Safeguarding and Securing the Open Internet; Restoring Internet Freedom

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: In this document, the Federal Communications Commission (Commission or FCC) adopts a Declaratory Ruling, Report and Order, Order, and Order on Reconsideration that reestablishes the Commission’s authority over broadband internet access service (BIAS). The Declaratory Ruling classifies broadband internet access service as a telecommunications service under Title II of the Communications Act, providing the Commission with additional authority to safeguard national security, advance public safety, protect consumers, and facilitate broadband deployment. The Order establishes broad, tailored forbearance of the Commission’s application of Title II to broadband providers while maintaining Title II provisions the Commission needs to fulfill its obligations and objectives. The Report and Order reinstates straightforward, clear rules that prohibit blocking, throttling, or engaging in paid or affiliated prioritization arrangements, adopts certain enhancements to the transparency rule, and reinstates a general conduct standard that prohibits unreasonable interference or unreasonable disadvantage to consumers or edge providers. The Order on Reconsideration partially grants and otherwise dismisses as moot four petitions for reconsideration filed in response to the 2020 Restoring Internet Freedom Remand Order.

DATES: Effective July 22, 2024, except for amendatory instruction 7 (revisions to 47 CFR 8.2(a) and (b)), which is delayed indefinitely. The FCC will publish a document in the Federal Register announcing the effective date.

As of September 19, 2024, China Mobile International (USA) Inc., China Telecom (Americas) Corporation, China Unicom (Americas) Operations Limited, Pacific Networks Corp., and ConnNet (USA) LLC, and their affiliates and subsidiaries as defined pursuant to 47 CFR 2.903(c), shall discontinue any and all provision of broadband internet access service.

ADDRESSES: Federal Communications Commission, 45 L Street SW, Washington, DC 20554. In addition to filing comments with the Office of the Secretary, a copy of any comments on the Paperwork Reduction Act information collection requirements contained herein should be submitted to Nicole Ongele, Federal Communications Commission, 45 L Street SW, Washington, DC 20554, or send an email to PRA@fcc.gov.

FOR FURTHER INFORMATION CONTACT: For further information, contact Chris Laughlin, Wireline Competition Bureau at 202–418–2193. For additional information concerning the Paperwork Reduction Act information collection requirements contained in this document, send an email to PRA@fcc.gov or contact Nicole Ongele, Nicole.Ongele@fcc.gov.

SUPPLEMENTARY INFORMATION: This is a summary of the Commission’s Declaratory Ruling, Order, Report and Order, and Order on Reconsideration in WC Docket Nos. 23–320 and 17–108, FCC 24–47 CFR Parts 8 and 20 adopted on April 25, 2024, and released on May 7, 2024. The full text of the document is available on the Commission’s website at https://docs.fcc.gov/public/attachments/FFC-24-52A1.pdf. To request materials in accessible formats for people with disabilities (e.g., braille, large print, electronic files, audio format, etc.), send an email to FCC504@fcc.gov or call the Consumer & Governmental Affairs Bureau at (202) 418–0530 (voice).

Paperwork Reduction Act of 1995 Analysis

This document contains new or modified information collection requirements. The Commission, as part of its continuing effort to reduce paperwork burdens, will invite the general public to comment on the information collection requirements contained in the Report and Order as required by the Paperwork Reduction Act of 1995, Public Law 104–13. In addition, the Commission notes that pursuant to the Small Business Paperwork Relief Act of 2002, Public Law 107–198, see 44 U.S.C. 3506(c)(4), we previously sought specific comment on how the Commission might further reduce the information collection burden for small business concerns with fewer than 25 employees.

In the Report and Order, we adopt the transparency rule originally adopted in 2010 and reaffirmed in 2015, which caters to a broader relevant audience of interested parties than the audience identified in the Restoring Internet Freedom Final Order (83 FR 7852 (Feb. 22, 2018)). We reinstate enhancements to the transparency rule disclosures pertaining to network practices and performance characteristics.

Specifically, with regard to network practices, we reaffirm that the transparency rule requires that BIAS providers disclose any practices applied to traffic associated with a particular user or user group (including any application-agnostic degradation of service to a particular end user), and requires that disclosures of user-based or application-based practices must include the purpose of the practice; which users or data plans may be affected; the triggers that activate the use of the practice; the types of traffic that are subject to the practice; and the practice’s likely effects on end users’ experiences. In addition, we require BIAS providers to disclose any zero-rating practices.

We reinstate the enhanced performance characteristics disclosures eliminated in 2017 to require BIAS providers to disclose packet loss and to require that performance characteristics be reported with greater geographic granularity and be measured in terms of average performance over a reasonable period of time and during times of peak usage. We also require BIAS providers to directly notify end users if their individual use of a network will trigger a network practice, based on their demand prior to a period of congestion, that is likely to have a significant impact on the end user’s use of the service. We temporarily exempt (with the potential to become permanent) BIAS providers that have 100,000 or fewer BIAS subscribers as per their most recent FCC Form 477, aggregated over all affiliates of the provider, from the requirements to disclose packet loss and report their performance characteristics with greater geographic granularity and in terms of average performance over a reasonable period of time and during times of peak usage, as well as from the direct notification requirement to provide them additional time to develop appropriate systems. We delegate to the Consumer and Governmental Affairs Bureau (CGB) the authority to determine whether to maintain the exemption, and if so, the appropriate bounds of the exemption. We require providers to disclose all information required by the transparency rule on a publicly available, easily accessible website and that all transparency disclosures made pursuant to the transparency rule also be made available in machine-readable format.

In addition, to provide upfront clarity, guidance, and predictability, we adopt an updated process for providers seeking an advisory opinion from Commission staff regarding the open
internet rules, through which any BIAS provider may request an advisory opinion regarding the permissibility of its proposed policies and practices affecting access to BIAS.

Congressional Review Act

Synopsis

I. Declaratory Ruling: Classification of Broadband Internet Access Services

1. We reinstate the telecommunications service classification of BIAS under Title II of the Act. Reclassification will enhance the Commission’s ability to ensure internet openness, defend national security, promote cybersecurity, safeguard public safety, monitor network resiliency and reliability, protect consumer privacy and data security, support consumer access to BIAS, and improve disability access. We find that classification of BIAS as a telecommunications service represents the best reading of the Act in light of how the service is offered and perceived today, as well as the factual and technical realities of how BIAS functions. Classifying BIAS as a telecommunications service also accords with Commission and court precedent and is fully and sufficiently justified under the Commission’s longstanding authority and responsibility to classify services subject to the Commission’s jurisdiction, as necessary. We also ensure that consumers receive the same protections when using fixed and mobile BIAS by reclassifying mobile BIAS as a commercial mobile service.

A. Reclassification Enhances the Commission’s Ability To Fulfill Key Public Interest Obligations and Objectives

2. As the record overwhelmingly demonstrates, BIAS connections are absolutely essential to modern day life, facilitating employment, education, healthcare, commerce, community-building, communication, and free expression. The “forced digitization” of the COVID–19 pandemic served to underscore the importance of BIAS connections in society as essential activities moved online, and the increased importance of BIAS connections has only persisted in the wake of the pandemic. It has therefore never been more important that the Commission have both the necessary authority to oversee this essential service to protect consumers, strengthen national security, and support public safety, and the full complement of tools to facilitate access to BIAS.

3. While our conclusion that classifying BIAS as a telecommunications service represents the best reading of the Act is itself sufficient grounds for our decision, we separately conclude that important policy considerations also support this determination. In particular, our reclassification decision will ensure the Commission can fulfill statutory obligations and policy objectives to ensure internet openness, defend national security, promote cybersecurity, safeguard public safety, monitor network resiliency and reliability, protect consumer privacy and data security, support consumer access to BIAS, and improve disability access. As such, these policy obligations and objectives, each independently and collectively, support the reclassification of BIAS as a telecommunications service. We therefore reject arguments that we should address other issues instead of reclassifying BIAS, particularly since reclassification will enhance the Commission’s ability to address many of the issues commenters raise.

1. Ensuring Internet Openness

4. We find that reclassification of BIAS as a telecommunications service enables the Commission to more effectively safeguard the open internet. In addition to protecting free expression, an open internet encourages competition and innovation, and is critical to public safety. As we explain below, we find that a safe, secure, and open internet is too important to consumers and innovators to leave without the protection of Federal regulatory oversight.

5. Upon this document’s reclassification of BIAS as a Title II telecommunications service, we rely on our authority in sections 201 and 202 of the Act, along with the related enforcement authorities of sections 206, 207, 208, 209, 216, and 217, for the open internet rules we adopt in the Declaratory Ruling, Order, Report and Order, and Order (Order) to address practices that are unjust, unreasonable, or unreasonably discriminatory. Specifically, we reinstate rules that prohibit BIAS providers from blocking or throttling the information transmitted over their networks or engaging in paid or affiliated prioritization arrangements, and reinstate a general conduct standard that prohibits practices that cause unreasonable interference or unreasonable disadvantage to consumers or edge providers. As discussed more fully below, these rules, in concert with strong transparency requirements, establish clear standards for BIAS providers to maintain internet openness and give the Commission a solid basis on which to take enforcement actions against conduct that prevents consumers from fully accessing all of the critical services available through the internet. The reclassification also enables the Commission to establish a nationwide framework of open internet rules for BIAS providers and thereby exercise our authority to preempt any state or local measures that interfere or are incompatible with the Federal regulatory framework we establish in the Order, while at the same time ensuring that all consumers are protected from conduct harmful to internet openness.

2. Defending National Security and Law Enforcement

6. The reclassification of BIAS enhances the Commission’s ability to protect the Nation’s communications networks from entities that pose threats to national security and law enforcement. The RIF Order’s classification of BIAS as an information service under Title I raised concerns about the Commission’s authority to take certain regulatory actions to address risks to BIAS providers and vulnerabilities in broadband networks. As the National Telecommunications and Information Administration (NTIA) highlights, “the Commission has encountered challenges that have hampered its ability to fully protect the public from serious national security threats.” For example, NTIA describes cases where the Commission identified such threats and revoked the authority of certain foreign-owned adversarial service providers to provide Title II telecommunications services (including “traditional telephony”) in the United States pursuant to its section 214 authority, but was not able to stop them from providing BIAS or other internet-based services that were then classified as Title I services. Classifying BIAS under Title II alleviates those concerns, restoring a broader range of regulatory tools and enhancing the Commission’s jurisdiction to cover BIAS services, providers, and networks. We also find that reclassification will enable the
Commission to make more significant national security contributions as we continue our longstanding coordination with our Federal partners.

7. We find that reclassification will significantly bolster the Commission’s ability to carry out its statutory responsibilities to safeguard national security and law enforcement. Congress created the Commission, among other reasons, “for the purpose of the national defense.” The Commission’s national security responsibilities are well established. Presidential Policy Directive 21 (PPD–21) describes the Commission’s roles as including “identifying communications sector vulnerabilities and working with industry and other stakeholders to address those vulnerabilities . . . [and] to increase the security and resilience of critical infrastructure within the communications sector.” The President’s recent National Security Memorandum, NSM–22, recognized the Commission’s role in securing critical infrastructure: “The Federal Communications Commission will, to the extent permitted by law and in coordination with DHS and other Federal departments and agencies: (1) identify and prioritize communications infrastructure by collecting information regarding communications networks; (2) assess communications sector risks and work to mitigate those risks by requiring, as appropriate, regulated entities to take specific actions to protect communications networks and infrastructure; and (3) collaborate with communications sector industry members, foreign governments, international organizations, and other stakeholders to identify best practices and impose corresponding regulations.”

8. There can be no question about the importance to our national security of maintaining the integrity of our critical infrastructure, including communications networks. As PPD–21 explains:

The Nation’s critical infrastructure provides the essential services that underpin American society. Proactive and coordinated efforts are necessary to strengthen and maintain the security, functionality, and resilience of our critical infrastructure for the continuity of national essential functions, and to organize itself to partner effectively with and add value to the security and resilience efforts of critical infrastructure owners and operators . . . . It is the policy of the United States to strengthen the security and resilience of its critical infrastructure against both physical and cyber threats.

Developments in recent years have only highlighted security concerns arising in connection with the U.S. communications sector. These security threats also impact BIAS providers and broadband networks. PPD–21 recognizes that “communications systems [are] uniquely critical due to the enabling functions they provide across all critical infrastructure sectors,” which highlights the importance of protecting communications infrastructure—including broadband networks. Disruptions of communications can easily have significant cascading effects on other critical infrastructure sectors that rely on communications. The PPD–21 states, “U.S. efforts shall address the security and resilience of critical infrastructure in an integrated, holistic manner to reflect this infrastructure’s interconnectedness and interdependency. This directive also identifies energy and communications systems as uniquely critical due to the enabling functions they provide across all critical infrastructure sectors.” We find that reclassification of BIAS under Title II will enable the Commission to more fully utilize its regulatory authority and rely on its subject matter expertise and operational capabilities to address these concerns and strengthen the security posture of the United States. As NTIA explains, the “lightning-fast evolutions of our communications technologies and our growing dependence on these offerings necessitate a whole-of-government approach to security that engages all available federal government resources.”

9. The Commission has on multiple occasions carried out its responsibilities to protect the Nation’s communications networks from threats to national security and law enforcement by taking regulatory actions under Title II regarding the provision of traditional telecommunications services, including voice. For example, the Commission denied an application for international section 214 authority and revoked the section 214 authority of, certain entities that are majority-owned and controlled by the Chinese government, based on recommendations and comments from interested Executive Branch agencies regarding evolving national security and law enforcement concerns. In the China Mobile USA Order, China Telecom Americas Order on Revocation and Termination, China Unicom Americas Order on Revocation, and Pacific Networks and ConNet Order on Revocation and Termination, the Commission found that these entities are subject to exploitation, influence, and control by the Chinese government, and that mitigation would not address the national security and law enforcement concerns. In the China Telecom Americas Order on Revocation and Termination, China Unicom Americas Order on Revocation, and Pacific Networks and ConNet Order on Revocation and Termination, the Commission also found that the significant national security and law enforcement risks associated with those entities’ retention of their section 214 authority “pose a clear and imminent threat to the security of the United States.” More recently, the Commission adopted the Evolving Risks Notice of Proposed Rulemaking (NPRM) (88 FR 50486 (Aug. 1, 2023)), which, among other things, proposed rules that would require carriers to renew, every 10 years, their international section 214 authority. In the alternative, the Commission sought comment on adopting rules that would require all international section 214 authorization holders to periodically update information enabling the Commission to review the public interest and national security implications of those authorizations based on that updated information. As stated in the Evolving Risks NPRM, the overarching objective of that proceeding is to adopt rule changes “that will enable the Commission, in close collaboration with relevant Executive Branch agencies, to better protect telecommunications services and infrastructure in the United States in light of evolving national security, law enforcement, foreign policy, and trade policy risks.”

10. The reclassification of BIAS as a Title II service, and our decision below to decline to forbear from the entry certification requirements of section 214, will enable the Commission to exercise its section 214 authority with respect to BIAS providers, and will enhance the Commission’s ability to protect the Nation’s communications networks from entities that pose threats to national security and law enforcement. Section 214(a) of the Act prohibits any carrier from constructing, acquiring, or operating any line, and from engaging in transmission through any such line, without first obtaining a certificate from the Commission “that the present or future public convenience and necessity require or will require the construction, or operation, or continued use of such . . . line . . . .” The Supreme Court has determined that the Commission has
considerable discretion in deciding how to make its section 214 public interest findings. As we discuss elsewhere, while we grant blanket section 214 authority for the provision of BIAS to all current and future BIAS providers, with exceptions, this grant of blanket authority is subject to the Commission’s reserved power to revoke such authority, consistent with established statutory directives and longstanding Commission determinations with respect to section 214 authorizations. The Commission has explained that it grants blanket section 214 authority, rather than forbearing from application or enforcement of section 214 entirely, in order to remove barriers to entry without relinquishing its ability to protect consumers and the public interest by withdrawing such grants on an individual basis. And we find that the Commission’s determinations, based on thorough record development, in the denial and revocation actions discussed below, in which the Commission extensively evaluated national security and law enforcement considerations associated with those entities, support our decision to exclude from this blanket section 214 authority for the provision of BIAS those same entities whose application for international section 214 authority was previously denied or whose domestic and international section 214 authority was previously revoked by the Commission because of national security and law enforcement concerns. As discussed below, we find that excluding those entities and their current and future affiliates and subsidiaries from blanket section 214 authority for the provision of BIAS is warranted based on the Commission’s determinations in those proceedings that the present and future public interest, convenience, and necessity would no longer be served by the retention of these entities’ section 214 authority, or that the public interest would not be served by the grant of international section 214 authority. The Commission’s actions in those proceedings were based on recommendations and comments regarding evolving national security and law enforcement concerns from Executive Branch agencies, including from Members of, or Advisors to, the Committee for the Assessment of Foreign Participation in the U.S. Telecommunications Sector (Committee) created pursuant to Executive Order 13913. Our action in the Order will enable the Commission to use its authority to address threats to communications networks, working cooperatively with our Federal partners and leveraging all investigative tools at our disposal.

11. Reclassification will also enhance the Commission’s ability to obtain information from BIAS providers that will enable the Commission to assess national security risks, through reliance on section 214 of the Act, along with sections 201, 202, 218, 219, and 220. The Commission relies on sections 201 and 202 of the Act, and section 706 of the 1996 Act, for its authority to collect information. Additionally, section 218 of the Act authorizes the Commission to seek “full and complete information necessary to enable the Commission to perform the duties and carry out the objects for which it was created.”

Section 219 of the Act provides that “[t]he Commission is authorized to require annual reports from all carriers subject to this chapter, and from persons directly or indirectly controlling or controlled by, or under direct or indirect common control with, any such carrier, to prescribe the manner in which such reports shall be made, and to require from such persons specific answers to all questions upon which the Commission may need information.”

Section 220(c) of the Act provides that “[t]he Commission shall at all times have access to and the right of inspection and examination of all accounts, records, and memoranda, including all documents, papers, and correspondence now or hereafter existing, and kept or required to be kept by such carriers, and the provisions of this section.” As one example, in the Evolving Risks Order (88 FR 85514 (Dec. 8, 2023)), the Commission adopted a one-time collection of foreign ownership information from international section 214 authorization holders, pursuant to sections 218 and 219 of the Act, among other statutory provisions. Reclassification grants the Commission additional authority to develop information collection requirements pursuant to applicable provisions under Title II with regard to BIAS providers.

12. We anticipate as well that Title II authority, such as that provided in section 201 of the Act, will be important in addressing national security and law enforcement concerns involving internet Points of Presence (PoPs), which are usually located within data centers, as those relate to the provision of BIAS. Today, internet service providers (ISPs) provide BIAS through PoPs. There are serious national security and law enforcement risks associated with PoPs that are owned or operated by entities that present threats to national security and law enforcement interests and potential harms related to the services provided by such entities. For instance, in the China Telecom Americas Order on Revocation and Termination, the Commission addressed concerns that China Telecom (Americas) Corporation’s (CTA) PoPs in the United States “are highly relevant to the national security and law enforcement risks associated with CTA” and that “CTA’s PoPs in the United States provide CTA with the capability to misroute traffic and, in so doing, access and/or manipulate that traffic.” The Commission also stated that “CTA, like any similarly situated provider, can have both physical and remote access to its customers’ equipment needed to provide such services,” and “[t]his physical access to customers’ equipment would allow CTA to monitor and record sensitive information.” The Commission concluded that CTA’s provision of services pursuant to its section 214 authority, “whether offered individually or as part of a suite of services—combined with CTA’s physical presence in the United States, CTA’s ultimate ownership and control by the Chinese government, and CTA’s relationship with its indirect parent [China Telecommunications Corporation], which itself maintains a physical presence in the United States—present unacceptable national security and law enforcement risks to the United States,” and it reached similar conclusions in the other proceedings. In the China Telecom Americas Order on Revocation and Termination, the Commission stated that “[i]n cases where [China Telecom Americas’ (CTA’s)] PoPs reside in IX points, CTA can potentially access and/or manipulate data where it is on the preferred path for U.S. customer traffic, through its services provided pursuant to section 214 authority and those services not authorized under section 214 authority.” The Commission also noted that “[t]he Executive Branch agencies refer to public reports that CTA’s network misrouted large amounts of information and communications traffic over long periods, often several months, sometimes involving U.S. government traffic.” Notably, CTA’s website indicates that the company operates 23 PoPs in the United States and offers a number of services that may be available in the United States, including colocation, broadband, internet access, IP transit, and data center services. We conclude that the same national security and law enforcement concerns identified in that revocation proceeding are at least as likely to be present of BIAS offerings when used to route or exchange BIAS traffic. In the China...
Telecom Americas Order on Revocation and Termination, the Commission concluded that CTA’s provision of services pursuant to its section 214 authority, “whether offered individually or as part of a suite of services—combined with CTA’s physical presence in the United States, CTA’s ultimate ownership and control by the Chinese government, and CTA’s relationship with its indirect parent [China Telecommunications Corporation], which itself maintains a physical presence in the United States—present unacceptable national security and law enforcement risks to the United States.” We expect that reclassification of Huawei and ZTE equipment and services from Title II will enable the Commission to exercise authority when necessary to prohibit a BIAS provider from exchanging internet traffic with third parties that present threats to U.S. national security and law enforcement, such as CTA.

13. This document’s reclassification decision also will provide the Commission with broader authority under Title II to safeguard BIAS providers, networks, and infrastructure from equipment and services that pose national security threats. The Commission has undertaken significant efforts to improve supply chain security pursuant to its universal service authority in section 254 of the Act, its authority to regulate equipment in sections 302 and 303 of the Act, and new mandates established by Congress through the Secure and Trusted Communications Networks Act of 2019, as amended, and the Secure Equipment Act of 2021. In particular, the Commission has taken action to: prohibit the use of universal service fund (USF) support to purchase or obtain any equipment or services produced or provided by companies posing a national security threat; prohibit the use of Federal subsidies administered by the Commission and used for capital expenditures to provide advanced communications service to purchase, rent, lease, or otherwise obtain such equipment or services; create and maintain a list of communications equipment and services that pose an unacceptable risk to the national security (“covered equipment and services”); administer the Secure and Trusted Communications Networks Reimbursement Program (Reimbursement Program) to reimburse the costs providers incur to remove, replace, and dispose of covered Huawei and ZTE equipment and services from their networks; and prohibit the authorization of equipment that poses a threat and the marketing and importation of such equipment in the United States. Reclassification furthered these efforts by enhancing the Commission’s ability to address issues raised by the use in our networks of equipment and services that pose a threat to national security and law enforcement. Notably, the Commission stated that the definition of “provider of advanced communication services” for purposes of the Reimbursement Program did not limit program eligibility to providers who offer service to end users, and included intermediate providers that carry traffic for other carriers only and do not originate or terminate traffic.

14. We are unpersuaded by commenters that argue that Title II classification is unjustified for national security purposes because they question this policy rationale, argue that market forces are sufficient to address national security risks, or contend that potential national security regulations under Title II would be costly or burdensome for BIAS providers. The Commission’s national security concerns are not new. As evidenced by the discussion above, the Commission has engaged in numerous and ongoing actions to address these risks. The Nation’s communications networks are critical infrastructure, and therefore too important to leave entirely to market forces that may sometimes, but not always, align with necessary national security measures. Arguments regarding costs and burdens are unpersuasive given that, at this point, they represent only speculative hypothetical costs and burdens. To the extent there are costs and burdens associated with any ultimate action the Commission may undertake, we anticipate that the benefits to national security will outweigh those costs.

15. We also disagree with those commenters that reject the national security justification for reclassification on the grounds that there are no gaps that need to be filled or problems that need to be solved by the Commission, that argue that the Commission has a marginal role in protecting national security, or that contend Commission action would undermine the existing whole-of-government national security approach. These commenters fail to recognize, as noted above, that Congress made clear, when creating the Commission, that one of its enumerated purposes was to further the “national defense.” Additionally, these commenters ignore the Commission’s significant contributions to the whole-of-government approach to national security. In addition to the regulatory actions discussed above, the Commission is actively engaged in several Federal interagency working groups and policy committees that address a diverse range of national security topics, including cybersecurity, critical infrastructure resilience, emergency preparedness and response, supply chain risk management, and space systems cybersecurity. Commission staff receive classified briefings from the Intelligence Community on threats to the communications sector, exchange relevant information with Federal partners, and coordinate with law enforcement agencies to support various national security initiatives. The Commission also supports National Special Security Events (NSSE) and Security Event Assessment Rating (SEAR) events and conducts investigations to determine if communications are being transmitted lawfully, if spectrum is being used appropriately, or if radio-frequency devices are authorized for operation. As a result of the Commission’s collaborative efforts, we have learned that there are segments of the communications sector that are not subject to sufficient Federal regulatory oversight, including BIAS, due to the RIF Order’s misclassification of the service in 2017. This lack of sufficient oversight allows security vulnerabilities to go undiscovered—and unaddressed—which can produce negative consequences for the communications sector, as well as other critical infrastructure sectors. As articulated above, reclassification directly supports the Commission’s role in cross-government efforts and helps fill gaps in oversight by enabling the Commission to take regulatory actions to address national security risks.

16. We are also unpersuaded by arguments that reclassification is unjustified because we can address certain harms without such change. Some commenters argue that it would be sufficient to prevent carriers already subject to Title II from interconnecting with any entities that pose national security risks, whether or not those entities are themselves subject to Title II. We find that merely taking this action would fail far short of what is necessary to address our national security concerns, especially given the vastly diminished role of Title II voice and other traditional telecommunications services in today’s communications marketplace. A prohibition on only regulated carriers—meaning those currently subject to Title II—from interconnecting with entities that pose a national security threat would not reach
providers of BIAS without reclassification. We find that it is instead necessary to directly address the national security risks associated with the provision of BIAS with the enhanced authorities available under Title II. The reclassification of BIAS is an important step toward closing the national security loopholes that exist within the communications sector, especially in broadband networks.

17. Finally, we reject arguments of commenters that oppose reclassification as unnecessary because the Commission’s existing authority is sufficient to address national security concerns for which Congress has authorized the Commission to act: because the Commission does not have statutory authority to address national security concerns involving BIAS, broadband transmission services, or certain network infrastructure; or because Title II does not provide the Commission with authority to address national security. The Commission relies on multiple statutory provisions when taking action to protect national security, but Title II of the Communications Act includes some of the most important authorities and vests the Commission with a broad grant of rulemaking authority to “prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this chapter.” Indeed, we have articulated several sources of authority above. As we do not adopt any new national-security-focused rules in the Order, we need not articulate with specificity each Title II provision that would provide a source of authority for potential action that the Commission may take in the future. Similarly, we are not persuaded that using Title II authority for national security purposes would violate Article II of the Constitution. As the U.S. Court of Appeals for the Fifth Circuit recently held, the Commission’s exercise of authority to address national security threats to communications networks does not violate the separation of powers or infringe upon the President’s constitutional authority to conduct foreign affairs.

3. Promoting Cybersecurity

18. As with national security, the Commission has an important role in addressing cybersecurity in communications networks that is inherent in its establishment “for the purpose of the national defense.” The National Cybersecurity Strategy highlights the importance of protecting critical infrastructure as more of our “essential systems” move online. The expanding cyber threat landscape is “making cyberattacks inherently more destructive and impactful to our daily lives.” This trend is especially problematic because “malicious cyber activity has evolved from nuisance defacement, to espionage and intellectual property theft, to damaging attacks against critical infrastructure, to ransomware attacks and cyber-enabled influence campaigns.” Further, “offensive hacking tools and services, including foreign commercial spyware, are now widely accessible . . . [to] organized criminal syndicates.” In addition, “China, Russia, Iran, North Korea, and other autocratic states . . . are aggressively using advanced cyber capabilities” to pursue economic and military objectives. These malicious cyber activities threaten “the national security, public safety, and economic prosperity of the United States and its allies and partners.”

19. The communications sector is squarely in the crosshairs of malicious cyber actors, who have targeted communications providers with ransomware attacks and have exploited vulnerabilities in communications networks to carry out cyberattacks against other critical infrastructure. For example, the 2023 Annual Threat Assessment of the U.S. Intelligence Community highlights the cyber threats to U.S. communications networks and states that “China’s cyber espionage operations have included compromising telecommunications firms.” More recently, Federal Bureau of Investigation (FBI) Director Christopher Wray highlighted “China’s interest in the buildout of offensive weapons within our critical infrastructure,” which has enabled “persistent PRC access” to U.S. “critical telecommunications, energy, water, and other infrastructure.”

20. The Commission actively supports the U.S. Government’s efforts to protect critical infrastructure by participating in cybersecurity planning, coordination, and response activities. However, the classification of BIAS as a Title I information service has limited the regulatory actions that the Commission could take to address cyber incidents impacting some aspects of the communications sector, as well as other critical infrastructure sectors. This is not a hypothetical concern. As NTIA states on behalf of the Executive Branch, “[r]eclassifying BIAS is necessary to ensure that the Commission has the authority it needs to advance national security objectives.” In recent years, Federal agencies have requested the Commission’s assistance with mitigating specific risks and vulnerabilities in broadband networks that foreign adversaries could exploit to carry out cyberattacks against the United States. The lack of Title II authority over BIAS has essentially precluded the Commission from taking regulatory action to directly address these concerns. We note, by way of example, recent reports of efforts of China-based hackers to target Philippine government officials by carrying out cyberattacks over broadband networks in that country. We find that reclassifying BIAS as a Title II service will help to fill this gap by enhancing the Commission’s ability to protect U.S. communications networks and infrastructure from cyberattacks and to ensure that communications devices and equipment do not pose security risks to other critical infrastructure sectors.

21. The reclassification of BIAS significantly bolsters the Commission’s existing authority to take regulatory actions to address cybersecurity risks and vulnerabilities in broadband networks. We agree with NTIA that reclassification will enable the Commission to better “protect our networks from malicious actors . . . by leveraging the appropriate tools at its disposal, including the relevant Title II provisions.” We agree with commenters that reclassification “provides multiple new authorities for the Commission to engage on cybersecurity” and take regulatory actions to “study cybersecurity needs and impose minimum standards on BIAS providers.” For example, the Commission could build on existing efforts to require BIAS providers to implement cybersecurity plans and risk management plans to protect their networks from malicious cyber activity. This enhanced authority over BIAS could also allow the Commission to obtain greater situational awareness by working in coordination on cyber incident reporting with the Cybersecurity & Infrastructure Security Agency (CISA) as it implements the Cyber Incident Reporting for Critical Infrastructure Act of 2022 (CIRICA). It also provides the Commission with additional regulatory tools to ensure network and service reliability and better support effective 911 and emergency preparedness and response efforts.

22. Reclassification also places the Commission in a stronger position to address vulnerabilities threatening the security and integrity of the Border Gateway Protocol (BGP), which impacts “the transmission of data from email, e-commerce, and bank transactions to interconnected Voice-over-Internet Protocol (VoIP) and 9–1–1 calls.” For example, the Commission could
consider requiring service providers to deploy solutions to address BGP vulnerabilities, such as BGP hijacks. The agency could also consider establishing cybersecurity requirements for BGP, including “security features to ensure trust in the information that it is used to exchange,” which could prevent bad actors from “deliberately falsify[ing] BGP reachability information to redirect traffic to itself or through a specific third-party network, and prevent that traffic from reaching its intended recipient.” We note, however, that this filing does not oppose the reclassification of BIAS under Title II, the issue being addressed in the Order. Similarly, the Commission could more effectively address security threats related to the Domain Name System (DNS), which enables domain names to resolve to the correct IP addresses, and other naming protocols when used by BIAS providers to facilitate the operation of BIAS.

23. Some commenters argue that reclassification is unnecessary because the Commission’s existing authority is sufficient to address cybersecurity risks in areas where Congress has authorized the Commission to act. Other commenters argue that the classification of BIAS is irrelevant because the Commission does not have statutory authority to address cybersecurity matters. But it is well established that the Commission may—indeed must—take security and public safety considerations into account in its public interest determinations under Title II. We disagree with these commenters because the classification of BIAS under Title I created a loophole that largely precluded the Commission from taking regulatory actions to address cyber risks to BIAS providers and vulnerabilities in broadband networks. For example, under the Title I classification, the Commission has limited authority to require providers of non-Telco services (e.g., BIAS providers) to adopt cybersecurity standards or performance goals, report information about cyber incidents, or take defensive measures to protect communications networks and critical infrastructure. The reclassification of BIAS under Title II allows the Commission to use a broader range of regulatory tools by reestablishing the Commission’s legal jurisdiction over broadband services, providers, and networks. This change is necessary to ensure the Commission can effectively address the cyber threats to the communications sector.

24. We also disagree with those commenters that argue that the Commission should not take action because it lacks the expertise and resources to implement a Title II regulatory regime in the area of cybersecurity and because other agencies are better equipped to address cybersecurity risks and vulnerabilities. For example, Verizon points out that CISA is “the federal leader for cyber and physical infrastructure security” and claims that the Commission plays “only a supporting role.” NCTA—The Internet & Television Association (NCTA) agrees, based on the fact that CISA “issue[s] administrative subpoenas to critical infrastructure entities, which includes broadband providers, to obtain information necessary to identify and notify entities of vulnerabilities in their system.” We recognize and appreciate CISA’s leadership in protecting critical infrastructure—including communications networks—from malicious cyber activity. The Commission works closely with CISA and other Federal agencies in a collaborative manner to address risks and vulnerabilities impacting the communications sector. Chairwoman Rosenworcel currently serves as Chair of the Cybersecurity Forum for Independent and Executive Branch Regulators, “a federal interagency group that shares information and expertise to enhance the cybersecurity of America’s critical infrastructure.” Further, the Commission is the regulatory agency for communications and, as such, has access to regulatory authorities and investigative tools that Congress has not granted to other agencies. For example, the Commission recently adopted a cybersecurity labeling program for Internet of Things (IoT) devices and products, and proposed a pilot program to help schools and libraries improve their cybersecurity through the USF. In addition, the Commission regularly investigates cyber intrusions and hacks related to the breach of regulatorily protected consumer data in the possession of common carriers, cable providers, and satellite providers. For example, cyber breaches may involve unauthorized access to personally identifiable information (PII) or customer proprietary network information (CPNI). Likewise, our data protection investigations frequently involve investigating and assessing whether the regulated entities had reasonable cybersecurity protections in place to protect the networks on which sensitive data are housed. The reclassification of BIAS will enable the Commission to more effectively fulfill its responsibilities, including those identified in PPD–21, within the existing frameworks that support the whole-of-government approach to cybersecurity.

25. Even though the Commission, under Title II, may not be able to address all significant cyber vulnerabilities, we find that the availability of that authority meaningfully enhances our ability to address significant cybersecurity threats. Given the interconnected nature of communications networks, any efforts to reduce the number of vulnerabilities and threat vectors that can be targeted by malicious cyber actors could provide substantial benefits to the larger communications sector. A recent cyberattack by Russian hackers against Kyivstar, Ukraine’s largest telecommunications provider, “knocked out services” for 24 million users and “completely destroyed the core” of the company’s network. This incident demonstrates how cyberattacks targeting communications service providers—including BIAS providers—can have disastrous impacts by damaging network infrastructure and causing widespread service outages. The Electronic Privacy Information Center (EPIC) asserts that “immediate regulatory action must be taken to compel ISPs to shore up their cybersecurity practices to better protect consumers,” and argues that Title II reclassification of BIAS would empower the Commission to take further action. We agree with EPIC and conclude that reclassification enhances the Commission’s ability to require BIAS providers to implement cybersecurity practices and take other actions to protect the confidentiality and integrity of information on the traffic that [each provider] stores or transmits.

26. Similar to certain arguments made opposing reclassification for national security purposes, commenters opposing reclassification for cybersecurity purposes argue that: the Commission has adequate authority to address cybersecurity issues under Title I; reclassification will be costly, burdensome, and too rigid for a dynamic threat landscape; and industry already addresses cybersecurity risks without regulatory mandates. We find that the Commission has an essential role in promoting measures that “currently seem to best protect consumers from breaches and other cyber incidents.” As described above, and consistent with our conclusions on national security matters generally, reclassification will provide additional authority to act when necessary and in coordination with our Federal partners to address cybersecurity in the communications sector. Although the adoption of specific cybersecurity
requirements is beyond the scope of this proceeding, we intend for any future proposed action to provide regulatory flexibility. “Leveraging existing cybersecurity frameworks,” encourage “public-private collaboration,” and be designed to minimize the “cost of implementation.”

4. Safeguarding Public Safety

27. Reclassifying BIAS as a telecommunications service enables the Commission to advance several public safety initiatives. Congress created the Commission, among other reasons, “for the purpose of promoting safety of life and property through the use of wire and radio communication,” and as the Commission recognized in the RIF Remand Order (86 FR 994 (Jan. 7, 2021)), “[a]dvancing public safety is one of our fundamental obligations.” The Mozilla court explained that when “Congress has given an agency the responsibility to regulate a market such as the telecommunications industry that it has repeatedly deemed important to protecting public safety,” then the agency’s decisions “must take into account its duty to protect the public.”

The Commission’s responsibility to address public safety is becoming increasingly important as the severity and frequency of natural disasters continue to rise. Reclassification enhances the Commission’s jurisdiction over BIAS providers, which, in combination with our other statutory authority, will allow us to ensure BIAS meets the needs of public safety entities and individuals when they use those services for public safety purposes.

28. Reclassification will empower the Commission to more effectively support public safety officials’ use of BIAS for public safety purposes. Public safety officials’ reliance on broadband service has become integral to their essential functions and services, even aside from their use of enterprise-level broadband services, including how they communicate with each other and how they convey information to and receive information from the public. Public safety entities and first responders often rely on retail broadband services to communicate during emergency situations. Increasingly, public safety entities rely on BIAS to access various databases, share data with emergency responders, and stream video into 911 and emergency operations centers. Public safety officials also rely on BIAS outside the emergency context, including relying on individuals’ residential security systems that use BIAS that are alternatives to incarceration, which require individuals to check in with supervising officers remotely, wear electronic location monitoring devices, or use continuous alcohol monitoring devices. In addition, public safety officials use services accessible over the top (OTT) of broadband connections, such as social media, to communicate important and timely information to the public and to gain valuable information from the public and build on-the-ground situational awareness. For example, during the recent 911 outage that impacted several western states, public safety officials used social media “to inform the public of the issue and to provide alternate means of contacting emergency services.” Santa Clara describes the essential role BIAS also plays in public safety officials’ ability to carry out their daily, non-emergency functions, including its importance in the functioning of its emergency communications and operations protocols. Santa Clara also describes the importance of redundancies in its emergency communications and operations systems, and that many of these systems rely on BIAS, outside of its enterprise systems. Public safety entities benefit as well when they rely on enterprise services, which often flow over the same facilities as mass-market retail services. Emergency Services Internet (ESInet) is a managed UP network that is used for emergency services communications and which may be constructed from a mix of dedicated and shared facilities. ESInets can be realized in several ways with one example using the Multi-Protocol Label Switching (MPLS) standard used by many BIAS and transit providers’ networks for traffic engineering and sharing facilities with other traffic.

Reclassification gives the Commission additional jurisdiction to advance the existing uses of BIAS to support public safety operations and communications by, for example, taking regulatory actions to improve the effectiveness of emergency alerting and 911 communications. Given how crucial BIAS is to the protection of public safety and that reclassification provides the Commission with the ability to ensure that BIAS is reliable and secure during emergencies, we disagree with those commenters who argue that reclassification will not enhance public safety communications on the basis that public safety entities heavily rely on enterprise-level dedicated networks that fall outside of the scope of reclassification.

29. BIAS also plays an increasingly important role in allowing the public to communicate with first responders during emergency situations. In the RIF Remand Order, the Commission noted that retail broadband services are used to translate communications with 911 callers and patients in the field and to deliver critical information about 911 callers that is not delivered through the traditional 911 network. The Commission has undertaken various efforts in recent years to improve how the public reaches and shares information with emergency service providers. Title II classification of BIAS supports these current and future efforts. For example, reclassification enhances the Commission’s jurisdiction to improve the flow of voice communications, photos, videos, text messages, real-time text (RTT), and other types of communications from the public to emergency service providers through Next Generation 911 or Wi-Fi calling.

30. The public relies on BIAS to easily access public safety resources and information. Commenters who support reclassification and petitioners for reconsideration of the RIF Remand Order note that social media is increasingly used as an important resource by the public to access information about emergencies and other public safety incidents. We therefore disagree with commenters who argue that there is no evidence that the Commission’s lack of regulatory authority over BIAS poses public safety risks. Similar to the arguments made by commenters who argue that reclassification will not affect communications networks used by public safety officials, this argument ignores that both public safety officials and the public increasingly rely on BIAS. Indeed, BIAS has become for many individuals the primary way to access critical public safety services, without which there would be no other mode of communication.

Reclassification enables the Commission to ensure that communications are secure and reliable in times of emergency. We agree with the Communications Workers of America (CWA) that “[w]hile many providers have made strides in improving service quality and reducing outages, voluntary commitments are clearly not enough.” Furthermore, the fact that many states have implemented their own laws to ensure public safety communications are safeguarded demonstrates the gap that has existed since the repeal of Title II classification of BIAS. We observe that the public also relies on BIAS for public safety communications that occur outside of emergencies, including for telemedicine; residential safety and security systems; and in-home
monitoring of individuals who are elderly, disabled, or otherwise able to benefit from such services.

31. BIAS is essential when used by individuals with disabilities to communicate with public safety services, and the Commission has taken several steps to improve access to IP-enabled 911 communications for people with disabilities. For example, the Department of Health and Human Services recently announced that the 988 Suicide & Crisis Lifeline will provide direct video calling ASL services for people who are deaf and hard of hearing, as part of ongoing efforts to expand accessibility to behavioral health care for underserved communities. This will allow an ASL user in crisis to communicate directly with a counselor in ASL. Reclassification enhances our existing authority to ensure these communications are not interrupted or degraded by, for example, giving the Commission the jurisdiction necessary to “develop minimum standards of service and enforcement mechanisms that affect people with disabilities.” Likewise, reclassification “provide[s] the FCC with the tools needed, for example, to promote broadband in rural areas lacking sufficient access to BIAS where there is no substitute for copper wires which carry 911, closed captioning, and TTY services.”

32. Reclassification will enhance the Commission’s ability to better protect public safety communications. For example, Title II positions the Commission to fully examine and investigate incidents involving BIAS providers that are alleged to have violated the Commission’s rules, including those against throttling or blocking. In addition to holding any particular violative action to account, enforcement proceedings would also enable the Commission to prevent or mitigate future threats to BIAS by using data and information gathered as a result of those proceedings. Reclassification will also enable the Commission to make the Nation’s alerting and warning capabilities more effective and resilient by, for example, adopting rules requiring BIAS providers to transmit emergency alerts to their subscribers. Further, given the expanding ways in which individuals and public safety officials rely on BIAS to keep themselves and their homes safe, Title II will enable the Commission to ensure that BIAS providers protect and securely transmit the sensitive information to which they are privy pursuant to section 224, which requires service providers to protect customer information. Thus, reclassification enables the Commission to take a wider range of regulatory actions to ensure the public can reliably and securely access life-saving public safety resources and information using BIAS.

33. We find that the ability of the Commission to adopt ex ante regulations will provide better public safety protections than the ex post enforcement framework established by the RIF Order. We agree with Santa Clara and INCOMPAS, which, in their Petitions for Reconsideration of the RIF Remand Order, criticize the RIF Remand Order’s analysis of the record at that time in light of these observations, including the RIF Remand Order’s minimalization of the opportunity for harm to public safety in the absence of reclassification and the open internet conduct rules as well as its acceptance of industry’s voluntary commitments to abide by the principles underlying the open internet rules. Reclassification and the conduct rules enable the Commission “to deal with public safety issues before a public safety situation arises—not afterwards, as the RIF Remand Order suggests,” and do not force the Commission to rely on voluntary industry commitments to protect public safety.

34. Some commenters assert that reclassification will stymie innovation and reduce incentives for investment, which in turn, does not serve public safety goals. Both INCOMPAS and Santa Clara petitioned for reconsideration of the RIF Remand Order in large part on this very notion, pointing out that the asserted benefits of increased investment and innovation under Title I was unsupported by the record and that there was evidence to the contrary. We agree with Public Knowledge in that “[n]owhere has the Commission ever found that the nebulous and unsubstantiated benefits of deregulation outweigh the specific benefits of ensuring that public safety responders can communicate reliably with each other and with the public in times of crisis.” Linking increases or decreases in investment and innovation with reclassification is not supported by the available evidence, as we discuss in more detail below.

5. Monitoring Network Resiliency and Reliability

35. The Commission also plays a critical role in monitoring the resiliency and reliability of the Nation’s communications networks and helping to ensure that these networks are in fact resilient and reliable. PPD–21 defines “resiliency” as “the ability to prepare for and adapt to changing conditions and withstand and recover rapidly from disruptions . . . [i]ncludes the ability to withstand and recover from deliberate attacks, accidents, or naturally occurring threats or incidents.” The Nation’s networks are critical lifelines for those in need during disasters and other emergency situations. Recent events, including hurricanes, wildfires, tornadoes, earthquakes, and severe winter storms, demonstrate how communications infrastructure remains susceptible to disruption. As broadband services become more widespread, consumers increasingly rely on these connections. As of February 2021, Pew Research estimates that 77% of adults in the United States have high-speed broadband service at home. Smartphone ownership among adults in the US is now estimated to be at 85%. The Commission has taken actions consistent with its existing authority to improve the reliability and resiliency of the Nation’s communications networks so that the public can communicate, especially during emergencies.

However, those efforts have had to largely focus on the networks’ provision of voice telephony under Title II. This document’s action to reclassify BIAS under Title II will enable the Commission to build upon these efforts by taking more effective regulatory actions to protect the resiliency and reliability of our broadband networks and infrastructure.

36. In particular, the Commission plays a vital role in ensuring that the Nation’s communications networks are resilient and reliable. For example, the Commission “monitors and analyzes communications network outages,[ . . . ] takes actions to help prevent and mitigate outages, and where necessary, assist[s] response and recovery activities.” During emergencies, the Commission “collects information on the operational status of communications infrastructure to support government disaster assistance efforts and to monitor restoration and recovery.” One of the principal benefits of reclassification is to enable all public safety officials to better assess the operational status of broadband networks for dissemination of emergency information and/or to better assess where support is needed. Under the Commission’s Network Outage Reporting System (NORS), qualifying service providers are required to report to the Commission network outages that satisfy certain criteria.

37. As Free Press points out, “because NORS is limited to voice service outages, the Commission has historically lacked reliable outage information for today’s modern,
Reclassification also enhances the agency’s ability to gain better visibility over the performance of broadband networks and also to completely and accurately determine the scope and causes of outages to these networks. Closing this reporting gap for outages could afford the Commission and public safety officials with more consistent and reliable data to better track changes in network reliability, identify trends, pinpoint possible improvements and best practices, and disseminate actionable information. New outage reporting requirements for BIAS providers could also provide the Commission with better situational awareness for major internet outages affecting first responders, 911 services, and impacted populations that are not currently captured by NORS data. Finally, reclassification supports the Commission’s authority to expand the scope of NORS by requiring BIAS providers, like Title II-regulated voice service providers, to submit outage reports in response to service incidents that cause outages or the degradation of communications services, such as cybersecurity breaches, wire cuts, infrastructure damages from natural disaster, and operator errors or misconfigurations.

38. The Commission also “oversees and monitors industry efforts to strengthen network resiliency,” including through the recently adopted Mandatory Disaster Response Initiative. Moreover, the Commission adopted new rules, “to require enumerated service providers (cable communications, wireline, wireless, and interconnected Voice over Internet Protocol (VoIP) providers) . . . to report on their infrastructure status during emergencies and crises in the Disaster Information Reporting System (DIRS) when activated and to submit a final report to the Commission within 24 hours of DIRS deactivation.” Reclassification bolsters the Commission’s authority to require BIAS providers to participate in DIRS. In addition, the Commission endeavors to “identify and reduce risks to the reliability of the nation’s communications network[s],” including by working with the Communications Security Reliability and Interoperability Council (CSRIC).

39. Reclassifying BIAS as a telecommunications service will significantly enhance the Commission’s ability to protect critical infrastructure by taking actions to address threats and vulnerabilities to communications networks. Public Knowledge agrees that “without Title II authority, the Commission cannot impose regulations to meet the need for resilience and reliability as more and more critical traffic passes through IP networks.” This change in policy will enable the Commission to set goals and objectives that foster resilience and to implement risk management directives on a wider basis in order to make our broadband networks more resilient and reliable, and thus more secure. We also disagree with those commenters who argue against reclassification by contending that outage reporting targeted to BIAS networks will not serve the public interest or that there are alternative sources of authority for outage reporting. The Commission is considering in a separate proceeding the extent to which outage reporting requirements should be placed on BIAS providers and we anticipate that having Title II as an additional source of authority will support that evaluation.

40. We also are not persuaded by other arguments that certain parties raise regarding network resilience and reliability that are consistent with their comments regarding national security. Some commenters argue reclassification is not necessary to ensure the resiliency and reliability of the Nation’s communications networks, that market-driven incentives motivate broadband providers to make significant investments to increase the resiliency and reliability of their networks, or that the Commission has only a limited role to play on resiliency and reliability issues. We agree with AARP and Next Century Cities, however, that reclassification is necessary to provide the Commission with sufficient authority to address network resiliency for critical infrastructure, which is too important for the Commission to be forced to rely upon mere voluntary measures and alleged market-driven incentives. As described above, and consistent with our conclusions on national security matters generally, we find that the Commission has an essential role on resilience and reliability issues, working in coordination with its Federal partners. Reclassification will allow for the direct network monitoring of the Nation’s broadband internet networks and provide a robust regulatory platform so that all BIAS providers maintain the highest levels of business continuity when incidents occur. We find that reclassification will support the Commission’s efforts to protect the public by ensuring that more reliable and resilient networks are in use, including by developing voluntary frameworks and policies when practical, and compelling enforceable compliance when needed.

41. Commenters opposing reclassification also argue that under Title I classification, broadband networks have provided robust internet service despite unprecedented levels of demand during the COVID–19 pandemic. We find these arguments unpersuasive. As more critical functions rely on BIAS, it is imperative for the Commission to have authority to address resiliency issues involving broadband networks to the same degree that it has for traditional voice networks. Further, we disagree with those commenters that contend that these types of reporting, monitoring, and regulatory requirements would likely impose significant new costs on BIAS providers and potentially stifle investment and broadband deployment. 42. In conclusion, the reclassification of BIAS will secure the Commission’s authority to, as necessary, implement requirements for network upgrades and changes, adopt rules to enforce recovery from network outages, and improve our incident investigation and enforcement authority to mitigate network threats and vulnerabilities. Reclassification also enables the Commission to create more stability and predictability on how providers should address disasters and emergency situations. Moreover, reclassifying broadband as a telecommunications service allows the Commission to address identified—and evolving—threats and vulnerabilities in the BIAS industry, as some BIAS providers may not have sufficient incentives to protect the traffic traversing their networks without such regulation. Thus, reclassification would allow the Commission, for example, to require BIAS providers to identify and reduce harmful activities occurring across their infrastructure. These measures will be taken in support of a whole-of-government approach by taking regulatory actions to enhance network reliability and resiliency in order to better protect all of our Nation’s networks.

6. Protecting Consumers’ Privacy and Data Security

43. We find that classifying BIAS as a telecommunications service will support the Commission’s efforts to protect consumers’ privacy and data security. Section 222 of the Act governs telecommunications carriers’ use, disclosure, and provision of access to information obtained from their customers, other telecommunication carriers, and equipment manufacturers. It imposes a general duty on every telecommunications carrier to protect
the confidentiality of proprietary information of its customers, other telecommunication carriers, and equipment manufacturers, and imposes heightened restrictions on carriers’ use, disclosure, or provision of access to customers’ customer proprietary network information (CPNI)—including customer location information—without consent. CPNI is defined as “(A) information that relates to the quantity, technical configuration, type, destination, location, and amount of use of a telecommunications service subscribed to by any customer of a telecommunications carrier, and that is made available to the carrier by the customer solely by virtue of the carrier-customer relationship; and (B) information contained in the bills pertaining to telephone exchange service or telephone toll service received by a customer of a carrier.”

44. Returning BIAS to its telecommunications service classification will bring BIAS providers back under the section 222 privacy and data security framework, restoring those protections for consumers and yielding substantial public interest benefits. In her separate remarks on the 2021 Federal Trade Commission (FTC) Staff Report, Chair Lina Khan noted that the FCC “has the clearest legal authority and expertise to fully oversee internet service providers,” a view supported by a number of commenters, who assert that the Commission’s specific expertise to regulate privacy matters is needed. We observe that the Commission’s privacy authority under Title II is not limited to CPNI. Section 222(a) also imposes obligations, which we enforce, on carriers’ practices with regard to protection of non-CPNI customer proprietary information and personally identifiable information (PII), and section 201(b)’s prohibition on practices that are unjust or unreasonable also provides authority over privacy practices. We also find that because section 222 places an obligation on telecommunications carriers to protect the confidentiality of the proprietary information relating to other telecommunications carriers (including resellers) and equipment manufacturers, our classification of BIAS as a telecommunications service will protect information concerning entities that interact with BIAS providers.

7. Supporting Access to Broadband Internet Access Service

45. Reclassifying BIAS as a telecommunications service under Title II will support the Commission’s multifaceted efforts to support access to BIAS in three ways. First, such authority will improve the Commission’s ability to foster investment in and deployment of wireline and wireless infrastructure and to promote competition for, and access to, BIAS for consumers by restoring to BIAS-only providers statutory protections for pole attachments that providers of cable and telecommunications services receive. Second, reclassification facilitates our ability to ensure access to BIAS by enabling the Commission to regulate BIAS-only providers that serve multi-tenant environments to ensure they do not engage in unfair, unreasonable, and anticompetitive practices, such as exclusivity contracts. Finally, authority under Title II will put the Commission on the firmest legal ground to promote the universal service goals of the Act.

46. Wireline and Wireless Infrastructure. We find that reclassifying BIAS as a telecommunications service under Title II will support the Commission’s mission to foster investment in and deployment of wireline and wireless infrastructure and to promote competition and access to BIAS for consumers. Specifically, we find that the application of sections 224, 253, and 332 of the Act to BIAS-only providers will provide equitable rights to those providers and the tools to enable the Commission to reach its goals, thereby promoting greater deployment, competition, and availability of both wireline and wireless BIAS. Furthermore, we find that the RIF Remand Order failed to adequately address the Mozilla court’s concerns regarding the effects of reclassification on BIAS-only providers.

47. Reclassification of BIAS as a Title II service will ensure that BIAS-only providers receive the same statutory protections for pole attachments guaranteed by section 224 of the Act that providers of cable and telecommunications services receive. Section 224 defines pole attachments as “any attachment by a cable television system or provider of telecommunications service to a pole, duct, conduit, or right-of-way owned or controlled by a utility.” It authorizes the Commission to prescribe rules to ensure that the rates, terms, and conditions of pole attachments are just and reasonable; requires utilities to provide nondiscriminatory access to their poles, ducts, conduits, and rights-of-way to telecommunications carriers and cable television systems (collectively, attachers); provides procedures for resolving pole attachment complaints; governs pole attachment rates for attachers; and allocates make-ready costs among attachers and utilities. The Act defines a utility as a “local exchange carrier or an electric, gas, water, steam, or other public utility, . . . who owns or controls poles, ducts, conduits, or rights-of-way used, in whole or in part, for any wire communications.” However, for purposes of pole attachments, a utility does not include any railroad, any cooperatively organized entity, or any entity owned by a Federal or State government. Section 224 excludes incumbent local exchange carriers (ILECs) from the meaning of the term “telecommunications carrier,” therefore these entities do not have a mandatory access right under section 224(f)(1). The Commission has held that when ILECs obtain access to poles, section 224 governs the rates, terms, and conditions of those attachments. The Act allows utilities that provide electric service to deny access to their poles, ducts, conduits, or rights-of-way because of “insufficient capacity and for reasons of safety, reliability and generally applicable engineering purposes.” As the Commission noted in 2015, it “has recognized repeatedly the importance of pole attachments to the deployment of communications networks” and therefore has undertaken a series of reforms to improve access to poles under section 224. The National League of Cities urges us to revisit and overturn our 2018 Wireless Infrastructure Order (83 FR 51867 (Oct. 15, 2018)) and, until that time, forbear from application of sections 253 and 332(c) to reclassified BIAS. We agree with the Wireless Infrastructure Association that the former request is outside the scope of this proceeding. We decline to forbear from applying section 253 and 332(c) to BIAS for the reasons we discuss in section IV.B.9. To that end, the Commission continues to pursue solutions to improve pole access including, most recently in December 2023, by adopting new rules that, among other things, speed up the pole attachment dispute resolution process by establishing a new intra-agency rapid response team, set forth specific criteria for the response team to use when considering a complaint, and increase transparency for new broadband buildouts by requiring disclosure of pole inspection reports during the make-ready process. Under a Title I classification scheme, BIAS-only providers are not entitled to any of the current or future benefits the Commission may enact to facilitate access to broadband infrastructure.

48. Section 253 of the Act provides further protections to telecommunications companies that,
through Title II reclassification, will apply to BIAS-only providers. Specifically, section 253 seeks to further facilitate deployment of communications services by enabling the Commission (or a court) to intervene when a State or local regulation or legal requirement “may prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service.” Without reclassification, however, BIAS-only providers may not seek the Commission’s intervention under section 253 when State or local regulations interfere with their network deployment. Moreover, State and local laws that are exclusively focused on, or exclusively implicate, the provision of BIAS, do not currently fall within the ambit of section 253 and thus cannot be the subject of Commission intervention when prohibiting or having the effect of prohibiting the provision of BIAS exclusively.

49. In the wireless context, section 332 of the Act protects regulated entities from State and local regulations that “unreasonably discriminate among providers or functionally equivalent services” or that “prohibit or have the effect of prohibiting the provision of personal wireless service.” However, because mobile broadband is not currently classified as a “commercial mobile service,” mobile BIAS-only providers who do not offer additional regulated services are not covered by section 332. As INCOMPAS notes, it has “members who are solely focused on providing broadband services,” and “[t]he current classification of BIAS and mobile broadband as Title I services makes it difficult for these providers to argue that they are building the kinds of facilities capable of commingled operation that are covered by Sections 332 and 253.” As with sections 224 and 253, without reclassification, mobile BIAS-only providers would be disadvantaged compared to their competitors.

50. We find that reclassifying BIAS as a Title II service levels the playing field by ensuring that BIAS-only providers enjoy the same regulatory protections—those guaranteed by sections 224, 253, and 332—as their competitors who offered services already classified as telecommunications services in addition to BIAS prior to our classification decision in the Order. As the Commission found in 2015, “[a]ccess to poles and other infrastructure is crucial to the efficient deployment of communications networks including, and perhaps especially, new entrants.” INCOMPAS notes that BIAS providers face “significant barriers to deploy broadband network infrastructure—among them access to poles, ducts, and conduit.” The California Public Utilities Commission (CPUC) explains further that “[a]ccess to poles, conduits, and rights-of-way may affect cost, feasibility, and timing of constructing and offering broadband services.” Sections 224, 253, and 332 however, seek to remove these barriers by guaranteeing providers access to utility poles at just and reasonable rates and by ensuring that State and local laws do not prohibit deployment. Even WISPA—the Association for Broadband Without Boundaries (WISPA), which otherwise opposes our reclassification decision, highlights the benefits of extending section 224 rights to BIAS-only providers.

51. NCTA argues that restoring section 224 rights will only provide “illusory” benefits to BIAS-only providers. We disagree. Under Title II, BIAS-only providers will be guaranteed access to utility poles at just and reasonable rates. BIAS-only providers, therefore, will no longer be forced to negotiate for the right of pole access directly with each set of pole owners, which will not only ensure they pay the same rates as their competitors but will also ensure that deployment of their networks is not unnecessarily bogged down by the negotiation process. While such benefits may seem “illusory” to the competitors who already enjoy such privileges, we find that eliminating one of the “significant barriers to deployment” of broadband network infrastructure is in fact a very real benefit for BIAS-only providers. Indeed, NCTA, who claims that the benefits of pole attachment rights will prove to be illusory, has consistently failed to challenge it given that section 253 only applies to those State and local legal requirements that affect the provision of “telecommunications service.” Moreover, in any area where BIAS-only providers are the sole provider of service (or are seeking to be a provider of service), they would be left without recourse. We agree with INCOMPAS, which notes that “reclassification so that BIAS-only providers receive the same Title II protections as incumbent telecommunications providers is in the public interest as it will best ensure that the Communications Act’s goal of the Commission enabling and promoting competition can be fulfilled and that consumers will benefit from additional choice in the marketplace.” Therefore, we find that restoring section 224 rights of BIAS-only providers is not only equitable, but will help ensure that BIAS-only providers are adequately protected by the Commission’s authority to address State and local policies that restrict deployment.

53. In the RIF Remand Order, the Commission attempted to downplay its decision to strip section 224 rights from reasonable period of time after the request is duly filed with such government or instrumentality, taking into account the nature and scope of such request.” As INCOMPAS notes, “a reclassification of BIAS . . . opens an avenue for additional protections for BIAS-only providers who may need Commission intervention to address state/local policies that restrict competitive deployment through its oversight for ensuring competitors can access new geographic markets.” Under Title I, BIAS-only providers cannot seek assistance from the Commission if State or local governments interfere with the deployment of BIAS-only networks—once again, leaving them worse off than their regulated competitors. For example, under a Title I regulatory regime, if State or local permitting processes effectively prohibit the deployment of BIAS networks, BIAS-only providers cannot raise the issue with the Commission. In areas where both BIAS-only and providers of commingled services operate, providers of commingled services may seek a resolution with the Commission that would resolve the issue for BIAS-only competitors as well, but BIAS-only providers would be reliant upon their competitors to bring the action to the Commission in the first place. But if a State or local legal requirement solely affects BIAS, even providers that currently offer commingled services lack the ability under section 253 to challenge it given that section 253 only applies to those State and local legal requirements that affect the provision of “telecommunications service.”
BIAS-only providers by claiming that “ISPs may gain the status of telecommunications providers, and thus become eligible for section 224 pole attachment rights.” Specifically, the Commission suggested that BIAS-only providers could either alter their business plans to offer other services that would then qualify them as telecommunications carriers or enter into partnerships with existing telecommunications carriers to attain section 224 rights. While it may be true that BIAS-only providers could alter their business plans or partner with other regulated entities to ensure they receive equitable pole access, our regulations should not be designed to stifle innovative offerings distinct from those currently offered in the marketplace. Furthermore, each year more and more Americans are opting to forgo these additional non-BIAS telecommunications services and instead are choosing to have only a fixed BIAS connection in their homes along with a mobile connection. INCOMPAS notes that because customers are opting to use over-the-top video or VoIP services, many of its fixed BIAS members were losing money on video and voice services and “have ceased offering voice and/or video options to their residential customers given that those customers can choose third-party over-the-top video or VoIP options for these services.” Thus, requiring BIAS-only providers to pursue declining lines of business just to receive the same legal protections as their competitors makes little sense. And in following the RIF Remand Order’s suggestion that BIAS-only providers could enter into partnerships with telecommunications carriers to gain pole access, BIAS-only providers would just swap one barrier to entry (negotiating directly with pole owners for access) for another (negotiating with a telecommunications carrier). As a result, the supposed solution the RIF Order offered up is in fact no solution at all and instead leaves BIAS-only providers with a different “competitive bottleneck.” Moreover, the RIF Remand Order failed to cite to even one instance of such a partnership or provide any evidence that such a partnership would even be economically or practically feasible, only mentioning the possibility that BIAS-only providers might be able to pursue one. Even assuming the possibility of such a partnership, unlike with section 224, which ensures pole owners provide access at just and reasonable rates, there are no legal safeguards to ensure that potential partners agree to reasonable terms with BIAS-only providers.

54. In addition, we find that the RIF Remand Order erred in concluding that the ability of states under section 224(c) to establish their own pole attachment rules in place of the Federal rules (often referred to as reverse-preemption) minimizes the impact of the loss of section 224 rights on BIAS-only providers. First, the majority of jurisdictions have not chosen to reverse-preempt the Commission and instead have opted to continue to allow the Commission to regulate pole attachments under section 224. Second, we disagree with the conclusion in the RIF Remand Order, as well as those commenters who agree with the conclusion, that “Title I classification does not impact the 22 states and the District of Columbia that have chosen to reverse-preempt our rules.” An additional state, Florida, has subsequently reverse preempted the Commission’s jurisdiction since the issuance of the RIF Remand Order. As INCOMPAS notes, some of the jurisdictions that have reverse-preempted the Commission have simply mirrored the Commission’s rules so that any changes implemented by the Commission are also directly implemented by the state. For example, Pennsylvania has reverse-preempted the Commission but chosen to adopt the “rates, terms and conditions of access to and use of utility poles, ducts, conduits and rights-of-way to the full extent provided for in 47 U.S.C. 224 and 47 CFR chapter I, subchapter A, part 1, subpart J (relating to pole attachment complaint procedures), inclusive of future changes as those regulations may be amended.” Therefore, because the Pennsylvania code reflects the “rates, terms, and conditions of access to” poles adopted by the Commission, reclassifying BIAS as a Title II service will provide pole access to BIAS-only providers in Pennsylvania even though Pennsylvania regulates its own poles. The same is true in West Virginia, another State that has reverse-preempted the Commission, where the West Virginia Public Service Commission, at the direction of the State legislature, adopted the FCC’s pole attachment regulations in their entirety, including subsequent modifications, superseded existing pole attachment regulations that conflicted with Federal regulations, and otherwise rejected stakeholder requests to alter the Commission’s regulations. Similarly, at least two states in the District of Columbia and Ohio, have reverse-preempted the Commission but continue to point to the Commission’s regulations for reference. Three other states seemingly have only partially preempted the Commission’s rules by opting to regulate only the attachments of other public utilities or cable television providers. In those states, the Commission’s rules will continue to govern the attachments of telecommunications carriers. Thus, the Commission’s pole attachment rules will continue to play a vital role in several jurisdictions that have elected to reverse-preempt, or partially reverse-preempt, the Commission.

55. The RIF Remand Order further posits that “if a state prefers to adopt a different regulatory approach, that state has the opportunity to exercise its authority to expand the reach of government oversight of pole attachments.” But, as the CPUC, the Public Utility Commission for a State which has reverse preempted the Commission, argues, it is not entirely clear states can grant BIAS-only providers pole access pursuant to their section 224 reverse-preemption authority if the Commission itself has specifically chosen to exclude BIAS-only providers from the purview of Title II, the very source of authority from which section 224 authority emanates. Thus, under Title I classification, the right of BIAS-only providers to access poles in those states that have chosen to self-regulate is subject to uncertainty; and in the majority of jurisdictions, which are governed by the Commission’s rules, such providers have no right to pole access at all.

56. Furthermore, as the CPUC and other commenters note, the lack of clear legal authority to regulate BIAS-only providers presents public safety issues as states may not be able to enforce safety regulations on BIAS-only providers that do manage to attach to poles. The CPUC states, however, that “reclassifying BIAS as a telecommunications service would eliminate this potential argument and the commensurate delay in responding to safety violations.” We agree and find that, in addition to the economic benefits of affording section 224 rights to BIAS-only providers, reclassification will also ensure that the Commission and State utility commissions have the requisite legal authority to protect public safety concerns associated with the deployment of broadband-only infrastructure.

57. We also find to be without merit the arguments of commenters who echo the Commission’s contention in the RIF Remand Order that the loss of section 224 rights is not a serious issue because the majority of BIAS providers offer
commingled services. To be clear, we do not dispute the fact that the majority of BIAS providers offer at least one Title II-regulated service in addition to BIAS, as some commenters contend. We believe, however, that the small number of BIAS-only providers is not due just to the popularity of other regulated services, but also because BIAS-only providers, many of which are smaller competitive companies, do not enjoy the competitive advantages of larger enterprises like many of their competitors. As a result, competitive bottlenecks and obstacles to deployment, such as access to poles at just and reasonable rates, present significant challenges to BIAS-only providers that may make breaking into markets with large entrenched incumbents next to impossible. As the CPUC notes, “[a]ll forms of telecommunications, including broadband, require access to rights-of-way generally, and specifically to poles and conduits, which are controlled by incumbent local exchange carriers and other entities. Access to poles, conduits, and rights-of-way may affect cost, feasibility, and timing of constructing and offering broadband services.”

Furthermore, we believe that the RIF Remand Order completely overlooked the future competitive realities for BIAS-only providers and the resulting harms that its decision will yield. As we discussed above, consumers are becoming more reliant on BIAS and are continually foregoing the purchase of services offered alongside BIAS (i.e., cable and voice). As a result, there is no reason to doubt that more and more providers will begin offering only BIAS and without reclassification would have no rights pursuant to section 224. Therefore, we find that restoring the section 224 rights and easing the burdens of pole access is likely to ensure that the number of BIAS-only providers does not artificially shrink due to inequitable treatment under the law.

58. Furthermore, we find that equitable regulatory treatment of BIAS-only providers, particularly with regard to regulations designed to speed network deployment, will also increase competition, ultimately benefitting consumers and assisting the Commission’s goal of achieving universal service. We agree with INCOMPAS which states that “[a]dditional competition is key to tackling our nation’s internet challenges” and that the Commission must ensure that policies do not further entrench large telecommunications carriers, reducing the viability of smaller, innovative alternative providers and also reducing the service options available to consumers. USTelecom states that “[t]he NPRM cites no evidence that there are broadband-only providers that could not receive those benefits today or that the availability of the Broadband Equity, Access, and Deployment funding is leading to the creation of such providers,” but INCOMPAS specifically notes that it “expect[s] that many entities that will be competing for BEAD dollars will be BIAS-only” and states that those entities “cannot exercise any rights afforded by Title II to speed their deployment.” USTelecom further contends that “there is no record evidence that Title I classification is preventing [BIAS-only providers] from obtaining just and reasonable pole attachment rates.” Even accepting USTelecom’s statement as true, it still misses the mark. Even if BIAS-only providers are somehow able to negotiate directly with pole owners to ultimately achieve rates that are just and reasonable, BIAS-only providers must still suffer the costs of securing pole access through private negotiations, and without any leverage, with each set of pole owners, unlike their regulated peers who have guaranteed access rights under section 224. Clearly then, by failing to provide equal access to the Act’s legal protections on a nondiscriminatory basis, the Title I regime favors large incumbents at the expense of BIAS-only providers. Because we opt to restore the Title II classification of BIAS, we find it unnecessary to address commenters who suggest the Commission can provide similar rights to BIAS-only providers through other sections of the Communications Act.

59. Multiple Tenant Environments (MTEs). In the 2023 Open Internet NPRM (89 FR 76048 (Nov. 3, 2023)), we sought comment on how reclassification of BIAS might impact the Commission’s authority to regulate service providers in MTEs. Specifically, we asked how reclassification might provide the Commission additional authority to foster competition and promote consumer choice for those living and working in MTEs. We conclude now that reclassification of BIAS as a telecommunications service facilitates these goals by enabling the Commission to regulate broadband-only providers that serve MTEs and thereby to end unfair, unreasonable, and anticompetitive practices facing MTE residents. Reclassification would give the Commission authority to require BIAS-only providers to abide by the same kinds of rules—including those that prohibit exclusivity contracts that bar competition outright in MTEs—that other telecommunications and cable providers must currently follow. Such rules in turn would secure the same protections for all residents of MTEs, regardless of the kind of service offered by providers in their building; reduce regulatory asymmetry between broadband-only providers and other kinds of providers; and potentially improve competition in the MTE marketplace.

60. More than 100 million people in the United States live or work in MTEs, including a disproportionate number of lower-income residents and members of marginalized communities. The Commission’s rules, which regulate the kinds of agreements service providers may enter into with MTE owners, currently extend to telecommunications carriers as well as cable operators and multichannel video programming distributors (MVPDs). Developed pursuant to congressional direction to protect consumer choice in emerging telecommunications technologies for residents of MTEs, these rules include, for example, a prohibition on exclusivity contracts that grant the provider the sole right to access and offer service in an MTE.

61. However, these rules do not govern broadband-only providers today. Although many BIAS providers offer telecommunications, video programming, and other commingled services that subject them to the Commission’s MTE rules, a provider offering only BIAS exists outside the scope of its rules. This means that while the Commission can, for example, impose rules on an entity offering both broadband and traditional phone service in an MTE, there is uncertainty about whether and when it could regulate a provider offering only the former. Even if such a provider entered into an agreement with an MTE owner barring competitors from the building outright—a type of agreement that the Commission has long declared anathema to the public interest—the Commission’s rules would not apply and the Commission is not currently aware of other authority it could rely on to prevent such an agreement.

62. We thus find that reclassification of BIAS as a Title II service, which would provide us authority to regulate broadband-only providers, enables the Commission to address these potential regulatory gaps and ensure that all MTE tenants may benefit from the pro-consumer MTE rules the Commission has adopted and may adopt in the future as part of its current open proceeding.
We therefore agree with Public Knowledge that reclassification would have many benefits for MTE residents including, among others, greater competition and innovation in MTEs, lower costs for consumers, and improved customer service. Reclassification would also create the potential for parity between BIAS-only and other providers serving MTEs, as well as protections for BIAS-only providers unable to compete against those employing anticompetitive practices.

63. We disagree with CTIA—The Wireless Association’s (CTIA) contention, citing the Commission’s 2022 MTE Report and Order and Declaratory Ruling (87 FR 51267 (Aug. 22, 2022)), that reclassification and regulation of the “few” BIAS-only providers in MTEs would “disregard[ ] the Commission’s ‘incremental approach’ in this area,” and that the Commission offers “no significant evidence as to why the Commission should change course now.” The 2022 MTE Report and Order and Declaratory Ruling adopted new rules and targeted additional practices that reduce consumer choice in MTEs. We note that in that proceeding’s record, some commenters urged the Commission to “subject broadband-only providers to our rules governing MTE access, citing... potential harms that could result from regulatory asymmetry if [it] did not.” The Commission declined to extend its rules to broadband-only providers at the time, citing its historically incremental approach to MTE regulation but noting explicitly that it would “continue to monitor competition in MTEs to determine whether we should alter the scope of [the rules].” However, nothing in the 2022 MTE Report and Order and Declaratory Ruling belies commenters’ claims about the harms arising out of the regulatory asymmetry, which we find remain valid today. Meanwhile, commenters in opposition to reclassification fail to raise arguments that justify failing to extend the benefits of the Commission’s rules to MTE residents where a broadband-only provider offers service to a building.

64. We are also unpersuaded by CTIA’s claims that broadband-only providers are so few in number that it justifies the Commission not taking any additional action to curb anticompetitive, unfair, and unreasonable practices by broadband-only providers in MTEs. Even assuming that CTIA is correct, or that the majority of service providers offer commingled services, it is unclear whether this will remain true in the future. And while some commenters claim that the Commission failed to identify widespread abuses by BIAS-only providers in the 2023 Open Internet NPRM, others, such as AARP, highlight that such abuses may indeed be ongoing, pointing to an alleged instance of a broadband-only provider exploiting its status to enter into an exclusivity contract. We therefore find that these abuses are not merely speculative or theoretical, and provide additional support for the Commission’s decision to reclassify BIAS as a Title II service.

65. Some commenters contend that the Commission need not reclassify BIAS to protect tenants and can instead rely on its ancillary or other existing authority to address broadband-only providers. Such authority, however, does not provide the same firm legal footing as Title II and thus is less likely to offer enduring protections for residents of MTEs. WISPA, in its comments, expresses concern that reclassification of BIAS would result in rule protections for over-the-air reception devices (OTARDs) no longer being available to fixed wireless broadband-only providers and contends that this will discourage deployment of broadband in multi-tenant environments, neighborhoods lacking access to nearby towers, and similar environments. We acknowledge WISPA’s concerns, and we will examine whether to revise § 1.4000(a)(5) in another proceeding. While classification of BIAS may affect the scope of services that are covered under the Commission’s rules regarding over-the-air reception devices, classification of BIAS as telecommunications service may also qualify fixed wireless broadband services for the protections available under sections 332(c)(7) and 253. Although sections 253 and 332(c)(7) do not apply to restrictions by private landlords they do provide for Federal preemption of State and local zoning restrictions that “prohibit or have the effect of prohibiting” “the ability of any entity to provide any interstate or intrastate telecommunications service” and “the provision of personal wireless services.”

66. Finally, we disagree with WISPA that any purported benefits of applying our MTE rules would be outweighed by a slowdown in broadband investment in MTEs precipitated by the need for BIAS-only providers to “assess the impact [reclassification more broadly would have] on their business plans.” We find that to the extent our reclassification of BIAS as a Title II service would cause a BIAS-only provider to re-think an exclusive contract to serve an MTE or an otherwise anticompetitive arrangement in an MTE, that would be an additional benefit to consumers, not a drawback. Moreover, our ability to regulate BIAS-only providers in MTEs is but one reason moving us to reclassify BIAS as a Title II service. Thus, the benefits outlined elsewhere in addition to those detailed here must be considered in the aggregate.

67. Universal Service. Reclassifying BIAS as a telecommunications service will also promote the universal service goals of section 254 by enabling more efficient deployment of broadband networks and greater access to affordable broadband services. In the 2023 Open Internet NPRM, we asked how reclassification might better enable the Commission to steward our universal service programs in a way that is responsive to the communications needs of the modern economy. We specifically sought comment on how reclassification might strengthen the Commission’s statutory authority to provide BIAS through the USF, eventually allow broadband-only providers to participate in the Lifeline program, and protect public investment in BIAS access and affordability. Reclassification enhances the Commission’s ability and flexibility to address affordability and availability issues across the country, both immediately and in the future. So as to not unnecessarily disrupt the current marketplace without ample consideration, the Commission does not designate BIAS as a supported service or extend eligible telecommunications carriers (ETC) eligibility to BIAS-only providers at this time. Such action would best be considered in a future proceeding.

68. Universal Service is the principle that all Americans should have access to telecommunications services and advanced communications services at just, reasonable, and affordable rates in all regions of the Nation. The Commission administers four programs in furtherance of these principles using contributions from telecommunications carriers to the USF: the High-Cost program, which helps eligible carriers recover some of the cost of providing access to modern communications networks to consumers in rural, insular, and high-cost areas; the Lifeline program, which provides discounted voice service and BIAS through eligible carriers to qualifying low-income subscribers; the E-Rate program, which provides discounts to eligible schools, school districts, and libraries to purchase affordable BIAS; and the Rural Health Care program, which provides funding to eligible health care providers to purchase telecommunications and
broadband services necessary for the provision of health care. All four USF programs fund BIAS or infrastructure and are able to rely on statutory authority to do so regardless of BIAS’s classification. Classifying BIAS as a telecommunications service, however, will put the Commission on the firmest legal ground to promote the universal service goals of section 254 by enabling the Commission and states to designate BIAS-only providers as ETCs.

69. The Commission has concluded that section 254(e) of the Act allows for the use of universal service funds to benefit both the facilities used to provide supported telecommunications services and the supported telecommunications services themselves, which permits the Commission to provide High Cost and Lifeline program support for non-telecommunications services offered over networks that also provide telecommunications services. The Commission currently conditions receipt of support on the provision of broadband service in funded networks in 11 of the 15 High Cost program funds, and also supports broadband through the Lifeline program.

70. The Commission has distinct authority to provide support for BIAS and connections through the E-Rate and Rural Health Care programs. Section 254(c)(3) specifies that “the Commission may designate additional services for such support mechanisms for schools, libraries, and health care providers for the purposes of subsection (h).” Subsection (h) reads, in part: “[t]he Commission shall establish competitively neutral rules—to enhance, to the extent technically feasible and economically reasonable, access to advanced telecommunications and information services for all public and nonprofit elementary and secondary school classrooms, health care providers, and libraries.”

71. However, section 214(e) limits providers receiving USF support to common carriers providing telecommunications services and designated as ETCs after undergoing Commission or State commission approval processes. Currently, only carriers that offer qualifying voice telephony services can be designated as ETCs and receive support from the two USF programs that provide funds directly to carriers, the High Cost and Lifeline programs. Reclassification will allow BIAS-only providers to act as common carriers providing telecommunications service and enable them to be designated as ETCs. Indeed, after the 2015 Open Internet Order (80 FR 19738 (Apr. 13, 2015)), the Wireline Competition Bureau designated ten such providers as “Lifeline Broadband Providers” (LBPs), and some of those providers began providing service that was subsidized by Lifeline support. But in 2017, the Bureau rescinded those designations, and since the RIF Order and the RIF Remand Order, standalone broadband providers have remained unable to receive critical Lifeline universal service support.

72. Allowing BIAS-only providers to participate in the High Cost and Lifeline programs would enhance both programs. Both programs are already oriented overwhelmingly toward BIAS over other service types. As discussed above, providers in most High Cost program funds are required to build BIAS-capable networks. Moreover, as of September 2023 approximately 96% of Lifeline customers subscribe to a plan that includes broadband service. Several commenters echo many of the anticipated benefits of allowing carriers that do not provide voice services to participate in the High Cost and Lifeline programs discussed in the 2023 Open Internet NPRM, including increased competition, program participation, consumer choice, rural coverage, and affordability. The Commission also has recognized that “encouraging[ing] market entry and increased competition among Lifeline providers, which will result in better services for eligible consumers to choose from and more efficient usage of universal service funds.” One commenter stresses that allowing BIAS-only providers to become ETCs will particularly benefit consumers in areas where there are currently few or no ETCs that provide BIAS. The need to allow BIAS-only providers to become ETCs is more important and will provide certainty that the standards when BIAS was last classified under Title II, as the 2015 classification allowed Lifeline subscribers to apply the benefit to a “new generation of ISPs that [did] not use their facilities to offer voice services,” and now there are even more ways to provide BIAS via innovative, affordable, and user-friendly technologies.

73. Thus, we adopt the 2023 Open Internet NPRM’s tentative conclusion “that classifying BIAS as a telecommunications service will strengthen our policy initiatives to support the availability and affordability of BIAS through USF programs.” The majority of commenters support this conclusion. Commenters state that, through the USF, the Federal government has made significant investments in networks to ensure BIAS is available to all consumers and in service subsidies to ensure BIAS is affordable for all consumers, and reclassification “will enable the Commission to protect these investments on an ongoing basis by ensuring that these connections benefit users.” Commenters further stated that “[t]he Commission needs clean authority over broadband-only services to implement and maintain an effective and efficient Lifeline policy.”

74. A minority of commenters disagree with the 2023 Open Internet NPRM’s tentative conclusion that we adopt in the Order. Several commenters argue that USF considerations are relatively unimportant because direct appropriations programs such as the Commission’s Affordable Connectivity Program (ACP) and NTIA’s Broadband Equity, Access, and Deployment (BEAD) Program are viable alternatives to achieving USF goals. Some commenters further argue that reclassification will deter private sector participation in the BEAD program. We find these claims to be speculative and give them no weight. Given that there is no definitive evidence that reclassification adversely affects privately funded BIAS investment, if it has any effect at all, see infra section III.H, we find the claim that reclassification would adversely affect BIAS investment that is substantially publicly funded to be not credible. Furthermore, we find as a general matter that new obligations on BIAS providers are unlikely to be more onerous under Title II than is the case currently, and therefore find it unlikely that BIAS providers’ decisions to participate in publicly funded programs would be meaningfully impacted as a result of reclassification. At least one commenter stressed the importance of funding the ACP or making the ACP part of the USF. Another commenter stressed both the need to renew ACP funding and the risks of making ACP part of the
USF. These issues are the remit of Congress and the Commission is unable to accomplish either through this or any proceeding. We therefore decline to address them here. We do not believe that the strength of other programs dependent on different funding sources should prevent the Commission from strengthening the USF. Closing the digital divide is a large undertaking that benefits from multiple programs, and we note that some of these alternative programs are winding down given their lack of funding. Moreover, the Commission is statutorily required to preserve and advance the USF. One commenter contends that the benefits of reclassification to the Commission’s universal service goals may not be realized because BIAS-only providers will be unwilling to assume increased oversight by State or Federal regulators to obtain ETC designation. This claim is not only speculative, it ignores the new opportunities that Title II offers to these providers to expand their networks and subscriber base through potential eligibility to participate in the High Cost and Lifeline programs. Moreover, as discussed above, the record shows significant consumer interest in allowing BIAS-only providers to become ETCs. We also make clear that reclassification only provides an opportunity to BIAS-only providers to become ETCs; it does not mandate it. Neglecting it because of the existence of other programs defies this mandate. One commenter argues that the Commission should focus on “ensuring that funding issued through the Universal Service Funds or the Affordable Connectivity Program are not wasted or subject to fraud or abuse” instead of reclassification. The Commission currently has strong program integrity protections for the USF programs and continues to update them as needed.

USF program integrity, however, is only tangentially related to BIAS reclassification and does not have a significant impact on our actions taken in the Order. We also decline to address commenters arguing for reforms to the portions of the USF that states regulate because they are similarly unrelated to the proceeding.

75. We reject some commenters’ assertions that as to universal service, reclassification is a solution in search of a problem because USF programs are functioning properly, the Commission currently has a strong legal basis to support BIAS through USF programs, and reclassification would not further, and would potentially hinder, affordability and availability goals. While we agree that the USF programs are currently well positioned to further BIAS availability and affordability, we disagree that reclassification cannot better position the statutory basis for the Commission’s universal service efforts. As noted above, with reclassification, we remove any doubt about the ability of the Commission to support BIAS-only providers with our universal service programs. While the Commission is not taking steps in the Order to allow BIAS-only providers to receive High Cost or Lifeline program support, the ever-changing nature of communications offerings may necessitate such future action to ensure that limited Commission resources are going towards services consumers need. Our action in the Order bolsters our existing legal framework and gives the Commission flexibility to establish BIAS as a supported telecommunications service.

76. We also adopt the 2023 Open Internet NPRM’s tentative conclusion that classifying BIAS as a telecommunications service would protect public investments in BIAS access and affordability. Establishing firmer legal authority to fund BIAS through the High Cost and Lifeline programs ensures that public funds can continue to flow into network buildouts and discounted service. Commenters agree that reducing barriers to USF participation, including by potentially allowing BIAS-only carriers to participate in the High Cost and Lifeline programs in the future, will protect public investment by increasing the number of entities eligible to receive it, including small providers previously ineligible to become ETCs and providers in rural areas where there had been no or few ETCs prior. We are unpersuaded by one commenter’s argument that “the NPRM’s tentative conclusion that reclassification ‘protects public investments in [broadband] access and affordability’ ignores the fact that, in the bipartisan [Infrastructure Investment and Jobs Act of 2021 (IIJA)], Congress appropriated tens of billions of dollars for broadband deployment, adoption, and affordability without subjecting broadband to any Title II requirements.” Congress’s choice to support discrete public investment through special appropriations does not affect whether reclassification furthers the Commission’s ability to protect ongoing public investment distinct from or in concert with appropriations.

77. While we agree with the potential for expanded access to our universal service programs, we do not, however, designate BIAS as a supported service at this time. Section 254(c)(1)’s requirement that the Commission “shall establish periodically” which telecommunications services meet the USF supported service standard does not require the Commission to designate universal services at any specific interval or time, much less the moment a service is classified as a telecommunications service. The record created in this proceeding is insufficient to properly and effectively address all of the concerns raised by designating BIAS a supported service. Rather than adjust our USF rules on a piecemeal basis, retaining existing supported universal services and, by extension, ETC eligibility standards, provides us the flexibility for holistically examining reclassification’s effects on the USF at a later time. For this reason, we decline at this time to revise our definition of supported services.

8. Improving Access for People With Disabilities

78. We find that reclassification of BIAS under Title II will enhance the Commission’s authority to ensure that people with disabilities can communicate using BIAS. Specifically, we agree with commenters that reclassification will enable the Commission to utilize its authority under sections 225, 255, 251(a)(2), and the newly adopted open internet rules to ensure that BIAS is accessible for people with disabilities.

79. People with disabilities who have access to BIAS rely on internet-based forms of communications for more effective and efficient direct and relayed communications. Reclassification of BIAS under Title II and prohibiting BIAS providers from blocking or throttling information transmitted over their BIAS networks, engaging in paid or affiliated prioritization arrangements, and engaging in practices that cause unreasonable interference or disadvantage to consumers will allow the Commission to better safeguard access to internet-based telecommunications relay services (TRS). Reclassification will also allow the Commission to ensure that BIAS and equipment used for BIAS are accessible to and usable by people with disabilities and precludes the installation of “network features, functions, or capabilities that do not comply with the guidelines and standards established pursuant to section 255 . . . .” These provisions work in concert with sections 716 and 718 of the Act, giving the Commission authority to increase and to maintain access for people with disabilities to modern communications. Section 716 of the Act requires that advanced communications services be accessible to and usable by people with
disabilities. Advanced communications services are: “(A) interconnected VoIP service; (B) non-interconnected VoIP service; (C) electronic messaging service; (D) interoperable video conferencing service; and (E) any audio or video communications service used by inmates for the purpose of communicating with individuals outside the correctional institution where the inmate is held, regardless of technology used.” Section 718 of the Act requires that internet browsers installed on mobile phones be accessible to people who are blind or visually impaired to ensure the accessibility of mobile services.

80. For example, persons who are deaf, hard of hearing, or have speech disabilities use BIAS to connect to internet-based video applications to communicate directly with other persons who use sign language (point-to-point) and other individuals who do not use the same form of communication. These applications include Video Relay Service (VRS), which involves multi-party synchronous high-definition video and audio streaming requiring users to have a high-speed broadband connection with sufficient data and bandwidth. Under section 225, the Commission may make a telecommunications relay service like VRS available to people with disabilities, but to use VRS, those individuals must still subscribe to BIAS or mobile BIAS. Section 225 enables us to ensure that individuals with hearing and speech disabilities can use BIAS-based services to communicate in a “manner that is functionally equivalent” to the ability of a person who does not have a hearing or speech disability. As the Commission recognized in the 2015 Open Internet Order, BIAS providers may impede the ability of the Commission to ensure BIAS-based forms of TRS are functionally equivalent if they adopt network management practices that have the effect of degrading the connections carrying video communications of persons with hearing and speech disabilities. For instance, bandwidth limits, data caps, or requirements to pay additional fees to obtain sufficient capacity can have a disproportionate negative impact on those people with disabilities who use VRS. These video-based services are used by people whose first language is sign language and are the only means of direct communications or a communications service that is functionally equivalent to voice communications services used by persons without hearing or speech disabilities.

81. We reject the argument by some commenters that reclassification of BIAS under Title II will not enhance the Commission’s authority to ensure the accessibility of BIAS or will not improve accessibility of BIAS for people with disabilities, given the existence of the Twenty-First Century Communications and Video Accessibility Act (CVAA). For example, USTelecom and CTIA argue that reclassification is “not necessary” or would have “no impact on accessibility” because Congress has already given the Commission the requisite authority to ensure the accessibility of BIAS in sections 716 and 718, which do not rely on the classification of BIAS. Reclassification will apply statutory provisions to BIAS that will enhance our ability to improve the accessibility of BIAS and internet-based communication services for people with disabilities. Specifically, as discussed below, we do not forebear from the application of sections 225, 251(a), and 255 or their implementing regulations. We disagree with USTelecom that these benefits are negligible. While the CVAA permits the Commission to adopt certain regulations concerning “advanced communications services,” BIAS itself is not an advanced communications service, as specifically defined in the CVAA. For example, the CVAA directs the Commission to enact regulations to prescribe, among other things, that networks used to provide advanced communications services “may not impair or impede the accessibility of information content when accessibility has been incorporated into that content for transmission through . . . networks used to provide [advanced communications services].” Under section 716, 47 U.S.C. 617, a manufacturer of equipment used for advanced communications services must ensure that such equipment is accessible to and usable by individuals with disabilities, if achievable; and similarly providers of advanced communications services must ensure that those services are accessible to and usable by individuals with disabilities, if achievable. Accordingly, reclassifying BIAS allows us to regulate that service under Title II in ways that complements our authority over advanced communications services under the CVAA. For example, under Title II, providers of BIAS and manufacturers of BIAS equipment must ensure that such equipment and services are accessible to and usable by individuals with disabilities, if readily achievable. In addition, section 251(a)(2) prohibits providers of telecommunications services from installing network features, functions, or capabilities that impede accessibility.

82. We conclude that BIAS is best classified as a telecommunications service based on the ordinary meaning of the statutory definitions for “telecommunications service” and “information service” established in the 1996 Act. This conclusion reflects the best reading of the statutory terms applying basic principles of textual analysis to the text, structure, and context of the Act in light of (1) how consumers understand BIAS and (2) the factual particulars of how the technology that enables the delivery of BIAS functions. We recognize that when interpreting a statute, our “analysis begins with the text” and “we look to both the language itself [and] the specific context in which that language is used.” As explained below, the Commission also has well-established and longstanding authority and responsibility, provided by Congress, to classify services subject to the Commission’s jurisdiction, as necessary, using the Act’s definitional criteria, including the statutory provisions enacted as part of the 1996 Act. And though not necessary to our conclusion that treating BIAS as a telecommunications service is the best reading of the Act based on the statutory text, structure, and context, our decision here is further supported by the principles set forth by the Supreme Court in *Chevron*, U.S.A., Inc. v. Natural Resources Defense Council, Inc. (*Chevron*). Our analysis is also appropriately afforded deference under *Skidmore* v. *Swift & Co.* Commenters in the record take various positions about possible judicial deference regimes that might (or might not) apply to our classification decision. We need not linger over those disputes given that we find our classification of BIAS reflects the best reading of the Act irrespective of such considerations. We also conclude that BIAS is not best classified as an information service.

83. Our application of the statutory definitions to BIAS is driven by how typical users understand the BIAS offering. For an offering to meet the “telecommunications service” definition, the telecommunications component of the offering, from the perspective of the end user, must have
a sufficiently separate identity from the other components to constitute a separate offering of service. As the Supreme Court explained in *Brand X*, “[it] is common usage to describe what a company ‘offers’ to a consumer as what the consumer perceives to be the integrated finished product, even to the exclusion of discrete components that compose the product.” The D.C. Circuit affirmed that consumer perception is important to determining the proper classification of a service in USTA. Furthermore, the Commission has consistently analyzed consumers’ understanding of the offering in its decisions classifying broadband services. The 2015 *Open Internet Order* and *RIF Order* both analyzed their classification decisions based on consumers’ understanding of the offering. That we should understand the Act’s definitional terms based on the consumer perception of the offering is also supported by the references to the “user” in the definition of “telecommunications.” The record also provides support for relying on consumer perception to conduct our classification analysis, and in light of the record and the well-established basis for relying on consumer perception and BIAS provider marketing, we disagree with commenters who argue that this consideration is unsuitable to our classification analysis.

84. Our classification decision also is guided by an evaluation of the statutory definitions based on the factual particulars of how the technology that enables the delivery of BIAS functions. In *Brand X*, the Supreme Court noted that the question of what service is being offered depends on “the factual particulars of how internet technology works and [how the service] is provided.” Past Commission classification decisions also indicate that evaluation of the underlying technology is an important factor. Consistent with the 2015 *Open Internet Order*, we also find that the functionality of the offering is also informed by how BIAS providers market the offering, including whether the offering is focused on the transmission capabilities of the service or any information service component or capabilities that may be provided with the transmission component. We therefore disagree with commenters who argue that this consideration should not apply to our classification analysis.

1. BIAS Is an Offering of Telecommunications for a Fee Directly to the Public.

85. We conclude that BIAS is best classified as a “telecommunications service” under the Act because it is an “offering of telecommunications for a fee directly to the public.” The *RIF Order* did not dispute that BIAS provides BIAS directly to the public for a fee. In support of this conclusion, we find that BIAS provides “telecommunications,” as defined in the Act, because it provides “transmission, between or among points specified by the user, of information of the user’s choosing, without change in the form or content of the information as sent and received.”

86. As the Commission has previously observed, the critical distinction between a telecommunications service and an information service turns on what the provider is “offering.” The record in this proceeding leads us to the conclusion that BIAS is perceived by consumers and functions as a transmission conduit that does not alter the information it transmits. The record also demonstrates that consumers perceive—and BIAS providers market—BIAS as a standalone offering of such telecommunications, which is separate and distinct from the applications, content, and services to which BIAS provides access, and which are generally information services offered by third parties. While we ground our conclusion that consumers perceive—and BIAS providers market—BIAS as a telecommunications service on the record before us in this proceeding, we also find that the conclusions reached by the 2015 *Open Internet Order* about consumer perception and BIAS provider marketing were not only accurate regarding the BIAS offered at the time, but remain accurate concerning BIAS today. Additionally, no party in the record disputes that BIAS providers routinely market BIAS widely and directly to the public for a fee, and therefore that BIAS is not a private carriage service.

a. BIAS Provides Telecommunications.

87. The record evinces significant support for the general proposition that BIAS provides “telecommunications”; that is, BIAS provides “transmission, between or among points specified by the user, of information of the user’s choosing, without change in the form or content of the information as sent and received.”

88. BIAS Transmits Information of the User’s Choosing. BIAS transmits information of a user’s choosing both functionally and from a user’s perspective, providing two independent, alternative grounds for this conclusion. Functionally, as a packet-switched transmission service using Internet Protocol (IP), BIAS transmits information of a user’s choosing because a user decides what information to place in each IP packet that is transmitted when the user decides what information to send and receive. A user chooses to send or receive particular information when the user visits a particular website, uses a particular application, or operates a particular online device or service. We are therefore unpersuaded by USTelecom’s argument that BIAS does not provide telecommunications because users often receive information that is not of their choosing, such as display advertising on a web page. That the user may not know exactly what information the user will receive does not mean that the information was not “of the user’s choosing.” Just as traditional voice service provides telecommunications even though a user making a telephone call does not necessarily know who will answer or what information will be conveyed in the call, BIAS provides telecommunications even when a user does not necessarily know exactly what information will be received in response to the user’s selections. We are likewise unconvinced by NCTA’s argument that BIAS does not transmit information of the user’s choosing because, “unlike traditional, circuit-switched voice services, in which the user chooses and sends the information—i.e., his or her voice—to a particular called party, broadband involves continual interaction between computers and the transmission network, as well as among computers themselves.” To the extent BIAS is continually sending and receiving information, it is doing so because users are choosing to interact with websites, applications, or online devices or services, and they are therefore directing the sending and receiving of such information.

