains Liquids”

All commenters agreed that, consistent with the existing definition of an inactive surface impoundment, any impoundment that “contains both liquids and CCR” at an inactive facility should be classified as a legacy CCR Surface impoundment. However, commenters disagreed on the correct interpretation of the phrase “contains. . . liquids.” Several commenters agreed with EPA’s explanation in the proposal that to the extent an impoundment still contains liquids on or after October 19, 2015, it is properly considered an inactive impoundment under the existing definition in § 257.53, even if (1) The unit had “closed” under State law; (2) The unit is in the process of closing on the effective date of this rule; or (3) After October 19, 2015 the unit is fully dewatered and can no longer impound liquid. These commenters also agreed that such units should also be considered legacy CCR surface impoundments when located at inactive facilities.

But other commenters objected to proposal’s construction of the regulation. These objections fell generally into two categories. First, a number of commenters argued that the discussion in the proposed rule reflected a “new” interpretation that expanded the meaning of the terms “CCR surface impoundment” and “inactive surface impoundment” by interpreting the phrase “contains liquids” to reach units that the commenters believe EPA never intended to cover in 2015. In support of this argument, these commenters objected to the statement in the proposal that free water, porewater, standing water, and groundwater are liquids under the existing regulation defining inactive CCR surface impoundments, arguing that this expands the existing definition of liquids to sources of water that the commenters assert “are not demonstrated to be contributing to hydraulic head creating the potential for impoundment failure and spread of contaminated water.” These

commenters further claimed that the existing definition of an “inactive impoundment” does not include: (1) Units “with any amount of water;” (2) Impoundments that closed prior to the effective date of the 2015 CCR Rule; and (3) “Dewatered” impoundments. These commenters contend therefore, that none of these units should be considered legacy CCR surface impoundments either. Second, a number of commenters raised concerns about the merits or wisdom of the approach. Many of these commenters also offered alternative definitions.

In addition, as discussed in the preceding section, a number of commenters objected to EPA’s proposal not to expand the definition of a legacy CCR surface impoundment to include units that no longer contained any liquid on October 19, 2015. These commenters argued that the proposed definition failed to address the full universe of surface impoundments at inactive plants that pose a reasonable probability of adverse effects on health and environment. In support of their contention, these commenters referenced EPA damage cases documenting harm to groundwater and/or surface water from impoundments that may not have contained liquid on or after 2015. The commenters also referenced a report, “Assessment of Legacy Surface Impoundments” by Gordon Johnson, M.Sc., P.Eng., that examines ten CCR surface impoundments at inactive facilities that were not on EPA’s list of potential legacy impoundments and do not appear to contain standing water. According to the commenter, the report shows that unacceptable levels of risk may still be present for historical impoundments that have been dewatered and/or capped.

(1) What is a “liquid”?

The May 2023 proposed rule explained that free water, porewater, standing water, and groundwater are liquids under the existing regulation. The source of the liquid does not impact its basic and fundamental designation as a liquid and its contribution to the risk posed by an impoundment. It therefore does not matter whether the liquid in the surface impoundment comes from the rain, waters the facility deliberately places in the unit, floodwaters from an adjacent river, or from groundwater—all are liquids, and once present in the unit, they have the same potential to create leachate (another type of liquid), and to contribute to hydraulic head and drive flows driven by hydraulic gradients. 88 FR 31992.

CCR surface impoundments to stop receiving waste. Facilities had until November 30, 2020 to submit demonstration to EPA for approval.

Several commenters agreed that the final rule should reflect EPA's existing interpretation that an impoundment containing any of the following types of liquid would be considered to contain liquid: free water, porewater, standing water, and groundwater without regard to their source.

However other commenters disagreed that under the existing regulations the term "liquids" includes free water, porewater, standing water, and groundwater in CCR units, and disagreed that EPA should adopt such a definition. Many of these commenters argued that EPA should not focus on "liquids" but on "free liquids," which they interpret to exclude groundwater. For example, one commenter asserted that "the term liquids, which is used in the definition of 'free liquids,' is not defined in the CCR Rule, and that the term 'free liquids' was never used in relation to groundwater." Another commenter objected that the existing regulations establish two separate definitions of free liquids and groundwater, which they claim do not reference each other or refer to overlapping concepts. The commenter further argued that free liquids are "liquids that readily separate from the solid portion of a waste under ambient temperature and pressure," but "groundwater" is "water below the land surface in a zone of saturation," and that these are different things from a technical perspective.

These commenters urged that regulating based on the presence of free liquids would be consistent with EPA's philosophy for regulating CCR surface impoundments because free liquids contribute to hydraulic head and hydraulic gradients regardless of their origin and impounded water must be removed from the impoundment to create a stable subgrade for the final cover system. Another commenter stated that this would be consistent with the 2015 CCR Rule, because even a unit closed under the existing regulatory criteria may contain some liquids after closure, so long as they are not free liquids.

The final rule continues to define "liquids" in accordance with its plain language meaning, consistent with the ordinary dictionary definition. Reliance on the ordinary meaning here is the default, as neither RCRA nor the existing part 257 regulations include a definition of the term "liquids." *FTC v. Tarriff*, 584 F.3d 1088, 1090 (D.C. Cir. 2009) (quoting *Williams v. Taylor*, 529 U.S. 420, 431 (2000)) ("It is fixed law that words of statutes or regulations must be given their 'ordinary, contemporary, common meaning.'").

This reflects EPA's existing construction of the current regulations. As discussed in greater detail in Unit III.B.1.b.i.(b)(4), the final rule incorporates this definition into § 257.53.

The dictionary definition encompasses all of the various types of liquid that may be present in a CCR unit, including water that was sluiced into the impoundment along with the CCR, precipitation, surface water, and groundwater that has migrated into the impoundment, which may be found as free liquids, free water or standing water ponded above the CCR or porewater intermingled with the CCR. These definitions are consistent with the surrounding regulatory text and structure of the regulation as a whole, as well as the wider context in which the terms are employed. As a consequence, the term functions effectively in all of the various contexts in which it is used in part 257. This is particularly true of the term "liquids," which plays a critical role in determining both whether a unit is subject to the regulations and in the performance standards that apply to impoundments closing with waste remaining on-site at § 257.102(d).

Further, reliance on this definition best achieves the statutory purpose of protecting human health and the environment. By accounting for all liquids, regardless of the source, the regulation ensures that the risks that legacy CCR surface impoundments pose will be addressed—both by focusing on the impoundments that pose the greatest risks and by ensuring that all sources of risk are addressed in closing an impoundment. As explained in the proposal, the source of the liquid does not determine its basic and fundamental properties. It therefore does not matter whether the liquid in the surface impoundment comes from the rain, waters the facility deliberately places in the unit, floodwaters from an adjacent river, or from groundwater. All liquids, once present in the impoundment have the same potential to become free liquids and promote contaminant leaching and contribute to structural instability or failure, by contributing to the creation of leachate (another type of liquid), and hydraulic head.

Contrary to the commenters' contentions there is no inconsistency between the regulatory definitions of groundwater and free liquids. By their terms the definitions of free liquids and groundwater are not mutually exclusive; rather, the term "free liquids" encompasses the term "groundwater." Nor is there any inconsistency in applying both of these terms in this context. First, the word "liquid," which

appears both in the existing definitions of an inactive CCR surface impoundment and free liquids, is broad enough that it can encompass groundwater, which has been defined in § 257.53 since 2015. Not all liquids are groundwaters, but all groundwater (water) is a liquid. And, where the water in the surface impoundment sits "below the land surface in a zone of saturation," the water in the unit meets the regulatory definition of groundwater. 40 CFR 257.53. Moreover, nothing in the definition of free liquids restricts the source of the liquid. It therefore does not matter whether the liquid in the surface impoundment comes from rain, waters that the facility deliberately places in the unit, floodwaters from an adjacent river, or from groundwater—all are liquids. The only test the regulation establishes for free liquids is whether the liquid readily separates from the solid portion of the wastes under ambient temperature and pressure. *Id.*

However, EPA generally agrees that regulating based on the presence of free liquids, albeit not based on the commenters' misinterpretation of the term, would be consistent with the existing regulations and the risks associated with CCR surface impoundments. As described in Unit III.A above, the risks are largely driven by the presence of free liquids in the unit, as these are the liquids that causes the metals and other constituents to leach out of the CCR, and that will eventually leak out of the unit into the surrounding soil and/or into the aquifer, along with any CCR constituents that have leached from the waste in the interim. Although some liquids will remain bound within the pore spaces of the CCR material and will not readily drain under ambient temperature and pressure, these residual liquids (*e.g.*, bound porewater or potential leachate) will not continue to drain from the unit, absent other forces, and exposure to these residual liquids is therefore not likely.

As discussed in the next section, EPA has adopted an approach based on whether free liquids are present in the impoundment.

(2) What does it mean to contain liquid?

The proposal explained that under the existing regulations, EPA determined whether an impoundment "contains liquids" by reference to a combination of the dictionary definition of "contains," and the dewatering standard in § 257.102(d)(2)(i). In essence, if liquids are present in an impoundment, the unit "contains liquid." However, EPA considers a unit that met the performance standard in

§ 257.102(d)(2)(i) to have been dewatered. Several commenters supported this proposal.

However, numerous other commenters raised concerns about relying on the plain language meaning of the phrase. For example, some commenters stated that all units contain some liquid, explaining that a landfill “contains” rain after a heavy rainfall event. Similarly, a commenter argued that that under EPA’s interpretation, a fully closed unit with ponded water on the cover resulting from precipitation or from fugitive dust control activities, and closed units with an engineered capability to impound water atop their covers would potentially be subject to the CCR regulations. The commenter stated that in all of these cases, the ponded water would seem to pose no risk.

Commenters also separately questioned whether EPA had real risk concerns from units that contained “any amount” of liquid. For example, one commenter asserted that EPA has not demonstrated that units with any amount of water, no matter how small an amount or without regard to whether the liquid is separable from the CCR will present sufficient risks to warrant regulation under RCRA section 4004(a). This commenter contended that EPA cannot rely on the 2014 Risk Assessment to support regulating such units because the assessment showed only that surface impoundments with a hydraulic head exceed that risk threshold. Several of these commenters recommended that EPA regulate based on whether the impoundment contains free liquids rather than liquids.

Another commenter raised concern that relying on the plain language meaning would present a number of technical challenges. These included how owners can determine whether a previously closed and dewatered surface impoundment at an active (or inactive) facility still contains “liquids.” The commenter explained that in some cases, State regulators confirmed that a site no longer had the capacity to impound water and therefore indicated that the site was no longer subject to the State’s dam safety and impoundment rules. The commenter also asked whether EPA would accept use of the paint filter test, the detection of water in piezometers, or some other method to determine whether sufficient separable porewater is present for an impoundment to be considered to “contain liquids.” The commenter also asked what kinds of samples would be required—individual or composite—as well as how many and at what locations, to determine if an

impoundment “contains liquids.” The commenter believed these questions need to be resolved in the numerous situations in which a formerly closed impoundment may contain some porewater as a result of periodic rainfall infiltration but is not in contact with the uppermost aquifer.

By contrast commenters generally supported reliance on § 257.102(d)(2)(i) to determine whether a unit contains liquid; although they disagreed over what that provision requires. Several commenters agreed with the proposal’s explanation of these existing closure requirements, stating that the discussion was fully consistent with EPA’s long-held position under the largely identical hazardous waste regulations, citing to EPA documents from 1982 and 1988.

But numerous other commenters argued that EPA had misinterpreted § 257.102(d)(2)(i), and consequently was proposing to regulate impoundments that the commenters believed had been dewatered, and therefore posed little risk. According to these commenters, § 257.102(d)(2)(i) does not require the elimination of all liquids, or even all free liquids, but only requires the removal of liquid wastes to the extent necessary to support the cover system. These commenters also contended that “the plain language of the 2015 CCR Rule does not require facilities to address groundwater as part of the closure performance standards under 40 CFR 257.102(d),” based in part on the claim that regulatory definition of free liquids does not encompass groundwater. These commenters urged EPA adopt the same approach to determining whether an impoundment contains liquid.

Several commenters also raised concern that the proposal failed to explain or provide clear guidance on how much water an impoundment must contain to be regulated as a legacy impoundment under the 2023 proposed rule. Many of these commenters requested EPA to clearly define a reasonable threshold associated with what it means to “contain liquids,” to aid the regulated community in determining when the performance standard has been met. One commenter noted that the Agency had attempted to fix this problem by relying on the closure standard in § 257.102(d)(2)(i), which requires the elimination of “free liquids,” but the commenter considered this approach to be insufficient because EPA had not articulated how to determine whether free liquids have been eliminated.

The final rule largely adopts the approach laid out in the proposal, relying on a combination of the plain

language meaning of the phrase and the performance standard in § 257.102(d)(2)(i) to determine whether an impoundment “contains liquid.” Under the ordinary meaning, an impoundment “contains liquid” if liquid is present in the impoundment, even if the impoundment does not prevent the liquid from migrating out of the impoundment. In other words, it “contains” water if it has water within it. See, *USWAG, supra* at 454 n. 23 (“The EPA’s regulatory definition of “impoundment” is consistent with the dictionary definition of the verb “impound,” which manifests continuing action,” citing *Impound*, Webster’s Third New International Dictionary 1136 (3d ed. 1993) (“[T]o confine or store (water)[.]”).

Accordingly, under the final rule, if liquids are present in the unit, it will be considered to contain liquids, unless the facility can demonstrate that free liquids have been eliminated. Simply put, if a facility can document that free liquids were permanently eliminated prior to October 19, 2015, the unit will not be considered a legacy impoundment.

Relying on § 257.102(d)(2)(i) in this context is reasonable and protective. Both the definition of an inactive CCR surface impoundment and the closure performance standard are designed to address the same issues (the presence or removal of liquid wastes) and are designed for the same purpose (to ensure the risks from the co-management of CCR and liquid are adequately addressed). Once the free liquids have been eliminated from the impoundment, any remaining liquids do not present a reasonable probability of contaminating the aquifer. Thus, EPA does not intend an operator to removal all moisture from an impoundment, but only the free liquids required under § 257.102(d)(2)(i), because of free liquids’ contribution to risk.

Contrary to some commenters’ claims, the existing text in § 257.102(d)(2)(i) requires a facility to eliminate both the standing liquid in the surface of the impoundment and all readily separable porewater in any sediment located in the base of the impoundment. Free liquids are currently defined at § 257.53 to mean “liquids that readily separate from the solid portion of a waste under ambient temperature and pressure.” This definition encompasses both standing liquids in the impoundment as well as any readily separable porewater (*i.e.*, porewater that readily separates under ambient temperature and pressure) in any sediment or CCR. As EPA explained in the proposal, the existing regulation does not differentiate between the sources of the liquid in the

impoundment (e.g., surface water infiltration, sluice water intentionally added, groundwater intrusion). This is further supported by the fact that the performance standard at § 257.102(d)(2)(i) was modeled on the regulations that apply to interim status hazardous waste surface impoundments, which are codified at § 265.228(a)(2)(i). EPA's guidance on these interim status regulations clarifies that these regulations require both the removal of standing liquids in the impoundment and sediment dewatering. See, "Closure of Hazardous Waste Surface Impoundments," publication number SW-873, September 1982. EPA previously discussed the subtitle C regulations at length beginning on page 29 in the Final Decision on Request For Extension of Closure Date Submitted by Gavin Power, LLC, 87 FR 72989 (November 15, 2022), as well as in the associated Response to Comments document located in the docket.⁴⁷ And the definition of liquid included in this final rule removes any misunderstanding.

The commenters are also mistaken that the existing regulation only requires the elimination of free liquids to the extent necessary to support the unit's final cover system. The provision does not state that the facility must "eliminate free liquids to the extent necessary to support the final cover system," or anything comparable. Given that § 257.102(d)(2)(ii) does specify that "waste must be stabilized sufficient to support the final cover system," the absence of any similar text in paragraph (d)(2)(i) is dispositive. Compare § 257.102(d)(2)(i) and (ii).

EPA disagrees that it is not taking into account whether the water in the unit poses risk. And for the same reasons EPA disagrees that it has failed to demonstrate that the units subject to regulation under this rule warrant regulation under RCRA section 4004(a).

Impoundments with free liquids do in fact pose significant risk for the reasons discussed above. In the proposal, EPA discussed two examples of units that still "contain liquids": (1) A unit constructed such that the CCR in the unit was continually saturated by water flowing freely through the unlined impoundment; and (2) Where the facility has removed only the standing water from the impoundment. As EPA explained, as a purely factual matter, a surface impoundment that has only

decanted the surface water would normally still contain free liquids if the waste in the unit was still saturated with water. Neither of these examples—which in actuality, likely represent the overwhelming majority of legacy impoundments subject to the final rule—have eliminated free liquids or involve trivial amounts of water. As explained in the preceding sections, such impoundments still contain hydraulic head and are otherwise essentially indistinguishable from the impoundments described in the 2015 CCR Rule preamble and modeled in the 2014 Risk Assessment. And as EPA explained in the proposal, these units retain the conditions that cause a heightened risk of contaminating the aquifer. That is true even if the unit is considered "closed" under State law, is in the process of closing, or at some subsequent point, the unit is fully dewatered and no longer contains liquid.

Moreover, as several commenters confirmed, it has apparently been a common practice to maintain CCR impoundments in a dewatered state. Even assuming these commenters meant that they had done more than merely remove the standing water, which seems unlikely given their comments on § 257.102(d)(2)(i), without an effective cover system many "dewatered" impoundments can nevertheless contain significant volumes of water simply as a consequence of the amount of precipitation that continually percolates through the unit. Based on an online USGS Rainfall Calculator Tool,⁴⁸ the example unit will receive a total of 27,154 gallons of water per acre during a single 1-inch rainfall event. Taking that a step further, a 50-acre impoundment in Atlanta, Georgia typically receives an average of 50 inches of rain a year, which equates, on a yearly average, to 67,885,000 gallons of water per year.⁴⁹ In the absence of any action taken to remove the water, over time it will continue to accumulate in the unit.

Thus, in many areas of the country (e.g., the Southeast), CCR surface impoundments without an effective cover system may contain free liquids and meet the definition of a legacy impoundment due to the amount of annual rainfall.⁵⁰ But this approach is

intended to also clarify that contrary to the commenters' contention, a unit whose periodic rainfall does not result in free liquids (e.g., is readily absorbed into the CCR) would not be regulated as a legacy CCR surface impoundment.

Finally, with respect to the small number of units that may have been completely dewatered after October 19, 2015, these units likely pose significant (and unacceptable) risks to human health and the environment that warrant regulation under RCRA section 4004(a), based solely on the expected presence of contamination that occurred while the impoundment was operating. See Unit III.A.2 of this preamble.

This approach also largely addresses commenters' request for a clear standard, and many of their technical concerns. For example, the clarification that EPA is concerned with the presence of readily separable porewater, (that is, free liquids), which can be easily verified by technical equipment such as piezometers, thus resolves the commenters' concern that that porewater may be difficult to measure as it is held in the interstices or pore spaces between particles of soil, sediment, and/or CCR material and may not flow readily or be easily quantified using field or laboratory methods. EPA has also developed a memorandum describing the current methods and tools that are available to determine whether free liquids have been eliminated, which is available in the docket for this rulemaking. EPA has provided a brief summary of the memorandum in the next four paragraphs below.

Many of the tools and methods to identify and eliminate free liquids are already widely used by industry to investigate and close surface impoundments. For example, tools currently used to identify free liquids include soil borings and cone penetrometers to map the stratigraphy of the CCR unit and characterize the geotechnical and hydraulic properties of the various CCR layers, as well as the installation of traditional piezometers, monitoring wells and vibrating wire piezometers to monitor pore pressures and water levels. Properly constructed

CCR surface impoundments, which may further increase the risk of these units contaminating their underlying aquifers. More frequent and more severe rainfall events may also increase the risk that legacy CCR impoundments flood, overtop, and experience structural failures leading to potentially catastrophic releases of CCR into the surrounding environment. Many legacy CCR surface impoundments are located in 100-year floodplains which suggests that they are particularly vulnerable to rainfall driven flooding. Unit V of this preamble and the RIA accompanying this final rule describe this scenario in more detail.

⁴⁷ The Final Decision and Response to Comments documents can be found in the docket for that action. See docket items EPA-HQ-OLEM-2021-0590-0100 and EPA-HQ-OLEM-2021-0590-0099, respectively.

⁴⁸ Found at <https://www.usgs.gov/tools/usgs-rainfall-calculator>. Found at <https://www.usgs.gov/tools/usgs-rainfall-calculator>.

⁴⁹ Based on 30-year average rainfall from National Weather Service data.

⁵⁰ The frequency and severity of future rainfall events may be amplified by the effects of climate change. On average this would result in more water percolating through, and accumulating in, legacy

wells and piezometers screened in the appropriate locations and depths have a prominent role in networks of instruments used to assess free liquids, as their design directly measures water levels under ambient conditions. Fundamentally, water levels in properly constructed and developed wells and piezometers are indicative of free liquids at that location. Conversely, networks of spatially discretized wells and piezometers can be used as part of a program to determine or confirm that free liquids no longer exist.

Similarly, tools and methods to eliminate free liquids within the CCR, such as rim ditches, underdrain systems, pumping wells, manifolded extraction wellpoints, etc., are also currently widely employed by industry. These elimination technologies can also provide diagnostic and confirmatory insights into the presence and nature of free liquids at a given CCR unit, e.g., rim ditches and open excavations enable direct observation of free liquids.

EPA recommends that a demonstration of whether free liquids are present rely on a holistic evaluation of all information collected from site-wide monitoring networks (e.g., piezometers and vibrating wire piezometers), as well as data collected from actual dewatering efforts. EPA further recommends that monitoring networks include points of sufficient density to independently verify dewatering performance determined from implementation of elimination technologies.

The memorandum also provides general guidance on considerations for developing successful site-specific strategies and approaches to identify, measure, monitor and eliminate free liquids. The elimination of free liquids relies on a well resolved understanding of the character and variability of the site-specific geology and hydrology, as well as the CCR materials themselves. Such information is frequently compiled into a Site Conceptual Model (CSM), and the memorandum also discusses some considerations related to the elements needed to construct a CSM if one does not already exist, or to augment a weak or poorly resolved CSM.

EPA has adopted this approach rather than the commenters' suggestion to define a legacy CCR surface impoundment as a CCR surface impoundment that "contains CCR and free liquids"—even though EPA expects the effect will be the same in almost all cases—because it represents the best balance of several competing considerations. First reliance on the broad dictionary definition is the most

protective because all liquids have the potential to become the free liquids that create leachate and contribute to hydraulic head. This approach also maintains consistency with the existing definition of an inactive CCR surface impoundment.

At the same time, EPA acknowledges that once the free liquids have been eliminated from the impoundment, any remaining liquids typically do not present a reasonable probability of contaminating the aquifer. EPA is also mindful of not establishing criteria that blur the lines between landfills and impoundments, EPA agrees with commenters that it would not be appropriate to designate a CCR landfill as a CCR surface impoundment based solely on periodic rainfall that is readily absorbed into the CCR and does not result in free liquids.

The regulation reflects this balance by placing the burden on the owner or operator to demonstrate that the standard in in § 257.102(d)(2)(i) has been met. In other words, the absence of free liquids is an affirmative defense, and therefore any uncertainty as to whether the standard in § 257.102(d)(2)(i) has been met is to be construed in favor of regulation because of the risks of environmental harm from free liquids in contact with CCR.

Although, consistent with the 2015 CCR Rule, EPA is not requiring facilities to post documentation to demonstrate that no legacy impoundment is present at the site, EPA recommends that facilities develop and retain records to support any determination that a particular unit meets this exception. Finally, as discussed in Unit III.B.2.b.i of this preamble, EPA has provided additional time to allow a facility to determine that it has eliminated free liquids as part of its applicability report.

(3) Whether the Proposal Reflected a "New" Interpretation

To support their claim that EPA had adopted new definitions of "liquid", "CCR surface impoundment" and "inactive CCR surface impoundment," a number of the commenters identified aspects of the 2015 CCR Rule or preamble that they believe to be inconsistent with the May 2023 proposed rule preamble. First, several of these commenters claimed that statements in the proposed rule are inconsistent with the requirement in the existing definition of a CCR surface impoundment that the unit must be "designed to hold an accumulation of CCR and liquids." 40 CFR 257.53. For example, some commenters stated that an impoundment that was dewatered and closed or is otherwise maintained

so as not to impound liquids is no longer "designed to hold an accumulation of CCR and liquids," and therefore, cannot be considered an inactive or legacy impoundment. Several commenters also claimed that the 2015 CCR Rule preamble, explained that the phrase, "designed to hold an accumulation of CCR and liquids," means *only* units that "contain a large amount of CCR managed with water, under a hydraulic head that promotes the rapid leaching of contaminants." According to these commenters, although a dewatered or closed impoundment may "contain liquid" as EPA defined it in the May 2023 proposal, no hydraulic head would be present. Or as one commenter stated, "The Proposed Rule definition of liquids was expanded to include sources of water that are not demonstrated to be contributing to hydraulic head, or creating the potential for impoundment failure and spread of contaminated water." These commenters argue that facilities had relied on this guidance in good faith, and that "simply citing the dictionary definitions of a 'liquid' and 'contains' eight years after the 2015 CCR Rule published and without context is not a sufficient rationale or appropriate."

Several of these same commenters raised concern that EPA was proposing to regulate units that do not present the same risks on which the original rule was based. These commenters stated that in 2015 EPA did not strictly interpret "liquids" as precipitation, porewater, or groundwater without considering the associated force of liquids on the unit's embankment. According to the commenters, the 2015 CCR Rule was based on—and the current rulemaking should continue to be concerned with only—"the risk of excessive hydraulic head and the potential for structural failure of embankments from impounded water." The commenters further stated that the maintenance of CCR impoundments in a dewatered state significantly reduces the risk of structural failure, reduces the contact time with larger quantities of CCR, and reduces constituent concentrations and overall risk of impact to groundwater.

Other commenters pointed to statements in the 2015 CCR Rule preamble that EPA did not intend the term "inactive impoundments" to include units that are closed, or to require closed units to reclose. Several of these commenters quoted the following discussion:

EPA did not propose to require "closed" surface impoundments to "reclose." Nor did

EPA intend, as the same commenters claim, that “literally hundreds of previously closed. . . surface impoundments—many of which were properly closed decades ago under state solid waste programs, have changed owners, and now have structures built on top of them—would be considered active CCR units.” Accordingly, the final rule does not impose any requirements on any CCR surface impoundments that have in fact “closed” before the rule’s effective date—*i.e.*, those that no longer contain water and can no longer impound liquid.

80 FR 21343.

Another commenter asserted that based on the proposal’s “strict interpretation,” all CCR landfills and all CCRMU would (inappropriately) be considered inactive or legacy CCR surface impoundments. As the commenter explained, a CCR landfill could contain liquids, especially after heavy rainfall, but as it was not designed to hold an accumulation of CCR and liquid it is not a CCR surface impoundment.

A number of commenters also argued that the interpretation in the proposal of “contains liquids” is inconsistent with the decision in 2015 to define sand and gravel pits as a CCR landfill. According to the commenters, if EPA intended inactive CCR surface impoundments to broadly encompass CCR in contact with groundwater, without hydraulic head, sand and gravel pits would have instead been added to the definition of CCR surface impoundment. The commenters base this on EPA’s statement in the proposed rule that “the damage from the placement of CCR in sand and gravel pits was almost always associated with CCR being placed in contact with water, which indicated that the placement of CCR in contact with water can lead to higher risks than from dry disposal.” See, 80 FR 32010.

Finally, a commenter raised concern that owners of inactive facilities that dewatered a CCR surface impoundment before October 19, 2015, but completed the removal of CCR at some time after October 19, 2015, could be subject to the CCR legacy rules because of what the commenter characterizes as the modification to the definitions of liquid and contains. This commenter also raised concern that some former coal-fired power plant properties were sold based on EPA’s prior guidance that dewatered surface impoundments were not regulated, and asked whether these non-utilities will be required to comply with the documentation requirements.

As discussed above, this final rule defines a legacy CCR surface impoundment as a CCR surface impoundment at an inactive facility that “contains both CCR and liquid,” as EPA

discussed that phrase in the proposal. EPA continues to believe that the appropriate construction of the phrase is to rely on its plain language meaning, consistent with the ordinary dictionary definitions those terms, in combination with the dewatering standard in § 257.102(d)(2)(i). EPA is also promulgating a definition of this term in this final rule. As discussed above, some commenters have asserted that this definition is “new.” EPA disagrees. Regardless, even if it were new, it is permissible for EPA to define the term here in this rulemaking—EPA is not bound to any prior definition, and fully explained its rationale for the definition herein. In addition, the definition of liquids is not in any way inconsistent with other definitions in § 257.53 or any other provisions from the 2015 CCR Rule.

EPA agrees that a legacy CCR surface impoundment must meet the existing definition of a CCR surface impoundment in § 257.53. That definition contains three criteria: (1) The unit must be “a natural topographic depression, manmade excavation or diked area;” (2) The unit must be “designed to hold an accumulation of CCR and liquid;” and (3) The unit “treats, stores or disposes of CCR.” 40 CFR 257.53. None of these require the presence of a particular amount of water or hydraulic head—or indeed any. Rather, the unit must be “designed”—that is, intended to—hold an accumulation of CCR and liquid. Although EPA expected that, based on its understanding of the utilities’ current management practices, water would be present as a consequence of the treatment, storage, or disposal occurring in the unit, nothing in the text of the definition requires it, let alone requires a minimum amount. The requirement that liquid actually be present in the unit appears in the definition of an “inactive surface impoundment” (or “legacy CCR surface impoundment”), which as discussed, requires that the unit “contains both CCR and liquids.” 40 CFR 257.53.

With this understanding, EPA disagrees with the commenter who asserted that based on the proposal’s “strict interpretation,” all CCR landfills and all CCRMU would be considered inactive or legacy CCR surface impoundments. The commenter explained that, for example, a CCR landfill could contain liquids, especially after heavy rainfall, and the commenter believed that the construction of the regulation outlined in the proposal would mean that this unit would be classified as a CCR surface impoundment even though the unit was

not “designed to hold an accumulation of both CCR and liquid.” EPA agrees that a unit that meets the definition of a CCR landfill would not become a CCR surface impoundment merely because it contained liquid; as the commenter noted, such a unit would not have been “designed to hold an accumulation of both CCR and liquid.” Ordinarily there should be clear indications that the unit was not intended or designed to function as an impoundment; for example, if the facility placed only dry CCR into a unit, or had designed or constructed the unit as a CCR landfill (*e.g.*, it was constructed or operated with a leachate collection and removal system that meets the requirements of § 257.70(d)). It was for this reason that EPA included sand and gravel pits within the definition of a CCR landfill; all of those instances involve the placement of exclusively dry CCR into the sand and gravel pits with no indication that they were designed to hold liquids.

For the same reason, EPA disagrees that an impoundment that has been dewatered and closed or is otherwise now maintained so as not to impound liquids should no longer be considered “designed to hold an accumulation of CCR and liquids,” and therefore, should not be considered an inactive or legacy impoundment. Just as a landfill would not suddenly become “designed to hold an accumulation of both CCR and liquids” based on the temporary presence of precipitation, removing liquids from a unit that was constructed as a surface impoundment and that operated as a surface impoundment by managing both CCR and liquids for decades, does not suddenly mean that the unit is no longer “designed to hold an accumulation of CCR and liquids.” Even assuming all free liquids had been removed from the unit, which as discussed below is unlikely, the subsequent removal of liquids as part of closing the unit does not change either the original design or use of the unit; the commenters do not intend to retrofit the unit for subsequent use as a landfill, but are merely in the process of complying with the requirements applicable to the closure of CCR surface impoundments. Nor does the subsequent dewatering change the present risks arising from the original design and long-term operation of the unit as an impoundment. To avoid any confusion on this point, EPA has deleted the phrase “which is” from the existing definition of a CCR surface impoundment.

EPA also disagrees that the proposed (and now final rule) expanded the existing definition of a CCR surface impoundment—either by regulating

different kinds of units as surface impoundments than are currently regulated as surface impoundments, or by regulating units that present substantially different kinds or level of risks. These commenters have misunderstood the 2015 CCR Rule and preamble.

EPA did not limit surface impoundments to units “containing a large amount of CCR managed with water, under a hydraulic head that promotes the rapid leaching of contaminants.” The definition of a CCR impoundment is discussed in the 2015 preamble at 80 FR 21357–21358. Reading the discussion as a whole, rather than the single sentence from the preamble that the commenters reference, clearly demonstrates that the 2015 CCR Rule was concerned with more than the risks associated with the force of impounded water on the embankment structure and included the risks of contamination when water travels from the impoundment to the surrounding are, and that EPA did not limit the CCR surface impoundments regulated under the 2015 CCR Rule to those that contain a particular amount of water or degree of hydraulic head.

It is clear from the complete discussion that what determines whether a unit is considered a CCR surface impoundment are the three criteria⁵¹ (discussed above) actually in § 257.53, rather than a finding that the particular unit “contain[s] a large amount of CCR managed with water, under a hydraulic head that promotes the rapid leaching of contaminants.”

In addition, the critical issue in crafting the definition was the quantity of CCR in the unit, not the quantity of water. Thus EPA explained that it was modifying the proposed definition to address concerns that it would capture ponds that contain only *de minimis* levels of CCR, because it agreed with commenters that the rule as proposed could inadvertently capture units that present significantly lower risks, such as process water or cooling water ponds that “although they will accumulate any trace amounts of CCR that are present, they will not contain the significant quantities that give rise to the risks modeled in EPA’s assessment.” 80 FR 21357. EPA then stated that by contrast, “units that are designed to hold an accumulation of CCR and in which treatment, storage, or disposal occurs

will contain substantial amounts of CCR and consequently are a potentially significant source of contaminants.” Id. (*Emphasis added*).

These points are best illustrated by the specific examples discussed in the preamble of the 2015 CCR Rule. First, in each example EPA explained whether the units would be considered CCR surface impoundments exclusively by reference to the criteria in the regulation. 80 FR 21357. Second, the units in each of the examples contained varying degrees of water and therefore hydraulic head. The final example was a diked area in which wet CCR is placed in order to remove the water for future transport to a CCR landfill or beneficial use. EPA explained that:

[t]he unit is accumulating CCR, while allowing for the evaporation or removal of liquid (no free liquids) to facilitate transport to a CCR landfill or for beneficial use. In this instance, the unit again meets all three definition criteria, it is a diked area (*i.e.*, there is an embankment), it is accumulating CCR for ultimate disposal or beneficial use; and it is removing any free liquids, (*i.e.*, treatment). As such, this unit would meet the definition of CCR surface impoundment.

80 FR 21357. The impoundment in this example contains far lower amounts of liquid than would be found in an operating impoundment because it is used to remove liquid from CCR. In essence such units would likely not contain significantly more liquid than the partially dewatered impoundments that the commenters now claim are exempt based on their supposed lack of a hydraulic head. 80 FR 21357–21358.

More to the point, the units that the commenters argue should be exempt do still contain a hydraulic head “that promotes the rapid leaching of contaminants” and the consequent increased risks of leachate contaminating groundwater.

Based on their comments on the closure performance standards, what these commenters mean by “dewatered” is merely the removal of: (1) Only the standing liquid or the free liquid visible at the surface of the impoundment; or (2) Free liquids in the CCR only to the depth needed to safely work with heavy machinery and to expedite the closure process. Properly characterized, this is merely partial dewatering. As previously discussed, because they are not removing free liquids beyond this depth, this eliminates neither the “liquid,” the hydraulic head in the unit, or the conditions that create the heightened risk of leachate contaminating ground or surface water. Although this will reduce the hydraulic head, until the water is eliminated, gravity will continue to exert downward

pressure on the saturated waste. Continued contact with free liquids will continue to cause metals and other constituents to leach from the CCR, and the downward pressure of the hydraulic head will continue to drive the leachate toward the bottom of the unit into the surrounding soil and/or into the aquifer, along with any CCR constituents that have leached from the waste.

It is clear from the 2015 preamble that the situation described by the commenters is not what EPA intended when it explained that the regulations did not apply to “closed” units. In the paragraphs preceding the commenters’ selective quotation, EPA defined inactive surface impoundments as “those that contain both CCR and water, but no longer receive additional wastes.” 80 FR 21343. EPA further explained that “By contrast, a ‘closed’ surface impoundment *would no longer contain water*, although it may continue to contain CCR (or other wastes), and would be capped or otherwise maintained.” Id. (*emphasis added*). See also, Id. (3d col) (“Accordingly, the final rule does not impose any requirements on any CCR surface impoundments that have in fact ‘closed’ before the rule’s effective date—*i.e.*, *those that no longer contain water and can no longer impound liquid.*”) (*emphasis added*). Note that EPA stated that a closed unit would not contain “water,” without qualification or limitation. Nowhere in this discussion (or the rest of the preamble) did EPA distinguish between water, free water, porewater, or groundwater, or expressly suggest that any of those might appropriately remain in the unit after closure.

EPA thus agrees that, as in the 2015 CCR Rule, “an impoundment that no longer contains liquid prior to October 19, 2015” would not be considered either an inactive impoundment or a legacy impoundment.⁵² EPA acknowledges that CCR surface impoundments that contained liquids prior to October 19, 2015, can still be associated with significant environmental and human health risks. As discussed in Unit III.A.1 of this preamble, many if not all of these impoundments lacked a composite liner system, and therefore likely leached contaminants into the soil and underlying aquifer during operation. Eliminating the liquid from the impoundment will not remediate these releases—which at some sites may be significant—although it may substantially reduce or eliminate a source of additional or continuing

⁵¹ The existing definition of a CCR surface impoundment contains three criteria: (1) The unit must be “a natural topographic depression, manmade excavation or diked area;” (2) The unit must be “designed to hold an accumulation of CCR and liquid;” and (3) The unit must “treat[, store[, or dispose] of CCR.” 40 CFR 257.53.

⁵² EPA also discusses its interpretation of “impound liquid” in Unit III.B.2.g of this preamble.

contamination. And to the extent the unit lacks an effective cover system, the unit may still be leaching contaminants, albeit at a reduced rate. Consequently, although such units would not be considered inactive or legacy impoundments, some will be regulated as a CCR management unit, as described in the next section.

However, the proposal by some commenters to regulate any impoundment that has ever contained CCR and liquids would represent a significant expansion of the regulations, in that it would essentially capture every CCR surface impoundment that ever operated in the United States. To illustrate the potential implications of such a revision: approximately 533 surface impoundments and 239 landfills are regulated under the 2015 Rule. EPA estimates that as a consequence of this final rule, an additional 194 (legacy) surface impoundments will be regulated. By contrast, as one commenter calculated, approximately 2,170 surface impoundments were operating in 1973 alone.⁵³ EPA, however, is not prepared at this juncture to expand the regulation so dramatically without first obtaining at least some basic information about the kinds of sites that would be regulated. Instead, EPA is proceeding to address the effects of past CCR management one step at a time, and is focusing here on a narrower universe of regulated units.

The Agency is not required to address every aspect of a problem immediately; courts have long recognized that it can be appropriate to address complex problems in stages. This final rule expands oversight to approximately 194 legacy CCR surface impoundments, and as discussed in Unit III.C, closes gaps in the existing regulations that currently fail to require facilities to remediate known contamination resulting from the operation of their CCR units. EPA expects to shortly publish a final permit rule and to begin issuing permits to bring facilities into full compliance. While the Agency works to address the risks from this current universe, EPA will also continue to collect information to better understand the full extent of the potential problem posed by the universe of abandoned sites that remain unregulated. In the interim, authority under RCRA section 7003 and CERCLA section 106 remains available to address any imminent and substantial threats to human health or the environment that

these unregulated sites may present. 42 U.S.C. 6873 and 9606.

EPA also agrees that as a consequence of the plain language meaning of the phrase “contains liquid,” the owners of inactive facilities that dewatered a CCR surface impoundment before October 19, 2015, but completed the removal of CCR at some time after October 19, 2015, would be subject to this final rule if only the standing water had been removed from the impoundment by this date. As EPA explained in the proposal, as a purely factual matter, a surface impoundment that has only removed visible surface water would normally still contain liquids if the waste lower in the unit was still saturated with water. However, this issue is also discussed further in the next section. Because the regulation applies exclusively to the current owners and operators, if such a facility had been sold to a non-utility, the new owner, rather than the previous owner, will be required to comply with the any applicable requirements.

(4) Adding a Definition to the Regulations

As noted previously, EPA solicited comments on whether adopting a definition of “liquids” into part 257 would provide greater clarity. The preamble discussed various possible definitions, including from Merriam-Webster and a technical definition. The proposal also explained that the term “liquids” encompasses all the various types of liquid that may be present in a CCR unit, including water that was sluiced into the impoundment along with the CCR, precipitation, surface water, and groundwater that has migrated into the impoundment due to the construction of the unit, which may be found as free water or standing water ponded above the CCR or porewater intermingled with the CCR. 88 FR 31992. Although there was widespread disagreement about what the definition should be, most commenters appeared to support including a definition in the regulations. Several commenters supported including a definition of “liquids” in the final rule to prevent future disputes over the meaning of the term. Some of these commenters stated that “given the clear, plain language of the CCR Rule’s closure provisions and EPA’s longstanding implementation of the regulations, codifying a regulatory definitions [sic] of the plain term ‘liquid(s)’ should be unnecessary.” However, the commenters also stated that “in light of industry’s apparent preference to litigate the reality that groundwater is liquid in favor of properly closing its leaking, unlined

ponds, EPA should codify its longstanding, plain meaning definitions of key terms in the hope of avoiding unnecessary and costly future litigation and ensuring timely, proper closure.”

By contrast several commenters opposed including a definition in the regulations, suggesting that EPA should instead continue to rely on how the commenters believed those terms have been used in the 2015 CCR Rule and historically applied in implementing RCRA requirements. Some of these commenters stated that EPA has not provided adequate notice to the public of a new regulatory definition of “liquids,” and claimed that EPA therefore could not adopt a regulatory definition of “liquids” in a final rule. Finally, a commenter opposed adding a definition of “liquids” to the regulations, arguing that it would not change the definition of “free liquids,” which the commenter believes is a distinct, technical regulatory term that does not encompass groundwater, or the performance standard in § 257.102(d)(2)(i), which, according to the commenter, only requires the removal of liquid wastes and stabilization of remaining wastes to support the cover system.

Several commenters recommended that in the absence of a statutory definition of “liquid(s)” and consistent with the CCR regulatory definition of “free liquids” and EPA’s longstanding implementation of the predecessor hazardous waste closure regulations, EPA should codify a definition of “liquid” based on the dictionary definitions as set forth in the Proposed Rule. They also suggested that the definition should make clear that the term encompasses free water, porewater, standing water, and groundwater without regard to their source.

Commenters also offered numerous alternatives. For example, several commenters offered technical definitions from various sources. One of those commenters raised concern that the technical definition discussed in the proposal had the potential to be confusing. According to this commenter, bulk particulate solids, such as fly ash, exhibit the physical properties of a liquid identified in the technical definition: specifically, dry fly ash flows when poured from container to container and conforms to the shape of a container—retaining its volume but not its shape. Instead, this commenter suggested that soil mechanics might provide useful information on which to base a definition.

As noted above, numerous commenters also suggested that EPA should focus on “free liquids” rather

⁵³ GenOn Comments at 5–6. Estimate based on the number of coal-fired generating units operating in 1973 according to the U.S. Energy Information Administration (1,839) and assuming 1.2 surface impoundments per plant, consistent with operations in 2010.

than “liquids.” Several of these commenters recommended that the final rule adopt the definition in 40 CFR 258.28(c)(1), which relies on the Paint Filter Liquids Test to determine whether liquids are present. The commenters recommended that the CCR and MSW landfill programs be consistent as both reside under RCRA subtitle D. However, one of these commenters also raised concern that it is unclear how far back in time this would reach and how EPA or the States would be expected to regulate inactive utilities that no longer exist but may have closed units that meet the definition. By contrast, other commenters raised concern about a definition that relied on the Paint Filter Liquids Test, stating that facilities had experienced difficulties implementing the test in the field.

Another commenter explained that focusing on porewater, rather than the separable porewater covered by the definition of free liquids would cause technical difficulties. According to this commenter, porewater may be difficult to measure as it is held in the interstices or pore spaces between particles of soil, sediment, and/or CCR material and may not flow readily or be easily quantified using field or laboratory methods. Consequently, the commenter believed that it would not be feasible to identify whether liquids inclusive of all porewater (whether separable or not) were present in an impoundment or landfill closed prior to October 19, 2015, or in other words, to demonstrate the absence of liquids eight years ago.

Similarly, one commenter stated that EPA should adopt a definition in the context of material in the “liquid state” such as free liquids and materials that behave as liquids and can be readily separated from the “solid” matrix and should not include those materials that are bound within the matrix and not readily separable. And another commenter recommended that EPA define a legacy impoundment based on the presence of free liquids and data to support that the free liquids have impacted groundwater.

EPA continues to strongly believe that the plain text of the regulation clearly communicates the Agency’s positions laid out above, and that in light of the dictionary definition a regulatory definition is not strictly necessary. However, in light of the different understanding of the regulations among commenters, EPA is incorporating the existing requirements into the definitions in § 257.53. Accordingly, the final rule includes a definition of “liquids” based on the definition from Merriam-Webster discussed in the proposal. The new definition, codified

at § 257.53, provides that “Liquids means any fluid (such as water) that has no independent shape but has a definite volume and does not expand indefinitely and that is only slightly compressible. This encompasses all of the various types of liquids that may be present in a CCR unit, including water that was sluiced into an impoundment along with CCR, precipitation, surface water, groundwater, and any other form of water that has migrated into the impoundment, which may be found as free water or standing water ponded above CCR or porewater intermingled with CCR.

In addition, the final rule includes in § 257.53 a definition of the phrase “contains both CCR and liquids,” consistent with the discussion above and in the proposal. The definition reflects both the dictionary definition of “contains” and EPA’s explanation that it relies upon the closure standard in § 257.102(d)(2)(i) to determine whether a unit contains liquids.

The definition states that “Contains both CCR and liquids means that both CCR and liquids are present in a CCR surface impoundment, except where the owner or operator demonstrates that the standard in § 257.102(d)(2)(i) has been met.”

These definitions reflect EPA’s construction of the existing regulations. In addition, codifying these definitions definitively confirms that an impoundment saturated by groundwater or continually inundated by surface water is an inactive or legacy impoundment. It also provides greater clarity that all kinds of liquid are relevant to determining whether an impoundment is subject to part 257 and has properly closed.

Consequently, EPA decided not to adopt either the technical definition of liquid discussed in the proposal or any of the suggested alternatives. EPA agreed that the technical definition in the proposal had the potential to be confusing given that fly ash can sometimes exhibit the physical properties of a liquid identified in the technical definition. While EPA also agrees that CCR is a porous material similar to soil, EPA did not adopt the commenter’s suggestion to rely on soil physics to craft an alternative. CCR is not a soil, and EPA is concerned more with the hydraulic characterization of CCR that involves other considerations in addition to soil physics.

EPA also chose not to adopt the definition in 40 CFR 258.28(c)(1), which relies on the Paint Filter Liquids Test, or to otherwise mandate reliance on the Paint Filter Liquids Test. First, a number of other commenters raised

technical concerns about relying on this test in this context. In addition, EPA would not generally recommend using the Paint Filter Liquids Test in this context. There can be physical effects from obtaining the sample that could affect the representativeness of the sample (vibration, heat from the drilling bit, etc.) and that can result in false negatives. Consequently, although it might provide relevant information to confirm the presence of water in a sample, EPA does not generally consider the results to be sufficiently reliable to confirm the absence of free liquids.

EPA disagrees that the public had insufficient notice of a potential definition. EPA explained the subjects and issues the agency would consider in reaching its decision, and provided examples of possible definitions. In general, to provide adequate notice an agency must “provide sufficient factual detail and rationale for the rule to permit interested parties to comment meaningfully.” *Florida Power & Light Co. v. United States*, 846 F.2d 765, 771 (D.C. Cir. 1988). As demonstrated in the preceding section, numerous other entities were able to effectively provide comments, for example raising concerns about the definitions discussed in the preamble, and offering potential alternatives. No commenter has indicated what further information is necessary to be able to comment effectively on the issue.

EPA agrees that adopting these definitions will not change the performance standard in § 257.102(d)(2)(i), but for very different reasons than those proffered by the commenters. Incorporating these definitions into the part 257 regulations merely reaffirms the plain language meaning of the term “liquids,” which, as previously explained, is the status quo. But because the term “liquids” is used in the definition of “free liquids,” defining liquids to expressly encompass all of the various types that may be present in a CCR unit, including groundwater, removes any misunderstanding that such liquids cannot be considered to be free liquids when they otherwise meet the definition, that is, they readily separate from the solid portion of CCR at ambient temperature and pressure.

However, the commenters are correct that it will not address their misconstruction of § 257.102(d)(2)(i), which attempts to limit the requirement based on text that does not appear in the provision. Further discussion of § 257.102(d)(2)(i) can be found in Unit III.B.2.g.

In conclusion, under this final rule the surface impoundments discussed in the proposal would still be considered legacy impoundments, as all would still contain free liquids. Specifically this includes (1) Any impoundment where, on or after October 19, 2015, water flowed or continues to flow through the impoundment, permeating the waste in the unit, such as where the base of the impoundment intersects with the groundwater; (2) A surface impoundment where only the surface water has been decanted; here too the impoundment would normally still contain free liquids if the waste in the unit was still saturated with water; and (3) Any impoundment that still contains free liquids: (a) even if it is considered “closed” under State law; (b) it is in the process of closing on the effective date of this rule; or (c) the unit has been fully dewatered and can no longer impound liquid only after October 19, 2015 (*i.e.*, it contained free liquids on October 19, 2015).

ii. What does it mean to “contain” CCR?

In the proposal, EPA explained that under the existing regulation, an inactive CCR surface impoundment must contain CCR to be subject to the rule. 40 CFR 257.53. EPA further explained that it was not proposing to revise that aspect of the legacy impoundment definition. EPA proposed that, consequently, a legacy impoundment that had closed by removal in accordance with the performance standards in § 257.102(c) before October 19, 2015, would not be considered an inactive (and therefore not a legacy) CCR surface impoundment.

EPA also proposed that an impoundment at an inactive facility that was still in the process of closing by removal on October 19, 2015, would be considered a legacy CCR surface impoundment subject to the final rule requirements. EPA proposed that facilities with such a unit would be required to certify and post documentation that they have met the existing standard for closure by removal in § 257.102(c) on their CCR website (*i.e.*, “certification requirement”). However, if a facility could not demonstrate that the closed impoundment meets the existing performance standards in § 257.102(c), the unit would be considered a legacy impoundment subject to the rule. EPA further explained that because the impoundment contained liquid and CCR on October 19, 2015, it would meet the definition of a legacy CCR surface impoundment, and that EPA had no basis to exempt it, because EPA had no

factual basis to conclude that a legacy CCR surface impoundment that was in the process of closing posed no risk. However, EPA explained that depending on when the impoundment completed closure, some individual requirements may no longer be applicable to the legacy CCR surface impoundment (*i.e.*, when the compliance date in the final rule falls after the date closure is completed for the impoundment).

No commenter opposed the proposal to exclude impoundments that did not contain any CCR prior to the effective date of the 2015 CCR Rule, although several commenters believe that additional impoundments should also be excluded. For example, many commenters stated that EPA does not have jurisdiction under RCRA over impoundments from which all CCR was removed between October 19, 2015, and the effective date of this final rule. As one of these commenters explained:

As proposed, a closed unit would still be regulated under the final rule if all CCR has been removed but groundwater monitoring shows exceedances of the groundwater protection standard constituents listed in Appendix IV. RCRA’s juridical boundaries are exceeded under this interpretation. The USWAG decision explained that RCRA gives EPA the authority to regulate past disposal of CCR based on the continued presence of CCR. Once the CCR is removed, CCR is no longer disposed of, and EPA does not have the ability to regulate based on the previous existence of CCRs.

Commenters also provided examples of the type of facility they believe that EPA cannot regulate. For example, one commenter described a closure of three interconnected CCR surface impoundments associated with the Richard H Gorsuch Power Plant. According to the commenter,

the closure was permitted by the state of Ohio, along with a redesign of one of the impoundments to control stormwater runoff post-closure. The closure of these impoundments included dewatering and removal of all CCR materials to clean soil prior to filling with clean soil and grading. All CCR was transported to the associated off-site fly ash landfill. No groundwater monitoring was required, all the CCR was removed, and the site is adjacent to an existing RCRA corrective action (Union Carbide) with known groundwater impacts.

Some of these commenters further stated that EPA cannot rely on any residual contamination left in groundwater to support jurisdiction because EPA has made clear that groundwater (as well as other environmental media containing contaminants) is not a solid waste. Finally, some commenters asserted that EPA has no data showing that there is

a reasonable probability of adverse impact from historical CCR units that have been closed by removing the CCR, and as a consequence, EPA cannot regulate such units.

By contrast, a number of commenters requested that EPA clarify that its statement in the Proposed Rule that EPA “no longer has jurisdiction over a former unit that has closed by removal in accordance with § 257.102(c)” —is based on the complete absence of CCR, and requires not only removal of CCR from and decontamination of the unit but completing all groundwater cleanup and other remedial measures and then adequately documenting, with at least two years of post-removal or decontamination groundwater monitoring, that GWPS are reliably achieved by removal prior to the effective date of the final rule.

EPA disagrees that it lacks jurisdiction over a site at which the owner has removed CCR from the impoundment after October 19, 2015. Many of the commenters misunderstand the USWAG decision, as well as the legal structure applicable to these units.

First, the USWAG decision did not limit EPA’s authority to sites where CCR remains, but to sites where *solid waste* is present. See, *USWAG*, 901 F.3d at 440–441 (“Properly translated then, an open dump includes any facility (other than a sanitary landfill or hazardous waste disposal facility), where *solid waste* still “is deposited,” “is dumped,” “is spilled,” “is leaked,” or “is placed,” regardless of when it might have originally been dropped off.”) (emphasis added).

Second, in the example EPA presented in the proposal, even though the facility may have removed all CCR from the surface impoundment, solid waste still remains on site because groundwater monitoring continues to detect statistically significant levels of one or more Appendix IV constituents. These monitoring results demonstrate the continued presence of CCR leachate⁵⁴—which is a solid waste under the definition in 42 U.S.C. 6903(27)—in groundwater, and, potentially, in soil at the site. As discussed in greater detail below, this is sufficient to demonstrate that EPA retains jurisdiction over the site, under the plain language of the statutory definitions of solid waste and disposal.

EPA also considers that it has authority to regulate as part of this rule, sites similar to the one presented by the

⁵⁴ Leachate is produced when liquids, such as rainwater or groundwater, percolate through wastes stored in a disposal unit. The resulting fluid will contain suspended components drawn from the original waste.

commenter above. As discussed in more detail below, the rulemaking record supports a presumption that solid waste remains at the site, even assuming the facility had removed all CCR from the impoundment. The rulemaking record demonstrates the high likelihood that the impoundment will have leaked during its operation. As a consequence, at any site that closed without groundwater monitoring, such as the one described in the comment above, or that has not undertaken any remediation, there is every reason to believe that leachate (and, therefore, solid waste) will remain on site. In addition, the measures that facilities have described taking to remove all CCR from the impoundment would in fact leave CCR leachate remaining in soils at many sites.

(a) Definition of Solid Waste

EPA's jurisdiction over sites at which CCR leachate remains is clear from the plain language of the statutory definitions of solid waste and disposal.

Under the CCR regulations, the statutory definition of solid waste applies, rather than any of the various narrower subtitle C regulatory definitions in 40 CFR part 261. Section 257.53 specifically provides that "Terms not defined by this section have the meaning given by RCRA." Part 257 does not include a definition of "solid waste" or "waste," which therefore takes the broader statutory definition of the term. See also the § 257.53 definition of disposal, which references "solid waste as defined in section 1004 (27) of the Resource Conservation and Recovery Act."

The subtitle C regulations are equally clear that they do not apply to subtitle D wastes. See, e.g., 40 CFR 260.1(a) ("This part provides definitions of terms, general standards, and overview information applicable to parts 260 through 265 and 268 of this chapter."); § 261.1 (a) ("This part identifies those solid wastes which are subject to regulation as hazardous wastes under parts 262 through 265, 268, and parts 270, 271, and 124 of this chapter and which are subject to the notification requirements of section 3010 of RCRA.").

Under RCRA the term "solid waste" means:

any garbage, refuse, sludge from a waste treatment plant, water supply treatment plant, or air pollution control facility and other discarded materials, but does not include solid or dissolved material in domestic sewage, or solid or dissolved materials in irrigation return flows or industrial discharges which are point sources subject to permits under section 1342 of title

33, or source, special nuclear, or byproduct material as defined by the Atomic Energy Act of 1954, as amended (68 Stat. 923) [42 U.S.C. 2011 *et seq.*].

42 U.S.C. 6903(27). The plain meaning of the word "discarded" in this definition is "disposed of," "thrown away," or "abandoned." See, e.g., *American Mining Congress v. U.S. EPA*, 824 F.2d 1177, 1184 (D.C. Cir. 1987) (citations omitted) ("AMC I"); *American Petroleum Institute v. EPA*, 906 F.2d 729, 740–741 (D.C. Cir. 1990) (per curiam). Such materials are "part of the waste disposal problem" that Congress enacted RCRA to address. *AMC I*, 824 F.2d at 1193. In other words, under the statute if something has been disposed of, as that term is defined in the statute, it is a solid waste.⁵⁵

Any CCR leachate left behind as soil and groundwater contamination after CCR removal would clearly constitute material that has been "abandoned" or "discarded" and is thus subject to regulation under subtitle D without further activity. EPA has long considered material that has spilled or leaked onto the soil and not been cleaned up to have been "abandoned" or "discarded." See, e.g., *Chemical Waste Management v. EPA*, 869 F.2d 1526, 1539 (D.C. Cir. 1989); *Connecticut Coastal Fishermen Ass'n v. Remington Arms Co.*, 989 F.2d 1305, (2d Cir 1993).

The conclusion that the CCR leachate contaminating soil and groundwater is a solid waste is also consistent with EPA's long-held interpretation (discussed at length in the 2015 CCR rule preamble) that leaking or passive migration of leachate constitutes the disposal of solid waste. 80 FR 21342–21347, quoting 43 FR 58954 ("This is an important issue, however, because some, and perhaps most, inactive facilities may still be 'disposing of waste' within the meaning of that term in Section 1004(3) of RCRA. . . . Many inactive facilities may well be leaking solid or hazardous waste into groundwater and thus be 'disposing' under RCRA."). See also, e.g., *In re Consolidated Land Disposal Litigation*, 938 F.2d 1386, 1388–1389 (D.C. Cir. 1991).

And even under the narrower regulatory definition of solid waste in subtitle C, EPA has long considered leachate (i.e., the leaked constituents) from previously disposed hazardous wastes to be a hazardous (and therefore, solid) waste. See, e.g., 40 CFR 261.3(c)(2)(i) ("any solid waste generated from the treatment, storage, or disposal of a hazardous waste, including

any . . . leachate . . . is a hazardous waste."). 45 FR 33096 (May 19, 1980) ("As a practical matter, this means that facilities which store, dispose of or treat hazardous waste must be considered hazardous waste management facilities for as long as they continue to contain hazardous waste and *that any wastes removed from such facilities—including spills, discharges or leaks—must be managed as hazardous wastes.*") (emphasis added). See, also, *Chemical Waste Management*, 869 F.2d at 1539.

Moreover, as discussed above, one factor the D.C. Circuit has considered in determining whether a substance is properly considered a waste is whether "the materials are 'part of the waste disposal problem' Congress intended to address in enacting RCRA." *AMC I*, quoting House Committee Report, H.R. Rep. No. 1491, 94th Cong., 2d Sess. at 2, U.S. Code Cong. & Admin. News 1976, p. 6240. If so, it falls under EPA's authority in RCRA to address. See, *American Mining Congress v. EPA*, 907 F.2d 1179, 1186–87 (D.C. Cir. 1990) (deferring to EPA's focus on potential environmental harm in determining whether material is discarded) (*AMC II*). The contamination from legacy impoundments (even when the CCR has been removed from the impoundment) remains a threat to human health and the environment that stemmed from discarded materials, and thus is "part of the waste disposal problem" RCRA was enacted to address.

As discussed in more detail in Unit III.A.3, EPA estimates that groundwater contamination at sites with legacy impoundments could pose lifetime cancer risks from arsenic as high as 2×10^{-5} to 1×10^{-5} (i.e., 2 to 100 cases of cancer for every 100,000 individuals exposed), depending on the specific management practices and site conditions. In addition, EPA estimated noncancer risks well in excess of an HQ of one for a wide variety of CCR constituents, depending on the management practices and site conditions; for example, the high-end of noncancer risks for lithium ranged between two to three; for molybdenum up to an HQ of four; thallium up to an HQ of two, and for cobalt and mercury up to an HQ of 13 and five, respectively. Moreover, in the absence of any groundwater remediation, there is no reason to believe that the removal of CCR from the impoundment mitigates these risks. Although the unit may no longer continue to contribute additional contamination, removal of the CCR does not address the release of and risk from the metals or other CCR constituents in any contaminant plume.

⁵⁵ As EPA explained in the 2015 preamble, "placement in a landfill or surface impoundment is prima facie evidence of discard." 80 FR 21348.

The leachate from a CCR surface impoundment or landfill is therefore unquestionably a solid waste under the broader statutory definition in 42 U.S.C. 6903(27). And to the extent the leachate remains in soil or groundwater, that is sufficient to support jurisdiction over that site, even though all CCR may have been removed from the disposal unit. The risks from the leachate-contaminated groundwater also clearly establish a reasonable probability of adverse impacts on health and the environment from legacy impoundments that have been closed by removing only the CCR.

EPA disagrees with the commenters who stated that the Agency should not presume that there have been impacts to groundwater from an area where the ash has been fully removed, absent specific evidence to the contrary. The record from both the 2015 CCR Rule and the current rulemaking supports a strong presumption that solid waste remains on-site at these facilities. As the D.C. Circuit noted, legacy impoundments have been shown to be even more likely to leak than units at utilities still in operation. 901 F.3d at 432.

Data collected as part of the 2015 rulemaking shows that the majority of the older operating (pre-1994) waste units lack liners; 63% and 24% of older surface impoundments have either no liners or clay liners, respectively. 80 FR 21326. Thus far, no commenter has identified a legacy impoundment with a composite liner.

Analysis of the information from the damage cases also demonstrates that unlined surface impoundments typically operate for 20 years before they begin to leak. *Id.* at 21326–21327. As discussed previously, commenters submitted data indicating that on average legacy impoundments are 55 years old. The following examples discussed in the 2015 CCR rule preamble further demonstrate the high probability that legacy impoundments will have leaked, and that in the absence of remediation measures leachate is highly likely.

In the wake of the 2008 TVA Kingston CCR spill, Illinois and North Carolina for the first time required utilities to install groundwater monitoring. Illinois required facilities to install groundwater monitoring downgradient from their surface impoundments. As a result, within only about two years, Illinois reported that seven facilities had detected instances of primary MCL exceedances, and five additional facilities had reported exceedances of secondary MCLs. The data for all 12 sites were gathered from onsite; it appears none of these facilities had been

required to monitor groundwater off-site, so whether the contamination had migrated off-site was unknown. Similarly, North Carolina required facilities to install additional down gradient wells. In January 2012, officials from the North Carolina Department of Environment and Natural Resources disclosed that elevated levels of metals were found in groundwater near surface impoundments at all the State's 14 coal-fired power plants. 80 FR 21455.

It is also highly unlikely that removal of CCR would also have removed all areas affected by releases at many (if not most) sites. In their comments, facilities have described relying on visual inspection or in some cases microscopic inspection of soil material to determine whether all CCR have been removed from the impoundment. In such cases, the practical depth limit of such investigations is generally just beneath (e.g., a foot or less) the visually observed maximum depth of CCR. However, it is not likely this practice would be sufficient at many legacy sites to remove all areas affected by releases of CCR leachate.

At a minimum, for units with bases above the groundwater, the soil column beneath the unit from the base of the unit to at least the depth of the lowest water levels recorded in the aquifer, would typically need to determine whether the zone of water table fluctuation constitutes a residual source and may be in need of corrective action. Concentrations of contaminants at this horizon could be significantly elevated. In a case where prior site assessment and groundwater monitoring activities have not resulted in a preexisting well network capable of making this determination it may be necessary to install additional wells or to assess groundwater.

Moreover, in a unit constructed with CCR below the ambient groundwater, after decades of groundwater infiltration through the waste, the leachate generated would be expected to show elevated levels of CCR constituents of concern. This chemically altered leachate can interact with unsaturated or partially saturated soils beneath the CCR and can react with aquifer solids beneath the unit to form intermediate chemical compounds, some of which may be bound to the aquifer matrix in solid phases. Also, depending on the amount of groundwater recharge and infiltration directed through the unit, some downwardly infiltrating leachate is likely to reach the saturated zone where additional chemical reactions occur. Depending on the degree of disequilibrium with the “ambient” conditions such reactions can be

significant and can also result in formation of mineral species that become temporarily immobilized at or beneath the water table as solid mineral phases by formation of mineral precipitates or simply adsorbed to the aquifer matrices by retardation processes. These intermediate transformation products may contain CCR constituents of concern as either major, minor or trace components of newly formed compounds. Depending on the aquifer chemistry, including redox state, pH, salinity, alkalinity, etc., some CCR constituents may remain mobile in groundwater and may continue to migrate downgradient of the unit. Consequently, in situations where the waste is below the water table, assessment efforts would generally need to penetrate a sufficient depth below the base of the waste or the lowest water levels in the aquifer, whichever is greater, to ensure that potential releases of leachate to the soil have been evaluated.

Consequently, based on the practices that facilities have stated that they use to confirm that they have removed all CCR from a site, both leachate contaminated soil and groundwater would frequently be expected to remain on site even after CCR may have been entirely removed from the impoundment. The totality of the information in the record thus supports a presumption that solid waste remains on-site. Demonstrating compliance with § 257.102(c) rebuts that presumption and documents that the site is no longer under RCRA's jurisdiction.

EPA also disagrees that reliance on the residual contamination left in groundwater to support jurisdiction is precluded by EPA's prior statements that contaminated media are not solid wastes. These commenters are referring to EPA statements made in connection with the “contained in” policy under the RCRA hazardous waste regulatory program. As an initial matter, the commenters have misunderstood the policy. The policy states only that with respect to contaminated soil or groundwater, the media itself—the soil or groundwater—is not a solid waste—even though it contains a hazardous waste. In other words, the contamination itself remains a solid waste, and therefore subject to EPA's jurisdiction. See, *Chemical Waste Management v. EPA*, 869 F.2d at 1539 (upholding EPA interpretation that hazardous waste restrictions continue to apply to waste “contained in soil or groundwater” as “consistent with the derived-from and mixture rules,” even though the rules by their terms do not apply to

contaminated soil or groundwater because they are not solid wastes).

In any event, as discussed above, none of the regulations in 40 CFR parts 260–268, or 270 apply, except to the extent EPA incorporated them into part 257, subpart D. This also means that any Agency interpretations or policies adopted under those regulations, no matter how long-standing, do not automatically apply to CCR, which are regulated under part 257, subpart D. Moreover, the policies and/or interpretations the commenters identify were developed based on the text of particular statutory or regulatory provisions under subtitle C, as well as the larger statutory context in which those particular statutory or regulatory requirements operate (for example, corrective action obligations at hazardous waste treatment, storage, and disposal facilities). RCRA subtitles C and subtitle D differ greatly. For example, only under subtitle C did Congress expressly prohibit land disposal of hazardous wastes that do not meet treatment standards established in EPA regulations. 42 U.S.C. 6924(d), (g), (h), (m). Similarly, there is no analog under subtitle D to section 6925(j), which imposes detailed requirements on hazardous waste surface impoundments. It would therefore be inappropriate to simply adopt a particular interpretation or policy developed under the particular provisions of the RCRA subtitle C hazardous waste regulatory program into the CCR program without evaluating whether the policy or interpretation is consistent the statutory language in subtitle D or would achieve Congress's purposes or direction. Note that EPA explains above how its approach is consistent with subtitle D and the congressional scheme.

Finally, it is important to note that EPA is not suggesting that the management of CCR leachate is now subject to the CCR regulations. EPA has jurisdiction over CCR leachate because the material is solid waste not because it is CCR. Under the existing regulations the definition of CCR does not include leachate. See, 40 CFR 257.53. EPA did not propose to amend this regulation and does not currently intend to do so.

(b) Exclusions

Several commenters suggested a number of other exemptions. For example, one commenter suggested that the final rule exclude legacy impoundments that only contain *de minimis* quantities of CCR. According to the commenter, EPA's risk analysis from the 2015 CCR Rule supports the conclusion that up to 75,000 tons of

CCR used as structural fill is generally safe. Therefore, the commenter recommended that inactive impoundments with 75,000 tons or less, be exempt from regulation. Other commenters urged EPA to clearly define what is meant by *de minimis* amounts of CCR in the context of legacy impoundments.

Other commenters requested that EPA exempt any legacy CCR surface impoundments that met State requirements for clean closure. These commenters argue that EPA cannot expect utilities who have closed legacy impoundments under State guidelines prior to this rulemaking to meet a standard that did not exist at the time of closure. These commenters also asserted that by regulating such units EPA is effectively disregarding a qualified State's regulatory authority to approve closure under the regulations and programs available to them at the time.

Other commenters suggested that EPA should allow facilities to certify that they had completed closure by removal in two additional situations. The first suggestion was to allow a facility to certify that it had complied with § 257.102(c) based solely on documentation that the facility had removed all ash by the effective date of the 2015 CCR Rule, unless EPA or the facility also had evidence (*e.g.*, from existing monitoring networks) of groundwater impacts that could impact human health or the environment. These commenters stated that EPA should not presume that there have been impacts to groundwater from an area where the ash has been fully removed years or even decades ago, absent specific evidence to the contrary. The second suggestion was that EPA exclude facilities that could certify and document that they have met the closure-in-place performance standards in § 257.102(d) by the effective date of this final rule. To support their proposal, the commenter noted that EPA has made it clear that the owner or operator of a CCR facility can close a CCR unit under either § 257.102 (c) or (d) and be in compliance with the Federal CCR regulations.

Finally, EPA received a number of comments on the kind of documentation that a facility needed to support a determination that it had closed a legacy impoundment by removal in accordance with the standards in § 257.102(c) prior to October 19, 2015. Some commenters requested that the final rule require facilities to post detailed documentation demonstrating compliance with § 257.102(c). Other commenters, however, objected to any documentation

requirements, asserting that it was inconsistent with EPA's treatment of similar facilities in 2015, who were not required to provide any compliance documentation of closure requirements. These commenters requested EPA to remove the requirements under § 257.100(f)(1)(ii) and allow owners to make the closure determination.

(c) Final Requirements

Consistent with the proposal, this final rule provides that an impoundment that contained CCR (and liquids) on or after October 19, 2015 is subject to this rule. This means that if a facility closed a legacy CCR surface impoundment by removal before October 19, 2015, that site is not subject to this final rule. However, the final rule does not require such facilities to demonstrate that these units were closed “in accordance with the performance standards in § 257.102(c).” Under § 257.102(c) closure is complete when all CCR has been removed from the CCR unit, any areas affected by releases from the CCR unit have been removed, and groundwater monitoring concentrations do not exceed the groundwater protection standard in § 257.95(h) for Appendix IV constituents. The proposed rule incorrectly stated that EPA was proposing to impose a documentation requirement on these facilities. That statement was made in error; EPA did not intend to propose such a requirement. EPA did not propose to require a facility to document that an impoundment did not contain liquids prior to October 19, 2015. Nor did the 2015 CCR Rule require any facilities to document that they were not subject to regulation. These facilities were never subject to the exemption for inactive impoundments at inactive facilities that was vacated in the *USWAG* decision and therefore should not be regulated as part of EPA's action to implement the Court's order. Accordingly—and consistent with the 2015 CCR Rule—if all CCR and liquids have been removed from the impoundment prior to October 19, 2015, nothing further is required.

Under the definition in the final rule, a facility that initiated closure by removal prior to October 19, 2015, but whose impoundment still contained CCR and liquids on or after October 19, 2015 is considered a legacy CCR surface impoundment and regulated under this final rule, even if the facility has removed all CCR prior to the effective date of this final rule. Depending on when the impoundment completes closure, some individual requirements may no longer be applicable to the legacy CCR surface impoundment (*e.g.*,

when the compliance date in the final rule falls after the date closure is completed for the impoundment); but as EPA explained in the proposal, the Agency has no basis for concluding that all legacy CCR surface impoundments that are still in the process of closing pose no risk.

The final rule retains the provision under which a facility with a CCR surface impoundment that contained CCR and liquids on October 19, 2015, but that completed closure by removal before the effective date of this rule, would only be required to post documentation on the facility's CCR website that it has met the standards in § 257.102(c) for that unit (*i.e.*, the certification of closure by removal for legacy CCR surface impoundments). To be eligible for the closure certification, the facility must document that it meets the criteria laid out in Unit III.B.2.b.iii. Namely, the facility must demonstrate that consistent with the existing standards, all CCR has been removed from the unit, any areas affected by releases from the CCR unit have been removed, and must have groundwater monitoring data demonstrating that the concentrations of each Appendix IV constituent do not exceed the relevant groundwater protection standard, which would be either the MCL or background concentration, for two consecutive sampling events.

If a facility certifies all of the legacy CCR surface impoundments on-site have met the requirements in § 257.102(c) for closure by removal before the effective date of this rule, the facility would not be subject to any further requirements under this final rule (*i.e.*, neither legacy CCR surface impoundment requirements or CCRMU requirements).

For similar reasons as explained above, EPA cannot accept the commenter's suggestion that EPA establish the same provision for facilities that closed a legacy impoundment prior to the effective date of this final rule in accordance with § 257.102(d) (closure when leaving CCR in place) and allow facilities to simply demonstrate that the closure meets the performance standards in § 257.102(d). The commenters appear to be requesting an exemption from post closure groundwater monitoring and corrective action requirements, but provided no factual basis for such an exemption. Nevertheless, as discussed in Unit III.B.2.g.iii of this preamble, if a facility can document that the closure of its unit meets the performance standards in § 257.102(d), all that would be required is compliance with the groundwater monitoring requirements in §§ 257.90–257.95, and any necessary corrective

action throughout the post-closure care period (in addition to recordkeeping and posting).

The documentation requirements, procedures, and compliance deadlines for these various options are discussed further in Unit III.B.2.g of this preamble.

EPA also disagrees with the commenter that 75,000 tons is a *de minimis* amount of CCR. The commenter has misunderstood EPA's findings in 2015; EPA did not conclude that quantities of CCR lower than 75,000 tons used as fill does not pose any risk to human health or the environment. Rather EPA concluded that, while the agency has sufficient information to document that unencapsulated uses can present a hazard, based on the rulemaking record EPA lacked the information necessary to demonstrate that unencapsulated uses in amounts lower than 12,400 tons are likely to present a risk. 80 FR 21352. In any event, as discussed in Unit III.A.4, recent EPA modeling demonstrates that far lower quantities of CCR (1,000 tons) can pose significant risks to human health and the environment.

In the 2015 CCR Rule, EPA provided guidance on which impoundments would not meet the definition of a CCR impoundment because they generally do not contain significant levels of CCR. 80 FR 21357. Specifically, EPA explained that CCR surface impoundments do not include units generally referred to as cooling water ponds, process water ponds, wastewater treatment ponds, storm water holding ponds, or aeration ponds. These units do not meet the definition of a CCR surface impoundment, that is, they are not designed to hold an accumulation of CCR and treatment storage or disposal of accumulated CCR does not occur in these units. Accordingly, EPA considers that such units would also not be legacy impoundments. EPA acknowledges that it mistakenly referred to one of these units as a CCR surface impoundment in the proposal, but that was an error.

c. Legacy CCR Surface Impoundment—Requirement To Be Located at an “Inactive Facility”

EPA proposed to define an “inactive facility” (or inactive electric utility or independent power producer) as one that ceased producing electricity prior to October 19, 2015, which is the effective date of the 2015 CCR Rule. EPA explained that this date is also the same date currently used in the regulation to define “active facility” under § 257.53, and that EPA originally used this date to define the exempted inactive units in the 2015 CCR Rule. The proposal further explained that use

of this date would mean that the same universe of units that were subject to the original exemption would be regulated and that this is consistent with the Court's vacatur, as vacatur is intended to restore the status quo ante, as though the vacated provision never existed. 88 FR 31994, 32034.

Commenters supported October 19, 2015, as the operative date to be used in the definition of an inactive facility because any other date would be inconsistent with the existing definition of an “active facility.” However, many commenters opposed the proposed substitution of the phrase “regardless of the fuel currently used to produce electricity” with “regardless of how electricity is currently being produced at the facility.” According to these commenters, the existing definition of “active facility” does not extend to facilities that do not use fuel, including, for example, facilities that produce solar power, because the plain language of § 257.50(c) makes clear that, to be active, a facility must use a fuel to produce electricity. These commenters cite two preamble statements in the 2015 CCR Rule to support their allegation. The first is the applicability section of 2015 CCR Rule, which only references the NAICS 221112 (Fossil Fuel Power Generation). These commenters speculate that if EPA had intended for the term “active facility” to extend to facilities that do not use fuel to produce electricity, EPA would have included other NAICS codes. The second statement appears in the executive summary and explains that the rule applies to:

Certain inactive CCR surface impoundments (*i.e.*, units not receiving CCR after the effective date of the rule) at active electric utilities or independent power producers' facilities, regardless of the fuel currently used at the facility to produce electricity (*e.g.*, coal, natural gas, oil), if the CCR unit still contains CCR and liquids.

80 FR 21303.

The commenters contended that EPA's proposal represents a significant change that will subject renewable generation to the CCR regulations (*e.g.*, a former coal-fired power plant that was retired, closed and dismantled well in advance of the 2015 CCR Rule that had new renewable generation built at the facility), creating strong disincentives to renewable repowering at those sites. These commenters further added that such a change in position requires EPA to take reliance interests into account. To address this, the commenters made two suggestions. The first was that EPA should establish an exemption from regulation for inactive facilities that

generate 50 megawatt (MW) or less to the grid (all from renewable energy). The 50 MW threshold is consistent with the small generating units subcategory under the Federal effluent limitations guidelines and standards (ELG) regulations.⁵⁶ In addition, the commenters believed that this would also account for sites that have utilized renewable energy (e.g., solar panels) for the primary purpose of powering the remaining infrastructure, but may potentially supply very limited amounts to the grid on occasion.

The second suggestion was that EPA confirm that this is a prospective change and provide a pathway for compliance for facilities that would be newly subject to the CCR Rule. According to those facilities relied in good faith on the explanatory statements in the 2015 CCR Rule preamble and the plain meaning of the term “fuel,” believed they were inactive facilities and did not have units subject to requirements of the CCR Rule, and accordingly should be allotted a separate new compliance timeframe.

EPA disagrees that the phrase “regardless of the fuel currently used to produce electricity” under § 257.50(c) indicates that EPA meant to limit the rule to facilities that combust fossil fuels. As EPA stated in the proposed rule, the definition of an active facility at § 257.53 does not include any limitation related to how the facility generates electricity. The clause, “regardless of the fuel currently used to produce electricity” in § 257.50(c) does not limit coverage only to facilities that use fuel to generate electricity. The plain language of the clause actually states the opposite; that coverage applies *without regard to the fuel used* to produce electricity. Or in other words, without regard to the type of fuel used or indeed whether any fuel is used to produce electricity.

EPA also disagrees that either of the cited preamble statements demonstrate a contrary intent. As the commenters themselves acknowledge, the discussion of affected entities expressly states that it “may not be exhaustive; other types of entities not listed could also be affected.” 80 FR 21302. In addition, EPA expressly stated that “[t]o determine whether your facility, company, business, organization, etc., is affected by this action, you should refer to the applicability criteria discussed in Unit VI.A of this document.” *Id.* Similarly, the parenthetical description “(e.g., coal, natural gas, oil)” uses the abbreviation e.g., which indicates that it is not comprehensive.

Consequently, EPA disagrees that facilities have any reliance interest in a less expansive definition. Generally, a reliance interest may be implicated if an agency issues a policy, a party takes an action based on that policy, and the agency subsequently changes its policy. *DHS v. Regents of the Univ. of Cal.*, 140 S. Ct. 1891, 1913 (2020). Here, EPA never changed its position, and there can be no legitimate reliance on a non-existent past position.

Even if the regulatory amendment reflected a changed in policy, EPA issued a proposal and solicited comment from affected entities on the substance of the policy that would be in place in the final action. The commenters had an opportunity to provide EPA with information detailing their reliance interests, although they failed to do more than allege that they had reliance interests in remaining exempt. EPA has explained why, notwithstanding those interests, the agency believes that this is the better policy. No more is required. *DHS v. Regents of the Univ. of Cal.*, *supra* at 1913.

Nevertheless, EPA is sensitive to not creating disincentives to renewable repowering at those sites. In addition, EPA acknowledges that although commenters’ interpretation is not the best reading of the provision, it is a plausible one. Accordingly, EPA has adopted the commenters’ suggestion that the Agency provide a pathway to compliance for facilities that believed they were inactive facilities and did not have units subject to the requirements of the 2015 CCR Rule. This final rule provides that facilities producing electricity through renewables (*i.e.*, non-fuels) are subject to the same applicable compliance deadlines for these units. See § 257.100(a)(1).

EPA is rejecting the commenters’ suggestion that EPA exempt inactive facilities that generate 50 megawatt (MW) or less to the grid. This is because an exemption for small generating units based on current operations, such as renewable generation with a capacity of 50 MW or less, do not necessarily correlate to the current risks resulting from past coal-fired generation operations.

d. Innocent Owners

EPA proposed not to establish an “innocent owner” provision in the CCR regulations, in part because EPA had no factual basis to establish one. 88 FR 31994–95. The Agency received comments both opposing and supporting such a provision. Most commenters opposed the inclusion of an innocent owner provision in the final

rule. Some of these stated that there is no statutory basis for uniformly excluding existing owners and operators from any RCRA regulations applicable to legacy impoundments. According to these commenters, the concept of an “innocent owner” does not apply to legacy impoundments because only the owner of the regulated unit can fulfill obligations involving affirmative regulatory controls.

Other commenters stated that relevant parties may allocate liability among themselves through various agreements and arrangements. These commenters explained that liability should not be rigidly limited only to the current owner, that liability should honor existing agreements (e.g., purchase and sale agreement), and that it may be appropriate under some circumstances for shared responsibility between the current owner and the utility. Another commenter stated that each of the utilities and each transferee should remain responsible for rule compliance regardless of how responsibility is currently allocated.

Other commenters supported adoption of an innocent owner provision in the regulations. These commenters claimed that EPA is responsible for creating a new class of innocent owner when it changed the 2015 CCR regulations. Consequently, these commenters urged EPA to develop an innocent landowner provision that would allow both the utilities and developers to come to a mutual agreement as to who has the environmental and financial responsibility of these newly regulated units. Finally, another commenter suggested EPA take time to evaluate the different types of innocent property owners and then consider adding an innocent owner provision to the regulations.

EPA has not included an innocent owner provision in the final rule. EPA explained in the proposal that its analysis of inactive facilities found that most inactive facilities are owned by companies that are already regulated by the CCR regulations. The analysis presented in the proposed rule indicated that approximately 80% of potential legacy impoundments (*i.e.*, 126 of the 156 identified potential units) are owned by companies the Agency knows as already having units subject to the CCR regulations. 88 FR 31994. As a consequence, EPA proposed it had no factual basis to establish an innocent owner provision. 88 FR 31995. EPA has updated the ownership analysis based on an updated list of potential legacy impoundments. The revised analysis continues to indicate that most inactive

⁵⁶ 80 FR 67838 (November 3, 2015).

facilities are owned by companies that are already regulated by the CCR regulations. The 194 potential legacy impoundments identified in the final rule are associated with 52 different unique corporate parents. Of the 194 impoundments, 142 units (or 73%), are owned by 28 companies the Agency knows own facilities currently subject to the CCR regulations. The remaining 52 impoundments are owned by 24 different companies, with each company generally having just one location/site with legacy CCR surface impoundments (with two exceptions, that each own two sites).

EPA is also aware of a number of instances in which parties have allocated liability among themselves through various agreements and arrangements. EPA infers from this that an innocent landowner provision is not necessary to allow utilities and developers to come to a mutual agreement on how best to allocate environmental and financial responsibility. EPA has no interest in taking actions that could potentially inhibit or interfere with these private arrangements. For all these reasons EPA continues to believe that an innocent owner provision is not currently needed and has not included such a provision in the final rule.

2. Applicable Requirements for Legacy CCR Surface Impoundments and Compliance Deadlines

This Unit of the preamble first provides a general overview of how EPA determined the applicable requirements and compliance deadlines for legacy CCR surface impoundments. Then, EPA discusses each of the existing requirements for CCR surface impoundments and explains: (1) Why EPA is (or is not) applying them to legacy CCR surface impoundments; and (2) The rationale for the compliance deadline EPA is finalizing for each requirement.

a. General Overview

i. Applicable Requirements for Legacy CCR Surface Impoundments

EPA proposed to apply all of the existing requirements in 40 CFR part 257, subpart D that are currently applicable to inactive CCR surface impoundments to legacy CCR surface impoundments, except for the location restrictions at §§ 257.60 through 257.64, and the liner design criteria at § 257.71. EPA also proposed one revision to the existing groundwater monitoring requirements and three new requirements specific to legacy CCR surface impoundments: a reporting

requirement; a new security requirement to restrict public access to these sites; and a closure certification. As explained in the proposed rule, EPA proposed to exclude the location restrictions and the liner design criteria requirements because EPA believed they would not be necessary if EPA took final action on the proposed requirement that all legacy CCR surface impoundments initiate closure no later than 12 months after the effective date of the final rule. Furthermore, the proposed rule explained that the record for the 2015 CCR Rule demonstrated that “there is little difference between the potential risks of an active and inactive surface impoundment; both can leak into groundwater, and both are subject to structural failures that release the wastes into the environment, including catastrophic failures leading to massive releases that threaten both human health and the environment.” 80 FR 21343. As discussed in Unit II.B of this preamble, the D.C. Circuit came to the same conclusion, and on that basis, vacated the exemption for legacy CCR surface impoundments. See, *USWAG* at 901 F.3d at 434. Based on the record, EPA considered that it has limited discretion to establish requirements for legacy CCR surface impoundments that are significantly different than those currently applicable to inactive CCR impoundments. This is also consistent with how the *USWAG* court viewed the 2015 record. Accordingly, EPA proposed that in most cases the existing requirements in 40 CFR part 257, subpart D applicable to inactive CCR surface impoundments would apply to legacy CCR surface impoundments.

EPA received numerous comments on the proposed rule regarding the requirements applicable to legacy CCR surface impoundments. Several commenters generally supported the regulatory approach, although some suggested that legacy CCR surface impoundments be subject to all the existing CCR regulations, including the location restrictions at §§ 257.60 through 257.64 and the liner design criteria at § 257.71. Other commenters stated that the inspections at § 257.83 were only relevant for operating CCR units and therefore should not be applied to legacy CCR surface impoundments. A few commenters suggested EPA create additional requirements for legacy CCR surface impoundments such as zero discharge limits, new reporting requirements, financial assurance measures, and beneficial reuse restrictions. Other commenters suggested that EPA revise the existing requirements applicable to

inactive impoundments, including by adding requirements to the fugitive dust, closure, and post-closure care requirements; further revising the groundwater monitoring requirements to ban intrawell data comparisons; mandating closure by removal; and using a risk-based approach for corrective action and closure requirements.

EPA still considers that based on the record (as described in III.A of this preamble), EPA has limited discretion to establish requirements for legacy CCR surface impoundments that are significantly different than those currently applicable to inactive CCR impoundments. For that reason and those laid out in the preamble of the proposed rule, EPA did not adopt any of the new requirements, such as zero discharge limits, new reporting requirements, financial assurance measures, or new beneficial use restrictions suggested by commenters. The final rule contains only one additional revision of the existing requirements for inactive CCR surface impoundments beyond the four included in the proposed rule: the deferral to permitting of certain closure activities. The rationale for the final requirements is detailed in subsequent sections in this Unit.

For the reasons detailed in the proposed rule, except for certain legacy impoundments, EPA is finalizing the requirement for legacy CCR surface impoundments to comply with the existing regulations in 40 CFR part 257, subpart D applicable to inactive CCR surface impoundments except for the location restrictions at §§ 257.60 through 257.64, and the liner design criteria at § 257.71. EPA is also finalizing the revision to the existing groundwater monitoring requirements, combining detection and assessment monitoring for legacy CCR surface impoundments and the two new requirements specific to legacy CCR surface impoundments: the applicability documentation (§ 257.100(f)(1)(i)) and the site security requirement (§ 257.100(f)(3)(iii)).

The final rule also establishes a tailored subset of requirements applicable to legacy CCR surface impoundments that were closed prior to the effective date of this rule, including those impoundments whose closures qualify for deferral because they were conducted in accordance with substantially equivalent State or Federal requirements. See Unit III.B.2.g.iii.(b) of this preamble for further discussion of the deferral.

(a) Applicable Requirements for Legacy CCR Surface Impoundments Closed by Removal

EPA is finalizing a tailored subset requirements for legacy CCR surface impoundments that have completed closure by removal before the effective date of this final rule but are not able to complete the certification of closure by removal (see, Unit III.B.2.b.iii). For the reasons detailed in this Unit and in the following Units of the preamble (Units III.B.2.b–III.B.2.h), the owner or operator of such units must comply with the following requirements: the applicability report, installation of a permanent marker, all groundwater monitoring and corrective action (including combined detection monitoring and assessment monitoring), recordkeeping, notification, and website posting. In addition, if a CCRMU is discovered onsite during the course of complying with the Facility Evaluation Report (FER), the owner or operator of these units must develop a fugitive dust control plan (see Unit III.C.3).

