Response: As required by Section 304(a)(5) of the NMSA, NOAA provided the WPRFMC with the opportunity to recommend any draft fishing regulations it deemed necessary to implement the proposed sanctuary designation. NOAA participated in six public meetings hosted by the WPRFMC on November 1st, 3rd, 4th, 5th, 8th, and 10th of 2022, which were focused on the development of fishing regulations for the area of the proposed sanctuary that overlaps with the MEA. In December 2022, the WPRFMC provided a recommendation for non-commercial fishing regulations for the area of the proposed sanctuary that overlaps with the MEA. NOAA accepted the majority of the WPRFMC's recommendations, as they were found to fulfill the purposes and policies of the NMSA and the goals and objectives of the proposed sanctuary designation. However, the WPRFMC's recommendation to provide Native Hawaiian subsistence practices fishing permit applicants the ability to request limited cost recovery by selling their catch in the permit application process through a statement of need for cost recovery along with expected costs, failed to fulfill the purposes and policies of the NMSA and the goals and objectives of the proposed sanctuary designation. Additionally, NOAA found that the allowance of "sale" under a Native Hawaiian subsistence practices fishing permit is inconsistent with the State's constitutional protection of

Native Hawaiian traditional and customary rights.

Accordingly, the sanctuary regulations proposed that prohibitions in paragraphs (a)(7) through (14) in Section 922.244 would not apply to non-commercial fishing activities in the Outer Sanctuary Zone authorized under the MSA, provided that no sale of harvested fish occurs. In response to comments of concern for this exemption, NOAA has made changes to ensure that a non-commercial fishing permit authorized under the MSA is only exempt from a limited subset of prohibited or otherwise regulated activities that may only be conducted as incidental to and necessary to a lawful non-commercial fishing activity. NOAA has also clarified that this narrow exemption from the sanctuary's permitting requirements is only applicable provided that the fish harvested, either in whole or in part, are neither intended to enter commerce nor enter commerce through sale, barter, or trade and that the resource is managed sustainably, consistent with Presidential Proclamation 9478. Moreover, consistent with the outcome of the NMSA Section 304(a)(5) process, for the exemption to apply, the fish harvested, either in whole or in part, are not intended to be sold and shall not be sold for any purposes, including, but not limited to, cost-recovery. See the final EIS, Section 3.3.1.

NOAA is preparing a separate proposed rule for regulations governing fishing in the MEA under the authority of the MSA, and will accept public comment on the proposal. NOAA and the State of Hawai'i encourage the commenter to participate in the future public review process for the proposed rule and any associated NEPA and/or other environmental compliance documentation for non-commercial fishing regulations in the MEA. Until a public process is conducted, and a final rule is issued for fishing regulations under the authority of the MSA, non-commercial fishing permits will not be issued for the MEA/Outer Sanctuary Zone. Consistent with existing Monument management, the sanctuary may authorize sustenance fishing outside of any special preservation area as a term or condition of any sanctuary permit.

66. F-5 Comment: Commenters requested a prohibition on mining, and/or stating opposition to mining activities, or any exemption allowing them.

Response: Consistent with the presidential proclamations establishing the Monument, NOAA will prohibit exploring for, developing, or producing

oil, gas, or minerals to protect sanctuary resources. NOAA will also prohibit “any energy development activities” to further the underlying intent of the prohibition on oil, gas, and mineral development by accounting for technological advances in other forms of energy development. Likewise, NOAA is not providing an exemption for mining activities.

67. F-6 Comment: A commenter stated that scientific or management activities undertaken by the USFWS within the Monument are not subject to any additional sanctuary requirements or authorization from NOAA.

Response: Nothing in the establishment of the national marine sanctuary will diminish USFWS’s authority to administer Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge under the National Wildlife Refuge System Administration Act. Where Papahānaumokuākea National Marine Sanctuary overlaps Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge, NOAA will implement the National Marine Sanctuaries Act to provide supplemental authority to protect resources. In other sanctuary sites when there is jurisdictional overlap between NOAA and USFWS, the agencies have worked to implement their respective authorities in a manner that complements, but does not diminish or interfere with, existing authorities and would strengthen existing protections and management. NOAA and USFWS are developing an agreement to provide details on the execution of sanctuary management where the national marine sanctuary overlaps with Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge.

The sanctuary permitting system was modeled after the existing Monument permitting system to ensure a single joint permitting system continues to be administered by the MMB. In addition, this final rule does not include authorization authority for the sanctuary. Consistent with Presidential Proclamation 9478, the sanctuary regulations exempt both the DOC/NOAA and the DOI/USFWS from the prohibitions, including the need to obtain a permit or authorization from the Secretary of Commerce in order to conduct scientific exploration or research activities in the MEA. NOAA has clarified the proposed framework for management and permitting in partnership with USFWS and the other Monument managers in the final EIS, Section 3.3.1.

68. G-1 Comment: Some commenters requested an extension of the public

comment period and/or additional virtual public meetings. Some commenters expressed concern that there was not adequate public education, engagement, and notification for the public comment period and meetings; that the methods for comment were not accessible for all and/or not an adequate way to gauge support or opposition; and that all communities, specifically the fishing community, were not properly engaged in the comment period. One commenter expressed concern that the public meetings did not allow for agency responses or answers to oral testimony and requested that the NOAA website provide responses to frequently asked questions from the public meetings.

Response: NOAA followed the designation processes and procedures as required pursuant to the NMSA and NEPA, both of which require broad public participation, as well as the Administrative Procedure Act’s notice requirements. The public comment period took place over the course of 68 days from March 1 to May 7, 2024. NOAA accepted public comments through the Federal eRulemaking Portal and by traditional mail. NOAA also encouraged public comments in both English and ‘Ōlelo Hawai‘i (Hawaiian language). NOAA and the State held 11 public comment meetings (nine in-person and two virtual). Additionally, prior to the public comment meetings, the State of Hawai‘i Division of Aquatic Resources held a virtual public informational meeting to engage the public. NOAA and the State of Hawai‘i provided question and answer sessions at the in-person public meetings, prior to and following the formal oral comment portion of the meeting.