89. BIAS Transmits Information Between or Among Points Specified by the User. The consumer perspective and technological functionality confirm that BIAS transmits information between or among points specified by the user, providing two independent, alternative grounds for this conclusion as well. A typical consumer understands the phrase “points specified by the user” to mean the person, business, or service provider with which the user intends to share information. Therefore, when a consumer chooses to use a particular
website, application, or online device or service, the user perceives that the user is specifying the points for the transmission of the information that the user is sending or receiving. The ordinary meaning of the terms “specify” and “point,” taken together, demonstrates that users understand that when they “specify” the “point,” of their choosing, they are specifying the website, application, online device, or service with which they wish to communicate, regardless of its physical or virtual location. We conclude that when BIAS users expressly or explicitly identify to BIAS providers the particular website, application, or online device or service they wish to access, they would understand themselves to be specifying the points between or among which the relevant information will be transmitted. Even assuming arguendo that “points specified by the user” should be interpreted more narrowly, the applications users are controlling to access information may actually know the specific destination before the transmission occurs, which provides an independent alternative basis for our conclusion. This is true, contrary to some commenters’ claims, even if a user does not know the specific geographic location of that person, business, or service provider or the precise physical or virtual location or address where the requested content is stored. Functionally, a user is also specifying the IP address of their desired point even when the user enters a fully qualified domain name, such as www.example.com, because the domain is resolved by the DNS to the appropriate IP address. Additionally, the fact that users may specify a point associated with more than one virtual location or address (e.g., due to load balancing) “does not transform that service to something other than telecommunications.” Indeed, the Commission has “never understood the definition of ‘telecommunications’ to require that users specify—or even know—information about the routing or handling of their transmissions along the path to the end point, nor do we do so now.” This understanding of the “points specified by the user” phrase is consistent with the 2015 Open Internet Order, which noted that users “would be quite upset if their internet communications did not make it to their intended recipients or the website addresses they entered into their browser would take them to unexpected web pages.” Thus, “there is no question that users specify the end points of their internet communications.”

90. That users specify the points for the transmission of their information when using BIAS is consistent with the functionality of other forms of telecommunications. For example, in the context of mobile voice service, when a user dials a number, the call is routed to a cell tower near the called party—likely the one that would provide the best user experience—just as how a BIAS user’s query to a video streaming service is often directed toward the server nearest to the user. In neither case does the user know the precise geographic location of the “point” specified. With toll-free 800 service, a call dialed to a single telephone number may route to multiple locations that are unknown to the user. Similarly, with call bridging services, when a user dials a telephone number, the call is routed often to multiple points, all with geographic locations that are unknown to the user.

Additionally, when the Commission first had the opportunity to classify a broadband service—namely, digital subscriber line (xDSL)-based advanced service—in the Advanced Services Order (63 FR 45140 (Aug. 24, 1998)), it concluded that the end user chooses the destination of the IP packets sent beyond the central office where the tariffed service of Bell Operating Companies (BOCs) ended, relying on the function of such voice services. The Commission did not understand any of these services to fall outside the meaning of telecommunications simply because the user did not know the precise location of the points.

91. The statutory context reinforces this understanding. The 1996 Act, which enacted the “telecommunications” definition, also included section 706, which directs the Commission to “encourage the deployment . . . of advanced telecommunications capability,” and to conduct marketplace reviews in that regard. Section 706 defines the specific sorts of “telecommunications capability” at issue as “enabling[] users to originate and receive high-quality voice, data, graphics, and video telecommunications using any technology”—but does not separately define “telecommunications capability” or “telecommunications.” Consequently, pursuant to section 3(b) of the 1996 Act, the definition from section 3 of the Communications Act—i.e., the “telecommunications” definition we are applying here—applies to the use of “telecommunication services” in section 706 of the 1996 Act. It is improbable that users could be expected to have more knowledge of the specific geographic or virtual locations between or among which “high-quality voice, data, graphics, and video” are transmitted than they do in the case of BIAS transmissions. Similarly, that Congress considered the information a user receives in the form of “high-quality voice, data, graphics, and video” to fall within “advanced telecommunications capability” accords with the understanding that users likewise have chosen the information they receive when accessing the internet using BIAS, even if they have not anticipated and specified its minutest details.

92. BIAS Transmits Information Without Change in the Form or Content as Sent and Received. BIAS transmits information “without a change in its form or content as sent and received” from a user perspective. The record demonstrates that users expect that their information will be sent and received without change and does not show that these user expectations are not being met. There is even record evidence that consumers have rejected past attempts by BIAS providers to change the form or content of their information. When a user “chooses” to stream a music video, for example, the user expects to hear the song and see the choreography without it being changed by their BIAS provider. The record does not show that the user perceives any processing or intelligence that is employed to deliver the video, let alone understands that processing or intelligence to cause a change in the form or content of that information.

93. BIAS also does not change the form or content of the information it transmits from a technical perspective. As we explain above, BIAS transmits the information of users’ choosing because users decide what information should be placed in the packets that are transmitted. There is no change in the form or content of that information because the packet payload is not altered in transit. Although BIAS may use a variety of protocols to deliver information from one point to another, the fundamental premise of the internet is to enable the transmission of information without change in the form or content across interconnected networks, and any such changes would undermine that very functionality.

94. It is therefore not the case, as some commenters at the time of the RIF Order contended and some commenters here repeat, that the processing or intelligence that is combined with the transmission component, and that may act upon a user’s information for routing purposes, changes the form or content of that information. NCTA argues, for example, that while packet content may
not change, the packet switching architecture itself—"the breaking apart, routing, and reconfiguration of these packets"—"involves a 'change in the form or content' of the information requested or sent by the user." Making a similar argument, CTIA uses streaming a video as an example, claiming that the "significant information-processing, from transforming keystrokes and clicks into machine readable languages, to dividing information into packets, to intelligently routing those packets to a server close to the user, to retrieving and processing the video data for transmission," is what makes BIAS an information service. CTIA also suggests that the form of information transmitted by BIAS is changed because the "coded information actually being transmitted looks quite different from anything the user would recognize." But the salient question under the statute is whether there is a change in form or content of the information "as sent and received." The statutory focus thus is on either end of the transmission, irrespective of any processing that occurs in between. With data communications, while the information may be fragmented into packets and unintelligible to users while in transit, "such fragmentation does not change the form or content, as the pieces are reassembled before the packet is handed over to the application at the destination," and thus the information is delivered to or from the desired endpoint as it was sent and therefore without a change in "form or content" within the meaning of the statute. The Commission has found in other contexts that protocol "processing" involved in broadband transmission causes no net change in the form or content of the information being transmitted. CTIA erroneously argues that the Non- Accounting Safeguards Order (62 FR 2991 [Jan. 21, 1997]) held that all protocol processing is an information service while ignoring the Commission’s finding that non-net protocol processing falls under the telecommunications systems management exception.

95. NCTA’s and CTIA’s arguments also fail to acknowledge that BIAS is not unique or distinguished from processing and intelligent routing used by traditional telecommunications services. Mobile voice telephone service for example, relies on similar processing to support essential functions including mobile call routing, mobile paging, and handover between cellular towers. For circuit-switched calls on these networks, when a mobile user moves from one serving base station area, to another serving base station area, the call is handed over from the current serving base station to the new serving base station with the help of the base station controller and the mobile switching center. Similarly, modern voice telephony (both fixed and mobile) can convert circuit-switched voice transmissions into IP packets, route those packets using the same processing as a BIAS provider does, and convert those packets back to a circuit-switched format to deliver the call. Similar conversions historically have been present in other packet-switched transmission services as well. Contrary to NCTA’s and CTIA’s view, none of these services are or can be understood to fall outside the meaning of telecommunications on the theory that there is a change in the form or content of the information as sent or received. CTIA tries to distinguish voice and data services, arguing that “the internet and PSTN are two fundamentally different networks” because the internet uses packet switching to route data while the PSTN uses SS7 signaling to route calls, which it says explains why they “are completely incompatible with each other and cannot directly interoperate.” But CTIA does not explain why these distinct protocols and their incompatibility are independently relevant to classification determinations, and its argument merely underscores that both BIAS and voice networks involve inherent processing and signaling to ensure that information is efficiently and correctly routed. Indeed, given the prevalence of such technologies used in transmission, reaching a contrary conclusion effectively would suggest that no transmission services could ever be telecommunications, which could not have been what Congress intended. The only services that reclassification opponents argue include a net protocol conversion are certain forms of VoIP. But even assuming arguendo the merits of the commenters’ technological description, they do not demonstrate that users of VoIP consider the conversion to effectuate material changes, let alone that they should inform our understanding of how BIAS users perceive that service, as relevant to the “telecommunications” definition.

96. Our understanding of the “telecommunications” definition in this regard also is supported by the scope of services encompassed by the meaning of “advanced telecommunications capability” in section 706 of the 1996 Act. The purported changes in form or content that some commenters associate with BIAS are no less likely to be associated with the accessing of “high-quality voice, data, graphics, and video” that Congress included within the scope of “advanced telecommunications capability” under section 706. This elicits harmonization within the 1996 Act between the “telecommunications” definition and section 706, supporting our application of the “telecommunications” definition to BIAS here. Elsewhere, the Order interprets section 706 of the 1996 Act as a grant of regulatory authority. We make clear, however, that our consideration of section 706 in our analysis here does not depend on whether section 706 is understood as a grant of regulatory authority. Separately, we recognize that the RIF Order concluded that BIAS is made available “via telecommunications” by reference to an amorphous set of inputs that BIAS providers use when offering service. But even accepting that, it raises more questions than answers as far as section 706 is concerned. For instance, it fails to address whether a BIAS provider’s own use of telecommunications as an input into BIAS would be enough to bring it within the scope of section 706, and if so, whether the entirety of the service would fall within the scope or just those aspects—ill-defined by the RIF Order—that rely on telecommunications inputs. The RIF Order also fails to explain how those amorphous details about the underlying inputs used in BIAS could be a meaningful factor in understanding the “telecommunications” definition from a user perspective. Even if those questions had answers, we find our approach best harmonizes the “telecommunications” definition and the meaning of “advanced telecommunications capability” in section 706.

97. The user perspective and functionality of BIAS is also consistent with the ordinary meaning of the words “form” and “content,” as they were understood at the time of the 1996 Act’s adoption. The word “form” was understood as a “shape; an arrangement of parts,” “the outward aspect (esp. apart from colour) or shape of a body,” or “the mode in which a thing exists or manifests itself [took the form of a book]”; “the shape or appearance of something” or “the particular mode in which a thing or person appears; wood in the form of paper”; and “the shape and structure of something as distinguished from its material.” In support of its view, CTIA cites a recent Second Circuit case purporting to define “form” as “pattern or schema,” which we do not find to differ fundamentally from the definitions we provide from the time of the 1996 Act’s passage. Thus, in the context of BIAS, the
question is whether the shape or appearance of the information being transmitted is changed. This might occur, for example, if BIAS manipulated the appearance of a website that a user is accessing or the presentation of the information that appears in an application—but it does not. When a user visits a website or uses an application, the information is presented in exactly the form intended by the content provider, and not a form determined by the BIAS provider.

USTelecom also argues that content filtering and video optimization means that information transmission virtually never occurs “without change in the form or content.” Insofar as this involves “content filtering,” the filtered-out information is not information we consider the user to have chosen to receive in the first place. Similarly in the case of measures that guard against the distribution of malware, whether or not consumers must affirmatively opt-in to such services, the record provides no reason to believe that malware is information that BIAS users have chosen to receive. Additionally, USTelecom cites video optimization—e.g., to “reduce the demand of high-resolution video on mobile devices with small screens, mobile operators optimize the content so as to consume less bandwidth.” But such functionality likely falls within the telecommunications systems management exception to the information service definition, and in any event, USTelecom does not suggest that video optimization causes the desired video not to play, changes the content of the video as originally sent, or causes the content not to present to the user as a video. The relevant statutory question is whether a BIAS user would see video optimization as sufficient to constitute a change in the form or content of the information chosen by the user, and the record here does not make that case. As such, BIAS transmits the form of the information to and from an end user as it is sent. The same holds true for the “content” of the information, a term which was understood at the time of the 1996 Act’s adoption as “the substance or material dealt with (in a speech, work of art, etc.) as distinct from its form or style”; “the meaning or substance of a piece of writing, often as distinguished from its style or form”; “substance, gist” or “meaning, significance.” BIAS providers do not change the substance of a news article on a website, a social media post, or melody of a streaming song, or the images that appear in a photograph or video, and thus BIAS providers do not change the content under the ordinary meaning of that term. ACA Connects argues that BIAS includes certain capabilities, namely retrieval and storage, that can fit within the information service definition even though they do not require net protocol conversion. But ACA Connects does not explain if the capabilities to which it is referring are actually offered by BIAS providers (as opposed to edge providers) or are different from those we already address in the Order. ACA Connects also does not appear to grapple with whether such capabilities—if indeed there are any we have not already addressed—would fall under the telecommunications systems management exception or are otherwise separable. In any event, that some information-processing capabilities do not necessarily change the form or content of information only further demonstrates that when information-processing capabilities facilitate the use of BIAS, they do not inherently cause BIAS to change the form or content of the information it transmits.

b. BIAS Is a Telecommunications Service

98. BIAS is a “telecommunications service” because consumers perceive it—and BIAS providers market it—as a standalone “offering” of telecommunications that is separate and distinct from the applications, content, and services to which BIAS provides access, and which are generally information services offered by third parties. BIAS providers also market BIAS directly to the public for a fee, and it therefore is not a private carriage service.

99. Consumers Perceive BIAS as a Standalone Offering of Telecommunications. As evidenced in the record, there is wide agreement, among both supporters and even some opponents of reclassification, that consumers today perceive BIAS to be a telecommunications service that is primarily a transmission conduit used as a means to send and receive information to and from third-party services. The D.C. Circuit recognized this in 2016, when it stated that “[e]ven the most limited examination of contemporary broadband usage reveals that consumers rely on the service primarily to access third-party content.” Since that time, this consumer perception of BIAS as a gateway to third-party services has only become more pronounced. The dramatic increase in consumers’ reliance on BIAS to participate in or observe aspects of daily life during the COVID–19 pandemic set in stark relief the central—and critical—importance of using BIAS to access third-party services. And, as Home Telephone notes, while a consumer “may decide to use edge services provided by the ISP . . . the consumer certainly is not expecting the ISP to dictate the edge services available to them when subscribing to BIAS.” It is thus clearer now, more than ever before, that consumers view BIAS as a neutral conduit (or, in the words of one commenter, a “dumb pipe”) through which they may transmit information of their choosing, between or among points they specify, “without change in the form or content of the information as sent and received,” and “not as an end in itself.” It is also clear from the record that the third-party services themselves rely on the neutral-conduit property of BIAS to reach their customers. Netflix emphasizes that “[their] members . . . depend on an open internet that ensures that they can access our content and the content of many other companies through their ISP’s networks without interruption.”

100. BIAS Providers Market BIAS as a Standalone Offering of Telecommunications. We also find that BIAS providers market BIAS as a telecommunications service that is essential for accessing third-party services, and this marketing has become more pronounced during and since the COVID–19 pandemic. In the 2015 Open Internet Order, the Commission concluded that BIAS providers market their BIAS “primarily as a conduit for the transmission of data across the internet,” with fixed providers distinguishing service offerings on the basis of transmission speeds, while mobile providers advertise speed, reliability, and coverage of their networks. Although the RIF Order contended that “ISPs generally market and provide information processing capabilities and transmission capabilities together as a single service,” it did not provide examples. BIAS providers’ marketing today appears even more focused than in 2015 on the capability of BIAS to transmit information of users’ choosing between internet endpoints, rather than any capability to generate, acquire, store, transform, process, retrieve, utilize, or make available that information. Such marketing emphasizes faster speeds aimed at connecting multiple devices, unlimited data for mobile service, and reliable and secure coverage.

INCOMPAS notes that “some mobile BIAS providers offering 5G services are now marketing their network capacity to serve the fixed BIAS marketplace.”

Public Knowledge notes that “[a] brief
survey of television and online advertising for both mobile and fixed broadband shows that ISPs compete with each other on the basis of speed, price, ease of use, reliability and availability.” In those cases where BIAS providers mention edge provider services, they often advertise them as separate offerings that can be bundled with or added on to their broadband internet access services, such as discounted subscriptions to unaffiliated video and music streaming services or access to mobile security apps.

101. BIAS Providers Market BIAS Directly to the Public for a Fee. The concept of the “offering” within the telecommunications service definition is based on the principles of common carriage. If the offering meets the statutory definition of “telecommunications service,” then the Act makes clear that a provider “shall be treated as a common carrier” under the Act “to the extent that it is engaged in providing” such a service. The Commission also has interpreted the language of the “telecommunications service” definition in such a way that meeting that definition also necessarily means the service meets the definition of a common carrier service. We note that a service can be a telecommunications service even where the service is not held out to all end users equally.

102. The record does not dispute that BIAS providers market BIAS directly to the public for a fee. This factual reality aligns with our definition of BIAS as a mass-market retail service as such services are necessarily offered to the public for a fee. Because BIAS providers do in fact offer BIAS as a mass-market retail service, we conclude, as the Commission did previously, that BIAS is not a private carriage offering. Because the RIF Order concluded that BIAS was an information service, it did not need to reach the question of whether any aspect of the BIAS transmission offering was common or private carriage. We note that no party argues that BIAS is offered on a private carriage basis. While ADTRAN argues that the Commission permits “a carrier to choose how to structure its offerings and decide whether to operate as a common carrier or a private carrier,” it does not argue that any particular BIAS offering is structured as a private carriage service.

103. Additionally, since we conclude below that BIAS includes the exchange of traffic by an edge provider or an intermediary with the BIAS provider’s network (i.e., traffic exchange or interconnection), we again conclude that the implied promise to make arrangements for such exchange does not make the traffic exchange itself a separate offering from BIAS—private carriage, or otherwise. Even if a traffic exchange arrangement involves some individualized negotiation, that does not change the underlying fact that a BIAS provider holds the end-to-end service out directly to the public. We again conclude that some types of individualized negotiations are analogous to other telecommunications carriers whose customer service representatives may offer variable terms and conditions to customers in circumstances where the customer threatens to switch service providers. Therefore the end-to-end service remains a telecommunications service.

2. BIAS Is Not an Information Service

104. We find that BIAS, as offered today, is not an information service under the best reading of the Act because it is not itself “the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information via telecommunications.” Rather, BIAS functions as a conduit that provides end users the ability to access and use information services that provide those capabilities. DNS, caching, and other information-processing capabilities, when used with BIAS, either fall within the telecommunications systems management exception to the definition of “information service,” or are separable information services not inextricably intertwined with BIAS, or both, and therefore do not convert BIAS into an information service. Additionally, BIAS is not perceived by consumers or marketed by BIAS providers as an information service.

a. BIAS Does Not Offer the Capability To Process Information in the Ways Provided in the Act

105. Information services are applications whose information payload is transmitted via telecommunications. These applications provide end users with the capability to process the information they send or receive via telecommunications in the ways Congress specified in the information service definition, including the capability to: “generate” and “make available” information to others through email and blogs; “acquire” and “retrieve” information from sources such as websites, online streaming services, and file sharing tools; “store” information in the cloud; “transform” and “publish” information by using image and document manipulation tools, online gaming, cloud computing, and machine learning capabilities; “utilize” information by interacting with stored data; and publish information on social media sites. We use the term “process” to reference all the terms described in the information service definition: generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available. In all these respects, information services are the platforms that edge providers offer today. Furthermore, all these information services are completely distinct from the conduit—i.e., the telecommunications—via which the payload for these services is sent and received. Although BIAS providers may separately offer some of these services to their subscribers, the information services most often accessed by users are provided by third parties. Below we discuss how certain such services can be used for the management, control, and operation of a telecommunications system or management of a telecommunications service, and how in those instances, those services fall into the telecommunications systems management exception to the information service definition.

106. ACA Connects argues that since “information services by definition are offered ‘via telecommunications,’ . . . just because a service has a material transmission component does not necessarily mean it is a telecommunications service.” We acknowledge in our discussion of precedent that information services are offered “via telecommunications” and that the existence of a material transmission component does not necessarily render a service a telecommunications service, but the classification of a service depends on the how consumers understand it and the factual particulars of how the technology functions. As we explain at length, BIAS is best classified as a telecommunications service because consumers perceive it as such and because the transmission component has a distinct identity from any information-processing capabilities. By contrast, ACA Connects diminishes, if not ignores, the core nature of the transmission component to BIAS. Moreover, ACA Connects’ entire claim that BIAS is an information service offering “via telecommunications” rests entirely on its assertion that BIAS is an offering of DNS, caching, and third-party information service offerings. But the service BIAS providers offer that we are classifying is BIAS, and as we explain herein, BIAS is not those other services.
107. The RIF Order and its proponents who commented in this proceeding engage in analytical gymnastics in an attempt to fit BIAS into the definition of “information service.” We are unconvinced. They first claim that BIAS itself offers subscribers the ability to process information in the ways prescribed by Congress’s information service definition. This claim simply reheashes old arguments about the integration of DNS, caching, or other information-processing capabilities into BIAS offerings, which we address below. For its own part, the RIF Order arbitrarily found that the term “capability” is “broad and expansive” and then used that understanding to reach the conclusion that the information service definition encompasses BIAS. But the RIF Order’s focus was misplaced. The question is not how broad the meaning of “capability” is, but what the service itself has the capability to do. As even the RIF Order makes clear, BIAS does not itself have the capability to process information in the ways the statute prescribes, it only “has the capacity or potential ability to be used to engage in the activities within the information service definition.” The RIF Order tries to prop up its flawed analysis by claiming that the “fundamental purposes” of BIAS are “for its use in” processing information in the ways described in the information service definition and that BIAS was “designed and intended” to perform those functions. But this claim amounts to nothing more than statutory eisegesis: reading words into the definition of “information service” that are not there to reach the RIF Order’s predetermined outcome. Having the “fundamental purpose” or being “designed and intended” to do something does not mean a service actually has the capability to do that thing. In any event, the fundamental purpose of BIAS is to serve as a conduit through which users can access and use the applications we describe above that are themselves information services. Put differently, a consumer with a BIAS connection could not generate, acquire, store, transform, process, retrieve, utilize, or make available information using that connection if those applications did not exist. We thus disagree with ACA Connects’ conflation of the service offered by edge providers and the service offered by BIAS providers.

108. The RIF Order’s expansive reading of “capability” also logically sweeps up the information service definition a category of services that is objectively different and obliterates the statutory distinction between telecommunications services and information services. For instance, under the RIF Order’s conception of information services, the broadband internet access services provided by BIAS providers like Comcast, Verizon, and AT&T are classified as the same type of services provided by edge providers like Netflix, DuckDuckGo, and Wikipedia. But that defies reality. Furthermore, if the RIF Order’s framework was followed through to its logical conclusion, even the most obvious of telecommunication services, traditional switched telephone service, would be classified as an information service, as it provides customers with the ability to make information available to others (e.g., public service announcements), retrieve information from others (e.g., through a simple phone call with another person), and utilize stored information from others (e.g., by interacting with a call menu or accessing voice mailbox services). The RIF Order tries to get around this problem by comparing the “design,” “functionality,” “nature,” and “purpose” of traditional telephony and BIAS, and then concluding that because they are different, BIAS cannot be a telecommunications service. But Congress did not design the Act’s definitional terms to preclude the Commission from ever classifying new offerings that differ from traditional telephony as telecommunications services. If Congress had intended to foreclose that option, it could have easily done so. Rather the Act simply provides the Commission with statutory definitions for “telecommunications service” and “information service” with which the Commission can make classification determinations on an ongoing basis. As discussed above, the better reading of these definitions makes clear that BIAS is a telecommunications service as defined by the 1996 Act.

109. We are also unpersuaded by the RIF Order’s contention, and that of some commenters in this proceeding, that BIAS is an information service by virtue of its provision of access to third-party information services. For instance, NCTA points to the U.S. Supreme Court’s statement that, “[w]hen an end user accesses a third-party’s website, . . . he is equally using the information service provided by the cable company that offers him internet access as when he accesses the company’s own website . . . .” However, the Court’s statement stemmed from its affirmation of the reasonableness of the Commission’s “understanding of the nature of cable modem service,” as offered at the time, an understanding which we do not find applicable to BIAS as offered today. This argument conflates the critical distinction between the information services that are typically offered by third parties and are not part of the BIAS offering itself with the telecommunications services that BIAS providers offer to their customers. In doing so, the RIF Order and its supporters largely eliminate the category of “telecommunications services” established in the Act, which Congress could not have intended. Congress would not have devised a scheme where the definition of “information service” would largely moot the “telecommunications service” definition or confine it only to telephone service, particularly when Congress was aware that non-telephone transmission services had been offered for years under the Computer Inquiries as basic services. Specifically, under the RIF Order’s framework, all telecommunications offerings used to access third-party information services that themselves have the “capability” to “store” or “transform” information would logically be transformed into information services. Such a conclusion would be inconsistent with Commission precedent. But the Commission has never, until the RIF Order, imputed the capabilities of such third-party information services to the telecommunications services that provide access to them. The RIF Order implicitly acknowledges the absurdity of this argument in finding the need to clarify that information services accessed via traditional telephone service do not convert telephone service into an information service.

b. DNS and Caching, When Used With BIAS, Fall Within the Telecommunications Systems Management Exception

110. We find that information-processing capabilities, such as DNS, caching, and others, when used with BIAS, fall within the telecommunications systems management exception to the definition of “information service.” The Act excludes from the definition of information service the use of information-processing capabilities “for the management, control, or operation of a telecommunications system or the management of a telecommunications service.” We refer to this as the “telecommunications systems management exception.” BIAS providers sometimes use information-processing capabilities, such as DNS and caching, to manage, control, and operate the telecommunications system
they operate and the telecommunications service they offer. Thus, when BIAS providers use DNS, caching, and other information-processing capabilities in that way, those services fall within the telecommunications systems management exception and therefore do not serve to convert the entire BIAS offering into an information service. AGA Connects suggests that we “disregard or downplay information processing capabilities” used by BIAS providers even though we provide a fulsome analysis herein of the role those capabilities play in the provisioning of BIAS. At the same time, in its filings, AGA Connects disregards or downplays the existence of the telecommunications systems management exception and how it applies to those capabilities.

111. We disagree with those commenters who argue that we should treat the transmission component of BIAS differently than the complete BIAS offering that often uses information-processing capabilities, like DNS and caching, to facilitate competition and achieve policy goals. For instance, ADTRAN advocates that we give BIAS providers a choice between complying with Title II requirements from which we do not forbear and our open internet rules for their BIAS offerings, or alternatively offering the transmission component of BIAS as a separate service subject to Title II regulation. And Mitchell Lazarus advocates that the Commission institute a Title II regime for the transport component of BIAS and forbear from all Title II regulation except a requirement that facilities-based ISPs open their facilities to competing ISPs. Both these proposals share the same fault in that they fail to recognize that the entire BIAS offering is best classified as a telecommunications service, as we explain in the Order. Because we already have identified a legally sound approach to address the issues taken up in the Order we are not persuaded that we should instead take these approaches, which these commenters recognize would likely necessitate that we defer action and issue a further notice of proposed rulemaking to address the practical details of these alternative approaches. And at least to the second proposal, it would likely compel all BIAS providers to separately offer the transmission component of BIAS as a telecommunications service, but the Commission, in 2017, expressed doubt about its “statutory authority to compel common carriage offerings . . . if the provider has not voluntarily offered such a service itself.

112. We find that DNS, caching, and other services the BIAS providers use with their BIAS offering comfortably fit within the telecommunications systems management exception, either because they are used to manage a telecommunications service; used to manage, control, or operate a telecommunications system; or both. Even if specific capabilities might seem most naturally to fit in one category or another, so long as they ultimately fit within the telecommunications systems management exception as a whole—which we find to be the case for all the capabilities at issue here—we need not precisely identify the specific category.

113. The text, structure, and context of the Act reveal that the telecommunications systems management exception operates in the aggregate to exempt from the “information service” definition those capabilities that facilitate the operation of the telecommunications system and the telecommunications service offered or provided on such system. While “telecommunications service” is a statutorily defined term, “telecommunications system” is not. Based on a number of uses of “system” in the Act, as well as the ordinary meaning of “system,” we find that “telecommunications system” is best understood as the facilities, equipment, and devices that a provider uses in a network to offer or provide telecommunications services. Definitions from specialized sources provide similar definitions. Thus, management of a telecommunications service necessarily is closely interrelated with the management, control, and operation of the underlying network, equipment, and facilities used to offer or provide that service. While “manage,” “control,” and “operate” each have independent meanings, their ordinary meanings substantially overlap. We find that these terms are therefore best viewed as sweeping into the exception any uses of information-processing capabilities with the telecommunications service or telecommunications system that satisfy that aggregate understanding, regardless of whether one might think they are better categorized within one of those terms or another. Read together, we find that these terms are meant to encompass the full scope of how a provider may use information-processing capabilities to manage a telecommunications service or manage, control, or operate a telecommunications system. Consequently, we ultimately need not resolve the precise contours of the individual terms in order to determine the proper classification of BIAS, and we elect not to do so at this time because such decisions could have broader implications for other classification decisions outside the context of this proceeding.

114. When evaluating information-processing capabilities under the telecommunications systems management exception, it is immaterial that a service may benefit consumers as well as providers. As the D.C. Circuit affirmed in USTA, the relevant question for determining whether a service falls within the exception is whether “a carrier uses a service that would ordinarily be an information service—such as DNS or caching—to manage a telecommunications service” or to manage, control, or operate a telecommunications system. Inevitably, a capability used to manage a telecommunications service or manage, control, or operate a telecommunications system will provide benefits to the provider, but the provider may also choose to use such capabilities to benefit consumers. Indeed, a service that facilitates the use of the system and service may provide better resource management for the provider and a better experience for the consumer. The relative benefit to providers and to consumers falls on a spectrum, rather than being a bright line distinction. It is therefore not the case, as the RIF Order claimed and some commenters reassert, that the primary or exclusive benefit of a service that falls within the telecommunications systems management exception must be directed to the providers’ operations.

115. DNS Falls Within the Telecommunications Systems Management Exception. We conclude that DNS, when used with BIAS, falls within the telecommunications systems management exception to the definition of “information service.” As explained in the 2015 Open Internet Order, DNS, when offered on a standalone basis by third parties, is likely an information service. DNS “is most commonly used to translate domain names, such as ‘nytimes.com,’ into numerical IP addresses that are used by network equipment to locate the desired
content.” We note, as we did in 2015, that although a BIAS provider’s DNS server may offer other functionalities, BIAS does not depend on such functionalities and therefore they are separable from BIAS. By analogy, just as a telephone book or 411 directory assistance service enables customers of telephone service to ascertain the telephone number of a desired call recipient, DNS enables customers of BIAS to ascertain the IP address of a desired internet endpoint. DNS may still be considered analogous to an adjunct-to-basic service that would not impact the classification of the transmission service under Commission precedent, given that it facilitates use of BIAS and does not alter the fundamental character of BIAS. DNS uses computer processing to convert the domain name that the end user enters into an IP address number capable of routing the communication to the intended recipient. In addition to providing benefits to consumers, a BIAS provider’s DNS service benefits the provider, as it “may significantly reduce the volume of DNS queries passing through its network” and can be employed by BIAS providers for “load balancing” and enabling efficient use of limited network resources during periods of high traffic or congestion. We thus agree with the 2015 Open Internet Order’s conclusion that DNS “allows more efficient use of the telecommunications network by facilitating accurate and efficient routing from the end user to the receiving party.” 116. USTelecom argues that because DNS is “undeniably an information service[,] when offered by third parties,” we cannot also conclude that same service is used for telecommunications management by BIAS providers. It contends that Brand X’s holding—that the statutory definitions do not distinguish between facilities-based and non-facilities-based carriers but on the capabilities the provider offers via the service—forecloses that conclusion. We disagree. As the statute’s text makes clear, the telecommunications systems management exception explicitly provides that information-processing capabilities are not information services when they are used for the purposes of managing a telecommunications service or managing, controlling, or operating a telecommunications network. Thus, the purpose for which a capability is used is key to evaluating the capability under the exception. We note that USTelecom attempts to reargue an argument that was settled by the D.C. Circuit in USTA. We are not persuaded to depart from the court’s understanding as reflected in USTA. In the case of DNS, “[i]t is important to distinguish between a DNS server operated by a broadband provider and a DNS server operated by an unaffiliated entity, as they have different reasons for operating a DNS server.” While DNS offered by a third party likely does not fall within the exception because the third party is not “using . . . such capability for the management, control, or operation of a telecommunications system or the management of a telecommunications service,” the fact that BIAS providers use DNS to manage BIAS or manage, control, or operate their BIAS networks causes it to fall within the exception. 117. Caching Falls Within the Telecommunications Systems Management Exception. We conclude that caching, when used with BIAS, falls within the telecommunications systems management exception to the definition of “information service.” Caching “is the storing of copies of content at locations in a network closer to subscribers than the original source of the content.” BIAS providers use caching “to facilitate the transmission of information so that users can access other services, in this case by enabling the user to obtain ‘more rapid retrieval of information’ through the network,” and thereby offer faster BIAS to consumers. A BIAS provider also uses caching for a number of internal benefits, including “to decrease its own bandwidth” and for “capacity management,” so that the strain of subscribers’ traffic on certain network segments or equipment is reduced, and to “reduce its own transit costs, because cached information need[,] not be retrieved across a tier-1 backbone network.” Indeed, Verizon currently describes its caching of video content as “network management.” We are therefore unpersuaded by assertions that caching is used primarily or exclusively to benefit end users, and for the reasons provided above, disagree that any benefits to users disqualify caching from the telecommunications systems management exception. Richard Bennett similarly argues that caching falls outside the exception because it “does not affect the transmission rate of bits on the network medium.” But Richard Bennett does not point to any statutory language or Commission precedent that requires a service to “affect the transmission rate of bits” in order to fall within the exception. For these reasons, we conclude that caching, when offered by a BIAS provider, falls within the telecommunications systems management exception when used by a provider to provision a telecommunications service and not fall within the exception when it is used for another purpose. c. Information-Processing Capabilities Are Not Inextricably Intertwined With BIAS 119. Even if, arguendo, DNS, caching, and other information-processing capabilities did not fall within the telecommunications systems management exception to the definition of “information service,” BIAS providers offer these capabilities as separate components that are not inextricably intertwined with BIAS, and therefore they do not convert BIAS into an information service. 120. Whether an information service is inextricably intertwined with a telecommunications service turns principally on whether users view the offering as a bundle of a telecommunications service and one or more information services or instead as a single integrated offering that is an information service. Users’ perception of the offering can be supported by a functional evaluation focused on whether the information service components are separable from the telecommunications service components. Thus, the mere act of bundling an information service with a telecommunications service, does not, on its own, automatically cause the services to become inseparable or inextricably intertwined. In this case,
the evidence of consumer perception and the separability of the functions at issue both point to one conclusion—BIAS is not an integrated information service. To the extent that prior Commission decisions suggested that an “inextricably intertwined” analysis was an independent prerequisite to a telecommunications service classification, we are now changing course in light of our evaluation of the statute.

121. We base our conclusion first and foremost on an examination of the consumer perception of the BIAS offering, which shows that consumers do not perceive the offering as an information service. We also examine the role that DNS, caching, and other information-processing capabilities functionally play in provisioning BIAS today and find that they are separable. We reiterate the factual reality that the core element of BIAS, as offered by BIAS providers today, is the transmission component. Our definition of BIAS, remaining unchanged since 2010, makes clear that the “data transport service,” or “telecommunications component,” and BIAS are indeed one in the same. Without the transmission component, BIAS, as offered today, would be no service at all. As we elaborate below, the same cannot be said for DNS, caching, and other information-processing capabilities, and thus they cannot reasonably be viewed to convert the core, indispensable transmission component of BIAS into an information service. We thus disagree with commenters who argue that the RIF Order’s approach to understanding inextricably intertwined services “best implements the Commission’s long-standing view that Congress intended the definitions of ‘telecommunications service’ and ‘information service’ to be mutually exclusive.” That reasoning is tautological, relying on the assumption that BIAS is an information service on the basis that it combines information-processing capabilities and a transmission component, and ignores our showing here that the information-processing capabilities fall within the telecommunications systems management exception, are separable information services, or both. We also discuss below that the availability of those services from third parties, and the use of those third-party services by consumers, demonstrate that BIAS providers’ DNS and caching components are neither integral nor indispensable to their provisioning of BIAS. Given consumer perception and these functional realities, DNS, caching, and other information-processing capabilities cannot be inextricably intertwined with BIAS and therefore they do not convert BIAS into an integrated information service.

122. The RIF Order tried to fortify its information service classification by asserting that DNS, caching, and other information-processing capabilities are inextricably intertwined with the transmission component of BIAS, thereby transforming BIAS into a single, functionally integrated information service—and some commenters in this proceeding endorse that proposition. But the RIF Order treated its “inextricably intertwined” analysis as entirely separate and distinct from the question of how users perceive the relevant “offer” without identifying any statutory basis for doing so. Even relying on this narrow analysis, the RIF Order reached the wrong conclusion. Although the RIF Order recognized that “the internet marketplace has continued to develop in the years since the earliest classification decisions,” it failed to give “serious technological reconsideration and engagement” to those new factual developments. Instead, the RIF Order found that DNS and caching, specifically, were “indispensable functionalit[ies] of broadband internet access service” at the time the RIF Order was adopted. At the same time, the RIF Order tried to downplay the primacy of the transmission component in the BIAS offering. But “the Commission’s exclusive reliance on DNS and caching blinkered itself off from modern broadband reality; it tethered the service ‘offer[ed]’ from both the real-world marketplace and the most ordinary of linguistic conventions.” As Judge Millett wrote in her concurrence to the D.C. Circuit’s decision in Mozilla, “the roles of DNS and caching themselves have changed dramatically since Brand X was decided. And they have done so in ways that strongly favor classifying broadband as a telecommunications service, as Justice Scalia had originally advocated.”

123. Consumers Do Not Perceive BIAS as an Information Service. Contrary to record assertions, consumers do not perceive BIAS as an information service. As an initial matter, the record does not show that consumers perceive information-processing capabilities, such as DNS and caching, let alone understand those capabilities as information services and thereby view the entire BIAS offering as an information service based on those capabilities. Of the consumers that do perceive BIAS’s information processing capabilities, they are likely the consumers that would configure their system to obtain these information-processing capabilities from third parties and therefore view them as a separate offering. In its reply, CTIA claims, without evidence, that “[c]onsumers also know that BIAS offer[s] these [information service] capabilities—that is why they purchase BIAS—and that BIAS relies on advanced under-the-hood technologies, regardless of whether they understand the precise mechanics of those technologies, such as advanced DNS, caching, protocol translation, dynamic network management, and other evolving services.” But CTIA undercuts this claim about consumer perception in a later filing where it and USTelecom assert that nearly all consumers “do not even know what DNS does.” Moreover, unlike the situation with ISPs of 30 years ago, today’s BIAS consumers do not purchase BIAS to receive an all-in-one suite of information services offered by their provider, or to gain access to a “walled garden” of internet endpoints cached by their provider. Instead, as already explained, consumers’ desired information services are generally the applications, content, or services offered by third-party edge providers across the global internet that provide end users with the capability to process the information they send or receive via the BIAS provider’s telecommunications. Consumers view these information services as completely distinct and separable from the transmission conduits offered by BIAS providers today. Consumers understand that when they access Netflix or an Apple iCloud storage account, the BIAS provider is “offering” the “capability” to access these third-party services, and not that these information services are being offered by the BIAS provider itself. While consumers may “highly value” the ability to access third-party services using their BIAS connections, that does not support a conclusion that BIAS is an information service. The RIF Order’s primary argument that consumers perceive BIAS as an information service rests on its misunderstanding that DNS and caching convert BIAS into an information service rather than fall into the telecommunications systems management exception, as we establish above. Additionally, consumers’ relationship with their BIAS providers is distinct from their relationships with edge providers. Most consumers have relationships with one or two BIAS providers—e.g., one for fixed residential service and one for mobile service—to gain access to the Internet; accordingly, consumers may have relationships with dozens or even hundreds of edge
providers to utilize the wide range of services that ride over the top of their BIAS connections.

124. Accordingly, we are unconvinced by USTelecom’s assertion that its consumer surveys show we are wrong to conclude that consumers perceive BIAS as a telecommunications service and not an information service. USTelecom relies on two consumer surveys to support its assertion. The first survey purports to show that 92% of consumers perceive broadband as providing information service capabilities, while only 8% of respondents said their broadband service offers only the capability to transmit information between or among points of their choosing. The second survey purports to remedy the faults of the first, but it not only fails to do so, it serves to further undermine the first survey. The first survey suffers from two primary faults. To start, the results are misleading because the survey was weighted by providing four “information service” options to one “telecommunications service” option and the respondents’ information service selections were aggregated. USTelecom argues that “a question structure that offers multiple information service capability options, while directing respondents to select all that apply, does not bias the results.” But when there are only two categories to begin with, providing one option for one category and four options for the other objectively biases the results. That fact is very clearly proven by the results of the second survey, which provided one option for the information service category and had a wildly different result. Specifically, while in the first survey, “59% of respondents selected at least one information service option without also selecting the telecommunications service option,” in the second survey, only 10.8% of respondents selected the information service option without also selecting the telecommunications service option. Returning to the first survey, the second fault is that the terminology it used misrepresented the statutory language by suggesting that BIAS itself has the capability to perform the functions listed in the statute, and also used plain English language for the so-called “information service” options while using more technical language for the “telecommunications service” option. USTelecom claims “[t]hat is not a valid criticism of the survey...” But to suggest that the reliability of the survey does not depend on the formulation of the questions is not only fallacious, it is proven wrong by the second survey.

While both surveys profess to measure consumer perception of broadband, their different question formulations result in markedly different results. Both surveys share the same additional fault in that they fail to treat the telecommunications service and information service categories as mutually exclusive, as we must. Thus, far from clarifying consumers’ perception about BIAS, the results from the two surveys, and their shortcomings, only demonstrate that they cannot be viewed as reliable sources of consumer perception of BIAS. However, it is worth noting, given the importance of evaluating consumer perception of the offering, as established by the Supreme Court in *Brand X* and consistently affirmed by Commission and court precedent, that USTelecom’s surveys do not show that consumers perceive BIAS as an information service, as opponents of reclassification would have us conclude. Indeed the second survey, which used more reliable question and answer formulations than the first, shows that more consumers perceive BIAS as providing the capabilities of a telecommunications service than providing the capabilities of an information service.

125. Consumer perception is also backed by BIAS providers’ marketing practices, which also do not show, as some commenters claim, that BIAS is best understood as an information service. Contrary to NCTA’s contention, BIAS providers’ marketing practices do not support a conclusion that they compete on the basis of their offering of “online storage, spam filters, [or] security protections,” for example. While consumers may be “aware of and value” the features offered by their BIAS providers, and some of these features also may be mentioned in BIAS providers’ advertising, that does not undercut the significant evidence that BIAS providers predominantly market BIAS as a transmission service. We also agree with Public Knowledge that “BIAS provider[s]’ various attempts to enter adjacent markets or bundle services with broadband do not change the nature of the service they offer, nor do they change ‘what the consumer perceives to be the integrated finished product.’” ACA Connects argues that the “marketing of broadband service has not undergone substantial change since the inception of the service,” and that such marketing “has always emphasized both the always-on capabilities that broadband service affords subscribers, including the ability to retrieve, store, and utilize the panoply of available internet content and applications, and the fast speeds at which they are able to stream, download, and upload internet content.” However, ACA Connects deflects from its failure to provide evidence to support such sweeping claims by adding that, “[t]o the extent that our Members’ marketing may place a greater emphasis on speed, this is a response to increased consumer familiarity with the capabilities offered by broadband service.” We are not convinced. We find that a more reasonable conclusion drawn from BIAS providers’ marketing practices is that consumers select a BIAS provider based on the quality of its transmission service offering, and thus BIAS providers compete on this basis.

126. We note that at least one of ACA Connects’ members, Sjoberg’s Cable TV, does not appear to emphasize or even mention any of the information-service capabilities in its advertisement for BIAS. Indeed, ACA Connects’ own members state that their “current marketing focuses on differentiating ourselves from our competitors by touting the speeds and process of our service packages” and “[t]he marketing of our broadband services puts primary emphasis on the speeds we offer, network reliability, and performance.” ACA Connects attempts to preserve its argument by asserting that “it is unremarkable that broadband providers emphasize . . . speeds and reliability . . . while ignoring basic information-processing capabilities” because that advertising choice does not undermine its assertion that the information-processing capabilities are integrated into the offering. But the question here is what consumers perceive to be the offering, and in part due to the focus of BIAS providers’ advertising on factors critical to transmission of information, consumers perceive the offering as a telecommunications service. Whether information-processing capabilities are integrated is a question of functionality that we discuss below.

127. DNS Is Not Inextricably Intertwined with BIAS. In reviewing the factual particulars of the DNS is functionally provided today, we find that it is a separable service that is not inextricably intertwined with BIAS and therefore does not convert BIAS into an information service. Indeed, as Free Press notes, “many ISPs have moved away from making these same tired and demonstrably false arguments that DNS service and caching transform a telecommunications service into an information service.” As we noted in the 2015 Open Internet Order, now that we conclude that DNS service is within the telecommunications systems management exception, “prior factual
findings that DNS was inextricably intertwined with the transmission feature of cable modem service do not provide support for the conclusion that cable modem service is an integrated information service.” Claims that the internet “would not work” without DNS, that DNS “is a must for broadband to function properly,” or that there “is no internet service without DNS,” are simply not borne out by the architecture of BIAS. The record reveals that DNS is not necessary to IP packet transfer, which is the core function of the service. As Professor Jon Peha explains, DNS is an “application that run[s] on top of IP packet transfer” and that, “[f]rom the beginning, the DNS . . . was designed to be separate from the systems that provide IP Packet Transfer Service.”

128. Even if DNS were necessary to the functionality of BIAS, the DNS offerings of BIAS providers are not themselves essential to BIAS, and therefore cannot be inextricably intertwined with their BIAS. As Professor Scott Jordan explains, because a BIAS provider’s DNS server rarely serves as the authoritative resource for an IP address, their DNS server plays only a limited role in DNS—and that role is replaceable. Commenters explain that third-party-provided DNS is now widely available and used by consumers. Consumers often use third-party DNS services because their web browsers, apps, and IoT devices are configured to use those third-party DNS services. Other consumers may choose to use such third-party DNS services, which they can do with a simple configuration change. Notably, Verizon provides instructions on its website for how to change the default DNS settings or perform manual DNS lookups. The record presents evidence that third-party DNS services may now make up a significant portion of all DNS services today. Indeed, commenters who otherwise argue that DNS is essential to the functionality of BIAS carefully avoid saying that DNS supplied by BIAS providers is essential to BIAS’s functionality. CTIA complains that “[t]he IBM study makes no effort to distinguish IoT manufacturers’ choices from consumers’ choices” and “therefore does not meaningfully address what consumers perceive as the finished service that BIAS providers offer them.” But the question about consumer perception of the “offer” is separate from the question of whether BIAS providers’ DNS is essential to BIAS, and we have already shown that consumers perceive the BIAS offering as a telecommunications service and not an information service. And contrary to CTIA and USTelecom’s assertion, if BIAS providers were to stop offering DNS, their DNS functionality would be quickly replaced by alternatives without consumers needing to take any action.

129. We are unmoved by CTIA and USTelecom’s arguments that the availability of third-party DNS and its use by consumers does not mean that BIAS providers’ DNS is not functionally integrated with their BIAS. They first argue that consumers’ use of third-party DNS is not determinative because “the statutory touchstone when classifying services is the capability ‘offer[ed].’” But consumers’ use of third-party services speaks to whether the capabilities offered by BIAS providers are functionally integrated, and the separate question of what is being offered by BIAS providers is about what consumers understand is the integrated finished product, not what discrete capabilities a BIAS provider claims itself to be offering.

130. USTelecom claims we assert that evidence of consumer perception shows that consumers perceive DNS as separable from BIAS, which it says contradicts USTelecom’s survey about consumer perception of DNS, but we do not such thing. Rather, we explicitly state here and above that consumer perception is evaluated on how consumers perceive the entire offering, not how consumers perceive the individual components, and we show in the Order that consumers perceive the offering of BIAS as a telecommunications service and not an information service. Conversely, the question of whether individual components are separable is a question of functionality, and we show here that DNS is functionally separable. As such, USTelecom’s assertions about consumer perception of DNS based on its survey are irrelevant. But even if consumer perception of DNS were relevant, USTelecom’s survey does not show that consumers perceive BIAS providers’ DNS as integrated with BIAS, as USTelecom claims. The survey says that only 17% of respondents could even identify the functionality of DNS, and only 4.8% of those respondents said they use their BIAS providers’ DNS, while 83.5% of respondents did not know which DNS they use. The survey then claims those results “suggest that 92% of the respondents—those who affirmatively said they are using their ISP provider’s DNS as well as those who do not know what DNS does and those who know what it does but are not sure which one they are using their ISP provider’s DNS.” This conclusion is based entirely on an assumption that all BIAS providers have a proprietary DNS system and present that as the default DNS system for their BIAS, which USTelecom has not demonstrated, rather than use a third-party DNS system. In any event, consumers’ use of their BIAS provider’s DNS is not the same thing as consumers’ perception as to whether their BIAS provider’s DNS is functionally integrated with their BIAS. Moreover, because the survey does not say anything about whether consumers only use a BIAS provider’s DNS, and given that browsers, apps, and devices can be preset to use third-party DNS systems, the survey results could be potentially interpreted to support the proposition that consumers use third-party DNS in addition to or instead of their BIAS provider’s DNS. So to the extent that consumers’ default use of DNS speaks to their perception of DNS, a question that we find is not dispositive to the underlying classification, the better conclusion is that consumers perceive DNS as relevant to their use of BIAS generally, not as integrated with a BIA provider’s BIAS offering specifically.

131. CTIA and USTelecom also argue “that almost all BIAS users rely on the DNS provided by their BIAS provider.” A BIAS provider’s choice to offer a separable feature that is bundled with BIAS, and a consumer’s use of that feature, do not on their own make that feature essential to, or functionally integrated with, BIAS. USTelecom tries to sustain the argument, asserting that just as “[a]lternative vendors commonly offer consumers the ability to change out integrated features in the products they buy,” the “ability of end users to select different DNS servers [does not] mean that ISPs do not integrate DNS into the broadband service they offer.” USTelecom compares DNS to “the radio and speakers or even the engines in cars; the hard drives, RAM, and graphics cards in desktop computers; the hand brakes, seat, and pedals on bicycles; and so on.” Even if, argüendo, DNS were functionally integrated with BIAS, that does not mean that DNS converts BIAS into an information service—either functionally or from a consumer perspective—any more than an engine converts a car into merely a device that changes gasoline into energy, a hard drive converts a computer into a data storage device, or hand brakes convert a bicycle into a mere stopping mechanism. As the Supreme Court held in Brand X, the entire question of whether DNS as provided with BIAS is functionally integrated or functionally separate turns on the “factual
particulars of how internet technology works and how it is provided.” And as we have already shown, DNS is a separable, application-layer service that does not technologically alter the ability of consumers to use BIAS as a transmission conduit to reach all or substantially all internet endpoints.

132. We also reject the related argument that BIAS provider DNS is intertwined with BIAS because a customer using third-party DNS loses the alleged unique benefits that arise from BIAS provider DNS, such as efficient routing of traffic to cached information. As an initial matter, there is conflicting evidence in the record on whether using BIAS provider DNS has a material benefit to end users over third-party DNS. An updated version of an article cited by CTIA states that “[p]ublic DNS servers are often faster than those provided by ISPs due to closer geographic locations, enabling quicker DNS resolutions” while noting that “an untrustworthy DNS server could slow performance or pose security threats.” It is also not evident that the EDNS Client Subnet (ECS) extension, when enabled by BIAS providers, ensures better performance over third-party DNS offerings that have also enabled the extension. In any event, that ECS is an extension that can be enabled (and disabled) shows that it is even more separable than DNS itself. In any event, that ECS is an extension that can be enabled (and disabled) shows that it is even more separable than DNS itself. Even if DNS does have a material benefit to end users over third-party DNS, we find that the mere existence of a potential consumer benefit resulting from BIAS provider DNS does not compel the conclusion that DNS is inextricably intertwined with BIAS. In any event, record evidence suggests it is more likely that BIAS providers, rather than their customers, are the true beneficiaries of their customers’ use of in-house DNS given its potential to reduce BIAS providers’ own transit costs.

133. Caching Is Not Inextricably Intertwined With BIAS. In reviewing the factual particulars of how caching is functionally provided today, we find that it is a separable offering that is not inextricably intertwined with BIAS and therefore does not convert BIAS into an information service. In particular, we find that caching offered by a BIAS provider is separable from BIAS because caching is not necessary for BIAS to work—end users can and do access data that is not cached at all. Indeed, the inherent nature of caching—to store content that has been requested by the end users and is likely to be requested again soon—means that users will request and be able to receive information that has not yet been cached.

134. The record also demonstrates that BIAS provider caching is separable because of the drastic reduction in its use and relevance and the rise of third-party CDN caching since Brand X. As Mozilla explains in its comments, “caching and CDNs have been taken out of the hands of ISPs and are largely operated by large content providers or independent companies.” Such third-party caching is now dominant because, according to record evidence, caching offered by a BIAS provider does not work with encrypted traffic—the overwhelming majority of traffic today. CTIA and US Telecom attempt to minimize the effect of encryption on BIAS provider caching, explaining that even when a website uses HTTPS, a BIAS provider can still see the top level of the website and asserting that they “use that information to cache entire websites, so they can resolve requests for pages associated with that website to the cached content . . . .” But this assertion is disputed in the record. Moreover, CDNs are uniquely able to meet consumer expectations for streaming video from third-party services. We therefore disagree with NCTA that BIAS provider caching is “as integrated into broadband offerings today as they were when Brand X was decided.” The RIF Order incoherently reached a similar conclusion that BIAS provider caching and DNS are “inextricably intertwined” with transmission even though it acknowledged that “some consumers” use third-party caching and excluded CDN caching from the definition of BIAS. Brand X was decided at a time when encryption was limited and there was much lower demand for streaming video (and therefore few, if any, CDNs). Opponents do not directly dispute that BIAS provider caching is incompatible with encryption, but try to downplay this by arguing that their DNS can direct user requests to the appropriate caching server. But DNS is a separate functionality from caching and the server to which they are referring is not the BIAS providers’ caching server but a third-party CDN. In any event, even if BIAS provider caching were unaffected by the increasing prevalence of encryption, no commenter disputes that CDN caching is now dominant. Some commenters conflate transparent caching offered by BIAS providers with CDN caching offered by third parties to assert that caching is inextricably intertwined with BIAS, but we are not fooled by this chicanery. These commenters provide no justification for concluding that CDN caching, primarily sold to, and for the benefit of, third-party content providers, and which is explicitly excluded from the definition of BIAS, is also a functionally integrated component of a BIAS provider’s BIAS offering—and we do not find any such justification either.

135. Other Information-Processing Capabilities Are Not Inextricably Intertwined With BIAS. We are not convinced by commenters who argue that BIAS is an information service because the routing and transmission of IP packets involves information-processing capabilities. CTIA, for example, argues that, because IP packet routing “involves examination and processing of the packet at every router the packet traverses,” information processing is inextricably intertwined with the transmission capability of BIAS itself. As an initial matter, as discussed above, the user’s data—forming part of a payload within the IP packet—remains unchanged from the moment it reaches the BIAS provider’s network to the moment it arrives at the desired endpoint. Thus, BIAS does not in fact offer subscribers the capability for processing their data—such capabilities occur at the internet endpoint selected by the subscriber. Other commenters raise old arguments that the existence of IPv4-to-IPv6 protocol transition mechanisms within BIAS is evidence of information processing that would convert BIAS into an information service. In 2016, the Internet Corporation for Assigned Names and Numbers (ICANN), a “not-for-profit entity responsible for the technical coordination of the internet’s domain name system,” announced that its Internet Assigned Numbers Authority (IANA) allocated “the last remaining IPv4 . . . internet addresses from a central pool” and that “future expansion of the internet is now dependent on the successful deployment of the next generation of internet protocol, called IPv6.” We find that these mechanisms are designed to ensure the effective and efficient transmission of BIAS traffic and thus fit comfortably in the telecommunications systems management exception. Given the difference in packet header formats between IPv4 packets and IPv6 packets, transition mechanisms permit the interoperability between IPv4-compliant and IPv6-compliant networks, servers, and routers. 136. We also disagree with commenters who argue that BIAS is a functionally integrated information service because it may be offered in
conjunction with information services such as electronic mail, security software, smartphone applications, parental controls or spam and content filtering software, distributed denial-of-service (DDoS) mitigation, botnet notification, and firewalls. Commenters have not demonstrated, beyond making conclusory statements, that these bundled information services are not used for telecommunications systems management or are inextricably intertwined with BIAS, rather than being included in the product offering simply as the result of a marketing decision not to offer them separately. As explained in the 2015 Open Internet Order, spam filtering and DDoS mitigation fall within the telecommunications systems management exception. As the Supreme Court affirmed in *Brand X*, the mere packaging of separable information services with a telecommunications service does not convert the telecommunications service into an information service. The Interisle Consulting Group (ICG) also notes that “[b]undles and offers do not define a service. Vertical integration of a retail product to include additional non-telecommunications services does not change the nature of the underlying services.” Many of these services, such as smartphone applications, electronic mail, and content filtering software, are indeed “offered at the application layer” of the IP stack, and thus are separable from the lower network layers that facilitate transmission and routing of packets. No commenter has argued that any of these services are necessary for IP packet transfer to function. Thus, as explained in the 2015 Open Internet Order, BIAS “is only trivially affected, if at all” by these services’ functionalities. Even the *RIF Order* stated that it did “not find the offering of these information processing capabilities determinative of the classification of broadband Internet access service.” For these reasons, we find that commenters have not provided new evidence of functionalities that would cause BIAS to be properly classified as a functionally integrated information service.

C. Classifying BIAS as a Telecommunications Service Accords With Commission and Court Precedent

137. The Commission has engaged in classification decisions of various services that operate at the nexus of telecommunications and computer-based data processing for almost half a century. As has been the case in previous proceedings when the Commission has classified broadband services, the record reveals a debate regarding the relevance and precedential value of these Commission decisions and related court rulings. As a general matter, we assign limited value to many of these past Commission decisions and find that our classification of BIAS as a telecommunications service is fully and independently supported by an evaluation of the statutory text of the 1996 Act. Nevertheless, when viewed as a whole and in the proper context, we find that, on balance, Commission and court precedent also support our classification of BIAS as a telecommunications service and that arguments from proponents of reclassification that attempt to use such precedent to undercut our statutory interpretation are unavailing.

138. Our consideration of past precedent takes two forms. In the case of pre-1996 Act precedent, we consider whether and how such precedent might have informed Congress’s understanding of the definitional language it used in the 1996 Act, and how that, in turn, might support particular interpretations that otherwise flow from the statutory language and statutory context. Given the role of the Commission’s *Computer Inquiries* precedent in the Commission’s regulatory scheme, we are persuaded to give that precedent appropriate (if modest) weight and conclude that it reinforces our classification of BIAS as a telecommunications service under the best reading of the Act. We are more circumspect with respect to precedent related to the 1984 Modification of Final Judgment (MFJ)—the consent decree which mandated the breakup of the Bell System—as the 1996 Act expressly abrogated the MFJ’s requirements. Although we do not affirmatively rely on any of that precedent, we also consider the *RIF Order* to have mischaracterized that precedent to reach an information service classification of BIAS.

139. In the case of post-1996 Act precedent concerning classification of services that relate to internet connectivity, we evaluate whether each decision supports, is distinguishable from, or is in tension with our decision, and explain any change in course. As discussed below, we find certain precedent addressing DSL service, while not precisely analogous with the circumstances here, helps reinforce our classification decision. More directly relevant and supportive are important court decisions addressing the classification of cable modem service. Other broadband service classification decisions prior to the 2015 Open Internet Order we find distinguishable on the basis of their factual predicates and/or the sufficiency or persuasiveness of the Commission’s assessment of those facts. We further conclude that the classification of BIAS as a telecommunications service in the 2015 Open Internet Order, ultimately affirmed by the D.C. Circuit in *USTA*, reinforces our conclusion that BIAS is a telecommunications service under the best reading of the Act. Likewise, the D.C. Circuit’s numerous, substantial concerns about the *RIF Order*’s decision being “unhinged from the realities of modern broadband service,” also militate in favor of our classification of BIAS as a telecommunications service.

1. Relevant Pre-1996 Act Precedent

140. Pre-1996 Act precedent helps to inform our understanding of the definitions used in the 1996 Act and reinforces our decision to classify BIAS as a telecommunications service. We agree as a general matter with the significant number of commenters that submit that the pre-1996 Act *Computer Inquiries* and MFJ service definitions informed Congress’s adoption of the definitional terms “telecommunications service,” along with “telecommunications,” and “information service,” inclusive of the telecommunications systems management exception. However, we find that the *RIF Order*’s heavy reliance on isolated MFJ precedent to understand the meaning of those terms in search of its predetermined information service classification was problematic. Contrary to the *RIF Order*’s analysis, we find that Congress, in giving those terms meaning, would not have relied upon precedent that arose from a single isolated pre-1996 Act case, or passages of such cases, without also considering the marketplace or regulatory context present at the time of enactment of the 1996 Act. Rather, as the *Brand X* Court surmised, it is likely that Congress would have looked to “settled . . . administrative interpretation[s]” of the analogous pre-1996 Act terms. Because much of the precedent that the *RIF Order* relied upon does not fall into the category of settled administrative interpretation, particularly the MFJ precedent, we conclude that it is not relevant to the classification of BIAS.

141. The FCC’s Computer Inquiries.

Through a series of proceedings collectively known as the *Computer Inquiries*, the Commission sought to foster the development of the emerging data processing marketplace by ensuring enhanced service providers’ access to communications facilities and services
necessary to the growth and success of that marketplace. To that end, the Computer II Final Decision (45 FR 31319 (May 13, 1980)) in 1980 established “a regulatory scheme that distinguishes a carrier’s basic transmission services from its enhanced services.” The Commission concluded that “basic [services]” were those that offered “pure transmission capability over a communications path that is virtually transparent in terms of its interaction with customer supplied information.” By contrast, “enhanced services,” which the Commission said had “intertwined” communications and data processing technologies, were, for example, used to “act on the content, code, protocol, and other aspects of the subscriber’s information,” and provide the subscriber “additional, different, or restructured information . . . through various processing applications performed on the transmitted information, or other actions . . . taken by either the vendor or the subscriber based on the content of the information transmitted through editing, formatting, etc.” Under the Computer II regulatory approach, basic services offered on a common carrier basis were subject to Title II while enhanced services were not. The Commission used this approach to classify a wide range of services, including, for example voicemail and frame relay transmission service.

142. Despite the Commission’s hope that its basic—enhanced dichotomy would be “relatively clear-cut,” it acknowledged certain features of a service that “might indeed fall within [the] literal reading [of] the definition of an enhanced service, but that would not change the classification of a basic service under its Computer Inquiries regulations because the features “are clearly basic in purpose and use and [they] bring maximum benefits to the public through their incorporation in the network.” The Commission coined the term “adjunct-to-basic” to describe those kinds of features, which, when included as part of a basic service, would be perceived the same way as the basic service itself.

143. Under the Computer II adjunct-to-basic analytical framework, the Commission permitted carriers to offer “call forwarding, speed calling, directory assistance, itemized billing, traffic management studies, voice encryption, etc.” as part of the basic service, concluding that these “ancillary services directly related to the provision of basic service do not raise questions about the fundamental . . . nature of a given service.” Carriers were also allowed to offer as basic services “memory or storage within the network” that is used only to “facilitate the transmission of the information from the origination to its destination.” Similarly, the Commission found that computer processing features, including “bandwidth compression techniques,” “packet switching,” and “error control techniques” that “facilitate [the] economical, reliable movement of information [did] not alter the nature of the basic service.” The Commission justified its inclusion of these features in the basic service to encourage “integrate[ion] of technological advances conducive to the more efficient transmission of information through the network.” We note that the Computer III (51 FR 24350 (July 3, 1986)) regime did not alter this approach. Continuing this approach, in the 1985 NATA Centrex Order, the Commission concluded that transmission of telephone numbers, even when “transformed” by the network into a format that can be displayed to the call recipient on a display, were considered adjunct-to-basic because the number display is derived from the basic transmission service. Call forwarding was also considered adjunct-to-basic because “it does not materially change the nature of a telephone call placed to that subscriber.” In subsequently applying these principles, the Commission concluded that the adjunct-to-basic exception applies to optional features or functions that are not necessary for the “basic” service to work but are merely helpful to that function.

144. In other decisions under the adjunct-to-basic framework, the Commission concluded that optional enhanced features of basic services or the use of basic services to access third-party information did not change the classification. Where enhanced features or functions are accessed via a provider’s basic service, but are not a part, or a “capability,” of the provider’s own network or service (i.e., are a third-party service), the service remained a basic service. Where a consumer is offered optional enhanced service components that are combined with the basic service, but need not be, the underlying service remained a basic service, regardless of whether the consumer actually purchased the enhanced service components.

145. Given that data processing services relied on communications facilities, the ability of facilities-based carriers to also offer enhanced services over their networks created a risk that they would have the incentive and ability to discriminate against their enhanced service provider rivals. To protect against that risk, in Computer II, the Commission specified that facilities-based carriers wishing to directly provide enhanced services over their own facilities were obligated to both offer the transmission component of their enhanced offerings—including internet access service—on a common carrier basis governed by Title II and acquire transmission capacity for their enhanced offerings under the same tariffed transmission service offering they made available to other enhanced service providers. Due to these obligations, any internet access provider, including an internet access provider affiliated with the facilities-based carrier and an unaffiliated, non-facilities-based enhanced service provider, was able to obtain common carrier transmission necessary to offer internet access to end users on the same tariffed terms and conditions under Title II. An end user could also obtain transmission on the same basis to connect with the internet access provider of its choice.

146. By the time the 1996 Act was enacted, the Commission had been using the Computer Inquiries framework and its subject-matter expertise to classify data services as either “basic” or “enhanced” for almost 16 years. Thus, Congress was well aware of the Commission’s well-established classification framework at the time it enacted the 1996 Act. There is a “presumption that Congress is aware of ‘settled judicial and administrative interpretation[s]’ of terms when it enacts a statute.” “[A] decision by Congress to overturn [Computer II, and subject [enhanced] services to regulatory constraints by creating an expanded ‘telecommunications service’ category incorporating enhanced services, would have effected a major change in the regulatory treatment of those services.” Although the Commission stated that it “would have implemented such a major change if Congress had required it,” it did not find “an intent by Congress to do so.” Rather, the Commission found “that Congress intended the 1996 Act to maintain the Computer II framework.”

147. Given the myriad and complex array of Computer Inquiries decisions, we do not attempt to detail here with specificity the ways in which the Commission’s Computer Inquiries precedent lends support to the classification decision we reach in the Order. We instead take a more measured approach, declining to give significant weight to isolated statements or draw analogies to particular classification outcomes dealing with services other than BIAS. It suffices to say that the 2015 Open Internet Order did describe the basis for such support when...
classifying BIAS as a telecommunications service and that the D.C. Circuit recognized the importance of the Computer Inquiries to the “structure of the current regulatory scheme” on its way to upholding that classification decision. Thus, where Computer Inquiries predominates are consistent with our determination that BIAS, as offered today, is best classified as a telecommunications service, they lend some support to that conclusion, and to the extent any such precedent is in tension or conflict with that understanding, we do not view them as undercutting that determination grounded in the best understanding of the statutory text. We are therefore uncompelled by the RIF Order’s suggestion that only a “drop” of an information service (i.e., DNS or caching) combined with the transmission component, is sufficient to transform BIAS into an information service, regardless of consumer perception or the functional realities of the offering. The RIF Order’s conclusion implicitly relies on isolated Computer Inquiries precedent finding that when a non-facilities-based ISP, as understood at the time, combines a telecommunications input purchased from a facilities-based provider with its own enhanced service, the enhanced service “contaminated” the resold transmission service such that the combined service sold to the end user is always an enhanced service. As an initial matter, that theory never applied to facilities-based providers, and some BIAS providers are facilities-based. Moreover, the 1996 Act’s definition of a “telecommunications service” makes clear that definition applies “regardless of the facilities used.”

148. The MFJ Antitrust Consent Decree. Similar policy concerns to those at issue in the Computer Inquiries were at play when, in 1982, the Department of Justice (DOJ) reached a negotiated settlement with AT&T and filed an MFJ with the D.C. Federal District Court to end a decades-long antitrust case. As with the Computer Inquiries, a policy objective of the MFJ Regulatory regime was to guard against the risk of carriers harming competitive providers of data processing services. Among other things, the MFJ prohibited BOCs from providing “interexchage telecommunications services or information services.”

149. As in the Computer Inquiries, the MFJ distinguished between basic and enhanced services, but instead used the terms “telecommunications services” and “information services” respectively. The MFJ defined a “telecommunications service” as “the offering for hire of telecommunications facilities, or of telecommunications by means of such facilities.” In turn, “telecommunications” was defined as “the transmission, between or among points specified by the user, of information of the user’s choosing, without change in the form or content of the information as sent and received, by means of electromagnetic transmission medium, including all instrumentalities, facilities, apparatus, and services (including the collection, storage, forwarding, switching, and delivery of such information) essential to such transmission.” The court defined “information service” for the purpose of the MFJ as “the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information which may be conveyed via telecommunications.” The MFJ information service definition also included an exception analogous to the “adjunct-to-basic” exception under the Computer Inquiries. Specifically, “information service” did not include any use of any such capability for the management, control, or operation of a telecommunications system or the management of a telecommunications service. Over time, the courts overseeing the MFJ developed a limited body of precedent regarding what was an “information service,” but did not squarely address the question of how internet access service fit within the MFJ’s definitional framework.

150. The RIF Order’s invocation of MFJ precedent to support its classification decision reflects significant flaws. To begin, its reliance on that precedent was predicated in part on the 1996 Act’s use of the information service definition established in the MFJ, a fact which we do not dispute when placed in the proper context, as described below. But the historical context shows that Congress did not necessarily intend for such reliance. Because the D.C. Circuit also was not presented with the considerations we identify here for giving little weight to MFJ precedent, its acceptance of certain of the RIF Order’s conclusions based on MFJ precedent in Mozilla does not undercut our contrary conclusions here. Unlike with the Computer Inquiries, which the Commission found Congress did not intend the 1996 Act’s definitional framework to supplant, the 1996 Act expressly abrogated the MFJ’s requirements, and replaced them with those enacted as part of the 1996 Act. Indeed, the regulatory approach in the MFJ is diametrically opposed to that in the 1996 Act. While the 1996 Act’s regulatory approach broadly tracks that of the Computer Inquiries, with “telecommunications services” subject to common carrier regulation and “information services” not subject to common carrier regulation, under the MFJ, an “information service” classification led to maximal regulation—a complete ban on the provision of the service—for the carriers subject to that regulatory regime. Thus, the relevance of MFJ precedent is better viewed narrowly, rather than expansively, as done in the RIF Order, given the origins of that precedent in a regulatory framework Congress expressly chose to displace.

151. The RIF Order’s reliance on MFJ precedent is also contrary to our measured approach, and thereby suffers from the same faults it claimed plagued the 2015 Open Internet Order’s reliance on the Computer Inquiries precedent—namely, viewing the precedent out of context and making imperfect analogies without adequately accounting for potentially distinguishing technical details and the regulatory context. It exhibited this practice most prominently by ignoring the MFJ framing of maximal regulation of information services. But it also mischaracterized specific precedent it relied upon.

152. For instance, the RIF Order, and some commenters, mischaracterized MFJ precedent “analyzing ‘gateway’ functionalities by which BOCs would provide end users with access to third party information services.” While the RIF Order acknowledged “that gateway functionalities and broadband internet access service are not precisely coextensive in scope,” it nonetheless purported to “find similarities between functionalities such as address translation and storage and retrieval to key functionalities provided by ISPs as part of broadband internet access service,” and claimed that “the court found such gateway and similar functionalities independently sufficient to warrant an information service classification under the MFJ.” CTIA quotes from the 1987 MFJ Initial Gateway Decision to argue that gateway services “rang[ed] from mere database access to such sophisticated services as teleshopping, electronic banking, order entry, and electronic mail.” But in the quoted passage the court is describing such services generally, not specifically the offered BOC gateway service. This characterization of the MFJ court’s conclusions is misleading, at best. Read in context, it is not evident the MFJ court concluded that the same features of translation and storage and retrieval features of the gateway service were
independently sufficient grounds for an information service classification. In relying on the court’s treatment of “address translation,” the RIF Order cited a high-level statement from the court “that the transmission of information services at issue there ‘involves a number of functions that by any fair reading of the term ‘information services’ would be included in that definition.’” But the court never concluded that address translation was important to its conclusion that the gateway service is an information service. It merely listed address translation as one of the five functions that were part of the “infrastructure necessary for the transmission of information service,” and there is no basis for concluding that all five of these functionalities were independently sufficient to justify an information service classification. Indeed, when confronted with arguments that “the Regional Companies are entitled to provide [address translation] even now under the decree as part of the permissible ‘forwarding or routing’ functions of ‘information access,’” the court did not respond by asserting that it actually constituted an information service, but instead by pointing out that “the Court has concluded otherwise, particularly since section IV(F) prohibits interchange routing.” Further, as to some of the other listed service components, the MFJ court appears to strongly suggest that it might not cause the gateway service to be classified as an information service. In sum, the notion that the footnote relied on by the RIF Order should be read to suggest that each function of the gateways was independently sufficient to constitute an information service seems highly doubtful and is at most ambiguous. Nor are we persuaded to reach a contrary conclusion by a high-level assertion by the court that a carrier’s “gateway proposal appears to be a variant” of “information services.” Although the MFJ court analyzed storage and retrieval as a distinct issue, the court’s view of that functionality encompassed that services “such as voice messaging, voice storage and retrieval (VSR), and electronic mail,” and therefore are not coextensive with BIAS. We also note that RIF Order did not address the D.C. Circuit’s conclusion that the gateway service included a separate offering of telecommunications transmission, similar to the Commission’s conclusion in the Advanced Services Order that DSL included a separate offering of transmission. For this reason, as well as the other concerns we raise in relying on this case and the MFJ precedent in general, we conclude that we need not adjudicate whether the MFJ permitted the generation of information by BOCs instead of their transmission or whether that distinction is relevant to the classification determination we make in the Order.

153. We also conclude the RIF Order misinterpreted the single MFJ case it relied upon in concluding that the telecommunications systems management exception to the information service definition should exclude functions directed at end users or customers. While Mozilla accepted the RIF Order’s analysis of the MFJ case as reasonable, it did not conclude that it was the only or best reading. In classifying Telecommunications Device for the Deaf (TDD) service as an information service, the MFJ court concluded that that “the very crux and purpose” of TDD service was the “transformation of information” and “it is patently obvious that what is being sought does not involve the internal management of Bell Atlantic.” Although the MFJ court noted that the telecommunications systems management exception “was directed at internal operations, not at services for customers or end users,” the facts did not require the court to meaningfully grapple with the full meaning of the exception.

154. In all events, the MFJ court’s view of the telecommunications systems management exception is not inconsistent with the view we reiterate in the Order that a service can fall under the 1996 Act’s exception if it is used by the provider to manage, control, or operate a telecommunications system, even if the service may also benefit end users. Indeed, the court also explained that it had applied that exception to “allow[ ] the regional companies to provide directory assistance to their own customers,” which unambiguously provides benefits for callers. Likewise, the Mozilla court recognized that an evaluation of provider and customer benefit from a given function involved “a spectrum or continuum” that “requires a decider to select a point where both ends are in play.” Thus, to the extent that these MFJ court precedents are relevant to our classification analysis, they do not clearly show that the relevant functions must not be so significantly focused on benefiting end users or customers (rather than providers) to fall within the telecommunications systems management exception.

2. Post-1996 Act Classification Decisions

155. As mentioned above, when Congress enacted the 1996 Act, it codified statutory definitions that reflected the dichotomy of services established by the Computer Inquiries and MFJ frameworks. Specifically, the 1996 Act’s definitions of “telecommunications service” and “information service”—including the telecommunications systems management exception to the definition of “information service”—largely track the definitions of those same terms in the MFJ. We note that while Congress adopted the terminology of the MFJ’s definition of “information service,” for the reasons we discussed above, we reject the view that Congress thereby intended that the Commission would be bound by MFJ precedent going forward. And the 1996 Act’s regulatory approach to that dichotomy of services broadly tracks that of the Computer Inquiries’ treatment of basic services, enhanced services, and adjunct-to-basic services, with “telecommunications services,” inclusive of associated services that fall into the telecommunications systems management exception, subject to common carrier regulation and “information services” not subject to common carrier regulation. As noted, just two years after the 1996 Act’s passage, the Commission confirmed that Congress had incorporated the Commission’s prior classification scheme under the Computer Inquiries in adopting the 1996 Act. And the Supreme Court affirmed that understanding in Brand X, stating that “Congress passed the definitions in the Communications Act against the backdrop of [the] regulatory history, and we may assume that the parallel terms ‘telecommunications service’ and ‘information service’ substantially incorporated their meaning, as the Commission has held.” We disagree with NCTA that the sole fact that Congress enacted the terms “telecommunications service” and “information service” “against the backdrop of [the] Commission’s own refusal to treat enhanced service offerings . . . as ‘basic,’” provides evidence of “Congress’s intent to classify broadband as an information service.” NCTA attempts to connect the dots by claiming that the Commission classified “the forerunners of broadband” as enhanced services, but it only cited to a single Bureau-level order that projected that Congress viewed a service wholly dissimilar from modern BIAS as an enhanced service. And although
Commission precedent did treat “internet access” as it existed around time of the 1996 Act as an enhanced service, as we make clear below, the nature of BIAS is significantly different than the Commission’s understanding of internet access during that period of time.

156. In implementing the 1996 Act, the Commission harmonized its earlier classification decisions with the 1996 Act’s new terms for the sake of providing regulatory certainty, and continued to draw on such pre-1996 Act precedent for support in classifying services under the 1996 Act’s categories. There was no need for the Commission to consider reconciling the MFJ with the 1996 Act because section 601(a)(1) of the 1996 Act expressly replaced the MFJ’s requirements with those enacted as part of the 1996 Act. Over the course of almost three decades since the passage of the 1996 Act, the Commission has considered the regulatory classification of a variety of services that relate to internet connectivity. In those decisions, the Commission has debated the practical significance of the Computer Inquiries and later classification decisions that preceded the decision under consideration. But as was observed by Justice Scalia in his Brand X dissent, the actual differences in Commission classification decisions have comparatively little to do with interpretation of statutory terms—like “offer”—and instead turn principally on the best understanding of particular facts, such as “the identity of what is offered.” As we describe below, however, over the span of time since the 1996 Act’s enactment, the underlying service that ISPs offer consumers, and indeed, what constitutes an internet service during that period of time, but also to consider how modern-day BIAS is classified as an information service under the 1996 Act. Some commenters observe that Commission actions shortly after the adoption of the Act can be particularly persuasive evidence of Congressional intent. But that does not provide a justification for attempting to apply early Commission decisions implementing the 1996 Act outside their logical context, or for overriding the direction gleaned from the text and statutory context. We thus reject arguments that neglect the material differences between present circumstances for BIAS and decisions like the Stevens Report. In our decision in the Order, we lay out the facts concerning how modern-day BIAS is offered based on how it functions and is perceived, and follow those facts to the most logical outcome under the best reading of the statutory text. In doing so, as detailed above, we find that BIAS is best understood as a telecommunications service under the Act’s definitional framework.

157. Stevens Report. When the Commission first considered how best to classify “internet access service” under the 1996 Act’s service, being at a nascent stage of development, differed substantially from the BIAS we classify in the Order in how it was offered, and how consumers perceived the service. In 1997, for the purpose of implementing the universal service provisions of the 1996 Act, Congress directed the Commission to review, inter alia, the definitions of the term “information service,” “telecommunications,” and “telecommunications service,” including how those definitions apply “to mixed or hybrid services and the impact of such application on universal service definitions and support . . . including with respect to internet access.” In response, in 1998, the Commission adopted a Report to Congress commonly referred to as the Stevens Report. We disagree with Consumer Action for a Strong Economy’s argument that the 1996 Act, in “creat[ing] a new framework for Title I ‘Information Services’ as a modern alternative to sclerotic, New Deal-era Title II rules[,]” reflected a “bipartisan consensus for lightly regulating high-speed broadband.” But even assuming such a consensus had existed with respect not only to the fundamentally different internet access service of the time, but also to broadband at such a nascent stage of its development, the Stevens Report makes clear that Congress preferred that the Commission decide its classification. And indeed, as we discuss below, the very year the Commission did so with respect to “internet access service” in the Stevens Report, the Commission also classified broadband provided via DSL as a telecommunications service subject to Title II. We also disagree with LARIAT’s contention that “Title II itself—with provisions explicitly mentioning differing charges dependent upon the source, destination, time, and purpose of communications—was not designed to regulate the internet, especially one that was ‘neutral.’” Beyond the fact that LARIAT provides only a vague description of the provisions it claims are not well-suited to regulating BIAS—and does not appear to consider how tailored forbearance could ameliorate such concerns—we find that the Stevens Report makes clear that Congress did not intend to foreclose application of Title II to new services.

158. At the time of the Stevens Report, internet access service providers typically did not own facilities or provide last-mile transmission services, instead providing their services over an unaffiliated telecommunications carrier’s public switched telephone network (PSTN). ISPs primarily offered their customers a suite of application-layer services such as World Wide Web, newsgroups, and electronic mail using their own computer systems. Some ISPs did not yet even provide their subscribers direct access to the wider internet, instead solely offering portals to “walled gardens” of proprietary content. In order to reach these application-layer services, an end user typically had to purchase a telecommunications service from an unaffiliated carrier. The Stevens Report drew on the “intertwined” language of Computer II, and coined the term “inextricably intertwined” to assert its belief that, because the “core of the internet and its associated services” offered by providers were “neutral,” “broadband over the internet,” especially one that was “neutral,” was not designed to regulate the internet. The Stevens Report provided only a vague description of the provisions it claims are not well-suited to regulating BIAS—and does not appear to consider how tailored forbearance could ameliorate such concerns—we find that the Stevens Report makes clear that Congress did not intend to foreclose application of Title II to new services.
and constituted a tiny fraction of all internet connections. As we establish above, modern-day BIAS both functions and is perceived vastly differently from the “internet access service” considered in the Stevens Report, so we thus disagree with commenters who argue that the Stevens Report’s assessment of the service offered at the time has precedential value to our decision making in the Order.

160. Advanced Services Order and Order on Remand. In the same year that the Commission adopted the Stevens Report, the Commission first classified an early form of BIAS—namely, digital subscriber line (DSL) service provided over the wireline telephone network—as a telecommunications service. The Advanced Services Order was subject to a voluntary remand requested by the Commission. The Commission explained in the 2015 Open Internet Order why the further history of the Advanced Services Remand Order (65 FR 7744 (Feb. 16, 2000)) is not relevant here. In the 1998 Advanced Services Order, the Commission defined DSL-based advanced service as encompassing: (1) the transmission of a customer’s data traffic from the customer’s modem to the telephone company’s central office; (2) the transmission between the central office and an interconnection point across the telephone company’s packet switched network; and (3) interconnection arrangements with other providers as necessary to fulfill the service. The Commission distinguished this service—as we do in the Order with our definition of BIAS—from what it considered to be “internet access”: the same bundle of application-level offerings (e.g., World Wide Web, email, newsgroups, and portals) described in the Stevens Report. The Commission therefore concluded that “[a]n end-user may utilize a telecommunications service together with an information service, as in the case of internet access. In such a case, however, we treat the two services separately: the first service is a telecommunications service (e.g., the [DSL-enabled transmission path], and the second service is an information service, in this case internet access.” In the 1999 Advanced Services Remand Order, the Commission affirmed its conclusion that “[D]SL-based advanced services constitute telecommunications services as defined by section 3(46) of the Act.” The definition of telecommunications service is now in section 3(53) of the Act. DSL-based broadband services were thus, under these Orders, to Title II in relevant part. In light of the factual circumstances underlying the Commission’s classification of DSL, we find the Advanced Services Order informative as to the best classification of BIAS today. Although the classification decision in the Advanced Services Order arose in the context of the Computer II requirement that facilities-based carriers offer the transmission underlying their enhanced service offering on a common carrier basis, and therefore the DSL transmission service was not a “retail” service within the meaning of the resale obligation in section 251(c)(4) of the Act, that does not alter the marketplace reality that this common carrier transmission service was nevertheless available for purchase by retail end users as well as wholesale customers, despite the RIF Order’s suggestion to the contrary. Retail end users could rely on that common carrier transmission service to access the application-layer services offered by the ISPs of the time, consistent with the explanation of telecommunications services and information services that the Commission laid out in the Stevens Report. The RIF Order’s further complaint that DSL common carrier transmission service “[d[id not] itself provide internet access” does not demonstrate that the purchase from two suppliers rather than a single supplier is inherently material to the classification analysis.

161. We disagree with the U.S. Chamber of Commerce which argues that the Advanced Services Order’s classification of “internet access” as an information service supports “the textual reading . . . that BIAS is best classified as a Title I ‘information service.’” As we explain here, the “internet access” described in the Advanced Services Order was fundamentally different from the BIAS we classify in the Order, being a non-facilities-based suite of application-layer information services to which users connected via their DSL-based broadband provider. Today’s BIAS, conversely, more closely resembles the DSL-based broadband classified as providing telecommunications service. We find that BIAS (as defined in the Order) provides a transparent conduit to edge providers’ information services. We also disagree with NCTA’s attempt to discount the relevance of the Advanced Services Order’s classification of DSL-based broadband service as a telecommunications service by claiming that the Order only considered the classification of “wholesale DSL transmission[,] which incumbent telephone companies historically offered to ISPs such as AOL or Earthlink as a telecommunications service unbundled from internet access, [rather than] retail broadband service.” This reading defies the very language in the Advanced Services Order which clearly considered the service to be offered both to end users and to ISPs.

162. Classification of Cable Modem Service. The regulatory classification of cable modem service was unaddressed when the Ninth Circuit had occasion to consider it in City of Portland. There, the court found that cable modem service was a telecommunications service to the extent that the cable operator “provides its subscribers internet transmission over its cable broadband facility.” The court found that cable modem service, “like [the internet access service of] other ISPs, . . . consists of two elements: a ‘pipeline’ [cable broadband instead of telephone lines], and the internet service transmitted through that pipeline,” but “unlike [the internet access service of] other ISPs, [the cable modem service provider] controls all of the transmission facilities between its subscribers and the internet.” The Ninth Circuit also noted that the Communications Act “includes cable broadband transmission as one of the ‘telecommunications services’ a cable operator may provide over its cable system.” Following City of Portland, two other courts had the opportunity to consider the application of cable modem service, neither of which we find undercut the weight the Ninth Circuit’s conclusion lends to our independent conclusion that today’s offering of BIAS is best classified as a telecommunications service.

163. Three months after the City of Portland decision, the Commission issued the Cable Modem Notice of Inquiry (65 FR 60441 (Oct. 11, 2000)), which sought comment on whether cable modem service should be classified as a telecommunications service under Title II or an information service subject to Title I. That proceeding culminated with the Cable Modem Declaratory Ruling (67 FR 18848 (Apr. 17, 2002)). Based on a factual record that had been compiled at that time, the Commission described cable modem service as “typically includ[ing] many and sometimes all of the functions made available through dial-up internet access service, including content, email accounts, access to news groups, the ability to create a personal web page, and the ability to retrieve information from the internet.” The Commission found that cable modem service was “an offering . . . which combines the transmission of data with computer
processing, information provision, and computer interactivity, enabling end users to run a variety of applications.” The Commission further concluded that, “as it [was] currently offered,” cable modem service as a whole met the statutory definition of “information service” because its components were best viewed as a “single, integrated service that enables the subscriber to utilize internet access service,” with a telecommunications component that was “not . . . separable from the data-processing capabilities of the service.” We disagree with the U.S. Chamber of Commerce which argues that the Cable Modem Declaratory Ruling’s classification of cable modem service as an information service supports “the textual reading . . . that BIAS is best classified as a Title I ‘information service.’” As ACA Connects explains, the Commission arrived at its conclusion after reviewing the factual record of how providers offered, and consumers perceived, the service at the time. However, we disagree with both commenters that somehow, this 22-year-old factual record has bearing on the classification of modern-day BIAS. As we amply show above, the record we received confirms that providers’ offering of broadband service has indeed changed dramatically, and so have consumers’ perception of the service. While the Cable Modem Declaratory Ruling did not mention the “inextricably intertwined” language from the Stevens Report or the earlier “intertwined” language from Computer II, it followed their classification approach in concluding that cable modem service, as viewed by the end user, was dominated by the information service aspects. The Brand X Court cited to the Stevens Report’s use of “inextricably intertwined” to analogize to the Cable Modem Declaratory Ruling classification analysis.

164. The Cable Modem Declaratory Ruling faced a legal challenge, but was ultimately upheld by the U.S. Supreme Court in Brand X. Brand X recognized that the Cable Modem Declaratory Ruling’s Title I classification was a “reversal of agency policy” and “change [in] course” from the Commission’s original classification of broadband in the Advanced Services Order, but held that it was permissible under the broad deference required by Chevron. Specifically, the Court held that the word “offering” in the Act’s definitions of “telecommunications service” and “information service” is ambiguous, and that the Commission’s finding that cable modem service is a functionally integrated information service was a permissible, though perhaps not the best, interpretation of the Act. NCTA misleadingly states that the Court’s conclusion in Brand X “confirmed that Congress never clearly intended for broadband to be treated as a telecommunications service.” By holding that the term “offering” in the 1996 Act is ambiguous, the Court also confirmed that Congress never clearly intended for broadband to be treated as an information service, and thus deferred to the Commission’s decision under Chevron. The Court explained that the Act’s definitions turn on what the cable modem service provider is understood to be “offering” to consumers, which in turn depends on what consumers reasonably perceive the offering to be. Based on the administrative record before the Commission in 2002, the Court found “reasonable” “the Commission’s understanding of the nature of cable modem service”—namely, that “[w]hen an end user accesses a third party’s website,” that user “is equally using the information service provided by the cable company that offers him internet access as when he accesses the company’s own website, its email service, or his personal web page...” citing as examples the roles of DNS and caching. In the wake of Brand X, the Commission proceeded to adopt information service classifications of internet access service offered via wireline networks, power line networks, and wireless networks, though the Commission continued to recognize that ISPs could offer broadband transmission as a telecommunications service subject to Title II, and many did.

165. The Cable Modem Declaratory Ruling, and the successive decisions following it, are not determinative of the classification of modern-day BIAS. The Cable Modem Declaratory Ruling was based on a record developed in the early 2000s—when ISPs were still viewed as playing a crucial role in the availability of websites, email, newsgroup access, and the like. And the follow-on classification decisions substantially relied on the record compiled in the Cable Modem Declaratory Ruling proceeding. The factual circumstances, as characterized by the Commission then, differ substantially from the functional and marketplace realities of BIAS today, to say nothing of the fact that none of these decisions considered the applicability of the telecommunications systems management exception to the information service definition. The Cable Modem Declaratory Ruling and the Wireline Broadband Classification Order (70 FR 60222 (Oct. 17, 2005)) mentioned the exception in quoting the statutory definition of “information service,” but did not analyze its potential applicability, such as to DNS.

166. While the Cable Modem Declaratory Ruling itself has limited relevance to our classification of modern-day BIAS, the Supreme Court’s opinions on it lends some support to the telecommunications classification we reach in the Order. In upholding the Cable Modem Declaratory Ruling on reasonableness grounds, every Justice joined opinions that, at best, showed that the Cable Modem Declaratory Ruling’s understanding of the factual circumstances was becoming increasingly outdated even at the time. Justice Thomas, writing for the majority, noted that “our conclusion that it is reasonable to read the Communications Act to classify cable modem service solely as an ‘information service’ leaves untouched Portland’s holding that the Commission’s interpretation is not the best reading of the statute.” Justice Breyer’s concurrence cautioned that the Commission’s information service classification was “perhaps just barely” permissible. And in dissent, Justice Scalia, joined by Justices Souter and Ginsburg, found that the Commission had adopted “an implausible reading of the statute” and that “the telecommunications component of cable-modem service retains such ample independent identity” that it could only reasonably be classified as a separate telecommunications service. As we demonstrate above, modern BIAS is now entirely divorced from providers’ information service offerings on which the Cable Modem Declaratory Ruling rested its classification decision. If cable modem service may have been best understood as a telecommunications service then, modern BIAS most certainly is best understood as a telecommunications service now.

167. 2015 Open Internet Order. In 2015, the Commission first considered the classification of “broadband internet access service,” as defined by the 2010 Open Internet Order (76 FR 59192 (Sept. 23, 2011)), narrowly focused on the transmission component of the service and any capabilities that are incidental to and enable the operation of that service, and irrespective of the technology over which that service is provided. In doing so, as we do here, the Commission reviewed its prior classification decisions concerning dial-up internet access service, DSL-based advanced service, cable modem service, wireline broadband service, and wireless broadband service, and weighed the relevance of such decisions
on a classification of BIAS based on the factual circumstances under which it was then offered. The Commission concluded that fixed and mobile “broadband internet access service” is a telecommunications service, finding that “broadband internet access service, as offered by both fixed and mobile providers, is best seen, and is in fact most commonly seen,” as a “separate ‘offering’” of transmission capacity that “is today sufficiently independent of . . . information services” such as “email and online storage.” The Commission first defined “broadband internet access service” in the 2010 Open Internet Order. The 2015 Open Internet Order also concluded that the bundling of certain services, such as DNS and caching, with broadband internet access service, does not “turn broadband internet access service into a functionally integrated information service.”

168. In 2016, the D.C. Circuit upheld the 2015 Open Internet Order in full in USTA. Requests for rehearing en banc were denied in 2017 in USTA II, 855 F.3d 391. Of note, two judges concurring in the denial of rehearing en banc reiterated Brand X's conclusion that a telecommunications service classification was both reasonable and the best reading of the Act. The court found that the Commission’s conclusion that consumer perception of BIAS as a separate offering of telecommunications found “extensive support in the record,” “justifying” the Commission’s decision to reclassify broadband as a telecommunications service.” It also affirmed the Commission’s view that DNS and caching fall under the telecommunications systems management exception because they “facilitate use of the network without altering the fundamental character of the telecommunications service.” Similarly, the court found “reasonable and supported by the record” the Commission’s classification of mobile BIAS as a commercial mobile service. It also concluded that the Commission fully justified its change in course.

169. RIF Order. In 2017, the Commission reclassified the technology-agnostic BIAS as an information service, reversing the conclusion of the 2015 Open Internet Order. While maintaining the same narrowly drawn definition of BIAS used since the 2010 Open Internet Order, the Commission nevertheless considered BIAS (1) to provide subscribers the capability “to engage in all of the information processes listed in the information service definition”; (2) to involve “information processing functions itself, such as DNS and caching”; and (3) to be inextricably intertwined with other information-processing capabilities offered by the BIAS provider or third parties. In conducting its factual analysis, the RIF Order relied on the Cable Modem Declaratory Ruling, along with Brand X, in addition to the isolated MFi precedent we previously addressed.

170. In addition to the RIF Order’s misapplication of the statutory definitions, which we discuss above, its application of Commission precedent to arrive at its preordained information service classification was flawed. By the time the RIF Order ventured to reconsider the classification of BIAS, the factual characterizations in the Cable Modem Declaratory Ruling, which Brand X showed were becoming outdated even at the time, were positively antiquated. Nevertheless, the RIF Order at times erroneously leaned on that proceeding’s factual record in its analysis of modern-day BIAS.

171. On review in Mozilla, the D.C. Circuit was skeptical of the RIF Order’s classification decision, and in particular its reliance on Brand X and the underlying Cable Modem Declaratory Ruling. As Judge Millett pointed out in her Mozilla concurrence, and as we likewise find here: “Today, the typical broadband offering bears little resemblance to its Brand X version. The walled garden has been razed and its fields sown with salt. The add-ons described in Brand X—a cable company’s email service, its web page, and the ability it provides consumers to create a personal web page,—have dwindled as consumers routinely deploy ‘their high-speed internet connections to take advantage of competing services offered by third parties,’ ” Although, the court ultimately upheld the RIF Order, it did so not because the RIF Order best represented the factual realities of the offering or most closely accorded with precedent, but under the judicial principles concerning deference and binding precedent. As Congress has granted the Commission the authority and responsibility to classify services, we are not so bound. Given the RIF Order’s flawed analysis of the statutory terms and misplaced reliance on aging conceptions of how internet access service is offered today, we thus decline to give the RIF Order’s classification determination any precedential value, and instead find that our classification of BIAS as a telecommunications service is not only the best reading of the statute under the factual circumstances of how BIAS is offered today but also best accords with Commission and court precedent.

D. Scope of Reclassification

172. Our classification decision continues to rely on the same definition of “broadband internet access service” the Commission has used since the 2010 Open Internet Order, which encompasses mass-market, retail data transmission and capabilities that are incidental to and enable its operation. We continue to exclude non-BIAS data services and clarify the framework for identifying those services. To the extent that the exchange of internet traffic by an edge provider or an intermediary with the BIAS provider’s network supports the capability to reach all or substantially all internet endpoints and enables the operation of the service, we find that BIAS includes such internet traffic exchange. However, we clarify that service to edge providers is not itself BIAS. We also continue to exclude premises operators and end users who provide access to their BIAS connections when not offered on a mass-market, retail basis.