While EPA acknowledges that these closed units are unlikely to have any ongoing activities that would create fugitive dust, EPA determined that requiring these units to comply with the fugitive dust requirement was appropriate because these units are subject to the CCRMU requirements and there is a reasonable likelihood that CCR fugitive dust would be generated as part of the actions required to comply with those requirements (e.g., field work to determine the presence or absence of CCRMU, CCRMU closure). As such, if a CCRMU is discovered onsite of a facility with a legacy CCR surface impoundment that has closed by removal, the owner or operator must complete a fugitive dust plan no later than six months after the FER is due (i.e., no later than 33 months after becoming subject to these requirements).

EPA determined that the site security requirements applicable to other legacy CCR surface impoundments would not be relevant for this subset of units as the CCR has been removed from the unit and the land may be being used for another purpose (e.g., nature preserve, agricultural land, redevelopment). However, EPA expects legacy CCR surface impoundments that closed by removal to protect the monitoring equipment and monitoring wells, similar to other legacy CCR surface impoundments.

EPA is also not requiring these units to comply with any other design criteria or operating criteria, aside from the installation of the permanent marker

and the fugitive dust requirements, as noted above. EPA has determined that the other design and operating criteria are not applicable to units that have closed by removal and therefore no longer contain CCR in the unit on the effective date of this final rule. For example, the requirement to prepare and maintain an EAP is not relevant when CCR is no longer present in the unit nor is the requirement to conduct weekly inspections of the legacy impoundment.

(b) Applicable Requirements for Legacy CCR Surface Impoundments That Closed With Waste in Place

EPA is finalizing a tailored subset of requirements for legacy CCR surface impoundments that, by the effective date of this final rule, have completed: (1) closure with waste in place or (2) a closure eligible for deferral to permitting as described in Unit III.2.g.iii(b). For the reasons detailed in this Unit and in the following sections (Units III.B.2.b–III.B.2.h), the owner or operator of such units must comply with the following requirements: applicability report, site security, installation of the permanent marker, history of construction, fugitive dust control plan, annual fugitive dust control report, all groundwater monitoring and corrective action (including combined detection monitoring and assessment monitoring), written post-closure care plan, post-closure care, recordkeeping, notification, and website posting. In addition, the final rule requires the facility to provide information on the completed closure of the legacy CCR surface impoundment, along with supporting documentation to demonstrate that the closure meets the performance standards in § 257.102(d) or the standards specified in § 257.101(g).

While EPA acknowledges that these closed units are unlikely to have any ongoing activity that would create fugitive dust, EPA determined that requiring these units to comply with the fugitive dust requirement was appropriate because these units are subject to the CCRMU requirements and there is a reasonable likelihood that CCR fugitive dust would be generated as part of the actions required to comply with those requirements (e.g., field work to determine the presence or absence of CCRMU, CCRMU closure). As such, if a CCRMU is discovered onsite of a facility with a legacy CCR surface impoundment that has closed by removal, the owner or operator must complete a fugitive dust plan no later than six months after the FER is due (i.e., no later than 33 months after

becoming subject to these requirements).

EPA is also finalizing the requirement for this subset of legacy CCR surface impoundments to comply with the site security requirements applicable to other legacy CCR surface impoundments. EPA determined that the site security requirements are needed to minimize the potential for the unauthorized entry of people or animals to disturb the final cover system, as these units are unlikely to be monitored. EPA also expects facilities that closed legacy CCR surface impoundments with waste in place to protect the monitoring equipment and monitoring wells, similar to other legacy CCR surface impoundments.

This final rule also requires the owners and operators of these units to complete the history of construction in accordance with § 257.73(c). The history of construction provides information regarding the original site conditions, as well as the unit's original design and construction, such as cross sections of the length and width of the CCR unit. It would also include information on subsequent revisions, such as the design and construction of any lateral expansions. This information is relevant to designing (and evaluating) the groundwater monitoring system, unit closures, and corrective actions. For example, the history of construction would normally include the elevations of the unit base and the CCR in the unit (i.e., the ground elevation contours within the footprint prior to unit construction); this information, in conjunction with the site characterization developed under § 257.90 to design the groundwater monitoring system can be used to determine whether the unit intersects with the groundwater (i.e., the unit's ability to sufficiently contain CCR and contaminants that may leach from CCR). This information remains relevant in evaluating closure, when addressing any contamination coming from the unit, and throughout the post-closure care period. Therefore, EPA is requiring this subset of legacy CCR surface impoundments to comply with the history of construction requirement.

EPA has determined that the other design and operating criteria (all those besides the permanent marker, site security, history of construction, and fugitive dust requirements) are not applicable to units that have completed closure in accordance with § 257.102(d) by the effective date of this final rule. For example, the requirement to prepare an inflow design flood control system plan is not relevant for units that have installed a final cover system, as post-

closure care requires a final cover system to be maintained and groundwater monitoring to continue. Additionally, periodic assessments, such as the hazard potential classification assessment and the structural stability assessments, are intended to address risks from unclosed unit and therefore, consistent with the requirements for units that have completed closure under the 2015 CCR Rule, are not applicable to units that have closed with waste in place.

ii. Compliance Deadlines for Legacy CCR Surface Impoundments

EPA proposed to establish new compliance dates for legacy CCR surface impoundments. The proposed rule explained that the 2015 CCR Rule compliance deadlines were based on the amount of time determined to be necessary to implement the requirements and the proposed compliance dates for legacy CCR surface impoundments were determined using the same approach. The proposed rule further explained that some factors considered in determining the 2015 CCR Rule compliance deadlines were not relevant for legacy CCR surface impoundments, such as the need to coordinate compliance deadlines with the then recently promulgated ELG rule. In addition, EPA anticipated most facilities would already be familiar with the existing regulations, and therefore the proposed requirements for legacy CCR surface impoundments, and fewer facilities and units would need to come into compliance, as compared to the 2015 CCR Rule. Consequently, EPA proposed generally expedited deadlines based on the expected shortest average amount of time needed to complete the necessary activities to meet the requirements. In the proposed rule, EPA requested comment on the proposed compliance deadlines and the feasibility to meet the proposed compliance timeframes for legacy CCR surface impoundments.

EPA received numerous comments regarding the proposed compliance deadlines. Several commenters expressed support for the proposed compliance deadlines for legacy CCR surface impoundments. Generally, these commenters stated that expedited compliance was appropriate due to the increased risk posed by these units, the likelihood that these units are actively contaminating groundwater, and the urgent need for corrective action to address that contamination for the protection of human health and the environment. Some of these commenters echoed the proposed rule, stating that owner's or operator's

familiarity with the existing requirements, along with the fact that these units are no longer in use and therefore would not need time to cease receipt of waste, further justified the expedited deadlines.

Many other commenters stated the proposed compliance deadlines were infeasible and should, at a minimum, allow as much time for compliance as the 2015 CCR Rule deadlines, although several commenters expressed that even the 2015 CCR Rule deadlines were inadequate, and that the insufficient timeframes were likely a factor in the gap between EPA's expectations and facilities' good faith efforts and utilization of best practices in developing groundwater monitoring networks, sampling and analysis plans, corrective action programs, and closure plans. Commenters pointed to several factors that they believed EPA did not fully incorporate into the proposed deadline calculations that make compliance with the proposed deadlines infeasible: the large number of CCR units (*i.e.*, existing CCR units, legacy CCR surface impoundments, CCRMU) competing for limited resources to meet overlapping compliance deadlines; the limited number of qualified contractors available to conduct necessary activities to reach the compliance deadlines; the nationwide labor shortage exacerbated by impacts from the COVID-19 pandemic; limited existing alternative disposal options; overlapping regulatory requirements (*e.g.*, State drilling permits, timing restrictions related to protected habitats, State CCR permits, Consent Decrees/Orders); seasonality impacts in different regions across the nation; and accessibility and completeness, or lack thereof, of historical documentation and information. One commenter provided specific information regarding typical delays experienced during the implementation of the 2015 CCR Rule caused by third-party availability and backlogs: two to four weeks for contractor mobilization; two to six weeks for site clearing; two to three weeks for surveys; three to 12 weeks for environmental drillers; and three to four weeks for laboratory analyses. These commenters also said EPA grossly underestimated the amount of time needed to hire a contractor, locate and review historical information, access a legacy CCR surface impoundment site, characterize and delineate a site, comply with the groundwater monitoring requirements, and conduct quality control or quality assurance on data and reports. Several of these

commenters expressed the belief that the proposed deadlines would result in unintentional non-compliance despite facilities' best efforts to comply due to the constraints listed above. Finally, a few commenters suggested EPA create alternative deadlines or mechanisms for extensions based on site-specific characteristics.

In response to comments, EPA reevaluated the compliance deadlines for legacy CCR surface impoundments. EPA reconsidered the impact of the following on the amount of time facilities needed to complete the activities involved in meeting the requirements: accessibility and abundance, or lack thereof, of historical documentation; seasonality; clearing restrictions and required local and State approvals to clear vegetation or drill wells; existing disposal options; impact of the national labor shortage and contractor and laboratory backlogs; and overlapping compliance deadlines for CCRMU, existing units (*i.e.*, groundwater monitoring, closure, and post-closure care), and legacy CCR surface impoundments. Overall, EPA found the information provided regarding the infeasibility of the proposed deadlines convincing. Specifically, EPA agrees that the shortage of qualified contractors and laboratory resources has persisted, if not increased, since the 2015 CCR Rule and that the increasing demand on these finite resources from new and existing CCR units, legacy CCR surface impoundments, and CCRMU complying with overlapping requirement deadlines will likely increase the time needed to come into compliance. EPA acknowledges that the proposed deadlines did not adequately account for those nationwide impacts of seasonality and extreme weather events; necessary coordination with outside parties (*e.g.*, State agencies, local governments); locating disposal capacity for those units closing by removal; the need to comply with overlapping regulatory requirements, such as State drilling permits or timing restrictions related to protected habitats; or necessary quality assurance and quality control in calculating the proposed deadlines. Therefore, as detailed in Units III.B.2.b through h, EPA extended the deadlines for legacy CCR surface impoundments to provide at least as much time facilities had to come into compliance with the 2015 CCR Rule. In some cases, EPA extended the deadlines for legacy CCR surface impoundments even further to mitigate factors mentioned by commenters that convinced EPA the 2015 compliance

deadlines would be infeasible for legacy impoundments. Overall, most of the comments EPA received supported deadlines that allowed at least as much time as EPA originally provided in the 2015 CCR Rule. While some units regulated by the 2015 CCR Rule were

able to come into compliance before the 2015 deadlines, the majority of units used all the time allowed by the 2015 CCR Rule.

Note that all deadlines herein are framed by reference to the effective date of the rule; the final rule will be effective six months after publication of

the final rule. Accordingly, facilities will have an additional six months beyond the deadlines to come into compliance. The Agency has included a document in the docket for this rule that summarizes the finalized compliance deadlines.⁵⁷

TABLE 1—FINAL COMPLIANCE TIME FRAMES FOR LEGACY CCR SURFACE IMPOUNDMENTS

40 CFR Part 257, Subpart D requirement	Description of requirement to be completed	Deadline (months after effective date of this final rule)	Date
Applicability Report (§ 257.100)	Complete applicability report	0	Friday, November 8, 2024.
Internet Posting (§ 257.107)	Establish CCR website	0	Friday, November 8, 2024.
Site Security (§ 257.100(f)(3)(iii)) ...	Implement site security measures	0	Friday, November 8, 2024.
Operating Criteria (§ 257.80)	Prepare fugitive dust control plan	0	Friday, November 8, 2024.
Operating Criteria (§ 257.80, 257.82, 257.83).	Initiate weekly inspections of the CCR unit.	0	Friday, November 8, 2024.
Operating Criteria (§ 257.80, 257.82, 257.83).	Initiate monthly monitoring of CCR unit instrumentation.	0	Friday, November 8, 2024.
Design Criteria (§ 257.73)	Install permanent marker	2	Wednesday, January 8, 2025.
Operating Criteria (§ 257.80, 257.82, 257.83).	Complete initial annual inspection of the CCR unit.	3	Monday, February, 10, 2025.
Operating Criteria (§ 257.80)	Complete initial annual fugitive dust report.	14	Thursday, January 8, 2026.
Design Criteria (§ 257.73)	Compile history of construction	15	Monday, February 9, 2026.
Design Criteria (§ 257.73)	Complete initial hazard potential classification assessment.	18	Friday, May 8, 2026.
Design Criteria (§ 257.73)	Complete initial structural stability assessment.	18	Friday, May 8, 2026.
Design Criteria (§ 257.73)	Complete initial safety factor assessment.	18	Friday, May 8, 2026.
Design Criteria (§ 257.73)	Prepare emergency action plan ...	18	Friday, May 8, 2026.
Operating Criteria (§ 257.82)	Complete initial inflow design flood control system plan.	18	Friday, May 8, 2026.
GWMCA (§§ 257.90–257.95)	Install the groundwater monitoring system, develop the groundwater sampling and analysis program, initiate the detection monitoring and assessment monitoring. Begin evaluating the groundwater monitoring data for SSIs over background levels and SSLs over GWPS.	30	Monday, May 10, 2027.
GWMCA (§ 257.90(e))	Complete initial annual GWMCA report.	January 31, 2027	January 31, 2027.
Closure (§§ 257.100–257.101)	Prepare written closure plan	36	Monday, November 8, 2027.
Post-Closure Care (§ 257.104)	Prepare written post-closure care plan.	36	Monday, November 8, 2027.
Closure and Post-Closure Care (§ 257.101).	Initiate closure	42	Monday, May 8, 2028.

b. New Requirements Specific to Legacy CCR Surface Impoundments

i. Applicability Report for Legacy CCR Surface Impoundments

EPA proposed to require the owner or operator of a legacy CCR surface impoundment to prepare an applicability report for any legacy CCR surface impoundment at that facility no later than the effective date of the final rule. This requirement would apply to all legacy CCR surface impoundments,

including incised impoundments and impoundments that do not meet the height and storage volume cutoffs specified in § 257.73(b). EPA proposed that this applicability report would include information to identify the unit, delineate the unit boundaries, include a figure of the facility and where the unit is located at the facility, the size of the unit, its proximity to surface water bodies, and the current site conditions. EPA also proposed that the applicability report include the facility address,

latitude and longitude, and contact information of the owner and/or operator of the legacy CCR surface impoundment with their business phone number and email address. EPA proposed that the report should document whether the legacy CCR surface impoundments are incised and whether the units meet the height and storage volume thresholds specified in § 257.73(b). EPA also proposed that the owner or operator of the legacy CCR surface impoundment notify the Agency

⁵⁷ A document “Final Rule Compliance Deadlines for Legacy CCR Surface Impoundments. April 2024.” is available in the docket for this action.

after a legacy impoundment is identified and the facility's CCR website is established, using the procedures currently in § 257.107(a) via the "contact us" form on EPA's CCR website. 88 FR 31998.

EPA received a few comments on the applicability report. Several commenters said the deadline to complete requirements of the applicability report could not be achieved. One commenter requested 24 months to complete the report. Another commenter presented several clarifying questions and said they could not estimate a compliance deadline without understanding these clarifications. This commenter asked if EPA will allow affected utilities to rely on information previously submitted to State regulatory authorities to satisfy the facility description requirements; what does EPA mean by the term "current site conditions" in the context of facility site descriptions; when EPA refers to providing a site identification number as previously provided to the State, is this intended only to apply in States that have achieved CCR Rule delegation, or in all States in which there is some level of State oversight over a legacy CCR surface impoundment; and if EPA can further determine what it considers to be "reasonably and readily available information" concerning history of construction. The commenter appreciates EPA's recognition that most of this information is likely "unknown or lost to time," but seeks additional guidance on the scope of investigation that should be conducted to meet the "reasonably and readily available" standard.

EPA believes that as part of the applicability report, an owner or operator of an inactive CCR facility can include information previously submitted to State regulatory authorities to describe the facility conditions. If, however, any changes have been made since the owner or operator last prepared that information or that information does not address all the issues inherent in an applicability determination, then updated or additional information should be included. The current site conditions should include, for example, when the facility operated, when it ceased generating electricity, the size of the facility property, a visual description of how the legacy impoundment looks on the effective date of the final rule (*e.g.*, ponded water, approximate size, vegetation, incised), a description of any nearby geological or hydrologic features (*i.e.*, rivers, lakes, streams, karst topography), and any other relevant information about the facility. The State

identification number can be for a previously issued solid waste, water, or other permit under State program, but does not have to be as part of an EPA-approved State CCR permit program.

EPA addressed the term "reasonably and readily available" at 80 FR 21380, "[t]herefore, in this rule, EPA is using the phrase 'to the extent available' and clarifying that the term requires the owner or operator to provide information on the history of construction only to the extent that such information is reasonably and readily available. EPA intends facilities to provide relevant design and construction information only if factual documentation exists. EPA does not expect owners or operators to generate new information or provide anecdotal or speculative information regarding the CCR surface impoundment's design and construction history."

Based on the comments about the infeasibility to complete the proposed requirements by the effective date of the final rule, EPA is not requiring that the applicability report include the size of the unit, its proximity to surface water bodies, or delineation of the unit boundaries. The size of the unit and delineation of the unit boundaries will be determined through the history of construction and groundwater monitoring requirements. Proximity to surface water bodies is not required by the 2015 CCR Rule, and EPA determined it is not feasible to determine the distance to surface water bodies before the unit boundaries are delineated, which would not be done by the effective date of the final rule. Therefore, EPA is not requiring proximity to surface water bodies to be completed in the applicability report.

Some commenters agreed with the proposed requirements on the applicability report and urged EPA to require additional information, including an EPA identification number, determination and public disclosure of whether legacy CCR surface impoundments contained both CCR and liquids, location and elevation of any 100-year floodplain within one mile, elevation and depth of CCR waste in the impoundment, proximity to public water supply wells or private water wells within two miles, proximity to wetlands, results of all environmental sampling, and owner/operator certification of the documentation. A commenter also said the applicability report should include a full investigation including the use of appropriate instrumentation to determine water levels, a report documenting the results certified by a qualified professional engineer, and the

publication of the report on a CCR website.

EPA considered these comments and decided not to require additional information since the recommended information would not be feasible to collect by the effective date of the final rule, especially given the limitations discussed in Unit III.B.2.a.i of this preamble. As stated previously, commenters discussed how delineating the unit boundaries and determining the exact location of the legacy CCR surface impoundment could not feasibly be completed by the deadline.

EPA is finalizing with revisions the proposed requirement for the owner or operator of a legacy CCR surface impoundment to prepare applicability reports for all legacy CCR surface impoundments at that facility no later than the effective date of the final rule. This requirement applies to all legacy CCR surface impoundments, including incised impoundments and impoundments that do not meet the height and storage volume cutoffs specified in § 257.73(b). This is codified in the regulatory text at § 257.100(f)(1)(i). The applicability report must include information to identify the unit, a figure of the facility and where the unit is located at the facility, and the current site conditions. The applicability documentation must also include the facility address, latitude and longitude, and contact information of the owner and/or operator of the legacy CCR surface impoundment with their phone number and email address. EPA is also finalizing the requirement that the owner or operator of the legacy CCR surface impoundment notify the Agency of the establishment of the facility's CCR website using the procedures currently in § 257.107(a) via the "contact us" form on EPA's CCR website.

Further, EPA is finalizing a requirement that a certification of the applicability report must be signed by the owner or operator or an authorized representative similar to the certification that is required at § 257.102(e) and § 257.102(f) for existing units undergoing closure. EPA proposed this requirement in § 257.75(c) for the FER and determined after reviewing the comments that a similar requirement should apply to the applicability report. This requirement is codified in the regulatory text at § 257.100(f)(1)(ii)(C).

For any legacy impoundments that have completed closure by removal or closure in place of the unit pursuant to a State permit or order that meets the requirements of § 257.101(g) prior to the effective date of this final rule, EPA is requiring the owner or operator to attach

such documentation to the applicability report required by § 257.100(f)(1) and post this documentation to its CCR website. This information will be evaluated by EPA permitting authorities at a future time to determine what further action, if any, is needed with the unit.

As discussed in Unit III.B.1.b.i.(b)(4) of this preamble, EPA is establishing a new definition of the phrase “contains both CCR and liquids” in the final rule. Under this definition CCR and liquids are present in a CCR surface impoundment except where the owner or operator has demonstrated that free liquids have been eliminated from the unit consistent with the performance standard in § 257.102(d)(2)(i). EPA recognizes that some owners and operators of inactive impoundments may not currently have records to demonstrate whether their inactive impoundment contained both CCR and liquids on or after October 19, 2015. In such cases, one option would be for the facility to conduct a field investigation to assess whether free liquids are currently present in the unit. To facilitate such investigations, the final rule establishes procedures to provide owners or operators with additional time to complete the legacy impoundment applicability report, should the owner or operator elect to conduct a field inspection to assess the unit for the presence or absence of free liquids. See § 257.100(f)(1)(v). To be clear, facilities are not required to conduct field testing to determine whether their unit is a legacy CCR surface impoundment. If records are available to allow the owner or operator to make that determination, this final rule does not require them to conduct field testing to confirm that information. However, to the extent facilities would prefer to rely on field investigations to supplement, or lieu of, a purely record-based investigation this final rule provides that option.

In order to obtain additional time to complete the legacy impoundment applicability report required under § 257.100(f)(1), an owner or operator must prepare an “applicability extension report” by the effective date of the final rule. The extension report consists of three parts. First, the extension report must include general identifying information about the potential legacy impoundment, including, the name associated with the unit, the identification number of the unit if one has been assigned by the State, and information about the location of the unit at the facility. This information is same as the first three

elements of the applicability report under § 257.100(f)(1)(i)(A) through (C).

Second, the extension report must include a statement by the owner or operator that available information does not provide a sufficient basis to determine that the inactive impoundment contained free liquids on or after October 19, 2015. Owners or operators that cannot make this statement are not eligible for this extension and must comply with the applicable requirements for legacy impoundments. For example, an owner or operator who knows that the unit currently contains liquids, or has aerial photographs from 2018 showing that the inactive impoundment contained standing or free water would not be eligible to make use of these extension provisions because the unit contained free liquids since October 19, 2015.

Finally, the extension report must contain a written field investigation workplan. The purpose of this plan is to describe the approach the owner or operator intends to follow to determine whether the inactive impoundment contains free liquids. The written field investigation workplan must contain the following elements:

- A detailed description of the approach to characterize the physical, topographic, geologic, hydrogeologic, and hydraulic properties of the CCR in the unit and native geologic materials beneath and surrounding the unit, and how those properties will be used to investigate for the presence of free liquids in the CCR unit.
- A detailed description of the methods and tools that will be employed to determine whether the inactive impoundment contains free liquids, the rationale for choosing these methods and tools, and how these methods and tools will be implemented, and at what level of spatial resolution at the CCR unit to identify and monitor the presence of free liquids.
- A detailed description of how groundwater elevations will be determined, and at what level of spatial resolution, in relation to the sides and bottom of the CCR unit and how any interaction of the groundwater table with the CCR unit will be evaluated, and at what level of spatial resolution.
- A plan for evaluating stormwater flow over the surface of the unit, stormwater drainage from the unit, and stormwater infiltration into the unit and how those processes may result in the formation of free liquids in the CCR unit. This plan must include a current topographic map showing surface water flow and any pertinent natural or man-made features present relevant to

stormwater drainage, infiltration and related processes.

- An estimated timeline to complete the workplan and make a determination if the CCR unit contains free liquids.
- A narrative discussion of how the results from implementing the workplan will determine whether the unit contains free liquids specified.
- A narrative discussion describing any anticipated problems that may be encountered during implementation of the workplan and what actions will be taken to resolve the problems, and anticipated timeframes necessary for such a contingency.

The final rule allows an owner to operator to obtain as many as three 6-month extensions (or 18 months from the effective date of the final rule) to complete the field investigation. Each six-month time extension must be supported by an updated extension report to justify the need for additional time. If the owner or operator needs either of the additional 6-month extensions, the subsequent extension report must be prepared no later than six months after completing the preceding extension report. Each prepared extension report must be placed in the facility's operating record as required § 257.105(k)(2) and posted to the owner or operator's CCR website.

Once the owner or operator determines that an inactive impoundment contains CCR and liquids the applicability report required by § 257.100(f)(1) must be completed within 14 days of the determination. EPA believes 14 days is a sufficient amount of time to complete the applicability report because the information will be known to owners or operators at this point. Following preparation of the applicability report, the inactive impoundment is subject to the requirements for legacy impoundments under § 257.100(f)(2) through (5), but with compliance deadlines adjusted by the length of the extension. These new timeframes are calculated on a unit-by-unit basis because the date the applicability report was prepared can vary by unit.

This following example illustrates how the new compliance timeframes are calculated for one of the design criteria for legacy impoundments. Section 257.100(f)(2)(i) requires that the permanent identification marker must be placed on or immediately adjacent to the legacy impoundment no later than 2 months after the effective date of the rule. If the owner or operator determines 10.5 months after the effective date of the rule that free liquids are present in the inactive impoundment, the owner or operator must prepare the legacy

impoundment applicability report with 14 days of that date. The new deadline for the owner or operator to install the permanent marker is 11 months after the original deadline (or in this case, 13 months from the effective date of the final rule (2+ 10.5 + 0.5 months)).

Finally, if the owner or operator determines that the unit does not contain liquids, the owner or operator must prepare a notification stating that the field investigation has concluded and that the owner or operator has determined that the inactive impoundment does not contain CCR and liquids. This notification informs the public, States and EPA that the unit is not a legacy CCR surface impoundment. The final rule also provides that if the owner or operator does not complete the field investigation work within the timeframes specified in § 257.100(f)(1)(iv)(B), the inactive impoundment shall be considered a legacy CCR surface impoundment and must comply with all applicable requirements under the new timeframes specified under § 257.100(f)(1)(iv)(E).

ii. Site Security for Legacy CCR Surface Impoundments

Active facilities generally have guards and fencing to control access to the facility, but inactive CCR facilities may not have such security controls in place at the facility. To minimize that risk, EPA proposed that owners or operators establish security controls to restrict access to legacy CCR surface impoundments. The proposed security requirements are written in terms of a performance standard, as opposed to a prescriptive set of technical standards, such as specific signage, barriers and fencing, or surveillance techniques. EPA chose this approach because it would allow the owner or operator to identify the most appropriate means of providing site security for the impoundment based on site-specific circumstances.

Commenters generally supported performance-based site security measures rather than having EPA prescribe specific technical standards. Some commenters agreed that such requirements are necessary because legacy CCR impoundments are located at inactive power plants, and unlike impoundments at operating power plants, they almost certainly lack the oversight and protection afforded by significant numbers of on-site personnel. These commenters stated that the integrity of impoundments and berms and the safety of nearby residents depend on robust security measures to ensure that people are not—whether

intentionally or unknowingly—entering the site and taking actions (such as all-terrain vehicle driving, dirt biking, or similar activities) that endanger the integrity of the impoundment or expose trespassers to health risks. Some commenters added that EPA should consider that some sites may not need security measures, for example, sites with closed legacy impoundments that closed under State programs, especially where CCR have been removed. EPA did not receive comments about the deadline to complete the site security requirements and is therefore finalizing as proposed.

EPA is adopting the proposed site security performance standard without revision from the proposal. Accordingly, the site security performance standard in the final rule requires the owner or operator to prevent the unknowing entry of people onto the legacy CCR surface impoundment and to minimize the potential for the unauthorized entry of people or livestock onto the impoundment. This is codified in the regulatory text in § 257.100(f)(3)(ii). The Agency generally modeled the requirements on the existing regulations that apply to interim status hazardous waste surface impoundments, which are codified at § 265.14(a). EPA recognizes that some facilities may already have facility-wide access controls in place, and in this case, the facility-wide controls would satisfy the requirement to limit public access to the legacy CCR surface impoundment. The Agency is finalizing the requirement for the facility to restrict access to the area containing the legacy CCR surface impoundment no later than the effective date of the final rule.

iii. Certification of Closure by Removal for Legacy CCR Surface Impoundments

EPA proposed that legacy CCR surface impoundments that completed closure by removal of CCR in accordance with the performance standards in § 257.102(c) after October 19, 2015, but before the effective date of the final rule would be subject to no further requirements under 40 CFR part 257, subpart D, provided the owner or operator completed certain actions.⁵⁸ 88 FR 31998 and proposed § 257.100(f)(1)(ii). Specifically, EPA proposed that the owner or operator would be required to post documentation on their CCR website showing that the legacy impoundment was closed in accordance with the

closure by removal standards in § 257.102(c). EPA further proposed to require that the closure certification be certified by a qualified P.E. Finally, EPA proposed to require that the certified demonstration be completed and placed in the operating record no later than the effective date of this final rule.

A number of commenters requested that EPA expand the certification to cover all State-approved closures by removal—including those in which all CCR was removed from the unit or site, but the State approved the closure without requiring any groundwater monitoring. The only factual basis these commenters offered to support their request was that EPA should rely on the State's determination that the closure was protective.

Other commenters raised concern that the information needed to support a certification may not be readily available, and as a consequence these units would be subject to all of the other requirements of the final rule, including groundwater monitoring, preparation of plans, filing of reports, and closure and post-closure activities. These commenters stated such an outcome is not necessary to protect human health and the environment.

Other commenters stated that the proposed closure certification under § 257.100(f)(1)(ii) was not sufficient to allow EPA, States, and the public to determine whether the facility has actually complied with the closure performance standards under § 257.102(c). These commenters requested that the final rule require owners/operators certifying closure by removal to specify, with supporting documentation all of the following:

- The nature and volume of CCR and all other materials in the unit prior to closure;
- All releases from the unit to the soil, surface water, groundwater, and atmosphere during the operation of the unit, during its inactive period(s), and prior to completion of closure activities;
- The nature and extent of all soil, groundwater, surface water, and other contamination associated with releases from the unit throughout its history, including active and inactive periods;
- The methods to be employed (in closure plans) and actually employed (in closure completeness certifications) to ensure complete removal of all CCR and other contaminated materials from the unit, including but not limited to post-removal sampling and analysis;
- Documentation that all CCR and other contaminated materials were in fact removed from the unit, including but not limited to post-removal sampling and analysis;

⁵⁸ These impoundments contained both CCR and liquids on or after October 19, 2015, and subsequently completed closure of the impoundment before the effective date of this final rule.

- The methods to be employed (in closure plans) and actually employed (in closure completeness certifications) to ensure complete decontamination of all areas affected by releases from the unit, including but not limited to post-decontamination sampling and analysis; and

- Documentation that all areas affected by releases from the unit were in fact decontaminated and that all groundwater affected by releases has achieved groundwater protection standards, including but not limited to a minimum of two years of post-removal/decontamination detection and assessment groundwater monitoring data collected pursuant to the CCR Rule's groundwater monitoring performance standards and analyzed pursuant to its sampling and analysis requirements, 40 CFR 257.91 and 257.93, to reliably demonstrate compliance with groundwater protection standards in order to certify the completion of closure in accordance with 40 CFR 257.102(c).

EPA is unable to adopt the commenters' suggestion to expand the certification to all State-approved closures by removal. Without any record of the factual and legal bases for the States' decisions, EPA cannot conclude that all State-approved closures by removal pose no reasonable probability of adverse effects on health or the environment, as it is required to do under RCRA section 4004(a). This is particularly true with respect to closures that were approved without any groundwater monitoring or other information to demonstrate that "groundwater . . . concentrations do not exceed the groundwater protection standard established pursuant to § 257.95(h)," 40 CFR 257.102(c). Given the high probability that these impoundments were unlined and leaked, the most likely conclusion is that contamination remains at the site. In the absence of any further information, it is not apparent how EPA could support approving such closures in a nationwide rulemaking. See also Unit III.B.2.g.iii of this preamble for further discussion of State programs.

EPA agrees that certifications under this paragraph need to include sufficient supporting data so that EPA, States, and the public can determine whether the facility has actually complied with the performance standards in § 257.102(c). However, EPA disagrees that all of the information the commenters suggest is necessary to achieve that goal. As described below, the final rule requires that a facility support its certification with information that would have been routinely developed as part of closing

the unit; either because the information is routinely required by State permit authorities or because the facility would have developed the information as part of the normal construction processes. Specifically, the final rule requires facilities to include the following supporting information with their certification:

- (1) The type and volume of CCR and all other materials in the unit prior to closure;

- (2) The methods used to verify complete removal of all CCR and other contaminated materials from the unit, including any post-removal sampling and analysis;

- (3) Documentation that all CCR and other contaminated materials were removed from the unit, including, the results of any post-removal sampling and analysis that was conducted;

- (4) The methods used to verify complete decontamination of all areas affected by releases from the unit, including but not limited to post-decontamination sampling and analysis; and

- (5) Documentation that all areas affected by releases from the unit were decontaminated and that all groundwater affected by releases has achieved groundwater protection standards.

The final rule identifies the minimum information needed to support a certification, but, for the most part does not substantially restrict the analyses or factual information that can be used. This is because these units closed before they were subject to the Federal CCR regulations, or knew that they would be subject to the regulations, and EPA expects it is unlikely that facilities would necessarily have the same documentation as a currently regulated entity. State requirements specifying the information and analyses necessary to obtain approvals or permits can vary significantly. However, the final rule specifies that the facility must have groundwater monitoring data demonstrating that the concentrations of each Appendix IV constituent do not exceed the relevant groundwater protection standard, which would be either the MCL or background concentration, for two consecutive sampling events, consistent with § 257.95(e). The final rule identifies the minimum information needed to support a certification, but does not substantially restrict the analyses or factual information that can be used. Because the facility was not subject to part 257 groundwater monitoring when the monitoring was conducted, the final rule does not require a facility to demonstrate that it had installed a

groundwater monitoring system that complied with all of the requirements in §§ 257.90 through 257.95. Nevertheless, the data supporting the certification must be scientifically valid and must credibly support a determination that the monitoring system would reliably detect any releases from the impoundment. Therefore, the final rule requires that owner or operator demonstrate that the groundwater monitoring system used to document the concentrations of Appendix IV constituents met a subset of the performance standards found in §§ 257.91(a) through (e), 257.93(a) through (d), and 257.93(i). Specifically, the facility needs to demonstrate that the groundwater monitoring system met the following criteria:

- (1) Accurately represented background water quality unaffected by a CCR unit;

- (2) Accurately represented the quality of water passing the waste boundary of the unit;

- (3) Was capable of detecting contamination in the uppermost aquifer;

- (4) Monitored all potential contaminant pathways;

- (5) Established groundwater background concentrations for Appendix IV constituents and compared samples to those background concentrations; and

- (6) Utilized wells that are (a) cased and maintained in a manner that protects the integrity of the monitoring well borehole, (b) screened or perforated and packed with gravel or sand, where necessary, to enable collection of groundwater samples, and (c) sealed between the borehole and the well casing to prevent contamination of the sample and groundwater.

Finally, the last sample used to demonstrate that no constituent in Appendix IV was detected in concentrations above the established groundwater protection standards must have been collected no earlier than one year prior to the initiation of closure.

If a facility can certify that all legacy CCR surface impoundments on-site met the standards in § 257.102(c) prior to the effective date of this rule, the facility would not be subject to any further requirements under this final rule (*i.e.*, neither legacy CCR surface impoundment requirements or CCRMU requirements). For these units, the certification of closure by removal would be due no later than the effective date of this final rule and must be placed in the facility operating record then posted on their public CCR website. See § 257.100(g).

EPA agrees that if a facility has actually met the performance standards

in § 257.102(c), there is no health or environmental benefit in requiring compliance with all of subpart D simply because the facility lacks the information to support the certification. Accordingly, the final rule provides an option that allows such a facility to obtain the information necessary to support a certification. If a facility has removed all CCR from a legacy CCR surface impoundment before the effective date of this final rule but never conducted groundwater monitoring (or had a groundwater monitoring system that does not meet the criteria laid out above), the facility would initially only be required to install a groundwater monitoring system and initiate groundwater monitoring in accordance with the requirements in §§ 257.90 through 257.95, as well as the recordkeeping, notification, and website posting requirements described in Units III.B.2.f and III.B.2.h. If the owner or operator of one of these units elects to pursue a closure certification, the owner or operator must prepare a notification of intent to certify closure by the effective date of this final rule and place it in the operating record, post it on their CCR website, and submit a notification to EPA or the State or Tribal Authority. The notification must state that the facility has removed all CCR from the unit and will be installing a groundwater monitoring system compliant with §§ 257.90 through 257.95 to determine whether there is contamination coming from the unit. If no SSL above the GWPS is detected for all Appendix IV constituent in at least the first two consecutive sampling events, consistent with the existing provisions of § 257.95(e), the facility could at that time complete the closure certification, and document compliance with § 257.102(c). EPA anticipates that the requirement to conduct two consecutive sampling events will result in one sample being taken during the dry season and one in the wet season and thus capture groundwater fluctuations. If the required sampling demonstrates no exceedances of Appendix IV constituents, the owner or operator of the unit must place the closure certification in the operating record, and submit a notification to the State or Tribal Authority, and post the certification documentation on their public CCR website. At that time, the facility would not be subject to any further requirements under this final rule (*i.e.*, neither legacy CCR surface impoundment requirements or CCRMU requirements). The deadline for the completion of the certification of closure by removal for these units is no

later than 42 months after the effective date of the final rule. This will provide the owner or operators of these units with the same amount of time as other legacy CCR surface impoundments to comply with the requirements to design and install a groundwater monitoring network, develop a sampling and analysis plan, collect eight baseline samples, and initiate combined detection and assessment monitoring (*i.e.*, 30 months after the effective date of the final rule) and an additional 12 months to perform at least two sampling rounds.

If, however, groundwater monitoring detects an SSL above the established GWPS of any Appendix IV constituent, the legacy CCR surface impoundment described above becomes subject to the corrective action requirements in §§ 257.96 through 257.98 and is no longer eligible to certify closure by removal under this provision. The owner or operator of the legacy impoundment must then prepare the applicability report no later than six months from the date of receiving the laboratory analysis documenting the SSL. No later than eight months from the date of receiving the laboratory analysis documenting the exceedance of the GWPS, the owner or operator must install the permanent marker. Furthermore, the facility must comply with the CCRMU requirements in Unit III.C. However, the compliance deadlines for the CCRMU requirements will be delayed by the number of months between the publication date of the rule and the date of receiving the laboratory analysis documenting the exceedance of the groundwater protection standard. For example, if a facility receives the laboratory analysis documenting an exceedance of the GWPS for any Appendix IV constituent 36 months after the effective date, the facility would add 42 months to all the CCRMU compliance deadlines. Additionally, if a CCRMU is discovered onsite, the owner or operator must prepare a fugitive dust plan no later than 6 months after the completion of the FER. For such units that are unable to certify, the final rule also includes a provision that allows a facility closing a unit by removal to complete any necessary corrective action during a post closure care period. Assuming the criteria in Unit III.B.2.g.iii are met, the facility can also elect to defer closure to permitting. However, given that the facility must comply with the groundwater monitoring and corrective actions under both options, EPA expects that most facilities will prefer to pursue

certifications. See Unit III.D of this preamble for further discussion.

c. Location Restrictions and Liner Design Criteria

Under the existing CCR regulations, existing CCR surface impoundments that cannot demonstrate compliance with the location restrictions for placement of CCR above the uppermost aquifer, in wetlands, within fault areas, in seismic impact zones, or in unstable areas (specified in §§ 257.60 through 257.64) must retrofit or close. The purpose of these requirements is to ensure that units located in particularly problematic areas cease operation. EPA explained in the proposed rule that because, by definition, legacy CCR surface impoundments are not operating, and because it appears that all legacy CCR surface impoundments are unlined and will therefore be required to close, EPA believed that requiring compliance with the location restrictions would be largely redundant.

Commenters largely supported not requiring location restrictions or liner demonstrations on the grounds that location restrictions and design criteria are not relevant to this class of units, as these requirements primarily seek to ensure active units operate safely. Other commenters believed that legacy CCR surface impoundments should not be exempted from liner and structural stability requirements out of concern that requiring compliance with one or more location restrictions would provide information that would be “critical” to designing unit closure and any necessary corrective action.

EPA disagrees that applying location restrictions and the liner design criteria to legacy CCR surface impoundments would be appropriate. First, as explained in the proposed rule, these criteria are more appropriate for operational units or units at active facilities. Second the consequence of failing to comply with the location restrictions and liner design criteria requirements is closure by a specific date. 40 CFR 257.101(a) through (b)(1). Because legacy CCR surface impoundments are not operational and will in any event be required to close, the consequence for failure to comply with location restrictions or the liner design criteria (*i.e.*, ceased receipt of waste and closure) is moot. Additionally, the commenter failed to identify any information necessary for conducting corrective action or closure uniquely gained by complying with the location restrictions or liner design criteria. Therefore, EPA continues to conclude that, as stated in the proposed rule, information useful for corrective

action or closure that would be obtained by complying with the location restrictions will be captured by compliance with the history of construction requirement, the closure plan, or in the development of the groundwater monitoring system.

EPA also continues to believe that the requirement to document whether the impoundment was constructed with a composite liner or alternative composite liner under § 257.71(a)(1) is not warranted for legacy CCR surface impoundments. The original purpose of this provision was to determine whether the unit was unlined, and consequently subject to closure. However, the available information indicates that legacy CCR surface impoundments were largely constructed well before composite liners systems were typically installed. Indeed, no commenter identified a legacy impoundment with a composite liner. For these reasons, EPA expects legacy CCR surface impoundment to be unlined and, therefore, the final rule requires all legacy CCR surface impoundments to close. As a consequence, requiring facilities to compile the information required by § 257.71(a)(1) would not provide useful information or otherwise be necessary. Therefore, EPA is not finalizing such requirement.

d. Design Criteria for Structural Integrity for Legacy CCR Surface Impoundments

EPA proposed that legacy CCR surface impoundments be subject only to the existing design criteria requirements in § 257.73, in order to help prevent damages associated with structural failures of CCR surface impoundments.

EPA received numerous comments on application of the design criteria requirements to legacy CCR surface impoundments. Most commenters on the design criteria specifically commented on the reporting/assessment requirements in § 257.73 (*i.e.*, history of construction, initial hazard potential classification, initial structural stability assessment, initial safety factor assessment). Some of these commenters supported the expedited deadline for the reports. However, most of these commenters echoed the concerns mentioned in Unit III.B.2.a.ii of this preamble, characterizing the proposed deadlines as infeasible, citing third-party availability, national labor shortage, seasonality, the need to conduct quality control and quality assurance, and the accessibility and completeness, or lack thereof, of historical documentation and data. These commenters stated that because legacy CCR surface impoundments are not operational and have not been

operational since before the 2015 CCR Rule took effect, it is highly unlikely that owners or operators will have the required historical documentation or data readily available and that, for most of these facilities, documentation is likely in storage or lost to time. Commenters have stated that more time is needed for owners or operators to do their due diligence in locating and reviewing the necessary data and information.

Furthermore, these commenters stated that due to the likely lack of historical information, additional analyses will more than likely be necessary to collect information essential to meeting the standards in the CCR rule for each report. Additionally, these commenters said that EPA was incorrect in characterizing these additional analyses as minor and capable of being performed within the proposed deadline (*i.e.*, three months from the effective date of the final rule) and that some of these analyses (*e.g.*, site visits, geotechnical investigations) could be impacted by both contractor availability and seasonality. Several commenters also pointed out that Professional Engineer (P.E.) certification or approval by the Participating State Director or EPA was required for these reports (*i.e.*, hazard potential classification assessments, structural stability assessments, and safety factor assessments). These commenters said that the proposed deadline did not provide adequate time to collect and review historical information, acquire any necessary new information (*i.e.*, perform additional analyses), and conduct sufficient quality control and quality assurance of said information to ensure the report would be certifiable by a P.E. or capable of being approved by a State Director, Tribal authority, or EPA. Commenters also highlighted that the information required by § 257.73 will also be important in complying with concurrent and subsequent requirements, such as the design of the groundwater monitoring network and the closure plan. These commenters stated that providing inadequate time to generate reports under § 257.73 that meet the standards set out in the rule has an adverse ripple effect on the inputs of other requirements, undermining the adequacy of those analyses and plans. Lastly, commenters stated the estimates in the proposed rule of the amount of time needed to complete actions necessary to achieve compliance (*e.g.*, hire a contractor; generate a report) were grossly underestimated, based on the

experiences of engineering firms, consultants, and owners or operators.

No commenters raised concern about requiring legacy impoundments to comply with the existing requirements in § 257.73. Therefore, EPA is finalizing the application of the structural integrity requirements in § 257.73 to legacy CCR surface impoundments.

As mentioned in Unit III.B.2.a.ii of this preamble, based on the information provided by commenters regarding the impacts of third-party availability, national labor shortage, seasonality, and accessibility and completeness of historical documentation, EPA has extended the deadlines for the design criteria located at § 257.73 as described below. This is at least as much time as facilities were granted to reach compliance in the 2015 CCR Rule deadlines. As detailed below in Units III.B.d.i through III.B.d.v, EPA calculates that this additional time as compared to the proposed deadlines mitigates the seasonality concerns associated with performing any necessary analyses involving field work; accommodates for the unavoidable delays caused by backlogs and shortages currently being faced by necessary third parties; provides owners or operators time to locate and compile the relevant historical documentation that was more readily available and accessible for facilities complying with the 2015 CCR Rule; and ensures a compliance deadline feasible for facility nationwide.

i. Installation of a Permanent Marker for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments, except for “incised CCR surface impoundments” as defined in § 257.53, comply with § 257.73(a)(1), which requires the placement of a permanent identification marker, at least six feet high on or immediately adjacent to the CCR unit. EPA also proposed that placement of the permanent marker be completed by the effective date of the final rule.

Overall, commenters stated this deadline should align with the 2015 CCR Rule deadline (*i.e.*, two months from the effective date) to accommodate for site access issues, seasonality, and the time needed to hire necessary third parties to conduct the work. EPA acknowledges that the proposal had not accounted for the national labor shortage of contractors, or the need to factor in seasonality for site access and the installation of the permanent marker. Therefore, EPA agrees with the commenters that extending the deadline for the installation of the permanent marker to no later than two months from

the effective date of the final rule provides owners or operators of legacy CCR surface impoundments would provide the necessary time to comply with the requirement at § 257.73(a)(1) while still being protective of human health and the environment.

Therefore, EPA is finalizing the requirement to install the permanent marker no later than Wednesday, January 8, 2025, which is two months after the effective date of the final rule. This is codified in the regulatory text at § 257.100(f)(2)(i).

To complete the installation of the permanent marker, owners or operators must ensure the marker is at least six feet high and displays the name of the legacy CCR surface impoundment, the name of the owner or operator of the unit, and the identification number of the CCR unit, if one has been assigned by the State.

ii. History of Construction for the Legacy CCR Surface Impoundments

Consistent with the existing regulations, EPA proposed that owners or operators of legacy CCR surface impoundments that either have: (1) A height of five feet or more and a storage volume of 20 acre-feet or more; or (2) Have a height of 20 feet or more, would be required to comply with the existing requirements to compile the history of construction of the legacy CCR surface impoundment. In the proposed rule, EPA acknowledged that information regarding construction materials, expansions or contractions of units, operational history, and history of events may be difficult for owners or operators to obtain. Therefore, EPA proposed that owners or operators would only need to provide information on the history of construction to the extent that such information is reasonably and readily available. EPA proposed a deadline of no later than three months after the effective date for owners or operators to comply with this requirement.

Overall, commenters on the proposed rule stated the proposed deadline for the history of construction was infeasible for the reasons listed in Unit III.B.2.d of this preamble; namely the limited availability of contractors, exacerbated by the number of CCR units competing for the same resources; seasonality impacts on necessary analyses; and accessibility and completeness of historical information. Some of these commenters also highlighted the importance of the history of construction requirement as an input into the design of the groundwater monitoring system, closure decisions, and other design criteria assessments;

these commenters further emphasized the direct impacts of the quality of the history of construction on the quality of subsequent (*i.e.*, groundwater monitoring network design, closure plan) and interrelated requirements (*i.e.*, hazard potential classification, structural stability and safety factor assessments, inflow design flood control system plan, EAP). These commenters said that, although EPA acknowledged in the proposed rule that EPA would only require information that is reasonably and readily available, owners or operators would still likely need to conduct surveys and other analyses to ensure the report would meet the requirements in § 257.73(a)(2) and to provide sufficient information for the completion of subsequent and interrelated requirements. These commenters also stated that locating the necessary documentation to complete the history of construction would take considerable time and effort due to the age of the units, the inactivity of the facility, and the likelihood of records being located at currently unknown offsite locations. Furthermore, some of these commenters requested clarification of what EPA means by “reasonably and readily available.” Finally, commenters’ suggested deadlines for the completion of the history of construction requirement ranged from three to 30 months.

As stated in Unit III.B.2.d of this preamble, EPA has reviewed the information provided by commenters citing the shortages and backlogs of qualified contractors, increased strain on those contractors related to the number of CCR units complying with the CCR rule simultaneously, difficulty accessing and reviewing historical documentation, and needed time to perform quality control and quality assurance, and considers it to be persuasive. EPA also acknowledges that the history of construction report ties into several subsequent requirements, including the other design criteria assessments and plan, the groundwater monitoring and corrective action requirements, and the closure and post-closure care requirements and therefore, agrees that providing sufficient time for the completion of a thorough history of construction report is important for the protection of human health and the environment.

Furthermore, as stated in Unit III.B.2.a.ii, EPA extended most deadlines to allow for as much time to come into compliance as was granted in the 2015 CCR Rule. While EPA recognizes that when coming into compliance with the 2015 CCR Rule, owners and operators had to locate

historical documentation, based on information provided by commenters regarding the unknown whereabouts of the necessary records, the age and inactivity of these facilities, and the labor shortages, EPA expects it will be slightly more difficult to access and assess historical documentation for the older legacy CCR surface impoundments than it was for the units regulated by the 2015 CCR Rule. Because of the increased difficulty in locating and accessing records, the importance of the history of construction as an input into other requirements, and the high likelihood of additional analyses being needed, EPA is finalizing a deadline of no later than Monday, February 9, 2026, which is 15 months from the effective date. This deadline is an extension of three months longer than the 2015 CCR Rule deadline and is sufficient to accommodate the slight increase in difficulty in accessing legacy impoundment records. This is codified in the regulatory text at § 257.100(f)(2)(ii).

Finally, as explained in Unit III.B.2.b.i, EPA addressed the term “reasonably and readily available” at 80 FR 21380. When using this term, EPA intends facilities to provide relevant design and construction information only if factual documentation exists and does not expect owners or operators to generate new information or provide anecdotal or speculative information.

Compliance with the history of construction requirement at § 257.73(c) requires owners or operators of a CCR unit to compile a report that documents identifying characteristics of the unit, the history of how the CCR unit was used, specifics related to the unit’s design and construction, and the unit’s instrumentation. Once compiled, the report must be placed into the facility’s operating record as required by § 257.105(f)(9). If the information included in the history of construction report needs to be changed at any point in time, the owner or operator must update the history of construction report and place the updated report into the operating record. A comprehensive list of information required in the history of construction is in § 257.73(c)(1).

iii. Initial Hazard Potential Classification for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments, except for incised CCR surface impoundments as defined in § 257.53, must complete the initial and periodic hazard potential classification assessments required under § 257.73(a)(2) without revision. EPA

proposed a deadline of no later than three months after the effective date for the completion of the initial hazard potential classification assessment.

No commenters raised concern about requiring legacy impoundments to comply with the existing requirements in § 257.73(a)(2). EPA is therefore finalizing this provision without revision. This is codified in the regulatory text at § 257.100(f)(2)(iii).

However, EPA received numerous comments on the proposed deadline. Overall, commenters on the proposed rule stated the proposed deadline for the initial hazard potential classification was infeasible for the reasons listed in Unit III.B.2.d of this preamble, namely the limited availability of contractors exacerbated by the number of CCR units competing for the same resources; seasonality impacts on necessary analyses; accessibility and completeness of historical information, and the need for quality assurance and quality control. As mentioned in Unit III.B.2.d.ii, a few commenters noted the interrelationship and overlapping activities (e.g., historical documentation review, site visit, geotechnical investigations, unit modeling) between the initial hazard potential classification and the history of construction, initial safety factor assessment, and the initial structural stability assessment. Specifically, commenters stated that the history of construction is done first and used to complete the initial hazard potential classification. Furthermore, commenters highlighted the direct dependence on the hazard potential classification for determining the design flood to use in inflow design flood control plan (§ 257.82(c)) and the trigger for the EAP requirement (§ 257.73(a)(3)). Commenters' suggested deadlines for the completion of the hazard potential classification requirement ranged from three to 24 months.

As explained in Units III.B.2.a.ii and III.B.2.d of this preamble, EPA acknowledges the need to extend the compliance deadline in consideration of the impacts of labor shortage, contractor backlogs, seasonality, accessibility and completeness of historical information, and the need for quality assurance and control. EPA further acknowledges the interrelationship of the design criteria reports and the direct dependence of the initial inflow design plan and EAP requirements on the completion of hazard potential classification. As explained in Unit III.B.2.d of this preamble, based on the information provided by commenters, EPA determined that extending the deadline for the initial hazard potential classification to allow for at least as

much time to come into compliance as was granted in the 2015 CCR Rule (*i.e.*, 18 months after the effective date) is necessary to ensure the compliance deadlines are nationally feasible. Because owners or operators will be locating and compiling historical documents and information as part of the history of construction requirement, EPA assumes that historical documentation necessary for the initial hazard potential classification assessment can be located and compiled concurrently. Additionally, EPA expects necessary historical information (e.g., engineering design drawings, geotechnical studies, dam hazard potential classification documents, stability assessments) and new analyses (e.g., surveys or geotechnical investigations) needed for the history of construction and the initial hazard potential classification to overlap to some degree. Therefore, EPA has determined that additional time beyond that granted to come into compliance with the 2015 CCR Rule is not needed for this requirement. As such, EPA is finalizing a deadline of no later than Friday, May 8, 2026, which is 18 months from the effective date of this final rule.

To comply with the hazard potential classification requirement at § 257.73(a)(2), owners or operators of legacy CCR surface impoundments must determine the hazard potential classification of the CCR unit and justify the determination in a report. The CCR unit can be classified as a low hazard potential CCR surface impoundment, a significant hazard potential CCR surface impoundment, or a high hazard potential CCR surface impoundment. The report must be certified by a P.E. stating the hazard potential classification was conducted in accordance with the CCR regulations. Subsequent periodic hazard potential classifications are required every five years after the completion of the previous hazard potential classification as described at § 257.73(f)(3).

iv. Initial Structural Stability Assessment and Initial Safety Factor Assessment for Legacy CCR Surface Impoundments

Consistent with the existing regulations and EPA's findings from the 2009–2014 Assessment Program as described in the proposed rule, EPA proposed that owners or operators of legacy CCR surface impoundments that meet the size thresholds in § 257.73(b) and (c), must conduct two types of technical assessments: (1) Structural stability assessments; and (2) Safety factor assessments. In the proposed rule,

EPA explained that these two assessments could be conducted concurrently and therefore, a deadline of no later than three months from the effective date of the final rule was proposed for both requirements.

No commenters raised concern about requiring legacy impoundments to comply with the existing requirements in § 257.73(b) and (c). EPA is therefore finalizing this provision without revision. This is codified in the regulatory text at § 257.100(f)(2)(iv).

However, EPA received numerous comments on the proposed deadline. Overall, commenters on the proposed rule stated the proposed deadlines for the initial structural stability and safety factor assessments were infeasible for the reasons outlined in Units III.B.2.a.ii and III.B.2.d of this preamble, namely, seasonality, third-party availability, national labor shortage, the need to conduct quality control and quality assurance, and the accessibility and completeness, or lack thereof, of historical documentation and data. As mentioned in Unit III.B.2.d.ii, a few commenters noted the interrelationship and overlapping activities (e.g., historical documentation review, site visit, geotechnical investigations, unit modeling) between the initial structural stability and safety factor assessments and the history of construction, initial hazard potential classification, and the inflow flood control system plan. Furthermore, commenters highlighted the need to have quality information within the structural stability and safety factor assessments to inform the EAP and to make sound closure decisions. Commenters' suggested deadlines for the completion of the initial structural stability assessment and the initial safety factor assessment ranged from six to 24 months.

As explained in Units III.B.2.a.ii and III.B.2.d, EPA acknowledges the need to extend the compliance deadline in consideration of the impacts of labor shortage, contractor backlogs, seasonality, accessibility and completeness of historical information, and the need for quality assurance and control. EPA further acknowledges the interrelationship of the design criteria reports and the value of using the structural stability and safety factor assessment to develop the EAP and the closure plan for the legacy CCR surface impoundment. As explained in Unit III.B.2.d of this preamble, based on the information provided by commenters, EPA determined that extending the deadline for the initial structural stability and safety factor assessments to allow for at least as much time to come into compliance as was granted in the

2015 CCR Rule is necessary to ensure the compliance deadlines are nationally feasible. Because owners or operators will be locating and compiling historical documents and information as part of developing the history of construction, EPA assumes that historical documentation necessary for the initial structural stability and safety factor assessments can be located and compiled concurrently. Additionally, the historical information (*e.g.*, engineering design drawings, operational records) and new analyses (*e.g.*, surveys, geotechnical investigations) needed for the history of construction, initial hazard potential classification, and the initial structural stability and safety factor assessments overlap to some degree. Therefore, EPA has determined that additional time beyond that granted to come into compliance with the 2015 CCR Rule is not needed for this requirement. As such, EPA is finalizing a deadline of no later than Friday, May 8, 2026, which is 18 months from the effective date of this final rule.

To comply with the structural stability assessment and safety factor assessment requirements at § 257.73(d) and § 257.73(e), owners or operators of legacy CCR surface impoundments must conduct initial and periodic structural stability and safety factor assessments. The structural stability assessment must document whether the design, construction, operation, and maintenance of the unit is consistent with recognized and generally accepted good engineering practices for the maximum volume of CCR and CCR wastewater capable of being contained within the unit. Accepted good engineering practices includes, but are not limited to, stable foundations and abutments, adequate slope protection, sufficiently compacted dikes, slope protections, spillways capable of managing flow during and following peak discharge events, structurally sound and operational hydraulic structures, and structurally sound downstream slopes capable of withstanding sudden drawdown of adjacent water bodies. See 40 CFR 257.73(d).

The safety factor assessment must document whether the calculated factors of safety for the legacy CCR surface impoundment achieves the minimum safety factor specified in §§ 257.73(e)(1)(i) through (iv) for the cross section of the embankment most susceptible to structural failure determined by loading conditions and other appropriate engineering considerations. See 40 CFR 257.73(e).

The periodic assessments are required every five years after the completion of the previous assessment described at § 257.73(f)(3). Each assessment must be certified by a P.E. stating that the assessment was conducted in accordance with the CCR regulations.

v. Preparation of an Emergency Action Plan for Legacy CCR Surface Impoundments

EPA proposed that the owners or operators of legacy CCR surface impoundments that have been identified as having either a high hazard potential or a significant hazard potential would be required to comply with the same requirement as existing CCR surface impoundments under § 257.73 to prepare and maintain a written EAP. An EAP is a document that identifies potential emergency conditions at a CCR surface impoundment and specifies actions to be followed to minimize loss of life and property damage.

No commenters raised concern about requiring legacy impoundments to comply with the existing requirements in § 257.73(a)(3). EPA is therefore finalizing this provision without revision. This is codified in the regulatory text at § 257.100(f)(2)(v).

However, EPA received numerous comments on the proposed deadline. Overall, most commenters on the proposed rule stated that at a minimum, EPA should allow as much time for legacy CCR surface impoundment to come into compliance as granted existing units the 2015 CCR Rule deadlines. Several commenters pointed out the direct reliance of the EAP on the hazard potential classification assessment and noted that the history of construction, safety factor assessment, and structural stability assessment provided critical information as well. These commenters noted that if the deadlines for any of those prerequisite requirements were extended beyond the proposed compliance deadline, the EAP deadline should be extended as well. Commenters' suggestions for the deadline for the completion of the EAP ranged from 11 to 18 months.

EPA acknowledges that the EAP relies on the hazard potential classification assessment and agrees with the commenters who stated that if the deadline for the hazard potential classification assessment was extended, the deadline for the development of the EAP should be extended to no earlier than the deadline for the initial hazard potential classification assessment. As stated in Unit III.B.2.d.iv, EPA is finalizing a deadline of no later than 18 months from the effective date of this

final rule for the initial hazard potential classification assessment. Furthermore, the deadlines for the initial safety factor and structural stability assessments are being finalized at no later than Friday, May 8, 2026, which is 18 months from the effective date of the final rule. This deadline also provides owners or operators the same amount of time for legacy CCR surface impoundments to comply with the requirements as was granted for existing units in the 2015 CCR Rule. Therefore, EPA is finalizing a deadline of no later than Friday, May 8, 2026, which is 18 months from the effective date of the final rule for legacy CCR surface impoundment to develop an EAP in accordance with § 257.73(a)(3).

As described above, an EAP specifies the actions to take during potential emergency conditions at a CCR surface impoundment. To prepare an EAP, the owner or operator must accurately and comprehensively identify potential failure modes and at-risk developments. See also 80 FR 21377–21379, April 17, 2015. To comply with the EAP requirement, the EAP must, at a minimum, define the events or circumstances involving the CCR unit that represent a safety emergency; describe the procedures that will be followed to detect a safety emergency in a timely manner; define responsible persons, each person's responsibilities, and notification procedures in the event of an emergency; provide contact information for emergency responders; include a map that delineates the downstream area that would be impacted by a CCR unit failure; a physical description of the CCR unit; and provisions for an annual face-to-face meeting between representatives of the owner or operator and the local emergency responders.

e. Operating Criteria for Legacy CCR Surface Impoundments

The operating criteria in §§ 257.80, 257.82, and 257.83 include air criteria for all CCR units, hydrologic and hydraulic capacity requirements for CCR surface impoundments, and periodic inspection requirements for CCR surface impoundments. These criteria address the potential risks from the day-to-day operations of CCR units and are established to prevent health and environmental impacts from CCR units. CCR surface impoundments are subject to hydrologic and hydraulic capacity requirements to ensure the unit can safely handle flood flows, which will help prevent uncontrolled overtopping of the unit or erosion of the materials used to construct the surface impoundment. The existing CCR

regulations also require periodic inspections of CCR units to identify any appearance of structural weakness or other conditions that are not consistent with recognized and generally accepted good engineering standards. EPA proposed that legacy CCR surface impoundments comply with these existing requirements without revision.

Several commenters recommended that EPA provide relief from these operating requirements for legacy impoundments that have closed prior to the effective date of this rule, since these operating requirements do not make sense for units that are no longer operating. These commenters also state that the proposed rule includes relief from many requirements for legacy impoundments that have closed by removal of CCR, but does not include similar flexibility for legacy impoundments that have closed in place. Commenters said requiring an owner or operator to meet operating requirements for units that no longer contain both CCR and liquids, and therefore do not pose the same operating risks as existing CCR units, is illogical. They contended these requirements are more applicable for legacy impoundments that continue to contain both CCR and liquids as of the effective date of this final rule. They further said EPA should therefore reconsider its position and account for prior closure activities and afford flexibility to those units that have undergone, or are undergoing, State-led closure activities.

EPA disagrees that applying the operating criteria to legacy CCR surface impoundments is inappropriate even if these units are no longer receiving waste. EPA believes that applying the fugitive dust requirements reduces the risk from airborne dust and requiring inspections and inflow design flood control plan for legacy impoundments that contain both CCR and liquids will reduce the risks from structural stability concerns. EPA further addresses legacy impoundments that closed by removal or closed with waste in place under a State or Federal authority in Unit III.B.2.g of this preamble. Accordingly, EPA is finalizing the requirement that legacy CCR surface impoundments comply with these existing operating criteria requirements in §§ 257.80, 257.82, and 257.83 without revision.

i. Fugitive Dust Control Plan for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments must complete a fugitive dust control plan by the effective date of the final rule. The existing regulations require the owner or

operator of a CCR unit to adopt measures that will effectively minimize CCR from becoming airborne at the facility, including CCR fugitive dust originating from CCR units, roads, and other CCR management and material handling activities. 40 CFR 257.80(b). To meet this requirement, the owner or operator of the CCR unit must prepare and operate in accordance with a fugitive dust control plan. *Id.* See also 80 FR 21386–21388. EPA considers that fugitive dust controls are warranted because closure activities can produce significant quantities of dust.

EPA received few comments on the fugitive dust control plan. One commenter requested that EPA amend § 257.80 to include additional requirements to protect those who work or live near CCR facilities from the risks of fugitive dust. EPA disagrees that additional fugitive dust controls are needed as EPA has no data to prove that the existing requirements are inadequate.

EPA received some comments on the compliance deadline to complete the fugitive dust control plan. Overall, commenters supported the proposed deadline. However, a couple commenters requested more time. One commenter requested three additional months for all requirements due on the effective date, including the fugitive dust plan. This commenter provided no evidence or factual basis to support this suggested deadline. Another commenter requested a deadline of 30 months for all requirements with proposed deadlines of the effective date to allow owners or operators 24 months to determine if the unit is eligible for the closure certification and prepare the certification report and then an additional 6 months to comply with other requirements, such as the dust plan and creation of a CCR website, if the unit is not eligible for the closure certification. EPA finds the requests for a deadline extension for the fugitive dust control plan to be unfounded.

The primary activities associated with this requirement are hiring a contractor who is a qualified P.E., having the contractor develop a plan based on daily operations at the unit and site conditions, and certification of the plan by a P.E. Little to no field-based activities are required to complete the fugitive dust control plan. Furthermore, this provides the same amount of time that EPA provided in the 2015 CCR Rule for facilities to develop their fugitive dust control plans. Therefore, EPA is finalizing the requirement that owners or operators of legacy CCR surface impoundments must complete a fugitive dust control plan no later than Friday,

November 8, 2024, which is the effective date of this final rule. This is codified in the regulatory text at § 257.100(f)(3)(i).

ii. Initial Fugitive Dust Control Report for Legacy CCR Surface Impoundments

EPA proposed to require the initial annual fugitive dust report to be due 12 months after the effective date of the final rule. Consistent with the existing regulations, the report must document all actions taken to control CCR fugitive dust, a record of all citizen complaints, and a summary of any corrective measures taken in the previous year. As this report is primarily a summary of owner or operator activities related to fugitive dust control and does not require a P.E. certification, the report may be completed by the owner or operator without the need for a contractor. The owner or operator has completed the annual CCR fugitive dust control report when the plan has been placed in the facility's operating record.

EPA did not receive comments on the annual fugitive dust control report requirements. As described in Unit III.B.2.a.ii of this preamble, commenters requested that deadlines provide at least as much time as was granted for 2015 CCR Rule requirements. Therefore, EPA is extending the deadline from 12 months to 14 months to allow for a full year to be reported in the first report (12 months plus two months for report generation).

EPA is finalizing the requirement that the initial annual fugitive dust report be completed no later than Thursday, January 8, 2026, which is 14 months after the effective date of this final rule. This is codified in the regulatory text at § 257.100(f)(3)(vi).

iii. Weekly Inspections of the Legacy CCR Surface Impoundment and Monthly Monitoring of the CCR Unit's Instrumentation

EPA proposed that owners or operators of legacy CCR surface impoundments must initiate the inspection requirements set forth in § 257.83(a) no later than the effective date of the final rule. Under § 257.83(a), all CCR surface impoundments must be examined by a qualified person at least once every seven days for any appearance of actual or potential structural weakness or other conditions that are disrupting or that have the potential to disrupt the operation or safety of the CCR unit. The results of the inspection by a qualified person must be recorded in the facility's operating record. Weekly inspections are intended to detect, as early as practicable, signs of distress in a CCR surface

impoundment that may result in larger, more severe conditions. Inspections are also designed to identify potential issues with hydraulic structures that may affect the structural safety of the unit and impact its hydraulic and hydrologic capacity. Section 257.83(a) also requires the monitoring of all instrumentation supporting the operation of the CCR unit to be conducted by a qualified person no less than once per month. See also 80 FR 21394–21395.

One commenter opposed applying the inspection requirements to legacy CCR surface impoundment, stating these requirements are intended for operational units and therefore are inappropriate for units that no longer receive waste. EPA disagrees that applying the inspection requirements to legacy CCR surface impoundments is inappropriate even if these units are no longer receiving waste. EPA believes that applying the weekly inspection requirements to legacy CCR surface impoundments that contain both CCR and liquids reduces the risks associated with structural stability concerns. Furthermore, the commenter provided no factual basis for the exclusion of legacy CCR surface impoundments from these requirements. EPA did not get any comments specifically about this deadline, thus, EPA is finalizing without revision the requirement that owners or operators of legacy CCR surface impoundments initiate the inspection requirements set forth in § 257.83(a) no later than Friday, November 8, 2024, which is the effective date of the final rule. This is codified in the regulatory text at § 257.100(f)(3)(iii).

iv. Initial Annual Inspection for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments must conduct the initial annual inspection no later than three months after the effective date of the final rule. Existing CCR surface impoundments exceeding the height and storage volume thresholds in § 257.73(b) and (c), are required to conduct annual inspections of the CCR unit throughout its operating life (§ 257.83(b)). These inspections are focused primarily on the structural stability of the unit and must ensure that the operation and maintenance of the unit is in accordance with recognized and generally accepted good engineering standards. Each inspection must be conducted and certified by a P.E. See also 80 FR 21395.

EPA received comments that said the inspections should be required for

legacy impoundments, in addition to the other operating criteria. However, one commenter opposed applying the inspection requirements to legacy CCR surface impoundment, stating these requirements are intended for operational units and therefore are inappropriate for units that no longer receive waste. EPA continues to conclude that the annual inspections required by § 257.83 are relevant for legacy CCR surface impoundments even if these units are no longer receiving waste. EPA believes that applying the annual inspection requirement to legacy CCR surface impoundments that contain both CCR and liquids reduces the risks associated with structural stability concerns. Furthermore, the commenter provided no factual basis for the exclusion of legacy CCR surface impoundments from these requirements.

Annual inspections include documentation review, a visual inspection of the CCR unit, and a visual inspection of any hydraulic structures underlying the base of the CCR unit or passing through the CCR unit's dike. Documentation reviewed as part of the annual inspection include operating records, previous structural stability assessments, and the results of previous weekly, monthly, and annual inspections and can overlap with reviews needed to complete the initial structural stability assessment.

EPA proposed that owners or operators of legacy CCR surface impoundments must conduct the initial annual inspection no later than three months after the effective date of the final rule. EPA proposed that owners or operators must prepare the initial inspection report for legacy CCR surface impoundments within the same time frame—no later than three months from the effective date of the final rule—as was required for existing CCR surface impoundments in the 2015 CCR Rule. The Agency believes this time frame to prepare the initial annual inspection is similarly appropriate for legacy CCR surface impoundments as for existing impoundments. As discussed in the preamble to the 2015 CCR Rule, the three-month time frame was based on EPA's experience with its CCR Assessment Program to evaluate the structural stability and safety of existing impoundments throughout the nation. Specifically, EPA found that three months would be adequate to complete the tasks supporting an annual inspection, including retaining the services of a P.E., reviewing relevant information in the facility's operating record, conducting the field inspection, and completing the inspection report.

See 80 FR 21395. EPA did not receive any comments objecting to this time frame.

EPA is finalizing the requirement without revision that owners or operators of legacy CCR surface impoundments must conduct the initial annual inspection no later than Monday, February 10, 2025, which is three months after the effective date of the final rule. This is codified in the regulatory text at § 257.100(f)(3)(iv).

v. Initial Inflow Design Flood Control System Plan for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments must prepare the inflow design flood control system plan nine months after the effective date of the final rule. Owners or operators of all CCR surface impoundments are required to design, construct, operate, and maintain hydraulic and hydrologic capacity to adequately manage flow both into and from a CCR surface impoundment during and after the peak discharge resulting from the inflow design flood, which is based on the Hazard Potential Classification of the CCR surface impoundment (§ 257.82(a)). The regulation also requires the preparation of an initial inflow design flood control system plan (§ 257.82(c)). See also 80 FR 21390–21392.

EPA did not receive any comments about this requirement. However, overall, most commenters believed that compliance deadlines should not be accelerated to be shorter than required for active units. Commenters also believed that substantial data collection efforts might be required resulting in situations where it is not feasible to meet the proposed deadline. For example, there is an ongoing shortage of contractors (e.g., consultants, drillers, laboratories) to complete this work. EPA considered these comments and extended the deadline to 18 months in consideration of third-party availability and in order to match the 2015 CCR Rule.

EPA is finalizing the requirement that owners or operators of legacy CCR surface impoundments prepare the inflow design flood control system plan no later than Friday, May 8, 2026, which is 18 months after the effective date of the final rule. This is codified in the regulatory text at § 257.100(f)(3)(v).

f. Groundwater Monitoring and Corrective Action Criteria for Legacy CCR Surface Impoundments

EPA proposed to require legacy CCR surface impoundments to comply with the existing groundwater monitoring

and corrective action criteria in 40 CFR 257.90 through 257.98, with one revision, to require sampling and analysis of constituents listed in Appendix IV at the same time as those listed in Appendix III. As explained in the proposed rule at 88 FR 32003, §§ 257.90 through 257.95 require owners or operators of a CCR unit to install a system of monitoring wells, specify procedures for sampling these wells, and set forth methods for analyzing the groundwater data collected to detect hazardous constituents (e.g., toxic metals) and other monitoring parameters (e.g., pH, total dissolved solids) released from the units. If the groundwater monitoring required in § 257.95, demonstrates an exceedance of the groundwater protection standards for constituents identified in Appendix IV of part 257, corrective action is required as laid out in §§ 257.96 through 257.98. These requirements apply throughout the active life and post-closure care period of the CCR unit.

Several commenters expressed support for requiring legacy CCR surface impoundments to comply with these groundwater monitoring and corrective action requirements, stating CCR units can and have caused groundwater contamination. Some commenters suggested additional requirements be added to those in §§ 257.90 through 257.98, including a mandate to test groundwater quality outside the boundary of the facility and make those results public; a report documenting the unit's proximity to the closest surface water body and nearest private and public groundwater wells; a deadline for the completion of the selection of remedy required by § 257.97; and a prohibition against using intrawell groundwater data comparisons at legacy CCR surface impoundments. Other commenters stated that applying the existing corrective action requirements to historic sites, such as legacy CCR surface impoundments, is not appropriate and suggested that instead EPA incorporate site-specific risk-based corrective action into the CCR regulations.

EPA further proposed two deadlines for the groundwater monitoring requirements, as opposed to the single deadline in the 2015 CCR Rule. EPA received numerous comments on EPA's proposal to split the single deadline for groundwater monitoring requirements contained within the 2015 CCR Rule (24 months from the effective date of the final 2015 rule) into two separate deadlines (six months from the effective date of the final rule for the installation of the groundwater monitoring network

and development of the groundwater sampling and analysis plan and 24 months from the effective date of the final rule for the initiation of the combined detection and assessment monitoring). A few commenters expressed support of the two separate deadlines for groundwater monitoring requirements, stating it increased accountability and ensured owners or operators were not unnecessarily delaying the installation of the groundwater monitoring system. However, overall, commenters stated that the groundwater monitoring requirements should have a single deadline as the separate deadlines made compliance with the rule infeasible. Several commenters said the proposed split deadlines eliminated the flexibility necessary for compliance that was contained within the 2015 CCR Rule's single deadline. Those commenters went on to say the single deadline allowed facilities to accommodate for delays associated with factors outside their control, such as third-party availability, weather, and required permits or approvals, by making schedule adjustments necessary to achieve compliance (e.g., expedite the development of the sampling plan in the case of delays with the well installation). Other commenters said the proposed two deadlines were unnecessarily prescriptive. One commenter pointed out that the proposed rule contained no deliverables to verify compliance for the installation of wells or the development of the sampling and analysis plan.

As explained in the proposed rule, the existing groundwater monitoring and corrective action requirements are essentially the same requirements that have been applied to both hazardous waste and municipal solid waste disposal units for decades, and with the one exception discussed below, there is nothing about legacy CCR surface impoundments that makes them distinct enough to warrant separate requirements from those for other CCR surface impoundments. No commenter provided any factual basis for treating legacy impoundments differently than all the other units that currently comply with the same groundwater monitoring requirements, including other inactive CCR surface impoundments. For those commenters requesting that EPA adopt "risk-based corrective action" into the requirements, EPA notes that the commenters have provided no further explanation of what requirements in the existing regulations they wanted EPA to revise, what the revisions should accomplish, or why they are necessary

or appropriate. As a general matter EPA considers that the corrective action regulations in §§ 257.95 through 257.98 do currently require facilities to tailor remedies to address the risks to human health and the environment, based on the conditions at the site. It is unclear what more the commenters are seeking. Accordingly, EPA is finalizing the proposal that legacy CCR surface impoundments comply with the existing groundwater monitoring and corrective action requirements with one modification, combined detection and assessment monitoring.

However, EPA agrees that having a single deadline for groundwater monitoring requirements as opposed to two deadlines allows flexibility to complete tasks, such as installing groundwater wells and collecting independent samples, which is necessary for compliance with a nationwide rule. The activities involved in achieving compliance with the groundwater monitoring requirements (i.e., drilling wells, collecting samples, receiving lab results) are more susceptible to factors outside a facility's control, such as extreme weather events, shortages of qualified contractors, and permitting or approval delays, and therefore, warrant greater flexibility. Additionally, activities can be restricted dependent on the time of year and the location of the facility (e.g., due to seasonality, protected species, clearing restrictions). Because the groundwater monitoring requirements build upon each other, EPA must ensure that facilities nationwide are reasonably able to achieve regulatory compliance by the deadline. Utilizing a single deadline for the groundwater monitoring requirements allows facilities to make reasonable accommodations for regional factors in a way the proposed deadlines do not, while still maintaining the same level of protection for human health and the environment. Furthermore, EPA agrees that the proposed rule does not have a clear mechanism for facilities to prove compliance or for interested parties to verify compliance with the separate deadlines for the installation of the groundwater monitoring network and the development of the groundwater sampling and analysis plan. Finally, based on the information provided by commenters, specifically the information regarding the current labor shortages and backlogs experienced by third parties necessary to accomplish tasks involved in complying with the groundwater monitoring requirements (e.g., drillers for well installation, laboratories for sample analysis), time needed to obtain

necessary approvals (e.g., State permits to drill water wells or clear vegetation), and to accommodate for seasonality, EPA has calculated six months as the appropriate extension of the 2015 CCR Rule groundwater monitoring system deadlines. Therefore, EPA is finalizing a single deadline of no later than 30 months after the effective date of this final rule for the groundwater monitoring requirements found at §§ 257.90 through 257.95.

i. Design and Installation of the Groundwater Monitoring System for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments install the groundwater monitoring system as required by § 257.91 no later than six months from the effective date of this final rule. EPA further proposed that existing monitoring wells can be used as a part of the legacy CCR surface impoundment groundwater monitoring systems provided the wells meet § 257.91. As explained in the proposed rule, based on the amount of time most facilities needed to complete or to collect baseline sampling, EPA calculated that facilities would be able to install the necessary monitoring wells within a single year.

As mentioned above, some commenters supported the expedited deadlines. However, most commenters stated the proposed deadline of six months from the effective date of the final rule for the design and installation of the groundwater monitoring network was infeasible and should be extended to no less than 24 months from the effective date to align with the 2015 rule deadline. As explained above, many of these commenters expressed the need for a single deadline for groundwater monitoring requirements. Furthermore, as described in Unit III.B.2.a.ii of this preamble, these commenters cited seasonality restrictions, the nationwide labor shortages, limited qualified contractor availability, the need for State approvals and permits, and the number of facilities competing for limited resources as reasons for why the proposed expedited deadline is infeasible. A few commenters noted that in recent decisions on Part A demonstrations, EPA cited deficiencies in the groundwater monitoring network as a basis for non-compliance. These commenters went on to state that the proposed deadline does not facilitate the establishment of a monitoring system that would meet the standards laid out in the CCR rule or the recent proposed decisions and thus, the proposed deadline creates de facto non-

compliance. One of these commenters elaborated by saying that the deadline does not allow facilities to acquire the permits that may be required to drill wells and precludes the observation of groundwater levels over time, which is needed to properly characterize groundwater flow. Other commenters stated meeting the proposed compliance deadline would prevent a facility from conducting proper site characterization, which is needed to inform well placement and depth and provide professional engineers sufficient information to certify the groundwater monitoring system. Lastly, commenters stated that contrary to EPA's assertion in the proposed rule that expediting the installation of the groundwater monitoring network is protective of human health and the environment, to meet the proposed deadline, facilities would likely be forced to design groundwater monitoring systems based on inadequate data resulting in unreliable groundwater monitoring data. Commenters provided estimates of time needed to comply with the design and installation of the groundwater monitoring system requirements ranging from 12 to 36 months.

As stated in Unit III.B.2.a.ii of this preamble, in response to comments EPA reevaluated the compliance deadline for the design and installation of the groundwater monitoring network and found the information provided regarding the general infeasibility of the proposed deadline compelling. Specifically, EPA agrees that more time is needed to account for limited third-party availability (e.g., contractor shortages and laboratory backlogs), seasonality and extreme weather events, procuring a contractor, complying with overlapping regulatory requirements, and coordinating with outside parties. EPA acknowledges the importance of proper site characterization as the foundation for designing a groundwater monitoring system and is convinced that although there may be some legacy CCR surface impoundments that have sufficient historical documentation for site characterization, many of these units may need to conduct more extensive site reconnaissance and field work to obtain the necessary information. Lastly, EPA recognizes that groundwater monitoring systems designed using inadequate data would be unable to properly monitor groundwater quality coming from the unit and therefore would not be protective of human health and the environment. Therefore, because EPA is convinced by information from the commenters that facilities would be

unable to conduct all the steps necessary to design and install a groundwater monitoring system capable of meeting the standards in § 257.91 by the proposed deadline, EPA has extended the deadline.

As stated in Unit III.B.2.f, based on information provided by commenters, EPA concluded that a single deadline should be used for the groundwater monitoring requirements. In the proposed rule, the latest proposed deadline for groundwater monitoring requirements was the deadline of 24 months from the effective date of this final rule for the initiation of the combined detection and assessment monitoring and the collection of the eight baseline samples. Based on information provided in response to comments on the proposed rule and as explained in Unit III.B.2.f, EPA calculated six months as the appropriate extension of the groundwater monitoring system deadlines. Therefore, EPA is finalizing a deadline for the completion of the design and installation of the groundwater monitoring system of no later than Monday, May 10, 2027, which is 30 months from the effective date of this final rule. This is codified in the regulatory text at § 257.100(f)(4)(i).

To complete the installation of the groundwater monitoring system, the owner or operator of a legacy CCR surface impoundment must ensure the monitoring system consists of sufficient number of wells both upgradient and downgradient of the CCR unit, installed at appropriate locations and depths, to yield groundwater samples from the uppermost aquifer that accurately represent the quality of background groundwater and groundwater passing the downgradient waste boundary of the CCR unit, monitoring all potential contaminant pathways. 40 CFR 257.91(a)(1) through (2). Because hydrogeologic conditions vary so widely from one site to another, the regulations do not prescribe the exact number, location, and depth of monitoring wells needed to achieve the general performance standard. Rather the regulation requires installation of a minimum of one upgradient and three downgradient wells, as well as any additional monitoring wells necessary to achieve the general performance standard of accurately representing the quality of the background groundwater and the groundwater passing. See, 80 FR 21399. The number and placement of the monitoring wells is critical to proper characterization of the groundwater. Thus, the specific number, spacing, and depth of the monitoring wells must be determined based on site-specific

information, including but not limited to the thorough characterization of aquifer thickness, groundwater flow rate, groundwater flow direction throughout seasonal and temporal fluctuations, the unit's geological setting, and the unit's hydrogeological setting.

The monitoring wells must be cased, constructed, operated, and maintained in a way that preserves the integrity of the monitoring well borehole, screened interval and other components so as to ensure the well performs to the design specifications throughout the life of the monitoring system. EPA expects owners or operators to ensure the groundwater monitoring wells are adequately protected from activities that may damage the wells or otherwise adversely impact their performance, such as accidental damage caused by livestock, vehicles, machinery, or other activities near the unit.

The owner or operator of the unit must ensure that the design, installation, development, and decommissioning of any aspect of the groundwater monitoring system is thoroughly documented and included in the operating record. Furthermore, the owner or operator must obtain a P.E. certification or approval from the Participating State Director or EPA stating the groundwater monitoring system meets the standards set out in § 257.91.

ii. Development of the Groundwater Sampling and Analysis Program for Legacy CCR Surface Impoundments

EPA proposed to require owners or operators of legacy CCR surface impoundments to comply with the existing groundwater sampling and analysis program requirements for CCR surface impoundments, including the selection of the statistical procedures that will be used for evaluating groundwater monitoring data. 40 CFR 257.93. EPA proposed a deadline of no later than six months after the effective date of the final rule for owners or operators to comply with this requirement.

One commenter suggested EPA prohibit use of intrawell groundwater data comparisons for legacy CCR surface impoundments. This commenter stated that intrawell comparisons are only appropriate when the background samples are collected before CCR was placed in the unit and therefore, since these units are likely already leaking, they would be ineligible for intrawell data comparisons. As stated in Unit III.B.2.f, the existing groundwater monitoring and corrective action requirements are essentially the same

requirements that have been applied to both hazardous waste and municipal solid waste disposal units for decades, and with the one exception discussed below, there is nothing about legacy CCR surface impoundments that makes them distinct enough to warrant separate or additional requirements. Furthermore, while EPA expects legacy CCR surface impoundments to largely be unlined and potentially leaking, the commenter did not provide any evidence that would support creating a prohibition against intrawell data comparisons. Therefore, EPA did not adopt a prohibition on intrawell data comparisons at legacy CCR surface impoundments. However, EPA acknowledges that since the 2015 CCR Rule went into effect, intrawell groundwater data comparisons have been misused to a large degree. No commenters raised concern about requiring legacy CCR surface impoundments to comply with the existing requirements in § 257.93. EPA is therefore finalizing this provision without revision. This is codified in the regulatory text at § 257.100(f)(4)(ii).

However, EPA received several comments on the proposed deadline for the development of the groundwater sampling and analysis plan. As mentioned in Unit III.B.2.a.ii, some commenters supported the expedited deadline. However, several other commenters pointed out that the sampling and analysis plan cannot be completed prior to the collection of the baseline samples, which had a proposed deadline of 24 months from the effective date. Many of these commenters went on to state that the proposed expedited deadline for the development of the sampling and analysis plan could result in too frequent sampling leading to non-independent, autocorrelated baseline samples for a large number of facilities, undermining the required statistical analysis. A few commenters further stated that EPA published decisions on Part A and Part B demonstrations citing lack of statistical independence in sampling as a basis for non-compliance, and failure for EPA to extend the deadline for the sampling and analysis plan to allow adequate time for facilities nationwide to gather independent samples would create de facto non-compliance.⁵⁹ Commenters also said

⁵⁹On January 25, 2023, EPA proposed determinations on six Part B applications for alternate liner demonstrations ("Part B"). All six proposals are proposed denials. The CCR Part B Final Rule (85 FR 72506, November 12, 2020), allowed a limited number of facilities to demonstrate to EPA or a Participating State Director that, based on groundwater data and the design of a particular surface impoundment, the unit has and

that the proposed deadlines do not account for the backlogs already experienced due to the existing CCR units using the small number of laboratories qualified to conduct the specialized analyses required by the rule, coupled with the national labor shortages. The commenters predicted the backlogs with laboratories will only increase with the regulation of legacy CCR surface impoundments and CCRMU, making the proposed deadlines even more infeasible. Finally, as mentioned in Unit III.B.2.f, commenters emphasized the need for one deadline for all groundwater monitoring requirements.

EPA agrees that a sampling and analysis plan cannot reasonably be completed before the collection of baseline samples. EPA also acknowledges the adverse impact of too frequent sampling on the validity of statistical analysis and the need to account for seasonal variability in groundwater flow, groundwater levels, and constituent concentrations. EPA further acknowledges that providing insufficient time for the collection of baseline samples or the development of the sampling and analysis plan would likely result in ineffective groundwater monitoring programs that may fail to alert facilities to groundwater contamination coming from CCR units. As explained in Unit III.B.2.a.ii and Unit III.B.2.f respectively, EPA recognizes the need for more time to accommodate third-party availability and a single deadline for the groundwater monitoring requirements. As stated in Unit III.B.2.f.i, for the reasons laid out above, EPA is finalizing a single deadline for the groundwater monitoring requirements of no later than Monday, May 10, 2027, which is 30 months from the effective date of this final rule.

The owner or operator must develop the groundwater sampling and analysis program that satisfies the requirements in § 257.93 and includes a list of monitoring wells to be sampled (*i.e.*, the monitoring network), the schedule for sampling, sampling procedures and techniques, sample preservation and shipping protocols, analytical procedures including an appropriate statistical method for analysis, and quality assurance and quality control methods. The sampling and analysis plan must include all analytes listed in Appendix III and Appendix IV. Recommendations and information on how to comply with many of the

will continue to ensure there is no reasonable probability of adverse effects to human health and the environment.

requirements for the groundwater sampling and analysis program (e.g., analytical procedures, QA/QC controls, sampling protocol) can be found in the following EPA guidance documents (e.g., *RCRA Groundwater Monitoring: Draft Technical Guidance*, 1992, EPA/530/R-93/001; *Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures*, 1996, EPA/540/S-95/504).

iii. Detection Monitoring Program and Assessment Monitoring Program Combined

EPA proposed to require sampling and analysis of constituents listed in Appendix IV at the same time as those listed in Appendix III. The proposed rule explained that this would expedite groundwater monitoring and initiation of corrective action by at least six months at sites where units have potentially been leaking for a time, as is likely the case at unlined legacy CCR surface impoundments. The proposed rule further explained that expediting Appendix IV constituent detection and any resulting corrective action is necessary for the protection of human health and the environment. EPA proposed no other revisions to the existing groundwater monitoring requirements in §§ 257.90 through 257.95.