NOAA also posted sanctuary designation process information and FAQs on the ONMS website in response to questions received during public meetings. NOAA believes that it has fairly engaged with and considered input from local communities, Kānaka ‘Ōiwi, government, and other stakeholders through extensive consultations, meetings, and discussions about sanctuary designation, and that draft designation documents and process steps have complied with applicable laws and policies, including the NMSA, NEPA, Administrative Procedure Act, and Section 106 of the National Historic Preservation Act. For more details regarding the public engagement process, see the final EIS, sections 1.3.1 and 1.3.2.

NOAA also specifically engaged with the fishing community and consulted with the WPRFMC as required by

Section 304(a)(5) of the NMSA. Through this consultation, NOAA provided the WPRFMC with the opportunity to recommend any draft fishing regulations it deemed necessary to implement the proposed sanctuary designation. NOAA and the State of Hawai‘i also participated in six public meetings hosted by the WPRFMC on November 1st, 3rd, 4th, 5th, 8th, and 10th of 2022, which were focused on the development of fishing regulations for the area of the proposed sanctuary that overlaps with the MEA.

69. H-2 Comment: A commenter recommended that, in describing the purposes and policies of the NMSA, and specifically, 16 U.S.C 1431 (b)(4), NOAA should define “sustainable use” as “to provide enhanced protections for pristine marine waters,” and prohibit use of the waters or marine ecosystems.

Response: The NMSA authorizes the Secretary of Commerce to designate national marine sanctuaries that meet the purposes and policies of the NMSA, including 16 U.S.C. 1431(b)(4), which focuses, in part, on the sustainable use of the marine environment. The sanctuary regulations build upon the existing protections for the Northwestern Hawaiian Islands, which provide for both restricted access to the area and responsible use subject to strict permitting terms and conditions. Given this management model, NOAA does not see a need for the sanctuary regulations to define “sustainable use” at this time.

70. I-1 Comment: Some commenters recommended that NOAA select Alternative 3, a boundary which excludes the waters of Midway Atoll and Hawaiian Islands National Wildlife Refuges. Commenters provided several reasons for supporting Alternative 3, including that the USFWS should have sole jurisdiction to manage the national wildlife refuges; that a sanctuary that overlaps with the national wildlife refuges would be inconsistent with presidential proclamations that created the Monument; that a sanctuary that overlaps with the national wildlife refuges would not comply with the National Wildlife Refuge System Administration Act; and that a sanctuary that overlaps with the national wildlife refuges may negatively impact the USFWS management of the national wildlife refuges.

Response: NOAA identified Alternative 1 (which would include the waters of Midway Atoll and Hawaiian Islands National Wildlife Refuges in the proposed sanctuary) as the Agency-Preferred Alternative based on its comparative merits. Nothing in the establishment of the national marine

sanctuary will diminish USFWS's authority to administer Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge under the National Wildlife Refuge System Administration Act. Where Papahānaumokuākea National Marine Sanctuary overlays Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge, NOAA will implement the NMSA to provide supplemental authority to protect resources. NOAA and USFWS are developing an agreement to provide details on the execution of sanctuary management where the national marine sanctuary overlaps with Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge.

In addition, the existing Monument is already jointly administered through a seven-member Monument Management Board, which includes NOAA's ONMS. ONMS and the USFWS have been cooperatively managing the area of the proposed sanctuary for nearly 20 years. As a result of the existing Monument management framework, of which ONMS is a critical part, this sanctuary rule has been specifically designed not to create any regulatory inconsistencies, and to ensure consistent management between the Monument, the national wildlife refuges, and the sanctuary.

Further, both NOAA and the State disagree that the designation is inconsistent with the directives that established the Northwestern Hawaiian Islands Coral Reef Ecosystem Reserve and the Monument. In part, the purpose of the designation is to specifically implement the provisions of Executive Order 13178, Presidential Proclamation 9478, and the Joint Explanatory Statement accompanying the Consolidated Appropriations Act, 2021, that directed NOAA to consider initiating the sanctuary designation process.

71. I-2 Comment: Commenters expressed opposition to any sanctuary that would include additional portions of Middle Bank, beyond the areas that are included in the Monument.

Response: NOAA considered designating a sanctuary that expanded beyond the southeastern portion of the Monument boundary to include Middle Bank. However, NOAA eliminated this alternative from detailed study, as described in the draft and final EIS, Section 3.7.

72. I-3 Comment: Commenters requested that NOAA consider including most or all of Middle Bank in the proposed sanctuary boundary, because of the scientific, ecological, and commercial benefits of the area. Commenters also requested that NOAA

consider expanding the boundary to include more area.

Response: NOAA identified Alternative 1 (which is coextensive with marine portions of the Monument) as the Agency-Preferred Alternative based on its comparative merits, and therefore does not include all of Middle Bank or any additional areas that are not part of the Monument. This is consistent with the defined purpose and need and with the provisions of Executive Order 13178, Presidential Proclamation 8031, Presidential Proclamation 9478, and the Joint Explanatory Statement accompanying the Consolidated Appropriations Act, 2021.

Although NOAA considered sanctuary boundary alternatives that included Middle Bank, NOAA concluded that aligning the boundary of the sanctuary with that of the Monument best fulfills the purposes and policies of the NMSA. In addition, the NMSA directs NOAA that it may designate any discrete area of the marine environment as a national marine sanctuary and promulgate regulations implementing the designation if it is determined that the area is of a size and nature that will permit comprehensive and coordinated conservation and management. NOAA concluded that any boundary alternative that expands beyond the existing boundaries of PMNM and the MEA would not be practicable in light of the need for comprehensive and coordinated management in a manner which complements the existing Monument management framework. NOAA has added these clarifications to the draft and final EIS, Section 3.7.1.