1. Broadband Internet Access Service

173. We continue to define “broadband internet access service” as a mass-market retail service by wire or radio that provides the capability to transmit data to and receive data from all or substantially all internet endpoints, including any capabilities that are incidental to and enable the operation of the communications service, but excluding dial-up internet access service. We also continue to include in this term any service that we find to provide a functional equivalent of the service described in the definition, or that is used to evade the protections set forth in part 8 of the Commission’s rules. The Commission has retained this definition since it first defined broadband internet access service in the 2010 Open Internet Order, and a broad range of commenters support us continuing to do so. Our use of the term “broadband” in the Order includes, but is not limited to, services meeting the threshold for “advanced telecommunications capability.” We continue to exclude dial-up internet access service from the definition of BIAS because of the different market and regulatory landscape for that service. We also make clear that the definition of BIAS does not include VoIP service and we do not classify VoIP service in the Order. We do not, however, find it appropriate to define BIAS as solely the “commercial offering of an IP packet transfer service” because such a description would expand the scope beyond the focus of this proceeding and our actions in the Order.
Indeed, such a high-level—and therefore broad—definition could sweep in services using IP packet transfer for reasons completely unrelated to internet access.

174. As the Commission has previously determined, the term “broadband internet access service” includes services provided over any technology platform, including, but not limited to, wire, terrestrial wireless (including fixed and mobile wireless services using licensed or unlicensed spectrum), and satellite. “Fixed” broadband internet access service refers to a broadband internet access service that serves end users primarily at fixed endpoints using stationary equipment, such as the modem that connects an end user’s home router, computer, or other internet access device to the internet, and encompasses the delivery of fixed broadband service over any medium, including various forms of wired broadband service (e.g., cable, DSL, fiber), fixed wireless access (FWA) broadband service (including fixed services using unlicensed spectrum and cellular fixed wireless access), and fixed satellite broadband service. Cellular fixed wireless access refers to a specific subclass of FWA offered using 4G or 5G mobile technologies and shares the mobile network. “Mobile” broadband internet access service refers to a broadband internet access service that serves end users primarily using mobile stations, and includes, among other things, services that use smartphones or mobile-network-enabled tablets or devices as the primary endpoints for connection to the internet, as well as mobile satellite broadband service. We continue to encompass within the definition of broadband internet access service all providers of any such service, regardless of whether the BIAS provider leases or owns the facilities used to provide the service.

175. We disagree with the Information Technology and Innovation Foundation’s (ITIF) argument that our definition of BIAS undermines the applicability of the Open Internet rules we adopt by rendering the rules “essentially voluntary” as long as an entity offers a service that does not provide indiscriminate access to all or substantially all internet endpoints and discloses its network management practices. This argument conflates not providing BIAS at all with providing BIAS while violating the rules. Notably, if ITIF’s argument were true, it would also be the case that the transparency rule maintained by the RIF Order would also be voluntary, and yet ITIF did not raise this issue as a concern in that proceeding. A BIAS provider cannot simply declare that it is not providing BIAS; the determination is dependent on the nature of the service the BIAS provider offers, as reasonably understood by consumers. An ISP offering that is clearly identified and marketed to consumers as providing edited or curated internet access—rather than service that consumers reasonably understand and expect to provide indiscriminate access to all or substantially all internet applications and services of their choosing—would fall outside the scope of the Order, but an ISP may not provide consumers what appears to be ordinary mass-market broadband service and then engage in discriminatory practices that deny customers the service they reasonably expect. An ISP that currently provides BIAS but seeks to instead provide a service that falls outside the definition of BIAS, particularly as a means to avoid the service being subject to the Commission’s rules, may find that this exercise could have non-trivial commercial and regulatory consequences. That decision also may carry other important consequences. For example, an ISP that is not providing BIAS might not qualify to participate in Federal and State programs to fund broadband deployment and affordability, might not benefit from the Commission’s pole attachment rights under section 224 and rules concerning access to MTEs, and might not be able to petition the Commission under section 253 to preempt State and local requirements that prohibit the provision of the non-BIAS service.

176. Mass Market. We continue to find that a “mass-market” service is “a service marketed and sold on a standardized basis to residential customers, small businesses, and other end-user customers, such as schools and libraries.” The Commission has retained this interpretation of “mass market” since the 2010 Open Internet Order, and the record does not appear to require us to change this definition. In order to maintain consistency with this interpretation, we decline Ad Hoc Telecom Users Committee’s request to remove the word “small” from “small business” in considering what constitutes a “mass market” service. We note that in examining whether a service is “mass market,” how a service generally is marketed and sold, rather than the entity purchasing the service, is the key determination. In addition to including broadband internet access service purchased with support from the E-Rate, Lifeline, and Rural Health Care programs, as well as any broadband internet access service offered using networks supported by the High Cost program, “mass market” services include any broadband internet access service purchased with support from the Affordable Connectivit Program (or any successor program offering discounts to eligible households for standardized broadband service offerings) or the Connected Care Pilot Program. These programs statutorily support BIAS regardless of its classification status. Consistent with the 2015 Open Internet Order and RIF Order, and with broad record support, we continue to interpret mass market to exclude enterprise internet access service offerings as well as other services, such as Business Data Services (BDS), that do not provide access to all, or substantially all, internet endpoints. The services we exclude from being considered mass market exhibit distinct marketplace and technological characteristics from those of BIAS. They are typically offered and sold to large businesses through customized or individually negotiated arrangements and thus depart significantly from BIAS offerings. We make clear that enterprise services are excluded from the definition of BIAS even when they are supported by the Commission’s broadband access and affordability programs. No commenter opposes this approach. Our determination that enterprise services are not included within the definition of BIAS should not be understood to mean that non-private-carriage enterprise services cannot otherwise be subject to regulation as telecommunications services. We believe it is likely that at least some such services are indeed offered as telecommunications services and note that would be consistent with previous Commission statements that non-private-carriage enterprise services are telecommunications services.

177. Retail. We retain the word “retail” in the definition of BIAS and hold that BIAS includes retail service provided by both facility-based providers and resellers. In doing so, we maintain the definition of BIAS that the Commission has consistently applied since the definition originated in 2010. We therefore decline, at this time, INCOMPAS’s request to delete the word “retail” from the definition of BIAS. The applicability of the Commission’s reclassification and rules to wholesale services was not directly raised in the 2023 Open Internet NPRM and we find that it would be premature for the Commission to take further action regarding wholesale services based on the current record. For the same reasons, we decline Public Knowledge’s request that the Commission “clarify”...
that wholesale services are subject to Title II. Nevertheless, we agree with commenters that broadband wholesalers should not engage in anticompetitive practices or sell or operate their wholesale offerings in a manner that prevents resellers from offering retail broadband service that is in compliance with our BIAS rules. If wholesale providers did engage in such harmful practices, the Commission would be able to take action to address them pursuant to its Title II authority, without including those wholesale providers within the scope of BIAS. 

That wholesale services do not fall within the definition of BIAS does not mean that they do not fall within the ambit of Title II in some circumstances or otherwise may be subject to the Commission’s oversight under section 201(b), which provides the Commission authority to ensure that all practices “in connection with” BIAS are “just and reasonable.” We thus disagree with INCOMPAS’s suggestion that a specific classification of wholesale service as a telecommunications service is a necessary prerequisite for protecting consumers and resellers from the unjust or unreasonable actions of wholesale service providers. Indeed, we agree with INCOMPAS that the Commission “has the authority under sections 201 and 202 to adjudicate disputes between wholesalers and resellers of BIAS.”

178. We conclude that our approach should provide consumers with necessary protections without unfairly burdening resellers with violations resulting from the actions of their wholesale providers. Our BIAS definition includes services from both facilities-based providers and resellers, and therefore any BIAS rules we adopt apply to both categories of service providers. As explained in the 2015 Open Internet Order, while “a reseller’s obligation under the rules is independent from the obligation of the facilities-based provider that supplies the underlying service to the reseller, . . . the extent of compliance by the underlying facilities-based provider will be a factor in assessing compliance by the reseller.” Thus, if a reseller has employed reasonable measures to ensure it is able to comply with its obligations under our rules, non-compliance by the reseller’s underlying facilities-based provider will not be imputed to the reseller. What constitutes reasonable measures will depend on the factual circumstances, including the details of the reseller’s arrangements with the wholesale provider and the reseller’s diligence in seeking to enforce the terms of that arrangement. We not only expect resellers to take care that the service they choose to resell to retail customers would not expose them to compliance issues under our rules, but we also expect that facilities-based providers that choose to provide wholesale service will not sell a service that does not allow resellers to comply with our rules. In any event, we intend to monitor the wholesale service marketplace and will take appropriate prescriptive or enforcement action to protect consumers and resellers should the need arise.

2. Non-BIAS Data Services

179. We continue to exclude non-BIAS data services (formerly “specialized services”) from the scope of broadband internet access service. As the Commission explained in the 2015 Open Internet Order, non-BIAS data services are certain services offered by BIAS providers that share capacity with broadband internet access service over BIAS providers’ last-mile facilities but are not broadband internet access service or another type of internet access service, such as enterprise services. Such services generally share the following characteristics: (1) are only used to reach one or a limited number of internet endpoints; (2) are not a generic platform, but rather a specific “application level” service; and (3) use some form of network management to isolate the capacity used by these services from that used by broadband internet access services. These characteristics are non-exhaustive and do not comprise elements of a definition of non-BIAS data services. We clarify this in light of confusion in the record that the characteristics established in the 2015 Open Internet Order constituted elements of a definition of non-BIAS data service. Thus, services with these characteristics will not always be considered non-BIAS data services. In 2015, the Commission identified examples of some services that, at the time, likely fit within the category of non-BIAS data services. The Commission identified some BIAS providers’ existing facilities-based VoIP and IP-video offerings, connectivity bundled with e-readers, heart monitors, energy consumption sensors, limited-purpose devices such as automobile telematics, and services that provide schools with curriculum-approved applications and content as examples of non-BIAS data services.

180. Innovation and Investment. We anticipate that maintaining an exclusion of non-BIAS data services from the definition of BIAS will foster innovation and investment in BIAS and non-BIAS data services. We agree with Professor van Schewick that excluding non-BIAS data services from the scope of BIAS “allows applications to emerge that would not be able to function on the Open Internet because they need special treatment that the Open Internet cannot provide.” We further expect that our approach will guard against artificial marketplace distortions by providing a level playing field for like data services under our rules: those that fit the “core” definition of BIAS, represent its functional equivalent, or are used in an attempt to evade our rules governing BIAS will be treated the same under our rules, while data services that fall outside the scope of BIAS—whether established or new—will be treated comparably. Additionally, we anticipate that, under our regulatory approach, BIAS providers will be motivated to innovate and invest in the development and deployment of new technologies that will help enable them to meet growing network capacity demands for both BIAS and non-BIAS data services utilizing the same network infrastructure, rather than responding to those growing demands through blocking, throttling, paid prioritization, or other conduct harmful to the broader public interest.

181. Evasion and Enforcement. Key to promoting these benefits is ensuring that our exclusion of non-BIAS data services is not used as a means to evade the rules we place on BIAS, including the open internet rules we adopt in the Order. To do so, we will continue to closely monitor the development and use of these services and will act to prevent harm to the open internet, as necessary. We are especially concerned about activities that may undermine national security or public safety, hinder consumers’ access to or use of BIAS, or impede the ability of over-the-top services to compete with other data services. If we determine that a particular service is providing the functional equivalent of BIAS or is being used to evade the protections set forth in our rules, we will take appropriate action. We will be watchful of consumer retail offerings, and will evaluate if necessary whether they actually require isolated capacity for a specific functionality or level of quality of service that cannot be met over the open internet, but we will presume that application-level enterprise offerings do not evade our rules. For example, we are likely to find that connectivity for video conferencing offered to consumers would evade the protections we establish for BIAS if the video-conferencing provider is paying the
BIAS provider for prioritized delivery. Conversely, we are likely to find that connectivity for remote surgery is properly categorized as a non-BIAS data service given its “stringent requirements for reliability” and lack of latency that “cannot be met over the Open Internet.” We also will closely monitor any services that have a negative effect on the performance of BIAS or the capacity available for BIAS over time. We decline to explicitly state that non-BIAS service may not share capacity with BIAS, as Professor Peha requests, as this may inhibit innovative uses of existing capacity that do not otherwise harm the open internet. And we will take appropriate action if a non-BIAS data service is undermining investment, innovation, competition, or end-user benefits. To assist us in monitoring non-BIAS data services, we continue to require BIAS providers to disclose: what non-BIAS data services they offer to end users; whether and how any non-BIAS data services may affect the last-mile capacity available for, and the performance of, BIAS; and a description of whether the service relies on particular network practices and whether similar functionality is available to applications and services offered over BIAS.

182. Alternative Approaches. We resist calls from some commenters that we eschew this approach and instead adopt an abstract, expansive definition of non-BIAS data services and/or a more detailed list of such services, as doing so would not account for the evolving, innovative nature of these services and the importance of ensuring BIAS providers cannot evade our rules. Our approach aligns with the approach taken towards non-BIAS data services in the 2015 Open Internet Order. Adopting an abstract, expansive definition of non-BIAS data services would encompass services functionally equivalent to BIAS and those used to evade our rules for BIAS, contradicting our BIAS definition and potentially undermining our ability to address services that cause open internet, national security, public safety, or other harms we identify in the Order. Similarly, providing an extensive list of non-BIAS data services could harm consumers if BIAS providers develop methods to use an identified service on the list to somehow circumvent our rules. Moreover, a more detailed definition of non-BIAS data services would require us to accurately predict the forms that “functionally equivalent” services or services used to “evade” our rules could take in the future. The record here does not persuade us that we could reliably do so, nor would we be positioned to maintain and update such a list in a timely manner as new services are developed. Additionally, rather than promote innovation, as the European Telecom Operators’ Association suggests, developing an extensive and detailed list may instead constrain innovation by disincentivizing BIAS providers from offering or developing services that are not on the list.

183. Network Slicing. Consistent with the approach we lay out above, we decline at this time to categorize network slicing or the services delivered through network slicing as inherently either BIAS or non-BIAS data services, or to opine on whether any particular use of network slicing or the services delivered through network slicing would be considered a reasonable network management practice under the open internet rules we adopt below.

184. Network slicing is a technique that enables mobile network operators (MNOs) to create multiple virtualized subnetworks known as a “slice” using shared physical wireless network infrastructure and common computing resources. Network slicing is often described as a “logical” segmentation of the network, which means that each slice may correspond to a unique set of network management rules tailored for specific technical requirements, but without any physical division or dedication of network resources. MNOs can use network management rules to configure each slice for customized use cases and quality-of-service (QoS) targets. Network slicing is a key innovation of standalone 5G networks, which are in varying stages of deployment for different providers, and it cannot be deployed on non-standalone 5G networks (i.e., 5G networks with a 4G LTE core network).

185. Proponents of network slicing ask us to clarify that network slicing or certain services delivered using network slicing are “non-BIAS”—and thus not subject to Title II regulation—or are reasonable network management practices under our open internet rules. They argue that network slicing allows for the efficient management of finite mobile network resources and eliminates the need for the deployment of separate physical networks for different types of services. For instance, network slicing proponents contend that it allows MNOs to establish separate slices for mobile broadband and fixed wireless traffic, while simultaneously offering customized slices for enterprise private networks, video calls, and a variety of other uses. These supporters state that network slicing might be used for: augmented reality (AR)/virtual reality (VR), automotive, agriculture, energy, health, manufacturing, IoT, public safety, smart cities, and other functions. They further assert that network slicing is more resilient to cyberattacks because breaches can be contained in one slice and prevented from affecting other parts of the network.

186. Other commenters raise concerns about the implications of network slicing. They specifically express concern that network slicing will be used to circumvent our prohibition on paid prioritization, throttling, or unreasonable discrimination. Public Knowledge also contends that allowing network slicing for specialized services will negatively affect the quality and capacity of general internet access, and New America’s Open Technology Institute contends that exempting applications, content, or services delivered over a slice of a mobile network from the rules “is likely to harm mobile market competition,” particularly for “independent MVNO [mobile virtual network operators] competitors since they purchase wholesale bandwidth, cannot ‘slice’ their networks, and could also see their capacity and quality of service crowded out over time as the more profitable edge providers are pushed to pay for special delivery” over the large mobile networks.

187. The record reflects that the potential use cases for network slicing are still under development and that MNOs are in the early stages of adopting the technique, with some moving more quickly than others. For instance, T-Mobile states it has begun offering a network slicing beta program that allows developers to begin building advanced video calling functionality using its infrastructure. Other MNOs are actively developing their own network slicing offerings, and equipment manufacturers are also preparing to update their operating systems to support network slicing applications. Given the nascent nature of network slicing, we conclude that it is not appropriate at this time to make a categorical determination regarding all network slicing and the services delivered through the use of network slicing. We agree with NCTA that we “should not allow network slicing to be used to evade [the] Open internet rules” that we adopt. In the meantime, MNOs should evaluate whether their particular uses of network slicing fall within the definition of BIAS, and if so, ensure their uses of network slicing are consistent with the network rules we adopt in the Order. MNOs may also use the advisory opinion process we...
establish below as a tool to seek Commission guidance on their use of network slicing. And to the extent uses of network slicing fall outside of BIAS, we will closely monitor those uses to evaluate if they are providing the functional equivalent of BIAS, being used to evade our open internet rules, or otherwise undermining investment, innovation, competition, or end-user benefits in the internet ecosystem. We will also monitor if network slicing affects the last-mile capacity available for, and the performance of, BIAS. If necessary, we will take action to address harmful uses of network slicing. We believe this approach will allow for the continued development and implementation of network slicing while at the same time ensuring that the use of network slicing in connection with BIAS conforms to the classification and rules adopted in the Order.

3. Internet Traffic Exchange

188. Consistent with the 2015 Open Internet Order, we find that BIAS, as defined above, includes the exchange of internet traffic by an edge provider or an intermediary with the BIAS provider’s network (i.e., internet peering, traffic exchange, or interconnection), to the extent that the exchange supports the “capability to transmit data to and receive data from all or substantially all internet endpoints . . . [and] enable the operation of the communications service.” As the Commission explained in 2015, “[t]he representation to retail customers that they will be able to reach all or substantially all internet endpoints necessarily includes the promise to make the interconnection arrangements necessary to allow that access” and “the promise to transmit traffic to and from those internet end points back to the user.” We disagree with the Information Technology Industry Council that “interconnection, peering, traffic exchange, . . . and similar arrangements should be excluded from the definition of BIAS.” For a BIAS provider to offer to its subscribers the capability to reach all or substantially all internet endpoints, it must make arrangements with other network operators that have the capability (whether via its own network or via another interconnected network) to reach those endpoints. Indeed, this system of interconnection is the core concept of the “internet”—it is a network of networks. We also conclude that the Commission’s findings and rationale regarding internet traffic exchange in the 2015 Open Internet Order—i.e., edge providers resulting from internet traffic exchange is derivative of BIAS and constitutes the same traffic to the consumers—remain valid. The Ad Hoc Broadband Carrier and Investor Coalition asks us to confirm that edge service “would be treated as part of BIAS only to the extent they are offered as part of a ‘mass-market retail’ internet access service.” Internet traffic arrangements are derivative of all services that meet the definition of BIAS, which not only includes mass-market retail services, but also services that provide the functional equivalent of BIAS or that evade the protections set forth in part 8 of the Commission’s rules. We observe that the BIP Order does not appear to dispute the Commission’s previous conclusion that BIAS includes internet traffic exchange, and instead determined that internet traffic exchange arrangements were appropriately regulated as an information service by virtue of its conclusion that BIAS is an information service. Many commenters support our approach. Additional commenters, by supporting our adoption of rules governing internet traffic exchange arrangements, also support sub silentio the inclusion of internet traffic exchange within the scope of BIAS.

189. We disagree with USTelecom’s arguments that the D.C. Circuit in USTA erred in concluding that the Commission has the authority to include internet traffic exchange within the scope of BIAS. USTelecom first asserts that sections 251(a), 251(c)(2), and 201(a) of the Act, which concern interconnection, “refute[] any notion that classification of a retail service as a Title II common-carrier service carries with it authority for the Commission to regulate on a common-carrier basis the terms and conditions on which those retail providers interconnect.” USTelecom specifically asserts that were this not the case, “the specific limitations on the Commission’s authority in Sections 251(c)(2) and 201(a) would be rendered obsolete.” But USTelecom rests its conclusion on the mere existence of these provisions and not any express statutory language prohibiting further Commission authority over interconnection. USTelecom’s understanding of section 201(a) is undercut by the history of the Commission’s treatment of interconnection and traffic exchange-related matters as cognizable under section 201(b). Nor does USTelecom grapple with the fact that section 251 expressly preserves the Commission’s prior authority under section 201 in its entirety. Thus, we do not read section 201(a) and/or section 251(c)(2) as limiting other authority as relevant here—notably including section 201(b). Our regulatory approach to the traffic exchange element of BIAS also is far removed from the type of case-by-case orders for physical interconnection between two carriers that is the subject matter of the interconnection requirements of section 201(a). We separately note that under section 251 “the term ‘interconnection’ refers solely to the physical linking of two networks, and not to the exchange of traffic between networks.”

190. Assuming, arguendo, that USTelecom were correct that the Commission lacks authority to include internet traffic exchange within the scope of BIAS, it goes on to claim that “[i]n the absence of such implicit authority,” the Commission may only regulate internet traffic exchange arrangements “if the Commission classified such arrangements as a telecommunications service,” which it cannot do given that “such arrangements by definition involve information service providers on both sides.” Importantly, USTelecom conspicuously ignores the statutory prescription of section 201(b) of the Act that all activities performed “in connection with” a telecommunications service be just and reasonable. For purposes of section 201(b), it does not matter whether the practice, classification, or regulation itself involves a separate telecommunications service if it is provided “in connection” with a telecommunications service. Accordingly, and as the USTA court affirmed, we need not classify internet traffic exchange arrangements as telecommunications services for the retail service that depends upon such arrangements for its operation to be within the scope of our Title II regulatory authority. We also disagree with USTelecom that all internet traffic arrangements “by definition involve information service providers on both sides” as that presumes that BIAS is an information service, which as we conclude in the Order, it is not.

191. Lastly, we dispute USTelecom’s characterization that the inclusion of internet traffic exchange within the scope of BIAS is flawed because we are compelling BIAS providers to offer internet traffic exchange arrangements on a common carrier basis when they “do not satisfy the NARUC test for classifying a service as common carriage rather than private carriage.” In offering BIAS to its end-user customers, a BIAS provider has voluntarily assumed an obligation to arrange the transfer of that traffic on and off its network. BIAS providers hold themselves to carry the traffic desired by the BIAS provider’s end-user customers.
regardless of source and regardless of whether an edge provider has a specific arrangement with the BIAS provider. While broadband providers may not need to enter into any specific agreement with any specific traffic exchange partner, by choosing to offer BIAS, they have bound themselves to enter into such agreements in general. In the absence of such agreements, they would be unable to provide BIAS because users would be unable to reach “all or substantially all internet endpoints.” Thus, our treatment of internet traffic exchange is based on the marketplace realities of how BIAS is offered today, not based on any compulsion that BIAS providers enter any arrangements on a common carriage basis. At the same time, nothing rules out those arrangements being common carriage arrangements if, as a factual matter, that is, in fact, how they are offered. Whether an offering is private or common carriage does not depend upon what a provider may assert is the nature of the offering, but rather on the factual particulars of how the service is offered and to whom. Therefore, simply because a BIAS provider’s terms of service disclaims offering internet traffic exchange on a common carrier basis does not make it so. Additionally, as the Commission did in 2015, we apply a case-by-case approach to exercising our section 201(b) authority over internet traffic exchange underlying retail BIAS offerings, and we do not concede—and USTelecom has not demonstrated—that such regulatory oversight will in practice require BIAS providers to enter traffic carriage agreements with edge providers or intermediaries in a way that, per se, requires them to act as common carriers.

4. Service Furnished to Edge Providers

192. We agree with ICG’s contention that edge service—insofar as the term “edge service” refers to “the service that the Verizon court identified as being furnished to the edge”—is not itself BIAS. In its review of the 2010 Open Internet Order, the D.C. Circuit in Verizon concluded that “in addition to the retail service provided to consumers, ‘broadband providers furnish a service to edge providers,’” and in the 2015 Open Internet Order, the Commission agreed that a two-sided market exists and that the beneficiaries of the non-consumer side are or potentially could be all edge providers.” The RF Order reflected the same understanding of the marketplace. Thus, we agree that any service that AS providers provide to edge providers is at least technically distinct from the “retail” and “mass market” service that we define BIAS to be. At the same time, we reaffirm the understanding that “the ‘service to edge providers’ is subsumed within the promise made to the retail customer of the BIAS service.” Whether the last-mile BIAS provider carries the traffic directly from an edge provider’s endpoint on the BIAS provider’s own network or from a data center or other interconnection point does not change the fact that the BIAS provider is carrying that traffic, on behalf of the edge provider, to the BIAS subscriber as part of the subscriber’s broadband internet access service. Just as BIAS can and does include the exchange of internet traffic without requiring us to classify the underlying service arrangements into which BIAS providers enter to enable that exchange of traffic, so too can and does BIAS include the transmission of edge provider traffic—as sought by BIAS end-users—without requiring us to classify the companion transmission service provided to edge providers that was identified by the Verizon court and accepted by subsequent Commission precedent. Specifically, “the so-called ‘edge service’ is secondary, and in support of, the promise made to the end user” to “transport and deliver traffic to and from all or substantially all internet endpoints,” given that it “necessarily includes the promise to transmit traffic to and from those internet end points back to the user.”

193. We decline INCOMPAS’s suggestion that we “clearly state that BIAS providers serve their BIAS customers, [and] not edge providers, in the provision of BIAS.” As explained above, the Verizon court identified this “edge service” as distinct from the retail service we define as BIAS here, and the Commission ultimately endorsed the understanding of it as a separate service in the 2015 Open Internet Order and the RF Order. Beyond claiming, without further explanation or evidence, that BIAS providers do not serve edge providers, INCOMPAS does not provide any justification for why we should change this understanding of the marketplace. Even assuming arguing that one accepted INCOMPAS’s assertion that while “BIAS providers and edge providers may share the BIAS customer—the end user who pays for the BIAS—. . . that does not make the edge provider a customer of the BIAS provider,” it would not persuade us to alter our understanding of the marketplace. As the Verizon court observed, “[i]t is true, generally speaking, to customers of broadband providers are end users. But that hardly means that broadband providers could not also be [a service provider] with respect to edge providers.” INCOMPAS also contends that “edge service is not derivative of BIAS,” but its arguments in that regard fall short. Insofar as INCOMPAS argues that the edge provider is not a customer of the BIAS provider, that disputes an underlying premise—that there exists an edge service in the first place—rather than explaining why such service, if it exists, should not be understood as derivative of BIAS. And insofar as INCOMPAS argues that the Commission “should account for the fact that edge service may be provided to some customers via connections that are not reliant on BIAS,” it misunderstands the nature of our finding. We do not conclude that services provided by edge providers are inherently derivative of BIAS or that they always are delivered via a BIAS connection. Rather, the issue only arises in our analysis as it relates specifically to traffic carried between edge providers and BIAS end users via a BIAS connection. INCOMPAS’s argument thus does not identify any flaw in our conclusion as understood in the proper context. Nor does INCOMPAS otherwise demonstrate how or why any of this impacts our classification decision or decisions regarding open internet rules. Indeed, some of INCOMPAS’s concerns appear entirely misplaced. The Commission did “not reach the regulatory classification of the service that the Verizon court identified as being furnished to the edge” in the 2015 Open Internet Order, nor do we do so here. Thus, INCOMPAS’s concern about the Verizon court’s description of BIAS providers as edge providers’ “carriers” is not implicated here.

5. Other Excluded Services

194. Consistent with the manner in which the Commission has historically defined broadband internet access service, we exclude premises operators and end users who provide access to their BIAS connections but do not offer it on a mass-market, retail basis. Thus, to the extent coffee shops, bookstores, airlines, private end-user networks such as libraries and universities, and other businesses acquire broadband internet access service from a BIAS provider to enable patrons to access the internet from their respective establishments, the provision of such service by the premise operator would not itself be considered BIAS unless it were offered to patrons as a retail mass-market service. Likewise, when a user employs, for example, a wireless router or a Wi-Fi hotspot to create a personal Wi-Fi network that is not intentionally offered
for the benefit of others, we find that he or she is not offering a broadband internet access service under our definition, because the user is not marketing and selling such service to residential customers, small businesses, and other end-user customers. Our decision to retain this approach received record support, and no opposition.

195. We also continue to view CDNs, virtual private network (VPN) services, web hosting services, and data storage services as outside the scope of broadband internet access service. In classifying BIAS as a telecommunications service in the Order, we do not, and need not, reach the question of whether and how these services are classified under the Act. As evidenced in the record, these services are not “mass market” services and/or do not provide the capability to transmit data to and receive data from all or substantially all internet endpoints. Commenters are unified in supporting the continued exclusion of such services from the definition of BIAS.

196. We decline at this time to make any further determinations regarding whether other services fall within the scope of BIAS, given the paucity of the record concerning such services. Regarding 5G IoT services specifically, while Transatel acknowledges that any such determination “requires the assessment of individual 5G IoT services . . . against the Commission[]’s proposed definition of BIAS and mass market,” Transatel nevertheless urges us to “exclude all 5G IoT services from the definition of BIAS and classify[] them[] as either non-BIAS data services or enterprise services on a use case by use case basis.” Transatel argues that doing so will ensure “these valued services will continue to be provided not only to end-users but also enterprise customers without constraining innovation or investment.” Although we anticipate that many 5G IoT services may qualify as non-BIAS data services, enterprise services, or other edge services, we decline to provide a blanket exclusion of these services. We first note that Transatel does not provide any evidence to support its claim that failing to provide this blanket exclusion would constrain innovation or investment. Moreover, we continue to view the potential for such services to provide “a common carrier . . . under the [Communications Act].”

E. Mobile Broadband Internet Access Service Is Best Classified as a Commercial Mobile Service

198. In addition to our decision to reinstate the classification of BIAS as a telecommunications service, we adopt our proposal to reinstate the classification of mobile BIAS as a commercial mobile service. We further conclude that, even if mobile BIAS does not meet the definition of “commercial mobile service,” it is the functional equivalent of a commercial mobile service and, therefore, not a private mobile service. As such, there is no obstacle to treating mobile BIAS “as a common carrier . . . under the [Communications Act].”

199. Section 332(d)(1) of the Act defines “commercial mobile service” as “any mobile service . . . that is provided for profit and makes interconnected service available (A) to the public or (B) to such classes of eligible users as to be effectively available to a substantial portion of the public, as specified by regulation by the Commission.” The commercial mobile service provisions of the Act are implemented under § 20.3 of the Commission’s rules, which employs the term “commercial mobile service” (CMRS). We find that mobile BIAS meets the elements of this definition. Mobile BIAS is a “mobile service” because subscribers access the service through their mobile devices, and it is provided “for profit” because BIAS providers offer it to subscribers with the intent of receiving compensation.

The Second CMRS Report and Order (59 FR 18493 (Apr. 19, 1994)) defined the statutory phrase “for profit” to include: “any mobile service that is provided with the intent of receiving compensation or monetary gain.” Mobile BIAS is also widely available to the public, without restriction on who may receive it. In the Second CMRS Report and Order, the Commission determined that a service is available “to the public” if it is “offered to the public without restriction in who may receive it.” We also find that mobile BIAS is an “interconnected service.”

200. Definition of Public Switched Network. Under section 332(d)(2) the term “interconnected service” means a service that is interconnected with the public switched network (as such terms are defined by regulation by the Commission). In the 2015 Open Internet Order, the Commission reached the conclusion that mobile BIAS is an interconnected service through the application of an updated definition of “public switched network” that included networks that use public IP addresses. In the RIF Order, the Commission reversed course, reinstituting the prior definition of “public switched network” and concluded mobile BIAS was not a commercial mobile service. The Commission found the prior definition to be “more consistent with the ordinary meaning and commonly understood definition of the term and with Commission precedent.”

201. In the 2023 Open Internet NPRM, we proposed reinstating the definition of “public switched network” from the 2015 Open Internet Order and indicated our belief that the Commission’s decision in the RIF Order failed “to align with the technological reality and widespread use of mobile BIAS.” We indicated our view that the proposed definition, which included IP addresses, “embodies the current technological landscape and the widespread use of mobile broadband networks, and is therefore more consistent with the Commission’s recognition that the public switched network will grow and change over time.” We proposed that, based on this reinstated definition, mobile BIAS would be an interconnected service and we sought comment on our analysis and proposed approach.
202. Commenters express differing views of the Commission’s proposal. Professor Scott Jordan and New America’s Open Technology Institute express support for readopting the definition of the public switched network from the 2015 Open Internet Order. New America’s Open Technology Institute notes that “public switched network” in section 332 “is not limited to the legacy telephone network and should be updated.” In contrast, CTIA and Free State Foundation oppose readopting the definition and instead express support for the reasoning in the RIF Order, with CTIA arguing that “public switched network” refers unambiguously to the telephone network.” CTIA misstates the legislative history here. The portion it cites is actually language from a Conference Report explaining that the House bill, which was not adopted, used the term “public switched telephone network.” That report language was mistaken because the House bill (like the Senate bill), as CTIA acknowledges, used the term “public switched network” (without “telephone”). The Conference Report went on to explain that the Senate amendment “expressly recognizes the Commission’s authority to define the terms used in defining ‘commercial mobile service’” and that the Conference Report was adopting the Senate definitions with minor changes. This is further evidence that the statutory language means what it says, i.e., that the Commission has authority to define these terms to reflect current technology and that it is not limited to telephones. Wired Broadband et al. also oppose the proposed definition and argue that evidence of the growth and widespread use of mobile broadband services provides insufficient justification for readopting the revised definition.

203. We adopt our proposal to reinstate the definition of “public switched network” from the 2015 Open Internet Order, and we define it to mean “the network that includes any common carrier switched network, whether by wire or radio, including local exchange carriers, interexchange carriers, and mobile service providers, that use(s) the North American Numbering Plan, or public IP addresses, in connection with the provision of switched services.” As the Commission determined in the 2015 Open Internet Order, the definition we adopt recognizes “that today’s broadband internet access networks use their own unique address identifier, IP addresses, to term users a universally recognized format for sending and receiving messages across the country and worldwide.” CTIA and the Wired Broadband et al. highlight technical distinctions between the telephone networks and IP-based networks. CTIA, for example, states that “[t]he telephone network uses North American Numbering Plan numbers across a single network, while the internet is a decentralized network of networks that relies on IP addresses and uses a variety of protocols and architectures for different purposes.” These operational characteristics, however, do not govern our determination of whether mobile BIAS should be considered a commercial mobile service under the Commission’s rules.

204. We find that the RIF Order’s and opponents’ assertions, that the term “public switched network” may only be defined to mean the traditional telephone network, fail to give sufficient weight to Congress’s express delegation of authority to the Commission to define the term “public switched network” and to the Commission’s own prior recognition that the definition of “public switched network” should evolve over time. Congress, in section 332(d)(2), defined the term “interconnected service” to mean a “service that is interconnected with the public switched network (as such terms are defined by regulation by the Commission).” The argument that the Commission may not define “public switched network” to mean anything other than the public switched telephone network runs counter to the statutory language in section 332 because, if Congress had intended “public switched network” to mean only the public switched telephone network, it would have included the word “telephone.” Instead, Congress not only used the broader term “public switched network” but also gave the Commission express authority to define the term. Congress’s delegation of authority to the Commission would have been unnecessary if Congress had intended the term to refer only to the public switched telephone network based on a regulatory understanding asserted to exist before 1993. Wired Broadband et al. suggest that Congress failed to use the term “public switched telephone network” in the statute “precisely because it was commonly understood that PSTN and PSTN were identical, the terms were used interchangeably.” As a fundamental matter, we disagree and find that this argument fails to give sufficient weight to the text of the statute and to Congress’s delegation of authority to the Commission to define the term “public switched network.” But independently, even on its terms, their argument fails. Under section 332(d)(1), CMRS must “make[] interconnected service available,” and section 332(d)(2), in turn, provides that “interconnected service” “means service that is interconnected with the public switched network.” But even if “public switched network” were understood as limited to the public switched telephone network, we find that mobile BIAS is interconnected with the public switched telephone network by virtue of VoIP applications.

205. Nothing in the text of the “public switched network” definition requires that the Commission’s implementing definitional regulations be limited to telephone service. Even at the time of the enactment of section 332(d)(2), such terminology was understood as a technological matter to be potentially more expansive than mere telephone service. Exercising the Commission’s authority to define “public switched network” by regulation to update the definition with evolving technological and marketplace realities also better reflects the broader statutory context. Section 1 of the Act explains that Congress created the Commission “to make available, so far as possible, . . . a rapid, efficient, Nation-wide, and world-wide wire and radio communication service with adequate facilities at reasonable charges, for the purpose of the national defense, [and] for the purpose of promoting safety of life and property through the use of wire and radio communications.” And section 706 of the 1996 Act directs the Commission to “encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans.” Given the increasing importance of BIAS, these objectives can be advanced more effectively if mobile BIAS is classified as a commercial mobile service, strengthening our ability to adopt measures to promote such infrastructure deployment through regulated access to pole attachments and universal service support, the ability to deploy infrastructure, and the Commission’s enhanced ability to protect public safety and national security through protections afforded by section 214. Although CMRS providers currently have forbearance from domestic section 214 requirements, they remain subject to international section 214 requirements. And even as to domestic section 214 requirements, the Commission could revisit forbearance from those requirements if necessary to better enable the agency to address public safety and national security...
concerns. It also is clear from the legislative history that Congress expected some services that were previously private land mobile services to become common carrier services as a result of the enactment of section 332. The D.C. Circuit affirmed this interpretation in the USTA decision.

206. In exercising its authority and defining “public switched network” in the Second CMRS Report and Order, the Commission determined that the term “should not be defined in a static way.” The Commission considered but rejected calls to define “public switched network” as the public switched telephone network and found that a broader definition was more consistent with the use of the term “public switched network” in section 332 rather than the more technologically based term “public switched telephone network.” The Commission recognized that the public switched network was “continuously growing and changing because of new technology and increasing demand.” Consistent with these determinations, in the 2015 Open Internet Order, the Commission found that it was necessary to update the definition of “public switched network” to reflect the growth and changes to the network that occurred since the time the Commission adopted its original definition.

207. In the Order, consistent with the Commission’s original determination that the definition of “public switched network” should evolve over time, we update the definition to reflect significant changes that have occurred in the technological landscape for mobile services. Since the time the Commission defined “public switched network” for purposes of section 332 in 1994, mobile broadband technologies have developed and become ubiquitous. In 1994, the Commission chose to define “public switched network” with reference to telephone numbers “because participation in the North American Numbering Plan provides the participant with ubiquitous access to all other participants in the Plan.” Concluding that “this approach to the public switched network is consistent with creating a system of universal service where all people in the United States can use the network to communicate with each other.” This is the reality of the internet, and IP addresses, today. Mobile broadband services are available everywhere and millions of subscribers use them to communicate. Evidence in the record shows, for example, that 85% of Americans own smartphones. In 2022, 72.6% of adults lived in wireless-only households with no landline. In addition, data show that Americans are using their smartphones more than ever, with more than 73 trillion megabytes of mobile data traffic exchanged in the United States in 2022, representing a 38% increase from the previous year. Continued growth of mobile BIAS is expected, with one forecast predicting that there will be 430 million 5G mobile subscriptions in North America by 2029. We find that it serves the public interest to adopt a definition of “public switched network” that reflects today’s technological landscape for mobile communications technology and the widespread use of mobile broadband services. We disagree with the RIF Order’s finding that the Commission’s analysis from the 2015 Open Internet Order placed undue emphasis on the wide availability of mobile BIAS in finding it to be an interconnected service. We likewise disagree with comments arguing that data showing the prevalence and use of mobile broadband technologies are irrelevant to a determination about whether to adopt a modernized definition of “public switched network.” We note that while Wired Broadband et al. also argue that “smartphone penetration has barely changed (by less than 3% of the population) since 2018,” they do not dispute the evolution in the growth and use of mobile broadband services that has occurred since the time the Commission adopted the 1994 definition of “public switched network.” That evolution of mobile communications technology is the basis for the action we take in the Order to adopt a modernized definition of the term. To the contrary, we find that these data provide evidence of the extent to which today’s mobile broadband networks provide an essential and universal means of communication among members of the public which is essential to our determination that mobile BIAS is a commercial rather than a private mobile service. Indeed, given the substantial changes in technology and the telecommunications market since 1994, it does not make sense to disregard mobile broadband networks in the Commission’s current definition of “public switched network.” This is especially so because, in distinguishing between the “commercial mobile service” and “private mobile service” definitions in the Act, it is only logical to take into account the ubiquity of technology as it stands today, and thereby interpret as commercial a service offered to, and universally adopted by, the public.

208. We also disagree with the RIF Order and arguments in the record that the definition we adopt is impermissible because it does not refer to a “single” network. CTIA contends that there “is no single, overarching network that combines the telephone network and the internet.” This argument fails to recognize that the Commission’s definition of “public switched network” has always referred to a composite of networks, covering “any common carrier switched network, whether by wire or radio, including local exchange carriers, interexchange carriers, and mobile service providers.” Our decision in the Order to include networks that use public IP addresses as part of the public switched network follows the same approach and treats mobile voice and broadband networks as components of a single public switched network. In their respective comments, Wired Broadband et al. and ICG oppose defining “public switched network” to include networks that use IP addresses, noting that the Commission lacks jurisdiction over the internet. We clarify that the modernized definition of public switched network we adopt in § 20.3 of the Commission’s rules in no way asserts Commission jurisdiction over the internet at large or over the assignment or management of IP addressing by the Internet Numbers Registry System.

209. Mobile BIAS Is an Interconnected Service. We conclude that mobile BIAS is an interconnected service because it is interconnected with the “public switched network,” as we define it in the Order. Mobile BIAS is also an interconnected service because it is a broadly available mobile service that gives users the ability to send and receive communications and from all other users of the internet. We find that the best reading of section 332 is reflected in the Commission’s determinations in the Second CMRS Report and Order that, by using the phrase “interconnected service,” Congress intended that mobile services should be classified as commercial services if they make interconnected service broadly available through their use of the “public switched network” and that “the purpose underlying the congressional approach . . . is to ensure that a mobile service that gives its customers the capability to communicate to or receive communication from other users of the public switched network should be treated as a common carriage offering.” New America’s Open Technology Institute notes that Congress intended to differentiate between services that were broadly available to the public and those that were private special purpose services, such as taxi dispatch services.
CTIA argues that the statute does not limit private mobile services to such types of services and that instead the only relevant question under the statute in determining whether a service is a private mobile service is whether or not the service is interconnected. Wired Broadband et al. similarly argue that the statutory definition is the only relevant consideration for determining what services are private mobile services. Even though section 332(d)(3) does not limit private mobile service to specific types of mobile services, it does provide that private mobile services are those mobile services that are not commercial mobile services or functionally equivalent. For the reasons outlined above, we find that mobile BIAS is an interconnected commercial mobile service and therefore by statute cannot be private mobile service. Moreover, we find more persuasive the argument that private mobile service is intended to refer to those services offered only to a more limited group of users, such as taxi fleets. This follows from both the ordinary meaning of the terms “commercial” and “private” and the state of the marketplace at the time of the 1996 Act. By contrast, mobile services classified as private are those mobile services that do not make communications broadly available.

The Commission found in the 2015 Open Internet Order that “mobile broadband internet access service fits the [commercial mobile service] classification as millions of subscribers use it to send and receive communications on their mobile devices every day.” Today, as the data described above demonstrate, it is clear that this remains the case as millions of Americans continue to communicate using mobile broadband services.

210. We also find that mobile BIAS is an interconnected service for the additional reason that it provides users with the capability to communicate with other users of the internet and with people using telephone numbers through VoIP applications. In the 2015 Open Internet Order, the Commission found that “users on mobile networks can communicate with users on traditional copper based networks and IP based networks, making more and more networks using different technologies interconnected.” The Commission further identified mobile VoIP, as well as over-the-top mobile messaging, as “among the increasing number of ways in which users communicate indiscriminately between [North American Numbering Plan (NANP)] and IP endpoints on the public switched network.” In the RIF Order, the Commission disagreed and found that the “definition of ‘interconnected service’ focuses on the characteristics of the offered mobile service itself.” In the 2023 Open Internet NPRM, we sought comment on whether “there have been any material changes in technology, the marketplace, or other factors that would warrant refinement or revision of the analysis regarding the interconnected nature of mobile BIAS from the 2015 Open Internet Order.”

211. We find that there is no evidence in the record showing material changes in technology or the marketplace that would warrant a revision to the Commission’s 2015 analysis of the interconnected nature of mobile BIAS. To the contrary, evidence shows that mobile BIAS users continue to communicate using these tools and that today “VoIP applications are even more functionally integrated” into mobile broadband services. CTIA also argues that, even with VoIP, mobile BIAS should not be viewed as interconnected because IoT devices, such as internet-connected lighting systems or internet-connected security cameras, cannot make calls. We disagree and conclude that we may find mobile BIAS to be an interconnected service even if there are some other broadband services or devices that are not designed to provide communications. Our findings in the Order apply in the context of BIAS, and to the extent that other types of broadband services do not meet the definition of BIAS, they are not within the scope of the Order. Moreover, as the D.C. Circuit recognized in the USTA decision, “[n]othing in the statute . . . compels the Commission to draw a talismanic (and elusive) distinction between (i) mobile broadband alone enabling a connection, and (ii) mobile broadband enabling a connection through use of an adjunct application such as VoIP.” In the Order, in view of the evidence regarding the extent to which VoIP applications continue to be integrated with mobile BIAS, we readopt the Commission’s analysis from the 2015 Open Internet Order and find that mobile BIAS may be considered an interconnected service because users with the capability to communicate with other users of the internet and with people using telephone numbers through VoIP applications. While the D.C. Circuit in the Mozilla decision upheld the RIF Order’s findings regarding the distinction between mobile VoIP applications and mobile BIAS itself, the Court nonetheless recognized that the Commission has discretion to make such a determination.

212. In connection with this approach, in the 2023 Open Internet NPRM we sought comment about whether we should also readopt the 2015 Open Internet Order’s revised definition of “interconnected service” in § 20.3 of the Commission’s rules. We noted that, in the 2015 Open Internet Order, the Commission redefined “interconnected service” to mean a service that gives subscribers the ability to “communicate to or receive communications from other users of the public switched network,” removing the requirement that such service provide the ability to communicate with all other users of the public switched network. The RIF Order reverted to the prior definition, concluding that “the best reading of ‘interconnected service’ is one that enables communication between its users and all other users of the public switched network.” In the 2023 Open Internet NPRM, we sought comment on whether it is necessary to return to the definition of “interconnected service” in the 2015 Open Internet Order to ensure that all appropriate services are covered by the definition. Professor Jordan expresses support for readopting the revised definition from the 2015 Open Internet Order and argues that the statute does not require interconnected services to give subscribers the ability to communicate to all other users of the public switched network and that such a requirement is inconsistent with how mobile services actually operate.

213. We readopt the revised definition from the 2015 Open Internet Order and define “interconnected service” to mean a service that gives subscribers the ability to communicate to or receive communications from other users of the public switched network. We remove the requirement adopted by the Commission in the RIF Order that such service provide the ability to communicate with all other users of the public switched network. We conclude that mobile services that provide the ability for users to communicate with others through the public switched network should be considered “interconnected” even if they are limited in certain ways and do not provide the ability to communicate with all other users on the network. We find that revising the definition in this way
will clarify the scope of services that may be viewed as interconnected and is consistent with section 332’s focus on differentiating between mobile services that are available “to the public” or to “a substantial portion of the public” and those that are not.

214. In addition, because we also have reclassified mobile BIAS as a telecommunications service, we find that classifying it as a commercial mobile service will avoid the inconsistency that would result if the service were both a telecommunications service and a private mobile service. The Commission explained this reasoning in the 2015 Open Internet Order, and we adopt our proposal from the 2023 Open Internet NPRM to apply a consistent rationale here. Because we have determined mobile BIAS to be a telecommunications service, we find that designating it also as a commercial mobile service subject to Title II is most consistent with Congressional intent to apply common carrier treatment to telecommunications services. Consistent with the Commission’s analysis in 2015, we find that classifying mobile BIAS as a commercial mobile service is necessary to avoid a statutory contradiction that would result if the Commission were to conclude both that mobile BIAS was a telecommunications service and also that it was not a commercial mobile service. A statutory contradiction would result from such a finding because, while the Act requires that providers of telecommunications services be treated as common carriers, it prohibits common carrier treatment of mobile services that do not either meet the definition of commercial mobile service or serve as the functional equivalent of commercial mobile service. We find that classifying mobile BIAS as a commercial mobile service avoids this statutory contradiction and is also most consistent with the Act’s intent to apply common carrier treatment to providers of telecommunications services.

215. Functional Equivalence. In the alternative, even to the extent that mobile BIAS were understood to fall outside the definition of “commercial mobile service,” we conclude that it is also the functional equivalent of a commercial mobile service and, thus, not private mobile service. In the 2015 Open Internet Order, the Commission found that mobile BIAS was functionally equivalent to commercial mobile service because, “like commercial mobile service, it is a widely available, for profit mobile service that offers mobile subscribers the capability to send and receive communications on their mobile device to and from the public.” The RIF Order found that the 2015 Open Internet Order’s focus on the public’s “ubiquitous access” to mobile BIAS alone was “insufficient” to establish functional equivalency and that the test established in the Second CMRS Report and Order provided a more thorough consideration of factors of whether a service is closely substitutable for a commercial mobile service.

216. In the 2023 Open Internet NPRM, we sought comment on both of these analyses and on whether we should adopt “any other or different definition of ‘functional equivalent.’” CTIA and Wired Broadband et al. argue that the Commission cannot find that mobile BIAS is functionally equivalent to commercial mobile service by assessing how widely it is used but instead it must assess functional equivalence based on the factors outlined in the Commission’s rules, such as whether the services are substitutable, whether a change in the price of one service would prompt customers to change to the other, and whether the service is advertised to the same targeted market. Under these factors, they contend, mobile BIAS is not functionally equivalent to commercial mobile service.

217. We disagree with these arguments and find that, to the extent mobile BIAS falls outside the definition of commercial mobile service, it is the functional equivalent of a commercial mobile service. Consistent with our proposal in the 2023 Open Internet NPRM, and with the analysis in the 2015 Open Internet Order, we find that mobile BIAS is the functional equivalent of commercial mobile service because like commercial mobile service, it is a widely available, for-profit mobile service that offers mobile subscribers the capability to send and receive communications on their mobile device to and from the public. We disagree with CTIA’s argument that this finding relies impermissibly on an overly general description of mobile BIAS to show functional equivalency. To the contrary, we find that the fact that mobile BIAS is used to send and receive communications broadly among members of the public is a critical factor in assessing its functional equivalency to commercial mobile service. Although mobile BIAS uses IP addresses rather than telephone numbers, consumers use both mobile voice service and mobile BIAS to communicate with others on their mobile devices. The fact that mobile BIAS may be used for some purposed more than what mobile voice services are used for does not mean that the services do not provide functional equivalence with respect to their capability to send and receive communications.

218. As the RIF Order acknowledges, the Commission has express delegated authority from Congress to make a policy determination on whether a particular mobile service may be the functional equivalent of a commercial mobile service. Specifically, section 332 of the Act defines “private mobile service” as “any mobile service . . . that is not a commercial mobile service or the functional equivalent of a commercial mobile service, as specified by regulation by the Commission.” While the factors outlined in § 20.3 of the Commission’s rules may be used in making a determination about the functional equivalence of a particular service, they do not prohibit the Commission from designating a category of service to be the functional equivalent of a commercial mobile service in a rulemaking and they do not prevent us from considering other factors in making our determination regarding the functional equivalence of mobile BIAS. Paragraph (c) of the “commercial mobile radio service” definition notes that “[a] variety of factors may be evaluated” to make a determination regarding functional equivalence “including” the enumerated factors. Based on this authority, the reasons outlined above and in the 2015 Open Internet Order, and in light of the continued widespread use and availability of mobile broadband services, we find that mobile BIAS is the functional equivalent of commercial mobile service, and is therefore not private mobile service.

219. Finally, in the 2023 Open Internet NPRM, we sought comment on the potential impact of applying openness requirements to mobile providers and on the “policy consequences that commenters believe may result from the proposed reclassification of mobile BIAS.” Several commenters stress the importance of applying the same open internet rules to fixed and mobile BIAS. CTIA, Verizon, and AT&T, however, oppose openness requirements for mobile providers contending that such requirements are unnecessary and may discourage investment and innovation in mobile broadband networks.

220. We find that returning mobile BIAS to its classification as a commercial mobile service and reinstating openness requirements on mobile BIAS providers will help protect mobile broadband consumers while allowing mobile providers to continue to compete successfully and develop
new products and services. We agree with commentators who note that because consumers use both fixed and mobile BIAS regularly, it is critical that we apply the same rules to both services. In addition, as commenters point out, mobile broadband services are particularly important to certain groups, such as low-income consumers, who may not be able to afford to subscribe to both fixed and mobile broadband service, and it is critical to ensure that these consumers are able to benefit from a free and open internet. The Commission’s previous experience applying open access rules to upper 700 MHz C Block licensees has shown that mobile operators subject to openness requirements have continued to compete successfully in the marketplace, and we expect mobile BIAS providers will continue to compete successfully under the openness requirements we adopt in the Order. ADTRAN contends that the C Block openness requirements drove down the price of C Block spectrum at auction. ADTRAN Comments at 32. While any number of factors may affect the price of any spectrum at auction, it is clear that Upper 700 MHz C Block licensees, including Verizon, invested heavily in deploying mobile broadband service over their C Block spectrum.

F. Restoring the Telecommunications Service Classification of Broadband Internet Access Service Is Lawful

221. Our classification of BIAS as a telecommunications service is fully and sufficiently justified under the Commission’s longstanding authority and responsibility, provided by Congress, to classify services subject to our jurisdiction, as necessary. This authority and responsibility is not supplanted by the major-questions doctrine.

1. The Commission Has the Authority and Responsibility To Classify BIAS

222. The Commission’s authority and responsibility to classify services subject to our jurisdiction, as necessary, is borne out of Congress’s well-established and longstanding reliance on the Commission to exercise this authority. Our decision to revisit the classification of BIAS derives from ordinary administrative law principles and the factual circumstances surrounding the RIF Order. And the classification decision we reach is consistent with the broader context of the Act.

223. Congress Authorized and Expected the Commission to Classify BIAS. No one disputes that internet access services are within the Commission’s subject-matter jurisdiction and historically have been supervised by the Commission. Congress created the Commission “[f]or the purpose of regulating interstate and foreign commerce in communication by wire and radio so as to make available, so far as possible, to all people of the United States . . . a rapid, efficient, Nation-wide, and world-wide wire and radio communication service with adequate facilities at reasonable charges, for the purpose of the national defense, [and] for the purpose of promoting safety of life and property through the use of wire and radio communication.” Section 2 of the Act grants the Commission jurisdiction over “all interstate and foreign communication by wire or radio.”

224. Since the original enactment of the Communications Act in 1934, Congress routinely has specified regulatory regimes that apply to particular communications services or service providers that meet statutorily defined categories, and Congress has relied on the Commission to determine whether a particular service or provider falls within the statutory definitions that trigger those regulatory frameworks. For example, when the Act originally was enacted in 1934, Congress adopted the statutory category of “common carrier,” and specified the associated regulatory framework under Title II for such providers, leaving it to the Commission to determine which specific entities were common carriers based on the statutory criteria, drawing on the historical backdrop of common carriage. For example, common carriers are, among other things, subject by default to various rate regulation, accounting, tariffing, market entry, and service discontinuance requirements, implemented by the Commission. Likewise, in 1934 Congress defined “radio station[s]” and “broadcasting” in the Act, and specified the regulatory regimes that the Commission was to apply when those definitions were met. For example, radio stations and broadcasters are, among other things, subject by default to various licensing and authorization requirements to ensure their operation consistent with the public interest, implemented by the Commission. Congress did so again, for instance, in the 1984 Cable Act for “cable operator[s]” and “cable service.” For example, cable operators are, among other things, subject by default to channel carriage requirements and ownership restrictions implemented by the Commission. In 1993, Congress did the same with respect to “commercial mobile service” and “private mobile service.” For example, commercial mobile service providers are, among other things, subject by default to the requirements governing common carriers under Title II of the Communications Act, while private mobile service providers are not. It did so again in 1994 in the Communications Assistance for Law Enforcement Act (CALEA), for “telecommunications carriers” as defined there. For example, entities that qualify as telecommunications carriers for purposes of CALEA are, among other things, subject by default to the requirement to file with the Commission and maintain up-to-date System Security and Integrity plans designed to help preserve the ability of law enforcement agencies to conduct electronic surveillance while protecting the privacy of information outside the scope of the investigation. When Congress enacted the definitional frameworks and associated regulatory regimes to be applied by the Commission in the 1996 Act, it continued its well-established, longstanding approach reflected in those historical examples—an approach that Congress has since continued to follow. Classification decisions under each of those frameworks are consequential in their own way, yet it is well established that Congress relies on the Commission to make just such determinations.

225. Provisions enacted as part of the 1996 Act amply detail Congress’ expectation that the Commission would classify services and providers under the “telecommunications service” and “information service” statutory definitions. The Act is replete with examples of provisions expressly to be implemented by the Commission that turn on the Commission’s interpretation and application of those statutory definitions to classify particular services and service providers. As relevant here, for example:

- Section 10 of the Act directs the Commission to forbear from applying provisions of the Act or Commission rules to telecommunications carriers or telecommunications services if certain statutory criteria are met.
- Section 11 of the Act requires the Commission to biennially review its rules “that apply to the operations or activities of any provider of telecommunications service” and determine if any such rules are no longer necessary in the public interest based on certain marketplace developments.

- Section 224 of the Act requires the Commission to ensure just and reasonable rates, terms, and conditions for pole attachments, among other
circumstances, when provided by a telecommunications carrier to a provider of telecommunications service.

- Sections 251 and 252 of the Act direct the Commission to effectuate certain market-opening requirements for telecommunications carriers, including setting rules to be applied by State commissions when arbitrating interconnection agreements among carriers to implement those statutory requirements.

- Section 253 directs the Commission to preempt certain State or local requirements that actually or effectively prohibit the ability of any entity to provide any telecommunications service.

- Section 254 of the Act requires the Commission to adopt rules to preserve and advance universal service, defined principally in terms of “an evolving level of telecommunications services” established by the Commission, and to fund universal service support by contributions from “every telecommunications carrier that provides interstate telecommunications services” along with certain other “provider[s] of interstate telecommunications,” and to rely on certain principles to inform its universal service rules, including providing access to telecommunications and information services.

- Section 272 of the Act gives the Commission the responsibility to implement certain separate affiliate safeguards for the former BOCs in connection with, among other things, the provision of certain information services.

These illustrative examples, all enacted as part of the 1996 Act, amply demonstrate the Commission’s authority—and responsibility, as necessary—to classify services under the definitional criteria established by the 1996 Act.

226. Congress reaffirmed that it had granted the Commission this authority when, less than two years after the 1996 Act’s passage, it directed the Commission to explain, in what came to be known as the Stevens Report, how the new statutory terms apply “with respect to internet access” for the purposes of universal service administration and support. As Public Knowledge notes, “[t]he Stevens Report represents . . . a clear demonstration that Congress had committed the question of classification of services to the FCC,” and “it is undeniable that the Stevens Report reflects the FCC’s interpretation—supported by the initial report requirement from Congress—that Congress assigned it the authority to classify services as either information services or telecommunications services.” Given the Commission’s longstanding, well-established authority and responsibility to classify services, we disagree with commenters who contend that the Commission does not have such authority or should defer to Congress to determine the classification of BIAS.

227. Revisiting the Classification of BIAS Is Not Inherently Suspect. We conclude that our decision to revisit the classification of BIAS does not somehow render it inherently suspect. As a threshold matter, it derives from ordinary administrative-law principles. The U.S. Supreme Court has observed that there is “no basis in the Administrative Procedure Act [(APA)] or in our opinions for a requirement that all agency change be subjected to more searching review. . . . [I]t suffices that the new policy is permissible under the statute, that there are good reasons for it, and that the agency believes it to be better, which the conscious change of course adequately indicates.” Relevant precedent holds that we need only “examine the relevant data and articulate a satisfactory explanation for our action,” a duty we fully satisfy here. The “possibility of drawing two inconsistent conclusions from the evidence does not prevent an administrative agency’s finding from being supported by substantial evidence.” Consistent with these principles, the Commission’s reasoned determination in the Order that classifying BIAS as a telecommunications service is superior first and foremost as a matter of textual interpretation—while also recognizing that public policy supports the change in direction—is sufficient to justify our action under ordinary administrative-law principles, even absent any new facts or changes in circumstances.

228. But even assuming, arguendo, that an agency must go beyond ordinary administrative-law principles and show new facts to justify its action, our decision to revisit the classification of BIAS is particularly warranted under the factual circumstances here. Our classification of BIAS flows in significant part from concerns with the RIF Order highlighted in Mozilla—to “bring the law into harmony with the realities of the modern broadband marketplace”—which is itself a sufficient justification for our classification here. The U.S. Supreme Court observed in Brand X that “the agency . . . must consider varying interpretations and the wisdom of its policy on a continuing basis.” Separately and secondarily, our classification decision accounts for certain statutory responsibilities and policy concerns—especially safeguarding public safety and providing a uniform regulatory framework for BIAS—where the RIF Order’s approach was called into doubt by Mozilla. The Commission’s attempt to respond to the Mozilla remand has remained subject to the petitions for reconsideration, which we resolve in the Order, and a petition for judicial review held in abeyance pending further Commission action. Given the Mozilla court’s palpable criticism of the RIF Order’s regulatory approach to BIAS, and that the merits of this approach were never brought to a final resolution, we find it especially appropriate for the Commission to resolve these lingering disputes now.

229. Reclassification Is Consistent with the Broader Context of the Act. We also find that our classification of BIAS as a telecommunications service accords with the goals and directives found in the 1996 Act. To begin with, section 706, which while worded in terms of encouraging the deployment of “advanced telecommunications capability,” has long been understood to encompass the goal of encouraging broadband internet access. That “advanced telecommunications capability” is not identical to BIAS as defined for purposes of the Order does not diminish the substantial extent to which section 706 has been—and is—understood as encouraging BIAS deployment. Congress specifically directed the Commission to encourage the deployment of advanced telecommunications capability “by utilizing, in a manner consistent with the public interest, convenience, and necessity, price cap regulation, regulatory forbearance, measures that promote competition in the local telecommunications market, or other regulating methods that remove barriers to infrastructure investment.” The list of specific regulating methods—price cap regulation, regulatory forbearance, measures that promote competition in the local telecommunications market—all are authorities that the Commission has long had, or that were granted by the 1996 Act, with respect to telecommunications services.

230. The Mozilla court’s critiques of the RIF Order highlight specific areas where the objectives of section 706 of the 1996 Act—and the operative provisions of the Communications Act itself—would be more effectively carried out if BIAS is classified as a telecommunications service. As we discuss above, reclassification will further enable the Commission to promote broadband access by granting
to BIAS-only providers just and reasonable access and rates for pole attachments under section 224, a key pro-competitive provision of the Act that the Mozilla court chastised the BIF Order for failing to properly grapple with when taking such rights from BIAS-only providers. The D.C. Circuit in Mozilla also was concerned about the effect of the BIF Order on the continued availability of funding for BIAS through universal service support—a tool Congress provided in section 254 of the 1996 Act to address barriers to infrastructure investment. Expressing particular concern with respect to Lifeline support in light of the arguments raised on review, the court highlighted that section 254(c)(1) “declared that ‘universal service is an evolving level of telecommunications services’” and sections 254(e) and 214(e) “tethered Lifeline eligibility to common-carrier status.” Our classification recognizes that BIAS itself meets the criteria for inclusion in “universal service” under section 254(c)(1) and therefore provides a direct basis for support that is not contingent on BIAS’s relationship to the network facilities used to offer voice service. Furthermore, reclassification would enable the Commission to provide universal service support to BIAS providers that solely supply BIAS.

231. By reclassifying BIAS as a telecommunications service, we also help to effectuate the intent of section 706 of the 1996 Act by empowering the Commission to focus section 253 on actions relating to BIAS, an advanced telecommunications capability. In addition to the market-opening amendments to pole access under section 224 of the Act, the 1996 Act also sought to open markets to competition by granting authority to the Commission in section 253 to preempt “State or local legal requirement[s] that may prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service.” If the Commission is to truly realize section 706’s command to encourage the deployment of advanced telecommunications capability through “measures that promote competition in the local telecommunications market,” it should not have to resort to applying section 253 to a co-mingled telecommunications service that may not even constitute “advanced telecommunications capability.”

232. Contrary to the BIF Order’s suggestion, our classification of BIAS as a telecommunications service is not undercut by section 230 of the Act, which was enacted as part of the 1996 Act. Section 230(b)(2) adopts the policy of “preserv[ing] the vibrant and competitive free market that presently exists for the internet and other interactive computer services, unfettered by Federal or State regulation.” Section 230 also finds that “[t]he internet and other interactive computer services have flourished, to the benefit of all Americans, with a minimum of government regulation.” As we discuss above, at the time the 1996 Act was enacted, the transmission component of enhanced services—namely, internet access—was subject to regulation under Title II of the Act. Thus, the regulatory status quo that “presently exist(ed)” and under which the internet and other interactive computer services “flourished” at the time of section 230’s enactment as part of the 1996 Act included Title II regulation of the transmission services used to access—the internet. We are not persuaded by Commissioner Carr’s suggestion that our rules are incompatible with section 230(c)(2), which is entitled “Civil Liability” and provides in relevant part that “No provider or user of an interactive computer service shall be held liable on account of any action voluntarily taken in good faith to restrict access to or availability of material that the provider or user considers to be obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable . . . .” We take no position here on when, if ever, a BIAS provider’s actions to discriminate against certain internet content, application, or services, or could be characterized as good-faith action to address “objectionable” content within the meaning of section 230(c)(2). Moreover, section 230(c)(2)’s title and text indicate that帽well immunizes providers against civil liability, such as damages, for their content-moderation decisions. It does not purport to otherwise immunize BIAS providers from any regulatory obligations, and if a BIAS provider violates our rules, the rules may be validly enforced through other means—such as a writ of injunction under section 401(b), or potentially criminal sanctions under section 501. In addition, the Commission could issue a declaratory ruling identifying a violation of the conduct rules by a given provider, 47 CFR 1.2, with the potential to consider that determination in subsequent adjudications not involving civil liability, such as evaluating the public interest when granting or denying licenses or authorizations, or crafting policies governing eligibility for universal service funding.

233. We also reject the contentions of the BIF Order and certain commenters that narrow-purpose statutory provisions like sections 230(f)(2) and 231 of the Act either settled the classification of BIAS or are even relevant to our telecommunications service classification. Section 230(f)(2) defines “for purposes of this section” an “interactive computer service” to “mean any information service, system, or access software provider that provides or enables computer access by multiple users to a computer server, including specifically a service or system that provides access to the internet.” Likewise, section 231(e)(4) provides that “for purposes of” section 231—which was added a year after the enactment of the 1996 Act—“internet access service’ means a service that enables users to access content, information, electronic mail, or other services offered over the internet. . . .” In a similar vein, NCTA seeks to invoke language in section 231 of the Act, stating that “[n]othing in this section shall be construed to treat interactive computer services as common carriers or telecommunications carriers.” But as we discuss above, that the internet access service prevalent at the time those provisions were enacted bears so little resemblance to the BIAS we classify in the Order reinforces our decision not to pull those definitions out of their statutory context and apply them to a fundamentally dissimilar service.

234. We also reject arguments that the IIJA counsels against reclassification. USTelecom points out that through the IIJA “Congress established numerous programs to promote digital equity” including actions to foster “deployment to unserved and underserved areas,” to “provide[] a discount for broadband service to eligible households,” to establish three grants with the goal of ensuring that all Americans, with a minimum of government regulation.” As we discuss above, at the time the 1996 Act was enacted, the transmission component of enhanced services—namely, internet access—was subject to regulation under Title II of the Act. Thus, the regulatory status quo that “presently exist(ed)” and under which the internet and other interactive computer services “flourished” at the time of section 230’s enactment as part of the 1996 Act included Title II regulation of the transmission services used to access—the internet. We are not persuaded by Commissioner Carr’s suggestion that our rules are incompatible with section 230(c)(2), which is entitled “Civil Liability” and provides in relevant part that “No provider or user of an interactive computer service shall be held liable on account of any action voluntarily taken in good faith to restrict access to or availability of material that the provider or user considers to be obscene, lewd, lascivious, filthy, excessively violent, harassing, or otherwise objectionable . . . .” We take no position here on when, if ever, a BIAS provider’s actions to discriminate against certain internet content, application, or services, or could be characterized as good-faith action to address “objectionable” content within the meaning of section 230(c)(2). Moreover, section 230(c)(2)’s title and text indicate that帽well immunizes providers against civil liability, such as damages, for their content-moderation decisions. It does not purport to otherwise immunize BIAS providers from any regulatory obligations, and if a BIAS provider violates our rules, the rules may be validly enforced through other means—such as a writ of injunction under section 401(b), or potentially criminal sanctions under section 501. In addition, the Commission could issue a declaratory ruling identifying a violation of the conduct rules by a given provider, 47 CFR 1.2, with the potential to consider that determination in subsequent adjudications not involving civil liability, such as evaluating the public interest when granting or denying licenses or authorizations, or crafting policies governing eligibility for universal service funding.
to “facilitat[e] equal access to broadband, including by preventing and eliminating digital discrimination.” USTelecom then asserts that “Congress’s decision to address equal access directly—in the way that it chose—demonstrates that it did not intend for the Commission to attempt to address the issue through Title II reclassification of broadband.” But such an argument proceeds from a mistaken assumption. First and foremost, as discussed above, the Act clearly grants the Commission authority and responsibility to classify services such as BIAS—the status of which remained unsettled by the unresolved challenges to the RIF Remand Order—where necessary to fulfill its statutory duties. And we classify BIAS as a telecommunications service because we conclude that represents the best reading of the Act. Second, even to the extent that we evaluate policy considerations as independently reinforcing our classification decision, we find USTelecom’s argument unpersuasive. We see nothing in the text of the IIJA to indicate that the targeted efforts to address BIAS-related policy concerns taken up in the IIJA were intended to comprehensively address BIAS policy in any or all of the targeted policy areas to the exclusion of other existing statutory authorities. Indeed, at the time the IIJA was enacted in 2021, there were pending petitions for reconsideration and a pending petition for judicial review of the RIF Remand Order, and thus we cannot assume Congress would have reached a conclusion that the ultimate classification of BIAS would be at the time of the IIJA’s enactment.

235. We conclude that a finding of market power is not a prerequisite to classifying a service as a telecommunications—and thus common carrier—service and are unpersuaded by arguments to the contrary. The Act is abundantly clear that common carrier regulation applies—at least absent forbearance—even in the case of services subject to competition. The 1996 Act is replete with examples of provisions making clear that Congress desired telecommunications carriers—which are treated as common carriers in their provision of telecommunications services—to be subject to competition. Indeed, one of the main goals of the 1996 Act was to foster competition amongst common carriers. For example, among other things:

• Section 10 of the Act directs the Commission to forbear from applying provisions of the Act or Commission rules to telecommunications carriers or telecommunications services if certain statutory criteria are met and provides that the public interest evaluations in section 10(a)(3) will be met if forbearance “will promote competitive market conditions, including . . . competition among providers of telecommunications services.”
• Section 11 of the Act requires the Commission to biennially review its rules “that apply to the operations or activities of any provider of telecommunications service” and determine if any such rules are no longer necessary “as the result of meaningful economic competition between providers of such service.”
• Section 251 of the Act provides for an array of requirements specifically designed to facilitate local competition for telecommunications services.
• Section 254(k) of the Act prohibits telecommunications carriers from “using services that are not competitive to subsidize services that are subject to competition.”
• Section 227 of the Act predicated the BOCs’ provision of long distance services on anticipated competition in local markets for telecommunications services, including through requirements designed to foster that competition.

Even prior to the 1996 Act, it was apparent that common carrier regulation under the Communications Act was not tied to market power or similar considerations. For example, section 332(c)(1) provided that commercial mobile service providers “shall, insofar as such person is so engaged, be treated as a common carrier.” But authorized the Commission to designate certain Title II provisions as inapplicable if certain statutory criteria are met, including an analysis of whether such relief “will enhance competition among providers of commercial mobile services.” Likewise, the Supreme Court, in MCI, evaluated the Commission’s pre-1996 Act efforts to grant relief from Title II requirements for common carriers that lacked market power, and ultimately rejected such efforts as beyond the Commission’s authority under the Communications Act.

2. The Major-Questions Doctrine Poses No Obstacle to Recognizing BIAS as a Telecommunications Service

236. We conclude that the major-questions doctrine—the notion that in certain extraordinary cases, a court will not lightly find that Congress has delegated authority to an agency—is no obstacle to our classification of BIAS as a telecommunications service. We also reject the argument that our actions violate the non-delegation doctrine. The Supreme Court has repeatedly held that “a statutory delegation is constitutional as long as Congress ‘lay[s] down by legislative act an intelligible principle to which the person or body authorized to [exercise the delegated authority] is directed to conform.’” In other words, a statutory delegation is constitutional if Congress provides “standards ‘sufficiently definite and precise to enable Congress, the courts, and the public to ascertain whether Congress’s guidance has been followed.’” The test is plainly satisfied here. The Act contains specific definitions of “information service” and “telecommunications service,” which enable courts to assess whether the Commission has properly classified BIAS under the Act. Similarly, the statute provides that the Commission may engage in regulatory forbearance only if it makes certain statutorily specified determinations. Thus, consistent with the Constitution, the Act sets forth intelligible principles to guide the Commission in exercising its delegated authority.

237. To begin with, for several reasons, we do not think the major-questions doctrine properly comes into play in this context at all. For one, we are simply following the best reading of the Communications Act, as demonstrated by the statute’s plain text, structure, and historical context; there is no call for deference to an interpretation that is not the statute’s most natural reading.

238. Moreover, as the D.C. Circuit has recognized, the Supreme Court’s Brand X decision establishes that the major-questions doctrine does not restrict our authority to determine the proper classification of BIAS. Brand X held that the Commission has the authority to determine the proper statutory classification of BIAS. If the major-questions doctrine were an obstacle to reclassification here, then it also should have applied to the earlier reclassification in that case from Title II to Title I. After all, a decision to adopt a Title I classification would simply be the opposite of a decision to adopt a Title II classification, with the same economic and political stakes (but in the opposite direction). But, in reviewing the Cable Modem Declaratory Ruling in Brand X, the Supreme Court recognized and upheld the Commission’s authority to determine the proper classification of BIAS without identifying any concern over whether that classification presents a major question. Indeed, the Court identified no major-questions problem even though several parties expressly raised the issue. We are unpersuaded by suggestions that a deregulatory Title I classification would not be a major
question. Yet a Title II classification would be. The Supreme Court has construed its earlier decision in MCI as a “major questions” case. And in MCI, the Court overturned a Commission order adopting a deregulatory interpretation of the Act, holding that the Commission’s authority to “modify” certain tariff-filing requirements did not permit elimination of the tariff-filing requirement for nondominant carriers altogether. It is therefore apparent that the major-questions doctrine applies equally to agency actions that are regulatory or deregulatory. Thus, if the major-questions doctrine applies to an interpretation that BIAS is a Title II telecommunications service, then the doctrine equally would apply to an interpretation that BIAS is a Title I information service. We therefore find that the major-questions doctrine does not resolve this issue or place a thumb on the scale in favor of one interpretation over the other.

239. We also do not think any inference can be drawn from Congress’s failure to clarify the regulatory status of BIAS one way or the other. Commenters point out that several bills were introduced in Congress to specify that broadband should be regulated under Title II, but were not enacted. But other bills were introduced in Congress to specify that broadband must be regulated under Title I, and those bills also failed to pass. Numerous failed bills would have required that broadband “shall be considered to be an information service.” Another failed bill would have required that “[t]he Commission may not impose regulations on broadband internet access service or any component thereof under title II.” Three other failed bills proposed to overturn and preclude reenactment of the 2015 Open Internet Order’s Title II classification and rules. And yet another bill proposed to classify broadband under a new Title VIII. This record of unenacted legislation on both sides reflects only indecision and inaction from Congress, not that Congress discernibly refused or rejected any particular approach. Failed legislation on both sides of this issue “tell[s] us little if anything about” Congress’s views on the proper classification of broadband. The record of indecision and inaction from Congress on the classification of broadband, against the backdrop of the Commission’s prior actions, readily distinguishes the situation here from that in FDA v. Brown & Williamson Tobacco Corp. There, the Food and Drug Administration (FDA) asserted jurisdiction to regulate tobacco products after having “disclaimed the authority to [do so] . . . for more than eighty years,” and “Congress had repeatedly legislated against this background.” By contrast, in the period since Congress enacted the 1996 Act, the Commission’s treatment of broadband service has wavered between Title II and Title I and remained unsettled. In the years soon after passage of the 1996 Act, the Commission classified DSL as including an offer of telecommunications service subject to Title II. In 2002, the Commission reversed course and classified cable broadband as a single integrated offering of information service subject only to Title I (although its legal status remained uncertain, until the Supreme Court upheld it in 2005). From 2015 to 2018, the Commission regulated broadband as a Title II telecommunications service. And then in 2018, the Commission reverted to classifying broadband as a single integrated offering of information service. And even during much of the Title I era, the Commission repeatedly sought to enforce policies that closely resemble the open internet rules we adopt in the Order. The Commission “never disclaimed any authority to regulate the internet or internet providers altogether, nor is there any similar history of congressional reliance on such a disclaimer.”

240. Even if the major-questions doctrine were to come into play, we do not think it would ultimately apply to the actions we take here. To determine whether the major-questions doctrine applies, courts weigh several factors, including (1) “the economic and political significance” of the agency action, (2) whether the agency is “claim[ing] to discover in a long-extension statute an unheralded power,” (3) whether the action falls within the agency’s “comparative expertise,” and (4) whether Congress “has consistently rejected” similar efforts. 241. We do not think the rules we adopt in the Order cross the major-questions threshold. We believe the rules we adopt in the Order will have substantial benefits for the American public. But not every regulatory action that has substantial effects is so momentous as to trigger the major-questions doctrine. For instance, we believe the rules we adopt in the Order will have substantial benefits for the American public. But not every regulatory action that has substantial effects is so momentous as to trigger the major-questions doctrine. BIAS providers have previously been regulated under Title II—including several years under the 2015 rules that were materially identical to those we adopt in the Order—yet the record does not show that our past Title II rules had any extraordinary negative impact on BIAS providers or the internet economy, which continued to flourish while those rules were in effect. Instead, commenters arguing that our actions in the Order cross the major-questions threshold appear to exaggerate the potential effect of the Order by focusing on the economic value of the internet economy as a whole or the total amount of capital that has been spent to construct the internet, rather than the effect of the specific actions we take here, or by relying on provisions that we have forborne from applying, or bare platitudes and ipse dixit. When considering economic effects, the Supreme Court has focused on the actual magnitude of a challenged action’s effect on an industry, rather than just the size of the underlying industry. To the extent parties have pointed to attempts to isolate the effects of Title II or the 2015 rules, we agree with the Mozilla court that “the Title II Order’s effect on investment is subject to honest dispute” and that the available studies are of only “quite modest probative value” and “could only be reliably adduced as evidence of the directionality of broadband investment, not ‘the absolute size of the change’ attributable to the Title II Order,” for the reasons we discuss below. The internet will continue to sustain its enormous economic and social value under our actions in the Order, just as it did under the 2015 Open Internet Order. And as with that Order, our broad forbearance from any particularly onerous requirements under Title II will significantly mitigate any economic impact on BIAS providers. As Justice Scalia observed in his dissent in Brand X, “the Commission’s statutory authority to forbear from imposing most Title II regulations” ensures that the economic effect of a Title II classification is “not a worry.” 242. But even if the economic and political significance of our order met the first prong of the major-questions doctrine, the other factors militate against applying it here. In every other respect, the situation here is the antithesis of the Supreme Court’s major-questions cases.

243. To start, we are not “claim[ing] to discover in a long-extension statute an unheralded power.” There is nothing novel about the Commission’s exercise of its classification power here. On the contrary, the Commission regularly classified services under the basic-enhanced Computer II framework even before Congress adopted the 1996 Act; Congress effectively codified that regulatory regime into the 1996 Act under the telecommunications service
and information service definitions; the Commission has continued to regularly exercise that authority under the 1996 Act, including by classifying DSL service as including a Title II telecommunications service in 1998 and classifying all BIAs as a Title II telecommunications service in 2015; and the Supreme Court expressly upheld the Commission’s authority to classify broadband service in Brand X. That is not some “newfound power,” but instead a power that the Commission has possessed and asserted all along. We also reject claims that our order would “effect[] a ‘fundamental revision of the statute, changing it from [one sort of] scheme of ... regulation’ into an entirely different kind.” That may have been true in MCI, which concerned a change from “from a scheme of rate regulation in long-distance common-carrier communications to a scheme of rate regulation only where effective competition does not exist.” But under the forbearance authority that Congress added to the Communications Act in response to that case, the Order specifically forbears from any tariff-filing requirements or rate regulation, ensuring that our classification decision will not alter those fundamental aspects of the regulatory scheme. Our exercise of that authority in the Order thus comes as no surprise. And given the important role that a service’s classification plays under numerous provisions of the Act, as well as the persistent focus on that issue in numerous classification decisions over the years, the classification power cannot be dismissed as some mere “‘ancillary provision[s]’ of the Act . . . that was designed to function as a gap filler and had rarely been used in the preceding decades.”

244. On top of that, regulating communications services and determining the proper regulatory classification of broadband falls squarely within the Commission’s wheelhouse. Regulating communications networks “is what [the Commission] does,” consistent with our statutory mandate to “regulat[e] interstate and foreign commerce in communications by wire and radio so as to make available . . . a rapid, efficient, Nation-wide and world-wide wire and radio communication service with adequate facilities at reasonable charges.” No one should be surprised to see the Commission classifying and regulating communications services. Our action in the Order is thus nothing like the Centers for Disease Control and Prevention seeking to regulate evictions, the Occupational Safety and Health Administration seeking to regulate non-occupational public health hazards, the Internal Revenue Service addressing healthcare policy, or the Attorney General making medical judgments. In contrast to those cases, the Order falls directly within the agency’s core statutory responsibility.

245. The regulatory issues we address in the Order also fall squarely within the Commission’s technical and policy expertise. The issues here “turn[] . . . on the factual particulars of how internet technology works and how it is provided,” and they “involve a ‘subject matter [that] is technical, complex, and dynamic,’” which the agency is well positioned “to address” through “its expert policy judgment.” In light of that relevant expertise, it is entirely appropriate and unsurprising that Congress would “leave[] federal telecommunications policy in this technical and complex area to be set by the Commission.”

246. For the reasons explained above, we also do not believe that, on the facts here, anything can be inferred from Congress’s failure to clarify the regulatory status of broadband one way or the other. Against a pre-1996 Act backdrop in which the Commission regularly classified emerging services as either basic services (now known as telecommunications services) or enhanced services (now known as information services), Congress essentially adopted that framework in the 1996 Act. But Congress chose not to directly specify which classification applies to broadband, which the Supreme Court understood in Brand X as “leave[ing] it to the Commission to resolve in the first instance” in the exercise of its expert technical and policy judgment. In the years since Brand X, Congress has failed to adopt several bills that would require broadband to be regulated under Title I and has also failed to adopt several bills that would instead provide for broadband to be regulated under Title II. Rather than casting any doubt on our regulatory authority, we think this recent stalemate leaves in place the prior understanding articulated in Brand X—i.e., that the Communications Act “leaves federal telecommunications policy in this technical and complex area to be set by the Commission.”

247. The situation here again stands in stark contrast to Brown & Williamson. In that case, the Court “[d[id] not rely on Congress’ failure to act” as casting doubt on agency action, but instead on affirmative actions that appeared to chart an incompatible course. There is no comparable record of incompatible action by Congress here. Here, the only affirmative action Congress has taken on broadband regulation in recent years was a 2017 resolution to invalidate broadband privacy rules promulgated by the Commission under section 222 of the Act. That resolution overturned only a specific set of privacy rules while leaving in place the underlying Title II classification and other rules that were then in effect, and so casts no doubt on the actions we take in the Order. We disagree with USTelecom’s contention that Congress’s authorization of the BEAD grant program somehow bears on the classification of BIAs under the Communications Act. USTelecom observes that, in authorizing that program, section 60102(h)(5)(D) of the IIJA states that “[n]othing in this title”—meaning Title I of Division F of the IIJA—“may be construed to authorize the Assistant Secretary [of Commerce] or the National Telecommunications and Information Administration to regulate the rates charged for broadband service.” But a disclaimer that Congress was not authorizing the Department of Commerce or its subagency to regulate broadband rates as part of a subsidy program that exists outside the Communications Act does not speak at all to how the Commission may or should administer the Communications Act. And even if the IIJA had adopted a broader prohibition on any rate regulation under the Communications Act—something that the Order does not impose, and indeed affirmatively forbears from—that would not speak to other forms of common-carriage treatment or to the rules we adopt in the Order prohibiting blocking, throttling, and paid prioritization. On its face, the IIJA is entirely agnostic about how BIAs should be classified under the Communications Act and whether the Commission should have the power to impose the rules we adopt in the Order. If Congress wanted to prohibit Title II regulation of broadband in the IIJA or to otherwise restrict the Commission’s authority, it surely could have done so, but USTelecom err in trying to read into the IIJA an unstated prohibition that Congress nowhere adopted.

248. Finally, in the event that (despite all the considerations above) the major-questions doctrine does apply here, we nonetheless think our authority to classify and regulate broadband is sufficiently clear under the Communications Act. We agree with the D.C. Circuit that the Supreme Court already held as much in Brand X, in which “the Supreme Court expressly recognized that Congress . . . had
delegated to the Commission the power to regulate broadband service.” Indeed, in a subsequent major-questions case, the Court expressly pointed to Brand X as a case finding that the agency’s “authority is clear” based on “the language of the statute itself.” That conclusion from the statute was clearly correct. The Communications Act is full of provisions that depend on whether a service is classified as a telecommunications service or an information service. The Commission cannot administer those provisions without first deciding how a service should be classified. To that end, section 4(i) of the Act expressly empowers the Commission to “perform any and all acts, make such rules and regulations, and issue such orders . . . as may be necessary in the execution of its functions.” Likewise, section 201(b) empowers the Commission to “prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of” the Act. And section 303(r) again empowers the Commission to “[m]ake such rules and regulations and prescribe such restrictions and conditions . . . as may be necessary to carry out the provisions of” the Act. The grant of authority required under the major-questions doctrine “may come from specific words in the statute, but context can also do the trick,” including “[s]urrounding circumstances, whether contained within the statutory scheme or external to it.” Here, as the Supreme Court has opined in numerous Commission-related cases, “[i]t suffices that Congress has unambiguously vested the FCC with general authority to administer the Communications Act through rulemaking and adjudication,” and the Commission necessarily must be able to assess the proper classification of BIAS “in the exercise of that authority.”

G. Preemption of State and Local Regulation of Broadband Service

249. Consistent with the Commission’s approach in the 2015 Open Internet Order, we will exercise our authority to preempt any State or local measures that interfere or are incompatible with the Federal regulatory framework we establish in the Order. And as in the 2015 Open Internet Order, we will proceed incrementally by considering such measures on a case-by-case basis as they arise “in light of the fact specific nature of particular preemption inquiries.” “We are not persuaded to depart from our description of the basic preemption framework here, particularly given our approach of generally deferring specific preemption analyses to future case-by-case assessments where the relevant issues can be fully vetted as warranted.” 250. Commenters broadly agree that Title II gives the Commission authority to preempt State or local requirements that interfere with our exercise of Federal regulatory authority over interstate communications. Under a doctrine known as the impossibility exception to State jurisdiction, the Commission may, in the exercise of its preeminent Federal regulatory authority over interstate communications, preempt State law when “it is impossible or impracticable to regulate the intrastate use of a communications service without affecting interstate communications, and (2) State regulation would interfere with the Commission’s exercise of its authority to regulate interstate communications. General principles of conflict preemption also lead to the same conclusion. “Under ordinary conflict pre-emption principles[,] a state law that ‘stands as an obstacle to the accomplishment and execution of the full purposes and objectives’ of a federal law is preempted.” In Geier v. Am. Honda Motor Co., for example, the Court “found that [a] state law stood as an obstacle to the accomplishment of a significant federal regulatory objective” embodied in Department of Transportation regulations and was therefore preempted.

251. The D.C. Circuit held in Mozilla that the Commission could not invoke the impossibility exception to preempt State law after it classified BIAS as an information service under Title I. But that was because “[c]lassifying broadband as an information service . . . placed broadband outside of [the Commission’s] Title II jurisdiction,” and “in any area where the Commission lacks the authority to regulate, it equally lacks the power to preempt state law.” Because the Order restores and rests on the broad regulatory authority conferred on the Commission by Title II, Mozilla does not cast any doubt on the Commission’s power, under the impossibility exception as well as ordinary principles of conflict preemption, to preempt State law when exercising—or when forbearing from—our affirmative regulatory authority over broadband. We reiterate, as we have in the past, that the reclassification decision made herein provides no justification for a State or local franchising authority to require a party with a franchise to operate a cable system under Title VI of the Act, to obtain an additional, or modified franchise in connection with the provision of BIAS, or to pay any new franchise fees in connection with the provision of such services. 252. We decline requests to categorically preempt all State or local regulation affecting BIAS in the absence of any specific determination that such regulation interferes with our exercise of Federal regulatory authority. Because we think preemption decisions will, at least in general, best be reached on a record specific to whether and how a State or local regulation conflicts with our Federal requirements, we also decline at this time to preempt specific State or local regulations insofar as we lack a specific and robust record in this proceeding. The Act establishes a dual Federal–State regulatory system in which the Federal government and the states may exercise concurrent regulatory authority over communications networks. While the Commission has occasionally described the internet as “jurisdictionally interstate” or “preeminently interstate, we cannot find it to be exclusively interstate. BIAS providers operate in and significantly affect local markets, and there are intrastate aspects of BIAS providers’ operations that could reasonably be handled differently in different jurisdictions. For example, different laws might apply to customer relationships and billing practices depending on a customer’s billing or service address. The Commission has previously stated that “whenever possible,” preemption should be applied “narrow[ly]” in order “to accommodate differing state views while preserving federal goals.” And as the Commission recognized even in the RIF Order, it would be inappropriate to “disturb or displace the states’ traditional role in generally policing such matters as fraud, taxation, and general commercial dealings.” Where State or local laws do unduly frustrate or interfere with interstate communications, however, we have ample authority to address and preempt those laws on a case-by-case basis as they arise. We will not hesitate to exercise that authority.

253. California’s Internet Consumer Protection and Network Neutrality Act of 2018, also known as SB–822, appears largely to mirror or parallel our Federal rules. Thus we see no reason at this time to preempt it. The law’s legislative history states that it was specifically designed to “codify portions of the [then]-rescinded Federal Communications Commission rules” by “recast[ing] and implement[ing] the ‘bright line rules’ . . . established in the 2015 Open Internet Order.” To that end, the California law makes it “unlawful” for any BIAS provider to engage in
“blocking,” throttling (i.e., “[i]mpairing or degrading” internet traffic), or “paid prioritization.” The law also prohibits BIAS providers from “unreasonably interfering” with or “unreasonably disadvantaging” internet content or services, similar to our general conduct rule. And the law includes a disclosure requirement that closely resembles our transparency rule.

254. On its face, the California law generally tracks the Federal rules we restore in the Order, including the bright-line rules prohibiting blocking, throttling, and paid-prioritization, as well as the general conduct rule and transparency disclosures. A State law that requires regulated parties to comply with the same requirements that already apply under Federal law is by definition unlikely to interfere with or frustrate those Federal rules.

255. Nor do we see any reason at this time to preempt California from independently enforcing the requirements imposed by our rules or by the states through appropriate State enforcement mechanisms. On the contrary, we think State enforcement generally supports our regulatory efforts by dedicating additional resources to monitoring and enforcement, especially at the local level, and thereby ensuring greater compliance with our requirements. However, should California State enforcement authorities or State courts seek to interpret or enforce these requirements in a manner inconsistent with how we intend our rules to apply, we will consider whether appropriately tailored preemption is needed at that time.

256. Some parties suggest that the California law might go further than our Federal requirements with respect to interconnection or zero-rating. Notably, most of these commenters express support for these requirements and urge against preempting them. We are not persuaded on the record currently before us that the California law is incompatible with the Federal rules we adopt in the Order with respect to either issue. As to the former, California prohibits BIAS providers from requiring interconnection agreements “that have the purpose or effect of evading the other prohibitions” by blocking, throttling, or charging for traffic at the interconnection point. We have likewise stated in the Order that BIAS providers may not engage in interconnection practices that circumvent the prohibitions contained in the open internet rules. As to the latter, California restricts otherwise prohibited “Internet content, applications, services, or devices in a category” or when performed “in exchange for consideration, monetary or otherwise, from a third party.” We have likewise explained in the Order that sponsored-data programs—where a BIAS provider zero rates an edge product in exchange for consideration (monetary or otherwise) from a third party or where a BIAS provider favors an affiliate’s edge products—raise concerns under the general conduct standard. The California Attorney General represents that these provisions of California law “are consistent with, and not in conflict with, the Commission’s proposal” that we adopt in the Order, because the Commission has “included protections against interconnection circumvention” and stated that we “may take action against zero-rating practices under the general conduct provision on a case-by-case basis.” Nothing in the record gives us any reason to doubt that representation. The California law has been in effect since early 2022, yet there is no record evidence that these provisions have unduly burdened or interfered with interstate communications service. And in contrast to our treatment of rate regulation, from which we have affirmatively forborne, we have not determined that regulation of zero-rating and interconnection is detrimental, leaving room for states to experiment and explore their own approaches within the bounds of our overarching Federal framework.

257. We caution, however, that we stand ready to revisit these determinations if evidence arises that State policies are creating burdens on interstate communications that interfere or are incompatible with the Federal regulatory framework we have established. Our determination here simply reflects that no convincing evidence has been presented to us in this proceeding.

258. A group of California Independent Small LECs ask us to preempt several CPUC decisions regulating rates for intrastate telephone service, insofar as those telephone service rates take into account a company’s broadband revenues or those of its affiliates. We find that those decisions are outside the scope of this proceeding, which concerns the regulatory framework that applies to BIAS, not rates for or regulation of traditional telephone service. The California Independent Small LECs or other parties are free to raise this issue in an appropriate proceeding, but we express no views on it here.

259. Some parties ask us to address more broadly the extent of State authority to adopt broadband affordability programs. The comments received in this proceeding do not contain a focused and robust record or discussion concerning any particular State broadband affordability program, so we decline to address any particular program here. Nevertheless, we find that states have a critical role to play in promoting broadband affordability and ensuring connectivity for low-income consumers. The BEAD grant program established by the IIJA, for example, requires State BEAD programs to ensure that ISPs offer a “low-cost broadband service option” for eligible subscribers. We also clarify that the mere existence of a State affordability program is not rate regulation.

H. Impact of Reclassification on Investment

260. Consistent with our tentative conclusion in the 2023 Open Internet NPRM, and contrary to the conclusion reached in the RIF Order, we find arguments that the reclassification of BIAS would lead to a substantial adverse impact on BIAS investment to be unsubstantiated. In the RIF Order, the Commission’s primary policy justification for reclassifying BIAS as a Title I information service was its conclusion regarding the alleged harm to investment by Title II classification. The RIF Order also advanced two additional policy rationales for reclassifying BIAS under Title I: (1) a claim that there were no demonstrated harms and that BIAS providers would be incentivized to maintain internet openness; and (2) a claim that existing consumer protection and competition laws were sufficient to protect an open internet. As we discuss further below, we also disagree with the RIF Order’s analysis regarding these policy justifications. However, the RIF Order failed to consider the evidence to the contrary, including the 2015 Open Internet Order’s evidence that investment in mobile voice and DSL thrived during the period in which they were regulated as Title II services. As the record in this proceeding clearly shows, the impact of reclassification on BIAS investment is uncertain. This finding comports with the literature on open internet regulations, the available empirical evidence, and the literature on regulation more broadly.

261. Commenters disagree as to whether reclassification of BIAS as a Title II service will discourage investment in broadband infrastructure or the internet generally. Several commenters contend that reclassification of BIAS as a Title I information service fosters investment,
claim that investment increased following the RIF Order, and raise the concern that reclassification of BIAS under Title II will increase regulatory burdens and uncertainty, leading to a reduction in investment and innovation. AT&T argues that investment decisions depend on long-run: (1) expected costs (including the costs of regulatory compliance), (2) expected revenues, and (3) the degree of uncertainty about costs and revenues; and it claims that Title II regulation would worsen all three. WISPA contends that regulatory compliance costs will disproportionately impact small service providers that lack the resources to handle the new compliance obligations. Several commenters claim that Title II classification, particularly the application of a general conduct rule, would increase uncertainty and therefore chill investment and innovation. Commenters also claim that application of section 214 to BIAS would create a regulatory burden and reduce network investment and innovation. Finally, many commenters claim that applying public-utility style regulation to the internet would result in high prices and chronic underinvestment.

262. Other commenters argue that Title II reclassification would not reduce investment or innovation, and that there is no evidence that the 2015 Open Internet Order reduced BIAS investment or that investment increased following the 2017 RIF Order. Some of these commenters argue that in fact the opposite occurred: BIAS deployment and investment increased following the 2015 Open Internet Order and declined following the 2017 RIF Order. The California Independent Small LECs argue that adopting Title II with strong forbearance, as we do here, would increase investment incentives by reducing uncertainty due to our rules preempting potentially different regulatory regimes within each state.

263. We disagree with those commenters that argue our application of Title II with broad forbearance would reduce investment incentives or innovation. Regulation is but one of several factors that drive investment and innovation in the telecommunications and digital-media markets. Given the varying factors that underlie BIAS providers’ investment decisions, we are not persuaded by CTIA and NCTA’s cursory assertions that our classification decision would upset their investment-backed reliance interests. Regulation interacts with demand conditions, innovation opportunities created by technological advances, and the competitive intensity of markets.