EPA received few comments on its proposal to combine detection and assessment monitoring. One commenter pointed out the increased demand on laboratory services, facility staff and/or contractors, and P.E.s that would result from having all legacy CCR surface impoundments comply with both monitoring programs simultaneously. Another commenter stated that by combining detection and assessment monitoring and assuming groundwater contamination, EPA has rendered detection monitoring superfluous. Further, the commenter asserted that skipping detection monitoring entirely would lose critical data regarding whether there are statistically significant increases (SSI) in groundwater constituents specifically due to the unit being monitored. Another commenter said that the justification in proposed rule regarding phased groundwater monitoring being “best suited to situations where there is little likelihood of pre-existing contamination” conflicts with EPA’s position in the 2015 CCR Rule. According to the commenter, in the 2015 CCR Rule, the Agency was aware many CCR surface impoundments were decades old and potentially leaking; yet EPA still adopted a phased approach with detection monitoring to monitor indicators of potential groundwater

contamination and assessment monitoring to determine if releases of CCR constituents of concern did occur.

As explained in the proposed rule, the phased approach in the 2015 CCR Rule is best suited to situations where there is little likelihood of pre-existing contamination, such as at a new facility or unit. As EPA explained in 2015, detection monitoring was designed to provide an early warning that a unit might be contaminating the aquifer, by first monitoring for constituents that would rapidly move through the subsurface and thus provide early detection of a potential problem before significant releases of constituents of concern (i.e., those in Appendix IV) had occurred. See, 80 FR 21397. At a site without an old, unlined impoundment, or other evidence of pre-existing contamination, a graduated response to increasing evidence of leakage and potential contamination is easily justified, as it both allows facilities ample time to investigate the source of contamination as well as the environmental fate and transport characteristics of CCR constituents in groundwater, while still protecting human health and the environment. In essence, this approach rests on a presumption that the unit is not already leaking. At new sites, for example, there is no reason to expect that groundwater will have been contaminated above regulatory levels of concern prior to detection by the groundwater monitoring system.

But that presumption is largely inapposite for a universe consisting exclusively of historic unlined units, many of which have operated for decades. And at sites where leakage (and therefore, likely groundwater contamination) has been occurring for a sustained period, the need to protect human health and environment warrants the quick detection of constituents of concern and initiation of any necessary corrective action. Unlike this rule, the 2015 CCR Rule applied both to new facilities, which would be expected to have little likelihood of pre-existing contamination, and to currently operating facilities. Over the long term, EPA expected that there would eventually be a greater percentage of new units than existing units as the older units reached capacity and closed. In addition, as discussed in the proposal at 88 FR 32010 and in Unit III.A.2 of this preamble, it is clear from the data posted on facilities’ websites that EPA significantly underestimated the number of unlined units (both impoundments and landfills), and consequently, significantly underestimated the number of leaking

units and the extent of contamination at these sites. In light of these considerations, EPA’s decision in 2015 to adopt phased monitoring was reasonable.

By contrast, there is good reason to believe that many legacy CCR surface impoundments are currently contaminating groundwater, based on the record from the 2015 CCR Rule, the results of EPA’s recent modeling, and the large number of presently regulated CCR surface impoundments that have been found to be leaking, despite frequently inadequate groundwater monitoring networks. In sum, the totality of this record demonstrates that it is highly likely that the installation of groundwater monitoring at legacy impoundments will identify the presence of plumes of contaminated groundwater that have persisted or even expanded over many prior years despite a previous absence of groundwater data.

As a practical matter, EPA expects combining Appendix III and Appendix IV constituents into a unified sampling and analysis plan and approach will likely have only minor effects on schedules, as this change will not require additional field mobilizations or sampling events and will only require collection of a slightly larger number of sample containers at each monitoring well to allow for analysis for both Appendix III and IV constituents. As such, no additional shipments of samples to the analytical laboratory will be required. However, EPA acknowledges that combining Appendix III and Appendix IV constituents into a unified sampling and analysis plan may increase the total throughput burden on analytical laboratories and related services. Similarly, while combined monitoring may require additional evaluation (e.g., concentration and trend analysis of data concerning both Appendix III and Appendix IV constituents), this incremental increase is unlikely to significantly increase the overall reporting level of effort, as the number of reports will be essentially unchanged.

Nevertheless, as discussed in Units III.B.2.a.ii and III.B.2.f of this preamble, EPA acknowledges the commenters’ concerns regarding existing and projected labor shortages, backlogs, and third-party availability, and agrees this has the potential to affect facilities’ ability to comply with the proposed deadlines for groundwater monitoring requirements. EPA is therefore extending the deadline, as well as building in flexibility for facilities to accommodate for delays, by finalizing a single deadline for groundwater

monitoring requirements in lieu of the proposed split deadlines.

However, EPA disagrees that combining detection and assessment monitoring will render detection monitoring redundant, and that critical data would be lost, by sampling for Appendix IV constituents at the same time as Appendix III constituents (*i.e.*, by collecting more information). The commenters provided no further explanation of what information they thought would be lost, but under the combined monitoring, the facility would collect the same information on Appendix III constituents that is collected under the detection monitoring in § 257.94. Given that under the existing assessment monitoring provisions, facilities must simultaneously analyze samples for all parameters in Appendix III and for any Appendix IV constituent detected in the initial sampling, it is not apparent why the commenter believes that requiring simultaneous monitoring more broadly is appreciably different. 40 CFR 257.95(d)(1).

As stated in the previous paragraph, concurrent monitoring for Appendix III and Appendix IV constituents provides considerably more information and enables a more complete understanding of the geochemical nature, fate, and transport of any detected releases. Additionally, simultaneously collecting samples for Appendix III and Appendix IV constituents will still provide the basis for determining SSIs, should they exist, so no information will be lost. Contrary to the commenter's concern, additional information will be gained in an expedited manner (*e.g.*, the potential spatial and temporal correlation of Appendix III SSIs with exceedances of statistically significant levels (SSLs) for Appendix IV constituents). Furthermore, EPA disagrees that its explanation that phased groundwater monitoring is "best suited to situations where there is little likelihood of pre-existing contamination" fundamentally conflicts with EPA's decision to adopt phased monitoring in the 2015 CCR Rule. Unlike this final rule, the 2015 CCR Rule applied to both new facilities, which would be expected to have little likelihood of pre-existing contamination, and to existing facilities. Over the long-term, EPA expected that there would eventually be a greater percentage of new units than existing units as the older units reached capacity and closed. In addition, as discussed in the proposal at 88 FR 32010 and in Unit III.A.2 of this preamble, it is clear from the data posted on facilities' websites that in 2015 EPA significantly underestimated the number of unlined

units (both impoundments and landfills), and consequently, significantly underestimated the number of leaking units and the extent of contamination at these sites.

If an alternate source is causing an exceedance of an Appendix III constituent, it may also be the source of any SSL detected for any Appendix IV constituents; in such a case, a facility may simply prepare a single ASD that covers constituents from both appendices. The sole difference between phased monitoring and combined monitoring is if the alternate source is only responsible for the Appendix III constituent, but the unit actually is releasing one or more Appendix IV constituents. In such a case, under a phased approach detection of the Appendix IV constituent can be delayed or even remain undetected, because the facility would not trigger assessment monitoring absent an SSI from another Appendix III constituent. In such situations, combined monitoring can make the monitoring program more accurate; it is unclear why the commenter believes this is inappropriate.

To avoid unnecessary and potentially inappropriate delays, ASDs should only be considered in cases where there is a strong technical case for an alternate source, and technically weak or equivocal ASDs should be rejected as soon as is appropriate to minimize delays in corrective action implementation. Given the age of most inactive CCR facilities, the potential for plumes of groundwater contamination extending for significant distances downgradient of the unit boundaries where exceedances are first determined should be anticipated. Additional lateral and vertical delineation of groundwater exceedances should be conducted in conjunction with corrective action as needed.

Ultimately, the combined monitoring expedites the initiation of assessment monitoring which in turn, allows for more expeditious identification of statistically relevant exceedances of Appendix IV constituents. This will in turn expedite ASD development or corrective action, depending on the circumstances.

The phased approach in the 2015 CCR Rule provides for a graduated response to groundwater contamination as the evidence of contamination increases over time. This approach allows facilities ample time to investigate the source of contamination as well as the transport characteristics of CCR constituents in groundwater while, usually being protective of human health and the environment. However,

at sites where there is a strong likelihood that groundwater contamination has been occurring for a sustained period, the advantages provided by a protracted graduated response are outweighed by disadvantages of persistent or even increasing contamination that continues to move downgradient. At these sites, the need to protect human health and the environment necessitates the quick detection of the constituents of concern in Appendix IV to expedite any necessary corrective action. See, *USWAG* 901 F.3d at 427–30. In this case, as highlighted in Unit III.A, the record provides strong reason to conclude that many legacy CCR surface impoundments are contaminating groundwater, given the large number of currently regulated CCR surface impoundments that have been found to be leaking.

Therefore, EPA is finalizing this requirement as proposed to be completed no later than Monday, May 10, 2027, which is 30 months after the effective date of this final rule. This is codified in the regulatory text at § 257.100(f)(4)(iii)(B) and (C).

iv. Detection Monitoring Program and Assessment Monitoring Program—Deadline for Collection and Analyses of Eight Independent Samples for Legacy CCR Surface Impoundments

EPA proposed that no later than 24 months after the effective date of the final rule, owners or operators of legacy CCR surface impoundments initiate the detection monitoring program by completing sampling and analysis of a minimum of eight independent samples for each background and downgradient well, as required by § 257.94(b). The proposed rule explained that within 90 days after initiation of the detection monitoring program, owners or operators must identify any SSIs over background levels for the constituents listed in Appendix III, as required by § 257.94. To expedite the time to initiate any required corrective action, EPA also proposed that by this same deadline owners or operators initiate the assessment monitoring program by establishing groundwater protection standards and starting to evaluate the groundwater monitoring data for an SSL over GWPS for the constituents listed in Appendix IV as required by § 257.95.

No commenters raised concern about requiring legacy impoundments to comply with the existing requirements in § 257.94(b). Therefore, EPA is finalizing this requirement as proposed. This is codified in the regulatory text at § 257.100(f)(4)(iii)(A).

However, EPA received several comments on the proposed deadline for the collection of the eight baseline samples. As mentioned in Unit III.B.2.a.ii, some commenters supported the expedited deadline. However, several other commenters requested that the groundwater monitoring requirement deadlines be combined into a single deadline that provided at least as much time to come into compliance as was provided in the 2015 CCR Rule deadlines (*i.e.*, 24 months after the effective date of the final rule). As stated in Unit III.B.2.f, based on information provided by commenters, EPA concluded that a single deadline should be used for the groundwater monitoring requirements. In the proposed rule, the latest proposed deadline for groundwater monitoring requirements was the deadline of 24 months from the effective date of this final rule for the initiation of the combined detection and assessment monitoring and the collection of the eight baseline samples. Based on information provided in response to comments on the proposed rule and as explained in Units III.B.2.a.ii and III.B.2.f, EPA calculated six months as the appropriate extension of the groundwater monitoring system deadlines. Therefore, EPA is finalizing a deadline for the completion of sampling and analysis of a minimum of eight independent samples for each background and downgradient well of no later than Monday, May 10, 2027, which is 30 months from the effective date of this final rule.

v. Annual Groundwater Monitoring and Corrective Action Reports for Legacy CCR Surface Impoundments

EPA proposed to apply the existing requirements in § 257.90(e) to legacy CCR surface impoundments and that owners or operators of legacy CCR surface impoundments comply no later than January 31 of the year following the calendar year after a groundwater monitoring system has been established (and annually thereafter).

One commenter suggested that the initial groundwater monitoring and corrective action report be due no later than January 31 of the year following the collection of the eight baseline samples and the first semi-annual sampling event in order to allow facilities to provide all the documentation required by § 257.90(e). EPA disagrees that the information required by § 257.90(e) would not be available to a facility upon completion of the groundwater monitoring system, as the annual report serves as an update on the activities related to the groundwater monitoring program,

including the installation of groundwater monitoring wells. Additionally, when specific actions are not required by the CCR regulations (*e.g.*, a facility has not triggered corrective action), facilities are not penalized for not having any activities related to that action to discuss in the groundwater monitoring and corrective action annual report (*e.g.*, not describing progress in selecting a remedy when not in corrective action).

EPA is finalizing the requirement for owners or operators of legacy CCR surface impoundments to comply with the requirements in § 257.90(e) which mandate the preparation of an annual groundwater monitoring and corrective action report no later than January 31, 2027, and annually thereafter. This is codified in the regulatory text at § 257.100(f)(4)(iv).

The report documents the activities associated with the groundwater monitoring program and progress of any corrective action over the past year and must contain specific information identified in the regulations, including but not limited to maps; aerial images or diagrams showing the CCR unit and all upgradient (background) and downgradient wells; identification of any monitoring wells installed or decommissioned in the previous year; monitoring data collected under §§ 257.90 through 257.98; and a narrative discussion of any transition between monitoring programs (*i.e.*, detection and assessment monitoring). Annual reporting should ensure that groundwater level data collected over the reporting period is tabulated, presented, and analyzed to determine groundwater levels relative to any residual CCR left in place as well as to confirm or determine groundwater flow directions.

Upgradient and downgradient well locations and depths should be validated annually with respect to measured and mapped flow directions. Groundwater quality sampling data should be included in appendices and summarized and tabulated in the annual reports. If appropriate, exceedances (SSIs and SSLs) of Appendix III and IV constituents should be tabulated and highlighted. As mentioned in some comments, annual reports should identify the nearest downgradient surface water bodies as well as groundwater supply wells in the vicinity of the unit.

If the groundwater monitoring required in § 257.95, demonstrates an exceedance of the groundwater protection standards for constituents identified in Appendix IV of part 257, corrective action as laid out in §§ 257.96

through 257.98, should be initiated as soon as possible. It is critical that annual corrective action and monitoring reports provide the basis for selection and documentation of corrective actions as early as possible well as graduated data to document initiation of corrective action activities and graduated and ongoing steps and associated data collected over the course of each year to document remedial performance, modifications, and other changes or improvements.

In addition to documenting compliance, the annual report must be posted to the unit's public CCR website which allows the public to review the groundwater monitoring results. Therefore, it is critical that the annual reports contain the basic data that informs the positions and status reported in those documents, including but not limited to boring logs, monitoring well installation diagrams, water level data, field sampling data sheets for groundwater sample collection, laboratory analytical data including QA/QC data, data validation, and others. In summary, the annual groundwater monitoring and corrective action reports should not only contain the information required by the regulations but should be organized in such a way that: (1) Compliance with the CCR regulations is evident; (2) Data supporting compliance conclusions are easily located within the document; and (3) The public is readily able to review the groundwater monitoring data and related information. Lastly, the name of the document on the public CCR website should be such that it is clear what the file is and readily printed and downloaded by the public.

vi. Corrective Action Requirements for Legacy CCR Surface Impoundments

EPA proposed to require owners or operators of legacy CCR surface impoundments to comply with the existing corrective action criteria, as applicable in §§ 257.96 through 257.98. The proposed rule explained that conducting the sampling simultaneously would expedite groundwater monitoring and, where necessary, initiation of corrective action by at least six months at sites where units have potentially been leaking for a long period, as is likely the case at many unlined legacy CCR surface impoundments. The proposed rule further explained that expediting Appendix IV constituent detection, assessment and any subsequent corrective action would protect human health and the environment.

Under the existing regulations, if groundwater monitoring demonstrates

an exceedance of the groundwater protection standards for constituents identified in Appendix IV of part 257, corrective action is required, as laid out in §§ 257.96 through 257.98. These requirements apply throughout the active life and any post-closure care period of the CCR unit.

A commenter suggested EPA create a deadline for the completion of the selection of a remedy required by § 257.97 of 90 days after the completion of the assessment of corrective measures (ACM) with the ability to extend the deadline up to 180 days after the completion of the ACM. The commenter pointed to the failure of units regulated by the 2015 CCR Rule to select a remedy as soon as feasible after the completion of the ACM as required by the rule and the subsequent unnecessary delay in addressing contaminated groundwater. Other commenters stated that applying the existing groundwater monitoring and corrective action requirements to historic sites, such as legacy CCR surface impoundments, is not appropriate and suggested that instead EPA incorporate site-specific risk-based corrective action into the CCR regulations. One of these commenters further stated that the application of the existing CCR corrective action requirements conflict with EPA's decision-making frameworks in other programs such as RCRA and CERCLA due to lack of site-specific risk assessments to evaluate risk and drive corrective action decisions. This commenter suggested that EPA utilize site-specific, risk-based corrective action that is consistent with the guidance documents EPA has developed for RCRA and CERCLA programs.

EPA acknowledges the widespread non-compliance with the mandate to complete the selection of a remedy as soon as feasible after the completion of the ACM. However, EPA disagrees with the commenter's suggested deadline. The recommended deadline could actually have the effect of extending the deadline for the completion of the selection of a remedy beyond that in 2015 CCR Rule because "as soon as feasible" in many cases would likely be before 90 days after the completion of the ACM. Granting owners or operators more time to select a remedy would be less protective of human health and the environment. Regarding noncompliance with the CCR regulations, EPA has been and will continue to take action to address the non-compliance on a myriad of issues including to the failure of owner or operators to select a remedy as soon as feasible. EPA has announced that enforcing the CCR regulations is part of the ongoing set of National

Enforcement and Compliance Initiatives and expects that enforcement actions taken as part of the Initiative may address, where relevant and appropriate, the concern raised by the commenter.⁶⁰

EPA disagrees with the suggestion that the existing corrective action requirements, if triggered, are inappropriate at legacy CCR surface impoundments. As stated in Units III.B.2.a.i and III.B.2.f, the physical characteristics of legacy impoundments are not sufficiently different from currently regulated units to justify different requirements. For those commenters requesting that EPA adopt "risk-based corrective action" into the requirements, EPA notes that the commenters have provided no further explanation of what requirements in the existing regulations they wanted EPA to revise, what the revisions should accomplish, or why they are necessary or appropriate. As a general matter EPA considers that the corrective action regulations in §§ 257.95 through 257.98 do currently require facilities to tailor remedies to address the risks to human health and the environment, based on the conditions at the site. It is unclear what more the commenters are seeking. Furthermore, the commenter that stated that the existing corrective action regulations conflict with other EPA programs (*i.e.*, RCRA and CERCLA) failed to fully explain how the existing corrective action regulations conflict with EPA-published RCRA or CERCLA guidance documents or how they preclude corrective action decisions driven by site-specific risks. Accordingly, EPA is finalizing, without revision, its proposal that legacy CCR surface impoundments comply with the existing corrective action requirements at §§ 257.95 through 257.98.

As explained in the proposed rule at 88 FR 32003, §§ 257.90 through 257.95 require an owner or operator of a CCR unit to install a system of monitoring wells, specify procedures for sampling these wells, and set forth methods for analyzing the groundwater data collected to detect hazardous constituents (*e.g.*, toxic metals) and other monitoring parameters (*e.g.*, pH, total dissolved solids) released from the units (*i.e.*, all parameters listed in Appendices III and IV). If the groundwater monitoring required in § 257.95, demonstrates an exceedance of the groundwater protection standards

for constituents identified in Appendix IV of part 257, corrective action is required as laid out in §§ 257.96 through 257.98. These requirements apply throughout the active life and post-closure care period of the CCR unit.

When corrective action is required, it should be initiated as soon as possible. The corrective action program includes initiating an ACM to prevent further releases, to remediate any releases, and to restore affected areas to original conditions, as specified in § 257.96(a). After the ACM has been completed, the owner or operator must select a remedy that meets prescribed standards, including a requirement that the remedy attain the groundwater protection standards. See § 257.97(a) and (b). Finally, the corrective action program requires the owner or operator of the CCR unit to initiate remedial activities within 90 days of selecting a remedy. See § 257.98(a). The requirement to address releases under this requirement is identical to those requirements for any CCR unit undertaking groundwater corrective action with the additional requirement that implementation of corrective action begin during the active life of the unit.

EPA expects that when assessing corrective measures and selecting a remedy, the owner or operator of the unit will consider the impact of the corrective measures on the water quality and safety of the nearest surface water bodies and the nearest private and/or public groundwater wells.

With respect to completion of an ACM and remedy selection, § 257.96(a) requires an ACM be initiated within 90 days of determining an SSL has occurred, and then completed within another 90 days. An extension, not to exceed 60 days, may be warranted due to site-specific conditions or circumstances. This deadline to complete an ACM, 180 to 240 days after determining an SSL, was not proposed to be changed, so comments suggesting changes to these provisions are outside the scope of the rulemaking. Additionally, the commenters provided no reason why corrective measures could not be assessed and compared in an ACM and a remedy could not be selected. Prior to closure of a CCR unit, the facility has been required to characterize site conditions, including groundwater flow conditions and geology. The facility has knowledge of wastestreams and water volumes it discharges to a CCR surface impoundment. This information can be used to develop a groundwater model to predict groundwater flow conditions after wastestream disposal ceases and closure is initiated. EPA believes this

⁶⁰ EPA Enforcement Alert, National Enforcement and Compliance Initiative, Protecting Communities from Coal Ash Contamination. EPA Document #310F23002. December 2023. <https://www.epa.gov/system/files/documents/2023-12/ccr-enf-alert-2023.pdf>.

would provide sufficient characterization of post-closure conditions to assess and compare groundwater cleanup alternatives to complete an ACM. The commenters have provided no reasons or explanation why this would not be achievable.

Once the ACM is complete, a public meeting has been held, and community input has been considered, a remedy must be selected as soon as feasible. EPA agrees that a selected remedy may include closure by removal to comply with source control requirements, and that this would constitute commencing implementation of a remedy. However, the selected groundwater remediation portion of the remedy must also be implemented within a reasonable time, in accordance with the schedule established in the remedy selection report. 40 CFR 257.97(d). Implementation of the source control measure does not negate this requirement.

g. Closure and Post-Closure Care Criteria for Legacy CCR Surface Impoundments

EPA proposed to apply all of the existing closure and post-closure care requirements in §§ 257.101 through 257.104 to legacy CCR surface impoundments, except for the alternative closure requirements in § 257.103(f). The proposed rule explained that based on the data gathered since 2015 from the currently regulated CCR unit universe, the Agency considered it highly unlikely that any legacy CCR surface impoundment has a composite liner that meets the requirements of § 257.71 and therefore EPA expected legacy CCR surface impoundments to be unlined as defined by § 257.71(a)(3)(i). Consistent with the USWAG decision and the existing regulations in § 257.101(a) mandating that all unlined (including clay-lined) impoundments must close, EPA proposed to require that all legacy CCR surface impoundments initiate closure within 12 months of the effective date of this final rule. The proposed rule also explained that the alternative closure provisions in § 257.103(f) were not appropriate for legacy CCR surface impoundments as these units, by definition, are inactive impoundments at inactive facilities and could not therefore demonstrate the need to continue to use the disposal unit, which is a qualifying component of the alternative closure provisions.

EPA received numerous comments on its proposal to apply the existing the closure and post-closure care requirements §§ 257.100 through 257.104 to legacy CCR surface

impoundments. Overall, most commenters supported or did not contest EPA's proposal. Some of these commenters agreed that requiring legacy CCR surface impoundments to comply with the existing closure requirements is necessary for the long-term protection of human health and the environment. A few of these commenters also suggested that EPA prohibit legacy CCR surface impoundments from closing with CCR in place under § 257.102(d).

Many other commenters however objected to subjecting legacy impoundments to § 257.101(a), which requires CCR surface impoundments constructed without a composite liner to close. These commenters generally argued that a national requirement to close was not appropriate for legacy CCR surface impoundments and that EPA should instead determine whether closure is warranted at each site based on a finding that the individual unit at the particular site poses unacceptable risks. These commenters largely reiterated comments previously made in response to the ANPRM, without addressing EPA's responses in the proposal. For example, some asserted that their particular legacy impoundments are not contaminating groundwater and do not pose a risk to groundwater. One claimed that the proposal was based on the upper bound of risk pulled from a sensitivity analysis of a nationwide risk assessment based on aggregated data unrepresentative of any given facility, and therefore could not support a finding that any particular site poses "actual risks." This commenter also asserted that a nationwide risk assessment should not be used to impose a "one-size-fits-all" closure requirement or universal performance standards for closure, because it could drive closure methods that are not necessary to ensure protection of human health and the environment. Other commenters repeated their claims that the closure of legacy CCR surface impoundments would itself present greater risks than leaving the disposal unit in its existing state. For example, one commenter asserted that closing legacy impoundments could raise environmental justice issues associated with increased traffic and (consequently) decreased air quality; could risk potentially destabilizing the unit and disturbing native species and animal habitats; and would increase air emissions, water consumption, and waste generation.

These commenters asserted that a "risk-based" closure or corrective action program was better suited "to address the unique nature and unknown risk of

legacy CCR surface impoundments." For example, one commenter suggested that the risks associated with legacy CCR surface impoundments can be better managed through corrective action implemented under a permit program, which the commenter believed would make the mandate to close these units unnecessary. The commenter explained that although closure can be useful as source control in remediating contamination, as long as the exposure pathways are appropriately addressed through corrective action, nearby receptors will not be impacted by the risks, and the RCRA subtitle D protectiveness standard would be met without closing the impoundment. Similarly, another commenter argued that mandating closure for all legacy impoundments is inconsistent with other RCRA and CERCLA or State cleanup programs, which, the commenter asserts generally use site-specific risk assessments to determine whether closure is warranted. The commenter suggested that instead, the final rule should rely on the upcoming implementation of EPA's Federal permitting rule pursuant to the WIIN Act and allow a regulated entity to conduct a site-specific risk assessment to evaluate whether the historical CCR disposal areas pose "actual risks" and allow closure and corrective actions to be tailored to site-specific conditions and risks.

Other commenters raised concern that some legacy impoundments are now located beneath infrastructure such as pipelines or transmission lines that cannot be disturbed without disrupting operations, active CCR units, or buildings. These commenters explained that requiring closure of these impoundments could adversely impact grid reliability, business operations, or other necessary public services (e.g., military infrastructure) and suggested that EPA exempt these units or at least extend the closure time frames to allow for closure of the impoundment when the other unit or structure is closed or decommissioned.⁶¹

⁶¹ EPA also received comments suggesting that it examine the cumulative impact of several recently or soon-to-be finalized power sector and vehicle rules. EPA performed suggested sensitivity analysis which demonstrated 1) the cumulative impact is not expected to adversely impact resource adequacy, and 2) that, considering the power sector rules together, the cumulative effect of these rules in terms of reduction in coal steam electric generating capacity is less than the sum of each of these rules individually for 2035. The affected universe of units with significant mitigation responsibilities among the EPA rules is overlapping, not purely additive, as it largely reflects the same segment of the grid's generation portfolio. See *Resource Adequacy Analysis: Vehicle Rules*, 111 EGU rule, ELG, and MATS Technical

Several commenters expressed support for the proposed 12-month deadline to initiate closure, stating that the shorter deadlines are necessary to address the increased risk from legacy CCR surface impoundments and likelihood these units are and have been contaminating groundwater. Many other commenters characterized the proposed deadline as infeasible for the reasons mentioned in Unit III.B.2.a.ii, including seasonality, need to comply with overlapping regulatory requirements, labor shortages, and the strain on the limited resources necessary to achieve compliance (e.g., contractors, laboratories, P.E.s) caused by the number of CCR units coming into compliance at the same time. Commenters also stated that compliance with the closure requirements should not be required until after the groundwater monitoring system was installed and baseline samples collected so that closure could be informed by the groundwater monitoring data. These commenters pointed to recent EPA Part A and Part B decisions as evidence of the gap between EPA's expectations and the closure and post-closure plans developed using good faith efforts by owners or operators and best practices; these commenters further stated that the proposed deadline precludes the incorporation of groundwater monitoring data in developing closure plans and is likely a contributing factor to the gap between EPA's expectation and closure and post-closure care plans submitted by owners or operators of currently regulated units. One commenter also claimed that legacy CCR surface impoundments are potentially still being used to manage non-CCR wastestreams, and that EPA consequently needed to create a mechanism for facilities to seek extensions similar to those that had been made available under § 257.103(f). Commenters' suggestions for alternative deadlines to initiate closure ranged from 24 to 34 months, or at least after the collection of the baseline groundwater monitoring samples required by § 257.94.

MEMO for more information. Also see *IPM Sensitivities MEMO*. The grid analysis did not include the proposed or final version of this rulemaking, because this CCR rule primarily addresses only disposal units that have not received CCR since before 2015, that is the disposal units are not part of ongoing operations at any facility, and consequently this rule is not expected to impact the generation of electricity. In addition, EPA continues to believe this final rule will not generally impact current utility operations, particularly due to the revisions made in the final rule to address commenters concerns, as discussed in the preamble to the final rule (e.g., extended deadlines for CCRMU located under critical infrastructure).

EPA continues to believe that applying the closure and post-closure requirements in §§ 257.101 through 257.104 to legacy CCR surface impoundments is appropriate and necessary to protect human health and the environment. Based on the record compiled for the 2015 CCR Rule, EPA concluded that "there is little difference between the potential risks of an active and inactive surface impoundment; both can leak into groundwater, and both are subject to structural failures that release the wastes into the environment, including catastrophic failures leading to massive releases that threaten both human health and the environment." 80 FR 21343. As discussed in Unit III.B of this preamble, the D.C. Circuit concurred, and on that basis, vacated the exemption for legacy CCR surface impoundments. See, *USWAG* at 901 F.3d at 434. EPA received no information during this rulemaking that would support a conclusion that legacy CCR surface impoundments present fewer risks than other inactive CCR surface impoundments. Indeed, as discussed in Unit III.A, more recent information continues to indicate that legacy CCR surface impoundments are more likely to contaminate groundwater and at higher levels, even in cases where the unit no longer presents structural stability concerns. Based on this record and on the specificity of the D.C. Circuit's findings in *USWAG*, EPA considers that it has limited discretion to establish requirements for legacy CCR surface impoundments that are significantly different than those currently applicable to inactive CCR surface impoundments. Accordingly, EPA in most cases instances has required legacy CCR surface impoundments to comply with the existing closure and post-closure requirements in 40 CFR part 257, subpart D, that are currently applicable to inactive CCR surface impoundments. This final rule also adopts the provisions that were originally proposed on March 3, 2020, that allow a facility closing by removal to complete required groundwater remediation during a post-closure care period, discussed in Unit III.D of this preamble.

However, in response to comments, EPA included one additional provision to account for the inception of Federal permitting. A key feature of a permit program is that, through a subsequent public process, a regulatory authority can adjudicate legal and factual issues based on the specific facts of an individual site, that would be more complex and challenging to resolve in a national rule. EPA has relied on this

feature to resolve one of the more complex legal and factual issues raised in this rulemaking by deferring it to the subsequent permitting process: how to address situations where the impoundment contained CCR and liquids on October 19, 2015, but prior to the effective date of this final rule, a facility closed its legacy CCR surface impoundment in accordance with standards established by a regulatory authority that are different than the performance standards in § 257.102, but that are likely to provide equivalent protection of human health and environment. Provided certain criteria are met, EPA is deferring the requirement for the closed unit to comply with § 257.102 until a permit authority can evaluate the adequacy of the previously completed closure, and determine during permitting whether (as well as what) additional measures are necessary to ensure that the closure is as protective as § 257.102. The criteria EPA is employing are designed to ensure that the regulatory authority overseeing the closure applied standards that were substantially equivalent to the otherwise-applicable CCR rules in terms of evaluating and mitigating the risks. In such cases, EPA would therefore have reliable evidence that the risks have likely been adequately mitigated and therefore, these are unlikely to pose a reasonable probability of adverse effects pending later permitting. The final rule also includes procedures for the closure equivalency determination modeled on similar determinations made for hazardous waste interim status units under § 270.1.

EPA is currently transitioning from the exclusively rule-based program to a Federal permitting program. Although every unit in operation, closure, or corrective action will ultimately receive a permit, and EPA expects to shortly begin issuing permits, it will be several years before permits are issued for every unit. This means that, at least in the near term, most facilities will continue to operate under the current self-implementing regime, similar to units under the subtitle C hazardous waste program that initially operated under interim status prior to obtaining a permit. While this necessarily limits the degree to which this final regulation can rely on the permitting process, this is an example of a situation that is better resolved through a combination of a national rulemaking and the individualized decision making provided through permitting rather than exclusively through a national rulemaking. EPA agrees that there are

examples of units closed under alternative criteria that appear to be equally as protective as the part 257 closure requirements. If EPA were to require all previously closed units to document compliance with § 257.102 immediately, several units that have likely already met the protectiveness standards would be swept in unnecessarily. Unfortunately, it is not feasible to evaluate these individual closures as part of this national rulemaking; these units are all subject to different requirements, and commenters have provided insufficient information on each individual unit for the Agency to conclude that they are in fact as protective as a closure conducted in accordance with § 257.102. If EPA were still limited to issuing minimum national criteria through rulemaking, it would be reasonable to craft a regulation that would regulate over broadly in order to ensure that the final rule achieves the statutory standard at each facility subject to the regulation. See 42 U.S.C. 6944(a) (“no reasonable probability of adverse effects on health or the environment . . . at such facility”). As EPA explained in 2015, to establish criteria under this provision, EPA must demonstrate, through factual evidence available in the rulemaking record, that the final rule will achieve the statutory standard at all sites subject to the standards based exclusively on the final rule provisions. This means that the regulations must account for and be protective of all sites, including those that are highly vulnerable. But now that Congress has granted the agency broader authority, it is reasonable in this case, where EPA can craft criteria to identify closures that may be protective and thus warrant a closer evaluation, to rely on that broader authority.

Under this provision, EPA is not exempting a facility from the requirement to demonstrate that a unit closure meets the performance standards in § 257.102, or from agency oversight, but only delaying application of the requirement until the Agency can resolve the outstanding legal and factual issues. EPA is also deferring only the requirement that a closed unit achieve compliance with the closure performance standards. To mitigate any potential risks, all other applicable requirements, including the requirements for groundwater monitoring and corrective action would continue to apply to these units. Further EPA’s existing authorities to respond to urgent threats to human health or the environment also remain available,

should the need arise. See, e.g., 42 U.S.C. 6973.

i. Requirement for Legacy CCR Surface Impoundments To Close

The final rule continues to require legacy CCR surface impoundments to close. As EPA explained in the proposal, the *USWAG* decision has effectively resolved this issue. No commenter submitted any evidence to demonstrate that the risks associated with these units are any lower than they were in 2018 when the Court decided that closure of all unlined and clay-lined impoundments was required by RCRA section 4004(a) or that the risks posed by legacy CCR surface impoundments are any lower than those at the currently regulated inactive impoundments at active facilities. If anything, more recent information indicates that a greater number of legacy CCR surface impoundments are more likely to have leaked even higher levels of contaminants than the operating impoundments modeled in 2014. See Unit III.A.

No commenter has identified any legacy CCR surface impoundment with a composite liner that meets the requirements of § 257.71. Based on the data gathered since 2015 from the currently regulated CCR unit universe, the Agency considers it highly unlikely that any legacy CCR surface impoundment has such a liner. EPA analyzed the list of inactive CCR facilities compiled based on comments received in response to the ANPRM and this rulemaking and knows that almost all these facilities were opened prior to 1990 (one facility opened in 1996) before composite liner systems were typically installed. Unless legacy CCR surface impoundments are very different than impoundments at active facilities, EPA expects all units of this age to be unlined as defined by § 257.71.

The D.C. Circuit has also already rejected arguments that EPA can avoid requiring CCR surface impoundments to close based on claims that “all impoundments aren’t leaking.”

The EPA and Industry Intervenor assert that the composite lining required for new units is not needed for existing units because most unlined impoundments do not leak, and an unlined impoundment that is not leaking is not dangerous. Industry Intervenor emphasize that the record suggests that “almost two-thirds of unlined impoundments do not leak,” and they assert that “appropriate controls on impoundments that do leak” suffice to meet RCRA’s “no reasonable probability” standard. The EPA underscores that it made no finding of any “reasonable probability that each and every unlined impoundment will, in fact, result in adverse effects on health and the

environment.” It insists that RCRA’s “no reasonable probability” standard is met by the Rule’s provisions for “extensive monitoring of groundwater to detect constituent leaking,” *id.* at 83, and “immediate action to stop that leak,” “redress that leak,” and to close the site as soon as a harmful leak is detected.

USWAG, *supra* at 427. The Court summarily rejected these arguments.

It is inadequate under RCRA for the EPA to conclude that a major category of impoundments that the agency’s own data show are prone to leak pose “no reasonable probability of adverse effects on health or the environment,” 42 U.S.C. § 6944(a), simply because they do not already leak.

Id. This holding largely rests on a legal conclusion of what RCRA section 4004(a) requires, which Congress did not alter when it amended the statute in the WIIN Act.

The Court similarly rejected arguments that reliance on the part 257 corrective action provisions to clean up releases can effectively substitute for a national requirement to close impoundments, or that corrective action alone is sufficient to meet the RCRA section 4004(a) standard. As the Court explained, that argument focuses on the wrong risks and addresses only half of the statutory standard. The contamination of a potential source of drinking water is itself an adverse effect on the environment, and the statutory requirement to ensure there will be no reasonable probability of adverse effects on health or the environment requires the Agency to take measures based on the risks to prevent this harm from occurring in the first place. It is not enough to remediate the contamination before it reaches an off-site receptor.

In defending the Rule here, the EPA looks at too narrow a subset of risk information and applies the wrong legal test.

The Final Rule’s approach of relying on leak detection followed by closure is arbitrary and contrary to RCRA. This approach does not address the identified health and environmental harms documented in the record, as RCRA requires.

RCRA requires the EPA to set minimum criteria for sanitary landfills that prevent harm to either “health or the environment.” The EPA’s criteria for unlined surface impoundments, limited as they are to groundwater monitoring for contaminant levels keyed to human health, only partially address the first half of the statutory requirement.

But here, too, the EPA has failed to show how unstaunched leakage while a response is pending comports with the ‘no reasonable probability’ standard.

Id. at 429–430, 431 (emphasis added). None of this has changed. Nor has any commenter identified any unique

characteristic of legacy impoundments that makes any of the Court's analysis irrelevant or inapplicable. Although some commenters continue to claim that their units are heavily vegetated or developed and that reopening or other removal/remediation activities may disrupt current use of the land, no commenter submitted any data or analysis to demonstrate that removal or remediation activities would be more detrimental to health and the environment than not cleaning up the contaminated groundwater in the aquifer or taking measures to prevent the legacy CCR surface impoundment from continuing to contaminate the aquifer. Moreover, the fact that some impoundments have become heavily vegetated or redeveloped does not mitigate the risks these unlined legacy CCR surface impoundments continue to pose.

The same is true for those commenters alleging that the closure of legacy CCR surface impoundments would itself present greater risks than leaving the disposal unit in its existing state; none presented any data or analysis, stating instead that possible effects were self-evident. However, EPA notes that most of these comments appear to have been premised on the assumption that closure by removal would be required. As discussed in the next section, EPA is not prohibiting legacy CCR surface impoundments from closing with waste in place, provided all of the performance standards in § 257.102(d) have been met.

EPA also cannot, as the commenters suggest, proceed exclusively on the basis of site-specific assessments and forego a nationwide risk assessment, national closure requirement, or universal performance standards for closure. When Congress amended the statute in 2016, it added a permitting component but retained without revision the requirements in RCRA sections 1008(a)(3) and 4004(a) that EPA establish minimum national standards ("criteria") by regulation. The statute relies on these criteria in several provisions, including as the standard EPA must use to evaluate State programs, to issue permits, and to determine whether a CCR unit is a sanitary landfill or an open dump. See, 42 U.S.C. 6945(d)(1)(B), (d)(1)(D), (d)(3), (d)(6). The D.C. Circuit has also effectively confirmed the continued necessity of national criteria; if the Court believed that the WIIN Act obviated the need to comply with RCRA section 4004(a) it would have granted EPA's request for an abeyance or dismissed the case as moot. That it did neither demonstrates that the Court

believed that its opinion would remain relevant. See, *USWAG*, 901 F3d at 436–437 (denying EPA's request for voluntary remand because "this claim involves a question—the scope of EPA's statutory authority—that is intertwined with any exercise of agency discretion going forward.")

Accordingly, the final rule requires all legacy CCR impoundments to close.

ii. Deferral for Legacy CCR Surface Impoundments Under Critical Infrastructure

As noted above, several commenters stated that some inactive facilities have been redeveloped and that the CCR surface impoundments are now located beneath critical infrastructure. These commenters claimed that requiring closure of units beneath infrastructure could adversely impact grid reliability, business operations, or other necessary public services and suggested EPA create exemptions or extensions for these units. For example, one commenter stated that closure of units located under other structures is not feasible as EPA has proposed. The commenter further explained that:

the issue is applicable and even more pronounced with respect to legacy impoundments. By definition legacy CCR surface impoundments are located at inactive sites that in some instances have been partially or completely redeveloped. As a result, former legacy units at this stage may be completely inaccessible due to vegetation, new infrastructure like pipelines or transmission lines that cannot be disturbed without disrupting operations, active CCR units, buildings, or other obstacles to access. If EPA proceeds to issue the proposal EPA must address such accessibility issues.

Other commenters supported the decision not to propose an exemption from the closure requirements for legacy CCR surface impoundments beneath redevelopments or infrastructure, based on the risks that these sites can present, and provided specific examples of such sites. Two of the examples related to a situation in which active CCR disposal units were built on top of former CCR surface impoundments (*i.e.*, overfills). In one instance, the commenter described a site where an unlined CCR surface impoundment had been closed by partially draining the impoundment and constructing a new CCR landfill (98.9 acres), two stormwater ponds and a leachate pond (10.8 acres), and a materials handling area (4.4 acres) on top of the former impoundment. According to the commenter, the facility claimed that the closed impoundment rather than any of the active CCR units, was responsible for SSIs detected in its groundwater monitoring. The

commenter referenced documents on the facility's CCR website which explained that:

Although it has not received sluice water since 2008, the CCR in the former Main Pond continues to receive, store, and discharge water, primarily groundwater entering the CCR through the sides of the filled valley. Groundwater flow into the CCR in the former Main Pond drains downward and outward to the east through the toe drain system under the dam.

The commenters explained that overfills can increase groundwater contamination from the underlying unit by reducing the hydraulic gradient and increasing the waste and water contact time. They stated that this has been documented by both an EPRI study and groundwater monitoring at a specific overfill that showed steady to gradually increasing concentrations of CCR related constituents in the landfill monitoring wells, rather than the predicted decline in concentrations of CCR-related constituents from the closure of the underlying surface impoundment.

As an initial matter, under both the existing definitions and the definitions in the final rule a legacy CCR surface impoundment could not be located below an active CCR unit. A legacy impoundment is located at an inactive facility, and the presence of an active CCR unit means that the facility is active, not inactive. See, §§ 257.50(b), 257.53 (definition of active facility). This means that in the example described by the commenter the surface impoundment underneath the active landfill is an inactive CCR surface impoundment at an active facility, and would be considered a "regulated unit" subject to the existing requirements in part 257, rather than this final rule.

In any event, EPA disagrees that its proposal did not adequately account for the circumstance in which a legacy CCR surface impoundment may be challenging to access, such as where the impoundment is located beneath infrastructure or buildings. In contrast to the comments received with respect to CCRMU, no commenter provided a concrete example in which closure of a legacy CCR surface impoundment would interfere with critical infrastructure. The overwhelming majority of commenters provided concrete examples of concerns with respect to CCRMU and then concluded that EPA needed to address the issue equally for legacy CCR surface impoundments. The most concrete example of potential interference with critical infrastructure is the reference to "new infrastructure like pipelines or transmission lines that cannot be disturbed without disrupting

operations” quoted above. But even in that case the commenter provided no explanation of the factual basis for the conclusion that over the five to 15 years the existing regulations provide to complete closure the facility could not schedule the outages necessary to move pipelines or transmission lines, and conduct the closure in stages as necessary to accommodate scheduling any necessary outages.⁶² In addition, as discussed in the next Unit of the preamble, EPA has extended the deadline to initiate closure to 48 months from promulgation. The amount of time provided by these deadlines is more than adequate to account for any accessibility issues. Further, EPA has been regulating utilities under multiple environmental statutes for decades and reliability issues are often raised when regulations are promulgated, but EPA is unaware of situations where those reliability concerns have been realized in the form of electric blackouts caused by compliance with Federal environmental standards. In this case, in the unlikely event closure of a legacy CCR surface impoundment cannot occur within the regulatory timeframe without creating a demonstrated reliability concern, the Agency will work with the facility, the relevant RTO, and other relevant Federal agencies to ensure proper closure occurs without causing the power to go out.

Finally, as noted above EPA received a substantial number of comments requesting the agency not require facilities to “re-close” any unit that had already completed closure. This final rule does not mandate that any previously closed unit automatically re-close. But, as described in the next section, the final rule does require all legacy CCR surface impoundments to meet the performance standards in § 257.102, although as discussed above, some may not be required to do so until permitting. EPA does not consider this to be equivalent to a requirement to “re-close” as, depending on the site conditions, facilities may be able to implement engineering measures, such as the installation of slurry walls to prevent groundwater infiltration, to address any deficits without removing

the cover system or entirely re-closing the whole impoundment.

iii. Requirement To Comply With Performance Standards in § 257.102

As discussed above, consistent with USWAG and the proposed rule, this final rule requires that the closure of legacy CCR surface impoundments meet the performance standards in either § 257.102(c) or (d). Under this final rule, all closures initiated after the effective date of this rule, as well as those that were not completed prior to the effective date of this rule, will need to comply with these requirements.

And in general, the same is true with respect to closures that were completed prior to the effective date of this rule. As discussed previously, a facility that can certify that its prior closure meets the performance standards in § 257.102(c) only needs to post the documentation that it meets the standard. Similarly, if a facility can demonstrate that the closed unit meets the requirements under § 257.102(d), EPA will consider them to be closed and the only requirements that will be applicable are those that apply to closed units under post-closure care—such as groundwater monitoring, and if necessary, corrective action. EPA never intended to require facilities that otherwise met the closure standards to go through the process again and re-close the unit. In addition, where the facility was subject to standards that are different than the Federal CCR closure standards (*e.g.*, if the closure were conducted as part of a CERCLA cleanup or State order) but are otherwise equivalent in terms of mitigating the risks, the requirement to meet the § 257.102 standards will be deferred to permitting, where a closure equivalency determination will be made.

In response to EPA’s proposal that all legacy CCR surface impoundments comply with § 257.102, many commenters again reiterated their request that EPA exempt any unit that has either completed closure or is in the process of closing pursuant to State law (*e.g.*, solid waste permit, consent orders or decrees). Commenters also requested EPA to exempt any site that had closed as part of a cleanup conducted pursuant to another Federal requirement, such as CERCLA or RCRA subtitle C. These commenters stated that EPA had failed to demonstrate that these units posed any risk as a consequence of the lack of ponded water, and that “re-closure” of these previously closed units is consequently unnecessary and overly burdensome.

By contrast, several commenters supported EPA’s proposal to require all

legacy CCR surface impoundments to comply with the performance standards in § 257.102, even if the closure was previously approved by a State regulatory agency. These commenters pointed to EPA’s conclusions in 2015 that significant gaps remain in many State programs; that some programs provide minimal or no regulatory oversight of CCR units; and that most CCR surface impoundments were permitted exclusively under NPDES or other surface water pollution prevention programs. See, 80 FR 21324–21325. The commenters also included recent examples of closures approved by various State agencies that were not consistent with the Federal closure standards including: (1) Ohio’s approval of the closure of an unlined CCR surface impoundment at the Gavin Plant, which EPA subsequently estimated could be sitting in groundwater as high as 64 feet deep in some locations post closure and that as much as 8.2 million cubic yards (or as much as 40% of the CCR in the Fly Ash Reservoir) could still be saturated—and would remain so indefinitely; (2) Alabama’s issuance of several permits authorizing several facilities to close unlined CCR surface impoundments with large quantities of free liquids and saturated CCR remaining in the closed units; and (3) Kentucky’s permit authorizing the closure of an unlined CCR surface impoundment by partially draining the impoundment and constructing a new CCR landfill (98.9 acres), two stormwater ponds and a leachate pond (10.8 acres), and a materials handling area (4.4 acres) on top of the impoundment. The CCR in the underlying closed impoundment continues to receive, store, and discharge water, primarily groundwater entering the CCR through the sides of the filled valley, drains downward and outward to the east through the toe drain system under the dam.

Finally, several commenters requested that EPA prohibit legacy CCR surface impoundments from closing in place under § 257.102(d).

EPA disagrees that legacy CCR surface impoundments should be prohibited from closing with waste in place in accordance with § 257.102(d). The commenters did not demonstrate that legacy impoundments could never meet the performance standards in § 257.102(d) or identify unique characteristics or risks of legacy impoundments that would not be adequately addressed by compliance with those provisions. Both clean closure and closure with waste in place can be equally protective, provided that all of the requisite performance

⁶² Electric generating facilities are required to schedule and agree upon boiler shutdown periods with their Regional Transmission Organization (RTO) to ensure grid reliability. Most plants have regular boiler shutdowns on an annual basis with a more substantial one every few years. Since regular boiler shutdowns are already scheduled, the facility can plan the closure construction around the already scheduled outage; however, the outage may need to be extended depending on the work. The RTOs require various lead times of consultation or notice prior to any retirements, outages, or extended periods of non-operation.

standards in § 257.102 are met. The final rule therefore requires legacy impoundments to comply with the same requirements applicable to other inactive impoundments, that is, to close in accordance with either § 257.102(c) or (d).

If all of the performance standards for clean closure and the performance standards for closure with waste in place can be met, an owner or operator may determine which alternative is appropriate for their particular unit. The regulations do not require an owner or operator to use one closure option over the other in such situations. However, the facility must meet all the performance standards for the option it has selected, and if it cannot meet all of the performance standards for one option, then it must meet all of the performance standards for the other option. 40 CFR 257.102(a) (specifying that “[c]losure of a CCR landfill, CCR surface impoundments . . . [m]ust be completed either by leaving the CCR in place and installing a final cover system or through removal of the CCR and decontamination of the CCR unit, as described in paragraphs (b) through (j) of this section.”). For example, if the facility is unable to meet the performance standards for closure with waste in place for a particular unit (or portion of a unit), it must close the unit by removal (or that portion). Whether any particular unit or facility can meet the performance standards is a fact and site-specific determination that will ultimately depend on a number of factual and engineering considerations, such as the hydrogeology of the site, the engineering of the unit, and the kinds of engineering measures available.

As discussed in the preceding section, this final rule does not require previously closed legacy CCR surface impoundments to automatically “re-close.” Rather, consistent with the proposal, facilities will be required to ensure that all closed legacy CCR surface impoundments meet the performance standards in § 257.102(c) or (d). To the extent any deficit can be remedied by supplementary engineering methods, that would be all that is required.

(a) Closure of Legacy CCR Surface Impoundments Under State Law

EPA continues to disagree that it would be appropriate to exempt any legacy CCR surface impoundment that has completed closure or is currently in the process of closing pursuant to State requirements. As EPA repeatedly explained in the proposal, Congress established a specific process that would authorize State requirements to

operate in lieu of the Federal CCR regulations, and it would be inappropriate for EPA to substitute its own process to achieve the same ends. Under the Congressionally mandated process, a State must obtain EPA approval, in whole or in part, of its CCR permit program, pursuant to RCRA section 4005(d). 42 U.S.C. 6945(d). Those provisions expressly identify the standard EPA must use to evaluate a State program including, where applicable, alternative technical criteria that differ from the Federal CCR regulations, along with requirements for EPA to review approved programs and, if necessary, to withdraw approval. Finally, the statute expressly provides that in the absence of a permit issued under an approved State program, the Federal criteria apply to all CCR units. 42 U.S.C. 6945(d)(6). These provisions reflect Congress’ considered judgment of the appropriate legal structure and relationship between State and Federal requirements, and it is not appropriate for EPA to effectively establish its own alternative.

In any event, EPA lacks the record necessary to support a broad exemption for all closures under any State requirement. As discussed in more detail below, the information currently available does not demonstrate that all closures conducted under State authority “ensure there is no reasonable probability of adverse effects on health or the environment.” 42 U.S.C. 6944(a).

First, commenters’ arguments appear to be premised largely on the existence of a State solid waste program with the attributes of the municipal solid waste landfill requirements adopted and approved well after those dates. But as some commenters acknowledged, many legacy impoundments closed well before any State had developed such regulations—e.g., during 1970s–1990s.⁶³ EPA has no evidence demonstrating the protectiveness of State requirements during this period. However, the results of the joint U.S. Department of Energy (DOE) and EPA study completed in 2006, “Coal Combustion Waste Management at Landfills and Surface Impoundments, 1994–2004,” are not encouraging. Only 19% (three out of 19) of the surveyed surface impoundment permits included requirements addressing groundwater protection standards (*i.e.*, contaminant concentrations that cannot be exceeded) or closure/post-closure care. The EPA/DOE report also concluded that

approximately 30% of the net disposable CCR generated was potentially exempt from all State solid waste permitting requirements (EPA/DOE Report at pp 45–46). For example, at the time of the report, Alabama did not regulate CCR disposal under any State waste authority and did not have a dam safety program. Finally, the report found that a number of States only regulated surface impoundments under Clean Water Act authorities, and consequently primarily addressed the risks from effluent discharges to navigable waters, but did not require liners or groundwater monitoring.

As part of developing the 2015 CCR Rule, EPA independently reviewed State statutes and regulations, with a more detailed focus on the 16 States responsible for approximately 74% of the CCR generated in 2009. See 80 FR 21324. This review identified some programs that provided minimal or no regulatory oversight of CCR units. For example, Arizona, New Mexico, and Utah had no regulations applicable to CCR units or entirely exempted CCR from State regulations governing solid waste. Similarly, Mississippi, Montana, and Texas (the largest coal-ash producer) exempted the on-site disposal of CCR (as “nonhazardous industrial solid waste”) from some or all key requirements, such as permits or groundwater monitoring. Such exemptions covered most of the disposal of CCR within the State, as the majority of utilities dispose of their CCR on-site. Other States, such as Florida, Indiana, Ohio and Pennsylvania, exempted CCR landfills or “monofills” from many requirements. For example, Indiana regulations considered surface impoundments that are dredged at least annually to be “storage units” that are exempt from solid waste regulations, including from corrective action requirements. Many of these States were among the leading generators of CCR wastes at the time. In total, EPA estimated that in 2015, approximately 20% of the net disposable CCR was entirely exempt from State regulatory oversight.

However, EPA concluded in 2015 that most States regulated the management of CCR to varying degrees, although the particular requirements varied significantly. Most CCR surface impoundments were permitted exclusively under NPDES or other surface water pollution prevention programs. In these States, requirements to protect groundwater, such as liners or groundwater monitoring systems, were frequently less robust than the corresponding requirements applicable to CCR landfills.

⁶³ As discussed previously, if an impoundment contained CCR and liquids on or after October 19, 2015, it is considered a legacy impoundment under these regulations even if the unit is considered to have been closed under state law.

EPA did not specifically evaluate State closure requirements in 2015. However, EPA's findings with respect to groundwater monitoring requirements suggests that it is unlikely States considered the extent to which a surface impoundment would remain saturated by groundwater after closure. In 2015 EPA had only limited anecdotal evidence on the status of groundwater monitoring in six States, including four States that are among the leading CCR generators. After the Kingston TVA spill in December of 2008, groundwater monitoring wells were installed at 12 of Illinois's existing surface impoundments, almost doubling the number of monitored surface impoundments in the State. However, 55 additional surface impoundments, both active and inactive, still lacked groundwater monitoring systems. In Ohio, 44 CCR units, out of a total of 57 CCR units in the State (42 surface impoundments and 15 landfills) still lacked groundwater monitoring in 2015, even though all the surface impoundments were permitted decades ago under Ohio's NPDES program. Ohio acknowledged in their comments that the extent of groundwater risks in the State was poorly documented, as 40 out of 44 unlined CCR units did not have a groundwater monitoring system. Some State programs also authorized a buffer zone or a "zone of discharge," which allows the facility to defer remediation of groundwater contamination for some period of time, usually until the contaminant plume has migrated to the facility site boundary. Florida, Illinois, North Dakota, and Tennessee were among the States with such a regulatory provision.

EPA acknowledges that some States have substantially revised their programs since 2015, but this is not universal. In addition, although a few States provided further information that was not available to EPA in 2015 about their programs in response to the proposal, most did not. For the most part, commenters offered general assertions that State regulatory authorities have considered the site-specific conditions and determined that the closure or closure plan meets the necessary requirements for addressing risk, and that EPA should not second guess these decisions, but provided little, if any, evidence that would support a wholesale exemption for any closure conducted in accordance with State requirements.

At the same time, as discussed above, several commenters provided examples of recent (post-2015) State-authorized closures that are significantly less protective than § 257.102. For example,

at least two States responsible for a significant percentage of the CCR generated annually, Ohio and Kentucky, recently (*i.e.*, after 2015) allowed facilities to close their impoundments by removing the CCR from the impoundment, but did not require groundwater monitoring to determine whether groundwater contamination remained at the site. Under the CCR regulations, closure by removal is only considered complete with documentation that all Appendix IV constituent concentrations are below the GWPS in two consecutive groundwater monitoring sampling events.

More to the point, as EPA explained in the proposal, the record clearly shows that significant numbers of CCR surface impoundments were constructed with at least some portion of the unit actually in the aquifer beneath it, or otherwise consistently saturated by groundwater or surface water migrating into the unlined impoundment. Many of these units were closed without addressing the liquids that continued to saturate the CCR, and the free liquids that remained or the fact that the unit continues to impound water—in some cases with full approval from the State. This is especially likely for closures that occurred prior to 2015. As noted previously, a 2006 DOE/EPA report concluded that only 19% of the surveyed surface impoundment permits included requirements addressing groundwater protection standards (*i.e.*, contaminant concentrations that cannot be exceeded) or closure/post-closure care, and approximately 30% of the net disposable CCR generated was potentially exempt. The risks associated with such closures can be substantial, as discussed in Unit III.A of this preamble. Ultimately, under the Federal CCR regulations what determines whether a unit meets the definition of an inactive CCR impoundment or a closed CCR impoundment—and what determines whether the unit continues to present a reasonable probability of adverse effects on health and the environment—are the conditions that remain and the resulting risks, rather than whether a facility or even a State regulatory authority has labeled the unit as "closed."

For all of these reasons, EPA cannot exempt: (1) All units that have closed consistent with State requirements, or (2) All units that have started closure or have had a closure plan approved under State requirements prior to the effective date of the final rule.

(b) Deferral of Certain Completed Closures to Permitting

A few commenters provided examples of closure that they believed were

substantially equivalent to closures in accordance with § 257.102, because they involved substantial regulatory oversight, a site-specific risk assessment, and general consistency between the programs on the standards to be applied. These included closures under CERCLA and an approved State's RCRA subtitle C program. According to these commenters, it is a near certainty that there will be slight differences in the way the closure activities were designed or conducted when compared to § 257.102, but because the closure activities accomplish the same environmental goals and meet the same ultimate performance standards with respect to avoiding groundwater impacts, there is little to be gained by duplicative closure activities under the Federal CCR regulations. Another commenter provided a copy of a Consent Order entered in State court governing the closure of CCR surface impoundments at seven sites across the State. The commenter also provided copies of several human health and ecological risk assessments that were conducted to support the State's approval of the closures, along with various third-party reports. The commenter concluded that based on this factual record, it is unnecessary to subject these units to the existing closure criteria for CCR surface impoundments in §§ 257.101 and 257.102.

EPA agrees that closures conducted as part of a CERCLA or RCRA subtitle C response action would normally be expected to be consistent with the performance standards in § 257.102; the CCR closure regulations were based on the closure regulations for hazardous waste facilities, and the CCR regulations would normally be considered ARARs under CERCLA for any closure of a CCR facility after 2015. Consequently, these facilities may ultimately be able to support a certification of compliance with § 257.102. But, as the commenters noted, there can be slight variations in how the standards are applied, and a facility may consequently not be confident that it can support a certification.

Nor are these the only closures that may be substantially equivalent. As the commenters' examples demonstrate, State requirements, even where different, can result in closures that are equally as protective as those conducted in accordance with Federal requirements.

However, as the commenters noted it is a near certainty that there will be differences in the way the closure activities were designed or conducted when compared to § 257.102. EPA does

not believe that it can craft an exemption that could encompass all these potential variations. Nor does EPA believe that it could develop criteria that are sufficiently precise that regulated entities could determine whether alternative requirements ultimately accomplish the same environmental goals and meet the same ultimate performance standards as the Federal requirements. But EPA has detailed criteria to identify whether a closure is potentially as protective as those conducted in accordance with § 257.102, and which therefore warrant a closer evaluation; closures that meet these criteria will be deferred until a permitting authority can evaluate the adequacy of the closure.

The closures described above all share certain features such as the risks at the site have been fully evaluated by a regulatory authority and carefully addressed with oversight by a regulatory authority. Even though the specific requirements may differ from § 257.102, there is nevertheless reason to believe that the closure will be protective, at least in the interim until a permitting authority can evaluate the adequacy of the closure to the CCR closure requirements. Based on these considerations, EPA is limiting this deferral to closures where the facility can document that it meets specific conditions. First, the deferral is limited to circumstances in which a regulatory authority played an active role in overseeing and approving the closure activities. EPA considers a “regulatory authority” to include a State or Federal permit, an administrative order, or consent order issued after 2015 under CERCLA or by an EPA-approved RCRA State program. The permitting or other authority must have required groundwater monitoring to ensure there was no contamination coming from the unit that is not addressed by corrective action.

Second, to support deferral of evaluation of a prior closure of a legacy CCR surface impoundment as substantially equivalent, the facility with a surface impoundment that closed with waste in place must document that free liquids have been eliminated, consistent with the standard in § 257.102(d)(2)(i). This requirement directly addresses the reason that EPA has concluded that many previously completed closures do not meet the standard in RCRA section 4004(a).

Third, a facility must document that it had installed a groundwater monitoring system and performed groundwater monitoring that meets a subset of the performance standards found in § 257.91(a). Specifically, the

facility must demonstrate that the groundwater monitoring system was capable of: (1) Accurately representing background water quality; (2) Accurately representing the quality of water passing the waste boundary; and (3) Detecting contamination in the uppermost aquifer. Finally, the groundwater monitoring system must have monitored all potential contaminant pathways. These are the same subset of standards that apply to a facility certifying that its closure by removal completed prior to the effective date of this final rule meets the performance standards in § 257.102(c).

Fourth, a facility would need to demonstrate that a site-specific risk assessment was conducted or approved by the regulatory authority prior to (or as part of) approving the closure, and that the closure and any necessary corrective action has been overseen by the regulatory authority, pursuant to an enforceable requirement.

These criteria are generally consistent with the criteria a commenter suggested to identify closures under other authorities that would be equivalent to those conducted in accordance with § 257.102. These included that the facility had installed a groundwater monitoring system and performed groundwater monitoring and analysis in accordance with §§ 257.90 through 257.95 and was conducting any necessary remediation in accordance with §§ 257.96 through 257.98, pursuant to an enforceable requirement. Although the commenter proposed these to serve as a basis for an exemption, EPA considers they are equally relevant to identifying decisions that can be deferred for future evaluation.

Fifth, the facility would be required to prepare and include documentation in the applicability report and operating record, demonstrating that it has met these criteria and is eligible for deferral. This would include all relevant specifics such as State permit, order, data, groundwater monitoring results, etc. This must be certified by the owner/operator or an authorized representative using the same language in § 257.102(e).

When it comes time for the permit authority to evaluate the closure, EPA intends to rely on the permit application process as the primary mechanism to collect the information to allow a determination to be made as to whether a legacy CCR surface impoundment that closed under these alternative standards did so in compliance with the requirements of § 257.102. The permit application process is a well-established system for reviewing the types of groundwater, soil and other sampling and analytical data that will typically be

required in determining the “equivalency” of alternative closures.

When the permit application is called in, the facility must provide sufficient information, including data on contaminant levels in groundwater, to demonstrate that the applicable § 257.102 standards have been met. EPA or a Participating State Director will review the information to determine whether the “equivalency” of the closure has been successfully demonstrated. If EPA determines that the closure has met the appropriate part 257 closure standard, EPA will issue a permit. If EPA or a Participating State Director determines that the closure does not meet the part 257 standards, the owner or operator will be required to submit a permit application containing all the applicable information for an operating permit, and EPA or a Participating State Director will issue a permit that contains the specific requirements necessary for the closed unit to achieve compliance with § 257.102.

iv. Closure Compliance Deadlines for Legacy CCR Surface Impoundments

(a) Initiation of Closure for Legacy CCR Surface Impoundments

EPA proposed that legacy CCR surface impoundments be subject to the existing requirement to initiate closure that are applicable to other unlined CCR surface impoundments because, as discussed in the proposed rule and in Unit III.B.2.c of this preamble, the current record indicates that legacy CCR surface impoundments are largely, if not entirely, unlined. Specifically, EPA proposed that owners or operators of legacy CCR surface impoundments initiate closure no later than 12 months after the effective date of the final rule because EPA anticipated 12 months being sufficient time for owners or operators to identify and delineate the legacy CCR surface impoundment, determine relevant engineering information (e.g., structural stability), characterize the site’s hydrogeology and other characteristics, and determine whether any of the uppermost aquifer has been contaminated. As explained in the proposed rule, EPA acknowledged that most of this information would be obtained through compliance with the proposed groundwater monitoring and corrective action requirements.

In the proposed rule, EPA solicited comment on whether the regulations should provide owners and operators the option to retrofit a legacy CCR surface impoundment in accordance with the retrofit requirements in § 257.102(k) as an alternative to

requiring the closure of a legacy CCR surface impoundment.

As stated in Unit III.B.2.g, generally commenters on the proposed rule supported requiring legacy CCR surface impoundments to close in accordance with the existing requirements. However, some commenters disagreed that closure was appropriate for certain legacy CCR surface impoundments, including those units underneath infrastructure needed to support current activities, those that had completed or currently undergoing closure, and those units that have been demonstrated not to pose unacceptable risk.

Most commenters stated that the proposed deadline for the initiation of closure was infeasible due to the factors listed in Units III.B.2.a.ii and III.B.2.g of this preamble (e.g., labor shortages, seasonality, limited contractor availability, overlapping regulatory requirements) and should be extended in consideration of those factors as well as to allow for the incorporation of the groundwater monitoring data.

No commenters provided feedback on whether the regulations should allow owners and operators to retrofit a legacy CCR surface impoundment.

For the reasons explained in the proposed rule as well as Unit III.B.2.g, EPA continues to conclude that the closure requirements in the existing rule are generally appropriate for legacy CCR surface impoundments. However, as explained in Unit III.B.2.g, EPA recognizes that in specific situations, mandatory closure of a legacy CCR surface impoundment by the deadline may cause more harm than benefits to human health and the environment. Based on information provided by the commenters and experience with the implementation of the 2015 CCR Rule (i.e., regulation of inactive CCR surface impoundments), EPA finds that these situations are limited to those in which the legacy CCR surface impoundment has completed closure under a State authority and those in which the unit is beneath infrastructure necessary for current activities.

For additional closure requirements of a legacy CCR surface impoundment, the decision to require reclosure will be deferred until a permitting authority is authorized to issue CCR permits to the facility, at which point, the permitting authority will be able to look at site-specific factors and evidence to decide if reclosure is necessary to protect human health and the environment. EPA concludes that this approach will mitigate adverse impacts to local communities and the environment, including environmental justice concerns that may result from activities

associated with reclosing a facility that is not contaminating groundwater or posing other risk to human health and the environment, such as increased traffic, increased greenhouse gas emissions, habitat loss, loss of native vegetation, water consumption, and additional waste generation.

When the legacy CCR surface impoundment is beneath infrastructure vital to the continuation of activities, such as beneath a substation, the initiation of closure will be deferred until the infrastructure is no longer needed or the closure of the facility, whichever is sooner. This approach protects human health and the environment while appropriately accounting for the need for operational continuity and reliability.

As explained in Unit III.B.2.g, EPA acknowledges the benefit of allowing owners or operators the time needed to incorporate groundwater monitoring data into the closure plan. Additionally, as stated in the proposed rule, EPA acknowledges the importance of using information gained by compliance with the groundwater monitoring and corrective action requirements to inform closure decisions and therefore the initiation of closure. For the reasons explained in Unit III.B.2.f, EPA is extending the deadline for the groundwater monitoring and corrective action requirements to a single deadline of no later than 30 months from the effective date of the final rule. As such, the initiation of closure is being extended as well. To ensure owners or operators have enough groundwater monitoring data to draw conclusions about seasonality impacts on groundwater levels and flow and the source of any potential groundwater contamination in the area, EPA is finalizing a deadline of no later than Monday, May 8, 2028, which is 42 months from the effective date of the final rule. This is codified in the regulatory text at § 257.101(e)(1).

EPA is finalizing the application of the existing requirements to initiate closure to legacy CCR surface impoundments as proposed except for those that fall under the deferral of closure described above (i.e., units closed under State authority, units beneath critical infrastructure).

As stated in § 257.102(e), closure has been initiated once any steps necessary to implement the closure plan as described by Unit III.B.2.g.ii of this preamble have been taken, including submitting an application for any necessary State or agency permits or permit modifications and taking steps to comply with standards of any State or

other agency that are a prerequisite to completing closure of a CCR unit.

(b) Preparation of a Written Closure Plan for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments comply with the existing requirements of § 257.102(b) requiring the preparation of a written closure plan no later than 12 months after the effective date of the final rule.

As mentioned above, overall commenters on the proposed rule agreed that closure requirements, including the written closure plan, would generally be appropriate for legacy CCR surface impoundments. One commenter suggested additional requirements for the content of the closure plan including the elevation of the base of the unit, groundwater information, and descriptions of compliance with § 257.102 will be achieved (e.g., how free liquids would be eliminated, how waste will be stabilized, measures to minimize the need for further maintenance of the CCR unit). A few commenters supported the proposed deadline but as summarized in Units III.B.2.a.ii and III.B.2.g of this preamble, other commenters stated the proposed deadline was infeasible and inappropriate. One commenter suggested the deadline for the closure plan be extended to be concurrent with the initiation of closure. Commenters suggestions for the deadline for the completion of the closure plan ranged from 12 (the 2015 CCR Rule deadline) to 32 months, or after the collection of the eight baseline groundwater samples.

EPA disagrees with the commenter that additional requirements regarding the content of the closure plan are necessary. The information the commenter requested be included in the closure plan is 1) already required to be in the closure plan pursuant to §§ 257.102(b) or 2) readily available in other required reports (e.g., the annual groundwater monitoring and corrective action reports). Furthermore, the commenter failed to fully explain how compliance with § 257.102(b) does not provide the information needed to determine if compliance with the closure performance standards will be met.

Regarding the deadline, as stated above, EPA concludes that the deadline for the closure plan should be extended from the proposed deadline to allow for owners or operators to incorporate information about groundwater quality, groundwater flows, seasonality impacts, and the migration of contaminants (if any) into the plan. Therefore, EPA is finalizing a deadline of no later than

Monday, November 8, 2027, which is 36 months after the effective date. This is codified in the regulatory text at § 257.100(f)(5)(i).

Based on comments on the proposed rule and experience from the 2015 CCR Rule, EPA expects the incorporation of this information into the closure plan will allow facilities to select a closure method that most appropriately addresses issues like waste that is in contact with groundwater, groundwater contamination, and long-term structural stability concerns. Closure plans that adequately address these issues will result in more compliant closure plans and therefore, be more protective of human health and the environment.

The closure plan describes the steps necessary to close a CCR unit at any point during the active life of the unit based on recognized and generally accepted good engineering practices. 40 CFR 257.102(b)(1). The plan must set out whether the closure of the CCR unit will be accomplished by leaving CCR in place or through closure by removal and include a written narrative describing how the unit will be closed in accordance with the section, or in other words, how the closure will meet all the performance standards in the regulations. 40 CFR 257.102(b)(1)(i). The written closure plan must also provide a schedule for completing all activities necessary to satisfy the closure criteria of the rule. See also 80 FR 21410–21425.

If the CCR is left in place, the closure plan must include a description of the final cover system and how the final cover system will achieve the regulatory performance standards. If the base of the impoundment intersects with groundwater, the closure plan would need to discuss the engineering measures taken to ensure that the groundwater had been removed from the unit prior to the start of installing the final cover system, as required by § 257.102(d)(2)(i). The closure plan would also need to describe how the facility plans to meet the requirements in § 257.102(d)(1) to “control, minimize or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste and releases of CCR, leachate, or contaminated run-off to the ground or surface waters.” This could include, for example, the installation of engineering controls that would address the post-closure infiltration of liquids into the waste from all directions, as well as any post-closure releases to the groundwater from the sides and bottom of the unit.

(c) Preparation of a Written Post-Closure Care Plan for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments would be required to comply with the existing requirement in § 257.104(d) regarding the preparation of a written post-closure no later than 12 months after the effective date of the final rule.

The comments EPA received on the proposed rule regarding the post-closure plan requirement are described in Units III.B.2.g and III.B.2.g.i and can be summarized as requests for an extension of the post-closure care deadline to allow for a more feasible deadline and the incorporation of groundwater monitoring data. For the reasons stated in Units III.B.2.g and III.B.2.g.i, EPA is finalizing a deadline of no later than Monday, November 8, 2027, which is 36 months from the effective date of the final rule to comply with the post-closure care requirement in § 257.104(d). This is codified in the regulatory text at § 257.100(f)(5)(ii).

Section 257.104(d) requires that an owner or operator of a CCR unit prepare a written post-closure plan. The contents of the P.E.-certified plan are stated in the rule at § 257.104(d)(1)(i) through (iii) and can be summarized as a description of the monitoring and maintenance activities required for the unit, the frequency that these activities will be performed, information for the point-of-contact during the post-closure care period, and planned uses of the property.

(d) Deadline To Complete Closure for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundment comply with the existing closure completion time frames in § 257.102(f).

As stated in Unit III.B.2.g of this preamble, some commenters on the proposed rule supported the proposed deadline, however, overall commenters supported applying the existing closure completion time frames as long as the proposed deadline for the initiation of closure was extended. For the reasons described throughout this section, EPA has extended the deadline for the initiation of closure. EPA expects the extension to the deadlines for the closure plan and initiation of closure, as well as the options to defer closure requirements for legacy CCR surface impoundments that have completed closure under a regulatory authority (see Unit III.B.2.g.iii.b), to address the concerns commenters expressed with

the infeasibility or inappropriateness of the deadline to complete closure. Therefore, EPA is finalizing the deadline for the completion of closure of legacy CCR surface impoundments as proposed.

Section 257.102(f) generally requires an owner or operator of existing and new CCR surface impoundments to complete closure activities within five years from initiating closure. However, the regulations also establish conditions, including documentation requirements, under which owners or operators can demonstrate and receive two-year extensions of the deadline. For CCR surface impoundments of 40 acres or less, the deadline can only be extended by one two-year extension. For CCR surface impoundments larger than 40 acres, the deadline can be extended in increments of two years for no more than five times.

(e) Post-Closure Care for Legacy CCR Surface Impoundments

EPA proposed to apply the existing post-closure care requirements at § 257.104 to legacy CCR surface impoundments without revision. These criteria are essential to ensuring the long-term safety of legacy CCR surface impoundments.

No commenters raised specific concern about requiring legacy impoundments to comply with the existing requirements in § 257.104. EPA is therefore finalizing this provision without revision.

The existing post-closure care criteria require the monitoring and maintenance of units that have closed with CCR in place for at least 30 years after closure has been completed. 40 CFR 257.104. During this post-closure period, the facility would be required to continue groundwater monitoring and corrective action, where necessary.

h. Recordkeeping, Notification, and Internet Posting Criteria for Legacy CCR Surface Impoundments

EPA proposed that owners or operators of legacy CCR surface impoundments be subject to the existing recordkeeping, notification, and website reporting requirements in the CCR regulations found at §§ 257.105 through 257.107. For reasons specified in the 2015 CCR Rule, the CCR regulations require the owner or operator of a new or existing CCR unit to record specific information in the facility's operating record, maintain files of all required information (e.g., demonstrations, plans, notifications, reports) that supports implementation and compliance with the rule, notify State Director and Tribal authorities, and maintain a public CCR

website that hosts this information. 80 FR 21427.

A commenter on the proposed rule supported applying recordkeeping, notification, and internet posting requirements to legacy CCR surface impoundments but stated that the existing requirements were ineffective at ensuring compliance with the CCR regulations or allowing for meaningful public awareness or participation. The commenter suggested that EPA create mechanisms within the rule to ensure the public has the opportunity to participate in the decision-making processes at regulated CCR units; standardize reporting to make the report more easily understood by the public; establish organizational requirements for the CCR websites; require public notice and engagement when notifying the State Director and/or appropriate Tribal authority as required by the CCR rule; extend the period of time the files required by the CCR rule must be maintained in the operating record; and require owners or operators to certify compliance documentation for the CCR units. This commenter also suggested EPA clarify what records owners or operators are required to retain and to publish.

EPA agrees with the commenter on the importance of meaningful public participation. The current regulations allow for public participation by requiring owner or operators to hold a public meeting as part of the assessment of corrective measures in § 257.96, creating a mechanism for the public to file dust complaints in § 257.80(b), and the “contact us” form or specific email address on facilities’ public CCR websites for questions or issues from the public as required by § 257.107(a). EPA does not have evidence to support the claim by the commenter that these opportunities for public participation are ineffective. Furthermore, EPA does not find other decision-making points in the rule appropriate for mandatory public meetings although facilities are encouraged to engage with the public and to both solicit and incorporate public input into decisions, such as closure methods, as able and appropriate.

With respect to the commenter’s suggestions that EPA require the owners or operators of CCR units to certify compliance documentation and create standardized reporting and website layout requirements, as explained in the proposed rule, EPA does not have evidence that legacy CCR surface impoundments are sufficiently different than currently regulated facilities to necessitate substantially different requirements. The commenter provided

no factual basis to support the suggestion that requiring owner or operator certifications would improve compliance with the regulations beyond the certifications currently required by professional engineers. When justifying the request for standardized reporting and website layout requirements, the commenter failed to explain how compliance with the public website posting requirements in § 257.107, including the requirement to ensure all information is “clearly identifiable and must be able to be immediately printed and downloaded by anyone accessing the site” is inadequate or a hindrance to the public accessing the required information. Therefore, EPA does not believe additional notification, certification, or public engagement requirements for legacy CCR surface impoundments would be appropriate.

EPA agrees with the commenter on the need to extend the period of time files required by the CCR rule must be maintained on the facilities’ public websites and in the operating records. As described in Unit III.D.5, EPA is extending how long files must be maintained in the operating record and on the public website. While EPA believes the regulations at §§ 257.105 and 257.107 clearly lay out what records must be retained and published, EPA has included in Unit III.D.5 a table that details what records are required to be maintained in the operating record and on the public website as well as the corresponding retention periods.

EPA is finalizing the requirement that owners or operators of legacy CCR surface impoundments comply with recordkeeping, notification, and internet posting requirements at §§ 257.105 through 257.107. Owners or operators must document implementation and compliance with the rule and must place these files into the facility’s operating record. Each required file must be maintained in the operating record for the entirety of the retention period specified in § 257.105 following submittal of the file into the operating record. Each file must also indicate the date the file was placed in the operating record. Files are required to be submitted into the operating record at the time the documentation becomes available or by the compliance deadline specified in the CCR regulations. Section 257.105 contains a comprehensive listing of each recordkeeping requirement and corresponding record retention periods.

Furthermore, the owner or operator of a legacy CCR surface impoundment must maintain a CCR website titled, “CCR Rule Compliance Data and Information” that hosts the compliance

information so that it may be viewed by the public. Unless provided otherwise in the rule (see, Unit III.E.5), information posted to the publicly accessible internet site must be available for a period of no less than five years from the initial posting date for each submission. Posting of information must be completed no later than 30 days from the submittal of the information to the operating record. Owners or operators of legacy CCR surface impoundments have 30 days from the effective date of this rule to establish a CCR website and post the required applicable information.

C. CCR Management Unit Requirements

EPA is establishing requirements to address the risks from previously unregulated solid waste management of CCR that involves the direct placement of CCR on the land at CCR facilities. Information obtained since 2015 demonstrates that these exempt solid waste management practices are currently contaminating groundwater at many sites, and at others, have the potential to pose risks commensurate with the risks associated with currently regulated activities.

The closure of CCRMU of 1,000 tons or greater also provides significant risk mitigation. As laid out in Unit III.A of this preamble, CCRMU at both active facilities and inactive facilities with legacy impoundments pose risks to human health and the environment that are at least as significant as the risks presented by legacy CCR surface impoundments and the units currently regulated under the 2015 CCR Rule. In particular, for highly exposed individuals off site, landfill CCRMU were estimated to pose cancer risks as high as 7×10^{-6} from arsenic III, while surface impoundment CCRMU were estimated to pose cancer risks as high as 8×10^{-5} from arsenic III and noncancer HQs as high as 2 for arsenic III, two for lithium, and one for molybdenum. Differences in national risks between currently regulated units and these older units are attributed largely to the proportion of units that were modeled at the time as lined. However, the risks associated with these older units may be even higher than EPA modeled in the 2014 Risk Assessment for active units. These units have been present onsite longer and had more time to leak. In addition, there are several management practices that have the potential to result in higher leakage, but that were previously modeled either less frequently for active units—based on a belief that the practices had declined over time—or not at all—due to data constraints on a national scale. These include: (1) The greater prevalence of

unlined units; (2) The greater likelihood of co-management of CCR with coal refuse and other wastes in surface impoundments, making the overall waste pH far more acidic and (3) The potential for the units to be constructed below the water table or to have become inundated with groundwater after the time of construction. As discussed in Unit III.A, each of these practices individually have the potential to result in nationwide risks higher than previously reported on a national basis for the currently operating universe of CCR units. For example, unlined landfill CCRMU were estimated to pose cancer risks as high as 1×10^{-5} from arsenic III, while unlined surface impoundment CCRMU were estimated to pose cancer risks ranging from 2×10^{-4} from arsenic III and noncancer HQs as high as 5 for arsenic III, 3 for lithium, 2 for molybdenum, and 1 for thallium. A combination of these practices could push risks even higher than modeled.

Based on these data, EPA is finalizing the addition of a new category of CCR units that would be subject to a set of requirements tailored to the characteristics of such units and the risks that they present. This new category of CCR units, called “CCR management units” or CCRMU, consists of CCR surface impoundments and landfills that were closed prior to the effective date of the 2015 CCR Rule, and inactive CCR landfills, which include inactive CCR piles. Under this final rule, CCR management units are subject to the regulations when they are located at: (1) A facility currently regulated under the 2015 CCR Rule; (2) Inactive facilities with a legacy CCR surface impoundment; and (3) Facilities that, on or after October 19, 2015, produced electricity for the grid but were not regulated under the 2015 CCR Rule because they had ceased placement of CCR in onsite CCR units and did not have an inactive CCR surface impoundment (the inclusion of these facilities are discussed in Unit III.C.2.f). EPA refers to the facilities in the above three categories in this preamble as “covered CCR facilities.”

Owners or operators of any of covered CCR facilities are required to conduct a facility evaluation to identify and delineate any CCRMU containing one ton (or more) at the facility and document the findings in two reports. In addition, owners or operators of a covered CCR facility are required to ensure that all identified CCRMU containing 1,000 tons or more comply with the existing requirements in 40 CFR part 257, subpart D for groundwater monitoring, corrective action (where

necessary), and in certain cases, closure, and post-closure care requirements. These issues are discussed in more detail in this Unit of the preamble.

EPA estimates that there are 179 CCRMU at 92 active facilities and 16 CCRMU at 12 inactive facilities that will be subject to the requirements of this final rule.⁶⁴ These areas include inactive CCR landfills, closed CCR landfills, closed CCR surface impoundments, and other solid waste management areas of CCR. EPA also identified 20 CCRMU at eight other active facilities. This estimate of CCRMU is an increase from the 134 CCRMU located at 82 facilities identified in the proposed rule. 88 FR 32028.

1. Damage Cases

EPA has a long history of considering damage cases in its regulatory decisions under RCRA. RCRA specifically directs EPA, when making a Regulatory Determination for CCR, to consider “documented cases in which danger to human health and the environment from surface run-off or leachate has been proved,” demonstrating that such information is to carry great weight in decisions of whether and how to regulate such wastes. 42 U.S.C. 6982(n)(4). See also 42 U.S.C. 6982(n)(3). In addition, damage cases are among the criteria EPA must consider under its regulations for determining whether to list a waste as a “hazardous waste.” See 40 CFR 261.11(a)(3)(ix). EPA also relied on damage cases to develop the specific requirements for CCR in part 257, subpart D. See, 80 FR 21452–21459.

Damage cases generally provide direct evidence of both the extent and nature of the potential risks to human health and the environment that have resulted from actual waste management practice. For example, in the 2015 CCR Rule, EPA relied on damage cases to identify actual management practices that resulted in harm above and beyond that already identified through modeling. Based on the damage cases, EPA identified several additional constituents (antimony, barium, beryllium, chromium, selenium, and lead) that were added to the Appendix IV list for groundwater monitoring.

For CCRMU, EPA proposed to rely on ten potential damage cases to further support the results of the modeling and 2014 Risk Assessment, and to better understand the characteristics of the sites and units, as well as the

management practices, in order to develop appropriate requirements. EPA reviewed information received in response to the ANPRM as well as the documents posted on facilities’ CCR websites for compliance with CCR regulations. See, 88 FR 32012. Specifically, EPA reviewed groundwater monitoring reports, assessment of corrective measures reports, corrective measures progress reports, remedy selection reports, history of construction reports, closure plans and reports, and fugitive dust control plans for facilities with CCR websites from 2018, 2019, 2020, and 2021. Through review of the groundwater monitoring and corrective action reports, EPA found many instances where the owners or operators of CCR facilities claimed that the detection of an SSI or SSL in concentrations of Appendix III or IV constituents in groundwater came from a CCRMU rather than the monitored regulated CCR unit.

Whenever a facility determines that there is an SSI over background levels for one or more of the constituents in Appendix III at a monitoring well at the downgradient waste boundary, the existing CCR regulations allow the facility an opportunity to complete an ASD showing that a source other than the unit (*i.e.*, an alternative source) was the cause of the SSI. 40 CFR 257.94(e)(2). The existing CCR regulations provide a similar opportunity whenever assessment monitoring results indicate that an SSL exceeding the GWPS has been detected at a downgradient well for any of the Appendix IV constituents. 40 CFR 257.95(g)(3). If a successful ASD for an SSL is not completed within 90 days, corrective action must be initiated.

In reviewing groundwater monitoring and corrective action reports EPA found that 42 ASDs or ACMs concluded that a Federally unregulated CCR source was responsible for the SSI or SSL. The proposed rule included ten examples (*i.e.*, damage cases) where owners or operators of CCR facilities claimed that an SSI or SSL is attributable to a CCR source rather than the Federally regulated CCR unit.

In addition to reviewing the groundwater monitoring and corrective action reports, EPA reviewed the history of construction reports, closure plans and reports, and fugitive dust control plans for facilities with CCR websites from 2018, 2019, 2020, and 2021. These documents contained either site maps, which identified currently regulated units, and in some cases, inactive or closed units at the facility, or narrative discussions of the site history, which included identification of where CCR

⁶⁴ An updated list of known potential CCRMU can be found in the docket for this action. See document titled “Universe of CCR Management Units. April 2024.”

were previously disposed or managed at the facility.

EPA received numerous comments about the damage cases provided in the proposed rule. Some commenters provided information to demonstrate that many of EPA's listed damage cases did not meet EPA's criteria for a damage case to be considered "a proven damage case," that had been developed for purposes of the Bevill Regulatory Determinations described in 65 FR 32214, 32224 (May 22, 2000). One commenter mischaracterized these criteria as "EPA's criteria for identifying damage cases in RCRA rulemakings," and claimed that groundwater exceedances are not sufficient to prove that there is any risk to human health. The commenter stated that "exceedances [must be] measured in ground water at a sufficient distance from the waste management unit to indicate that hazardous constituents had migrated to the extent that they could cause human health concerns" citing the 2000 Regulatory Determination (65 FR 32224, May 22, 2000), and the 2010 proposed CCR Rule (75 FR 35131, June 21, 2010). The commenter asserted that without such information, none of the cases can be used to justify EPA's proposed regulation of CCR management units.

Another commenter argued that "the damage cases are not representative of all CCRMUs, and, consequently, cannot legitimately be relied upon to develop national standards and requirements for all CCRMUs." The commenter claims that a report generated by Gradient documents "many examples of CCRMUs that are not causing any GWPS exceedances, are not associated with any undue risk, and are being effectively regulated under state purview." Additionally, the commenter claims that the "damage cases cited by US EPA do not demonstrate that CCRMUs are currently impacting groundwater quality and causing an unacceptable risk because EPA has not addressed whether the groundwater impacts that they have attributed to CCRMUs result from the current condition of each CCRMU or its historical operating condition." The commenter concludes that because EPA has provided no evidence to determine whether the impacts are being caused by the current condition of each CCRMU (potentially closed, inactive, and/or dewatered), EPA's conclusions that the damage cases provide evidence of potential risks associated with CCRMU is misguided and unsupported.

One commenter also took issue with EPA's inclusion of "only" ten "hand-picked" damage cases to justify

regulation of CCRMU. The commenter complained that "EPA's damage cases are not based on information collected by EPA, but rather are based on information compiled by advocacy groups using data collected from CCR websites, [and t]here is no indication EPA has conducted its own data collection, or verified the data that was collected." The commenter went on to say,

Much of the data refers to alternative source analyses conducted for regulated CCR units, suggesting that the discussed 'CCRMU' may be the source of groundwater contamination; however, EPA makes no statements regarding whether, and conducts no analysis to determine whether, it agrees with those analyses. This is highlighted by the carefulness of EPA's declaration that its review of the third-party compiled information identified 42 areas "potentially contaminating groundwater." . Potential groundwater impacts does not rise to the RCRA protectiveness level of "reasonable probability of adverse effects on health or the environment from disposal of solid waste at such facility.