73. I-4 Comment: Commenters recommended Alternative 2, a boundary which excludes the MEA, as the preferred alternative. Some commenters expressed support for this alternative, emphasizing that excluding the MEA may allow for more fishing, including commercial fishing, in that area.

Response: NOAA identified Alternative 1 as the Agency-Preferred Alternative, which includes the MEA, based on its comparative merits. This final rule implements and is consistent with directives in Presidential Proclamation 9478, which has the force of law. Presidential Proclamation 9478, which designated the MEA, prohibits commercial fishing and provides that non-commercial fishing may be a regulated activity (*i.e.*, allowed only with a permit). Selection of Alternative 2 would not alter the directives provided in Presidential Proclamation 9478, including the prohibition on commercial fishing in the MEA.

74. I-5 Comment: A commenter requested the inclusion of a legal definition of shoreline delineation in relation to iron seawall ruins and rubble at Tern Island, and questioned if the seawall and debris would be included in the sanctuary boundary.

Response: The shoreline in the State of Hawai'i as defined by the Hawai'i Department of Land and Natural Resources is "the upper reaches of the wash of the waves, other than storm or seismic waves, at high tide during the season of the year in which the highest wash of the waves occur, usually evidenced by the edge of vegetation growth, or the upper limit of debris left by the wash of the waves" (HAR § 13-222). The Coastal Lands Program of the Hawai'i Department of Land and Natural Resources, Office of Conservation and Coastal Lands maintains the State of Hawaii Shoreline Certification Program (see Shoreline Certification Rules in HAR § 13-222). It is this program that would determine where the shoreline is delineated in the location of the iron seawall on Tern Island when necessary. Therefore, under the current definitions, any debris or rubble or portion of the Tern Island iron seawall that occurs seaward of this shoreline as defined by the State of Hawai'i will be within the sanctuary, and that which occurs upland of the shoreline will be outside the sanctuary.

75. I-6 Comment: A commenter requested that the shoreward boundary be extended to the mean high tide.

Response: NOAA considered an alternative that designated the mean high tide line as the shoreward boundary, but eliminated this alternative from detailed study (see Section 3.7.1 of the EIS). NOAA typically uses the shoreline as legally defined by the State within which the national marine sanctuary occurs, because the shoreline delineates the boundary between public and private land. The shoreline in the State of Hawai'i as defined by the Hawai'i Department of Land and Natural Resources is "the upper reaches of the wash of the waves, other than storm or seismic waves, at high tide during the season of the year in which the highest wash of the waves occur, usually evidenced by the edge of vegetation growth, or the upper limit of debris left by the wash of the waves" (HAR § 13-222). NOAA strives to designate a sanctuary which supplements and complements existing authorities, and this designation adheres to both the State's definition as well as the current landward boundary designation of the Monument.

76. *J-12 Comment:* Commenters expressed concerns regarding the lack of analysis and description on NOAA's ability to issue "emergency regulations" to prevent or minimize the loss or injury to a sanctuary resource. The commenter stated that the regulations issued jointly by NOAA and USFWS in 2006 for the original Monument contain an exemption from prohibitions for emergency actions, and that Presidential Proclamation 9478 specifically exempts from prohibitions activities "necessary to respond to emergencies threatening life, property, or the environment, or to activities necessary for law enforcement purposes." The commenters questioned why sanctuary authority to issue sanctuary regulations is necessary given existing provisions and regulations for the Monument.

Response: NOAA acknowledges that the existing management of the area includes exemptions for any activity necessary to respond to emergencies that threaten life, property, or the environment, or to activities necessary for law enforcement purposes. These exemptions are also included in the sanctuary regulations. However, NOAA's references to "emergency regulations" throughout the EIS are not referring to this exemption, but to NOAA's authority pursuant to 15 CFR 922.7, which states that "where necessary to prevent or minimize the destruction of, loss of, or injury to a Sanctuary resource or quality, or minimize the imminent risk of such destruction, loss, or injury, any and all such activities are subject to immediate temporary regulation, including prohibition." This authority may be useful in implementing immediate temporary regulations to protect resources following incidents of resource damages, such as vessel groundings or disease. NOAA has added information regarding emergency regulations in the final rule, Section IV.O.

77. *K-6 Comment:* Commenters suggested that scientific research should not be conducted in a way that would harm resources. Commenters also expressed concerns about the use of remotely operated vehicles (ROVs) and other scientific instruments on the seafloor.

Response: The sanctuary includes a permitting system modeled after the existing Monument permitting system, such that there are sufficient safeguards in place that apply to the permit review process for all activities, including for scientific research and ROVs. The sanctuary has adopted the same permit criteria as currently required for Monument permits, including that the

proposed activity will be conducted in a manner compatible with resource protection. In addition, conditions can be placed on the permit specific to the activity being permitted and permit applications would be reviewed with respect to all other pertinent regulations and statutes, including NEPA, 42 U.S.C. 4321 *et seq.*, and any required consultations, permits, or authorizations.

78. *K-8 Comment:* A commenter suggested that NOAA leave Battle of Midway vessels and aircraft undisturbed to be respectful of the war and preserve the materials for future archaeological purposes.

Response: NOAA's management principles emphasize an *in-situ* management approach for the long-term protection of site information and integrity, as well as other preservation methods and activities outlined in the ONMS policy guidance document *Monitoring and Management of Tangible Maritime Heritage Resources*. The Sunken Military Craft Act of 2004 preserves and protects all sunken military craft that are owned by the U.S. government, as well as foreign sunken military craft that lie within U.S. waters, from unauthorized disturbances.

79. *K-10:* Commenters expressed concerns regarding the impacts of sonar activity and underwater detonations to marine mammals, fish, sea turtles, and sea invertebrates. Commenters specifically expressed concern with impacts from sonar activity and testing by the military. One commenter recommended mid-frequency active sonar as an alternative technology.