Appropriate regulation is often required to create market conditions that support infrastructure investment, as regulation can enhance competition, mitigate transaction costs between market players, and otherwise reduce market uncertainty, thus boosting investment and innovation. We find that the approach we take in the Order will foster a more competitive broadband marketplace, increase overall regulatory certainty, and provide a more level playing field for all market participants. We acknowledge that regulation generally, and open internet regulations in particular, can affect market participants differently. On balance, however, we conclude that our approach is unlikely to reduce, and would likely promote, overall investment and innovation in the internet ecosystem.

264. The RIF Order and at least one commenter argue that regulation in general, and the prospect of future price regulation in particular, which we clearly disclaim, will chill BIAS provider investment. However, research on the relationship between regulation and investment shows that the impact of regulation is more nuanced. For example, the findings of empirical research on how Commission regulations concerning the provision and pricing of network elements affected investment reaches different conclusions with respect to incumbent firms and competitors. To facilitate new entry into the local exchange market, the Telecommunications Act of 1996 required an ILEC to, among other things, offer new competitive carriers interconnection at any technically feasible point in the ILEC’s network, access to unbundled network elements (UNEs) on a rate-regulated basis, and make retail services available for resale at regulated wholesale rates.

Researchers have reached different conclusions regarding how the Commission’s implementation of this requirement has affected ILEC and CLEC investment. Thus, a generic claim that regulation will chill investment cannot be sustained. Furthermore, we emphasize that we do not consider the effect of regulation solely on investment in broadband infrastructure—whether positive or negative. Rather, we assess the overall effect of regulation on consumer welfare, evaluating changes in broadband investment along with effects on the prices and quality of broadband access and edge services, and on edge provider investment and innovation.

265. We find the comparison made by certain commenters between Title II classification coupled with open internet rules and public-utility regulation to be inapt for several reasons. First, unlike utilities such as water, electricity, and gas, BIAS is a two-sided platform with BIAS subscribers on one side of the market and edge providers on the other.

According to economist Mark Rysman, “a two-sided market is defined as one in which: (1) two sets of agents interact through an intermediary or platform, and (2) the decisions of each set of agents affects the outcomes of the other set of agents . . . [because] there is some kind of interdependence or externality between groups of agents that the intermediary serves.” Rysman’s definition aptly describes the BIAS virtuous cycle between consumer demand and edge provider innovation. Consumers value BIAS more as the diversity and quality of valuable edge services increase, and edge providers see value in investing and innovating as the breadth and depth of consumer demand increases. We note that Rysman specifically lists “internet . . . markets” under his examples. In contrast, in water and traditional gas and electricity markets, the value to the consumer of having access to the utility does not materially increase with the number of suppliers through an interdependency, and even modern energy markets only exhibit limited aspects of multisided markets. Therefore, the type of regulation required and the effects of those regulations will necessarily be different for BIAS than for such utilities. Second, and most importantly, the rules we now adopt are carefully tailored to avoid the potential issues that commenters claim are problematic in the regulations of utilities. In particular, unlike the range of utility-style regulations that were applied to monopoly telephone service under Title II, including rate regulation, we forbear from many of these provisions and do not adopt any rate regulation, which is a hallmark of utility regulation. The Commission has long recognized that regulating rates is not its preferred approach, and therefore has spent decades promoting competition in the market rather than relying on rate regulation. The approach we adopt in this proceeding is consistent with this longstanding policy objective.

266. Economics literature shows that open internet provisions may increase investment and innovation, and may have welfare-enhancing effects. Contrary to BIAS provider claims that open internet provisions would diminish their investment incentives, some economics literature shows that allowing BIAS providers to sell prioritized access, for instance, can
actually lower investment incentives. For example, Professors Jay Pil Choi and Byung-Cheol Kim show under their assumptions that, if paid prioritization is allowed, BIAS providers have an incentive to reduce investment because expanding broadband capacity would lower the price that they can charge for priority access. In addition, the authors find that content provider investment incentives are also lower absent neutrality regulation due to BIAS providers potentially expropriating the benefits of content provider investment by charging for access to their customers. Another paper by Professors Nicholas Economides and Benjamin Hermelin finds that prohibiting BIAS providers from charging for priority access unambiguously reduces BIAS provider investment in their model.

However, the study’s finding on the overall effect of net neutrality regulation on social welfare is still ambiguous because social welfare is the sum of consumer welfare and producer surplus, including any surplus that accrues to edge providers.

267. Given that economics literature supports a conclusion that the effects of applying open internet provisions may not be harmful, and can actually be beneficial to BIAS investment incentives, the RIF Order and opponents of reclassification in this proceeding cite studies that claim to show there was a decline in investment following the reclassification of BIAS to Title II in the United States, or after other countries implemented similar regulations. We find the evidence presented to be unpersuasive for the following reasons.

268. First, as the RIF Order correctly recognized, network infrastructure is a long-term irreversible investment that often requires years of planning, preparation, and approvals before construction can begin. The RIF Order then proceeds to suggest, however, that there is a causal link between the adoption of the 2015 Open Internet Order and declines in broadband investments that occurred in the same year that the Order was adopted, noting that this was the first year of decline since 2009. The RIF Order goes on to review studies that compare BIAS provider investment before and after adoption of the 2015 Open Internet Order and suggests that the brief two-year reclassification of BIAS under Title II resulted in a decline in BIAS provider investment of up to 5.6% between 2014 and 2016. Given the substantial planning, preparation and permitting required to make most large-scale capital investments in broadband networks, it is implausible that the 2015 Open Internet Order would have resulted in such an immediate and substantial decline in BIAS provider investment. Such a finding is also inconsistent with the reaction of investors to Title II reclassification, the findings of investment analysts, multiple statements made by company executives to investors following Title II reclassification, and common sense. An “event study” analysis that examined the effect of the Title II decision on ISP and edge provider stock prices found that the decision had almost no impact, except for a very short-term decline in the stock prices of a few cable ISPs. And Sprint’s Chief Technology officer stated that Sprint “does not believe that a light touch application of Title II, including appropriate forbearance, would harm the continued investment in, and deployment of, mobile broadband services.” In short, a proper evaluation of the investment effects of Title II reclassification, or open internet rules more generally, would require a longer time period in order to properly evaluate any potential effects on investment.

269. Second, as the RIF Order also correctly recognized, many of the studies that it cites and evidence it presents did not account for other factors that likely have a much larger impact on investment decisions than the classification of BIAS. The RIF Order notes that “[t]hese types of comparisons can only be regarded as suggestive, since they fail to control for other factors that may affect investment (such as technological change, the overall state of the economy, and the fact that large capital investments often occur in discrete chunks rather than being spaced evenly over time), and companies may take several years to adjust their investment plans.” These include the broader economic conditions, capacity constraints, increasing demand for broadband, technology changes (such as the transition from 3G to 4G and then to 5G networks), and BIAS providers’ general business development decisions. Commenters in this proceeding point to the recent increase above trend in aggregate broadband capital expenditures as evidence that a “light touch” regulatory approach promotes broadband investment. However, such claims do not adjust for macroeconomic factors such as inflation, new technologies like 5G New Radio (NR), and myriad other factors that likely explain most if not all of the observed increases in investment since the RIF Order. We also note that following the release of the RIF Order, major mobile BIAS providers began investing in 5G NR technology, and this increase in investment would have occurred even absent the adoption of the RIF Order. In his dissent, Commissioner Carr points to a decline in wireless investment in 2016 and 2017 as evidence that the 2015 Open Internet Order caused wireless investment to decline. However, these two years are the period when wireless carriers had mostly concluded building their 4G networks. And the subsequent increase in wireless investment was due to carriers beginning to deploy 5G in 2018. Thus, after accounting for all relevant factors—the data Commissioner Carr cites does not undercut our investment analysis.

270. Third, it is widely known in statistics that correlation does not imply causation. In the broadest sense, correlation measures the degree to which two random variables are associated with one another, and tests of correlation measure the strength of such a relationship. However, just because two variables—e.g., Title II reclassification and changes in investment—are observed to occur together, does not imply that one variable (reclassification) caused the other (observed changes in investment). For example, ice cream sales and violent crime rates tend to exhibit a strong positive association. However, it is not the case that ice cream sales cause crime, or that higher crime causes increased ice cream sales, but rather that a third variable, temperature, affects both. Not adjusting for average daily temperature could lead a researcher to draw an incorrect conclusion. To determine whether Title II reclassification caused the change in investment, we would need to determine what the level of investment would have been if Title II reclassification had not been adopted.

271. The “gold standard” in empirical research for determining what would have happened is the randomization of research subjects into treatment and control groups, such as is commonly done in drug and other medical trials. In a randomized clinical trial, the outcomes of the control group that did not receive a treatment serve as the counterfactual for measuring the extent of a treatment that is given to the other group (the treatment group). However, in many real-world scenarios, such as the evaluation of the effect of open internet regulations, it is obviously not possible to randomize companies into treatment and control groups to determine investment effects. For this reason, there are a number of “quasi-experimental” empirical methods that have been developed in statistics that attempt to use observational data in a
manner that mimics a randomized experiment. Some of the statistical techniques used to perform such an analysis are fixed effects, instrumental variables (IV), differences-in-differences, and matching estimators.

272. Only a few studies cited in the present record and in the RIF Order record attempt to perform any type of rigorous analysis of the effects on investment of open internet regulations or Title II reclassification with forbearance. As for those, we find, as we discuss below, that, in all cases, the results of these studies are inconclusive due to methodological issues. As an initial matter, no study in the record attempts to measure changes in edge provider investment under Title II reclassification, so no study can make claims about the effect of reclassification on the relevant investment variable of interest from a policy perspective, which is total investment in the internet ecosystem. Further, even if total investment in the internet ecosystem were shown to be lower, that would not be determinative of whether reclassification of BIAS under Title II with forbearance is socially beneficial. To make this determination, changes in social welfare, notably accounting for consumer benefits, would need to be examined. There is no empirical study in the record that attempts to measure such changes in social welfare, and as noted above, the theoretical literature is ambiguous in terms of whether open internet regulations would raise or lower social welfare.

273. One empirical study cited prominently in the record and in the RIF Order uses a Differences-in-Differences (DiD) estimator on aggregate investment data by industry from the Bureau of Economic Analysis (BEA) to conclude that the 2010 announcement by Chairman Genachowski that the Commission was considering reclassifying BIAS under Title II raised uncertainty and reduced BIAS provider network investment on average by about 20% from 2011 to 2016. We find several other issues with this paper that lead us to give it no probative value in this proceeding. ITIF criticizes our dismissal of this study, but it does nothing to address the fundamental concerns with the study. ITIF also fails to provide support for its contention that the Commission should only reclassify BIAS as a Title II telecommunications service if there is evidence doing so will enhance broadband investment. In any event, we show below that the benefits of reclassification will outweigh the costs.

274. The study conducts a DiD analysis by choosing five other industries that the author claims will have comparable trends in investment to the “Broadcasting and Telecommunications” industry that serves as the treatment group for purposes of assessing the impact of Title II reclassification on investment. The BEA industry classifications that the author chose as comparable to telecommunications are: wholesale trade; transportation and warehousing; machinery manufacturing; computer and electronics products; and plastics and rubber products. The BEA series identification numbers for the industries used are “13n51301es00” for telecommunications, “13n42001es00” for wholesale trade, “13n48001es00” transportation and warehousing, “13n33301es00” for machinery manufacturing, “13n33401es00” for computer and electronics products, and “13n32601es00” for plastics and rubber products. It is not clear why this diverse set of industries with very different technology and productivity shocks would be an appropriate control group for telecommunications. Visual inspection comparing the pre-2010 (pre-treatment) investment trends of the control industries with the trends in telecommunications and broadcasting investment confirm that the controls are inappropriately chosen. Prior to the 2010 announcement of potential Title II reclassification, there are sharp divergences in the investment trends between the two groups, which implies that the “parallel trends” assumption of the DiD estimator may be violated and that biased estimates will be produced as a result. This study is the published version of a 2017 working paper that many commenters cite in the record. Two other papers by the same author present similar evidence, the latter of which, George Ford, Investment in the Virtuous Circle, uses USTelecom investment data for its measure of telecommunications investment and BEA data for its measure of investment in other industries, which may be problematic given that the two data sources may not be comparable. In addition, staff was unable to replicate this paper due to the author’s not describing the twenty industries that were used in the control group. In fact, over 60% of the growth in investment in the control group between the pre-treatment and treatment periods is being driven in this study by the inclusion of investment in the transportation and warehousing industry. Investment in transportation and warehousing rose dramatically during the post-2010 time period due to the boom in e-commerce that occurred. According to Census Bureau data, e-commerce sales increased by over 120 percent from Q4 2009 to Q4 2016. However, investment is forward-looking, and this retail sales data does not capture expected future sales. As one measure of forward-looking expectations for the e-commerce sales that drove investment in this industry, the stock price of Amazon increased by more than 400% over this same period. This trend makes this industry a poor choice for predicting what the trend in telecommunications investment would have been absent the announcement of the potential for BIAS to be reclassified as a Title II service. A more appropriate method to choose the control group industries to avoid these problems is to choose a weighted combination of the potential controls where the weights are chosen to minimize the pre-treatment differences between the treatment group and the control group, but this procedure was not followed.

275. The aggregate measure of investment used by the author as the primary variable of interest is also too broad to provide meaningful estimates, both in terms of the business entities and types of investments included in the measure. There are currently 2,201 BIAS providers in the United States that would be affected by Title II reclassification, but the BEA collects investment data from nearly 125,000 business entities in the telecommunications, broadcasting, motion picture, and video production industries when calculating their “Broadcasting and Telecommunications” investment data. Title II reclassification would therefore be expected to have little direct effect on most of the businesses reported in the author’s measure of broadband investment. Furthermore, investments captured within this broad measure would include investments in buildings, trucks, office equipment, software, and other investment categories that likely would be unaffected by Title II reclassification. A proper analysis would focus on discretionary investments by BIAS providers that would be expected to actually be impacted by reclassification.

276. Finally, the BEA data used by the author has been substantially revised since this study was published and the corrected data undercut the conclusion that open internet regulations led to a decline in telecommunications investment. The Census Bureau conducts an Economic Census every five years that forms the basis of the investment data published by the BEA.
and used by the author in this study. In the intervening years, the BEA estimates investment within each industry and then revises these estimates when the actual investment data becomes available from the newly conducted Economic Census. Whereas the author found that telecommunications investment declined by 6.2% in real terms when comparing the 2004–2009 period to the 2011–2016 period in his data, the corrected data now available on the BEA website show that telecommunications real investment in fact rose 10.2% between these two periods. We replicated the author’s regression analysis exactly based on this previous data and found, as he did, that real investment in telecommunications in the uncorrected data declined between the 2004–2009 and 2011–2016 periods, which leads us to conclude that the change in the conclusion based on the revised data is due entirely to changes in the underlying data and not differences in model specification. The revised data also substantially affect the results of the DiD regression analysis performed by the author. When Commission staff re-estimate his baseline regression model in Table 2 with the corrected data, rather than finding a statistically significant 22% decline in telecommunications investment as the author found, the corrected regression finds only a 6.2% decline relative to expectations based on the control group industries and this is not statistically significant. If the inappropriate “transport and warehousing” control group is then removed from the model, for all practical purposes the model predicts no decline in telecommunications investment resulting from the potential for Title II reclassification. While telecommunications investment is still estimated to be −2.7% in the period following the announcement of potential Title II reclassification, the p-value is .71, which indicates that there is a 71% chance of obtaining a negative effect at least this large even if the null hypothesis of no effect on investment is true. In other words, this small negative effect is very likely due to random noise rather than there being a true negative effect of Title II regulation on investment. Therefore, if this paper supports anything, it supports the position that Title II reclassification had no effect on BIAS provider investment.

277. The study’s author, Dr. George Ford, offers a critique of the Commission’s analysis and attempts to resuscitate his earlier assertions regarding Title II investment impacts with new analysis—neither his critique nor new analysis are persuasive. As an initial matter, we note that Dr. Ford does not dispute that the underlying data was revised by the BEA since his study was performed, or that substituting the revised data into his previous model changes the results to show a statistically insignificant difference in investment following the announcement of Title II reclassification. Dr. Ford’s primary argument is that we did not replicate his study when reaching our conclusions because we did not follow his “entire research process” when updating his analysis with the new BEA data. We note that Dr. Ford fails to cite a professionally accepted definition of replication from a peer reviewed article on this topic, but rather cites merely a website post for his definition. Dr. Ford implies that we should have changed his underlying model, including the control groups, as he proceeds to do in his new analysis. But his new analysis, like his prior analysis, does not conduct a proper DiD regression analysis with a replicable research process. As discussed below, Dr. Ford did not use a rigorous and principled methodology for selecting his control groups, and as such, there is no way that the Commission could predict which control groups Dr. Ford would choose now that the revised BEA data and original model no longer support his previous conclusions. Dr. Ford also changed his criteria for choosing the control groups, the level of aggregation at which control groups were selected, and his standard error procedure. As Dr. Ford acknowledges, the standard error procedure he now adopts for many of his new analyses would be more likely to (incorrectly) conclude that there is a statistically significant difference in investment when there is not. His “entire research process,” therefore, could not have been replicated. Even by his own—and not generally accepted—definition of replication, Dr. Ford also chose not to replicate his original study in the Ford Response, from which we conclude that he appears to be retracting the original study, or at least, conceding that it no longer supports the theory that Title II negatively impacts ISP investment.

278. Even if we had been able to replicate his entire research process, the process he employs lacks rigor and is not in line with recommended best practices from the empirical economics literature. Dr. Ford appears to advocate basing the selection of DiD control groups entirely on a comparison of the pre-treatment trends in the outcome between the treatment and control groups. However, such a process is known to be theoretically dubious and statistically problematic. Dr. Ford is correct that one requirement for the DiD estimator to produce valid estimates is that “the selected control group for the industries of interest plausibly satisfy the parallel paths (or common trends) assumption, where the investment of the control group serves as a reliable counterfactual for the treated group during the treatment period.” However, demonstrating this plausibility requires much more than the “visual inspection and some descriptive statistics” methodology that he reports employing. Rigorous DiD analysis employs the following three principles when choosing controls: (1) there should be no reason to believe the untreated group would suddenly change around the time of treatment; (2) the treated group and untreated groups should be generally similar in many ways; and (3) the treated group and untreated groups should have similar trajectories for the dependent variable before treatment. In his analyses, Dr. Ford focuses only on the last principle and does not consider the first two principles. In fact, Dr. Ford explicitly argues against following principles 1 and 2 in the Ford Response and criticizes the Draft Order for raising this issue. Dr. Ford’s other DiD analyses also do not properly construct an appropriate control group which further leads us to give no probative value to his findings. In a proper DiD research design, observing parallel trends in outcomes prior to treatment should be a consequence of choosing controls that are generally similar to the treated group, not the tool by which the controls are chosen. We note that the use of synthetic control methods does obviate the need to follow the first two principles. For example, in a widely cited synthetic control analysis of the economic effects of German reunification, even among Organization for Economic Cooperation and Development (OECD) countries, the authors excluded Luxemburg and Iceland “because of their small size and because of the peculiarities of their economies.” This illustrates that the authors followed principle 2. In addition, they excluded Canada, Finland, Sweden, and Ireland “because these countries were affected by profound structural shocks during the sample period.” This demonstrates that the authors also followed principle 1.

279. Just as Dr. Ford’s choice of the Transportation and Warehousing industry as a control group for his previous analysis was in violation of the first principle, Dr. Ford makes the same
mistake in his new synthetic DiD (sDiD) analysis where this same control actually receives the largest weight. The Transportation and Warehousing industry is industry code 48 and receives a weight of 18.7% in his analysis. Dr. Ford also does not follow the second principle in both his previous and current analyses because he never explains why or how the treatment and control group industries are “generally similar” and would be expected to have similar technology and productivity shocks as the telecommunications industry. If Dr. Ford had properly chosen the initial control groups, then the controls would be valid in both the previous BEA data and revised BEA data. It is not accepted practice to change control groups and research design in response to changes in the underlying data. Finally, we note that both graphical and statistical comparisons between Dr. Ford’s original data and the revised data confirm that the pre-treatment data for both the treatment and control groups are nearly identical between the two datasets. This is not surprising because the BEA conducts an Economic Census every five years and the newly collected data in the 2017 Census would generally have little impact on the investment data prior to 2012 when the last Economic Census was conducted. Only the post-2010 investment data for the telecommunications industry was significantly revised by the BEA. The pre-treatment trends remain essentially unchanged, suggesting that even by Dr. Ford’s methodology, there is no basis for switching the control groups he originally selected. According to the control group selection methodology set forth in Dr. Ford’s previous paper, the old control groups remain valid because “the pre-treatment growth rates are (statistically) the same between the treated and control groups.” Therefore, even by Dr. Ford’s own statements and line of reasoning, the Commission was correct to retain the old control groups when replicating his study. We further note that his only evidence that the control group industries are now inappropriate is that a “pseudo-treatment” dummy from 2007–2010 is now positive and statistically significant using his revised standard errors. However, Dr. Ford includes 2010, the year the Commission first sought comment on potential Title II classification, so this is an improper test under this method as it used data from the treatment period.

280. The only other paper in the record that uses rigorous analytical methods and data to evaluate the effect of open internet regulations on investment uses a panel data set for 32 OECD countries covering the period from 2003 to 2019 and a fixed effects model to examine the impact of open-internet-type regulations on the deployment of new fiber connections. The paper finds that the adoption of open-internet-type regulations in a country is associated with a 45% decrease in fiber investments. However, we have serious concerns regarding this paper that lead us to heavily discount its findings.

281. Our first concern is that it is not clear whether the results of this study are even applicable to the present circumstances. The policies adopted by various countries and the market dynamics within them are wide ranging and quite different from the U.S. context. If the types of regulations adopted were not similar to those adopted here (for example, if a country adopted rate regulation), then these results would not be a good proxy for how the regulations we adopt in the Order would be expected to affect U.S. broadband investment.

282. A second concern is that, in the present U.S. context, the size of the effect on broadband investment is implausibly large. The authors admit that the large magnitude of the effect is likely driven by the fact that, at the beginning of their sample, countries had almost no fiber connections so the growth rate in fiber connections was very high, while, at the end of their data sample, fiber coverage rates exceeded 100% in many countries with correspondingly low fiber connection growth rates. The crucial assumption the authors make to claim that they are identifying causal effects of the change in regulations is that decisions to implement or withdraw open-internet-type regulations have been made exogenously, i.e., the timing of these decisions is effectively random because these decisions are made for ideological reasons and politicians make these decisions without considering market outcome variables such as the number of fiber connections in the country.

283. We find that this identifying assumption may be faulty and the findings of this paper may be due to spurious correlations rather than the authors having identified true causal effects of the impact of open-internet-type regulation on investment. Contrary to the authors’ assertions, we find that it is likely that changes in which political party controls a country is likely to have direct effects on investment do not relate to adoption of open-internet-type regulations. For example, if more left-leaning parties in Europe tax investments at a higher rate than their right-leaning counterparts, then the authors’ findings could be due to unaccounted-for changes in the tax system or other national policy change that occurred at the same time as the adoption or relaxation of open-internet-type rules. The authors’ instrumental variable estimates may be flawed for this same reason. The authors use how “left” or “right” the current political party is as an instrument. However, this measure likely has a direct effect on broadband investment through multiple other channels, so it violates the fundamental assumption of an instrumental variable that it must be uncorrelated with the outcome of interest—broadband investment in this case—conditional on the other variables in model. In this context, instrumental variables estimation is often used when a treatment may not have been assigned to subjects randomly. In this case, the treatment is net neutrality regulations and OECD countries are the subjects of the experiment. An appropriate instrument in this example would be a third variable that is strongly correlated with the passage of net neutrality regulations in a country but, conditional on all the variables in the model, is not associated with the investment outcome except through its effect on the probability of net neutrality regulations being adopted. We find that whether the party in power is more “left” or “right” on the political spectrum is likely to exert a direct effect on ISP investment through many channels, and therefore this crucial “exclusion restriction” assumption is violated and the resulting estimates are biased.

284. There is a simple alternative explanation for why the authors find such strong negative effects of open-internet-type regulation on broadband investment. If countries do not adopt open-internet-type regulations until BIAS becomes an essential service in the country, as is the case in the United States, and the countries for which it is essential have much higher fiber connection bases, then we would expect exactly the results the authors find. The growth rates in fiber connections in these mature broadband economies would be much lower than the growth rates in fiber connections in countries that have a low base number of such fiber connections due to a less mature broadband market. If this is the case, these lower observed fiber growth rates in countries with open-internet-type regulations would not be due to the adoption of these regulations. Consistent with this view, the two countries that were among the earliest
adopters of open-internet-type regulations in the authors’ data sample, South Korea and Japan, were also the countries that had by far the greatest deployment of fiber connections at the time they adopted the rules between 2010–2011. In 2010, 58% of broadband subscriptions in Japan were provisioned by fiber-based technologies and 55% in South Korea were fiber-based, which far exceeded the rates observed in the next OECD country, the Slovak Republic at 29%, and many OECD countries had almost no fiber-based connections at the time. In short, it would not be possible for the growth rates in fiber access in these two early adopting countries of open-internet-type regulations to keep pace with the later adopting countries that had fiber access in the low single digits at the time, and the model specification estimated by the authors is not sufficiently rich to correct for these issues. The authors include country fixed effects, year dummies, lags in investment and time-varying covariates in their model, however, these controls are not sufficient to address our concerns and satisfy the fundamental identifying assumption of DiD models that “the interventions are as good as random, conditional on time and group fixed effects.” We conclude that it is not appropriate to compare fiber growth rates across these countries using this model.

285. Finally, the authors admit that the results of all of their models are inconsistent and biased because the lagged dependent variable and the error term are correlated. For the only consistent and unbiased model they estimate, the bias-corrected fixed effects estimator, open-internet-type regulations are found to have a statistically insignificant effect on BIAS provider investment.

286. As our detailed analysis demonstrates, the Commission’s conclusions in the RIF Order that BIAS provider investment is closely tied to the classification of BIAS were not based on sound empirical analysis, and no new studies submitted in the current record support the conclusions of the RIF Order. Indeed, the record in both the Order and the RIF Order proceeding on the likely effect of Title II classification is ambiguous, offering conflicting viewpoints regarding the potential investment effects. The theoretical literature, empirical studies, and comments are all inconclusive. As such, we conclude that any changes in BIAS provider investment following the adoption of Title II were more likely the result of other factors unrelated to the classification of BIAS.

287. The RIF Order also relied on a second study that used a “natural experiment,” but this study was not submitted into the record of this proceeding. It found that DSL subscriptions exhibited a statistically significant upward shift relative to its baseline trend after the Commission removed rate-sharing rules on DSL in 2003 and again in response to the reclassification of DSL as a Title I information service in 2005. There appear to be several serious problems with this study. First, it considers changes in DSL subscription, not changes in DSL investment, so it is not clear what inferences can be drawn about the effect of the regulatory changes on investment. Further, the authors attribute the increase in subscribers solely to the regulatory changes, without accounting for other factors that may have explained the increase. In particular, the authors ignore the fact that very high-speed digital subscriber line (VDSL) and asymmetric digital subscriber line (ADSL2) were developed and began to be deployed in 2001 and 2002, respectively, and both of these technologies significantly improved DSL speeds. It may be that these technological innovations and lagging DSL market shares led to the aggressive DSL price cuts that occurred starting in 2003 and this—not a change in regulations—led to the observed strong DSL subscriber gains relative to cable starting in 2003. Finally, we note that this study is also methodologically flawed. The effects of the 2003 and 2005 regulatory changes that applied to DSL, if any, would also impact the other broadband providers in the market due to such providers being substitutes. Therefore, cable is not an appropriate comparison group and the inclusion of the growth rate in cable modem subscriptions in the estimation equation is endogenous (i.e., correlated with the error term), which results in statistically biased and inconsistent estimates.

II. Order: Forbearance for Broadband Internet Access Services

A. Forbearance Framework

288. Section 10 of the Act provides that the Commission shall forbear from applying any regulation or provision of the Communications Act to telecommunications carriers or telecommunications services if the Commission determines that:

• enforcement of such regulation or provision is not necessary to ensure that charges, rates, classifications, or regulations by, for, or in connection with that telecommunications carrier or telecommunications service are just and reasonable and are not unjustly or unreasonably discriminatory;

• provision is not necessary for the protection of consumers; and

• forbearance from applying such provision or regulation is consistent with the public interest.

289. In making the determination under section 10(a)(3) that forbearance is in the public interest, the Commission shall consider whether forbearance from enforcing the provision or regulation will promote competitive market conditions, including the extent to which such forbearance will enhance competition among providers of telecommunications services. If the Commission determines that such forbearance will promote competition among providers of telecommunications services, that determination may be the basis for a Commission finding that forbearance is in the public interest. In addition, “[a] State commission may not continue to apply or enforce any provision” from which the Commission has granted forbearance under section 10.

290. Our approach to forbearance here builds on the Commission’s approach in the 2015 Open Internet Order. In that Order, the Commission broadly granted forbearance—to the full extent of its authority under section 10 of the Act—with respect to provisions of the Act and Commission rules that newly would have applied by virtue of the classification of BIAS as a telecommunications service there, subject only to exceptions in the case of certain expressly identified statutory provisions and Commission rules. The Commission also recognized that prior to the 2015 Open Internet Order some carriers chose to offer internet transmission services as telecommunications services subject to the full range of Title II requirements, and clarified that those carriers could elect to operate under the 2015 Open Internet Order’s forbearance framework instead of that legacy framework.

291. It is unclear what effect the RIF Order had on the forbearance granted in the 2015 Open Internet Order. It is possible to view the RIF Order as implicitly vacating the forbearance granted in the 2015 Open Internet Order, so that forbearance does not remain in effect when we return to a Title II classification. Alternatively, the RIF Order’s silence on this issue can be read to leave the forbearance granted in the 2015 Open Internet Order in place, so that it continues to apply automatically to or enforce any provision or any regulation that would have been reclassified as a telecommunications service here, absent some action on our part to the
contrary. We conclude that the forbearance set forth in the Order is justified under either understanding. Except as expressly modified in the Order, the record in this proceeding and our own assessment each support and provide no reason to question the forbearance granted in the 2015 Open Internet Order, as we explain below, regardless of how the RIF Order’s effect on that prior forbearance is conceptualized. We reject NCTA’s arguments that “ambiguity regarding the scope of forbearance risks undermining its efficacy.” In purporting to find ambiguity in the 2015 Open Internet Order’s approach to forbearance, NCTA cites a paragraph providing a high-level summary of aspects of the forbearance granted in that Order—which does not even appear in the forbearance section. That does not persuade us that the scope of forbearance as actually described in the forbearance section of the 2015 Open Internet Order—or the scope of forbearance as described in our forbearance section here—is ambiguous in a way that undercuts the efficacy of that regulatory relief. In further support of its claims of ambiguity, NCTA contends that “the NPRM itself does not specifically propose to forbear from Section 251(c)—or even discuss the Commission’s intent with respect to unbundling and other similar common-carrier requirements under Title II of the Act.” But the 2023 Open Internet NPRM was clear that the Commission was proposing “to use the forbearance granted in the 2015 Open Internet Order as the starting point for our consideration of the appropriate scope of forbearance,” and the 2015 Open Internet Order was explicit in the forbearance it was granting from (among other things) section 251(c) of the Act and common carrier requirements such as those that would enable ex ante rate regulation. Independently, as the Commission observed in this regard in 2015, “the Commission cannot impose a penalty for conduct in the absence of ‘fair notice of what is prohibited.’” Consequently, we are not persuaded that our approach to forbearance results in ambiguity regarding the scope of relief that undercuts its efficacy.

292. In evaluating and applying the section 10(a) forbearance criteria, we follow the same basic analytical approach used by the Commission in the 2015 Open Internet Order and affirmed by the D.C. Circuit in its USTA decision. As a threshold matter, we do not grant forbearance beyond the scope of our authority, under section 10 of the Act. As the Commission explained in the 2015 Open Internet Order, “[c]ertain provisions or regulations do not fall within the categories of provisions of the Act or Commission regulations encompassed by that language because they are not applied to telecommunications carriers or telecommunications services, and we consequently do not forbear as to those provisions or regulations.”

293. We also target our forbearance analysis to those provisions of the Act or Commission rules that would not apply but for our classification of BIAS as a telecommunications service and our classification of mobile BIAS as a commercial mobile service. That follows the Commission’s approach in the 2015 Open Internet Order, and also is how we contemplated targeting forbearance as proposed in the 2023 Open Internet NPRM in this proceeding. The record does not persuade us to depart from that focus here, but BIAS providers remain free to seek relief from other provisions or regulations through appropriate filings with the Commission.

294. Section 296 of the 1996 Act once again informs our forbearance analysis here, as well. That provision “explicitly directs the FCC to ‘utilize[]’ forbearance to ‘encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans.’” Within the statutory framework that Congress established, the Commission “possesses significant, albeit not unfettered, authority and discretion to settle on the best regulatory or deregulatory approach to broadband.” Thus, as in 2015, we seek to strike the appropriate balance between retaining statutory protections and our open internet rules to adequately protect the public, while minimizing the burdens on BIAS providers and ensuring incentives for broadband deployment consistent with the objectives of section 706 of the 1996 Act.

295. One element of adopting a balanced regulatory approach is giving BIAS providers reasonable regulatory predictability about the obligations that will or will not be applied under that framework. We thus reject broad-brush arguments that we should not forbear from applying provisions that are by their own terms discretionary in some manner. As a threshold matter, we see no indication in the text of section 10 that provisions of the Act that give the Commission discretion in their application to telecommunications carriers or telecommunications are somehow categorically beyond the purview of forbearance. Independently, increasing clarity about how and to what extent the Commission will or will not provide even greater regulatory predictability in our application of the section 10 criteria.

296. At the same time, we also are not persuaded that our forbearance decisions here provide insufficient clarity and regulatory predictability about providers’ regulatory obligations. Fundamentally, these commenters’ concerns are not truly directed at our approach to forbearance but instead at the threshold classification decision. We have determined that BIAS is a telecommunications service under the best reading of the Act and its application to the record evidence here. As a result, certain legal consequences under the Act flow from that by default. The substantial forbearance we grant from rules and provisions reaches the full extent of what we find warranted at this time under the section 10 framework, which is the tool Congress provided for the Commission to tailor those default regulatory consequences. We therefore reject the suggestion that we improperly are using forbearance to increase regulation. Our classification decision simply “bring[s] the law into harmony with the realities of the modern broadband marketplace” and against that backdrop our use of forbearance plays its traditional role in granting relief from the legal consequences that otherwise would flow by default from that determination as warranted by the section 10 criteria. To the extent that commenters are concerned that forbearance decisions could be revisited, they do not demonstrate that it would be trivial for the Commission to do so, particularly if reasonable reliance interests could be demonstrated. Nor does the record reveal ways that the Commission could provide even greater regulatory predictability to providers beyond the approach adopted here, while still honoring what we find to be the best understanding of the Act in our classification of BIAS.

297. We also follow the conceptual approach from the 2015 Open Internet Order by considering the practical realities under an “information service” classification of BIAS to inform our section 10(a) analysis. As the Commission observed in 2015, although that baseline is not itself dispositive of the appropriate regulatory approach to BIAS, it is reasonable for the Commission to weigh concerns about the burdens or regulatory uncertainty
that could arise from sudden changes in the actual or potential regulatory requirements and obligations. Given agencies’ discretion to proceed incrementally, our forbearance analysis accounts for benefits from adopting an incremental approach here. While we find that the tailored regulatory framework we adopt in the Order strikes the right balance, we note that the D.C. Circuit has recognized the Commission’s authority to revisit its decision that should not prove to be the case. That said, although our conceptual approach in this regard tracks what the Commission did in 2015, our application of that approach naturally accounts for the additional experience and insight the Commission has gained in the years since the RIF Order. In addition, there is a petition for judicial review of the RIF Remand Order still pending and the petitions for reconsideration of that Order were pending until our action in the Order. Consequently, the insights we draw from the recent past account for the likelihood that the unresolved status of the regulatory approach adopted in the RIF Order could well have tempered BIAS providers’ conduct relative to what they otherwise might have engaged in.

298. In addition, our analytical approach as to all the provisions and regulations from which we forbear in the Order is consistent with section 10(a) as interpreted by the Commission and courts. Consistent with precedent, in interpreting the word “necessary” in section 10(a)(1) and (a)(2) we consider whether a current need exists for a rule or statutory requirement. Under section 10(a)(1), we consider here whether particular provisions and regulations are “necessary” to ensure “just and reasonable” rates and practices with respect to BIAS. In full, section 10(a)(1) directs the Commission to consider whether enforcement “is not necessary to ensure that the charges, practices, classifications, or regulations by, for, or in connection with that telecommunications carrier or telecommunications service are just and reasonable and are not unjustly or unreasonably discriminatory.” As a shorthand, we refer to that as requiring an analysis of whether rates and practices will be just and reasonable. And under section 10(a)(2), we consider whether particular provision and regulations are “necessary for the protection of consumers.” Consistent with our conclusion in the 2015 Open Internet Order, when evaluating whether there is a current need for a rule or provision to ensure just and reasonable rates and practices and to protect consumers, we can account for policy trade-offs that can arise under particular regulatory approaches. Thus, even when confronted with arguments that applying a rule or provision could have some near-term benefit, we nonetheless reasonably could conclude that application of the rule or provision is not currently necessary within the meaning of section 10(a)(1) or (a)(2) based on countervailing intermediate- or longer-term consequences of applying the rule or provision. This approach also is consistent with how the Commission has applied the “just and reasonable” criteria and otherwise evaluated consumers’ interests under other provisions of the Act.

299. Under section 10(a)(3), the Commission considers whether forbearance is consistent with the public interest. This inquiry allows us to account for additional factors beyond the sort of considerations we evaluate under section 10(a)(1) and (a)(2), guided by the Commission’s statutory duties. 300. We agree with the 2015 Open Internet Order that persuasive evidence of competition is not a necessary prerequisite to granting forbearance under section 10 so long as the section 10 criteria otherwise are met. As the 2015 Open Internet Order observed, although competition can be a sufficient basis to grant forbearance, it is not inherently necessary in order to find section 10 satisfied. To the extent that commenters cite prior forbearance decisions relying on competition as sufficient to justify forbearance, that precedent does not persuade us that competition is inherently necessary to justify forbearance. Nothing in the text of section 10 requires that forbearance be premised on a finding of sufficient competition where the Commission can conclude that the rules or provisions are not “necessary” under section 10(a)(1) and (a)(2) and that forbearance is in the public interest under section 10(a)(3) on other grounds. A statute that “by its terms merely requires the Commission to consider” a factor does not mean that the Commission must “give any specific weight” to the factor, and the Commission may “ultimately conclude[] that it should not be given any weight.” That interpretation of section 10 is not altered where the rules or provisions at issue involve measures to facilitate competition, despite some claims to the contrary. To the extent that Congress wanted the Commission to make additional findings beyond the general requirements of section 10(a) in order to forbear from particular market-opening provisions of the Act, it did so explicitly, precluding the Commission from forbearing from the application of sections 251(c) or 271 of the Act “until it determines that those requirements have been fully implemented.” Given that we have found those provisions to be fully implemented, we reject the view that we cannot simply apply the section 10(a) criteria according to their terms when evaluating forbearance from market opening provisions of the Act and instead must make different or more specific findings to justify forbearance. Even when implementing such provisions, the Commission often has rejected a single-minded focus on competition to the exclusion of other policies such as network deployment consistent with the goals of section 706 of the 1996 Act, and we see nothing in section 10 of the Act that would require a single-minded focus on competition when considering forbearance from such rules or provisions. In any case, the D.C. Circuit in USTA has “found reasonable the Commission’s conclusion that its section 10 analysis did not need to incorporate any statutory requirement arising from section 251.” Judge Williams, dissenting in part in USTA, contended that Commission forbearance precedent had not, to that point, involved the convergence of rules or provisions designed to facilitate competition that were subject to a grant of forbearance without heavy reliance on a competitive analysis. Whether or not Commission precedent prior to the 2015 Open Internet Order involved the precise convergence of factors identified by Judge Williams, we see nothing in section 10 of the Act that would categorically preclude the Commission from granting such forbearance.

301. We reject claims that an identified need for regulation in one respect to address shortcomings in competition—such as with respect to BIAS providers’ gatekeeper role—implies a need for regulation in other respects, as well. In other contexts the Commission has, for example, regulated charges that certain carriers impose on other carriers without finding it necessary to adopt ex ante regulation of those same carriers’ end-user charges. And the Commission has recognized such distinctions between charges imposed on other providers and charges imposed on end users in this context, as well. Separately and independently, although the 2015 Open Internet Order did not find pervasive evidence of competition or treat it as in itself sufficient to justify forbearance, it would be a mistake to conclude that competition played no role at all in our analysis. As the Commission concluded in 2015, “there is some amount of
competition for broadband internet access service,” even if “it is limited in key respects,” and the Commission’s overall regulatory approach to BIAS, by striking the right balance between current regulation and longer-term investment incentives, “thus does advance competition in important ways.” This kind of recognition of potential trade-offs associated with particular regulatory approaches is consistent with our reading of the section 10(a) criteria, as discussed above. In addition, we note that, during the last 15 years, when BIAS was classified as Title I information service or subject to forbearance under Title II, we have seen no significant increases in prices or unreasonably discriminatory pricing that would seem to warrant the imposition of rate regulation or tariffs.

302. As in the 2015 approach, “[b]ecause the Commission is not responding to a petition under section 10(c), we conduct our forbearance analysis under the general reasoned decision making requirements of the Administrative Procedure Act, without the burden of proof requirements that section 10(c) petitioners face.” Consistent with that approach, in our rulemaking decision here, we explain our application of the statutory forbearance criteria and other relevant statutory objectives such as section 706 of the 1996 Act in the level of detail necessitated by the record and our own assessment of the merits of forbearance from applying particular rules or provisions. We conclude that satisfies our statutory obligations under section 10 of the Act and the APA. We agree with Public Knowledge that we should not grant forbearance “cavalierly.” But we disagree with Public Knowledge insofar as it suggests that we approach the section 10 analysis with a presumption against forbearance. We seek to faithfully apply the section 10 forbearance criteria here without artificially placing a thumb on the scale either for or against forbearance. That approach best effectuates the Act as a whole, which not only reflects Congress’s default regulatory approach for telecommunications carriers and telecommunications service but also directs that the Commission “shall” forbear where the section 10 criteria are met, as part and parcel of that overall legal framework. We are unpersuaded by claims that our application of the section 10 forbearance criteria in a manner akin to that done in the 2015 Open Internet Order would violate the nondelegation doctrine. Under Supreme Court precedent, a delegation is constitutionally permissible if Congress has “laid[ed] down by legislative act an intelligible principle to which the person or body authorized to [exercise the delegated authority] is directed to conform.” Section 10 readily satisfies that standard by directing the Commission that it shall forbear where the rule or provision is not necessary to ensure just and reasonable rates and practices; is not necessary for the protection of consumers; and where forbearance is in the public interest—including based on its competitive effects. These are the types of assessments that Congress has entrusted to the Commission since the original enactment of the Communications Act. The Commission’s authority to act in the public interest is not “unlimited.” “[T]he words ‘public interest’ in a regulatory statute” do not give an agency “broad license to promote the general public welfare,” but rather “take meaning from the purposes of the regulatory legislation.” Thus, for example, the Supreme Court has held that the Communications Act’s public interest standard, in context, is sufficiently definite to overcome a nondelegation challenge. We likewise conclude that the section 10(a) analysis is guided by intelligible principles set down by Congress, and we therefore reject the view that section 10 of the Act violates the nondelegation doctrine either in general or as applied here.

303. Once again, where warranted we also evaluate forbearance assuming arguendo that particular provisions of the Act or Commission rules apply to BIAS, rather than “first exhaustively determining provision-by-provision and regulation-by-regulation whether and how particular provisions and rules apply to this service.” We agree with the 2015 Open Internet Order’s reasoning that “to achieve the balance of regulatory and deregulatory policies adopted here for BIAS, we need not—and thus do not—first resolve potentially complex and/or disputed interpretations and applications of the Act and Commission rules that could create potentially unanticipated consequences for other services beyond the scope of this proceeding, and which would not alter the ultimate regulatory outcome in this Order in any event.”

304. Given our approach in this regard, we conclude that simple counts of provisions of the Act or Commission rules subject to forbearance do not shed meaningful light on the extent to which our regulatory approach to BIAS under the Order differs in practice from the default decision under Title II of the Act or otherwise for purposes of arguments that a telecommunications service classification of BIAS (and commercial mobile service classification of mobile BIAS) are contrary to the Act’s statutory scheme. As in the 2015 Open Internet Order, forbearance is not used solely to grant relief from default regulatory requirements affirmatively known and established to be both applicable and burdensome. Rather, outside of certain key requirements affirmatively determined to fall outside the scope of justified forbearance, we grant forbearance broadly even as to requirements that theoretically could newly apply by virtue of the classification decision and, if they applied, would represent any manner of departure from the preexisting status quo under an information service classification. The Commission has taken this approach not based on an affirmative determination that the default regulatory requirements are somehow inherently incompatible with BIAS but in the interest of being crystal clear about the targeted ways in which the regulatory regime being applied here will depart from the status quo under an information service classification. We thus find that simply counting the number of provisions of the Act or Commission rules subject to forbearance sheds no meaningful light on the magnitude of any practical departure in our regulatory approach here from the default requirements of the Act and our implementing rules.

305. Independently, the notion that even extensive forbearance would illustrate the incompatibility of our approach with the statutory scheme established by Congress fails to appreciate the full scope and operation of the 1996 Act understood against its regulatory backdrop. The Commission’s section 10 forbearance authority was part and parcel of the regulatory regime enacted for telecommunications carriers and telecommunications services in the 1996 Act. The criteria specified in section 10 for when the Commission shall forbear from applying the Act or Commission rules to telecommunications carriers or telecommunications services track nearly verbatim the standard Congress established in 1993 in section 332(c)(1) of the Act for the Commission to specify requirements of Title II that would be inapplicable to commercial mobile service providers. And prior to the enactment of the 1996 Act, the Commission already had relied on that section 332(c)(1) authority to grant commercial mobile service providers broad relief from the regulatory requirements of Title II, including relief from, among other things, the tariffing requirements
that the Supreme Court characterized as “the heart of the common-carrier section of the Communications Act” under the pre-1996 Act framework. There can be little doubt that when Congress enacted section 10 of the Act against that backdrop, it contemplated that services meeting the definition of “telecommunications services” likewise could—and would—be subject to broad forbearance where justified by the statutory criteria. Such an outcome thus is entirely compatible with the overall legal framework Congress enacted in the 1996 Act.

306. We disagree with arguments that our exercise of forbearance is contrary to MCI v. AT&T and Biden v. Nebraska. In MCI, the Supreme Court rejected the Commission’s attempt to eliminate tariffing for competitive common carriers, concluding that exempting carriers from those obligations represented a “fundamental revision of the statute” that Congress was unlikely to have authorized through “a subtle device” in the statutory language like the Commission’s authority to “modify” tariffing requirements. And relying on MCI, the Court in Biden v. Nebraska similarly concluded that “statutory permission to ‘modify’ does not authorize ‘basic and fundamental changes in the scheme’ designed by Congress.” By contrast, as the Commission has long recognized, Congress enacted section 10 forbearance authority in response to MCI—to grant the Commission the authority to make more extensive changes that the MCI Court previously found lacking. That fact—coupled with Congress’s decision to model section 10 on section 332(c)(1) under which the Commission previously granted broad forbearance in the past—amply demonstrates that section 10 forbearance authority was intentionally designed by Congress to authorize more expansive changes than what would flow from distinct statutory language of the sort at issue in MCI and Biden v. Nebraska. And the circumstances here also bear no meaningful similarity to the Court’s objection in Biden v. Nebraska that the Department of Education was seeking to “augment[ ] and expand[ ] existing [statutory] provisions dramatically.” In this case, after exercising the explicitly-granted forbearance authority in accordance with the terms specified by Congress, the remaining requirements that we apply flow directly from the statutory regime Congress enacted as applied to BIAS consistent with our classification decision here. 307. Finally, our forbearance with respect to BIAS does not encompass internet transmission services that incumbent local exchange carriers or other common carriers chose to offer as telecommunications services subject to the full range of Title II requirements prior to the 2015 Open Internet Order. The RIF Order observed that such services “have never been subject to the [2015 Open Internet Order] forbearance framework,” and stated that “carriers that choose to offer transmission service on a common carriage basis are, as under the Wireline Broadband Classification Order, subject to the full set of Title II obligations, to the extent they applied before the’’ 2015 Open Internet Order. The 2015 Open Internet Order did, however, allow a provider previously offering broadband transmission on a common carrier basis “to change to offer internet access services pursuant to the construct adopted in” that Order subject to filing with and review by the Wireline Competition Bureau of the provider’s proposal for the steps it would take to convert to such an approach. In the 2023 Open Internet NPRM we proposed to follow the same approach again here, and no commenter opposes that proposal. As such, our forbearance with respect to BIAS does not encompass such services.

B. Maintaining Targeted Authority To Protect Consumers, Promote National Security, and Preserve the Broadband Ecosystem

308. We find that the standard for forbearance is not met with respect to BIAS for the following limited provisions:

- Sections 201, 202, and 208, along with the related enforcement provisions of sections 206, 207, 209, 216, and 217, and the associated complaint procedures; and the Commission’s implementing regulations (but, to be clear, the Commission forbears from all ratemaking authority based on, or ratemaking regulations adopted under, sections 201 and 202);
- Section 214 entry certification requirements, pursuant to which the Commission considers all aspects of the public interest associated with section 214 authorizations, including national security, law enforcement, and other concerns. We grant blanket section 214 authority for the provision of BIAS to all current and future BIAS providers, with exceptions and subject to the Commission’s reserved power to revoke such authority and waive the Commission’s implementing rules in section 214(a)–(d) of the Act. Our grant of blanket section 214 authority includes authority for entry, acquisitions (including transfers of control and assignments), and temporary or emergency service and related requirements. We forbear from section 214 exit certification requirements regarding the discontinuance, reduction, or impairment of BIAS and the Commission’s implementing section 214(a)–(d) rules. In addition, since we classify mobile BIAS as a commercial mobile service in the Order, the existing forbearance from all domestic section 214 requirements for CMRS providers applies to mobile BIAS providers. That forbearance is maintained and undisturbed by the Order;
- Sections 218, 219, and 220(a)(1) and (c)–(e), which enable the Commission to conduct inquiries and obtain information;
- Section 222, which establishes core customer privacy protections (while waiving application of our current implementing rules to BIAS);

- Section 224 and the Commission’s implementing rules, which grant certain benefits that foster network deployment by providing telecommunications carriers with regulated access to poles, ducts, conduits, and rights-of-way;

- Sections 225, 255, and 251(a)(2), and the Commission’s implementing rules, which collectively advance access for persons with disabilities, except that the Commission forbears from the requirement that BIAS providers contribute to the Telecommunications Relay Service (TRS) Fund at this time; and

- Section 254, the interrelated requirements of section 214(e), and the Commission’s implementing regulations to strengthen the Commission’s ability to support broadband, supporting the Commission’s ongoing efforts to support broadband deployment and adoption. 309. Our forbearance decision in this subsection focuses on addressing consequences arising from the reclassification of BIAS in the Order. Thus, we do not forbear with respect to requirements to the extent that they already applied prior to the Order, without regard to the classification of BIAS. Similarly, consistent with the 2015 Open Internet Order, to the extent that provisions or regulations apply to an entity by virtue of other services it provides besides BIAS, the forbearance in the Order does not extend to that context. Consistent with the Commission’s conclusions in the 2015 Open Internet Order, the Order does not alter any additional or broader forbearance previously granted that already might encompass BIAS in certain circumstances, for example, insofar as BIAS, when provided by mobile providers, is a CMRS service. As one example, the Commission has
grant some forbearance from section 310(d) for certain wireless licensees that meet the definition of “telecommunications carrier.” But section 310(d) is not itself framed in terms of “common carriers” or “telecommunications carriers” or providers of “CMRS” or the like, nor is it framed in terms of “common carrier services,” “telecommunications services,” “CMRS services” or the like. To the extent that such forbearance thus goes beyond the forbearance for wireless providers granted in the Order, the Order does not narrow or otherwise modify that pre-existing grant of forbearance.

1. Authority To Protect Consumers and Promote Competition (Sections 201 and 202)

310. The Commission has previously described sections 201 and 202 as lying “at the heart of consumer protection under the Act,” providing, along with their attendant enforcement sections, “bedrock consumer protection obligations.” The Commission has never previously completely forbore from these important statutory protections, and we generally do not find forbearance warranted here. We find sections 201 and 202 of the Act, along with section 208 and certain fundamental Title II enforcement authority, necessary to ensure just, reasonable, and nondiscriminatory conduct by BIAS providers and necessary to protect consumers under section 10(a)(1) and (a)(2). We also find that forbearance from these provisions would not be in the public interest under section 10(a)(3), and therefore do not grant forbearance from those provisions and associated enforcement procedural rules with respect to BIAS. However, particularly in light of the protections the open internet rules provide and the ability to employ sections 201 and 202 in case-by-case adjudications, we are otherwise persuaded to forbear from applying sections 201 and 202 of the Act to the extent they would permit the adoption of ex ante rate regulation of BIAS in the future, as discussed below. To be clear, this ex ante rate regulation forbearance does not extend to inmate calling services and therefore has no effect on our ability to address rates for inmate calling services under section 276.

311. Section 201 enables the Commission to protect consumers against unjust or unreasonable charges, practices, classifications, and regulations in connection with BIAS. And section 202 prohibits discrimination in the provision of communications services, thereby advancing the Commission’s goals of ending digital discrimination and promoting universal service and digital equity. In order to forbear from these statutory provisions, we would have to conclude, among other things, that their enforcement is not necessary for consumer protection, something the record provides no basis to do. Indeed, the Commission has previously taken enforcement action against providers under section 201 for violation of consumers’ privacy rights. And Congress itself recognized the importance of sections 201 and 202 when it specifically excluded them (along with section 208) from earlier CMRS-specific forbearance authority under section 332(c)(1)(A).

312. Additionally, sections 201 and 202 reinforce the Commission’s ability to preserve internet openness, and applying these provisions benefits the public broadly by helping foster innovation and competition at the edge, thereby promoting broadband infrastructure investment nationwide. Thus, in this decision to apply the provisions actually will promote competitive market conditions at the edge. As explained below, the open internet rules adopted in the Order reflect more specific protections against unjust or unreasonable practices for or in connection with BIAS. These benefits—which can extend beyond the specific dealings between a particular BIAS provider and customer—persuade us that forbearance from sections 201 and 202 here is not in the public interest.

313. We also observe that section 201(b) enables the Commission to regulate BIAS-only providers that serve MTEs and thereby end unfair, unreasonable, and anticompetitive practices facing MTE residents, furthering the Commission’s goals to foster competition and promote consumer choice for those living and working in MTEs. Obligating BIAS-only providers to abide by the same kinds of rules—including those that prohibit exclusive contracts that bar competition outright in MTEs—that other telecommunications and cable providers must currently follow will secure the same protections for all residents of MTEs, regardless of the kind of service offered by providers in their building; reduce regulatory asymmetry between BIAS-only providers and other kinds of providers; and potentially improve competition in the MTE marketplace. Therefore, we do not forbear from § 64.2500 of our rules as to BIAS providers, which prohibits common carriers from entering into certain types of agreements and requires disclosure of others. BIAS-only providers should therefore ensure that all MTE-related contracts entered into subsequent to the effective date of the Order we adopt in the Order are in compliance with § 64.2500. With respect to pre-existing MTE-related contracts, we temporarily waive § 64.2500 with respect to these contracts for BIAS-only providers for a period of 180 days to allow these providers to bring their pre-existing contracts into compliance with § 64.2500. The Commission may waive its rules and requirements for “good cause shown,” which may be found “where particular facts would make strict compliance inconsistent with the public interest.” In making this determination, the Commission may “take into account considerations of hardship, equity, or more effective implementation of overall policy,” and if “special circumstances warrant a deviation from the general rule and such deviation will serve the public interest.” We find good cause in this instance to provide adequate notice and time to give BIAS-only providers an opportunity to bring pre-existing contracts for MTEs into compliance with our newly applicable MTE rules. We note that this 180-day period is consistent with the fact that the Commission has previously granted providers to bring their pre-existing contracts into compliance with newly enacted MTE rules. We reject LARIAT’s request that the Commission exempt small providers from “restrictions” on “bulk billing of multi-tenant dwellings.” LARIAT does not provide a specific justification for exempting small BIAS providers from our MTE requirements, but rather generalizes that these provisions (along with others) “could” impose “tremendous unnecessary burdens on our company . . . and also harm consumers.” We have provided all BIAS-only providers a suitable period of time to come into compliance with these provisions, and further, the Commission’s MTE provisions are designed to protect, not harm, consumers and LARIAT provides no evidence to the contrary.

314. For the foregoing reasons we find that sections 201 and 202 of the Act are necessary to ensure just, reasonable, and nondiscriminatory conduct by BIAS providers and necessary to protect consumers under sections 10(a)(1) and (a)(2). Moreover, retaining these provisions is in the public interest because it provides the Commission direct statutory authority to protect internet openness and promote fair competition while allowing the Commission to adopt a tailored
approach and forbear from most other requirements. We find that our sections 201 and 202 authority provides a more flexible framework better suited to the broadband marketplace than many of the alternative regulations—such as ex ante rate regulations and interconnection requirements—from which we are forbearing but which otherwise would be necessary. We thus reject the arguments of some commentators against the application of these provisions insofar as they assume that such additional regulatory requirements also will apply in the first instance. Such considerations provide additional grounds for our conclusion that section 10(a)(3) is not satisfied as to forbearance from sections 201 and 202 of the Act with respect to BIAS.

315. We disagree with commenters urging the Commission to forbear from sections 201 and 202 outright. WISPA disputes the value section 202 brings to the Commission’s antidiscrimination efforts, highlighting the broad enforcement powers Congress conferred upon the Commission and the rules established in our digital discrimination proceeding. But these sections enable the Commission to advance digital equity in other ways not contemplated elsewhere, including providing authority for our open internet rules.

316. We also disagree with ACA Connects and WISPA that the Commission should forbear from applying sections 201 and 202 to small BIAS providers. ACA Connects contends that reclassification would impose costs and that smaller service providers lack the resources, such as in-house legal staff, needed to navigate a Title II world. They thus argue that the Commission should grant forbearance from direct application of sections 201 and 202 and instead “bring ad hoc enforcement actions . . . for conduct that falls outside the scope of the proposed conduct-based rules.” Similarly, WISPA asserts that there is “ample evidence that application of these requirements to smaller providers will do more harm than good.” These arguments fail to consider that sections 201 and 202 are a legal basis for adoption of the open internet conduct rules. Further, in making these arguments, commentators fail to acknowledge the legal framework applied in the CMRS context, where sections 201 and 202 have applied for years. This history should allay any “concerns . . . about potential burdens, or uncertainty, resulting from the application of sections 201 and 202.”

317. We also do not forbear from section 208’s complaint proceeding rules and other fundamental Title II enforcement provisions. In particular, we do not forbear from applying section 208 of the Act and the associated procedural rules, which provide a complaint process for enforcement of applicable provisions of the Act or any Commission rules. We also retain additional statutory provisions that we find necessary to ensuring a meaningful enforcement process. In particular, we do not forbear from sections 206, 207, and 209. Without these provisions that permit “redress through collection of damages,” Section 208’s complaint protections would be “virtually meaningless.” Allowing for the recovery of damages does not mean that an award of damages necessarily would be appropriate in even most cases. The Commission has discretion to deny an award of damages and grant only prospective relief where a case raises novel issues on which the Commission has not previously spoken, or where the measurement of damages would be speculative. The Commission also has authority to adopt rules and procedures that are narrowly tailored to address the circumstances under which damages would be available in particular types of cases. Section 208 and its associated procedural rules, as well as sections 206 and 207, which serve as a necessary adjunct to the complaint process, provide the public the means to “file a complaint with the Commission and seek redress.” We similarly do not forbear from sections 216 and 217, which “were intended to ensure that a common carrier could not evade complying with the Act by acting through others over whom it has control or by selling its business.” Thus, we do not forbear from enforcing these key Title II enforcement provisions with respect to BIAS.

318. In the event that a carrier violates its common carrier duties, the section 208 complaint process would permit challenges to a carrier’s conduct, and many commentators advocate for section 208 to apply. The Commission’s procedural rules establish mechanisms to carry out that enforcement function in a manner that is well-established and clear for all parties involved. The Commission has never previously forborne from section 208. Indeed, we find it remarkable that in the CMRS context Congress specifically precluded the Commission from using section 332 to forbear from section 208. Commenters also observe the important interrelationship between section 208 and sections 206, 207, 216, and 217, which the Commission itself has recognized in the past, as discussed above. We note, however, that in complaint proceedings filed pursuant to section 207, courts have historically been careful to consider the Commission’s views as a matter of primary jurisdiction on the reasonableness of a practice under section 201(b). A Federal district court may determine that the Commission is better to suited to answer the particular question before the court in the first instance and elect to invoke the primary jurisdiction doctrine. The primary jurisdiction doctrine applies where a claim is originally cognizable in the courts, and comes into play whenever enforcement of the claim requires the resolution of issues which, under a regulatory scheme, have been placed within the special competence of an administrative body; in such a case the judicial process is suspended pending referral of such issues to the administrative body for its views. In addition, to forbear from sections 216 and 217 would create a loophole in our ability to even enforce the Act, which would imperil our ability to protect consumers and to protect against unjust or unreasonable conduct, and would be contrary to the public interest. The prospect that carriers may be forced to defend their practices before the Commission supports the strong public interest in ensuring the reasonableness and nondiscriminatory nature of those actions, protecting consumers, and advancing our overall public interest objectives. For the reasons discussed above, we thus reject the assertions of some commenters that enforcement is unduly burdensome. In particular, we are not persuaded that such concerns outweigh the overarching interest advanced by the enforceability of sections 201 and 202. Nothing in the record demonstrates that our need for enforcement differs among broadband providers based on their size, and we thus are not persuaded that a different conclusion in our forbearance analysis should be reached in the case of small broadband providers, for example. While some commenters express fears of burdens arising from the application of these provisions to BIAS, we find such arguments to be speculative, particularly given the lack of evidence of such actions where those provisions have already been included (in the CMRS context). As a result, for all of the foregoing reasons, we conclude
that none of the section 10(a) criteria is met as to forbearance from these fundamental Title II enforcement provisions and the associated Commission procedural rules with respect to BIAS. As explained above, sections 201 and 202 do not pose the existential threat that some commenters claim they do. Moreover, individuals harmed by a provider’s unlawful practices must have some means of being made whole, and we agree with the Lawyers’ Committee that section 208 is “essential” for pursuing claims of discrimination and other harms.

3. Requirement for a Certificate of Public Convenience and Necessity (Section 214)

319. We do not forbear from the entry certification requirements of section 214(a)–(d) of the Act with respect to the provision of BIAS. Section 214(a) requires carriers to obtain a Commission certification to construct, acquire, operate, or engage in transmission over lines of communication. By reclassifying BIAS as a Title II telecommunications service subject to section 214, the Commission can ensure that the “present or future public convenience and necessity” is served, including its obligation to protect the Nation’s telecommunications networks and to protect the United States from entities that pose threats to national security and law enforcement interests. To ensure continued service for consumers and to provide regulatory certainty to BIAS providers, however, we grant blanket section 214 authority for the provision of BIAS to all current and future BIAS providers, with exceptions and subject to the Commission’s reserved power to revoke such authority. Specifically, to protect national security and law enforcement interests, we exclude the following entities and their current and future affiliates and subsidiaries from this blanket section 214 authority—China Mobile International (USA) Inc. (China Mobile USA), China Telecom (Americas) Corporation (CTA), China Unicom (Americas) Operations Limited (CUA), Pacific Networks Corp. (Pacific Networks), and ComNet (USA) LLC (ComNet)—whose application for international section 214 authority was previously denied or whose domestic and international section 214 authority was previously revoked by the Commission in view of national security and law enforcement concerns. The Order does not modify China Mobile USA’s blanket domestic section 214 authority or other domestic interstate services and to construct or operate any other domestic transmission line, which was not addressed in the China Mobile USA Order. The Commission retains the authority to revoke a carrier’s blanket domestic section 214 authority when warranted.

320. Section 214 entry certification, albeit blanket certification, is consistent with our conclusion that reclassifying BIAS as a telecommunications service will significantly bolster the Commission’s ability to carry out its statutory public interest responsibilities to safeguard national security and law enforcement. The Supreme Court has determined that the Commission has considerable discretion in deciding how to make its section 214 public interest findings. Exercising this section 214 authority achieves two core purposes—national security and the promotion of safety of life and property—and is integral to the Commission’s public interest assessment of providers seeking to provide essential BIAS to consumers. The 2023 Open Internet NPRM recognized that reclassification of BIAS “is necessary to unlock tools the Commission needs to fulfill its objectives and responsibilities to safeguard this vital service.”

321. The importance of section 214 of the Act with regard to the Commission’s national security efforts is evident in the Commission’s actions concerning entities that are majority-owned and controlled by the Chinese government. Over the past several years, the Commission denied an application for international section 214 authority and revoked certain carriers’ section 214 authority based on recommendations and comments from interested Executive Branch agencies regarding evolving national security and law enforcement concerns. In one of those proceedings, the Executive Branch agencies and the Commission confronted the implications of changed circumstances in the national security environment on the evaluation of international section 214 authority. In each of these revocation actions, the Commission extensively evaluated national security and law enforcement concerns raised by existing section 214 authorizations and determined, based on thorough record development, that the present and future public interest, convenience, and necessity was no longer served by those carriers’ retention of their section 214 authority. We disagree with commenters that contend that an insignificant fraction of all BIAS providers serving U.S. customers “present the type of national security risk that the Commission intends to address,” and there is no indication that any of the carriers whose section 214 authorizations the Commission revoked in recent years provides BIAS.” At the time the Commission took these actions, section 214 did not apply to BIAS, potentially exposing the Nation’s communications networks to national security and law enforcement threats by entities providing BIAS or seeking to provide BIAS. We believe the same national security and law enforcement concerns identified in the Commission’s recent denial and revocation and/or termination proceedings equally exist with respect to these and other entities providing BIAS or seeking to provide BIAS. We agree with arguments in the record that applying section 214 of the Act to the provision of BIAS may have significant future national security, law enforcement, and other benefits by enhancing the Commission’s ability to act immediately in response to future threats. By declining to forbear from the application of the section 214 entry authorization requirement to BIAS, we build upon these and other actions the Commission has taken to strengthen and advance its ability to protect U.S. telecommunications networks and critical infrastructure against national security threats. For instance, in November 2019, the Commission prohibited the use of public funds from the Commission’s Universal Service Fund (USF) to purchase, obtain, maintain, improve, modify, or otherwise support any equipment or services produced or provided by companies posing a national security threat to the integrity of communications networks or the communications supply chain.

322. We find that BIAS is subject to section 214 on the basis of it being both a domestic and an international telecommunications service. The Commission has employed different rules for domestic and international section 214 authorizations to date. Within the category of international section 214 authorizations, it has adopted a regulatory approach that turns, among other things, on the particular destination country to be served. BIAS is defined as a “service by wire or radio that provides the capability to transmit data to and receive data from all or substantially all internet endpoints,” and our interpretation of “all internet endpoints” includes, without distinction, foreign as well as domestic endpoints. Thus, BIAS necessarily involves “foreign communication” as well as “interstate communication” (and at least some intrastate communication, as well). Given the global nature of BIAS, we find it appropriate to treat BIAS as a mixed
domestic and international service. We recognize that the Commission stated in the 2015 Open Internet Order that “[b]roadband internet access service involves the exchange of traffic between a last-mile broadband provider and connecting networks.” But what could be termed the “physical” location or scope of a service does not dictate its jurisdictional status, which instead turns on the jurisdiction of the communications being carried.

implementing section 214 as applied to all other services subject to section 214 of the Act. We believe that blanket section 214 authority will allow BIAS providers to continue operating and providing BIAS without the need for Commission-approved applications at this time. While certain benefits arising from our decision not to forbear may be difficult to quantify, such as the current and future protection of national security, law enforcement, or other public interest benefits, we nevertheless conclude that the expected benefits of applying section 214 entry authority to the provision of BIAS through the Order greatly exceed any potential costs to providers. The costs to providers are, in any event, minimized by our grant of blanket authority with no prescriptive entry requirements. Our decision to condition grant of blanket section 214 authority for the provision of BIAS on the Commission’s reserved power to revoke such authority is consistent with the established statutory directives and longstanding Commission determinations with respect to section 214 authorizations. In previously granting all telecommunications carriers blanket domestic section 214 authority, the Commission found that the “present and future public convenience and necessity require the construction and operation of all domestic new lines pursuant to blanket authority,” subject to the Commission’s ability to revoke a carrier’s section 214 authority when warranted to protect the public interest. Indeed, when the Commission opened the U.S. telecommunications market to foreign participation in the late 1990s, it delineated a non-exhaustive list of circumstances where it reserved the right to designate for revocation an international section 214 authorization based on public interest considerations and stated that it considers “national security” and “foreign policy” concerns when granting authorizations under section 214 of the Act.

b. China Mobile USA, CTA, CUA, Pacific Networks, ComNet, and Their Current and Future Affiliates and Subsidiaries Are Excluded From Blanket Section 214 Authority for BIAS

326. To further protect the Nation’s telecommunications networks from threats to national security and law enforcement, we exclude China Mobile USA, CTA, CUA, Pacific Networks, ComNet, and their current and future affiliates and subsidiaries from grant of blanket section 214 authority for the provision of BIAS. We find that excluding these Chinese government-owned entities and their current and future affiliates and subsidiaries from blanket section 214 authority is warranted based on the Commission’s prior determinations that the present and future public interest, convenience, and necessity would no longer be served by these Chinese government-owned entities’ retention of section 214 authority, or that the public interest would not be served by the grant of international section 214 authority.

327. The Commission found that these entities are subject to exploitation, influence, and control by the Chinese government, and that mitigation would not address the national security and law enforcement concerns. The Commission identified national security and law enforcement concerns with respect to the entities’ access to internet PoPs (usually located within data centers) and other harms in relation to the services provided by those entities pursuant to section 214 authorization. To deter evasion of our exclusion of these entities, and consistent with the Commission’s inclusion of these entities and their affiliates and subsidiaries in the list of equipment and services covered by section 2 of the Secure and Trusted Communications Networks Act, we also exclude their current and future affiliates and subsidiaries from our grant of blanket section 214 authority. Of course, any entity affected by this
exclusion remains free to petition the Commission for section 214 authority under the statute and demonstrate how grant of the authority would serve the public interest, convenience, and necessity.

c. Transition Period for China Mobile USA, CTA, CUA, Pacific Networks, and ComNet

328. We direct China Mobile USA, CTA, CUA, Pacific Networks, and ComNet and their affiliates and subsidiaries to discontinue any and all provision of BIAS no later than sixty (60) days after the effective date of the Order as established in the Federal Register. We require these entities to provide notice of service discontinuance to all affected customers within thirty (30) days after the effective date of the Order as established in the Federal Register. The Order shall be effective sixty (60) days after publication in the Federal Register. Such notice shall be in writing to each affected customer. We further require the entities to file a copy of the standard notice(s) sent to their customers (without providing the Commission with any customers’ personally identifiable information (PII)) in the docket of this proceeding through the Commission’s Electronic Comment Filing System (ECFS) within sixty (60) days after the effective date of the Order as established in the Federal Register. If the entity does not provide BIAS, the entity shall file a letter attesting to this information and certified by a corporate officer in ECFS within sixty (60) days after the effective date of the Order as established in the Federal Register. We find this transition reasonable, as the Commission previously gave CTA, CUA, Pacific Networks, and ComNet this same transition period to discontinue all services previously provided under section 214 authority, and it should mitigate any difficulties BIAS customers may face in finding other providers.

d. Waiver of Rules Implementing Section 214(a)–(d) of the Act

329. We recognize that application of the Commission’s current rules implementing section 214(a)–(d) of the Act, which historically have addressed traditional telecommunications services, may raise operational issues in the context of BIAS. For example, the current rules contain requirements with respect to the regulatory classification of U.S. international carriers as “either dominant or non-dominant for the provision of particular international communications services on particular routes,” by, and prior approval for, U.S. international carriers that are, or propose to become, affiliated with a foreign carrier; conditions applicable to all international section 214 authorizations; conditions applicable to authorized facilities-based international carriers; and conditions applicable to carriers authorized to resell the international services of other authorized carriers. In addition, some commenters suggest that the Commission should pursue a further rulemaking to consider implementation of rules under section 214(a)–(d) that are tailored to BIAS in view of our classification of BIAS herein. The Commission expects to release a further notice of proposed rulemaking (FNPRM) at a future time to examine whether any section 214 rules specifically tailored to BIAS, including for small providers, are warranted. But in light of the current record and the blanket authority we grant herein, we find it appropriate to waive the current rules implementing section 214(a)–(d) of the Act with respect to BIAS to the extent they are otherwise applicable. In light of the forbearance we grant for section 214 related exit authority, i.e., discontinuance requirements, it is unnecessary to waive our discontinuance rules to the extent they would be applicable to BIAS as a telecommunications service.

330. The Commission may waive its rules and requirements for “good cause shown.” In the 2023 Open Internet NPRM, we sought comment on issues related to implementation of section 214, including whether we should adopt temporary forbearance, grant blanket section 214 authority, or act in some other manner. One commenter proposed issuing a waiver of the rules if the Commission does not forbear from section 214. Good cause, in turn, may be found “where particular facts would make strict compliance inconsistent with the public interest.” In making this determination, the Commission may “take into account considerations of hardship, equity, or more effective implementation of overall policy,” and whether “special circumstances warrant a deviation from the general rule and the public interest.” The current rules were established in the context of traditional telecommunications services. Given our consideration of hardship and equity that may arise by immediate application of those rules to BIAS following our action in the Order, we find there is good cause to waive those rules pending the adoption of BIAS-specific rules at some future time to the extent the public interest dictates.

331. We find that the public interest is served by this waiver as it will ensure that consumers can continue to receive the broadband internet access services to which they presently subscribe and avoid any disruption to, or uncertainty for, BIAS consumers and BIAS providers. We reiterate that with respect to mobile BIAS, because we conclude herein that mobile BIAS is a commercial mobile service, it is subject to the forbearance granted for CMRS providers as a whole in 1994. We note that this forbearance from domestic section 214 requirements as applied to mobile BIAS providers will also apply to mobile satellite service providers, to the extent they provide mobile satellite broadband service, that are licensed as common carriers for the provision of service that meets the statutory definition of CMRS (e.g., mobile earth station licensees). Under our decision in the Order, mobile BIAS, including mobile satellite broadband service, will continue to be subject to international section 214 requirements for their international operations, but as discussed, we are granting blanket section 214 authority for the provision of BIAS set forth in the Order. The Commission anticipates issuing an FNPRM to consider what rules should apply going forward. As we observed in the 2023 Open Internet NPRM, our Title III licensing authority with respect to facilities-based mobile BIAS providers independently “grant[s] us important authority that can be used to advance national security and public safety with respect to the services and equipment subject to licensing.”

e. The Commission Will Forbear From the Section 214 Exit Certification Requirement

332. We find the section 10 criteria met for forbearance from applying the exit certification requirements in section 214(a)–(d) and the Commission’s implementing rules to the extent they would newly apply through the classification of BIAS as a Title II telecommunications service. As explained above, we focus our regulatory oversight on the entry certification requirement for BIAS providers and find it prudent to forbear from mandating an exit certification that would require them to obtain approval from the Commission to discontinue, reduce, or impair service to a community. Knowing that we can ensure that the Commission can review existing and future BIAS participants serving consumers through their blanket entry into the market, we find that there is no current need to also require exit certifications. Doing so would conflict with the overall tailored regulatory approach we adopt and that is designed to promote infrastructure investment and innovation. We are persuaded by
commenters that BIAS providers’ freedom to make network investments is optimized when they need not divert capital to outdated network equipment and services while seeking discontinuance approval. We agree that applying section 214 in a targeted and narrow manner to address national security and law enforcement concerns allows us to monitor market entrants that may then invest and innovate without being “locked in” to maintaining those investments as circumstances and technology evolve. This is also consistent with the 2015 Open Internet Order, which acknowledged that discontinuance obligations entail costs and that it is important to incrementally apply regulations beyond the status quo. Thus, applying the exit certification provision of section 214(a) of the Act is not “necessary” under section 10(a)(1) and (a)(2). We thus disagree with those commenters that support not forbearing from section 214 exit requirements because of alleged public safety benefits with respect to discontinuance requirements. The services for which they are primarily concerned are not BIAS and remain subject to our sections 214 discontinuance rules.

333. For those same reasons, we also find that forbearance is in the public interest under section 10(a)(3). Some commenters have raised important issues regarding the ability of consumers and companies to maintain awareness of potential service changes and disruptions, including for alarm companies monitoring and public safety activities. To the extent that Public Knowledge urges the Commission to avoid forbearance and instead waive the section 214 exit certification requirements, we note that while the Commission may waive its rules, it may not generally waive a provision of a statute. Forbearance is the mechanism for not applying statutory provisions when warranted. Carriers remain subject to section 214 discontinuance requirements for all telecommunications services other than BIAS, including for telephone exchange and other services, and for services being transitioned to IP-based technology, which appear to be the focus of the Alarm Industry Communications Committee’s (AICC) concerns at this time. As services evolve, providers must ensure that customers remain informed. As we stated in the 2015 Open Internet Order, our universal service rules are designed to advance the deployment of broadband networks, including in rural and high-cost areas. Providers receiving funding to deploy networks are subject to public interest obligations that protect consumers subscribing to BIAS, including in rural areas or in areas that might have only one provider. In addition, the conduct standards in our open internet rules are a necessary backstop to ensure BIAS providers act reasonably and provide protections against reduction or impairment of BIAS short of complete cessation of providing that service. As the Commission determined in the 2015 Open Internet Order, all of these protections are sufficient to protect consumers.

4. Information Collection and Reporting

To Promote National Security, Public Safety, and Improve Network Resiliency

Sections 218, 219, and 220(a)(1), (c)–(e))

334. We do not forbear from sections 218, 219, and 220(a)(1) and (c)–(e) of the Act. The Commission was created in part “[f]or the purpose of obtaining maximum effectiveness from the use of radio and wire communications in connection with safety of life and property.” As we conclude in the Order, reclassification of BIAS is essential to protecting national security and public safety. Sections 218, 219, and 220(a)(1) and (c)–(e) of the Act provide the Commission with the ability to inquire into the management of providers, collect information, and require reporting, among other things, in order to carry out the Commission’s duties. Sections 218, 219, and 220 provide additional tools necessary to ensure that our Nation’s networks are reliable, secure, and protected from bad actors seeking to disrupt our communications and access sensitive information. For example, sections 218 and 220(a)(1) and (c) will enhance the Commission’s ability to require BIAS providers to report outages through NORS and DIRS, which promotes the Commission’s ongoing efforts to improve network resiliency and increase situation awareness during disasters. Further, sections 218, 219, and 220(a)(1) and (c)–(e) will provide the Commission with the ability to obtain information from BIAS providers that is essential to the Commission’s performance of its duties and statutory responsibilities. For example, in the Evolving Risks Order, the Commission adopted a one-time collection of foreign ownership information from international section 214 authorization holders, noting that the information will assist the Commission in developing a timely and effective process for prioritizing the review of international section 214 authorities most likely to raise national security, law enforcement, foreign policy, and/or trade policy concerns. Additionally, sections 220(a)(1) and (c) will enhance the Commission’s ability to require BIAS providers to establish cybersecurity risk management plans and other best practices to mitigate exploitation of BIAS networks. For these reasons, we find that forbearance from sections 218, 219, and 220(a)(1) and (c)–(e) of the Act would neither serve the public interest under section 10(a)(3) nor satisfy the requirements of section 10(a)(2) as it pertains to the protection of consumers. Although WISPA argues that section 220(a)(2)'s recordkeeping requirements would be unduly burdensome for smaller providers, WISPA itself acknowledges the Commission’s ability to tailor application thereof as necessary.

335. We agree with Free Press that we should exclude section 218 from forbearance because it could be an important source of investigative authority, and that we should retain section 220(c) to address national security. We are not persuaded by the Computer & Communications Industry Association (CCIA) that we should forbear from these sections because the Commission forbore from them in 2015. Because of the changed circumstances since 2015, we find that the national security and public safety benefits require that we exclude these sections from forbearance. We also disagree with WISPA that enforcement of sections 218 and 220 will be burdensome to small providers. Arguments about the hypothetical costs and burdens to providers are speculative if and until we take additional regulatory action pursuant to those sections, at which time the Commission would consider the impact on small providers. Furthermore, we find that the benefits to national security, public safety, and network resiliency likely weigh in favor of not forbearing from these sections.

5. Customer Privacy (Section 222)

336. As proposed, we do not forbear from section 222 of the Act, which establishes core privacy protections for customers of telecommunications services, as well as other entities that do business with Title II providers. We do, however, waive the rules implementing section 222 to the extent such rules are applicable to BIAS as a telecommunications service by virtue of the Order. Section 222 governs telecommunications carriers’ protection, use, and disclosure of information obtained from their customers or other carriers. The requirements of section 222 itself impose duties on carriers, and the Commission has recognized its ability to directly enforce
the statutory requirements of section 222 even in the absence of rules specifically addressing a given issue. We find that forbearance from section 222 would neither serve the public interest under section 10(a)(3) nor satisfy the requirements of section 10(a)(2) as it pertains to the protection of consumers. Our decision in the Order conforms to the Commission’s long history of protecting consumer privacy, and the Commission’s long-held understanding that “[c]onsumers’ privacy needs are no less important when consumers communicate over and use broadband internet access than when they rely on [telephone] services.”

We also find that because section 222 places an obligation on telecommunications carriers to protect the confidentiality of the proprietary information of, and relating to, other telecommunications carriers (including resellers), equipment manufacturers, and business customers, requiring BIAS providers to comply with section 222 will protect information concerning entities that interact with BIAS providers.

337. As discussed above, the record supports our finding that BIAS providers serve as a necessary conduit for information passing between their customers and Internet sites or other users, and are thus situated to collect vast swaths of sensitive information about their customers, including personal information, financial information, precise location information, and information regarding their online activity. And this finding, in turn, supports our conclusion not to forbear from section 222. A 2021 FTC Staff Report found that BIAS providers collect and combine data across product lines, collect data beyond what is necessary to provide the service (including the websites that customers visit, the shows they watch, the apps they use, or details about their home energy use, their real-time and historical location, and their internet search queries), use web data to target ads, group consumers using sensitive characteristics, and share real-time location data with third parties. Evidence suggests that consumers are not fully comprehended—and therefore may not be able to meaningfully consent to—BIAS providers’ collection, processing, and disclosure of customer information. Further, as the American Library Association explains, “due to the lack of competition, even if consumers understand the extent to which their ISP collects their personal data, they most likely do not have the option to switch to an ISP that aligns with their privacy and data security goals.” As just one example that illustrates the fact that providers do not compete on privacy—and the importance of the Commission’s domain-specific expertise in the area of privacy enforcement—we note that all of the nationwide wireless carriers are currently subject to Forfeiture Orders for their similar failures to protect customer location information. We remain concerned that, absent statutory and regulatory requirements to do so, BIAS providers have minimal incentive to adopt adequate administrative, technical, physical, and procedural safeguards to protect their customers’ data from improper or excessive uses by providers themselves, or from further disclosure and misuse by third parties. Additionally, WISPA’s contention that protection of CPNI may be particularly burdensome for small providers is not itself cause for forbearance from section 222 outright. A customer’s privacy needs do not fluctuate with the size of a provider, and therefore section 10(a)’s forbearance criteria, which focus on whether a requirement is necessary to ensure just and reasonable and nondiscriminatory practices, do not justify the relief requested by WISPA.

338. We also disagree with CCIA’s position that the Commission must, at this time, apply section 222 to BIAS providers only with respect to “‘information’ that is a clear analog to non-CPNI customer telecommunications service information that the Commission is charged with protecting.” As an initial matter, we observe that the Commission has never provided an exhaustive list of what constitutes CPNI. But more importantly, as explained above, the Commission’s privacy authority under Title II is not limited to CPNI. Sections 222(a) and 201 also impose obligations, which we enforce, on carriers’ practices with regard to non-CPNI customer proprietary information and PII. We see no reason to depart from that approach with respect to BIAS; on the contrary, the types of sensitive information to which BIAS providers have access by virtue of their provision of BIAS as a service underscores the imperative of applying section 222 to BIAS providers broadly—i.e., without limiting its application to only particular information types. Similarly, we are unpersuaded by USTelecom’s suggestion that section 222 only applies to CPNI, as defined therein, and does not provide authority beyond that as cause for forbearance.

339. We reject assertions that application of section 222 to BIAS will lead to “regulatory bifurcation” of privacy on the internet, or that it would be arbitrary and capricious for the Commission to impose privacy requirements on BIAS providers while leaving larger edge, content, or social media platforms, such as Google, Apple, and Meta, subject to the FTC’s section 5 authority. As an initial matter, we think that the statutory framework makes clear that the Commission has authority over the misuse of the “underlying communications infrastructure by consumer-facing service providers, whereas the FTC . . . concerns itself with businesses offering their products and services by means of that infrastructure.” Further, we disagree that BIAS providers’ access to user data is “not comprehensive.” And, as the Lawyers’ Committee explains, “even when communications content is encrypted or un inspected, unshielded metadata can still reveal highly sensitive information.”

340. In addition, assertions that “[i]t is confusing for consumers when privacy regimes differ based on who holds the information” ignore the fact that consumers are already subject to a dichotomy of privacy regimes. Currently, a provider of mobile voice service is subject to the section 222 privacy and data protection framework, while mobile BIAS offered by the same provider, and used on the same device, is currently not subject to the same framework under the RIF Order. We are skeptical of claims, and find no actual evidence in the record, that consumers view their use of over-the-top applications like Google Maps, YouTube, or TikTok—applications that a consumer chooses to download and to which they consent to provide their information—as more closely comparable to BIAS than they view BIAS as comparable to other communications services, like voice services, which are typically provided by, and billed in conjunction with, their broadband services. On the contrary, we find that declining to forbear from applying section 222 to BIAS will support a consistent privacy and data security framework across data services, which consumers often subscribe to from one provider in a bundle and perceive to be part of the same service, particularly for mobile services.

341. Finally, we also disagree with commenters’ assertions that application of section 222 to BIAS is inconsistent with the Congressional Review Act (CRA). As one independent basis for our decision, this argument fails because it attempts to impute Congress’s 2017 CRA resolution with respect to the Commission’s 2016 Privacy Order (81
FR 87274 (Jan. 3, 2017)) to the Commission’s 2015 Open Internet Order. Specifically, in the 2015 Open Internet Order, the Commission classified BIAS as a telecommunications service and granted forbearance from the Commission rules implementing section 222, but did not grant forbearance from section 222 itself. Thus, the application of section 222 to BIAS was established by the 2015 Open Internet Order, and that Order was not subject to a resolution of disapproval. While Commissioner Carr’s dissent suggests that enforcement under the statute might fall short because “calls” are the only telecommunications services specifically mentioned in section 222,” this argument overlooks the fact that the relevant requirements under section 222—specifically section 222(a) and 222(c)—and the definition of CPNI found in section 222(h) do not refer to “calls” but instead to “telecommunications” services, thus allowing for Commission enforcement under the Act. Indeed, we note that such enforcement was specially contemplated by the Commission following the CRA resolution.

342. The argument about the 2017 CRA resolution of disapproval also fails for additional, independent reasons. Subsequent to the 2015 reclassification of BIAS as a telecommunications service subject to section 222, the Commission attempted to further address privacy requirements for BIAS providers, adopting rules in the 2016 Privacy Order that applied to BIAS providers in addition to other telecommunications carriers and interconnected VoIP providers. In 2017, however, Congress nullified those 2016 revisions to the Commission’s privacy rules under the CRA. Pursuant to the language of the Resolution of Disapproval, the 2016 Privacy Order was rendered “of no force or effect.” That resolution conformed to the procedure set out in the CRA, which requires agencies to submit most rules to Congress before they can take effect and provides a mechanism for Congress to disapprove of such rules. Pursuant to the operation of the CRA, the 2016 Privacy Order “may not be reissued in substantially the same form, and a new rule that is substantially the same as such a rule may not be issued, unless the reissued or new rule is specifically authorized by a law enacted after the date of the joint resolution disapproving the original rule.”

343. Commenters’ CRA arguments are unavailing on their own terms, however. As the Commission explained in the Data Breach Notification Order (99 FR 9968 (Feb. 12, 2024)), “the CRA is best interpreted as prohibiting the Commission from reissuing the 2016 Privacy Order in whole, or in substantially the same form, or from adopting another item that is substantially the same as the 2016 Privacy Order.” It does not prohibit the application of Title II generally, or sections 222 or 201 specifically, to BIAS, nor does it prohibit the Commission from considering the later adoption of regulations implementing those obligations. We do not, through our reclassification of BIAS as a telecommunications service, reinstate the 2016 Privacy Order. Pursuant to the procedure set out in the CRA, which requires agencies to submit most rules to Congress before they can take effect, the 2016 Privacy Order or, for that matter, any of the rules that it adopted. And even if one considers the aggregate effect of Commission actions related to privacy, we are not persuaded that they collectively adopt or effectuate rules that are substantially the same as the 2016 Privacy Order as a whole. This is particularly true because the 2016 Privacy Order was focused in substantial part on privacy rules for BIAS providers, and as discussed in the next paragraph, our application of section 222 to BIAS providers here is not substantially the same as the rules adopted for BIAS providers in the 2016 Privacy Order. If the Commission later initiates a proceeding to consider the privacy rules for BIAS pursuant to Title II, it will be bound by the CRA not to issue a rule that is substantially the same as the 2016 Privacy Order. We are doubtful that future Commission actions that recapitulated some or even all of the data elements that constituted customer proprietary network information in the BIAS context under the 2016 Privacy Order would run afoul of the CRA resolution, as suggested by Commissioner Carr’s dissent. And, in any event, based on the Commission’s long experience enforcing section 222 without having offered a comprehensive definition of CPNI, we do not anticipate any difficulty in enforcing section 222 with respect to BIAS providers without first adopting a comprehensive definition of BIAS CPNI that includes virtually all data and metadata elements.

344. Indeed, even if, as some parties argue, the CRA prohibits the Commission from adopting rules similar to some of the aspects of the 2016 Privacy Order, we believe that reinstating the applicability of the statutory obligations and the Commission’s ability to consider other regulatory obligations still would not be contrary to the Resolution of Disapproval, and serves the public interest. As explained in the Data Breach Notification Order, the 2016 Privacy Order “made a number of changes to the Commission’s privacy rules that, among other things, required carriers to disclose their privacy practices, revised the framework for customer choice regarding carriers’ access, use, and disclosure of the customers’ information, and imposed data security requirements in addition to data breach notification requirements.” For example, the 2016 Privacy Order specified in detail the contents that had to be included in privacy notices, including mandatory disclosures related to other substantive requirements adopted in the 2016 Privacy Order, requirements for translation into languages other than English, and detailed requirements for where and how the notice is made available and updated. As another example, the 2016 Privacy Order adopted detailed customer approval requirements, including when opt-out approval was permitted; when and how approval must be solicited; and detailed requirements for a mandatory mechanism to grant, deny, or withdraw approval at any time. And as another example, the 2016 Privacy Order restricted BIAS providers’ conditioning service on waiver of privacy rights, including limiting the incentives BIAS providers could offer customers in exchange for authorization to use, disclose, and/or permit access to the customer’s personal information. Although the basic principles underlying the requirements adopted in the 2016 Privacy Order obviously flow from the statutory requirements of section 222 themselves, section 222 alone (even when coupled with open internet rules like the transparency rule) leaves BIAS providers with leeway in the details of how they go about complying with those obligations to a materially greater extent than the much more prescriptive 2016 rules.

345. In addition, the Commission Order effectuating the 2017 Resolution of Disapproval explicitly recognized that BIAS providers would “remain subject to Section 222” itself. As such, we reject assertions that the Commission may not have authorization to apply section 222 to BIAS providers because Congress overturned the 2016 rules implementing section 222 with respect to BIAS. Thus, even at the time of the 2017 Resolution of Disapproval, the Commission saw no inconsistency between that resolution and the application of the statutory requirements of section 222. As such, we reject arguments that this document’s classification is contrary to Congress’s disapproval to the 2016 Privacy Order in 2017.
We nevertheless find it appropriate to waive the rules implementing section 222 to the extent such rules are applicable to BIAS as a telecommunications service by virtue of the Order. The Commission may waive its rules and requirements for “good cause shown.” Good cause, in turn, may be found “where particular facts would make strict compliance inconsistent with the public interest.” In making this determination, the Commission may “take into account considerations of hardship, equity, or more effective implementation of overall policy,” and if “special circumstances warrant a deviation from the general rule and such deviation will serve the public interest.” We observe that many of the Commission’s current rules implementing section 222 were adopted to address specific concerns in the voice context, as the Commission recognized in 2015 when initially reclassifying broadband as a Title II telecommunications service. Additionally, there is nothing in the record to indicate that the current rules implementing section 222 would be a good fit for BIAS to the extent that they impose more specific requirements than section 222 itself. Thus, insofar as rules focused on addressing problems in the voice service context are among the central underpinnings of our CPNI rules, we find the public interest better served by waiving all of our CPNI rules at this time, insofar as they would apply to BIAS, to give us the opportunity to carefully evaluate appropriate rules for BIAS, particularly given the need to consider the effect of the Resolution of Disapproval. As the Commission explained in 2015, it is within the agency’s discretion to proceed incrementally, and we similarly find that adopting an incremental approach here “guards against any unanticipated and undesired detrimental effects on broadband deployment that could arise.” We find that requiring BIAS providers to comply with section 222, while at the same time waiving application of our voice-specific rules, will allow providers the flexibility to adopt security practices that are effective and appropriate in the BIAS context, enhancing protections for customers without placing undue costs on providers, including small providers. As discussed above, we continue to apply section 222 to the Act itself, as well as section 201(b)’s prohibition on practices that are unjust or unreasonable, which also provides authority over privacy practices.

6. Access to Poles, Ducts, Conduit, and Rights-Of-Way (Section 224)

7. Universal Service
carriers are eligible to participate in universal service programs. More specifically, an entity must be designated an eligible telecommunications carrier (ETC) under section 214(e) in order to get High Cost or Lifeline program support, but the same constraint does not apply with respect to receipt of support under the E-Rate or Rural Health Care programs. As discussed in greater detail above, the Commission already exercises its authority to support broadband services to schools, libraries, and health care providers and to support deployment of broadband-capable networks in high-cost areas. BIAS is a key focus of those universal service policies, and classification in the Order simply provides another statutory justification in support of these policies going forward. Even assuming arguendo that section 706 of the 1996 Act may also enhance the Commission’s ability to achieve its universal service policies in certain targeted ways, the likely limits of that authority mean that we are not persuaded simply to rely on section 706 of the 1996 Act in lieu of section 254. Under our broader section 10(a)(3) public interest analysis, the historical focus of our universal service policies on advancing end users’ access to BIAS persuades us that strengthening the foundation of our universal service activities is justified and will have limited impact on BIAS providers. Because forbearance would not be in the public interest under section 10(a)(3), we generally apply sections 254 and 214(e), and our implementing rules, to BIAS.

351. However, we find it appropriate—as the Commission previously found in 2015—to forbear from the first sentence of section 254(d) and our associated rules insofar as they would immediately require new universal service contributions to be assessed on broadband internet access service to end users. In addition, pursuant to our forbearance from section 254(d) to maintain the status quo for contributions based on the provision of BIAS, and consistent with the 2015 Open Internet Order, we maintain the status quo with respect to states’ ability to impose state-level contribution obligations on the provision of BIAS for State universal service programs. The first sentence of section 254(d) states that “[e]very telecommunications carrier that provides interstate telecommunications services shall contribute, on an equitable and nondiscriminatory basis, to the” USF. In the 2015 Open Internet Order, however, the Commission “forbore in part from the first sentence of section 254(d) and our associated rules insofar as they would immediately require new universal service contributions associated with [BIAS].” The Commission stated that, as with forbearance from requiring new TRS contributions, forbearance from requiring new universal service contributions to be assessed on BIAS would permitfully “balance the future benefits” of encouraging broadband deployment against the short term impact” from forbearing from immediate new contribution assessments. The Commission also pointed to other parallel proceedings, both before the Commission and before other bodies, examining “a wide range of issues regarding how contributions should be assessed, including whether to continue to assess contributions based on revenues or to adopt alternative methodologies for determining contribution obligations.” The Commission thus determined to “forbear[] from applying the first sentence of section 254(d) and our implementing rules insofar as they would immediately require new universal service contributions for [BIAS] but not insofar as they authorize the Commission to require such contributions in a rulemaking in the future.”

352. We agree with commenters who say that the Universal Service Fund helps to protect consumers and to ensure that communications services are available to all Americans on just and reasonable rates and terms, and indeed for that reason we have found it important to reclassify BIAS as a Title II telecommunications service to ensure that we can continue to support the availability and affordability of BIAS through USF programs. But the record does not show that assessing new USF contribution requirements on BIAS is necessary for the Universal Service Fund to fulfill those goals at this time. On the contrary, the Universal Service Fund has been funding broadband access and affordability for well over a decade without imposing contribution requirements on BIAS providers. And the record does not show that anything would substantially change in that regard without imposing contribution requirements on BIAS. In fact, the Universal Service Fund successfully operated under a materially identical set of contribution and support schemes throughout the time that the 2015 Open Internet Order was in effect. To be sure, several commenters contend that it would be preferable to expand the contribution base to include BIAS, or that doing so might become necessary in the future, but the record does not convincingly show that imposing universal service contribution requirements on BIAS is necessary at this time.