Finally, one commenter complained that of the 134 areas EPA identified where the management of CCR remain exempt, less than one third were found to potentially have groundwater impacts, yet EPA seeks to regulate the entire universe of 134 areas and more. According to this commenter, even assuming the potential groundwater impacts are real, they are not necessarily an indication that the CCR management practice creates a reasonable probability of an adverse effect on human health or the environment, as the commenter believes there are several other factors, such as the nature and extent of the CCR management practice, whether a hydraulic head is present, the hydraulic conductivity of surrounding soils, and the proximity of the material to water and the likelihood of contact with water, that must be considered before concluding a CCR management practice creates a reasonable probability of an adverse effect.

EPA disagrees that it is inappropriate to characterize the cited SSIs and SSLs as damage cases. As explained in the 2015 CCR Rule preamble, EPA has a long history of considering damage cases in its regulatory decisions under RCRA. 80 FR 21452. The statute specifically directs EPA to consider "documented cases in which danger to human health and the environment from surface runoff or leachate has been proved," in reaching its Regulatory Determination for these wastes, demonstrating that such information is to carry great weight in determining whether to regulate these wastes. 42 U.S.C. 6982(n)(4). Damage cases, even if

only potential damage cases, are also relevant under the third Bevill factor: "potential danger, if any, to human health and the environment from the disposal and reuse of such materials." 42 U.S.C. 6982(n)(4). In addition, damage cases are among the criteria EPA must consider under its regulations for determining whether to list a waste as a "hazardous waste." See 40 CFR 261.11(a)(3)(ix). Damage cases generally provide extremely potent evidence in hazardous waste listings.

As with the 2015 CCR Rule, EPA considers that both proven and potential damage cases provide information directly relevant to this rulemaking. Damage cases—whether proven or potential—provide evidence of both the extent and nature of the potential risks to human health and the environment. The primary difference between a proven and a potential damage case is whether the contamination has migrated off-site of the facility. But the mere fact that groundwater contamination has not yet migrated off-site does not change the fact that a potentially harmful constituent has leached from the unit into groundwater. Whether the constituent ultimately causes further damage by migrating into drinking water wells does not diminish the significance of the environmental damage caused to the groundwater under the site, even where it is only a future source of drinking water. As explained in the original 1979 subtitle D criteria, EPA is concerned with groundwater contamination even if the aquifer is not currently used as a source of drinking water. Sources of drinking water are finite, and future users' interests must also be protected. (See 44 FR 53445–53448.) ("The Act and its legislative history clearly reflect Congressional intent that protection of groundwater is to be a prime concern of the criterion. . . . EPA believes that solid waste activities should not be allowed to contaminate underground drinking water sources to exceed established drinking water standards. Future users of the aquifer will not be protected unless such an approach is taken."). EPA is therefore presenting its findings with regard to damage cases because this information further supports the results of EPA's 2014 and 2024 Risk Assessments, which together provide the factual bases for the actions taken in this final rule.

EPA also disagrees with the arguments that attempt to minimize the significance of the damage case record. EPA is relying on the damage cases to evaluate the extent and nature of the risks associated with particular CCR management practices. Facts

demonstrating the consequences from particular activities therefore remain relevant, particularly (although not solely) where the management practices continue to occur. In other words, what matters in this regard are facts that provide information on the reasons that unit leaked, the particular contaminants that were present, the levels of those contaminants, and the nature of any impacts caused by that contamination. This is entirely consistent with RCRA section 8002(n), which requires EPA to evaluate the “potential danger, if any, to human health and the environment from the disposal and reuse of such materials” in addition to “documented” damage cases. 42 U.S.C. 6982(n)(3)–(4).

EPA further disagrees that only the presence of receptors within the impact sphere of a contaminating facility merits consideration of a particular damage case. EPA’s longstanding and consistent policy across numerous regulatory programs has been that groundwater contamination is a significant concern that merits regulatory action in its own right, whether or not the aquifer is currently used as a source of drinking water. Sources of drinking water are finite, and future users’ interests must also be protected. The absence of current receptors is therefore also not an appropriate basis on which to discount damage cases. And for all the reasons discussed above, EPA also disagrees that only exceedances of health-based standards of contaminants that have migrated off-site (*i.e.*, only proven damage cases) should be accounted for as part of this rulemaking.

EPA further disagrees with commenters’ assertions about the sources of information that EPA included in the proposed rule and that EPA is relying upon in this final rule. In the proposal EPA discussed information that the Agency obtained from comments submitted in response to the ANPRM, and from other sources provided by environmental groups. However, EPA conducted an independent review of information posted on facility websites, including groundwater monitoring reports, assessment of corrective measures reports, corrective measures progress reports, remedy selection reports, history of construction reports, closure plans and reports, and fugitive dust control plans for facilities with CCR websites from 2018, 2019, 2020, and 2021 to develop the record for the proposed rule. 88 FR 32012–32013.

Several commenters disagreed with EPA’s characterization in the proposed rule of certain sites as damage cases because the units have now been closed or the contamination has been

remediated (or is in the process of being remediated) under State oversight. For example, one commenter noted that they are “aware of situations where over the years CCR was intermittently dispersed within fill to facilitate facility expansions (commonly referred to as “made land”), which was a common practice along heavily industrialized shores of the Great Lakes.” The commenter further stated that, the “Phases I and II of the Landfill at NIPSCO’s R.M. Schahfer Generating Station, is an example of how the Proposed Rule mischaracterizes the risk associated with CCRMU.” According to the commenter Phases I and II have been closed in a manner that is protective of groundwater, and the data demonstrates that the groundwater plume resulting from Phases I and II is stable, with concentrations of constituents declining.

Another commenter similarly objected to EPA’s inclusion of Reid Gardner as an example of CCRMU with identified SSIs. The commenter said EPA mistakenly assumed the historical ponds under the regulated units may be a cause of SSIs. They said these historical ponds were excavated and removed prior to 2015 so these units cannot be deemed to be a CCRMU. As a result, they said EPA’s characterization of Reid Gardner as a damage case is inaccurate and inappropriate and should be removed from the final rule. In addition, they disagreed with EPA’s reliance on “standard GWPS” equivalent to MCLs, stating that by doing so, EPA fails to consider site-specific factors such as pre-existing groundwater contamination, natural variation in groundwater, and the site conceptual model, as well as EPA guidance for statistical analysis. Finally, the commenter said that corrective actions at Reid Gardner are comprehensively regulated under the State, which governs the performance and/or completion of Environmental Contaminant characterization, the screening and selection of Corrective Action, and the implementation and long-term Operation and Maintenance of [NDEP] approved Corrective Action concerning Pollution Conditions at the Site (Nevada Division of Environmental Protection Administrative Order on Consent Reid Gardner Generating Station, I.4, page 2). According to the commenter, interim corrective actions completed under the Administrative Order have already resulted in the removal of over 2.5 million cubic yards of CCR and associated materials from the site.

The same commenter also disagreed with EPA’s inclusion of Huntington as an example of a CCRMU with identified SSLs. They said EPA’s statement that the plant’s remedy selection report “does not appear to address releases from the Old Landfill,” is incorrect, as the selected remedy—a groundwater capture system—has been placed to capture groundwater from both the regulated landfill and the Old Landfill. In addition, the commenter said the Old Landfill is subject to separate State oversight and corrective action, including elimination of infiltration, capping of closed sections and capture of any seepage. As a result, they disagreed with EPA’s characterization of Huntington as a damage case and stated it should be removed from the final rule.

One commenter claimed that the damage case example concerning East Kentucky Power Cooperative’s Cooper Station does not support the conclusion EPA draws from it. Specifically, EPA’s proposal refers to a former surface impoundment below the current landfill at the facility, but, as the proposal recognizes, the facility conducted an ASD that did not identify the former impoundment as an alternate source of groundwater impact and the unit therefore remains in detection monitoring, with no conclusion having been drawn. As such, the commenter said, “EPA is relying on an ASD which did not identify the impoundment as an alternative source to justify more stringent regulation of CCRMU with respect to groundwater impacts that have not been found to have resulted from the unit.” EPA agrees that this facility should not be included in the final list of damage case examples based on this comment.

Other commenters provided information about EPA’s Damage Case Compendiums developed for the 2015 CCR Rule to show some of those include potential CCRMU. They also provided additional damage cases and lists of potential CCRMU for EPA to include in the record.

Except as noted above, EPA disagrees that the damage cases are not representative of CCRMU, even if the units are regulated under State programs. The data from these units shows these CCRMU are contributing to groundwater contamination, irrespective of any prior State oversight.

EPA also continues to believe that, as EPA explained in the 2015 CCR Rule, cases where contamination has been remediated remain relevant to this rulemaking. EPA is relying on the damage cases to evaluate the extent and nature of the risks associated with particular CCR management practices.

Facts demonstrating the consequences from particular activities therefore remain relevant, particularly (although not solely) where the management practices continue to occur. In other words, what matters in this regard are facts that provide information on the reasons that unit leaked, the particular contaminants that were present, the levels of those contaminants, and the nature of any impacts caused by that contamination. None of these facts are affected by whether the damage is ultimately mitigated or remedied. This is entirely consistent with RCRA section 8002(n), which requires EPA to evaluate the “potential danger, if any, to human health and the environment from the disposal and reuse of such materials” in addition to “documented” damage cases. 42 U.S.C. 6982(n)(3)–(4). Accordingly, the fact that any contamination has subsequently been remediated is not a basis for disregarding a damage case. See 80 FR 21455.

In summary, EPA continues to believe the damage cases provide extremely valuable evidence that is directly relevant to the question of whether and how to regulate CCR. For example, the damage cases provide “real world” evidence against which to compare EPA’s risk modeling estimates, such as evidence regarding the frequency with which particular constituents leach into groundwater. 80 FR 21326. They also provide direct evidence regarding specific waste management practices at electric utilities, along with the potential consequences of those practices. Accordingly, EPA has sufficient confidence in the veracity of the collected information to rely on it in making decisions in this rule. EPA expects that additional damage cases will be discovered in response to the installation of the groundwater monitoring systems required by the final rule.

a. Examples of CCRMU With Identified SSLs

Under the existing CCR regulations, when a facility determines there is an SSL for one or more Appendix IV constituents and completes a successful ASD showing that a source other than the regulated unit is the cause of the SSL(s), the facility is not required to initiate corrective action for that particular constituent. Through reviewing the ASD posted on facility websites, EPA identified several areas at active facilities where CCR is managed outside of a regulated unit and is identified as a source of one or more Appendix IV SSL(s). The following facilities are examples of situations in

which such areas have been identified as the source of an SSL and therefore support EPA’s determination that such areas warrant regulation under RCRA section 4004(a).

James H Campbell Power Plant, West Olive, Michigan

The JH Campbell Power Plant, owned and operated by Consumers Energy Company, is located within a mile of Lake Michigan. The facility has five regulated CCR units, including three CCR surface impoundments (Pond A, Bottom Ash Ponds 1–2, and Bottom Ash Pond 3) and two CCR landfills. The “wet ash ponds area” is approximately 267 acres and is bounded by perimeter dikes with a system of internal dikes separating the individual ash ponds. In addition to the five regulated CCR units, there are at least seven other unregulated, unlined “closed” impoundments⁶⁵ that ceased placement of waste prior to October 19, 2015, do not have an engineered cap nor vegetative cap, and have a closure plan that was approved by the State. Based on the groundwater monitoring report reviews, there were SSLs over background at many wells at all units and some had an SSL for arsenic and selenium. At Pond A, which closed with waste in place in 2019, there are SSLs for boron and sulfate, and SSLs were identified for arsenic (13 µg/L [MCL of 10 µg/L]) and selenium⁶⁶ (143 µg/L [MCL of 50 µg/L]) for which an assessment of corrective measures was completed, and the selected remedy is source removal and final cover as the primary corrective action. In the 2021 Annual Groundwater Monitoring and Corrective Action Report posted in January 2022, Consumers Energy concluded there was an ASD for Pond A and said, “Increases in Appendix III constituents (e.g. boron) and direct exceedances of the selenium GWPS in JHC–MW–15011, JHC–MW–15010, JHC–MW–15009, and JHC–MW–15008R that have not yet resulted in a statistically significant exceedance suggest a detectable influence from the immediately adjacent, upgradient, closed, pre-existing CCR units on-site. The closed, preexisting units are not regulated under the RCRA CCR Rule, but remedial action is being taken under

⁶⁵ These “closed” impoundments (Pond B, Pond C, Pond D, Pond F, Pond G (G1 and G2), Pond H, and Pond K) are listed in a figure on page 12 of the 2021 Annual Groundwater Monitoring and Corrective Action Report, JH Campbell Power Plant Pond A, January 2022, Prepared for Consumer’s Energy.

⁶⁶ JH Campbell Semiannual Progress Report—Selection of Remedy, Ponds 1–2 North and 1–2 South, and Pond A, July 30, 2022. Pages 3–4.

Consent Agreement WMRPD No. 115–01–2018. A [remedial action plan] for these units was submitted to [Michigan’s Department of Environment, Great Lakes, and Energy] on September 30, 2021.” During the 2021 groundwater monitoring period for Bottom Ash Ponds 1–2, which closed by removal in 2018, SSLs were identified for boron, calcium, chloride, pH, sulfate, and total dissolved solids (TDS); also, one SSL was identified for arsenic (38 µg/L [MCL of 10 µg/L]).⁶⁷ An assessment of corrective measures has been completed for the CCR unit and the primary selected remedy is source removal and final cover. Consumers Energy also said in the 2022 semiannual progress report that the facility is reevaluating the groundwater “monitoring system for [Bottom Ash] Ponds 1–2 to more accurately account for the influence from the closed, pre-existing units.”

New Castle Generating Station, Pennsylvania

GenOn Power Midwest LP (GenOn) operates the New Castle Generating Station located in West Pittsburg, Pennsylvania. The New Castle Generating Station has two CCR units subject to the regulations—an impoundment (North Bottom Ash Pond) and a landfill (New Castle Plant Ash Landfill). Each of these CCR units has relevance to this proposal due to other unregulated disposal units located adjacent to the regulated CCR units.

The North Bottom Ash Pond was used for the management of bottom ash until 2016 when the facility transitioned from coal to natural gas. After the transition to natural gas, GenOn initiated closure of the North Bottom Ash Pond by removing all waste from the impoundment. Closure of the impoundment was certified in 2019.⁶⁸ Groundwater monitoring associated with the impoundment while the unit was operating detected arsenic at SSL above the GWPS in all downgradient monitoring wells.⁶⁹ In accordance with the procedures in the regulations for CCR units in 40 CFR 257.94(e)(2), GenOn determined that an alternative source was responsible for these SSLs of arsenic. Specifically, the ASD found that a 120-acre unlined CCR surface impoundment located immediately adjacent to the North Bottom Ash Pond

⁶⁷ Annual Groundwater Monitoring and Corrective Action Report, JH Campbell Power Plant Ponds 1–2 North and 1–2 South, January 2022, Prepared for Consumers Energy. Page 23.

⁶⁸ CCR Compliance, Closure Certification Report, Closure by Removal, New Castle North Bottom Ash Pond. June 2019.

⁶⁹ *Id.* At 5.

was responsible for the arsenic concentrations in the downgradient monitoring wells.⁷⁰ According to the 2019 Annual Report prepared by GenOn, there were SSLs for arsenic (0.087 mg/L [MCL of 10 µg/L]) in the downgradient monitoring wells.⁷¹ Consequently, because the SSLs of arsenic were attributed to another source (*i.e.*, a former unlined CCR surface impoundment), GenOn concluded it was not required to remediate the arsenic contamination under the Federal CCR regulations.

GenOn also determined that there were SSIs above background levels for multiple analytes at the New Castle Plant Ash Landfill (Ash Landfill), which is the other regulated CCR unit at the New Castle Generating Station. In its most recent annual groundwater monitoring report in 2022, GenOn reported SSIs for boron, calcium, fluoride, sulfate, and total dissolved solids.⁷² GenOn determined that an alternative source was responsible for these analyte increases, specifically pointing to an “underlying historic ash impoundment and other closed stages of the landfill.”⁷³ Prior to development of the 60-acre Ash Landfill, CCR was disposed in an impoundment from approximately 1939 to 1978.⁷⁴ After the impoundment was dewatered in 1978, dry CCR was disposed in this area in several stages of CCR placement up until the time Ash Landfill began operation. Since 2018, GenOn has attributed SSIs for boron, calcium, fluoride, sulfate, and TDS to this historic disposal of CCR.

Huntington Power Plant, Utah

The Huntington Power Plant in Huntington, Utah is owned and operated by PacifiCorp and has one regulated unit, the Huntington CCR Landfill. While conducting the required groundwater monitoring for the Huntington CCR Landfill, there were SSLs for chromium, cobalt, lithium, molybdenum, selenium, fluoride, and arsenic, so the owner or operator conducted assessment of corrective measures. There is also a former combustion waste landfill called the Old Landfill, which is located northwest of the regulated Huntington CCR

Landfill. The ACM report⁷⁵ assumes the SSLs are the result of groundwater interactions with both the Huntington CCR Landfill and the Old Landfill. Both landfills have stormwater run-on from the area surrounding the landfill. This run-on is routed around the landfills via diversion ditches and run-off from the landfills itself is collected and retained in a sediment basin north of the Huntington CCR Landfill. The facility is implementing a remedy to address releases only from the regulated CCR Huntington Landfill, but the remedy selection report⁷⁶ does not appear to address releases from the Old Landfill.

J.B. Sims, Grand Haven, Michigan

The J.B. Sims Generating Station, owned and operated by Grand Haven Board of Light and Power, is located on Harbor Island, north of Grand Haven, Michigan. Harbor Island is bound to the north, east, and west by the Grand River and to the south by the South Channel, tributaries of Lake Michigan. The facility has two Federally regulated CCR units (Unit 1 & 2 and Unit 3), both of which are inactive, unlined surface impoundments. Unit 1 & 2 is approximately 1.2 acres and includes areas where, prior to October 19, 2015, CCR was placed in unlined impoundments and used as fill in low-lying areas of adjacent wetlands. Unit 3 is approximately 0.5 acres and was built on top of historically placed CCR. The boundary of Unit 1 & 2 was updated in an agreement with EPA and the State in January 2021,⁷⁷ to include an area that received CCR prior to 1978. Therefore, the groundwater monitoring network and closure plan are currently being updated to reflect the new boundary and better address contamination from historical CCR across the units.⁷⁸ Additionally, in March 2022, the State issued an enforcement notice⁷⁹ to J.B. Sims citing inadequate groundwater

monitoring and failure to address all areas where CCR were managed (*e.g.*, stored, placed) prior to disposal during the unit's operation. As such, the facility is considering expanding Unit 3's groundwater monitoring network. The units are often partially flooded, and groundwater elevations and flow direction are influenced by precipitation and water levels in the Grand River and the South Channel.

Based on groundwater monitoring report reviews, both units have had SSIs and SSLs since groundwater monitoring was initiated in 2017. During 2021, both Unit 1 & 2 and Unit 3 had SSIs for all Appendix III constituents and SSLs for arsenic (98 µg/L [MCL is 10 µg/L]), chromium (270 µg/L [MCL is 100 µg/L]), cobalt (22 µg/L [GWPS is 6 µg/L]), fluoride (13 mg/L [MCL is 4 mg/L]), and lithium (2800 µg/L [site-specific GWPS is 59 µg/L]).⁸⁰ In December 2020, J.B. Sims submitted an ASD for Unit 3's 2019 SSLs for chromium, cobalt, fluoride, lead, and lithium, pointing to the historic fill across the island as the source of the SSLs.⁸¹ Furthermore, the Fourth Quarterly 2021 Monitoring Report suggested the continued SSIs and SSLs at Unit 3 were due to historical CCR fill beneath the unit, historical fill outside of Unit 1 & 2, and waste historically placed across the site.⁸² However, until the groundwater monitoring networks are finalized, the extent of groundwater contamination and the source of all contamination cannot be determined. The assessment of corrective measures for both units began in February 2019 and is ongoing, pending finalization of the groundwater monitoring networks. Based on groundwater monitoring reports, EPA has found that due to the fluctuations in groundwater elevations in response to precipitation and nearby surface water levels, portions of the facility, including Unit 1 & 2, can be inundated or partially in contact with groundwater.

b. Examples of CCRMU With Identified SSIs

Under the existing CCR regulations, when a facility determines there is an SSI for one or more Appendix III constituents and completes a successful ASD showing that a source other than the regulated unit is the cause of the SSI(s), the facility is not required to initiate assessment monitoring for that particular constituent. 40 CFR 257.94(e). Through ASD reviews, EPA identified several areas at active facilities where CCR was managed outside of a regulated unit and was identified as a source of one or more Appendix III SSI(s). As such, any groundwater contamination from these potential CCRMU have not been investigated under the existing Federal CCR regulations. The following facilities are examples of situations in which potential CCRMU have been identified as the source of an SSI and demonstrate the need to regulate CCRMU.

Reid Gardner Generating Station, Moapa Valley, Nevada

Reid Gardner Generating Station (Reid Gardner), owned and operated by NV Energy, is located adjacent to the Muddy River and the Moapa Band of Paiutes reservation, approximately 45 miles northeast of Las Vegas. Reid Gardner has seven regulated CCR units: four unlined inactive surface impoundments (Pond 4B-1, Pond 4B-2, Pond 4B-3, and Pond E-1), two active unlined surface impoundments (Pond M-5 and Pond M-7), and one partially lined landfill (Mesa Landfill). The inactive surface impoundments covered 47 acres and were closed by removal in 2017.⁸⁴ The inactive surface impoundments were constructed in 2003 (Pond E-1) and 2006 (Pond 4B-1, Pond 4B-2, and Pond 4B-3) to replace four of the eleven historical unlined evaporation ponds located at the facility that made up the evaporation pond complex (Pond 4A, Pond 4B-1, Pond 4B-2, Pond 4B-3, Pond 4C-1, Pond 4C-2, Pond D, Pond E-1, Pond E-2, Pond F, and Pond G).⁸⁵ The evaporation pond complex was built within the Muddy River floodplain and used from approximately 1974 until approximately 2002 to evaporate CCR and other process wastewaters from the facility. The two active surface impoundments (Ponds M-5 and M-7) were constructed in 2010 approximately 0.75 miles south

of the historical evaporation ponds and cover 28 acres. Mesa Landfill was constructed and operational prior to the 2015 CCR Rule and has a surface area of roughly 252 acres.

Based on groundwater monitoring report reviews, the inactive surface impoundments had no Appendix III SSIs above their established background concentrations during the detection monitoring event in 2019.^{86 87 88 89 90 91} However, the inactive surface impoundments did have Appendix IV constituent concentrations above the standard GWPS, including arsenic (2.52 mg/L [MCL is 0.01 mg/L]), cadmium (0.0072 mg/L [MCL is 0.005 mg/L]), cobalt (242 µg/L [standard GWPS is 6 µg/L]), fluoride (35.4 mg/L [MCL is 4.0 mg/L]), lithium (27,300 µg/L [standard GWPS is 40 µg/L]), molybdenum (6,390 µg/L [standard GWPS is 100 µg/L]), selenium (0.204 mg/L [MCL is 0.05 mg/L]), thallium (0.026 mg/L [MCL is 0.002 mg/L]), and radium 226 & 228 combined (8.02 pCi/L [MCL is 5 pCi/L]). Ponds M-5 and M-7 and the Mesa Landfill have had SSIs for fluoride every year of detection monitoring for which ASDs have been performed pointing to natural variation in groundwater quality.^{92 93 94 95 96 97} ASDs were also

performed for SSIs at Mesa Landfill for pH (2019 and 2021) and turbidity (2020 and 2021) that attributed the SSIs to natural variation in groundwater quality. Therefore, since ASDs have been performed for all SSIs and the active units, Reid Gardner has not moved from detection monitoring to assessment monitoring. The facility also claims the historical, co-located evaporation ponds are the source of groundwater contamination in the area and not the CCR-regulated units. Specifically, in the closure certification for the inactive surface impoundments, the facility points to documentation as far back as the 1980s that describe seepage from Pond D, the historical Pond E-1 and E-2, Pond F, and Pond G and leakage at an estimated rate of 50 acre-feet/year from Ponds 4C-1 and 4C-2 and historical Ponds 4B-1, 4B-2, and 4B-3.

Seminole Electric Cooperative, Florida

Seminole Electric Cooperative (Seminole) operates the Seminole Generating Station located in Palatka, Florida. For CCR that is not beneficially used, CCR is disposed at the facility in a landfill (Increment One Landfill), which is subject to the CCR regulations. This CCR landfill is a double-lined landfill with a leachate collection system and, because part of the Increment One Landfill overlaps with the side-slope of a former, Federally unregulated landfill, the liner system also includes a high-density polyethylene geomembrane where the two units interface.⁹⁸ Seminole determined there were SSIs above background levels for multiple analytes in one or more monitoring wells at the downgradient waste boundary in 2018, including SSIs for boron, calcium, chloride, sulfate, and TDS. Seminole determined that one or more alternative sources were responsible for these analyte increases. These sources include

former test cells (*i.e.*, areas where CCR was placed in the 1980s for purposes of construction evaluations that are now located beneath the Increment One Landfill), a former CCR landfill adjacent to the Increment One Landfill, and several process water ponds next to the Increment One Landfill.⁹⁹ Since 2018, Seminole has attributed SSIs for these analytes to these alternative sources and therefore, has not moved from detection monitoring to assessment monitoring.

R.M. Schahfer Generating Station,
Indiana

The R.M. Schahfer Generating Station, owned and operated by Northern Indiana Public Service Company, LLC (NIPSCO), has several CCR units subject to the regulations, including several CCR impoundments and a CCR landfill consisting of multiple cells or phases of operation (“Landfill”). The Landfill is of particular relevance to this proposal because it includes three cells subject to Federal CCR regulations (Phases V through VII) and four landfill cells that are not (Phases I through IV). In the course of conducting the required groundwater monitoring for the regulated cells of the Landfill, in January 2018, NIPSCO determined that there were SSIs above background levels for all seven analytes in Appendix III at one or more monitoring wells at the downgradient waste boundary of the regulated CCR units. This included SSIs for boron, calcium, chloride, fluoride, pH, sulfate, and TDS.¹⁰⁰ Through procedures laid out in the regulations for regulated CCR units in 40 CFR 257.94(e)(2), NIPSCO determined that these groundwater SSI impacts were not due to a release from the regulated CCR landfill cells, but instead were attributable to another source. Specifically, NIPSCO has concluded that “a release from the non-regulated, unlined portions of the landfill, Phases 1 and II, is the source of the identified SSIs.”¹⁰¹ Subsequent groundwater monitoring of the regulated Landfill cells since 2018 continues to identify SSIs and NIPSCO continues to attribute

those impacts to releases from the unregulated Phase I and II cells.¹⁰²

Landfill Phase I is a 20-acre unlined cell that received CCR (flue gas desulfurization materials and fly ash) between 1984 and 1991 and subsequently closed with a final cover system in 1999. Phase II of the Landfill is an unlined 42-acre cell where flue gas desulfurization materials and fly ash were disposed between 1991 to 1998. The Phase II cell was closed with a final cover system in 1998. CCR landfills such as the Phase I and II cells are not regulated by the existing regulations because the cells have not received CCR on or after October 19, 2015. As a result, NIPSCO has not been required under the existing Federal CCR regulations to investigate further and remediate as necessary groundwater impacts from the unlined Phase I and II cells.

Waukegan Generating Station, Illinois

An example of CCR used as fill on-site is Midwest Generation’s Waukegan Generating Station in Waukegan, Illinois. There are two CCR surface impoundments named the East Ash Pond and West Ash Pond, which were used interchangeably during the facility’s operational history and have a multi-unit groundwater monitoring system. The East Ash Pond has a surface area of 9.8 acres with a storage capacity of 184,000 cubic yards. The West Ash Pond has a surface area of 10 acres with a storage capacity of 223,000 cubic yards. According to the 2018 Annual Groundwater Monitoring and Corrective Action Report, there was detection of SSIs over background for Appendix III constituents, including pH and sulfate.¹⁰³ An ASD was completed that claimed other potential historic sources were the cause of the SSIs. In the 2019 Annual Groundwater Monitoring and Corrective Action Report, an ASD for Appendix III constituents identified calcium and TDS with the same claim that other potential historic sources were the cause of the SSIs.¹⁰⁴ The ASDs discuss that the downgradient monitoring wells were installed within the berms for the surface impoundments that consisted of a “mixture of fill and beneficially reused coal combustion by-product”.¹⁰⁵ ¹⁰⁶ The 2018 ASD also

notes that a upgradient well, MW–05 which is not a part of the CCR groundwater monitoring network, has substantially higher sulfate and boron concentrations than the downgradient wells suggesting an upgradient source. Furthermore, the 2019 ASD mentions that the fluctuating TDS concentrations at downgradient well MW–16 are correlated to fluctuations in TDS at MW–05 further suggesting an upgradient source. While these ASDs suggest that the sources may be CCR within the berms and a upgradient source they do not analyze these potential sources to verify the claims. EPA did verify that the boring logs for groundwater monitoring wells MW–01 through MW–05 and MW–16 show they were installed within 11 to 20 feet of CCR in the berms surrounding the surface impoundments.¹⁰⁷ In addition, construction drawings in the history of construction show “existing fill” or CCR was used in the construction of the surface impoundment access ramps and underneath the surface impoundments liners.¹⁰⁸ The facility continued to use the ASDs for SSIs in 2020 and 2021, therefore, the surface impoundments remain in detection monitoring.

White Bluff Steam Electric Station,
Arkansas

The White Bluff Steam Electric Station in Redfield, Arkansas is owned or operated by Entergy and has three CCR units: two CCR surface impoundments (A Recycle Pond/South Pond and B Recycle Pond/North Pond); and one CCR landfill (Existing CCR Landfill Cells 1–4). CCR previously was disposed in a 20-acre ravine,¹⁰⁹ which was closed and covered in accordance with the original facility State-issued permit. The active landfill was then built on top of, and adjacent to, the unlined, closed landfill. In 2018, the facility conducted intrawell monitoring of the groundwater at the facility and SSIs for pH, calcium, TDS, and boron were detected. An ASD was completed and determined that the sources of the SSIs were: (1) Releases from portions of the Coal Ash Disposal Landfill (CADL) closed before the effective date of the CCR Rule (October 19, 2015); (2) Surface water that has come into contact with on-site CCR and has migrated into the subsurface; and/or (3) Natural variation

in groundwater quality. Therefore, the landfill remains in detection monitoring.

c. Examples of CCRMU With Identified SSIs or SSLs From Comments

EPA received several comments about potential damage cases from CCRMU. In addition, many comments provided additional potential CCRMU but evidence of a thorough groundwater quality investigation in this area was not presented. If there are monitoring wells at the facility, the wells are not sufficient to characterize groundwater impacts from the CCRMU. Therefore, due to lack of data, EPA and the commenters could not definitively determine if certain unregulated placement of CCR at facilities is a CCRMU or if the CCRMU could be potential damage cases. EPA presents the following additional examples of CCRMU that have adequate groundwater monitoring to show impacts.

Brandywine Ash Management Facility, Maryland

The Brandywine Ash Management Facility in Prince George's County, Maryland has a 217-acre CCR landfill. It is operated by GenOn MD Ash Management, LLC. CCR has been landfilled at the facility since approximately 1971. As of 2018, an estimated 6.8 million cubic yards, or 7 billion kilograms, of CCR were placed at the site. CCR at Brandywine has contaminated groundwater and surface water, leading to legal action by the State of Maryland. A 2013 Consent Decree resulted in the development of a Corrective Measures Plan and a Nature and Extent of Contamination Study.^{110 111} According to the Consent Decree, "The original design of the disposal cells and operation of the disposal areas. . . has resulted in some leachate escaping the disposal cells via groundwater and constructed outfalls and entering surface waters. . . ." ¹¹²

"Based on a review of the quarterly Discharge Monitoring Reports . . . and other quarterly and annual monitoring reports submitted by GenOn, [Maryland Department of the Environment (MDE)] has determined that wastewater discharges from monitoring points at Brandywine have at times exceeded ambient surface water quality standards for cadmium and/or selenium. MDE has also determined that leachate has entered groundwater and is causing the

[maximum contaminant level (MCL)] for cadmium to be exceeded at times at certain groundwater monitoring points, as were federally recommended secondary standards for manganese, sulfate, iron, [total dissolved solids (TDS)], aluminum and chloride." ¹¹³

This broader context related to State law—which is absent from documents submitted pursuant to the 2015 CCR Rule—is important for understanding the complexity of the Brandywine site and its impacts. For example, unsafe lithium levels hundreds of times higher than the default GWPS in the 2015 CCR Rule have been documented at groundwater monitoring wells, as have unsafe molybdenum levels up to approximately 80 times higher than its default GWPS. Some of these unsafe levels are found in monitoring wells not included in the network used to demonstrate compliance with the Federal CCR Rule.¹¹⁴

The Brandywine site includes four areas of interest: Historical Area 1, Historical Area 2, Phase I, and Phase II.^{115 116} Because these four areas are all part of a single landfill and in some cases overlap, they should have all been subject to the 2015 CCR Rule—even though three of the areas were closed before the rule took effect. In its filings to comply with the 2015 CCR Rule, GenOn has treated the Historical Area 1, Historical Area 2, and Phase I areas as unregulated units and has pointed to these areas as the source of pollution in its ASDs. For this reason, the site has remained in detection monitoring through at least 2021.¹¹⁷

Bull Run Fossil Plant, Tennessee

The Bull Run Fossil Plant is owned and operated by Tennessee Valley Authority (TVA) in Clinton, Tennessee and has two unregulated CCR landfills. Groundwater monitoring results show the landfills have been leaching arsenic, boron, cobalt, manganese, and

molybdenum into the groundwater for decades, resulting in groundwater that exceeds health standards for these toxins by many times. In addition, a portion of one of the landfills, the Dry Fly Ash Stack, is not regulated by the 2015 CCR Rule as it ceased receipt of CCR in 2015 an interim soil cover was placed on Phase 2, and in accordance with a permit issued by the Tennessee Department of Environment and Conservation, it will be closed in conjunction with the currently operating Dry Fly Ash Stack Lateral Expansion.¹¹⁸ Among other things, the 2023 Bull Run Environmental Assessment Report states that the Dry Fly Ash Stack contains 3.7 million cubic yards of coal ash, and shows that lithium and molybdenum in downgradient groundwater exceed groundwater screening levels by at least an order of magnitude.¹¹⁹

Hennepin Power Station, Illinois

The Hennepin Power Station in Hennepin, Illinois has five CCR units including four CCR surface impoundments (Ash Pond No. 2, East Ash Pond, Old West Ash Pond, and Old West Polishing Pond) and one CCR landfill (CCR Landfill). The East Ash Pond System includes Ash Pond No. 2, the East Ash Pond, and Ash Pond No. 4, which were built on top of historic CCR fill.¹²⁰ Ash Pond No. 4 was a 30-foot-deep gravel quarry where coal ash fill was disposed in the mid-1980s.¹²¹ Groundwater downgradient of the East Ash Pond System, showed concentrations of sulfate and boron that exceeded State groundwater standards.¹²² The groundwater was (and may still be) contaminated with coal ash constituents.¹²³

Will County Station, Illinois

The Will County Station in Romeoville, Illinois is owned and operated by Midwest Generation Co. The facility has two CCR surface impoundments, Ash Pond 2S and Ash Pond 3S. Ash Ponds 1N and 1S were removed from service in 2010, and although they were not actively used for

waste storage, they still contained at least one inch of water in 2019 and the base of these unlined impoundments are in contact with at least one foot of groundwater.¹²⁴ In addition, through borings taken at the facility, historical CCR has been buried around the ash ponds, and the Former Slag and Bottom Ash Placement Area has been identified at the southeast corner of the station's boundary.

When constructing the groundwater monitoring system in 2010 and 2011, well borings also showed a thick layer of CCR buried along the eastern edge of the four ash ponds. MW-1, MW-2, MW-3, MW-4, and MW-6 show layers of fill between five and twelve feet thick containing CCR.¹²⁵ Historical topographic maps and aerial imagery document ponds extending from north of Pond 1N to close to the southern property boundary. These historical waste storage areas would have surrounded the current regulated ponds and the area where CCR has been found buried near the ponds. The topographic map and aerial imagery from 1962 show a large pond extending from north of Pond 1N to the southern property boundary. In 1973, waste storage areas are present in the vicinity of Ponds 2S and 3S and extend to the southern property boundary. By 1980, waste areas are depicted south of Pond 3S and surrounding Pond 1N. The series of unregulated ponds near the southern property boundary south of Pond 3S are visible on available maps until present day.^{126 127}

Historical ash in fill near the ponds is in contact with groundwater. Groundwater elevations fluctuate between 579 and 584 feet above mean sea level in this area. CCR is buried at elevations as low as 578.6 feet above mean sea level. MW-2 provides an example of ash in contact with groundwater. The boring log completed during its installation shows CCR down to 578.6 feet above mean sea level and the groundwater elevation was at 580.6 feet above mean sea level, meaning that at least two feet of groundwater was in contact with CCR at that time. Groundwater measurements at this well commonly range from 582 to 584 feet, meaning three to five feet of CCR are

routinely saturated with groundwater near MW-2.¹²⁸

The Former Slag and Bottom Ash Placement Area is located at the southeast corner of the Will County site. A Phase II Environmental Site Assessment completed in 1998 identified this location as an ash disposal area. Borings revealed coal ash mixed with gravel up to three feet below the ground surface.¹²⁹

Groundwater monitoring completed under the 2015 CCR Rule also demonstrates groundwater contamination at Will County. SSIs for chloride, fluoride, and TDS have been identified since the inception of the monitoring program in 2017 and in 2022, SSLs for arsenic and selenium were detected.¹³⁰

While the regulated ponds are likely contributing to groundwater contamination, historical ash at the station is also a likely culprit. Historical ash along the eastern boundary of the four ponds is not capped or lined and is thus exposed to precipitation and groundwater. The regulated and unregulated ponds are unlined and are in contact with groundwater, making these units potential sources of groundwater contamination. Groundwater contamination increases as it passes through/under the ponds. Boron and sulfate concentrations doubled between well MW-1 upgradient of Pond 1N and MW-7 downgradient of the pond in monitoring data collected between 2010 and 2018.¹³¹

ASDs also provide evidence of a contaminant source other than the regulated ponds. An ASD completed in 2018 following SSIs for chloride, fluoride, and TDS at the regulated units concluded that the SSIs were from "other potential sources" and not from the regulated units.¹³²

Groundwater monitoring during 2022 identified SSIs for boron, calcium, chloride, fluoride, and TDS across the monitoring network. SSLs for selenium at one well and arsenic at two wells were also identified and resulted in initiation of an ACM for the site. Notably, the two upgradient monitoring wells are contaminated. MW-06 had an SSI for calcium and an SSI for boron and SSL for selenium were detected at MW-05. These two upgradient wells are

located along the eastern edge of the ponds in the area known to contain buried ash. SSIs and SSLs in downgradient wells indicate that the regulated ponds may also be contributing to groundwater contamination.¹³³

The ASD completed following identification of SSLs at regulated Pond 2S and 3S determined that Pond 3S is likely contributing to groundwater contamination. The ASD reported statistically significant decreasing trends in chloride concentrations in both upgradient monitoring wells and statistically significant increasing trends in chloride concentrations in MW-09 and MW-11, both of which are immediately downgradient of Pond 2S.¹³⁴

The prevailing groundwater flow at the site is from the east to the west across the ponds. Because historical ash is present along the eastern boundary of the ponds, the current monitoring network is not capable of accurately measuring groundwater contamination from each potential source. Further, all the wells designated upgradient are within the likely footprint of the historical CCR disposal area described above. Thus, none of the wells can assess upgradient groundwater quality accurately.

EPA Impoundment Assessments

Commenters provided additional reviews of EPA's impoundment assessment reports that were conducted in 2011–2013. During the impoundment assessments, EPA documented eight power plants with historical ponds where coal dams were constructed in whole or part of coal ash.¹³⁵ These plants include six plants on EPA's list of potential legacy CCR surface impoundments: Glen Lyn (VA), Hutsonville (IL), Jefferies (SC), Muskigum River (OH), Philip Sporn (WV), and Tanners Creek (IN). At two additional plants where historical ponds are identified, Cape Fear (NC) and Frank E. Ratts (IN), EPA also found coal ash used in the construction of the dams. The commenters included these plants as additional potential CCRMU.

2. Applicability and Definitions Related to CCR Management Units

EPA is finalizing new definitions and revising several existing definitions necessary to implement the new requirements for CCRMU. Specifically,

the final rule establishes new definitions for “CCR management unit,” “Contains CCR and liquids,” “Inactive CCR landfill,” “Liquids,” and “Regulated CCR unit” and revises existing definitions for “CCR landfill or landfill,” “CCR unit,” “Operator,” “Owner,” and “State Director.” Some of these definitions are discussed elsewhere in the preamble.

EPA is also revising § 257.50(d) to specify that part 257, subpart D applies to CCRMU of 1,000 tons or greater, located at facilities with a regulated CCR unit or active facilities without a regulated CCR unit. That provision also applies to CCRMU greater than or equal to one ton and less than 1,000 tons, located at active facilities or facilities legacy CCR surface impoundment are only subject to the requirements of the FER in § 257.75 until a permitting authority determines that regulation of these units, either individually or in the aggregate, is warranted and determines the applicable requirements. Under the 2015 CCR Rule, § 257.50(d) exempted from regulation those CCR landfills that had ceased receiving CCR prior to October 19, 2015. This action amends the exemption included in the 2015 CCR Rule.

The sections below briefly explain what EPA proposed, summarize the public comments received, and provide the Agency’s responses. The Agency addresses new and revised definitions in the following order: (1) CCR management unit; (2) CCR unit; (3) Owner and operator; and (4) Conforming revisions to other existing definitions.

a. Definition of CCR Management Unit

EPA proposed to define a *CCR management unit* or CCRMU to capture the solid waste management practices that have been demonstrated in the 2014 and 2024 Risk Assessments and the damage cases to have the potential to contaminate groundwater. EPA proposed to define a CCRMU as any area of land on which any non-containerized accumulations of CCR are received, placed, or otherwise managed, that is not a CCR unit. EPA explained in the proposed rule that the definition of a CCRMU is based on the current definitions of a CCR pile—which is currently regulated as a CCR landfill under part 257, subpart D—and of a CCR surface impoundment, which both rely on the concept of “accumulations of CCR.” See, 40 CFR 257.53 and 88 FR 32018.

EPA proposed that CCRMU would include historical solid waste management units such as CCR landfills and surface impoundments that closed

prior to the effective date of the 2015 CCR Rule (October 19, 2015), as well as inactive CCR landfills (including abandoned piles). The proposal stated that a CCRMU would also include any other areas where the solid waste management of CCR on the ground has occurred, such as structural fill sites, CCR placed below currently regulated CCR units, evaporation ponds, or secondary or tertiary finishing ponds that have not been properly cleaned up, and haul roads made of CCR if the use does not meet the definition of beneficial use in § 257.53. EPA explained that all of these examples involved the direct placement of CCR on the land, in sufficient quantities to raise concern about releases of hazardous constituents, and—in most, if not all cases—with no measures in place to effectively limit the contact between the CCR and liquids, and subsequent generation and release of any leachate.

EPA acknowledged that the proposed definition was broad, but the Agency did not intend that the placement of any amount of CCR would necessarily constitute a CCRMU. Accordingly, EPA proposed that the following would not be considered CCRMU: consistent with the current regulations, closed or inactive process water ponds, cooling water ponds, wastewater treatment ponds, and stormwater holding ponds or aeration ponds. EPA explained that these units are not designed to hold an accumulation of CCR, and in fact, do not generally contain a significant amount of CCR. See, 80 FR 21357. EPA also explained, consistent with the existing regulations, neither an area or unit at which exclusively non-CCR waste is managed, nor any containerized CCR, such as a silo, would be considered CCRMU because neither of these units present conditions that give rise to the risks modeled in EPA’s assessment or identified in the damage cases. See, *Id.* at 21356.

For similar reasons, the Agency proposed that any CCR used in roadbed and associated embankments would not be considered CCRMU. As EPA explained in the 2015 rule the methods of application are sufficiently different from CCR landfills that EPA cannot extrapolate from the available risk information to determine whether these activities present similar risks. Roadways are subject to engineering specifications that generally specify CCR to be placed in a thin layer (*e.g.*, six to 12 inches) under a road. The placement under the surface of the road limits the degree to which rainwater can influence the leaching of the CCR. There are also significant differences between the manner in which roadways and

landfills can potentially impact groundwater, such as the nature of mixing in the media and the leaching patterns. First, CCR landfills are typically a homogeneously mixed system, and as a result, there are no spatial variations of the chemical and physical properties of the media (*e.g.*, bulk density, hydraulic conductivity and contaminant concentration). By contrast, roadways are generally constructed of several layers with different material properties (heterogeneity). This difference affects the hydraulic conductivity of a mass of CCR in a landfill, as compared to CCR placed in an embankment. Any potential leaching will tend to spread over the length of the embankment, as opposed to the leaching in a downward motion that would occur in a homogeneously filled landfill. Finally, EPA is concerned that groundwater monitoring of a road may not be practicable. However, even though EPA considers that the available information does not demonstrate that use in roadbed present sufficient risk to warrant the suite of requirements applicable to CCRMU, that calculus changes in the event the CCR in roadbed is contaminating groundwater. Accordingly, EPA proposed that if a facility subsequently determines that the CCR in onsite roadbed is contributing to contamination to the aquifer, the facility would be required to address the contamination. For example, if during an ongoing corrective action, a facility identifies the roadbed as an additional source of contamination, it would be required to address that contamination as part of the ongoing remediation of the aquifer. In addition, the measures EPA proposed to require facilities to take would not be expected to identify truly de minimis quantities of CCR. As discussed in greater detail in the next section, EPA proposed that facilities would only be required to identify accumulations if records confirm the existence of the CCRMU or visual evidence of CCR placement on the ground.

In addition, EPA proposed to define the term *inactive CCR landfill* to mean an area of land or an excavation that contains CCR but that no longer receives CCR on or after the effective date of this final rule and that is not a surface impoundment, an underground injection well, a salt dome formation, a salt bed formation, an underground or surface coal mine or a cave. For purposes of this subpart, this term also includes sand and gravel pits that received CCR and abandoned CCR piles.

i. RCRA Authority

Some commenters contended that *West Virginia v. EPA*, 142 S. Ct. 2587, 2609 (2022) requires EPA to have clear congressional authorization to regulate CCRMU, and that Congress has not provided EPA with such authorization under either RCRA sections 4004(a) or 4005(d). The commenters are incorrect. All of the requirements adopted in this rulemaking to regulate CCRMU fall squarely within the authority Congress delegated to the Agency in RCRA sections 1008(a)(3), 4004(a), and 4005(d). Commenters' arguments to the contrary are based misunderstandings of the statutory structure and EPA's historical practice. The rule does not expand the scope of CCR regulation beyond what Congress envisioned. Further, in large part, commenters' arguments are premised on aspects of the proposal which have been revised in this final action in response to comments. Although the revisions were not necessary under *West Virginia v. EPA* (because EPA's exercise of authority through this rule does not implicate a major question), the revisions resolve many of the commenters' objections based on their view of the major questions doctrine. EPA addresses the comments in turn.

Some commenters based their claim that the regulation of CCRMU presents a major question on the assertion that the proposal would regulate an undefinable number of past CCR management and disposal practices, "irrespective of risk, location, or even whether such past activities have been (or are currently being) addressed by state governments or by EPA itself under other federal authorities." These commenters claimed that the proposal has no bounds.

Just as an example, the Proposal would require operating power generation facilities to identify every CCRMU within its boundaries, even if located under existing structures critical to a plant's energy production operations, and to "close," and in many cases reclose, those CCRMUs under the CCR rule's closure provisions. The Proposal blithely ignores whether in fact such requirements could be met, the associated costs, and the resulting interruption to power generation activities that could be incurred in attempting to meet these requirements.

These commenters also note that Congress's failure to include the same authority for corrective action applicable to permitted hazardous waste sites found in section 3004(u) under subtitle D demonstrates that EPA lacks the authority to require CCRMU to comply with the part 257 corrective action and closure requirements.

Another commenter argued that the proposal "would impermissibly expand EPA's role in the Subtitle D statutory regime beyond the limited role that Congress envisioned for the Agency" based on their belief that the Congressional intent behind the WIIN Act was "to restore the States to their historical, congressionally-intended lead role under RCRA Subtitle D in the implementation and enforcement of solid waste management programs." According to this commenter,

[w]hether or not EPA should have such a "central role" in the regulation of CCR under RCRA Subtitle D—one that would allow the Agency to assert federal jurisdiction over any area of land in any state simply because the land was, at any time, used to manage any non-containerized accumulation of CCR, regardless of whether the land has been and is in compliance with applicable state regulations—is a major policy question of significant national economic and political magnitude that Congress has not clearly delegated EPA the authority to address. . . . At its core, EPA's delegated RCRA Subtitle D authority entails only the authority to promulgate guidelines and criteria, to be implemented by the States, to prohibit open dumping and to ensure that units are classified as sanitary landfills "only if there is no reasonable probability of adverse effects on health or the environment from disposal of solid wastes at such facility. EPA's Proposal construes "open dumps" and "sanitary landfills" to now include historically state-regulated solid waste management and resource conservation and recovery practices that Congress never intended (clearly or otherwise) for the Agency to regulate federally, as most recently evidenced by Congress's definition of a "sanitary landfill" in the WIIN Act as a CCR unit that complies with a state CCR permit, or a federal CCR permit in a nonparticipating state, or the requirements of the CCR Rule applicable to CCR units in the absence of a federal CCR permitting program.

This commenter stated that the WIIN Act limited the reach of EPA's authority to "CCR units," as defined in the 2015 CCR Rule, *i.e.*, to "any CCR landfill, CCR surface impoundment, or lateral expansion of a CCR unit, or a combination of more than one of these." In addition, the commenter argued that EPA lacks the authority to now regulate units that were expressly exempted from regulation under the EPA regulations that Congress specifically incorporated by reference in the WIIN Act. According to this commenter, in 2015 EPA interpreted its RCRA Subtitle D statutory authority to regulate, as "CCR units," only existing and new CCR landfills, existing and new CCR surface impoundments, and inactive CCR surface impoundments at active facilities, and Congress did not in 2016 grant the Agency any authority to

regulate anything else. The commenter further claimed that EPA has acknowledged that the definition of a "CCR unit" does not include the areas of land that EPA proposed to regulate as CCRMU. Finally, the commenter objected that the proposal would regulate activities or sites that "have historically been regulated under state programs, per EPA approved State Solid Waste Management Plans, and have closed or continued to operate in accordance with the State's program and plan."

EPA disagrees that the regulation of CCRMU under this final rule is fairly characterized as an "unprecedented" expansion of authority under RCRA Subtitle D or otherwise presents a major question under *West Virginia v. EPA*, 142 S. Ct. at 2609. The commenters have mischaracterized EPA's proposal, which largely just removes regulatory exemptions adopted in 2015, and requires the owners and operators of solid waste disposal units to clean up the contamination from their disposal of solid waste (CCR). These are the same requirements that apply to the currently regulated CCR landfills and CCR impoundments—most of which are located at the same sites as the CCRMU regulated under this final rule—and that Congress incorporated into RCRA in the 2016 WIIN Act. See, *e.g.*, See, 42 U.S.C. 6945(d)(3), (6), (7). EPA has imposed these types of requirements on these kinds of entities and activities since 1980. Characterizing this as novel or unprecedented fundamentally misstates both the nature of EPA's action and the authority Congress delegated to the Agency in RCRA sections 1008(a)(3), 4004(a), and 4005(d).

(a) Types of Units and Activities Regulated

As an initial matter, these commenters have mischaracterized EPA's statements about the extent of its authority under subtitle D. EPA never stated that its authority was limited to the particular CCR units regulated by the 2015 CCR Rule. The only citation the commenter provides to support its assertion is 80 FR 21303, which is simply a factual recitation of the CCR units covered by the 2015 CCR Rule. That section contains no statement about EPA's authority to regulate; nor does any other section of the 2015 CCR Rule preamble contain such a statement.

Similarly, EPA never stated or in any way suggested in the May 2023 proposed rule that the existing regulatory definition of a CCR unit—and by implication, the statutory term in 4005(d)—does not include the "areas of land that EPA proposed to regulate as

CCRMUs.” Based on the pages in the proposal that the commenter cites, it appears the commenter was confused by EPA’s explanation that it was proposing to use two different terms to distinguish between: (1) the CCR units that would be subject to all of the requirements in part 257 and (2) the CCR units that would subject to only a subset of the existing requirements. EPA proposed to use the terms CCR unit and CCRMU, respectively, to refer to these two categories of units. To effectuate this, EPA proposed to *revise* the existing definition of a CCR unit by adding a statement that CCR management units are not covered by the definition. If the commenter were correct that EPA did not consider CCRMU to be a type of CCR unit, EPA would not have needed to revise the definition.

But to the larger point, the CCRMU regulated under this rule clearly fall within RCRA sections 1008(a)(3), 4004(a) and 4005(d). In essence, as the commenter recognizes, CCRMU are simply CCR landfills and CCR surface impoundments that were not regulated by the 2015 Rule: inactive CCR landfills, or CCR surface impoundments and landfills that were closed prior to the effective date of the 2015 rule.¹³⁶ As EPA explained in the May 2023 proposal, the proposed definition of a CCRMU was based on the existing definitions of a CCR pile—which is currently included in the definition of a CCR landfill—and of a CCR surface impoundment, which both rely on the concept of “accumulations of CCR.” See, 40 CFR 257.53 and 88 FR 32018. And the record for this rulemaking documents that the CCRMU regulated under this final rule present risks at least as significant as the units regulated under the 2015 rule. CCRMU thus clearly are CCR units under both the regulations and the statute. As the commenter itself notes, when the WIIN Act was passed in 2016, and Congress incorporated the term CCR unit into the statute, the 2015 CCR Rule defined (and still defines) a CCR unit as “any CCR landfill, CCR surface impoundment, or lateral expansion of a CCR unit, or a combination of more than one of these.” 40 CFR 257.53 (*emphasis added*).

The commenter relies heavily on the fact that CCRMU were exempt under the 2015 CCR Rule; but that is ultimately irrelevant. First, as noted above, CCRMU actually fall within the 2015 regulatory definition of a CCR unit.

More to the point, Congress did not define the term “CCR unit,” thereby leaving it to EPA develop a definition. Although the WIIN Act incorporates the 2015 regulations into the statute, Congress simultaneously made clear that EPA retains the authority to modify or expand those requirements as necessary to ensure that the standard in section 4004(a) will continue to be met. See, e.g., 42 U.S.C. 6945(d)(1)(A)(i), (3), (6) (referencing “or successor regulations promulgated pursuant to sections 6907(a)(3) and 6944(a) of this title”). The commenters never acknowledge these provisions or address their logical implications.

Instead, the commenters focus on two aspects of the CCRMU definition to support their claims of an “unprecedented expansion”: (1) the proposal to define a CCRMU as “any non-containerized accumulation of CCR” without limitation or threshold; and (2) the regulation of “any area of land” on which CCR “is received, placed, or otherwise managed at any time.” With the incorporation of the thresholds in § 257.50(d) the first issue has been rendered moot. EPA has also deleted the phrase “at any time” from the CCRMU definition. EPA had originally included that phrase to clarify that it did not matter when the CCR was originally placed, received, or otherwise managed, provided the CCR remained at the site. EPA deleted the phrase from the final definition because, as the D.C. Circuit explained, this concept is fully communicated by the phrase “is placed.”

Importantly, while the “is” retains its active present tense, the “disposal” takes the form of a past participle (“disposed”). In this way, the disposal itself can exist (it “is”), even if the act of disposal took place at some prior time Properly translated then, an open dump includes any facility (other than a sanitary landfill or hazardous waste disposal facility), where solid waste still “is deposited,” “is dumped,” “is spilled,” “is leaked,” or “is placed,” regardless of when it might have originally been dropped off. See 42 U.S.C. 6903(3), (14).

901 F.3d at 440. The same logic applies to the phrases “is received” and “is otherwise managed.” Including the phrase “at any time,” is consequently at best redundant, and at worst confusing—as demonstrated by the above comments.

In any event, these aspects of the CCRMU definition were either taken directly from or largely mirror existing regulatory or statutory definitions. The phrase “any non-containerized accumulation of CCR” appears verbatim in the existing “CCR pile” definition, which as EPA previously explained,

essentially mirrors the existing definition of a “waste pile or pile” from § 257.2 (*i.e.*, the regulation that applied to CCR facilities prior to 2015), as well as the definition in part 260 that has been in place since 1982. See 80 FR 21356. Compare, §§ 257.2, 257.53, and 260.10. More to the point, regulating the placement of non-containerized¹³⁷ CCR directly on any land is fully consistent with RCRA’s definition of disposal, which is defined in part as the “‘placing of any solid waste or hazardous waste into or on any land or water so that such solid waste or hazardous waste or any constituent thereof may enter the environment or be emitted into the air or discharged into any waters, including ground waters.’” 42 U.S.C. 6903(3) (*emphasis added*). Similarly, and as illustrated by the D.C. Circuit decision quoted above, the phrase “is received, is placed, or is otherwise managed,” flows from the statutory definition of an open dump, which RCRA defines as “any facility or site where solid waste *is disposed of*” 42 U.S.C. 6903(14) (*emphasis added*).

EPA responds to comments about the “any area of land” portion of the CCRMU definition in relevant portions of the discussions below.

(b) Extent of Requirements

The commenters complain that the proposal was “virtually unbounded” as it would require operating power generation facilities to identify every CCRMU within its boundaries, even if located under existing structures critical to a plant’s energy production operations, and to “close,” and in many cases reclose, those CCRMUs under the CCR rule’s closure provisions. While EPA disagrees with the commenters’ characterization of the proposal, the final rule, in any event, is more limited than the proposal, and is not unbounded. Under the final rule a covered facility must still identify every CCRMU of one ton or more within its boundaries, but groundwater monitoring, corrective action, closure, and post-closure requirements apply only to CCRMU containing at least 1,000 tons of CCR. Regulation of CCRMU between one and 1,000 tons is deferred to a subsequent permitting authority who will assess the risks posed by these smaller CCRMU, individually and/or in the aggregate, and determine which, if any, requirements are appropriate for the CCRMU. In addition, this final rule defers the requirement to demonstrate

¹³⁶ The proposal described an additional category: any solid waste management that involves the placement or receipt of CCR directly on the land; such activities fall within the existing definition of a CCR pile, which is in turn defined as a CCR landfill.

¹³⁷ The phrase “non-containerized” means that specific measures to control exposures to human health and the environment have not been adopted. See 80 FR 21356.

compliance with § 257.102 for CCRMU that closed prior to the effective date of this rule in accordance with alternative, substantially equivalent requirements. EPA is also deferring the requirement to initiate closure where the CCRMU is located beneath critical infrastructure, such as high power electric transmission towers, air pollution control or wastewater treatment systems, or an electrical substation until the infrastructure is no longer needed, a permit authority determines closure is necessary to ensure that there is no reasonable probability of adverse effects on human health or the environment, or the closure or decommissioning of the facility, whichever occurs first.

The commenters also objected to the imposition of corrective action and closure obligations on disposal units that were closed in accordance with State law or on areas where the State considered the placement of CCR on the land to be beneficial use under State law. But the regulation under subtitle D of closed or inactive disposal units or of activities exempt under State law is neither novel nor unprecedented. Indeed, many CCR units currently regulated under the 2015 CCR rule were inactive or exempt under State law. See, 80 FR 21322–21323, 21456. And in this case EPA is only extending the part 257 regulations to activities or placements of CCR that, as discussed above, are already defined as “disposal” under Federal law—and that the record demonstrates present risks exceeding the threshold for regulation in section 4004(a).

Under section 4004(a), EPA is charged with issuing regulations to address all “reasonable probabilities of adverse effects” (*i.e.*, all reasonably anticipated risks) to health and the environment from the disposal of solid waste.¹³⁸ The statute is clear that this includes regulations to address the current risks from previous solid waste management activities (including disposal). EPA explained at length the basis for this conclusion as part of the Agency’s rationale for regulating inactive impoundments. See, 80 FR 21344–21345. See also *USWAG, et al. v. EPA* 901 F.3d at 440. See also *In re Consolidated Consol. Land Disposal Regulation Litig.*, 938 F.2d 1386, 1389 (D.C. Cir. 1991) (EPA’s reading of the term “disposal” in RCRA’s Subtitle C, 42 U.S.C. 6924, to include “the continuing presence of waste” was

reasonable); *USWAG*, 901 F.3d at 453–54 (Henderson, J., concurring) (same). By the same logic, these provisions authorize EPA to regulate inactive landfills and closed disposal units that continue to pose risks to health or the environment, for example by requiring the owners and operators of such units to remediate any contamination from these units, or to take action to prevent such contamination.

The 2016 WIIN Act amendments reaffirmed EPA’s authority over these activities. In section 4005(d), Congress relied on the 2015 regulations, and expressly stated that the amendments were not intended to limit or restrict the authority already provided under sections 1008(a)(3) and 4004(a). See, 42 U.S.C. 6945(d)(3), (6), (7). With these amendments, Congress also affirmed the Agency’s authority to impose the kind of requirements established in part 257 (*e.g.*, corrective action to remediate groundwater contamination and closure to prevent it). This rule simply extends many of those same requirements to additional areas at which disposal of CCR is occurring—often at the same sites covered by the original 2015 CCR Rule. Moreover, Congress made clear that EPA retains the authority to modify or expand the requirements in the 2015 CCR rule as necessary to ensure that the standard in section 4004(a) will continue to be met. See, *e.g.*, 42 U.S.C. 6945(d)(1)(A)(i), (3), (6) (referencing “or successor regulations promulgated pursuant to sections 6907(a)(3) and 6944(a) of this title”). None of the commenters acknowledge these provisions or address their logical implications.

Moreover, this rule requires CCR facilities to remediate only the contamination associated with the disposal of CCR on site of a facility with other currently regulated CCR disposal units. Although expanding the corrective action obligations to other areas of CCR disposal on site may seem similar to the facility wide corrective action obligations applicable under the hazardous waste program—in that a facility will be required to clean up all of the on-site contamination caused by its disposal of CCR—the two requirements are not commensurate. For example, in contrast to a clean up under 3004(u), this rule does not require a facility to clean up any Appendix IV constituent from any source on-site, such as a spilled commercial product, unconnected to the solid waste (CCR) in the disposal unit. Rather, this rule imposes the same unit specific obligations that CCR facilities have been required to comply with since 2015, that were clearly authorized under 4004(a)

and that Congress effectively affirmed in 2016 with the WIIN Act.

(c) Relationship to State Law

Finally, EPA disagrees that either the proposed or final rule expands “EPA’s role in the Subtitle D statutory regime” or otherwise alters the Congressionally mandated relationship between EPA and the States.

The fact that EPA regulation affects the status of activities or units that were previously regulated under State law is precisely what the statute authorizes. Even under the more limited authority conferred upon the Agency prior to WIIN Act, EPA’s subtitle D criteria established minimum national standards with which facilities were required to comply, irrespective of State law. See 80 FR 21310–21311.

Moreover, the commenter has misunderstood both the intent and effect of the WIIN Act. Under the legal framework in place when the 2015 CCR rule was enacted,

EPA’s delegated RCRA Subtitle D authority entails the authority to promulgate guidelines and criteria, to be implemented by the States, to prohibit open dumping and to ensure that units are classified as sanitary landfills “only if there is no reasonable probability of adverse effects on health or the environment from disposal of solid wastes at such facility

See 80 FR 21310–21311. Congress deliberately expanded EPA’s role under that framework in 2016 when it granted EPA the authority to enforce the Federal criteria, issue permits in nonparticipating States, and to establish the minimum national standards that are both applicable directly to facilities and used to evaluate State programs. The commenter’s description of the section 4005(d)(6) definition of a “sanitary landfill” is similarly misleading. Congress did not define a sanitary landfill as a CCR unit that complies with any State CCR permit, but a State permit issued in accordance with an EPA approved program. See 42 U.S.C. 6845(d)(6)(A)(i).

(d) Other Comments Concerning Authority To Regulate CCRMU

Other commenters stated that the proposed CCRMU definition exceeds the Agency’s authority under RCRA subtitle D because EPA has failed to demonstrate that any amount of CCR placed anywhere on the land at any time presents the level of risk necessary to warrant regulation under section 4004(a). These commenters contend that the proposed CCRMU definition unlawfully eliminates the concept of risk out of the statutory definition of disposal. These commenters further asserted that the authority to regulate

¹³⁸ Although section 1008(a)(3) expands EPA’s authority to address the risks from any of the listed activities, the CCRMU regulated under this final rule—consisting of CCR surface impoundments and landfills (including CCR piles) only involve disposal.

“solid waste management practices” under section 1008(a)(3) similarly does not authorize the regulation of any amount of CCR placed anywhere on the land at any time. Finally, a commenter raised concern that the proposed definition would encompass CCR used as fill material pursuant to acts of Congress or validly issued Section 404 permits under the Clean Water Act, which commenter alleged falls outside the scope of RCRA.

EPA disagrees that it lacks the authority for any of the provisions in this final rule. The record demonstrates that the CCRMU regulated under the final rule meet the standard for regulation under section 4004(a). This rule is supported by two separate risk assessments; the final rule adheres closely to the results, and regulates only the units and activities that present risks that warrant regulation under sections 1008(a)(3) and 4004(a). Further, the results of EPA’s risk assessments are consistent with the damage cases discussed in Unit III.C.1 of this preamble.

As discussed at length in Unit III.A of this preamble, leakage from CCRMU can adversely impact groundwater quality and pose risk to future receptors in the range that EPA typically considers for regulation. Closed and inactive landfills and surface impoundments pose substantially the same levels of risk to offsite receptors as those estimated in 2014 for currently regulated units. This is particularly true if the unit has not been properly closed, *e.g.*, lacks a final cover system.

In response to comments received on the proposed rule raising concerns about the adequacy of EPA’s basis for regulating smaller CCRMU, EPA modeled groundwater concentrations at the boundary of smaller CCRMU fills to understand the potential for exceedance of GWPS that would trigger corrective action. The results of that 2024 Risk Assessment confirm that smaller CCRMU fills can pose risk to onsite receptors and materially contribute to broader groundwater contamination across the facility. In addition, depending on the location of these fills, they can also pose risk to offsite receptors that exceed the levels at which EPA normally regulates. On the whole, this analysis identified the potential for both moderate and high-end groundwater concentrations of molybdenum (among other Appendix IV constituents) to exceed GWPS.

EPA conducted further sensitivity analysis to better understand whether there is an amount below which there is no reasonable probability of adverse impacts to groundwater quality. EPA

remodeled quantities of CCR between one ton and 78,000 tons to determine both the risks associated with the potential for groundwater contamination and radioactivity. EPA modeled only individual placements of CCR in these quantities rather than the aggregate risks from the placement of multiple small quantities of CCR co-located at the same site.

This analysis found that exceedances of the GWPS by a factor of as much as 40 are still possible for placements below 1,000 tons of CCR. Thus, such placements can meaningfully contribute to groundwater contamination at these facilities, including, for example by adding two contaminant plumes already present on site from larger placements, or in the aggregate. Although further analysis of the results indicates that there will be a tonnage that does not present a reasonable probability of adverse effects to groundwater quality, EPA was unable to identify that amount based on the available information. EPA conducted no modeling below one ton; however all indications in the existing data are that groundwater concentrations from individual quantities below one ton are very unlikely to exceed GWPSs. In other words, although EPA’s modeling indicates that some amount between one ton and 1,000 tons is likely below EPA’s level of concern, EPA cannot determine what that precise amount would be. It was not possible to identify a limit much lower than 1,000 tons because too few model runs were conducted at smaller amounts to support extrapolation.

To ensure that the final rule is consistent with the Agency’s authority under RCRA section 4004(a), this final rule incorporates thresholds consistent with the results of its risk analyses. Accordingly, the final rule only requires CCRMU containing 1,000 tons or more of CCR to comply with the applicable requirements for CCRMU.

However, EPA estimated the risks associated with a 1,000 ton CCRMU to be an HQ of 40, which exceeds the Agency’s normal level of acceptable risk by a significant margin. In addition, EPA’s risk assessment may underestimate the risks at some sites. EPA modeled the risks associated with individual CCRMU of varying sizes, rather than the aggregate risks associated with numerous smaller CCRMU across the facility. It is possible that even though smaller CCRMU may not individually give rise to levels of concern, the risks may be greater when all of the CCRMU are considered together. According to many of the commenters, it is common for multiple

small CCRMU to be located at a single facility. And although EPA’s modeling estimated radiation risks of concern at lower quantities, EPA’s concerns were based on a *future* residential use of the property (*e.g.*, after clean closure of the regulated units, but where smaller CCRMU remain on site). As several commenters noted, current exposures at existing facilities (occupational) are very different. To address these risks, as section 4004(a) requires, the final rule does not exempt CCRMU containing between one and 1,000 tons of CCR, but defers the regulation of such units to a permitting authority who will assess the risks posed by these smaller CCRMU, individually and/or in the aggregate, and determine which, if any, requirements are appropriate for the CCRMU to ensure there will be no reasonable probability of adverse effects on health or the environment. In order to facilitate this, the final rule requires facilities to identify these smaller units as part of the FER, so that this information can be submitted as part of their permit application. The facility will also continue to monitor the regulated units and larger CCRMU at the site, consistent with the requirements in this rule and the existing regulations. To the extent that these smaller unmonitored CCRMU are leaching contaminants and contributing to groundwater plumes, that should become apparent as the facility continues to monitor and conduct any necessary corrective action at the currently monitored units.

EPA has codified these provisions in the “Scope” section of the regulations, at § 257.50(d). The provision reads as follows:

(1) This subpart applies to CCR management units of 1,000 tons or greater, located at facilities with a regulated CCR unit or active facilities without a regulated CCR unit.

(2) CCR management units greater than or equal to 1 ton and less than 1,000 tons, located at facilities with a regulated CCR unit or active facilities without a regulated CCR unit, are only subject to the requirements of the facility evaluation report in § 257.75 until a permitting authority determines that regulation of these units, either individually or in the aggregate, is warranted and determines the applicable requirements.

Finally, the commenter is mistaken that CCR used as fill material pursuant to acts of Congress or validly issued CWA section 404 permits under the State falls outside the scope of RCRA. To support its allegation, the commenter references section 1006(a), claiming that this “expressly carves out any activity covered by 33 U.S.C. 1251 *et seq.*” But RCRA section 1006(a) does not bar EPA

from imposing requirements under one of the listed statutes and RCRA on the same units and waste streams, unless those requirements are inconsistent with a requirement in one of the statutes. 42 U.S.C. 6906(a). This is clear from the second sentence, which provides that “such integration shall be effected only to the extent that it can be done in a manner consistent with the goals and policies expressed in this chapter and in the other acts referred to in this subsection,” and thus expressly contemplates that there will be situations in which EPA regulates under both RCRA and one of the listed statutes. *Id.* See, *Chemical Waste Management v. EPA*, 976 F.2d 2, 23, 25 (D.C. Cir. 1992).

Numerous courts have upheld this interpretation. See, *Ecological Rights Foundation v. Pacific Gas & Electric Co.*, 874 F.3d 1083, 1095 (9th Cir., 2017) (“RCRA’s anti-duplication provision does not bar RCRA’s application unless that application contradicts a specific mandate imposed under the CWA (or another statute listed in RCRA section 1006(a))”); *Goldfarb v. Mayor and City Council of Baltimore*, 791 F.3d 500 510 (4th Cir. 2015) (The CWA must require something fundamentally at odds with what RCRA would otherwise require to be “inconsistent” under 1006(a)); *Edison Electric Institute v. EPA*, 996 F.2d 326, 337 (D.C. Cir.1993) (rejecting “generalized claim” that EPA action was barred under section 1006(a) because it interfered with “the primary purpose” of the Atomic Energy Act); *U.S. v. E.I. du Pont de Nemours & Co., Inc.*, 341 F.Supp.2d 215, 236 (W.D. N.Y. 2004) (approving EPA action as “not inconsistent” under RCRA where CERCLA’s heightened standard would not be met by release of hazardous substance). The commenter has identified no requirement in the Clean Water Act that is inconsistent with EPA’s regulation of CCRMU.

The same is true with respect to the commenter’s contention regarding acts of Congress. Although the commenter refers to “acts of Congress” it cites only to 33 U.S.C. 59d. That provision of the Clean Water Act states only that a particular area is not a water of the United States, and authorizes the owner to place fill in the area.

The old channel of the River Raisin in Monroe County, Michigan, lying between the Monroe Harbor range front light and Raisin Point, its entrance into Lake Erie, is declared to be not a navigable stream of the United States within the meaning of the Constitution and the laws of the United States, and the consent of Congress is hereby given for the filling in of the old channel by the riparian owners on such channel.

Regulation of CCRMU neither contradicts a specific mandate nor is fundamentally at odds with this provision, which does not require the owner to place CCR in the old channel or grant the owner an exemption from any requirement other than section 404 of the Clean Water Act.

ii. Subcategorization Is Appropriate for CCRMU Because CCRMU Are Dissimilar

Commenters stated that the proposal groups all pre-2015 CCR Rule disposal areas into one large category. According to the commenters, this approach treats many different scenarios as a worst-case by imposing burdensome requirements for all. Commenters provided examples of potential subcategories, including: past CCR disposal varies based on site location (close to a surface water body), geography (eastern vs western sites), hydrology (flow variability/distance to uppermost aquifer), regulatory status (State closed-units vs unaddressed CCR sites), and historical CCR disposal areas currently used to harvest CCR for beneficial use. By categorizing all these situations together, the commenters claimed that EPA ignores the risk profiles of these subcategories and forces actions not tailored to the issues at hand. Some of these commenters opposed including in the CCRMU definition former landfills, impoundments and other accumulations of CCR that been closed in accordance with existing Federal or State regulations and regulatory oversight that pose no risk to groundwater.

As discussed in Unit III.A, the risk record does not support the distinctions the commenters make. This final rule already imposes only a subset of the regulations in part 257 on CCRMU, consisting primarily of groundwater monitoring and closure. Corrective action is required only if triggered by site-specific determinations particular to individual units. EPA disagrees that the commenters have shown that any further differentiation is warranted.

iii. Size Threshold for a CCRMU

Many commenters stated that the proposed definition of CCRMU does not provide the regulated community with “fair notice” of what in fact is forbidden or required. Citing to *FCC v. Fox Television Stations, Inc.*, 567 U.S. 239, 253 (2012), these commenters stated that due process requires that “laws which regulate persons or entities must give fair notice of conduct that is forbidden or required.” According to these commenters, the proposed CCRMU definition does not give fair notice of what is regulated because it is an overly broad definition that would

apply to “any non-containerized accumulation of CCR.” Furthermore, commenters raised concern that EPA has not provided any clarity on how much non-containerized CCR is enough to trigger regulation, nor does the proposal provide any criteria for determining significance, but instead points to examples where it does not expect this to be the case, such as closed or inactive process water ponds, cooling water ponds, wastewater treatment ponds, and stormwater holding ponds or aeration ponds. These commenters also questioned the references to evaporation ponds or secondary or tertiary finishing ponds that have not been properly cleaned up as examples of potential CCRMU, because in the 2015 CCR Rule preamble, EPA had identified these as examples of impoundments that would not be considered CCR surface impoundments because they contained only de minimis concentrations of CCR. These commenters argued that the burden is on EPA to provide the regulated community with ascertainable certainty as to what the regulation requires, a mark for which they believe the proposed CCRMU definition falls short.

Commenters also pointed out that the limitations of or exemptions from the definition were only discussed in the preamble to the proposed rule but were not reflected in the regulatory text itself. These commenters argued that the CCRMU definition must include various limitations and exceptions in the final rule, such as, specifying a *de minimis* or insignificant quantity threshold in the definition of a CCRMU. Commenters further stated that without such clarity, owners or operators would be required to consider all CCR placement as CCRMU.

As discussed in the preceding section, EPA has revised the rule to be consistent with the results of the 2024 Risk Assessment, and the final rule defers the regulation of CCRMU containing between one and 1,000 tons of CCR to a permitting authority. Only CCRMU containing 1,000 tons or more of CCR will be subject to the applicable requirements for CCRMU after the effective date of this rule. Although EPA has codified the thresholds in § 257.50(d) rather than the CCRMU definition, the effect is the same. In addition, as discussed in more detail in Unit III.C.2.a, EPA has revised the CCRMU definition in response to concerns raised by commenters that the definition was confusing and unclear. The combined effect of these revisions is more than sufficient to address the commenters’ concerns about the clarity of the definition including claims that

the proposed regulations would not provide regulated entities fair notice of what the regulations require.

Finally, EPA acknowledges that the reference in the proposal to evaporation ponds, or secondary or tertiary finishing ponds that have not been properly cleaned up as examples of potential CCRMU was a mistake. EPA agrees that these units would generally be expected to contain no more than a *de minimis* amount of CCR.

iv. Exemption for Beneficial Use of CCR

Several commenters stated that the CCRMU definition is too broad and does not account for the beneficial use of CCR. According to these commenters, the proposal to regulate CCRMU effectively revoked or amended the current exemption for beneficial use in § 257.50, and the broad CCRMU definition now requires previously approved beneficial uses to be reexamined for potential regulation. Several of these commenters criticized the agency for failing to address the issue in the proposal, and argued that the Agency lacked the authority to include such beneficial uses, either because neither RCRA section 1008(a)(3) nor section 4004(a) authorize EPA to regulate use or because such regulation would be inconsistent with the 2015 Regulatory Determination. These commenters recommended that the CCRMU definition be revised to exclude any beneficial use of CCR as defined by § 257.53 or as previously approved by State agencies.

By contrast, several commenters request EPA to prohibit the use of coal ash as fill unless full protective measures such as liners, monitoring, and caps are required everywhere it is placed. Commenters claimed that immediate attention to this recommendation will protect the health and environment of millions of U.S. residents by preventing the spread of toxic coal ash pollution.

EPA disagrees that the proposal to regulate CCRMU effectively revoked or amended the current exemption for beneficial use in § 257.50. The proposal merely accurately reflects the existing regulations, which these commenters have misunderstood.

Under the existing regulations, the direct placement of CCR on the land on site of a utility, with nothing to control releases is, by definition, a CCR pile and therefore not beneficial use. The examples of historical CCRMU discussed in the proposal, structural fill and CCR placed below currently regulated CCR units on-site of a utility also clearly fit that definition.

These are the same provisions that have been in place since 2015. The existing definition of a CCR pile is

Any non-containerized accumulation of solid, non-flowing CCR that is placed on the land. CCR that is beneficially used *off-site* is not a CCR pile.

§ 257.53 (emphasis added). The second sentence expressly limits the beneficial use of CCR to “off site,” and thus any non-containerized CCR placed directly on the land on-site of a utility is not beneficial use.

EPA previously explained this in its August 14, 2019, proposal “Hazardous and Solid Waste Management System: Disposal of Coal Combustion Residuals From Electric Utilities; Enhancing Public Access to Information; Reconsideration of Beneficial Use Criteria and Piles” to revise the definition of a CCR pile with respect to temporary piles. 84 FR 40353. Specifically, EPA proposed to establish a new set of requirements that would apply equally to temporary or “storage piles” located on-site and off-site of a utility. As part of the background to that proposal, EPA described the requirements under the existing regulation so that the public could fully understand what it was—and was not¹³⁹—proposing to revise. The proposal reiterated the existing definition of a CCR pile in § 257.53, and explained that this definition closely mirrors the RCRA definition of disposal, which is defined in part as the “placing of any solid waste or hazardous waste into or on any land or water so that such solid waste or hazardous waste or any constituent thereof may enter the environment or be emitted into the air or discharged into any waters, including ground waters.” See 42 U.S.C. 6903(3). EPA further explained:

Under this regulation, CCR piles constitute disposal and are consequently subject to all regulatory criteria applicable to CCR landfills. In contrast, activities that meet the definition of a beneficial use are not considered disposal, even if they involve the direct placement on the land of “non-containerized” CCR. See §§ 257.50(g) and 257.53 (definitions of CCR landfill and CCR pile); 80 FR 21327–30.

The current regulation distinguishes piles of CCR on-site (at an electric utility or independent power producer site) from temporary piles of CCR off-site (at a beneficial use site), based on whether CCR from the pile could fairly be considered to be in the process of being beneficially used. See § 257.53 (definition of CCR pile); 80 FR

21356 (April 17, 2015). While the CCR from the pile on-site may someday be beneficially used, it is not currently in the process of being beneficially used . . . If CCR is not containerized, the pile is a CCR pile and subject to the same requirements as a CCR landfill. See *Id.*

In contrast, the regulations treat CCR stored off-site at a beneficial use site in a temporary pile to be in the process of being beneficially used (even though a pile is not itself a beneficial use). If the CCR is temporarily placed at a beneficial use site and meets the regulatory definition of a beneficial use, the pile is not a CCR pile and is not subject to disposal requirements.

. . . .

In the current definition [of a CCR pile], EPA distinguishes between piles on-site (which were almost always regulated as landfills) and piles off-site, (which, if temporary, were generally considered to be beneficial use, subject only to the four criteria in the definition). The current regulation also distinguishes between on-site piles that are not containerized and those that are containerized. See 80 FR 21356 (April 17, 2017); § 257.53.

84 FR 40365.

Thus, under the 2015 CCR Rule the activities covered under the definition of a CCRMU (*i.e.*, permanent placement of CCR on the land, on-site of a utility, without controlling releases) were defined as disposal rather than beneficial use. In 2019, EPA did not propose to revise or reconsider that. Instead, EPA proposed to extend that existing requirement to permanent piles located off-site of a utility. EPA therefore declines to reconsider the issue here.

In the May 2023 proposed rule EPA expressly stated that it did not intend to reopen or reconsider any issue other than those on which the agency expressly solicited comment.

In this proposal, EPA is not reconsidering, proposing to reopen, or otherwise soliciting comment on any other provisions of the existing CCR regulations beyond those specifically identified in this proposal. For the reader’s convenience, EPA has provided a background description of existing requirements in several places throughout this preamble. In the absence of a specific request for comment and proposed change to the identified provisions, these descriptions do not reopen any of the described provisions.

88 FR 31984. EPA further advised the public that it would “not respond to comments submitted on any issues other than those specifically identified in this proposal, and such comments will not be considered part of the rulemaking record.” *Id.*

Nowhere in the May 2023 proposed rule did EPA solicit comment on or suggest that it was in any way reconsidering the existing definition of

¹³⁹ EPA expressly advised the public that it was “not reconsidering, proposing to reopen, or otherwise soliciting comment on any other provisions of the final CCR rule beyond those specifically identified in this proposal.” 84 FR 40355.

a CCR pile. The sole mention in the proposal is EPA's explanation that its proposed definition of a CCRMU was "based on the current definitions of a CCR pile—which is currently regulated as a CCR landfill. . . ." Id at 32018. Consistent with the interpretation that all CCR placed on the land on-site of a utility is currently regulated, EPA also characterized structural fill and CCR placed below currently regulated CCR units on-site of a utility as "historical" solid waste management. Id. While commenters mischaracterize such activities as beneficial use, EPA's characterization of this conduct as "historical" shows that the Agency assumed that facilities were complying with the existing requirement and had not continued these practices on-site.

Accordingly, EPA declines the commenters' request to reconsider the definition of a CCR pile. EPA also declines to prohibit the use of CCR structural fill as part of this rulemaking. That issue is related to the 2019 proposal¹⁴⁰ to revise the fourth criterion in the definition of beneficial use, which remains pending.

v. Exemption for Roadbeds and Associated Embankments

EPA proposed to exempt CCR used in roadbeds and associated embankments. EPA further proposed that if a facility subsequently determined that the CCR in onsite roadbed is contributing to contamination of the aquifer, the facility would be required to address the contamination as part of the ongoing remediation.

No commenters opposed EPA's proposal, and several commenters supported it. However, commenters pointed out that EPA had neglected to include an exemption for roadbeds and associated embankments in the proposed regulatory text.

EPA is finalizing the exemption for roadbeds as proposed, and has amended the definition of a CCRMU accordingly.

b. Revision to Definition of CCR Unit

In order to distinguish between CCR units that would be subject to all of the requirements in part 257, and those that would be subject to only a subset, EPA proposed to rely on two terms: (1) CCR unit and (2) CCR management unit. Under the proposal the term, "CCR units" would refer to only the units subject to all of part 257, subpart D. As defined in the proposal, the term "CCR management unit" would refer to the units subject only to the subset of groundwater monitoring, corrective action, closure, and post-closure

requirements. To effectuate this EPA proposed to modify the definition of *CCR unit* by stating that *CCR management units* are not covered by the definition of a *CCR unit*. Under the existing regulations, CCR units are defined as "CCR landfills and CCR surface impoundments, as well as any lateral expansion of a CCR landfill or CCR surface impoundment. In addition, the term *CCR unit* already covers inactive CCR surface impoundments at active facilities because these units are CCR surface impoundments." 40 CFR 257.53

Commenters raised concern about the "circularity" of these definitions, and requested clarification on what type of unit would be considered a CCR unit, CCRMU, CCR landfill, or CCR surface impoundment. Several commenters noted that

"[f]or instance, 'CCR landfill,' 'CCR management unit,' and 'CCR unit' are defined by reference to each other. For example, a 'CCR landfill is 'not a surface impoundment' and not a 'CCRMU,' while a 'CCRMU' is 'not a CCR unit' but includes 'inactive CCR landfills' and 'CCR units that closed prior to October 17, 2015.' And similarly, a 'CCR unit' is 'not a CCRMU,' but includes CCR landfills and CCR surface impoundments. Similar circular references are contained in the definitions of 'inactive CCR landfill,' 'inactive facility,' and 'legacy CCR surface impoundment.'

Commenters claimed that defining one term by exclusion of another and in turn defining the latter term by exclusion of the former provides no clarity on the boundary between the two. These commenters went on to state that "in a context in which definitional clarity is essential for regulatory clarity—i.e., what's "in" and what's "out"—such ambiguity is fatal, EPA must clarify these definitions to define these terms by their essential characteristics, not by circular references to each other." And as discussed in a previous section, some commenters were also confused by EPA's explanation in the proposal that, because it planned to use the term "CCR unit" to refer only to those CCR units that would be subject to all of the regulations in subpart D, CCRMU would not be included in this term.

In light of these comments, EPA reevaluated the proposed definitions and agrees that revisions are necessary. As noted, the proposed terms were intended to categorize units according to the requirements that would eventually be applied to them. EPA hoped that as a consequence, few revisions to the regulations would be necessary, with the idea that this would be less confusing to regulated entities and the public. Unfortunately, that was

not the case and as the commenters noted, the definitions were frequently circular. Consequently, the final rule relies on three definitions: *CCR unit*, *Regulated CCR unit*, and *CCR management unit*.

EPA has largely reverted to the existing definition of a *CCR unit*. The definition, as it was promulgated in 2015, provides that

"*CCR unit* means any CCR landfill, CCR surface impoundment, or lateral expansion of a CCR unit, or a combination of more than one of these units, based on the context of the paragraph(s) in which it is used. This term includes both new and existing units, unless otherwise specified.

Section 257.53. To avoid any ambiguity, EPA has also added a sentence stating that "This term includes both Regulated CCR units and CCR management units." This is now the broadest term under the regulations and encompasses all units subject to 40 CFR part 257, subpart D.

This final rule now also includes the term *Regulated CCR unit*, which refers to the units regulated by the 2015 CCR rule, i.e., new CCR landfills and new CCR surface impoundments (which include all lateral expansions of CCR landfills and CCR surface impoundments), existing CCR landfills, existing CCR surface impoundments, and inactive surface impoundments at active facilities. It also includes legacy CCR surface impoundments. Because legacy CCR surface impoundments will be subject to the same requirements as other inactive CCR surface impoundments, using this term will allow the Agency to implement this with relatively few revisions to the regulatory text.

Finally, the final rule largely reverts to the proposed definition of a CCR management unit. This final rule defines *CCR management unit* to mean any area of land on which any noncontainerized accumulation of CCR is received, is placed, or is otherwise managed, that is not a regulated CCR unit. This term includes inactive CCR landfills and CCR units that closed prior to October 19, 2015. EPA has also included a definition of the phrase, "closed prior to October 19, 2015," which provides that the term means "the CCR landfill or surface impoundment completed closure of the unit in accordance with state law prior to October 19, 2015."

EPA deleted the phrase "at any time" from the proposed definition. EPA had originally included that phrase to clarify that it did not matter when the CCR was placed, received, or otherwise managed, provided the CCR remained present at the site. EPA deleted the phrase from

¹⁴⁰ 84 FR 40353 (August 14, 2019).

the final definition because, as the D.C. Circuit has already explained, this concept is fully communicated by the phrase “is placed,” and the inclusion of the phrase “at any time,” is therefore redundant. In addition, several commenters were confused by the phrase, assuming it meant that if CCR had ever been placed on the land at any time, even if it is no longer present, the site would be considered a CCRMU.

These definitions are all codified in the regulatory text at § 257.53. EPA also made conforming changes throughout 40 CFR part 257, subpart D to clarify which types of CCR units are subject to which requirements. As discussed elsewhere in this preamble, consistent with the proposal, EPA is extending only a subset of the existing requirements in part 257, subpart D to CCRMU, consisting of requirements for groundwater monitoring, corrective action, closure, post-closure care, and recordkeeping.

c. Revisions to Definitions of Owner and Operator

EPA proposed revisions to the existing definitions of *Owner* and *Operator*. The existing definition of *Owner* is the “person(s) who owns a CCR unit or part of a CCR unit.” First, EPA proposed to revise the definition to incorporate the concept of CCRMU into the existing definition because CCRMU would otherwise be excluded from the definition of a CCR unit as discussed in the preceding Unit of the preamble. This would be accomplished by adding “or CCR management unit” to the existing definition. Second, the Agency proposed to revise the definition of *Owner* to include the owner(s) of the entire facility, which would be achieved by adding “or a facility, whether in whole or in part” to the definition. EPA did not propose to revise the definition of a “facility,” which under the existing regulations means “all contiguous land, and structures, other appurtenances, and improvements on land, used for treating, storing, disposing, or otherwise conducting solid waste management of CCR. A facility may consist of several treatment, storage, or disposal operational units (e.g., one or more landfills, surface impoundments, or combinations of them).” 40 CFR 257.53.