Response: Consistent with the presidential proclamations establishing the Monument, NOAA will prohibit "using or attempting to use poisons, electrical charges, or explosives in the collection or harvest of a sanctuary resource." NOAA will also prohibit, unless conducted pursuant to a permit "removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging; or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving sanctuary resource." The use of sonar by U.S. Armed Forces is a lawful Armed Forces activity and the use has been analyzed by the U.S. Navy within prior environmental planning documents (HSTT, 2018) and is subject to other applicable laws, permits, and authorizations, including the MMPA.

NOAA provides a broad exemption to allow activities and exercises of the U.S. Armed Forces, including those carried out by the U.S. Coast Guard, to be consistent with existing management of this area, as provided for the Monument

by Presidential Proclamations 8031 and 9478. However, all activities and exercises of the Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on sanctuary resources and qualities. See also the F.3 response.

80. *K-11 Comment:* A commenter recommended protections for koholā (humpback whale) that are similar to the protections included in Hawaiian Islands Humpback Whale National Marine Sanctuary, including vessel rules, restrictions on sonar, and maintaining a minimum distance away from koholā.

Response: NOAA will prohibit several activities in the sanctuary that are responsive to this comment, consistent with the presidential proclamations establishing the Monument. The prohibitions most relevant for the protection of humpback whales include prohibitions on "removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging; or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving sanctuary resource" and "attracting any living sanctuary resource." The use of sonar by the U.S. Armed Forces is a lawful activity of the Armed Forces, but is subject to other applicable laws, permits, and authorizations, including the MMPA.

81. *K-12 Comment:* A commenter requested that the Outer Sanctuary Zone be named "pu'uhonua," which means a place of safety and refuge. Another commenter asked if there would be a process for naming this area of the sanctuary.

Response: NOAA will give further consideration to this and would like to ensure an inclusive process that allows for additional input and discussion from all stakeholders and Monument co-trustees regarding a name for the Outer Sanctuary Zone. The proposed name and the process of naming this Outer Sanctuary Zone will be discussed within the Papahānaumokuākea Native Hawaiian CWG, facilitated by OHA.

82. *L-5 Comment:* A commenter requested that the rule language be revised to allow for an ongoing process for updating the sanctuary regulations. Specifically, the commenter suggested replacing the words "as may be necessary," in the Terms of Designation, Activities Subject to Regulation section, with "on an ongoing basis."

Response: The terms of designation, as defined under section 304(a)(4) of the NMSA, may be modified only by the same procedures by which the original designation is made, including public hearings, consultations with interested

Federal, Tribal, State, regional, and local authorities and agencies, review by the appropriate Congressional committees, and approval by the Secretary of Commerce, or his or her designee. Any future proposed changes to sanctuary regulations or boundaries would be subject to public review as mandated by the NMSA and other Federal statutes.

83. *L-6 Comment:* A commenter provided questions and suggestions regarding perceived data anomalies in the boundary description, including:

- “The proposed SMA and SPA boundaries do not coincide with the boundaries as described in Presidential Proclamation 8031 nor do they coincide with the proclamation’s SMA and certain SPA boundaries as charted on ENC’s that are larger scale than Band 2 (General Navigational Purpose). It appears that the coordinates of the proposed boundaries may have been derived from the SMA and SPA boundaries of the national monument as depicted on the Band 2 ENC’s.

- Appendix A to Subpart W, Points 610–662—Papahānaumokuākea National Marine Sanctuary Boundary: Points 610 through 662 form the easternmost extent of the proposed sanctuary boundary. However, these points are coincident with a portion of the Inner Reporting Area Boundary Around Nihoa ATBA. Should Points 610 through 662 be coincident with the Reporting Area Outer Boundary instead of the Inner Reporting Area Boundary?

- Pages 15302–15303, Appendix D to Subpart W—Unnamed, unnumbered table: ONMS did not designate a table number and name for the first set of coordinates that encompasses Kure Atoll.

- Pages 15306–15307, Appendix E to Subpart W, Table 1—Ship Reporting Area (Reporting Area Outer Boundary): According to FR page 15278, Column 1: “NOAA proposes to establish this reporting area, which would be defined as “the area of the proposed sanctuary that extends outward ten nautical miles from the PSSA [Particularly Sensitive Sea Area] boundary, as designated by the IMO. . . .” The coordinates for the Reporting Area Outer Boundary of Appendix E/Table 1 do not completely coincide with a 10–NM buffer (geodesic) from the PSSA boundary per the International Maritime Organization (IMO). I recommend a re-evaluation of the boundary points for the Reporting Area Outer Boundary.”

Response: The boundary discrepancies in the special management area and special preservation areas have been corrected and the updated coordinate tables, appended to this final rule, will

correspond to the coordinates as described in Presidential Proclamation 8031.

Regarding the outer boundary of the Reporting Area, NOAA will define the Reporting Area as was defined by IMO Resolution MSC.171(57) and the subsequent amendment IMO Resolution MSC.279(85) adopted in December 2008. This boundary has been corrected and is now described citing the geographic coordinates of the outer boundary of the “CORALSHIPREP” reporting area of IMO Resolution MSC.279(85).

Regarding the missing designation of a table number and name for the first set of coordinates that encompass the Kure Atoll Special Preservation Area, after investigating the issue, NOAA determined that the table did in fact have a name and number as referenced at the *web address* and therefore no corrective action was necessary.

Regarding the portion of the proposed sanctuary boundary identified as being coincident with the Inner Ship Reporting Area Boundary around the Nihoa Area to be Avoided, NOAA determined that this portion of the boundary was the same as that used for both the original and expanded marine national monument, and intends that it will also be used for this portion of the national marine sanctuary boundary. Therefore, no edits were necessary.