353. We conclude that forbearance from imposing new universal service contribution requirements on BIAS at this time is in the public interest. Others disagree with this proposal, primarily arguing that not forbearing from section 254(d) and our implementing rules would abandon a much-needed expansion of contributors, decrease the contribution amount for each provider, increase the size of the USF, complicate future USF reform, and/or be an unnecessary step toward precluding BIAS providers from assessment. For one thing, we agree with commenters who warn that suddenly and unnecessarily imposing new fees on BIAS could pose “major upheaval in what is actually a stable and equitable contribution system.” Rather than risk this upheaval, we believe it to be in the public interest to proceed cautiously and incrementally. The Commission thus recognized in 2015 that it is appropriate to forbear from extending new contribution requirements to BIAS pending ongoing deliberations, both before the Commission and before other bodies, on future USF contribution reform. Contrary to the assumption of some commenters, Commission efforts remain ongoing in this area. In the Luján Letter, Chairwoman Rosenworcel stressed that “[t]here are a number of potential options for reforming the USF contribution system, each with advantages and disadvantages, and, critically, different cost burdens on consumers . . . . Nonetheless, any reform efforts would benefit from further inquiry, such as a rulemaking or data collection, to fully appreciate the potential burdens on consumers and any other unforeseen, negative downstream effects.” She added that any such effort “must result in a sustainable funding model and also fully consider the current telecommunications marketplace and the potential cost burdens on consumers.” Several commenters also suggested that the Commission should seek and obtain statutory authority to assess edge providers, while another stressed that assessing edge providers “would undermine the ultimate goal of universal connectivity by imposing new fees on the very services that drive consumers to seek broadband connections in the first place.” Congress has also been actively deliberating on legislative proposals to reform the USF...
contribution and funding mechanisms. USF contribution reform is an immensely complex and delicate undertaking with far-reaching consequences, and we believe that any decisions on whether and how to make BIAS providers contribute to the USF are best addressed holistically in those ongoing discussions of USF contribution reform, with a full record and robust input from all interested parties, rather than in this proceeding.

354. Forbearance will also serve the important public interest goals of broadband access and affordability. As always, we are mindful of section 706’s directive to “encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans . . . by utilizing . . . regulatory forbearance.” That directive is echoed in the universal service principles set forth in section 254(b) of the Act, which include “access . . . in all regions of the Nation” at “just, reasonable, and affordable rates.” Here, estimates show that assessing contribution requirements on BIAS could result in a material increase in consumer broadband bills, potentially in the range of roughly $5 to $18 per month. “The monthly household payment would increase, even though the contribution factor would decrease, because the contribution factor would be applied for the first time to customer broadband bills (in addition to telephone bills) which are generally higher than telephone bills.” INCOMPAS disputes these figures, citing materials that it has previously submitted to the Commission, including materials fully considered in the Future of USF Report. We decline to revisit those figures here without a fully updated record and comprehensive input from a full array of interested parties. Indeed, INCOMPAS itself acknowledges “the need to develop a fuller record on contribution reform.”

355. We are not persuaded that allowing BIAS providers to continue to forgo USF contributions would be contrary to section 254(d)’s requirement that providers contribute “on an equitable and nondiscriminatory basis” even if we were not forbearing from that requirement. Forbearance essentially maintains the longstanding status quo. Under the final sentence of section 254(d), the Commission has had discretion to impose contribution requirements on BIAS providers even under Title I, but no one has argued it is unlawful not to do so. Arguments by commenters that forbearance from contribution requirements would improperly permit BIAS providers to receive USF support without having to contribute likewise neglect that operation of our current contribution rules. Our rules generally permit carriers to recoup their universal service contributions from their customers through surcharges on customers’ monthly bills, so most of the burden ultimately falls on end users. Given estimates that extending the contribution requirements to BIAS could considerably increase consumers’ broadband bills and would require residential consumers to bear a much greater share of the burden relative to business users, forbearing from new contribution requirements may be more equitable. And in any event, we do not think it inequitable to forbear from imposing new and unnecessary costs on BIAS when seeking to promote universal broadband availability, while requiring contributions from more mature services that have already achieved near-universal penetration. We are likewise unpersuaded by claims that forbearance would give BIAS a competitive advantage over non-BIAS services. It is not evident that BIAS and non-BIAS services are generally competitive substitutes even if there is limited evidence of substitution in some instances, or that USF fees have enough of a price impact to give rise to significant or widespread substitution. In any event, this issue would be better raised and addressed as part of a broader holistic proceeding on USF contribution reform, based on a full record and full input on all relevant issues, than in this proceeding.

356. We caution, as the Commission did in 2015, that our determination to forbear at this time is based on the present record in a complex and developing area. We do not disclaim our authority to require new universal service contributions in a future rulemaking, and our decision in the Order is not intended to prejudge or limit how the Commission might take action in the future. Some commenters express concern that “it will be difficult, if not impossible, to ‘unforbear’” from the contributions-related forbearance that applies in this context. We find that this concern is unfounded. It is appropriate for the Commission to reverse a forbearance decision if “[c]ontinued forbearance from this regulation would be inconsistent with the statutory forbearance criteria” and the Commission has done so previously. We are confident that, if any future USF contribution reform renders continued forbearance from BIAS USF assessments inconsistent with statutory forbearance criteria, the Commission could and would reverse that grant of forbearance.

357. Some commenters contend that the Commission could refrain from assessing BIAS providers for USF contributions without forbearing by instead “clarify[ing] that it will pause from immediately enforcing the statute and that BIAS providers are not required to include those revenues until the Commission moves to Order on that contribution reform.” However, we explain above why the forbearance standard is met and why we find it in the public interest under that standard to rely on the Commission’s well-established statutory forbearance authority to ensure that BIAS providers are not immediately assessed contributions. We therefore decline WTA—Advocates for Rural Broadband’s (WTA) request to delete any discussion of section 254(d) forbearance until a rulemaking is conducted. Moreover, the Commission’s waiving the application of § 54.706 of its rules for BIAS providers as some commenters propose an alternative forbearance would not alter the Commission’s underlying statutory obligation under section 254(d). We therefore decline to adopt a different approach. Section 254(d) directs the Commission to establish mechanisms—including contribution requirements—to preserve and advance universal service. Some commenters attempt to rely on various precedents to argue that section 254(d) is not “self-effectuating.” We find that the examples cited—the initial implementation of section 54, the assessment of wireless voice providers, the assessment of VoIP providers, and the brief period of assessment of wireline BIAS providers—are inapposite and are not
germane as to whether the statute is self-enacting. Indeed, these examples are not analogous to the assessment of contributions for BIAS providers because the wireless providers in questions were in fact required to contribute to the USF immediately pending the development of a Commission-specified allocation methodology; the VoIP providers were assessed based on permissive, not mandatory, authority; and the 2005 wireline BIAS providers were subject to an existing contribution methodology on a time-limited basis to maintain the status quo. Notably in this case, the Commission already has established requirements that, by their terms, would require contributions on BIAS revenues if they immediately applied.

358. We also forbear from applying section 254(g) and (k) and our associated rules. Section 254(g) requires “that the rates charged by providers of interexchange telecommunications services to subscribers in rural and high-cost areas shall be no higher than the rates charged by each such provider to its subscribers in urban areas.” Section 254(k) prohibits the use of revenues from a non-competitive service to subsidize a service that is subject to competition. As with the 2015 Open Internet Order, we are not persuaded that applying these provisions is necessary for purposes of section 10(a)(1) and (a)(2), particularly given the availability of the core BIAS requirements. By “core BIAS requirements,” we mean the provisions of the Act and regulations expressly excluded from the scope of forbearance under the Order, along with section 706 of the 1996 Act, and our Open Internet rules. Likewise, under the tailored regulatory approach we find warranted here, informed by our responsibilities under section 706, we conclude that forbearance from enforcing section 254(g) and (k) is in the public interest under section 10(a)(3). Forbearance from section 254(g) also is consistent with our commitment to forbear from all provisions that would permit rate regulation of BIAS. We also note that comments addressing section 254 appear focused on provisions regarding universal service support for BIAS networks and universal service contributions, addressed above, and not on the requirements of section 254(g) and (k) and our implementing rules. We thus forbear from applying these provisions insofar as they would be newly triggered by the classification of BIAS in the Order. Nothing in our forbearance with respect to section 254(k) for BIAS is intended to encompass, however, situations where ILECs or other common carriers voluntarily choose to offer internet transmission services as telecommunications services subject to the full scope of Title II requirements for such services. As a result, such providers remain subject to the obligations that arise under section 254(k) and the Commission’s rules by virtue of their elective provision of such services. For example, if a rate-of-return incumbent LEC (or other provider) voluntarily offers internet transmission outside the forbearance framework adopted in the Order, it remains subject to the pre-existing Title II rights and obligations, including those from which we forbear in the Order.

8. Access for Persons With Disabilities (Sections 225, 235, and 251(a)(2))

359. We do not forbear from those provisions of Title II that ensure access to BIAS by individuals with disabilities. Consistent with our conclusion above that BIAS is essential, we find that all Americans, including those with disabilities, must be able to reap the benefits of an open internet. Application of sections 225, 255, and 251(a)(2) is necessary to ensure access for these individuals, thereby protecting consumers and furthering the public interest.

360. Section 225 mandates that telecommunications relay services be made available on an interstate and intrastate basis to individuals who are deaf, hard of hearing, deafblind, and who have speech disabilities in a manner that is “functionally equivalent to the ability of a hearing individual who does not have a speech disability to communicate using voice communication services by wire or radio.” To achieve this, the Commission has required all interstate service providers (other than one-way paging services) to provide TRS. People who are deaf, hard of hearing, deafblind, and who have speech disabilities increasingly rely upon internet-based video communications, both to communicate directly (point-to-point) with other persons who are deaf or hard of hearing who use sign language and through video relay service with individuals who do not use the same mode of communication that they do. VRS is a form of TRS that allows people who are blind, hard of hearing, deafblind, and who have speech disabilities who use sign language to communicate with voice telephone users through a communications assistant using video transmissions over the internet. In addition, these populations rely on other forms of internet-based TRS, including Internet Protocol Relay Service (IP Relay) and Internet Protocol Captioned Telephone Service (IP CTS). IP Relay is a “telecommunications relay service that permits an individual with a hearing or a speech disability to communicate in text using an Internet Protocol-enabled device via the internet, rather than using a text telephone (TTY) and the public switched telephone network.” IP CTS is a “telecommunications relay service that permits an individual who can speak but who has difficulty hearing over the telephone to use a telephone and an Internet Protocol-enabled device via the internet to simultaneously listen to the other party and read captions of what the other party is saying.” In using these forms of video communications, they rely on high definition two-party or multiple-party video conferencing that necessitates a broadband connection. Indeed, the Commission recognized the increased importance for persons with disabilities to have access to video conferencing services that arose during the COVID–19 pandemic and its aftermath.

361. Section 225 is forward-looking and requires the Commission to adopt TRS regulations that encourage the use of existing technologies and not discourage or impair the development of new technologies. As technology advances, the obligations of section 225 carry forward to ensure the Commission makes available to all individuals in the United States a rapid, efficient, nationwide communications service. For example, in 2007, the Commission extended the application of section 225 requirements to interconnected VoIP providers, relying at the time on its ancillary authority to the Commission’s to carry out the purposes established under section 1 of the Act, make available to all individuals in the United States a rapid, efficient nationwide communication service, and increase the utility of the telecommunications system. The Commission also relied on express authority under section 225(d)(3)(B) to issue regulations that “shall generally provide that costs caused by interstate relay services shall be covered from all subscribers for every interstate service” to require VoIP providers to contribute to the TRS fund. Congress, in the CVAA, subsequently codified the obligations of interconnected and non-interconnected VoIP providers to contribute to the TRS fund. Limits imposed on bandwidth use through network management practices that might otherwise appear neutral, could have an adverse effect on internet-based TRS users who use sign language to communicate by degrading the...
would newly apply to BIAS. We find the application of TRS fund contributions for BIAS providers, from our forbearance of universal service we forbear at this time, for reasons forbearance would not be in the public protection of consumers, and that section 225 is necessary for the sum, we find that the enforcement of equivalency mandate will protect possible the voice communication equivalent, that is, mirror as closely as through TRS are functionally communication services made available section 225.

362. As emphasized in the 2015 Open Internet Order, section 225 is important not only as a basis for future rules adopting additional protections but also to clarify internet-based TRS providers’ obligations under existing rules. To be compensated from the TRS fund, providers’ services must comply with section 225 and the Commission’s TRS rules and orders. A number of IP-based TRS services are delivered through users’ broadband internet access services. Forbidding from applying section 225 and our TRS service requirements would risk creating loopholes in the protections otherwise afforded to users of internet-based TRS services, or even just uncertainty that might result in degradation of these services. More specifically, if we were to forbear from applying these provisions, we run the risk of allowing actions taken by BIAS providers to come into conflict with the overarching goal of section 225, i.e., ensuring that communication services made available through TRS are functionally equivalent, that is, mirror as closely as possible the voice communication services available to the general public. Enforcement of this functional equivalent mandate will protect against such degradation of service. In sum, we find that the enforcement of section 225 is necessary for the protection of consumers, and that forbearance would not be in the public interest.

363. Notwithstanding the foregoing, we forbear at this time, for reasons similar to those discussed above relating to our forbearance of universal service contributions for BIAS providers, from the application of TRS fund contribution obligations that otherwise would newly apply to BIAS. We find that applying new TRS fund contribution requirements at this time is not necessary to ensure just, reasonable, and nondiscriminatory conduct by BIAS providers or for the protection of consumers under section 10(a)(1) and (a)(2) and that forbearance is in the public interest under section 10(a)(3).

We limit our action only to forbearing from applying section 225(d)(3)(B) and our implementing rules insofar as they would immediately require new TRS fund contributions from BIAS providers. We reserve the ability to conduct a future rulemaking to require such contributions in the event future developments necessitate such action. Before adopting any TRS-related contributions requirements, the Commission would assess the need for such funding, and the appropriate contribution level, given the totality of concerns implicated in this context.

364. Consistent with the Commission’s approach in 2015, nothing in our forbearance from TRS fund contribution requirements for BIAS is intended to encompass situations when ILECs or other common carriers voluntarily choose to offer internet transmission services as telecommunications services subject to the full scope of Title II requirements for such services. As a result, such providers remain subject to the TRS fund contribution obligations that arise under section 225 and the Commission’s rules by virtue of their elective provision of such services until such time as the Commission further addresses such contributions in the future.

365. Further, with respect to BIAS, we do not forbear from applying sections 255 and 251(a)(2), and the associated rules, that require telecommunications carriers and equipment manufacturers to make their services and equipment accessible to individuals with disabilities, unless not readily achievable, and preclude the installation of “network features, functions, or capabilities that do not comply with the guidelines and standards established pursuant to section 255.” In prior proceedings, the Commission has emphasized its commitment to implementing the important policy goals of section 255 in the internet access service context. Commenters have noted that broadband adoption, while growing, still lags among certain groups, including individuals with disabilities. Adoption of BIAS by persons with disabilities can enable these individuals to achieve greater productivity, independence, and integration into society in a variety of ways. These capabilities, however, are not available to persons with disabilities if they face barriers to BIAS usage, such as inaccessible hardware, software, or services. We anticipate that increased adoption of services and technologies accessible to individuals with disabilities will, in turn, spur further availability of such capabilities, and of BIAS deployment and usage more generally.

366. Our forbearance analysis regarding sections 255 and 251(a)(2), and our implementing rules, is also informed by the incremental nature of the requirements imposed. The CVAA addressed advanced communication services (regardless of their regulatory classification) to ensure that such products and services are accessible to persons with disabilities, unless it is not achievable to do so. While the CVAA permits the Commission to adopt regulations that networks used to provide advanced communications services “may not impair or impede the accessibility of information content when accessibility has been incorporated into that content for transmission,” such provisions alone do not help the Commission ensure that BIAS is accessible to people with disabilities.

367. As explained above, we find the provisions of the CVAA, while significant, are not sufficient protections in the context of BIAS, despite the claims of several commenters. Insofar as sections 255, 251(a)(2), and our implementing rules impose different requirements that are reconcilable with the CVAA, we find it appropriate to apply those additional protections in the context of BIAS for the reasons described above. For example, providers of BIAS must ensure that network services and equipment do not impair or impede accessibility pursuant to the sections 255 and 251(a)(2) framework. Because this section requires pass through of telecommunications in an accessible format, and 47 CFR 14.20(c) requires pass through of advanced communications services in an accessible format, the two sections work in tandem with each other, and forbearance from sections 255 and 251(a)(2) would therefore result in a diminution of accessibility. In particular, we find that these provisions and regulations are necessary for the protection of consumers and forbearance would not be in the public interest. We recognize that the Commission previously has held that section 2(a) of the CVAA exempts entities, such as internet service providers, from liability for violations of section 716 when they are acting only to transmit covered services or to
provide an information location tool. Thus, service providers that merely provide access to an electronic messaging service, such as a broadband platform that provides an end user with access to a web-based email service, are excluded from the accessibility requirements of section 216. Our decision here is not at odds with Congress’s approach to such services under the CVAA, however, because we also have found that “relating to section 253, section 216 requires a higher standard of achievement for covered entities.” Thus, under our decision here, BIAS will remain excluded from the “higher standard of achievement” required by the CVAA to the extent provided by that law, and instead will be subject to the lower standard imposed under section 253 in those cases where the CVAA does not apply.

9. Other Title II Provisions

368. We adopt our proposal to not grant forbearance to the extent it was considered and rejected for particular statutory provisions in the 2015 Open Internet Order. The record does not reflect that the Commission’s forbearance criteria or analyses must be updated with regard to these obligations, and no commenter suggests we should forbear from these provisions. Specifically, we do not forbear from section 257 of the Act and provisions insofar as they only reserve State or local authority, as these provisions impose certain obligations on the Commission without creating enforceable obligations that the Commission would apply to telecommunications carriers or telecommunications services. Section 257 also may enhance public safety by giving the Commission additional authority to address outage reporting requirements. We also decline requests to forbear from applying sections 253 and 332(c), which provide us authority to preempt State and local requirements, which is consistent with the preemption approach we articulate in the Order, and we therefore find it in the public interest to continue applying those provisions. Additionally, for the reasons fully elaborated on in the 2015 Open Internet Order, we decline to forbear from the CALEA requirements in section 229. To the extent we do not forbear from these or any other provisions or regulations, BIAS providers remain free to seek relief from such provisions or regulations through appropriate filings with the Commissions.

369. We similarly do not forbear from applying Title II provisions that could be viewed as a benefit to BIAS providers, such as sections 223, 230(c), and 231. Section 230(c) was not covered by the scope of forbearance in the 2015 Open Internet Order because “its application does not vary based on the classification of BIAS here.” Since section 230(c)’s application has not changed since the Commission adopted the 2015 Open Internet Order, the Commission again does not forbear. Similarly, applying sections 223 and 231 (to the extent enforced) and their associated limitations on liability, still do not vary with BIAS’s classification, and are not encompassed by the forbearance in the Order. Many of the relevant provisions in these sections stem from the Child Online Protection Act (COPA), which has been enjoined as unconstitutional. A Federal court held that COPA is unconstitutional and placed a permanent injunction against its enforcement, and that decision was affirmed on appeal. We also find that, to the extent that Title II provisions benefit BIAS providers and newly apply by virtue of reclassification, applying those provisions better serve the public interest because they promote broadband deployment.

C. Broad Forbearance From Other Title II Provisions for Broadband Internet Access Service

370. Beyond the specific statutory provisions and regulations expressly excluded from forbearance as discussed above and in the sections below, we apply broad forbearance, to the full extent permitted by our authority under section 10 of the Act, from provisions of Title II of the Act and implementing Commission rules that would apply to BIAS by virtue of its classification as a Title II telecommunications service. We are persuaded that this forbearance is appropriate and in the public interest based on our predictive judgment regarding the adequacy of other protections where needed, the role of section 706 of the 1996 Act, and how we have tailored our forbearance to account for updated conclusions in this proceeding regarding the application of particular rules, requirements, and sources of authority to BIAS. The record also provides support for the forbearance approach we take here.

371. Consistent with our analysis in 2015, we conclude that our analytical approach as to all the provisions and regulations from which we forbear in the Order is consistent with section 10(a). We also decline WISPA’s request that we conduct a cost-benefit analysis of the imposition of Title II regulations in the context of the limits which regulations we should or should not forbear from. WISPA Comments at 60. This is unnecessary, as we find that our forbearance is in the public interest and is consistent with 10(a) analysis. Under section 10(a)(1), we consider here whether particular provisions and regulations are “necessary” to ensure “just and reasonable” conduct by BIAS providers. In interpreting that terminology, we conclude that we reasonably can account for policy trade-offs that can arise under particular regulatory approaches, as discussed above. While the specific balancing at issue in EarthLink v. FCC may have involved trade-offs regarding competition, we nonetheless believe the view expressed in that decision accords with our conclusion here that we persuasively can interpret and apply all the section 10(a) criteria to also reflect the competing policy concerns here. As the D.C. Circuit also has observed, within the statutory framework that Congress established, the Commission “possesses significant, albeit not unfettered, authority and discretion to settle on the best regulatory or deregulatory approach to broadband.” For one, we find it reasonable in the BIAS context for our interpretation and application of section 10(a)(1) to be informed by section 706 of the 1996 Act. Given the characteristics specific to BIAS that we find on the record here—including, among other things, protections from the newly adopted open internet rules and the overlay of section 706—we limit our forbearance from the relevant provisions and regulations to the context of BIAS.

Outside that context, they will continue to apply as they have previously, unaffected by the Order. As discussed above, section 706 of the 1996 Act “explicitly directs the FCC to ‘utiliz[e]’ forbearance to ‘encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans,’” and our recent negative section 706(b) determination triggers a duty under section 706 for the Commission to “take immediate action to accelerate deployment.” As discussed in greater detail below, a tailored regulatory approach avoids disincentives for broadband deployment, which we weigh in considering what outcomes are just and reasonable—and whether the forborne-from provisions are necessary to ensure just and reasonable conduct—under our section 10(a)(1) analyses in this item. Furthermore, our forbearance in the Order, informed by past experience and the record in this proceeding, reflects a condition that, beyond the specific provisions from which we decline to forbear above and
the bright-line open internet rules we adopt below, particular conduct by a BIAS provider can have mixed consequences, rendering a case-by-case evaluation superior to bright-line rules. Consequently, based on those considerations, we predict that, outside the authority we retain and the rules we apply in the Order, just and reasonable conduct by BIAS providers is better ensured under section 10(a)(1) by the case-by-case regulatory approach we adopt—which enables us to account for the countervailing policy implications of given conduct—rather than any of the more bright-line requirements that would have flowed from the provisions and regulations from which we forbear.

As explained above, we conclude that while competition can be a sufficient basis to grant forbearance, it is not inherently necessary to find section 10 satisfied. These same considerations underlie our section 10(a)(2) analyses as well, since advancing BIAS deployment and ensuring appropriately nuanced evaluations of the consequences of BIAS provider conduct better protects consumers. Likewise, these same policy considerations are central to the conclusion that the forbearance granted in the Order, against the backdrop of the protections that remain, best advance the public interest under section 10(a)(3).

372. The Commission’s practical experience with the classification of BIAS informs our section 10(a) analysis for the remaining statutory and regulatory obligations triggered by classifying BIAS as a Title II telecommunications service. Although practical experience in and of itself does not resolve the appropriate regulatory treatment of BIAS, it suggests that our approach guards against undue burden that could hinder BIAS deployment or otherwise be contrary to the public interest. We are not persuaded by arguments to the contrary, nor that we should not adopt the regulatory framework in the Order because it will impose such high compliance costs on providers relative to the status quo from the near-term past. The record reflects that providers were not deterred from network investment after the Commission adopted a similar regulatory approach in the 2015 Open Internet Order and that some providers voluntarily continue to follow certain conduct rules. We note in this regard that when exercising its section 10 forbearance authority “‘[g]uided by section 706,’” the Commission permissibly may “‘decide[] to balance the future benefits’” of encouraging broadband deployment “against [the] short term impact” from a grant of forbearance. Under the section 10(a) analysis, we are particularly persuaded to give greater weight to the likely benefits of proceeding cautiously given the speculative or otherwise limited nature of the arguments in the current record regarding the forbearance approach adopted here, which we discuss in greater detail below. Although we adopt firm forbearance from all direct rate regulation, with respect to other provisions from which we forbear here, we note that it also is within the Commission’s discretion to proceed incrementally, and we find that adopting an incremental approach here—by virtue of the forbearance granted here—guards against any unanticipated and undesired detrimental effects on broadband deployment that could arise. While we find that the tailored regulatory framework we adopt in the Order strikes the right balance, we note that the D.C. Circuit has recognized the Commission’s authority to revisit its decision should that prove not to be the case.

1. Rate Regulation (Sections 201 and 202)

373. Although we conclude, as the Commission did in 2015, that the section 10 criteria are not met with respect to forbearance from section 201 and 202 in full, “because we do not and cannot envision adopting new ex ante rate regulation” or ex post rate regulation of BIAS beyond the scope of our open internet conduct rules in the future, we forbear from applying sections 201 and 202 to BIAS to the extent they would permit such regulation. Contrary to New America’s Open Technology Institute’s claim, our sections 201 and 202 forbearance with respect to rate regulation is consistent with the Commission’s approach in 2015. In forbearing from sections 201 and 202 in this manner, we reiterate that states may have a role to play in promoting broadband affordability. Given the protection of our open internet rules, we do not find ex ante or ex post rate regulation necessary for purposes of section 10(a)(1) and (a)(2), and we find it in the public interest to forbear from applying sections 201 and 202 insofar as they would permit the adoption of such rate regulations for BIAS in the future. We therefore find to be unfounded claims that our refusal to forbear entirely from sections 201 and 202 means that the Commission could introduce rate regulation of BIAS despite our commitment not to do so.

2. Tariffing (Sections 203 and 204)

374. We find the section 10(a) criteria met and forbear from applying section 203 of the Act insofar as it newly applies to BIAS providers by virtue of our classification of BIAS. Section 203 requires Title II common carriers to file a schedule of rates and charges for interstate common carrier services. We forbear from tariffing provisions because we predict that the other protections that remain in place are adequate to guard against unjust and unreasonable, and unjustly and unreasonably discriminatory, rates and practices in accordance with section 10(a)(1) and to protect consumers under section 10(a)(2). We also conclude that those other protections reflect the appropriate calibration of regulation of BIAS at this time, such that forbearance is in the public interest under section 10(a)(3).

375. We find that section 203’s requirements are not necessary to ensure just and reasonable, and not unjustly or unreasonably discriminatory, rates and practices under section 10(a)(1) nor to protect consumers under 10(a)(2). Sections 201 and 202 of the Act, from which we do not forbear, and our open internet rules are designed to preserve and protect internet openness by prohibiting unjust and unreasonable, and unjustly or unreasonably discriminatory, conduct by BIAS providers for or in connection with BIAS, protecting the retail mass market customers of BIAS. In calibrating that legal framework, we considered, among other things, the operation of the marketplace in conjunction with those protections. This regulatory scheme is substantially similar to the one we used in the 2015 Open Internet Order, since there is no evidence that approach did not adequately protect the interests of consumers—including the interest in just, reasonable, and nondiscriminatory conduct—that might otherwise be threatened by the actions of BIAS providers. As such, we make the same finding in the Order. In the event that BIAS providers violate sections 201 or 202 of the Act, the open internet rules, or any other BIAS requirements, they remain subject to complaints and Commission enforcement action.

376. That the Commission has never before imposed tariffing requirements on BIAS as defined here also supports our section 10 analysis. This practical experience informs what issues may arise with forbearance from tariffing requirements in this proceeding and underlies our prediction that the remaining rules and requirements are sufficient to fulfill the requirements under section 10. Additionally, our
forbearance from section 203 is consistent with our broad forbearance from all Title II provisions that could be used to impose \textit{ex ante} or \textit{ex post} rate regulation on BIAS providers, and we therefore make clear that we will not impose any such rate regulation nor any requirement of advanced Commission approval of rates and practices as otherwise would have been imposed under section 203 on BIAS providers.

377. We find that forbearance from tariffing requirements for BIAS satisfies section 10(a)(1) and (a)(2) and is consistent with the public interest under section 10(a)(3) in light of the objectives of section 706. As explained above, section 706 of the 1996 Act “explicitly directs the FCC to ‘utilize[e]’ forbearance to ‘encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans.’” The D.C. Circuit has further held that the Commission “possesses significant, albeit not unfettered, authority and discretion to settle on the best regulatory or deregulatory approach to broadband.” We find that the scope of our adopted forbearance strikes the right balance at this time between, on the one hand, providing the regulatory protections clearly required by the evidence and our analysis to, among other things, guard the virtuous cycle of internet innovation and investment and, on the other hand, avoiding additional regulations that do not appear required at this time and that risk needlessly deterring from BIAS providers’ broadband investments. We clarify that although we forbear from applying to BIAS section 203 and, as noted below, section 204, forbearance from tariffing does not limit the Commission’s existing authority to study rates or competition.

378. We also conclude that the public interest supports forbearing from tariffing requirements for BIAS under section 10(b)’s requirement that we analyze the impact forbearance would have on competitive market conditions. While we consider the section 10(b) criteria in our section 10(a)(3) public interest analysis, our public interest determination rests on other grounds. In particular, under the entirety of our section 10(a)(3) analysis, as discussed above, we conclude that the public interest supports the forbearance adopted in the Order. These same section 10(b) findings likewise apply in the case of our other section 10(a)(3) public interest evaluations with respect to BIAS, and should be understood as incorporated there. Nonetheless, we also believe that our overall regulatory approach, viewed broadly, advances competition in important ways. The record reflects that competition is still limited, and does not provide a strong basis for concluding that the forbearance granted in the Order is likely to directly affect the competitiveness of the marketplace for BIAS. Our granted forbearance continues to be part of an overall regulatory approach designed to promote infrastructure investment in significant part by preserving and promoting innovation and competition at the edge of the network, and we similarly conclude that a grant of forbearance from section 203 indirectly promotes market competition by enabling us to strike the right balance at this time in our overall regulatory approach.

379. We disagree with Public Knowledge that we should not forbear from section 203 for BIAS because tariff filings “provide consumers with the transparency necessary to protect their interests.” The transparency rule and the broadband label requirements are designed to provide consumers with disclosures of BIAS providers’ commercial terms, including rates, as well as a wide array of other information about their services, and Public Knowledge fails to explain why these requirements are insufficient to provide consumers with information they need to protect their interest. We are thus not persuaded to depart from our section 10(a) findings above regarding section 203.

380. We also forbear from applying section 204 of the Act insofar as it newly applies to providers by virtue of our classification of BIAS. Section 204 provides for Commission investigation of a carrier’s rates and practices newly filed with the Commission, and to order refunds, if warranted. Since we forbear from section 203’s tariffing requirements, it is not clear what purpose section 204 would serve, and we thus apply our overarching section 10(a) forbearance analysis above to section 204. We decline Public Knowledge’s suggestion that the Commission retain section 204. We are not persuaded by Public Knowledge’s argument that “[t]here appears to be no a priori reason to assume that the Commission can adequately protect consumers by disclaiming its authority to suspend unjust rates and practices (Section 204).” Public Knowledge fails to explain why our remaining authority and regulations would be insufficient to protect consumers, or how section 204 would effectuate that purpose once we have forbore from applying section 203.

3. Enforcement-Related Provisions (Sections 205 and 212)

381. We forbear from applying certain enforcement-related provisions of Title II to BIAS beyond the core Title II enforcement authority discussed above, and find this forbearance warranted under section 10(a). Section 205 provides for Commission investigation of existing rates and practices and to prescribe rates and practices if it determines that the carrier’s rates or practices do not comply with the Communications Act. The Commission has forborne from enforcing section 205 when it sought to adopt a tailored, limited regulatory environment and, notwithstanding that forbearance, sections 201 and 202 and other complaint processes continued to apply. The Commission previously forbore from enforcing section 205 in the 2015 \textit{Open Internet Order}, finding that the core Title II enforcement authority, along with the ability to pursue claims in court, as discussed below, provide adequate enforcement options and the statutory forbearance test is met for section 205. Since we are adopting a substantially similar regulatory scheme as the 2015 \textit{Open Internet Order} and there is no evidence that those enforcement options were inadequate, we make the same finding in the Order. Consistent with our analysis above, we predict that these provisions are not necessary to ensure just, reasonable, and nondiscriminatory conduct by providers of BIAS or to protect consumers under section 10(a)(1) and (a)(2). In addition, as above, under the tailored regulatory approach we find warranted here, informed by our responsibilities under section 706, we conclude that forbearance is in the public interest under section 10(a)(3). We thus reject claims that we should not forbear from section 205 insofar as it is triggered by our classification of BIAS. Public Knowledge requests that we not forebear from enforcing sections 205, 209, 206, 216–217, and 212 because they provide consumers adequate remedies and the Commission the ability to hold providers accountable. But by Public Knowledge’s own admission applying these provisions is unnecessary, as we “arguably have similar authority under the broad grant of Sections 201 and 202 and its general authority under Section 4(i)” with regard to section 205 and other provisions it requests that we not forebear from enforcement.

382. We also forbear from applying section 212 to the extent that it newly applies by virtue of our classification of BIAS. Section 212 empowers the Commission to monitor interlocking
directorates, i.e., the involvement of directors or officers holding such positions in more than one common carrier. The Commission has granted forbearance from section 212 in the CMRS context on the grounds that forbearance would reduce regulatory burdens without adversely affecting rates in the CMRS market. In so doing, the Commission noted that section 212 was originally placed in the Communications Act to prevent interlocking officers from engaging in anticompetitive practices, such as price fixing, but found protections of sections 201(b) and 221 and antitrust laws were sufficient to protect consumers against the potential harms from interlocking directorates. (The Commission noted that section 221 provided protections against interlocking directorates, but section 221(a) was repealed in the Telecommunications Act of 1996. This section gave the Commission the power to review proposed consolidations and mergers of telephone companies. While section 221(a) allowed the Commission to bolster its analysis to forbear from section 212 in the Second CMRS Report and Order, the protections against interlocking directorates provided by section 201(b) and 15 U.S.C. 19 provide sufficient protection to forbear from section 212 for BIAS.) Forbearance also reduced an unnecessary regulatory cost imposed on carriers. The Commission later extended this forbearance to dominant carriers and carriers not yet found to be non-dominant, repealing part 62 of its rules and granting forbearance from the provisions of section 212. Since we are adopting a substantially similar regulatory scheme as the 2015 Open Internet Order and there is no evidence that other protections are not adequate, we make the same finding in the Order. We predict that other protections will adequately ensure just, reasonable, and nondiscriminatory conduct by BIAS providers and protect consumers here, and thus conclude that the application of section 212 is not necessary for purposes of section 10(a)(1) or 10(a)(2). Moreover, as above, under the tailored regulatory approach we find warranted here, informed by our responsibilities under section 706, we conclude that forbearance is in the public interest under section 10(a)(3). We thus reject Public Knowledge’s claim that we should not forbear from section 212 insofar as it is triggered by our classification of BIAS.

4. Information Collection and Reporting (Sections 211, 213, 215, and 220(a)(2), (b), (f)–(j))

383. Outside the national security and public safety context, which we discuss above, we forbear from applying information collection and reporting provisions of the Act insofar as they would newly apply by virtue of our classification of BIAS as a Title II telecommunications service. These provisions principally are used by the Commission to implement its traditional rate-making authority over common carriers. Since we are not applying tariffing requirements to BIAS nor engaging in ex ante or ex post rate regulation of BIAS, it is not clear what purpose these provisions would serve. The Commission also has undertaken the Broadband Data Collection and adopted broadband labeling requirements since the 2015 Open Internet Order, both of which empower consumers by providing them with greater transparency as to their broadband service and further suggest these information collection requirements are unnecessary. Given both our intention to tailor the regulations applicable to BIAS and our responsibility under section 706 to encourage deployment, we conclude that forbearance of these information collection and reporting provisions is in the public interest under section 10(a)(5) and applying these sections is not necessary within the meaning of section 10(a)(1) and (a)(2).

384. We disagree, in part, with Public Knowledge, which broadly argues that we should not forbear from sections 211, 213, 215, and 220. We also disagree with Public Knowledge that there is “no reason to forbear simply for the sake of forbearing when a waiver will minimize any regulatory burden without depriving the Commission of useful tools for the future.” We again note that while the Commission may waive its rules, it may not generally waive a provision of a statute. Forbearance is the mechanism for not applying statutory provisions when warranted. As discussed earlier, we retain sections 218 and 219, and certain provisions of section 220, which Public Knowledge also asserts should be excluded from forbearance, to ensure that the Commission has the ability to collect information and require reporting if necessary, including for national security and public safety purposes, and to ensure network resiliency. We conclude that excluding sections 218 and 219, and the section 220 provisions from forbearance, as detailed above, ensures that the Commission can collect information necessary to carry out its duties with respect to the public interest. Public Knowledge does not name any uncollected information that would enhance our “ability to make informed policy choices that promote the Congressional goals of ubiquitous, affordable deployment.”

5. Interconnection and Market-Opening Provisions (Sections 251, 252, and 256)

385. We find the section 10 criteria met for forbearance from applying the interconnection and market-opening provisions in sections 251 (other than sections 251(a)(2)), 252, and 256 to the extent that they would newly apply through the classification of BIAS as a Title II service. As a result of the forbearance granted from section 251, section 252 thus is inapplicable, insofar as it is simply a tool for implementing the section 251 obligations. Although we do not forbear from applying section 251(a)(2) with respect to BIAS, we note that the Commission previously has held that the procedure of section 252 is not applicable in matters simply involving section 251(a). To the extent that the Commission nonetheless could be seen as newly applying section 252 with respect to BIAS as a result of our classification decision here, we find the section 10 criteria met for forbearance from that provision for the same reasons discussed below with respect to section 251. Given otherwise-existing authority that we retain under our open internet rules and provisions of the Act from which we do not forbear, we find that there is no current Federal need for those provisions—and, indeed, that they would conflict with the regulatory approach to BIAS that we find most appropriate. Thus, applying those provisions of the Act is not “necessary” under section 10(a)(1) and (a)(2). For those same reasons, we also find that forbearance is in the public interest under section 10(a)(3). We note that the Commission has determined that section 251(c) has been fully implemented throughout the United States, and thus permissibly is within the scope of the Commission’s section 10 forbearance authority.

386. We begin by putting the key market-opening requirements of the sections 251 and 252 framework in their broader legal and regulatory context under current precedent (while saving discussion of the more limited role of section 256 for our targeted analysis of interconnection below). At a high level, section 251 provides a graduated set of interconnection requirements and other obligations designed to foster competition in telecommunications markets, particularly local markets. The
nature and scope of these obligations vary depending on the type of service provider involved.

- Section 251(a) sets forth general duties applicable to all telecommunications carriers, including the section 251(a)(1) duty “to interconnect directly or indirectly with the facilities and equipment of other telecommunications carriers.”
- Section 251(b) sets forth additional duties for local exchange carriers pertaining to resale of services, number portability, dialing parity, access to rights-of-way, and reciprocal compensation—the duty to establish reciprocal compensation arrangements for the transport and termination of telecommunications (i.e., arrangements for exchange of traffic terminating on another carrier’s network).
- Section 251(c) sets forth the most detailed obligations, which apply to ILECs, the group of local telephone companies that, prior to the 1996 Act, generally had been subject to little or no competition. These section 251(c) obligations include: the duty to “negotiate in good faith in accordance with section 252 the particular terms and conditions of agreements” to fulfill the section 251(b) and (c) requirements; additional direct, physical interconnection obligations; requirements to unbundle network elements; the duty to allow resale of telecommunications services at wholesale rates; requirements to provide notice of network changes; and a requirement to allow colocation of equipment.

387. In turn, section 252 directs State commissions to mediate and arbitrate interconnection disputes involving an ILEC, as well as to review interconnection agreements arrived at “by negotiation and arbitration.” The Commission has declined to adopt rules advising the State commissions on how to conduct mediations and arbitrations, and has stated that the states are in a better position to develop mediation and arbitration rules that support the objectives of the 1996 Act. ILECs are required to negotiate the implementation of section 251(b) and (c), precedent demonstrates that State commissions acting under section 252 can resolve interconnection disputes even as to issues where the Commission has not adopted rules. Further, agreements between ILECs and other parties under section 252 can be entered “without regard to the standards set forth in subsections (b) and (c) of section 251 of this title.” And while interconnection agreements are subject to approval, by default that entails approval by a State commission—act the FCC. Further, parties aggrieved by State commission actions under section 252 do not raise those with the FCC—instead, they go in the first instance to Federal district court.

389. Even stated at that high level of abstraction, it is clear that the section 251/252 framework is significantly at odds with the regulatory framework we find warranted for BIAS to implement the “just and reasonable” requirements of sections 201 and 202; to protect consumers; and to advance the public interest. Our bright-line conduct rules implementing sections 201 and 202, Title III of the Act, and section 706 of the 1996 Act, squarely address key issues regarding the carriage of traffic, subject to reasonable network management. We otherwise deliberately elect to take a case-by-case approach in evaluating BIAS-related conduct, including traffic exchange agreements. And although we do not categorically preempt all State or local regulation affecting BIAS, we clearly express our intention to dictate State and local regulations—including regulations more onerous than the regulatory framework we adopt.

390. Trying to square our chosen regulatory approach to BIAS with the section 251/252 framework is problematic, to say the least. As described above, the section 251/252 framework presupposes heavy State involvement in its implementation, providing for states to resolve previously unaddressed legal and policy questions under the Federal framework while also leaving states to impose State law requirements. Sections 251 and 252 also render all such decisions subject to State commission interpretation and enforcement in the first instance, with any direct review coming not from the FCC but from Federal courts. Given our conscious choice to leave significant issues to case-by-case evaluation, if the section 251/252 framework applied we would risk forgoing the ability to be the first one to pass on previously unresolved issues, instead yielding those decisions to State commissions. Although we could seek to constrain states by adopting ex ante rules in this regard specifically implementing section 251, that would force us down a course we have expressly disavowed as unwarranted under the general conduct rule and oversight of traffic exchange agreements, where we find case-by-case review most appropriate. Even then, section 251(d)(3) specifies that, in prescribing and enforcing regulations to implement the requirements of the section, the Commission shall not preclude the enforcement of any regulation, order, or policy of a State commission that: (a) establishes access and interconnection obligations of local exchange carriers; (b) is consistent with the requirements of the section; and (c) does not substantially prevent implementation of the requirements of the section and the purposes of the part. What is more, tying our rules to the section 251/252 framework opens the door for them to be disregarded entirely through intercarrier agreements entered into “without regard to the standards set forth in subsections (b) and (c) of section 251.” In sum, rather than a primarily Federal policy framework administered in the first instance by the Commission—and our choice of the best mix of bright-line rules and case-by-case review—applying the section 251/252 framework risks forcing us into a choice between preserving case-by-case review in many scenarios, but leaving unresolved policy questions to be first addressed by states in many cases, or else forgoing case-by-case review even where we think it is warranted in favor of ex ante rules that might have the perverse consequence of opening the door for providers to disregard them.

391. That backdrop is a key overlay to all of our forbearance analyses in this regard. Insofar as applying the section 251/252 framework would undermine the regulatory approach we have identified as the best way to ensure just and reasonable rates and practices under sections 201 and 202 of the Act, and the best way to protect consumers, that is highly relevant to our evaluation of whether there is a current Federal need for the section 251/252 framework in the BIAS context under the section 10(a)(1) and (a)(2) forbearance criteria. Those considerations also carry significant weight in our public interest evaluation under section 10(a)(3). Although Congress directed the Commission, in section 706 of the 1996 Act, to encourage the deployment of advanced telecommunications capability through rules and other things, “measures that promote competition in the local telecommunications market”—
and we concede that the section 251/252 framework is one such example—we nonetheless conclude that our approach correctly reflects the overall legal framework Congress established in the 1996 Act. Congress recognized that our preexisting section 201 authority could enable us, in the case of interstate and international services, to do many of the same things addressed for intrastate services as well under section 251, and thus expressly preserved that authority against any inference of an implicit repeal or narrowing through its enactment of section 251. Likewise, the Commission previously has sought to balance the advancement of competition policy with the duty to encourage advanced services deployment pursuant to section 706, which we conclude is advanced by our tailored regulatory approach here. Our overall analysis of the record on investment incentives—including evidence and arguments regarding more extensive or less extensive regulation than the tailored approach adopted here—is discussed in greater detail above.

a. Interconnection and Traffic Exchange

392. Arguments in the record that identify concrete scenarios where sections 251(a)(1), 251(b)–(c), 252, and 256 could be relevant only involve the related issues of interconnection and traffic exchange. We clarify that for purposes of this section we use the term “interconnection” solely in the manner it is used and defined for purposes of these provisions. Most significantly, WTA argues that the section 251/252 framework could help resolve problems rural carriers experience when dealing with “large internet backbone and middle mile transport providers” due to “disadvantages and discrepancies in negotiation power and resources”—including “refusals to upgrade the capacity and quality of middle mile facilities, take-it-or-leave it offers rather than bona fide negotiations of IP interconnection and traffic exchange terms and conditions, and demands that broadband traffic be accepted at and delivered to large carrier facilities in distant cities at the WTA member’s expense.” Although those are important concerns, we are not persuaded that applying the section 251/252 framework—or section 256—would be an appropriate course of action. As with our forbearance analysis more generally, we can proceed by assuming that certain requirements apply and evaluate the section 10 criteria on that basis. And because we forbear from the relevant requirements and do not resolve whether BIAS could constitute “telephone exchange service” or “exchange access,” nor whether any particular non-BIAS provider seeking to interconnect and exchange traffic with a BIAS provider is a carrier. To the extent that WTA goes beyond BIAS and argues that the section 251/252 framework should apply to “any other IP broadband services” or “other IP interconnection,” it does not explain what it means in a way that would undercut—or even demonstrate the relevance of—those other scenarios to the forbearance at issue here. We thus do not depart from the forbearance analysis above on the basis of such undeveloped references.

393. Sections 251(a)(1) and 256. Section 251(a)(1) requires all carriers to interconnect with other carriers directly or indirectly. However, the identified concerns do not demonstrate a refusal to interconnect (even indirectly). Rather, they reflect dissatisfaction with the claimed inconvenience and expense. Thus, section 251(a)(1) does not appear even potentially to be a solution to these concerns.

394. Likewise, section 256 does not appear any more relevant of a solution, even in theory. Section 251(a)(2)—which we do not forbear from applying, as explained above—prohibits carriers from “install[ing] network features, functions, or capabilities that do not comply with the guidelines and standards established” pursuant to two other provisions of the Act. The first of those provisions is section 255 of the Act, which is designed to make networks more usable by individuals with disabilities—and which is the premise of our decision not to forbear from applying section 251(a)(2). The second of those provisions is section 256, which, without granting the Commission any new authority, provides for the Commission to encourage coordinated network planning and network interconnectivity, including through participating in industry standards-setting. But again, the types of industry standards or network planning contemplated by section 256 do not appear to address the concerns raised by rural carriers about the cost and inconvenience of interconnection.

395. Consequently, because these concretely identified concerns about interconnection would not be addressed by sections 251(a)(1) and 256 in any case, we see no current Federal need to apply those provisions of the Act insofar as they would be newly triggered by our classification of BIAS. Indeed, the Commission retains authority under section 251(c)(2) and the open internet rules, to address interconnection issues should they arise, including through evaluating whether BIAS providers’ conduct is just and reasonable on a case-by-case basis. These remaining legal protections that apply with respect to BIAS providers will enable us to act if needed to ensure that a provider does not unreasonably refuse to provide service or interconnect. Thus, we do not find it “necessary” to apply section 251(a)(1) or section 256 to ensure just and reasonable rates and practices under section 10(a)(1) or to protect consumers under section 10(a)(2). For those same reasons, we find forbearance in the public interest under section 10(a)(3), consistent with our decision to proceed incrementally and make clear the limited extent of our departure from the preexisting regulatory status quo.

396. Sections 251(c)(2) and 252. We next turn to the interconnection requirements of section 251(c)(2). That provision requires ILECs to provide interconnection “at any technically feasible point within the carrier’s network . . . on rates, terms, and conditions that are just, reasonable, and nondiscriminatory.” Because it is a provision implemented under the combined section 251/252 framework, it squarely implicates the full array of concerns discussed above about the conflict between that framework and the regulatory approach to BIAS that we conclude is most appropriate.

397. WTA’s arguments do not persuade us that forbearance is unwarranted. For one, it does not appear that WTA’s concerns about rural carriers’ need to carry traffic “to large carrier facilities in distant cities at the WTA member’s expense” meaningfully would be remedied by the application of section 251(c)(2), which still requires the carrier invoking section 251(c)(2) to get its traffic to a “point within the [ILEC’s] network.” Although WTA’s concerns about “refusals to upgrade the capacity and quality of middle mile facilities” and “take-it-or-leave it offers rather than bona fide negotiations of IP interconnection . . . terms and conditions” theoretically could be addressed under section 251(c)(2) where that provision applies, the practical scope of that provision appears quite limited as relevant here. Even assuming arguendo that the internet backbone providers and middle mile providers of concern to WTA would be telecommunications carriers (or else they would not be subject to the section 251/252 framework in the first place), the universe of ILECs providing such service—the only providers actually subject to section 251(c)—is far more limited. And even then, section 251(c) does not apply to many rural carriers by
virtue of section 251(f). Section 251(f)(1) of the Act establishes a default exemption from all of section 251(c) for a "rural telephone company" absent a request from a carrier invoking section 251(c) and an affirmative determination by a State commission "that such request is not unduly economically burdensome, is technically feasible, and is consistent with section 254 of this title (other than subsections (b)(7) and (c)(1)(D) thereof)." Further, under section 251(f)(2), "[a] local exchange carrier with fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide may petition a State commission for a suspension or modification of the application of a requirement or requirements of subsection (b) or (c)" of section 251.

398. But once we assume arguendo that the internet backbone providers and middle mile providers of concern to WTA would be telecommunications carriers, that scenario is one that the Commission can address far more comprehensively through sections 201 and 202 on a case-by-case basis. And it will be the FCC—rather than State commissions—addressing previously unresolved policy issues and generating a more uniform Federal regulatory framework for BIAS. We otherwise have determined that an FCC-led case-by-case evaluation is the best approach to internet traffic exchange arrangements consistent with our obligation to ensure just and reasonable rates and practices under sections 201 and 202 of the Act. Because we conclude that the section 251(c)(2)/252 framework would interfere with that approach, and because we find that our regulatory approach will enable us to more comprehensively and consistently address any issues that arise in this regard, while appropriately balancing BIAS providers' investment incentives, we conclude that applying those provisions is not "necessary" under section 10(a)(1) and (a)(2), and that forbearance is in the public interest under section 10(a)(3).

399. Sections 251(b)(5) and 252. The final concrete issue raised by WTA—its concern about "take-it-or-leave it offers rather than bona fide negotiations of IP . . . traffic exchange terms and conditions"—requires a clarification about terminology. When the Commission referred to "Internet traffic exchange arrangements" in the 2015 Open Internet Order and again here, it contemplated arrangements or agreements potentially dealing with both the physical linking of networks and the associated exchange of traffic. Section 251 reflects a different approach. Subsections (a)(1) and (c)(2) address the linking of networks, while subsection (b)(5) addresses compensation arrangements for traffic exchange. Thus, when considering concerns associated with traffic exchange under section 251, we must focus on subsection (b)(5).

400. Section 251(b)(5) requires LECs "to establish reciprocal compensation arrangements for the transport and termination of telecommunications." In the Commission's implementation of this provision (in conjunction with other statutory provisions) outside the BIAS context, it has established an extensive series of rules addressing traffic exchange arrangements between local carriers and other carriers, that generally has moved in the direction of "bill-and-keep" arrangements rather than per-minute (or other) intercarrier compensation payments. Under bill-and-keep arrangements, a carrier generally looks to its end users—which are the entities and individuals making the choice to subscribe to that network—rather than to other carriers and their customers to pay for the costs of its network. The changes to the preexisting intercarrier rate regulations were paired with universal service support when appropriate to account for lost revenues, and with a State role in defining the specific point in the network where each carrier is responsible for its own costs in delivering the network (called the "network edge").

401. Because section 251(b)(5)—like section 251(c)(2)—is a provision implemented under the combined section 251/252 framework, it squarely implicates the full array of concerns discussed above about the conflict between that framework and the regulatory approach to BIAS that we conclude is most appropriate. Against that backdrop, the record on this issue likewise does not persuade us that forbearance is unwarranted.

402. As a threshold matter, we are not persuaded to simply apply our existing rules implementing section 251(b)(5) in the case of BIAS traffic. Those rules reflect a carefully calibrated regulatory regime designed to account for historical reliance interests as well as the interests of universal service contributors being asked to bear costs associated with revenue replacement mechanisms. They were not adopted with the expectation that they would apply to BIAS traffic, and abruptly doing so could seriously unsettle that careful balance.

403. Although there is debate in the record about whether and when bill-and-keep could be appropriate in this context irrespective of those intercarrier compensation rules, our past experience counsels for a cautious approach. As noted above, before adopting a shift to bill-and-keep for traffic historically subject to intercarrier compensation, the Commission evaluated a comprehensive record on the merits of such an approach, the associated reliance interests that could be affected, and how to employ universal service support in response to any legitimate reliance interests or need for revenues beyond what could be recovered from end users. Absent a carefully calibrated regulatory approach founded on such a record, an industry-wide shift to mandatory bill-and-keep for BIAS traffic risks disruptive consequences for end-user BIAS rates, overall industry recovery, and provider viability.

404. Thus, we find that either applying our existing intercarrier compensation framework implementing section 251(b)(5) (along with sections 201(b) and 254, among other provisions) or adopting bill-and-keep here as the industry approach to traffic exchange arrangements for BIAS traffic under section 251(b)(5) itself risks undermining just and reasonable rates and practices and harming consumers. Thus, applying such requirements naturally is not necessary to ensure just and reasonable rates and practices under section 10(a)(1) or for the protection of consumers under section 10(a)(2). And for those same reasons, we find forbearance to be in the public interest under section 10(a)(3).

405. The remaining near-term issue is the choice between relying on case-by-case assessments under the regulatory framework for BIAS we already have identified as most appropriate, or instead on attempting case-by-case assessments under the section 251(b)(5)/252 framework. As discussed above, there are inherent incompatibilities between the Federal case-by-case review we contemplate and any approach that relies on the heavily state-commission-dependent section 251/252 framework. Thus, we do not see it as realistically viable to maintain both approaches simultaneously in disparate forums with the likelihood of divergent policy decisions from different decisionmakers. And the record does not reveal benefits from the section 251(b)(5)/252 framework that would offset the harms to what we have identified as the best way to ensure just and reasonable rates and practices, to protect consumers, and to advance the public interest.

406. As an alternative to case-by-case evaluation of traffic exchange issues, we find the section 251(b)(5)/252 framework inferior. For one, as
contemplated by our regulatory approach based principally on sections 201 and 202 of the Act, oversight of internet traffic exchange arrangements can encompass both interconnection and traffic exchange issues. But section 251(b)(5) is limited narrowly to traffic exchange, and at best could be paired with the broadly applicable interconnection requirement of section 251(a)(1) that imposes limited substantive duties unlikely to address the concerns raised in the record and/or the (theoretically) somewhat helpful substantive requirement of section 251(c)(2) that appears likely to apply to at most a very narrow subset of the providers of concern. Further, the notion of a truly case-by-case approach under section 251(b)(5) is at least somewhat illusory. Given the wording of section 251(b)(5), an “originating carrier is barred from charging another carrier for delivery of traffic that falls within the scope of section 251(b)(5).” Thus, section 251(b)(5) itself constrains the possible outcomes of traffic exchange arrangements as compared to the greater flexibility we find in our approach grounded in sections 201 and 202.

407. For all those reasons, we conclude that application of the section 251(b)(5)/252 framework is not necessary under section 10(a)(1) and (a)(2). For those same reasons, we also conclude that forbearance is in the public interest under section 10(a)(3).

b. Generalized Arguments About Competition

408. We also do not depart from our forbearance analysis above—or the forbearance from sections 251 other than subsection (a)(2), 252, and 256 in the 2015 Open Internet Order—based on generalized arguments about the need for, or benefits of, competition. To be clear, we forbear from applying all of section 251 other than subsection (a)(2) insofar as it would newly apply to BIAS or a BIAS provider by virtue of our classification of BIAS as a telecommunications service. Public Knowledge asserts that “[a] wide variety of provisions of the Commission proposes to forbear from enforcing are essential to promoting competition,” but does not identify specifically what provisions it has in mind. Against the backdrop of the 2015 Open Internet Order having identified sections 251, 252, and 256 as involving interconnection and market-opening provisions, we consider Public Knowledge’s arguments in that context here. To the extent that Public Knowledge had other provisions in mind, its high-level arguments about competition divorced from any reference to specific provisions or requirements does not persuade us to depart from the forbearance approach adopted in the 2015 Open Internet Order. Competition is important, and the regulatory framework for BIAS that we adopt here will contribute to increased competition for BIAS itself as well as for the broader internet marketplace. At the same time, it is not the Commission’s purpose to protect specific competitors—or even competition merely for its own sake—but ultimately to seek the benefit of end users. Thus, generalized arguments about competition do not persuade us to depart from the forbearance analysis above, the forbearance analysis in the 2015 Open Internet Order, or the forbearance from sections 251 (other than subsection (a)(2)), 252, and 256 granted there.

6. Subscriber Changes (Section 258)

409. We forbear from applying section 258 insofar as it would newly apply by virtue of our classification of BIAS as a Title II telecommunications service. Section 258 and the Commission’s implementing rules provide important protections to voice service customers against unauthorized carrier changes. As was the case when the Commission adopted the 2015 Open Internet Order, the record does not indicate whether or how unauthorized changes involving BIAS providers could occur. Consequently, it remains unclear what purpose applying this provision would serve, especially given the consumer protections afforded by the core BIAS requirements. As under our analyses of other Title II provisions from which we forbear, we conclude that application of section 258 is not necessary for purposes of section 10(a)(1) and (a)(2) and that forbearance is in the public interest under section 10(a)(3). We disagree with Public Knowledge that we should not forbear from section 258. While we do not disagree that section 258 can provide consumers protections for voice services, Public Knowledge fails to articulate how an unauthorized carrier change could occur in the context of BIAS.

7. Other Title II Provisions

410. Beyond the provisions already addressed above, we also forbear from applying additional Title II provisions that could give rise to new requirements by virtue of our classification of BIAS to the extent our section 10 authority allows. We find it notable that no commenter raises significant concerns about forbearing from these requirements, which reinforces our analysis below.

411. We conclude that the three-part statutory test under section 10(a) is met to forbear from applying certain provisions concerning BOCs in sections 271–276 of the Act to the extent that they would impose new requirements arising from classifying BIAS as a Title II telecommunications service, as the Commission did in the 2015 Open Internet Order. Sections 271, 272, 274, and 275 establish requirements and safeguards regarding the provision of interLATA services, electronic publishing, and alarm monitoring services by the BOCs and their affiliates. The Commission has determined that section 271 has been fully implemented throughout the United States. Therefore, the prohibition in section 10(d) of the Act against forbearing from section 271 prior to such a determination is not applicable. Section 273 addresses the manufacturing, provision, and procurement of telecommunications equipment and customer premises equipment (CPE) by the BOCs and their affiliates, the establishment and implementation of technical standards for telecommunications equipment and CPE, and joint network planning and design, among other matters. Section 276 addresses the provision of “payphone service,” and in particular establishes nondiscrimination standards applicable to BOCs’ provision of payphone service.

412. We again conclude that the application of any newly triggered provisions of sections 271 through 276 to BIAS is not necessary within the meaning of section 10(a)(1) or (a)(2), and that forbearance from these requirements is consistent with the public interest under section 10(a)(3), with one exception regarding section 276 that we discuss below. Many of the provisions in these sections are not currently in effect at all. Others impose continuing obligations that are, at most, tangentially related to the provision of BIAS. Forbearance from any application of these provisions with respect to BIAS insofar as they are newly triggered by our classification of that service will not meaningfully affect the charges, practices, classifications, or regulations for or in connection with that service, consumer protection, or the public interest. The Alarm Industry Communications Committee (AICC) argues that we should not forbear from section 275 because it “would actively strip the alarm industry of existing protections.” AICC asserts that forbearing from forbearance of section 275 would be consistent with the 2015 Open Internet Order because “that
Order held that forbearance from section 275 was only appropriate where it would impose new requirements arising from the reclassification of BIAS as a Title II service.” We note that the 2015 Open Internet Order specifically said that it forbears from section 275, inter alia, “to the extent that [it] would impose new requirements arising from the classification of broadband internet access service in this Order.” We take the same approach in the Order, and therefore find that the Order does not strip the alarm industry of any protections that may have existed prior to our reclassification of BIAS. Consistent with our general approach to forbearance here, which seeks to address new requirements that could be triggered by our classification of BIAS, we do not forbear with respect to provisions to the extent that they already applied prior to the Order. For example, section 271(c) establishes substantive standards that a BOC was required to meet to obtain authorization to provide interLATA services in an in-region state, which it must continue to meet to retain that authorization. In addition, section 271(c)(2)(B)(iii), which requires that a BOC provide nondiscriminatory access to poles, ducts, conduits, and rights-of-way in accordance with the requirements of section 224 of the Act, does not depend upon the classification of BOCs’ BIAS. In combination with section 271(d)(6), this provision provides the Commission with an additional mechanism to enforce section 224 against the BOCs. We also do not forbear from section 271(d)(6) to the extent that it provides for enforcement of the provisions we do not forbear from here. In addition, while the BOC-specific provisions of section 276 theoretically could be newly implicated insofar as the reclassification of BIAS might result in some entities newly being treated as a BOC, the bulk of section 276 appears independent of the classification of BIAS and we thus do not forbear as to those provisions.

413. We generally forbear from applying sections 221 and 259 of the Act, consistent with our forbearance throughout the Order. First, as described elsewhere, we forbear from all ex ante and ex post rate regulation, tariffing, and related recordkeeping and reporting requirements insofar as they would arise from our classification of BIAS. Second, we likewise forbear from unbundling and network access requirements that would newly apply based on the classification decision in the Order. We predict that other, nondiscretionary conduct by providers of BIAS and to protect consumers for purposes of section 10(a)(1) and (a)(2). Further, informed by our responsibilities under section 706, we adopt a regulatory approach that we find strikes the appropriate public interest balance under section 10(a)(3). For these reasons, we also forbear from section 221’s property records classification and valuation provisions, which would be used in the sort of rate regulation that we do not find warranted for BIAS. Likewise, just as we forbear from broader unbundling obligations, that same analysis persuades us to forbear from applying section 259’s infrastructure-sharing and notification requirements.

414. We also again grant forbearance from other miscellaneous provisions to the extent that they would newly apply as a result of our classification insofar as they do not appear necessary or even relevant for BIAS. Section 226 protects consumers making interstate operator services calls from pay telephones and other public telephones from unreasonably high rates and anti-competitive practices. Section 227(c)(3) imposes on carriers certain notification obligations related to the Telephone Consumer Protection Act (TCPA), and section 227(e) restricts the provision of inaccurate caller identification information associated with any telecommunications service. Because we are forbearing from these substantive requirements, we note that, as a consequence, there will not be a private right of action granted under section 227(c)(5) based on alleged violations of those forbear-from requirements in the context of BIAS. We note that while the universe of “calls” covered by section 227(b)(1)(A)(iii) is prerecorded or autodialed calls to “a paging service, cellular telephone service, specialized mobile radio service, or other radio common carrier service, or any service for which the called party is charged for the call” even with the reclassification of mobile BIAS we do not interpret there to be any new or expanded restrictions arising from that provision because the relevant calls also would need to be specifically to a “telephone number” assigned to the relevant service. As a result, there also would not be any private right of action under section 227(b)(3) that is newly triggered by the decisions in the Order. Section 228 regulates the offering of pay-per-call services and requires carriers, inter alia, to maintain lists of information providers to whom they assign a telephone number, to provide a short description of the services the information providers offer, and to provide a statement of the cost per minute or the total cost for each service. Section 260 regulates LEC practices with respect to the provision of telemessaging services. It remains unclear how these provisions would be relevant to BIAS, and commenters do not explain how or argue that they would. Since the core BIAS requirements would also still be available to the Commission, we find that enforcing these provisions, to the extent they would newly apply by virtue of our classification of BIAS, is not necessary to ensure that the charges, practices, classifications, or regulations by, for, or in connection with BIAS providers are just and reasonable and are not unjustly or unreasonably discriminatory under section 10(a)(1). Enforcement also is not necessary for the protection of consumers under section 10(a)(2), and forbearance from applying these provisions is consistent with the public interest under section 10(a)(3), particularly given our conclusion, informed by section 706, that it is appropriate to adopt a tailored approach here.

415. We clarify that we will not forbear from applying section 276 to the extent it applies to incarcerated people’s communications services (IPCS) or the Commission’s IPCS rules. Though the IPCS rules themselves do not appear to vary depending on whether BIAS is an “information service” or “telecommunications service,” the Commission previously made this clarification in the 2015 Open Internet Order to respond to a concern that forbearance “could be misconstrued as a limitation on the Commission’s authority with respect to any advanced ICS services (such as video visitation) that may replace or supplement traditional ICS telephone calls.” Congress amended section 276 of the Act in January 2023 to expand the Commission’s authority over IPCS under that provision, but the ultimate scope and bounds of that expanded authority is the subject of a pending rulemaking proceeding. Consistent with our conclusion below that it would be contrary to the public interest to forbear from applying section 276 to the extent it applies to IPCS or the Commission’s IPCS rules, given open questions about the scope of the Commission’s expanded authority under section 276, we find it prudent at this time—and consistent with the public interest—to retain our full section 201(b) authority specifically in the context of IPCS, as well. Though no commenter raises similar concerns in this proceeding, we make the same clarification, consistent
with the Commission’s ongoing efforts to grant relief from exorbitantly high rates for calls between incarcerated people and their loved ones, particularly in light of Congress recently recognizing the increased role that advanced communications plays in these communications. This also is consistent with the Commission not forbearing from section 225, as the Commission has acted to improve communications access for incarcerated people with disabilities. Therefore we find that forbearance would fail to meet the statutory test of section 10 of the Act, in that the protections of section 276 remain necessary to protect consumers and serve the public interest.

8. Truth-in-Billing Rules

416. We again forbear from applying our truth-in-billing rules insofar as they are triggered by our classification of BIAS here. As with our section 10 analysis above, we conclude that our truth-in-billing rules are not needed for the purposes of section 10(a)(1) and (2) and that forbearance is in the public interest under section 10(a)[3]. No commenter discusses whether we should or should not forbear from our truth-in-billing rules, and we have no reason to believe that “our core BIAS requirements, including the requirement of just and reasonable conduct under section 201(b), will not provide important protections in this context even without specific rules.”

9. Roaming-Related Provisions and Regulation

417. We adopt our proposal to grant the same conditional forbearance from common carrier roaming regulations as in the 2015 Open Internet Order and find that doing so meets the section 10(a) analysis. As there is no record discussion regarding our forbearance from applying the Commission’s roaming rules, we have no reason to believe that we should depart from the forbearance in the 2015 Open Internet Order or that it would fail to meet the section 10(a) analysis. The Commission has established two different regimes to govern the roaming obligations of commercial mobile providers. One requires certain CMRS providers, “on reasonable request, to provide automatic roaming on reasonable and not unreasonably discriminatory terms and conditions.” The second requires providers of commercial mobile data services, as defined and including mobile BIAS, to “offer roaming arrangements to other such providers on commercially reasonable terms and conditions, subject to certain specified limits.” As the Commission previously determined in the 2015 Open Internet Order, it remains the case that reclassifying mobile BIAS as CMRS potentially affects the roaming obligations of mobile BIAS providers in two ways. First, absent any action by the Commission to preserve data roaming obligations, the determination that mobile BIAS is an interconnected service would result in providers of mobile BIAS no longer being subject to the data roaming rule, which applies only to non-interconnected services. Second, the determination that mobile BIAS is CMRS potentially subjects mobile BIAS providers to the terms of the CMRS roaming rules.

418. We again forbear from the application of the CMRS roaming rule, § 20.12(d) of the Commission’s rules, to mobile BIAS, conditioned on such providers continuing to be subject to the obligations, process, and remedies under the data roaming rule codified in § 20.12(e). Retaining the roaming obligations for mobile BIAS that applied prior to reclassification remains consistent with our tailored approach, and we are again persuaded that the Commission rules in § 20.12(e) and our remaining core BIAS requirements render the forborne-from rules unnecessary. We thus find that applying the forborne-from rules is not necessary for purposes of section 10(a)(1) and (a)(2) and that the conditional forbearance is in the public interest under section 10(a)[3].

10. Terminal Equipment Rules

419. We also again forbear from applying certain terminal equipment rules to the extent that they would newly apply by virtue of the classification of BIAS. Similar to the rules adopted in the 2015 Open Internet Order, the open internet rules we adopt in the Order will prevent BIAS providers from restricting the use of non-harmful devices subject to reasonable network management. The record does not discuss whether we should forbear from our terminal equipment rules. We thus find that applying the Commission’s terminal equipment rules, insofar as they would newly apply to BIAS providers by virtue of our classification decision here, are necessary for purposes of section 10(a)(1) and (a)(2), particularly given the availability of the core BIAS requirements, and in particular our bright-line rules. Likewise, as above, under the tailored regulatory approach we find warranted here, informed by our transparent rule § 706, we conclude that forbearance is in the public interest under section 10(a)[3].

D. Other Regulations and Non-Title II Provisions

1. Maintaining Authority Under Certain Title III Provisions
   a. Wireless Licensing

420. We clarify that we do not forbear from applying—or waive—our rules governing the wireless licensing process and authorities and clarify that our adopted forbearance does not encompass Title III licensing, except to the extent specifically noted below. Among other benefits, we find that maintaining these provisions will support our national security goals, as they will allow us to continue to review wireless license applications under our normal processes, including to determine whether they are in the public interest—which includes consideration of national security. As we observed in the 2023 Open Internet NPRM, our Title III licensing authority with respect to facilities-based mobile BIAS providers independently “grant[s] us important authority that can be used to advance national security and public safety with respect to the services and equipment subject to licensing.” In determining whether to grant an original application for a license or permit or an application for renewal of a license under Title III (47 U.S.C. 309(a)), approve the assignment or transfer of control of a Title III license or permit (47 U.S.C. 310(d)), or revoke a Title III license or permit (47 U.S.C. 312(a)(2)), the Commission considers whether the applicant has the requisite citizenship, character, and other necessary qualifications. The Commission also must “determine whether the public interest, convenience, and necessity will be served” by granting the application or revoking the license or permit. Among the factors the Commission may consider are national security, law enforcement, public safety, or other risks. Therefore, given the Commission’s public interest obligations in licensing decisions, and based on the key public interest considerations that inform our action in the Order, we retain the right to review fully original applications and applications for assignment or transfer of control of Title III licenses and permits, and we reserve the right to conduct ad hoc review of whether a licensee’s retention of a Title III license presents national security, law enforcement, public safety, or other risks that warrant revocation of such authority. We discuss how our review under Title III requirements intersects with our determinations regarding foreign ownership requirements below. The record does not address whether we...
should adopt the same forbearance for Title III wireless licensing as the Commission did in its 2015 Open Internet Order, so we have no basis for adopting different findings here. We do mean, however, to apply current Title III wireless licensing requirements (i.e., ones that are new or revised since the 2015 Open Internet Order). Adopting this approach also has the added benefit of being consistent with the Commission adopting largely the same broad forbearance as the 2015 Open Internet Order. Consequently, as the Commission found in the 2015 Open Internet Order, we find that forbearing from the Commission’s flexible use rules would be against the public interest under section 10(a)(3) because it would lead to inaccurate license information. Accordingly, we do not forbear from applying—or waive—the wireless licensing requirements under Title III and the Commission’s rules, except to the extent specified below.

b. Foreign Ownership of Common Carrier Wireless Licensees (Section 310(a) and (b))

421. With limited exceptions, we do not forbid from section 310(a) and (b) of the Act, which requires the Commission to review foreign investment in radio station licenses and impose specific limitations on who may hold certain types of radio station licenses. As discussed below, we find that forbearance from section 310(a) and (b), except to the extent the Commission previously determined to forbear from section 310(b)(3) for wireless common carriers, would neither serve the public interest under section 10(a)(3) nor satisfy the requirements of section 10(a)(2) as it pertains to the protection of consumers. As noted below, the Commission previously determined that forbearance from the application of section 310(b)(3) to wireless common carriers, which now includes wireless BIAS providers, was in the public interest with respect to a discrete type of foreign ownership. We anticipate a future proceeding will, among other things, develop a fuller record on the application of the Commission’s rules implementing section 310(b)(3) and (b)(4) in the context of BIAS.

422. By the Order, we find that foreign ownership in excess of the statutory benchmarks in common carrier wireless licenses that are providing only BIAS is in the public interest under section 310(b)(3) when such foreign ownership is held in the licensee through a U.S. entity that does not control the common carrier licensee in which the foreign investment is held in the licensee through a U.S.-organized entity that does not control the licensee, to the extent the Commission determines such foreign ownership is consistent with the public interest under the policies and procedures that apply to the Commission’s public interest review of foreign ownership subject to section 310(b)(4) of the Act. The Commission’s forbearance authority does not extend to broadcasting or aeronautical radio station licenses covered by section 310(b)(3). The forbearance approach that the Commission adopted in the 2012 Foreign Ownership First Report and Order applies only to foreign ownership in common carrier licensees held through intervening U.S.-organized entities that do not control the licensee. The Commission codified this forbearance approach in the 2013 Foreign Ownership Second Report and Order, which adopted rules to treat foreign investment under section 310(b)(4) and the forbearance approach of section 310(b)(3) consistently.

424. Foreign Ownership Is Not in the Public Interest With Limited Exceptions. We do not forbid from section 310(a) and (b) of the Act except to (1) extend our existing section 310(b)(3) forbearance policy to require the filing of a petition for declaratory ruling or similar request where and to the extent the Commission has already found the foreign ownership at issue to be in the public interest and (2) provide a reasonable period for other BIAS providers newly subject to section 310(b)(3) to reduce their foreign ownership interests below the statutory limit or restructure their holdings to include an intervening, non-controlling U.S. interest holder. Our determination that this limited forbearance is in the public interest rests on the same reasoning as our determination below that waiver of the associated rules is in the public interest. The Commission concluded in 2012 that application of the statutory threshold is not necessary to ensure that rates are just and reasonable and not unjustly or unreasonably discriminatory, and we determine below that consumers will benefit from our decision not to require BIAS-only providers to file petitions for declaratory ruling under the circumstances described here. Except to this limited extent, we find that forbearance from section 310(a) and (b) would neither serve the public interest under section 10(a)(3) nor satisfy the requirements of section 10(a)(2) as it pertains to the protection of consumers. Congress created the Commission,
among other reasons, “for the purpose of the national defense [and] for the purpose of promoting safety of life and property through the use of wire and radio communication.” We find that our decision not to forbear ensures the Commission can continue to advance the public interest, and furthers two core purposes—national security and the promotion of safety of life and property—for which Congress created the Commission. In the 2023 Open Internet NPRM, we sought comment “on any other provisions of the Act or Commission rules that likewise should be expressly excluded from the scope of forbearance based on national security and/or public safety considerations, including, for example, sections 305, 310, and 332 of the Act.” In evaluating a petition for declaratory ruling seeking a determination that it is in the public interest to exceed the statutory foreign ownership benchmarks, the Commission’s public interest analysis under section 310(b)(3) and (b)(4) considers, among other things, any national security, law enforcement, foreign policy, and trade policy concerns raised by the proposed foreign investment. The Commission has also identified public safety and security of critical infrastructure as relevant to the Commission’s review of foreign investment under section 310(b)(4). We find that our decision not to forbear further from section 310(a) and (b) is consistent with the Commission’s statutory responsibilities under section 10(a) and is warranted based on the key public interest considerations that inform our action in the Order and to enable the Commission to address national security, public safety, and other public interest concerns with respect to BIAS.

425. Public Interest Finding and Waiver of Rules. Notwithstanding the determination about public interest considerations supporting our decisions regarding section 310(b)’s application to BIAS, we reserve the right, as part of our review under Title III licensing provisions, to override that determination with respect to specific applications. Under the existing section 310(b)(3) forbearance policy, and under the Commission’s rules applicable to section 310(b)(4), wireless common carriers must file a petition for declaratory ruling before they may exceed the statutory foreign ownership thresholds. The Commission applies the same rules to both types of petitions for declaratory ruling. Sections 1.5000 through 1.5004 of the Commission’s rules implement section 310(b)(3)—with regard to the class of common carrier radio station licensees subject to the forbearance approach adopted in the 2012 Foreign Ownership First Report and Order that seek Commission approval to exceed the 20% foreign ownership limit in section 310(b)(3)—and section 310(b)(4) of the Act. We recognize that application of these rules may raise operational issues in the context of BIAS. WISPA, for example, addresses the potential impact on common carrier wireless licensees that would be subject to section 310(b) pursuant to our reclassification of BIAS under Title II. The Commission anticipates releasing a further notice of proposed rulemaking to address this and other comments. By the Order, and pending the outcome of a further notice of proposed rulemaking, we find that foreign ownership interests that exceed the statutory benchmarks in common carrier wireless licensees that are providing only BIAS are in the public interest under section 310(b)(3)—when such foreign ownership is held in the licensee through a U.S. entity that does not control the licensee—and under section 310(b)(4). The waiver that we adopt in the Order shall not apply to any common carrier wireless licensee providing only BIAS that does not fall within this class, including foreign ownership held directly in a common carrier wireless licensee under section 310(b)(3). Foreign ownership held directly in common carrier licensees under section 310(b)(3) is not subject to the forbearance approach adopted in the 2012 Foreign Ownership First Report and Order and shall not be covered in the waiver that we adopt in the Order. As such, the 20% foreign ownership limit set forth in section 310(b)(3) shall apply to such common carrier wireless licensee providing only BIAS that does not fall within this class. For the same reasons discussed below in support of our waiver of the rules, and in furtherance of our decision to extend our existing section 310(b)(3) forbearance policy for common carrier licensees to BIAS-only providers, we temporarily find that foreign ownership in a common carrier wireless licensee providing only BIAS is in the public interest where foreign interests are held in a licensee through an intervening U.S. entity that does not control the licensee, even though we are temporarily not requiring the filing of a petition for declaratory ruling as to such interests. For such licensees, we waive the requirements to request a declaratory ruling under §§ 1.5000 through 1.5004 of the Commission’s rules, pending adoption of any rules for BIAS. We recognize that, for the period for which we waive §§ 1.5004 through 1.5004 of the rules as specified herein, we will not be receiving petitions for declaratory ruling seeking prior approval to exceed the section 310(b)(3) and (b)(4) statutory benchmarks—as set out in the existing rules—from common carrier wireless licensees that are providing only BIAS, and it is our intent to address this matter in a further notice of proposed rulemaking. This waiver of those rules as it relates to the foreign ownership of common carrier wireless licensees providing only BIAS will not apply to foreign ownership held directly in such licensees under section 310(b)(3). We note that the blanket section 214 authority that we grant to such common carrier wireless licensees providing BIAS, pursuant to our reclassification of BIAS in the Order, is subject to the Commission’s power to revoke such authority. The Commission also has the power to revoke a Title III station license, including “for willful or repeated violation of, or willful or repeated failure to observe any provision of this chapter or any rule or regulation of the Commission authorized by this chapter or by a treaty ratified by the United States.”

426. We further find that temporary forbearance is warranted to afford additional time after the Order’s effective date for other BIAS providers newly subject to Title II to restructure to the extent necessary to bring any direct foreign ownership interest in the licensee below the statutory limit or to include a non-controlling intervening U.S. interest holder. WISPA asked the Commission to provide time for these providers to come into compliance with section 310(b)(3) and the terms of the forbearance policy applicable to BIAS providers with foreign interests in the licensee held through a non-controlling U.S. entity. We find that a compliance period of twelve months after the effective date is reasonable based on the amount of time that it could take to restructure corporate ownership or take other similar steps to come into compliance given our experience with transactions of a similar scale and type and strikes the right balance between maximizing public interest benefits and minimizing potential public interest harm. For that period of time, enforcement of the statutory prohibition in section 310(b)(3) is not necessary to protect consumers or ensure just and reasonable and nondiscriminatory rates and practices. Forbearing from enforcement of the prohibition for that period of time serves the public interest by allowing newly covered BIAS providers to continue providing service
during the limited time necessary to protect existing investments in such businesses without presenting undue risk of harm given the limited duration of this temporary forbearance. Following that period of time, forbearance will no longer serve the public interest except as the Commission adopted in the 2012 Foreign Ownership First Report and Order and as applied herein with respect to foreign interests held in the licensee through a non-controlling U.S. interest holder.

242. The Commission may waive its rules and requirements for “good cause shown.” Good cause, in turn, may be found “where particular facts would make strict compliance inconsistent with the public interest.” In making this determination, the Commission may “take into account considerations of hardship, equity, or more effective implementation of overall policy,” and if “special circumstances warrant a deviation from the general rule and such deviation will serve the public interest.” As discussed above, the current rules that implement section 310(b)(3) and (b)(4) of the Act establish requirements and conditions for obtaining the Commission’s prior approval of foreign ownership in common carrier wireless licensees, among other licensees. Importantly, the current rules that we waive, as set out in the Order, were established in the context of traditional telecommunications services, and thus we find there is good cause to waive those rules pending adoption of any rules for BIAS.

248. As such, we find that, for the period leading to adoption of any rules for BIAS, foreign ownership in excess of the statutory benchmarks in common carrier wireless licensees that are providing only BIAS is in the public interest under section 310(b)(3) when such foreign ownership is held in the licensee through a U.S.-organized entity that does not control the licensee and under section 310(b)(4). For such licensees, we waive the requirements to request a declaratory ruling under §§ 1.5000 through 1.5004 of the Commission’s rules, pending the adoption of any rules for BIAS. We find that our decision to waive §§ 1.5000 through 1.5004 of the Commission’s rules with respect to this class of licensees is in the public interest given our consideration of hardship and equity that may be raised by immediate application of those rules to such licensees following our action in the Order. The recategorization of BIAS under Title II is a special circumstance that requires careful consideration of rules concerning BIAS and thus warrants devation at this time from the application of our current rules implementing section 310(b)(3) and (b)(4), pending a further notice of proposed rulemaking. We find that the public interest is served as our approach will ensure that consumers can continue to receive the BIAS services to which they subscribe. Additionally, by waiving the requirements to request a declaratory ruling under §§ 1.5000 through 1.5004 of the Commission’s rules, where it pertains to the foreign ownership of common carrier wireless licensees that are providing only BIAS as set out in the Order, we will avoid any disruption to or uncertainty for BIAS consumers and BIAS providers.

As we conclude in the present Order, our action to reclassify BIAS under Title II will protect consumers and ensure a safe, secure, and open internet. Accordingly, we find that granting a waiver of the requirements to request a declaratory ruling under §§ 1.5000 through 1.5004 of the Commission’s rules, where it pertains to the foreign ownership of common carrier wireless licensees that are providing only BIAS as set out in the Order, is fully consistent with our responsibility to account for the effective implementation of our overall objectives and objectives to address national security, law enforcement, public safety, or other public interest concerns while ensuring the uninterrupted provision of BIAS for consumers pending a further notice of proposed rulemaking to develop a fuller record. This waiver as set out in the Order will remain in effect pending such further notice of proposed rulemaking and the adoption of any rules for BIAS.

249. We find that it is in the public interest not to disturb the section 310(b)(3) forbearance approach the Commission adopted in the 2012 Foreign Ownership First Report and Order and to temporarily apply it to those common carrier wireless licensees providing only BIAS as set out in the Order. We recognize that the forbearance analysis adopted in the 2012 Foreign Ownership First Report and Order relied on the filing of a declaratory ruling and prior approval of the Commission. At this time, however, we find that there is good cause to apply the section 310(b)(3) forbearance approach to those common carrier wireless licensees providing only BIAS, where strict compliance with the rules implementing section 310(b)(3)—in those instances where the foreign ownership is held in the licensee through a U.S. entity that does not control the licensee—would be inconsistent with the public interest based on consideration of hardship and equity that may be raised by immediate application of those rules until the Commission releases a further notice of proposed rulemaking to develop a fuller record on this matter. Pending such further notice of proposed rulemaking, we note that the Commission stated in the 2012 Foreign Ownership First Report and Order, with regard to the class of common carrier licensees subject to the forbearance approach adopted in that Order, “that the public interest would be served by not applying the foreign ownership limit of section 310(b)(3) to licensees subject to section 310(b)(3) forbearance . . . for the same reasons that the public interest is served when we allow, under section 310(b)(4), greater than 25 percent foreign ownership in a U.S.-organized entity that does control the licensee under otherwise identical circumstances.” The approach that we adopt in the Order would allow us to treat foreign ownership in excess of the statutory benchmarks in common carrier wireless licensees providing only BIAS consistently under section 310(b)(4) and (b)(3), respectively, whether the foreign ownership is held through a controlling U.S. parent of the common carrier licensee or through an intervening U.S. entity that does not control the licensee, by including such licensees here and waiving §§ 1.5000 through 1.5004 of the Commission’s rules until adoption of any rules.

2. Forbearance From Certain Provisions of Titles III, VI, and Other Commission Rules

430. We forbear from applying other provisions of the Act insofar as they would be triggered by classifying BIAS as a telecommunications service, to the extent of our section 10 authority. In particular, beyond the Title II provisions and certain implementing rules discussed above, we grant forbearance, as the Commission did in the 2015 Open Internet Order, from obligations related to BIAS providers’ provision of BIAS under certain provisions of Title III, Title VI, and associated Commission rules. We conclude that the same analysis justifies forbearance from these provisions, and the record does not dispute that. We thus predict, as we did in the 2015 Open Internet Order, that other provisions and rules will be adequate to ensure just, reasonable, and nondiscriminatory conduct by BIAS providers and to protect consumers for purposes of section 10(a)(1) and (a)(2). Further, informed by our responsibilities under section 706, we find the tailored regulatory approach we
adoption of the proper public interest balance under section 10(a)(3). Accordingly, we adopt the following forborne:

- First, we forbear from applying certain provisions of Titles III and VI and Commission rules associated with those Titles or the provisions of Title II from which we forbear that may apply by their terms to providers classified in particular ways. The Commission has forbore from provisions of Title II and from Commission rules in many instances in the past. However, nothing in the language of section 10 categorically limits the scope of Commission forbearance only to the provisions of Title II, and although it has been less common for the Commission to forbear from provisions of Titles III and VI, it has done so at times. For clarity, we note that by "rules" we mean both codified and uncodified rules. In addition, by "associated" Commission rules, we mean rules implementing requirements or substantive Commission jurisdiction under the provisions in Title II, III, and/or VI of the Act from which we forbear. As to this first category of requirements, and except as to the core BIAS requirements, we forbear from any such provisions and regulations to the full extent of our authority under section 10, but only as far as a BIAS provider falls within those categories or provider classifications by virtue of its provision of BIAS, but not as far as those entities fall within those categories of classifications by virtue of other services they provide. The Order's classification of BIAS could trigger requirements that apply by their terms to "common carrier services," "telecommunications services," or "CMRS" or "commercial mobile" services. Similarly, other provisions of the Act and Commission rules may impose requirements on services predicated on a service's classification as a "common carrier service," "telecommunications service," "CMRS," or "commercial mobile" service without being framed in those terms. Regarding this second category of requirements (to the extent not already covered by the first category), and except as to the core BIAS requirements, we forbear from any such provisions and regulations to the full extent of our authority under section 10 specifically with respect to BIAS, but do not forbear from these requirements as to any other services (if any) that BIAS providers offer that are subject to these requirements.

- Third, while commenters do not appear to have identified such rules, there potentially could be other Commission rules for which our authority derives from provisions of the Act all of which we forbear from under the first two categories of requirements identified above, but which are not already subject to that identified scope of forbearance. To the extent not already identified in the first two categories of requirements above, and except as to the core BIAS requirements, we forbear to the full extent of our authority under section 10 from rules based entirely on our authority under provisions from which we forbear under the first and second categories above (or for which the forbore-from provisions provide essential authority) insofar as the rules newly apply as a result of the classification of BIAS.

- Fourth, we include within the scope of our broad forbearance for BIAS any preexisting rules with the primary focus of implementing the requirements and substantive Commission jurisdiction in sections 201 and/or 202, including forbearing from preexisting pricing, accounting, billing, and recordkeeping rules. This forbearance would not include rules implementing our substantive jurisdiction under provisions of the Act from which we do not forbear that merely cite or rely on sections 201 or 202 in some incidental way, such as by, for example, relying on the rulemaking authority provided in section 201(b). Consistent with our discussions above, this category also does not include our open internet rules or MTE rules. As with the rules identified under the first and second categories above, we do not forbear insofar as a provider is subject to these rules by virtue of some other service it provides.

- Fifth, the classification of BIAS as a telecommunications service could trigger certain contributions to support mechanisms or fee payment requirements under the Act and Commission rules, including some beyond those encompassed by the categories above. Insofar as any provisions or regulations not already covered above would immediately require the payment of contributions or fees by virtue of the classification of BIAS (rather than merely providing Commission authority to assess such contributions or fees) they are included within the scope of our forbearance. As under the first and second categories above, we do not forbear insofar as a provider is subject to these contribution or fee payments by virtue of some other service it provides.

III. Report and Order: Open Internet Rules

431. The rules we adopt in the Order mark the return to the Commission’s longstanding basic framework governing BIAS provider conduct to protect the open internet. We establish "rules of the road" that are straightforward and clear, prohibiting specific practices harmful to an open internet—blocking, throttling, and paid prioritization—as well as a strong standard of conduct designed to prevent deployment of new practices that would harm internet openness, and certain enhancements to the transparency rule. Our rules are designed to prevent BIAS providers from engaging in practices that are harmful to consumers, competition, and public safety. As proposed in the 2023 Open Internet NPRM, our approach reinstates the rules that the Commission adopted in 2015. We find that the temporary deviation from this framework, which the Commission adopted in the RIF Order, left consumers exposed to behavior that can hinder their ability to access—and the Commission without recourse to protect and promote—an open internet. As we explained in the 2023 Open Internet NPRM, we find that the rules we adopt in the Order are "consistent with numerous other steps the Commission has taken to ensure that this country has access to affordable, competitive, secure, and reliable broadband."

A. Need for Rules

432. We affirm our tentative conclusion from the 2023 Open Internet NPRM that baseline internet conduct rules for BIAS providers are necessary to enable the Commission to prevent and address conduct that harms
consumers and competition. BIAS is an essential service that is critical to so many aspects of everyday life, from healthcare and education to work, commerce, and civic engagement. Because of its importance, we conclude that rules are necessary to promote free expression; encourage innovation, competition, and consumer demand; and protect public safety. As the Commission found in both 2010 and 2015, BIAS providers continue to have the incentive and ability to harm internet openness. We find that the framework the Commission adopted in the RIF Order provides insufficient protection from these dangers, and that a safe, secure, and open internet is too important to consumers and innovators to leave unprotected.

1. Promoting Free Expression and Encouraging Innovation, Competition, and Consumer Demand

433. The internet serves as a cornerstone for free expression, fostering an inclusive digital space where individuals can share ideas, opinions, and information without undue influence or interference. It promotes the exchange of diverse perspectives, ultimately enriching society by exposing individuals to a wide range of thoughts and experiences. As the Supreme Court noted in 1997, the internet enables any person to “become a town crier with a voice that resonates farther than it could from any soapbox.” In the 2023 Open Internet NPRM, we sought comment on the need for conduct rules to protect free expression, innovation, and investment. The record confirms the Commission’s long-held tenet that an open internet is critical to facilitate the free flow of diverse speech and content, and serves as a platform for speech and civic engagement. Several commenters highlight that open internet rules would ensure that BIAS providers cannot discriminate against content, thereby providing a space for all voices, including those from diverse and minority backgrounds. We agree with the Communications Workers of America that a BIAS provider’s “ability to place restrictions on what speech is permitted on its platform creates a chilling effect on civic discourse.”

434. In addition to protecting free expression, an open internet encourages competition and ensures that breakthrough innovations are not limited. In the 2015 Open Internet Order, the Commission recognized that “innovations at the edges of the network enhance demand, leading to expanded investments in broadband infrastructure that, in turn, spark new innovations at the edge.” This self-reinforcing cycle, which the Commission has referred to as a “virtuous cycle” and which was a primary basis for the actions the Commission took in the 2010 Open Internet Order and the 2015 Open Internet Order, was accepted by the Verizon court. The Verizon court found that “the Commission’s determination that internet openness fosters the edge-provider innovation that drives this ‘virtuous cycle’ was . . . reasonable and grounded in substantial evidence,” and that “the Commission has adequately supported and explained its conclusion that, absent rules such as those set forth in the Open Internet Order, broadband providers represent a threat to internet openness and could act in ways that would ultimately inhibit the speed and extent of future broadband deployment.”

435. In the RIF Order, the Commission did not question the existence of the virtuous cycle or the fact that, at least in theory, BIAS providers might take actions that undermine the cycle. However, the Commission pointed out that BIAS providers may also contribute to the “virtuous cycle,” and, without presenting any evidence or reasoned analysis, opined that the three potential sources of harm by BIAS providers to the “virtuous cycle” “have been overestimated, and can be substantially eliminated or reduced by the more light-handed approach [the RIF Order] implements.”

436. In the 2023 Open Internet NPRM, we sought comment on the “virtuous cycle” and whether “it is necessary to secure the open internet to preserve the virtuous cycle.” Of the few parties that comment on this issue, none question the validity of the “virtuous cycle” or the fact that innovations at the edge of the network can increase consumer demand, which can lead to expanded investments in broadband infrastructure, which in turn stimulate further innovation at the edge. Rather, those opposing the proposed bright-line rules instead either argue that BIAS providers lack the incentive or ability to engage in activities that would undermine the “virtuous cycle” or that BIAS providers have not engaged in such activities, or they suggest, irrelevantly, that other entities, including large edge providers, transit providers, backbone providers, and CDNs can also affect and undermine the consumer experience. We note that, to the extent that other entities may have the incentive or ability to engage in anticompetitive activities that undermine the virtuous cycle, such activities are beyond the scope of this proceeding.

437. We agree with Netflix that “where both affiliated and independent content providers compete on a level playing field that offers the same access to terminating access networks, these companies are spurred to compete vigorously and to continue to improve their offerings by investing in quality content and technology.” The record reflects wide agreement that the internet ecosystem has become more diverse during the past decade with the entrance of new network operators, new intermediaries such as CDNs and interexchange carriers, and new edge providers. Small and emerging edge providers constitute particularly dynamic drivers of innovation and are a critical part of the diversity of the internet ecosystem. In March 2023, 1,054,052 business establishments in the United States (11.6% of all businesses) were less than one year old and 2,436,791 (26.8% of all businesses) were less than three years old. Although many of these companies may go out of business, others innovate successfully and become a major impetus to innovation and growth in the economy. Most of these businesses depend on reliable, open internet connections to build and scale their businesses. Research on internet-based innovation shows that the innovative generativity of the internet is strongly related to its open, transparent, and modular architecture. These technological design choices greatly reduce the costs of innovation for edge providers and hence stimulate more innovation experiments. They enable coordination and the realization of synergies between the participants in the internet ecosystem. These insights are congruent with recent research in innovation economics. This work shows that particularly important innovation drivers are (1) the contestability of a market (that is, the intensity of competition in the market segment and the competitive threats exerted by potential new entrants); (2) the available technological and business innovation opportunities; and (3) the appropriability of temporary risk premiums that reward taking the innovation risk. In digital ecosystems, innovation is further stimulated by synergies between market participants (e.g., between ISPs and edge providers) but it is impeded by coordination costs between market participants. The importance of synergies and complementarities in interdependent innovation processes was examined rigorously. An important insight from this research is that innovation is
stimulated in a reciprocal process, with edge provider innovation stimulating infrastructure innovation. In turn, infrastructure innovation enhances the innovation opportunities and activities of edge providers. The negative effects of coordination costs, such as the costs of adapting an application to different ISPs and the costs of negotiating agreements. However, this generativity can be weakened, and the innovation performance degraded, if individual market participants have incentives that impede this complementary innovation process. The more recent innovation research often uses the term “complementary innovation” or “interdependent innovation” to refer to the reciprocal synergies that exist in digital innovation systems. The notion of a virtuous cycle of innovation and investment, used in the 2010 Open Internet Order and 2015 Open Internet Order, describes key features of such complementary innovation processes. The more recent research clarifies that several types of complementary innovation coexist in the advanced internet that thrive under different conditions. A vast set of innovation opportunities will thrive in a best-effort internet offering that is transparent and provides nondiscriminatory connectivity for edge providers and users. Emerging technologies such as new forms of edge computing and open radio access network (open RAN) will further expand these innovation opportunities. In all these cases, the virtuous cycle of complementary innovation creates synergies between innovation processes in networks, applications, services, and devices. While we do not disagree with commenters who argue that excessive regulation can stifle innovation by creating barriers to entry and reduce competition, we do dispute that the rules we adopt in the Order would constitute the type of regulation that would stifle innovation. If anything, the surge in innovation over the past 25 years underscores the success of innovators under an open internet. We believe this success can be attributed, at least in part, to the absence of any preemptive control by service providers or any other entities over new applications, services, or content. We agree with the Electronic Frontier Foundation, which asserts that an open internet is also essential to help new businesses find investors. As the Greenlining Institute explains, “[w]ithout net neutrality rules, the next Amazon or YouTube may never get off the ground and an ex post regulatory intervention will be too little, too late.”