Some commenters opposed changing the definition of *Owner*. One commenter said “It may be the current owner is unaware he owns the newly regulated facility. The current operator may have none of those parties responsible conducting activities since the parties may have ceased to exist long ago. Or, if the current owner is unwilling to work with those who previously

disposed of the ash (potentially beneficially) there are legal issues (including potential access and trespass rules) that will need to be resolved.”

Commenters agreed that it would not be appropriate to include an innocent owner provision, specifically because of the difficulty in defining complex owner structures where direct accountability is difficult to define. One commenter “does not fully agree with this ‘limited accountability’ and suggest accountability must also honor indemnity and the assignment of liability defined in a Purchase and Sale Agreement (PSA). Specifically, any entity should transition or maintain liability based on an established purchase and sale agreement, thus responsibility cannot be limited to only the current owner. In addition, it is reasonable to expect that for known active or inactive CCR Units at an active facility, the current owner should be responsible for required closure that satisfies the requirements of the 2015 CCR Rule and for corrective action that does not exceed industry standard for remediation. However, it is unreasonable to expect only current owners to be accountable for all past practices and the responsibility for the unknown, specifically for areas that were undefined and unknown and most importantly unregulated at the time of a transaction from a previous owner, most often a regulated utility.”

EPA proposed and is finalizing this revision in part to account for the more complicated ownership arrangements that exist at some utilities. EPA has found that there may be multiple owners at the same facility; for example, one entity may hold title to a single impoundment, while another entity may own the remaining disposal units at the site. Moreover, ownership can change over time, as individual units or portions of the facility are parceled off. This final rule also more accurately reflects the nature of the obligations EPA is establishing for CCRMU. For example, as discussed below, EPA is finalizing the regulations to require an investigation of the entire facility to identify CCRMU. At many sites, this would involve areas other than those encompassed by the definition of a CCR unit, extending to all areas where disposal or other solid waste management may be occurring. Moreover, relying exclusively on the “owner” of the CCRMU may be ambiguous in this context, as at some sites the owner may not yet be aware that a CCRMU is present (e.g., because it results from the historic placement or accumulation of CCR). EPA recognizes that this final rule will apply to

currently regulated facilities and newly regulated facilities, but EPA does not expect that this revision will actually amend the entities that currently are liable. EPA expects that most (if not all) utilities currently operate as though the regulation already required the owner and operator of the facility to take actions; for example, under the existing regulations owners and operators are required to conduct corrective action even where the plume has migrated beyond the footprint of the regulated unit. In addition, EPA is extending the deadlines for the CCRMU requirements, which can accommodate any issues with access to the facility in order to conduct the applicable requirements.

For similar reasons, EPA proposed to revise the definition of *Operator* to incorporate the concept of CCRMU into the existing definition by adding “or CCR management unit” to the existing definition. In addition, the Agency proposed revisions to account for the unique characteristics of a CCRMU. In cases where the CCRMU is closed (i.e., not receiving waste or otherwise in operation) or is a historic placement or accumulation of CCR, there may not be an entity that neatly fits the normal concept of an “operator,” because there may not be any current or ongoing oversight or activity with respect to the continued use of the unit. To avoid any ambiguity, EPA proposed to revise the definition of “operator” to clarify that the term *Operator* includes those person(s) or parties responsible for disposal or otherwise actively engaged in solid waste management of CCR. It also includes those responsible for directing or overseeing groundwater monitoring, closure, or post-closure activities at a CCR unit or CCRMU.

Commenters said the revised definition of operator is “too broad and may be interpreted to impose CCR Rule liability on individuals or contractors who are retained by owners or operators to ‘actively engage’ in CCR waste management. This definition should be revised to reflect the standard principles for ‘operator’ liability under environmental laws, which should not include employees, individuals, or contractors operating under the direction of a responsible owner or operator.” Another commenter disagreed with the revised definition of *Operator*, “which can imply the operator could have obligations under this rule. We disagree. While some owners and operators are one and the same many facilities are operated by third parties operators and in these cases, such operators should have no obligations under this proposed rule. We request EPA clarify that distinction

and clearly state that third party operators have no obligation.”

Another commenter stated “Companies actively engaged in the solid waste management of CCR” would include the construction contractors responsible for installation of CCR units including excavation, lining, filling, regrading, covering, closure, and more. Companies “responsible for directing or overseeing groundwater monitoring, closure or post-closure activities” would include well drillers, the professional engineers who certify the plans for CCR units, and again, construction contractors. Contractors will no longer be willing to ‘actively engage[] in the solid waste management of CCR’ or ‘direct[] or oversee[] groundwater monitoring, closure or post-closure activities’ if they will consequently become liable for compliance with the CCR rule. As a result, the ‘shortage of contractors’ will continue and grow worse. EPA should revise the definition of ‘Operator’ to clarify that contractors are not Operators.”

The revision to the definition of *Operator* is not intended to include every person who is “actively engaged in the solid waste management of CCR” but would follow the standard “operator” liability under environmental regulations. Such liability would include the operator who oversees the facility to ensure compliance with the regulations.

Because multiple entities may potentially be liable, (i.e., owners and operators) EPA is providing the following guidance. Consistent with EPA’s typical practice, unless otherwise provided in the regulations, as long as one responsible entity (an owner or operator) has complied with the requirements, EPA will consider the obligation satisfied as to all potentially liable parties and will initially rely on owners and operators to determine among themselves how best to ensure compliance with the requirements. See, e.g., 45 FR 33295 (May 19, 1980). (“EPA has no intention to require both owner and operator to take all or even most compliance actions in tandem. EPA will regard compliance by either owner or operator with any given obligation under the permit as sufficient for both of them”).

EPA is finalizing the revisions to *Owner* and *Operator* as proposed without revision. This is codified in the regulatory text at § 257.53.

d. Conforming Revisions to Other Existing Definitions

EPA proposed revisions to eight definitions in § 257.53 to refer to CCRMU. These definitions currently

refer only to CCR units and EPA proposed to add the words “or CCR management unit” to the definitions to incorporate the concept of CCRMU into the existing definition. The eight definitions for which EPA proposed this revision are: Active life or in operation, Active portion, Closed, CCR landfill or landfill, Qualified person, Qualified professional engineer, State Director, and Waste boundary. EPA received comments only about clarifying the definition of “closed,” which is discussed in the Volume II Response to Comments document. EPA did not receive comments about the other seven definitions for which EPA proposed this revision. As described in Unit III.C.2.b of this preamble, EPA has revised the definition of “CCR unit” in response to comments, and as a consequence the definitions for Active life or in operation, Active portion, Closed, Qualified person, Qualified professional engineer, and Waste boundary no longer need to be amended. EPA is finalizing the proposed revisions to the definitions of CCR landfill and State Director. These are codified in the regulatory text at § 257.53.

e. Scope of Regulated Facilities With CCRMU

EPA proposed to require the owners or operators of both active facilities with one or more currently regulated CCR unit(s) and inactive facilities with a legacy CCR surface impoundment to comply with the CCRMU regulations. The term active facility or active electric utilities or independent power producers is defined in § 257.53. Inactive facilities are discussed in Unit III.A.1.c of this preamble.

Some commenters on the proposed rule opposed limiting the universe to active facilities and inactive facilities with at least one CCR unit. They argued that CCR in landfills, dewatered surface impoundments, and CCRMU at other, currently unregulated, active facilities pose the same risks to groundwater, surface water, and air as facilities with CCR units. These commenters said RCRA section 4004(a) cannot be met if these leaking units are arbitrarily excluded from regulation. Other commenters said EPA does not have the authority to regulate CCRMU at all and should limit the scope of the final rule to units that pose risks.

After reviewing the comments on the proposed rule, EPA reconsidered whether the regulated universe should be expanded to include other facilities currently generating power for the electrical grid that only have CCRMU on-site. These unregulated active facilities, or “Other Active Facilities,”

are those that: (1) On or after October 19, 2015, were producing electricity for the grid; (2) Had ceased placement of CCR in their on-site CCR units before the effective date of the 2015 CCR Rule (October 19, 2015); and (3) Had no inactive CCR surface impoundments. As such, CCRMU (e.g., inactive CCR landfills, closed CCR landfills, or closed CCR surface impoundments) are located at these facilities. Commenters on the proposed rule identified 13 units at six other active facilities, based on sourced data, and these units including inactive CCR landfills, closed CCR landfills, or closed CCR surface impoundments. Based on the most recent information, including from NODA comments, EPA believes there are nine units at five other active facilities.¹⁴¹

The addition of these units provides regulatory consistency; the CCRMU at these active facilities pose the same risks to human health and the environment whether or not they are co-located with a currently regulated CCR unit or a legacy CCR surface impoundment. And with the expansion of corrective action and closure obligations to CCRMU, these facilities are more similarly situated to the currently regulated active utilities and independent power producers than they are to the inactive facilities that remain exempt under this final rule (i.e., inactive facilities with only CCRMU). Moreover, in contrast to the exempt facilities, EPA was able to identify the affected facilities and evaluate the potential consequences of regulating them.

EPA disagrees that it lacks the authority to regulate these CCRMU, for the same reasons discussed in Units II.C and III.C.2.a of this preamble.

The Agency also considered whether to regulate all CCRMU at inactive power plants. But as EPA explained in Unit III.B.1.b.i.(b) of this preamble, the location and number of inactive facilities without a legacy CCR surface impoundment are unknown, as is the number and condition of the units at these facilities. Without being able to better understand the full extent of the sites and entities that could be affected, EPA is not prepared to expand the regulations to this extent at the current time. Even though CCRMU pose the same risk when located at active or inactive facilities, EPA considers that the higher priority is to ensure that active facilities address the full extent of the contamination that currently exists, and to prevent further contamination at

¹⁴¹ This universe is included in “Universe of CCR Management Units. April 2024.” in the docket for this action.

these sites—in other word to address rather “those ills we have, than fly to others that we know not of.”

Therefore, EPA is finalizing amendments to regulate CCRMU at all active electric utilities or independent power producers that generated power for the electrical grid on or after October 19, 2015, in addition to those facilities with legacy CCR surface impoundments. As noted, EPA refers to these facilities as “covered facilities” throughout this preamble. This is codified in the regulatory text at § 257.50(d).

3. Facility Evaluation for Identifying CCR Management Units

EPA proposed that owners or operators of active facilities with a currently regulated unit or inactive facilities with a legacy CCR surface impoundment would need to conduct facility evaluations. The purpose of the facility evaluation is to confirm whether any CCRMU exist on-site, and, if so, to delineate the lateral and vertical extent of the unit(s). In developing the proposal, EPA relied heavily on the RCRA subtitle C Facility Assessment process for identifying solid waste management units at a hazardous waste facility. In addition, EPA accounted for certain existing requirements in the CCR regulations; for example, under the 2015 CCR Rule, facilities were required to compile a history of construction for their existing impoundments. 40 CFR 257.73(c)(1). Facilities were generally able to obtain all information specified in § 257.73(c)(1)(i) through (ix), even for units constructed decades ago. EPA expected that facilities will similarly be able to obtain the information that EPA proposed would be required in the Facility Evaluation Report (FER).

EPA proposed that facilities prepare one report, to be completed in two consecutive steps, with a single deadline. As proposed, the first step would consist of a thorough review of available records in combination with a physical facility inspection and any necessary field work, such as soil sampling, to fill any data gaps from the information obtained from the review of available records. The second step of the facility evaluation would be to generate a FER to document the findings of the facility evaluation. EPA proposed separate deadlines to complete the investigation and to compile the report: a deadline of no later than the effective date of this final rule to initiate the facility evaluation and a deadline of no later than three months after the effective date to complete the FER. Commenters suggested that EPA follow more closely the investigation processes developed under the current RCRA and

CERCLA regulatory programs, that is, RCRA Facility Assessment Guidance, CERCLA all appropriate inquiry (Phase I and Phase II) process. Commenters suggested that separating the information collection requirements from the physical evaluation requirements will provide a more thorough evaluation of existing available information to better inform the physical evaluation to fill data gaps and properly identify CCRMU.

EPA is finalizing the procedures for facility evaluation for identifying CCR management units with a few revisions from the proposal. Owners or operators of any covered facilities will need to conduct a facility evaluation. The purpose of the facility evaluation is to confirm whether any CCRMU containing one ton (or more) exist on-site, and, if so, to delineate the lateral and vertical extent of the unit(s). In developing the final rule EPA relied heavily on the investigation processes EPA developed under the current RCRA and CERCLA regulatory programs, that is, the RCRA subtitle C Facility Assessment process for identifying solid waste management units at a hazardous waste facility, and the CERCLA all appropriate inquiry (Phase I and Phase II) process.

There is a two-step process for a facility evaluation. The first step consists of a thorough review of available records. The second step of the facility evaluation is to conduct a physical facility inspection and any necessary field work, such as soil sampling, to fill any data gaps from the information obtained from the review of available records.

In response to comments, EPA examined facility evaluation processes currently being implemented under RCRA and CERCLA and concurs that creating two separate reports—one for each step of the process—is consistent with these established approaches. EPA believes this two-step approach to facility evaluation will reduce the need for rework and the overall burden for both facility owners or operators and contractors who may be hired to complete this work. Additionally, EPA concludes this approach increases transparency by allowing the public the opportunity to see the work plan developed by the owner or operator.

Therefore, the final rule creates two parts to the facility evaluation—the Part 1 FER includes the results of the available information collection and evaluation. The Part 2 FER addresses data and information gaps through a physical evaluation of the facility. Together, the Part 1 and Part 2 reports will give a complete picture of the

historic use, placement and the current status of CCR at each facility, ultimately identifying any CCRMU containing 1,000 tons or more that will be required to meet the regulatory requirements of this final rule. The FER must also identify those CCRMU containing between one and 1,000 tons, whose regulations is deferred until permitting. See, Unit III.C.2.a.iii of this preamble for further discussion.

a. Final Requirements for Facility Evaluation for CCR Management Units

During the facility evaluation, the owner or operator of a covered facility will need to identify and delineate the extent, laterally and vertically, of any CCRMU containing one ton or more at the facility. To begin, the owner or operator reviews all existing records and documents reasonably and readily available to (including information that is readily and reasonably attainable by) the facility, that contain information regarding any past and present CCR management that resulted in the accumulation of CCR on the ground. Consistent with the definition of a CCRMU, in this context EPA considers the terms “placement” and “receipt” to include situations in which spilled or released CCR has been left on the ground. During this first step, the facility is required to gather and review reasonably and readily available information to identify potential locations of CCR placement at, and to determine preliminary boundaries, lateral and vertical dimensions, and estimates of volume of any CCRMU. Then, at the second step, the facility evaluation requires physical inspection of the facility. Where necessary, the physical inspection must include field investigation activities, such as conducting exploratory soil borings, geophysical assessments, or any other similar physical investigation confirmation activities to establish the location and boundaries of identified CCRMU, and to affirmatively rule out other areas of potential CCR placement at the facility that were identified during the information review. The scope of the facility evaluation is the entire facility as the term is currently defined in 40 CFR 257.53.

As noted, the facility evaluation begins with a review of all reasonably and readily available information regarding past and present placement of CCR at the facility. In this first stage, the facility must gather all reasonably and readily available existing information that may be useful to determine any locations at the facility where CCR may have been placed (including spilled) on the ground. EPA expects that in this

initial phase, the facility will cast a wide net, and collect all reasonably and readily available information that could potentially contain useful information to identify the potential locations of CCR placement at the facility. Finally, to complete the information review, the investigatory process must be documented, any data gaps identified, and plans for conducting a physical inspection of the site to verify locations, boundaries, and volumes of CCR placement at the facility formalized. This information is documented in the Part 1 FER. Then, at Part 2, the physical inspection must be documented. Each step of this process is described in greater detail below.

All recorded observations and data gathered during the facility evaluation, including any conclusions regarding the status of each CCRMU containing one ton or more of CCR at the facility (e.g., delineation of the lateral and vertical extent of each CCRMU and an associated site map that identifies the location of the CCRMU (including GIS coordinates)), must be assembled and incorporated into the FER.

If, after conducting a thorough document review and a visual inspection, the facility has found no evidence of any CCRMU containing one ton or greater, no further testing or sampling is required to conclude that no such CCRMU are present at the facility. Consistent with the proposal, the final rule does not require facilities to conduct widespread site sampling to prove that no such CCRMU exists on-site.

The FER must include a certification to be signed by a P.E. and the owner or operator or an authorized representative. Owners or operators of active or inactive facilities with one or more CCR unit(s) that do not contain any CCRMU would need to complete and place in the operating record a certified FER documenting the steps taken during the facility evaluation to determine the absence of any CCRMU. Both Part 1 and Part 2 of the FER must be placed in the facility operating record (§ 257.105(f)(25)), submitted to the appropriate regulating entity (§ 257.106(f)(24)), and published on the facility's website (§ 257.107(f)(24)). Further, the Agency is requiring that the FER include a certification to be signed by the owner or operator or an authorized representative similar to the certification that is required at § 257.102(e) and (f) for existing units undergoing closure.

i. Facility Evaluation Report Part 1—Information Collection, Data Gap Identification

The first step in the facility evaluation process involves the collection of reasonably and readily available information that contains any detail or information on whether CCR was either routinely and systematically placed on land, or where facility activities otherwise resulted in measurable accumulations of CCR on land. The quality and reliability of the information review will depend greatly on the owner's and operator's ability to collect relevant information. Information reviews may provide misleading results when significant sources of information are not considered. The information that must be gathered during this step should include any documents that contain information relevant to past facility operations and waste disposal processes. By the conclusion of the facility evaluation, EPA expects that the facility would be able to identify the date, locations, durations, and volumes or estimated quantities of CCR placement.

EPA expects that the amount of available written information and documentation that will be available for review during the document review phase may vary by facility. However, the following documents developed as part of complying with 40 CFR part 257, subpart D, which are reasonably and readily available to facilities, would normally contain information that can be useful in identifying CCRMU: inspection reports; history of construction reports; fugitive dust control plans; annual groundwater monitoring and corrective action reports; ASDs; ACM reports or other corrective action reports; and closure plans and reports. Further, there are other sources of reasonably and readily available data that frequently contain information relevant to past facility operations and waste disposal processes, such as facility compliance reports produced for non-CCR programs (e.g., Toxic Substances Control Act [TSCA]/Occupational Safety and Health Administration [OSHA]/National Pollutant Discharge Elimination System [NPDES]/Clean Air Act [CAA]/Clean Water Act [CWA]); permits and permit applications, including NPDES, solid waste, dam safety, and air permits; historical and contemporary monitoring and reporting data, and facility operating logs and maps; and site imagery including available historical aerial photographs, site photographs, topographic maps, and/or engineering or construction drawings, including

drawings for physical facility improvement projects, such as surface water control, water and power infrastructure and utilities, roads, berms, ponds and/or other physical features at the facility. EPA expects that facilities will search all reasonably and readily available records to determine whether they contain information relevant to the potential existence and locations of CCRMU containing at least one ton of CCR.

EPA proposed that as part of this process, owners and operators must further gather information by conducting meetings with current facility personnel familiar with the facility to the extent that those persons are available and have knowledge about past and/or present facility operations. The goal of the meeting process was to help gather any information relevant to the facility operations and waste disposal processes.

Commenters objected that conducting interviews of current or former facility personnel and any available State and local officials is burdensome and will place a significant strain, specifically, on State and local agencies. In addition, commenters stated that interviews with State personnel would put the State personnel in a difficult position to verify compliance on EPA's behalf without receiving State permit approval first.

In this final rule, EPA is not requiring the owner or operator to conduct interviews of current or former facility personnel, nor any available State and local officials. The regulatory language of the final rule only requires documentation of any interviews that are conducted as part of the information collection process. Nevertheless, owner and operator interviews of current or former personnel could well assist in identification of data and information that will be helpful in identifying CCRMU, particularly at those facilities that have not been in operation recently. Consequently, EPA continues to recommend that facilities use good faith efforts to collect information through interviews where current or past personnel are willing to assist in the identification of information or data that will assist the identification of CCRMU.

During this stage, EPA is requiring that a P.E. review the documents and information gathered during the information review process to draw conclusions regarding the existence of CCRMU at the facility. At the end of this stage, EPA expects the facility to identify: (1) Any areas where the facility can affirmatively conclude based on the reasonably and readily available information that one or more CCRMU

containing greater than one ton are present; and (2) Any areas where the reasonably and readily available information indicates that CCR may have been either routinely and systematically placed on the land, or where facility activities otherwise could have resulted in one ton of CCR on the land (*i.e.*, areas where the available information indicates that one or more CCRMU may be present).

Each of the information sources discussed above can provide valuable information that can be used to identify the existence and locations of CCRMU. In addition, some specific examples are provided below:

- Environmental reports for multimedia inspections contain useful information on site management practices, monitoring data, and unit conditions. These reports can also describe comprehensive monitoring evaluations at the site that can indicate where releases or areas of concern exist.

- Multimedia permit and permit applications contain large amounts of information on the facility design, waste management practices including how wastes were disposed of, and the physical characteristics of the surrounding area. These documents can contain old topographic maps, facility figures and drawings, wastestream flow diagrams, and unit and process descriptions.

- If a groundwater monitoring report for a CCR unit indicates that contaminant levels in groundwater monitoring wells are the result of CCRMU rather than the monitored CCR unit, this would need to be further investigated during the facility evaluation process to fully delineate the locations of areas where CCR was placed on the ground, including the size of the unit and other related unit details.

- Similarly, a review of aerial photographs can identify potential CCRMU at the facility at locations that have become overgrown or otherwise hidden over time. When used in conjunction with USGS topographic maps, owners or operators can look for evidence that may be indicative of placement of CCR on the ground. As an example, if aerial photographs and USGS topographic maps indicate the existence of a pond or dam system at the site, this may be enough to warrant further investigation of available documents and may require field investigation depending on the strength of information to determine if the changes were made to allow placement of CCR on the ground.

One of the primary purposes of the information review is to provide an understanding of the CCR management

activities at the facility, allowing for subsequent observations during the physical site inspection to be focused to the greatest extent practical. While information obtained during the review may be insufficient to support affirmative conclusions regarding the existence or non-existence of a CCRMU, based on the information available at most facilities, EPA expects that it will be possible to determine which areas at the facility would need to be inspected, and the type of data that would be needed to draw definitive conclusions. The Agency expects that the information gathered in the information review will be relevant to determining the areas to be inspected during the physical (visual) site inspection. Further, the information gathered during the information review would be used to support any necessary field activities.

EPA notes that the amount of available written information and documentation that will be available for review during the document review phase will vary by facility. Commenters confirmed this expectation by noting that many of the facilities subject to this final rule may have ceased operations years, and sometimes decades, ago. They also stated that record retention and storage locations may be difficult to determine and require some effort to access for some facilities. Based on past experience, EPA continues to believe that sufficient information is reasonably and readily available to allow facilities to obtain the information required under the FER. For example, as discussed in the proposal, under the 2015 CCR Rule facilities were generally able to obtain all of the information needed to compile a history of construction for their existing impoundments, even for units constructed decades ago. See, 40 CFR 257.73(c)(1). Nevertheless, owners or operators are required to compile this information only to the extent it is reasonably and readily available. EPA acknowledges that there may be certain information or data that may be unknown or lost. EPA intends that facilities provide relevant information only if documentation exists or if it is obtained during the physical site inspection. EPA does not expect owners or operators to provide anecdotal or speculative information regarding the presence or absence of CCRMU. However, if data gaps exist, owners or operators subject to these provisions may need to collect additional field data to fill the gaps.

The Part 1 FER must also include a narrative that documents the data reviewed as part of the facility evaluation process, and that lists all of

the data and information reviewed that indicates the presence or absence of CCR management units at the facility. Finally, the FER must identify any data gaps, and provide a plan for remedying all identified data gaps through a physical examination of the facility, including any field or laboratory work needed to remedy data gaps identified in the narrative in the Part 1 FER record. The plan must include the major milestones needed to fill each identified data gaps (*e.g.*, a physical examination of the facility, sampling of media, measurements of CCR concentrations or physical presence, delineation of CCRMU) and dates to complete the needed tasks.

EPA is finalizing that Part 1 FER must contain the following: (1) The name and address of the person(s) owning and operating the facility; the unit name associated with any regulated CCR unit and CCRMU containing one ton or more of CCR at the facility; and the identification number of each CCR unit and CCRMU if any have been assigned by the State or by the owner; (2) The location of any CCRMU identified on the most recent U.S. Geological Survey (USGS) 7.5-minute or 15-minute topographic quadrangle map, or a topographic map of equivalent scale if a USGS map is not available, with the location of each regulated CCR unit at the facility identified. The location of each regulated CCR unit at the facility must also be identified in the same manner; (3) A statement of the purpose(s) for which each CCRMU at the facility is or was being used; (4) A description of the physical and engineering properties of the foundation and abutment materials on which each CCRMU is constructed; (5) A discussion of any known spills or releases of CCR, including any associated remediation activities, from each CCRMU and whether the spills or releases were reported to State or Federal agencies; (6) Any record or knowledge of structural instability of each CCRMU; (7) Any record or knowledge of groundwater contamination associated or potentially associated with each CCRMU; (8) The size of each CCRMU, including the general lateral and vertical dimensions and an estimate of the volume of waste contained within the unit; (9) Identification of all types of CCR in each CCRMU at the facility; (10) A narrative description of any closure activities that have occurred, including any applicable engineering drawings or reports; (11) A narrative that documents the data reviewed as part of the facility evaluation process, and that lists all data and information indication the

presences or absence of CCRMU at the facility; (12) Any supporting information used to identify and assess CCRMU at the facility, including but not limited to any construction diagrams, engineering drawings, permit documents, wastestream flow diagrams, aerial photographs, satellite images, historical facility maps, any field or analytical data, groundwater monitoring data or reports, inspection reports, documentation of interviews with current or former facility workers, and other documents or sources of information used to identify and assess CCRMU at the facility; (13) narrative description of any data gaps, for information in paragraphs (c)(i) through (xiii) of this section, not available in existing information collection records and a plan for remedying identified data gaps through a physical examination of the facility, including any field or laboratory work needed to remedy data gaps in the FER Part 1 record. The plan must include the major milestones needed to fill the identified data gaps (e.g., a physical examination of the facility, sampling of media, measurements of CCR concentrations in and around the unit or physical presence, delineation of CCR management unit(s)) and dates to complete such needed tasks. Also, as necessary and timely, any updates to data gap remedy plans must be added to the public record during the FER Part 1. In addition, the FER is required to include a certification from a P.E. stating that the FER meets the requirements at § 257.75(c).

ii. Facility Evaluation Report Part 2—Physical Evaluation and Remedy of Data Gaps

A facility must conduct a physical site inspection of the entire facility in all cases. The purpose of the physical site inspection is to visually inspect the entire facility for evidence of CCR placement on the land, ensure that all CCRMU containing one ton or more of CCR have been identified, and fill any data gaps identified during the initial information evaluation. To that end, EPA is finalizing without revision the requirement that the physical site inspection must consist of a visual inspection of the entire facility to look for evidence that CCR is currently being managed on the land. At a minimum, a facility is required to visually inspect the site to confirm the information obtained from the information review phase and to identify any anomalies that warrant further investigation, such as an unnatural topographic rise or depression or an area where unspecified liquid waste was applied over several

years. In addition, the facility is required to conduct any field work, such as soil sampling, necessary to determine whether areas that had been identified as a potential CCRMU in fact contain at least one ton of CCR and to obtain the information required for the FER.

The complexity of past and current facility operations, combined with the amount of data that was available for review during the information review phase would impact how extensive the facility inspection must be. For example, if facility records are sparse or contain data gaps, the Agency expects that the facility inspection would be more thorough than in situations where detailed records exist. However, even in situations where detailed facility records exist, the facility must still conduct a visual inspection to ensure that all CCRMU containing one ton or more of CCR have been identified, whether or not those areas were identified in the initial document review. In addition, EPA expects that in most cases, a facility will need to conduct some sampling or other fieldwork to obtain all the information required for the FER. For example, even if the facility had as-built engineering drawings for an old landfill, EPA expects that in some cases the facility may still need to conduct some sampling to establish the lateral and vertical dimensions of the CCRMU.

A facility can use a variety of visual means to inspect the entire site (e.g., physically walking the site, using motorized vehicles to inspect the site, using drone video footage to inspect the site) to confirm the information obtained from the information review in Part 1 and to identify any anomalies that warrant further investigation, such as an unnatural topographic rise or depression or an area where unspecified liquid waste was applied over several years. EPA recommends that any sampling be conducted using standard industry methods, including any relevant standards and methodologies established by State environmental agencies. The FER must also include a discussion of quality assurance procedures, sampling equipment handling, sample collection, analytical methods, and data reporting.

If, after conducting a thorough document review and a visual inspection, the facility has found no evidence of any CCRMU, no further testing or sampling would be required to conclude that there is no CCRMU present at the facility. EPA is not requiring facilities to conduct widespread site sampling to prove that no CCRMU exists on-site. All recorded

observations and data gathered during the facility evaluation, including any conclusions regarding the status of each CCRMU at the facility, must be assembled and incorporated into a FER, which is described in detail below.

EPA is finalizing that Part 2 FER must contain the following: (1) The name and address of the person(s) owning and operating the facility; the unit name associated with any regulated CCR unit and CCRMU containing one ton or more of CCR at the facility; and the identification number of each CCR unit and CCRMU if any have been assigned by the State; (2) The location of any CCRMU containing one ton or greater identified on the most recent U.S. Geological Survey (USGS) 7.5-minute or 15-minute topographic quadrangle map, or a topographic map of equivalent scale if a USGS map is not available. The location of each regulated CCR unit at the facility must also be identified in the same manner; (3) A statement of the purpose(s) for which each CCRMU at the facility is or was being used; (4) A description of the physical and engineering properties of the foundation and abutment materials on which each CCRMU was constructed; (5) Any further evidence of known spills or releases of CCR, including any associated remediation activities, of CCR from each CCRMU and whether the spills or releases were reported to State or Federal agencies; (6) Any further evidence of structural instability of each CCRMU; (7) Any further evidence of groundwater contamination associated or potentially associated with each CCRMU; (8) The size of each CCRMU, including the general lateral and vertical dimensions and an estimate of the volume of CCR contained within the unit; (9) Identification of the types of CCR in each CCRMU; (10) A narrative description of any closure activities that have occurred, including any applicable engineering drawings or reports; (11) A narrative that documents the nature and extent of field oversight activities and data reviewed as part of the facility evaluation process, and that lists all data and information that was reviewed indicating the presence or absence of CCRMU at the facility; and (12) Any additional supporting information used to identify and assess CCRMU at the facility, including but not limited to any construction diagrams, engineering drawings, permit documents, wastestream flow diagrams, aerial photographs, satellite images, historical facility maps, any field or analytical data, groundwater monitoring data or reports, inspection reports, documentation of interviews with

current or former facility workers, and other documents or sources of information used to identify and assess CCRMU at the facility. In addition, the FER is required to include a certification from a P.E. stating that the FER meets the requirements at § 257.75(c).

In addition to the information described in numbers (1)-(12) in the preceding paragraph, Part 2 of the FER must include a narrative that documents the nature and extent of field oversight activities and data reviewed as part of the facility evaluation process, and that lists all data and information reviewed that indicated the absence or presence of any CCRMU containing one ton or more of CCR at the facility. The narrative must also discuss how each data gap identified in Part 1 was addressed. As many commenters stated, the physical examination and any field work will require the hiring of specialized contractors. EPA understands this level of field and laboratory work will require a detailed work plan, and EPA expects the FER Part 1 data gap remedy plan to reflect this detail, including milestones and time frames for completion. EPA also anticipates that as field activities commence, plans to address data gaps may change and/or additional field work may be necessary based on ongoing discoveries. In these cases, the owner or operators will need to update the plans accordingly and update the publicly available information in the Part 1 or Part 2 FER, depending on the timing of the update.

b. Certification of Facility Evaluation Report—Part 1 and Part 2

The Agency proposed to require that the FER include a certification from a P.E. stating that the FER meets the requirements at § 257.75(c). Further, the Agency proposed to require that the FER include a certification to be signed by the owner or operator or an authorized representative similar to the certification that is required at § 257.102(e) and § 257.102(f) for existing units undergoing closure. Commenters raised concerns that the rules were not sufficiently objective or technically precise for a P.E. to be able to certify. One commenter raised that EPA has indicated that no facility has successfully implemented the 2015 CCR Rule's requirements to date, even though facilities have secured the certification of Qualified Professional Engineers as prescribed by the 2015 CCR Rule.

These commenters have misunderstood the purpose and role of the P.E. in the FER reports. The P.E. does not make final determinations; the

role of the P.E. is to act as an engineer in information collection, data gap identification, physical site inspection, and remedy of data gaps and certify accordingly. As stated in the preamble of the 2015 CCR Rule, EPA reasoned that the requirement for a P.E. maintains the most important components of any certification requirement: (1) That the engineer be qualified to perform the task based on training and experience; and (2) that she or he be a professional engineer licensed to practice engineering under the title Professional Engineer which requires following a code of ethics with the potential of losing his/her license for negligence. The final rule requirements are sufficient for an P.E. to implement the final rule and follow industry standards.

Other commenters raised that the P.E. certification requirement is overly burdensome and will extend the timeframe to complete the facility evaluation. EPA has re-structured the process for the FER by extending the time frame and separated the FER into two parts with separate and adequate time frames to prepare the reports. When determining the new compliance deadlines, EPA considered the shortages and backlogs of qualified contractors as well as the increased strain on those contractors.

Another commenter asked for EPA to modify or add language to acknowledge the good faith and due diligence efforts of a P.E., especially when considering the age and nature of the potential CCRMUs. EPA does not agree with this suggestion. As discussed above, EPA discussed in the preamble of the 2015 CCR Rule that the P.E. follows a code of ethics with the potential of losing their license for negligence. As stated in the 2015 CCR Rule preamble, the Agency maintains that an engineer is able to give fair and technical review because of the oversight programs established by the State licensing boards that will subject the professional engineer to penalties, including the loss of license and potential fines if certifications are provided when the facts do not warrant it.

EPA does not agree with suggestions to modify the certification and therefore we are finalizing the certification language as proposed.

c. Facility Evaluation Reports Deadlines

The majority of the comments related to the timing and due date of the FER report stated that EPA had not allowed sufficient time to gather the required information and conduct a physical inspection of the facility. Comments cited many concerns with the proposed time frame, *i.e.*, the time frame was too

short to complete all the tasks required, for the FER, *e.g.*, the difficulty in collecting historic information/data that may or may not be accessible at the facility or place of off-site records retention, the possible extensive volume of information, reports and/or data that owner or operators would need to review, the possible iterative nature of field work and sampling, the impact of seasonal disruptions to field work, the lack of qualified field personnel and the timing to acquire their services through contracts. Commenters suggested allowing significantly more time to complete individual aspects of the FER requirements.

EPA has reviewed the information provided by commenters citing the shortages and backlogs of qualified contractors, increased strain on those contractors related to the number of CCR units complying with the CCR rule simultaneously, difficulty accessing and reviewing historical documentation, potential seasonal disruptions, and time needed to perform quality control and quality assurance, and considers it to be persuasive. After considering these factors EPA has extended the time frame and separated the FER into two parts with separate and adequate time frames to prepare the reports.

The FER Part 1 is required to be prepared and placed in the operating record and posted on the facility's website, pursuant to § 257.105(f) no later than 15 months after the effective date of the final rule. This time frame was determined based on suggestions from commenters as to the time necessary to conduct a thorough review of historic records, and, if necessary, conduct interviews of those with facility and site knowledge, and by EPA further considering the time needed under RCRA Subtitle C and CERCLA to do similar reviews for historic sites.

The FER Part 2 is required to be prepared and included in the public record no later than 27 months after the effective date of the final rule. EPA established this time frame by also considering suggestions from commenters, who gave examples of timelines to hire contractors and conduct site work, as well as EPA's own experience and timelines at RCRA Subtitle C and CERCLA sites for conducting facility investigations. EPA believes the provided limited additional time is adequate to perform all necessary tasks under the FER, Part 1 and Part 2 respectively.

After completing the information gathering part of the facility evaluation process, owners or operators of covered facilities must compile and place in the operating record information pertaining

to every CCRMU containing one ton or more of CCR located at the facility no later than the deadline identified below. Both Part 1 and Part 2 of the FER must be posted to the facility's CCR publicly accessible internet site within 30 days of that date. In developing the list of items to be included in the FER, the Agency examined certain requirements from existing regulations for History of Construction reports that must be generated for existing CCR surface impoundments at § 257.73(c)(1) as well as other requirements necessary to provide basic information about each CCRMU containing one ton or more of CCR at the facility.

After gathering the information required for the FER Part 1 (*i.e.*, not including a physical evaluation of the facility), the owner or operator must prepare a Part 1 FER by placing the information required in the facility's operating record as required by § 257.105(f)(25).

4. Applicable Existing CCR Requirements for CCR Management Units and Compliance Deadlines

EPA proposed that in addition to the facility evaluation requirements discussed in Unit III.C.3 of this preamble, owners or operators of a CCR facility comply with the existing requirements in part 257 for fugitive dust, groundwater monitoring, corrective action, closure, post-closure care, recordkeeping, notification, and internet posting. As explained in the preamble of the proposed rule, these requirements are intended to address the risks posed by any existing releases of CCR or CCR constituents to the groundwater, regardless of when the CCR was placed in the units and prevent future releases. The other existing requirements in 40 CFR part 257, subpart D are not necessary for CCRMU. For example, (1) since CCRMU should not contain sufficient liquids to create a hydraulic head or to otherwise cause the conditions that might lead to a structural failure, the structural stability requirements are not appropriate; (2) similar to legacy CCR surface impoundments, since CCRMU are existing units and will be required to close, the location restriction and liner design requirements would not be appropriate. EPA proposed that the fugitive dust, groundwater monitoring, corrective action, closure, post-closure care, recordkeeping, notification, and internet posting requirements apply to all CCRMU at active facilities and at inactive facilities with one or more legacy CCR surface impoundment.

Several commenters generally supported the regulatory approach,

although a commenter suggested that CCRMU be subject to more existing CCR regulations, namely the location restrictions at §§ 257.60 through 257.64, the liner design criteria at § 257.71, and the structural stability requirements at § 257.73. This commenter stated that these requirements were necessary to protect human health and the environment from the risk of failure posed by poorly constructed and sited CCRMU and to provide information "critical" to developing unit closure plans and any necessary corrective action.

EPA disagrees that generally applying location restrictions, the structural stability requirements, and the liner design criteria to CCRMU would be appropriate. First, as explained in the proposed rule, the structural stability criteria are more appropriate for operational units and those units that maintain a hydraulic head. Second, the consequence of failing to comply with the location restrictions and liner design criteria requirements is closure by a specific date. 40 CFR 257.101(a) through (b)(1). Except for those situations described in Unit III.C.4.e (*i.e.*, deferral for CCRMU beneath critical infrastructure and deferral for CCRMU closed under a regulatory authority), because CCRMU are not operational CCR units and will in any event be required to close, the consequence for failure to comply with location restrictions or the liner design criteria (*i.e.*, ceased receipt of waste and closure) is moot. Additionally, the commenter failed to identify any information necessary for conducting corrective action pursuant to §§ 257.96 through 257.98 or closure in accordance with §§ 257.101 and 257.102 that would be gained by requiring CCRMU to comply with the location restrictions or liner design criteria that would not be gained by compliance with the facility evaluation and groundwater monitoring requirements.

Other commenters opposed the regulation of CCRMU holistically, citing lack of authority or lack of demonstrated risk to human health or the environment from CCRMU. Other commenters opposed EPA's proposal to apply specific existing requirements to CCRMU (*i.e.*, groundwater monitoring, corrective action, closure). Several of the commenters that opposed requiring CCRMU to comply with the existing regulations stated that applying a "one-size-fits-all" approach to CCRMU was not appropriate due to the variety of units that would be captured in the definition of CCRMU and suggested the EPA wait to regulate these units until site-specific requirements could be

developed (*i.e.*, permitting programs). Comments regarding lack of authority or lack of demonstrated risk from CCRMU are summarized and addressed in Units III.A and III.C.2.a.i of this preamble, respectively. Comments about the applicability of specific existing requirements are described and responded to in later portions of this unit (Unit III.C.4). Regarding comments about the existing regulations being what commenters characterized as a "one-size-fits-all" approach to the variety of CCR units captured under the definition of CCRMU, EPA disagrees that the existing regulations are not holistically appropriate to apply to CCRMU or to address the potential risk from these units. Furthermore, commenters did not provide suggestions on how to regulate these units under the existing regulatory framework (*i.e.*, self-implementing rule) and EPA, as explained in Units III.A and III.C.1, finds the risks posed by these units to be not only credible but significant enough to warrant regulation at this time (*i.e.*, under the self-implementing rule as opposed to waiting until the Federal permitting program is established).

In response to comments and for the reasons laid out below, EPA is finalizing the requirements for CCRMU to comply with fugitive dust, groundwater monitoring, corrective action, closure, post-closure care, recordkeeping, notification, and internet posting requirements. These requirements apply to all CCRMU at active CCR facilities, at inactive facilities with one or more legacy CCR surface impoundments, and at active facilities that ceased placement of CCR in onsite CCR units before October 19, 2015, regardless of how or when the CCR was placed in the CCRMU. These issues are discussed in more detail in this Unit of the preamble.

a. Compliance Deadlines for CCR Management Units

EPA proposed compliance deadlines for CCRMU that closely aligned to the proposed compliance deadlines for legacy CCR surface impoundments. The proposed rule explained that the 2015 CCR Rule compliance deadlines were based on the amount of time determined to be necessary to implement the requirements and the proposed compliance dates for legacy CCR surface impoundments, and CCRMU were determined using the same approach. The proposed rule further explained that some factors considered in determining the 2015 CCR Rule compliance deadlines were not relevant for CCRMU, such as the need to coordinate compliance deadlines with

the then recently promulgated ELG rule. In addition, EPA anticipated most owners or operators of CCRMU would already be familiar with the existing regulations, and therefore most of the proposed requirements for CCRMU. Consequently, EPA proposed generally expedited deadlines, as compared to the 2015 CCR Rule deadlines, based on the expected shortest average amount of time needed to complete the necessary activities to meet the requirements. In the proposed rule, EPA requested comment on the proposed compliance deadlines and the feasibility of meeting the proposed compliance time frames for CCRMU.

EPA received numerous comments regarding the proposed compliance deadlines. Several commenters expressed support for the proposed compliance deadlines for CCRMU. Generally, these commenters stated that expedited compliance was appropriate due to significant risk posed by these units, the likelihood that these units are actively contaminating groundwater, and the urgent need for corrective action to address that contamination for the protection of human health and the environment. Some of these commenters echoed the proposed rule, stating that owners' or operators' familiarity with the existing requirements, along with the fact that these units are no longer in use and therefore would not need time to cease receipt of waste, further justified the expedited deadlines.

Many other commenters stated the proposed compliance deadlines were infeasible and should, at a minimum, allow as much time for compliance as the 2015 CCR Rule deadlines, although several commenters expressed that even the 2015 CCR Rule deadlines were inadequate, and that the insufficient time frames were likely a factor in the gap between EPA's expectations and facilities' good faith efforts and utilization of best practices in developing groundwater monitoring networks, sampling and analysis plans, corrective action programs, and closure plans. Commenters pointed to several factors that they believed EPA did not fully incorporate into the proposed deadline calculations that make compliance with the proposed deadlines infeasible: EPA's grossly underestimated number of CCRMU; the large number of CCR units (*i.e.*, existing CCR units, legacy CCR surface impoundments, CCRMU) competing for limited resources to meet overlapping compliance deadlines; the limited number of qualified contractors available to conduct necessary activities to reach the compliance deadlines; the

nationwide labor shortage exacerbated by impacts from the COVID-19 pandemic; limited existing alternative disposal options; overlapping regulatory requirements (*e.g.*, State drilling permits, timing restrictions related to protected habitats, State CCR permits, Consent Decrees/Orders); seasonality impacts in different regions across the nation; and accessibility and completeness, or lack thereof, of historical documentation and information. One commenter provided specific information regarding typical delays experienced during the implementation of the 2015 CCR Rule caused by third-party availability and backlogs: two to four weeks for contractor mobilization; two to six weeks for site clearing; two to three weeks for surveys; three to 12 weeks for environmental drillers; and three to four weeks for laboratory analyses. These commenters also said EPA grossly underestimated the amount of time needed to hire a contractor, locate and review historical information, access historical or heavily vegetated portions of facilities, characterize and delineate a site, comply with the groundwater monitoring requirements, and conduct quality control or quality assurance on data and reports. Several of these commenters expressed the belief that the proposed deadlines would result in unintentional non-compliance despite facilities' best efforts to comply due to the constraints listed above. Finally, a few commenters suggested EPA create alternative deadlines or mechanisms for extensions based on site-specific characteristics.

In response to comments, EPA reevaluated the compliance deadlines for CCRMU. EPA reconsidered the impact of the following on the amount of time facilities needed to complete the activities involved in meeting the requirements: the potential size of the CCRMU universe; accessibility and abundance, or lack thereof, of historical documentation; seasonality; clearing restrictions and required local and State approvals to clear vegetation or drill wells; need to coordinate with local or State regulatory authorities; existing disposal options; impact of the national labor shortage and contractor and laboratory backlogs; and the strain on limited resources from overlapping compliance deadlines for legacy CCR surface impoundments, existing units (*i.e.*, groundwater monitoring, closure, and post-closure care), and CCRMU. Overall, EPA found the information provided regarding the infeasibility of the proposed deadlines convincing. Specifically, EPA acknowledges the

potential for an underestimation of the CCRMU universe given the number of comments received regarding non-containerized CCR historically being spread across facilities. Additionally, EPA agrees that the shortage of qualified contractors and laboratory resources has persisted, if not increased, since the 2015 CCR Rule and that the increasing demand on these finite resources from new and existing CCR units, legacy CCR surface impoundments, and CCRMU complying with overlapping requirement deadlines will likely result in additional delays. EPA acknowledges that the proposed deadlines did not adequately account for those nationwide impacts of seasonality and extreme weather events; necessary coordination with outside parties (*e.g.*, State agencies, local governments); locating disposal capacity for those units closing by removal; the need to comply with overlapping regulatory requirements, such as State drilling permits or timing restrictions related to protected habitats; or necessary quality assurance and quality control in calculating the proposed deadlines. Furthermore, as detailed in Unit III.C.3.c, EPA recognizes that the proposed CCRMU deadlines did not provide sufficient time for the completion of the FER which serves as the prerequisite requirement for all other CCRMU requirements. Additionally, the concurrent deadlines for legacy CCR surface impoundments and CCRMU did not allow for inactive facilities to first determine if there is a legacy CCR surface impoundment onsite before complying with the CCRMU regulations. Therefore, as detailed in Units III.C.3 and III.C.4.c through e, EPA extended the deadlines for CCRMU to provide: (1) At least as much time facilities had to come into compliance with the 2015 CCR Rule, (2) Sufficient time for owners or operators to complete a robust FER, and (3) Additional time such that the deadlines for legacy CCR surface impoundment do not coincide with the CCRMU deadlines, with the exception of the requirement to establish a CCR website and the completion of the history of construction (for legacy CCR surface impoundments) and the FER Part 1 (for CCRMU) which can be conducted concurrently. These extended deadlines for CCRMU will mitigate factors mentioned by commenters that convinced EPA the proposed deadlines would be infeasible for CCRMU. Overall, most of the comments EPA received supported deadlines that allowed at least as much time as EPA originally provided in the 2015 CCR Rule.

Note that all deadlines herein are framed by reference to the effective date of the rule; the final rule will be effective six months after publication of

the final rule. Accordingly, facilities will have an additional six months beyond the deadlines to come into compliance. The Agency has included a

document in the docket for this rule that summarizes the finalized compliance deadlines.¹⁴²

TABLE 2—FINAL COMPLIANCE TIME FRAMES FOR CCRMU

40 CFR Part 257, Subpart D requirement	Description of requirement to be completed	Deadline (months after effective date of the final rule)	Date
Internet Posting (§ 257.107)	Establish CCR website	15	Monday, February 9, 2026.
Facility Evaluation Report (§ 257.75).	Complete the Facility Evaluation Report Part 1 ..	15	Monday, February 9, 2026.
Facility Evaluation Report (§ 257.75).	Complete the Facility Evaluation Report Part 2 ..	27	Monday, February 8, 2027.
GWMCA (§ 257.91)	Install the groundwater monitoring system	42	Monday, May 8, 2028.
GWMCA (§ 257.93)	Develop the groundwater sampling and analysis program.	42	Monday, May 8, 2028.
GWMCA (§§ 257.90–257.95)	Initiate the detection monitoring and assessment monitoring. Begin evaluating the groundwater monitoring data for SSLs over background levels and SSLs over GWPS.	42	Monday, May 8, 2028.
GWMCA (§ 257.90(e))	Complete the initial annual GWMCA report	January 31, 2029	January 31, 2029.
Closure (§ 257.102)	Prepare written closure plan	48	Wednesday, November 8, 2028.
Post-Closure Care (§ 257.104)	Prepare written post-closure care plan	48	Wednesday, November 8, 2028.
Closure and Post-Closure Care (§ 257.101).	Initiate closure	54	Tuesday, May 8, 2029.

b. Fugitive Dust Requirements for CCR Management Units

The air criteria in the existing regulations address the pollution caused by windblown dust by requiring the owners or operators of CCR units to minimize CCR from becoming airborne at the facility. 40 CFR 257.80. These requirements apply to the entire facility, which means that the owner or operator is required to minimize CCR fugitive dust originating not only from the CCR unit, but also from roads and other CCR management and material handling activities at the facility. Consequently, under the proposal, CCRMU would already be covered by the fugitive dust requirements in § 257.80 because CCRMU are located at facilities with a CCR unit. EPA therefore only proposed to make those changes to the fugitive dust requirements in § 257.80 that are necessary to make clear that these requirements also apply to CCRMU. Specifically, EPA proposed to amend the regulations to add “CCRMU” to the list of units subject to the requirements under § 257.80 and associated provisions under §§ 257.105 through 257.107. Additionally, EPA solicited comments on amending § 257.80(b)(6) to include a deadline for facilities to amend the fugitive dust control plan no later than 30 days following a triggering event, such as the closure of a CCRMU

or change in facility or CCR unit operations.

No commenters raised concern about requiring CCRMU to comply with the existing requirements in § 257.80. EPA is therefore finalizing this provision without revision.

One commenter supported creating a deadline for the amendment of the fugitive dust plan no later than 30 days following a triggering event. This commenter went on to suggest that EPA further revise § 257.80 to require owners or operators to notify potentially impacted populations including residents living within three miles of the plant, populations potentially impacted by transportation of CCR, and residents living near disposal areas where CCR will be off-loaded and disposed and to require air monitoring at excavation sites and plant boundaries. The commenter was not clear on the circumstances in which owners or operators would notify potentially impacted population or what these populations would be notified of and did not provide a factual basis to support the need for air monitoring at regulated CCR units. Therefore, EPA is therefore only finalizing an amendment to § 257.80(b)(6) to require owners or operators to amend the fugitive dust plan no later than 30 days following a triggering event, such as the closure of

a CCR unit or change in facility or CCR unit operations.

c. Groundwater Monitoring and Corrective Action Requirements for CCR Management Units

EPA proposed to require CCRMU to comply with the existing groundwater monitoring and corrective action criteria in 40 CFR 257.90 through 257.98, with one revision, to require sampling and analysis of constituents listed in Appendix IV at the same time as those listed in Appendix III. As explained in the proposed rule at 88 FR 32003, §§ 257.90 through 257.95 require owners or operators of a CCR unit to install a system of monitoring wells, specify procedures for sampling these wells, and set forth methods for analyzing the groundwater data collected to detect hazardous constituents (e.g., toxic metals) and other monitoring parameters (e.g., pH, total dissolved solids) released from the units. If the groundwater monitoring required in § 257.95, demonstrates an exceedance of the groundwater protection standards for constituents identified in Appendix IV of part 257, corrective action is required as laid out in §§ 257.96 through 257.98. These requirements apply until closure in accordance with § 257.102(c) is

¹⁴² A document “Final Rule Compliance Deadlines for CCR Management Units. April 2024.” is available in the docket for this action.

complete or the post-closure care period of the CCRMU ends.

Several commenters expressed support for requiring CCRMU to comply with these groundwater monitoring and corrective action requirements, stating CCRMU can and have caused groundwater contamination. Some commenters suggested additional requirements be added to those in §§ 257.90 through 257.98, including a mandate to test groundwater quality outside the boundary of the facility and make those results public, a deadline for the completion of the selection of remedy required by § 257.97, and a prohibition against using intrawell groundwater data comparisons at CCRMU. However, other commenters stated that applying the existing groundwater monitoring and corrective action requirements to CCRMU is not appropriate and suggested that instead EPA incorporate flexibility into the CCRMU regulations by providing for alternative groundwater monitoring standards and site-specific risk-based corrective action into the CCR regulations. These commenters suggested groundwater monitoring standards that allow owners or operators to complete evaluations to determine if Appendix IV constituents are above the GWPS instead of conducting monitoring, allowing a site-wide groundwater network, and exempting units from groundwater monitoring when owners or operators are able to demonstrate through site-specific risk assessments there is no probable risk to groundwater. These commenters said these alternative approaches are necessary to address the overburdensome nature of compliance with groundwater monitoring and corrective action when a unit has already completed closure under a State authority and when units are completing groundwater monitoring under a State or other Federal program. Some of these commenters stated that EPA does not have the record to demonstrate potential risk from these units to justify requiring groundwater monitoring and corrective action as laid out in the existing regulations, especially for units that have already completed closure under a State authority. Other commenters said that flexibility is needed due to the diversity of CCR units captured in the definition of CCRMU, age of some of the units, and overlapping State requirements.

EPA further proposed two deadlines for the groundwater monitoring requirements, as opposed to the single deadline in the 2015 CCR Rule. EPA received numerous comments on EPA's proposal to split the single deadline for

groundwater monitoring requirements contained within the 2015 CCR Rule (24 months from the effective date of the final 2015 rule) into two separate deadlines (six months from the effective date of the final rule for the installation of the groundwater monitoring network and development of the groundwater sampling and analysis plan and 24 months from the effective date of the final rule for the initiation of the combined detection and assessment monitoring). A few commenters expressed support of the two separate deadlines for groundwater monitoring requirements, stating it increased accountability and ensured owners or operators were not unnecessarily delaying the installation of the groundwater monitoring system. However, overall, commenters stated that the groundwater monitoring requirements should have a single deadline as the separate deadlines made compliance with the rule infeasible. Several commenters said the proposed split deadlines eliminated the flexibility necessary for compliance that was contained within the 2015 CCR Rule's single deadline. Those commenters went on to say the single deadline allowed facilities to accommodate for delays associated with factors outside their control, such as third-party availability, weather, and required permits or approvals, by making schedule adjustments necessary to achieve compliance (*e.g.*, expedite the development of the sampling plan in the case of delays with the well installation). Other commenters said the proposed two deadlines were unnecessarily prescriptive. One commenter pointed out that the proposed rule contained no deliverables to verify compliance for the installation of wells or the development of the sampling and analysis plan.

As explained in the proposed rule, the existing groundwater monitoring and corrective action requirements are essentially the same requirements that have been applied to both hazardous waste and municipal solid waste disposal units for decades, and with the one exception discussed below, there is nothing about CCRMU that makes them distinct enough to warrant separate groundwater monitoring requirements from other CCR units. No commenter provided any factual basis for treating CCRMU differently than all of the other units that currently comply with the same groundwater monitoring and corrective action requirements. Specifically, for commenters who requested alternative groundwater monitoring requirements to allow site-

wide or property-boundary groundwater monitoring due to the potential presence of CCRMU across the facility, the commenters failed to explain how the provisions at § 257.91(d), which allow for multiunit groundwater monitoring systems fail to address their concern.

Regarding the request for alternative groundwater monitoring criteria to mitigate the inappropriateness of requiring compliance with the CCR groundwater monitoring and corrective action requirements when the CCRMU has already completed closure under a State authority or when the CCRMU is already subject to another State or Federal groundwater monitoring program, the commenters did not provide any factual or specific information to support the conclusions that groundwater monitoring and corrective action is not appropriate for all CCRMU that have completed closure under a State authority or that utilizing or augmenting an existing groundwater monitoring network that may have been required as part of the State closure or other groundwater monitoring program would be infeasible or inappropriate. Furthermore, as explained in Unit III.C.4.e, EPA received comments regarding State closures during which no groundwater monitoring was required, thereby highlighting the need for groundwater monitoring and corrective action, if necessary, even in situations in which closure has been completed under a State authority.

For those commenters requesting that EPA adopt "risk-based groundwater monitoring and corrective action" into the requirements, EPA notes that the commenters have provided no further explanation of what requirements in the existing regulations they wanted EPA to revise, what the revisions should accomplish, or any factual basis for why they are necessary or appropriate. As a general matter EPA considers that the corrective action regulations in §§ 257.95 through 257.98 do currently require facilities to tailor remedies to address the risks to human health and the environment, based on the conditions at the site. It is unclear what more the commenters are seeking. Accordingly, EPA is finalizing the proposal that CCRMU comply with the existing groundwater monitoring and corrective action requirements with one modification, combined detection and assessment monitoring.

However, EPA agrees that having a single deadline for groundwater monitoring requirements as opposed to two deadlines allows flexibility to complete tasks, such as installing groundwater wells and collecting

independent samples, that is necessary for compliance with a nationwide rule. The activities involved in achieving compliance with the groundwater monitoring requirements (*i.e.*, drilling wells, collecting samples, receiving lab results) are more susceptible to factors outside a facility's control, such as extreme weather events, shortages of qualified contractors, and permitting or approval delays, and therefore, warrant greater flexibility. Additionally, activities can be restricted dependent on the time of year and the location of the facility (*e.g.*, due to seasonality, protected species, clearing restrictions). Because the groundwater monitoring requirements build upon each other, EPA must ensure that facilities nationwide are reasonably able to achieve regulatory compliance by the deadline. Utilizing a single deadline for the groundwater monitoring requirements allows facilities to make reasonable accommodations for regional factors in a way the proposed deadlines do not, while still maintaining the same level of protection for human health and the environment. Furthermore, EPA agrees that the proposed rule does not have a clear mechanism for facilities to prove compliance or for interested parties to verify compliance with the separate deadlines for the installation of the groundwater monitoring network and the development of the groundwater sampling and analysis plan.

As stated in Unit III.C.4.a, EPA recognizes that the proposed CCRMU deadlines did not provide sufficient time for the completion of the FER and therefore extended the deadline for the completion of the FER by 24 months as detailed in Unit III.C.3.c. The FER informs the owner or operator of the presence or absence of CCRMU at the facility, which is vital information for the completion of the groundwater monitoring system requirements (*i.e.*, design and installation of the groundwater monitoring system). As such, the deadline for the groundwater monitoring requirements must be extended as well to allow owners or operators time to locate CCRMU as part of the FER. Furthermore, EPA was convinced that the deadlines for compliance with the legacy CCR surface impoundments and CCRMU requirements should be offset to mitigate impacts mentioned by commenters regarding the current labor shortages and backlogs experienced by third-parties necessary to accomplish tasks involved in complying with the groundwater monitoring requirements (*e.g.*, drillers for well installation,

laboratories for sample analysis) and the need for owners or operator of inactive facilities to first determine if there are legacy CCR surface impoundments onsite. Finally, based on the above-mentioned factors and the information provided by commenters, specifically the information regarding the suspected underestimation of the CCRMU universe due to historic facility-wide placement of non-containerized CCR on land, time needed to obtain necessary approvals (*e.g.*, State permits to drill water wells or clear vegetation), and to accommodate for seasonality, EPA has calculated 18 months as the appropriate extension of the groundwater monitoring system deadlines for the latest groundwater monitoring requirement. In the proposed rule, the latest proposed deadline for groundwater monitoring requirements was the deadline of 24 months from the effective date of this final rule for the initiation of the combined detection and assessment monitoring and the collection of the eight baseline samples. Therefore, EPA is finalizing a single deadline of no later than 42 months after the effective date of this final rule for the groundwater monitoring requirements found at §§ 257.90 through 257.95.

i. Design and Installation of the Groundwater Monitoring System for CCR Management Units

EPA proposed that owners or operators of CCRMU install the groundwater monitoring system as required by § 257.91 no later than six months from the effective date of this final rule. EPA further proposed that existing monitoring wells can be used as a part of the CCRMU groundwater monitoring systems provided the wells meet the Federal criteria. As explained in the proposed rule, based on the amount of time most facilities needed to complete or to collect baseline sampling, EPA calculated that facilities would be able to install the necessary monitoring wells within a single year.

As mentioned earlier, some commenters supported the expedited deadlines. However, most commenters stated the proposed deadline of six months from the effective date of the final rule for the design and installation of the groundwater monitoring network was infeasible and should be extended to no less than 24 months from the effective date to align with the 2015 rule deadline. As explained above, many of these commenters expressed the need for a single deadline for groundwater monitoring requirements. Furthermore, as described in Unit III.C.4.a of this preamble, these commenters cited

seasonality restrictions, the nationwide labor shortages, limited qualified contractor availability, the need for State approvals and permits, and the number of facilities competing for limited resources as reasons for why the proposed expedited deadline is infeasible. A few commenters noted that in recent decisions on Part A demonstrations, EPA cited deficiencies in the groundwater monitoring network as a basis for noncompliance. These commenters went on to state that the proposed deadline does not facilitate the establishment of a monitoring system that would meet the standards laid out in the CCR rule or the recent proposed decisions and thus, the proposed deadline creates *de facto* non-compliance. Some of these commenters elaborated by saying that the deadline does not allow facilities to acquire the permits that may be required to drill wells and precludes the observation of groundwater levels over time, which is needed to properly characterize groundwater flow. Other commenters stated meeting the proposed compliance deadline would prevent a facility from conducting proper site characterization, which is needed to inform well placement and depth and providing P.E.s sufficient information to certify the groundwater monitoring system. Lastly, commenters stated that contrary to EPA's assertion in the proposed rule that expediting the installation of the groundwater monitoring network is protective of human health and the environment, to meet the proposed deadline, facilities would likely be forced to design groundwater monitoring systems based on inadequate data resulting in unreliable groundwater monitoring data. Commenters provided estimates of time needed to comply with the design and installation of the groundwater monitoring system requirements ranging from nine to 36 months.

As stated in Unit III.C.4.a of this preamble, in response to comments EPA reevaluated the compliance deadline for the design and installation of the groundwater monitoring network and found the information provided regarding the general infeasibility of the proposed deadline compelling. Specifically, EPA agrees that more time is needed to allow inactive facilities time to determine if a legacy CCR surface impoundment is online prior to complying with the CCRMU requirements and to account for limited third-party availability (*e.g.*, contractor shortages and laboratory backlogs), seasonality and extreme weather events, procuring a contractor, complying with

overlapping regulatory requirements, and coordinating with outside parties. EPA acknowledges the importance of proper site characterization as the foundation for designing a groundwater monitoring system and is convinced that although there may be some facilities that have adequate information for site characterization, many of these facilities, especially inactive facilities, may need to conduct more extensive site reconnaissance and field work to obtain the necessary information due to the widespread use of non-containerized CCR across facilities. EPA further recognizes that groundwater monitoring systems designed using inadequate data would be unable to properly monitor groundwater quality coming from the unit and therefore would not be protective of human health and the environment. Lastly, because EPA is convinced by information from the commenters that facilities would be unable to conduct all the steps necessary to design and install a groundwater monitoring system capable of meeting the standards in § 257.91 by the proposed deadline, EPA has extended the deadline.

As stated in Unit III.C.4.c, based on information provided by commenters, EPA concluded that a single deadline of 42 months from the effective date of this final rule should be used for the groundwater monitoring requirements. Therefore, EPA is finalizing a deadline for the completion of the design and installation of the groundwater monitoring system of no later than Monday, May 8, 2028, which is 42 months from the effective date of this final rule. This is codified in the regulatory text at § 257.90(b)(3)(i).

To complete the installation of the groundwater monitoring system, the owner or operator of a CCRMU must ensure the monitoring system consists of sufficient number of wells both upgradient and downgradient of the CCR unit, installed at appropriate locations and depths, to yield groundwater samples from the uppermost aquifer that accurately represent the quality of background groundwater and groundwater passing the downgradient waste boundary of the CCR unit, monitoring all potential contaminant pathways. 40 CFR 257.91(a)(1) through (2). Because hydrogeologic conditions vary so widely from one site to another, the regulations do not prescribe the exact number, location, and depth of monitoring wells needed to achieve the general performance standard. Rather the regulation requires installation of a minimum of one upgradient and three downgradient wells, as well as any

additional monitoring wells necessary to achieve the general performance standard of accurately representing the quality of the background groundwater and the groundwater passing. See, 80 FR 21399. The number and placement of the monitoring wells is critical to proper characterization of the groundwater. Thus, the specific number, spacing, and depth of the monitoring wells must be determined based on site-specific information, including but not limited to the thorough characterization of aquifer thickness, groundwater flow rate, groundwater flow direction throughout seasonal and temporal fluctuations, the unit's geological setting, and the unit's hydrogeological setting.

The monitoring wells must be cased, constructed, operated, and maintained in a way that preserves the integrity of the monitoring well borehole, screened interval and other components so as to ensure the well performs to the design specifications throughout the life of the monitoring system. EPA expects owners or operators to ensure the groundwater monitoring wells are adequately protected from activities that may damage the wells or otherwise adversely impact their performance, such as accidental damage caused by livestock, vehicles, machinery, or other activities near the unit.

The owner or operator of the unit must ensure that the design, installation, development, and decommissioning of any aspect of the groundwater monitoring system is thoroughly documented and included in the operating record. Furthermore, the owner or operator must obtain a P.E. certification or approval from the Participating State Director or EPA stating the groundwater monitoring system meets the standards set out in § 257.91.

ii. Development of the Groundwater Sampling and Analysis Plan for CCR Management Units

EPA proposed to require owners or operators of CCRMU to comply with the existing groundwater sampling and analysis program requirements for CCR units, including the selection of the statistical procedures that will be used for evaluating groundwater monitoring data. 40 CFR 257.93. EPA proposed a deadline of no later than six months after the effective date of the final rule for owners or operators to comply with this requirement.

One commenter suggested EPA prohibit use of intrawell groundwater data comparisons for CCRMU. This commenter stated that intrawell comparisons are only appropriate when

the background samples are collected before CCR was placed in the unit and therefore, since these units are likely already contaminating groundwater, they would be ineligible for intrawell data comparisons. Other commenters requested EPA allow alternative groundwater monitoring requirements, such as alternative groundwater sampling procedures and statistical analysis because of the inability to collect groundwater samples unaffected by CCR at some facilities due to the number of CCRMU at the site. As stated in Unit III.C.4.c, the existing groundwater monitoring and corrective action requirements are essentially the same requirements that have been applied to both hazardous waste and municipal solid waste disposal units for decades, and with the one exception discussed below, there is nothing about CCRMU that makes them distinct enough to warrant separate or additional requirements. Furthermore, while EPA expects many CCRMU have leaked or are potentially leaking, the commenter did not provide any evidence for creating a prohibition against intrawell data comparisons. Therefore, EPA will not be finalizing a prohibition on intrawell data comparisons at CCRMU. However, EPA acknowledges that since the 2015 CCR Rule went into effect, intrawell groundwater data comparisons have been misused to a large degree. Regarding the commenter who stated that the owner or operator would be unable to accurately represent background groundwater quality due to the potential extensive presence of CCRMU across the facility, during implementation of the 2015 CCR Rule, EPA has not found a situation in which representing background groundwater quality was impossible nor does EPA believe such a situation exists, as owners or operators are allowed to collect samples as far upgradient as needed, even offsite, to ensure that the groundwater sample is not impacted by CCR. Additionally, at § 257.91(a)(1), EPA allows the owner or operator to collect background groundwater samples at other representative wells when hydrogeologic condition do not allow the determination of what wells are hydraulically upgradient wells or when other wells are more representative of background groundwater quality than upgradient wells. Furthermore, the commenter's assertion relied solely on the exhaustive presence of CCRMU at the facility as evidence of the inability to represent background water quality and did not provide any factual basis to support their claim that the requirement to

establish background groundwater quality as part of the groundwater monitoring requirements is infeasible. EPA is therefore finalizing this provision without revision. This is codified in the regulatory text at § 257.90(b)(3)(ii).

EPA received several comments on the proposed deadline for the development of the groundwater sampling and analysis plan. As mentioned in Unit III.C.4.c, some commenters supported the expedited deadline. However, several other commenters pointed out that the sampling and analysis plan cannot be completed prior to the collection of the baseline samples, which had a proposed deadline of 24 months from the effective date. Many of these commenters went on to state that the proposed expedited deadline for the development of the sampling and analysis plan could result in too frequent sampling leading to non-independent, autocorrelated baseline samples for a large number of facilities, undermining the required statistical analysis. A few commenters further stated that EPA published decisions on Part A and Part B demonstrations citing lack of statistical independence in sampling as a basis for non-compliance, and failure for EPA to extend the deadline for the sampling and analysis plan to allow adequate time for facilities nationwide to gather independent samples would create de facto non-compliance.¹⁴³ Commenters also said that the proposed deadlines do not account for the backlogs already experienced due to the existing CCR units using the small number of laboratories qualified to conduct the specialized analyses required by the rule, coupled with the national labor shortages. The commenters predicted the backlogs with laboratories will only increase with the regulation of legacy CCR surface impoundments and CCRMU, making the proposed deadlines even more infeasible. Finally, as mentioned in Unit III.C.4.c, commenters emphasized the need for one deadline for all groundwater monitoring requirements.

EPA agrees that a sampling and analysis plan cannot reasonably be completed before the collection of

baseline samples. EPA also acknowledges the adverse impact of too frequent sampling on the validity of statistical analysis and the need to account for seasonal variability in groundwater flow, groundwater levels, and constituent concentrations. EPA further acknowledges that providing insufficient time for the collection of baseline samples or the development of the sampling and analysis plan would likely result in ineffective groundwater monitoring programs that may fail to alert facilities to groundwater contamination coming from CCR units. As explained in Unit III.C.4.a and Unit III.C.4.c respectively, EPA recognizes the need for more time to accommodate third-party availability and a single deadline for the groundwater monitoring requirements. As stated in Unit III.C.4.c.i, for the reasons laid out above, EPA is finalizing a single deadline for the groundwater monitoring requirements of no later than Monday, May 8, 2028, which is 42 months from the effective date of this final rule. This is codified in the regulatory text at § 257.90(b)(3)(ii).

The owner or operator must develop the groundwater sampling and analysis program that satisfies the requirements in § 257.93 and includes a list of monitoring wells to be sampled (*i.e.*, the monitoring network), the schedule for sampling, sampling procedures and techniques, sample preservation and shipping protocols, analytical procedures including an appropriate statistical method for analysis, and quality assurance and quality control methods. The sampling and analysis plan must include all analytes listed in Appendix III and Appendix IV. Recommendations and information on how to comply with many of the requirements for the groundwater sampling and analysis program (*e.g.*, analytical procedures, QA/QC controls, sampling protocol) can be found in the following EPA guidance documents (*e.g.*, *RCRA Groundwater Monitoring: Draft Technical Guidance*, 1992, EPA/530/R-93/001; *Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures*, 1996, EPA/540/S-95/504).

iii. Detection Monitoring Program and Assessment Monitoring Program Combined

EPA proposed to require sampling and analysis of constituents listed in Appendix IV at the same time as those listed in Appendix III. The proposed rule explained that this would expedite groundwater monitoring and initiation of corrective action by at least six months at sites where units have potentially been leaking for a long

period of time, as is likely the case at CCRMU. The proposed rule further explained that the expediting Appendix IV constituent detection and any resulting corrective action is necessary for the protection of human health and the environment. EPA proposed no other revisions to the existing groundwater monitoring requirements in §§ 257.90 through 257.95.

EPA received several comments on its proposal to combine detection and assessment monitoring. One commenter pointed out the increased demand on laboratory services, facility staff and/or contractors, and professional engineers that would result from having CCRMU comply with both monitoring programs simultaneously. Another commenter stated that by combining detection and assessment monitoring and assuming groundwater contamination, EPA has rendered detection monitoring superfluous. Further, the commenter asserted that skipping detection monitoring entirely would lose critical data regarding whether there are statistically significant increases in groundwater constituents specifically due to the unit being monitored. One commenter stated that EPA lacked the record demonstrating risk posed by CCRMU to warrant combined detection and assessment monitoring and should either maintain the approach in the existing regulations or only apply groundwater monitoring to those CCRMU that have been identified as a source of an SSI or SSL in an ASD. Another commenter said that the justification in proposed rule regarding phased groundwater monitoring being “best suited to situations where there is little likelihood of pre-existing contamination” conflicts with EPA’s position in the 2015 CCR Rule. According to the commenter, in the 2015 CCR Rule, the Agency was aware many CCR surface impoundments were decades old and potentially leaking; yet EPA still adopted a phased approach with detection monitoring to monitor indicators of potential groundwater contamination and assessment monitoring to determine if releases of CCR constituents of concern did occur.

As a practical matter, EPA expects combining Appendix III and Appendix IV constituents into a unified sampling and analysis plan and approach will likely have only minor effects on schedules, as this change will not require additional field mobilizations or sampling events and will only require collection of a slightly larger number of sample containers at each monitoring well to allow for analysis for both Appendix III and IV constituents. As such, no additional shipments of

¹⁴³ On January 25, 2023, EPA proposed determinations on six Part B applications for alternate liner demonstrations (“Part B”). All six proposals are proposed denials. The CCR Part B Final Rule (85 FR 72506, November 12, 2020), allowed a limited number of facilities to demonstrate to EPA or a Participating State Director that, based on groundwater data and the design of a particular surface impoundment, the unit has and will continue to ensure there is no reasonable probability of adverse effects to human health and the environment.

samples to the analytical laboratory will be required. However, EPA acknowledges that combining Appendix III and Appendix IV constituents into a unified sampling and analysis plan may increase the total throughput burden on analytical laboratories and related services. Similarly, while combined monitoring may require additional evaluation (e.g., concentration and trend analysis of data concerning both Appendix III and Appendix IV constituents), this incremental increase is unlikely to significantly increase the overall reporting level of effort, as the number of reports will be essentially unchanged.

Nevertheless, as discussed in Units III.C.4.a and III.C.4.c of this preamble, EPA acknowledges the commenters' concerns regarding existing and projected labor shortages, backlogs, and third-party availability, and agrees this has the potential to affect facilities' ability to comply with the proposed deadlines for groundwater monitoring requirements. EPA is therefore extending the deadline, as well as building in flexibility for facilities to accommodate for delays, by finalizing a single deadline for groundwater monitoring requirements in lieu of the proposed split deadlines.

However, EPA disagrees that combining detection and assessment monitoring will render detection monitoring redundant, and that critical data would be lost, by sampling for Appendix IV constituents at the same time as Appendix III constituents (*i.e.*, by collecting more information). The commenters provided no further explanation of what information they thought would be lost, but under the combined monitoring, the facility would collect the same information on Appendix III constituents that is collected under the detection monitoring in § 257.94. Given that under the existing assessment monitoring provisions, facilities must simultaneously analyze samples for all parameters in Appendix III and for any Appendix IV constituent detected in the initial sampling, it is not apparent why the commenter believes that requiring simultaneous monitoring more broadly is appreciably different. 40 CFR 257.95(d)(1).

As stated in the previous paragraph, concurrent monitoring for Appendix III and Appendix IV constituents provides considerably more information and enables a more complete understanding of the geochemical nature, fate, and transport of any detected releases. Additionally, simultaneously collecting samples for Appendix III and Appendix IV constituents will still provide the

basis for determining SSIs, should they exist, so no information will be lost. Contrary to the commenter's concern, additional information will be gained in an expedited manner (e.g., the potential spatial and temporal correlation of Appendix III SSIs with exceedances of SSLs for Appendix IV constituents). Furthermore, EPA disagrees that its explanation that phased groundwater monitoring is "best suited to situations where there is little likelihood of pre-existing contamination" fundamentally conflicts with EPA's decision to adopt phased monitoring in the 2015 CCR Rule. Unlike this rule, the 2015 CCR Rule applied to both new facilities, which would be expected to have little likelihood of pre-existing contamination, and to existing facilities. Over the long-term, EPA expected that there would eventually be a greater percentage of new units than existing units as the older units reached capacity and closed. In addition, as discussed in the proposal at 88 FR 32010 and in Unit III.A.2 of this preamble, it is clear from the data posted on facilities' websites that in 2015 EPA significantly underestimated the number of unlined units (both impoundments and landfills), and consequently, significantly underestimated the number of leaking units and the extent of contamination at these sites.

Under the phased approach in the current regulations, detection monitoring was intended to provide an early detection of whether groundwater was potentially being contaminated. In selecting the parameters for detection monitoring, EPA chose constituents present in CCR that would be expected to move rapidly through the subsurface and thus provide an early detection of a potential problem before significant releases of constituents of greatest concern (*i.e.*, those in Appendix IV) had occurred. This approach rests on a presumption that the unit is not already leaking and the record shows (see Unit III.C.1) that presumption is largely inappropriate for CCRMU.

If an alternate source is causing an exceedance of an Appendix III constituent, it may also be the source of any SSL detected for any Appendix IV constituents; in such a case, a facility may simply prepare a single ASD that covers constituents from both appendices. The sole difference between phased monitoring and combined monitoring is if the alternate source is only responsible for the Appendix III constituent, but the unit actually is releasing one or more Appendix IV constituents. In such a case, under a phased approach detection of the Appendix IV constituent can be delayed

or even remain undetected, because the facility would not trigger assessment monitoring absent an SSI from another Appendix III constituent. In such situations, combined monitoring can make the monitoring program more accurate; it is unclear why the commenter believes this is inappropriate.

Ultimately, the combined monitoring expedites the initiation of assessment monitoring which in turn, allows for more expeditious identification of statistically relevant exceedances of Appendix IV constituents. This will in turn expedite ASD development or corrective action, depending on the circumstances.

The phased approach in the 2015 CCR Rule provides for a graduated response to groundwater contamination as the evidence of contamination increases over time. This approach allows facilities ample time to investigate the source of contamination as well as the transport characteristics of CCR constituents in groundwater, while usually being protective of human health and the environment. However, at sites where there is a strong likelihood that groundwater contamination has been occurring for a long time, the advantages provided by a protracted graduated response are outweighed by disadvantages of persistent or even increasing contamination that continues to move downgradient. At these sites, the need to protect human health and the environment necessitates the quick detection of Appendix IV constituents of concern to expedite any necessary corrective action. See, *USWAG*, 901 F.3d at 427–30. In this case, as highlighted in Unit III.A, the record provides strong reason to conclude that many CCRMU are contaminating groundwater, given the large number of currently regulated CCR units that have been found to be leaking.

Therefore, EPA is finalizing this requirement as proposed to be completed no later than Monday, May 8, 2028, which is 42 months after the effective date of this final rule. This is codified in the regulatory text at § 257.90(b)(3)(iv) and (v).

iv. Collection and Analyses of Eight Independent Samples for CCR Management Units

EPA proposed that no later than 24 months after the effective date of the final rule, owners or operators of CCRMU initiate the detection monitoring program by completing sampling and analysis of a minimum of eight independent samples for each background and downgradient well, as

required by § 257.94(b). The proposed rule explained that within 90 days after initiation of the detection monitoring program, owners or operators must identify any SSIs over background levels for the constituents listed in Appendix III, as required by § 257.94. To expedite the time to initiate any required corrective action, EPA also proposed that by this same deadline owners or operators initiate the assessment monitoring program by establishing groundwater protection standards and by starting to evaluate the groundwater monitoring data for an SSL over GWPS for the constituents listed in Appendix IV as required by § 257.95.

EPA is finalizing this requirement as proposed. This is codified in the regulatory text at § 257.90(b)(3)(iii).

EPA received several comments on the proposed deadline for the collection of the eight baseline samples. As mentioned in Unit III.B.2.a.ii, some commenters supported the expedited deadline. However, several other commenters requested that the groundwater monitoring requirement deadlines be combined into a single deadline that provided at least as much time to come into compliance as was provided in the 2015 CCR Rule deadlines (*i.e.*, 24 months after the effective date of the final rule). As stated in Unit III.C.4.c, based on information provided by commenters, EPA concluded that a single deadline of 42 months after the effective date of this final rule should be used for the groundwater monitoring requirements. Therefore, EPA is finalizing a deadline for the completion of sampling and analysis of a minimum of eight independent samples for each background and downgradient well of no later than Monday, May 8, 2028, which is 42 months from the effective date of this final rule.

v. Preparation of Initial Groundwater Monitoring and Corrective Action Report for CCR Management Units

EPA proposed to apply the existing requirements in § 257.90(e) to CCRMU and require that owners or operators of CCRMU comply no later than January 31 of the year following the calendar year after a groundwater monitoring system has been established (and annually thereafter).

One commenter suggested that the initial groundwater monitoring and corrective action report be due no later than January 31 of the year following the collection of the eight baseline samples and the first semi-annual sampling event in order to allow facilities to provide all the documentation required by § 257.90(e).

EPA disagrees that the information required by § 257.90(e) would not be available to a facility upon completion of the groundwater monitoring system, as the annual report serves as an update on the activities related to the groundwater monitoring program, including the installation of groundwater monitoring wells. Additionally, when specific actions are not required by the CCR regulations (*e.g.*, a facility has not triggered corrective action), facilities are not out of compliance merely because they do not have activities related to that action to discuss in the groundwater monitoring and corrective action annual report (*e.g.*, not describing progress in selecting a remedy when not in corrective action).

EPA is finalizing the requirement for owners or operators of CCRMU to comply with the requirements in § 257.90(e), which mandate the preparation of an annual groundwater monitoring and corrective action report no later than January 31, 2029 and annually thereafter. This is codified in the regulatory text at § 257.90(e).

The report documents the activities associated with the groundwater monitoring program and progress of any corrective action over the past year and must contain specific information identified in the regulations, including but not limited to maps; aerial images or diagrams showing the CCRMU and all upgradient (background) and downgradient wells; identification of any monitoring wells installed or decommissioned in the previous year; monitoring data collected under §§ 257.90 through 257.98; and a narrative discussion of any transition between monitoring programs (*i.e.*, detection and assessment monitoring). The annual reporting requirement will help ensure that groundwater level data collected over the reporting period is tabulated, presented, and analyzed to determine groundwater levels relative to any residual CCR left in place as well as to confirm or determine groundwater flow directions.

Upgradient and downgradient well locations and depths should be validated annually with respect to measured and mapped flow directions. Groundwater quality sampling data should be included in appendices and summarized and tabulated in the annual reports. If appropriate, exceedances (SSIs and SSLs) of Appendix III and IV constituents should be tabulated and highlighted. As mentioned in some comments, annual reports should identify the nearest downgradient surface water bodies as well as

groundwater supply wells in the vicinity of the unit.

It is critical that annual corrective action and monitoring reports provide the basis for selection and documentation of corrective actions as early as possible. The owner or operator must not only document compliance in the annual report, but also post the annual report on the public CCR website to allow the public to review the groundwater monitoring results. It is critical that the annual reports contain the basic data which informs the positions and status reported in those documents, including but not limited to boring logs, monitoring well installation diagrams, water level data, field sampling data sheets for groundwater sample collection, laboratory analytical data including QA/QC data, data validation, etc. In summary, the annual groundwater monitoring and corrective action reports should not only contain the information required by the regulations but should be organized in such a way that: (1) Compliance with the CCR regulations is evident; (2) Data supporting compliance conclusions are easily located within the document; and (3) The public is readily able to review the groundwater monitoring data and related information. Lastly, the name of the document on the public CCR website should be such that it is clear what the file is and it must be capable of being readily printed and downloaded by the public.

vi. Corrective Action Requirements for CCR Management Units

EPA proposed to require owners or operators of CCRMU to comply with the existing corrective action criteria, as appropriate in §§ 257.96 through 257.98. The proposed rule explained that conducting the sampling simultaneously would expedite groundwater monitoring and, where necessary, initiation of corrective action by at least six months at sites where units have potentially been leaking for a long period of time, as is likely the case at many CCRMU. The proposed rule further explained that expediting Appendix IV constituent detection, assessment and any required corrective action would protect human health and the environment.

Under the existing regulations, if groundwater monitoring demonstrates an exceedance of the groundwater protection standards for constituents identified in Appendix IV of part 257, corrective action is required, as laid out in §§ 257.96 through 257.98. These requirements apply throughout the active life and any post-closure care period of the CCR unit.

A commenter suggested EPA create a deadline for the completion of the selection of remedy required by § 257.97 of 90 days after the completion of the assessment of corrective measures (ACM) with the ability to extend the deadline up to 180 days after the completion of the ACM. The commenter pointed to the failure of owners and operators of units regulated by the 2015 CCR Rule to select a remedy as soon as feasible after the completion of the ACM as required by the rule and the subsequent unnecessary delay in addressing contaminated groundwater. Other commenters stated that applying the existing groundwater monitoring and corrective action requirements to historic sites, such as CCRMU, is not appropriate and suggested that instead EPA incorporate site-specific risk-based corrective action or State corrective action programs into the CCR regulations. Finally, some commenters requested EPA adopt a RCRA subtitle C approach and utilize existing EPA guidance. One of these commenters further stated that the application of the existing CCR corrective action requirements conflict with EPA's decision-making frameworks in other programs such as RCRA and CERCLA due to lack of site-specific risk assessments to evaluate risk and drive corrective action decisions. This commenter suggested that EPA utilize site-specific, risk-based corrective action that is consistent with the guidance documents EPA has developed for RCRA and CERCLA programs.

EPA acknowledges the widespread non-compliance with the mandate to complete the selection of remedy as soon as feasible after the completion of the ACM. However, EPA disagrees with the commenter's suggested deadline for two reasons. First, the recommended deadline extends the deadline for the completion of the selection of remedy beyond that in 2015 CCR Rule since "as soon as feasible" in many cases would likely be before 90 days after the completion of the ACM and granting owners or operators more time to select a remedy would be less protective of human health and the environment. Second, EPA is taking action to address the non-compliance related to the failure of owner or operators to select a remedy as soon as feasible as part of the EPA's National Enforcement and Compliance Initiative and expects this enforcement initiative to address the concern raised by the commenter.¹⁴⁴

EPA disagrees with the suggestion that existing corrective action requirements, if triggered, are inappropriate at CCRMU. As stated in Units III.A and III.C.4.d, the physical characteristics and potential risks of CCRMU are not sufficiently different from currently regulated units to justify different requirements. For those commenters requesting that EPA adopt "risk-based corrective action" into the requirements, EPA notes that the commenters have provided no further explanation of what requirements in the existing regulations they wanted EPA to revise, what the revisions should accomplish, or why such revisions are necessary or appropriate. As a general matter EPA considers that the corrective action regulations in §§ 257.95 through 257.98 do currently require facilities to tailor remedies to address the risks to human health and the environment, based on the conditions at the site. It is unclear what more the commenters are seeking. Additionally, regarding incorporating or allowing State corrective action programs to substitute for the existing corrective action requirements, the commenters failed to demonstrate through factual or specific information that the State corrective action programs referenced are either different than that required by the CCR regulations or adequate to address the risks posed by CCRMU. Even if individual examples were sufficient to overcome the record with respect to State programs generally, none of the examples presented by the commenters provided sufficient detail for EPA to actually evaluate the adequacy of the corrective action programs. More to the point, EPA lacks the record necessary to support a broad exemption for all CCRMU conducting corrective actions under any State requirements. Regarding comments requesting a RCRA subtitle C approach be adopted for CCRMU, a RCRA subtitle C approach is more appropriate for regulation under a permitting program than under the existing regulatory framework (*i.e.*, self-implementing) and as explained in Units III.A and III.C.1, EPA finds the risks posed by CCRMU to be not only credible but significant enough to warrant regulation at this time (*i.e.*, under the self-implementing rule as opposed to waiting until the Federal permitting program is established). Lastly, the commenter that stated that the existing corrective action regulations conflict with other EPA programs (*i.e.*, RCRA and CERCLA) failed to fully explain how the existing corrective

action regulations conflict with EPA-published RCRA or CERCLA guidance documents or how they preclude corrective action decisions driven by site-specific risks. Accordingly, EPA is finalizing, without revision, its proposal that CCRMU comply with the existing corrective action requirements at §§ 257.95 through 257.98.

As explained in the proposed rule at 88 FR 32003, §§ 257.90 through 257.95 require that an owner or operator of a CCR unit to install a system of monitoring wells, specify procedures for sampling these wells, and set forth methods for analyzing the groundwater data collected to detect hazardous constituents (*e.g.*, toxic metals) and other monitoring parameters (*e.g.*, pH, total dissolved solids) released from the units (*i.e.*, all parameters listed in Appendices III and IV). If the groundwater monitoring required in § 257.95, demonstrates an exceedance of the groundwater protection standards for constituents identified in Appendix IV of part 257, corrective action is required as laid out in §§ 257.96 through 257.98. These requirements apply throughout the active life and post-closure care period of the CCRMU.

When corrective action is required, it must be initiated without delay, in accordance with the time frames laid out in the regulations. The corrective action program includes initiating an ACM to prevent further releases, to remediate any releases, and to restore affected areas to original conditions, as specified in § 257.96(a). After the ACM has been completed, the owner or operator must select a remedy that meets prescribed standards, including a requirement that the remedy attain the groundwater protection standards. See § 257.97(a) and (b). Finally, the corrective action program requires the owner or operator of the CCR unit to initiate remedial activities within 90 days of selecting a remedy. See § 257.98(a). The requirement to address releases under this requirement is identical to those requirements for any CCR unit undertaking groundwater corrective action with the additional requirement that implementation of corrective action begin during the active life of the unit.

EPA expects that when assessing corrective measures and selecting a remedy, the owner or operator of the unit will consider the impact of the corrective measures on the water quality and safety of the nearest surface water bodies and the nearest private and/or public groundwater wells.