VI. Classification

A. National Marine Sanctuaries Act

NOAA consulted with the WPRFMC as required by section 304(a)(5) of the NMSA. Through this consultation, NOAA provided the WPRFMC with the opportunity to recommend any draft fishing regulations it deemed necessary to implement the proposed sanctuary designation. NOAA initiated the consultation on November 19, 2021. On March 22, 2022, the WPRFMC agreed to develop draft fishing regulations for the proposed sanctuary. NOAA participated in six public meetings hosted by the WPRFMC on November 1st, 3rd, 4th, 5th, 8th, and 10th of 2022, which were focused on the development of fishing regulations for the area of the proposed sanctuary that overlaps with the MEA. At its 193rd meeting in December of 2022, the WPRFMC provided a final recommendation. NOAA found that the final recommendation, in part, did not fulfill the purposes and policies of the NMSA and the goals and objectives of the proposed designation. The WPRFMC amended their recommendation during their 194th meeting in March of 2023, and submitted a revised final

recommendation to NOAA on April 14, 2023.

In May of 2023, NOAA accepted the majority of the WPRFMC’s recommendation as it fulfilled the purposes and policies of the NMSA and the goals and objectives of the proposed sanctuary designation. However, the WPRFMC’s recommendation for the disposition of Native Hawaiian Subsistence Practices Fishing catch, which would provide permit applicants the ability to request limited cost-recovery by selling their catch, was rejected by NOAA in a decision letter dated May 31, 2023. As NOAA explained in the letter, any recommendation for the allowance of “sale” is inconsistent with the goals and objectives of the proposed sanctuary designation. To reflect the outcome of the NMSA 304(a)(5) process, NOAA has prepared this final rule under the NMSA, and is preparing a separate proposed rule for regulations governing fishing in the MEA under the authority of the MSA.

Pursuant to section 304(a)(1)(C) of the NMSA, the Committee on Natural Resources of the House of Representatives, the Committee on Commerce, Science, and Transportation of the Senate, and the Governor of Hawai’i will have the opportunity to review this final action.

B. National Environmental Policy Act

As described in Section I above, NOAA and the State of Hawai’i prepared a final EIS to evaluate the impacts of designating a national marine sanctuary, which considered four alternatives for the designation of a national marine sanctuary in marine portions of the Monument. Copies of the final EIS, final management plan, and Record of Decision are available at the website listed in the **ADDRESSES** section of this final rule.

C. Executive Orders 12866: Regulatory Impact, 13563 Improving Regulation and Regulatory Review, and 14094: Modernizing Regulatory Review

The Office of Management and Budget (OMB) has determined this final rule to be significant under Executive Order 12866, “Regulatory Planning and Review,” 58 FR 190 (Oct 4, 1993), as supplemented by Executive Order 14094, “Modernizing Regulatory Review,” 88 FR 21879 (April 6, 2023). NOAA prepared an analysis of the potential costs and benefits associated with this action, which is available at <https://sanctuaries.noaa.gov/papahanaumokuakea/>.

The final rule is largely consistent with the existing management

framework for the Monument. Because the site-specific regulations finalized under the NMSA have been crafted to ensure consistency with Presidential Proclamations 8031, 8112, and 9478, the overall management framework for the area will largely remain unchanged. The designation would clarify aspects of existing Monument management and add to that management framework in ways that would have a limited effect on the public given that access to and activity within the Monument is already highly regulated and requires a permit in most instances. In most cases, permit applicants would be subject to substantially similar findings criteria and permitting requirements as currently required within the Monument. Further, the area of the sanctuary is extremely remote, nearly 300 miles at its closest point from the main Hawaiian Islands, and very few entities operate there. Limited activities are expected to continue. Therefore, the quantifiable benefits and costs associated with the site-specific regulations are limited. The primary benefits of sanctuary designation are provided by the supplemental authorities provided through the NMSA and National Marine Sanctuary Program regulations.

D. Executive Order 13132: Federalism Assessment

NOAA has concluded that this regulatory action does not have federalism implications sufficient to warrant preparation of a federalism assessment under Executive Order 13132 because NOAA supplements and complements State and local laws under the NMSA rather than supersedes or conflicts with them. This final rule will not have substantial direct effects on State or local governments. NOAA has coordinated closely with State partners throughout the development of this final rule and, where applicable and practicable, the final rule aligns with existing State regulations. In addition, the State of Hawai'i served as a cooperating agency and co-developed the draft EIS and final EIS, which was also developed in accordance with the Hawai'i Environmental Policy Act (HEPA, Chapter 343 HRS, HAR Chapter 11–200.1). The State of Hawai'i also co-developed the sanctuary management plan. NOAA has aimed for consistent regulations throughout sanctuary waters including those within State and Federal jurisdiction.

E. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA; 5 U.S.C. 601 *et seq.*) requires Federal agencies to prepare an analysis of a

rule's impact on small entities whenever the agency is required to publish a rulemaking, unless the agency certifies, pursuant to 5 U.S.C. 605, that the action will not have significant economic impact on a substantial number of small entities. The RFA requires agencies to consider, but not necessarily minimize, the effects of rules on small entities. The goal of the RFA is to inform the agency and public of expected economic effects of the rule and to ensure the agency considers alternatives that minimize the expected economic effects on small entities while meeting applicable goals and objectives. Pursuant to section 605(b) of the RFA, the Chief Counsel for Regulation of the Department of Commerce certified to the Chief Counsel for Advocacy of the Small Business Administration that the proposed rule would not have a significant economic impact on a substantial number of small entities. The purpose, context, and statutory basis for this action is described above and not repeated here. The rationale for that certification was set forth in the preamble of the proposed rule (89 FR 15272, March 1, 2024), and NOAA's analysis stands.