As discussed below, we find that BIAS providers have the incentive and technical ability to engage in activities that harm edge providers, which can reduce investment and innovation at the edge, which in turn can harm consumers and ultimately reduce incentives to invest in broadband infrastructure. As the Commission explained in the 2010 Open Internet Order, pervasive interference with the open internet would likely slow or even break the virtuous cycle of innovation enabled by internet, likely causing irreversible or very costly harms. If broadband provider practices chill entry and innovation by edge providers and thereby prevent development of the next revolutionary technology or business, the missed opportunity may be significant, and it may be impossible to restore the lost innovation, investment, and competition after the fact. Additionally, because the internet is a general purpose technology, erosion of internet openness threatens to harm innovation, investment in the core and at the edge of the network, and competition in many sectors. This can have a disproportionate effect on small, entering, and non-commercial edge providers that drive much of the innovation on the internet. Effective open internet rules can both prevent or reduce the risk of these harms and help to ensure the public has unfettered access to diverse sources of news, information, and entertainment, as well as an array of technologies and devices that enhance health, education, and the environment. Moreover, as the Commission explained in the 2015 Open Internet Order, such “behavior [by BIAS providers to throttle or degrade edge content] has the potential to cause a variety of other negative externalities that hurt the open nature of the internet.” The Commission went on to explain that “[b]roadband providers have incentives to engage in practices that will provide them short term gains but will not adequately take into account the effects on the virtuous cycle . . . [and] that the unaccounted-for harms to innovation are negative externalities [that] are likely to be particularly large because of the rapid pace of internet innovation, and wide-ranging because of the role of the internet as a general purpose technology.”

438. Thus, the conduct that we seek to prevent can not only harm edge providers, which will reduce their incentives to invest and innovate, but can also harm consumers. This harmful conduct may even reduce other BIAS providers’ incentives to invest in broadband infrastructure. Overall, the record before us corroborates the need for a balanced approach to safeguard edge innovation while allowing entrepreneurial experimentation to advance innovation. The Order achieves this balance by establishing a framework of bright-line rules for BIAS. These rules offer guardrails to safeguard important open internet principles that will maintain edge-provider innovation and protect the smallest and most vulnerable edge providers. At the same time, the ability of BIAS providers to offer specialized and innovative new services is preserved by allowing BIAS providers to use appropriate network management, offer enterprise services, and offer non-BIAS data services. We believe that, overall, the benefits of this balanced approach, which secures an open internet while allowing flexibility for edge and BIAS provider innovation, outweigh its costs. As such, we conclude that the protections we adopt in the Order will help to facilitate “the development of diverse, content, applications, and services,” and enable “a virtuous cycle of innovation.”

2. Protecting Public Safety

439. The conduct rules that we adopt in the Order are necessary to prevent and mitigate harms to public safety that could result from blocking, throttling, paid prioritization, and other actions that have the potential to impair public safety communications. These conduct rules may also support consumer use of telehealth service and remote healthcare monitoring, such as through connected devices, by ensuring consumers can continue to access these services without the threat of blocking, throttling, or other degradation. The prohibited conduct could make it more difficult for the public to receive emergency services and critical information and could impair the ability of first responders to communicate during emergency situations. As discussed above, one of the Commission’s fundamental obligations is to advance public safety. The Mozilla court highlighted this obligation and recognized its significance, emphasizing that “whenever public safety is involved, lives are at stake.” The court went on to note that “[a]ny blocking or throttling of [officials’] Internet communications during a public safety crisis could have dire, irreversible results.” Similarly, in the 2015 Open Internet Order, the Commission recognized that paid prioritization and peering disagreements can negatively affect public safety communications traveling over the same networks.
440. Above, we discuss the wide range of public safety communications and applications that rely on broadband networks and the related national security concerns impacting broadband services, providers, and critical infrastructure. The CPUC points out that first responders use “communications tools to respond to life-threatening situations,” such as by “notifying [residents and businesses by mobile phone, text message, email and social media with timely, geographically specific emergency notifications.” We agree with the CPUC that the ability of first responders to "communicate with the public in a timely manner is, literally, a matter of life and death.”

441. We conclude that open internet conduct rules are necessary to support public safety communications by preventing “harmful practices that could impede emergency response and critical information sharing.” The D.C. Circuit found that “the harms from blocking and throttling during a public safety emergency are irreparable . . . because people could be injured or die.” Santa Clara asserts that “such practices could interfere with the communications about the existence of a fire line or evacuation zone, the location of flooding, or the location of criminal suspects or missing individuals, among many other critical and time-sensitive communications.”

442. Several commenters emphasize the importance of the conduct rules for public safety. For example, the ACC contends that the proposed "bright-line rules would serve a vital role in protecting public safety" by preventing "interruptions in signal transmissions between customers and the monitoring centers which serve them.” New America’s Open Technology Institute agrees, stating that “it is imperative that the Commission . . . regulate BIAS . . . and take enforcement action in the interest of public safety through Title II classification and the creation of conduct standards.” The CPUC also agrees, arguing that “strong, non-discriminatory rules are needed to ensure that providers of emergency services or public safety agencies are not impaired in providing comprehensive, timely information to the public in a crisis.”

443. We also agree with commenters who assert that the conduct rules will provide other public safety benefits beyond emergency communications. As the CPUC points out, “[t]he ‘Internet of Things’ is deeply intertwined with many aspects of society, including critical infrastructure such as the energy grid and water pipelines.” The CPUC contends that “[a]llowing ISPs to engage in paid prioritization deals with energy suppliers” could have detrimental impacts on demand response programs that are vital to “California’s battle against catastrophic wildfires.” The CPUC further explains that, “[s]ince demand response relies on fast, instantaneous communication to the customer, non-discriminatory Open internet rules are vital to dispatching demand response during times of extreme grid stress.” The CPUC concludes that “it is critical to energy safety and reliability that internet communications . . . not be subject to paid prioritization delays, payment demands, or service degradation due to priority accorded to other users who pay extra.”

444. We conclude that the conduct rules will benefit public safety as proactive actions to protect life and property by preventing potential harms from occurring, as opposed to the Commission solely taking enforcement actions after the harms have already occurred. Santa Clara recognizes the benefits of the conduct rules, which “impose requirements on ISPs ex ante, that is, before their blocking, throttling, or unreasonable interference can hinder or prevent time-sensitive, life-saving public safety communications from reaching their destinations.” In addition, Santa Clara reiterates that “ex post remedies cannot adequately protect against or compensate for the harms that ISP interference can cause to public safety.” Free Press argues because, “[w]ithout agency authority for ex post enforcement (or authority for ex ante rules) the Commission cannot do its job to promote public safety.” INCOMPAS also agrees with the need for ex ante rules, on the basis that the Commission’s “fundamental obligation to promote and protect public safety . . . includes ensuring that emergency situations are prevented, mitigated, and/or handled immediately.” We agree that “[t]he harm caused by blocking and throttling [public safety] communications simply cannot be remedied after the fact.” We also agree that the conduct rules are needed to enable the Commission to “deal with public safety issues before a public safety situation arises—not afterwards.” Notably, the Mozilla court expressed skepticism about the Commission’s contention in the RIF Order that post-activity enforcement is a suitable method to address harmful conduct in the public safety context, finding that “the harm to the public cannot be undone” by ex post enforcement. For these reasons, we conclude that the conduct rules are necessary because ex ante regulations would provide better public safety protections than an ex post enforcement framework.

445. Some commenters also contend that the conduct rules would have a limited impact on public safety because public safety entities heavily rely on enterprise-level dedicated networks, which fall outside of the scope of reclassification. As explained above, public safety officials’ reliance on BIAS has become integral to their essential functions and services, aside from their reliance on enterprise-based systems. We agree with INCOMPAS’s analysis in its petition for reconsideration that “[t]he Commission should not ignore the effects of reclassifying BIAS on public safety by conflating the idea that non-BIAS services are also used to address public safety issues.”

446. We reject the argument of some commenters that the conduct rules are unnecessary due to the lack of evidence of public safety harms. Many of these commenters refute these arguments. For example, New America’s Open Technology Institute cites the Mendocino Complex Fire in 2018 as evidence that, “in the absence of general conduct standards and rules against blocking, throttling, or prioritization, ISP behavior did directly impact public safety efforts.” New America’s Open Technology Institute states that “the full extent of these impacts . . . is unknown” but cites to other comments to explain that “it is difficult, if not impossible, for governments to identify harms caused by violations of net neutrality principles.” INCOMPAS notes that, with regard to the Santa Clara County incident, “there [was] no agency authority to determine whether [the service provider] violated the rules, and that in itself is dangerous for public safety.” We agree with INCOMPAS that the Commission needs the authority to address public safety matters through ex ante rules before a public safety situation arises.

447. Commenters reach differing conclusions regarding the significance of the 2018 Mendocino Complex Fire. Commenters who support reclassification point to the wildfire incident as an example demonstrating the need for the open internet rules and for the Commission to have greater authority to examine and investigate such incidents, and ultimately, to prevent future harms from occurring. Without such rules, these commenters warn, BIAS providers will engage in conduct that could result in harm to public safety, and that voluntary commitments are insufficient to ensure
public safety. Commenters who oppose reclassification contend that the wildfire incident is irrelevant to, and an unpersuasive example used in support of, reclassification and the open internet rules, because “the data plan at issue was marketed to government users, and therefore not covered by the FCC’s 2015 rules, nor by the definition of BIAS contained in the NPRM” and that Verizon’s actions would not have violated the 2015 Open Internet Order. In other words, they state that the type of data use plan that Verizon offered and that the Santa Clara fire department purchased did not violate the 2015 Open Internet Order. Opponents also argue that the Santa Clara fire department did not purchase a data plan that was appropriate for their needs. In our view, the 2018 Mendocino Complex Wildfire incident demonstrates that given the high stakes at issue—the loss of life and property—reliance on the free market alone is insufficient in the area of public safety.

448. We also disagree with commenters that argue open internet rules could deter providers from blocking or throttling access to websites that pose a threat to public safety for fear of violating the rules. We find that these concerns lack merit because the rules we adopt in the Order only apply to lawful content and the use of non-harmful devices. As was the case with the 2015 open internet rules, transfers of unlawful content or unlawful transfers of content are not covered by the no-throttling and no-blocking rules.

449. Public Accessibility for People with Disabilities. We find that the adoption of the open internet conduct rules will allow the Commission to ensure that people with disabilities both have access to essential information and can communicate with public safety personnel during emergencies.

450. Many people with hearing- and speech-based disabilities rely on data-intensive, latency-sensitive video applications, such as VRS and other types of internet-based relay services, to communicate with public safety personnel. In the 2023 Open Internet NPRM, we tentatively concluded that such data-intensive, latency-sensitive applications would be at a higher risk of being degraded by BIAS providers during emergency situations. Throttling or paid prioritization of certain services over others has the effect of degrading the network carrying individuals with hearing and speech disabilities’ essential video communications, and discriminates against them by preventing them from communicating in the same manner as individuals without disabilities. We also tentatively concluded in the 2023 Open Internet NPRM that the proposed conduct rules would prevent this degradation of such communications. In their comments, both the CPUC and the Equity Advocates support this finding and argued that the application of “strong net neutrality protections” to BIAS networks would benefit people with disabilities. Applying the prohibitions on blocking, throttling, and paid prioritization to BIAS will ensure that individuals with hearing and speech disabilities who need to use data-intensive video applications have access to reliable and accessible means to communicate with emergency service operators. As a result of the rules prohibiting throttling and blocking of lawful content, any person who uses internet-based relay services to communicate with emergency management agencies can be confident that they can do so without experiencing a degraded network connection. Additionally, the general conduct rule we adopt will ensure that BIAS providers do not unreasonably interfere with, disadvantage, or discriminate against the internet-based relay services that individuals with disabilities use for emergency communications.

451. The conduct rules prohibiting throttling and blocking, and governing the general conduct of BIAS providers will ensure that people with disabilities have access to essential information during emergencies. As Santa Clara raises in its comments, cities, localities, states, and other entities operating during emergencies increasingly rely on BIAS networks to send out essential information through social-media, email, and other internet-supported channels. For some people with disabilities, accessing information through these internet-supported channels may be their preferred way of receiving accessible information alerting them, for example, of a wildfire or a hurricane. The same populations may use BIAS to communicate to friends and families that they have evacuated or taken other safety precautions during emergencies. We agree with commenters that it is essential for members of the disability community to be able to receive information and for emergency service organizations to be able to transmit public safety information. In sum, the conduct rules that we adopt in the Order will ensure that people with disabilities, especially those individuals with hearing or visual disabilities, can access essential public safety information.

3. BIAS Providers’ Incentive and Ability To Harm Internet Openness

452. Based on the record in this proceeding, and consistent with the findings of the Commission in both the 2010 Open Internet Order and the 2015 Open Internet Order, we find that open internet rules are needed because BIAS providers have the economic incentive and technical ability to engage in practices that pose a threat to internet openness and have engaged in such practices in the past.

453. As explained below, BIAS providers may have incentives to block, throttle, or otherwise degrade service to specific edge providers, classes of edge providers, or end users. They also have incentives to increase revenues by charging edge providers in addition to end users. And, if BIAS providers can charge for prioritized access, BIAS providers will have incentives to degrade the quality of service to non-prioritized traffic classes and users.

454. In the 2010 Open Internet Order, the Commission explained that BIAS providers may face at least three types of incentives to reduce the current openness of the internet. We find that this analysis continues to be correct, even after accounting for developments in the broadband ecosystem and advances in broadband technology over the last decade.

455. First, a BIAS provider may have incentives to block, degrade, or otherwise disadvantage services offered by specific edge providers or classes of edge providers by controlling the transmission of network traffic over the provider’s broadband connection. These incentives are particularly strong if a third party’s services compete with the BIAS provider’s own revenue-generating offerings. For example, if a large, vertically integrated BIAS provider offers video streaming and other content services, such as cable television service, in competition with content offered by edge providers, it would have an incentive to discriminate against those edge providers. Unless safeguards are in place, a vertically integrated BIAS provider may have incentives to interfere with the transmission of such competing services. Similarly, a vertically integrated BIAS provider may have an incentive to limit the entry of new content or application providers that may compete with its own offerings in the future. The record suggests that BIAS providers have engaged in such behavior.

456. Such incentives also exist if a BIAS provider has contractual arrangements with a third-party edge provider in which the third-party pays...
the ISP to terminate traffic. Commissioner Carr in his dissent suggests that, because a small BIAS provider is unlikely to block access to Netflix, this suggests that regulation is unnecessary. This argument fails for a number of reasons, most importantly because, if a BIAS provider, regardless of its size, provides a service that competes directly with an edge provider’s service (or is affiliated with a provider of a competing service or has a contractual relationship with such a competing provider), that BIAS provider will have an incentive to block or degrade access to the competing provider’s service in order to increase its own profits. Whether a small BIAS provider in Louisiana could provide a service comparable to Netflix’s may or may not be possible, but that does not mean there would not be other services and edge providers for which a small provider might have a stronger incentive to degrade access. In this case, the BIAS providers would have an incentive to interfere with and degrade the quality of the transmission provided to non-affiliated content providers. Some commentators contend that, in both cases (of vertical integration of the BIAS provider and contractual agreements with third-party content providers), paid peering and interconnection agreements may be used to raise rival content providers’ costs through inefficiently high payments and that such practices will negatively affect the internet ecosystem.

457. Second, a BIAS provider may have an incentive to charge specific edge providers or classes of edge providers for access or prioritized access to the provider’s end users. A BIAS provider could have an incentive to charge inefficiently high fees to edge providers because the BIAS provider is typically an edge-provider’s only option for reaching a particular end user. Thus, as the Commission noted in the 2015 Open Internet Order, BIAS providers have the ability to act as gatekeepers. The additional cost associated with these fees, in turn, would reduce the incentives of providers to innovate. Harms from such inefficiently high charges could be particularly impactful because many edge innovations generate large benefits for the internet as a whole (what economists call positive spillover effects). Reduced edge innovation activity therefore may cause harms for the internet ecosystem that extend beyond an individual edge provider.

458. Third, if a BIAS provider can profitably charge edge providers for prioritized access to end users, it may have an incentive to strategically degrade, or decline to maintain or increase, the quality of service to non-prioritized uses and users in order to raise the profits from selling priority access. And even though the quality of broadband access generally has improved over time, as reflected in higher download and upload speeds, a BIAS provider might withhold or decline to expand capacity in order to “squeeze” and degrade nonprioritized traffic, thus increasing network congestion.

459. We note, as the Commission did in both the 2015 Open Internet Order and the 2010 Open Internet Order, that BIAS providers need not possess monopoly power over end users in order to engage in conduct that harms edge providers, consumers, and the open internet. We recognize, however, that BIAS providers generally possess some degree of market power. As discussed below this market power generally arises from product differentiation and a limited choice among BIAS providers, significant switching costs, and customer inertia, though the incentive and ability to engage in such conduct is likely exacerbated by an increase in market power. As the Commission explained in the 2010 and 2015 Open Internet Orders, a “broadband provider’s incentive to favor affiliated content or the content of unaffiliated firms that pay for it to do so, its incentive to block or degrade traffic or charge edge providers for access to end users, and its incentive to squeeze non-prioritized transmission will all be greater if end users are less able to respond by switching to rival broadband providers.” Similarly, in the 2015 Open Internet Order, the Commission observed that “a broadband provider’s incentive to favor affiliated content or the content of unaffiliated firms that pay for it to do so, to block or degrade traffic, to charge edge providers for access to end users, and to disadvantage non-prioritized transmission all increase when end users are less able to respond by switching to rival broadband providers.”

460. In Verizon, the D.C. Circuit found that the Commission “adequately supported and explained” that, absent open internet rules, “broadband providers represent a threat to internet openness and could act in ways that would ultimately inhibit the speed and extent of future broadband deployment.” And in the 2015 Open Internet Order, the Commission generally adopted the analysis underlying the Commission’s 2010 Open Internet Order. Based on the record in this proceeding, we continue to find the analysis contained in both the 2010 and 2015 Open Internet Orders persuasive.

461. Opponents of open internet regulation present several arguments as to why BIAS providers will not have the incentive or ability to engage in conduct that harms the open internet. As discussed below, we find that none of these arguments are well-founded. First, opponents argue that BIAS providers lack the incentive to block, throttle, or otherwise disadvantage unaffiliated edge providers because they face effective competition and because end users can switch to other service providers. The Commission has acknowledged that the gatekeeper role of BIAS providers could be “mitigated if a consumer could easily switch broadband providers.” However, there are several problems with the opponents’ argument in practice. While the number of BIAS providers is increasing and BIAS providers are expanding their networks, many consumers still lack a choice of BIAS providers or, where they do have a choice, they have a choice of only two providers and/or the services offered by competing providers are often not close substitutes. The 2024 Section 706 Report shows that as of year-end 2022, 37.4% of households lived in areas where only one provider offered wireline or terrestrial fixed wireless broadband internet access services at 100 Mbps download and 20 Mbps upload speeds (100/20 Mbps), the new benchmark for defining advanced telecommunications capability, and the Commission’s fixed speed benchmark for broadband, while 36.6% of households lived in areas with two providers offering 100/20 Mbps service, and only 18.2% lived in areas where they had a choice of three or more providers offering 100/20 Mbps service. 7.9% of households did not have any terrestrial fixed broadband provider offering 100/20 Mbps service. The figures in the text include fixed wireless services at 100/20 Mbps. If fixed wireless is excluded, then 49.8% of households had a choice of only one provider offering 100/20 Mbps. 34.9% of households had a choice of two providers offering these speeds, and only 5.1% of households had a choice of three or more providers offering 100/20 Mbps. We reach no conclusion as to whether, or how close, a substitute fixed wireless is for wireline fixed broadband, though we note that subscription rates for fixed wireless are only 4%, which may suggest that fixed wireless is not a close substitute for fixed broadband service at 100/20 Mbps. NCTA takes issue with the Commission’s reliance on
these data, which represent the most recent Commission-analyzed competition data, claiming that the June 2023 Broadband Data Collection data demonstrate “existing competition is already sufficient to prevent open internet harms while it is driving increased investment and deployment.” As discussed above, we do not rest our findings about BIAS providers’ incentives and abilities to harm internet openness solely or even primarily on the competitive state of the marketplace, though to be sure, these incentives are influenced by a consumer’s ability to switch to a competitive provider. In any event, even if we take NCTA’s June 2023 data calculations at face value, we find that the incremental increases in competition do not meaningfully change our incentive and ability analysis.

NCTA also submits that the Commission should account for wireless and low Earth orbit satellite providers in its competitive analysis. However, the Commission has consistently found that fixed and mobile broadband services are not full substitutes, and given the nascent availability of low Earth orbit satellite services, we find it is premature to make a determination regarding the potential substitutability of these services for fixed terrestrial service. Furthermore, with respect to NCTA’s claims regarding the impact of future potential competition, we find that our analysis is best conducted based on the current state of the marketplace rather than speculation regarding future BIAS deployment. At the Commission’s long-term speed goal of 1,000 Mbps download and 500 Mbps upload, 34.4% of households lived in areas with one provider of such service, 3.5% lived in areas with two providers, and only 0.2% lived in areas offering a choice of three or more providers. To report service availability at the long-term speed goal, the Commission uses BDC data reporting 940GB download and 500 Mbps upload. In most locations, end users also have access to satellite and mobile broadband services. However, the Commission has found that fixed and mobile broadband services are not full substitutes to each other and both services are necessary to ensure that all Americans have access to advanced telecommunications capability. Both have different service capabilities and use cases, and because these services are complements, and many consumers subscribe to both, which means that the incentives to degrade one of these services would not fully affect the other service.

Further, the 2024 Section 706 Report observed that satellite services have a relatively low subscription rate despite their apparent widespread service availability, and satellite capacity limits the number of subscribers that can be served without service degradation.

462. Several commenters argue that the development of cellular FWA as an alternative to more traditional fixed BIAS is an example that broadband deployment, innovation, and competition are flourishing, and that the Commission’s proposed rules are unnecessary. Cellular FWA, the subclass of FWA offered using 4G or 5G mobile technologies, is a relatively new residential fixed wireless broadband internet access service offered by nationwide providers AT&T, T-Mobile, and Verizon. As USTelecom notes, “[n]ew 5G fixed wireless offerings provide a competitive alternative to . . . wireline offerings.” INCOMPAS and Free Press, conversely, suggest that claims of cellular FWA’s competitive effects on the fixed BIAS market may be exaggerated, arguing that the fixed BIAS market is highly concentrated and requires open internet regulation. While Free Press acknowledges fixed wireless as a potential source of competition for home broadband, it argues in favor of the need to reclassify broadband as Title II “regardless of how competitive the market is.” While we acknowledge the availability of cellular FWA as an alternative to wired home internet offerings, we note that the development of this technology—and any resulting impact on competition—is not sufficient by itself to outweigh our concerns regarding BIAS providers’ incentives.

463. A second response to the argument that BIAS providers lack the incentive to engage in conduct that harms edge providers is that even where consumers face a choice among BIAS providers that are close substitutes, they likely face high switching costs. The record shows broad support for the relevance of switching costs in reducing the intensity of competition. Other commenters emphasize that competition among BIAS providers has reduced switching costs and increased customer choice options. While we recognize that these competitive forces may exist to lower switching costs for some consumers in some areas, many areas and groups remain for whom switching costs remain high. As the Commission explained in the 2015 Open Internet Order, consumers may face “high upfront device installation fees; long-term contracts and early termination fees; the activation fee when changing service; and incompatibility costs of owned equipment not working with the new service.” In addition, BIAS providers can use bundling strategies to increase switching costs.

464. Third, even where a BIAS provider degrades the quality of an edge provider’s service to the extent that it is noticeable to the consumer, the consumer may not be able to determine whether the poor quality is due to the BIAS provider or to the edge provider. Consumers often lack the information needed to understand how the practices of their current BIAS provider may affect their user experience and are confused by the complexity of multifaceted pricing plans and discount offers. This uncertainty reduces consumers’ willingness to switch, solidifying the gatekeeper position of BIAS providers, and weakening the checks provided by competing providers.

465. Another argument raised by opponents of open internet rules is that BIAS providers will not have the incentive to degrade or disadvantage edge providers to the extent that BIAS and edge services are complements. We find that this argument does not always hold. For example, if a BIAS provider is vertically integrated with a content provider or has a contractual relationship with an edge provider that competes directly against other edge providers, then the BIAS provider may have an incentive to block or degrade access to unaffiliated edge providers. Similarly, if a BIAS provider sees an edge provider as a potential future competitor in an upstream market, it may have the incentive to discriminate in providing access. Finally, each BIAS provider only accounts for how its actions impact its own profits and ignores the effect it has on other BIAS providers and the broader internet ecosystem. As a result, each individual BIAS provider’s profit-maximizing decision, when aggregated across all BIAS providers, can be harmful. For example, an individual BIAS provider may find charging edge providers a small amount increases its profits. To the extent that charge leads edge providers to degrade output, the BIAS provider would only account for the impact on its own customers, but not the impact on customers of other BIAS providers. While the BIAS provider might use some of its revenue from the edge providers to compensate its own customers and negate the harm, other users of the edge providers’ services would still be harmed by the charge. While the harm caused when a single BIAS provider takes such action may be small, all BIAS providers may have an incentive to behave this way, substantially harming edge provision.
466. Opponents of the proposed open internet rules further argue that a supposed lack of examples of BIAS providers blocking or throttling edge content proves that such rules are not needed. We find this argument unpersuasive. As an initial matter, we note that open internet rules and active enforcement of such rules have been in effect nearly continuously in some form since 2010. Following the RIF Order, various states began enacting their own open internet rules, and given the national scope of many BIAS providers and services, such State rules provided at least some constraint on the ability of BIAS providers to engage in behavior that would harm internet openness. Indeed, AT&T abandoned its sponsored data plan that zero-rated affiliated DirecTV video as a direct result of the passage of the California open internet regulations. AT&T stated that, “[g]iven that the internet does not recognize state borders, the new law not only ends our ability to offer California customers such free data services but also similarly impacts our customers in states beyond California.” As we explained above, BIAS providers continue to have strong incentives and the ability to favor some edge provider content and to discriminate against other content, especially when a BIAS provider is vertically integrated, or has contractual relationships, with edge provider content that competes with unaffiliated content. Therefore, the perceived lack of examples of BIAS providers engaging in practices that harm internet openness is more likely evidence in favor of the effectiveness of open internet regulation and enforcement rather than evidence of a lack of incentives for BIAS providers to engage in such activities.

467. However, there have been repeated cases of discriminatory conduct that often required Commission action to resolve and would likely be addressed by the rules we adopt in the Order. The record and independent research document a list of incidences, such as blocking, throttling, and other forms of conduct that harm edge providers. This includes the blocking by Madison River Communications of VoIP service provided by Vonage; the throttling and blocking of peer-to-peer (P2P) traffic by cable providers; the blocking of video calling on the Apple FaceTime app by AT&T; and, as discussed below, recent evidence that major BIAS providers are currently engaged in throttling. BIAS provider RCN settled a class action lawsuit related to its throttling of P2P traffic on its network. RCN denied any wrongdoing, but it acknowledged that in order to ease network congestion, it targeted specific P2P applications. A 2008 study by the Max Planck Institute revealed significant blocking of BitTorrent applications in the United States. Comcast and Cox were both cited as examples of providers blocking traffic. AT&T initially restricted use of Apple’s FaceTime application to times when the end user was connected to Wi-Fi and thus to another BIAS provider. In addition, there have been many instances over the past decade where BIAS providers changed the traffic that was requested by their users, including by redirecting search requests to websites chosen by the BIAS provider in exchange for payments; injecting JavaScript code into traffic, raising security concerns; adding unique tracking IDs to web requests, raising privacy concerns; and stripping email encryption requests, raising security and privacy concerns.

468. The RIF Order asserted that there are only a few examples of BIAS providers engaging in practices harmful to internet openness, and that proponents of the 2015 Open Internet Order “relied on purely speculative threats.” It argued that, in a holistic view, both BIAS and edge providers “are important drivers of the virtuous cycle” of innovation and investment, and that regulatory analysis must examine this two-sided market interaction. The RIF Order then concludes that, seen through a two-sided market lens, BIAS providers “face material competitive constraints.” Furthermore, it contended that the terminating monopoly problem forces BIAS providers to compete for subscribers, thus creating downward price pressure for end users. Moreover, it claimed that smaller BIAS providers cannot exercise market power against large edge providers. Finally, the RIF Order argued that positive externalities associated with the general-purpose technology internet and their regulatory implications were not substantiated by commenters who supported the 2015 Open Internet Order’s approach and thus considered the support of the application of Title II regulation to all BIAS providers “unreasonable and unreasoned.”

469. As our analysis in this section shows, these arguments are not persuasive. Although it is correct that both BIAS and edge providers provide impetus for innovation, the interests of BIAS providers and edge providers often conflict with each other. BIAS providers have incentives to disfavor competitors to the providers and edge providers that might offer competing services in the future. And as discussed above, even where end users have competitive choices, they generally face significant switching costs and often lack the ability to identify when their BIAS provider is degrading the quality of particular edge services. Consequently, even from a two-sided-market perspective, the interactions between each side of the market are not well aligned. Finally, externalities deserve serious consideration as they imply that the decentralized decisions of BIAS providers and edge providers can have undesirable sectoral outcomes, even when BIAS providers have no incentives to favor their own operations. For example, if a BIAS provider imposes an access fee on an edge provider, it is only considering the effect of such a charge on its own profits, and not the potential reduced edge provider innovation and investment caused by the new cost imposed on the edge provider. A BIAS provider’s mere exploitation of its existing market power will reduce edge provider investment, a harm the BIAS provider will only account for to the extent it reduces its own profits, ignoring the damage to the broader internet ecosystem.

4. The RIF Order’s Framework Is Insufficient To Safeguard and Secure the Open Internet

470. We find that framework in the RIF Order does not adequately protect consumers from the potential harms of BIAS provider misconduct. As discussed above, BIAS providers have the incentive and technical ability to engage in conduct that undermines the openness of the internet. In 2018, when the Commission repealed the open internet conduct rules, the Commission asserted that a modified transparency rule, combined with the effects of competition, would prevent BIAS provider conduct that might threaten the internet’s openness. Notwithstanding this conclusion, the Commission found that “[i]n the unlikely event that ISPs engage in conduct that harms internet openness,” preexisting antitrust and consumer protection laws will protect consumers. In the RIF Order, the Commission further found that even if the conduct rules adopted by the Commission in 2015 provided “any additional marginal deterrence,” those benefits were not worth the costs. We believe that this framework is insufficient to safeguard and secure the open internet.
antitrust law to protect the open internet in Mozilla, the court observed that the RIF Order’s “discipline of antitrust and consumer protection law is no model of agency decisionmaking.” As the court explained, although “[t]he Commission theorized why antitrust and consumer protection law is preferred to ex ante regulations [it] failed to provide any meaningful analysis of whether these laws would, in practice, prevent blocking and throttling.” Consequently, although “the Commission opined[d] that ‘most of the examples of net neutrality violations discussed in the [2015 Open Internet Order] could have been investigated as antitrust violations’,” the RIF Order “fail[ed] to explain what, if any, concrete remedies might address these antitrust violations.” The court found it “concerning that the Commission provide[d] such an anemic analysis of the safety valve that it insists will limit anticompetitive behavior among broadband providers.

472. Consistent with the D.C. Circuit’s skepticism of the RIF Order’s approach, we find that the consumer protection and antitrust laws, even combined with transparency requirements, are insufficient to protect against blocking, throttling, and other conduct that harms the open internet. We believe that the approach we adopt in the Order, based on the 2015 Open Internet Order, is consistent with a light-touch regulatory framework to protect internet openness. Even while upholding the RIF Order, the D.C. Circuit was “troubled by the Commission’s failure to grapple with the fact that, for much of the past two decades, broadband providers were subject to some degree of open internet restrictions,” and we aim to return to the Commission understanding that existed from the 2005 Internet Policy Statement through the repeal of the 2015 Open Internet Order in 2017.

473. As an initial matter, we find the RIF Order’s reliance on transparency as a deterrent for problematic practices to be insufficient to protect consumers and edge providers from BIAS provider misconduct. We affirm our tentative conclusion from the 2023 Open Internet NPRM that there are types of conduct, such as blocking, throttling, and traffic discrimination, that require ex ante intervention to prevent their occurrence in the first instance. We agree with those commentators that argue it is not enough for the Commission to require that BIAS providers disclose their policies on these network practices in the commercial terms of their service offerings because it does not restrict BIAS providers from engaging in harmful behavior. We conclude that a comprehensive set of conduct rules, which includes a transparency element, is required to protect consumers from harmful BIAS provider conduct, and that the open internet rules we adopt in the Order, including bright-line rules, are necessary to safeguard and secure the open internet. As discussed above, we find that: (1) BIAS providers may have the incentive to engage in conduct that harms edge providers and the open internet even where they lack market power over end users; and (2) contrary to the claims of some commenters, there have been several instances of conduct that the Commission felt a need to address and correct, despite the fact that there were open internet rules in place.

474. Furthermore, based on the record in this proceeding, we find that the RIF Order’s reliance on the DOJ and the FTC for enforcement of the consumer protection and antitrust laws is unlikely to provide sufficient deterrence to BIAS providers from engaging in conduct that may harm consumers, edge providers, and the open internet. Both the DOJ and the FTC have authority to enforce the Federal antitrust laws, and particularly sections 1 and 2 of the Sherman Act. Section 1 of the Sherman Act makes illegal “[e]very contract, combination . . . , or conspiracy in restraint of trade . . . among the several States,” while section 2 prohibits monopolization, attempts to monopolize, or combinations or conspiracies to monopolize “any part of the trade or commerce among the several States.” In the 2010 and 2015 Open Internet Orders, the Commission found that it was necessary to adopt certain rules to protect the openness of the internet and that sole reliance on enforcement of the antitrust laws by the DOJ and FTC was insufficient to protect edge providers, consumers, and the open internet. In the RIF Order, the Commission reconsidered and concluded that conduct that harms the openness of the internet was unlikely, and that other legal regimes—particularly antitrust law and section 5 of the Federal Trade Commission Act (FTC Act)—were sufficient to protect consumer interests. Section 5 authorizes the FTC to prohibit “any person who has or exercises market power with respect to commerce among the several States to engage in any act that is created or acquired in such commerce by such person, if such act is likely to reduce the extent to which such commerce among the several States is free from burden or injury by reason of such person’s having or exercising market power.”

475. We disagree with commentators who argue that existing consumer protection and antitrust laws provide adequate protection against the harms the open internet rules we adopt in the Order seek to prevent. To begin with, the FTC’s section 5 authority does not apply to “common carriers subject to” the Communications Act, so if BIAS providers are properly classified as common carriers, section 5 does not apply at all. With respect to antitrust oversight, it is clear that all conduct that could harm consumers and edge providers would constitute an “unfair method of competition” under section 5 of the FTC Act or a violation of section 1 or 2 of the Sherman Act. The FTC goes on to explain that conduct that violates section 5 includes practices “deemed to violate the antitrust laws,” “conduct deemed to be an incipient violation of the antitrust laws,” and “conduct that violates the spirit of the antitrust laws,” but none of the examples cited by the FTC clearly address the types of conduct the open internet rules seek to prohibit. For example, if a vertically integrated BIAS provider blocked or throttled the content of a particular edge provider with which it competed in the content market, it is not clear whether such conduct would constitute a violation of section 2 of the Sherman Act. It is well settled that there are two elements to the offense of unlawful monopolization under section 2 of the Sherman Act: “(1) the possession of monopoly power in the relevant market; and (2) the willful acquisition or maintenance of that power as distinguished from growth or development as a consequence of a superior product, business acumen, or historic accident.” As the Commission has repeatedly explained, however, it is not necessary for a BIAS provider to have “market power with respect to end users” for it to be able to engage in conduct that harms edge providers, the open internet, and consumers. This conclusion was accepted and affirmed by the D.C. Circuit in Verizon, where it stated:

Broadband providers’ ability to impose restriction on edge providers does not depend on their benefiting from the sort of market concentration that would enable them to impose substantial price increases on end users—which is all the Commission said in declining to make a market power finding. . . . Rather, broadband providers’ ability to impose restriction on edge providers simply depends on end users not being fully responsive to the imposition of such restrictions.

Thus, section 2 of the Sherman Act will not provide adequate protection, at least in cases where the BIAS provider lacks monopoly power over its end user customers. In Mozilla, the D.C. Circuit reiterated its concern about the insufficiency of the RIF Order’s reliance on antitrust law, explaining that the RIF Order “fail[ed] to explain what, if any, concrete remedies might address these antitrust violations.” As such, while the Sherman Act may complement the rules we adopt in the Order, it would not be sufficient on its own to protect edge providers, consumers, and the open internet.

476. Similarly, it is not clear that all conduct that harms edge providers,
consumers, and the open internet would necessarily violate section 5 of the FTC Act’s prohibition on “unfair or deceptive acts or practices” even while BIAS providers are not classified as common carriers and thus are subject to the FTC Act. Whether an act is unfair or deceptive under consumer protection law each depends on its own subjective test. Commenters argue that the FTC is a more appropriate enforcer of open internet principles, emphasize that the FTC has the authority to enforce BIAS provider pledges and commitments not to block, throttle, or otherwise harm consumers. But these commenters do not address whether the FTC would have any enforcement authority with respect to a BIAS provider that does not make affirmative pledges or commitments. Nor is it clear how the FTC would rule should a BIAS provider engage in other types of conduct that do not amount to blocking or throttling, but that nevertheless harm edge providers and the open internet. As such, we disagree that consumer protection law is adequate to protect the open internet.

477. We also find that there are significant advantages to adopting ex ante bright-line rules compared with relying on an ex post case-by-case approach, the latter of which is necessary for the DOJ and FTC. First, ex ante bright-line rules can reduce regulatory uncertainty and provide better guidance to BIAS providers, edge providers, and end users. In the antitrust context, the U.S. Supreme Court has created certain per se rules that prohibit specific types of conduct. It has described this per se approach as “reflect[ing] broad generalizations holding true in so many cases that inquiry into whether they apply to the case at hand would be needless and wasteful.” Where, as here, however, no commenter claims that the blocking or throttling of a specific edge-provider’s lawful content will increase consumer or social welfare, we find it reasonable and efficient to adopt a bright-line prohibition. In contrast, ex post case-by-case enforcement like that under the FTC and DOJ involves greater expense, longer delays in prosecuting enforcement actions, and greater uncertainty as to which types of conduct are allowed or proscribed.

478. We further find that the oversight and enforcement elements of the RIF Order’s framework likely do not provide consumers a meaningful opportunity to obtain relief. The primary means by which the RIF Order suggests consumers might seek redress for harmful BIAS provider conduct is to submit complaints to the FTC, with the hope that the complaint might spark an agency investigation. The Mozilla court criticized the RIF Order’s reliance on antitrust and consumer protection law. Moreover, the Supreme Court’s decision in AMG Capital Management v. Federal Trade Commission restricted the FTC’s ability to seek monetary relief on behalf of consumers. Finally, while the Commission also suggested that consumers could seek non-legal forms of relief by switching to an alternative BIAS provider and bringing public attention to the BIAS provider conduct at issue to influence that provider into changing its behavior, we find that there may be high costs associated with trying to switch providers. While some of these options may provide relief for some subset of consumers, overall, they are far from widely available. As part of arguments opposing the re-adopt of internet conduct rules, some commenters highlight the example of a small ISP in the Pacific Northwest as positive proof that consumer backlash can prevent violations of open internet principles. In this circumstance, a small BIAS provider announced that it would block access to social media sites that had permanently banned the former president. After public criticism, the BIAS provider backed off. We do not doubt that transparency plays an important role in policing BIAS provider behavior, as this example demonstrates. However, we observe that this particular situation involves an important public figure and some of the largest social media companies in the country. It is not clear that a situation that did not involve some of the largest figures in the country would gain the same type of traction with the public, and a smaller edge provider would not be in the same position as those in this example to draw attention to the behavior. This lack of predictability makes reliance on transparency an uncertain course for consumers to obtain relief. As discussed above, the D.C. Circuit expressed concern that the RIF Order “failed to provide any meaningful analysis of whether [antitrust and consumer protection] laws would, in practice, prevent blocking and throttling.” Furthermore, the harms contemplated in section V.A.3 may not always be observable to the average consumer.

479. Finally, we agree with Public Knowledge that “Congress correctly identified that telecommunications services require sector-specific rules from an expert regulator; the FCC.” To the extent that the conduct complained of does not involve a violation of a bright-line rule, as with enforcement under the Sherman Act and to the extent that section 5 of the FTC Act might apply, it seems inefficient to place enforcement responsibility with generalist agencies rather than with the FCC, which possesses the technical and market knowledge and expertise concerning communications and broadband technologies. Indeed, the common carrier exception in section 5 of the FTC Act appears to presume that telecommunications carriers should instead be principally governed by sector-specific FCC rules. Moreover, because the FCC is constantly monitoring the telecommunications markets that it is charged with regulating, it is more likely to detect and deter conduct that harms the open internet. Finally, the FCC is better placed to enforce open internet rules and such violations where remedying harmful conduct is likely to require ongoing monitoring and supervision by the expert agency’s enforcement oversight. Thus, we reaffirm our belief that the Commission, as the expert agency on communications, is best positioned to safeguard internet openness. In the RIF Order, the Commission removed its own authority to enforce open internet requirements, leaving the responsibility of addressing harmful BIAS provider conduct to the FTC. The current Chair of the FTC has recognized the need for the Commission’s critical oversight. In remarks released in 2021, Chair Lina M. Khan noted that “the Federal Communications Commission has the clearest legal authority and expertise to fully oversee internet service providers.” She continued that she “support[s] efforts to reassort [the FCC’s] authority and once again put in place the nondiscrimination rules, privacy protections, and other basic requirements needed to create a healthier market.” In response to the 2023 Open Internet NPRM, several commenters agreed, arguing that the Commission’s general expertise is needed.

B. Rules To Safeguard and Secure the Open Internet

1. Bright-Line Rules

480. The record in this proceeding is rife with support for the reinstatement of strong, enforceable open internet rules to prohibit BIAS providers from blocking, throttling, or engaging in paid or affiliated prioritization arrangements. Without rules in place to safeguard and secure the open internet, the incentives BIAS providers have to act in ways that allow harmful BIAS provider conduct to innovation threaten both broadband networks and edge content, as the D.C.
Circuit has recognized. We find that a safe, secure, and open internet is too important to consumers and innovators to leave unprotected. As in 2015, we believe that conduct-based rules targeting specific practices are necessary, and accordingly adopt bright-line rules to prohibit blocking, throttling, and paid prioritization by providers of both fixed and mobile BIAS. For the reasons described below, we find each of these practices inherently unjust and unreasonable, in violation of section 201(b) of the Act, and that these practices threaten the virtuous cycle of innovation and investment.

481. We disagree with commenters that assert that reinstatement of conduct rules is unnecessary because BIAS providers have not engaged in widespread blocking or throttling of traffic since the elimination of the conduct rules in 2018. As an initial matter, there exists evidence—as well as numerous consumer allegations—that BIAS providers have not refrained from this conduct. Contrary to industry assertions claiming that rules are unnecessary because YourTTiWifi.com reversed its policy, we do not believe that consumers should have to rely on public outcry alone to be able to reach all content of their choosing. The Commission has received nearly 40,000 consumer complaints since adoption of the BIF Order raising speed, throttling, open internet, and data cap concerns. Some consumers assert, for example, that certain video traffic was throttled by their BIAS provider, as demonstrated by the fact that VPN-masked video traffic had no similar issues. We make no determinations regarding the allegations in these complaints in the Order. To the extent that some BIAS providers have acted consistently with open internet principles, we agree with Netflix and Mozilla that the combination “of individual state laws and a pending regulatory proceeding disincentivized ISPs from undermining the open internet.” In any event, we find that it is not acceptable for consumers to be beholden to the voluntary whims of their BIAS provider or be selectively protected depending on the State in which they live or the size of their provider, nor is it sufficient to promote innovation among edge providers. As we explain throughout this section, there is nothing in the record that convinces us that customers of small BIAS providers are entitled to less protection than customers of large BIAS providers, so we find that imposition of these open internet rules on small BIAS providers will be so burdensome as to justify a six-month or one-year delay in implementation for these providers (except where we provide a temporary exemption for certain of the transparency rule requirements, as discussed below), particularly given that ACA Connects itself indicates that small BIAS providers are already complying with the open internet principles. We are similarly not convinced of the need for a FNPRM, as requested by WISPA, examining, among other things, whether the “Regulatory Flexibility Act requires the Commission to exempt small BIAS providers from the rules” and the “costs to comply with all of the regulatory obligations the Commission has imposed on BIAS providers over the past two years.” and “propos[ing] to permanently exempt small providers from the bright line rules, the general conduct rule, and the new transparency requirements.” The Commission sought comment on the effect of the proposed rules and policies on small entities in the 2023 Open Internet NPRM and the accompanying Initial Regulatory Flexibility Analysis. The Commission has carefully considered these impacts in adopting the requirements in the Order, and as such, a FNPRM examining these issues is not necessary. In adopting strong, enforceable open internet rules, we will ensure a safe and open internet for all consumers nationwide and promote innovation that fuels the virtuous cycle.

a. Preventing Blocking of Lawful Content, Applications, Services, and Non-Harmful Devices

482. We reinstate a bright-line rule prohibiting BIAS providers from blocking lawful content, applications, services, or non-harmful devices. This “no-blocking” principle has long been a cornerstone of the Commission’s policies. While first applied in the internet context as part of the Commission’s Internet Policy Statement, the no-blocking concept dates back to the Commission’s protection of end users’ rights to attach lawful, non-harmful devices to communications networks. We continue to find, as the Commission has previously, that “the freedom to send and receive lawful content and to use and provide applications and services without fear of blocking continues to be essential to the internet’s openness.” Because of BIAS providers’ potential incentives to block edge providers’ content in certain circumstances, the need to protect a consumer’s right to access lawful content, applications, services, and to use non-harmful devices is as important today as it was when the Commission adopted the first no-blocking rule in 2010. Consistent with our proposal, we reinstate the no-blocking rule, which is widely supported in the record, providing that a person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not block lawful content, applications, services, or non-harmful devices, subject to reasonable network management.

483. Consistent with the 2015 no-blocking rule, the phrase “content, applications, and services” refers to all traffic transmitted to or from end users of a broadband internet access service, including traffic that may not fit clearly into any of these categories. The no-blocking rule applies to transmissions of lawful content only and does not prevent or restrict a BIAS provider from refusing to transmit unlawful material, such as child pornography or copyright-infringing materials. The no-blocking rule also entitles end users to connect, access, and use any lawful device of their choice, provided that the device does not harm the network. The no-blocking rule prohibits network practices that block a specific application or service, or any particular class of applications or services, unless it is found to be reasonable network management. Finally, as with the 2010 and 2015 no-blocking rules, this document’s no-blocking rule prohibits BIAS providers from charging edge providers a fee to avoid having edge providers’ content, services, or applications blocked from reaching BIAS providers’ end-user customers.

484. We agree with the Free State Foundation that, “[l]oy offering subscribers access to whatever lawful internet content they want, broadband ISPs enhance the perceived value of their services and thereby increase demand, subscriptions, and opportunities for financial returns and profits.” Further, we expect that provider costs for compliance with the no-blocking rule will be minimal, given that many BIAS providers have continued to comply with the no-blocking rule even after its repeal in 2018, and that providers themselves assert that they have every incentive not to block traffic.

b. Preventing Throttling of Lawful Content, Applications, Services, and Non-Harmful Devices

485. Consistent with our proposal, we reinstate a separate bright-line rule prohibiting BIAS providers from impairing or degrading lawful internet traffic on the basis of content, application, service, or use of non-harmful device—conduct that was
prohibited under the commentary to the no-blocking rule adopted in the 2010 Open Internet Order, and that the Commission explicitly prohibited in 2015. We use the term “throttling” to refer to conduct that is not outright blocking, but that inhibits the delivery of particular content, applications, or services, or particular classes of content, applications, or services.

486. We adopt the following no-throttling rule applicable to BIAS providers, which tracks the language of the Commission’s 2015 Open Internet Order, providing that a person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not impair or degrade lawful internet traffic on the basis of internet content, application, or service, or use of a non-harmful device, subject to reasonable network management.

487. With the no-throttling rule, we ban conduct that is not outright blocking, but inhibits the delivery of particular content, applications, or services, or particular classes of content, applications, or services. Likewise, we prohibit conduct that impairs or degrades lawful traffic to a non-harmful device or class of devices. We interpret this prohibition to include, for example, any conduct by a BIAS provider that impairs, degrades, slows down, or renders effectively unusable particular content, services, applications, or devices, that is not reasonable network management. Our interpretation of “throttling” encompasses a wide variety of conduct that could impair or degrade an end user’s ability to access content of their choosing. We clarify that a BIAS provider’s decision to speed up “on the basis of internet content, applications, or services” would “impair or degrade” other content, applications, or services which are not given the same treatment. For purposes of this rule, “content, applications, and services” has the same meaning given to this phrase in the no-blocking rule. Like the no-blocking rule, BIAS providers may not impose a fee on edge providers to avoid having the edge providers’ content, service, or application throttled. Further, transfers of unlawful content or unlawful transfers of content are not protected by the no-throttling rule. As in past Orders, we continue to recognize that in order to optimize end-user experience, BIAS providers must be permitted to engage in reasonable network management practices. We note, however, that the record reflects that “[t]here are many factors that limit video impact, including the fact that video providers use adaptive bitrates to select video resolution (bitrates) according to available bandwidth, they use congestion-control algorithms while transmitting, and network providers expanded network capacity during the COVID lockdown era.”

488. Because our no-throttling rule addresses instances in which a BIAS provider targets particular content, applications, services, or non-harmful devices, it does not address the practice of slowing down or speeding up an end user’s connection to the internet based on a choice clearly made by the end user. For example, a BIAS provider may offer a data plan in which a subscriber receives a set amount of data at one speed tier and any remaining data at a lower tier. We note that user-selected data plans with reduced speeds must comply with our transparency rule, such that the limitations of the plan are clearly and accurately communicated to the subscriber. If there were internet openness concerns with the particulars of a data plan, the Commission could undertake a review under the general conduct standard, discussed below. In contrast, if a BIAS provider degraded the delivery of a particular application or class of application, it would violate the bright-line no-throttling rule.

Further, consistent with the 2015 Open Internet Order, the no-throttling rule also addresses conduct that impairs or degrades content, applications, or services that might compete with a BIAS provider’s affiliated content. For example, if a BIAS provider and an unaffiliated entity both offered over-the-top applications, the no-throttling rule would prohibit the BIAS provider from constraining bandwidth for the competing over-the-top offering to prevent it from reaching the BIAS provider’s end user in the same manner as the affiliated application.

489. We agree with the Information Technology Industry Council that the no-throttling rule “ensures the internet remains a vibrant platform for any individual, startup, or company to provide new, innovative, and competitive offerings without needing to worry that access to their offerings may be blocked or degraded for anticompetitive purposes.” Because we find that BIAS providers have the incentive and ability to throttle or otherwise interfere with traffic of competing content providers, we conclude that a bright-line rule prohibiting throttling, subject to reasonable network management, is necessary. Further, we believe that the bright-line rule we adopt in the Order to protect consumers’ right to access lawful internet traffic of their choice without impairment or degradation will not impose significant compliance burdens or costs, particularly given that many BIAS providers continue to advertise on their website that they do not throttle traffic except in limited circumstances. Finally, we disagree with commenters that argue that concerns about throttling lack persuasiveness, citing the datedness of examples provided in the record. Professor David Choffnes explains that data show that “nearly every cellular provider that offers mobile BIAS in the US throttles at least one video streaming service,” explaining that there is “direct empirical evidence that ISPs in the US . . . [use] special networking equipment called middleboxes that inspect the contents of our network traffic to make guesses as to what application is being used, and then potentially limit the bandwidth available to that application in response.” While we do not rely on these findings as justification for the no-throttling rule, they remain instructive regarding BIAS providers’ technical ability to throttle traffic.

c. No Paid or Affiliated Prioritization

490. We reinstate the prohibition on paid or affiliated prioritization practices, subject to a narrow waiver process. In the 2023 Open Internet NPRM, the Commission proposed to reestablish a ban on arrangements in which a BIAS provider accepts consideration (monetary or otherwise) from a third party to manage its network in a manner that benefits particular content, applications, services, or devices, or manages its network in a manner that favors the content, applications, services, or devices of an affiliated entity. The Act defines “affiliate” as “a person that (directly or indirectly) owns or controls, is owned or controlled by, or is under common ownership or control with, another person. For purposes of this paragraph, the term ‘own’ means to own an equity interest (or the equivalent thereof) of more than 10 percent.” After consideration of the record, we conclude that paid prioritization network practices harm consumers, competition, and innovation, as well as create disincentives to promote broadband deployment and, as such, we reinstate a bright-line rule prohibiting such practices.

491. We adopt the following paid prioritization rule applicable to BIAS providers, which tracks the language of the Commission’s 2015 Open Internet Order, providing that a person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not engage in paid prioritization. “Paid or prioritization” refers to the management of a broadband provider’s network to directly or
indirectly favor some traffic over other traffic, including through use of techniques such as traffic shaping, prioritization, resource reservation, or other forms of preferential traffic management, either (a) in exchange for consideration (monetary or otherwise) from a third party, or (b) to benefit an affiliated entity.

492. We find that the same concerns present in 2015 remain true in the Order, that preferential treatment arrangements have the potential to create a chilling effect, disrupting the Internet’s virtuous cycle of innovation, consumer demand, and investment. While small BIAS providers argue that they have neither the incentive nor market power to limit access to edge provider applications, services, and devices, and “reciprocally to control or limit edge provider access to their small customer bases,” for the reasons we describe below we find it appropriate to establish a bright-line rule applicable to all BIAS providers in order to provide certainty to BIAS and edge providers alike. In the 2023 Open Internet NPRM, we tentatively concluded that, absent open Internet rules, BIAS providers might engage in practices that “could unravel the virtuous cycle” and that there are “far more edge services that are small . . . which the RIF Order does not acknowledge or evaluate.” We sought comment on these tentative conclusions and on whether small edge providers had any leverage in negotiations with BIAS providers and on whether BIAS providers “seeking paid prioritization arrangements . . . would disproportionately harm small edge providers. As discussed above, we find, in general, that BIAS providers have the incentive and ability engage in conduct that harms edge providers, particularly small edge providers. Based on the record and related research on competition in vertically related markets, we find more specifically that forms of paid and affiliate prioritization can be used by BIAS providers in ways that may harm edge providers and edge innovation. In particular, BIAS providers may use paid or affiliated prioritization to raise the costs of edge providers that compete with their vertically integrated edge affiliates or with edge providers with whom they have a contractual arrangement. In addition, if BIAS providers can profitably charge edge providers for prioritized access, they may have the incentive to strategically degrade, or decline to maintain or increase, the quality of non-prioritized uses and users in order to raise the profits from selling priority access. Thus, BIAS providers might withhold or decline to expand capacity in order to “squeeze” and degrade nonprioritized traffic, thus increasing network congestion. These types of conduct create competitive disadvantages for unaffiliated edge providers. Other things being equal, they increase the costs of innovation for edge providers and reduce the number of innovation experiments. In turn, this will likely decrease the rate of edge and network innovation.

493. The Commission has previously found it well established that BIAS providers have both the incentive and the ability to engage in paid prioritization. In its Verizon opinion, the D.C. Circuit noted the powerful incentives BIAS providers have to accept fees from edge providers in return for excluding their competitors or for granting prioritized access to end users. The record reflects commenters concerns regarding preferential treatment arrangements, with many advocating for a flat ban on paid prioritization. Commenters argue, for example, that permitting paid prioritization will result in a two-tiered internet, with a “fast” lane for those willing and able to pay, and a “slow” lane for everyone else. Other commenters argue that paid prioritization will distort the market: harm competition, consumers, edge providers (particularly small edge providers), and free expression; and discourage innovation. The American Library Association also expressed concern that permitting paid prioritization would advantage “non-profit or public interest entities such as libraries and other public institutions that often operate under very tight budgets.”

494. Our concerns regarding paid prioritization are compounded by the fact that documenting the harms could prove challenging, as it is impossible to identify small businesses and new applications that are stifled before they become commercially viable. We are also concerned that the widespread use of paid prioritization practices would cause damage to internet openness that would be difficult to reverse. As we noted in the 2023 Open Internet NPRM, we find it encouraging that some BIAS providers continue to advertise that they do not engage in paid or affiliated prioritization practices. As with our no-blocking and no-throttling bright-line rules, however, we continue to believe that the potential harm to the open Internet is too significant to rely on promises from BIAS providers because “the future openness of the Internet should not turn on the decision[s] of a particular company.”

495. The record reflects some positive use cases of paid prioritization, and conversely, some costs associated with a ban on such practices. For example, ADTRAN asserts that “requiring free prioritization ignores the costs that are incurred in enabling that service and encourages over-consumption,” and also highlights uses of paid prioritization in other settings. The International Center for Law and Economics emphasizes the importance of prioritization when congestion is detected on the network. While we do not discount the potential benefits of paid prioritization, we remain convinced that the potential harms to consumers and the open Internet outweigh any speculative benefits. 496. As in 2015, we find that there are advantages to adopting a bright-line rule prohibiting paid prioritization. For one, we believe it will protect consumers against a harmful practice that may be difficult to understand, even if disclosed. In addition, this approach relieves small edge providers, innovators, and consumers of the burden of detecting and challenging instances of harmful paid prioritization. Prohibiting paid prioritization outright will also likely help foster broadband network investment by setting clear boundaries of acceptable and unacceptable behavior. Thus, we find it most appropriate to adopt a bright-line rule banning paid prioritization arrangements, while entertaining waiver requests under limited circumstances. Consistent with the 2015 Open Internet Order and the record, we clarify that the ban on paid prioritization does not restrict the ability of a BIAS provider to enter into an agreement with a CDN to store content locally within the BIAS provider’s network.

497. Under the Commission’s longstanding waiver rule, the Commission may waive any rule in whole or in part, for good cause shown. A general waiver of the Commission’s rules is only appropriate if special circumstances warrant a deviation from the general rule and such a deviation will serve the public interest. In 2015, the Commission found that it was appropriate to adopt specific rules concerning the factors that it will use to examine a waiver request of the paid prioritization ban, and we proposed to adopt a waiver rule for the paid prioritization ban consistent with the 2015 Open Internet Order. We conclude that it remains appropriate to accompany a rule prohibiting paid prioritization arrangements with specific guidance on how the Commission would evaluate subsequent waiver requests.
Accordingly, we adopt a rule concerning waiver of the paid prioritization ban that establishes a balancing test, consistent with our proposal, providing that the Commission may waive the ban on paid prioritization only if the petitioner demonstrates that the practice would provide some significant public interest benefit and would not harm the open nature of the internet.

In accordance with the framework established in 2015, applicants seeking a waiver of the paid prioritization ban will be required to make two related showings. First, the applicant must demonstrate that the practice will have some significant public interest benefit. The applicant can make such a showing by providing evidence that the practice furthers competition, innovation, consumer demand, or investment. Second, the applicant must demonstrate that the practice does not harm the open nature of the internet, including, but not limited to, providing evidence that the practice (i) does not materially degrade or threaten to materially degrade the BIAS of the general public; (ii) does not hinder consumer choice; (iii) does not impair competition, innovation, consumer demands, or investment; and (iv) does not impede any forms of expression, types of service, or points of view. An applicant seeking waiver relief under this rule faces a high bar. We anticipate approving such exemptions only in exceptional cases.

We disagree with commenters that assert that delays associated with the waiver process will deter investment and innovation in prioritization services. As an initial matter, we find that prioritization services themselves generally deter investment and innovation. In any event, the Commission has shown itself capable of handling a variety of different types of waiver requests on a timely basis, so assertions about delay are speculative at this juncture. We also disagree with the parties that suggest the waiver process we re-adopt in the Order provides insufficient protection to potential waiver applicants. We are not merely relying on the Commission’s general longstanding waiver standard and instead provide specific factors that the Commission will evaluate in considering such waiver requests, which, for instance, provide guidance on how a party might show a “public benefit” or show how the conduct “does not harm the open nature of the internet.”

2. General Conduct Rule

In addition to the three bright-line rules, we also reinstate a no-unreasonable interference/disadvantage standard, under which the Commission can prohibit practices that unreasonably interfere with the ability of consumers or edge providers to select, access, and use BIAS to reach one another, thus causing harm to the open internet. This no-unreasonable interference/disadvantage general conduct standard will operate on a case-by-case basis, applying a non-exhaustive list of factors, and is designed to evaluate other current or future BIAS provider policies or practices—not covered by the bright-line rules—and prohibit those that harm the open internet. Our prohibitions on blocking, throttling, and paid prioritization are critical to protecting and promoting the open internet, and we expect that these bans will prevent many of the harms identified above. We conclude, however, as the Commission found in 2015, that the Commission needs a mechanism to enable it to respond to attempts by BIAS providers to wield their gatekeeper power in ways that might otherwise compromise the open internet. In other words, the general conduct rule is a necessary backstop to ensure that BIAS providers do not find a technical or economic means to evade the bright-line prohibitions on blocking, throttling, and paid prioritization.

In the 2023 Open Internet NPRM, we proposed adopting a general conduct rule that tracks the language and approach that the Commission adopted in the 2015 Open Internet Order. We sought comment on our analysis that a general conduct rule is still needed as a backstop to the three bright-line prohibitions we proposed, and on the need and characteristics of any potential modifications we should make to the version of the rule that the Commission had previously adopted, if commenters deemed such a rule necessary. We also sought comment on the accuracy of the RIF Order’s critiques that the general conduct rule was “vague and had created regulatory uncertainty in the marketplace hindering investment and innovation.” The Commission might take to increase BIAS providers’ understanding of potentially prohibited practices under a re-adopted rule.

The Commission has long identified the need to protect consumers and edge providers from discriminatory conduct by BIAS providers. In 2010, the Commission enshrined this goal in a no-unreasonable discrimination rule that enabled the Commission to evaluate, on a case-by-case basis, the conduct of fixed BIAS providers based on a number of factors. At the time, the 2010 Open Internet Order exempted mobile BIAS providers from the anti-discrimination rule. When challenged, the D.C. Circuit accepted the Commission’s underlying policy rationale for the regulations in the 2010 Open Internet Order, including its nondiscrimination rule; however, the court vacated the Commission’s anti-discrimination and no-blocking rules for imposing de facto common carrier status on BIAS providers in violation of the Commission’s then-classification of BIAS as an information service. In 2015, when the Commission reclassified BIAS as a telecommunications service, it adopted a revised general conduct rule that was designed to prevent BIAS providers from unreasonably interfering with, or disadvantaging, consumers’ ability to reach the internet content, services, and applications of their choosing or edge providers’ ability to access consumers using the internet. The D.C. Circuit subsequently upheld the 2015 Open Internet Order in full, including the Commission’s new no-unreasonable interference/disadvantage standard (i.e., the 2015 general conduct rule).

We agree with the goals of the Commission’s previous nondiscrimination and general conduct rules, and we conclude that such a rule is still needed as a backstop to the bright-line prohibitions on blocking, throttling, and paid prioritization to protect the open nature of the internet. Accordingly, we adopt the following general conduct rule to address unreasonable discrimination, providing that any person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not unreasonably interfere with or unreasonably disadvantage (a) end users’ ability to select, access, and use broadband internet access service or the lawful internet content, applications, services, or devices of their choice, or (b) edge providers’ ability to make lawful content, applications, services, or devices available to end users. Reasonable network management shall not be considered a violation of this rule.

For the purposes of this rule, we define “edge provider” as “any individual or entity that provides any content, application, or service over the internet, and any individual or entity that provides a device used for accessing any content, application, or service over the internet.” And we define “end user” as “any individual or entity that uses a broadband internet access service.” Consistent with the Commission’s guidance in 2015, we note that the general conduct standard we adopt in the Order “represents our...
interpretation of sections 201 and 202 in the broadband internet access context and, independently, our interpretation—upheld by the Verizon court—that rules to protect internet openness promote broadband deployment via the virtuous cycle under section 706 of the 1996 Act.”

505. We find that this rule is necessary to protect the ability of consumers and edge providers to use the open internet for several reasons. First, we agree with the American Civil Liberties Union and other commenters that the rule will allow the Commission to respond to harmful conduct not easily categorized as blocking, throttling, or paid prioritization. Second, because of the “constantly evolving nature of technologies underlying the internet ecosystem,” it is difficult to predict all of the practices that might harm the openness of the internet, and we agree with those commenters, such as the Ad Hoc Telecom Users Committee and Cloudflare, who argue that the Commission needs flexibility to address consumer and competitive harms as technology evolves. And third, the general conduct rule will provide the Commission a means of addressing BIAS providers that develop policies and practices that evade the bright-line prohibitions. As Professor Jon Peha notes, even with the adoption of the bright-line rules, BIAS providers would still have the incentive to act as gatekeepers.

506. Consistent with our proposal, we adopt a case-by-case approach that will consider the totality of the circumstances when analyzing whether conduct satisfies the general conduct standard to protect the open internet. We endeavor to maintain an internet ecosystem that balances the Commission’s ability to protect consumers and edge providers from harmful conduct, while still allowing BIAS providers the flexibility and encouragement to develop new technologies and business practices. We conclude, based on the record before us, that evaluating potential conduct on a case-by-case basis will allow the Commission to respond to emerging practices that may harm the open nature of the internet while enabling BIAS providers to offer innovative services that keep pace with evolving technology and business practices. We make clear that the general conduct rule is not an attempt to institute any form of rate regulation; nor is it an attempt by the Commission to expand our bright-line conduct rules in an indeterminate manner. The general conduct rule is designed to operate as a backstop to the Commission’s prohibitions on blocking, throttling, and paid prioritization to address, on a case-by-case basis, practices that may harm the open nature of the internet.

507. To provide guidance to BIAS providers regarding the application of the general conduct rule, we adopt a non-exhaustive list of factors that we will consider to aid in our analysis. These factors include: (i) whether a practice allows end-user control and enables consumer choice; (ii) whether a practice has anticompetitive effects in the market for applications, services, content, or devices; (iii) whether a practice affects consumers’ ability to select, access, or use lawful broadband services, applications, or content; (iv) the effect a practice has on innovation, investment, or broadband deployment; (v) whether a practice threatens free expression; (vi) whether a practice is application agnostic; and (vii) whether a practice conforms to best practices and technical standards adopted by open, broadly representative, and independent internet governance initiatives, or standards-setting organizations. Consistent with the 2015 Open Internet Order, we note that in addition to this list, there may be other considerations relevant to determining whether a particular practice violates the no-unreasonable interference/disadvantage standard. We decline to adopt the New York State School Boards Association’s proposal that we adopt an additional factor that “weighs whether a practice will inhibit the ability of educational institutions to provide educational materials to students.” We believe that the educational access concerns raised are adequately covered by the existing “free expression” and “consumer ability to access” factors or could be considered on a case-by-case basis as needed.

508. When the D.C. Circuit upheld the general conduct rule as adopted in the 2015 Open Internet Order, it recognized the need to build flexibility into the rule. The court noted that, if regulations were too specific, it would open up large loopholes, a concern that the court observed was especially applicable because of the speed at which broadband technology evolves. We conclude that evaluating potential conduct against these factors will allow BIAS providers to “reasonably discern whether certain practices would violate the rule,” and that “having clear standards for evaluation of questionable behavior in the form of the general conduct factors . . . will permit more rapid resolution of potentially harmful practices.” To address concerns raised in the record concerning the meaning of the factors, how the factors will be weighed against each other, and the list’s non-exhaustive nature, we describe in detail each of the factors below and establish an advisory opinion process for BIAS providers to seek Commission advice on potential conduct, if they so choose. We anticipate that the factors we outline for consideration of practices will provide important guideposts for consumers, edge providers, and BIAS providers on whether practices are likely to unreasonably disadvantage or interfere with end users’ ability to reach the internet content, services, and applications of their choosing or of edge providers to access consumers using the internet.

509. End-User Control. We reaffirm our conclusion from the 2015 Open Internet Order and find that a practice that allows end-user control and that is consistent with promoting consumer choice is less likely to unreasonably interfere with or cause an unreasonable disadvantage affecting the end user’s ability to use the internet as he or she sees fit. It is critical that consumers’ decisions, rather than those of BIAS providers, remain the driving force behind the development of the internet. We observe that there are competing narratives surrounding certain mobile plans that provide different video resolution levels. We find that the current record lacks sufficient specificity about specific plans to make a definitive determination. Practices that favor end-user control and empower meaningful consumer choice are more likely to satisfy the general conduct standard than those that do not. As the Commission recognized in 2010 and 2015, we remain aware of the reality that user control and network control are not mutually exclusive. Rather, practices will fall somewhere on a spectrum between more end-user control and more BIAS provider control. There also may be practices that involve complete BIAS provider control that nonetheless satisfy the general conduct rule. Some commenters point to the fact that the Commission recognizes this range between end-user control and BIAS provider control as evidence of this factor’s vagueness problem. However, we find that our approach is consistent with the Commission’s regulatory approach in other contexts that require the Commission, and providers, to balance competing interests, and we believe that this approach provides appropriate guidance to BIAS providers while still enabling them to experiment and innovate with practices that function across this
spectrum. We emphasize that in all practices, BIAS providers should be fully transparent to the end user and effectively reflect end users’ choices. The Electronic Frontier Foundation asserts that “in practice transparency is a poor substitute for meaningful choice.” As part of our case-by-case analysis for this factor, the Commission will examine whether transparency regarding the practice at issue actually enables meaningful consumer choice.

510. Competitive Effects. As discussed above, we find that BIAS providers have incentives to interfere with and disadvantage the operation of third-party internet-based services that compete with the providers’ own services or with those of an edge provider with which the BIAS provider has a contractual relationship. A practice that has anticompetitive effects in the market for applications, services, content, or devices would likely unreasonably interfere with, or unreasonably disadvantage, edge providers’ ability to reach consumers in ways that would have a dampening effect on innovation, interrupting the virtuous cycle. We find that practices like this, i.e., anticompetitive practices, are likely to harm consumers’ and edge providers’ ability to use BIAS to reach one another. For example, fees that discourage consumer choice among BIAS providers could fall within the rule’s scope. In contrast, more competition leads to more options for consumers in services, applications, content, and devices. Therefore, we find that practices that would enhance competition would weigh in favor of promoting consumers’ and edge providers’ ability to use BIAS to reach one another. We disagree with Free State Foundation’s contention that considering the competitive effects of a practice is unhelpful because it is not tied to particular economic theory.

Commission staff, and in particular the Commission’s Office of Economics and Analytics, is well versed in examining the competitive effects of our rules and of industry practices, using generally accepted economic theory and analytical techniques. And this is particularly true where the Commission has examined potentially anticompetitive conduct by vertically integrated firms. For example, since the introduction of competition into the interstate long-distance telephone market, the Commission has repeatedly investigated claimed anticompetitive concerns raised by vertically integrated firms, and as part of the Commission’s review of the competitive effects of a given practice, we will also review the relevant entities’ corporate structure, to consider the extent of an entity’s vertical integration as well as its relationships with affiliated entities.

511. Consumer Protection. As in 2015, we intend the general conduct rule to act as a strong consumer protection standard. It prohibits BIAS providers from employing any deceptive or unfair practice that will unreasonably interfere with or unreasonably disadvantage end-user consumers’ ability to select, access, or use broadband services, applications, or content, so long as the services are lawful, subject to the exception for reasonable network management. For example, unfair or deceptive billing practices, as well as practices that fail to protect the confidentiality of end users’ proprietary information, will be unlawful if they unreasonably interfere with or unreasonably disadvantage end-user consumers’ ability to select, access, or use broadband services, applications, or content, so long as the services are lawful, subject to the exception for reasonable network management. The Commission explained in 2015, while each practice will be evaluated on a case-by-case basis, this rule is intended to include protection against fraudulent practices such as “cramming” and “slamming” that have long been viewed as unfair and disadvantageous to consumers.

512. Effect on Innovation, Investment, or Broadband Deployment. We continue to find that internet openness drives a “virtuous cycle” in which innovations at the edges of the network enhance consumer demand, leading to expanded investments in broadband infrastructure that, in turn, spark new innovations at the edge. As such, a practice that will act to stifle innovation, investment, or broadband deployment would likely unreasonably interfere with or unreasonably disadvantage end users’ or edge providers’ use of the internet.

513. Free Expression. Consistent with the Commission’s findings in the 2015 Open Internet Order, we believe that practices that threaten the use of the internet as a platform for free expression would also likely unreasonably interfere with or unreasonably disadvantage consumers’ and edge providers’ ability to use broadband service to communicate with each other, thereby causing harm to that ability. Such practices, in turn, would dampen consumer demand for broadband services, disrupting the virtuous cycle, and harming end user and edge provider use of the internet under the general conduct rule we adopt in the Order. As the Commission explained in 2015, we find that the general conduct standard we adopt in the Order does not unconstitutionally burden any of the First Amendment rights held by BIAS providers because BIAS providers are conduits, not speakers, with respect to BIAS.

514. Application Agnosticism. We further find that application-agnostic (sometimes referred to as use-agnostic) practices likely will not cause an unreasonable interference with or an unreasonable disadvantage to end users’ or edge providers’ ability to use BIAS to communicate with each other. Because application-agnostic practices do not interfere with end users’ choices about which content, applications, services, or devices to use, neither do they distort competition and unreasonably disadvantage certain edge providers, they likely would not cause harm by unreasonably interfering with or unreasonably disadvantaging end users’ or edge providers’ ability to communicate using BIAS. A network practice is application-agnostic if it does not differentiate in treatment of traffic, or if it differentiates in treatment of traffic without reference to the content, application, or device. We will consider a practice to be application-specific if it is not application-agnostic. Application-specific network practices include, for example, those applied to traffic that has a particular source or destination, that is generated by a particular application or by an application that belongs to a particular class of applications, that uses a particular application- or transport-layer protocol, or that has particular characteristics (e.g., the size, sequence, and/or timing of packets). There may still be circumstances where application-agnostic practices raise competitive concerns, and as such may violate our standard to protect the open internet. As with all practices, the Commission will evaluate these situations on a case-by-case basis.

515. Standard Practices. Lastly, in evaluating whether a practice violates our general conduct rule, we will consider whether a practice conforms to best practices and technical standards adopted by open, broadly representative, and independent internet engineering, governance initiatives, or standards-setting organizations. These technical advisory groups play an important role in the internet ecosystem, and at times are convened by the Commission. We make clear, however, that we are not delegating authority to interpret or implement our rules to outside bodies.

516. Rejection of Alternatives. We do not adopt the alternative approaches to the general conduct rule suggested in the record, including:
reliance on the “just and reasonable” language of sections 201 and 202; prohibiting unreasonable discrimination; assessing only whether the practice at issue promotes or hinders free expression, and whether the practice is “application agnostic”; or adopting a “commercial reasonableness” standard for overseeing BIAS provider conduct under section 706 of the 1996 Act and our ancillary authority. As we explain above, we find it important for the Commission to be able to weigh all of the factors we describe in order to provide the maximum flexibility to providers in managing their networks and developing innovative services, plans, and packages for customers, particularly given the rapidly developing and evolving technological landscape in both the network and at the edge, and some of the proposed alternatives would not advance that interest as well as the rule we adopt. We agree with commentators that evaluating conduct using the multi-factor analysis under the general conduct rule will likely result in faster resolution for BIAS providers, and is easier for consumers and edge providers to use when evaluating BIAS provider conduct. We also find that, as a general matter, practices evaluated under the alternative standards outlined in the record would likely result in the same outcome if evaluated under the general conduct standard we adopt in the Order, given the substantial overlap in the factors. For example, Professor Jon Peha explains that under a bright-line prohibition against unreasonable discrimination, it would be permissible if a subscriber chose for their BIAS provider to discriminate in order to ensure that a telemedicine application receives superior quality of service. As part of its consideration of the practice under the general conduct standard we adopt, the Commission would weigh the fact that the practice allows end-user control and is consistent with promoting consumer choice. However, we believe the factors we outline for consideration of practices will provide more clarity to consumers, edge providers, and BIAS providers, as well as more flexibility for BIAS providers to innovate. We consequently find that the additional guidance provided by our general conduct rule has certain advantages for case-by-case adjudications over proceeding purely under the text of sections 201 and 202 alone. Finally, as the Commission concluded in 2015, we are unpersuaded that a prohibiting unreasonable practices is the most appropriate approach for protecting and promoting an open internet. Internet openness involves many relationships that are not business-to-business and serves many purposes that are noncommercial. Further, smaller edge providers also may not “have the resources to fight against commercially unreasonable practices, which could result in an unfair playing field before the Commission,” potentially stifling innovation and harming competition.

517. We conclude that the language we adopt in the Order offers sufficient clarity to BIAS providers, consumers, and edge providers on what conduct is prohibited, while still allowing and encouraging innovation and technological development. We disagree with those commentators who argue that the proposed general conduct rule is too vague and unclear, and that the rule’s alleged vagueness would cause regulatory uncertainty that will stifle investment and harm innovation. Because of the insight into our approach provided by the rule itself and our guidance above, we conclude that stakeholders have more clarity—not less—than they would have had if we relied on sections 201 and 202 of the Act alone. We nevertheless retain authority to address practices under sections 201 and 202 of the Act except to the extent that we forbear from doing so.

518. Second, our advisory opinion process is available to allow BIAS providers to seek a determination of the legality of a practice, without having to actually engage in that practice and risk being held in violation in order to obtain a decision. As explained below, the Enforcement Bureau will not bring an enforcement action against a requesting party with respect to any action taken in good faith reliance upon an advisory opinion if all of the relevant facts were fully, completely, and accurately presented to the Bureau, and where such action was promptly discontinued upon notification of recission or revocation of the Commission’s or the Bureau’s approval.

519. Third, although we conclude that our rule, coupled with the guidance above, gives providers warning of a range of prohibited conduct, our priority with this rule is ensuring that harmful practices can be stopped when they are identified. Thus, although we certainly will consider the imposition of penalties when specific interpretations or applications of our rule address particular conduct, we otherwise will focus on ensuring that the provider’s behavior going forward. This is consistent with the approach the Commission has taken in the past in cases of violations of internet policy.

520. Finally, as the D.C. Circuit found in 2016 when it upheld the 2015 Open Internet Order in full, the Commission’s general conduct rule is not impermissibly vague, and provides sufficient notice to the affected entities of what conduct would be prohibited moving forward. We adopt the same rule and framework in the Order that the D.C. Circuit upheld in 2016, and, as discussed further below, we conclude that the general conduct rule, and the multi-factor framework we offer to provide guidance on its application, provides BIAS providers sufficient notice regarding what conduct is prohibited under the rule.

521. Application to Zero Rating. In the 2023 Open Internet NPRM, we sought comment on whether there were additional steps we should take to ensure that BIAS providers understand the types of conduct and practices that might be prohibited under the proposed general conduct standard, asking, for example, whether “there are any zero rating or sponsored data practices that raise particular concerns under the proposed general conduct standard.” Based on the record, and consistent with the 2015 Open Internet Order and our proposal, we find it appropriate to assess zero-rating programs under the general conduct standard to determine whether such practices cause harm to the open nature of the internet. We address the implications of our decision on zero rating on California’s net neutrality law in the preemption discussion. We acknowledge that sponsored data programs—where a BIAS provider zero rates an edge product for economic benefit, either by receiving consideration from a third party to have the edge product zero rated or where a BIAS provider favors an affiliate’s edge products—raise concerns under the general conduct standard. Nonetheless, we will continue to evaluate such programs based on a totality of the circumstances.

522. Zero rating is the practice of a BIAS provider exempting edge services, devices, applications, and/or content (edge products) from an end user’s usage allowance or data cap. Zero rating enables the BIAS provider to make some edge products cheaper to access, which can put those edge products at an advantage over others. In the 2015 Open Internet Order, the Commission recognized that zero rating had the potential to distort the market and incentivize restrictive caps, but noted that zero rating can provide benefits depending on how they are structured, could benefit consumers and competition.”
Based on this, the Commission stated that it would “look at and assess such practices under the no-unreasonable interference/disadvantage standard, based on the facts of each individual case, and take action as necessary.”

523. The record indicates that zero-rating programs can be structured in a manner that benefits consumers, competition, and traffic management. Allowing a mechanism that lowers the cost of accessing certain edge products could be beneficial to consumers, and at least one commenter contends that zero-rating programs can help bring new entrants online.

524. However, the record also reveals concerns about certain forms of zero rating, such as where BIAS providers use zero rating to favor some edge products over others, especially as a business practice in exchange for consideration or to favor a provider’s affiliates. Commenters claim that since adoption of the 2015 Open Internet Order, BIAS providers have adopted such practices that favor affiliates and charge competing edge providers high per-gigabyte rates. Commenters express concern that where there is an economic incentive to use zero rating to favor some edge products over others, zero rating can create the same harms to the open internet as paid prioritization.

Further, the record reflects that sponsored data programs may favor large edge providers, as they are the only providers that can afford to participate in such programs. These comments also suggest that zero rating, like paid prioritization, is a practice that could result in distortions in the internet market by creating negative externalities that raise the cost for the entire edge market, which can decrease innovation and harm the virtuous cycle.

525. Given the potential benefits and harms of zero-rating practices and their potential effect on the virtuous cycle, we will analyze zero-rating programs under the multi-factor analysis of the general conduct standard to ensure that innovative offerings are permitted and encouraged where the open internet is not harmed. By placing zero-rating programs under the general conduct standard, we do not preclude beneficial zero-rating innovations that may assist BIAS providers needing to manage scarce resources fairly and reasonably, while also potentially allowing lower-cost access to edge products of exceptional societal value or of value to particular consumers, as chosen by those consumers. But each zero-rating program can be different, and we find that a multi-factor analysis of the general conduct standard on a case-by-case basis allows for such innovations while curbing potentially market-distorting behavior by BIAS providers.

526. To provide greater clarity, we identify certain types of programs that may raise concerns under the general conduct standard because they may be more likely to unreasonably interfere with, or unreasonably disadvantage, consumers and edge providers. Specifically, a zero-rated program is likely to raise concerns under the general conduct standard where it zero rates an edge product (1) in exchange for consideration (monetary or otherwise) from a third party, or (2) to favor an affiliated entity. These sponsored data programs are examples of business practices that are not a part of reasonable network management and therefore fall outside of “best practices and technical standards” developed by standards-setting organizations. The information in the record regarding sponsored data programs offered since 2015 indicates that those programs raise concerns under the general conduct standard, in that they may unreasonably interfere with end users’ ability to select, access, and use BIAS or the lawful internet content, applications, services, or devices of their choice and unreasonably disadvantage edge providers’ ability to make lawful content, applications, services, or devices available to end users, raising the cost to bring innovative new options to the edge market. Thousands of express comments filed in the docket state that “[t]he agency must move forward on a strong rule that rejects zero rating.”

527. We are not convinced by commenters that argue that sponsored data programs should always be permitted because they lower the cost of subscribing to BIAS. The record suggests that zero-rating programs can increase the prices to consumers directly, and indirectly in the form of passed-through charges by the edge provider. Nor are we convinced by suggestions made by two commenters that sponsors pay the equivalent of toll free calling, presumably because with toll free calling, the business assumes the cost of the call rather than the consumer. On this basis alone, they suggest that sponsored data programs, like toll free calling, should be permitted. In suggesting that zero rating should be treated the same as toll free calling, however, one commenter notes that zero rating should still be “offered on a case-by-case basis including potential benefits.” We find this comparison to be unpersuasive, given the many distinctions between toll free calling in the telephony context, as compared to edge products offered over BIAS (e.g., an 800 number is used to reach a business, whereas the edge product is often the edge provider’s entire business; the edge provider might be dependent on the BIAS provider to reach the BIAS provider’s end users). Finally, other proponents of sponsored data zero-rating contend that such programs can increase consumer choice when accessing edge products.

However, other commenters suggest sponsored data zero-rating programs can distort consumer choice by pressuring consumers to access the cheaper edge products chosen for them by the BIAS provider, counter to the aims of an open internet. Despite these concerns, we will continue to evaluate such programs based on a totality of the circumstances, including potential benefits.

528. While we identify sponsored data programs as the type of practices that may raise concerns under the general conduct standard, subject to a totality of circumstances determination, we note that there could be other types of zero-rating practices that are less likely to raise concerns under the general conduct standard, again based on a case-by-case evaluation. For example, some commenters have asserted that zero rating all edge products during low traffic hours or zero rating all of the edge products within the same category of products would be unlikely to cause unreasonable interference/disadvantage to edge products, as well as being application agnostic under the general conduct rule factors. New America’s Open Technology Institute asks the Commission to clarify that it is “likely to find that a zero rating practice is unreasonably discriminatory if BIAS customers are offered an exemption from their data caps or limits for the applications, content or service provided by one or more specific edge providers to the exclusion of other similar or competing edge providers, whether or not the BIAS provider receives payment or is favoring an affiliate.” While zero rating all apps in the same category is more likely to be an acceptable zero rating practice under the general conduct standard, providers, acting in good faith, may have difficulty determining which apps should and should not be included in the same categories or have other logistical issues when including similar apps. Accordingly, we will review such zero rating on a case-by-case basis under the
general conduct standard. Professor van Schewick observes that there can be competitive concerns with any categorization. We will consider those practices, as well as any other zero-rating practices, under the general conduct standard, which relies on case-by-case review based on established factors.

529. Application to Data Caps. Data caps—also referred to as usage allowances or in some cases, a type of usage-based billing—are a BIAS provider restriction on the amount of data a customer can consume over a specified period of time (e.g., 25GB per month). Professor Scott Jordan urges the Commission to find that data caps that do not qualify as reasonable network management are likely to violate the general conduct standard. In particular, Professor Jordan explains that, based on his research, data caps that are not tailored to a primary purpose of managing congestion are likely to have negative effects on competition, network investments, broadband deployment, innovation, and investment by edge providers; and are likely to reduce end user control. In their white paper submitted by USTelecom and NCTA, Dr. Mark Israel et al. dispute Professor Jordan’s claims, asserting that usage-based pricing “offers a mechanism for broadband providers to create incentives for users to internalize the costs that they impose on broadband networks and to distribute the greater costs of the network onto those users that make greater use of the network while putting downward pressure on the prices that light users pay,” and that if such plans were prohibited by the Commission, “moderate and light users (including those with lower incomes) would likely be forced to pay more than if [data caps are] allowed.”

530. We agree with Professor Jordan that the Commission can evaluate data caps under the general conduct standard. We do not at this time, however, make any blanket determinations regarding the use of data caps based on the record before us. The record demonstrates that while BIAS providers can implement data caps in ways that harm consumers or the open internet, particularly when not deployed primarily as a means to manage congestion, data caps can also be deployed as a means to manage congestion or to offer lower-cost broadband services to consumers who use less bandwidth. As such, we conclude that it is appropriate to proceed incrementally with respect to data caps, and we will evaluate individual data cap practices under the general conduct standard based on the facts of each individual case, and take action as necessary.

3. Transparency Rule

531. Transparency has long been a key element of the Commission’s framework for protecting the open nature of the internet, recognized and upheld by both the courts and Congress, and in the Order, we update our transparency rule to reflect that important role. Specifically, we modify the transparency rule by reversing the changes made to the text of the rule under the BIF Order, restoring the requirements to disclose certain network practices and performance characteristics eliminated by the RIF Order, and adopting changes to the means of disclosure, including adopting a direct notification requirement. We find that these actions appropriately balance the benefits to consumers and edge providers and the costs to BIAS providers. As explained below, we find that any changes or modifications to disclosures required by the Broadscind Label Order (87 FR 76959 (Dec. 16, 2022)) are most appropriately addressed in response to that proceeding’s FNPRM (87 FR 77048 (Dec. 16, 2022)).

532. In the 2010 Open Internet Order, the Commission adopted a transparency rule that required a BIAS provider to “publicly disclose accurate information regarding the network management practices, performance, and commercial terms of its broadband internet access services sufficient for consumers to make informed choices regarding use of such services and for content, application, service, and device providers to develop, market, and maintain internet offerings.” The 2011 Advisory Guidance advised providers on appropriate methods for disclosing performance metrics, network practices, and commercial terms, and clarified how providers could comply with the requirement to provide such information to consumers at the “point-of-sale.” The 2014 Advisory Guidance reminded providers that their transparency rule disclosures and advertising claims must be consistent.

533. Finding that BIAS end-users and edge providers would be better served and informed by additional disclosures, the Commission adopted targeted, incremental enhancements to the 2010 transparency rule in the 2015 Open Internet Order requiring providers to disclose additional information about performance characteristics, commercial terms, and network practices. Specifically, in regards to performance characteristics, the Commission required providers to disclose all performance characteristics, including packet loss, for each broadband service offered, and mandated that all performance-related disclosures reasonably reflect the performance a consumer could expect in the geographic area in which the consumer would be purchasing service. The Commission also required that BIAS providers provide more precise information regarding commercial terms, including the full monthly service charge during the promotional period, the full monthly charge after the expiration of a promotional rate, any one-time or recurring fees or surcharges, and data caps and allowances.

Regarding network practices, the Commission required BIAS providers to make additional disclosures pertaining to congestion management, application-specific behavior, device attachment rules, and security. Lastly, the Commission required BIAS providers to directly notify end users “if their individual use of a network will trigger a network practice, based on their demand prior to a period of congestion that is likely to have a significant impact on the end user’s use of service.” To assist providers with compliance, the Commission also offered a voluntary broadband label “safe harbor.” Shortly thereafter, the Commission also adopted the 2016 Advisory Guidance, detailing acceptable methods for reporting performance characteristics and clarifying the “point-of-sale” requirements.

534. In 2017, however, the Commission reversed course and in the RIF Order eliminated the enhancements adopted by the 2015 Open Internet Order, including the requirements to: (1) disclose packet loss; (2) ensure performance related-characteristics reasonably reflect the performance a consumer could expect in the geographic area in which the consumer would be purchasing service; (3) ensure network performance is measured over a reasonable period of time and during times of peak service; (4) disclose any network practice applied to traffic associated with a particular user or user group, including any application-agnostic degradation of service to a particular end user; and (5) directly notify a user if an individual use of a network would trigger a network practice based on demand prior to a period of congestion that is likely to have a significant impact on the end user’s service. The Commission also eliminated the 2016 Advisory Guidance, which advised providers on how to report performance characteristics consistent with the 2015 Open Internet Order enhancements. Additionally,
because the RIF Order eliminated the bright-line rules prohibiting blocking, throttling, and paid or affiliated prioritization practices, the Commission revised the obligations of the transparency rule to require BIAS providers to disclose such practices. The Commission also revised the text of the rule to require that any person providing broadband internet access service shall publicly disclose accurate information regarding the network management practices, performance, and commercial terms of its broadband internet access services to enable consumers to make informed choices regarding the purchase and use of such services and entrepreneurs and other small businesses to develop, market, and maintain internet offerings, in order to reflect the Commission’s reliance on section 257 of the Act as authority for the transparency rule. The Verizon court upheld the transparency rule as a reasonable exercise of the Commission’s authority under section 706 of the 1996 Act. In the RIF Order, the Commission departed from its long-held view and instead concluded that the directives to the Commission in section 706 of the 1996 Act are better interpreted as hortatory, and not as grants of regulatory authority. As a result, the Commission relied on authority under section 257 of the Act for the transparency rule. Section 257(a) directs the Commission to “identify[, ] and eliminat[e] . . . market entry barriers for entrepreneurs and other small businesses in the provision and ownership of telecommunications services and information services, or in the provision of parts or services to providers of telecommunications services and information services.” Section 257(c) directed the Commission to triennially report to Congress on such marketplace barriers and how they have been addressed by regulation or could be addressed by recommended statutory changes. Congress later repealed subsection (c) of section 257 and replaced it with section 13, which imposes a substantially similar reporting requirement.

535. As part of the Infrastructure Act in 2021, Congress directed the Commission to promulgate rules for an FDA nutrition-style label of broadband facts to be displayed at the point-of-sale by providers based on the 2015 Open Internet Order broadband label safe harbor. In November 2022, the Commission adopted the Broadband Label Order implementing this congressional direction, which requires “ISPs to display, at the point of sale, labels that disclose certain information about broadband prices, introductory rates, data allowances, and broadband speeds, and to include links to information about their network management practices, [and] privacy policies.” The Commission recently declined broad reconsideration of the broadband label rules in the Broadband Label Reconsideration Order (88 FR 63853 (Sept. 18, 2023)) but does have an ongoing Broadband Label FNPRM (87 FR 77048 (Dec. 16, 2022)). Providers also must make clear whether the price for a given service is an introductory rate and, if so, what the price will be after the introductory period ends. Since April 10, 2024, providers with more than 100,000 subscribers have been obligated to display the broadband label.

a. Content of the Transparency Rule

536. We adopt the transparency rule originally adopted in 2010 and reaffirmed in 2015. Doing so caters to a broader relevant audience of interested parties than is identified in the RIF Order. As such, we revise the transparency rule to provide that a person engaged in the provision of broadband internet access service shall publicly disclose accurate information regarding the network management practices, performance, and commercial terms of its broadband internet access services sufficient for consumers to make informed choices regarding use of such services and for content, application, service, and device providers to develop, market, and maintain internet offerings.

537. The RIF Order revised the text of the transparency rule, which had been in place since 2010 and upheld by the courts twice as a lawful exercise of the Commission’s regulatory authority under section 706 of the 1996 Act, and independently under the Commission’s exercise of its authority under Title II. When the Commission found it did not have independent regulatory authority under section 706 in the RIF Order, finding instead that section 706 was “merely hortatory,” it eliminated the Commission’s underlying authority for the transparency rule. Instead, it chose to rely solely on section 257 of the Act and revised the text of the rule to reflect that reliance. As discussed further below, we reaffirm our interpretation of section 706 of the 1996 Act as an independent source of regulatory authority, and rely on our regulatory authority under section 706, our authority under Title II of the Act to prohibit unjust and unreasonable practices, and our authority under section 257 as the legal bases for the transparency rule. As such, we return to the prior formulation of the transparency rule, which more appropriately captures the relevant audience of BIAS providers’ transparency disclosures—content, application, service, and device providers. Reinstating the text of the transparency rule from the 2010 Open Internet Order is also consistent with the Commission’s finding in the Broadband Label Order that while the labels primarily serve as a quick reference tool, “the transparency rule seeks to enable a deeper dive into details of broadband internet service offerings, which could be relevant not only for consumers as a whole, but also for consumers with particularized interests or needs, as well as a broader range of participants in the internet community—notably including the Commission itself.” We find that content, application, service, and device providers are vital to the health of the internet ecosystem and that given their reliance on broadband services, returning the scope of the transparency rule to explicitly cover their interests is warranted and alleviates any confusion created by the changes adopted in the RIF Order.

538. Consistent with prior Commission guidance, we make clear that BIAS providers must maintain the accuracy of all disclosures. Thus, “whenever there is a material change in a provider’s disclosure of commercial terms, network practices, or performance characteristics, the provider has a duty to update the disclosure in a manner that is timely and prominently disclosed in plain language accessible to current and prospective end users and edge providers, the Commission, and third parties who wish to monitor network management practices for potential violations of open internet principles.” A “material change” is “any change that a reasonable consumer or edge provider would consider important to their decisions on their choice of provider, service, or application.”

539. Beginning with the 2010 Open Internet Order, the Commission has provided guidance on the network management practices, performance, and commercial terms that BIAS providers must disclose. We repeat the relevant guidance here, updated as appropriate based on the record.

Network Practices

  * Congestion Management.

Descriptions of congestion management practices, if any. These descriptions should include the types of traffic subject to practices; purposes served by practices; the practices’ effects on end
Application developers and device providers should also follow the procedures, if any; clearly explain their device and application certification criteria for any restrictions on the use of traffic that are subject to the practice, and the practice’s likely effects on end users’ experiences.

- **Affiliated Prioritization.** Any practice that directly or indirectly favors some traffic over other traffic, including through use of techniques such as traffic shaping, prioritization, or resource reservation, to benefit an affiliate, inclusion in the provision of the affiliate.

- **Paid Prioritization.** Any practice that directly or indirectly favors some traffic over other traffic, including through use of techniques such as traffic shaping, prioritization, or resource reservation, in exchange for consideration, monetary or otherwise.

- **Zero Rating.** Any practice that exempts edge services, devices, applications, and content (edge products) from an end user’s usage allowance or data cap.

- **Application-Specific Behavior.** Whether and, if applicable, where the provider blocks or rate-controls specific protocols or protocol ports, modifies protocol in ways not prescribed by the protocol standard, or otherwise inhibits or favors certain applications or classes of applications.

- **Device Attachment Rules.** Any restrictions on the types of devices and any approval procedures for devices to connect to the network. Mobile providers must disclose their third-party device and application certification procedures, if any; clearly explain their criteria for any restrictions on the use of their network, and expediently inform device and application providers of any decisions to deny access to the network or of a failure to approve their particular devices or applications. Mobile providers should also follow the guidance the Commission provided to licensees of the upper 700 MHz C Block spectrum regarding compliance with their disclosure obligations, particularly regarding disclosure to third-party application developers and device manufacturers of criteria and approval procedures (to the extent applicable).

For example, these disclosures include, to the extent applicable, establishing a transparent and efficient approval process for third parties, as set forth in Rule § 27.16(b).

- **Security.** Practices used to ensure end-user security or security of the network, including types of triggering conditions that cause a mechanism to be invoked (but excluding information that could reasonably be used to circumvent network security). As the Commission has previously explained, we expect BIAS providers to exercise their judgment in deciding whether it is necessary and appropriate to disclose particular security measures. We do not expect BIAS providers to disclose internal network security measures that do not bear on a consumer’s choices.

**Performance Characteristics**

- **Service Description.** A general description of the service, including the service technology, expected and actual access speed and latency, packet loss, and the suitability of the service for real-time applications. Fixed BIAS providers may use the methodology from the Measuring Broadband América (MBA) program to measure actual performance, or may disclose actual performance based on internal testing, consumer speed test data, or other data regarding network performance, including reliable, relevant data from third-party sources. BIAS providers that have access to reliable information on network performance may disclose the results of their own or third-party testing. Those mobile BIAS providers that do not have reasonable access to such network performance data may disclose a Typical Speed Range (TSR) representing the range of speeds and latency that can be expected by most of their customers, for each technology/service tier offered, along with a statement that such information is the best approximation available to the broadband provider of the actual speeds and latency experienced by its subscribers. Actual network performance data should be reasonably related to the performance the consumers would likely experience in the geographic area in which the consumer is purchasing service, and should be measured in terms of average performance over a reasonable period of time and during times of peak usage.