With respect to completion of an ACM and remedy selection, § 257.96(a) requires an ACM be initiated within 90

¹⁴⁴ EPA Enforcement Alert, National Enforcement and Compliance Initiative, Protecting Communities from Coal Ash Contamination. EPA Document #310F23002. December 2023. [https://www.epa.gov/](https://www.epa.gov/system/files/documents/2023-12/ccr-enf-alert-2023.pdf)

days of determining an SSL has occurred, and then completed within another 90 days. An extension, not to exceed 60 days, may be warranted due to site-specific conditions or circumstances. Prior to closure of a CCR unit, the facilities have been required to characterize site conditions, including groundwater flow conditions and geology. The facilities have knowledge of the wastestreams and water volumes it discharges to CCR units. This information can be used to develop a groundwater model to predict groundwater flow conditions after waste stream disposal ceases and closure is initiated. Therefore, EPA believes this would provide sufficient characterization of post-closure conditions to assess and compare groundwater cleanup alternatives to complete an ACM.

Once the ACM is complete, a public meeting has been held, and community input has been considered, a remedy must be selected as soon as feasible. A selected remedy may include closure by removal to comply with source control requirements. This would constitute commencing implementation of a remedy. However, the selected groundwater remediation portion of the remedy must also be implemented within a reasonable time, in accordance with the schedule established in the remedy selection report. 40 CFR 257.97(d). Implementation of the source control measure does not negate this requirement.

d. Closure and Post-Closure Care Criteria for CCR Management Units

EPA proposed that all of the existing closure and post-closure care requirements in §§ 257.101 through 257.104 would apply to CCRMU, except for the alternative closure requirements in § 257.103(f). EPA further explained that the alternative closure provisions in § 257.103(f) were not appropriate for CCRMU as these units, by definition, are inactive impoundments at inactive facilities and could not therefore demonstrate the need to continue to use the disposal unit, which is a qualifying component of the alternative closure provisions. In addition, EPA solicited comments on two potential revisions to the existing closure standards in § 257.102(d). The first potential revision would extend the existing dewatering requirement in § 257.102(d)(2)(i) to any CCR landfill constructed in groundwater or otherwise saturated by liquids. The second potential revision would incorporate a definition of the term “infiltration” into § 257.102.

EPA also proposed to require that all CCRMU initiate closure within 12

months of the effective date of this final rule. While EPA proposed that the CCR unit closure requirements would apply, EPA also solicited comment on other approaches to how a facility might implement the requirement to close at a site where the CCRMU lies beneath an operating unit.

Finally, EPA proposed to apply the existing post-closure care requirements in § 257.104 to CCRMU. Each of these proposals and the comments are discussed in detail below.

EPA received numerous comments on its proposal to apply the existing closure and post-closure care requirements §§ 257.100–257.104 to CCRMU. Several commenters stated that EPA must require all CCRMU to close, because the risks EPA identified in the proposal, together with information provided by regulated facilities under the 2015 CCR Rule, indicate that CCRMU pose significant and ongoing threats of contamination if not properly closed. These commenters also identified several examples of units that the commenters believe demonstrate the need for CCRMU to close. One commenter referenced a report it submitted to support EPA’s proposal to regulate CCRMU. The report focuses on six sites with both CCR units currently regulated by the CCR Rule and with CCRMU. According to the commenter the report documents significant and harmful coal ash pollution that has been allowed to persist under the 2015 CCR Rule and that would be remediated under the proposed rule.

For example, the report analyzes the Brandywine Ash Management Facility in Maryland, which has a single landfill that its operator GenOn has treated as four distinct CCR dumpsites for purposes of the CCR Rule. This artificial division of the landfill has enabled GenOn to claim that three of the four areas of the landfill are unregulated under the CCR Rule; to attribute contamination at the site, such as molybdenum levels eighty times above the GWPS, to the three purportedly unregulated areas; and to keep the site in detection monitoring through ASDs. The Proposed Rule will compel GenOn to address all coal ash at the site. Another site that demonstrates the necessity of regulating CCRMU under the Proposed Rule is the Joliet #29 Station owned by Midwest Generation in Illinois. This site has one regulated pond, Ash Pond 2, and a number of additional units that would be treated as CCRMU under the Proposed Rule. In fact, the site was used for coal ash disposal long before it had a power plant, potentially as early as 1917, indicating the presence of unlined landfills going back decades. Midwest Generation has found statistically significant increases (“SSIs”) for TDS, sulfates, chloride, and calcium at the site, but is only monitoring the groundwater around Ash Pond 2 and two former ash ponds, and

not monitoring the groundwater around three large onsite landfills.

These commenters also described a facility where, according to the commenters, two million tons of fill containing CCR sits behind corroding steel pilings on the shore of Lake Michigan, and is leaking arsenic and other hazardous chemicals into the lake, as well as into an adjacent creek commonly used for fishing and boating. These commenters also pointed to a facility with an inactive 90-acre unlined CCR landfill that, according to the commenter, is contaminating groundwater with unsafe levels of sulfate, lithium, radium, cobalt, arsenic, molybdenum and selenium. Similarly, a private citizen also provided the following example of a potential CCRMU during one of public hearings:

My utility is City Utilities. Once the current coal ash landfill is full, CU plans to dispose of future coal ash at a temporarily closed landfill next to Lake Springfield, which feeds into the James River. Both dumps are in karst terrain. This makes them susceptible to sinkhole collapses and leakage of pollutants into the James River watershed and the area’s shallow and deep aquifers. These waters affect a four-state area, including Table Rock Lake near Branson where tourism is the main industry. Safer methods of disposal exist, although they are more cumbersome and expensive. In December 2022, CU held a public meeting regarding the utility’s future. After questions about pollution, one representative said he wasn’t aware of any pollutants coming from the landfill. The Interdisciplinary Environmental Clinic at Washington University School of Law researched this. Twelve rounds of sampling done by CU from late 2016 to early 2018 showed 387 statistically significant increases in pollutants in every down-gradient well. Those increases included 27 out of the 35 monitored parameters. Regarding CU’s dye tests at the dump site, a 2017 memo from the Missouri Department of Natural Resources stated, “Dye is moving through the karst system and not being detected by the monitoring well network.”

These commenters also pointed to the high likelihood that many CCRMU have waste in contact with groundwater, as many are located in floodplains, wetlands, or near large rivers and lakes. According to the commenters, if EPA does not mandate closure of CCRMU, aquifer contamination would not be identified until it is too late to be prevented—in contravention of RCRA’s protectiveness standard. These commenters have also argued that CCRMU are inactive units with no practical justification to avoid closure.

A number of other commenters however argued that a national requirement to close was not appropriate for CCRMU and that EPA should instead determine whether

closure is warranted at each site based on a finding that the individual unit at that particular site poses unacceptable risks. Many of these commenters suggested that the risks associated with CCRMU can be better managed through corrective action implemented under a permit program, which the commenters believed would make the mandate to close these units unnecessary. For example, one commenter claimed that mandating the closure of all CCRMU as part of the proposed CCR corrective action regime is more stringent than what EPA requires under subtitle C for solid waste management units (SWMUs), and therefore any final CCRMU rule cannot impose a mandatory closure requirement on CCRMU. According to this commenter, the subtitle C process does not require the closure of SWMUs, because EPA recognizes that addressing the risks from SWMUs via the site-specific subtitle C corrective action process alone is fully protective. Many commenters also raised concern that CCRMU at their facilities are located beneath vital infrastructure, such as pipelines or transmission lines, active CCR units, or buildings and that requiring closure of these CCRMU could adversely impact grid reliability, business operations, or other necessary public services (e.g., military infrastructure). These commenters suggested that EPA exempt these units or at least extend the closure time frames to allow for closure of the CCRMU when the other unit or structure is closed or decommissioned.

Numerous commenters again requested that EPA exempt any CCRMU that had been closed in accordance with State requirements. These commenters claimed that these closures were protective and that EPA should only regulate these CCRMU where the Agency has affirmative evidence that the particular unit is contaminating groundwater or otherwise presents unacceptable risks. For example, one commenter stated that a more rational approach to regulating CCRMU would be first to determine if the uses are impacting groundwater before requiring expensive closure. According to the commenter,

[i]t is not clear why EPA requires closure before groundwater data indicates there is a problem. If groundwater is impacted by the CCRMU then other corrective action measures should be taken, but only after data indicates that groundwater is being affected. As noted earlier, the 2015 CCR Rule did not require unlined landfills to close unless they failed to meet the location restrictions for unstable areas. In the event an unlined CCR landfill is the source of groundwater

contamination, the unit is subject to the CCR Rule's corrective action requirements, but closure is not mandatory.

But many other commenters characterized the proposed deadline as infeasible for the reasons discussed in Unit III.B.2.a.ii, including seasonality, the need to comply with overlapping regulatory requirements, labor shortages, and the limited resources available to achieve compliance (e.g., contractors, laboratories, P.E.s), which the commenters claimed would become even more limited as a consequence of the number of CCR units that would need to come into compliance at the same time. Commenters also stated that compliance with the closure requirements should not be required until after the groundwater monitoring system was installed and baseline samples collected so that closure could be informed by the groundwater monitoring data.

EPA has largely adopted the proposal, with a few significant revisions. This final rule requires CCRMU that contain 1,000 tons or greater of CCR to comply with the existing closure and post-closure care requirements in §§ 257.101 through 257.104, except for the alternative closure requirements in § 257.103(f). The final rule also extends the existing dewatering requirement in § 257.102(d)(2)(i) to any CCR landfill constructed in groundwater or otherwise saturated by liquids, and incorporates a definition of the term "infiltration" in § 257.53.

However, consistent with the provision adopted for legacy CCR surface impoundments, EPA is deferring, in certain cases, the requirement to demonstrate compliance with § 257.102 for CCRMU that closed prior to the effective date of this rule in accordance with alternative requirements that are likely to be as protective as the requirements in § 257.102. This is the same provision that EPA is establishing for legacy CCR surface impoundments, as EPA is not aware of a reason to treat CCRMU differently. In addition, EPA is deferring the requirement to initiate closure where the CCRMU is located beneath critical infrastructure or large buildings or structures vital to the continuation of current site activities, such as beneath high power electric transmission towers, air pollution control or wastewater treatment systems, large buildings, or an electrical substation. In this case, the potential exists for adverse, localized impacts on electric reliability (e.g., voltage support, local resource adequacy) from requiring all facilities to meet these requirements on the same time frame, and EPA lacks the record to

determine that such impacts are unlikely. Consequently, EPA is deferring the requirement to initiate closure of such a CCRMU until the infrastructure is no longer needed, a permit authority determines closure is necessary to ensure that there is no reasonable probability of adverse effects on human health or the environment, or the closure or decommissioning of the facility, whichever occurs first.

Finally, EPA has extended the deadline to initiate closure to Wednesday, November 8, 2028, which is 48 months the effective date of the final rule to allow groundwater monitoring data to inform closure, consistent with the approach for legacy CCR surface impoundments.

Each of these issues are discussed in greater detail in subsequent sections of this preamble.

i. Requirement To Initiate Closure

The final rule requires CCRMU containing 1,000 tons or greater of CCR to close. Closure will address the existing risks associated with these units. In addition, requiring the closure of CCRMU is consistent with the existing regulations, which require closure of all units that no longer receive waste as a preventative measure, whether or not the unit is currently leaking. See, 40 CFR 257.102(e)(1). CCRMU, which consist of inactive CCR landfills and previously closed CCR surface impoundments and CCR landfills, meet these criteria as they also no longer receive waste.

The closure of CCRMU of 1,000 tons or greater also provides significant risk mitigation. As laid out in Unit III.A of this preamble, CCRMU at both active facilities and inactive facilities with legacy impoundments pose risks to human health and the environment that are at least as significant as the risks presented by legacy CCR surface impoundments and the units currently regulated under the 2015 CCR Rule. In particular, for highly exposed individuals off site, landfill CCRMU were estimated to pose cancer risks as high as 7×10^{-6} from arsenic III, while surface impoundment CCRMU were estimated to pose cancer risks as high as 8×10^{-5} from arsenic III and noncancer HQs as high as two for arsenic III, two for lithium, and one for molybdenum. Differences in national risks between currently regulated units and these older units are attributed largely to the proportion of units that were modeled at the time as lined. However, the risks associated with these older units may be even higher than EPA modeled in the 2014 Risk Assessment for active units. These units have been present onsite

longer and had more time to leak. In addition, there are several management practices that have the potential to result in higher leakage, but that were previously modeled either less frequently for active units—based on a belief that the practices had declined over time—or not at all—due to data constraints on a national scale. These include: (1) The greater prevalence of unlined units; (2) The greater likelihood of co-management of CCR with coal refuse and other wastes in surface impoundments, making the overall waste pH far more acidic and (3) The potential for the units to be constructed below the water table or to have become inundated with groundwater after the time of construction. As discussed in Unit III.A, each of these practices individually have the potential to result in nationwide risks higher than previously reported on a national basis for the currently operating universe of CCR units. For example, unlined landfill CCRMUs were estimated to pose cancer risks as high as 1×10^{-5} from arsenic III, while unlined surface impoundment CCRMUs were estimated to pose cancer risks ranging from 2×10^{-4} from arsenic III and noncancer HQs as high as 5 for arsenic III, 3 for lithium, 2 for molybdenum, and 1 for thallium. A combination of these practices could push risks even higher than modeled.

In addition, the modeling conducted in 2024 confirms that smaller CCRMUs fill can meaningfully contribute to groundwater contamination across a facility. The 90th percentile concentrations at the waste boundary exceeded GWPS by factors of 26 for arsenic III, 19 for arsenic V, 156 for molybdenum, and 19 for thallium. The 50th percentile concentrations exceeded GWPS by a factor of two for molybdenum. EPA's modeling also confirms that any prior contamination from CCRMUs is likely to still be present. EPA calculated, for example, that it could take around 2,300 years from the time of first exceedance for high-end releases of arsenic V to fully dissipate.

Depending on their location, leakage of Appendix IV constituents from individual CCRMUs may not migrate off-site at levels of concern. However, according to the commenters it is highly unlikely that only one CCRMU would be present on-site. In addition, these concentrations can combine with contamination from other CCRMUs, currently regulated CCR units, or legacy CCR surface impoundments that are also present on the same site. EPA did not model the aggregate or cumulative risk associated with these potential sources of co-located contamination, which may

underestimate the risks. At a minimum, EPA expects that the presence of multiple sources of potential contamination at the same facility would increase the likelihood of a contaminant plume that could migrate off-site at levels of concern. In sum, the record confirms that, at a minimum, regulation of the smaller sized CCRMUs fills is necessary for any corrective action to successfully reduce the concentrations of Appendix IV constituents in the aquifer to concentrations below the GWPS.

Available toxicological profiles indicate that ingestion of arsenic is linked to increased likelihood of cancer in the skin, liver, bladder and lungs, as well as nausea, vomiting, abnormal heart rhythm, and damage to blood vessels; ingestion of lithium is linked to neurological and psychiatric effects, decreased thyroid function, renal effects, cardiovascular effects, skin eruptions, and gastrointestinal effects; and ingestion of molybdenum is linked to higher levels of uric acid in the blood, gout-like symptoms, and anemia. 80 FR 21451. To date, groundwater monitoring required by the 2015 CCR Rule has revealed that at least 40% of currently regulated surface impoundments and landfills have identified groundwater contamination and require corrective action to mitigate the associated risks. This number is expected to increase as more facilities come into compliance with the groundwater monitoring requirements. Another 23% of existing CCR units have identified evidence of leakage and continue to monitor groundwater to ensure that contamination does not occur before the unit can be closed and source controls put in place. In many cases, CCRMUs are historical landfills and surface impoundments. Thus, the relevant release pathways, exposure routes, and associated harm that can result are the same.

Given the locations of many CCRMUs (located in floodplains, or wetlands, or near large surface water bodies), EPA is also concerned that the base of these units may intersect with the groundwater beneath the unit. If such CCRMUs were not required to close, EPA would not adequately address the risks from those units that still contain CCR saturated with free liquids.

In general, EPA considers that closure is the only effective way to adequately address the source of potential or existing releases from these units. Although, as some commenters suggested, EPA could rely upon the existing corrective action requirements to achieve source reduction, the Agency is concerned that this will not

adequately prevent harm, as the statute requires, because these requirements would only apply upon a determination that the CCRMU has contaminated the aquifer above the GWPS. In addition, the closure requirements in § 257.102 provide a uniform approach that EPA is confident will adequately protect human health and the environment.

Contrary to the commenter's contentions the regulation of CCRMUs under RCRA section 4004(a) is not analogous to the corrective action requirements applicable to SWMUs under RCRA section 3004(u). Nor is the absence of a national mandate to close SWMUs as part of every corrective action under section 3004(u) based on the recognition that closure is unnecessary because the corrective action process alone is fully protective. The closure and corrective action regulations are distinct and independent requirements that generally serve different purposes. The closure requirements under both subtitle C and D are largely intended to be prevent contamination from occurring in the first place, by ensuring that the closed unit does not become a source of future contamination. See, e.g., 47 FR 32318, 32321, 32323. By contrast, corrective actions are remedial or retrospective in that they are designed to clean up contamination that has already occurred. EPA has previously promulgated regulations mandating the closure of disposal units for wastes under both subtitles C and D for wastes within each subsection's jurisdiction. See, 40 CFR 264, subpart G, 258, subpart F. But the requirement for corrective action of *solid waste* management units under the provisions applicable to hazardous wastes under section 3004(u) is an anomaly; Congress has otherwise limited subtitle C to the regulation of hazardous wastes. The appropriate comparison is thus not to EPA's regulation of SWMUs under subtitle C, but rather to EPA's regulation of hazardous waste units under subtitle C, where the Agency requires hazardous waste units to comply with both closure and corrective action requirements.

In sum, the record demonstrates that closure is warranted for CCRMUs, even for those that are not yet leaking. As the D.C. Circuit explained, RCRA requires EPA to set minimum criteria for sanitary landfills that prevent harm, not merely to ensure that contamination is remediated. See, *USWAG*, 901 F.3d at 430.

Consistent with the requirements for legacy CCR surface impoundments, EPA is not requiring previously closed CCRMUs to automatically re-close but simply to evaluate whether the unit

meets the requirements of § 257.102(d), and if they do not, to take such measures as are necessary to bring the unit into compliance.

ii. Deferral for CCRMU Under Critical Infrastructure

As noted above, many commenters stated that some CCRMU are currently located beneath critical infrastructure. For example, a number of commenters stated that CCR has historically been used on-site at generating stations for many years as structural fill, including for utility line bedding, and under site infrastructure such as switchyards, coal piles, railroad embankments, and occupied buildings. Additionally, commenters pointed to many areas at their existing facilities with CCR currently located under existing critical energy infrastructure such as generating units, cooling towers, substations, levees, dikes, on-site wastewater treatment systems, dams, transmission towers, gas lines, and solar installations.

These commenters claimed that requiring closure of CCRMU beneath infrastructure could adversely impact grid reliability, business operations, or other necessary public services and suggested EPA create exemptions or extensions for these units. According to these commenters, attempting to close any of these areas under the rule's closure standards would not only be impossible, but also would require disturbing and/or even disassembling critical components of power plant's energy infrastructure, which would only further exacerbate the pressures on grid reliability. Other commenters raised concern that remediation would require removal of existing infrastructure to access the CCR, which in some cases could present significant operational risk and potential danger. As one commenter characterized it,

Particularly at active power plants, requiring closure of CCRMU . . . would cause massive ripple effects that need to be more carefully considered. Closure would be incredibly disruptive for these type of sites—particularly given the inadequate time for electricity resource planning—and exacerbate the grid reliability challenges that co-ops and other utilities are already facing. Moreover, EPA must consider and allow for power plant owners to follow the mandated procedures put in place by the relevant balancing authority, such as regional transmission organizations or electric utilities, and by state authorities which have a role in ensuring the reliability of the local grid.

Several commenters also expressed concern about the closure of CCRMU located under active CCR landfills, asserting that such closures pose complex challenges that EPA did not fully understand or account for in the

proposed rule. Many of these commenters asserted that these closed landfill or surface impoundment CCRMU present no risks. For example, one commenter discussed a closed surface impoundment located beneath its active CCR landfill. The commenter asserted that the permitted, Federally regulated CCR landfill above the closed unit, combined with the collective effect of the CCR landfill liner and leachate collection system, runoff controls, and engineered cap, keeps the impoundment isolated from exposure to stormwater runoff and other sources of water infiltration. The commenter further asserts that there is no evidence that this former impoundment is impounding or otherwise contains any significant amount of free liquids, and that such a condition is unlikely given the overlying landfill infrastructure.

By contrast, numerous commenters supported the proposed mandate to close due to the substantial risks that these kinds of “overfill” units can pose. As one of these commenters explained,

In this situation the underlying CCRMU serves the function of the foundation of the overlying CCR unit. The liner of the overlying CCR unit serves as a cap over the underlying CCRMU. CCR contaminants released from either the overlying CCR unit or underlying CCRMU can adversely impact groundwater quality with little potential for distinguishing between contaminants released from one or the other of these units. Each of the co-located units must be capable of containing CCR contaminants if releases to the environment are to be avoided.

Construction of a CCR unit over a previously existing CCRMU is known to have the potential to increase concentrations of CCR groundwater contaminants. A 2001 study by the Electric Power Research Institute (EPRI) showed that reducing the hydraulic gradient beneath a CCR impoundment can induce increased contaminant concentrations when the waste is in contact with groundwater. EPRI concluded that reducing the hydraulic gradient by dewatering an impoundment slowed groundwater flow and increased contact time between the waste and groundwater. Contact time between waste and water is an important variable that influences concentrations of contaminants found in groundwater.

Release of contaminants from the overlying unit, while possible, is not necessary to cause increasing contaminant concentrations. The bottom liner of the overlying CCR unit reduces infiltration of water from above, reducing the hydraulic gradient and increasing waste/water contact time. The increased contact time can increase contaminant concentrations in downgradient monitoring wells.

The commenters acknowledged that where the waste in the CCRMU is dry and the owner/operator can assure that separation of the waste from water (groundwater and/or infiltration from

above) will be maintained the unit may be closed in place under the CCR rule without posing ongoing risks. The commenter also noted, however, that where unlined waste units are continually or periodically in contact with groundwater, more extensive closure techniques such as engineering controls designed to prevent groundwater from flowing through waste or to stabilize the waste and fix contaminants in place may be attempted, or excavation and clean closure of the unit may ultimately be necessary.

Unlike the comments received on legacy CCR surface impoundments, the overwhelming majority of commenters provided concrete examples of concerns with respect to the timing of closure activities for CCRMU. In total, these commenters have provided sufficient information to raise a legitimate question whether adverse, localized impacts on electric reliability (e.g., voltage support, local resource adequacy) could result from a nationwide requirement to close all CCRMU within the deadlines under the regulations.

EPA agrees that closing CCRMU underlying critical infrastructure at active generating facilities is very different and more challenging than closing disposal units at inactive utilities. When it was developing the proposal, EPA was unaware of the extent to which facilities had historically used CCR as part of the foundation supporting generating units, cooling towers, substations, or on-site wastewater treatment systems. In some cases, it appears that in order to close these CCRMU individual facilities may need to disturb substantial portions of the entire site and disassemble critical components of the power plant's energy infrastructure, such as high power electric transmission towers, and electrical substations.

EPA agrees that its proposal did not adequately account for this circumstance. This is particularly true in the case of a CCRMU located beneath infrastructure necessary for energy production, where the potential exists for adverse, localized impacts on electric reliability (e.g., voltage support, local resource adequacy). This issue arises whenever multiple facilities need to take their EGU offline for an extended period to complete construction or other compliance activities. The likelihood of an adverse impact on electric reliability can be greater if multiple facilities need to schedule outages simultaneously in order to comply with EPA's closure deadlines. EPA understands that it is

also possible that in some instances temporarily taking generating units (including coal-fired units) offline could have an adverse, localized impact on electric reliability (e.g., voltage support, local resource adequacy). If a generating asset were needed for local reliability requirements, the grid operator might not approve a request for a planned outage. In such instances, the owners/operators of the generating unit could find themselves in the position of either operating in noncompliance with RCRA or halting operations and thereby potentially causing adverse reliability conditions. In addition, failure of an electric transmission or generation system can lead to substantial risks to human health (e.g., if an outage impairs the ability of emergency services to function properly or it causes home heating or cooling systems to fail, which increases risk, particularly for vulnerable populations).

However, such impacts are far less likely to arise from an individual facility-specific decisions, and should normally be adequately managed by the established RTO processes for scheduling outages. EPA recognizes that this final rule provides a substantial amount of time for facilities to complete these closures. In contrast with the proposal, the final rule provides facilities 54 months to initiate closure, and depending on the CCRMU, the facility may have as much as an additional seven to 15 years to complete closure. Based on the comments, however it appears that the overwhelming majority of CCRMU below critical energy production infrastructure are likely to be landfills, and therefore the seven year deadline is more likely to be applicable.

Further, this situation is not analogous to the closure of unlined and clay lined impoundments in response to the *USWAG* vacatur, and thus the information used to develop the deadline for those CCR units in the Part A rule cannot be used to develop a comparable requirement for these CCRMU. For example, there appear to be a greater number of CCRMU at these sites and the construction estimates EPA relied upon in 2020 in the Part A final rule applied exclusively to the six specific technologies that a facility might use to develop alternative disposal capacity. That rulemaking did not involve the potential effect of disturbing substantial portions of the entire site or disassembling critical components of the power plant's energy infrastructure, such as high power electric transmission towers or electrical substations, which is what some

commenters have alleged will be necessary in this case.

Unfortunately, because EPA only became aware of these facts after development of the proposal the Agency has not had the time to obtain the information necessary to evaluate—or to consult with balancing authorities and other electric reliability authorities (e.g., DOE or NERC) on the feasibility of mandating closure of all CCRMU within these deadlines, within the time to complete this rulemaking.¹⁴⁵

EPA acknowledges that the risks associated with CCRMU above the regulatory threshold are substantial, and generally warrant a mandate to close in accordance with § 257.102. Moreover, the fact that EPA did not model the aggregate risks associated with the widespread use of small amounts of unencapsulated CCR throughout the entire facility raises questions about whether EPA may have underestimated the potential risks associated with these CCRMU. EPA also agrees that overfills can present significant risks, particularly when the closed CCR unit remains inundated by groundwater or otherwise continues to contain free liquids. EPA therefore concludes that exempting these CCRMU from the requirement to close in accordance with § 257.102 is not appropriate.

Given that EPA has the ability to rely on the permitting process to address issues on a case-by-case basis, and because doing so will allow the Agency to adequately address both the competing environmental and reliability risks presented at individual sites, it is reasonable for the Agency to choose this option. Consequently, EPA is deferring the requirement to initiate closure of CCRMU located beneath critical infrastructure until either: (1) The infrastructure is no longer essential for the activity to be successful; (2) A permit authority determines closure is necessary to ensure there will be no reasonable probability of adverse effect on health or the environment; or (3) The closure or decommissioning of the facility, whichever occurs first.

The final rule also includes an additional condition on CCRMU under active disposal units. In order for these units to qualify for the deferral, the facility must document that the CCRMU meets one of two existing performance standards: either (1) The standard in § 257.60 that the unit was constructed with a base that is located no less than 1.52 m (5 feet) above the upper limit of

the uppermost aquifer, or must demonstrate that there is no intermittent, recurring, or sustained hydraulic connection between any portion of the CCR unit and the upper limit of the uppermost aquifer or surface water; or (2) The dewatering standard in § 257.102(d)(2)(i) that all free liquids have been eliminated. EPA believes the location standard in § 257.60 is likely to be more directly applicable to many CCRMU, as they are landfills that would not have been constructed or designed to hold free liquids. EPA has also included the dewatering standards in § 257.102(d)(2)(i) for those closed CCR surface impoundment CCRMU. Based on the descriptions provided by commenters EPA expects that this requirement will largely be relevant to closed CCRMU located beneath active disposal units, rather than CCRMU located beneath infrastructure vital to energy production, which are unlikely to be inundated by groundwater. Moreover, this requirement directly addresses the reason that EPA has concluded that many previously completed closures do not meet the standard in RCRA section 4004(a).

To be clear, EPA is not exempting these CCRMU from the requirement to close as commenters requested, but merely extended the deadline for compliance until the Agency can address it on an individualized basis as part of permitting. In addition, these units will be required to comply with all other requirements applicable to CCRMU, including the requirements for groundwater monitoring and corrective action, if necessary.

As noted above and discussed in the next section, in response to public comments, EPA has extended the deadline to initiate closure to Tuesday, May 8, 2029, which is 54 months after the effective date of this final rule. Based on its current schedule, EPA expects to be issuing permits before that deadline.

EPA is defining “critical infrastructure” as infrastructure, large buildings, or other structures vital to the success or continuation of current site operations or activities for the public welfare. This does not include infrastructure, large buildings, or other structures that solely provide commercial or financial benefit to private entities. Examples of critical infrastructure include high power electric transmission towers, large buildings, and electrical substations. The structures must be both (1) necessary for the continued generation of power or currently used for an ongoing site activity; and (2) not readily replaced or relocated. For example, a

¹⁴⁵ EPA is obligated to take final action on the proposal no later than May 6, 2024, pursuant to *Statewide Organizing for Community eMpowerment v. EPA*, No. 1:22-cv-2562-JDB (D.D.C.).

parking lot that could easily be replaced by a parking lot in a different location onsite would not qualify as critical infrastructure; but a lined industrial stormwater ponds, wind or solar farms, substations, or military infrastructure would qualify.

The owner or operator of a CCRMU located under critical infrastructure must include information documenting their eligibility for the deferral in the FER part 2 in § 257.75(d) that includes at a minimum a description of the infrastructure, its current and anticipated use(s), and the decommissioning date or anticipated active lifespan. The documentation must also demonstrate that the CCRMU complies with either § 257.60 or § 257.102(d)(2)(i). The documentation must also demonstrate that the structures are both: (1) Necessary for the continued generation of power or currently used for an ongoing site activity; and (2) Not readily replaced or relocated.

When it comes time for a permit authority to evaluate the CCRMU, EPA intends to rely on the permit application process as the primary mechanism to collect the information to allow a determination to be made as to whether to require closure of the CCRMU prior to facility closure. The permit application process is a well-established system for reviewing the types of groundwater, soil and other sampling and analytical data that will typically be required in determining the potential risks associated with the CCRMU.

When the permit application is called in, the facility must provide sufficient information, including data on contaminant levels in groundwater, to demonstrate that the criteria listed above for the deferral have been met, and for the permit authority to be able to evaluate the risks associated with the CCRMU. EPA (or other permit authority) will review the information to determine whether the criteria for deferral have been met and whether closure is necessary to mitigate unacceptable risks to human health or the environment from the CCRMU.

Finally, EPA received a substantial number of comments requesting that the Agency not require facilities to “re-close” any unit that already completed closure. This final rule does not mandate that any previously closed unit automatically re-close. But as described in the next section, the final rule does require all CCRMU to meet the performance standards in § 257.102, although as discussed above, some may not be required to do so until the permitting process begins for that unit. EPA does not consider this to be

equivalent to a requirement to “re-close” as facilities may be able to implement engineering measures to address any deficits without removing the cover system or entirely re-closing the whole impoundment. Whether any particular measure will be effective is a site-specific determination, but some reasonably available engineering measures that may be effective and should be considered include the installation of physical barriers (e.g., slurry walls), groundwater diversion techniques (e.g., interception trench) or hydraulic containment systems (e.g., groundwater extraction wells) to prevent groundwater infiltration.

iii. Requirement To Comply With Performance Standards in § 257.102

As discussed above, this final rule requires that the closure of CCRMU meet the performance standards in either § 257.102(c) or (d). Under this final rule all closures initiated after the effective date of this rule, as well as to those that were not completed prior to the effective date of this rule, will need to comply with these requirements.

And in general, the same is true with respect to closures that were completed prior to the effective date of this rule. As discussed previously, a facility that can certify that prior closure of a unit meets the performance standards in § 257.102(c) only needs to post the documentation that the closure meets the standard. Similarly, if a facility can demonstrate that the closed unit meets the requirements under § 257.102(d), EPA will consider the unit to be closed and the only requirements that will be applicable are those that apply to closed units under post closure care—that is groundwater monitoring, and if necessary, corrective action. EPA never intended to require facilities that otherwise met the closure standards to go through the process again and re-close the unit. In addition, as discussed in the next section, where the facility was subject to standards that are different than the Federal CCR closure standards—e.g., if the closure was conducted as part of a CERCLA cleanup—but otherwise is equivalent in terms of mitigating the risks, the requirement to meet the § 257.102 standards will be deferred to permitting, where a closure equivalency determination will be made.

(a) Closure of CCRMU Under State Law and Deferral of Certain Completed Closures to Permitting

In response to EPA’s proposal that all CCRMU comply with § 257.102, many commenters requested that EPA exempt any unit that has either completed

closure or is in the process of closing pursuant to State law (e.g., solid waste permit, consent orders or decrees). Commenters also requested that EPA exempt any site that closed as part of a cleanup conducted pursuant to another Federal requirement, such as CERCLA or RCRA subtitle C. For the most part, these commenters simply repeated the comments that they had made with respect to legacy CCR surface impoundments, stating that EPA had failed to demonstrate that these units posed any risk as a consequence of the lack of ponded water, and that “re-closure” of these previously closed units is consequently unnecessary and overly burdensome. However, several commenters also presented individual examples of CCRMU that had been closed in accordance with State requirements, which the commenters believed would demonstrate the State closures were equally as protective as those conducted in accordance with § 257.102. These included the following examples:

[A facility] has an approximately 20-acre dry stack landfill with 20 plus years of groundwater monitoring that does not show groundwater exceedances, zero potential receptors downstream (from the direction of groundwater) that use wells for drinking water (also no potable wells within a two-mile radius). The landfill construction using best practices to minimize erosion potential, including only placement of stabilized material in the landfill, perimeter ditch surrounding the entire landfill to collect any runoff that is processed before discharge, and the unit is regulated by the Florida Department of Environmental Protection that includes semi-annual groundwater monitoring results review and yearly on-site regulatory inspections.

[Another facility] had two CCRMU landfills that were closed prior to the effective date of the 2015 CCR Rule and were closed in accordance with the State of Florida’s Chapter 62–701, F.A.C., for municipal and solid waste landfills. Neither landfill was built on top of a liner system. The closed landfills were subject to design criteria for cover systems and stormwater management, as well as long-term operations and maintenance provisions. The groundwater monitoring system requirements for landfills in Florida are similar to, but not the same as, those in the 2015 CCR rule. Both closed cells would be subject to corrective action if dictated by the monitoring program. Maintenance, inspections, and repair of the cover systems, as needed, are also part of the long-term care program.

[Another facility] reported closing an inactive CCR landfill in the 1980s. The 20-acre site was used to dispose of bottom and fly ash, including scrubber sludge. The owner performed monitoring of a nearby spring to demonstrate whether any ponded water was leaking. Upon visual inspection, it was determined that the bentonite/clay-lined pond remained intact throughout the active

operation of the landfill. However, because of the age of the site, groundwater monitoring wells were not required.

In addition, several States provided information about their existing programs or individual closures. In some instances, the information was intended to demonstrate that the closures were equally as protective as § 257.102, and to provide factual support for an exemption for CCRMU that closed in accordance with State requirements. Other States acknowledged the risks but urged EPA to make the CCRMU requirements “more flexible and allow for practical alternatives to closure and corrective action for units that have not impacted groundwater,” or to provide an opportunity to demonstrate if the previous closure of the CCRMU is protective of human health and the environment.

By contrast, several commenters supported EPA’s proposal to require all CCRMU to comply with the performance standards in § 257.102, even if the closure was previously approved by a State regulatory agency. These commenters also largely made the same comments they had made with respect to legacy CCR surface impoundments, pointing to EPA’s conclusions in 2015 that significant gaps remain in many State programs. These commenters also identified recent examples of closures approved by various State agencies that they believed were not consistent with the Federal closure standards.

No commenter submitted any information that would support a conclusion that different provisions are warranted for CCRMU that closed prior to the effective date of this rule than EPA adopted for similarly situated legacy CCR surface impoundments. Even if individual examples were sufficient to overcome the record with respect to State programs generally, none of the examples presented by the commenters provided sufficient detail for EPA to actually evaluate the adequacy of the closures. For instance, in the three examples presented above, neither of the first two examples actually describe the groundwater monitoring that was required; while the second states that “groundwater monitoring system requirements for landfills in Florida are similar to, but not the same as, those in the 2015 CCR rule” it provides no further information. The third example explains that no groundwater monitoring at all was required because of the age of the unit; it is unclear why the commenter believes that this supports a finding that

the State program is as protective as those in part 257.

More to the point, as EPA explained in Unit III.B.2.g of this preamble, with respect to legacy CCR surface impoundments, EPA lacks the record necessary to support a broad exemption for all CCRMU closures under any State requirement. The limited information currently available does not demonstrate that all closures conducted under State authority, particularly those completed prior to 2015, “will ensure there is no reasonable probability of adverse effects on health or the environment.” 42 U.S.C. 6944(a).

EPA, however, agrees that there are examples of closures that are substantially equivalent to those conducted in accordance with § 257.102. Moreover, EPA has no basis for concluding that the same considerations that warrant deferral of certain legacy CCR surface impoundments closures are not equally applicable to comparable CCRMU closures. Accordingly, EPA is deferring the requirement for a CCRMU that closed prior to the effective date of this rule to demonstrate compliance with § 257.102(d) until a permit application is required to be submitted where the facility can document that all of the following conditions have been met. First, the deferral is limited to circumstances in which a regulatory authority played an active role in overseeing and approving the closure activities. EPA considers a “regulatory authority” to include a State or Federal agency or department that oversaw implementation of requirements imposed through a permit, an administrative order, or consent order issued after 2015 under CERCLA or by an EPA-approved RCRA State program. The permit, order, regulatory or other authority must have required groundwater monitoring to ensure there was no contamination coming from the unit that is not addressed by corrective action until cleanup standards are achieved.

To support deferral of a prior closure of a CCRMU as substantially equivalent, the facility must also document that the CCRMU meets one of two existing performance standards: either: (1) The standard in § 257.60 that the unit was constructed with a base that is located no less than 1.52 m (5 feet) above the upper limit of the uppermost aquifer, or must demonstrate that there is no intermittent, recurring, or sustained hydraulic connection between any portion of the CCR unit and the upper limit of the uppermost aquifer or surface water; or (2) The dewatering standard in § 257.102(d)(2)(i) that all free liquids

have been eliminated. This requirement directly addresses the reason that EPA has concluded that many previously completed closures do not meet the standard in RCRA section 4004(a).

In addition, a facility must document that it had installed a groundwater monitoring system and performed groundwater monitoring that meets a subset of the performance standards found in § 257.91(a). Specifically, the facility must demonstrate that the groundwater monitoring system was capable of: (1) Accurately representing background water quality, (2) Accurately representing the quality of water passing the waste boundary, and (3) Detecting contamination in the uppermost aquifer. The groundwater monitoring system must have monitored all potential contaminant pathways.

Next, a facility would need to demonstrate that a site-specific risk assessment was conducted or approved by the regulatory authority prior to (or as part of) approving the closure, and that the closure and any necessary corrective action has been overseen by the regulatory authority, pursuant to an enforceable requirement.

Finally, the facility would be required to prepare and include documentation in the applicability report and operating record, demonstrating that it has met these criteria and is eligible for deferral. The documentation must include specifics including the State permit, order, data, GWM results, etc. This must be certified by the owner/operator or an authorized representative using the same language in § 257.102(e).

When it comes time for the permit authority to evaluate the closure, EPA intends to rely on the permit application process as the primary mechanism to collect the information to allow a determination to be made as to whether a CCRMU that closed under these alternative standards did so in compliance with the requirements of § 257.102. The permit application process is a well-established system for reviewing the types of groundwater, soil and other sampling and analytical data that will typically be required in determining the “equivalency” of alternative closures.

When the permit application is called in, the facility must provide sufficient information, including data on contaminant levels in ground water, to demonstrate that the applicable § 257.102 standards have been met. EPA or an approved State Director (the permitting authority) will review the information to determine whether the “equivalency” of the closure has been successfully demonstrated. If EPA determines that the closure has met the

appropriate part 257 closure standard, EPA or an approved State Director will issue a post-closure permit. If EPA or an approved State Director determines that the closure does not meet the part 257 standards, the owner or operator will be required to submit a permit application containing all the applicable information for an operating permit, and EPA will issue a permit that contains the specific requirements necessary for the unit to achieve compliance with § 257.102.

(b) Revisions to Performance Standards for Closing With Waste in Place

(1) Expansion of § 257.102(d)(2)(i) to CCR Landfills

Given the locations of many CCRMU (located in floodplains, or wetlands, or near large surface water bodies), EPA is concerned that the base of these units may intersect with the groundwater beneath the unit. As EPA has previously explained, where the base of a surface impoundment intersects with groundwater, the facility will typically need to include engineering measures specifically to address any continued infiltration of groundwater into the impoundment in order to close with waste in place consistent with § 257.102(d). See, *e.g.*, 87 FR 72989 (November 28, 2022), 85 FR 12456, 12464 (March 3, 2020). The same holds true for CCRMU that intersect with groundwater. The existing requirements in § 257.102(d)(1) and (3) apply to all CCR units and EPA proposed that these provisions would also apply to CCRMU without revision. By contrast, the existing requirements in § 257.102(d)(2), which establish performance standards for drainage and stabilization of the unit, only apply to CCR surface impoundments. These performance standards are critical to ensuring that units that contain liquids are properly and safely closed, and therefore should apply to any unit, including a CCRMU and a CCR landfill, where free liquids remain in the unit. Accordingly, EPA proposed to revise § 257.102(d)(2) so that it applies to all CCR units and CCRMU. To assist commenters, the proposal included a background discussion of the existing closure performance standards. Finally, EPA explained that if there are no liquids in the unit, the proposed revision would not require the facility to do anything to meet the performance standards.

Several commenters supported the proposed revision. For example, one commenter provided data about an unlined CCR landfill that was constructed above the groundwater table and was found to be “impacting

groundwater with high concentrations of heavy metals, with particularly high concentrations of boron fluctuating between 14 and 30 mg/L.” The State of Michigan required closure of this landfill due to groundwater impacts and after the landfill completed closure, “the boron concentrations returned to background concentrations approximately five years later.” The commenter further went on to state, “this example is provided to demonstrate that any type of water contact with CCR disposal areas can impact groundwater, causing concentrations to rise to concerning levels above water quality standards.” Another commenter suggested that, consistent with its statement in the proposal, EPA should further revise § 257.102 to clarify that the performance standards are met if there is no liquid in the CCRMU. The commenter recommended the following revisions to § 257.102(d)(1) and (2):

(1) General performance standard. The owner or operator of a CCR unit or CCR management unit that contains liquid must ensure that, at a minimum, the CCR unit or CCR management unit is closed in a manner that will: * * *

(2) Drainage and stabilization of CCR units and CCR management units. The owner or operator of any CCR unit or CCR management unit that contains liquid must meet the requirements of paragraphs (d)(2)(i) and (ii) of this section prior to installing the final cover system required under paragraph (d)(3) of this section.

A few commenters opposed extending § 257.102(d)(2) to CCR landfills and CCRMU, asserting that EPA had failed to provide a factual basis to justify the revision. For example, one commenter stated that:

There are two purposes for free liquids removal—addressing stability and potential groundwater contamination. For long-closed units, stability is demonstrably not a concern. For groundwater, any potential contamination can be addressed through corrective action rather than closure. . . . EPA does not explain why the existing corrective action regulations—which would require corrective action and potentially source control in the event groundwater contact causes impacts to groundwater—are insufficient. In short, the proposed extension of the requirements is unnecessary and unsupported by the record.

Another commenter contested the factual basis for the “proposed rule’s assumption” that CCR are in contact with groundwater. According to the commenter, CCR surface impoundments and CCR landfills are not located in the same hydrogeological environments and requires a site-specific evaluation to determine, which is beyond the requirements of the existing CCR

regulations. One commenter criticized EPA for failing to identify the 19 landfills “already regulated under the 2015 CCR final rule, but which have waste in contact with groundwater,” and depriving the public of an opportunity to comment on the accuracy of that proposed finding. Another commenter said it takes a very long time to eliminate free liquids in a CCRMU or landfill, which typically happens during post-closure care.

EPA disagrees that it has failed to justify the revision. The proposed rule did not rest on an assumption but on information (*e.g.*, annual groundwater monitoring and corrective action reports, closure plans) posted to facility CCR websites showing that the bases of their CCR landfills are in contact with groundwater. EPA has included a list of these facilities in the docket for this final rule. In addition, other commenters have provided further examples of landfills that are submerged in the aquifer. Moreover, while the commenter is correct that whether groundwater is infiltrating a particular unit is a site-specific determination, the commenter failed to provide any factual basis for its assertion that CCR surface impoundments and CCR landfills are never located in the same hydrogeological environments. And contrary to the commenter’s assertion EPA has repeatedly explained why it is insufficient to rely on corrective action rather than closure to address the risks associated with CCR landfills. The closure and corrective action regulations are distinct and independent requirements, each of which must be met. The closure in-place standards are designed to ensure that the waste in the closed unit has been dried out and is kept dry so that leachate cannot form in the closed unit and subsequently be released to the environment. See, *e.g.*, 47 FR 32318, 32321, 32323. For impoundments that are not yet leaking compliance with these provisions are largely designed to ensure that the closed unit does not become a source of future contamination. In other words, the closure standards are expressly designed to *prevent* groundwater contamination. By contrast, the corrective action provisions in §§ 257.96 through 257.98 contain the standards and procedures for cleaning up the contamination in the groundwater that has already leaked out of the unit. See, *e.g.*, 40 CFR 257.97(b)(2) and (4) (requiring that clean up remedies “attain the groundwater protection standard [in] § 257.95(h)” and “remove from the environment as much of the contaminated material as was released

from the CCR unit as feasible”). See, *USWAG*, 901 F.3d at 429–430, 431.

EPA appreciates the commenter’s suggested alternative regulatory text; however, EPA is concerned that the suggested revision is effectively redundant of the new definition of “contains CCR and liquids” and would not clearly communicate the entities that are subject to the regulation. Therefore, EPA is finalizing this requirement as proposed. In addition, because it can take a significant amount of time to meet the performance standards in § 257.102(d)(2), EPA has extended the closure deadlines applicable to any CCR landfill that needs to meet these standards.

(2) Definition of Infiltration

EPA requested comment on whether to adopt a regulatory definition of the term “infiltration,” consistent with term’s plain meaning and the dictionary definitions discussed in the preamble.

Several commenters agreed that EPA should adopt a regulatory definition of infiltration that explicitly recognizes the myriad ways that liquids can infiltrate CCR surface impoundments. Some commenters supported EPA’s proposed definition of “infiltration” because industry has argued that “the presence of groundwater in ash ponds is essentially irrelevant to closure compliance and that the CCR Rule’s closure in place requirements are limited to draining the surface portion of the pond, constructing a final cover, and preventing surface water—but not groundwater—infiltration thereafter.” Another commenter stated EPA should define “infiltration” to make clear that it is “a general term that refers to the migration or movement of liquid into or through a CCR unit from any direction, including the top, sides, and bottom of the unit.”

Other commenters objected to EPA’s proposal to adopt a definition, citing ongoing litigation in *Electric Energy, Inc., et al. v. EPA*, Case Nos. 22–1056 and 23–1035. These commenters complained that EPA makes no mention of this litigation in the proposed rule, even as it claims that its interpretation is “sufficiently clear that a definition is not necessary.” One commenter further stated that if EPA ultimately elects to adopt regulatory definitions of those terms, it should wait until the court rules so that the definitions are informed by and consistent with any such ruling.

Another commenter asserted that EPA must acknowledge (and make a good faith attempt to reconcile) the competing interpretations of key terms

of art in the 2015 CCR Rule before extending them into this final rule.

One commenter argued that even if EPA adopted its proposed definition, the rule provides no criteria—in contrast to the detailed criteria for the necessary cover system—for how to “control, minimize or eliminate to the maximum extent feasible” horizontal groundwater “infiltration.” The commenter alleged that “this type of undefined performance standard would be void for vagueness, especially when compared to the great lengths EPA went to specify the other technical criteria to address vertical infiltration in the performance standard.”

EPA also received numerous comments recommending that infiltration be defined by reference to technical definitions that define infiltration as exclusively the vertical flow of water from the surface down into the unit. These included a definition provided by the U.S. Geological Survey (“USGS”), as “flow of water from the land surface into the subsurface.” Also, according to the USGS: “Water that infiltrates at land surface moves vertically downward to the water table to become ground water. The ground water then moves both vertically and laterally within the ground-water system.”

As discussed previously, EPA disagrees that it is necessary to wait until the court issues its decision in the pending litigation (*Electric Energy, Inc., et al. v. EPA*, Case Nos. 22–1056 and 23–1035). However, the court may rule on the procedural question at issue, it would not resolve the substantive question EPA posed in the proposal, of whether the inclusion of a definition would be useful.

EPA also disagrees that it should adopt a definition of infiltration as exclusively the vertical flow of water from the surface down into the unit. The purpose of adopting a definition is not to establish a generic definition of infiltration, but to assist in the application of standards to ensure that a CCR unit closes in a manner that will protect human health and the environment. When promulgating definitions applicable in regulatory programs, EPA relies not only on available dictionary definitions, but also the surrounding context of the regulation as a whole, as well as what will best achieve the overall purpose of the regulation, and the Agency’s statutory mandate. None of the commenters address any of these factors in recommending that EPA adopt their various technical definitions. In this case, the plain language definition of infiltration best fits within the context

of the regulation as a whole, and best achieves both the purpose of the regulation and the RCRA section 4004(a) mandate to protect human health and the environment. This is because under the commenters’ unnecessarily restrictive definitions the regulation would allow a significant number of sites to continue leaking hazardous constituents, such as arsenic and mercury, indefinitely.

Accordingly, the final rule adopts a definition of infiltration based on the dictionary definitions discussed in the proposal. The final rule defines infiltration to mean “the migration or movement of liquid, such as surface water or ground water, into or through a CCR unit from any direction, including from the surface, laterally, and through the bottom of the unit.” This definition also is consistent with two technical sources that use infiltration more broadly by incorporating lateral flow through continuous porous media. As EPRI explained in its comments, *Geotechnical Aspects of Landfill Design and Construction* (Qian 2002) does not contain an explicit definition of infiltration but does refer to both “surface water infiltration” and “groundwater infiltration” in its description of landfill leachate. Similarly, the National Research Council in *Assessment of the Performance of Engineered Waste Containment Barriers* (National Research Council 2007) does not explicitly define infiltration but uses infiltration to describe surface water and groundwater movements into waste as well as soil migration into drainage systems.

With respect to the comment requesting EPA to “acknowledge (and make a good faith attempt to reconcile) the competing interpretations of key terms of art in the 2015 regulation,” EPA considers that its adoption of this definition does this. As noted, the definition is consistent with both the plain language meaning of the term, and with relevant technical sources. Further, the definition fits within the context of the regulation as a whole and best achieves both the purpose of the regulation and RCRA’s mandate to protect human health and the environment.

Finally, EPA disagrees that the regulation, with or without a regulatory definition of infiltration, is unconstitutionally vague. The scope of the regulatory definition is clear, and thus regulated parties have adequate notice of the rule’s requirements.

In point of fact, the commenter’s complaint is not that it cannot

determine what is required under the regulation, but that it dislikes what the plain language clearly compels. Relying on the plain language definition of infiltration simply requires facilities that want to close an unlined CCR impoundment with waste in place to implement engineering measures to “control, minimize, or eliminate, to the maximum extent feasible” liquid entering the unit from the sides or the base of the unit. EPA has previously identified several reasonably available engineering measures exist that can prevent, or at least control, the flow of groundwater into the unit (and consequently the releases out of the unit). For example, EPA’s 1982 guidance on the closure of hazardous waste surface impoundments, which the commenter also references, identifies several engineering controls “to prevent the subsurface flow of ground water into the impounded waste.” EPA Office of Solid Waste, Closure of Hazardous Waste Surface Impoundments, SW-873, p 81 (September 1982), Revised Edition (emphasis added). In other words, the regulation “clearly proscribes” the commenter’s preferred conduct of closing its CCR impoundments without addressing the groundwater in its unit. Finally, § 257.102(d)(1)(i) is no more vague than the corresponding requirement in § 265.111(a), which has been in effect since 1982 (requiring interim status facilities to “control, minimize or eliminate to the extent necessary to protect human health and the environment, post-closure releases of leachate . . .”). The clarity of this regulation is shown by the fact that, over the past 40 years the regulation has been in effect, interim status hazardous waste facilities have been able to adequately determine what the regulation requires and comply with it. The commenter has offered nothing to distinguish the interim status requirements from those in § 257.102(d)(i).

(3) Closure in Place Performance Standards Under § 257.102(d)

The May 2023 proposal explained how the performance standards for closing with waste in place applied to a CCR surface impoundment that intersected with groundwater. EPA received a number of comments that agreed with the Agency’s explanation, as well as several that opposed it. Several commenters raised objections they had previously presented in the context of prior decisions. EPA has previously responded to these comments in detail in (1) U.S. EPA. Denial of Alternative Closure Deadline for General James M. Gavin Plant,

Cheshire, Ohio (November 18, 2022) in the docket at EPA-HQ-OLEM-2021-0590-0100; (2) 88 FR 31982 (May 18, 2023); and (3) 88 FR 55220 (August 14, 2023). EPA continues to be unpersuaded by the commenters objections and to avoid any confusion is reiterating below the explanation provided in the May 2023 proposal.

The CCR closure requirements applicable to closing with waste in place include general performance standards and specific technical standards that set forth individual engineering requirements related to the drainage and stabilization of the waste and to the final cover system. The general performance standards and the technical standards complement each other, and both must be met at every unit.

The specific technical standards related to the drainage of the waste in the unit require that, “free liquids must be eliminated by removing liquid wastes or solidifying the remaining wastes and waste residues.” 40 CFR 257.102(d)(2)(i). Free liquids are defined as all “liquids that readily separate from the solid portion of a waste under ambient temperature and pressure,” regardless of whether the source of the liquids is from sluiced water or groundwater. 40 CFR 257.53. Consequently, the directive applies to both the freestanding liquid in the impoundment and to all readily separable porewater in the impoundment, whether the porewater was derived from sluiced water, stormwater run-off, or groundwater that migrates into the impoundment. In situations where the waste in the unit is inundated with groundwater, the requirement to eliminate free liquids thus obligates the facility to take engineering measures necessary to ensure that the groundwater, along with the other free liquids, has been permanently removed from the unit prior to installing the final cover system. See, 40 CFR 257.102(d)(2)(i).

In addition to the process-specific technical requirements, all closures must meet the requirements in the general performance standard to “control, minimize or eliminate, to the maximum extent feasible,” both post closure infiltration of liquids into the waste and releases of CCR or leachate out of the unit to the ground or surface waters, and to “preclude the probability of future impoundment of water, sediment, or slurry.” 40 CFR 257.102(d)(1)(i), (ii).

In situations where the groundwater intersects an unlined CCR unit, water may infiltrate into the unit from the sides and/or bottom of the unit because

the base of the unit is below the water table. In this scenario, the CCR in the unit will be in continuous contact with water. This contact between the waste and groundwater provides a potential for waste constituents to be dissolved and to migrate out of (or away from) the closed unit. In such a case, the general performance standard also requires the facility to take measures, such as engineering controls, that will “control, minimize, or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste” as well as “post-closure releases to the groundwater” from the sides and bottom of the unit. 40 CFR 257.102(d)(1).

Whether any particular unit can meet these performance standards is a fact and site-specific determination that will depend on a number of considerations, such as the hydrogeology of the site, the design and construction of the unit, and the kinds of engineering measures implemented at the unit. Accordingly, the fact that prior to closure the base of a unit intersects with groundwater does not mean that the unit may not ultimately be able to meet the performance standards in § 257.102(d) for closure with waste in place.

Depending on the site conditions, a facility may be able to meet these performance standards by demonstrating that a combination of engineering measures and site-specific circumstances will ensure that as a consequence of complying with the closure performance standards, the groundwater will no longer be in contact with the waste in the closed unit. As one example, where groundwater intersects with only a portion of an impoundment, the facility could close that portion of the unit by removing the CCR from that area of the unit but leaving waste in place in other areas. As another example, if the entire unit sits several feet deep within the water table, engineering controls can potentially be implemented to stop the continued flow of groundwater into and out of the waste. See, EPA Office of Solid Waste, Closure of Hazardous Waste Surface Impoundments, SW-873, p 81 (September 1982), Revised Edition.

(4) Methods and Tools for the Identification and Elimination of Free Liquids

Many commenters requested EPA provide greater clarity regarding the closure performance standard that requires that “free liquids must be eliminated by removing liquid wastes or solidifying the remaining wastes and waste residues.” 40 CFR 257.102(d)(2)(i). Commenters stated that there continues to be confusion over

what technical means and methods can be implemented to meet EPA's expectations and, in particular, what design considerations must be taken into account to achieve compliance with the existing closure performance standards (as applied to both currently and newly regulated units). The commenters explained that there are no regulatory specifications for eliminating free liquids prior to installing the final cover system or controlling, minimizing or eliminating, to the maximum extent feasible, the post-closure infiltration of liquids as required by § 257.102(d)(2)(i) and (d)(1)(i), respectively.

In response to these requests, EPA is providing further information with this final rule. EPA has included in the docket to this rulemaking a document titled "Methods and Tools for the Identification and Elimination of Free Liquids." A summary of some of the main points of the guidance are discussed below.

The document discusses many of the methods and tools needed to identify and eliminate free liquids that are already widely used by industry to investigate and close surface impoundments. For example, tools that may be used to identify free liquids include soil borings and cone penetrometers to map the stratigraphy of the CCR unit and characterize the geotechnical and hydraulic properties of the various CCR layers, as well as the installation of traditional piezometers, monitoring wells and vibrating wire piezometers to monitor pore pressures and water levels. Properly constructed wells and piezometers screened in the appropriate locations and depths have a prominent role in networks of instruments necessary for assessing free liquids in that their design directly measures water levels under ambient conditions. At the most basic level water levels in wells and piezometers are indicative of free liquids. Conversely, networks of wells and piezometers could be used as part of a program used to determine that free liquids no longer exist. Similarly, methods and tools to eliminate free liquids within the CCR, such as rim ditches, pumping wells, extraction wellpoints are also currently employed by industry. These technologies also provide insights into the presence and nature of free liquids at a given CCR unit, *e.g.*, rim ditches and open excavations enable direct observation of free liquids.

Finally, the document identifies considerations useful to developing successful site-specific strategies and approaches to identify, measure, monitor and eliminate free liquids.

Longer term variables such as potential groundwater intrusion or other influences are also discussed. In summary, full compliance requires successful sustained attainment of performance standards over the long term. Designing successful approaches will necessarily involve careful consideration of all potential sources of free liquids, including groundwater. Owners or operators of units that contain CCR in contact with groundwater will likely need to take additional actions such as CCR removal or implement specific engineering measures applied over time frames needed to preclude groundwater from intruding back into CCR units after free liquids have been initially eliminated.

iv. Preparation of a Written Closure Plan for CCR Management Units

EPA proposed that owners or operators of CCRMU comply with the existing requirements of § 257.102(b) requiring the preparation of a written closure plan no later than 12 months after the effective date of the final rule.

As mentioned in Unit III.C.4.d, aside from those commenters that disagreed with requiring CCRMU to comply with overall closure requirements, commenters on the proposed rule agreed that the written closure plan requirement would generally be appropriate for CCRMU. One commenter suggested additional requirements for the content of the closure plan including the elevation of the base of the unit, groundwater information, and descriptions of compliance with § 257.102 will be achieved (*e.g.*, how free liquids would be eliminated, how waste will be stabilized, measures to minimize the need for further maintenance of the CCR unit). A few commenters supported the proposed deadline but as summarized in Units III.C.4.a and III.C.4.d of this preamble, other commenters stated the proposed deadline was infeasible and inappropriate. One commenter suggested the deadline for the closure plan be extended to be concurrent with the initiation of closure. Another commenter requested EPA create extension mechanisms for this requirement based on the number of CCRMU at the facility. Commenters suggestions for the deadline for the completion of the closure plan ranged from 12 (the 2015 CCR Rule deadline) to 60 months.

EPA disagrees with the commenter that additional requirements regarding the content of the closure plan are necessary. The information the commenter requested be included in the closure plan is 1) already required to be

in the closure plan pursuant to §§ 257.102(b) or 2) readily available in other required reports (*e.g.*, the annual groundwater monitoring and corrective action reports). Furthermore, the commenter failed to fully explain how compliance with § 257.102(b) does not provide the information needed to determine if compliance with the closure performance standards will be met.

Regarding the deadline, for the same reasons in Units III.B.2.g and III.B.2.g.iv.b for legacy CCR surface impoundments, EPA concludes that the deadline for the closure plan should be extended from the proposed deadline to allow for owners or operators to incorporate information about groundwater quality, groundwater flows, seasonality impacts, and the migration of contaminants (if any) into the plan. Therefore, EPA is finalizing a deadline of no later than Wednesday, November 8, 2028, which is 48 months after the effective date. This final deadline extends the proposed deadline by 36 months and EPA expects that this adequately address the concern regarding the infeasibility of the deadline expressed by a commenter requesting EPA create extension based on the number of CCRMU at the facility. This is codified in the regulatory text at § 257.102(b)(2)(iii).

However, consistent with the requirements for legacy CCR surface impoundments, EPA is not requiring compliance with the written closure plan requirement for CCRMU that, by the effective date of this final rule, have completed: (1) closure with waste in place or (2) a closure eligible for deferral to permitting as described in § 257.101(g). Instead, the final rule requires the owner or operator to provide information on the completed closure of the CCRMU, along with supporting documentation to demonstrate that the closure meets the performance standards in § 257.102(d) or the standards specified in § 257.101(g). This is codified in the regulatory text at § 257.102(b)(2)(v).

Based on comments on the proposed rule and experience from the 2015 CCR Rule, EPA expects the incorporation of this information into the closure plan will allow facilities to select a closure method that most appropriately addresses issues like waste that is in contact with groundwater, groundwater contamination, and long-term structural stability concerns. Closure plans that adequately address these issues will result in better protection of human health and the environment.

The closure plan describes the steps necessary to close a CCR unit at any

point during the active life of the unit based on recognized and generally accepted good engineering practices. 40 CFR 257.102(b)(1). The plan must set out whether the closure of the CCR unit will be accomplished by leaving CCR in place or through closure by removal and include a written narrative describing how the unit will be closed in accordance with the section, or in other words, how the closure will meet all the performance standards in the regulations. 40 CFR 257.102(b)(1)(i). The written closure plan must also provide a schedule for completing all activities necessary to satisfy the closure criteria of the rule. See also 80 FR 21410–21425.

If the CCR is left in place, the closure plan must include a description of the final cover system and how the final cover system will achieve the regulatory performance standards. If the base of the impoundment intersects with groundwater, the closure plan would need to discuss the engineering measures taken to ensure that the groundwater had been removed from the unit prior to the start of installing the final cover system, as required by § 257.102(d)(2)(i). The closure plan would also need to describe how the facility plans to meet the requirements in § 257.102(d)(1) to “control, minimize or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste and releases of CCR, leachate, or contaminated run-off to the ground or surface waters.” This could include, for example, the installation of engineering controls that would address the post-closure infiltration of liquids into the waste from all directions, as well as any post-closure releases to the groundwater from the sides and bottom of the unit.

v. Preparation of a Written Post-Closure Care Plan for CCR Management Units

EPA proposed that owners or operators of CCRMU would be required to comply with the existing requirement in § 257.104(d) regarding the preparation of a written post-closure no later than 12 months after the effective date of the final rule.

As mentioned in Unit III.C.4.d, aside from those commenters that disagreed with requiring CCRMU to comply with overall closure requirements, commenters on the proposed rule agreed that the written post-closure care plan requirement would generally be appropriate for CCRMU. Overall commenters requested an extension of the post-closure care deadline to allow for a more feasible deadline and the incorporation of groundwater monitoring data. Another commenter requested EPA create extension

mechanisms for this requirement based on the number of CCRMU at the facility. For the same reasons in Units III.B.2.g and III.B.2.g.iv.c for legacy CCR surface impoundments, EPA is finalizing a deadline of no later than Wednesday, November 8, 2028, which is 48 months from the effective date of the final rule to comply with the post-closure care requirement in § 257.104(d). This final deadline extends the proposed deadline by 36 months and EPA expects that this adequately address the concern regarding the infeasibility of the deadline expressed by commenter requesting EPA create extension based on the number of CCRMU at the facility. This is codified in the regulatory text at § 257.104(d)(2)(iii).

Section 257.104(d) requires that an owner or operator of a CCR unit prepare a written post-closure plan. The contents of the P.E.-certified plan are stated in the rule § 257.104(d)(1)(i) through (iii) and can be summarized as a description of the monitoring and maintenance activities required for the unit, the frequency that these activities will be performed, information for the point-of-contact during the post-closure care period, and planned uses of the property.

vi. Deadline To Initiate Closure for CCR Management Units

EPA proposed that owners or operators of CCRMU initiate closure no later than 12 months after the effective date of the final rule. As explained in the proposed rule, the proposed deadline was expedited from the 2015 CCR Rule to address the risks posed from these units and EPA’s estimated minimum amount of time necessary to collect the information needed to determine whether to close the unit in place or close by removal.

Several commenters expressed support for the proposed 12-month deadline to initiate closure, stating that the shorter deadlines are necessary to address the increased risk from CCRMU and likelihood these units are and have been contaminating groundwater. However, as mentioned in Unit III.C.4.d, many other commenters characterized the proposed deadline as infeasible for the reasons mentioned in Unit III.C.4.a, including seasonality, need to comply with overlapping regulatory requirements, labor shortages, and the strain on the limited resources necessary to achieve compliance (e.g., contractors, laboratories, P.E.s) caused by the number of CCR units coming into compliance at the same time. Commenters emphasized the importance of the groundwater monitoring data to inform closure,

stating that compliance with the closure requirements should not be required until after the groundwater monitoring system was installed and baseline samples collected. These commenters pointed to recent EPA Part A and Part B decisions as evidence of the gap between EPA’s expectations and the closure and post-closure plans developed by owners or operators and best practices; these commenters further stated that the proposed deadline precludes the incorporation of groundwater monitoring data in developing closure plans and is likely a contributing factor to the gap between EPA’s expectation and closure and post-closure care plans submitted by owners or operators of currently regulated units. Additionally, as described in Unit III.C.4.d.ii, several commenters requested the delays for the initiation of closure for CCRMU beneath critical infrastructure until the decommissioning or closure of the infrastructure or facility. Finally, a few commenters suggested EPA create extensions for the deadline to initiate closure to address concerns about comply with overlapping State permitting requirements or based on the number of CCRMU present at the facility. Commenters’ suggestions for alternative deadlines to initiate closure ranged from 12 with extensions to 60 months, or at least after the collection of the baseline groundwater monitoring samples required by § 257.94.

Consistent with the approach for legacy CCR surface impoundments closure, EPA acknowledges the benefit of allowing owners or operators the time needed to incorporate groundwater monitoring data into the closure plan. Additionally, as stated in the proposed rule, EPA acknowledges the importance of using information gained by compliance with the groundwater monitoring and corrective action requirements to inform closure decisions and therefore the initiation of closure. For the reasons explained in Unit III.C.4.c, EPA is extending the deadline for the groundwater monitoring and corrective action requirements to a single deadline of no later than 42 months from the effective date of the final rule. As such, the initiation of closure is being extended as well. To ensure owners or operators have enough groundwater monitoring data to draw conclusions about seasonality impacts on groundwater levels and flow and the source of any potential groundwater contamination in the area, EPA is finalizing a deadline of no later than Tuesday, May 8, 2029, which is 54 months from the effective

date of the final rule. This is codified in the regulatory text at § 257.101(f)(1). This final deadline extends the proposed deadline by 42 months and EPA expects that the concerns expressed by commenters requesting EPA create extensions (*i.e.*, the need to comply with State permitting requirements and the number of CCRMU at the facility) are addressed by this overall deadline extension. Finally, regarding those CCRMU under critical infrastructure, owners or operators of these units have the opportunity to defer the deadline to initiate closure until the Agency can address these units on an individual basis as part of permitting. See Unit III.C.4.d.ii.

vii. Deadline To Complete Closure for CCR Management Units

EPA proposed to apply the current CCR surface impoundment closure time frames at § 257.102(f) to CCRMU. The existing CCR regulations currently require an owner or operator of a CCR surface impoundment generally to complete closure activities within five years from initiating closure. The regulations also establish the conditions for extending this deadline, upon a showing that additional time is necessary. Consistent with the existing requirements for CCR surface impoundments, EPA proposed the amount of additional time that an owner or operator could obtain would vary based on the size (using surface area acreage of the CCR unit as the surrogate of size) of the CCRMU. For CCRMU 40 acres or smaller, the proposed maximum time extension is two years. For CCRMU greater than 40 acres, the proposed maximum time extension is five 2-year extensions (10 years), and the owner or operator must substantiate the factual circumstances demonstrating the need for each year extension.

Several commenters expressed support for the proposed deadlines to complete closure, citing the increased risk from CCRMU and likelihood these units are and have been contaminating groundwater. However, many commenters on the proposed rule requested an extension of the deadline to complete closure to allow for a more feasible deadline and to mitigate the factors mentioned in Unit III.C.4.a. Some of these commenters stated if the deadline to initiate closure was extended to no less than the time granted for CCR unit closure in the 2015 CCR Rule, then the proposed deadlines would be feasible. These commenters supported the ability of CCRMU to seek extensions of the deadline based on size. However, a few of the commenters requested longer extensions or an

increase in the maximum number of extensions for CCRMU. These commenters cited factors mentioned in Unit III.C.4.a as reasons to allow for longer or more extensions (*i.e.*, third-party availability, need to comply with State permitting requirements prior to certain activities, backlogs, number of CCR units coming into compliance at the same time). One commenter stated more extensions were necessary to meet the closure performance standards in § 257.102 (*i.e.*, remove liquid from the unit and meet the groundwater protection standards).

For the reasons described throughout this Unit of the preamble, EPA has extended the deadline for the initiation of closure. EPA expects the extension to the deadlines for the closure plan and initiation of closure, as well as the options to defer closure requirements for CCRMU under critical infrastructure and those that have completed closure under a regulatory authority (see Units III.C.4.d.ii and III.C.4.d.iii.a, respectively), to address the concerns commenters expressed with the infeasibility or inappropriateness of the deadline to complete closure. Furthermore, with respect to requests for longer or more extensions for CCRMU as compared to the existing CCR regulations, EPA still concludes that as explained in the proposed rule, CCRMU closure will closely resemble CCR impoundment closures because of half of these identified potential CCRMU were associated with former, Federally unregulated CCR surface impoundments. Additionally, the requirements for former impoundments to be closed with waste in place (*i.e.*, procurement, transportation, and placement of substantial volumes of soil or borrow material), would also apply to certain CCR fill placements as well as to inactive CCR landfills where past waste disposal did not reach the landfill's design capacity (*i.e.*, landfill airspace was not fully utilized). As such, in these situations, EPA has determined the time frames to complete closure for existing CCR surface impoundments are appropriate (*i.e.*, 5 years). Finally, as discussed in proposed rule, the Agency believes that the base of at least some CCRMU may intersect with the groundwater because CCRMU may be located in floodplains or wetlands, or near large surface water bodies. EPA's experience in implementing the regulations is that such closures are generally more complex and take longer to complete. EPA thus believes the time frames to complete closure of CCRMU should be the same as the time frames provided for existing CCR surface

impoundments. No commenters provided factual information or evidence to support the conclusion that CCRMU closure, apart from those CCRMU under critical infrastructure or closed under a regulatory authority mentioned above, is different enough from closure of units regulated under the 2015 CCR Rule to warrant additional extensions or separate requirements. Therefore, EPA is finalizing the deadline for the completion of closure of CCRMU as proposed. This is codified in the regulatory text at § 257.102(f).

viii. Post-Closure Care for CCR Management Units

EPA proposed to apply the existing post-closure care requirements at § 257.104 to CCRMU without revision. These criteria are essential to ensuring the long-term safety of CCRMU.

As mentioned in Unit III.C.4.d, aside from those commenters that disagreed with requiring CCRMU to comply with overall closure requirements, no commenters raised specific concern about requiring CCRMU to comply with the existing requirements in § 257.104. However, one commenter suggested that EPA allow units that have closed under a State program to either continue post-closure care under that State program or reduce the post-closure care period for these units by the number of years of post-closure care completed under the State program. As described in Unit III.C.4.d.iii(a), EPA is finalizing a provision to address closures completed under other authorities provided the closure meets specific criteria by deferring any closure activities to permitting, including the determination of when post-closure care is completed. In instances where the criteria for deferral to permitting has been met and units have conducted post-closure care under a State program for many years, the permitting authority, once authorized, will be able to look at the site-specific information, including the closure and the specific activities required by the State's post-closure care program, and determine what, if any, further closure or post-closure activities would be appropriate. EPA is therefore finalizing this provision without revision.

The existing post-closure care criteria require the monitoring and maintenance of units that have closed in place for at least 30 years after closure has been completed. 40 CFR 257.104. During this post-closure period, the facility would be required to continue groundwater monitoring and corrective action, where necessary.

e. Recordkeeping, Notification and Internet Posting for CCR Management Units

EPA proposed that, like legacy CCR surface impoundments, owners or operators of CCRMU be subject to the existing recordkeeping, notification and website reporting requirements in the CCR regulations found at §§ 257.105 through 257.107. EPA also proposed changes to add CCRMU to § 257.107(a) to require the facility to notify the Agency using the procedures for the establishment of the website no later than the effective date of the final rule. For reasons specified in the 2015 CCR Rule, the CCR regulations require the owner or operator of a new or existing CCR unit to record specific information in the facility's operating record, maintain files of all required information (e.g., demonstrations, plans, notifications, and reports) that supports implementation and compliance with the rule, notify State Director and Tribal authorities, and maintain a public CCR website that hosts this information. 80 FR 21427.

A commenter supported applying recordkeeping, notification, and internet posting requirements to CCRMU but stated that the existing requirements were ineffective at ensuring compliance with the CCR regulations or allowing for meaningful public awareness or participation. The commenter suggested that EPA create mechanisms within the rule to ensure the public has the opportunity to participate in the decision-making processes at regulated CCR units; standardize reporting to make the report more easily understood by the public; establish organizational requirements for the CCR websites; require public notice and engagement when notifying the State Director and/or appropriate Tribal authority as required by the CCR rule; extend the period of time the files required by the CCR rule must be maintained in the operating record; and require owners or operators certify compliance documentation for the CCR units. This commenter also suggested EPA clarify what records owners or operators are required to retain and to publish. Other commenters suggested the website requirement not be due until the first document is required to be posted.

EPA agrees with the commenter on the importance of meaningful public participation. The current regulations allow for public participation by requiring owner or operators to hold a public meeting as part of the assessment of corrective measures in § 257.96, creating a mechanism for the public to file dust complaints in § 257.80(b), and

the "contact us" form or specific email address on facilities' public CCR websites for questions or issues from the public as required by § 257.107(a). Public comment periods are also held as part of the determination process for Part A and Part B demonstrations; however, these demonstrations are not applicable to CCRMU. EPA does not have evidence to support the claim by the commenter that these opportunities for public participation are ineffective. Furthermore, EPA does not find other decision-making points in the rule appropriate for mandatory public meetings or public comment periods although facilities are encouraged to engage with the public and to both solicit and incorporate public input into decisions, such as closure methods, as able and appropriate.

With respect to the commenter's suggestions that EPA require the owners or operators of CCR units to certify compliance documentation and create standardized reporting and website layout requirements, as explained in the proposed rule, EPA does not have evidence that CCRMU are sufficiently different than currently regulated facilities to necessitate substantially different requirements. The commenter provided no factual basis to support the suggestion that requiring owner or operator certifications would improve compliance with the regulations beyond the certifications currently required by professional engineers. When justifying the request for standardized reporting and website layout requirements, the commenter failed to explain how compliance with the public website posting requirements in § 257.107, including the requirement to ensure all information is "clearly identifiable and must be able to be immediately printed and downloaded by anyone accessing the site" is inadequate or a hindrance to the public accessing the required information. Therefore, EPA does not believe additional notification, certification, or public engagement requirements for CCRMU would be appropriate.

EPA agrees with the commenter on the need to extend the period of time files required by the CCR rule must be maintained on the facilities' public websites and in the operating records. As described in Unit III.D.5, EPA is extending how long files must be maintained in the operating record and on the public website. While EPA believes the regulations at §§ 257.105 and 257.107 clearly lay out what records must be retained and published, EPA has included in Unit III.D.5. a table that details what records are required to be maintained in the operating record and

on the public website as well as the corresponding retention periods. No commenters raised concerns about requiring CCRMU to comply with the existing requirements in §§ 257.105 through 257.107.

Lastly, EPA agrees with the commenters who suggested the deadline for the establishment of the website coincide with the first required document (i.e., the FER Part 1). Therefore, EPA is finalizing a deadline of 15 months after the effective date for the establishment of the website.

EPA is also finalizing the requirement that owners or operators of CCRMU comply with recordkeeping, notification, and internet posting requirements at §§ 257.105 through 257.107.

As discussed in Unit III.B.2.h of this preamble, owners or operators must document implementation and compliance with the rule and must place these files into the facility's operating record. Each required file must be maintained in the operating record for the entirety of the retention period specified in § 257.105 following submittal of the file into the operating record. Each file must also indicate the date the file was placed in the operating record. Files are required to be submitted into the operating record at the time the documentation becomes available or by the compliance deadline specified in the CCR regulations. Section 257.105 contains a comprehensive listing of each recordkeeping requirement and corresponding record retention periods.

Furthermore, the owner or operator of a CCRMU must maintain a CCR website titled, "CCR Rule Compliance Data and Information" that hosts the compliance information so that it may be viewed by the public. Unless provided otherwise in the rule (see, Unit III.E.5), information posted to the CCR website must be available for a period no less than five years from the initial posting date for each submission. Posting of information must be completed no later than 30 days from the submittal of the information to the operating record. Owners or operators of CCRMU have 15 months from the effective date of this rule to establish a CCR website and post the required applicable information.

D. Closure of CCR Units By Removal of CCR

1. Background

On March 3, 2020, in the Proposed Rule entitled: Hazardous and Solid Waste Management System: Disposal of CCR; A Holistic Approach to Closure Part B: Alternate Demonstration for

Unlined Surface Impoundments; Implementation of Closure, EPA proposed to revise the 2015 CCR Rule to, among other things, provide facilities with an additional option for CCR units being closed by removal of CCR. 85 FR 12456. Specifically, EPA proposed to allow a facility to complete the closure in two stages: first, by completing all removal and decontamination procedures; and second, by completing all groundwater remediation in a separate post-closure care period. 85 FR 12456. In this final rule, the Agency is taking final action on this proposal.

The closure by removal regulation consists of two performance standards. In the first standard, the owner or operator must remove all CCR from the unit and decontaminate all areas affected by releases from the CCR unit. In the second standard, the regulation specifies that closure is complete when all CCR in the unit and any areas affected by releases from the CCR unit have been removed and groundwater monitoring demonstrates that there are no exceedances of any groundwater protection standard. See § 257.102(c). Importantly, the second performance standard requires groundwater corrective action of a unit to be completed in order for closure of the unit to be considered complete.

As previously discussed, the CCR regulations also establish deadlines to initiate and complete closure activities. For example, the regulations generally require owners and operators of CCR surface impoundments to complete closure activities within five years of commencing closure activities, while closure of CCR landfills must be completed within six months. See § 257.102(f)(1). Notwithstanding these deadlines to complete closure, the CCR regulations also allow for additional time provided the owner or operator can make the prescribed demonstrations that are based on site-specific circumstances beyond the facility's control. For CCR surface impoundments, the amount of additional time beyond the five years varies based on the demonstrated need and the surface area acreage of the impoundment. For impoundments 40 acres or smaller, the maximum time extension that can be obtained is two years. For impoundments greater than 40 acres, the maximum time extension is five two-year extensions (for a total extension of ten years). For CCR landfills, the amount of additional time beyond the six months does not vary according to the size of the landfill, rather the maximum time extension is two one-year extensions (for a total extension of two years). To obtain

additional time, owners or operators of CCR units must substantiate the factual circumstances demonstrating the need for the extension. See § 257.102(f)(2). In all instances the number of time extensions is capped to a certain number of years.

The CCR regulations also require the owner or operator of the CCR unit to obtain a certification from a qualified professional engineer or approval from the Participating State Director (or EPA where EPA is the permitting authority) verifying that closure has been completed in accordance with the written closure plan and all applicable closure requirements of § 257.102. See § 257.102(f)(3). In addition, the owner or operator must prepare a notification stating that closure of the unit has been completed. This notification must be completed within 30 days of completion of unit closure and must include the certification required by § 257.102(f)(3). See § 257.102(h). As the CCR regulations are currently structured for units closing by removal of CCR, the closure certification and notification cannot be completed until all CCR removal and decontamination activities, including groundwater corrective action,¹⁴⁶ are completed. Prior to this final rule, owners and operators that complete closure of a unit by removal of CCR were exempt from any other post-closure care requirements for the unit and were also exempt from the deed notation requirements upon certification that closure by removal of CCR has been completed.

2. March 2020 Proposed Rule

Under the March 2020 proposal, an owner or operator that cannot complete groundwater corrective action by the time all other closure by removal activities have been completed (*i.e.*, during the active life¹⁴⁷ of the CCR unit) may complete groundwater corrective action during a post-closure care period. Under this option, the owner or operator must first complete all other removal and decontamination activities within the time frames provided for completing closure. In addition, EPA proposed to require the owner or operator to have implemented the remedy selected under § 257.97 such that all components of the remedy are in place and operating as intended prior to completing all

¹⁴⁶ For purposes of this preamble discussion, the term "groundwater corrective action" includes those actions taken to implement the selected remedy specified in § 257.98(c) to attain the groundwater protection standards in § 257.95(h).

¹⁴⁷ The "active life" of a CCR unit is defined in § 257.53 as the period of operation beginning with the initial placement of CCR in the CCR unit and ending at completion of closure activities in accordance with § 257.102.

removal and decontamination activities. Upon completion of all removal and decontamination activities (except for completion of groundwater corrective action) and implementation of the selected remedy, the owner or operator would be allowed to certify that the CCR unit has been closed. Thereafter, the CCR unit would be required to continue to conduct corrective action in accordance with the existing requirements in § 257.98 and would be subject to the existing post-closure care requirements in § 257.104 until completion of groundwater corrective action. EPA did not propose any substantive revisions to the current closure standard when closing by removal of CCR under § 257.102(c), but presented the current closure standard in a slightly revised format to accommodate the proposed action.

EPA proposed this option because the Agency received new information indicating that the closure of CCR units will likely be more complex than EPA envisioned in 2015, and that more than 40% of existing CCR surface impoundments were planned to be closed by removal of CCR. In addition, available information indicated that more than 70% of all CCR surface impoundments are unlined. EPA determined that, given the number of unlined CCR units, many of which have already reported exceedances of groundwater protection standards, it was evident that many CCR units have released CCR constituents into the surrounding soils and groundwater. EPA concluded that this meant that closure would not simply be a matter of removing CCR from the unit, but would likely require a significant undertaking to remediate impacted soil and groundwater in order to achieve the current CCR removal and decontamination standards. The proposal explained that based on this new information EPA concluded that the existing timelines to complete closure by removal of CCR were not designed to also provide sufficient time to complete groundwater corrective action. The Agency explained that it was also concerned that the existing deadlines in § 257.102(c) may create a disincentive to close a unit by removal of CCR.

After considering the comments received, the same considerations discussed in the proposal remain relevant. Moreover, the groundwater monitoring installed pursuant to the 2015 CCR Rule has documented groundwater contamination that is more extensive and more frequent than EPA had originally estimated. It is now apparent not only that a greater number

of facilities are electing to close by removal than EPA originally estimated, but also that some facilities may need to close by removal because they are unable to meet the standards to close with waste in place due to the site conditions. And more critically, EPA is concerned that, based on the existing time frames, some facilities could not comply with either performance standard because it is not feasible to remediate the contamination within the existing deadlines in § 257.102(f). EPA has therefore incorporated this provision into this final rule.

Most of the comments EPA received on this proposal¹⁴⁸ related to the revised regulatory text in § 257.102, the requirement to implement the corrective action remedy during the active life of the unit and the requirement for deed notifications. One commenter also stated that there was nothing in the record to demonstrate that facilities were not able to meet the existing § 257.102(c) performance standard by deadlines in § 257.102(f). The commenter also expressed concern that the proposed option would allow exceedances of groundwater protection standards to continue indefinitely after an impoundment is closed by removal. Further, the commenter contended that the proposed change did not include any additional requirements for owners and operators to substantiate the need to take additional time following removal activities. This, they stated, could incentivize the selection of the slowest, least protective corrective measures such as “natural attenuation,” allowing dangerous contamination to persist for long periods of time when it could have been stopped decades earlier. They were concerned that owners or operators would unreasonably select remedies that take much longer to achieve compliance over other available options that could achieve compliance faster.

The Agency disagrees that there is no record to support the need for additional time to complete groundwater remediation within the time frames provided in § 257.102(f). For example, this same commenter submitted comments on the May 2023 proposed rule providing examples of numerous plants who have certified the removal portion of closure by removal while noting the need for additional time beyond the existing deadlines in § 257.102(f) in order to be able to certify compliance with GWPS.¹⁴⁹ These facilities include Duke Energy’s Gibson Station, LG&E-KU’s Ghent Generating

Station, and Dominion Energy’s Possum Point Power Station.

Additionally, EPA compiled data on remediation efforts published in the Superfund 5-Year Review Reports conducted pursuant to CERCLA § 121(c).¹⁵⁰ The data review focused on sites that presented releases of metals similar to those expected at CCR facilities and sites that were likely to choose remediation technologies that could also be applicable to CCR facilities. The compilation included data for 20 sites with groundwater remediation remedies in place for at least 15 years. There were eight sites that implemented a combination of remediation strategies (for example, pump and treat and vertical barrier wall in the same site). The most common remedy noted was pump and treat (14 sites), followed by monitored natural attenuation (MNA) (eight sites), barrier walls (five sites), in-situ stabilization (two sites), and permeable reactive barriers (one site). At the time of this data compilation, 18 out of 20 remedies were still ongoing with cleanup durations ranging from 15 to more than 32 years. 11 of 20 remedies exceeded 20 years of operation.

The Agency also disagrees that the proposal would allow exceedances to continue indefinitely, and the owner or operator to purposely choose the slowest, least protective groundwater remediation technology. The facility would remain subject to the existing requirements for corrective action, §§ 257.96 through 257.98, which prohibit the actions the commenter describes. Additionally, the facility must have initiated remedial activities as required by § 257.98(a) during the active life of the unit in order to be eligible for this closure alternative. The sole exception to this would be where the facility only triggered corrective action for the constituent near the end of the closure process, and the facility cannot extend the active life of the unit because it would exceed a deadline in § 257.102(f). In such a case, the facility would be required to document that (1) it was in compliance with all applicable requirements in §§ 257.96 through 257.98; and (2) that it could not extend the active life of the unit, consistent with § 257.102(f).

¹⁵⁰ Memorandum from RTI International to Mary Jackson, U.S. EPA, Development of Benchmark Times for Conducting the Closure of CCR Units, February 29, 2024. Superfund 5-Year Review Reports conducted pursuant to CERCLA § 121(c). Available in the docket.

3. What EPA Is Finalizing Related to the March 2020 Proposed Rule

EPA is finalizing its proposal with some limited revisions adopted in response to public comments. Under this final rule and consistent with the proposal an owner or operator would be able to close a CCR unit by completing removal of all CCR from the unit and decontamination of all areas affected by releases from the CCR unit, except for groundwater, during the active life of the CCR unit, and completing the groundwater corrective action during post-closure care. The owner or operator will need to meet the following requirements when closing a CCR unit under this option. First, the owner or operator must complete all removal and decontamination activities, except groundwater corrective action, during the active life of the unit. Second, with one exception, the owner or operator must have begun to implement the corrective action remedy selected in accordance with §§ 257.96 through 257.97 to achieve compliance with the GWPS during the active life of the unit (*i.e.*, before completing closure). Third, groundwater corrective action must be completed during post-closure care. Fourth, the owner or operator must amend the written closure and post-closure plans to reflect this approach to close the unit. Fifth, the owner or operator must obtain the certification or approval of closure completion within the current time frames for closure in § 257.102(f). Finally, prior to the start of the post-closure care period, the owner or operator must record the notation on the deed to the property that the land has been used as a CCR unit. Each of these requirements is discussed further below. EPA is revising the regulatory text of § 257.102(c) and § 257.104(g) and (h). The revisions to § 257.104 are to make it clear that the unit must be in detection monitoring in order to complete post closure care.

a. Removal and Decontamination Activities

EPA proposed to revise the closure performance standard at § 257.102(c) to specify all of the various actions that would be required prior to certifying that closure is complete. EPA proposed that this would include removing or decontaminating all CCR and CCR residues, containment system components, contaminated subsoils, contaminated groundwater, and CCR unit structures and ancillary equipment. To qualify for the new closure by CCR removal option, owners or operators would need to complete all the specified removal and decontamination

¹⁴⁸ See the Response to Comments document found in the docket for this rule.

¹⁴⁹ EPA-HQ-OLEM-2020-0107-0368.

activities within the closure time frame except for completing groundwater remediation. The proposal specified that to demonstrate that all CCR has been removed from the unit, the owner or operator would need to remove the entire contents of the CCR unit, including all CCR and any CCR residues. This would include, for example, the removal of any fugitive dust (CCR) discovered outside the waste unit boundary. In addition, the proposal specified that any containment system components such as a bottom liner, contaminated subsoils, and unit structures and equipment (e.g., concrete outlet structures and ancillary piping) would have to be removed prior to closure of the unit. Finally, EPA proposed that any areas affected by releases from the CCR unit must have been removed (e.g., impacted soils beneath the bottom liner system).