This final rule is not expected to place a substantial number of small entities at a significant competitive disadvantage to large entities, and would not significantly reduce profits for a substantial number of small entities operating in the area of the sanctuary, as the overall management framework for the area will largely remain unchanged. The final rule would be largely consistent with the existing management framework for the Monument, which was established by Presidential Proclamation 8031 and 8112 (PMNM, 0–50 nm), and by Presidential Proclamation 9478 (MEA, 50–200 nm). The existing management framework established by these Presidential Proclamations has the force of law, and includes a permitting system, under which all entities are subject to the same reporting requirements. Further, very few entities operate in the area of the sanctuary, as the area of the sanctuary is extremely remote, nearly 300 miles at its closest point from the main Hawaiian Islands. The number of permits issued for the Monument annually ranged from 9 to 21 between 2018 and 2022.

Through this final rule, permit applicants, including applicants for activities in the area of the sanctuary that overlaps with the MEA, would be subject to substantially similar findings criteria and permitting requirements as currently required for PMNM. Based on the NOAA Monument manager's site knowledge and experience, the final

rule is not expected to result in an increase in the number of permit requests, as the majority of users operate in the area of the sanctuary that overlaps with PMNM, and do not solely operate in the area of the sanctuary that overlaps with the MEA. Therefore, these additional permitting requirements will not significantly reduce profits for a substantial number of small entities because most entities are already subject to such requirements.

NOAA does not charge a fee for review and issuance of general permits, and there are minimal, indirect costs associated with the time for an individual to complete a permit application and respond to any follow-up questions from NOAA. While NOAA may assess fees for the conduct of any activity authorized under a special use permit, fees are not required and decisions are made on a case-by-case basis. No unique professional skills are necessary to meet these reporting requirements.

Although NOAA has made minor technical changes and clarifications to the regulations from the proposed rule to the final rule, none of the changes alter the initial determination that this rule will not have a significant impact on a substantial number of small entities. NOAA also did not receive any comments relevant to the analysis or conclusions of this determination. Therefore, the determination that this rule will not have a significant economic impact on a substantial number of small entities remains unchanged. As a result, a final regulatory flexibility analysis was not required and none was prepared.

F. Paperwork Reduction Act

Notwithstanding any other provisions of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with a collection of information subject to the requirements of the Paperwork Reduction Act (PRA), 44 U.S.C. 3501 *et seq.*, unless that collection of information displays a currently valid OMB control number. NOAA plans to use an existing collection, Papahānaumokuākea Marine National Monument Permit Applications and Reports for Permits, currently approved under OMB Control Number 0648–0548 in association with this final rule. This information collection is currently used to determine whether to approve or deny a permit application for the Papahānaumokuākea Marine National Monument. Information collected includes such items as the professional qualifications and financial ability of the applicant (as related to the requested

activity); the duration of the activity and its effects; the appropriateness of the methods and procedures proposed by the applicant for the conduct of the activity; and the extent to which the conduct of the activity may diminish or enhance the qualities for which the Monument was designated. Some of the information collected may also be used to inform management actions or decision making after a final decision has been made. Additional information regarding this collection of information—including all background materials—can be found at <https://www.reginfo.gov/public/do/PRAMain> by using the search function to enter either the title of the collection or the OMB Control Number.

NOAA believes designating a national marine sanctuary in the marine portions of the Monument will not result in a significant change to the burden, reporting, recordkeeping, and other compliance requirements as discussed in the preamble of the rule. To the extent compliance with this final rule would impose a burden on persons, including small businesses, NOAA believes this burden will be minimal. NOAA did not receive any comments in response to this determination at the proposed rule stage. Following sanctuary designation, NOAA may elect to re-visit the current collection to determine if additional changes are needed. Should NOAA, in consultation with the Department of Interior, the State of Hawaii, and the Office of Hawaiian Affairs, believe additional changes are needed to better facilitate implementation of sanctuary permitting and reporting, NOAA will publish a 60 day notice announcing potential revisions for public comment before submitting materials to OMB.

G. National Historic Preservation Act

Section 106 of the National Historic Preservation Act (NHPA, 54 U.S.C. 306108) requires Federal agencies to take into account the effects of their undertakings on historic properties and afford the Advisory Council on Historic Preservation (ACHP) the opportunity to comment with regard to the undertaking. “Historic property” means any prehistoric or historic district, site, building, structure, or object included in or eligible for inclusion in the National Register of Historic Places maintained by the Secretary of the Interior. This term includes artifacts, records, and material remains that are related to and located within such properties, including properties of traditional religious and cultural importance to an Indigenous nation or Tribe or Native

Hawaiian organization (see 36 CFR 800.16(l)).

The regulations implementing section 106 of the NHPA (36 CFR part 800) establish a process requiring Federal agencies to: (1) determine whether the undertaking is a type of activity that could affect historic properties; (2) identify historic properties in the area of potential effects; (3) assess potential adverse effects; and (4) resolve adverse effects. The regulations require that Federal agencies consult with States, Tribes, and other interested parties when making their effect determinations.

NOAA has determined that the designation of a national marine sanctuary and related rulemaking for sanctuary-specific regulations meet the definition of an undertaking as defined at § 800.16(y). In fulfilling its responsibilities under section 106 of the NHPA, NOAA initiated consultation with the Hawai‘i State Historic Preservation Division through the Hawai‘i Cultural Resource Information System on November 21, 2021. NOAA also invited the Advisory Council on Historic Preservation (ACHP) to participate on November 21, 2021. NOAA further initiated an effort to identify consulting parties to participate in the Section 106 process through distribution of over 500 letters to individuals, organizations, and families. This included outreach to families with lineal and cultural connections to Papahānaumokuākea, cultural practitioners, Native Hawaiian Organizations, the fishing community (including subsistence, recreational, and commercial fishers), maritime heritage organizations, government agencies, and others. These letters solicited input regarding the identification of, and potential effects on, historic properties from the proposed sanctuary designation for the purpose of obtaining input for the Section 106 review and to additionally determine their interest in participating as a consulting party. Through this process NOAA identified 31 consulting parties.