- **Impact of Non-BIAS Data Services.** What non-BIAS data services, if any, are offered to end users; whether and how any non-BIAS data services may affect the last-mile capacity available for, and the per-applicability and a description of whether the service relies on particular network practices and whether similar functionality is available to applications and services offered over BIAS.

**Commercial Terms**

- **Pricing.** For example, monthly prices, usage-based fees, other fees, data caps and allowances, and fees for early termination or additional network services. Monthly pricing shall include the full monthly service charge, and any promotional rates should be clearly noted as such, specified during the duration of the promotional period, and note the full monthly service charge the consumer will incur after the expiration of the promotional period. We clarify that price disclosure requirements, which have been part of the transparency rule since 2010, will not lead to the publishing of data that will act as a de facto tariff system, as the International Center for Law & Economics cautions. We observe that the transparency requirements, including publication of commercial terms, such as rates, have been upheld by the D.C. Circuit under section 706 and in any event, Congress specifically gave the Commission authority to require that broadband providers publish their rates in the IIJA. Other fees include all additional one time and/or recurring fees and/or surcharges the consumer may incur either to initiate, maintain, or discontinue service, including the name, definition, and cost of each additional fee. These may include modem rental fees, installation fees, service charges, and early termination fees, among others. BIAS providers should disclose any data caps or allowances that are a part of the plan the consumer is purchasing, as well as the consequences of exceeding the cap or allowance (e.g., additional charges, loss of service for the remainder of the billing cycle).

- **Privacy Policies.** For example, whether network management practices entail inspection of network traffic, and whether traffic information is stored, provided to third parties, or used by the carrier for non-network management purposes.

- **Redress Options.** Practices for resolving end-user and edge provider complaints and questions.

Below, we discuss in more detail our rationale for revisions to the current transparency rule.
extent that a provider engages in paid or affiliated prioritization subject to a Commission waiver. We agree with commenters who assert that the RIF Order created unnecessary confusion around the required network practice disclosures, and we reaffirm that providers must disclose congestion management practices, application-specific behavior, device attachment rules, and security practices. We also reaffirm that the transparency rule requires that BIAS providers disclose any practices applied to traffic associated with a particular user or user group, including any application-agnostic degradation of service to a particular end user. As the Commission explained in the 2015 Open Internet Order, for example, a BIAS provider “may define user groups based on the service plan to which users are subscribed, the volume of data that users send or receive over a specified time period of time or under specific network conditions, or the location of users.” We also require that “disclosures of user-based or application-based practices [must] include the purpose of the practice, which users or data plans may be affected, the triggers that activate the use of the practice, the types of traffic that are subject to the practice, and the practice’s likely effects on end users’ experiences.” In addition, we require BIAS providers to disclose any zero-rating practices, specifically, any practice that exempts particular edge services, devices, applications, and content (edge products) from an end user’s usage allowance or data cap. We find that requiring disclosure of information pertaining to zero-rating practices will better enable the Commission and internet researchers to identify those zero-rating practices that may harm the openness of the internet. And as the Commission has previously explained, “[t]hese disclosures with respect to network practices are necessary: for the public and the Commission to know about the existence of network practices that may be evaluated under the rules, for users to understand when and how practices may affect them, and for edge providers to develop internet offerings.”

541. We decline the request by one commenter to require BIAS providers to make disclosures that would permit end users to identify application-specific usage or to distinguish which user or device contributed to which part of the total data usage. We find, as we did in the 2015 Open Internet Order, that collection of application-specific usage data by a BIAS provider may require use of deep packet inspection practices that may pose privacy concerns for consumers.

542. Performance Characteristics. We reinstate the enhanced performance characteristics disclosures eliminated by the RIF Order to require BIAS providers to disclose packet loss under the transparency rule. This proceeding is not the appropriate forum for us to determine whether such disclosures should be added to the broadband label as some commenters request, and in any event, the Commission recently declined this suggested addition to the broadband label in the Broadband Label proceeding. As Professor Scott Jordan explains, the three primary network performance metrics are speed (throughput), latency (end-to-end delay), and packet loss, which have been consistently recognized as such since the early days of the internet. Latency and packet loss are particularly relevant metrics to real-time applications. We agree with Professor Jordan that “both latency and packet loss are critical to the user-perceived performance of real-time applications,” such as video-conferencing applications, and the record reflects that the suitability of BIAS for real-time applications depends on both of these metrics. We believe that such information is also readily available to BIAS providers from commercial network performance measurement companies, along with speed and latency measurements.

543. Contrary to AT&T’s assertions that requiring disclosure of packet loss would be burdensome, we expect that many BIAS providers “already measure packet loss today, as this primary network performance metric is required in order to determine the suitability of their [services] for the real-time applications that are important to many of their customers.” As Professors Peha and Jordan explain, “measurements of latency, which are already required, inevitably enable simultaneous measures of packet loss with de minimis effort.” And to the extent CTIA argues that the Office of Management and Budget’s (OMB) previous “refusal to approve packet loss should foreclose collecting that information from mobile providers,” we disagree. We also note that interested parties will have the opportunity to comment on any burdens associated with these requirements pursuant to the Paperwork Reduction Act (PRA). In its 2016 review, OMB found that “packet loss will not be a required performance metric for mobile disclosures at this time, and directed the Commission to assess i. the practical utility of packet loss as it relates to mobile performance disclosure;” “ii. accurate methods of calculating mobile packet loss (i.e., drive testing, voluntary app, etc.);” and “iii. whether using voluntary consensus standards would be a viable alternative.” We agree with Professors Peha and Jordan that the “practical utility of packet loss as it relates to mobile performance is clearly established by the rapidly increasing number of end users who utilize video conference apps on their smartphones.” Finally, while we acknowledge that the Commission recently declined to require packet loss as part of the broadband label, the Commission nonetheless found that packet loss “may provide useful information to certain consumers.” We also observe that the disclosures required by the transparency rule serve to inform more than just consumers—they also serve edge providers and other interested third parties, including the Commission. Limiting the transparency rule requirements to information displayed via the broadband label would therefore not provide adequate insight for edge providers, internet researchers, certain consumers, or the Commission. As such, we reject arguments by commenters that the Commission should not require packet loss disclosure under the transparency rule because it declined to do so in the Broadband Label proceeding. To the extent commenters express concern regarding the performance characteristics disclosures required under the Broadband Label Order, the Broadband Label proceeding is the appropriate forum in which to address them.

544. We also reinstate the transparency requirements in the 2015 Open Internet Order and 2016 Advisory Guidance that require performance characteristics to be reported with greater geographic granularity and to be “measured in terms of average performance over a reasonable period of time and during times of peak usage.” The record reflects that mobile BIAS providers “have access to substantially different amounts of spectrum in different geographical regions, and thus speeds may vary substantially by region,” and that disclosure requirements with geographic granularity are “essential to determine real-time application performance and provide consumers with necessary information to make an informed choice.” We thus disagree with AT&T that disclosure of actual network performance should be shifted to the performance that consumers would likely experience in the geographic.
areas in which a customer is purchasing service is of “little to no meaningful or beneficial use for consumers to make informed decisions.” Further, we find that peak usage performance can differ substantially from non-peak usage period performance and from all day performance, and we agree that “peak usage period speeds are more useful information to consumers” than are speeds calculated from measurements over 24-hour periods. As such we find it appropriate to reinstate these enhancements to the transparency rule.  

545. We are not persuaded by AT&T’s assertions that reporting actual peak usage metrics on a geographically disaggregated basis would be “an enormous undertaking,” and agree with Professor Jordan that “it is implausible that broadband providers do not already today measure broadband performance in various geographical regions,” as providers likely use that information to inform their decisions regarding additional spectrum purchases in various geographical regions as well decisions about when and where to place additional cellular antennas to improve performance in these granular geographic areas.

546. In response to concerns about reporting peak usage in the record, we make clear that peak usage periods may be based solely on the local time zone, and that BIAS providers retain flexibility to determine the appropriate peak usage periods for their network performance metrics (but must disclose the peak usage periods chosen for such disclosure). We decline to otherwise codify specific methodologies for measuring the actual performance required by the transparency rule, finding, as in 2010 and 2015, that there is a benefit in permitting measurement methodologies to evolve and improve over time, with further guidance from Bureaus and Offices—like in 2011 and 2016—as to acceptable methodologies. We delegate authority to the Office of Engineering Technology (OET) and the Consumer and Governmental Affairs Bureau (CGB) to lead this effort. We expect this effort will include, among other things, examining the appropriate geographic measurement units for reporting. We need not determine, at this time, the accuracy of CTIA’s assertion that “consumers have no idea what [Cellular Market Areas (CMAs)] are, and even if they did, they likely would not know what CMA they are in at any given time since they use wireless on the go.” Consumers know where they live and likely purchased service from as long as BIAS providers “show the measurements associated with the CMA containing the user’s listed address,” as T-Mobile did for several years following the 2015 Open Internet Order, the consumer “does not have to know where the CMAs are, or even what a CMA is.”  

547. The record demonstrates, however, that unlike their larger counterparts, BIAS providers that have 100,000 or fewer broadband subscribers may generally lack access to the resources necessary to easily comply with these enhanced performance characteristic transparency requirements. As such, we temporarily exempt (with the potential to become permanent) BIAS providers that have 100,000 or fewer broadband subscribers as per their most recent FCC Form 477, aggregated over all affiliates of the provider, from the requirements to disclose packet loss and report their performance characteristics with greater geographic granularity and to be measured in terms of average performance over a reasonable period of time and during times of peak usage. We observe that our description of small providers to which we apply this exemption aligns with exceptions the Commission has previously provided for small providers, including the implementation of the Safe Connections Act, a longer implementation period for certain providers in the Broadband Label proceeding, a delayed deadline to implement ID authentication rules stemming from the TRACED Act, and in describing which small providers are exempt from certain rural call completion rules. While we believe that reinstituting these performance characteristic transparency enhancements will have minimal costs for most larger BIAS providers, we take seriously the concerns raised in the record about the additional compliance costs for small businesses. Moreover, we observe that the Commission provided a temporary exception (with the potential to become permanent) for some providers from the enhancements adopted in the 2015 Open Internet Order. In light of the concerns in the record, past precedent, and the expenditures BIAS providers that have 100,000 or fewer broadband subscribers have already made—and continue to make—to address the requirements adopted by the Broadband Label Order, we find that an exemption for these providers is supported in this case. We note that in each of those proceedings, the Commission specifically sought comment on, and considered the impact of, its proposals on small entities, consistent from the requirements of the Regulatory Flexibility Act. We delegate to CGB the authority to determine whether to maintain the exemption, and if so, the appropriate bounds of the exemption. We direct CGB to seek comment on the question and adopt an order announcing whether it is maintaining an exemption by no later than 18 months after publication of the Order in the Federal Register. WISPA also requests that the Commission apply any temporary or permanent exemptions to BIAS providers with 250,000 or fewer subscribers. WISPA provides no explanation as to how many additional small providers would be covered by its proposed change to the scope of our exemptions, nor does it explain why such an expansion in scope is needed, other than asserting that “[i]f exempting small ISPs from these rules was important in 2016, it is all the more important now given the other burdensome regulations that the Commission has imposed on BIAS providers.” As such, we decline to expand the temporary exemptions in the Order to BIAS providers with 250,000 or fewer subscribers.

548. We decline, however, to require disclosure of additional performance characteristics, as suggested by Measurement Lab, such as the source, location, timing, or duration of network congestion; and packet corruption and jitter. Noting that “congestion may originate beyond the broadband provider’s network and the limitations of a broadband provider’s knowledge of some of these performance characteristics,” the Commission specifically declined to require the source, location, timing, or duration of network congestion in 2015. The Commission also declined to include packet corruption and jitter because of concerns around the difficulty of defining metrics for such performance characteristics. We find that Measurement Lab fails to adequately address the concerns expressed by the Commission in the 2015 Open Internet Order and we thus decline to require these additional disclosures.

549. Commercial Terms. We find that additional disclosures pertaining to commercial terms are not necessary at this time. The broadband label now requires largely the same commercial term disclosures, including information about promotional rates, fees, and/or surcharges, and all data caps or data allowances as those the Commission required in the 2015 Open Internet Order. Thus, we find no need to restore the commercial term enhancements required by the 2015 Open Internet Order. To the extent the record suggests that additional pricing information, we find that a potential addition aimed at informing consumers...
about pricing would be best considered in the broadband label docket. We also decline to require more extensive privacy disclosures, as some commenters request, as we find that this is not the appropriate proceeding in which to address the content of BIAS providers’ privacy notices.

550. Requested Updates to the Broadband Label. The record indicates that in addition to packet loss, commenters urge a wide variety of additional disclosures or changes to the broadband label, including requirements to disclose speed ranges for fixed and mobile broadband; to change how speeds are reported (e.g., change “typical” speeds and latency to median speeds and median latency); to include specific privacy disclosures directly on the label; to incorporate network management tables directly on the label; to include cybersecurity disclosures; to include network reliability measurements (e.g., number of minutes of outage per year); and to include the labels on a user’s monthly bill (in addition to the point of sale). The Commission considered many of these requests as part of the record in the Broadband Label proceeding, and rejected them in the Broadband Label Order. We find that such requests are more properly considered in that proceeding, as are requests for additional changes or additions that were raised in the Broadband Label FNPRM.

b. Means of Disclosure

551. We agree with New America’s Open Technology Institute that “[t]o be truly ‘publicly available,’ these disclosures must be where the public would expect to find them—on provider websites marketing these services.” As such, we require providers to disclose all information required by the transparency rule on a publicly-available, easily-accessible website. We believe that consumers expect to find information about a provider’s services on the provider’s public website and that most consumers would not consider visiting the Commission’s website, particularly the ECFS, to find information about a provider’s services. We find that by requiring providers to provide disclosures on their own websites, consumers will have greater access, and if there is any additional cost to providers, it would be minimal. Ensuring disclosures under the transparency rule are accessible to individuals with disabilities remains a priority, and as such, we require BIAS providers to post the disclosures on their websites using an accessible format. Consistent with the Commission’s approach in the Broadband Label Order, we strongly encourage BIAS providers to use the most current version of the Web Content Accessibility Guidelines, an approach unopposed in the record.

552. Machine-Readable Format. As with the broadband label, we require that all transparency disclosures made pursuant to the transparency rule also be made available in machine-readable format. By “machine readable,” we mean providing “data in a format that can be easily processed by a computer without human intervention while ensuring no semantic meaning is lost.” The machine-readable disclosures should be made available in a spreadsheet file format such as the comma-separated values (.csv) format and be available on the same page and accessible via the same URL as the relevant “non-machine-readable” disclosures (e.g., network practice disclosures should be available in both the traditional narrative format and the machine-readable format on the same page of the provider’s website). We agree with commenters who note that machine readability enables interested parties to better compare the transparency disclosures of different companies. As a result, this information can be more easily studied by third parties and then more easily conveyed by those third parties to end users, who may otherwise be unable to, or uninterested in, understanding detailed privacy or network management practices. We find, therefore, that machine readable disclosures will further increase transparency. Notably, no commenter objects to this specific requirement in the record. We note that some commenters did object to the machine-readability requirement in the Broadband Label Order. In that proceeding, however, we found that transferring the data into machine-readable format did not impose a high burden upon providers or require a high degree of technical difficulty. As no commenter has raised any specific objections to machine-readability in the current proceeding we conclude that there is no reason to depart from the findings we made with regard to the machine-readability requirement for the broadband label.

c. Direct User Notification

553. Consistent with our findings in the 2015 Open Internet Order, we require BIAS providers to directly notify end users “if their individual use of a network will trigger a network practice, based on their demand prior to a period of congestion, that is likely to have a significant impact on the end user’s use of the service.” The Commission eliminated this requirement in the RIF Order, finding it “unduly burdensome” for BIAS providers, without any analysis. Commenters in opposition of such a requirement contend that because consumers are provided advance notice of network management practices, any subsequent notification about particular actions is unnecessary and unduly burdensome to providers.

As the Commission explained in the 2015 Open Internet Order, however, “[t]he purpose of such notification is to provide the affected end users with sufficient information and time to consider adjusting their usage to avoid application of the practice.” While our transparency rule requires BIAS providers to disclose details regarding their network practices, the record provides no evidence that consumers are easily able to track their usage to identify when their usage is likely to trigger a network practice so that they may then adjust their usage accordingly. We find that because providers must already monitor their networks in order to apply network practices when a user takes a particular action, a specific event occurs, or a data cap threshold is reached, providers are better positioned to advise customers about the circumstances surrounding the applied network practice than are users positioned to track and identify such occurrences on their own.

554. We are also skeptical of WTA’s assertion that “direct notification would entail major hardship and unnecessary expense for service providers to maintain accurate and up-to-date versions of the frequently changing lists of their customers and contact addresses (whether email, text or physical),” as providers need customer contact information for billing purposes. Thus, because providers must necessarily actively monitor their networks in order to apply network practices and already collect contact information for their users, we believe that any additional burden would come from identifying the particular application of a network practice and notifying the user. We do not anticipate that the burdens associated with notifying customers would be significant, as we expect that most providers who offer plans without unlimited data already provide an automated notification to users notifying them that they will be billed an additional fee for additional data upon reaching their data threshold or provide some method of tracking monthly usage. For example, mobile BIAS providers either automatically notify users when they will soon go over
a data cap or permit them to turn on data usage notifications. AT&T provides notification to users subject to a data threshold when they reach 75% of the threshold. Fixed providers with data caps also provide similar notifications or offer similar tools to track usage. Therefore, we find that the benefits to consumers outweigh any additional costs to BIAS providers, particularly since, as in 2015, we do not require real-time notifications.

555. Temporary Exemption for BIAS Providers with 100,000 or Fewer Broadband Subscribers. In response to concerns expressed in the record pertaining to the direct customer disclosure requirement, we provide a temporary exemption (with the potential to become permanent) to the direct notification requirement for BIAS providers that have 100,000 or fewer broadband subscribers as per their most recent FCC Form 477, aggregated over all provider affiliates. We observe that this temporary exemption aligns with the longer implementation period for the broadband label applicable to certain providers. We believe that providers that have 100,000 or fewer broadband subscribers are less likely to already have in place the tools and mechanisms needed to allow customers to track usage or provide automated direct notifications, and we therefore afford such providers additional time to develop appropriate systems. We delegate to CGB the authority to determine whether to maintain the exemption, and if so, the appropriate boundaries. We direct CGB to seek comment on the question and adopt an Order announcing whether it is maintaining an exemption no later than 18 months after publication of the Order in the Federal Register.

C. Reasonable Network Management

556. The record broadly supports maintaining an exception for reasonable network management. We agree that a reasonable network management exception to the no-blocking rule, the no-throttling rule, and the general conduct rule is necessary for BIAS providers to optimize overall network performance and maintain a consistent quality experience for consumers while carrying a variety of traffic over their networks. The transparency rule does not include an exception for reasonable network management. We clarify, however, that the transparency rule “does not require public disclosure of competitively sensitive information or information that would compromise network security or undermine the efficacy of reasonable network management practices.” Therefore, the no-blocking rule, the no-throttling rule, and the general conduct rule will be subject to reasonable network management for both fixed and mobile BIAS providers. We note that unlike conduct implicating the no-blocking, no-throttling, or general conduct rule, paid or affiliated prioritization is not a network management practice because it does not primarily have a technical network management purpose. In retaining the exception, we return to the definition of reasonable network management adopted by the Commission in 2015, providing that a network management practice is a practice that has a primarily technical network management justification, but does not include other business practices. A network management practice is reasonable if it is primarily used for and tailored to achieving a legitimate network management purpose, taking into account the particular network architecture and technology of the broadband internet access service.

557. When considering whether a practice violates the no-blocking rule, no-throttling rule, or general conduct rule, the Commission may first evaluate whether a practice falls within the exception for reasonable network management. For a practice to even be considered under this exception, a BIAS provider must first show that the practice is primarily motivated by a technical network management justification rather than other business motivations. If a practice is primarily motivated by another non-network related justification, then that practice will not be considered under this exception. The term “particular network architecture and technology” refers to the differences across broadband access platforms of any kind, including cable, fiber, DSL, satellite, unlicensed Wi-Fi, fixed wireless, and mobile wireless.

558. We find that permitting reasonable network management practices that are primarily technical in nature will provide BIAS providers sufficient flexibility to manage their networks, while at the same time will help protect against BIAS providers using the exception to circumvent open internet protections. We agree with Professor Jon Peha that if a practice can have both a primary technical and a business purpose, it may still be considered reasonable network management “simply because it is needed in support of a ‘business practice,’ this opens potentially a large loophole unless one severely limits the meaning of ‘business practice.’” Likewise, Public Knowledge explains, “any traffic management practice, including one that is narrowly anticompetitive, can be characterized as having some technical purpose—for example, to slow down a rival’s traffic.” We agree that restricting the scope of “reasonable network management” to practices that are primarily justified as traffic management techniques will help prevent the exception from becoming a loophole permitting otherwise unlawful business and traffic management practices.

559. We believe that the reasonable network management exception provides both fixed and mobile BIAS providers sufficient flexibility to manage their networks. We recognize, consistent with the consensus in the record, that the additional challenges involved in mobile BIAS network management mean that mobile BIAS providers may have a greater need to apply network management practices, including mobile-specific network management practices, and to do so more often to balance supply and demand while accommodating mobility. As the Commission has previously observed, mobile network management practices must address dynamic conditions that fixed networks typically do not, such as the changing location of users as well as other factors affecting signal quality. Similarly, SpaceX argues that satellite providers require additional network management flexibility to account for the same challenges that the 2015 Open Internet Order recognized in the context of mobile and Wi-Fi networks, including dynamic conditions, spectrum constraints, and congestion issues.

WISPA likewise explains that fixed wireless providers face challenges “managing networks of multiple spectrum bands.” The ability to address these dynamic conditions in mobile, wireless, and satellite network management is especially important given capacity constraints these BIAS providers, many of them small, face. The Commission will take into account when and how network management measures are applied as well as the particular network architecture and technology of the BIAS in question, in determining if a network management practice is reasonable.

560. We disagree with Ericsson that just because a network management practice can have both a primary technical reason and include other business practices, our definition “presents a false dichotomy.” As an initial matter, the standard we adopt in the Order does not require that a network management practice’s purpose be solely technical in nature, but rather primarily technical in nature. The exception does not exclude practices...
that have multiple purposes, so long as the practice’s purpose is primarily technical. It would, however, not extend to network management practices established for other purposes that lack a primarily technical purpose. To the extent that a BIAS provider engages in a network management practice for purposes other than a primarily technical reason, such practice is not per se prohibited, but would be evaluated under the general conduct standard or assessed for compliance with the prohibitions against blocking and throttling. We thus reject assertions in the record that distinctions of intent are not workable, that technical and business decision-making are not separable, or that the 2015 definition will adversely impact “business models that allow mobile operators to optimize their networks in response to consumers’ choices and could even bar any practice that affects the provider’s costs or revenues.” Further, we find unavailing commenters’ assertions that the reasonable network management exception we adopt in the Order is vague or ambiguous. While we acknowledge, as the Commission has previously, the advantages a more detailed definition of reasonable network management can have on long-term network investment and transparency, we conclude that a more detailed definition risks quickly becoming outdated as technology evolves, as borne out by commenters’ own assertions.

561. Evaluating Network Management Practices. We recognize the need to ensure that the reasonable network management exception will not be used to circumvent the open internet rules while still allowing BIAS providers flexibility to experiment and innovate as they reasonably manage their networks. We therefore elect to maintain a case-by-case approach. Case-by-case analysis will allow the Commission to use the conduct-based rules adopted in the Order to take action against practices that are known to harm consumers without interfering with BIAS providers’ beneficial network management practices. Beneficial practices include protecting their broadband internet access services against malicious content or offering a service limited to “family friendly” materials to end users who desire only such content. The case-by-case review also allows sufficient flexibility to address mobile-specific management practices because, by the terms of our rule, a determination of whether a network management practice is reasonable takes into account the particular network architecture and technology. We also note that our transparency rule requires disclosures that provide an important mechanism for monitoring whether providers are inappropriately exploiting the exception for reasonable network management.

562. We decline to specify particular network management practices as per se unreasonable, as advocated by WISPA, in order to afford BIAS providers maximum flexibility in managing their dynamic networks. While we are sensitive to the needs of small BIAS providers, we do not believe the record currently supports a one-size-fits-all approach. However, to provide greater clarity, particularly for small BIAS providers, and to further inform the Commission’s case-by-case analysis, we offer the following guidance regarding legitimate network management purposes. We also note that, consistent with the 2010 and 2015 reasonable network management exceptions, BIAS providers may request a declaratory ruling or an advisory opinion from the Commission before deploying a network management practice, but are not required to do so.

563. As with the network management exception in the 2015 Open Internet Order, BIAS providers may implement network management practices that are primarily used for, and tailored to, ensuring network security and integrity, including by addressing traffic that is harmful to the network, such as traffic that constitutes a denial-of-service attack on specific network infrastructure elements. Likewise, BIAS providers may also implement network management practices that are primarily used for, and tailored to, addressing traffic that is unwanted by end users. Further, network management practices that alleviate congestion without regard to the source, destination, content, application, or service are also more likely to be considered reasonable network management practices in the context of this exception. As in the no-throttling rule and the general conduct standard, we include classes of content, applications, services, or devices. In evaluating congestion management practices, a subset of network management practices, we will also consider whether the practice is triggered only during times of congestion and whether it is based on a user’s demand during the period of congestion. In addition, we maintain the guidance that a network management practice is more likely to be found reasonable when it is transparent and allows the end user to control it. Finally, we also reaffirm that reasonable network management practices should be as application-agnostic as possible.

D. Oversight of BIAS Providers’ Arrangements for Internet Traffic Exchange

564. Because we conclude that BIAS necessarily includes the exchange of internet traffic by an edge provider or an intermediary with the BIAS provider’s network, disputes involving a BIAS provider regarding internet traffic exchange arrangements that interfere with the delivery of a BIAS end user’s traffic are subject to our authority under Title II of the Act. The Commission has previously found, and the current record reflects, that anticompetitive and discriminatory practices in this portion of BIAS could have a deleterious effect on the open internet. The record evidence thus undermines USTelecom’s assertion that because “‘transit providers and their customers almost always rely on multiple redundant paths for the exchange of traffic to customers on any ISP’s network, and edge providers dynamically shift between transit providers in real time to avoid congestion,’” a BIAS provider “thus could not execute a ‘degradation by congestion’ strategy without limiting capacity across all of its peering points for extended periods.” When internet traffic exchange breaks down—regardless of the cause—it risks preventing consumers from reaching the services and applications of their choosing, disrupting the virtuous cycle, and potentially causing public safety or other harms. Further, consumers’ ability to respond to unjust or unreasonable BIAS provider practices are limited by switching costs. We therefore retain targeted authority under sections 201, 202, and 208 of the Act (and related enforcement provisions) to protect against such practices, and will continue to monitor BIAS providers’ internet traffic exchange arrangements to ensure that they are not harming or threatening to harm the open nature of the internet. This regulatory backstop is not a substitute for robust competition. The Commission’s regulatory and enforcement oversight, including over common carriers, is complementary to vigorous antitrust enforcement. Thus, it will remain essential for the Commission, as well as the DOJ, to continue to carefully monitor, review, and where appropriate, take action against any anticompetitive mergers, acquisitions, agreements or conduct, including where BIAS is concerned. We conclude, consistent with the 2015 Open Internet Order, that the 2015 case review under sections 201 and 202 is the appropriate vehicle for enforcement.
“where disputes are primarily over commercial terms and that involve some very large corporations, including companies like transit providers and CDNs, that act on behalf of smaller edge providers.” Thus, the Commission will be available to hear disputes raised under sections 201 and 202 on a case-by-case basis. In addition, Federal courts will also be able to adjudicate complaints brought under Title II. We also observe that section 706 provides the Commission with an additional, complementary source of authority to ensure that internet traffic exchange practices do not harm the open internet.

565. We disagree with USTelecom’s assertions that our oversight of BIAS providers’ arrangements for internet traffic exchange would “result in irrationally asymmetric regulation of bilateral negotiations” and “would leave the ISP’s counterparty . . . an unregulated entity immune from such complaints, giving it new opportunities for regulatory gamesmanship.” While BIAS providers would be subject to the Commission’s prohibitions against unjust and unreasonable practices, the other parties to such agreements are not without oversight; such parties would remain subject to the FTC’s oversight of “unfair and deceptive” practices as well as the FTC’s and DOJ’s antitrust authority. Further, we observe that should a complaint arise regarding BIAS provider internet traffic exchange practices, practices by edge providers (and their intermediaries) would be considered as part of the Commission’s evaluation as to whether BIAS provider practices were “just and reasonable” under the Act.

566. We decline to apply any open internet rules to internet traffic exchange. We note that this exclusion also extends to interconnection with CDNs. Internet traffic exchange agreements have historically been and will continue to be commercially negotiated. Given the constantly evolving market for internet traffic exchange, we conclude that at this time it would be difficult to predict what new arrangements will arise to serve consumers’ and edge providers’ needs going forward, as usage patterns, content offerings, and capacity requirements continue to evolve. Consistent with the Commission’s findings in 2015 and subsequent inquiries, we find that the best approach with the respect to arrangements for internet traffic exchange is to rely on the regulatory backstop of sections 201 and 202, which prohibit common carriers from engaging in unjust and unreasonable practices. Our “light touch” approach therefore does not directly regulate interconnection practices. We make clear, however, that BIAS providers may not engage in interconnection practices that “circumvent the prohibitions contained in the open internet rules” or that have the purpose or effect of evading our rules to protect internet openness.

567. We conclude that it would be premature to adopt prescriptive rules to address any problems that have arisen or may arise, and we decline at this time to adopt a rule requiring BIAS providers to offer settlement-free peering to edge providers and transit providers that agree to reasonably localize the exchanged traffic, or to otherwise prohibit fees associated with internet traffic exchange arrangements, as some commenters suggest. The record reflects competing narratives regarding the imposition of paid peering arrangements. For example, one research study claims that paid peering results in higher prices for consumers, reduces consumer surplus, and results in higher profits for broadband providers. In contrast, USTelecom asserts that “the providers of such double-sided platforms [like ISPs] routinely assess fees on both sides, and it is well understood that charges to one side of the platform (here, direct-interconnection fees) exert downward pressure on charges to the other side (here, resulting in lower consumer broadband bills).” USTelecom further argues that “eliminating direct-interconnection fees would eliminate price signals that, today, give content-originating networks efficient incentives to reduce unnecessary costs in their transmission of internet traffic,” explaining that “the prospect of such fees currently gives streaming video providers incentives to implement efficient forms of digital compression that reduce traffic loads while still providing high video quality to end users” and that “[i]mposing a new obligation of settlement-free direct interconnection would undermine those efficiency-inducing price signals, generate wasteful over-expenditure of finite network resources, and thus impose on broadband providers unavoidable costs that consumers would ultimately bear in the form of higher broadband bills.” Lumen, in response, asserts that “the fees large BIAS providers attempt to impose are indeed supra-competitive . . . and can exceed what Lumen charges for transit service,” “a highly competitive market—demonstrating “conclusively” that the entrants suggest. The record reflects the New America’s Open Technology Institute asserts that “[e]dge providers have plenty of price incentives to move, manage, and deliver traffic efficiently without the BIAS provider extracting a toll for access to their subscribers.” We are cautious of imposing a one-size-fits-all rule on this dynamic sector of the broadband industry based on the record before us, which raises potential concerns about such arrangements but lacks detail regarding specific incidences of such actions. Instead, we will proceed on a case-by-case basis regarding assertions or claims that arrangements for internet traffic exchange, including fee-based arrangements, violate sections 201 or 202 of the Act, or are being used to circumvent or evade open internet protections. As we note above, the Commission has taken action to require settlement-free peering agreements where appropriate.

E. Enforcement of Open Internet Rules

568. Effective and timely conflict resolution and clear guidance on prohibited and prohibited practices under the rules we adopt in the Order are important to further our goal to secure and safeguard an open internet. As in the past, we expect that many disputes that will arise can and should be resolved by the parties without Commission involvement. We continue to encourage parties to resolve disputes through informal discussion and private negotiations whenever possible.

569. At the same time, we are prepared to enforce our open internet rules as the need arises. To that end, we will rely on a multifaceted enforcement framework comprised of advisory opinions, enforcement advisories, Commission-initiated investigations, and informal and formal complaints. Some commenters endorse a multi-faceted enforcement framework. The advisory opinions and enforcement advisories should provide upfront clarity, guidance, and predictability with respect to the open internet rules, thereby giving providers an avenue to avoid formal complaint litigation, remediation, or fines after the fact. Commission-initiated investigations will also play a role in our enforcement framework. Investigations may stem from review of informal complaints, from which trends of behavior can be identified, or information otherwise brought to the Commission’s attention. When the Commission determines a violation has occurred, we will pursue remedies and penalties. Lastly, the formal complaint processes will provide parties options to bring open internet rule violations to the Commission’s attention and to resolve specific disputes. As explained infra, the
Enforcement Bureau’s Market Disputes Resolution Division provides confidential mediation services, at no cost, to assist parties in settling or narrowing disputed issues. We find that, when necessary, the formal complaint process will provide a backstop framework that will effectively and timely address open internet disputes and provide guidance on practices that are permitted or prohibited under our rules.

1. Advisory Opinions and Enforcement Advisories

570. Advisory Opinions. The Commission previously concluded in 2015 that the use of advisory opinions would be in the public interest and had the potential to provide clarity, guidance, and predictability concerning the Commission’s open internet rules. In 2017, the RIF Order ended the use of enforcement advisory opinions, asserting that they were no longer necessary due to the elimination of the conduct rules. In the Order, we reaffirm the conclusions of the 2015 Open Internet Order, and adopt an updated process for providers seeking an advisory opinion from Commission staff regarding the open internet rules to provide upfront clarity, guidance, and predictability. Updated process steps are not intended to substantively differ from those outlined in the 2015 Open Internet Order. We continue to believe an advisory opinion process will provide clarity and guidance to providers seeking to comply with our regulations. We believe the advisory opinion process we adopt in the Order will help, and not impede, innovation by providing published guidance that illustrates how we implement our laws and regulations.

571. Under the process we adopt in the Order, any BIAS provider may request an advisory opinion regarding the permissibility of its proposed policies and practices affecting access to BIAS. As noted in our rules, requests for an advisory opinion may be filed via the Commission’s website or with the Office of the Secretary and must be copied to the Chief of the Enforcement Bureau and the Chief of the Investigations and Hearings Division of the Enforcement Bureau. We hereby delegate to the Enforcement Bureau the authority to receive such requests and issue such advisory opinions, and we direct the Enforcement Bureau to coordinate closely with other relevant Bureaus and Offices regarding such advisory opinions. The Enforcement Bureau will have discretion to determine whether to issue an advisory opinion in response to a particular request or group of requests and will inform each requesting entity, in writing, whether the Bureau plans to issue an advisory opinion regarding the matter in question. The Enforcement Bureau shall decline to issue an advisory opinion if the relevant policy or practice is the subject of a pending government investigation or proceeding.

572. BIAS providers may submit requests for advisory opinions regarding prospective policies and practices affecting broadband access. A request must pertain to a policy or practice that the requesting party intends to utilize, rather than a mere possible or hypothetical scenario. As a general matter, the Enforcement Bureau will prioritize requests involving substantial questions with no clear Commission precedent and/or subject matter involving significant public interest. Other Federal agencies have similar advisory opinion processes. For example, the Rules of Practice of the FTC provide that the FTC or its staff, in appropriate circumstances, may offer industry guidance in the form of an advisory opinion. The FTC specifies that it will consider requests for advisory opinions, where practicable, under the following circumstances: “(1) The matter involves a substantial or novel question of fact or law and there is no clear Commission or court precedent; or (2) The subject matter of the request and consequent publication of Commission advice is of significant public interest.”

573. When submitting requests, BIAS providers must include all material information such that Commission staff can make a fully informed determination on the matter. Requesting parties will also be required to certify that factual representations made to the Enforcement Bureau are truthful, accurate, and do not contain material omissions. The Enforcement Bureau will have discretion to request additional information from the requesting entity and from other parties that might have relevant information or be impacted by the request. These might include, for example, impacted consumers or state, local, or Tribal governments.

574. Our advisory opinion process will affect BIAS providers and the Commission’s enforcement actions as described below. First, the process is fully voluntary. No BIAS provider will be rewarded or penalized for seeking an advisory opinion, and the seeking (or not) of an advisory opinion will not itself influence any enforcement-related decision by the Commission. Second, in an advisory opinion, the Enforcement Bureau will issue a determination of whether or not the policy or practice detailed in the request complies with the open internet rules. We disagree with Smithwick & Belendiuk’s assertion that the Commission must provide the public an opportunity to comment on a BIAS provider’s request for an advisory opinion, or eliminate the process entirely. As Smithwick & Belendiuk itself acknowledges, a BIAS provider may “face a legitimate potential for competitive harm if its operational plan are made public at the advisory opinion stage,” and further, the Commission does not routinely seek public input on its interpretation of its own rules.

575. The Bureau will not respond to requests for opinions that relate to ongoing or prior conduct, and the Bureau may initiate an enforcement investigation to determine whether such conduct violates the open internet rules. Third, a requesting party may rely on an advisory opinion to the extent that its request fully and accurately describes all material facts and circumstances. Fourth, advisory opinions will be issued without prejudice to the Enforcement Bureau’s or the Commission’s ability to reconsider the questions involved, and rescind the opinion. We disagree with commenters who assert that advisory opinions are not helpful because they would only apply to the requesting party and the facts at hand and not other providers or because any guidance would be revocable and not binding. While advisory opinions will specifically engage with the facts provided by a requesting party, we believe published advisory opinions will inform other providers with similar questions, and that usefulness will still apply even if the Commission subsequently revises its guidance.

576. The Enforcement Bureau will attempt to respond to requests for advisory opinions as efficiently as possible. We decline to establish firm deadlines, however, because we anticipate that the nature, complexity, and magnitude of requests may vary widely. Furthermore, it may take time for Commission staff to request any additional information needed to issue an opinion. Once issued, the Enforcement Bureau will make the advisory opinion available to the public. Entities concerned about privacy and sensitive market information may request confidential treatment of certain information, as provided under Commission rules. And to provide further guidance to industry and consumers, the Bureau will also release the initial request and any additional materials deemed necessary to contextualize the opinion.
577. We continue to believe an advisory opinion process will provide clarity and guidance to providers seeking to comply with our regulations. While some commenters assert that seeking an advisory opinion would potentially harm the requesting party, the advisory opinion process we adopt in the Order does not contemplate the Enforcement Bureau taking enforcement action solely in response to a provider seeking an advisory opinion.

2. Complaint Processes

578. Informal Complaints. As stated in the 2023 Open Internet NPRM, the Commission’s informal complaint process under § 1.41 of the rules “remain[s] available to parties with respect” to open internet rules. Commenters support continued use of the informal complaint process as an effective enforcement mechanism of our rules. For example, NDIA affirms the value of the informal complaint pathway in its “accessibility to most consumers.” The Commission previously found, and we continue to find, that § 1.41 provides “a simple and cost-effective option for calling attention to open internet rule violations.” With reclassification, §§ 1.711 through 1.717 also apply to informal complaints arising under Title II of the Act. Consumers may submit informal complaints online, and no filing fee is required. Informal complaints are filed through the Commission’s user-friendly complaint interface, the Consumer Inquiries and Complaint Center Help Center. We note that the Commission’s Consumer Complaint Center is responsive on mobile devices and that the Commission’s call center is staffed by both English- and Spanish-speaking agents who can file complaints on behalf of consumers. Individuals who use videophones and are fluent in American Sign Language (ASL) may call the Commission’s ASL Consumer Support line for assistance in ASL with filing informal complaints or obtaining consumer information. Those who wish to file an informal complaint may simply visit the Consumer Inquiries and Complaint Center portal on the Commission’s website and click the internet icon to access relevant information and the online complaint intake system. Consistent with our current process and procedures, consumers may also file informal complaints by fax or postal mail. The informal consumer complaint process facilitates a conversation between the consumer and the provider to address disputes. It does not involve arbitration, mediation, or investigation. These complaints will be reviewed and may be served on the consumer’s BIAS provider for investigation and response to the consumer within 30 days. WISPA requests a 30-day negotiating period before filing an informal complaint. We decline WISPA’s request, but we note that the informal complaint process is designed to allow parties to reach an informal, negotiated resolution before proceeding to a more formal process. Although individual informal complaints will not typically result in written Commission Orders, the Enforcement Bureau will examine trends or patterns in complaints to identify potential targets for investigation and enforcement action. The availability of complaint procedures does not bar the Commission from initiating separate and independent enforcement proceedings for potential violations. The Commission reviews informal complaints and, when applicable, will initiate investigations internally in furtherance of our enforcement efforts. These include Commission-initiated inquiries under section 403 of the Act, which may lead to the issuance of forfeitures under section 503(b) of the Act.

579. Formal Complaints. The RIF Order eliminated the open internet complaint rules adopted in the 2010 Open Internet Order and preserved in the 2015 Open Internet Order. With our action in the Order to reclassify BIAS as a Title II telecommunication service, absent adoption of a different approach, the section 208 formal complaint rules will apply. In the 2023 Open Internet NPRM, we sought comment on whether it would be beneficial to re-establish a formal complaint process for complaints arising under our open internet rules and whether our section 208 formal complaint process is sufficient for this purpose. We agree with commenters that the formal complaint process should continue to be part of the enforcement framework for the open internet rules. Several commenters state that formal complaint procedures are necessary to ensure equal access to BIAS and support having a structured formal complaint process. In its comment, the U.S. Chamber of Commerce objects to “adopt[ing] a formal complaint mechanism under section 208 of the Communications Act for alleged instances of digital discrimination.” The instant Order, however, only concerns open internet rules and takes no position on the applicability of section 202 to the digital discrimination rules. We further conclude that the existing formal complaint rules codified at §§ 1.720 through 1.740 of our rules should apply to formal open internet complaints.

580. The Commission updated the existing section 208 rules in 2018, and they govern all formal complaint proceedings delegated to the Enforcement Bureau. These comprehensive rules are largely the same as the prior open-internet-specific formal complaint rules, providing for a complaint, answer, and reply, as well as discovery and briefing, as appropriate. They also establish deadlines for the resolution of complaints. We reject WISPA’s request that the Commission be required to render a decision on any complaint within 60 days from the date the BIAS provider files its response to the Commission. The formal complaint rules are designed to resolve complaints on a written record and give defendants sufficient opportunity to respond to the allegations against them so as to afford due process. The rules contemplate the exchange of information and other efforts to narrow the issues in dispute and streamline the adjudicative process. A 60-day deadline would not provide adequate time for the development of a complete record in a complex case. We also reject WISPA’s request for a shortened, one-year statute of limitations from the time of an alleged open internet rule violation. Section 415 of the Act generally provides that complaints be filed within two years from the time the cause of action accrues, and WISPA provides no basis justifying a departure from this statutory requirement. For these reasons we find it unnecessary, as WISPA requests, for the Commission to seek additional comment on streamlined enforcement procedures and timeframes for BIAS providers with 250,000 or fewer subscribers. We find that the size of the defendant BIAS provider (or the number of subscribers it has) does not determine the complexity or scope of the violations alleged, nor does it form the basis for developing a separate set of procedures or deadlines. Furthermore, we find it unnecessary to examine whether to establish a specific forfeiture amount for smaller providers under part 8 of the Commission’s rules. The Commission’s rules already provide for discretion when assessing penalties, so there is no need to limit that discretion solely for small BIAS providers. Moreover, we believe that using the section 208 formal complaint rules will avoid the potential for two different complaint processes if a complaint includes both open internet violations and other Title II violations.

581. ACA ConnectPlus program participants concern about the burden and cost associated with defending potential complaint.
proceedings. We find such proceedings are likely to be rare and unlikely to be particularly burdensome. To reiterate, we view formal complaint litigation as a last resort. The section 208 formal complaint rules require a complainant to certify that it has made a good faith effort to settle the dispute. Additionally, any party may seek voluntary mediation at the Commission—before a complaint is filed or while the complaint is pending—in an effort to avoid litigation. Mediation may be requested by a letter or by filing an informal complaint with the Enforcement Bureau’s Market Disputes Resolution Division. Mediation often obviates the need for litigation or, barring settlement of the entire dispute, may narrow issues for adjudication.

F. Legal Authority

582. We rely on multiple sources of independent, complementary legal authority for the open internet rules we adopt in the Order, including Title II and III of section 706 of the 1996 Act. These are the same sources of authority that the Commission relied upon when it adopted rules in the 2015 Open Internet Order, which were upheld in full by the D.C. Circuit. These sources of authority work to safeguard and secure internet openness to ensure that the internet continues to grow as a platform for competition, free expression, and innovation; to be a driver of economic growth; and to be an engine of the virtuous cycle of broadband deployment, innovation, and consumer demand.

583. In the Order, we find that BIAS is a telecommunications service subject to Title II, with forbearance where appropriate under section 10 of the Act, allowing the Commission to exercise its authority under sections 201 and 202 of the Act to ensure that BIAS providers do not engage in unjust and unreasonable practices or preferences. As described below, under section 706, the Commission has the authority to adopt these open internet rules to encourage and accelerate the deployment of broadband to all Americans. The rules are also supported by Title III of the Act, under which the Commission has broad spectrum management authority to protect the public interest through spectrum licensing and regulations. Each of these sources of authority provides an alternative ground to independently support our open internet rules. With respect to our revised transparency rule, we rely on the same sources of authority along with section 10 (and associated authority now in section 13 of the Act), consistent with the relevant reasoning of the 2010 Open Internet Order and the RIF Order. Below, we discuss the basis and scope of each of these sources of authority, provide an overview of prior precedents which justifies such use, and then explain their application to the open internet rules we adopt in the Order.

1. Title II of the Act With Forbearance

584. As in the 2015 Open Internet Order, we find that the open internet rules we adopt in the Order are also supported by our legal authority under Title II to regulate telecommunications services. We rely on sections 201, 202, and 208 of the Act, along with the related enforcement authorities of sections 206, 207, 209, 216, and 217, as additional legal authority for the open internet rules we adopt in the Order.

585. Section 201(a) places a duty on common carriers to furnish communications services subject to Title II “upon reasonable request” and “establish physical connections with other carriers” where the Commission finds it to be in the public interest.” Section 201(b) provides that “[a]ll charges, practices, classifications, and regulations for and in connection with such communication service, shall be just and reasonable, and any such charge, practice, classification, or regulation that is unjust or unreasonable is declared to be unlawful.” Section 201(b) also gives the Commission the authority to “prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this chapter.” Section 202(a) makes it unlawful for any common carrier to make any unjust or unreasonable discrimination in charges, practices, classifications, regulations, facilities, or services for or in connection with like communication service, directly or indirectly, by any means or device, or to make or give any undue or unreasonable preference or advantage to any particular person, class of persons, or locality, or to subject any particular person, class of persons, or locality to any undue or unreasonable prejudice or disadvantage.

586. Thus, the unjust and unreasonable standards in sections 201 and 202 afford the Commission significant discretion to distinguish acceptable behavior from behavior that violates the Act. Indeed, the very terms “unjust” and “unreasonable” are broad, inviting the Commission to undertake the kind of line-drawing that is necessary to differentiate just and reasonable behavior on the one hand from unjust or unreasonable (behaviors) on the other. As the D.C. Circuit has stated, for example, “the generality of these terms . . . opens a rather large area for the free play of agency discretion, limited of course by the familiar ‘arbitrary’ and ‘capricious’ standard in the Administrative Procedure Act.” Stated differently, because both sections “set out broad standards of conduct,” it is up to the “Commission to give[ ] the standards meaning by defining practices that run afoul of carriers’ obligation, either by rulemaking or by case-by-case adjudication.” Acting within this discretion, the Commission has exercised its authority under section 201(b), through both adjudication and rulemaking, to ban unjust and unreasonable carrier practices as unlawful under the Act. The Commission need not proceed through adjudication in announcing a broad ban on a particular practice. Indeed, the text of section 201(b) itself gives the Commission authority to “prescribe such rules and regulations as may be necessary in the public interest to carry out the provisions of this chapter.” Although the particular circumstances have varied, in reviewing these precedents, we find that the Commission generally takes this step where necessary to protect competition and consumers against carrier practices for which there was either no cognizable justification for the action or where the public interest in banning the practice outweighed any countervailing policy concerns.

587. Our rulemaking actions interpret and apply the statutory authority at issue here, thereby enabling the Commission to address the sorts of core communications policy issues that the agency has dealt with since the enactment of the Communications Act. This is illustrated by the many historical precedents for the regulation of carriers consistent with the conduct rules we adopt.

588. Prohibitions on Blocking and Throttling. The conduct rules we adopt in the Order are consistent with longstanding Commission precedent under the Act, and in some respects also historical common carrier requirements more generally. Our rules prohibiting blocking or throttling of traffic except for purposes of reasonable network management or at the desire of end users aligns with policies the Commission long has applied to carriers under the Communications Act. These rules also accord with longstanding requirements imposed on common carriers of various sorts to defer to their customers regarding the content being carried and to ensure that content gets to its destination in a timely and reliable manner.
589. Restriction on paid prioritization. Our rule banning paid prioritization also reflects the Commission’s historical recognition that just and reasonable rates and practices can require regulating carriers’ relationships with other communications suppliers. The Commission historically has regulated those relationships as needed, including to restrict carriers’ ability to impose charges on providers delivering them communications traffic. We recognize that in addition to benefitting BIAS customers, our justification for the ban on paid prioritization rests in part on the identified harms to edge provider operations and innovation—but that, too, is consistent with how the Commission has exercised its authority historically. For example, the Supreme Court has rejected the view that section 201(b) limits the Commission to addressing practices exclusively when they harm customers, rather than also encompassing harms to communications service suppliers, basing its rationale in part on historical regulation under the Interstate Commerce Act. Further, a policy goal of the historical Computer Inquiries regime was to guard against the risk of carriers harming competitive providers of enhanced services.

590. General Conduct Rule. Our general conduct rule, by which we evaluate conduct not covered by the bright-line rules, is consistent with the Commission’s historical exercise of authority under the Act. Since its original enactment in 1934, the Communications Act has prohibited unjust, unreasonable, and unjustly or unreasonably discriminatory, rates and practices by carriers, and the Commission has regularly judged carriers’ conduct against those standards on a case-by-case basis. The origins of common carrier duties under common law, and then under the Interstate Commerce Act, likewise commonly were subject to case-by-case adjudication.

591. The specific considerations that guide the application of the general conduct rule also reflect the types of factors the Commission historically has weighed in evaluating the justness and reasonableness of carrier conduct.

• For example, section 201(b) of the Act has long been understood to allow for carrier practices that enable end users to control their use of the service to which they have subscribed as just and reasonable, absent a countervailing adverse public impact.

• Consumer protection, such as protection against deceptive or misleading practices, also has been a part of the Commission’s implementation of section 201(b) of the Act.

• The Commission historically has implemented the Act to guard against conduct that would have harmful competitive effects, as well.

• The Commission not only has considered effects on innovation and investment in its implementation of longstanding provisions of the Act, but since the enactment of the 1996 Act also has relied on the mandate to advance broadband deployment in section 706 of that statute.

• The Commission also has treated compliance with industry standards or best practices as relevant—though not dispositive—to its evaluation of the justness and reasonableness of carrier practices.

Thus, the consideration of such factors through a case-by-case reasonableness evaluation is fully consistent with longstanding historical practice.

592. The record also provides broad support for relying on authority in sections 201 and 202 of the Act. Some commenters oppose relying on sections 201 and 202, because these sections may be unduly burdensome, particularly on smaller providers. In such cases, commenters urge the Commission to forbear from sections 201, 202, and 208 for smaller BIAS providers, or alternatively, initiate a new proceeding to define the limits of obligations for small BIAS providers. Other commenters argue that the Commission should focus on Title II authority rather than section 706. These commenters contend that the Commission should focus on Title II authority rather than section 706. For the reasons set forth above, we find the open internet rules we adopt in the Order are supported by our legal authority under Title II.

593. As proposed in the 2023 Open Internet NPRM, and consistent with the 2010 Open Internet Order and the RIF Order, and as affirmed by the D.C. Circuit in Mozilla, we rely on section 257 of the Act (now in conjunction with section 13 of the Act) as additional legal authority for the transparency requirements we retain. Section 257(a) directs the Commission to “identify[] and eliminate[] . . . market entry barriers for entrepreneurs and other small businesses in the provision and ownership of telecommunications services and information services, or in the provision of parts or services to providers of telecommunications services and information services.” The RAY BAUM’S Act of 2018 eliminated section 257(c) of the Act, and instead included language in new section 13 of the Act, 47 U.S.C. 163, requiring similar review under that provision. Thus, to be clear, section 257 previously included subsection (c), which directed the Commission to submit a triennial report to Congress on the market entry barriers for entrepreneurs and other small businesses. The RAY BAUM’S Act now requires the Commission to submit a biennial report that is similar to the report previously required under section 257(c). In carrying out section 257(a), the Commission “shall seek to promote the policies and purposes of this chapter favoring diversity of media voices, vigorous economic competition, technological advancement, and promotion of the public interest, convenience, and necessity.”

594. We continue to find that section 13(d)(3) is properly understood as not only imposing a current obligation to “consider market barriers for entrepreneurs and other small businesses in the communications marketplace in accordance with the national policy under section 257(b),” but also imposing an ongoing obligation to do so. In this regard, section 13(a) directs the Commission to submit a report to Congress, “[i]n the last quarter of every even-numbered year, on the state of the communications marketplace.” The report must assess the state of competition in the communications marketplace, including competition to deliver voice, video, audio, and data services among providers of telecommunications, providers of commercial mobile service (as defined in section 332), multichannel video programming distributors (as defined in section 522), broadcast stations, providers of satellite communications, internet service providers, and other providers of communications services. The report must “assess whether laws, regulations, regulatory practices (whether those of the Federal Government, States, political subdivisions of States, Indian tribes or tribal organizations (as such terms are defined in section 5304 of title 25), or foreign governments), or demonstrated marketplace practices pose a barrier to competitive entry into the communications marketplace or to the competitive expansion of existing providers of communications services.” Section 163(d)(3) further directs that, “[i]n assessing the state of competition . . . and regulatory barriers . . . , the Commission shall consider market entry barriers for entrepreneurs and other small businesses in the communications marketplace in accordance with the national policy under section 257(b) of this title.”
2. Section 706 of the 1996 Act

595. We adopt our proposal to return to the Commission’s prior judicially affirmed interpretation of section 706 of the 1996 Act as granting the Commission regulatory authority. We do so in light of the considerations that persuaded the Commission to adopt such interpretations in the past, and that persuaded courts to affirm those interpretations. Consistent with the prior approach, we rely on section 706(a) as part of our authority for the adoption of open internet rules. We also rely on section 706(b) to the extent that the Commission concludes under section 706(a) that advanced telecommunications capability is not being deployed to all Americans in a reasonably timely fashion. The Commission’s most recent section 706 report issued last month concluded that advanced telecommunications capability was not being deployed to all Americans in a reasonable and timely fashion. The record reflects support for returning to the Commission’s prior interpretation of section 706(a) and (b) as grants of regulatory authority from a range of commenters, including State and local groups, public interest groups, think tanks, academia, and others. These commenters generally argue that interpreting section 706 as a grant of regulatory authority provides a better reading of the statute than the interpretation adopted in the RIF Order, is supported by judicial and Commission precedent, is supported by legislative history, and will survive judicial scrutiny even with limited deference. The record also reflects commenters who oppose returning to interpreting section 706 as a grant of regulatory authority, for reasons such as the provision should be viewed as hortatory rather than as a directive, the provision is not supported by statutory interpretation, and the provision is not supported by clear congressional intent. For the reasons discussed by the Commission in the 2010 Open Internet Order and the 2015 Open Internet Order, the D.C. Circuit in Verizon and USTA, the Tenth Circuit in In re FCC, and in the Order, we disagree. We also disagree with other commenters’ claims that the Commission could adopt rules using section 706 and Title I authority.

596. The RIF Order principally grounded its rationale for changing the interpretation of section 706 on its view that section 706 was better interpreted as hortatory. As explained below, upon further analysis, we conclude that interpreting section 706(a) and (b) as grants of regulatory authority represents the better reading of the statute and likewise provides a basis for us to change our interpretation.

597. For one, we have ample support for relying on specific rationales for interpreting section 706(a) and (b) of the 1996 Act as grants of regulatory authority. In Comcast, the D.C. Circuit identified section 706(a) as a provision that “at least arguably . . . delegate[s] regulatory authority to the Commission,” and in fact “contain[s] a direct mandate—the Commission ‘shall encourage.’ ” In the 2010 Open Internet Order, the Commission explained why section 706(a) and (b) each represent a grant of regulatory authority to the Commission after considering the statutory text, regulatory and judicial precedent, and legislative history, and rejecting objections to that interpretation. In particular, the Commission explained that Congress, in directing the Commission to “encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans . . . by utilizing . . . price cap regulation, regulatory forbearance, measures that promote competition in the local telecommunications market, or other regulating methods that remove barriers to infrastructure investment,” necessarily vested the Commission with the statutory authority to carry out those acts. Indeed, the relevant Senate Report explained that the provisions of Section 706 are “intended to ensure that one of the primary objectives of the [1996 Act]—to accelerate deployment of advanced telecommunications capability—is achieved,” and stressed that these provisions are “a necessary fail-safe” to guarantee that Congress’s objective is reached. As the Commission explained, it would be odd indeed to characterize Section 706(a) as a “fail-safe” that “ensures” the Commission’s ability to promote advanced services if it conferred no actual authority. As with the 2010 Open Internet Order, our reading, Section 706(a) authorizes the Commission to address practices, such as blocking VoIP communications, degrading online video, or denying end users material information about their broadband service, that have the potential to stifle overall investment in internet infrastructure and limit competition in telecommunications markets.

598. Consistent with what the Commission went on to explain, section 706(a) accordingly provides the Commission with a specific delegation of legislative authority to promote the deployment of advanced services, including by means of the open internet rules adopted in the 2010 Open Internet Order. As the Commission explained in 2010 Open Internet Order, our understanding of section 706(a) is also harmonious with other statutory provisions that confer a broad mandate on the Commission. For example, section 706(a)’s directive to “encourage the deployment [of advanced telecommunications capability] on a reasonable and timely basis” using the methods specified in the statute is no broader than other provisions of the Commission’s authorizing statutes that command the agency to ensure “just” and “reasonable” rates and practices, or to regulate services in the “public interest.” Our section 706(a) authority is also generally consistent with—though narrower than—the understanding of ancillary jurisdiction under which this Commission operated for decades before the Comcast decision. The similarities between the two in fact explain why the Commission had not, before the 2010 Open Internet Order, had occasion to describe section 706(a) in this way. That is because in the particular proceedings prior to Comcast, providing such understanding of section 706(a) that we articulate in the 2010 Open Internet Order would not meaningfully have increased the authority that we understood the Commission already possessed.

599. In addition, in the 2015 Open Internet Order, the Commission built on the foundation of its explanations in the 2010 Open Internet Order, rejecting various objections to the interpretation of section 706(a) and (b) as grants of regulatory authority and elaborating on the Commission’s authority to adopt rules implementing that provision, and to enforce those rules.

600. The Commission concluded in the 2015 Open Internet Order and 2010 Open Internet Order that open internet rules were a reasonable way to implement Commission authority under section 706(a) and (b), and the nexus between open internet rules and the directives in section 706(a) and (b) was affirmed by the D.C. Circuit in Verizon. For those same reasons, we find that the open internet rules we adopt here are a reasonable exercise of section 706(a) authority. As the Commission recently concluded that advanced telecommunications capability is not being deployed to all Americans in a reasonable and timely fashion under section 706(b), the open internet rules we adopt here are a reasonable exercise of authority under that provision as well.

601. To be clear, we interpret section 706(a) and (b) as independent, complementary sources of affirmative Commission authority for the rules
adopted in the Order. Our interpretation of section 706(a) as a grant of express authority is in no way dependent upon our findings in the section 706(b) inquiry. Thus, even if the Commission’s inquiry were to have resulted in a positive conclusion such that our section 706(b) authority were not triggered, this would not eliminate the Commission’s authority to take actions to encourage broadband deployment under section 706(a). And Commission actions adopted pursuant to a negative section 706(b) determination would not simply be swept away by a future positive section 706(b) finding, and subsequently render those actions unnecessary or unauthorized without any further Commission process. Throwing away such measures because they are working would be like “throwing away your umbrella in a rainstorm because you are not getting wet.” Even if that were not the case, independent section 706(a) authority would remain. We mention, however, two legal requirements that appear relevant. First, section 408 of the Act mandates that “all” Commission orders (other than orders for the payment of money) “shall continue in force for the period of time specified in the order or until the Commission or a court of competent jurisdiction issues a superseding order.” Second, the Commission has a “continuing obligation to practice reasoned decisionmaking” that includes revisiting prior decisions to the extent warranted. We are aware of no reason why these requirements would not apply in this context.

602. The Commission takes such measures precisely to achieve section 706(b)’s goal of accelerating deployment.

603. Our return to an interpretation of section 706 of the 1996 Act as granting the Commission regulatory authority and, in turn, as a basis for open internet rules is also propelled by the realization that BIAs has become even more essential to consumers for work, health, education, community, and everyday life. While internet access has long been important to daily life, the COVID–19 pandemic and the subsequent rapid shift of work, education, and health care online has demonstrated how essential BIAs connections are for consumers’ participation in our society and everyday life. In light of this reality, we believe that returning to the Commission’s prior interpretation of section 706 is necessary and timely given the critical importance of ensuring the Commission’s authority to fulfill policy objectives and responsibilities to protect this vital service.

604. We find that the Commission has the legal authority to return to the prior, judicially affirmed, pre-RIF Order interpretations of section 706(a) and (b) of the 1996 Act. The APA’s requirement of reasoned decision-making ordinarily demands that an agency acknowledge and explain the reasons for a changed interpretation. But so long as an agency “adequately explains the reasons for a reversal of policy,” its new interpretation of a statute cannot be rejected simply because it is new. In Fox, the Supreme Court emphasized that, although an agency must acknowledge that it is changing course when it adopts a new construction of an ambiguous statutory provision, “it need not demonstrate to a court’s satisfaction that the reasons for the new policy are better than the reasons for the old one . . . .” Rather, it is sufficient that “the new policy is permissible under the statute, that there are good reasons for it, and that the agency believes it to be better, which the conscious change of course adequately indicates.” We have so done here.

605. We are unpersuaded by arguments in the RIF Order that section 706(a) and (b) of the 1996 Act are better interpreted as hortatory, and not as grants of regulatory authority. For the reasons set forth below, we find there are deficiencies in the RIF Order’s analysis that lead us to conclude that the RIF Order’s reasoning, which has already been rejected by a court, is misguided and misplaced, and once again should be rejected. We therefore return to the Commission’s prior judicially affirmed interpretation of section 706(a) and (b) of the 1996 Act as grants of regulatory authority and conclude that it is a better reading of the statute.

606. First, according to the RIF Order’s reasoning, the language in section 706(a) and (b) should be viewed as statutory surplusage that neither grants nor restrains Commission authority, but merely expresses the sense of Congress that advanced telecommunications are important. The D.C. Circuit has already twice affirmatively rejected this line of reasoning. In Verizon, the court affirmed as reasonable the Commission’s interpretation that section 706(a) and (b) are grants of regulatory authority. The court held that section 706(a) “vest[s] the Commission with actual authority to utilize the regulatory methods set forth in the statute to ‘encourage the development of advanced telecommunications capability.’” This authority, Congress explained, is a “fail safe” to enable the Commission to achieve the goal of permitting all Americans to send and receive information in all forms—voice, data, graphics, and video—over a high-speed, switched, interactive broadband, transmission capability.” And section 706(b) imposes an affirmative duty on the Commission “to conduct a regular inquiry ‘concerning the availability of advanced telecommunications capability.’” In the event that it determines that such capability is not “being deployed to all Americans in a reasonable and timely fashion,” the statute compels the Commission to “take immediate action to accelerate deployment of such capability by removing barriers to infrastructure investment and by promoting competition in the telecommunications market.” In USTA, the court likewise affirmed as reasonable the Commission’s interpretations that section 706(a) and (b) are grants of regulatory authority. Moreover, although the Tenth Circuit failed to recognize that the Commission had, in fact, interpreted section 706(a) as a grant of regulatory authority in the 2010 Open Internet Order, it affirmed the Commission’s reliance on section 706(b) as a grant of regulatory authority.

607. Second, the RIF Order was too quick to dismiss the importance of the term “shall” in section 706(a) (“shall encourage”) and (b) (“shall take immediate action”), a term which describes a particularly potent word in statutory construction that “usually connotes a requirement,” and serves as a legislative mandate for regulation. Although the RIF Order recognized that the term “shall” generally indicates a command that admits of no discretion, it gave short shrift to the importance of its use in these statutory provisions, and instead interpreted the provisions as exhortative. The RIF Order reasoned that the Commission has other authority in the Communications Act under which it can exercise the mandates in section 706(a) and (b) and thus there is no need to interpret these provisions as directives, in spite of the significant contrary evidence. But the D.C. Circuit explained in Verizon that section 706 “does not limit the Commission to using other regulatory authority already at its disposal, but instead grants it the power necessary to fulfill the statute’s mandate.” We believe that acceptance of the RIF Order’s reasoning would contravene the statute’s clear language and structure and nullify textually applicable provisions. Indeed, if such faulty reasoning were allowed to stand, the term “shall” could be nullified in any other textually applicable provision where there may be other sources of
authority under the Act, an outcome we reject.

608. Third, we also are unpersuaded by the RIF Order’s argument that section 706(a) and (b) were interpreted as grants of regulatory authority, it would enable the internet and information services to be heavily regulated in a manner inconsistent with the policy goals reflected in the Act. Although the RIF Order acknowledged that the Commission’s prior interpretation of section 706 was, by its own terms, constrained in order to be consistent with the Act, it claimed that such constraints did not adequately address its statutory concerns. In the view of the RIF Order, seemingly the only outcomes of interpreting section 706 as granting regulatory authority would be extreme results where those constraints had little meaning and left the Commission with essentially unbounded authority or were such severe limitations as to render section 706 of little possible use. But as prior Commission and judicial precedents explain, there are several limitations to section 706(a) authority, which makes these views unfounded. In Verizon, the D.C. Circuit agreed with the Commission that while authority under section 706 may be broad, it is not unbounded. Specifically, authority under section 706(a) must fall within the scope of the Commission’s subject-matter jurisdiction over “interstate and foreign commerce in communications by wire and radio.” Additionally, the Commission’s actions under section 706(a) must be designed to “encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans.” Moreover, the court in Verizon firmly concluded that the Commission’s 2010 Open Internet Order regulations fell within the scope of section 706. It explained that the rules “not only apply directly to broadband providers, the precise entities to which section 706 authority to encourage broadband deployment presumably extends, but also seek to promote the very goal that Congress explicitly sought to promote.” Further, the court credited “the Commission’s prediction that the 2010 Open Internet Order regulations will encourage broadband deployment.” The same is true of the open internet rules we adopt in the Order. Our regulations again only apply to last-mile providers of BIAS—a service that is not only within our subject-matter jurisdiction, but also expressly within the terms of section 706. And, again, each of our rules is designed to remove barriers in order to achieve the express purposes of section 706. We also find that our rules will provide additional benefits by promoting competition in telecommunications markets, such as, for example, by fostering competitive provision of VoIP and video services and informing consumers’ choices.

609. Fourth, we are also unpersuaded by the RIF Order’s concerns about our ability to enforce violations of requirements adopted under section 706(a) and (b) of the 1996 Act. The rules we adopt in the Order implement the provisions of the Communications Act and are thus covered by our Titles IV and V authorities to investigate and enforce violations of those rules. With specific respect to section 706, in Verizon, the D.C. Circuit suggested that section 706 was part of the Communications Act of 1934. Under such a reading, rules adopted pursuant to section 706 fall within our Title IV and V authorities. The 1996 Act incorporated the relevant statutory definitions in the Act, which the Commission has broad authority to implement. The 1996 Act also required the Commission to adopt rules or orders that turned on the interpretation of those statutory definitions.

610. But even if this were not the case, we believe it reasonable to interpret section 706 itself as a grant of authority to investigate and enforce our rules. Moreover, to the extent that section 706 was not viewed as part of the Communications Act, we have authority under section 4(i) of the Communications Act to adopt rules implementing section 706. Thus, even then the Commission’s rules, insofar as they are based on our substantive jurisdiction under section 706, nonetheless would be issued under the Communications Act. “[B]y its terms our section 4(i) rulemaking authority is not limited just to the adoption of rules pursuant to substantive jurisdiction under the Communications Act, and the Verizon court cited as reasonable the Commission’s view that Congress, in placing upon the Commission the obligation to carry out the purposes of section 706, ‘necessarily invested the Commission with the statutory authority to carry out those acts.’ ” Under such a reading, rules adopted pursuant to section 706 fall within our Titles IV and V authorities. The Commission would also have all of its standard rulemaking authority under sections 4(i), 201(b), and 303(r). Our enforcement authority was not explicitly discussed in either the 2010 Open Internet Order or Verizon. The court did cite as reasonable the Commission’s view that Congress, in placing upon the Commission the obligation to carry out the purposes of section 706, “necessarily invested the Commission with the statutory authority to carry out those acts.” We believe it likewise reasonable to conclude that, having provided the Commission with affirmative legal authority to take regulatory measures to further section 706’s goals, Congress invested the Commission with the authority to enforce those measures as needed to ensure those goals are achieved. Courts have long recognized the Commission’s authority to interpret and implement the Communications Act of 1934. Both the 2015 Open Internet Order and the RIF Order recognized this authority.

3. Title III of the Act for Mobile Providers

611. As in the 2015 Open Internet Order, we find that the open internet rules we adopt in the Order are further supported in the case of mobile BIAS by our broad legal authority under Title III of the Act to protect the public interest through spectrum licensing and administration regulations, including sections 303 and 316 of the Act.

612. Section 303(b) directs the Commission, consistent with the public interest, to “[p]rescribe the nature of the service to be rendered by each class of licensed stations and each station within any class.” The open internet rules we adopt in the Order prescribe the nature of the service to be rendered by licensed entities providing mobile BIAS. The rules we adopt in the Order specify the form this service must take for those who seek licenses to offer it. In providing such licensed service, BIAS providers must adhere to the rules we adopt in the Order.

613. This authority is bolstered by at least two additional provisions. First, as the D.C. Circuit has explained, section 303(r) provides the Commission authority to “make such rules and regulations and prescribe such restrictions and conditions, not inconsistent with law, as may be necessary to carry out the provisions of this chapter.” Second, section 316 authorizes the Commission to adopt new conditions on existing licenses if it determines that such action “will promote the public interest, convenience, and necessity.” The Commission also has ample authority to impose conditions to serve the public interest in awarding licenses in the first instance. Moreover, this document’s rules do not make any fundamental changes to those licenses. Rather, our rules are largely consistent with the current operation of the internet and the current practices of mobile BIAS providers.
614. The RIF Order acknowledged that the Commission could rely on Title III licensing authority to support conduct rules but declined to follow the Commission’s historical approach due to concerns about disparate treatment of wireline and wireless internet service providers. As discussed above, we classify BIAS as a Title II service and mobile BIAS as commercial mobile service. We believe that our reclassification avoids any inconsistent treatment between different categories of BIAS providers that may have resulted under the RIF Order's classification. Moreover, we recognize that the D.C. Circuit’s Mozilla decision includes a brief statement as part of its review of the RIF Order’s preemption decision stating that BIAS is not “radio transmission,” so Title III does not apply. But the RIF Order did not attempt to apply (or justify applying) Title III to BIAS, and the Mozilla decision did not develop any reasoning in support of that assertion. Rather, we read the Mozilla court’s statement that “BIAS is not ‘radio transmission’” as limited to the court’s decision to vacate the RIF Order’s blanket preemption of State and local regulation of BIAS. In particular, the D.C. Circuit found that the Commission “failed to ground its sweeping Preemption Directive . . . in a lawful source of statutory authority,” and concluded that “in any area where the Commission lacks the authority to regulate, it equally lacks the power to preempt state law.” Given this backdrop, we do not believe the court’s statement should be read to call into question the Commission’s prior recognition that mobile BIAS falls within the scope of Title III. Commenters did not address the court’s statement regarding radio transmission in the Mozilla decision or the Commission’s view that the court’s statement does not call into question our prior recognition that mobile BIAS falls within the scope of Title III.

615. Finally, CTIA argues that the Act fords applying Title II common carrier regulations to BIAS, and in particular, to mobile BIAS. Similarly, a broad coalition consisting of local groups and individuals located throughout the U.S. urges the Commission to avoid reclassifying any mobile data-only service, but if it does, it should maintain the current regulatory classification under section 332(c)(2) as a non-common-carrier private mobile service and thereafter exercise authority over mobile data-only service under sections 301, 305, and 316 of the Act. For the reasons discussed above, we reject these arguments and conclude that mobile BIAS is best viewed as a commercial mobile service, or, in the alternative, the functional equivalent of commercial mobile service, and therefore, not private mobile service.

G. Other Laws and Considerations

616. As the Commission did in the 2015 Open Internet Order, we make clear that the open internet rules we adopt in the Order do not expand or contract BIAS providers’ rights or obligations under other laws or preclude them from responding to safety and security considerations—including the needs of emergency communications and law enforcement, public safety, and national security authorities—or affect the ability of BIAS providers to make reasonable efforts to address transfers of unlawful content and unlawful transfers of content.

617. Emergency Communications and Safety and Security Authorities.

Consistent with our proposal in the 2023 Open Internet NPRM, and the 2010 and 2015 Open Internet Orders, we adopt a rule that acknowledges the ability of BIAS providers to serve the needs of law enforcement and the needs of emergency communications and public safety, national, and homeland security authorities, which provides that nothing in the part supersedes any obligation or authorization a provider of broadband internet access service may have to address the needs of emergency communications or law enforcement, public safety, or national security authorities, consistent with or as permitted by applicable law, or limits the provider’s ability to do so.

618. We reiterate that the purpose of the safety and security provision is first to ensure that open internet rules do not restrict BIAS providers in addressing the needs of law enforcement authorities, and second to ensure that BIAS providers do not use the safety and security provision without the imprimatur of a law enforcement authority, as a loophole to the rules. As the Commission has previously explained, application of the safety and security rule should be tied to invocation by relevant authorities rather than to a BIAS provider’s independent notion of the needs of law enforcement.

619. The record reflects no disagreement that the open internet rules we adopt in the Order do not supersedee any obligation a BIAS provider may have—or limit its ability—to address the needs of emergency communications or law enforcement, public safety, or homeland or national security authorities.” BIAS providers have obligations under statutes such as CALEA, the Foreign Intelligence Surveillance Act, and the Electronic Communications Privacy Act that could in some circumstances intersect with open internet protections. Likewise, in connection with an emergency, there may be Federal, state, tribal, and local public safety entities, homeland security personnel, and other authorities that need guaranteed or prioritized access to the internet in order to coordinate disaster relief and other emergency response efforts, or for other emergency communications.

620. Transfers of Unlawful Content and Unlawful Transfers of Content. We also adopt our proposal to make clear that the open internet rules protect only lawful content, and are not intended to inhibit efforts by BIAS providers to address unlawful transfers of content or transfers of unlawful content, to ensure that open internet rules are not used as a shield to enable unlawful activity or to deter prompt action against such activity. Specifically, we find that nothing in the part prohibits reasonable efforts by a provider of broadband internet access service to address copyright infringement or other unlawful activity.

621. The record is generally supportive of our proposal to make clear that the open internet rules protect only lawful content, and are not intended to inhibit efforts by BIAS providers to address unlawful transfer of content or transfers of unlawful content. For example, as the Commission explained in the 2015 Open Internet Order, the no-blocking rule should not be invoked to protect copyright infringement, which has adverse consequences for the economy, nor should it protect child pornography. We reiterate that our rules do not alter copyright laws and are not intended to prohibit or discourage voluntary practices undertaken to address or mitigate the occurrence of copyright infringement. However, as in 2015, we note that we “retain the discretion to evaluate the reasonableness of broadband providers’ practices under this rule on a case-by-case basis.”

H. Cost-Benefit Analysis

623. In the 2023 Open Internet NPRM, we sought comment on the costs and benefits of Title II reclassification of BIAS and the proposed open internet rules. The record reflects a broad range of views on the potential costs and benefits of both. We apply a cost–benefit framework to evaluate the overall effect (net benefits or net costs) of reclassifying BIAS as a Title II telecommunications service and the open internet rules. While the record,
and indeed the nature of the benefits and costs under consideration, do not allow us to quantify the magnitude of the effects of the key decisions in the Order, we are able to reasonably assess their directional impact, that is, whether the result is on-net beneficial or costly. For example, it is difficult to quantify with precision the benefits of a more vibrant and thriving internet ecosystem, or of increased national security or public safety.

624. The primary benefits and costs attributable to the Order are the changes in the economic welfare of consumers, BIAS providers, and edge providers that would occur due to our actions. Our cost–benefit analysis nets out transfers among these economic actors. We evaluate the costs and benefits of reclassifying BIAS as a Title II telecommunications service and of adopting our open internet rules relative to the regulatory framework introduced by the RIF Order, but adjust that baseline in light of changes since the Commission adopted it. Therefore, we compare the expected costs and benefits of these actions against the RIF Order framework of Title I classification of BIAS, but account for the existence of State open internet requirements, the statutorily required broadband label, and other changed circumstances since the RIF Order. Relevant changes that have occurred since the RIF Order include the national security environment and the increased need for cybersecurity. We find that the benefits of Title II reclassification and the proposed open internet rules outweigh the costs.

1. Title II Reclassification

625. Fulfilling Key Public Interest Obligations and Objectives. As discussed in detail above, our reclassification decision will ensure the Commission can fulfill statutory obligations and important policy objectives. BIAS providers function as gatekeepers for both their end-user customers who access the internet, and for the edge providers, transit providers, and CDNs that require reliable access to BIAS end-user subscribers. The reclassification of BIAS and the rules we set forth in the Order will ensure that the internet remains open and that the virtuous cycle of edge innovation and broadband investment continues unabated. Furthermore, we find our reclassification of BIAS as a Title II service will have substantial additional benefits enabling the Commission to defend national security, promote cybersecurity and public safety, monitor network resiliency and reliability, protect consumer privacy and data security, support consumer access to BIAS, enable access to infrastructure, and improve disability access. As explained in that section above, we conclude that the RIF Order and RIF Remand Order did not fully consider, or gave too little weight, to those benefits of the classification of BIAS as a telecommunications service. Consequently, we reject those cost–benefit analyses as predicated on a finding of too little benefit from a Title II classification of BIAS. Although many of these policy benefits do not readily lend themselves to quantification, they flow directly from our reclassification of BIAS as a telecommunications service.

626. Effect on Investment. Commenters argue that one of the greatest potential costs of reclassifying BIAS as a Title II telecommunications service is that it will lower BIAS provider investment incentives by reducing profits associated with the provision of BIAS, as well as by increasing regulatory uncertainty. These commenters claim that BIAS provider investment declined following previous announcements of Title II reclassification, and they cite studies that purport to demonstrate empirically that the application of Title II to BIAS’ providers harms investment. As our detailed analysis above shows, the concerns of these commenters are unfounded, as there is little compelling evidence that applying Title II to BIAS has such a measurable effect on investment. As we explain in that section above, our assessment of the available evidence regarding the effect of reclassification on investment leads to a different conclusion than that in the RIF Order. Insofar as the RIF Order’s and RIF Remand Order’s cost–benefit analyses were predicated on that different understanding of the effect of reclassification on investment, we reject them on that basis.

627. We first note that generic claims that regulation can be harmful to investment and innovation do not persuade us in this specific case. Regulation is just one of several factors that drive investment and innovation in the broadband marketplace. Today, new State and Federal support programs are a significant driver of BIAS investment, and we expect Title II classification to allow BIAS-only providers to face lower deployment costs, for example, because they will be able to take advantage of our pole attachment rules under section 224 or seek assistance from the Commission or courts under section 253. In addition, the effects of regulation depend on the nature of the regulations adopted and on market conditions, and they may vary by market participant. As research and past experience show, appropriate telecommunications regulation may be required to create market conditions that are conducive to infrastructure investment, and we conclude that this is true in the present case. The Cable Act of 1984 and its subsequent regulatory implementation by the Commission also dramatically increased investment in the cable industry by providing access to poles, ducts, conduits and public rights of way. In terms of open internet regulations in particular, many studies in the economics literature find that regulation can have positive effects on both BIAS and edge provider investment incentives, and also find that overall economic welfare may be higher.

628. Given the lack of clear direction provided by the theoretical economics literature on how reclassification may affect BIAS investment, commenters and our own analysis draw on the empirical economics literature to evaluate the likely impact. In contrast to the claims by commenters opposed to Title II reclassification, and the authors of the studies they cite, our analysis persuades us that reduced BIAS provider investment has not been causally linked to Title II reclassification. We find that the studies in the record that claim to establish this link are in some cases not applicable to the U.S. context and in all cases suffer from methodological and data issues that render their conclusions unreliable. With regard to the one rigorous empirical study where the underlying data used by the author were readily available, we find that, after correcting the data, which had been revised and updated by the Bureau of Economic Analysis, and fixing the methodological problems identified with the study, the correct conclusion from the study is that there is no evidence that the announcement of Title II reclassification had any statistically significant effect on investment. We note that a second study by Briglauer et al. was cited in the record but the underlying data for this study were not available to us in our analysis. This study was heavily relied upon by the RIF Order to reach a conclusion that Title II reclassification is harmful to investment, but after these corrections, this study supports our conclusion that there is no empirical evidence in the record that Title II reclassification would have any significant negative impact on broadband investment. We therefore give little weight to these claims and view these claimed costs as being
relatively limited in our cost–benefit analysis.

629. Regulatory Compliance Costs. Commenters separately argue that Title II classification will result in higher regulatory compliance costs compared to Title I classification, and that increased compliance costs will disproportionately impact small BIAS providers that lack the resources to handle the new compliance obligations. Although no commenter provided quantitative estimates of the magnitude of these potential compliance costs, we acknowledge that reclassifying BIAS as a Title II telecommunications service may lead to some increase in compliance costs. In our predictive analysis, and based on qualitative analysis, however, we believe that these compliance costs are likely to be small and are outweighed by the benefits of reclassification that have been identified in our analysis.

630. We first note that any direct increase in compliance costs from the rules adopted in the Order appears modest, and to the extent we adopt any new rules governing BIAS in the future, we will assess incremental compliance costs, if any, at that time as part of a cost–benefit analysis. We further note that we have taken several steps to reduce compliance burdens, especially for BIAS providers with 100,000 or fewer subscribers. In the cases where we do apply a Title II provision to BIAS, we attempt to minimize compliance costs in the application of the provision. For example, we grant blanket section 214 authority for the provision of BIAS to any entity currently providing or seeking to provide BIAS—except those specifically identified entities whose application for international section 214 authority was previously denied or whose domestic and international section 214 authority was previously revoked and their current or future affiliates and subsidiaries. Similarly, we waive the rules implementing section 222 to the extent such rules are applicable to BIAS as a telecommunications service and any future application of rules will be undertaken only after seeking public comment and considering the costs of such rules. In all cases where applying a provision may increase regulatory compliance costs, we have been careful to apply the provisions of Title II to BIAS providers only in a manner in which the expected benefits exceed expected costs. For example, we do not apply sections 201 and 202 in their entirety because we conclude that the costs of applying the provisions to impose ex ante or ex post rate regulation on BIAS would exceed the benefits. Finally, the Title II provisions that assist BIAS network deployment, including sections 224 and 253 (in addition to section 332), do not impose affirmative obligations or compliance costs on BIAS providers. Rather, they simply give BIAS providers new rights to seek assistance from the Commission and/or courts, if they find that such assistance is on-net beneficial. For example, a BIAS provider seeking pole access under section 224 would only do so if it were to its benefit. Similarly, a BIAS provider would only seek Commission or court intervention under section 253 if it were to its benefit.

631. The adoption of bright-line rules should also generally lower overall compliance costs because they provide greater certainty to market participants in regard to conduct that would likely result in an enforcement action relative to the current regulatory framework established by the RIF Order in which there is uncertainty as to which conduct would be deemed to be harmful to edge providers or the open internet and such conduct is subject to ex post, case-by-case enforcement by antitrust or consumer protection authorities, or by states that have passed open internet rules. The RIF Order framework could therefore lead to lengthy enforcement actions and ultimately higher compliance costs for BIAS providers as they are required to determine through a trial-and-error process whether actions that would violate the bright-line rules we adopt would be subject to enforcement at the state or Federal level. In our judgment, establishing bright-line Federal rules and enforcing those rules through a single expert agency will achieve timelier and more consistent outcomes and reduce the costs of uncertainty for all interest holders, and thus yield significant public interest benefits. As noted above, our approach to preemption also provides regulatory certainty insofar as it is clear that the Commission, versus another Federal agency, will address, and as needed preempt, on a case-by-case basis, State laws that unduly frustrate or interfere with interstate communications.

632. “Regulatory Creep.” The last broad set of potential costs that some commenters raise with respect to reclassification of BIAS as a Title II telecommunications service pertain to “regulatory creep.” Although we forbear from applying Title II rate regulation provisions to BIAS, some commenters express concern that the Commission will adopt future rate regulation. We are not persuaded by these unsupported assertions. We have carefully tailored application of all Title II provisions to current broadband market conditions and avoided any unnecessary regulations. Moreover, decades of Commission precedent suggest that, in contrast to regulatory creep, the Commission has tended to deregulate over time and to forbear from additional statutory provisions and Commission rules. For example, the Commission in 1980 streamlined the regulation of non-dominant interchange carriers by eliminating ex ante rate regulation and streamlining existing section 214 requirements. And after Congress gave the Commission forbearance authority under the 1996 Act, the Commission has forborne from dozens of statutory provisions and Commission rules, where it found that enforcement was not necessary to preserve “just and reasonable” terms of service, to protect consumers, or to serve the public interest. The Commission’s forbearance decisions include eliminating tariff-filing requirements, the ending of certain Automated Reporting Management Information System (ARMIS) reporting requirements, and streamlining the regulation of business data services. We see no reason the Commission would depart from this general tendency to remove regulations when they are no longer required due to changed circumstances. Finally, we note that any changes to this framework or future rules the Commission considers adopting under the Title II framework would be subject to notice and comment and an analysis of the record, including any purported costs, prior to adoption.

2. Bright-Line Rules

633. No-Blocking and No-Throttling Rules. While larger BIAS providers have repeatedly assured their customers and publicly advertised that they will not block access to legal content or engage in throttling, not all BIAS providers have made such commitments. Moreover, there are no assurances that providers will continue to make or adhere to such commitments in the future, and the framework established in the RIF Order allows BIAS providers to engage in such activities as long as they disclose these practices to consumers. Given that BIAS providers have incentives and the ability to engage in blocking and throttling, our rules against this conduct protect free expression online, reduce uncertainty for edge providers when developing new services and applications, and provide necessary foundations for preventing anticompetitive or discriminatory conduct that harms edge providers and the open internet. Even if, in the absence of rules, BIAS providers
generally would not block or throttle the edge services offered today, our bright-line rules will reduce uncertainty for, and protect, innovators seeking to offer new edge services, particularly if those new services would compete with services that BIAS providers offer now or will offer in the future. If investors fear future blocking or throttling could be forthcoming despite current BIAS provider commitments, such investments in new edge services may not be undertaken. At the same time, the no-blocking and no-throttling rules, because they are clear bright-line rules, should deter such conduct, or to the extent such conduct does occur, should enable the Commission to aggressively respond. Thus, we conclude that these rules will create substantial economic value for edge providers and consumers, and for the economy broadly. We note that even the RIF Order acknowledged that “the costs of banning blocking and throttling are likely small,” though it went on to State that the rule “may create some compliance costs.” We agree that the costs of banning blocking and throttling are likely to be small and further conclude that any compliance costs are also likely small, particularly for those BIAS providers that have committed to refrain from—and intend to continue refraining from—such conduct. We part ways with the RIF Order insofar as it also concluded that the benefits of those rules also are likely to be small based on the availability of “antitrust and consumer protection law, coupled with consumer expectations and ISP incentives.” As we discussed above, by contrast, we find antitrust and consumer protection laws to be insufficient to guard the open internet. We also conclude that the marketplace alone is not sufficient to guard against harmful blocking and throttling of internet traffic. Consequently, in contrast to the RIF Order, we not only find the costs of our rules banning blocking and throttling to be low, but we also conclude that these rules provide meaningful benefits that more than outweigh those limited costs.

634. No Paid or Affiliated Prioritization. As discussed above, we find that, absent regulation, BIAS providers may use paid and affiliated prioritization in ways that harm edge providers and the open internet. In particular, they could have the incentive and ability to use paid or affiliated prioritization to raise the costs of edge providers that compete with their vertically integrated edge affiliates or with edge providers with whom they have contractual arrangements. Moreover, if they can profitably charge edge providers for prioritized access, BIAS providers may have an incentive to strategically degrade, or decline to maintain or increase, the quality of service to non-prioritized uses and users in order to raise the profits from selling priority access. We further find that adopting a bright-line rule prohibiting paid and affiliated prioritization has the advantage of relieving small edge providers, innovators, and consumers of the burden of detecting and challenging cases of socially harmful paid prioritization.

635. The RIF Order’s cost–benefit analysis concluded that a ban on paid prioritization has a net negative effect on economic welfare. We find that this conclusion was the result of the RIF Order heavily discounting the benefits of banning paid prioritization identified above and substantially overstating the costs. On the cost side, the RIF Order first contends that “the ban on paid prioritization has created uncertainty and reduced ISP investment,” but, as we have demonstrated, claims regarding the 2015 Open Internet Order’s allegedly detrimental effect on investment were unsupported. The RIF Order analysis further states “that the ban [on paid prioritization] is likely to prevent certain types of innovative applications from being developed or adopted.” We disagree with this statement for two reasons. First, the rules adopted in the Order do not prohibit BIAS providers from developing innovations that require quality of service differentiation that are compatible with the open internet rules. Second, while we recognize that there may also be positive use cases of paid prioritization and some costs associated with a ban on such uses, we find that such positive use cases may be addressed through the waiver rule we adopt. Consequently, the RIF Order’s claim that there would be high costs in the form of forgone investment and innovation cannot be sustained. Thus, we find the benefits of adopting a bright-line rule prohibiting paid prioritization exceed its costs.

3. General Conduct Rule

636. We also find that the expected benefits of the general conduct standard we adopt will exceed the expected costs. We find, as the Commission found in 2015, that the Commission needs a backstop mechanism to respond to attempts by BIAS providers to wield their gatekeeper power in ways that do not violate the bright-line rules, but nevertheless may compromise the open internet. We also acknowledge that several commenters raise concerns about possible regulatory uncertainty created by the general conduct rule and its potential negative effects on investment and innovation. To the extent that these commenters are addressing the costs and benefits of our decision, we find that these concerns should be reduced as a result of our providing a list of factors that we will consider in our analysis and our creation of an advisory opinion process. Indeed, in upholding the 2015 Open Internet Order’s general conduct rule, the D.C. Circuit cited with approval to “the Commission’s articulation of the Rule’s objectives and the specification of factors that will inform its application,” and emphasized that the Commission “also included a description of how each factor will be interpreted and applied” with examples “specifically identifying the kind of conduct that would violate the Rule.” In this context, the court explained, “[t]he flexible approach adopted by the General Conduct Rule aims to address that concern [of over-specificity leading to loopholes] in a field in which ‘specific regulations cannot begin to cover all of the infinite variety of conditions.’ ” Exercising our predictive judgment, we find that the general conduct rule should not impose significant ex ante compliance costs on BIAS providers, but it should enable the Commission on a case-by-case basis to address conduct that is not covered by the bright-line rules, but that nevertheless harms consumers, edge providers, and the open internet. Creating a flexible general conduct rule allows more agile Commission responses to developments that might harm the open internet, and should spur innovation experiments and experiential learning by providing guidance on the types of actions that are likely to harm the open internet.

637. We recognize that this conclusion differs substantially from the RIF Order, which found that the costs of the general conduct rule exceed the benefits. We find that the Commission’s analysis in the RIF Order significantly understated the benefits of the general conduct rule and overstated costs. The RIF Order analysis asserts that the benefits of the general conduct rule are nearly zero because the consumer protection and antitrust laws provide adequate protections and because examples of harmful conduct are rare. We disagree with both premises as we have shown that BIAS providers have the incentive and ability to harm edge providers and have provided examples of when such conduct has occurred. Furthermore, we find that applying antitrust and consumer protection enforcement are insufficient to protect
consumers and edge providers from BIAS provider conduct that may harm the open internet. In addition, the primary costs associated with the conduct rule that the RIF Order identified were that it would reduce investment, and we have shown that the evidence the RIF Order presented as the basis for these concerns is unreliable. We conclude that the general conduct rule is a necessary component of a forward-looking regulatory framework that will provide both greater flexibility for the Commission to address new issues as they arise and greater certainty to BIAS providers in terms of the factors that will be considered when assessing whether new practices will be likely to harm the open internet.

4. Transparency Rule

638. In evaluating the potential costs and benefits of the transparency rule we adopt, we need to compare it to the status quo. As discussed above, as part of the IIJA, Congress directed the Commission to promulgate rules for a broadband label to be displayed at the point of sale by BIAS providers. The Broadband Label Order responded to this Congressional directive and reintroduced many of the transparency requirements eliminated in the RIF Order as required by the IIJA. Therefore, the baseline transparency framework against which costs and benefits are compared has changed significantly since the cost–benefit analysis performed in the RIF Order. The transparency rules established in the Order represent only small, incremental changes relative to the prevailing statutorily required regulations. The most important incremental changes relative to this new baseline is our adoption of the direct customer disclosure requirement and our re-adoption of the 2015 enhancements to the performance characteristics disclosure requirements. However, as we explain above, given that such performance characteristic information is widely commercially available and large BIAS providers already have direct notification capabilities in their networks, and that we provide a temporary exemption for BIAS providers with 100,000 or fewer subscribers, the current change in incremental costs of adopting this rule are small. Furthermore, adopting these changes will provide consumer benefits that exceed these small costs by enabling consumers to select the appropriate BIAS that meets their needs and by ensuring that the consumer notifications that are already in place are consistently providing consumers with sufficient information and time to consider adjusting their usage to avoid their BIAS provider from applying a network management practice that could result in additional unwanted charges or other adverse effects.

5. Preemption

639. As discussed above, we preempt State or local measures that “interfere or are incompatible with the federal regulatory framework we establish today.” Further, we will proceed on a case-by-case basis to consider challenged measures “in light of the fact specific nature of particular preemption inquiries.” We find that, under this standard and approach, the Commission can preempt inconsistent State and local regulations, which we predict will reduce the costs on BIAS providers caused by inconsistent State and local regulations and reduce regulatory uncertainty. At the same time, this standard recognizes and accommodates the “concurrent regulatory authority [of states] over communications networks.” This stands in contrast to the situation under the RIF Order where the D.C. Circuit invalidated the RIF Order’s attempt at preemption, thereby allowing for the emergence of inconsistent State laws, which could increase compliance costs. Consequently, we find that the benefits of the approach we adopt here will exceed the costs.

IV. Constitutional Considerations

A. First Amendment

1. Free Speech Rights

640. We believe that the rules we adopt in the Order fully comport with the First Amendment and do not unlawfully infringe any free speech rights, contrary to the few commenters who suggest otherwise. That is so for two reasons. First, when BIAS providers are carrying their users’ communications, they are not themselves acting as speakers or engaged in any expressive activity subject to the First Amendment, but instead are acting as mere conduits for the speech of others. Alternatively, even if BIAS providers were treated as speakers themselves when carrying their customers’ communications, the rules we adopt in the Order withstand the applicable intermediate standard of scrutiny because they are tailored to serve important governmental interests without unduly burdening speech. We note that most of the comments filed by BIAS providers and their trade associations in this proceeding have not raised or joined these First Amendment arguments.

641. The Supreme Court has rejected similar arguments that private parties have a freestanding First Amendment right to refuse to carry or allow third-party speech when it does not interfere with the private party’s own ability to speak. In PruneYard Shopping Center v. Robins, the Court rejected a shopping mall’s First Amendment challenge to a State law requiring it to allow members of the public to distribute pamphlets on the mall’s property. The Court explained that allowing others to distribute their messages would not impair the mall owner’s right to free expression because “[t]he views expressed by members of the public” in a forum open to the public “will not likely be identified with those of the owner,” and because the owner always “can expressly disavow any connection with the message . . . and could explain that the persons are communicating their own messages by virtue of [the] state law.” Similarly, in Rumsfeld v. Forum for Academic & Institutional Rights, Inc., the Court unanimously rejected several law schools’ First Amendment challenge to a law requiring them to permit military recruiters access to school facilities, despite the schools’ ideological objections to the military’s employment policies, as a condition for Federal funding. The Court held that permitting access by military recruiters would not violate the schools’ First Amendment rights because “[n]othing about recruiting suggests that law schools agree with any speech by recruiters, and nothing . . . restricts what the law schools may say about the military policies.”

642. The rules we adopt in the Order do not abridge any speech or expression by BIAS providers because, when a BIAS provider offers BIAS as understood by consumers and as defined in the Order—that is, a mass-market retail service by wire or radio that provides the capability to transmit data to and receive data from all or substantially all internet endpoints—the BIAS provider is acting merely as a conduit for others’ speech, not as a speaker itself. In other words, when providing BIAS, BIAS providers “merely facilitate the transmission of the speech of others rather than engage in speech in their own right.” Consumers “expect that they can obtain access to all content available on the internet, without the editorial intervention of their broadband provider.” When BIAS providers deliver services that have been requested by their customers, they are no different from telephone companies or package
delivery services like FedEx, which have never been thought to be engaging in their own expressive activity when merely carrying the messages of others.