Commenters pointed out that the term “CCR residues” was not a defined term. They also pointed out that it may not be necessary or wise to require the removal of ancillary equipment or structures if they are not contaminated with CCR. Further, they pointed out that requiring the removal of fugitive dust outside the unit boundary would expand the closure performance standard.

One commenter was concerned that the term “CCR unit structures,” appears to encompass both areas impacted by CCR disposal (which should be removed) and non-contaminated disposal unit structural components, which, according to the commenter, in some cases includes CCR that has been beneficially used in the construction of the impoundment or other disposal units (which the commenter asserted need not be removed). The commenter further stated that structural components, including those structures built with beneficially reused CCR (e.g., bottom ash), must be allowed to remain in place.

The Agency does not agree that components of the unit that are constructed with CCR can be left in place if the unit is in fact closing by removal of CCR. If the unit is to be “closed by removal of CCR,” consistent with the existing requirement to remove all CCR, the final rule requires that any components of the unit made of or including CCR must also be removed.

The regulatory text included in this final rule requires removing all CCR from the unit, including CCR mixed with soils or that are included in berms, liners or other unit structures, and either removing or decontaminating all areas affected by releases from the CCR unit. Although there are no soil cleanup standards in the CCR regulations, if the

soil beneath the unit is contaminated sufficiently to serve as a secondary source of groundwater contamination, its removal may be required as part of the source control portion of a remedy selected under § 257.97. To clarify, contaminated groundwater (groundwater with constituent concentrations triggering corrective action) must be remediated through the corrective action process detailed in §§ 257.96 through 257.98.

Although the regulatory text now specifies the removal and decontamination activities to be conducted, the Agency does not consider this to be a substantive revision to § 257.102(c). The revision is intended to clearly describe the activities that must be completed prior to closure under the new alternative in § 257.102(c)(2). The regulation now expressly describes how EPA interpreted the original phrase “CCR removal and decontamination.” Therefore, the regulatory text for § 257.102(c) has been revised from what was proposed:

(c) *Closure by removal of CCR.* An owner or operator closing a CCR unit by removal of CCR must follow the procedures specified in either paragraph (c)(1) or (c)(2) of this section. Closure by removal activities include removing or decontaminating all CCR and CCR residues, containment system components such as the unit liner, contaminated subsoils, contaminated groundwater, and CCR unit structures and ancillary equipment.

To what is being finalized:

(c) *Closure by removal of CCR.* An owner or operator that elects to close a CCR unit by removal of CCR must follow the procedures specified in either paragraph (c)(1) or (c)(2) of this section. Closure by removal is complete when CCR has been removed; any areas affected by releases from the CCR unit have been removed or decontaminated; and groundwater monitoring concentrations of the constituents listed in appendix IV to this part do not exceed groundwater protection standards established pursuant to § 257.95(h). Removal and decontamination activities include removing all CCR from the unit, CCR mixed with soils, and CCR included in berms, liners or other unit structures, and removing or decontaminating all areas affected by releases from the CCR unit.

Under this provision, the owner or operator must complete all CCR removal activities during closure prior to transitioning to the post-closure care period which will largely consist of a groundwater cleanup activity.

b. Implementation of Selected Remedy

Under the existing regulations, if one or more constituents in Appendix IV to part 257 are detected at SSLs above the

GWPS in any sampling event, the owner or operator must, among other requirements, initiate a corrective action program. See § 257.95(g). The corrective action program includes initiating an assessment of corrective measures to prevent further releases, to remediate any releases, and to restore affected areas to original conditions, as specified in § 257.96(a). After the ACM has been completed, the owner or operator must select a remedy that meets prescribed standards, including a requirement that the remedy attain the GWPS. See § 257.97(a) and (b). Finally, the corrective action program requires the owner or operator of the CCR unit to initiate remedial activities within 90 days of selecting a remedy. See § 257.98(a). EPA did not propose to revise any of these requirements as part of this option. However, under this closure option, the owner or operator must have initiated remedial activities required by § 257.98(a) prior to certifying that it has completed closure. This requirement would help ensure that impacted groundwater is returned to original conditions as soon as is feasible.

Several commenters objected to this requirement. Some of these commenters suggested that at many sites, it is not appropriate to implement a remedy before source removal is complete. Other commenters claimed that after excavation is complete at certain sites, new groundwater flow patterns may be established and/or groundwater chemistry may need to stabilize, and in these cases neither design nor implementation of a corrective measure may be practical before CCR removal is finished. A few commenters went further yet, stating that it would not be appropriate to require completion of an ACM and selection of a remedy until after CCR removal activities are complete. Finally, other commenters state that source control is required by § 257.97(b) and may be considered part of the remedy, therefore, implementation of the remedy would commence with closure by removal.

Under the existing regulations, the closure requirements and the corrective action requirements operate independent of one another, and facilities are required to comply with both. The commenters cite nothing to support their claim that closure must be completed prior to initiating corrective action. In fact, it would be inconsistent with the existing mandatory deadlines for initiating and pursuing corrective action. For example, § 257.96(a) requires an ACM to be initiated within 90 days of determining an SSL has occurred, and then completed within another 90

days. An extension, not to exceed 60 days, may be warranted due to site-specific conditions or circumstances. EPA did not propose to revise these deadlines, so comments suggesting changes to these provisions are outside the scope of the rulemaking. Additionally, the commenters provided no reason why corrective measures could not be assessed and compared in an ACM and a remedy could not be selected. Long before initiating closure of a CCR unit, the facility was required to characterize site conditions, including groundwater flow conditions and geology to design and install the groundwater monitoring system. See, e.g., § 257.91(b). The facility already has knowledge of the wastestreams and water volumes it disposes into a CCR surface impoundment. This information can be used to develop a groundwater model to predict groundwater flow conditions after wastestream disposal ceases and closure is initiated, which would provide sufficient characterization of post-closure conditions to assess and compare groundwater cleanup alternatives to complete an ACM. The commenters have provided neither reasons nor explanation why this would not be feasible.

Once the ACM is complete, a public meeting has been held, and community input has been considered, a remedy must be selected as soon as feasible. EPA agrees that a selected remedy may include closure by removal to comply with source control requirements, and that this would constitute commencing implementation of a remedy. However, the selected groundwater remediation portion of the remedy must also be implemented within a reasonable time, in accordance with the schedule established in the remedy selection report. 40 CFR 257.97(d). Implementation of the source control measure does not satisfy this separate requirement.

With respect to commenters' assertion that the design and implementation of the groundwater remediation portion of the remedy is not feasible until closure by removal is complete, the commenters provided no explanation or reasons to support this claim, although one commenter identified MNA as an example of such a remedy. EPA does not agree that design or implementation of MNA would need to be delayed due to closure activities. The ACM would include identification of attenuation mechanisms and characterization of site conditions influencing them. This could be based on current site conditions and any modeled future conditions. If MNA is evaluated more favorably than other

groundwater remedies and is ultimately selected, it requires no construction other than installation of additional monitoring wells to identify plume boundaries and monitor performance. This installation would occur downgradient of the unit and should not be affected by unit closure activities. The data from downgradient wells are critical to determining if MNA is working. While groundwater elevations may decrease after dewatering a surface impoundment, and therefore additional wells may need to be installed with screens at lower elevations later in the corrective action process, this would be an expected aspect of implementing MNA for a CCR unit.

Some commenters mentioned that geochemical conditions of groundwater may change during closure. The commenters did not provide specific reasons for this or the anticipated effects of excavation. While removal of CCR is not expected to remove reactants available for immobilization reactions (i.e., any attenuation mechanisms) from the environment, EPA agrees that groundwater chemistry could be impacted, particularly near the excavation site. However, in the absence of evidence that permanent immobilization mechanisms are viable at the site, either under current conditions or in modeled future conditions, MNA would not meet the § 257.97(b) criteria for selection as a remedy.

The CCR regulations establish independent performance standards for corrective action and closure. The regulations do not provide for delaying corrective action while closure occurs, or vice versa. In the example of MNA or, in fact, any groundwater remedy, delaying remedy implementation until after closure is complete would be inconsistent with the requirement in § 257.98(d) to complete remedial activities within a reasonable period. This is particularly true in this example, because collecting monitoring data is the primary action required in an MNA remedy. When data collection is delayed, those data are lost. Because this monitoring can be done during closure, it is required in order to move forward with corrective action as soon as possible.

Additionally, delaying groundwater remediation would not be protective. When a release has been detected, corrective action to clean up the contamination is necessary to prevent it from migrating to downgradient receptors, both human and environmental. Because Appendix IV constituents persist in the environment, delaying corrective action increases the

amount of the contamination that is released to the environment and allows existing contamination to move further downgradient. To ensure there will be no reasonable probability of adverse effect on health or the environment as EPA is required to do under RCRA section 4004(a), the final regulation requires that corrective action be implemented in accordance with the requirements of §§ 257.96 through 257.98 without unnecessary or unreasonable delays.

Further, as one commenter mentioned, in the event that measures taken to implement the remedy following closure are not proving to be effective, the remedy can be altered during corrective action. Under the existing regulations, an owner or operator is required to "implement other methods or techniques that could feasibly achieve compliance" if, after the remedy is implemented, it is determined that compliance is not being achieved. 40 CFR 257.98(b). If such additional measures are necessary after certification of closure, an owner/operator would have the ability to undertake those measures without impacting the facility's closure certification.

Therefore, EPA is finalizing the proposal that the owner or operator must have initiated the remedial activities as required by § 257.98(a) in order to be eligible for this closure alternative.

The sole exception would be if the facility only triggered corrective action for a constituent sufficiently late in the closure process that it would not be feasible to delay closure until a remedy could be selected. For example, if a facility first detected an SSL of antimony one week before the deadline to complete closure in § 257.102(f), it would not be possible to comply with all of the requirements in §§ 257.96–257.97 before the deadline. As explained above, the closure and corrective action obligations are independent of one another and run concurrently. To prevent placing a facility in such a position, EPA has incorporated a provision to allow the facility to demonstrate that it was not feasible to implement the corrective action remedy prior to the expiration of a deadline in § 257.102(f). In such a case, the facility must document that (1) it was in compliance with all applicable requirements in §§ 257.96 through 257.98; and (2) that it could not extend the active life of the unit, consistent with § 257.102(f).

c. Groundwater Corrective Action

For owners and operators that close a unit under this provision, the CCR unit would remain subject to the post-closure care requirements under § 257.104 until groundwater corrective action has been completed. These units would not be subject to the requirement to conduct post-closure care for 30 years; rather, these units would remain in post-closure care until all groundwater monitoring and corrective action requirements are completed, which may be longer or shorter than 30 years. EPA proposed that groundwater corrective action is complete when the groundwater monitoring concentrations do not exceed the groundwater protection standards for constituents listed in Appendix IV to part 257. EPA has reconsidered this, as the Agency did not intend to modify the existing requirement for completing post-closure care, which also applies to concluding post closure care for a unit closed with waste-in-place. The existing provision in § 257.104(c) states that post-closure care ends after 30 years unless at the end of the post-closure care period the owner or operator of the CCR unit is operating under assessment monitoring in accordance with § 257.95. If the unit remains in assessment monitoring, the owner or operator must continue to conduct post-closure care until the owner or operator returns to detection monitoring in accordance with § 257.95. This means that there can be no detections of any Appendix IV constituents for two consecutive sampling events. Therefore, the final regulatory text has been revised to account for this.

The requirement to be in detection monitoring to conclude the post-closure care is the same standard currently specified in the requirements for closure by leaving waste in place. This rule does not change any requirements of the groundwater monitoring and corrective action program. The owner or operator would need to conduct groundwater monitoring and corrective action in accordance with the requirements of §§ 257.90 through 257.98. See revised § 257.104(c).

d. Closure and Post-Closure Care Plans

The Agency is finalizing as proposed the requirement that owners and operators closing a CCR unit under this new closure alternative would need to revise their written closure plan. The closure plan describes the closure of the unit and provides a schedule for implementation of the plan. The owner or operator would need to revise the current plan and describe how the CCR

unit would be closed in accordance with the revised closure options. The current CCR regulations already include procedures to amend written plans under certain circumstances, including when there is a change in the operation of a CCR unit that would substantially affect the current written plan or when unanticipated events necessitate a revision of the plan. See § 257.102(b)(3)(ii). EPA expects owners and operators to revise the current closure plan according to these existing procedures. This rule also requires owners or operators opting for this approach to prepare an initial post-closure care plan within six months of the effective date of this final rule. The post-closure care plan describes how the CCR unit will be maintained after closure of the unit is completed. Prior to this final rule, CCR units that closed by removal of CCR are exempt from any post-closure care requirements so the preparation of a post-closure care plan will be a new requirement for owners and operators closing a unit under this new option. EPA believes that six months from the effective date of this final rule, or one year from publication of this final rule is a reasonable amount of time to prepare the post-closure care plan because the owner or operator should already have prepared the closure plan for the unit and begun implementation of the corrective measures remedy.

EPA is aware that some facilities that planned to close a unit by removal of CCR nonetheless completed a post-closure care plan. In this situation, the CCR regulations already include requirements to amend written plans under certain circumstances, including when there is a change in the operation of a CCR unit that would substantially affect the current written plan or when unanticipated events necessitate a revision of the plan. See § 257.104(d)(3). EPA expects that these owners or operators would revise the existing post-closure care plan according to these existing procedures.

e. Notation on the Deed to the Property

Under the existing regulations, following the closure of a CCR unit that will be subject to post-closure care, the owner or operator must record a notation on the deed to the property, or some other instrument that is normally examined during title search, notifying any potential purchaser of the property in perpetuity that the land has been used as a CCR unit, and its use is restricted under the post-closure care requirements. See § 257.102(i). The rationale for this requirement is to ensure that prospective and subsequent

owners are aware of the presence of a closed unit on the property and of the need for continued maintenance of the cover or of any ongoing corrective actions. Following that same logic, units that have closed by removal in accordance with § 257.102(c) have been exempt from the deed notation requirement, both because all waste and associated contamination have been removed, and because there is no continuing post-closure care that needs to be maintained.

Units closing under this new closure option will be required to record a deed notation because they would not have closed by removal in accordance with § 257.102(c)(1) (as corrective action would not have been completed) and because post-closure care would be required. See § 257.102(i)(4). But these units are not wholly analogous to the other units subject to a deed notation (*i.e.*, those closing with waste in place). Units falling under this new closure option will have already had all waste removed in its entirety and so would require no continued maintenance. However, groundwater remediation actions would be continuing, raising concern about potential exposures.

Therefore, EPA proposed that the owner or operator record a notation on the deed to the property (or some other instrument normally examined during a title search) until all groundwater corrective action has been completed—that is, when groundwater monitoring concentrations do not exceed the groundwater protection standard established pursuant to § 257.95(h) for constituents listed in appendix IV to part 257. EPA proposed the deed notation because all removal and decontamination actions have not been completed. Given that groundwater corrective action may continue for years or decades, the deed restrictions are a practical way of limiting human exposure during a period when contamination is still present, and thereby ensuring that the statutory standard under RCRA section 4004(a) continues to be met.

As part of the post-closure care provisions under § 257.104, EPA proposed to allow removal of the deed notation, or the addition of a second notation reflecting the inapplicability of the first notation, as may be applicable under existing State or local law, when groundwater corrective action is completed for the CCR unit. Under this closure option, completion of groundwater corrective action would indicate that all removal and decontamination actions have been completed. To remove the deed notation (or add a second notation), the owner or

operator would need to complete two actions. First, the owner or operator would need to demonstrate that groundwater monitoring concentrations no longer exceed any groundwater protection standard established pursuant to § 257.95(h) for constituents listed in Appendix IV to part 257. See § 257.104(g). Second, the owner or operator would need to complete the notification stating the post-closure care requirements have been met as required in § 257.104(e). Removing the deed notation upon completion of all removal and decontamination activities is consistent with the current procedures for CCR units that close by removal under § 257.102(i)(4).

The existing CCR regulations require a specific type of control (*i.e.*, deed notations) to communicate use limitations to present and future users of the land with the closed CCR unit. The Agency solicited comments on whether the use of deed restriction controls is too narrow under this new closure option and whether the CCR regulations should allow for the use of different legal mechanisms and controls to communicate limits on the activities that can safely take place at the site. Some commenters supported inclusion of more flexibility and alternative instruments to accomplish this purpose. For example, one commenter pointed out that in Colorado, the State routinely uses Environmental Use Restrictions/Environmental Covenants. Other commenters asserted that EPA should allow the owner or operator to determine which instrument to use or allow the Participating State Director to decide. ASTSWMO commented that the proposed language requiring the use of deed restriction controls appears to be consistent with language in 40 CFR 258.60(i) as applicable to Municipal Solid Waste (MSW) Landfills, and that it might be helpful for States that the language between CCR and MSW landfills aligns.

Other commenters mentioned the importance of deed notations is that it compels impoundment owners to create a publicly accessible record attached to a property deed noting that the property is subject to ongoing groundwater corrective action requirements. Attaching such a note to the deed also ensures any subsequent owner of the property would be on notice of ongoing cleanup obligations and would be liable for following through on them. The commenter stated that any alternative to deed notification that EPA may be considering (*i.e.*, other approaches under private property law) should only be considered if they also provide these

benefits of the deed notification requirement.

The Agency has decided to finalize the proposal to require that the owner or operator record a notation on the deed to the property until all groundwater corrective action has been completed. EPA agrees that a deed notation performs an important function to ensure any subsequent owner of the property is on notice of the ongoing cleanup obligations and of the liability of any subsequent owner until those obligations are completed. None of the commenters provided sufficient information for EPA to conclude that the alternative measures that they suggested would provide the same level of assurance as a deed notation. Moreover, the use of a deed notation is consistent with the requirements for MSW landfills and with CCR units closing by leaving waste in place, and therefore EPA expects the public and regulated entities will be familiar with them. Additionally, as discussed above, once the closure by removal is complete, the owner or operator can remove the deed notification.

f. Closure Certification or Approval

The Agency is adopting without revision the proposal that the owner or operator will continue to be subject to the same certification or approval requirement that is currently applicable to all CCR units as specified in § 257.102(f)(3). Under this requirement, the owner or operator must obtain a certification from a qualified P.E. or approval from the Participating State Director (or EPA where EPA is the permitting authority) verifying that closure has been completed in accordance with the written closure plan and all applicable closure requirements of § 257.102. Under this provision, the certification or approval would reflect that all removal and decontamination activities, except for groundwater corrective action, have been completed. The certification or approval would not address the remediation of the impacted groundwater because groundwater corrective action will be completed during the post-closure care period, including applicable post-closure care certification and approval requirements.

E. Technical Corrections

Through the implementation of the 2015 CCR Rule, the Agency identified several minor errors and inconsistencies. Therefore, EPA is amending the CCR regulations to clarify definitions, accurately reference the definition of wetlands, and use consistent language when referring to

publicly accessible internet sites. The Agency is also amending an incorrect reference to § 257.99 in the groundwater monitoring scope section. Finally, EPA is extending the period for certain document retention and posting.

1. Definitions of “Technically Feasible” and “Technically Infeasible”

EPA proposed to revise the definition of *technically feasible* to clarify that the terms *technically feasible* and *feasible* have the same meaning in the regulations. The existing regulations define *technically feasible* as “possible to do in a way that would likely be successful.” EPA codified this definition in 2020 when amending the alternative closure requirements for landfills and impoundments. 85 FR 53542 (August 28, 2020). As EPA explained, the definition was based on two dictionary definitions of “feasible”: “capable of being done or carried out” (Merriam website (<https://www.merriam-webster.com/dictionary/feasible>)) and “possible to do and likely to be successful” (Cambridge English Dictionary (<https://dictionary.cambridge.org/us/dictionary/english/feasible>)). Id.

However, some rule provisions use the term *feasible*. EPA never intended to distinguish between these terms. See, *e.g.*, 80 FR 21422–21423, 85 FR 53542. Therefore, EPA proposed to add the term *feasible* to the existing definition of *technically feasible* to make clear that both terms have the same meaning in the regulations. This definition revision would be accomplished by adding “or feasible” to the existing definition so that the definition would read “*Technically feasible or feasible means possible to do in a way that would likely be successful.*” For similar reasons, EPA proposed to also revise the definition of *technically infeasible* to clarify that the terms *technically infeasible* and *infeasible* have the same meaning in the regulations.

EPA received comments on this issue that opposed adding “feasible” and “infeasible” as definitions. The commenters said the term “feasible” is used in the § 257.102(f)(2)(i) standard for obtaining extensions to the closure time frames, and that if EPA finalizes the provision as proposed, the change should not be applied retroactively to facilities that used the closure extension. Other commenters said this is not how EPA should correct regulatory errors and there is a lack of discussion on all situations and regulatory history regarding these terms.

EPA disagrees that these terms have different meanings under the CCR regulations or that this clarification will

negatively impact implementation of the requirements by regulated entities. See, 85 FR 53542 (relying on dictionary definitions of “feasible” to define ‘technically feasible’). EPA is simply clarifying the meaning of these synonymous terms. *Id.* Therefore, EPA is finalizing these changes as proposed. This is codified in the regulatory text at § 257.53.

2. Wetlands Reference Correction

When the 2015 CCR Rule was finalized in April 2015, § 257.61(a) referenced § 232.2, which contained a definition of wetlands. An EPA and United States Army Corps of Engineers joint final rule published June 29, 2015 (80 FR 37053) amended § 232.2 by removing the definition of wetlands. However, the reference to § 232.2 in § 257.61(a) of the 2015 CCR Rule was not updated. EPA proposed an amendment that would correct the CFR reference for the wetlands definition by referring to 40 CFR 230.41(a) (December 24, 1980, 45 FR 85344). EPA received one comment on this issue about the U.S. Supreme Court decision in *Sackett v. EPA*, 21–454, in which the Court substantially narrowed the scope of wetlands subject to Federal jurisdiction under the Clean Water Act. EPA reviewed the *Sackett* decision and determined that the wetlands definition contained in § 257.61(a) remains valid after that decision. EPA is therefore finalizing this provision as proposed. This is codified in the regulatory text at § 257.61.

3. Groundwater Monitoring and Corrective Action Applicability

EPA proposed to correct a typographical error in the initial applicability paragraph of the groundwater monitoring and corrective action regulations. In § 257.90(a), the existing regulations refer to the “groundwater monitoring and corrective action requirements under §§ 257.90 through 257.99”; however, there are no requirements codified under § 257.99. This was brought to EPA’s attention by a State interested in permit program approval. To avoid confusion with the regulations, EPA proposed to revise the section references in § 257.90(a) to read “groundwater monitoring and corrective action requirements under §§ 257.90 through 257.98.” EPA did not receive any comments on this issue and is therefore finalizing this provision as proposed.

4. Publicly Accessible Internet Site

EPA proposed to change several provisions using the term “CCR website” to “CCR website,” which is the

term used in § 257.107(a). The inconsistent spelling of CCR website was brought to our attention by a State interested in permit program approval. To avoid confusion with the regulations, EPA proposed to correct such references in §§ 257.100(e)(1)(iii) and 257.107(b) through (j). EPA did not receive any comments on this issue and is therefore finalizing these provisions as proposed.

EPA is also revising § 257.107(b) to provide owners and operators the flexibility to maintain one website for multiple electric power sector rules. This new provision allows an owner or operator to document the facility’s compliance with the requirements of other environmental rules on the same website that is used for CCR units. In order to use a combined website, the final rule requires that the owner or operator delineate the postings for each regulatory program under a separate heading on the website. For example, the required CCR rule postings must be placed under a “CCR Rule Compliance Data and Information” heading, while postings required by the ELG rule would be posted under a separate heading “ELG Rule Compliance Data and Information.”¹⁵¹ EPA is providing this flexibility to reduce paperwork burden and make it easier for communities to access this information.

5. Document Retention

The CCR regulations require the production of many documents that provide information on many aspects of regulated CCR units, for example from history of construction to periodic inspections, as well as closure activity and groundwater sampling and cleanup, if necessary. These documents must be retained in the facility operating record as well as posted on the facility CCR website, generally for a five-year period. In the proposed rule, EPA requested comment on potential revision of document posting and retention times currently in the regulations. EPA raised the concern that some of the current retention times may be too short to accomplish the goals underlying the posting requirement, namely transparency and information availability. This concern stems from the fact that information that is still relevant for CCR units may reach the original retention time limit while the availability of the documents would still serve the purposes of transparency and information availability after the original retention deadline.

The comments received were largely in favor of revising the document

retention periods, though those commenters who provided suggested approaches or examples of longer retention periods were not entirely consistent in the approaches offered.

One commenter opposed the concept of expanding the retention time for any documents that are required to be posted on facility websites. This commenter stated the current retention period provides clear guidance to the regulated community and that extending the retention period could add to additional redundant or outdated material on the websites. This commenter also said that the purpose of the website posting requirement has been obviated by the passage of the WIIN Act. For several reasons, EPA disagrees with this comment. First, the regulations already include provisions to decrease or eliminate redundancy or outdated postings. See, for example, § 257.107(g)(1), which requires only the most recent dust suppression plan to be maintained on the website. Second, the core principle of the website posting requirement is relevance: facilities are required to post information relevant to the operation and closure of CCR units and cleanup of any releases from those units. It is clear that a five-year retention period may not be adequate for documents that remain relevant well beyond that length of time, which is proving to be true for many of the required documents. Third, while it is true that website posting is one of several measures EPA implemented in the original rule before the WIIN Act was enacted, nothing in the WIIN Act makes the goals of transparency and information availability for communities and other interested parties obsolete.

The other commenters all agree that extensions to the website posting and retention time periods are warranted. Those comments that included actual time frame suggestions based those suggestions on the type of document and relevance to the operation, closure, and cleanup requirements of the regulations, though they varied in the exact approach and length of extensions.

EPA has decided that to accomplish the regulatory goals underlying the document preparation and retention requirements, longer retention times are required. Therefore, EPA is revising the retention periods as provided in this final rule. EPA does agree that the approach for extensions should be based on the nature of each document and the relevance of each document to demonstrating compliance with regulatory milestones. This approach was already employed in the 2015 CCR

¹⁵¹ See § 423.19 for ELG rule posting requirements.

Rule for numerous documents (*e.g.*, the groundwater remedy selection document is currently required to be retained until remedy completion). See § 257.107(h)(9). In this rule, EPA is applying this same approach to other documents prepared under the regulations.

There are several related issues that are involved in the document preparation, retention and posting requirements that deserve discussion here. First, the website posting regulations in § 257.107 are companions to, and cross-reference, the operating record regulations in subpart § 257.105. The interrelation of these sections means that this revisiting of the website posting regulations necessitates a review of those regulations that address the placing and retaining of documents in the facility operating record. Accordingly, EPA is including accompanying retention time period changes to § 257.105 as appropriate and relevant to the changes to § 257.107. Additionally, as suggested by several commenters, the retention of the documents in the operating record for a longer period than retention on the website not only makes sense for some documents, but supports the Agency not requiring that every prepared document remain on the website. This is particularly true for documents that are either periodically updated or result from recurring assessments. In implementing this approach, the Agency is mindful of and in agreement with the comments that urged the

Agency to not require the posting of all documents out of concern that the websites would become cluttered and confusing.

Second, a related issue arises where there may be more than one version of a document, which version of a required document must be posted or retained in the operating record. This situation arises, for example, when a required document is updated or a document is required to be prepared for recurring assessments. Where appropriate, the regulations are being revised to ensure they are clear about what version or versions of documents must be posted and retained.

A third issue is that, for some documents, the five-year retention and posting duration requirements may have expired. However, some of these documents are still relevant to an operating or closing unit, or a unit in post-closure care status or undergoing groundwater cleanup. For these documents, the purposes of retaining and posting them are still viable and there are compelling reasons to ensure these documents are available on the facility website and in the facility operating record. EPA is, therefore, requiring that documents that may have been taken down and removed from operating records are placed back in the operating records and reposted on the website. Although it is unlikely that documents that were required to be prepared under the CCR regulations, placed in the operating record, and posted on the website were destroyed or

discarded after the applicable retention time ran, this requirement nonetheless includes such documents. In other words, any required documents that have been destroyed or discarded must be reproduced and placed in the operating record and reposted on the facility website. Otherwise, there could be inconsistencies among the required facility websites totally dependent upon whether a facility had elected to remove documents from the website and operating record and not otherwise retain the documents in any facility files. EPA believes that allowing this inconsistency across facility websites is an unacceptable approach to ensuring information relevant to each CCR unit is publicly available.

Finally, while the approach adopted here links retention and posting times to document relevance and the status of the CCR unit and work undertaken at the unit, EPA does not believe that the interest in information availability ends at the moment a unit's status changes or required work ends (*e.g.*, completion of closure). Therefore, EPA is requiring that documents remain available for a reasonable time period after related milestones are reached. For many documents, EPA has chosen five years as the reasonable time period for document posting and retention after work is completed or the unit's status changes. This is also consistent with timeframes offered by commenters where specific timeframes were suggested.

TABLE 3—DOCUMENT RETENTION IN THE OPERATING RECORD AND CCR WEBSITE

Document	Operating record	CCR website
Location restrictions demonstration as specified in §§ 257.60–257.64.	§ 257.105(e): 5 years after: closure by removal (CBR) or post-closure care ends.	§ 257.107(e): 5 years after: CBR or post-closure care ends.
Landfill liner and leachate collection preconstruction design certification and post construction certification as specified in § 257.70(e) and (f).	§ 257.105(f)(1): 5 years after: CBR or post-closure care ends.	§ 257.107(f)(1): 5 years after: CBR or post-closure care ends.
Documentation of liner type as specified in § 257.71(a).	§ 257.105(f)(2): 5 years after: CBR or post-closure care ends.	§ 257.107(f)(3): 5 years after: unit ends post closure care OR liner is removed.
Surface impoundment liner preconstruction design certification and postconstruction certification as specified in § 257.72(c) and (d).	§ 257.105(f)(3): 5 years after: CBR or post-closure care ends.	§ 257.107(f)(2): 5 years after: CBR or post-closure care ends OR liner is removed.
Documentation that permanent identification marker was installed as specified in §§ 257.73(a)(1) and 257.74(a)(1).	§ 257.105(f)(4): 5 years after: CBR or post-closure care ends.	N/A.
The initial and periodic hazard potential classification assessments as specified in §§ 257.73(a)(2) and 257.74(a)(2).	§ 257.105(f)(5): Retain all versions CBR Until closure is complete not including meeting GWPS. Closure in place (CIP): until post-closure care is complete.	§ 257.107(f)(4): Current and previous one. CBR Until closure is complete not including meeting GWPS. CIP: Until post closure care is complete.
The emergency action plan, and any revisions of it, as specified in §§ 257.73(a)(3) and 257.74(a)(3).	§ 257.105(f)(6): Retain all 5 years after: CBR not including meeting GWPS or unit ends post-closure care.	§ 257.107(f)(5): Current version, if EAP is required.

TABLE 3—DOCUMENT RETENTION IN THE OPERATING RECORD AND CCR WEBSITE—Continued

Document	Operating record	CCR website
Documentation prepared by the owner or operator recording the annual face-to-face meeting or exercise between representatives of the owner or operator of the CCR unit and the local emergency responders, as specified in §§ 257.73(a)(3)(i)(E) and 257.74(a)(3)(i)(E).	§ 257.105(f)(7): Retain all 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(6): Current version, if EAP is required.
Documentation prepared by the owner or operator recording any activation of the emergency action plan, as specified in §§ 257.73(a)(3)(v) and 257.74(a)(3)(v).	§ 257.105(f)(8): Retain all 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(7): Any documentation prepared in the last five years; if no activation in the last 5 years, a statement posted relating that information.
The history of construction, and any revisions of it as specified in § 257.73(c).	§ 257.105(f)(9): Retain all 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(8): Only most recent and any revisions from the last 5 years. 5 years after: CBR or unit ends post closure care.
The initial and periodic structural stability assessments as specified in §§ 257.73(d) and 257.74(d).	§ 257.105(f)(10): Retain all CBR Until closure is complete not including meeting GWPS. CIP: Until post closure care is complete	§ 257.107(f)(9): Current and previous one. CBR Until closure is complete not including meeting GWPS. CIP: Until post closure care is complete.
The documentation detailing the corrective measures taken to remedy the structural stability deficiency for existing or new surface impoundments as specified in §§ 257.73(d)(2) and 257.74(d)(2).	§ 257.105(f)(11): Retain all 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(10): Current and any corrective measures. 5 years after: CBR or unit ends post closure care.
The initial and periodic safety factor assessments as specified in §§ 257.73(e) and 257.74(e).	§ 257.105(f)(12): Retain all 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(11): Current and previous one. 5 years after: CBR or unit ends post closure care.
The design and construction plans of the unit, and any revisions of the plans as specified in § 257.74(c).	§ 257.105(f)(13): Retain all 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(12): Current and previous one. 5 years after: CBR or unit ends post closure care.
The application and any supplemental materials submitted in support of the alternative liner demonstration application as specified in § 257.71(d)(1)(i)(E).	§ 257.105(f)(14): 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(13): 5 years after: CBR or unit ends post closure care.
CCRMU Facility Evaluation Report Document Part 1 as specified in § 257.75(c).	§ 257.105(f)(25): 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(24): 5 years after: CBR or unit ends post closure care.
CCRMU Facility Evaluation Report Document Part 2 as specified in § 257.75(d).	§ 257.105(f)(26): 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(25): 5 years after: CBR or unit ends post closure care.
The decision on the alternative liner application as specified in § 257.71(d)(2)(iii)(F).	§ 257.105(f)(19): 5 years after: CBR or unit ends post closure care.	§ 257.107(f)(18): 5 years after: CBR or unit ends post closure care.
The CCR fugitive dust control plan, or any subsequent amendment of the plan as specified in § 257.80(b).	§ 257.105(g)(1): Retain all until last CCR unit at the facility completes post closure care or CBR.	§ 257.107(g)(1): Only most recent. Retain until last unit completes post closure care or CBR.
The annual CCR fugitive dust control report as specified in § 257.80(c).	§ 257.105(g)(2): Retain all until last CCR unit at the facility completes post closure care or CBR.	§ 257.107(g)(2): Current plus last 5 years. Retain until last unit completes post closure care or CBR.
The initial and periodic run-on and run-off control system CCR landfill plans as specified in § 257.81(c).	§ 257.105(g)(3): Only most recent Until 5 years after closure of the landfill is complete not including achievement of GWPS.	§ 257.107(g)(3): Current plus any other versions from the last 5 years (if updated). Until 5 years after closure of the landfill is complete not including achievement of GWPS.
Initial and periodic inflow design flood control system CCR surface impoundment plans as specified in § 257.82(c).	§ 257.105(g)(4): Only most recent Until 5 years after closure of the landfill is complete not including achievement of GWPS.	§ 257.107(g)(4): Current plus any other versions from the last 5 years (if updated). Until 5 years after closure of the landfill is complete not including achievement of GWPS.
Documentation recording the results of each CCR surface impoundment inspection and monitoring as specified in § 257.83(a).	§ 257.105(g)(5): Retain all until 5 years after closure is complete not including achievement of GWPS.	N/A.
Annual CCR surface impoundment inspection reports as specified in § 257.83(b)(2).	§ 257.105(g)(6): Retain all until 5 years after closure is complete not including achievement of GWPS.	§ 257.107(g)(5): Current plus last 5. Retain until 5 years after closure is complete not including achievement of GWPS.
The documentation detailing the corrective measures taken to remedy the deficiency or release as specified in §§ 257.83(b)(5) and 257.84(b)(5).	§ 257.105(g)(7): Retain all until 5 years after closure is complete not including achievement of GWPS.	§ 257.107(g)(6): Any corrective measures until 5 years after closure is complete not including achievement of GWPS.
Documentation recording the results of weekly landfill structural weakness inspection as specified in § 257.84(a).	§ 257.105(g)(8): Retain all until 5 years after closure is complete not including achievement of GWPS.	N/A.
Annual landfill inspection reports as specified in § 257.84(b)(2).	§ 257.105(g)(9): Retain all until 5 years after closure is complete not including achievement of GWPS.	§ 257.107(g)(7): Current plus last 5. Retain until 5 years after closure is complete not including achievement of GWPS.

TABLE 3—DOCUMENT RETENTION IN THE OPERATING RECORD AND CCR WEBSITE—Continued

Document	Operating record	CCR website
Annual groundwater monitoring and corrective action report as specified in § 257.90(e).	§ 257.105(h)(1): Retain all until 5 years after the last CCR unit at the facility completes post-closure care or completion of CBR including achieving GWPS for 3 consecutive years.	§ 257.107(h)(1): Current plus previous 5 years. Retain until 5 years after last unit completes post-closure care or completion of CBR including achieving GWPS for 3 consecutive years.
Documentation of design, installation, development, and decommissioning of any monitoring wells, piezometers and other devices as specified in § 257.91(e)(1).	§ 257.105(h)(2): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.	N/A.
Groundwater monitoring system certification as specified in § 257.91(f).	§ 257.105(h)(3): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.	§ 257.107(h)(2): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.
Selection of a statistical method certification as specified in § 257.93(f)(6).	§ 257.105(h)(4): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.	§ 257.107(h)(3): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.
Assessment of corrective measures as specified in § 257.96(d).	§ 257.105(h)(10): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.	§ 257.107(h)(8): 5 years after CBR and GWPS have been met or 5 years after completion of post-closure care.
Documentation recording the public meeting for the corrective measures assessment as specified in § 257.96(e).	§ 257.105(h)(11): 5 years after CBR and App IV GWPS have been met or 5 years after completion of post-closure care.	N/A.
Notification that the remedy has been completed specified under in § 257.98(e).	§ 257.105(h)(13): 5 years after completion of remedy.	§ 257.107(h)(10): 5 years after completion of remedy.
Demonstration supporting the suspension of groundwater monitoring activities as specified in § 257.90(g).	§ 257.105(h)(14): 5 years after last unit ends post closure care.	§ 257.107(h)(11): 5 years after posting.
Written closure plan, and any amendment of the plan as specified in § 257.102(b).	§ 257.105(i)(4): Only the most recent 5 years after CBR or 5 years after post-closure care is complete.	§ 257.107(i)(4): Only the most recent. 5 years after CBR or 5 years after post-closure care is complete.
Demonstration(s) for a time extension for initiating closure as specified in § 257.102(e)(2)(ii) and (iii).	§ 257.105(i)(5): Until notice of closure completion is posted.	§ 257.107(i)(5): Until notice of closure completion is posted.
Demonstration(s) for a time extension for completing closure as specified in § 257.102(f)(2)(i) and (iii).	§ 257.105(i)(6): 5 years after closure is complete.	§ 257.107(i)(6): 5 years after closure is complete.
Notification of intent to close a CCR unit as specified in § 257.102(g).	§ 257.105(i)(7): 5 years after closure complete	§ 257.107(i)(7): 5 years after closure complete.
Notification of completion of closure of a CCR unit as specified in § 257.102(h).	§ 257.105(i)(8): 5 years after unit ends post closure care or CBR.	§ 257.107(i)(8): 5 years after unit ends post closure care or CBR
Notification recording a notation on the deed as specified in § 257.102(i).	§ 257.105(i)(9): 5 years after unit ends post closure care.	§ 257.107(i)(9): 5 years after unit ends post closure care.
Notification of intent to comply with the alternative closure requirements for landfills as specified in § 257.103(c)(1).	§ 257.105(i)(10): 5 years after the unit completes closure.	§ 257.107(i)(10): 5 years after the unit completes closure.
Annual progress reports under the alternative closure requirements for landfills as specified in § 257.103(c)(2).	§ 257.105(i)(11): 5 years after the unit completes closure.	§ 257.107(i)(11): 5 years after the unit completes closure.
Written post-closure plan, and any amendment of the plan as specified in § 257.104(d).	§ 257.105(i)(12): 5 years after unit ends post closure care.	§ 257.107(i)(12): 5 years after unit ends post closure care.
Notification of completion of post-closure care as specified in § 257.104(e).	§ 257.105(i)(13): 5 years after unit ends post closure care.	§ 257.107(i)(13): 5 years after unit ends post closure care.
Notification of intent to comply with the site-specific alternative to initiation of closure due to development of alternative capacity infeasible as specified in § 257.103(f)(1)(ix)(A).	§ 257.105(i)(14): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(14): 5 years after: CBR or unit ends post closure care.
Approved or denied demonstration for the site-specific alternative to initiation of closure due to development of alternative capacity infeasible as specified in § 257.103(f)(1)(ix)(B).	§ 257.105(i)(15): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(15): 5 years after: CBR or unit ends post closure care.
Notification for requesting additional time to the alternative cease receipt of waste deadline as specified in § 257.103(f)(1)(ix)(C).	§ 257.105(i)(16): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(16): 5 years after: CBR or unit ends post closure care.
Semi-annual progress reports for the site-specific alternative to initiation of closure due to development of alternative capacity infeasible as specified in § 257.103(f)(1)(xi).	§ 257.105(i)(17): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(17): 5 years after: CBR or unit ends post closure care.
Notification of intent to comply with the site-specific alternative to initiation of closure due to permanent cessation of a coal-fired boiler(s) by a date certain as specified in § 257.103(f)(1)(viii).	§ 257.105(i)(18): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(18): 5 years after: CBR or unit ends post closure care.

TABLE 3—DOCUMENT RETENTION IN THE OPERATING RECORD AND CCR WEBSITE—Continued

Document	Operating record	CCR website
Approved or denied demonstration for the site-specific alternative to initiation of closure due to permanent cessation of a coal-fired boiler(s) by a date certain as specified in § 257.103(f)(2)(ix).	§ 257.105(i)(19): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(19): 5 years after: CBR or unit ends post closure care.
Annual progress report for the site-specific alternative to initiation of closure due to permanent cessation of a coal-fired boiler(s) by a date certain as specified in § 257.103(f)(2)(x).	§ 257.105(i)(20): 5 years after: CBR or unit ends post closure care.	§ 257.107(i)(20): 5 years after: CBR or unit ends post closure care.
Legacy Applicability Report as specified in § 257.100(f)(1)(i).	§ 257.105(k)(1): 5 years after: CBR or unit ends post closure care.	§ 257.107(k)(1): 5 years after: CBR or unit ends post closure care.

IV. Effect on State CCR Permit Programs

In the proposed rule, EPA discussed the effect of the amended regulations on State CCR permit programs. The revisions to the CCR regulations both establish standards for new types of units and revise existing requirements for CCR units defined in and subject to the 2015 CCR Rule. For this reason, the requirements for approval and retention of a State CCR permit program in accordance with RCRA section 4005(d) will change. How these revisions will affect States depends on whether the State has received approval for the provisions that are ultimately included in any final rule and whether the State is seeking full or partial approval of its permit program.

EPA received several comments asking for clarification on what States need to do to adopt these revisions. As EPA explained in the proposed rule, if a State has an approved program pursuant to RCRA section 4005(d), that State program will continue to operate in lieu of the portions of the Federal program adopted by the State, even if EPA revised the Federal analog of that regulation in this final action. See 42 U.S.C. 6945(d)(1)(A), (3). This means that the applicable revisions to the Federal CCR regulations will only take effect in an approved State when the State revises its program to adopt them. For this reason, RCRA requires a State to revise its program within three years of any applicable revision to the Federal CCR regulation that is more protective than the existing State program in order to maintain approval. See, 42 U.S.C. 6945(d)(1)(D)(i)(II). Conversely, the Federal requirements continue to apply directly to CCR facilities in States without an approved CCR program and in States with a partial CCR program. EPA will work with each State that is interested in adopting these regulations to ensure the State CCR permit program is at least as protective as the Federal program. If a State chooses not to adopt

certain portions of this final rule, when EPA establishes a Federal CCR permit program, EPA will begin issuing permits for CCR units, legacy CCR surface impoundments, and CCRMU in nonparticipating States.

As discussed in Units III.A. and III.B of this preamble, EPA is establishing requirements for legacy CCR surface impoundments and CCRMU. Because legacy CCR surface impoundments and CCRMU are new types of Federally regulated units, no State is currently approved to issue State CCR permits to such units in lieu of the Federal CCR regulations. Thus, any State that wants approval to issue permits to such units will be required to update the State CCR regulations and go through the State CCR permit program approval process set forth in RCRA section 4005(d).

As discussed in Units III.B.g and III.D of this preamble, EPA is also revising requirements under the existing CCR regulations. The revised requirements will directly apply to affected facilities except to the extent EPA has already approved the State to issue permits for the original requirement. In such a case, the State requirement will apply in lieu of the new Federal requirement until the State program is revised. certain provisions (*i.e.*, the requirement to expand § 257.102(d)(2) to landfills that are inundated with groundwater, document retention timeframes) to be more protective

One commenter asked if a State can adopt regulations for either legacy CCR surface impoundments or CCRMU, but not both. EPA issued the Coal Combustion Residuals State Permit Program Guidance Document; Interim Final (82 FR 38685, August 15, 2017) (the “Guidance Document”) to advise States interested in developing a State CCR permit program for approval by EPA. The Guidance Document explains the process for developing a State CCR permit program and expressly contemplates a State requesting partial approval of such a program. Thus, a

State may request approval of the final rule provisions applicable to either or both the legacy CCR surface impoundments and the CCRMU requirements.

Some commenters discussed the process for approving State CCR permit programs and inquired about the number of States that EPA is currently working with and the timeframe for approval of a State program package. As noted above, the Guidance Document explains the process for States to develop of State CCR permit program. The time it takes to develop an approvable State program depends on a number of factors, including the time it takes for a State to promulgate or enact regulations that are as protective as the Federal CCR regulations. Once the State has a complete and approvable program, EPA will issue the final program determination within 180 days of determining that the State’s submission is complete. EPA commits to working with States to adopt regulations that are at least as protective as the Federal CCR regulations and to review any draft application materials and provide comments to ensure the final application package can go through EPA’s approval process in a timely manner. The process for approving program modifications is the same as for the initial program approval: EPA will propose to approve or deny the program modification and hold a public hearing during the comment period. EPA will then issue the final program determination within 180 days of determining that the State’s submission is complete.

Finally, EPA received comments saying that EPA seems to be finalizing these regulations under the self-implementing regulatory scheme that existed when the 2015 CCR rule was promulgated. The comments further say that since then, Congress enacted the WIIN Act, which fundamentally changed the regulatory landscape and now requires implementation through

State and Federal permit programs. EPA acknowledges this Congressional mandate and is working to finalize the Federal CCR permit program in addition to approving State permit programs. States have requested that EPA finalize the legacy CCR surface impoundment provisions and other provisions that were remanded back to the Agency to allow States to apply for full program approval. EPA disagrees that the self-implementing rule is inappropriate in lieu of the WIIN Act requirements because all owners and operators of CCR units and CCRMU will need to follow the self-implementing rule until they obtain a State or Federal permit. Lastly, any permits that are issued by EPA will refer to the regulatory requirements in 40 CFR part 257, subpart D, or the equivalent State regulation in the case of State permits.

V. The Projected Economic Impact of This Action

A. Introduction

EPA estimated the costs and benefits of this action in a Regulatory Impact Analysis (RIA), which is available in the docket for this action.

B. Affected Universe

The universe of facilities and units affected by the final rule includes four categories. The first is comprised of facilities with legacy CCR surface impoundments. The RIA identifies 194 legacy CCR surface impoundments located at 84 facilities. The second component of the affected universe is composed of CCRMU. The RIA identifies 195 CCRMU at 104 facilities. The third component of the affected universe is composed of CCRMU at “other active facilities,” or OAFUs. The RIA identifies 15 OAFUs at six facilities. The final component of the universe is comprised of CCR landfills that are already regulated under the 2015 CCR Rule, but which have waste in contact with groundwater. The RIA identifies 39 such landfills at 33 facilities.

C. Baseline Costs

The RIA examines the extent to which baseline practices at legacy CCR surface impoundments and CCRMU address contamination in a manner consistent with the requirements of the final rule. To the extent that legacy CCR surface impoundments and CCRMU are already sufficiently addressing contamination, they are assumed to not incur costs or realize benefits under the final rule. To estimate the proportion of legacy CCR surface impoundments addressing contamination in the baseline, the RIA examines relevant Federal and State

programs and determines that about 9.8% of legacy CCR surface impoundments are addressing site contamination. To estimate the proportion of CCRMU addressing contamination, the RIA examines publicly available filings from owners and operators of regulated coal-fired power plants. The RIA estimates that about 20.8% of CCRMU are undergoing sitewide corrective action and closure in a manner sufficient to meet the requirements of the final rule.

D. Costs and Benefits of the Final Rule

The RIA estimates that the annualized costs of this action will be approximately \$214–\$240 million per year when discounting at 2%. Of this, \$123–\$135 million is attributable to the requirements for legacy CCR surface impoundments, which are subject to the D.C. Circuit’s order in *USWAG*, \$79–\$92 million is attributable to the requirements for CCRMU, \$8–\$9 million is attributable to the requirements for OAFUs, and \$4 million is attributable to requirements for landfills. The costs of this final rule are discussed further in the RIA and include the costs of unit closure, corrective action, fugitive dust controls, structural integrity inspections, and recordkeeping and reporting.

The RIA estimates that the annualized monetized benefits attributable to this action will be approximately \$53–\$80 million per year when discounting at 2%. Of this, \$43–\$57 million is attributable to the requirements for legacy CCR surface impoundments, \$9–\$21 million is attributable to the requirements for CCRMU, \$1–\$2 million is attributable to the requirements for CCRMU at “other active facilities,” or OAFUs. Requirements for landfills account for a de minimis amount of benefits. The monetized benefits of this proposed rule are discussed further in the RIA, and include reduced incidents of cancer from the consumption of arsenic in drinking water, avoided intelligence quotient (IQ) losses from mercury and lead exposure, non-market benefits of water quality improvements, and the protection of threatened and endangered species. EPA also monetized the benefits of avoided impoundment failures, including both “catastrophic” failures and smaller-volume releases. One example of a severe impoundment failure is the Dan River Steam Station failure that occurred in 2014, when a stormwater drainage pipe under the inactive surface impoundments at the Dan River Steam Station caused the inadvertent release of 39,000 tons of CCR directly into the nearby Dan River. The resulting high-

end estimate of the costs of this impoundment failure is \$300 million.

The monetized benefits in the RIA are incomplete and omit categories of benefits that are known to be significant. One such category of benefits is avoided cases of lung and bladder cancers due to exposure to arsenic III and arsenic V. Inorganic arsenic is known to occur in CCRs, and can leach into drinking water from leaking CCR disposal units. The EPA IRIS Toxicological Review of Inorganic Arsenic (CASRN 7440–38–2) draft, published in October 2023, provides updated toxicity values for cancer outcomes associated with inorganic arsenic exposure. From these values the benefits of avoided cancer cases can be monetized. The RIA does not consider these avoided cancer benefits in the main analysis because the IRIS report underlying them is still draft and subject to revision. These benefits are instead monetized in a sensitivity analysis and are estimated to be \$19 million per year when discounting at 2%. As these benefits are but two health endpoints from a single contaminant, they point to the possible true magnitude of benefits attributable to the final rule.

The RIA also describes a number of important benefits that cannot currently be quantified or monetized due to data limitations or limitations in current methodologies. These benefits include reducing the baseline risk of unit leakage and failure attributable to climate-change driven severe weather events. Many legacy CCR surface impoundments and CCRMU are situated close to rivers or are located along the coast. These units are vulnerable to inland or coastal flooding, which may occur at an increased frequency due to the effects of climate change. Flooding events may cause these units to overtop or catastrophically collapse, releasing CCR into the environment, exposing nearby communities to toxic contamination and necessitating potentially costly cleanup and remediation. EPA has identified 62 legacy CCR impoundments at medium or high risk from climate change-driven flooding, and 74 CCRMU at medium or high risk from climate change driven-flooding.

Another set of benefits outside the scope of quantification include reducing the instance of negative human health impacts such as cardiovascular mortality, neurological effects, and cancers (separate from the quantified cancer benefits) brought on by exposure to toxins found in coal ash. Either through leaking impoundment sites or release events, many pollutants from legacy CCR surface impoundments are

likely to contaminate nearby water bodies, affecting surface waters, local fish populations, and drinking water reservoirs. Because known transport pathways exist between these release events and human health endpoints, EPA expects the proposed rule to cause risk reductions for various categories that are not yet quantifiable. Toxins such as thallium, molybdenum, and lithium, while all present in CCR, lack the data to create dose-response relationships between ingestion rates and specific health endpoints, and thus precludes EPA from quantifying associated benefits.

The RIA describes several surface water quality benefits such as the improved health of ecosystems proximate to CCR disposal units, and the avoided costs of treating public drinking water impacted by CCR contamination. EPA expects leakages or releases of effluent from any CCR surface impoundment site to contaminate nearby surface waters and environments. Introduction of arsenic, selenium, and other heavy metals associated with CCR surface impoundment contents are shown to accumulate in sediments of nearby stream and lake beds, posing risks and injury to organisms and consequently ecosystems. Although surface waters are broadly protected from high levels of contaminants under EPA's regulations and Water Quality Criteria (WQC), complex interactions from trace amounts of heavy metals and other toxins known to be released from legacy CCR surface impoundment sites have displayed measurable impact to aquatic animals and ecosystems.¹⁵²

The RIA discusses how the final rule may result in avoided drinking water treatment costs and drinking water quality improvements at public water systems. First, by reducing the risk of CCR leakage events and impoundment failures, the proposed rule will help avoid costs of water quality treatment at public intake sources. Second, by preventing release events the proposed rule has the potential to reduce the incidence of eutrophication in source waters for public drinking supplies. Eutrophication is primarily caused by an overabundance of nitrogen and phosphorus. It causes foul tastes and odors, which require additional treatment, and commensurate expenditure, to remove.

The RIA discusses potential impacts on the market for the beneficial use of

CCR as a substitute for virgin materials. Future uses of CCR are unknown. Research on the recovery of rare earth elements and yttrium from coal fly ash is ongoing but currently only at laboratory scale. It is possible that in the future, the availability of additional CCR may reach an equilibrium price that encourages demand, particularly as coal plants retire and the supply of "new" CCR falls. However, the quality of CCR in legacy CCR surface impoundments and CCRMU may limit their value. Older, closed impoundments or other CCR storage areas are less likely to have CCR material of a known and reliable composition.

The RIA also discusses potential reductions in fugitive dust emanating from legacy CCR surface impoundments, which will benefit fence line communities by reducing the amount of resuspended ash from legacy CCR surface impoundments that could otherwise lead to respiratory health hazards for communities surrounding a given legacy impoundment.

The RIA discusses the benefits of improved property values near closed and remediated sites. Neighborhoods located near hazardous waste sites often experience depressed property values due to health risks posed by contaminant exposure pathways, potential reductions in ecological services, unsightly aesthetics of the disposal unit site, and potential stigma associated with proximity to a disposal site. Almost a million households, and over 2.5 million people are located within three miles of legacy CCR surface impoundments and CCRMU.

Approximately 75,000 households and 200,000 people are located within a mile. Improvements in home values resulting from the proposed rule have the potential to bestow welfare gains to homeowners located near legacy CCR surface impoundments and CCRMU.

The RIA also discusses the value of reusing land formerly occupied by legacy CCR surface impoundments, and CCRMU. Once legacy CCR surface impoundments and CCRMU are closed by removal, landfills are properly capped, or corrective action activities are completed, the land is more likely to move into alternative, economically productive purposes. For example, these land reuse projects might include industrial redevelopment or implementation of green energy generation which can utilize the existing electricity grid infrastructure.

Finally, based on the demographic composition and environmental conditions of communities within one and three miles of legacy CCR surface impoundments, the final rule will

reduce existing disproportionate and adverse effects on economically vulnerable communities, as well as those that currently face environmental burdens. For example, in Illinois the population living within one mile of legacy CCR surface impoundment sites is over three times as likely compared to the State average to have less than a high school education (35.66% compared to 10.10%, see RIA exhibit ES.14), and that population already experiences higher than average exposures to particulate matter, ozone, diesel emissions, lifetime air toxics cancer risks, and proximity to traffic, Superfund sites, Risk Management Plan sites, and hazardous waste facilities (see RIA exhibit ES.15).

The RIA also discusses the interaction of the CCR rules with Office of Air rules governing emissions at power plants. Following on the significant progress EPA has made over many decades to reduce dangerous pollution from coal-fired electric utilities' stack emissions and effluents, this proposed rule will help EPA further ensure that the communities and ecosystems closest to coal facilities are sufficiently protected from harm from groundwater contamination, surface water contamination, fugitive dust, floods and impoundment overflows, and threats to wildlife. The volume and toxicity of CCR at many sites persisted or increased over past decades even as coal-fired units' air and water emissions decreased, and this proposed rule will help EPA fulfill the promise of substantial public health and welfare gains from its full suite of regulations aimed at reducing the harms from coal-combustion pollution.

As noted previously, EPA establishes the requirements under RCRA sections 1008(a)(3) and 4004(a) without taking cost into account. *See, USWAG*, 901 F.3d at 448–49. Although EPA has accordingly designed its proposal based on its statutory factors and court precedent and has not relied on this benefit-cost analysis in the selection of its proposed alternative, EPA believes that after considering all unquantified and distributional effects, the public health and welfare gains that will result from the proposed alternative would justify the rule's costs.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at <https://www.epa.gov/laws-regulations/laws-and-executive-orders>.

¹⁵² Brandt, Jessica E., et al. "Beyond selenium: coal combustion residuals lead to multielement enrichment in receiving lake food webs." *Environmental science & technology* 53.8 (2019): 4119–4127.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 14904: Modernizing Regulatory Review

This action is a “significant regulatory action” under section 3(f)(1) of Executive Order 12866, as amended by Executive Order 14094. Accordingly, the EPA submitted this action to the Office of Management and Budget (OMB) for review. Any changes made in response to recommendations received as part Executive Order 12866 review have been documented in the docket. The EPA prepared an analysis of the potential costs and benefits associated with this action. This analysis, Regulatory Impact Analysis: Hazardous and Solid Waste Management System: Disposal of Coal Combustion Residuals from Electric Utilities; Legacy CCR Surface Impoundments, is available in the docket and is briefly summarized in Unit V.

B. Paperwork Reduction Act (PRA)

The information collection activities in this rule will be submitted for approval to the Office of Management and Budget (OMB) under the PRA. EPA submitted the proposed rule ICR to OMB for approval on March 25th, 2024, triggering a 30-day public comment period for this proposed information collection. EPA anticipates the final ICR will be approved by the effective date of this final rule. If EPA receives any new and substantive comments on proposed collection, *i.e.*, substantive comments that were not received during the 60 day public comment period on the rule (from May 18, 2023–July 17, 2023), EPA will address those comments in a revision to the ICR via the standard PRA approval process. The Information Collection Request (ICR) document that the EPA prepared has been assigned EPA ICR number 2761.01. Due to the concurrent timing of this rulemaking and the timing of the renewal of the collection of information 2050–0223, *Disposal of Coal Combustion Residuals From Electric Utilities*, EPA is requesting a temporary OMB control number for this rulemaking collection, which will be assigned upon approval of the proposed ICR by OMB. EPA will submit a request to merge this rulemaking collection into the existing ICR for the program, 2050–0223, once the final rulemaking ICR and renewal for 2050–0223 are approved by OMB. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

The final rule requires legacy CCR surface impoundments to comply with the reporting and recordkeeping requirements already in place for regulated CCR units. Many of these requirements are one-time requirements that will occur soon after the promulgation of the rule, while several are ongoing. The final rule also requires legacy CCR surface impoundments to submit an applicability report, unique to this universe of units, which will provide stakeholders with essential site characteristic and contact information for the unit.

Respondents/affected entities: Inactive electric utility plants with inactive CCR surface impoundments (legacy CCR surface impoundments), electric utility plants with CCRMU, electric utility plants with OAFUs, and electric utility plants with landfills already subject to regulation under the 2015 final CCR rule, but which have waste in contact with groundwater.

Respondent's obligation to respond: The recordkeeping, notification, and posting are mandatory as part of the minimum national criteria promulgated under Sections 1008(a), 2002(a), 4004, and 4005(a) and (d) of RCRA.

Estimated number of respondents: 2,083.

Frequency of response: one-time and annually.

Total estimated burden: 172,909 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: \$11.2 million (per year), includes \$11.2 million annualized capital or operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. The small entities subject to the requirements of this action are owners and operators of coal fired electric utility plants in NAICS code 221112 and firms that own property on which an inactive/retired coal fired power plant is located. The Agency has identified 175 small entities

subject to the final rule. The Agency estimates that the average annual cost to a small entity will be approximately \$0.31 million; the vast majority of these entities do not own legacy CCR surface impoundments, CCRMU, or OAFUs, and must only complete the evaluation report requirements of the final rule. EPA has identified 15 small entities owning legacy CCR surface impoundments, CCRMU, and/or OAFUs; EPA assumes that small entities will not be able to pass on any compliance costs to ratepayers. This assumption, in EPA's opinion, constitutes a high-end scenario. In total, these 15 small entities are estimated to incur approximately \$52.1 million in annual costs. The Agency has determined that five small entities may experience an impact greater than 3% of annual revenues. Details of this analysis are presented in the Regulatory Impact Analysis, which can be found in the docket for this action.

D. Unfunded Mandates Reform Act (UMRA)

This action contains a Federal mandate under UMRA, 2 U.S.C. 1531–1538, that may result in expenditures of \$100 million or more for State, local and Tribal governments, in the aggregate, or the private sector in any one year. Accordingly, the EPA has prepared a written statement required under section 202 of UMRA. The statement is included in the docket for this action and briefly summarized here.

The RIA estimates that the proposed rule may affect 194 legacy CCR surface impoundments at 84 facilities, 195 CCRMU at 104 facilities, 15 OAFUs at six facilities, and 39 landfills already regulated under the 2015 final rule. The final rule will extend the existing requirements of the 2015 CCR final rule, found in 40 CFR part 257, subpart D, to these units.

In preparing the 2015 CCR final rule, and consistent with the intergovernmental consultation provisions of section 204 of the UMRA, EPA initiated pre-proposal consultations with governmental entities affected by the rule. In developing the regulatory options for the 2015 CCR Rule, EPA consulted with small governments according to EPA's UMRA interim small government consultation plan developed pursuant to section 203 of UMRA. The details of this consultation can be found in the preamble to the 2015 CCR final rule. Consistent with section 205 of UMRA, EPA identified and considered a reasonable number of regulatory alternatives, and adopted the least-costly approach (*i.e.*, a modified version

of the “D Prime” least costly approach presented in the 2010 proposed CCR rule). The final rule merely extends the provisions of the 2015 final rule to four additional classes of facilities.

This action is not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments. The threshold amount established for determining whether regulatory requirements could significantly affect small governments is \$100 million annually. The RIA estimates annual average costs of \$7 million total for the four local governments identified as owning units subject to the final rule. These estimates are well below the \$100 million annual threshold established under UMRA. There are no known Tribal owner entities of facilities that would incur substantial direct costs under the final rule.

E. Executive Order 13132: Federalism

This action does not have Federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have Tribal implications as specified in Executive Order 13175. For the “Final Rule: Hazardous and Solid Waste Management System; Disposal of Coal Combustion Residuals from Electric Utilities” published April 17, 2015 (80 FR 21302), EPA identified three of the 414 coal-fired electric utility plants (in operation as of 2012) as being located on Tribal lands. To the extent that these plants contain CCRMU subject to the proposed rule, the impacts to Tribes will be limited to document review and walking the site. As these are not substantial direct costs, this action does not impose substantial direct compliance costs or otherwise have a substantial direct effect on one or more Indian Tribes, to the best of EPA’s knowledge. Neither will it have substantial direct effects on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 directs Federal agencies to include an evaluation of the health and safety effects of the planned regulation on children in Federal health and safety standards and explain why the regulation is preferable to potentially effective and reasonably feasible alternatives. This action is subject to E.O. 13045 (62 FR 19885, April 23, 1997) because it is a significant regulatory action under section 3(f)(1) of E.O. 12866, and EPA believes that the environmental health or safety risks addressed by this action may have a disproportionate effect on children. In addition, EPA’s Policy on Children’s Health applies. Accordingly, EPA evaluated the environmental health or safety effects of CCR constituents of potential concern on children. The results of this evaluation are contained in the Human and Ecological Risk Assessment of Coal Combustion Wastes available in the docket for this action.

As ordered by E.O. 13045 Section 1–101(a), EPA identified and assessed environmental health risks and safety risks that may disproportionately affect children in the revised risk assessment. Pursuant to U.S. EPA’s Guidance on Selecting Age Groups for Monitoring and Assessing Childhood Exposures to Environmental Contaminants, children are divided into seven distinct age cohorts: 1 to <2 yr, 2 to <3 yr, 3 to <6 yr, 6 to <11 yr, 11 to <16 yr, 16 to <21 yr, and infants (<1 yr). Using exposure factors for each of these cohorts, EPA calculated cancer and non-cancer risk results in both the screening and probabilistic phases of the assessment. In general, risks to infants tended to be higher than other childhood cohorts, and also higher than risks to adults. However, for drinking water cancer risks, the longer exposure periods for adults led to the highest risks over a standard adult lifetime. Screening risks exceeded EPA’s human health criteria for children exposed to contaminated air, soil, and food resulting from fugitive dust emissions and run-off. Similarly, 90th percentile child cancer and non-cancer risks exceeded the human health criteria for the groundwater to drinking water pathway under the full probabilistic analysis (Table 5–17 in the Human and Ecological Risk Assessment of Coal Combustion Wastes). The closure, groundwater monitoring and corrective action required by the rule will reduce risks from currently unregulated legacy CCR surface impoundments, and CCRMU. Thus,

EPA believes that this rule will be protective of children’s health.

In general, because the pollution control requirements under the CCR rule will reduce health and environmental exposure risks at all coal-fired electric utility plants, the CCR rule is not expected to create additional or new risks to children.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This action is not a “significant energy action” because it is not likely to have a significant adverse effect on the supply, distribution or use of energy. Because the final rule addresses management of CCR and pertains mainly to inactive CCR units (legacy CCR surface impoundments at inactive facilities and CCRMU at facilities already regulated under the 2015 CCR rule), this final rule will have no effect on the production of crude oil, coal, fuel, or natural gas. In addition, the final rule will have no direct effect on electricity production, generating capacity, or on foreign imports or exports of energy.

Electricity price effects on the price of energy are only possible because in some cases, utilities may attempt to pass the costs of managing CCR under the proposed rule on to ratepayers in the form of increased electricity rates through Public Utility Commissions (PUCs). As a result, the final rule may indirectly affect electricity prices within the energy sector. To estimate what the electricity price effects of this final rule may be on a national level, EPA compared the expected costs of this rule to the expected costs and effects resulting from three previously conducted IPM runs for three previous RIAs, the 2015 CCR Rule, the 2015 ELG Rule (which included the costs of the 2015 CCR Rule in its baseline), and the 2019 ELG Rule, which was a deregulatory rule. Extrapolating from these IPM runs, EPA estimates that the effect of the current action on electricity prices will be between 0.060% and 0.156%. Since these effects fall below the 1% threshold, EPA concludes that this rule is not expected to generate significant adverse energy effects. The full energy impacts analysis is available in the Regulatory Impact Analysis that accompanies this action.

I. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking involves technical standards. The EPA has decided to use technical standards in this rule as the existing CCR regulations rely on the

following: (1) RCRA Subpart D, Section 257.70 liner design criteria for new CCR landfills and any lateral expansion of a CCR landfill includes voluntary consensus standards developed by ASTM International and EPA test methods such as SW-846, (2) Section 257.71 liner design criteria for existing CCR surface impoundments includes voluntary consensus standards developed by ASTM International and EPA test methods such as SW-846, (3) Section 257.72 liner design criteria for new CCR surface impoundments and any lateral expansion of a CCR surface impoundment includes voluntary consensus standards developed by ASTM International and EPA test methods such as SW-846, and (4) Section 257.73 structural stability standards for new and existing surface impoundments use the ASTM D 698 and 1557 standards for embankment compaction. In this rulemaking, EPA expands the application of § 257.73 structural stability standards, which as noted, rely on the ASTM D 698 and 1557 standards for embankment compaction, to facilities with legacy CCR surface impoundments. This rulemaking does not adopt or otherwise involve any additional technical standards.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations and Executive Order 14096: Revitalizing Our Nation's Commitment to Environmental Justice for All

EPA believes that the human health or environmental conditions that exist prior to this action result in or have the potential to result in disproportionate and adverse human health or environmental effects on communities with environmental justice concerns.

EPA conducted a demographic screening analysis for all facilities subject to the rule to determine the composition of populations living within one and three miles of facilities with these units. Specifically, EPA looked at the percentages of the relevant populations that are identified as minority/people of color, households below the Federal poverty level, population with less than high school education (among those 25 years and older), and populations characterized by linguistic isolation. EPA chose to look at radii of one and three miles because they represent the areas most likely to be affected by groundwater contamination and surface water impacts from legacy CCR surface impoundments and CCRMU. EPA compared the demographic profile

within these radii to national and State averages to assess the extent to which marginalized groups are disproportionately affected by CCR-related contamination in the baseline.

To more fully explore the conditions in communities and populations surrounding facilities subject to the 2024 final rule, EPA expanded the demographic proximity analysis to include a suite of metrics that represent baseline health and social factors that are likely to be affected by, or interact with, changes in the management of facilities as a result of the rule. This analysis also focuses on populations within one mile of legacy CCR surface impoundments and CCRMU sites, but includes a combination of eight baseline indicators from the CDC Environmental Justice Index (EJI) and EPA's EJScreen that document community conditions that (a) suggest potential environmental justice concerns and (b) are relevant to actions resulting from the 2024 final rule. These include:

- CDC EJI Indicators: Lack of internet access, prevalence of disabilities, cancer, poor mental health, high blood pressure, asthma, and diabetes.

- EJScreen Indicators: PM_{2.5} concentrations and low life expectancy.

This specific subset of indicators captures health-related risks, environmental burdens, and access to information that affect a substantial number of communities living near the universe of facilities to provide a clearer picture of the baseline conditions. To assess the extent to which facilities affected by the final rule are located within communities with high baseline risks, the analysis specifically identifies, for each indicator, communities that fall in the highest (most at risk) 40 percent, or top two quintiles of communities nationwide. In other words, the analysis only identifies instances where a community is more at risk or more burdened than 60 percent of all communities in the U.S. For each indicator, the analysis calculates the number of communities within one mile of legacy CCR surface impoundments, CCRMU, and OAFU facilities that are in the top two quintiles.

Many of the health-related indicators appeared in communities with high percentiles for other health-related indicators, especially combinations of high blood pressure, diabetes, and asthma. Communities with high populations of people with disabilities were also likely to have high prevalence of high blood pressure, asthma, diabetes, poor mental health, and cancer. Additionally, high prevalence of poor mental health and lack of internet

accompanied prevalence of morbidities besides cancer.

EPA also identified lack of internet access, which is generally associated with poverty but also is a distinct factor in ensuring that information about regulated facilities and units that is required by the 2024 final rule is accessible to the people in surrounding communities. Half of the facilities with a lack of internet access in surrounding communities were also above two times the State average for households below the national poverty level, but the other half are not, suggesting that this barrier to information may be more widespread and less predictable in the 2024 rule context. In addition to the income-related implications, lack of internet access has consequences for information access that are pertinent to the 2024 final rule, which requires facilities to publish information online for public access. Therefore, a lack of internet access is a key barrier for communities who may be unable to receive important information.

These analyses found that of the roughly 182 sites in the regulated universe, more than half are located in areas with environmental justice concerns in surrounding communities. These communities are likely to face existing environmental burdens, economic stressors, and health conditions that put their residents and ecosystems at greater cumulative risk from the impacts associated with proximity to legacy impoundments. Because the final rule is designed to both prevent future contamination and eliminate existing contamination from CCR units that are near these already-vulnerable communities, EPA believes that the rule is likely to incrementally reduce existing disproportionate and adverse effects on communities with EJ concerns. EPA believes that the rule is particularly likely to reduce disproportionate and adverse effects on people of color and populations who experience low income. The rule improves overall environmental quality for all exposed communities and populations by ensuring protection and remediation of groundwater, resulting in avoided health effects (including cancer) from drinking water exposures to arsenic and other contaminants, and by reducing releases of CCR from impoundments into the surface waters, ecosystems, and air surrounding the facilities. The final rule is equity-enhancing in that it addresses EJ concerns present in the communities and populations near many of the facilities by reducing environmental and health burdens that contribute to the cumulative impacts experienced by

these communities, including the often-costly burdens associated with health effects. Moreover, the rule requires that facilities make information about their contamination and remediation actions available on public websites; this provides all interested members of the public, including communities with EJ concerns, improved access to information related to their environment or health, supporting effective community involvement.

Overall, EPA found that facilities affected by the rule are often located near populations of color with higher rates of poverty and linguistic isolation, and lower levels of education. Of the roughly 182 sites in the regulated universe, more than half are located in areas with environmental justice concerns in surrounding communities. These communities are likely to face existing environmental burdens, economic stressors, and health conditions that put their residents and ecosystems at greater cumulative risk from the impacts associated with proximity to legacy impoundments. Because the final rule is designed to both prevent future contamination and eliminate existing contamination from CCR units that are near these already-vulnerable communities, EPA believes that the rule is likely to incrementally reduce existing disproportionate and adverse effects on communities with EJ concerns. EPA believes that the rule is particularly likely to reduce disproportionate and adverse effects on people of color and populations who experience low income.

The information supporting this Executive Order review is contained in the accompanying Regulatory Impact Analysis, which can be found in the docket for this action.

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action meets the criteria set forth in 5 U.S.C. 804(2).

List of Subjects

40 CFR Part 9

Environmental protection, Reporting and recordkeeping requirements.

40 CFR Part 257

Environmental protection, Beneficial use, Coal combustion products, Coal combustion residuals, Coal combustion

waste, Disposal, Hazardous waste, Landfill, Surface impoundment.

Michael S. Regan,
Administrator.

For the reasons set out in the preamble, title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 9—OMB APPROVALS UNDER THE PAPERWORK REDUCTION ACT

- 1. The authority citation for part 9 continues to read as follows:

Authority: 7 U.S.C. 135 *et seq.*, 136–136y; 15 U.S.C. 2001, 2003, 2005, 2006, 2601–2671; 21 U.S.C. 331j, 346a, 31 U.S.C. 9701; 33 U.S.C. 1251 *et seq.*, 1311, 1313d, 1314, 1318, 1321, 1326, 1330, 1342, 1344, 1345 (d) and (e), 1361; E.O. 11735, 38 FR 21243, 3 CFR, 1971–1975 Comp. p. 973; 42 U.S.C. 241, 242b, 243, 246, 300f, 300g, 300g–1, 300g–2, 300g–3, 300g–4, 300g–5, 300g–6, 300j–1, 300j–2, 300j–3, 300j–4, 300j–9, 1857 *et seq.*, 6901–6992k, 7401–7671q, 7542, 9601–9657, 11023, 11048.

- 2. Amend § 9.1 by adding an undesignated center heading and an entry for “257.50–257.107” in numerical order to read as follows:

§ 9.1 OMB approvals under the Paperwork Reduction Act

* * * * *				
40 CFR citation				OMB control No.
* * * * *				*
Disposal of Coal Combustion Residuals From Electric Utilities				
257.50–257.107				2050–0223
* * * * *				*
* * * * *				

PART 257—CRITERIA FOR CLASSIFICATION OF SOLID WASTE DISPOSAL FACILITIES AND PRACTICES

- 3. The authority citation for part 257 is revised to read as follows:

Authority: 42 U.S.C. 6907(a)(3), 6912(a)(1), 6927, 6944, 6945(a) and (d); 33 U.S.C. 1345(d) and (e).

Subpart A [Amended]

- 4. Amend § 257.1 by revising paragraph (c)(12) to read as follows:

§ 257.1 Scope and purpose.

* * * * *

(c) * * *

(12) Except as otherwise specifically provided in subpart D of this part, the

criteria in subpart A of this part do not apply to CCR units, as that term is defined in subpart D of this part. CCR units are instead subject to subpart D of this part.

Subpart D [Amended]

- 5. Amend subpart D by removing the phrase “Web site” and adding in its place the word “website” wherever it appears.

- 6. Amend § 257.50 by revising paragraph (c), (d), and (e) to read as follows:

§ 257.50 Scope and purpose.

* * * * *

(c) This subpart also applies to inactive CCR surface impoundments at active electric utilities or independent power producers, regardless of how electricity is currently being produced at the facility.

(d) (1) This subpart applies to CCR management units containing 1,000 tons or greater of CCR, located at active facilities or facilities with a legacy CCR surface impoundment.

(2) CCR management units containing greater than or equal to 1 ton and less than 1,000 tons of CCR, located at active facilities or facilities with a legacy CCR surface impoundment, are subject only to the requirements of the facility evaluation report in § 257.75 until a permitting authority determines that regulation of these units, either individually or in the aggregate, is warranted and determines the applicable requirements.

(e) This subpart applies to electric utilities or independent power producers that ceased producing electricity prior to October 19, 2015 and have a legacy CCR surface impoundment onsite.

* * * * *

§ 257.51 [Removed and Reserved]

- 7. Amend subpart D by removing and reserving § 257.51.

- 8. Revise § 257.52 to read as follows:

§ 257.52 Applicability of other regulations.

(a) Compliance with the requirements of this subpart does not affect the need for the owner or operator of a CCR unit to comply with all other applicable federal, state, tribal, or local laws or other requirements.

(b) Any CCR unit continues to be subject to the requirements in §§ 257.3–1, 257.3–2, and 257.3–3.

- 9. Amend § 257.53 by:

■ a. Revising the definition of “Active facility or active electric utilities or independent power producers”;

- b. Adding in alphabetical order the definition of “Closed prior to October 19, 2015”;
- c. Revising the definition of “CCR landfill or landfill”;
- d. Adding in alphabetical order the definition of “CCR management unit”;
- e. Revising the definitions of “CCR surface impoundment or impoundment” and “CCR unit”;
- f. Adding in alphabetical order the definitions of “Critical infrastructure”, “Contains both CCR and liquids” and “Inactive CCR landfill”;
- g. Revising the definition of “Inactive CCR surface impoundment”;
- h. Adding in alphabetical order the definitions of “Inactive facility or inactive electric utility or independent power producer”, “Infiltration”, “Legacy CCR surface impoundment”, and “Liquids”;
- i. Revising the definitions of “Operator” and “Owner”;
- j. Adding in alphabetical order the definition of “Regulated CCR unit”;
- k. Revising the definition of “State Director”;
- l. Removing the definitions of “Technically feasible” and “Technically infeasible”; and
- m. Adding in alphabetical order the definitions of “Technically feasible or feasible” and “Technically infeasible or infeasible”.

The revisions and additions read as follows:

§ 257.53 Definitions.

* * * * *

Active facility or active electric utilities or independent power producers means any facility subject to the requirements of this subpart that is in operation on or after October 19, 2015. An electric utility or independent power producer is in operation if it is generating electricity that is provided to electric power transmission systems or to electric power distribution systems on or after October 19, 2015. An off-site disposal facility is in operation if it is accepting or managing CCR on or after October 19, 2015.

* * * * *

Closed prior to October 19, 2015 means the CCR landfill or surface impoundment completed closure of the unit in accordance with state law prior to October 19, 2015.

* * * * *

CCR landfill or landfill means an area of land or an excavation that contains CCR and which is not a surface impoundment, an underground injection well, a salt dome formation, a salt bed formation, an underground or surface coal mine, or a cave. For

purposes of this subpart, a CCR landfill also includes sand and gravel pits and quarries that receive CCR, CCR piles, and any practice that does not meet the definition of a beneficial use of CCR.

CCR management unit means any area of land on which any noncontainerized accumulation of CCR is received, is placed, or is otherwise managed, that is not a regulated CCR unit. This includes inactive CCR landfills and CCR units that closed prior to October 19, 2015, but does not include roadbed and associated embankments in which CCR is used unless the facility or a permitting authority determines that the roadbed is causing or contributing to a statistically significant level above the groundwater protection standard established under § 257.95(h).

* * * * *

CCR surface impoundment or impoundment means a natural topographic depression, man-made excavation, or diked area, designed to hold an accumulation of CCR and liquids, and the unit treats, stores, or disposes of CCR.

CCR unit means any CCR landfill, CCR surface impoundment, or lateral expansion of a CCR landfill or CCR surface impoundment, or a combination of more than one of these units, based on the context of the paragraph(s) in which it is used. This term includes both new and existing units, unless otherwise specified. This term includes CCR management units and legacy CCR surface impoundments.

Contains both CCR and liquids means that both CCR and liquids are present in a CCR surface impoundment, except where the owner or operator demonstrates that the standard in § 257.102(d)(2)(i) has been met.

Critical infrastructure means physical structures, such as buildings, railways, bridges, or tunnels, that are not readily replaced or relocated and are either:

- (1) Necessary for the continued generation of power, or
- (2) Vital to the success or continuation of other on-going site activity for the public welfare. Examples of critical infrastructure include high power electric transmission towers, air pollution control or wastewater treatment systems, active CCR units, buildings, or an electrical substation. Buildings or other structures that exclusively provide commercial or financial benefit to private entities are not critical infrastructure.

* * * * *

Inactive CCR landfill means an area of land or an excavation that contains CCR but that no longer receives CCR on or

after October 19, 2015 and that is not a surface impoundment, an underground injection well, a salt dome formation, a salt bed formation, an underground or surface coal mine, or a cave. This term also includes sand and gravel pits that contain CCR and CCR piles, which have not received CCR on or after October 19, 2015, and abandoned or inactive CCR piles.

Inactive CCR surface impoundment means a CCR surface impoundment located at an active facility that no longer receives CCR on or after October 19, 2015, and still contains both CCR and liquids on or after October 19, 2015.

Inactive facility or inactive electric utility or independent power producer means any electric utility or independent power producer that ceased providing power to electric power transmission systems or to electric power distribution systems before October 19, 2015. An off-site disposal facility is inactive if it ceased accepting or managing CCR prior to October 19, 2015.

* * * * *

Infiltration means the migration or movement of liquid, such as surface water or ground water, into or through a CCR unit from any direction, including from the surface, laterally, and through the bottom of the unit.

* * * * *

Legacy CCR surface impoundment means a CCR surface impoundment that no longer receives CCR but contained both CCR and liquids on or after October 19, 2015, and that is located at an inactive electric utility or independent power producer.

* * * * *

Liquids means any fluid (such as water) that has no independent shape but has a definite volume and does not expand indefinitely and that is only slightly compressible. This encompasses all of the various types of liquids that may be present in a CCR unit, including water that was sluiced into an impoundment along with CCR, precipitation, surface water, groundwater, and any other form of water that has migrated into the impoundment, which may be found as free water or standing water ponded above CCR or porewater intermingled with CCR.

* * * * *

Operator means the person(s) responsible for the overall operation of a CCR unit. This term includes those person(s) or parties responsible for disposal or otherwise actively engaged in the solid waste management of CCR. It also includes those responsible for directing or overseeing groundwater

monitoring, closure or post-closure activities at a CCR unit.

* * * * *

Owner means the person(s) who owns a CCR unit or part of a CCR unit, or a facility, whether in full or in part.

* * * * *

Regulated CCR unit means any new CCR landfill, existing CCR landfill, new CCR surface impoundment, existing CCR surface impoundment, inactive CCR surface impoundment, or legacy CCR surface impoundment. This term does not include CCR management units.

* * * * *

State Director means the chief administrative officer of the lead state agency responsible for implementing the state program regulating disposal in CCR units.

* * * * *

Technically feasible or *feasible* means possible to do in a way that would likely be successful.

Technically infeasible or *infeasible* means not possible to do in a way that would likely be successful.

* * * * *

■ 10. Amend § 257.61 by revising the introductory text of paragraph (a) to read as follows:

§ 257.61 Wetlands.

(a) New CCR landfills, existing and new CCR surface impoundments, and all lateral expansions of CCR units must not be located in wetlands, as defined in § 230.41(a) of this chapter, unless the owner or operator demonstrates by the dates specified in paragraph (c) of this section that the CCR unit meets the requirements of paragraphs (a)(1) through (5) of this section.

* * * * *

■ 11. Amend § 257.73 by revising the introductory text of paragraph (a) to read as follows:

§ 257.73 Structural integrity criteria for existing CCR surface impoundments.

(a) The requirements of paragraphs (a)(1) through (4) of this section apply to all existing CCR surface impoundments and legacy CCR surface impoundments, except for those that are incised CCR surface impoundments.

* * * * *

■ 12. Add § 257.75 to read as follows:

§ 257.75 Requirements for identifying CCR management units.

(a) *Applicability.* The requirements of this section apply to owners and operators of active facilities or facilities with a legacy CCR surface impoundment.

(b) *Facility evaluation.* The owner or operator of an active facility or a facility with a legacy CCR surface impoundment must conduct a facility evaluation to identify all CCR management units at the facility in accordance with paragraphs (c) through (e) of this section. At a minimum, the presence or absence of CCR management units at the facility must be confirmed and documented through a thorough evaluation of reasonably and readily available records that contain the information needed to prepare the Facility Evaluation Reports Part 1 and Part 2 required by paragraphs (c) and (d) of this section. The facility evaluation must also include a physical inspection of the facility. Where necessary, the physical inspection must include field investigation activities to fill data gaps, such as conducting exploratory soil borings, geophysical assessments, or any other similar physical investigation activities to establish the location and boundaries of potential or likely CCR management units, and to affirmatively rule out other areas of potential CCR placement at the facility that were identified during the information review or physical inspection. The facility evaluation must identify all CCR management units at the facility regardless of when the CCR management unit came into existence.

(c) *Facility Evaluation Report Part 1.* (1) No later than Monday, February 9, 2026, the owner or operator of an active facility or a facility with a legacy CCR surface impoundment must prepare a Facility Evaluation Report Part 1, which shall contain, to the extent reasonably and readily available, the information specified in paragraphs (c)(1)(i) through (xiv) of this section. The owner or operator has prepared the Facility Evaluation Report Part 1 when the report has been placed in the facility's operating record as required by § 257.105(f)(25).

(i) The name and address of the person(s) owning and operating the facility; the unit name associated with each regulated CCR unit and CCR management unit at the facility; and the identification number of each regulated CCR unit and CCR management unit if any have been assigned by the state or by the owner.

(ii) The location of any CCR management unit identified on the most recent U.S. Geological Survey (USGS) 7½ minute or 15-minute topographic quadrangle map, or a topographic map of equivalent scale if a USGS map is not available. The location of each regulated CCR unit at the facility must also be identified in the same manner.

(iii) A statement of the purpose(s) for which each CCR management unit at the facility is or was used.

(iv) A description of the physical and engineering properties of the foundation and abutment materials on which each CCR management unit is constructed.

(v) A discussion of any known spills or releases of CCR, including any associated remediation activities, from each CCR management unit and whether the spills or releases were reported to state or federal agencies.

(vi) Any record or knowledge of structural instability of each CCR management unit.

(vii) Any record or knowledge of groundwater contamination associated or potentially associated with each CCR management unit.

(viii) The size of each CCR management unit, including the general lateral and vertical dimensions and an estimate of the volume of waste contained within the unit.

(ix) Dates when each CCR management unit first received CCR and when each CCR management unit ceased receiving CCR.

(x) Identification of all types of CCR in each CCR management unit at the facility.

(xi) A narrative description of any closure activities that have occurred, including any applicable engineering drawings or reports.

(xii) A narrative that documents the data reviewed as part of the facility evaluation process, and that lists all data and information indicating the presence or absence of CCR management units at the facility.

(xiii) Any supporting information used to identify and evaluate CCR management units at the facility, including but not limited to any construction diagrams, engineering drawings, permit documents, wastestream flow diagrams, aerial photographs, satellite images, historical facility maps, any field or analytical data, groundwater monitoring data or reports, inspection reports, documentation of interviews with current or former facility workers, and other documents used to identify and evaluate CCR management units at the facility.

(xiv) A narrative description of any data gaps for information in paragraphs (c)(i) through (xiii) of this section, not available in existing information collection records and a plan for remedying identified data gaps through a physical examination of the facility, including any field or laboratory work needed to remedy data gaps in the Facility Evaluation Report Part 1 record. The plan must include the major

milestones needed to fill the identified data gaps (e.g., a physical examination of the facility, sampling of media, measurements of CCR concentrations in and around the unit or physical presence, delineation of CCR management unit(s)) and dates to complete such needed tasks. Also, as necessary and timely, any updates to data gap remedy plans must be added to the public record during the Facility Evaluation Report Part 1.

(2) The owner or operator of any facility regulated under this subpart must obtain a certification from a qualified professional engineer stating that the Facility Evaluation Report Part 1 meets the requirements of paragraph (c)(1) of this section.

(3) The owner or operator of any facility regulated under this subpart must certify the Facility Evaluation Report Part 1 required by paragraph (c)(1) of this section with the following statement signed by the owner or operator or an authorized representative:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this demonstration and all attached documents, and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(4) No later than Monday, February 9, 2026, the owner or operator must notify the Agency of the establishment of a CCR website using the procedures in § 257.107(a) via the “contact us” form on EPA’s CCR website.

(5) The owner or operator of any facility regulated under this subpart that does not contain any CCR management unit must submit Facility Evaluation Report Part 1 documenting the steps taken during the facility evaluation to determine the absence of any CCR management unit. The Facility Evaluation Report Part 1 must include the certifications required under paragraph (c)(3) of this section.

(d) *Facility evaluation report part 2.*
(1) No later than Monday, February 8, 2027, the owner or operator of an active facility or a facility with a legacy CCR surface impoundment must prepare a facility evaluation report part 2, which shall contain, to the extent not provided in the Facility Evaluation Report Part 1 under paragraph (c) of this section, the information specified in paragraphs (d)(1)(i) through (xiii) of this section obtained from a physical evaluation of the facility, including where necessary

field sampling. The owner or operator has prepared the facility evaluation report part 2 when the report has been placed in the facility’s operating record as required by § 257.105(f)(26).

(i) The name and address of the person(s) owning and operating the facility; the unit name associated with each regulated CCR unit and CCR management unit at the facility; and the identification number of each regulated CCR unit and CCR management unit if any have been assigned by the state or by the owner.

(ii) The location of any CCR management unit identified on the most recent U.S. Geological Survey (USGS) 7½ minute or 15-minute topographic quadrangle map, or a topographic map of equivalent scale if a USGS map is not available. The location of each regulated CCR unit at the facility must also be identified in the same manner.