NOAA subsequently hosted ten Section 106 consultation meetings with the consulting parties. Through these consultation meetings, NOAA further sought to invite consulting party and public input regarding the identification of, and potential effects on, historic properties from the proposed sanctuary designation. Subsequently, pursuant to 36 CFR 800.4(d)(1) NOAA issued a Finding of No Historic Properties Affected for this undertaking (see final EIS Appendix C). The consulting parties have been notified of the finding and the finding was provided to the Hawai‘i

State Historic Preservation Division for concurrence.

As the draft EIS was a joint Federal-State action, the State also prepared a Cultural Impact Assessment and Legal Analysis pursuant to the Hawai‘i Environmental Policy Act, Hawai‘i Revised Statutes (HRS) section 343, the corresponding Hawai‘i Administrative Rules (HAR) section 11–200.1, and the Environmental Council’s 1997 Guidelines for Assessing Cultural Impacts. Pursuant to HRS § 6E–8 and HAR § 13–275–3, the Hawai‘i Department of Land and Natural Resources (DLNR) submitted a written request to the State Historic Preservation Division (SHPD) for an agency determination letter. On June 7, 2024, SHPD concurred with DLNR’s determination of no historic properties affected. The concurrence letter from the State Historic Preservation Division is available at <https://sanctuaries.noaa.gov/papahanaumokuakea/>.

H. Sunken Military Craft Act

The Sunken Military Craft Act of 2004 (SMCA; Pub. L. 108–375, Title XIV, sections 1401 to 1408; 10 U.S.C. 113 note) preserves and protects from unauthorized disturbance all sunken military craft that are owned by the United States government, as well as foreign sunken military craft that lie within United States waters, as defined in the SMCA. Thousands of U.S. sunken military craft lie in waters around the world, many accessible to looters, treasure hunters, and others who may cause damage to them. These craft, and their associated contents, represent a collection of non-renewable and significant historical resources that often serve as war graves, carry unexploded ordnance, and contain oil and other hazardous materials. By protecting sunken military craft, the SMCA helps reduce the potential for irreversible harm to these nationally important historical and cultural resources.

Sunken military craft are administered by the respective Secretary concerned pursuant to the SMCA. The Secretary concerned is solely responsible for authorizing disturbance of sunken military craft under the SMCA, specifically for archaeological, historical, or educational purposes, and will consult with NOAA when considering permitting such activities. The Secretary concerned is also responsible for determinations of sunken military craft status and ownership, publicly disclosing the location of sunken military craft, and for determining eligibility and nominating

sunken military craft as historic properties to the National Register of Historic Places. Any agreements with foreign sovereigns regarding sunken military craft in U.S. waters are negotiated by the Secretary of Defense, the Secretary of State, and the Secretary of the Navy, according to authorities vested in each by the SMCA. The Secretary concerned, or his or her designee, and NOAA will ensure coordination and foster collaboration on any research, monitoring, and educational activities pertaining to sunken military craft located within the sanctuary system.

The 1942 Battle of Midway occurred both at Midway Atoll as well as some 100–150 nautical miles north of the atoll in the northwestern portion of Papahānaumokuākea. Aircraft carriers from the historic conflict have been located in the deep ocean, and multiple aircraft and sunken military vessels have been surveyed within the Midway Atoll Special Management Area. Hundreds of aircraft and several other aircraft carriers and destroyers from the battle remain to be discovered in Papahānaumokuākea.

K. Coastal Zone Management Act (CZMA)

Section 307 of the Coastal Zone Management Act (CZMA; 16 U.S.C. 1456) requires Federal agencies to consult with a State's coastal program on potential Federal agency activities that affect any land or water use or natural resource of the coastal zone. Because the sanctuary lies partially within State waters, NOAA submitted its Federal consistency determination to the Hawai'i Coastal Zone Management Program of the Office of Planning and Sustainable Development. NOAA's analysis found the proposed action would be undertaken in a manner consistent to the maximum extent practicable with the enforceable policies of the Hawai'i Coastal Zone Management Program. NOAA's Federal consistency determination, and the State of Hawai'i May 17, 2024 concurrence letter, are included in the final EIS Appendix C1.

L. Executive Order 12898 and 14096: Environmental Justice

Executive Order 12898 and Executive Order 14096 direct Federal agencies to identify and address disproportionately high and adverse effects of their actions on human health and the environment of communities with environmental justice concerns. Additionally, Federal agencies are directed to better protect overburdened communities from pollution and environmental harms;

strengthen engagement with communities and mobilize Federal agencies to confront existing and legacy barriers and injustices; promote the latest science, data, and research, including on cumulative impacts; increase accountability and transparency in Federal environmental justice policy; and honor and build on the foundation of ongoing environmental justice work. The designation of national marine sanctuaries by NOAA helps to ensure the enhancement of environmental quality for all populations in the United States. The sanctuary designation would not result in disproportionate negative impacts on any communities with environmental justice concerns. In addition, many of the potential impacts from designating the sanctuary would result in long-term or permanent beneficial impacts by protecting resources, which may have a positive impact on communities by providing employment and educational opportunities, and potentially result in improved ecosystem services.

List of Subjects in 15 CFR Part 922

Administrative practice and procedure; Coastal zone; Cultural resources; Environmental; Protection; Fishing; Historic preservation; Marine protected areas; Marine resources; Natural resources; National marine sanctuaries; Penalties; Recreation and recreation areas; Reporting and recordkeeping requirements; Shipwrecks; Wildlife.

Nicole R. LeBoeuf,

Assistant Administrator for Ocean Services and Coastal Zone Management, National Ocean Service, National Oceanic and Atmospheric Administration.