643. Unlike newspapers, websites, social media platforms, or even cable operators, BIAS providers do not select, alter, arrange, annotate, or contextualize the content that their users request or that edge providers deliver in response. BIAS providers neither select which information to present nor determine how it is presented. Consumers understand and expect BIAS providers providing BIAS to transparently transmit information to and from the applications and services of the consumers’ choosing, not their BIAS providers’ choosing, without change in form or content. Consumers do not understand a BIAS provider to be selecting or compiling speech to present the BIAS provider’s own expressive offering. Unlike the editors of a newspaper, the curators of a library or museum, or the managers of a theater, BIAS providers do not select which speech to feature, nor do they arrange or compile the speech they transmit into a new form of expression. BIAS providers instead deliver the content that their users independently have chosen, without engaging in any distinct expressive activity or communicating any distinct message.

644. The record in this proceeding confirms this conclusion. In the 2023 Open Internet NPRM, we sought comment on “whether or to what extent ISPs engage in content moderation, curation, or exercise control over what third-party content their users are able to access on the internet.” We further observed that “some social media platforms and other edge providers purport to engage in various forms of content moderation or editorial control” and asked whether there is “any record of ISPs announcing and engaging in comparable activity?”

In response, no BIAS provider has identified any evidence of BIAS providers engaging or wishing to engage in any such practices, nor has any other commenter. We find that silence telling. Despite our asking, there is no evidence in the record that any BIAS provider covered by our Order engages in any exercise of editorial control, curation, or other expressive activity. And, we note, BIAS providers have often relied on their status as mere conduits and their lack of editorial control to obtain immunity from copyright violations and other liability for material distributed over their networks.

645. We further agree with the D.C. Circuit that, in providing BIAS, BIAS providers do not communicate any distinct or discernible message of their own: “The Supreme Court has explained that the First Amendment comes ‘into play only . . . when an ‘intention to convey a particularized message [is] present, and in the surrounding circumstances the likelihood [is] great that the message would be understood by those who viewed it.’” But a BIAS provider’s delivery of content requested by a user neither reflects an intent to convey any particular message nor is likely to be perceived or understood by the user as conveying the provider’s message. “[W]hen a subscriber uses his or her broadband service to access internet content of her own choosing, she does not understand the accessed content to reflect her broadband provider’s editorial judgment or viewpoint.” and “nothing about affording indiscriminate access to internet content suggests that the broadband provider agrees with the content an end user happens to access.”

646. Similarly, we are not persuaded that a BIAS provider’s decision to block or throttle a given website or application would, standing alone, constitute expressive or communicative conduct implicating the First Amendment. Blocking or throttling internet traffic is not inherently expressive. A customer “may have no reason to suppose that her inability to access a particular application, or that the markedly slow speeds she confronts when attempting to use it, derives from her ISP’s choices rather than from some deficiency in the application. After all, if a subscriber encounters frustratingly slow buffering of videos when attempting to use Netflix, why would she naturally suspect the fault lies with her ISP rather than with Netflix itself?” Such conduct would not convey a message without some separate “explanatory speech”—that is, the conduct would support a message “only [if the BIAS provider] accompanied [its] conduct with speech explaining it,” such as a statement on its website or in its customer bills explaining what content it restricts and why. And the Supreme Court has explained that where conduct “is not inherently expressive” without separate explanatory speech, parties “are not speaking” when they seek to engage in that conduct, so the conduct itself is not protected by the First Amendment. BIAS providers may still express their views on any internet content or other matters by stating those views on their websites, in their customer bills, or elsewhere, and that explanatory speech would receive full First Amendment protection—but the separate act of blocking or throttling individual websites or applications is not “inherently expressive” conduct and is not protected by the First Amendment.

647. We find additional support for this view in the long history of common carrier regulation in the United States. “The common carrier doctrine is a body of common law dating back long before our Founding” that “vests [the government] with the power to impose nondiscrimination obligations on communication and transportation providers that hold themselves out to serve all members of the public without individualized bargaining.” The Supreme Court has frequently distinguished common carriers from speakers, broadcasters, or editors engaged in First Amendment activity. As the D.C. Circuit has observed, common carriers “have long been subject to nondiscrimination and equal access obligations akin to” those we adopt here “without raising any First Amendment question.” This “absence of any First Amendment concern in the context of common carriers rests on the understanding that such entities, insular as they are subject to equal access mandates, merely facilitate the transmission of the speech of others rather than engage in speech in their own right.” And “[g]iven the firm rooting of common carrier regulation in our Nation’s constitutional tradition, any interpretation of the First Amendment that would make [it] facially unconstitutional would be highly incongruous.”

648. To be sure, a different question would be presented if a BIAS provider were to create and market a curated internet access product that caters to some target audience and is clearly presented as such to consumers. The rules we adopt in the Order apply only to offerings of mass-market broadband service providing indiscriminate access to all or substantially all internet endpoints, which consumers understand to transparently transmit information to and from the internet applications and services of their choosing without being curated or edited by their BIAS provider. A curated internet product, if clearly identified and marketed as such, would fall outside the scope of the Order. And if a BIAS provider “represent[s] itself to consumers as affording them less of a ‘go wherever you’d like to go’ service and more of a ‘go where we’d like you to go’ service,” that might well be an expressive offering receiving First Amendment protection. A BIAS provider that wishes to provide such a curated service may freely do so, long as the BIAS provider “make[s] adequately clear its intention to provide
edited services of that kind, so as to avoid giving customers a mistaken impression that they would enjoy indiscriminate access to all content available on the internet [without the editorial intervention of their broadband provider]."

649. If a BIAS provider decides to offer a service that is clearly identified as providing edited or curated internet access, consumers would be free to decide whether to subscribe to that curated offering based on its expressed editorial policies or viewpoint. No commenter has offered evidence of any curated internet access product in the marketplace, and we take no position on whether there is market demand for such a product. But what BIAS providers may not do is provide consumers what purports to be ordinary mass-market broadband service, which consumers reasonably understand to provide indiscriminate access to all or substantially all internet applications and services of their choosing, and then engage in discriminatory practices that deny customers the service they reasonably expect. Our rules thus simply ensure that BIAS providers “act in accordance with their customers’ legitimate expectations.” We agree with the USTA decision that nothing supports “the counterintuitive notion that the First Amendment entitles an ISP to engage in the kind of conduct barred by the net neutrality rule—i.e., to hold itself out to potential customers as offering them an unfiltered pathway to any web content of their own choosing, but then, once they have subscribed, to turn around and limit their access to certain web content based on the ISP’s own commercial preferences.”

650. Even if our rules were construed to somehow implicate BIAS providers’ First Amendment speech rights, they would still be permissible as content-neutral regulations satisfying intermediate scrutiny. The rules make no distinction based on content or viewpoint, and a content-neutral regulation will be upheld if it “furthers an important or substantial government interest ... unrelated to the suppression of free expression” and if it “do[es] not burden substantially more speech than is necessary.”

651. The rules we adopt in the Order serve multiple important—indeed compelling—governmental interests. To begin, the rules “[a]lso serv[e] that the public has access to a multiplicity of information sources” by promoting “the widest possible dissemination of information from diverse and antagonistic sources.” The Supreme Court has declared this to be “a governmental purpose of the highest order,” as it “promotes values central to the First Amendment.” The rules we adopt in the Order also enable fair competition among edge providers and ensure a level playing field for a wide variety of speakers who might otherwise be disadvantaged, and the Supreme Court has likewise deemed it “undisputed” that “the Government has an interest in eliminating restraints on fair competition . . . , even when the individuals or entities subject to particular regulations are engaged in expressive activity protected by the First Amendment.” And we find that our rules will substantially further the national interest in ensuring that Americans have widespread access to a vibrant internet on reasonable terms. Indeed, Congress has specifically directed the Commission to “encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans” and to “promote the continued development of the internet and other interactive computer services and other interactive media.”

652. None of these important governmental interests involves the suppression of free expression or targets any speakers’ messages based on their content. For the reasons we have explained, moreover, we firmly believe the actions we take in the Order further these interests. And the rules we adopt are tailored to accomplish those interests without placing an unnecessary burden on speech: BIAS providers themselves remain free to speak on an unlimited range of subjects, including by publicizing their views on their own websites or by delivering their messages on inserts accompanying customers’ monthly bills; they simply may not unreasonably suppress the speech of others in their capacity as conduits. And in any event, “even on the doubtful assumption that a narrower but still practicable . . . rule could be drafted . . . content-neutral regulations are not ‘invalid simply because there is some imaginable alternative that might be less burdensome on speech.’”

653. We disagree with CTIA’s argument that under the Supreme Court’s Turner decisions, the government can satisfy intermediate First Amendment scrutiny only by providing specific evidence that a given BIAS provider possesses market power within its specific geographic market. For one thing, Turner discussed three important interests: (1) preserving free broadcast television, (2) promoting a multiplicity of voices, and (3) promoting fair competition. For another, even a rule competition-related interests, the Court held that there is an important Federal interest in “preserving a multiplicity of broadcast outlets regardless of whether the conduct that threatens it . . . rises to the level of an antitrust violation.”

654. More generally, such a market power requirement would be at odds with the ordinary operation of intermediate scrutiny under the First Amendment, which has routinely been articulated as requiring “an important or substantial governmental interest . . . unrelated to the suppression of free expression” but never as requiring any specific showing of market power. And it would be ahistorical for a constitutional amendment adopted in 1791 to be predicated on modern-day concepts of market power. To be sure, the Court in the Turner cases found that cable companies had “bottleneck” control, but in doing so, did not rely on granular empirical evidence or market-by-market analysis, but instead largely on legislative findings, anecdotal testimony, and general economic principles. In response to the dissent’s argument that a court must carefully and independently examine the economic evidence, the Court acknowledged it was ultimately upholding the challenged must-carry rules based on “defer[ence] to the reasonable judgment of a legislative body” and opined that “[t]he level of detail in factfinding required by the dissent would be an improper burden for courts to impose on the Legislative Branch.” Our explanation of “how broadband providers’ position in the market gives them the economic power to restrict edge providers access to potential traffic and charge for the services they furnish edge providers”—that is, that a BIAS provider possesses a terminating-access monopoly over edge providers’ ability to reach the BIAS provider’s customer, sustained by barriers to entry arising from switching costs and imperfect information, which allows BIAS providers to act as gatekeepers—is at least as sufficient to sustain the rules we adopt in the Order.

655. In sum, the rules we adopt in the Order do not unconstitutionally abridge any speech or expression by BIAS providers. As the record confirms, BIAS providers are merely conduits for others’ speech—not speakers themselves—when delivering content that has been requested by their users. BIAS providers do not select, alter, arrange, annotate, or contextualize the content that their users request or that edge providers deliver in response, and there is no evidence in the record that any BIAS providers covered by our order engage in any exercised editorial control, curation, or other expressive activity. And even if BIAS providers
could somehow show that they were engaged in expression protected by the First Amendment, the rules we adopt in the Order would still satisfy constitutional requirements because they further important governmental interests without any substantially greater burden on speech than necessary to fulfill those interests.

2. Compelled Disclosure

656. CTIA—alone—briefly argues that our updated transparency rule unconstitutionally compels speech. We disagree. The Supreme Court held in Zauderer v. Office of Disciplinary Counsel of the Supreme Court of Ohio (Zauderer) that requiring businesses to disclose “purely factual and uncontroversial information” about their services is generally permissible so long as the requirements are not “unjustified” or “unduly burdensome.” Our transparency rule complies with that standard, just like the similar 2010, 2015, and 2018 transparency rules embraced by multiple administrations and upheld through multiple court challenges.

657. Here, as in Zauderer, our updated transparency rule is a reasonable measure to prevent deception or consumer confusion, among other things. The record of consumer complaints received by the Commission reflects that consumers are often unaware of or confused by practices that may result in slowed or impaired access to internet applications and services, impose data caps, or otherwise fail to provide the level of service reasonably expected at the advertised rates. Our rules ensure that consumers purchasing BIAS receive what they reasonably expect—that is, unimpeded access to all or substantially all internet endpoints of their choosing. Courts have recognized that BIAS providers have both the incentive and the ability to engage in harmful conduct, often in ways that might not be readily apparent to users; without enforceable transparency measures, consumers might have no ability to know if their BIAS provider is engaging in such practices.

658. The disclosures required by the updated transparency rule will also provide essential information the Commission needs to fulfill its statutory mandate to biennially report to Congress on the State of the communications marketplace, including the State of competition in the marketplace and any marketplace practices that pose a barrier to competitive entry into the marketplace.

659. Other important governmental interests also strongly support our updated transparency rule. The disclosures required by our transparency rule protect competition and curb the incentive of BIAS providers to interfere with, or disadvantage, third-party edge providers’ services by helping to ensure that such practices come to light. More generally, accurate information about BIAS provider practices encourages innovation and the development of high-quality services, and in turn helps drive consumer demand and broadband investment. Transparency and disclosure of BIAS provider practices further ensure that edge providers have the information they need to develop conforming applications and services. And transparency ultimately helps ensure that consumers, edge providers, and all other participants in the internet economy have confidence in the networks and business practices of the BIAS providers they rely on for their communications.

660. The need for our transparency rule is thus clear. And on the other side of the ledger, CTIA makes no showing that requiring BIAS providers to disclose “purely factual and uncontroversial information about the terms under which . . . services will be available” would be unduly burdensome.

661. Finally, even if Zauderer did not apply, we find that the updated transparency rule would withstand scrutiny even under the Central Hudson framework for substantially the same reasons, and for the reasons given in the RIF Order. Recognizing that the First Amendment “affords a lesser protection to commercial speech than to other constitutionally guaranteed expression,” the government may regulate commercial speech under Central Hudson to directly advance a substantial government interest so long as the regulation is not more extensive than necessary to fulfill that interest. We note that the Central Hudson test is a peculiar fit here because it purports to govern “restrictions” on speech, whereas disclosure requirements are not restrictions.

662. As explained, our transparency rule serves multiple substantial governmental interests in preventing deception and consumer confusion, protecting competition, and encouraging innovation. The rule also directly advances those interests. For consumers, “subscribers will be able to use the disclosed information to evaluate BIAS offerings and determine which offering will best enable the use of the applications and service they desire.” “In addition,” these disclosures “help ensure accountability by ISPs and the potential for quick remedies if problematic practices occur.” Meanwhile, edge providers who “might be particularly sensitive to the manner in which an ISP provides broadband internet access service potentially could benefit from [this information] to better ensure the performance of their internet applications and services” and “to evaluate how well their offerings will perform.” This transparency “helps reduce barriers to entry that otherwise could exist and encourages entrepreneurs’ and small businesses’ ability to compete and develop and advance innovative offerings in furtherance of our statutory objectives.” Moreover, disclosure of information to the Commission will allow the Commission to publish reports and information for consideration by consumers and edge providers, and “will provide the Commission the information it needs for the evaluation required by [section 13] of the Act, enabling [the agency] to spur regulatory action or seek legislative changes as needed.” And the transparency rule is appropriately tailored to these interests and no more extensive than necessary to substantially fulfill them. The RIF Order cited section 257 of the Act, which directed the Commission “to report to Congress on such marketplace barriers and how they have been addressed by regulation or could be addressed by recommended statutory changes.” Congress later repealed subsection (c) of section 257 and replaced it with section 13, 47 U.S.C. 163, which imposes a substantially similar reporting requirement.

B. Fifth Amendment Takings

663. As with the Commission’s analysis under the Fifth Amendment’s Takings Clause in the 2015 Open Internet Order, we do not identify any takings concerns with our actions here. Because our actions here merely regulate the commercial relationship between BIAS providers and their customers, they do not grant a right to physical occupation of the broadband providers’ property and thus do not constitute a per se taking. Our actions also do not constitute a regulatory taking under the relevant ad hoc balancing test because of the minimal effect on BIAS providers’ reasonable investment-backed expectations and the nature of our actions, which are far removed from a traditional physical invasion of property by the government. Nor are our actions confiscatory, because our regulatory approach enables BIAS providers to obtain a fair return on the network costs incurred in carrying traffic to and from BIAS end users.
1. Per Se Taking

664. We reject claims that our actions would effect a *per se* taking by granting third parties a right to physically occupy broadband providers’ facilities. The record does not reflect a concern that our actions in the Order deprive BIAS providers of all economically beneficial use of their property—nor would we find such a concern merited. We therefore limit our discussion to the physical occupation theory of *per se* takings. As a threshold matter, as the Commission observed in the 2015 Open Internet Order, “[c]ourts have repeatedly declined to extend *per se* takings analysis to rules regulating the transmission of communications traffic over a provider’s facilities;” and “these decisions comport with the Supreme Court’s perspective that permanent physical occupation of property is a narrow category of takings jurisprudence and is ‘easily identifiable’ when it does occur.” The record here does not reveal precedent to the contrary. At most, the record notes concurring or dissenting statements of judges or justices—frequently merely tentatively noting and/or setting aside possible takings questions—that predate most of the precedent on which we rely. The record also references an argument made in cable must-carry-related advocacy before the Commission seeking to rely on precedent addressing the scenario where “the Government took over a provider’s facilities,” and “these都不会 be closely tied to BIAS provider relationships with their end-user customers. Such requirements simply ensure that end users can use the service that BIAS providers have offered them, and that the end users have paid for, to obtain access to content, applications, and services that end users have elected to receive. Note that our rules do not apply to “curated” services and, where our bright-line conduct rules apply, allow for reasonable network management. The Commission explained in 2015 that where “owners voluntarily invite others onto their property—through contract or otherwise—the courts will not find that a physical occupation has occurred for purposes of constituting a *per se* taking.” Where, as here, BIAS providers have invited traffic on their networks through the offering of BIAS, reasonable conduct regulations can be imposed on the use of such properties without raising *per se* takings concerns. Thus, to the extent that BIAS providers allow customers to transmit or receive information over their networks, the imposition of reasonable conduct rules on the provision of BIAS does not constitute a *per se* taking.

666. Finally, even if the rules did impose a type of physical occupation on the facilities of BIAS providers, such an imposition is not an unconstitutional taking because BIAS providers are compensated for the traffic passing over their networks through end-user revenues.

2. Regulatory Taking

667. Contrary to CTIA’s claims, the actions we take in the Order also do not constitute a regulatory taking under the “essentially ad hoc, factual inquiries” into a variety of unweighted factors used by courts. Those factors evaluate the “economic impact of the regulation,” the degree of interference with “investment-backed expectations,” and “the character of the government action.” “[E]ach of these [factors] focuses directly upon the severity of the burden that government imposes upon private property rights.” Because our actions in the order are far removed from anything “functionally equivalent to the classic taking in which government directly appropriates private property or ousts the owner from his domain,” we find no regulatory taking.

668. As relevant to the multi-factor takings analysis, we find the economic impact of our actions on BIAS providers’ property interests to be limited. As we explain above, our class of carriers for which a telecommunications service is unlikely to be closely tied to BIAS providers investment decisions, which instead are more likely driven by broader economic conditions, technology changes, and BIAS providers’ general business development decisions. And in any case, although some diminution in value of property is necessary, it is not sufficient to constitute a taking.

669. We also find no meaningful interference with BIAS providers’ investment-based expectations. “[T]o support a claim for a regulatory taking, an investment-backed expectation must be reasonable,” involving “an objective, but fact-specific inquiry into what, under all the circumstances, the [plaintiff] should have anticipated.” As a general matter, property owners cannot expect that existing legal requirements regarding their property will remain entirely unchanged, and the Commission explained at length in 2015 the history of Commission jurisdiction and regulatory oversight over BIAS. Additionally, persons operating in a regulated environment develop fewer reliance interests in industries subject to comprehensive regulation. Such considerations have even greater force in light of intervening events. The regulatory approach adopted by the Commission in the 2015 Open Internet Order was affirmed by the D.C. Circuit in the face of legal challenges, and petitions for rehearing en banc and certiorari were rejected by the D.C. Circuit and the Supreme Court, respectively. We recognize that the Federal government, in opposing the petitions for certiorari, pointed to the fact that the 2015 Open Internet Order had been superseded by the RIF Order. But the issue is not whether the regulatory approach in the 2015 Open Internet Order was set in stone, but the reasonableness of any BIAS provider expectation that such a regulatory approach was foreclosed. Irrespective of the specific arguments made by the Federal government at that time, we see the Supreme Court’s denial of certiorari as at least one part of the overall history relevant to evaluating BIAS providers’ reasonable expectations. By contrast, when the Commission sought to change course in the RIF Order, the regulatory approach adopted there was vacated in part and the classification decision was remanded. The Commission’s attempt to respond to the remand in the RIF Remand Order is subject to petitions for reconsideration before the Commission and judicial review in the D.C. Circuit, which have remained pending until our action in the Order. We dispense with the petitions for reconsideration in this item. That history subsequent to the 2015 Open Internet Order demonstrates
that BIAS providers have even less basis than before to reasonably expect that they would operate under a materially different regulatory approach than what we adopt in the Order.

670. The character of our actions here also cuts against a finding of a regulatory taking. In that regard, the Penn Central Court held that a taking “may more readily be found when the interference with property can be characterized as a physical invasion by government . . . than when interference arises from some public program adjusting the benefits and burdens of economic life to promote the common good.” As we already have explained when rejecting a per se takings claim, our regulatory approach to BIAS simply seeks to ensure that end users can use the service that BIAS providers have offered them and that the end users have paid for, rather than involving something that properly could be understood as a physical invasion by the government.

671. Finally, because we do not regulate BIAS providers’ ability to set market rates for the broadband internet access services they offer end users, there is no reason to believe that our actions will deprive broadband providers of just compensation, thus fully addressing any takings claim.

3. Confiscation

672. Commenters fare no better when they seek to invoke Fifth Amendment precedent from the ratemaking context. As the Supreme Court has held: “The guiding principle [in the ratemaking context] has been that the Constitution protects utilities from being limited to a charge for their property serving the public which is so ‘unjust’ as to be confiscatory. . . . If the rate does not afford sufficient compensation, the [government] has taken the use of utility property without paying just compensation.” Because we leave BIAS providers free to set market rates for the broadband internet access services they offer end-users, we see no evidence that our regulatory approach “threaten[s] an [ISP’s] financial integrity” and is confiscatory.

673. We reject commenters’ efforts to reach a contrary conclusion by identifying a separate, service that BIAS providers may offer to edge providers and focusing narrowly on what BIAS providers can charge edge providers for such a service. As the Commission recognized in 2015, and we affirm in the Order, any such “‘edge service’ is secondary, and in support of, the promised end user, and broadband provider practices with respect to edge providers—including terms and conditions for the transfer and delivery of traffic to (and from) the BIAS subscriber—impact the broadband provider’s provision of the Title II broadband internet access service.” Given the relationship between BIAS end users and edge providers, it is the same traffic delivery that is at issue whether viewed from the perspective of the end user or the edge provider—the traffic demanded by end users, for example, is the traffic that edge providers seek to deliver, with the BIAS provider serving as the intermediary from the perspective of either end of the exchange. From a takings standpoint, we thus conclude that the relevant issue is whether a BIAS provider’s use of its network for the carriage of BIAS traffic is subject to confiscatory Commission regulation. The Order leaves BIAS providers free to charge market-based rates for the use of its facilities to carry the relevant traffic. Indeed, the freedom to charge market-based end-user rates has been—and remains—a consistent part of the Commission’s overall regulatory approach for BIAS; neither under the framework of the 2015 Open Internet Order, the RIF Order, or the Order and is consistent with the Commission strong commitment to not engage in rate regulation, despite speculative claims from some commenters that the Commission may someday decide to reverse course. We are persuaded that “the end result” of the regulatory approach we adopt here allows for the “attraction of capital and compensation for risk” for a BIAS provider’s investment in its network used to carry BIAS traffic.

V. Order on Reconsideration

674. We now turn to the Petitions for Reconsideration of Common Cause et al., INCOMPAS, Public Knowledge, and Santa Clara seeking reconsideration of the RIF Remand Order. As described more fully below, we grant these petitions to the extent consistent with and described in the Order, and otherwise dismiss as moot all four petitions. In particular, for the reasons discussed in the Order, we vacate the RIF Remand Order and find that through the 2023 Open Internet NPRM and the Order, we provide the relief petitioners have sought.

675. In Mozilla, the D.C. Circuit remanded the RIF Order for further consideration, finding that the Commission failed to adequately evaluate and address the potential negative effects of reclassifying BIAS as a Title I information service on (1) protecting the public interest; (2) promoting infrastructure deployment by regulating pole attachment rights; and (3) providing Lifeline support for BIAS to low-income consumers through the Universal Service Fund. In response to the court’s remand, the Wireline Competition Bureau issued a Public Notice (85 FR 12555 (Mar. 3, 2020)) seeking to refresh the record on these issues. Subsequently, the Commission adopted the RIF Remand Order, in which it reaffirmed its conclusions from the RIF Order and found that reclassification of BIAS as a Title I information service would promote public safety, facilitate broadband infrastructure deployment, and allow the Commission to continue to provide Lifeline support for BIAS.

676. The RIF Remand Order (and, through it, the RIF Order) has remained under further administrative and judicial review. One week after the RIF Remand Order was published in the Federal Register, the CPUC filed a petition for judicial review in the D.C. Circuit. Meanwhile, Common Cause et al., INCOMPAS, Public Knowledge, and Santa Clara filed timely petitions for agency reconsideration of the RIF Remand Order (discussed further below). The D.C. Circuit has held judicial review of the RIF Remand Order in abeyance pending the Commission’s consideration of the petitions for reconsideration.

677. On October 19, 2023, the Wireline Competition Bureau issued a Public Notice (88 FR 74389 (Oct. 31, 2023)) seeking comment on the issues raised in the four petitions for reconsideration and on the connection between those issues and the recently adopted 2023 Open Internet NPRM. Several commenters responded to the Bureau’s Public Notice, either in separate filings that specifically discuss the merits of one or more petitions or as part of their overall comments to the 2023 Open Internet NPRM. To the extent necessary, we grant INCOMPAS’s request that we waive the page limitation set forth in § 1.429 of the Commission’s rules that applies to Oppositions to Petitions for Reconsideration and Replies to Oppositions. Given that the two proceedings are interrelated and in light of the number and complexity of issues, we find that good cause is shown and that it is in the public interest to allow stakeholders to submit filings responsive to both proceedings that may exceed the page limitation.

678. Petitioners ask that the Commission reverse, vacate, or withdraw the RIF Remand Order, and request that the Commission initiate a new rulemaking to reclassify BIAS as a Title II telecommunications service and reinstate the open internet conduct
rules. Collectively, petitioners make several procedural arguments for why the Commission should reconsider the RIF Remand Order. Common Cause et al. and Public Knowledge each assert that procedural deficiencies in the process the Commission used to adopt the RIF Remand Order are cause for reconsideration. Common Cause et al. argue that because the Commission failed to open the record to receive comment on the impact of the COVID–19 pandemic, it failed to adequately consider harms of reclassifying BIAS as a Title I information service on public safety, pole attachments, and the Lifeline program. In addition, Public Knowledge claims that because the Commission did not adopt a notice of proposed rulemaking prior to adopting the RIF Remand Order, and instead sought comment through a Bureau-issued public notice, the Commission did not follow the proper rulemaking procedures under the APA.

679. Common Cause et al., INCOMPAS, and Santa Clara also each provide several substantive arguments for why the RIF Remand Order should be reconsidered. Common Cause et al. argue that the RIF Remand Order weakened the Lifeline program at a time when it was most needed. In limiting the Lifeline program to facilities-based broadband-capable networks that support voice service, Common Cause et al. argue that the Commission failed to account for how this would affect BIAS during the COVID–19 pandemic and ignored evidence of BIAS-only providers that were seeking to enter the Lifeline program. These petitioners also take issue with the RIF Remand Order’s conclusion that even if a court were to reject the Commission’s legal authority to provide Lifeline support to the BIAS of a common carrier, the overall benefits of reclassification would outweigh this cost. Common Cause et al. assert that this position contradicts both the Commission’s policy and statutory goals of achieving universal service, and that it also goes against the purpose for which the Lifeline program was first created.

680. Santa Clara argues in its Petition that, despite the Commission’s statutory mandate to consider and promote public safety, the Commission failed to seriously consider this issue in either the RIF Order or the RIF Remand Order. Because modern public safety efforts rely on the public’s access to BIAS, Santa Clara argues that the Commission needs the ability to adopt ex ante conduct rules in order to fulfill its public safety mandate. Santa Clara disagrees with the RIF Order’s analysis that consumers and edge providers will be protected from BIAS provider misconduct by a combination of market forces, consumer choice, public pressure, and ex post antitrust and consumer protection remedies. And it argues that instead of responding to the Mozilla court’s criticism of this reasoning, the RIF Remand Order simply restates it without further analysis. Furthermore, Santa Clara criticizes the RIF Remand Order for the negative impact it will have on the development of public-safety-focused edge provider content. Finally, Santa Clara rejects the RIF Remand Order’s conclusion that reclassification of BIAS as a Title I information service will increase investment and innovation, and that these benefits will outweigh any harm to public safety, and further argues that the Commission ignored evidence of the harmful impact of reclassification on public safety.

681. INCOMPAS asserts in its Petition that the RIF Remand Order did not sufficiently address the Mozilla court’s concerns regarding public safety and pole attachments. INCOMPAS notes that while it supports the Commission’s reconsideration of the RIF Remand Order due to the harms to Lifeline consumers, it focuses its petition on public safety and pole attachment concerns because those are the issues that directly relate to the issues that its member companies face. With regard to public safety, INCOMPAS argues broadly that the RIF Remand Order is flawed because it “turns its back on the historical role of the Commission to protect the public’s ability to connect without permission.” More specifically, INCOMPAS asserts that the RIF Remand Order relies on unsubstantiated claims of increased investment to support its conclusions that the benefits of Title I classification outweigh potential public safety concerns. INCOMPAS also argues that the Commission wrongly dismisses the potential harms to public safety submitted by INCOMPAS and overlooks the importance of having an expert agency with the authority to create ex ante rules to protect the public. And in reaching its conclusions, the petitioner criticizes the Commission for not properly accounting for the lack of competition in the residential BIAS market or the harms that large BIAS providers will cause consumers and edge providers. With respect to pole attachments, INCOMPAS contends that the RIF Remand Order’s examination of the issue similarly does not comply with the Mozilla court’s instructions. INCOMPAS takes issue with the inadequate consideration the RIF Remand Order gives to how reclassification will eliminate BIAS-only providers’ pole attachment rights; rejects the RIF Remand Order’s argument that this lack of pole attachment rights under section 224 will allow BIAS-only providers to enter into more flexible and innovative arrangements; and argues that, contrary to its suggestion otherwise, the RIF Remand Order does not resolve the issue of State authority to regulate pole attachments.

682. In light of the Commission’s actions in the Order, we grant in large part and otherwise dismiss as moot each of the four Petitions for Reconsideration of the RIF Remand Order. The Commission will consider a petition for reconsideration when the petitioner shows either a material error in the Commission’s original order, or raises additional facts or arguments, not known or existing at the time of the petitioner’s last opportunity to present such matters. Petitions for reconsideration which rely on facts or arguments not previously presented to the Commission but which were known or existing at the time of the petitioner’s last opportunity to present such matters may nonetheless be granted if the Commission determines that consideration of the facts and arguments relied on is required in the public interest. While the Petitioners raise some arguments that existed at the time of the filing of their Petitions, we find it would serve the public interest to consider them in the Order, when we have fully considered how the Title II classification and our open internet rules impact public safety, pole attachments, and Lifeline service. Indeed, we explain above how classification of BIAS as an information service is inconsistent with the best interpretation of the statute and cannot be reconciled with our responsibilities with regard to public safety, pole attachments, and universal service support to low-income consumers. Thus, to the extent the Petitions requested that the Commission reconsider and/or vacate the RIF Remand Order or RIF Order itself, we do so here. As a procedural matter, we find that we have effectively provided the relief sought by each of the Petitions through a combination of the 2023 Open Internet NPRM and the Order’s actions. To the extent the Petitions sought readoption or reimplementation of open internet conduct rules consistent with the 2015 Open Internet Order and reclassification and/or reversion of BIAS as a Title II telecommunications service, we find that we have done so in the Order. As a substantive matter, for the
reasons explained above, we agree with the petitioners that the Commission’s analysis in the RIF Order and RIF Remand Order was insufficient in addressing the public safety, pole attachment, and Lifeline-related repercussions of classifying BIAS as a Title I information service. To the extent the Petitions sought a new open-internet-related rulemaking in response to the Mozilla remand, we dismiss them as moot in light of the rulemaking proceeding we have conducted to consider precisely those issues. To the extent concerns or issues raised in the Petitions remain, we dismiss them as moot on the basis that the adoption of the Order effectively replace and overturn the RIF Order and RIF Remand Order. The RIF Order was vacated in part and otherwise remanded to the Commission by the D.C. Circuit. Because the majority of the RIF Order framework thus remained in effect, our action on reconsideration has only prospective consequences, rather than having retrospective effect of the sort not possible through our new rulemaking action here.

VI. Severability

683. We consider the actions we take in the Order to be separate and severable such that in the event any particular action or decision is stayed or determined to be invalid, we would find that the resulting regulatory framework continues to fulfill our goal of preserving and protecting the open internet and that it shall remain in effect to the fullest extent permitted by law. Though complementary, each of the rules, requirements, classifications, definitions, and other provisions that we establish in the Order operate independently to promote and protect the open internet, safeguard national security and public safety, and promote the deployment of broadband on a timely basis.

684. Severability of Open Internet Rules from One Another. The open internet rules we adopt in the Order each operate independently to protect the open internet, promote the virtuous cycle, and encourage the deployment of broadband on a timely basis. The severability of the Commission’s open internet rules was recognized by the Verizon court, which held that the Commission’s transparency rule established in the 2010 Open Internet Order was severable from the nondiscrimination and no-blocking rules also established in that Order. We continue to apply that view to the tracebacking, no-throttling, no-paid prioritization, and general conduct rules we adopt in the Order.

While the Order’s newly adopted rules put in place a suite of open internet protections, we find that each of these rules, on its own, serves to protect the open internet. Each rule protects against different potential harms and thus operates semi-independently from one another. For example, the no-blocking rule protects consumers’ right to access lawful content, applications, and services by constraining BIAS providers’ incentive to block competitors’ content. The no-throttling rule serves as an independent supplement to this prohibition on blocking by banning the impairment or degradation of lawful content that does not reach the level of blocking. Should the no-blocking rule be declared invalid, the no-throttling rule would still afford consumers and edge providers significant protection, and thus could independently advance the goals of the open internet, if not as comprehensively were the no-blocking rule still in effect. The same reasoning holds true for the ban on paid prioritization, which protects against particular harms independent of the other bright-line rules. Finally, the no-unreasonable interference/disadvantage standard governs BIAS provider conduct generally, providing independent protections against those three harmful practices along with other and new practices that could threaten to harm internet openness. Were any of these individual rules held invalid, the resulting regulations would remain valuable tools for protecting the open internet.

685. Severability of Rules Governing Mobile/Fixed Providers. We have also made clear in the Order that our rules apply to both fixed and mobile BIAS. These are two different services, and thus the application of our rules to either service functions independently. Accordingly, we find that should application of our open internet rules to either fixed or mobile BIAS be held invalid, the application of those rules to the remaining fixed or mobile service would still fulfill our regulatory purposes and remain intact.

VII. Procedural Matters

686. Regulatory Flexibility Act. The Regulatory Flexibility Act of 1980, as amended (RFA), requires that an agency prepare a regulatory flexibility analysis for notice and comment rulemakings, unless the agency certifies that “the rule will not, if promulgated, have a significant economic impact on a substantial number of small entities.” Accordingly, the Commission has prepared a Final Regulatory Flexibility Analysis (FRFA) concerning the potential impact of the rule and policy changes adopted in the Order on small entities. The FRFA is set forth in section VIII.

VIII. Final Regulatory Flexibility Analysis

687. As required by the Regulatory Flexibility Act of 1980, as amended (RFA), an Initial Regulatory Flexibility Analysis (IRFA) was incorporated in the Safeguarding and Securing the Open Internet Notice of Proposed Rulemaking (2023 Open Internet NPRM), released October of 2023. The Commission sought written public comment on the proposals in the 2023 Open Internet NPRM, including comment on the IRFA. The comments received are discussed below in section B. This present Final Regulatory Flexibility Analysis (FRFA) conforms to the RFA.

A. Need for, and Objectives of, the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration

688. Broadband internet access service (BIAS) connections, not unlike other essential utilities, have proved essential to every aspect of our daily lives, from work, education, and healthcare, to commerce, community, and free expression. The COVID–19 pandemic revealed that without a BIAS connection, consumers could not fully participate in vital aspects of daily life. We find, and the record overwhelmingly reflects, that BIAS is not a luxury, but a necessity for education, communication, healthcare, and participation in the economy. The actions taken in the Order to restore the Commission’s Title II authority over BIAS, reclassify mobile BIAS as a commercial mobile service, and adopt open internet conduct rules are necessary to help ensure the health, vitality, and security of the entire internet ecosystem.

689. Need for, and objective of, reclassification. Our classification decision in the Order reestablishes the Commission’s authority to protect consumers and resolves the pending challenges to the Commission’s 2017 classification decision. We conclude that BIAS is best classified as a telecommunications service based on an analysis of the statutory definitions for “telecommunications service” and “information service” established in the 1996 Act. This conclusion reflects the best reading of the statutory terms applying basic principles of textual analysis to the text, structure, and context of the Act in light of (1) how consumers understand BIAS and (2) the factual particulars of how the technology that enables the delivery of BIAS functions. We also conclude that
BIAS is not best classified as an information service. Classifying BIAS as a telecommunication service accords with Commission and court precedent and is fully and sufficiently justified under the Commission’s longstanding authority and responsibility to classify services subject to the Commission’s jurisdiction, as necessary. Additionally, as the expert agency entrusted by Congress to oversee our country’s communications networks and services, our experience demonstrates that for the Commission to protect consumers and ensure a safe, reliable, and open internet, it must exercise its authority to do so under Title II of the Communications Act. As such, we also separately conclude that multiple policy considerations, relating to internet openness, national security, public safety, consumer privacy, broadband deployment, and disability access, each independently and collectively, support the reclassification of BIAS as a telecommunications service.

690. We also reclassify mobile BIAS as a commercial mobile service. As we explain in the Declaratory Ruling, reclassifying mobile BIAS as a commercial mobile service is necessary to avoid the statutory contradiction that would result if the Commission were to conclude that mobile BIAS is a telecommunications service but not a commercial mobile service. Moreover, as we discuss in the Declaratory Ruling, because consumers regularly use both fixed and mobile broadband, it is critical to protect both services equally.

691. Notwithstanding any bright-line rule necessary because preferential treatment arrangements have the potential to create a chilling effect, disrupting the internet’s virtuous cycle of innovation, consumer demand, and investment. In addition to the three bright-line rules, we also reinstate a no-reasonable interference/disadvantage standard, under which the Commission can prohibit practices that unreasonably interfere with the ability of consumers or edge providers to select, access, and use broadband internet access service to reach one another, thus causing harm to the open internet. This no-unreasonable interference/disadvantage general conduct standard will operate on a case-by-case basis, applying a non-exhaustive list of factors, and is designed to evaluate other current or future BIAS provider policies or practices—not covered by the bright-line rules—and prohibit those that harm the open internet. While we believe that our prohibitions on blocking, throttling, and paid prioritization will prevent many harms to the open internet, we believe that reimplementing the general conduct standard is a necessary backstop to ensure that BIAS providers do not find technical or economic ways to evade our bright-line rules.

694. We also restore the text of the transparency rule to its original format adopted in 2010 and reaffirmed in 2015. We believe this change is necessary in order to encompass a broader relevant audience of interested parties than that captured by the BIF Order and more appropriately reflects the nature of the current transparency landscape where the broadband labels serve as a quick reference for consumers, and the transparency rule enables a deeper dive. Furthermore, we made minor revisions to the disclosures required by the transparency rule to better enable end-user consumers to make informed choices about broadband services and similarly to provide edge providers with the information necessary to develop new content, applications, services, and devices that promote the virtuous cycle of investment and innovation. In revising the specific transparency requirements, we contemplated the recently adopted broadband label rules to minimize unnecessary duplication and improve efficiency for providers.

B. Summary of Significant Issues Raised by Public Comments in Response to the IRFA

695. In response to the 2023 Open Internet NPRM, four entities filed comments or reply comments that specifically addressed the IRFA to some degree: WISPA, NTCA—the Rural Broadband Association (NTCA), ACA Connects, and National Rural Electric Cooperative Association (NRECA).

696. Some commenters expressed concern that reclassification and reimplementing the open internet rules would be particularly onerous for small providers and suggest that the Commission issue a blanket exemption for small providers or from “all but the most essential” rules. ACA Connects urges the commission to delay application of the rules on small providers for at least six months or one year, forbear from applying sections 201, 202, and 208 to small providers, or defer sections 201 and 202 obligations into another proceeding to specifically define and limit the obligations for small providers. The National Federation of Independent Businesses
(NFIB) recommends that the Commission add certain language to our rules to protect small providers. NTCA states that even with proposed forbearance, small BIAS providers will face significant economic burdens, and there is no marketplace justification for regulatory intervention. WISPA urges the Commission to issue a FNPRM that examines whether to exempt small providers from the bright-line rules, general conduct rule, and transparency enhancements and to apply any exemptions to BIAS providers with 250,000 or fewer subscribers. WISPA also requests that the Commission reconsider application of sections 206, 207, 208, 214, 218 and 220 of the Act to small providers and permanently exempt small BIAS-only providers from the Commission’s transfer-of-control requirements. We carefully considered the effects reclassification and our rules would have on all BIAS providers and small entities, and while we did not create exemptions for small providers, we included temporary exemptions (with the potential to become permanent) for providers with 100,000 or fewer subscribers from the performance characteristic reporting enhancements and the direct notification requirement under the transparency rule, which will have the effect of benefiting many small providers. We do not believe exemptions beyond that which we have provided are necessary or in the public interest, particularly a blanket exemption from all rules, as the record fails to demonstrate customers of small BIAS providers should be afforded less protection than those of larger BIAS providers. Furthermore, as we noted above, in certain cases, reclassification will afford small providers additional rights (e.g., pole attachment rights) to which they are currently not entitled.

NRECA urges the commission to define “small entities” as those with 100,000 broadband customers or less rather than those with 1,500 employees or less as we proposed in our IRFA. NRECA suggests that our proposed definition is problematic because it would “create a situation where a small-entity exception would swallow the general rule.” According to NRECA, because most covered entities would fall within the “small entity” category under the Small Business Administration (SBA) size thresholds used in the IRFA, these thresholds would “limit the Commission’s ability to implement small-entity exceptions that would be meaningful for truly small entities.” NTCA echoed NRECA’s concerns regarding the definition. WISPA, however, does not agree with NRECA’s proposed definition. We decline commenters’ invitation to deviate from the SBA size standards for purposes of the regulatory flexibility analysis. NRECA does not argue that the size standard is inappropriate for regulatory flexibility analysis purposes. Rather, it focuses on exemptions from the rules adopted herein “and for subsequent Title II regulations.” As noted above, however, we have largely declined to provide exemptions from the rules adopted in the Order, as customers of all BIAS providers should be afforded their protection. The exceptions are temporary exemptions (with the potential to become permanent) from the performance characteristics disclosure enhancements and direct notification requirement for BIAS providers that we reason are less likely to already have in place the tools and mechanisms needed to allow customers to track usage or provide automated direct notifications or the resources to immediately report this information.

C. Response to Comments by the Chief Counsel for Advocacy of the Small Business Administration

698. Pursuant to the Small Business Jobs Act of 2010, which amended the RFA, the Commission is required to respond to any comments filed by the Chief Counsel for Advocacy of the SBA, and to provide a detailed statement of any change made to the proposed rules as a result of those comments. The Chief Counsel did not file any comments in response to the proposed rules in this proceeding.

D. Description and Estimate of the Number of Small Entities to Which Rules Will Apply

699. The RFA directs agencies to provide a description of, and where feasible, an estimate of the number of small entities that may be affected by the rules adopted herein. The RFA generally defines the term “small entity” as having the same meaning as the terms “small business,” “small organization,” and “small governmental jurisdiction.” In addition, the term “small business” has the same meaning as the term “small-business concern” under the Small Business Act. Pursuant to 5 U.S.C. 601(3), the statutory definition of a small business applies “unless an agency, after consultation with the Office of Advocacy of the Small Business Administration and after opportunity for public comment, establishes or modifies definitions of such term which are appropriate to the activities of the agency and publishes such definition(s) in the Federal Register.” A “small-business concern” is one which: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) satisfies any additional criteria established by the SBA.

1. Total Small Entities

700. Small Businesses, Small Organizations, Small Jurisdictions. Our actions, over time, may affect small entities that are not easily categorized at present. We therefore describe, at the outset, three broad groups of small entities that could be directly affected herein. First, while there are industry specific size standards for small businesses that are used in the regulatory flexibility analysis, according to data from the SBA’s Office of Advocacy, in general a small business is an independent business having fewer than 500 employees. These types of small businesses represent 99.9% of all businesses in the United States, which translates to 33.2 million businesses.

701. Next, the type of small entity described as a “small organization” is generally “any not-for-profit enterprise which is independently owned and operated and is not dominant in its field.” The Internal Revenue Service (IRS) uses a revenue benchmark of $50,000 or less to delineate its annual electronic filing requirements for small exempt organizations. Nationwide, for tax year 2022, there were approximately 530,109 small exempt organizations in the U.S. reporting revenues of $50,000 or less according to the registration and tax data for exempt organizations available from the IRS.

702. Finally, the small entity described as a “small governmental jurisdiction” is defined generally as “governments of cities, counties, towns, townships, villages, school districts, or special districts, with a population of less than fifty thousand.” U.S. Census Bureau data from the 2022 Census of Governments indicate there were 90,837 local governmental jurisdictions consisting of general purpose governments and special purpose governments in the United States. Of this number, there were 36,845 general purpose governments (county, municipal, and town or township) with populations of less than 50,000 and 11,879 special purpose governments (independent school districts) with enrollments of populations of less than 50,000. Accordingly, based on the 2022 U.S. Census of Governments data, we estimate that at least 48,724 entities fall into the category of “small governmental jurisdictions.”
2. Wired Broadband Internet Access Service Providers

703. Wired Broadband Internet Access Service Providers (Wired ISPs). Providers of wired broadband internet access service include various types of providers except dial-up internet access providers. Wireline service that terminates at an end user location or mobile device and enables the end user to receive information from and/or send information to the internet at information transfer rates exceeding 200 kilobits per second (kbps) in at least one direction is classified as a broadband connection under the Commission’s rules. Wired broadband internet services fall in the Wired Telecommunications Carriers industry. The SBA small business size standard for this industry classifies firms having 1,500 or fewer employees as small. U.S. Census Bureau data for 2017 show that there were 3,054 firms that operated in this industry for the entire year. Of this number, 2,964 firms operated with fewer than 250 employees.

704. Additionally, according to Commission data on internet access services as of June 30, 2019, nationwide there were approximately 2,747 providers of connections over 200 kbps in at least one direction using various wireline technologies. The Commission does not collect data on the number of employees for providers of these services, therefore, at this time we are not able to estimate the number of providers that would qualify as small under the SBA’s small business size standard. However, in light of the general data on fixed technology service providers in the Commission’s 2022 Communications Marketplace Report, we believe that the majority of wireline internet access service providers can be considered small entities.

3. Wireline Providers

705. Wired Telecommunications Carriers. The U.S. Census Bureau defines this industry as establishments primarily engaged in operating and/or providing access to transmission facilities and infrastructure that they own and/or lease for the transmission of voice, data, text, sound, and video using wired communications networks. Transmission facilities may be based on a single technology or a combination of technologies. Establishments in this industry use the wired telecommunications network facilities that they operate to provide a variety of services, such as wired telephony services, including VoIP services, wired (cable) audio and video programming distribution, and wired broadband internet services. By exception, establishments providing satellite television distribution services using facilities and infrastructure that they operate are included in this industry. Wired Telecommunications Carriers are also referred to as wireline carriers or fixed local service providers.

706. The SBA small business size standard for Wired Telecommunications Carriers classifies firms having 1,500 or fewer employees as small. U.S. Census Bureau data for 2017 show that there were 3,054 firms that operated in this industry for the entire year. Of this number, 2,964 firms operated with fewer than 250 employees. Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 4,590 providers that reported they were engaged in the provision of fixed local services. Of these providers, the Commission estimates that 4,146 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, most of these providers can be considered small entities.

707. Incumbent Local Exchange Carriers (Incumbent LECs). Neither the Commission nor the SBA have developed a small business size standard specifically for incumbent local exchange carriers. Wired Telecommunications Carriers is the closest industry with a SBA small business size standard. The SBA small business size standard for Wired Telecommunications Carriers classifies firms having 1,500 or fewer employees as small. U.S. Census Bureau data for 2017 show that there were 3,054 firms that operated in this industry for the entire year. Of this number, 2,964 firms operated with fewer than 250 employees. Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 127 providers that reported they were engaged in the provision of interexchange services. Of these providers, the Commission estimates that 91 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, the Commission estimates that the majority of providers in this industry can be considered small entities.

710. Operator Service Providers (OSPs). Neither the Commission nor the SBA has developed a small business size standard specifically for operator service providers. The closest applicable industry with a SBA small business size standard is Wired Telecommunications Carriers. The SBA small business size standard classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 3,054 firms in this industry that operated for the entire year. Of this number, 2,964 firms operated with fewer than 250 employees. Additionally, based on Commission data in the 2022 Universal Service
Monitoring Report, as of December 31, 2021, there were 20 providers that reported they were engaged in the provision of operator services. Of these providers, the Commission estimates that all 20 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, all of these providers can be considered small entities.

711. Other Toll Carriers. Neither the Commission nor the SBA has developed a definition for small businesses specifically applicable to Other Toll Carriers. This category includes toll carriers that do not fall within the categories of interexchange carriers, operator service providers, prepaid calling card providers, satellite service carriers, or toll resellers. Wired Telecommunications Carriers is the closest industry with a SBA small business size standard. The SBA small business size standard for Wired Telecommunications Carriers classifies firms having 1,500 or fewer employees as small. U.S. Census Bureau data for 2017 shows that there were 3,054 firms in this industry that operated for the entire year. Of this number, 2,964 firms operated with fewer than 250 employees. Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 90 providers that reported they were engaged in the provision of other toll services. Of these providers, the Commission estimates that 87 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, most of these providers can be considered small entities.

4. Wireless Providers—Fixed and Mobile

712. Wireless Broadband Internet Access Service Providers (Wireless ISPs or WISPs). Providers of wired broadband internet access service include various types of providers except dial-up internet access providers. Wireline service that terminates at an end user location or mobile device and enables the end user to receive information from and/or send information to the internet at information transfer rates exceeding 200 kbps in at least one direction is classified as a broadband connection under the Commission’s rules. Wired broadband internet services fall in the Wired Telecommunications Carriers industry. The SBA small business size standard for this industry classifies firms having 1,500 or fewer employees as small. U.S. Census Bureau data for 2017 show that there were 3,054 firms that operated in this industry for the entire year. Of this number, 2,964 firms operated with fewer than 250 employees.

Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 4,590 providers that reported they were engaged in the provision of fixed local services. Of these providers, the Commission estimates that 4,146 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, most of these providers can be considered small entities.

716. Wireless Communications Services. Wireless Communications Services (WCS) can be used for a variety of fixed, mobile, radiolocation, and digital audio broadcasting satellite services. Wireless spectrum is made available and licensed for the provision of wireless communications services in several frequency bands subject to part 27 of the Commission’s rules. Wireless Telecommunications Carriers (except Satellite) is the closest industry with an SBA small business size standard applicable to these services. The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

717. The Commission’s small business size standards with respect to WCS involve eligibility for bidding credits and installment payments in the auction of licenses for the various frequency bands included in WCS. When bidding credits are adopted for the auction of licenses in WCS frequency bands, such credits may be available to several types of small businesses based average gross revenues (small, very small and entrepreneur) pursuant to the competitive bidding rules adopted in conjunction with the requirements for the auction and/or as identified in the designated entities section in part 27 of the Commission’s rules for the specific WCS frequency bands.

718. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with actual licenses that would qualify as small under the SBA’s small business size standard.
719. Wireless Resellers. Neither the Commission nor the SBA have developed a small business size standard specifically for Wireless Resellers. The closest industry with a SBA small business size standard is Telecommunications Resellers. The Telecommunications Resellers industry comprises establishments engaged in purchasing access and network capacity from owners and operators of telecommunications networks and reselling wired and wireless telecommunications services (except satellite) to businesses and households. Establishments in this industry resell telecommunications and they do not operate transmission facilities and infrastructure. Mobile virtual network operators (MVNOs) are included in this industry. Under the SBA size standard for this industry, a business is small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that 1,386 firms in this industry provided resale services during that year. Of that number, 1,375 firms operated with fewer than 250 employees. Thus, for this industry under the SBA small business size standard, the majority of providers can be considered small entities.

720. 1670–1675 MHz Services. These wireless communications services can be used for fixed and mobile uses, except aeronautical mobile. Wireless Telecommunications Carriers (except Satellite) is the closest industry with an SBA small business size standard applicable to these services. The SBA size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

721. According to Commission data as of November 2021, there were three active licenses in this service. The Commission’s small business size standards with respect to 1670–1675 MHz Services involve eligibility for bidding credits and installment payments in the auction of licenses for these services. For licenses in the 1670–1675 MHz service band, a “small business” is defined as an entity that, together with its affiliates and controlling interests, has average gross revenues not exceeding $15 million for the preceding three years. The 1670–1675 MHz service band auction’s winning bidder did not claim small business status.

722. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

723. Wireless Telephony. Wireless telephony includes cellular, personal communications services, and specialized mobile radio telephony carriers. The closest applicable industry with an SBA small business size standard is Wireless Telecommunications Carriers (except Satellite). The size standard for this industry under SBA rules is that a business is small if it has 1,500 or fewer employees. For this industry, U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 331 providers that reported they were engaged in the provision of cellular, personal communications services, and specialized mobile radio services. Of these providers, the Commission estimates that 255 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, most of these providers can be considered small entities.

724. Broadband Personal Communications Service. The broadband personal communications services (PCS) spectrum encompasses services in the 1850–1910 and 1930–1990 MHz bands. The closest industry with a SBA small business size standard applicable to these services is Wireless Telecommunications Carriers (except Satellite). The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

725. Based on Commission data as of November 2021, there were approximately 5,060 active licenses in the Broadband PCS service. The Commission’s small business size standards with respect to Broadband PCS involve eligibility for bidding credits and installment payments in the auction of licenses for these services. In auctions for these licenses, the Commission defined “small business” as an entity that, together with its affiliates and controlling interests, has average gross revenues not exceeding $40 million for the preceding three years, and a “very small business” as an entity that, together with its affiliates and controlling interests, has had average annual gross revenues not exceeding $15 million for the preceding three years. Winning bidders claiming small business credits won Broadband PCS licenses in C, D, E, and F Blocks. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

727. Specialized Mobile Radio Licenses. Special Mobile Radio (SMR) licenses allow licensees to provide land mobile communications services (other than radiolocation services) in the 800 MHz and 900 MHz spectrum bands on a commercial basis including but not limited to services used for voice and data communications, paging, and facsimile services, to individuals, Federal Government entities, and other entities licensed under part 90 of the Commission’s rules. Wireless Telecommunications Carriers (except Satellite) is the closest industry with a SBA small business size standard applicable to these services. The SBA size standard for this industry classifies a business as small if it has 1,500 or
fewer employees. For this industry, U.S. Census Bureau data for 2017 show that there were 2,893 firms in this industry that operated for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 95 providers that reported they were of SMR (dispatch) providers. Of this number, the Commission estimates that all 95 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, these 119 SMR licensees can be considered small entities.

728. Based on Commission data as of December 2021, there were 3,924 active SMR licenses. However, since the Commission does not collect data on the number of employees for licensees providing SMR services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard. Nevertheless, for purposes of this analysis the Commission estimates that the majority of SMR licensees can be considered small entities using the SBA’s small business size standard.

729. Lower 700 MHz Band Licenses.

The lower 700 MHz band encompasses spectrum in the 698–746 MHz frequency bands. Permissible operations in these bands include flexible fixed, mobile, and broadcast uses, including mobile and other digital new broadcast operation; fixed and mobile wireless commercial services (including FDD- and TDD-based services); as well as fixed and mobile wireless uses for private, internal radio needs, two-way interactive, cellular, and mobile television broadcasting services. Wireless Telecommunications Carriers (except Satellite) is the closest industry with a SBA small business size standard applicable to licenses providing services in these bands. The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of that number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

730. According to Commission data as of December 2021, there were approximately 2,824 active Lower 700 MHz Band licenses. The Commission’s small business size standards with respect to Lower 700 MHz Band licensees involve eligibility for bidding credits and installment payments in the auction of licenses. For auctions of Lower 700 MHz Band licenses the Commission adopted criteria for three groups of small businesses. A very small business was defined as an entity that, together with its affiliates and controlling interests, has average annual gross revenues not exceeding $15 million for the preceding three years, a small business was defined as an entity that, together with its affiliates and controlling interests, has average gross revenues not exceeding $40 million for the preceding three years, and an entrepreneur was defined as an entity that, together with its affiliates and controlling interests, has average gross revenues not exceeding $3 million for the preceding three years. In auctions for Lower 700 MHz Band licenses seventy-two winning bidders claiming a small business classification won 329 licenses, twenty-six winning bidders claiming a small business classification won 214 licenses, and three winning bidders claiming a small business classification won all five auctioned licenses.

731. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

732. Upper 700 MHz Band Licenses.

The upper 700 MHz band encompasses spectrum in the 746–806 MHz bands. Upper 700 MHz D Block licenses are not available in the 758–763 MHz and 788–793 MHz bands. Permissible operations in these bands include flexible fixed, mobile, and broadcast uses, including mobile and other digital new broadcast operation; fixed and mobile wireless commercial services (including FDD- and TDD-based services); as well as fixed and mobile wireless uses for private, internal radio needs, two-way interactive, cellular, and mobile television broadcasting services. Wireless Telecommunications Carriers (except Satellite) is the closest industry with a SBA small business size standard applicable to licenses providing services in these bands. The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show
that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

736. According to Commission data as of December 2021, there were approximately 224 active 700 MHz Guard Band licenses. The Commission’s small business size standards with respect to 700 MHz Guard Band licensees involve eligibility for bidding credits and installment payments in the auction of licenses. For the auction of these licenses, the Commission defined a “small business” as an entity that, together with its affiliates and controlling principals, has average gross revenues not exceeding $40 million for the preceding three years, and a “very small business” an entity that, together with its affiliates and controlling principals, has average gross revenues that are not more than $15 million for the preceding three years. Pursuant to these definitions, five winning bidders claiming one of the small business status classifications won 26 licenses, and one winning bidder claiming small business won two licenses. None of the winning bidders claiming a small business status classification in these 700 MHz Guard Band license auctions had an active license as of December 2021.

737. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

738. Air-Ground Radiotelephone Service Air-Ground Radiotelephone Service is a wireless service in which licensees are authorized to offer and provide radio telecommunications service for hire to subscribers in aircraft. A licensee may provide any type of air-ground service (i.e., voice telephony, broadband internet, data, etc.) to aircraft of any type, and serve any or all aviation markets (commercial, government, and general). A licensee must provide service to aircraft and may not provide ancillary land mobile or fixed services in the 800 MHz air-ground spectrum.

739. The closest industry with an SBA small business size standard applicable to these services is Wireless Telecommunications Carriers (except Satellite). The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

740. Based on Commission data as of December 2021, there were approximately four licensees with 110 active licenses in the Air-Ground Radiotelephone Service. The Commission’s small business size standards with respect to Air-Ground Radiotelephone Service involve eligibility for bidding credits and installment payments in the auction of licenses. For purposes of auctions, the Commission defined “small business” as an entity that, together with its affiliates and controlling interests, has average gross revenues not exceeding $40 million for the preceding three years, and a “very small business” as an entity that, together with its affiliates and controlling interests, has had average annual gross revenues not exceeding $15 million for the preceding three years. In the auction of Air-Ground Radiotelephone Service licenses in the 800 MHz band, neither of the two winning bidders claimed small business status.

741. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, the Commission does not collect data on the number of employees for licensees providing these services therefore, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

742. Advanced Wireless Services (AWS)—(1710–1755 MHz and 2110–2155 MHz bands (AWS–1); 1915–1920 MHz, 1995–2000 MHz, 2020–2025 MHz and 2175–2180 MHz bands (AWS–2); 2155–2175 MHz band (AWS–3); 2000–2020 MHz and 2180–2200 MHz (AWS–4)). Spectrum is made available and licensed in these bands for the provision of various wireless communications services. Wireless Telecommunications Carriers (except Satellite) is the closest industry with a SBA small business size standard applicable to these services. The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

743. According to Commission data as of December 2021, there were approximately 4,472 active AWS licenses. The Commission’s small business size standards with respect to AWS involve eligibility for bidding credits and installment payments in the auction of licenses for these services. For the auction of AWS licenses, the Commission defined a “small business” as an entity with average annual gross revenues for the preceding three years not exceeding $40 million, and a “very small business” as an entity with average annual gross revenues for the preceding three years not exceeding $15 million. Pursuant to these definitions, 57 winning bidders claiming status as small or very small businesses won 215 of 1,087 licenses. In the most recent auction of AWS licenses 15 of 37 bidders qualifying for status as small or very small businesses won licenses.

744. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

745. 3650–3700 MHz band. Wireless broadband service licensing in the 3650–3700 MHz band provides for nationwide, non-exclusive licensing of terrestrial operations, utilizing
contention-based technologies, in the 3650 MHz band (i.e., 3650–3700 MHz). Licenses are permitted to provide services on a non-common carrier and/or on a common carrier basis. Wireless broadband services in the 3650–3700 MHz band fall in the Wireless Telecommunications Carriers (except Satellite) industry with an SBA small business size standard that classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

746. The Commission has not developed a small business size standard applicable to 3650–3700 MHz band licensees. Based on the licenses that have been granted, however, we estimate that the majority of licensees in this service are small Internet Access Service Providers (IASPs). As of November 2021, Commission data shows that there were 902 active licenses in the 3650–3700 MHz band. However, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

747. Fixed Microwave Services. Fixed microwave services include common carrier, private-operational fixed, and broadcast auxiliary radio services. They also include the Upper Microwave Flexible Use Service (UMFUS), Millimeter Wave Service (70/80/90 GHz), Local Multipoint Distribution Service (LMDS), the Digital Electronic Message Service (DEMS), 24 GHz Service, Multiple Address Systems (MAS), and Multichannel Video Distribution and Data Service (MVDDS), where in some bands licensees can choose between common carrier and non-common carrier status. Wireless Telecommunications Carriers (except Satellite) is the closest industry with a SBA small business size standard applicable to these services. The SBA small size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of fixed microwave service licensees can be considered small.

748. The Commission’s small business size standards with respect to fixed microwave services involve eligibility for bidding credits and installment payments in the auction of licenses for the various frequency bands included in fixed microwave services. When bidding credits are adopted for the auction of licenses in fixed microwave services frequency bands, such credits may be available to several types of small businesses based average gross revenues (small, very small and entrepreneur) pursuant to the competitive bidding rules adopted in conjunction with the requirements for the auction and/or as identified in part 101 of the Commission’s rules for the specific fixed microwave services frequency bands.

749. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

750. Broadband Radio Service and Educational Broadband Service. Broadband Radio Service systems, previously referred to as Multipoint Distribution Service (MDS) and Multichannel Multipoint Distribution Service (MMDS) systems, and “wireless cable,” transmit video programming to subscribers and provide two-way high speed data operations using the microwave frequencies of the Broadband Radio Service (BRS) and Educational Broadband Service (EBS) (previously referred to as the Instructional Television Fixed Service (ITFS)). Wireless cable operators that use spectrum in the BRS often supplemented with leased channels from the EBS, provide a competitive alternative to wired cable and other multichannel video programming distributors. Wireless cable programming to subscribers resembles cable television, but instead of coaxial cable, wireless cable uses microwave channels.

751. In light of the use of wireless frequencies by BRS and EBS services, the closest industry with a SBA small business size standard applicable to these services is Wireless Telecommunications Carriers (except Satellite). The SBA small business size standard for this industry classifies a business as small if it has 1,500 or fewer employees. U.S. Census Bureau data for 2017 show that there were 2,893 firms that operated in this industry for the entire year. Of this number, 2,837 firms employed fewer than 250 employees. Thus, under the SBA size standard, the Commission estimates that a majority of licensees in this industry can be considered small.

752. According to Commission data as December 2021, there were approximately 5,869 active BRS and EBS licenses. The Commission’s small business size standards with respect to BRS involves eligibility for bidding credits and installment payments in the auction of licenses for these services. For the auction of BRS licenses, the Commission adopted criteria for three groups of small businesses. A very small business is an entity that, together with its affiliates and controlling interests, has average annual gross revenues exceeding $3 million and did not exceed $15 million for the preceding three years, a small business is an entity that, together with its affiliates and controlling interests, has average gross revenues exceeding $15 million and did not exceed $40 million for the preceding three years, and an entrepreneur is an entity that, together with its affiliates and controlling interests, has average gross revenues not exceeding $3 million for the preceding three years. Of the ten winning bidders for BRS licenses, two bidders claiming the small business status won four licenses, one bidder claiming the very small business status won three licenses and two bidders claiming entrepreneur status won six licenses. One of the winning bidders claiming a small business status classification in the BRS license auction has an active license as of December 2021.

753. The Commission’s small business size standards for EBS define a small business as an entity that, together with its affiliates, its controlling interests and the affiliates of its controlling interests, has average gross revenues that are not more than $55 million for the preceding five (5) years, and a very small business is an entity that, together with its affiliates, its controlling interests and the affiliates of its controlling interests, has average gross revenues that are not more than $20 million for the preceding five (5)
years. In frequency bands where licenses were subject to auction, the Commission notes that as a general matter, the number of winning bidders that qualify as small businesses at the close of an auction does not necessarily represent the number of small businesses currently in service. Further, the Commission does not generally track subsequent business size unless, in the context of assignments or transfers, unjust enrichment issues are implicated. Additionally, since the Commission does not collect data on the number of employees for licensees providing these services, at this time we are not able to estimate the number of licensees with active licenses that would qualify as small under the SBA’s small business size standard.

5. Satellite Service Providers

5.1. Satellite Telecommunications. This industry comprises firms "primarily engaged in providing telecommunications services to other establishments in the telecommunications and broadcasting industries by forwarding and receiving communications signals via a system of satellites or reselling satellite telecommunications." Satellite telecommunications service providers include satellite and earth station operators. The SBA small business size standard for this industry classifies a business with $38.5 million or less in annual receipts as small. U.S. Census Bureau data for 2017 show that 275 firms in this industry operated for the entire year. Of this number, 242 firms had revenue of less than $25 million. Additionally, based on Commission data in the 2022 Universal Service Monitoring Report, as of December 31, 2021, there were 65 providers that reported they were engaged in the provision of satellite telecommunications services. Of these providers, the Commission estimates that approximately 42 providers have 1,500 or fewer employees. Consequently, using the SBA’s small business size standard, a little more than half of these providers can be considered small entities.

5.2. All Other Telecommunications. This industry is comprised of establishments primarily engaged in providing specialized telecommunications services, such as satellite tracking, communications telemetry, and radar station operation. This industry also includes establishments primarily engaged in providing satellite terminal stations and associated facilities connected with one or more terrestrial systems and capable of transmitting telecommunications, and receiving telecommunications from, satellite systems. Providers of Internet services (e.g., dial-up ISPs or Voice over Internet Protocol [VoIP] services, via client-supplied telecommunications connections are also included in this industry. The SBA small business size standard for this industry classifies firms with annual receipts of $35 million or less as small. U.S. Census Bureau data for 2017 show that there were 1,079 firms in this industry that operated for the entire year. Of those firms, 1,039 had revenue of less than $25 million. Based on this data, the Commission estimates that the majority of “All Other Telecommunications” firms can be considered small.

6. Cable Service Providers

6.1. Cable and Other Subscription Programming. The U.S. Census Bureau defines this industry as establishments primarily engaged in operating studios and facilities for the broadcasting of programs on a subscription or fee basis. The broadcast programming is typically narrowcast in nature (e.g., limited format, such as news, sports, education, or youth-oriented). These establishments produce programming in their own facilities or acquire programming from external sources. The programming material is usually delivered to a third party, such as cable systems or direct-to-home satellite systems, for transmission to viewers. The SBA small business size standard for this industry classifies firms with annual receipts less than $41.5 million as small. Based on U.S. Census Bureau data for 2017, 378 firms operated in this industry during that year. Of that number, 149 firms operated with revenue of less than $25 million a year and 44 firms operated with revenue of $25 million or more. Based on this data, the Commission estimates that a majority of firms in this industry are small.

6.2. Cable Companies and Systems (Rate Regulation). The Commission has developed its own small business size standard for the purpose of cable rate regulation. Under the Commission’s rules, a “small cable company” is one serving 400,000 or fewer subscribers nationwide. Based on industry data, there are about 420 cable companies in the U.S. Of these, only seven have more than 400,000 subscribers. In addition, under the Commission’s rules, a “small system” is a cable system serving 15,000 or fewer subscribers. Based on industry data, there are about 4,139 cable systems (headends) in the U.S. Of these, about 639 have more than 15,000 subscribers. Accordingly, the Commission estimates that the majority of cable companies and cable systems are small.

6.3. Cable System Operators (Telecom Act Standard). The Communications Act of 1934, as amended, contains a size standard for a “small cable operator,” which is “a cable operator that, directly or through an affiliate, serves in the aggregate fewer than one percent of all subscribers in the United States and is not affiliated with any entity or entities whose gross annual revenues in the aggregate exceed $250,000,000.” For purposes of the Telecom Act Standard, the Commission determined that a cable system operator that serves fewer than 498,000 subscribers, either directly or through affiliates, will meet the definition of a small cable operator. Based on industry data, only six cable system operators have more than 498,000 subscribers. Accordingly, the Commission estimates that the majority of cable system operators are small under this size standard. We note however, that the Commission neither requests nor collects information on whether cable system operators are affiliated with entities whose gross annual revenues exceed $250 million. Therefore, we are unable at this time to estimate with greater precision the number of cable system operators that would qualify as small cable operators under the definition in the Communications Act.

7. Other

7.1. Electric Power Generators, Transmitters, and Distributors. The U.S. Census Bureau defines the utilities sector industry as comprised of “establishments, primarily engaged in generating, transmitting, and/or distributing electric power.” Establishments in this industry group may perform one or more of the following activities: (1) operate generation facilities that produce electric energy; (2) operate transmission systems that convey the electricity from the generation facility to the distribution system; and (3) operate distribution systems that convey electric power received from the generation facility or the transmission system to the final consumer.” This industry group is categorized based on fuel source and includes Hydroelectric Power Generation, Fossil Fuel Electric Power Generation, Nuclear Electric Power Generation, Solar Electric Power Generation, Wind Electric Power Generation, Geothermal Electric Power Generation, Biomass Electric Power Generation, Other Electric Power Generation, Electric Bulk Power Transmission and Control and Electric Power Distribution.
The SBA has established a small business size standard for each of these groups based on the number of employees which ranges from having fewer than 250 employees to having fewer than 1,000 employees. U.S. Census Bureau data for 2017 indicate that for the Electric Power Generation, Transmission and Distribution industry there were 1,693 firms that operated in this industry for the entire year. Of this number, 1,552 firms had less than 250 employees. Based on this data and the associated SBA size standards, the majority of firms in this industry can be considered small entities.

All Other Information Services. This industry comprises establishments primarily engaged in providing other information services (except news syndicates, libraries, archives, internet publishing and broadcasting, and web search portals). The SBA small business size standard for this industry classifies firms with annual receipts of $30 million or less as small. U.S. Census Bureau data for 2017 show that there were 704 firms in this industry that operated for the entire year. Of those firms, 556 had revenue of less than $25 million. Consequently, we estimate that the majority of firms in this industry are small entities.

Internet Service Providers (Non-Broadband). Internet access service providers using client-supplied telecommunications connections (e.g., dial-up ISPs) as well as VoIP service providers using client-supplied telecommunications connections fall in the industry classification of All Other Telecommunications. The SBA small business size standard for this industry classifies firms with annual receipts of $35 million or less as small. For this industry, U.S. Census Bureau data for 2017 show that there were 1,079 firms in this industry that operated for the entire year. Of those firms, 1,039 had revenue of less than $25 million. Consequently, under the SBA size standard a majority of firms in this industry can be considered small.

E. Description of Projected Reporting, Recordkeeping and Other Compliance Requirements for Small Entities

Reclassifying broadband as a Title II service may lead to some increase in compliance costs for small entities, however we find that these compliance costs are likely to be quite small. The Order reestablishes the transparency rule in its entirety and clarifies and adopts certain changes to the transparency rule that may impact small entities. We reinstate rules that prohibit BIAS providers from blocking or throttling the information transmitted over their networks or engaging in paid or affiliated prioritization arrangements, and reinstate a general conduct standard that prohibits practices that cause unreasonable interference or unreasonable disadvantage to consumers or edge providers. We modify the transparency rule by reversing the changes made under the RIF Order, restoring the requirements to disclose certain network practices and performance characteristics eliminated by the RIF Order, and adopting changes to the means of disclosure, including adopting a direct notification requirement. Below, we summarize the recordkeeping and reporting obligations of the Order.

First, we describe the specific commercial terms, network performance characteristics, and network practices providers must disclose to ensure compliance with the transparency rule. For example, to fully satisfy their duty to disclose network performance characteristics, providers must now disclose their zero rating practices. Specifically, BIAS providers must report any practice that exempts particular edge services, devices, applications, and content (edge products) from an end user’s usage allowance or data cap. We reinstate the enhanced performance characteristics disclosures eliminated in 2017 to require BIAS providers to disclose packet loss and to require that performance characteristics be reported with greater geographic granularity and be measured in terms of average performance over a reasonable period of time and during times of peak usage. We temporarily (with the potential to become permanent) exempt BIAS providers that have 100,000 or fewer broadband subscribers as per their most recent FCC Form 477, aggregated over all affiliates of the provider, from these latter requirements.

Second, we require that providers make all necessary disclosures on their own publicly-available websites. We no longer permit direct disclosure to the Commission, as allowed under the RIF Order. Additionally, we require that all disclosures made pursuant to the transparency rule be made in machine-readable format. By “machine readable,” we mean providing “data in a format that can be easily processed by a computer without human intervention while ensuring no semantic meaning is lost.”

Third, we re-implement the requirement for BIAS providers to directly notify end users if their particular use of a network will trigger a network practice, based on a user’s demand during more than the period of congestion, that is likely to have a significant impact on the end user’s use of the service. The purpose of such notification is to provide the affected end users with sufficient information and time to consider adjusting their usage to avoid application of the practice. Recognizing the extra burden this requirement creates, we provide a temporary exemption, with the potential to become permanent, for providers with 100,000 or fewer subscribers that will be promulgated by the Consumer & Governmental Affairs Bureau. We discuss this exemption and other steps to minimize compliance costs in section F, below.

F. Steps Taken To Minimize the Significant Economic Impact on Small Entities and Significant Alternatives Considered

The RFA requires an agency to provide "a description of the steps the agency has taken to minimize the significant economic impact on small entities—indicating a statement of the factual, policy, and legal reasons for selecting the alternative adopted in the final rule and why each one of the other significant alternatives to the rule considered by the agency which affect the impact on small entities was rejected.”

We have considered the factors for reinstating the obligations above and modifying the transparency rule subsequent to receiving substantive comments from the public and potentially affected entities. The Commission has considered the economic impact on small entities, as identified in comments filed in response to the 2023 Open Internet NPRM and its IRFA in reaching its final conclusions and taking action in this proceeding. We considered, for example, whether to fully reimplement the transparency requirements from the 2015 Open Internet Order and adopted a temporary (with the potential to become permanent) exemption for providers with 100,000 or fewer subscribers from the compliance with certain reporting requirements regarding performance characteristics to minimize burdens for providers. Furthermore, in response to concerns expressed by some commenters, we provided a temporary (with the potential to become permanent) exemption from compliance with the direct notification requirement for providers with 100,000 or fewer subscribers, as such providers are less likely to already have in place the tools and mechanisms needed to allow customers to track usage or provide automated direct notifications. This exemption, which will have the effect of
benefitting many small providers, provides regulatory flexibility while maintaining the Commission’s goals and is similar to exemptions we have adopted in other contexts. For example, for the broadband labels proceeding, we created a longer implementation period for certain providers.

770. As we did in 2015, we determined that a flat ban on paid prioritization has advantages over alternative approaches, particularly in relieving small edge providers, innovators, and consumers of the burden of detecting and challenging instances of harmful paid prioritization. In developing our rule, we specifically noted the concerns commenters expressed over the harms that would particularly befall small edge providers should they be required to pay for priority access. We believe that the adoption of a bright-line rule prohibiting paid prioritization will likely lower compliance costs for small and other entities because they provide greater certainty to market participants. Also, costs for compliance will be lower compared to the current regulatory framework where harmful conduct would be subject to ex post, case-by-case enforcement by antitrust and consumer protection authorities. This could lead to lengthy enforcement actions and higher compliance costs for BIAS providers. In our judgment, enforcement by an expert agency will achieve timelier and more consistent outcomes and reduce the costs of uncertainty resulting in significant public interest benefits.

771. In re-implementing our no-unreasonable interference/disadvantage standard, we were mindful of how a rule that operates on a case-by-case basis may be more difficult for smaller providers. As such, we attempted to provide an extensive list of factors that we will consider in our analysis. Moreover, in consideration of the concerns raised by certain commenters that this rule will create difficulty for smaller providers, we implemented an advisory opinion process whereby providers may seek specific guidance from the Commission.

772. We continue to find that our existing informal complaint rule offers an accessible and effective mechanism for parties—including consumers and small businesses with limited resources—to report possible noncompliance with our open internet rules without being subject to burdensome evidentiary or pleading requirements. In formulating our open internet formal complaint rules, we noted NFIB’s request to “make [our] regulations as concise and simple as possible,” and opted to maintain our existing formal complaint rules codified at §§ 1.720 through 1.740 to streamline the complaint process, which should accord with NFIB’s request.

773. Upon finding that BIAS is best classified under the statute as a telecommunications service under Title II, we broadly forbear, to the full extent permitted by our authority under section 10 of the Act, from applying provisions of Title II of the Act and implementing Commission rules that would apply to BIAS by virtue of its classification as a Title II service—including from all ex ante direct rate regulation—to minimize the burdens an all BIAS providers, including small BIAS providers. For provisions of Title II that the Commission finds it is not in the public interest from which to forbear with respect to BIAS providers, we take additional actions to minimize the effects on small providers. For example, in applying section 222 to BIAS, we waive application of all of the Commission’s rules implementing section 222 to BIAS. Likewise, to address the potential impact on BIAS providers that will be subject to section 214 of the Act, we grant blanket section 214 authority for the provision of BIAS to any entity currently providing or seeking to provide BIAS—except those specific identified entities whose application for international section 214 authority was previously denied or whose domestic and international section 214 authority was previously revoked and their current and future affiliates and subsidiaries. We also waive the current rules implementing section 214(a)–(d) of the Act with respect to BIAS to the extent they are otherwise applicable. Additionally, we find that foreign ownership in excess of the statutory benchmarks in common carrier wireless licensees that are providing only BIAS is in the public interest under section 310(b)(3) when such foreign ownership is held in the licensee through a U.S.-organized entity that does not control the licensee, and under section 310(b)(4) of the Act, and we waive the requirements to request a declaratory ruling under §§ 1.5000 through 1.5004 of the Commission’s rules pending adoption of any rules for BIAS. The Commission expects to release a FNPRM at a future time to examine whether any section 214 rules specifically tailored to BIAS, including for small providers, are warranted. Consistent with our tailored regulatory approach, we also considered the impact of any certification requirements and find that it is prudent and in the public interest to forbear from requiring providers to obtain approval from the Commission to discontinue, reduce, or impair service to a community. We expect that this will minimize burdens on small entities.

774. We also considered the benefits certain Title II provisions offer to providers, particularly BIAS-only providers, which are frequently small providers, in making its forbearance determination. For example, the Commission did not find the standards for forbearance to be met with respect to sections 224, 253, and 332, which all assist providers with network deployment. Section 224 guarantees pole attachment rights to all BIAS providers, including BIAS-only providers, who are frequently small entities. Section 253 permits BIAS-only providers to seek the Commission’s intervention when State or local regulations interfere with their network deployment. Meanwhile, section 332 guarantees that State and local governments act on requests by wireless providers, including BIAS-only providers, to place, construct, or modify personal wireless service facilities within a reasonable period of time.

G. Report to Congress

775. The Commission will send a copy of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration, including the FRFA, in a report to Congress pursuant to the Congressional Review Act. In addition, the Commission will send a copy of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration, including the FRFA, to the Chief Counsel for Advocacy of the SBA. A copy of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration and FRFA (or summaries thereof) will also be published in the Federal Register.

IX. Ordering Clauses

Commission’s Rules, 47 CFR parts 8 and 20, are amended.

777. It is further ordered, pursuant to sections 1, 4(i), 4(j), 214, 215, 218, and 403 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 154(i), 154(j), 214, 215, 218, 403, and §§ 1.1, 2.903, 63.12, 63.18, and 63.21 of the Commission’s rules, 47 CFR 1.1, 2.903, 63.12, 63.18, and 63.21, that blanket section 214 authority for the provision of broadband internet access service is granted to any entity currently providing or seeking to provide broadband internet access service except for China Mobile International (USA) Inc., China Telecom (Americas) Corporation, China Unicom (Americas) Operations Limited, Pacific Networks Corp., and ComNet (USA) LLC and their current and future affiliates and subsidiaries.

778. It is further ordered, pursuant to sections 1, 4(i), 4(j), 214, 215, 218, and 403 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 154(i), 154(j), 214, 218, 403, and §§ 1.1, 2.903, 63.12, 63.18, and 63.21 of the Commission’s rules, 47 CFR 1.1, 2.903, 63.12, 63.18, and 63.21, that China Mobile International (USA) Inc., China Telecom (Americas) Corporation, China Unicom (Americas) Operations Limited, Pacific Networks Corp., and ComNet (USA) LLC, and their affiliates and subsidiaries as defined pursuant to 47 CFR 2.903(c), shall discontinue any and all provision of BIAS no later than sixty (60) days after the effective date of the Order as established in the Federal Register.

779. It is further ordered, pursuant to sections 1, 4(i), 4(j), 160, 201–205, 211, 214, and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. 151, 152, 154(i), 154(j), 160, 201–205, 211, 214, 303(r); sections 1–6 of the Cable Landing License Act of 1921, 42 Stat. 8, 47 U.S.C. 34–39; section 402(b)(2)[B], (c) of the Telecommunications Act of 1996, Public Law 104–104, 110 Stat. 56, 47 U.S.C. 204 note, 208 note, 214 note; and §1.3 of the Commission’s rules, 47 CFR 1.3, that §§ 1.763, 43.82, 63.03, 63.04, 63.09 through 63.14, 63.17, 63.18, 63.20 through 63.25, 63.50 through 63.53, 63.65, 63.66, 63.100, 63.701, and 63.702 of the Commission’s rules, 47 CFR 1.763, 43.82, 63.03, 63.04, 63.09 through 63.14, 63.17, 63.18, 63.20 through 63.25, 63.50 through 63.53, 63.65, 63.66, 63.100, 63.701, and 63.702, are waived as applied to the provision of broadband internet access service.

780. It is further ordered that a copy of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration shall be sent by Certified Mail, Return Receipt Requested, and by regular first-class mail to the addresses of record of China Mobile International (USA) Inc., China Telecom (Americas) Corporation, China Unicom (Americas) Operations Limited, Pacific Networks Corp., and ComNet (USA) LLC, and shall be posted in the Office of the Secretary pursuant to section 413 of the Communications Act of 1934, as amended, 47 U.S.C. 413. 781. It is further ordered, pursuant to sections 1, 2, 4(i), 4(j), 10, 303(e), 309, 310, and 403 of the Communications Act of 1934, as amended, 47 U.S.C. 151, 152, 154(i), 154(j), 160, 303(r), 309, 310, 403, and §§1.3 and 1.5004 through 1.5004 of the Commission’s rules, 47 CFR 1.3, 1.5004 through 1.5004, that the requirements to request a declaratory ruling pursuant to section 310(b)(3)–(4) of the Act and §§ 1.5004 through 1.5004 of the Commission’s rules are waived for common carrier wireless licensees that are providing only broadband internet access service pending the adoption of any rules for broadband internet access service.

782. It is further ordered, pursuant to sections 1, 2, 4(i), 4(j), 222, and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. 151, 152, 154(i), 154(j), 222, 303(r), and § 1.3 of the Commission’s rules, 47 CFR 1.3, that part 64, subpart U, of the Commission’s rules is waived as applied to the provision of broadband internet access service.

783. It is further ordered that the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration shall be effective 60 days after publication in the Federal Register, except that those amendments which contain new or modified information collection requirements will not become effective until after the Office of Management and Budget completes any review that the Wireline Competition Bureau determines is required under the Paperwork Reduction Act. The Commission directs the Wireline Competition Bureau to announce the effective date for those amendments by subsequent Public Notice. It is our intention in adopting the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration that, if any provision of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration, or the application thereof to any person or circumstance, is held to be unlawful, the remaining portions of such Declaratory Ruling, Order, Report and Order, and Order on Reconsideration not be deemed unlawful. The application of such Declaratory Ruling, Order, Report and Order, and Order on Reconsideration to other person or circumstances, shall remain in effect to the fullest extent permitted by law.

784. It is further ordered that the Office of the Secretary, Reference Information Center shall send a copy of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration, including the Final Regulatory Flexibility Analysis and Initial Regulatory Flexibility Analysis, to the Chief Counsel for Advocacy of the Small Business Administration.

785. It is further ordered that the Office of the Managing Director, Performance and Program Management, shall send a copy of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration in a report to be sent to Congress and the Government Accountability Office pursuant to the Congressional Review Act, see 5 U.S.C. 801(a)(1)[A].

786. It is ordered, that, pursuant to 47 CFR 1.4(b)(1), the period for filing petitions for reconsideration or petitions for judicial review of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration will commence on the date that a summary of the Declaratory Ruling, Order, Report and Order, and Order on Reconsideration is published in the Federal Register.

787. It is further ordered that the Petitions for Reconsideration of the Restoring Internet Freedom Demand Order [86 FR 994 (Jan. 7, 2021)] are granted to the extent described herein and otherwise dismissed as moot.

List of Subjects for 47 CFR Parts 8 and 20

Common carriers, Communications, Communications common carriers, Radio, Reporting and recordkeeping requirements, Satellites, Telecommunications.

Federal Communications Commission.
Katura Jackson, Federal Register Liaison Officer.

Final Rules

For the reasons set out in this document, the Federal Communications Commission amends 47 CFR chapter I as follows:

1. Under the authority of 47 U.S.C. 151, 152, 153, 154(i)–(j), 160, 163, 201, 202, 206, 207, 208, 209, 214, 215, 216, 217, 218, 219, 220, 230, 251, 254, 256, 257, 301, 303, 304, 307, 309, 310, 312, 316, 332, 403, 501, 503, 522, 1302, revise the heading for subchapter A to read as follows:
Subchapter A—Internet Openness

PART 8—SAFEGUARDING AND SECURING THE OPEN INTERNET

2. The authority citation for part 8 is revised to read as follows:

3. Revise the heading for part 8 to read as set forth above.

§ 8.1 [Redesignated as § 8.2]

§ 8.2 Transparency.

(a) A person engaged in the provision of broadband internet access service shall publicly disclose accurate information regarding the network management practices, performance, and commercial terms of its broadband internet access services sufficient for consumers to make informed choices regarding use of such services and for content, application, service, and device providers to develop, market, and maintain internet offerings. Disclosures made under this paragraph (a) must be displayed on the broadband internet access service provider’s website in a machine-readable format.

(b) Compliance with paragraphs (a)(1), (2), and (4) through (6) of this section for providers with 100,000 or fewer subscriber lines is required as of October 10, 2024, and for all other providers is required as of April 10, 2024, except that compliance with the requirement in paragraph (a)(2) of this section to make labels accessible in online account portals will not be required for all providers until October 10, 2024. Compliance with paragraph (a)(3) of this section is required for all providers as of October 10, 2024.

§ 8.3 Conduct-based rules.

(a) No blocking. A person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not block lawful content, applications, services, or non-harmful devices, subject to reasonable network management.

(b) No throttling. A person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not impair or degrade lawful internet traffic on the basis of internet content, application, or service, or use of a non-harmful device, subject to reasonable network management.

§ 8.6 Advisory opinions.

(a) Procedures. (1) Any entity that is subject to the Commission’s open internet rules in this part may request an advisory opinion from the Enforcement Bureau regarding the permissibility of its proposed policies and practices relating to broadband internet access service. Requests for advisory opinions may be filed via the Commission’s website or with the Office of the Secretary and must be copied to the Chief of the Enforcement Bureau and the Chief of the Investigations and Hearings Division of the Enforcement Bureau.

(2) The Commission may waive the ban on paid prioritization only if the petitioner demonstrates that the practice would provide some significant public interest benefit and would not harm the open nature of the internet.

(b) No unreasonable interference or unreasonable disadvantage standard for internet conduct. (1) Any person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall not unreasonably interfere with or unreasonably disadvantage:

(i) End users’ ability to select, access, and use broadband internet access service or the lawful internet content, applications, services, or devices of their choice; or

(ii) Edge providers’ ability to make lawful content, applications, services, or devices available to end users.

(2) Reasonable network management shall not be considered a violation of this paragraph (d).

(3) Requests for other obligations or authorizations. Nothing in this part supersedes any obligation or authorization a provider of broadband internet access service may have to address the needs of emergency communications or law enforcement, public safety, or national security authorities, consistent with or as permitted by applicable law, or limits the provider’s ability to do so. Nothing in this part prohibits reasonable efforts by a provider of broadband internet access service to address copyright infringement or other unlawful activity.

§ 8.7 Petitions for advisory opinions.

(a) General. Requests for advisory opinions shall be filed with the Commission in accordance with the procedures set forth in this section.

(b) Petition for advisory opinion. Any person engaged in the provision of broadband internet access service, insofar as such person is so engaged, shall be entitled to file a petition for an advisory opinion to determine whether a particular request or group of requests falls within the scope of one or more of the provisions or requirements set forth in this part.

§ 8.8 Effect on other obligations or authorizations.

(a) Emotional support services. (1) To the extent that a provider offers emotional support services, such provider shall comply with all applicable requirements of this part.

(b) Upper and lower billing tiers. (1) Upper and lower billing tiers shall be permitted as long as they are not inconsistent with the Commission’s policies and practices relating to broadband internet access service.

(c) Fair access to networks. (1) A provider shall not unreasonably discriminate against any carrier or service provider based on their financial ability, unless such discrimination is permitted by applicable law, or otherwise consistent with or as permitted by applicable law.

§ 8.9 Robustness.

(a) General. Providers shall take reasonable steps to ensure the robustness of their networks, while complying with all applicable requirements of this part.

(b) Robustness practices. Providers shall not engage in practices that unreasonably disadvantage a provider’s network to directly or indirectly favor some traffic over other traffic, including through use of techniques such as traffic shaping, prioritization, resource reservation, or other forms of preferential traffic management, either:

(i) In exchange for consideration (monetary or otherwise) from a third party; or

(ii) To benefit an affiliated entity.

(c) Robustness practices may include:

(i) Reasonable efforts to maintain internet offerings.

(ii) Disclosures made under paragraph (b) of this section.

§ 8.10 Effect on other obligations or authorizations.

(a) Reference to Commission’s open internet rules. Nothing in this part supersedes any obligation or authorization a provider of broadband internet access service may have to address the needs of emergency communications or law enforcement, public safety, or national security authorities, consistent with or as permitted by applicable law.

(b) Effect on other obligations or authorizations. Nothing in this part supersedes any obligation or authorization a provider of broadband internet access service may have to address the needs of emergency communications or law enforcement, public safety, or national security authorities, consistent with or as permitted by applicable law.
intends to pursue. The Enforcement Bureau will not respond to requests for opinions that relate to ongoing or prior conduct, and the Bureau may initiate an enforcement investigation to determine whether such conduct violates the open internet rules in this part. Additionally, the Bureau will not respond to requests if the same or substantially the same conduct is the subject of a current Government investigation or proceeding, including any ongoing litigation or open rulemaking at the Commission.

(4) Requests for advisory opinions must be accompanied by all material information sufficient for Enforcement Bureau staff to make a determination on the policy or practice for which review is requested. Requesters must certify that factual representations made to the Bureau are truthful and accurate, and that they have not intentionally omitted any information from the request. A request for an advisory opinion that is submitted by a business entity or an organization must be executed by an individual who is authorized to act on behalf of that entity or organization.

(5) Enforcement Bureau staff will have discretion to ask parties requesting advisory opinions, as well as other parties that may have information relevant to the request or that may be impacted by the proposed conduct, for additional information that the staff deems necessary to respond to the request. Such additional information, if furnished orally or during an in-person conference with Bureau staff, shall be promptly confirmed in writing. Parties are not obligated to respond to staff inquiries related to advisory opinions. If a requesting party fails to respond to a staff inquiry, then the Bureau may dismiss that party’s request for an advisory opinion. If a party voluntarily responds to a staff inquiry for additional information, then it must do so by a deadline to be specified by Bureau staff. Advisory opinions will expressly state that they rely on the representations made by the requesting party, and that they are premised on the specific facts and representations in the request and any supplemental submissions.

(b) Response. After review of a request submitted under this section, the Enforcement Bureau will:

(1) Issue an advisory opinion that will state the Bureau’s present enforcement intention with respect to whether or not the proposed policy or practice detailed in the request complies with the Commission’s open internet rules in this part;

(2) Issue a written statement declining to respond to the request; or

(3) Take such other position or action as it considers appropriate. An advisory opinion states only the enforcement intention of the Enforcement Bureau as of the date of the opinion, and it is not binding on any party. Advisory opinions will be issued without prejudice to the Enforcement Bureau or the Commission to reconsider the questions involved, or to rescind or revoke the opinion. Advisory opinions will not be subject to appeal or further review.

(c) Enforcement effect. The Enforcement Bureau will have discretion to indicate the Bureau’s lack of enforcement intent in an advisory opinion based on the facts, representations, and warranties made by the requesting party. The requesting party may rely on the opinion only to the extent that the request fully and accurately contains all the material facts and representations necessary to issuance of the opinion and the situation conforms to the situation described in the request for opinion. The Bureau will not bring an enforcement action against a requesting party with respect to any action taken in good faith reliance upon an advisory opinion if all of the relevant facts were fully, completely, and accurately presented to the Bureau, and where such action was promptly discontinued upon notification of rescission or revocation of the Commission’s or Bureau’s approval.

(d) Public disclosure. The Enforcement Bureau will make advisory opinions available to the public on the Commission’s website. The Bureau will also publish the initial request for guidance and any associated materials. Parties soliciting advisory opinions may request confidential treatment of information submitted in connection with a request for an advisory opinion pursuant to §0.459 of this chapter.

(e) Withdrawal of request. Any requesting party may withdraw a request for review at any time prior to receipt of notice that the Enforcement Bureau intends to issue an adverse opinion, or the issuance of an opinion. The Enforcement Bureau remains free, however, to submit comments to such requesting party as it deems appropriate. Failure to take action after receipt of documents or information, whether submitted pursuant to this procedure or otherwise, does not in any way limit or stop the Bureau from taking such action at such time thereafter as it deems appropriate. The Bureau reserves the right to retain documents submitted to it under this procedure, or otherwise and to use them for all governmental purposes.

PART 20—COMMERCIAL MOBILE SERVICES

10. The authority citation for part 20 continues to read as follows:

Authority: 47 U.S.C. 151, 152(a), 154(i), 155, 157, 160, 201, 214, 222, 251(e), 301, 302, 303, 303(b), 303(r), 307, 307(a), 309, 309(j)(3), 316, 316(a), 332, 610, 615, 615a, 615b, and 615c, unless otherwise noted.

11. Amend §20.3 by:

(a) Revising the definitions of “Commercial mobile radio service”; and

(b) Removing the definition of “Interconnected Service” and adding the definition for “Interconnected Service” in its place; and

(c) Removing the definition for “Public Switched Network” and adding the definition for “Public switched network” in its place.

The revision and additions read as follows:

§20.3 Definitions.

* * * * *

Commercial mobile radio service. A mobile service that is:

(1)(i) Provided for profit, i.e., with the intent of receiving compensation or monetary gain;

(ii) An interconnected service; and

(iii) Available to the public, or to such classes of eligible users as to be effectively available to a substantial portion of the public; or

(2) The functional equivalent of such a mobile service described in paragraph (1) of this definition, including a mobile broadband internet access service as defined in §8.1 of this chapter.

(3) A variety of factors may be evaluated to make a determination whether the mobile service in question is the functional equivalent of a commercial mobile radio service, including: Consumer demand for the service to determine whether the service is closely substitutable for a commercial mobile radio service; whether changes in price for the service under examination, or for the comparable commercial mobile radio service, would prompt customers to change from one service to the other; and market research information identifying the targeted market for the service under review.

(4) Unlicensed radio frequency devices under part 15 of this chapter are excluded from this definition of commercial mobile radio service.

* * * * *

Interconnected service. A service:

(1) That is interconnected with the public switched network, or interconnected with the public switched network through an interconnected service provider, that gives subscribers
the capability to communicate to or receive communication from other users on the public switched network; or
(2) For which a request for such interconnection is pending pursuant to section 332(c)(1)(B) of the Communications Act, 47 U.S.C. 332(c)(1)(B). A mobile service offers interconnected service even if the service allows subscribers to access the public switched network only during specified hours of the day, or if the service provides general access to points on the public switched network but also restricts access in certain limited ways. Interconnected service does not include any interface between a licensee’s facilities and the public switched network exclusively for a licensee’s internal control purposes.

Public switched network. The network that includes any common carrier switched network, whether by wire or radio, including local exchange carriers, interexchange carriers, and mobile service providers, that uses the North American Numbering Plan, or public IP addresses, in connection with the provision of switched services.