(iii) A statement of the purpose(s) for which each CCR management unit at the facility is or was used.

(iv) A description of the physical and engineering properties of the foundation and abutment materials on which each CCR management unit was constructed.

(v) Any further evidence of known spills or releases, including any associated remediation activities, of CCR from each CCR management unit and whether the spills or releases were reported to state or federal agencies.

(vi) Any further evidence of structural instability of each CCR management unit.

(vii) Any further evidence of groundwater contamination associated or potentially associated with each CCR management unit.

(viii) The size of each CCR management unit, including the general lateral and vertical dimensions and an estimate of the volume of CCR contained within the unit.

(ix) Identification of the types of CCR in each CCR management unit.

(x) A narrative description of any closure activities that have occurred, including any applicable engineering drawings or reports.

(xi) A narrative that documents the nature and extent of field oversight activities and data reviewed as part of the facility evaluation process, and that lists all data and information that was reviewed indicating the presence or absence of CCR management units at the facility.

(xii) Any additional supporting information used to identify and evaluate CCR management units at the facility, including but not limited to any construction diagrams, engineering drawings, permit documents, wastestream flow diagrams, aerial

photographs, satellite images, historical facility maps, any field or analytical data, groundwater monitoring data or reports, inspection reports, and other documents used to identify and assess CCR management units at the facility. Additionally, as necessary and timely, any updates to the part 1 data gap remedy plan must be added to the record during the facility evaluation report part 2 timeframe.

(xiii) The Facility Evaluation Report Part 2 must explain how each data gap identified in Facility Evaluation Report Part 1 was addressed.

(xiv) A description of each CCR management unit for which regulation under this subpart is deferred for allowable reasons as specified in § 257.101(g) or (h). The owner or operator must provide documentation in the Facility Evaluation Report Part 2 to substantiate that the requirements § 257.101(g) or (h) have been met.

(2) The owner or operator of any facility regulated under this subpart must obtain a certification from a qualified professional engineer stating that the Facility Evaluation Report Part 2 meets the requirements of paragraph (d)(1) of this section.

(3) The owner or operator of any facility regulated under this subpart must certify the Facility Evaluation Report Part 2 required by paragraph (d)(1) of this section with the following statement signed by the owner or operator or an authorized representative:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this demonstration and all attached documents, and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(4) The owner or operator of any facility regulated under this subpart that does not contain any CCR management unit must submit Facility Evaluation Report Part 2 documenting the steps taken during the facility evaluation to determine the absence of any CCR management unit. The Facility Evaluation Report Part 2 must include the certifications required under paragraph (d)(3) of this section.

(e) The owner or operator of the facility must comply with the recordkeeping requirements specified in § 257.105(f), the notification requirements specified in § 257.106(f), and the internet requirements specified in § 257.107(f).

■ 13. Amend § 257.80 by revising paragraphs (a) and (b)(6) to read as follows:

§ 257.80 Air criteria.

(a) The owner or operator of a CCR unit must adopt measures that will effectively minimize CCR from becoming airborne at the facility, including CCR fugitive dust originating from CCR units, roads, and other CCR management and material handling activities.

(b) * * *

(6) *Amendment of the plan.* The owner or operator subject to the requirements of this section may amend the written CCR fugitive dust control plan at any time provided the revised plan is placed in the facility's operating record as required by § 257.105(g)(1). The owner or operator must amend the written plan no later than 30 days whenever there is a change in conditions that would substantially affect the written plan in effect, such as the construction and operation of a new CCR unit.

* * * * *

■ 14. Amend § 257.82 by revising the introductory text of paragraph (a) to read as follows:

§ 257.82 Hydrologic and hydraulic capacity requirements for CCR surface impoundments.

(a) The owner or operator of an existing or new CCR surface impoundment, legacy CCR surface impoundment, or any lateral expansion of a CCR surface impoundment must design, construct, operate, and maintain an inflow design flood control system as specified in paragraphs (a)(1) and (2) of this section.

* * * * *

■ 15. Amend § 257.83 by revising the introductory text of paragraphs (a)(1) and (b)(1) to read as follows:

§ 257.83 Inspection requirements for CCR surface impoundments.

(a) * * *

(1) All CCR surface impoundments, including legacy CCR surface impoundments, and any lateral expansion of a CCR surface impoundment must be examined by a qualified person as follows:

* * * * *

(b) * * *

(1) If the existing or new CCR surface impoundment or any lateral expansion of the CCR surface impoundment or legacy CCR surface impoundments is subject to the periodic structural stability assessment requirements under § 257.73(d) or § 257.74(d), the CCR unit must additionally be inspected on a

periodic basis by a qualified professional engineer to ensure that the design, construction, operation, and maintenance of the CCR unit is consistent with recognized and generally accepted good engineering standards. The inspection must, at a minimum, include:

* * * * *

■ 16. Revise and republish § 257.90 to read as follows:

§ 257.90 Applicability.

(a) *Applicability.* All CCR units are subject to the groundwater monitoring and corrective action requirements under §§ 257.90 through 257.98, except as provided in paragraph (g) of this section.

(b) *Initial timeframes—(1) Existing CCR landfills and existing CCR surface impoundments.* No later than October 17, 2017, the owner or operator of the CCR unit must be in compliance with the following groundwater monitoring requirements:

(i) Install the groundwater monitoring system as required by § 257.91;

(ii) Develop the groundwater sampling and analysis program to include selection of the statistical procedures to be used for evaluating groundwater monitoring data as required by § 257.93;

(iii) Initiate the detection monitoring program to include obtaining a minimum of eight independent samples for each background and downgradient well as required by § 257.94(b); and

(iv) Begin evaluating the groundwater monitoring data for statistically significant increases over background levels for the constituents listed in appendix III of this part as required by § 257.94.

(2) *New CCR landfills, new CCR surface impoundments, and all lateral expansions of CCR units.* Prior to initial receipt of CCR by the CCR unit, the owner or operator must be in compliance with the groundwater monitoring requirements specified in paragraph (b)(1)(i) and (ii) of this section. In addition, the owner or operator of the CCR unit must initiate the detection monitoring program to include obtaining a minimum of eight independent samples for each background well as required by § 257.94(b).

(3) *CCR management units.* No later than Monday, May 8, 2028, the owner or operator of the CCR management unit must be in compliance with the following groundwater monitoring requirements:

(i) Install the groundwater monitoring system as required by § 257.91.

(ii) Develop the groundwater sampling and analysis program to include selection of the statistical procedures to be used for evaluating groundwater monitoring data as required by § 257.93.

(iii) Initiate the detection monitoring program to include obtaining a minimum of eight independent samples for each background and downgradient well, as required by § 257.94(b).

(iv) Begin evaluating the groundwater monitoring data for statistically significant increases over background levels for the constituents listed in appendix III of this part, as required by § 257.94.

(v) Begin evaluating the groundwater monitoring data for statistically significant levels over groundwater protection standards for the constituents listed in appendix IV of this part as required by § 257.95.

(c) *Requirement to conduct groundwater monitoring and corrective action.* Once a groundwater monitoring system and groundwater monitoring program has been established at the CCR unit as required by this subpart, the owner or operator must conduct groundwater monitoring and, if necessary, corrective action throughout the active life and post-closure care period of the CCR unit.

(d) *Responding to a release from a CCR unit.* In the event of a release from a CCR unit, the owner or operator must immediately take all necessary measures to control the source(s) of releases so as to reduce or eliminate, to the maximum extent feasible, further releases of contaminants into the environment. The owner or operator of the CCR unit must comply with all applicable requirements in §§ 257.96, 257.97, and 257.98.

(e) *Annual groundwater monitoring and corrective action report.* For existing CCR landfills and existing CCR surface impoundments, no later than January 31, 2018, and annually thereafter, the owner or operator must prepare an annual groundwater monitoring and corrective action report. For new CCR landfills, new CCR surface impoundments, and all lateral expansions of CCR units, the owner or operator must prepare the initial annual groundwater monitoring and corrective action report no later than January 31 of the year following the calendar year a groundwater monitoring system has been established for such CCR unit as required by this subpart, and annually thereafter. For CCR management units, the owner or operator must prepare the initial annual groundwater monitoring and corrective action report no later than January 31, 2029, and annually thereafter. For the preceding calendar

year, the annual report must document the status of the groundwater monitoring and corrective action program for the CCR unit, summarize key actions completed, describe any problems encountered, discuss actions to resolve the problems, and project key activities for the upcoming year. For purposes of this section, the owner or operator has prepared the annual report when the report is placed in the facility's operating record as required by § 257.105(h)(1). At a minimum, the annual groundwater monitoring and corrective action report must contain the following information, to the extent available:

(1) A map, aerial image, or diagram showing the CCR unit and all background (or upgradient) and downgradient monitoring wells, to include the well identification numbers, that are part of the groundwater monitoring program for the CCR unit;

(2) Identification of any monitoring wells that were installed or decommissioned during the preceding year, along with a narrative description of why those actions were taken;

(3) In addition to all the monitoring data obtained under §§ 257.90 through 257.98, a summary including the number of groundwater samples that were collected for analysis for each background and downgradient well, the dates the samples were collected, and whether the sample was required by the detection monitoring or assessment monitoring programs;

(4) A narrative discussion of any transition between monitoring programs (e.g., the date and circumstances for transitioning from detection monitoring to assessment monitoring in addition to identifying the constituent(s) detected at a statistically significant increase over background levels); and

(5) Other information required to be included in the annual report as specified in §§ 257.90 through 257.98.

(6) A section at the beginning of the annual report that provides an overview of the current status of groundwater monitoring and corrective action programs for the CCR unit. At a minimum, the summary must specify all of the following:

(i) At the start of the current annual reporting period, whether the CCR unit was operating under the detection monitoring program in § 257.94 or the assessment monitoring program in § 257.95;

(ii) At the end of the current annual reporting period, whether the CCR unit was operating under the detection monitoring program in § 257.94 or the assessment monitoring program in § 257.95;

(iii) If it was determined that there was a statistically significant increase over background for one or more constituents listed in appendix III to this part pursuant to § 257.94(e):

(A) Identify those constituents listed in appendix III to this part and the names of the monitoring wells associated with such an increase; and

(B) Provide the date when the assessment monitoring program was initiated for the CCR unit.

(iv) If it was determined that there was a statistically significant level above the groundwater protection standard for one or more constituents listed in appendix IV to this part pursuant to § 257.95(g) include all of the following:

(A) Identify those constituents listed in appendix IV to this part and the names of the monitoring wells associated with such an increase;

(B) Provide the date when the assessment of corrective measures was initiated for the CCR unit;

(C) Provide the date when the public meeting was held for the assessment of corrective measures for the CCR unit; and

(D) Provide the date when the assessment of corrective measures was completed for the CCR unit.

(v) Whether a remedy was selected pursuant to § 257.97 during the current annual reporting period, and if so, the date of remedy selection; and

(vi) Whether remedial activities were initiated or are ongoing pursuant to § 257.98 during the current annual reporting period.

(f) *Recordkeeping, notification, and internet requirements.* The owner or operator of the CCR unit must comply with the recordkeeping requirements specified in § 257.105(h), the notification requirements specified in § 257.106(h), and the internet requirements specified in § 257.107(h).

(g) *Suspension of groundwater monitoring requirements.* (1) The Participating State Director or EPA where EPA is the permitting authority may suspend the groundwater monitoring requirements under §§ 257.90 through 257.95 for a CCR unit for a period of up to ten years, if the owner or operator provides written documentation that, based on the characteristics of the site in which the CCR unit is located, there is no potential for migration of any of the constituents listed in appendices III and IV to this part from that CCR unit to the uppermost aquifer during the active life of the CCR unit and the post-closure care period. This demonstration must be certified by a qualified professional engineer and approved by the Participating State Director or EPA

where EPA is the permitting authority, and must be based upon:

(i) Site-specific field collected measurements, sampling, and analysis of physical, chemical, and biological processes affecting contaminant fate and transport, including at a minimum, the information necessary to evaluate or interpret the effects of the following properties or processes on contaminant fate and transport:

(A) Aquifer Characteristics, including hydraulic conductivity, hydraulic gradient, effective porosity, aquifer thickness, degree of saturation, stratigraphy, degree of fracturing and secondary porosity of soils and bedrock, aquifer heterogeneity, groundwater discharge, and groundwater recharge areas;

(B) Waste Characteristics, including quantity, type, and origin;

(C) Climatic Conditions, including annual precipitation, leachate generation estimates, and effects on leachate quality;

(D) Leachate Characteristics, including leachate composition, solubility, density, the presence of immiscible constituents, Eh, and pH; and

(E) Engineered Controls, including liners, cover systems, and aquifer controls (e.g., lowering the water table). These must be evaluated under design and failure conditions to estimate their long-term residual performance.

(ii) Contaminant fate and transport predictions that maximize contaminant migration and consider impacts on human health and the environment.

(2) The owner or operator of the CCR unit may renew this suspension for additional ten year periods by submitting written documentation that the site characteristics continue to ensure there will be no potential for migration of any of the constituents listed in Appendices III and IV of this part. The documentation must include, at a minimum, the information specified in paragraphs (g)(1)(i) and (ii) of this section and a certification by a qualified professional engineer and approved by the State Director or EPA where EPA is the permitting authority. The owner or operator must submit the documentation supporting their renewal request for the state's or EPA's review and approval of their extension one year before the groundwater monitoring suspension is due to expire. If the existing groundwater monitoring extension expires or is not approved, the owner or operator must begin groundwater monitoring according to paragraph (a) of this section within 90 days. The owner or operator may continue to renew the suspension for

ten-year periods, provided the owner or operator demonstrate that the standard in paragraph (g)(1) of this section continues to be met for the unit. The owner or operator must place each completed demonstration in the facility's operating record.

(3) The owner or operator of the CCR unit must include in the annual groundwater monitoring and corrective action report required by § 257.90(e) or § 257.100(e)(5)(ii) any approved no migration demonstration.

■ 17. Amend § 257.95 by revising paragraph (b) to read as follows:

§ 257.95 Assessment monitoring program.

* * * * *

(b) (1) Within 90 days of triggering an assessment monitoring program, and annually thereafter:

(i) Except as provided by paragraph (b)(1)(ii) of this section, the owner or operator of the CCR unit must sample and analyze the groundwater for all constituents listed in appendix IV to this part.

(ii) The owner or operator of a CCR management unit must sample and analyze the groundwater for all constituents listed in appendix IV to this part no later than Monday, May 8, 2028.

(2) The number of samples collected and analyzed for each well during each sampling event must be consistent with § 257.93(e), and must account for any unique characteristics of the site, but must be at least one sample from each well.

* * * * *

■ 18. Revise and republish § 257.100 to read as follows:

§ 257.100 Inactive CCR surface impoundments and Legacy CCR surface impoundments.

(a) *General.* (1) Inactive CCR surface impoundments are subject to all of the requirements of this subpart applicable to existing CCR surface impoundments, except that an active electric utility or independent power producer that generates electricity without the use of fuel is subject to the compliance deadlines applicable to legacy CCR surface impoundments, provided the facility has not generated electricity using fuels on or after October 19, 2015.

(2) Legacy CCR surface impoundments are subject to all of the requirements of this subpart applicable to existing CCR surface impoundments, except for the requirements in §§ 257.60 through 257.64 and 257.71.(b) through (d) [Reserved]

(e) *Timeframes for certain inactive CCR surface impoundments.* (1) An inactive CCR surface impoundment for

which the owner or operator has completed the actions by the deadlines specified in paragraphs (e)(1)(i) through (iii) of this section is eligible for the alternative timeframes specified in paragraphs (e)(2) through (6) of this section. The owner or operator of the CCR unit must comply with the applicable recordkeeping, notification, and internet requirements associated with these provisions. For the inactive CCR surface impoundment:

(i) The owner or operator must have prepared and placed in the facility's operating record by December 17, 2015, a notification of intent to initiate closure of the inactive CCR surface impoundment pursuant to § 257.105(i)(1);

(ii) The owner or operator must have provided notification to the State Director and/or appropriate Tribal authority by January 19, 2016, of the intent to initiate closure of the inactive CCR surface impoundment pursuant to § 257.106(i)(1); and

(iii) The owner or operator must have placed on its CCR website by January 19, 2016, the notification of intent to initiate closure of the inactive CCR surface impoundment pursuant to § 257.107(i)(1).

(2) *Location restrictions.* (i) No later than April 16, 2020, the owner or operator of the inactive CCR surface impoundment must:

(A) Complete the demonstration for placement above the uppermost aquifer as set forth by § 257.60(a), (b), and (c)(3);

(B) Complete the demonstration for wetlands as set forth by § 257.61(a), (b), and (c)(3);

(C) Complete the demonstration for fault areas as set forth by § 257.62(a), (b), and (c)(3);

(D) Complete the demonstration for seismic impact zones as set forth by § 257.63(a), (b), and (c)(3); and

(E) Complete the demonstration for unstable areas as set forth by § 257.64(a), (b), (c), and (d)(3).

(ii) An owner or operator of an inactive CCR surface impoundment who fails to demonstrate compliance with the requirements of paragraph (e)(2)(i) of this section is subject to the closure requirements of § 257.101(b)(1).

(3) *Design criteria.* The owner or operator of the inactive CCR surface impoundment must:

(i) No later than April 17, 2018, complete the documentation of liner type as set forth by § 257.71(a) and (b).

(ii) No later than June 16, 2017, place on or immediately adjacent to the CCR unit the permanent identification marker as set forth by § 257.73(a)(1).

(iii) No later than October 16, 2018, prepare and maintain an Emergency

Action Plan as set forth by § 257.73(a)(3).

(iv) No later than April 17, 2018, compile a history of construction as set forth by § 257.73(b) and (c).

(v) No later than April 17, 2018, complete the initial hazard potential classification, structural stability, and safety factor assessments as set forth by § 257.73(a)(2), (b), (d), (e), and (f).

(4) *Operating criteria.* The owner or operator of the inactive CCR surface impoundment must:

(i) No later than April 18, 2017, prepare the initial CCR fugitive dust control plan as set forth in § 257.80(b).

(ii) No later than April 17, 2018, prepare the initial inflow design flood control system plan as set forth in § 257.82(c).

(iii) No later than April 18, 2017, initiate the inspections by a qualified person as set forth by § 257.83(a).

(iv) No later than July 19, 2017, complete the initial annual inspection by a qualified professional engineer as set forth by § 257.83(b).

(5) *Groundwater monitoring and corrective action.* The owner or operator of the inactive CCR surface impoundment must:

(i) No later than April 17, 2019, comply with groundwater monitoring requirements set forth in §§ 257.90(b) and 257.94(b); and

(ii) No later than August 1, 2019, prepare the initial groundwater monitoring and corrective action report as set forth in § 257.90(e).

(6) *Closure and post-closure care.* The owner or operator of the inactive CCR surface impoundment must:

(i) No later than April 17, 2018, prepare an initial written closure plan as set forth in § 257.102(b); and

(ii) No later than April 17, 2018, prepare an initial written post-closure care plan as set forth in § 257.104(d).

(f) *Timeframes for legacy CCR surface impoundments.* Owners and operators of legacy CCR surface impoundments are subject to the requirements of paragraphs (f)(1) through (5) of this section, except as provided in paragraphs (g) through (i) of this section.

(1) *Legacy CCR surface impoundment applicability report.* (i) Except as provided in paragraph (f)(1)(iii) of this section, owners and operators of legacy CCR surface impoundments must prepare a report for each legacy CCR surface impoundment no later than Friday, November 8, 2024. The owner or operator has prepared the applicability report when the report has been placed in the facility's operating record as required by § 257.105(k)(1). At a minimum, the report for each legacy

CCR surface impoundment must contain:

(A) The name and address of the person(s) owning and operating the legacy CCR surface impoundment with their business phone number and email address.

(B) The name associated with the legacy CCR surface impoundment.

(C) Information to identify the legacy CCR surface impoundment, including a figure of the facility and where the unit is located at the facility, facility address, and the latitude and longitude of the facility.

(D) The identification number of the legacy CCR surface impoundment if one has been assigned by the state. (E) A description of the current site conditions, including the current use of the inactive facility.

(ii) (A) The owner or operator of any legacy CCR surface impoundment must certify the applicability report required by paragraph (f)(1)(i) of this section with the following statement signed by the owner or operator or an authorized representative:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this demonstration and all attached documents, and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(B) The owner or operator must notify the Agency of the establishment of the facility's CCR website and the applicability of the rule, using the procedures in § 257.107(a) via the "contact us" form on EPA's CCR website.

(iii) (A) Notwithstanding the deadline to complete the applicability report under paragraph (f)(1)(i) of this section, an owner or operator may secure additional time to complete the report for the sole reason of determining through a field investigation whether the unit contains both CCR and liquids. The amount of additional time that can be secured is limited as specified in paragraph (f)(1)(iii)(B) of this section. For owners and operators following the procedures of this paragraph (f)(1)(iii), the compliance timeframes for the requirements specified under paragraphs (f)(2) through (5) of this section are adjusted by the length of the extension(s) justified under this paragraph (f)(1)(iii). To qualify for additional time, the owner or operator must prepare an applicability extension report consisting of the following:

(1) The information specified in paragraph (f)(1)(i)(A) through (C) of this section;

(2) A statement by the owner or operator that to the best of their knowledge or belief, existing and available information does not provide a sufficient basis to determine that the unit contained free liquids on or after October 19, 2015; and

(3) The details of a written field investigation work plan, including of the following:

(i) A detailed description of the approach to characterize the physical, topographic, geologic, hydrogeologic, and hydraulic properties of the CCR in the unit and native geologic materials beneath and surrounding the unit, and how those properties will be used to investigate for the presence of free liquids in the CCR unit.

(ii) A detailed description of the methods and tools that will be employed to determine whether the unit contains free liquids, the rationale for choosing these methods and tools, how these methods and tools will be implemented, and at what level of spatial resolution at the CCR unit to identify and monitor for the presence of free liquids.

(iii) A detailed description of how groundwater elevations will be determined, and at what level of spatial resolution, in relation to the sides and bottom of the CCR unit and how any intersection of the groundwater table with the CCR unit will be evaluated, and at what level of spatial resolution.

(iv) A plan for evaluating stormwater flow over the surface of the unit, stormwater drainage from the unit, and stormwater infiltration into the unit and how those processes may result in the formation of free liquids in the CCR unit. This plan must include a current topographic map showing surface water flow and any pertinent natural or man-made features present relevant to stormwater drainage, infiltration and related processes.

(v) An estimated timeline to complete the workplan and make a determination if the CCR unit contains free liquids.

(vi) A narrative discussion of how the results from implementing the workplan will determine whether the unit contains free liquids specified.

(vii) A narrative discussion describing any anticipated problems that may be encountered during implementation of the workplan and what actions will be taken to resolve the problems, and anticipated timeframes necessary for such a contingency.

(viii) The owner or operator of the CCR unit must obtain a written certification from a qualified

professional engineer stating that the field investigation work plan meets the requirements of paragraph (f)(1)(iii)(A)(3) of this section.

(B) The maximum amount of additional time that can be secured under paragraph (f)(1)(iii) of this section is 18 months, secured in 6-month increments, provided each 6-month increment is supported by an applicability extension report.

(C) Owners and operator must prepare the initial applicability extension report no later than Friday, November 8, 2024. Subsequent applicability extension reports must be prepared no later than 6 months after completing the preceding applicability extension report. The owner or operator has prepared the applicability extension report when the report is placed in the facility's operating record as required by § 257.105(k)(2).

(D) No later than Friday, November 8, 2024, the owner or operator must notify the Agency of the establishment of a CCR website using the procedures in § 257.107(a) via the "contact us" form on EPA's CCR website.

(E) If the owner or operator determines that the unit contains free liquids during implementation of the written field investigation workplan, the owner or operator must cease operating under these extension provisions and prepare the applicability report required by paragraph (f)(1) of this section within 14 days of determining that the unit contains free liquids. The owner or operator must comply with the requirements specified under paragraphs (f)(2) through (5) of this section under new timeframes. The new timeframes are determined by adding the total length of the extension(s) justified under paragraph (f)(1)(iii) of this section to each of the deadlines specified under paragraphs (f)(2) through (5) of this section.

(F) If the owner or operator determines that the unit does not contain both CCR and liquids during implementation of the written field investigation work plan, the owner or operator must prepare a notification stating that the field investigation has concluded and that the owner or operator has determined that the unit does not contain both CCR and liquids and does not meet the definition of a legacy CCR surface impoundment. The owner or operator has prepared the notification when the report is placed in the facility's operating record as required by § 257.105(k)(3).

(G) If the owner or operator does not complete the field investigation work within the timeframes specified in paragraph (f)(1)(iii)(B) of this section,

the unit shall be considered a legacy CCR surface impoundment and must comply with the requirements under paragraphs (f)(2) through (5) of this section pursuant to the timeframes specified under paragraph (f)(1)(iii)(E) of this section.

(2) *Design criteria.* The owner or operator of a legacy CCR surface impoundment must:

(i) Except for legacy CCR surface impoundments that are incised, no later than Wednesday, January 8, 2025, place on or immediately adjacent to the CCR unit the permanent identification marker as set forth by § 257.73(a)(1).

(ii) Except for legacy CCR surface impoundments that do not exceed the height and/or storage volume thresholds under § 257.73(b), no later than Monday, February 9, 2026, compile a history of construction as set forth by § 257.73(c).

(iii) Except for legacy CCR surface impoundments that are incised, no later than Friday, May 8, 2026, complete the initial hazard potential classification assessment as set forth by § 257.73(a)(2) and (f).

(iv) Except for legacy CCR surface impoundments that do not exceed the height and/or storage volume thresholds under § 257.73(b), no later than Friday, May 8, 2026, complete the structural stability and safety factor assessments as set forth by § 257.73(d), (e), and (f).

(v) Except for legacy CCR surface impoundments that are incised, no later than Friday, May 8, 2026, prepare and maintain an Emergency Action Plan as set forth by § 257.73(a)(3).

(3) *Operating criteria.* The owner or operator of the legacy CCR surface impoundment must:

(i) No later than Friday, November 8, 2024, prepare the initial CCR fugitive dust control plan as set forth in § 257.80(b).

(ii) No later than Friday, November 8, 2024, prevent the unknowing entry, and minimize the possibility for the unauthorized entry, of persons or livestock onto the legacy CCR surface impoundment.

(iii) No later than Friday, November 8, 2024, initiate the inspections by a qualified person as set forth by § 257.83(a).

(iv) No later than Monday, February 10, 2025, complete the initial annual inspection by a qualified professional engineer as set forth by § 257.83(b).

(v) No later than Friday, May 8, 2026, prepare the initial inflow design flood control system plan as set forth in § 257.82(c).

(vi) No later than Thursday, January 8, 2026, prepare the initial annual fugitive

dust control report as set forth in § 257.80(c).

(4) *Groundwater monitoring and corrective action.* No later than Monday, May 10, 2027, the owner or operator of the legacy CCR surface impoundment must:

(i) Install the groundwater monitoring system as required by § 257.91.

(ii) Develop the groundwater sampling and analysis program, including the selection of the statistical procedures, that will be used for evaluating groundwater monitoring data as required by § 257.93.

(iii) Be in compliance with the following groundwater monitoring requirements:

(A) Initiate the detection monitoring program to include obtaining a minimum of eight independent samples for each background and downgradient well, as required by § 257.94(b).

(B) Begin evaluating the groundwater monitoring data for statistically significant increases over background levels for the constituents listed in appendix III of this part, as required by § 257.94.

(C) Begin evaluating the groundwater monitoring data for statistically significant levels over groundwater protection standards for the constituents listed in appendix IV of this part as required by § 257.95.

(iv) No later than January 31, 2027, prepare the initial groundwater monitoring and corrective action report as set forth in § 257.90(e).

(5) *Closure and post-closure care.* Except as provided in § 257.102(g), the owner or operator of the legacy CCR surface impoundment must:

(i) No later than Monday, November 8, 2027, prepare an initial written closure plan as set forth in § 257.102(b); and

(ii) No later than Monday, November 8, 2027, prepare an initial written post-closure care plan as set forth in § 257.104(d).

(g) For owners and operators of legacy CCR surface impoundments that completed closure of the CCR unit by removal of waste prior to Friday, November 8, 2024, no later than Friday, November 8, 2024, complete a closure certification that includes the following supporting information:

(1) The type and volume of CCR and all other materials in the unit prior to closure;

(2) The methods used to verify complete removal of all CCR and other contaminated materials from the unit, including any post-removal sampling and analysis;

(3) Documentation that all CCR and other contaminated materials were

removed from the unit, including, the results of any post-removal sampling and analysis that was conducted;

(4) The methods used to verify complete decontamination of all areas affected by releases from the unit, including but not limited to post-decontamination sampling and analysis;

(5) Documentation that all areas affected by releases from the unit were decontaminated and that all groundwater affected by releases has achieved groundwater protection standards; and

(6) Document that groundwater monitoring concentrations do not exceed the groundwater protection standards established pursuant to § 257.95(h) for constituents listed in appendix IV to this part. The documentation must also include a demonstration that the groundwater monitoring system has met all of the following:

(i) Was capable of accurately representing background water quality unaffected by a CCR unit;

(ii) Was capable of accurately representing the quality of water passing the waste boundary of the unit;

(iii) Was capable of detecting contamination in the uppermost aquifer;

(iv) Monitored all potential contaminant pathways;

(v) Established groundwater background concentrations for appendix IV constituents and compared samples to those background concentrations;

(vi) Monitoring wells must have been cased in a manner that maintains the integrity of the monitoring well borehole. This casing must have been screened or perforated and packed with gravel or sand, where necessary, to enable collection of groundwater samples. The annular space (*i.e.*, the space between the borehole and well casing) above the sampling depth must have been sealed to prevent contamination of samples and the groundwater; and

(vii) The last groundwater monitoring sample used to document that the standard in paragraph (g)(3) of this section has been met must have been collected no earlier than one year prior to the initiation of closure.

(h) If the owner or operator of a legacy CCR surface impoundment is unable to complete the closure by removal certification by the date listed in paragraph (f)(1)(i) of this section, they may elect to conduct groundwater monitoring in accordance with §§ 257.90 through 257.95 to demonstrate there are no exceedances of the groundwater protection standards. If the owner or operator meets all the requirements of paragraph (h)(1) of this

section, no further requirements under this subpart apply. If the owner or operator does not meet the requirements of paragraph (h)(1) of this section by Monday, May 8, 2028 or if one or more constituents in appendix IV to this part are detected at statistically significant levels above the groundwater protection standard established under § 257.95(h), they must proceed in accordance with paragraph (h)(2) of this section.

(1) In order to comply with this paragraph (h)(1), the owner or operator must complete all of the following:

(i) Prepare a notification of intent to certify closure no later than Friday, November 8, 2024. The owner or operator has prepared the notification when the report is placed in the facility's operating record as required by § 257.105(k)(4).

(ii) Conduct groundwater monitoring in accordance with §§ 257.90–257.95 for at least two consecutive sampling events to demonstrate that all constituents in appendix IV of this part have concentrations that do not exceed the groundwater protection standards listed in § 257.95(h).

(iii) Complete a closure by removal certification documenting compliance with paragraphs (g)(1) through (5) and (h)(1)(ii) of this section no later than Monday, May 8, 2028.

(2) If the owner or operator does not meet the requirements of paragraph (h)(1) of this section (*e.g.*, by the date or they detect an SSL of an appendix IV constituent), they must comply with all of the following:

(i) If a statistically significant level is detected, the corrective action provisions and proceed in accordance with § 257.102(c)(2).

(ii) The permanent marker requirements in § 257.73(a)(1) no later than 8 months from the date they became subject to this requirement.

(iii) The applicability report requirements of paragraph (f)(1)(i) of this section no later than 6 months from the date they became subject to this requirement.

(iv) The facility evaluation provisions for CCR management units under § 257.75 no later than 33 months from the date they became subject to this requirement.

(v) If any CCR management unit is discovered after completing the facility evaluation report, the fugitive dust requirements of § 257.80(b) no later than 6 months from the date of the facility evaluation report.

(vi) The groundwater monitoring requirements for CCR management units under § 257.90(b)(3)(i) through (iv) no later than 48 months from the date they became subject to this requirement.

(vii) The requirement to prepare an initial written closure plan for CCR management units consistent with the requirements specified in § 257.102(b)(1) no later than 54 months from the date they became subject to this requirement.

(viii) The requirement to prepare an initial post-closure plan for CCR management units consistent with the requirements specified in § 257.104(d)(2)(iii) no later than 54 months from the date they became subject to this requirement.

(ix) The requirement to initiate the closure of CCR management units in accordance with the requirements of § 257.102 no later than 60 months from the date they became subject to this requirement.

(i) Owners and operators of legacy CCR surface impoundments that completed closure of the unit in accordance with § 257.102(d) or that meet the requirements in § 257.101(g) prior to Friday, November 8, 2024 must only:

(1) Prepare the applicability report as set forth by § 257.100(f)(1);

(2) Prevent the unknowing entry, and minimize the possibility for the unauthorized entry, of persons or livestock onto the legacy CCR surface impoundment as set forth in § 257.100(f)(3)(ii);

(3) Place on or immediately adjacent to the unit the permanent identification marker as set forth by § 257.73(a)(1);

(4) Compile a history of construction as set forth by § 257.73(c);

(5) Prepare the initial CCR fugitive dust control plan as set forth in § 257.80(b);

(6) Prepare the initial annual fugitive dust control report as set forth in § 257.80(c);

(7) (i) Install the groundwater monitoring system as required by § 257.91;

(ii) Develop the groundwater sampling and analysis program, including the selection of the statistical procedures, that will be used for evaluating groundwater monitoring data as required by § 257.93;

(iii) Be in compliance with the following groundwater monitoring requirements:

(A) Initiate the detection monitoring program to include obtaining a minimum of eight independent samples for each background and downgradient well, as required by § 257.94(b);

(B) Begin evaluating the groundwater monitoring data for statistically significant increases over background levels for the constituents listed in appendix III of this part, as required by § 257.94;

(C) Begin evaluating the groundwater monitoring data for statistically significant levels over groundwater protection standards for the constituents listed in appendix IV of this part as required by § 257.95;

(8) Include in the applicability report specified in § 257.100(f)(1) information on the completed closure, along with supporting documentation to demonstrate that the closure meets the performance standards in § 257.102(d) or the standards specified in § 257.101(g);

(9) Prepare an initial written post-closure care plan as set forth in § 257.104(d);

(10) Conduct post-closure care as set forth in § 257.104(b); and

(11) Comply with applicable recordkeeping, notification, and website posting requirements as set forth by §§ 257.105 through 257.107.

(j) The owner or operator of the legacy CCR surface impoundment must comply with the recordkeeping requirements specified in § 257.105(k), the notification requirements specified in § 257.106(k), and the internet requirements specified in § 257.107(k).

■ 19. Amend § 257.101 by adding paragraphs (e), (f), (g) and (h) to read as follows:

§ 257.101 Closure or retrofit of CCR units.

* * * * *

(e) Except as provided in paragraph (g) of this section, the owner or operator of a legacy CCR surface impoundment is subject to the requirements of paragraphs (e)(1) and (2) of this section.

(1) No later than Monday, May 8, 2028, an owner or operator of a legacy CCR surface impoundment must initiate the closure of the legacy CCR surface impoundment in accordance with the requirements of § 257.102.

(2) An owner or operator of a legacy CCR surface impoundment that closes in accordance with paragraph (e)(1) of this section must include a statement in the notification required under § 257.102(g) that the legacy CCR surface impoundment is closing under the requirement of paragraph (e)(1) of this section.

(f) Except as provided in paragraphs (g) and (h) of this section, the owner or operator of a CCR management unit must comply with the requirements of paragraphs (f)(1) and (2) of this section.

(1) No later than Tuesday, May 8, 2029, an owner or operator of a CCR management unit must initiate the closure of the CCR management unit in accordance with the requirements of § 257.102.

(2) An owner or operator of a CCR management unit that closes in

accordance with paragraph (f)(1) of this section must include a statement in the notification required under § 257.102(g) that the CCR management unit is closing under the requirements of paragraph (f)(1) of this section.

(g) Deferral to permitting for closures conducted under substantially equivalent regulatory authority. Notwithstanding the provisions of paragraphs (e) and (f) of this section, the owner or operator of a CCR management unit or a legacy CCR surface impoundment need not demonstrate compliance with the performance standards in § 257.102(c) or (d) provided they demonstrate that the closure of the CCR unit met the standards specified in paragraphs (g)(1) through (g)(6) of this section.

(1) The owner or operator of the CCR unit must document that a regulatory authority played an active role in overseeing and approving the closure and any necessary corrective action, pursuant to an enforceable requirement. This includes a State or Federal permit, an administrative order, or consent order issued after 2015 under CERCLA or by an EPA-approved RCRA State program.

(2) The owner or operator of the CCR unit must document that the regulatory authority required or conducted a site-specific risk assessment prior to (or as part of) approving the closure and any necessary corrective action.

(3) The owner or operator of the CCR unit must document that it installed a groundwater monitoring system and performed groundwater monitoring that meets all of the following:

- (i) Was capable of accurately representing background water quality;
- (ii) Was capable of accurately representing the quality of water passing the waste boundary;
- (iii) Was capable of detecting contamination in the uppermost aquifer; and
- (iv) Monitored all potential contaminant pathways.

(4) Must document that the closed unit meets either:

- (i) The performance standard in § 257.60; or
- (ii) The performance standard in § 257.102(d)(2)(i).

(5) The owner or operator must include the following statement, signed by the owner or operator or an authorized representative, in the facility evaluation report for CCR management units specified in § 257.75 or applicability report for legacy CCR surface impoundments specified in § 257.100(f)(1) along with all information required by paragraphs (g)(1) through (4) of the section:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this demonstration and all attached documents, and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(6) Closure equivalency determination at permitting. The owner or operator must submit the following documentation to the permit authority.

(i) A permit application that contains sufficient information, including data on contaminant levels in groundwater, to demonstrate that the applicable § 257.102 standards have been met.

(ii) EPA will review the information to determine whether the “equivalency” of the closure has been successfully demonstrated. If EPA or a Participating State Director determines that the closure has met the appropriate part 257 closure standard, EPA or a Participating State Director will issue a permit to require compliance with applicable post-closure requirements. If EPA or a Participating State Director determines that the closure does not meet the part 257 standards, the owner or operator will be required to submit a complete permit application and obtain a permit that contains the specific requirements necessary for the closed unit to achieve compliance with § 257.102.

(h) Deferral for CCR management units under critical infrastructure. Notwithstanding the provisions of paragraph (f)(1) of this section, the owner or operator of a CCR management unit located beneath critical infrastructure need not initiate closure until the infrastructure is no longer needed, EPA or a Participating State Director determines closure is necessary to ensure that there is no reasonable probability of adverse effects on human health or the environment, or the closure or decommissioning of the facility, whichever occurs first. Owners and operators of CCR management units under active disposal units must meet either:

(1) Demonstrate that the CCR management unit complies with the performance standard in § 257.60; or

(2) Demonstrate that the CCR management unit complies with the performance standard in § 257.102(d)(2)(i).

■ 20. Revise and republish § 257.102 to read as follows:

§ 257.102 Criteria for conducting the closure or retrofit of CCR units and closure of CCR management units.

(a) *General.* Closure of a CCR unit must be completed either by leaving the CCR in place and installing a final cover system or through removal of the CCR and decontamination of the CCR unit, as described in paragraphs (b) through (j) of this section. Retrofit of a CCR surface impoundment must be completed in accordance with the requirements in paragraph (k) of this section.

(b) *Written closure plan—(1) Content of the plan.* The owner or operator of a CCR unit must prepare a written closure plan that describes the steps necessary to close the CCR unit at any point during the active life of the CCR unit consistent with recognized and generally accepted good engineering practices. The written closure plan must include, at a minimum, the information specified in paragraphs (b)(1)(i) through (vi) of this section.

(i) A narrative description of how the CCR unit will be closed in accordance with this section.

(ii) If closure of the CCR unit will be accomplished through removal of CCR from the CCR unit, a description of the procedures to remove the CCR and decontaminate the CCR unit in accordance with paragraph (c) of this section.

(iii) If closure of the CCR unit will be accomplished by leaving CCR in place, a description of the final cover system, designed in accordance with paragraph (d) of this section, and the methods and procedures to be used to install the final cover. The closure plan must also discuss how the final cover system will achieve the performance standards specified in paragraph (d) of this section.

(iv) An estimate of the maximum inventory of CCR ever on-site over the active life of the CCR unit.

(v) An estimate of the largest area of the CCR unit ever requiring a final cover as required by paragraph (d) of this section at any time during the CCR unit's active life.

(vi) A schedule for completing all activities necessary to satisfy the closure criteria in this section, including an estimate of the year in which all closure activities for the CCR unit will be completed. The schedule should provide sufficient information to describe the sequential steps that will be taken to close the CCR unit, including identification of major milestones such as coordinating with and obtaining necessary approvals and permits from other agencies, the dewatering and stabilization phases of CCR surface impoundment closure, or installation of

the final cover system, and the estimated timeframes to complete each step or phase of CCR unit closure. When preparing the written closure plan, if the owner or operator of a CCR unit estimates that the time required to complete closure will exceed the timeframes specified in paragraph (f)(1) of this section, the written closure plan must include the site-specific information, factors and considerations that would support any time extension sought under paragraph (f)(2) of this section.

(2) *Timeframes for preparing the initial written closure plan*—(i) *Existing CCR landfills and existing CCR surface impoundments.* No later than October 17, 2016, the owner or operator of the CCR unit must prepare an initial written closure plan consistent with the requirements specified in paragraph (b)(1) of this section.

(ii) *New CCR landfills and new CCR surface impoundments, and any lateral expansion of a CCR unit.* No later than the date of the initial receipt of CCR in the CCR unit, the owner or operator must prepare an initial written closure plan consistent with the requirements specified in paragraph (b)(1) of this section.

(iii) *CCR management units.* Except as provided for in paragraph (b)(2)(v) of this section, no later than November 8, 2028, the owner or operator of the CCR management unit must prepare an initial written closure plan consistent with the requirements specified in paragraph (b)(1) of this section.

(iv) *Recordkeeping.* The owner or operator has completed the written closure plan when the plan, including the certification required by paragraph (b)(4) of this section, has been placed in the facility's operating record as required by § 257.105(i)(4).

(v) *Closure documentation for certain CCR management units.* Owners and operators of a CCR management unit that completed closure of the unit in accordance with § 257.102(d) prior to Friday, November 8, 2024 or that meet the requirements in § 257.101(g) must include in the facility evaluation report specified in § 257.75 information on the completed closure, along with supporting documentation to demonstrate that the closure meets the performance standards in § 257.102(d) or the standards specified in § 257.101(g).

(3) *Amendment of a written closure plan.* (i) The owner or operator may amend the initial or any subsequent written closure plan developed pursuant to paragraph (b)(1) of this section at any time.

(ii) The owner or operator must amend the written closure plan whenever:

(A) There is a change in the operation of the CCR unit that would substantially affect the written closure plan in effect; or

(B) Before or after closure activities have commenced, unanticipated events necessitate a revision of the written closure plan.

(iii) The owner or operator must amend the closure plan at least 60 days prior to a planned change in the operation of the facility or CCR unit, or no later than 60 days after an unanticipated event requires the need to revise an existing written closure plan. If a written closure plan is revised after closure activities have commenced for a CCR unit, the owner or operator must amend the current closure plan no later than 30 days following the triggering event.

(4) *Certification or approval.* The owner or operator of the CCR unit must obtain a written certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority that the initial and any amendment of the written closure plan meets the requirements of this section.

(c) *Closure by removal of CCR.* An owner or operator that elects to close a CCR unit by removal of CCR must follow the procedures specified in either paragraph (c)(1) or (2) of this section. Closure by removal is complete when CCR has been removed; any areas affected by releases from the CCR unit have been removed or decontaminated; and groundwater monitoring concentrations of the constituents listed in appendix IV to this part do not exceed groundwater protection standards established pursuant to § 257.95(h). Removal and decontamination activities include removing all CCR from the unit, CCR mixed with soils, and CCR included in berms, liners or other unit structures, and removing or decontaminating all areas affected by releases from the CCR unit.

(1) *Complete all removal and decontamination activities during the active life of the CCR unit.* Within the timeframes specified in paragraph (f) of this section the owner or operator must do all of the following:

(i) Complete removal of CCR and decontamination of all areas affected by releases from the CCR unit;

(ii) Document that the standards in paragraph (c) of this section have been met. Documentation that groundwater protection standards have been met for

the constituents listed in appendix IV to this part must consist of groundwater monitoring results that show no constituents were detected at statistically significant levels above the groundwater protection standards for either:

(A) Two consecutive monitoring events; or

(B) Three years, in accordance with § 257.98(c); and

(iii) Obtain the completion of closure certification or approval required by paragraph (f)(3) of this section.

(2) *Complete removal and decontamination activities during the active life and post-closure care period of the CCR unit.* The owner or operator may close a CCR unit by completing all removal and decontamination activities, except for groundwater corrective action, during the active life of the CCR unit and by completing groundwater corrective action during the post-closure care period pursuant to the following procedures:

(i) Within the timeframes specified in paragraph (f) of this section, document that CCR has been removed from the unit and any areas affected by releases from the CCR unit have been removed or decontaminated;

(ii) Within the timeframes specified in paragraph (f) of this section, begin implementation of the remedy selected in accordance with § 257.97 such that all components of the remedy are constructed, or otherwise in place, and operating as intended unless the owner or operator documents both that:

(A) All applicable requirements in §§ 257.96 through 257.98 have been met; and

(B) The active life of the unit could not be extended until implementation of the remedy consistent with § 257.102(f);

(iii) Complete groundwater corrective action as a post-closure care requirement as specified in § 257.104(g);

(iv) Amend the written closure plan required by paragraph (b) of this section and the written post-closure care plan required by § 257.104(d);

(v) Within the timeframes specified in paragraph (f) of this section, obtain the completion of closure certification or approval required by paragraph (f)(3) of this section; and

(vi) Within the timeframes specified in paragraph (f) of this section, record the notation on the deed to the property required by paragraph (i) of this section.

(d) *Closure performance standard when leaving CCR in place—*

(1) *General performance standard.* The owner or operator of a CCR unit must ensure that, at a minimum, the CCR unit is closed in a manner that will:

(i) Control, minimize or eliminate, to the maximum extent feasible, post-closure infiltration of liquids into the waste and releases of CCR, leachate, or contaminated run-off to the ground or surface waters or to the atmosphere;

(ii) Preclude the probability of future impoundment of water, sediment, or slurry;

(iii) Include measures that provide for major slope stability to prevent the sloughing or movement of the final cover system during the closure and post-closure care period;

(iv) Minimize the need for further maintenance of the CCR unit; and

(v) Be completed in the shortest amount of time consistent with recognized and generally accepted good engineering practices.

(2) *Drainage and stabilization of CCR units.* The owner or operator of any CCR unit must meet the requirements of paragraphs (d)(2)(i) and (ii) of this section prior to installing the final cover system required under paragraph (d)(3) of this section.

(i) Free liquids must be eliminated by removing liquid wastes or solidifying the remaining wastes and waste residues.

(ii) Remaining wastes must be stabilized sufficient to support the final cover system.

(3) *Final cover system.* If a CCR unit is closed by leaving CCR in place, the owner or operator must install a final cover system that is designed to minimize infiltration and erosion, and at a minimum, meets the requirements of paragraph (d)(3)(i) of this section, or the requirements of the alternative final cover system specified in paragraph (d)(3)(ii) of this section.

(i) The final cover system must be designed and constructed to meet the criteria in paragraphs (d)(3)(i)(A) through (D) of this section. The design of the final cover system must be included in the written closure plan required by paragraph (b) of this section.

(A) The permeability of the final cover system must be less than or equal to the permeability of any bottom liner system or natural subsoils present, or a permeability no greater than 1×10^{-5} cm/sec, whichever is less.

(B) The infiltration of liquids through the closed CCR unit must be minimized by the use of an infiltration layer that contains a minimum of 18 inches of earthen material.

(C) The erosion of the final cover system must be minimized by the use of an erosion layer that contains a minimum of six inches of earthen material that is capable of sustaining native plant growth.

(D) The disruption of the integrity of the final cover system must be minimized through a design that accommodates settling and subsidence.

(ii) The owner or operator may select an alternative final cover system design, provided the alternative final cover system is designed and constructed to meet the criteria in paragraphs (d)(3)(i)(A) through (C) of this section. The design of the final cover system must be included in the written closure plan required by paragraph (b) of this section.

(A) The design of the final cover system must include an infiltration layer that achieves an equivalent reduction in infiltration as the infiltration layer specified in paragraphs (d)(3)(i)(A) and (B) of this section.

(B) The design of the final cover system must include an erosion layer that provides equivalent protection from wind or water erosion as the erosion layer specified in paragraph (d)(3)(i)(C) of this section.

(C) The disruption of the integrity of the final cover system must be minimized through a design that accommodates settling and subsidence.

(iii) The owner or operator of the CCR unit must obtain a written certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority that the design of the final cover system meets the requirements of this section.

(e) *Initiation of closure activities.* Except as provided for in paragraph (e)(4) of this section and § 257.103, the owner or operator of a CCR unit must commence closure of the CCR unit no later than the applicable timeframes specified in either paragraph (e)(1) or (2) of this section.

(1) The owner or operator must commence closure of the CCR unit no later than 30 days after the date on which the CCR unit either:

(i) Receives the known final receipt of waste, either CCR or any non-CCR waste stream; or

(ii) Removes the known final volume of CCR from the CCR unit for the purpose of beneficial use of CCR.

(2)(i) Except as provided by paragraph (e)(2)(ii) of this section, the owner or operator must commence closure of a CCR unit that has not received CCR or any non-CCR waste stream or is no longer removing CCR for the purpose of beneficial use within two years of the last receipt of waste or within two years of the last removal of CCR material for the purpose of beneficial use.

(ii) Notwithstanding paragraph (e)(2)(i) of this section, the owner or operator of the CCR unit may secure an

additional two years to initiate closure of the idle unit provided the owner or operator provides written documentation that the CCR unit will continue to accept wastes or will start removing CCR for the purpose of beneficial use. The documentation must be supported by, at a minimum, the information specified in paragraphs (e)(2)(ii)(A) and (B) of this section. The owner or operator may obtain two-year extensions provided the owner or operator continues to be able to demonstrate that there is reasonable likelihood that the CCR unit will accept wastes in the foreseeable future or will remove CCR from the unit for the purpose of beneficial use. The owner or operator must place each completed demonstration, if more than one time extension is sought, in the facility's operating record as required by § 257.105(i)(5) prior to the end of any two-year period.

(A) Information documenting that the CCR unit has remaining storage or disposal capacity or that the CCR unit can have CCR removed for the purpose of beneficial use; and

(B) Information demonstrating that there is a reasonable likelihood that the CCR unit will resume receiving CCR or non-CCR waste streams in the foreseeable future or that CCR can be removed for the purpose of beneficial use. The narrative must include a best estimate as to when the CCR unit will resume receiving CCR or non-CCR waste streams. The situations listed in paragraphs (e)(2)(ii)(B)(1) through (4) of this section are examples of situations that would support a determination that the CCR unit will resume receiving CCR or non-CCR waste streams in the foreseeable future.

(1) Normal plant operations include periods during which the CCR unit does not receive CCR or non-CCR waste streams, such as the alternating use of two or more CCR units whereby at any point in time one CCR unit is receiving CCR while CCR is being removed from a second CCR unit after its dewatering.

(2) The CCR unit is dedicated to a coal-fired boiler unit that is temporarily idled (*e.g.*, CCR is not being generated) and there is a reasonable likelihood that the coal-fired boiler will resume operations in the future.

(3) The CCR unit is dedicated to an operating coal-fired boiler (*i.e.*, CCR is being generated); however, no CCR are being placed in the CCR unit because the CCR are being entirely diverted to beneficial uses, but there is a reasonable likelihood that the CCR unit will again be used in the foreseeable future.

(4) The CCR unit currently receives only non-CCR waste streams and those

non-CCR waste streams are not generated for an extended period of time, but there is a reasonable likelihood that the CCR unit will again receive non-CCR waste streams in the future.

(iii) In order to obtain additional time extension(s) to initiate closure of a CCR unit beyond the two years provided by paragraph (e)(2)(i) of this section, the owner or operator of the CCR unit must include with the demonstration required by paragraph (e)(2)(ii) of this section the following statement signed by the owner or operator or an authorized representative:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this demonstration and all attached documents, and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(3) For purposes of this subpart, closure of the CCR unit has commenced if the owner or operator has ceased placing waste and completes any of the following actions or activities:

(i) Taken any steps necessary to implement the written closure plan required by paragraph (b) of this section;

(ii) Submitted a completed application for any required state or agency permit or permit modification; or

(iii) Taken any steps necessary to comply with any state or other agency standards that are a prerequisite, or are otherwise applicable, to initiating or completing the closure of a CCR unit.

(4) The timeframes specified in paragraphs (e)(1) and (2) of this section do not apply to any of the following owners or operators:

(i) [Reserved]

(ii) An owner or operator of an existing unlined CCR surface impoundment closing the CCR unit as required by § 257.101(a);

(iii) An owner or operator of an existing CCR surface impoundment closing the CCR unit as required by § 257.101(b);

(iv) An owner or operator of a new CCR surface impoundment closing the CCR unit as required by § 257.101(c); or

(v) An owner or operator of an existing CCR landfill closing the CCR unit as required by § 257.101(d).

(f) *Completion of closure activities.*

(1) Except as provided for in paragraph (f)(2) of this section, the owner or operator must complete closure of the CCR unit:

(i) For existing and new CCR landfills and any lateral expansion of a CCR landfill, within six months of commencing closure activities.

(ii) For existing and new CCR surface impoundments and any lateral expansion of a CCR surface impoundment, within five years of commencing closure activities.

(iii) For CCR management units, within five years of commencing closure activities.

(2)(i) *Extensions of closure timeframes.* The timeframes for completing closure of a CCR unit specified under paragraphs (f)(1) of this section may be extended if the owner or operator can demonstrate that it was not feasible to complete closure of the CCR unit within the required timeframes due to factors beyond the facility's control. If the owner or operator is seeking a time extension beyond the time specified in the written closure plan as required by paragraph (b)(1) of this section, the demonstration must include a narrative discussion providing the basis for additional time beyond that specified in the closure plan. The owner or operator must place each completed demonstration, if more than one time extension is sought, in the facility's operating record as required by § 257.105(i)(6) prior to the end of any two-year period. Factors that may support such a demonstration include:

(A) Complications stemming from the climate and weather, such as unusual amounts of precipitation or a significantly shortened construction season;

(B) Time required to dewater a CCR unit due to the volume of CCR contained in the CCR unit or the characteristics of the CCR in the unit;

(C) The geology and terrain surrounding the CCR unit will affect the amount of material needed to close the CCR unit; or

(D) Time required or delays caused by the need to coordinate with and obtain necessary approvals and permits from a state or other agency.

(ii) *Maximum time extensions.* (A) CCR surface impoundments of 40 acres or smaller may extend the time to complete closure by no longer than two years.

(B) CCR surface impoundments larger than 40 acres may extend the timeframe to complete closure of the CCR unit multiple times, in two-year increments. For each two-year extension sought, the owner or operator must substantiate the factual circumstances demonstrating the need for the extension. No more than a total of five two-year extensions may be obtained for any CCR surface impoundment.

(C) Except as provided in paragraph (f)(2)(ii)(D) of this section, CCR landfills may extend the timeframe to complete closure of the CCR unit multiple times, in one-year increments. For each one-year extension sought, the owner or operator must substantiate the factual circumstances demonstrating the need for the extension. No more than a total of two one-year extensions may be obtained for any CCR landfill.

(D) CCR landfills that intersect with groundwater are eligible for the time extensions available to CCR units in paragraph (f)(2)(ii)(B) of this section, provided the owner or operator documents that groundwater intersects the CCR unit in the closure plan.

(E) CCR management units of 40 acres or smaller may extend the time to complete closure by no longer than two years.

(F) CCR management units larger than 40 acres may extend the timeframe to complete closure of the CCR management unit multiple times, in two-year increments. For each two-year extension sought, the owner or operator must substantiate the factual circumstances demonstrating the need for the extension. No more than a total of five two-year extensions may be obtained for any CCR management unit.

(iii) In order to obtain additional time extension(s) to complete closure of a CCR unit beyond the times provided by paragraph (f)(1) of this section, the owner or operator of the CCR unit must include with the demonstration required by paragraph (f)(2)(i) of this section the following statement signed by the owner or operator or an authorized representative:

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this demonstration and all attached documents, and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

(3) Upon completion, the owner or operator of the CCR unit must obtain a certification from a qualified professional engineer or approval from the Participating State Director or approval from EPA where EPA is the permitting authority verifying that closure has been completed in accordance with the closure plan specified in paragraph (b) of this section and the requirements of this section.

(g) *Notification of intent to close.* No later than the date the owner or operator initiates closure of a CCR unit, the

owner or operator must prepare a notification of intent to close a CCR unit. The notification must include the certification by a qualified professional engineer or the approval from the Participating State Director or the approval from EPA where EPA is the permitting authority for the design of the final cover system as required by § 257.102(d)(3)(iii), if applicable. The owner or operator has completed the notification when it has been placed in the facility's operating record as required by § 257.105(i)(7).

(h) *Notification of completion of closure.* Within 30 days of completion of closure of the CCR unit, the owner or operator must prepare a notification of closure of a CCR unit. The notification must include the certification by a qualified professional engineer or the approval from the Participating State Director or the approval from EPA where EPA is the permitting authority as required by § 257.102(f)(3). The owner or operator has completed the notification when it has been placed in the facility's operating record as required by § 257.105(i)(8).

(i) *Deed notations.* (1) Except as provided by paragraph (i)(4) of this section, following closure of a CCR unit, the owner or operator must record a notation on the deed to the property, or some other instrument that is normally examined during title search.

(2) The notation on the deed must in perpetuity notify any potential purchaser of the property that:

- (i) The land has been used as a CCR unit; and
- (ii) Its use is restricted under the post-closure care requirements as provided by § 257.104(d)(1)(iii).

(3) Within 30 days of recording a notation on the deed to the property, the owner or operator must prepare a notification stating that the notation has been recorded. The owner or operator has completed the notification when it has been placed in the facility's operating record as required by § 257.105(i)(9).

(4) An owner or operator that closes a CCR unit in accordance with paragraph (c)(1) of this section is not subject to the requirements of paragraphs (i)(1) through (3) of this section.

(j) *Recordkeeping, notification, and internet requirements.* The owner or operator of the CCR unit must comply with the closure recordkeeping requirements specified in § 257.105(i), the closure notification requirements specified in § 257.106(i), and the closure internet requirements specified in § 257.107(i).

(k) *Criteria to retrofit an existing CCR surface impoundment.* (1) To retrofit an existing CCR surface impoundment, the owner or operator must:

- (i) First remove all CCR, including any contaminated soils and sediments from the CCR unit; and
- (ii) Comply with the requirements in § 257.72.
- (iii) A CCR surface impoundment undergoing a retrofit remains subject to all other requirements of this subpart, including the requirement to conduct any necessary corrective action.

(2) *Written retrofit plan—(i) Content of the plan.* The owner or operator must prepare a written retrofit plan that describes the steps necessary to retrofit the CCR unit consistent with recognized and generally accepted good engineering practices. The written retrofit plan must include, at a minimum, all of the following information:

(A) A narrative description of the specific measures that will be taken to retrofit the CCR unit in accordance with this section.

(B) A description of the procedures to remove all CCR and contaminated soils and sediments from the CCR unit.

(C) An estimate of the maximum amount of CCR that will be removed as part of the retrofit operation.

(D) An estimate of the largest area of the CCR unit that will be affected by the retrofit operation.

(E) A schedule for completing all activities necessary to satisfy the retrofit criteria in this section, including an estimate of the year in which retrofit activities of the CCR unit will be completed.

(ii) *Timeframes for preparing the initial written retrofit plan.* (A) No later than 60 days prior to date of initiating retrofit activities, the owner or operator must prepare an initial written retrofit plan consistent with the requirements specified in paragraph (k)(2) of this section. For purposes of this subpart, initiation of retrofit activities has commenced if the owner or operator has ceased placing waste in the unit and completes any of the following actions or activities:

- (1) Taken any steps necessary to implement the written retrofit plan;
- (2) Submitted a completed application for any required state or agency permit or permit modification; or
- (3) Taken any steps necessary to comply with any state or other agency standards that are a prerequisite, or are otherwise applicable, to initiating or completing the retrofit of a CCR unit.

(B) The owner or operator has completed the written retrofit plan when the plan, including the

certification required by paragraph (k)(2)(iv) of this section, has been placed in the facility's operating record as required by § 257.105(j)(1).

(iii) *Amendment of a written retrofit plan.* (A) The owner or operator may amend the initial or any subsequent written retrofit plan at any time.

(B) The owner or operator must amend the written retrofit plan whenever:

(1) There is a change in the operation of the CCR unit that would substantially affect the written retrofit plan in effect; or

(2) Before or after retrofit activities have commenced, unanticipated events necessitate a revision of the written retrofit plan.

(C) The owner or operator must amend the retrofit plan at least 60 days prior to a planned change in the operation of the facility or CCR unit, or no later than 60 days after an unanticipated event requires the revision of an existing written retrofit plan. If a written retrofit plan is revised after retrofit activities have commenced for a CCR unit, the owner or operator must amend the current retrofit plan no later than 30 days following the triggering event.

(iv) *Certification or approval.* The owner or operator of the CCR unit must obtain a written certification from a qualified professional engineer or an approval from the Participating State Director or an approval from EPA where EPA is the permitting authority that the activities outlined in the written retrofit plan, including any amendment of the plan, meet the requirements of this section.

(3) *Deadline for completion of activities related to the retrofit of a CCR unit.* Any CCR surface impoundment that is being retrofitted must complete all retrofit activities within the same time frames and procedures specified for the closure of a CCR surface impoundment in § 257.102(f) or, where applicable, § 257.103.

(4) *Certification or approval.* Upon completion, the owner or operator must obtain a written certification from a qualified professional engineer or an approval from the Participating State Director or an approval from EPA where EPA is the permitting authority verifying that the retrofit activities have been completed in accordance with the retrofit plan specified in paragraph (k)(2) of this section and the requirements of this section.

(5) *Notification of intent to retrofit.* No later than the date the owner or operator initiates the retrofit of a CCR unit, the owner or operator must prepare a notification of intent to retrofit a CCR

unit. The owner or operator has completed the notification when it has been placed in the facility's operating record as required by § 257.105(j)(5).

(6) *Notification of completion of retrofit activities.* Within 30 days of completing the retrofit activities specified in paragraph (k)(1) of this section, the owner or operator must prepare a notification of completion of retrofit activities. The notification must include the certification from a qualified professional engineer or an approval from the Participating State Director or an approval from EPA where EPA is the permitting authority has is required by paragraph (k)(4) of this section. The owner or operator has completed the notification when it has been placed in the facility's operating record as required by § 257.105(j)(6).

(7) *Cease retrofit and initiation of closure.* At any time after the initiation of a CCR unit retrofit, the owner or operator may cease the retrofit and initiate closure of the CCR unit in accordance with the requirements of § 257.102.

(8) *Recordkeeping, notification, and internet requirements.* The owner or operator of the CCR unit must comply with the retrofit recordkeeping requirements specified in § 257.105(j), the retrofit notification requirements specified in § 257.106(j), and the retrofit internet requirements specified in § 257.107(j).

- 21. Amend § 257.104 by:
- a. Revising paragraphs (a) and (c)(1);
- b. Adding paragraph (c)(3);
- c. Revising paragraph (d)(2); and
- d. Adding paragraph (g).

The additions and revisions read as follows:

§ 257.104 Post-closure care requirements.

(a) *Applicability.* (1) Except as provided by paragraph (a)(2) of this section, § 257.104 applies to the owners or operators of CCR units that are subject to the closure criteria under § 257.102.

(2) An owner or operator of a CCR unit that elects to close a CCR unit by removing CCR as provided by § 257.102(c)(1) is not subject to the post-closure care criteria under this section.

* * * * *

(c) * * *

(1) Except as provided by paragraph (c)(2) and (3) of this section, the owner or operator of the CCR unit must conduct post-closure care for 30 years.

* * * * *

(3) An owner or operator closing a unit pursuant to § 257.102(c)(2) must complete groundwater corrective action in accordance with § 257.98(c).

(d) * * *

(2) *Deadline to prepare the initial written post-closure plan—(i) Existing CCR landfills and existing CCR surface impoundments.* No later than October 17, 2016, the owner or operator of the CCR unit must prepare an initial written post-closure plan consistent with the requirements specified in paragraph (d)(1) of this section.

(ii) *New CCR landfills, new CCR surface impoundments, and any lateral expansion of a CCR unit.* No later than the date of the initial receipt of CCR in the CCR unit, the owner or operator must prepare an initial written post-closure plan consistent with the requirements specified in paragraph (d)(1) of this section.

(iii) *CCR management units.* No later than Wednesday, November 8, 2028, the owner or operator of a CCR management unit must prepare an initial written post-closure care plan as set forth in paragraph (d)(1) of this section.

(iv) *Recordkeeping.* The owner or operator has completed the written post-closure plan when the plan, including the certification required by paragraph (d)(4) of this section, has been placed in the facility's operating record as required by § 257.105(i)(4).

* * * * *

(g) *Removal of a deed notation.* The owner or operator of a CCR unit closed pursuant to §§ 257.102(c)(2) and 257.104 may remove the notation from the deed specified in § 257.102(i) upon:

(1) Completion of groundwater corrective action demonstrating that any areas affected by releases from the CCR unit do not exceed the groundwater protection standards established pursuant to § 257.95(h) for constituents listed in appendix IV to this part; and

(2) Completion of the notification of completion of post-closure care period required by paragraph (e) of this section.

* * * * *

- 22. Revise § 257.105 to read as follows:

§ 257.105 Recordkeeping requirements.

(a) *Operating Record.* Each owner or operator of a CCR unit subject to the requirements of this subpart must date and maintain files of all information required by this section in a written operating record at their facility. Each file must indicate the date the file was placed in the operating record.

(b) *Document Retention.* Unless specified otherwise, each file must be retained for at least five years following the date of each occurrence, measurement, maintenance, corrective action, report, record, or study.

(c) *Recordkeeping for multiple CCR units.* An owner or operator of more

than one CCR unit subject to the provisions of this subpart may comply with the requirements of this section in one recordkeeping system provided the system identifies each file by the name of each CCR unit. The files may be maintained on microfilm, on a computer, on computer disks, on a storage system accessible by a computer, on magnetic tape disks, or on microfiche.

(d) *State Director and/or appropriate Tribal authority notification.* The owner or operator of a CCR unit must submit to the State Director and/or appropriate Tribal authority any demonstration or documentation required by this subpart, if requested, when such information is not otherwise available on the owner or operator's CCR website.

(e) *Location restrictions.* The owner or operator of a CCR unit subject to this subpart must place the demonstrations documenting whether or not the CCR unit is in compliance with the requirements under §§ 257.60(a), 257.61(a), 257.62(a), 257.63(a), and 257.64(a), as it becomes available, in the facility's operating record, except each location restrictions demonstration must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g).

(f) *Design criteria.* The owner or operator of a CCR unit subject to this subpart must place the following information, as it becomes available, in the facility's operating record:

(1) The design and construction certifications as required by § 257.70(e) and (f), except each certification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(2) The documentation of liner type as required by § 257.71(a), except each liner type documentation must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(3) The design and construction certifications as required by § 257.72(c) and (d), except each certification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in

accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(4) Documentation prepared by the owner or operator stating that the permanent identification marker was installed as required by §§ 257.73(a)(1) and 257.74(a)(1), except each document must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or until completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(5) The initial and periodic hazard potential classification assessments as required by §§ 257.73(a)(2) and 257.74(a)(2), except each hazard potential classification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(6) The emergency action plan (EAP), and any amendment of the EAP, as required by §§ 257.73(a)(3) and 257.74(a)(3), except each EAP must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(7) Documentation prepared by the owner or operator recording the annual face-to-face meeting or exercise between representatives of the owner or operator of the CCR unit and the local emergency responders as required by §§ 257.73(a)(3)(i)(E) and 257.74(a)(3)(i)(E), except each document must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(8) Documentation prepared by the owner or operator recording all activations of the emergency action plan as required by §§ 257.73(a)(3)(v) and 257.74(a)(3)(v), except each documentation of EAP activations must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g)

irrespective of the time requirement specified in paragraph (b) of this section.

(9) The history of construction, and any revisions of it, as required by § 257.73(c), except each history of construction must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(10) The initial and periodic structural stability assessments as required by §§ 257.73(d) and 257.74(d), except each structural stability assessment must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(11) Documentation detailing the corrective measures taken to remedy the deficiency or release as required by §§ 257.73(d)(2) and 257.74(d)(2), except each document must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(12) The initial and periodic safety factor assessments as required by §§ 257.73(e) and 257.74(e), except each safety factor assessment must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(13) The design and construction plans, and any revisions of it, as required by § 257.74(c), except the design and construction plans must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(14) The application and any supplemental materials submitted in support of the application as required by § 257.71(d)(1)(i)(E), except each application and supplemental materials must be maintained for five years after completion of closure by removal in

accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(15) The alternative liner demonstration as required by § 257.71(d)(1)(ii)(D).

(16) The alternative liner demonstration extension request as required by § 257.71(d)(2)(ii)(D).

(17) The documentation prepared for the preliminary demonstration as required by § 257.71(d)(2)(ii)(E).

(18) The notification of an incomplete application as required by § 257.71(d)(2)(iii)(B).

(19) The decision on the application as required by § 257.71(d)(2)(iii)(F), except each decision must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(20) The final decision on the alternative liner demonstration as required by § 257.71(d)(2)(vii).

(21) The alternative source demonstration as required under § 257.71(d)(2)(ix)(A)(4).

(22) The final decision on the alternative source demonstration as required under § 257.71(d)(2)(ix)(A)(5).

(23) The final decision on the trend analysis as required under § 257.71(d)(2)(ix)(B)(3).

(24) The decision that the alternative source demonstration has been withdrawn as required under § 257.71(d)(2)(ix)(C).

(25) The facility evaluation report part 1 as required by § 257.75(c), except the facility evaluation report part 1 must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(26) The facility evaluation report part 2 as required by § 257.75(d), except the facility evaluation report part 2 must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(g) *Operating criteria.* The owner or operator of a CCR unit subject to this

subpart must place the following information, as it becomes available, in the facility's operating record:

(1) The CCR fugitive dust control plan, and any subsequent amendment of the plan, required by § 257.80(b), except each fugitive dust control plan must be maintained for five years after closure by removal in accordance with § 257.102(c)(1) or (2) or completes post-closure care in accordance with § 257.104(e) or (g) is completed at the last CCR unit at the facility irrespective of the time requirement specified in paragraph (b) of this section.

(2) The annual CCR fugitive dust control report required by § 257.80(c), except each fugitive dust control report must be maintained for five years after closure by removal in accordance with § 257.102(c)(1) or (2) or post-closure care in accordance with § 257.104(e) or (g) is completed at the last CCR unit at the facility irrespective of the time requirement specified in paragraph (b) of this section.

(3) The initial and periodic run-on and run-off control system plans as required by § 257.81(c), except each plan must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(4) The initial and periodic inflow design flood control system plan as required by § 257.82(c), except each plan must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(5) Documentation recording the results of each inspection and instrumentation monitoring by a qualified person as required by § 257.83(a), except each document must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(6) The periodic inspection report as required by § 257.83(b)(2), except each inspection report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the

time requirement specified in paragraph (b) of this section.

(7) Documentation detailing the corrective measures taken to remedy the deficiency or release as required by §§ 257.83(b)(5) and 257.84(b)(5), except each document must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(8) Documentation recording the results of the weekly inspection by a qualified person as required by § 257.84(a), except each inspection report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(9) The periodic inspection report as required by § 257.84(b)(2), except each inspection report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(h) *Groundwater monitoring and corrective action.* The owner or operator of a CCR unit subject to this subpart must place the following information, as it becomes available, in the facility's operating record:

(1) The annual groundwater monitoring and corrective action report as required by § 257.90(e), except each annual groundwater monitoring and corrective action report must be maintained for five years after the last CCR unit at the facility either completes closure by removal in accordance with § 257.102(c)(1) or completes post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(2) Documentation of the design, installation, development, and decommissioning of any monitoring wells, piezometers and other measurement, sampling, and analytical devices as required by § 257.91(e)(1), except each document must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement

specified in paragraph (b) of this section.

(3) The groundwater monitoring system certification as required by § 257.91(f), except each certification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(4) The selection of a statistical method certification as required by § 257.93(f)(6), except each certification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(5) Within 30 days of establishing an assessment monitoring program, the notification as required by § 257.94(e)(3).

(6) The results of appendices III and IV to this part constituent concentrations measured as required by § 257.95(d)(1).

(7) Within 30 days of returning to a detection monitoring program, the notification as required by § 257.95(e).

(8) Within 30 days of detecting one or more constituents in appendix IV to this part at statistically significant levels above the groundwater protection standard, the notifications as required by § 257.95(g).

(9) Within 30 days of initiating the assessment of corrective measures requirements, the notification as required by § 257.95(g)(5).

(10) The completed assessment of corrective measures as required by § 257.96(d), except each certification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(11) Documentation prepared by the owner or operator recording the public meeting for the corrective measures assessment as required by § 257.96(e), except each certification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(12) The semiannual report describing the progress in selecting and designing the remedy and the selection of remedy report as required by § 257.97(a), except that the selection of remedy report must be maintained until the remedy has been completed.

(13) Within 30 days of completing the remedy, the notification as required by § 257.98(e), except each notification must be maintained for five years after completion of the remedy selected pursuant to § 257.97 irrespective of the time requirement specified in paragraph (b) of this section.

(14) The demonstration, including long-term performance data, supporting the suspension of groundwater monitoring requirements as required by § 257.90(g), except each document must be maintained for five years after the last unit at the facility completes post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(i) *Closure and post-closure care.* The owner or operator of a CCR unit subject to this subpart must place the following information, as it becomes available, in the facility's operating record:

(1) The notification of intent to initiate closure of the CCR unit as required by § 257.100(c)(1).

(2) The annual progress reports of closure implementation as required by § 257.100(c)(2)(i) and (ii).

(3) The notification of closure completion as required by § 257.100(c)(3).

(4) The written closure plan, and any amendment of the plan, as required by § 257.102(b), except that only the most recent closure plan must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(5) The written demonstration(s), including the certification required by § 257.102(e)(2)(iii), for a time extension for initiating closure as required by § 257.102(e)(2)(ii), except each demonstration must be maintained until notice of completion of closure is placed in the operating record in accordance with § 257.102(h) irrespective of the time requirement specified in paragraph (b) of this section.

(6) The written demonstration(s), including the certification required by § 257.102(f)(2)(iii), for a time extension for completing closure as required by § 257.102(f)(2)(i), except each demonstration must be maintained for five years after completion of closure in

accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (b) of this section.

(7) The notification of intent to close a CCR unit as required by § 257.102(g), except each notification must be maintained for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (b) of this section.

(8) The notification of completion of closure of a CCR unit as required by § 257.102(h), except each notification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(9) The notification recording a notation on the deed as required by § 257.102(i), except each notification must be maintained for five years after completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(10) The notification of intent to comply with the alternative closure requirements as required by § 257.103(c)(1), except each notification must be maintained for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (b) of this section.

(11) The annual progress reports under the alternative closure requirements as required by § 257.103(c)(2), except each report must be maintained for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (b) of this section.

(12) The written post-closure plan, and any amendment of the plan, as required by § 257.104(d), except that only the most recent post-closure plan must be maintained for five years after completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(13) The notification of completion of post-closure care period as required by § 257.104(e), except each notification must be maintained for five years after completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (b) of this section.

(14) The notification of intent to comply with the site-specific alternative to initiation of closure due to development of alternative capacity infeasible as required by § 257.103(f)(1)(ix)(A), except each notification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(15) The approved or denied demonstration for the site-specific alternative to initiation of closure due to development of alternative capacity infeasible as required by § 257.103(f)(1)(ix)(B), except each approval or denial must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(16) The notification for requesting additional time to the alternative cease receipt of waste deadline as required by § 257.103(f)(1)(ix)(C), except each notification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(17) The semi-annual progress reports for the site-specific alternative to initiation of closure due to development of alternative capacity being infeasible as required by § 257.103(f)(1)(xi), except each semi-annual progress report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(18) The notification of intent to comply with the site-specific alternative to initiation of closure due to permanent cessation of a coal-fired boiler(s) by a date certain as required by § 257.103(f)(2)(viii), except each notification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(19) The approved or denied demonstration for the site-specific alternative to initiation of closure due to permanent cessation of a coal-fired boiler(s) by a date certain as required by § 257.103(f)(2)(ix), except each demonstration must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(20) The annual progress report for the site-specific alternative to initiation of closure due to permanent cessation of a coal-fired boiler(s) by a date certain as required by § 257.103(f)(2)(x), except each annual progress report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or (2) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(k) *Legacy CCR surface impoundments.* In addition to the information specified in paragraphs (e) through (j) of this section, the owner or operator of a legacy CCR surface impoundment subject to this subpart must place the following information, as it becomes available, in the facility's operating record:

(1) The applicability report required by § 257.100(f)(1), including the certification required by § 257.100(f)(1)(i), except each report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(2) The applicability extension reports required by § 257.100(f)(1)(iii)(C), except each report must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (b) of this section.

(3) The notification of field investigation conclusion required by § 257.100(f)(1)(iii)(F), except the notification must be maintained for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement

specified in paragraph (b) of this section.

(4) The notification of intent to certify closure required by § 257.100(h)(1)(i), except the notification must be maintained for five years after completion of closure by removal in accordance with § 257.100(h)(1) or § 257.102(c)(2) irrespective of the time requirement specified in paragraph (b) of this section.

■ 23. Amend § 257.106 by:

■ a. Revising paragraphs (a), (b), (c), and (d);

■ b. Adding paragraphs (f)(24) and (25) and (k).

The revisions and additions read as follows:

§ 257.106 Notification requirements.

(a) *Deadline to submit notification to the relevant State Director and/or appropriate Tribal authority.* The notifications required under paragraphs (e) through (i) of this section must be sent to the relevant State Director and/or appropriate Tribal authority before the close of business on the day the notification is required to be completed. For purposes of this section, *before the close of business* means the notification must be postmarked or sent by electronic mail (email). If a notification deadline falls on a weekend or federal holiday, the notification deadline is automatically extended to the next business day.

(b) *Notifications to Tribal authority.* If any CCR unit is located in its entirety within Indian Country, the notifications of this section must be sent to the appropriate Tribal authority. If any CCR unit is located in part within Indian Country, the notifications of this section must be sent both to the appropriate State Director and Tribal authority.

(c) *Combining notifications.* Notifications may be combined as long as the deadline requirement for each notification is met.

(d) *Notification deadline after placement in operating record.* Unless otherwise required in this section, the notifications specified in this section must be sent to the State Director and/or appropriate Tribal authority within 30 days of placing in the operating record the information required by § 257.105.

* * * * *

(f) * * *

(24) Provide notification of the availability of the facility evaluation report part 1 as specified by § 257.105(f)(25).

(25) Provide notification of the availability of the facility evaluation

report part 2 as specified by § 257.105(f)(26).

* * * * *

(k) *Legacy CCR surface impoundments.* In addition to the information specified in paragraphs (e) through (j) of this section, the owner or operator of a legacy CCR surface impoundment subject to this subpart must notify the State Director and/or appropriate Tribal authority when information has been placed in the operating record and on the owner or operator's publicly accessible internet site. The owner or operator must:

(1) Provide notification of the availability of the applicability documentation as specified under § 257.105(k)(1).

(2) Provide notification of the availability of the applicability extension report as specified under § 257.105(k)(2).

(3) Provide notification of the availability of the notification as specified under § 257.105(k)(3).

(4) Provide notification of the availability of the intent to certify closure by removal certification as specified under § 257.105(k)(4).

■ 24. Revise and republish § 257.107 to read as follows:

§ 257.107 Publicly accessible internet site requirements.

(a) *CCR website requirement.* Each owner or operator of a CCR unit subject to the requirements of this subpart must maintain a publicly accessible internet site (CCR website) containing the information specified in this section. The owner or operator's website must be titled "CCR Rule Compliance Data and Information." The website must ensure that all information required to be posted is immediately available to anyone visiting the site, without requiring any prerequisite, such as registration or a requirement to submit a document request. All required information must be clearly identifiable and must be able to be immediately printed and downloaded by anyone accessing the site. If the owner/operator changes the web address (*i.e.*, Uniform Resource Locator (URL)) at any point, they must notify EPA via the "contact us" form on EPA's CCR website and the state director within 14 days of making the change. The facility's CCR website must also have a "contact us" form or a specific email address posted on the website for the public to use to submit questions and issues relating to the availability of information on the website.

(b) *CCR website for multiple CCR units or combined websites for multiple regulatory programs.*

(1) An owner or operator of more than one CCR unit subject to the provisions of this subpart may comply with the requirements of this section by using the same internet site for multiple CCR units provided the CCR website clearly delineates information by the name or identification number of each unit.

(2) An owner or operator may maintain one website combining the postings required under this subpart with the postings required by other regulatory programs (e.g., the “ELG Rule Compliance Data and Information” website required pursuant to § 423.19 of this chapter), provided the postings required for each regulatory program are delineated under a separate heading on the website.

(c) *Document retention on a CCR website.* Unless otherwise required in this section, the information required to be posted to the CCR website must be made available to the public for at least five years following the date on which the information was first posted to the CCR website.

(d) *Website posting deadline after placement in operating record.* Unless otherwise required in this section, the information must be posted to the CCR website within 30 days of placing the pertinent information required by § 257.105 in the operating record.

(e) *Location restrictions.* The owner or operator of a CCR unit subject to this subpart must place each demonstration specified under § 257.105(e) on the owner or operator’s CCR website except each location restrictions demonstration must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (c) of this section.

(f) *Design criteria.* The owner or operator of a CCR unit subject to this subpart must place the following information on the owner or operator’s CCR website:

(1) Within 60 days of commencing construction of a new unit, the design certification specified under § 257.105(f)(1) or (3), except each certification must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(2) No later than the date of initial receipt of CCR by a new CCR unit, the construction certification specified under § 257.105(f)(1) or (3), except each

certification must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g), or until the liner is removed irrespective of the time requirement specified in paragraph (c) of this section, whichever is later.

(3) The documentation of liner type specified under § 257.105(f)(2), except each document must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g), or until the liner is removed irrespective of the time requirement specified in paragraph (c) of this section, whichever is later.

(4) The initial and periodic hazard potential classification assessments specified under § 257.105(f)(5), except only the two most recent hazard potential classification assessments must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(5) The emergency action plan (EAP) specified under § 257.105(f)(6), except that only the most recent EAP must be maintained on the CCR website irrespective of the time requirement specified in paragraph (c) of this section.

(6) Documentation prepared by the owner or operator recording the annual face-to-face meeting or exercise between representatives of the owner or operator of the CCR unit and the local emergency responders specified under § 257.105(f)(7), except only the most recent documentation must be posted on the CCR website irrespective of the time requirement specified in paragraph (c) of this section.

(7) Documentation prepared by the owner or operator recording any activation of the emergency action plan specified under § 257.105(f)(8); if no activation in the last five years, documentation that includes that information irrespective of the time requirement specified in paragraph (c) of this section.

(8) The history of construction, and any revisions of it, specified under § 257.105(f)(9), except the history of constructions, and any revisions of it, must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g)

irrespective of the time requirement specified in paragraph (c) of this section.

(9) The initial and periodic structural stability assessments specified under § 257.105(f)(10), except only the two most recent structural stability assessments must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(10) The documentation detailing the corrective measures taken to remedy the deficiency or release specified under § 257.105(f)(11), except each document must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(11) The initial and periodic safety factor assessments specified under § 257.105(f)(12), except only the two most recent safety factor assessments must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(12) The design and construction plans, and any revisions of them, specified under § 257.105(f)(13), except each plan must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(13) The application and any supplemental materials submitted in support of the application specified under § 257.105(f)(14), except each application must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(14) The alternative liner demonstration specified under § 257.105(f)(15).

(15) The alternative liner demonstration specified under § 257.105(f)(16).

(16) The documentation prepared for the preliminary demonstration specified under § 257.105(f)(17).

(17) The notification of an incomplete application specified under § 257.105(f)(18).

(18) The decision on the application specified under § 257.105(f)(19), except each decision must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(19) The final decision on the alternative liner demonstration specified under § 257.105(f)(20).

(20) The alternative source demonstration specified under § 257.105(f)(21).

(21) The final decision on the alternative source demonstration specified under § 257.105(f)(22).

(22) The final decision on the trend analysis specified under § 257.105(f)(23).

(23) The decision that the alternative source demonstration has been withdrawn specified under § 257.105(f)(24).

(24) The facility evaluation report part 1 as specified under § 257.105(f)(25), except each report must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(25) The facility evaluation report part 2 as specified under § 257.105(f)(26), except each report must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(g) *Operating criteria.* The owner or operator of a CCR unit subject to this subpart must place the following information on the owner or operator's CCR website:

(1) The CCR fugitive dust control plan, or any subsequent amendment of the plan, specified under § 257.105(g)(1) except that only the most recent plan must be maintained on the CCR website irrespective of the time requirement specified in paragraph (c) of this section until the last CCR unit at the facility completes closure by removal in accordance with § 257.102(c) or completes post-closure care in accordance with § 257.104(e) or (g)

irrespective of the time requirement specified in paragraph (c) of this section.

(2) The annual CCR fugitive dust control report specified under § 257.105(g)(2). Each report must be posted for the duration specified in paragraph (c) of this section, except that the final report must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(3) The initial and periodic run-on and run-off control system plans specified under § 257.105(g)(3), except each plan must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(4) The initial and periodic inflow design flood control system plans specified under § 257.105(g)(4), except each plan must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(5) The periodic inspection reports specified under § 257.105(g)(6). Each report must be posted for the duration specified in paragraph (c) of this section, except that the final report must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(6) The documentation detailing the corrective measures taken to remedy the deficiency or release specified under § 257.105(g)(7). Each report must be posted for the duration specified in paragraph (c) of this section, except that the final documentation must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(7) The periodic inspection reports specified under § 257.105(g)(9). Each report must be posted for the duration specified in paragraph (c) of this section, except that the final report must

be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(h) *Groundwater monitoring and corrective action.* The owner or operator of a CCR unit subject to this subpart must place the following information on the owner or operator's CCR website:

(1) The annual groundwater monitoring and corrective action report specified under § 257.105(h)(1). Each report must be posted for the duration specified in paragraph (c) of this section, except that the final report must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(2) The groundwater monitoring system certification specified under § 257.105(h)(3), except each certification must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(3) The selection of a statistical method certification specified under § 257.105(h)(4), except each certification must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(4) The notification that an assessment monitoring programs has been established specified under § 257.105(h)(5).

(5) The notification that the CCR unit is returning to a detection monitoring program specified under § 257.105(h)(7).

(6) The notification that one or more constituents in appendix IV to this part have been detected at statistically significant levels above the groundwater protection standard and the notifications to land owners specified under § 257.105(h)(8).

(7) The notification that an assessment of corrective measures has been initiated specified under § 257.105(h)(9).

(8) The assessment of corrective measures specified under § 257.105(h)(10), except each assessment must be posted for five years

after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(9) The semiannual reports describing the progress in selecting and designing remedy and the selection of remedy report specified under § 257.105(h)(12), except that the selection of the remedy report must be maintained until the remedy has been completed.

(10) The notification that the remedy has been completed specified under § 257.105(h)(13), except each notification must be posted for five years after completion of the remedy selected pursuant to in § 257.97 irrespective of the time requirement specified in paragraph (c) of this section.

(11) The demonstration supporting the suspension of groundwater monitoring requirements specified under § 257.105(h)(14), except each demonstration must be posted for five years after completion of closure by removal in accordance with § 257.102(c) or until completion of post-closure care in accordance with § 257.104(e) or (g) irrespective of the time requirement specified in paragraph (c) of this section.

(i) *Closure and post-closure care.* The owner or operator of a CCR unit subject to this subpart must place the following information on the owner or operator's CCR website:

(1) The notification of intent to initiate closure of the CCR unit specified under § 257.105(i)(1).

(2) The annual progress reports of closure implementation specified under § 257.105(i)(2).

(3) The notification of closure completion specified under § 257.105(i)(3).

(4) The written closure plan, and any amendment of the plan, specified under § 257.105(i)(4), except that only the most recent closure plan must be posted on the CCR website irrespective of the time requirement specified in paragraph (c) of this section and each closure plan must be maintained for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (c) of this section.

(5) The demonstration(s) for a time extension for initiating closure specified under § 257.105(i)(5), except each demonstration must be posted until notice of completion of closure is placed

in the operating record in accordance with § 257.102(h) irrespective of the time requirement specified in paragraph (c) of this section.

(6) The demonstration(s) for a time extension for completing closure specified under § 257.105(i)(6), except each demonstration must be posted for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (c) of this section.

(7) The notification of intent to close a CCR unit specified under § 257.105(i)(7), except each notification must be posted for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (c) of this section.

(8) The notification of completion of closure of a CCR unit specified under § 257.105(i)(8), except each notification must be posted for five years after completion of closure by removal in accordance with § 257.102(c)(1) or completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (c) of this section.

(9) The notification recording a notation on the deed as required by § 257.105(i)(9), except each notification must be posted for five years after completion of post-closure care in accordance with § 257.104(e) irrespective of the time requirement specified in paragraph (c) of this section.

(10) The notification of intent to comply with the alternative closure requirements as required by § 257.105(i)(10), except the notification must be posted for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (c) of this section.

(11) The annual progress reports under the alternative closure requirements as required by § 257.105(i)(11), except the notification must be posted for five years after completion of closure in accordance with § 257.102(c) or (d) irrespective of the time requirement specified in paragraph (c) of this section.