For the reasons set forth above, NOAA amends part 922, title 15 of the Code of Federal Regulations as follows:

PART 922—NATIONAL MARINE SANCTUARY PROGRAM REGULATIONS

■ 1. The authority citation for part 922 continues to read as follows:

Authority: 16 U.S.C. 1431 *et seq.*

■ 2. Amend § 922.30 by:

■ a. Removing the word “and” at the end of paragraph (b)(6);

■ b. Removing the period at the end of paragraph (b)(7) and adding “;” in its place; and

■ c. Adding paragraphs (b)(8) and (9).

The additions read as follows:

§ 922.30 National Marine Sanctuary general permits

* * * * *

(b) * * *

(8) Native Hawaiian Practices—activities that allow for Native Hawaiian practices within Papahānaumokuākea National Marine Sanctuary; and

(9) Recreation—recreational activities within Papahānaumokuākea National Marine Sanctuary limited to the Midway Atoll Special Management Area.

■ 3. Amend § 922.33 by:

■ a. Removing the word “and” at the end of paragraph (a)(8);

■ b. Removing the period at the end of paragraph (a)(9) and adding “; and” in its place; and

■ c. Adding paragraph (a)(10).

The addition read as follows:

§ 922.33 Review procedures and evaluation.

(a) * * *

(10) For Papahānaumokuākea National Marine Sanctuary, there is no practicable alternative to conducting the activity within the sanctuary and the activity can be conducted with adequate safeguards for the resources and ecological integrity of the sanctuary. Further, for Native Hawaiian Practices and Recreation permits in Papahānaumokuākea National Marine Sanctuary, the activity meets the additional site-specific permit review criteria identified in § 922.245.

* * * * *

■ 4. Amend 922.37 by adding paragraph (g).

§ 922.37 Appeals of permitting decisions.

* * * * *

(g) Paragraphs (a) through (f) of this section do not apply to Papahānaumokuākea National Marine Sanctuary.

* * * * *

■ 5. Add subpart W to read as follows:

Subpart W—Papahānaumokuākea National Marine Sanctuary

Sec.

922.240 Boundary.

922.241 Definitions.

922.242 Cooperative management.

922.243 Access.

922.244 Prohibited or otherwise regulated activities.

922.245 Permit procedures and criteria.

922.246 Vessel monitoring system.

922.247 Sunken military craft.

Appendix A to Subpart W of Part 922—Papahānaumokuākea National Marine Sanctuary Boundary Description and Coordinates

Appendix B to Subpart W of Part 922—Coordinates for the Outer Sanctuary Zone

Appendix C to Subpart W of Part 922—Coordinates for the Midway Atoll Special Management Area

Appendix D to Subpart W of Part 922—
Coordinates for the Special Preservation
Areas (SPAs)

Appendix E to Subpart W of Part 922—
Coordinates for the Ship Reporting Area

Appendix F to Subpart W of Part 922—IMO
Standard Reporting Format and Data
Syntax for Ship Reporting System

§ 922.240 Boundary.

Papahānaumokuākea National Marine Sanctuary consists of an area of approximately 582,570 square miles (439,910 square nautical miles) of Pacific Ocean waters surrounding the Northwestern Hawaiian Islands and the submerged lands thereunder. The precise boundary coordinates are listed in Appendix A to this subpart. The outer seaward sanctuary boundary begins approximately 200 nautical miles SW of Kure Atoll at Point 1 and continues from this point roughly north to each successive point in numerical order to Point 232 which is approximately 204 nautical miles north of Kure Atoll. From Point 232 the sanctuary boundary continues roughly ESE to each successive point in numerical order to Point 609 which is approximately 200 nautical miles NE of Necker Island. From Point 609 the sanctuary boundary continues south to Point 610 which is approximately 90 nautical miles ENE of Necker Island. From Point 610 the sanctuary boundary continues roughly east and then SE and south to Point 635 which is approximately 50 nautical miles east of Nihoa. From Point 635 the sanctuary boundary continues roughly south and then SW and west to each successive point in numerical order to Point 662 which is approximately 71 nautical miles SW of Nihoa. From Point 662 the sanctuary boundary continues south to Point 663 which is approximately 236 nautical miles SSW of Nihoa. From Point 663 the sanctuary boundary continues roughly NW to each successive point in numerical order to Point 703 which is approximately 200 nautical miles SSE of Necker Island. From Point 703 the boundary continues roughly NW to each successive point in numerical order to Point 1128 where it ends approximately 200 nautical miles SW of Kure Atoll. The inner landward boundary of the sanctuary follows the shoreline as defined by the State of Hawai'i (HAR § 13–222).

§ 922.241 Definitions.

In addition to those definitions found at § 922.11, the following definitions apply to this subpart. To the extent that a term appears in § 922.11 and this section, the definition in this section governs.

Areas to be avoided (ATBA) means the four areas, as adopted by the International Maritime Organization, that should be avoided by vessels that are conducting passage without interruption through the sanctuary. The precise boundary coordinates for the ATBAs are listed in Appendix E to this subpart.

Bottomfish species means all species of bottomfish as defined at 50 CFR 665.201.

Categories of hazardous cargoes means goods classified in the International Maritime Dangerous Goods (IMDG) Code; substances classified in chapter 17 of the International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (IBC Code) and chapter 19 of the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code); oils as defined in MARPOL Annex I; noxious liquid substances as defined in MARPOL Annex II; harmful substances as defined in MARPOL Annex III; and radioactive materials specified in the International Code for the Safe Carriage of Packaged Irradiated Nuclear Fuel, Plutonium and High-Level Radioactive Waste on Board Ships (INF Code).

Commercial fishing means, as defined in the Magnuson-Stevens Fishery Conservation and Management Act, fishing in which the fish harvested, either in whole or in part, are intended to enter commerce or enter commerce through sale, barter, or trade.

Ecological integrity means a condition determined to be characteristic of an ecosystem that has the ability to maintain the function, structure, and abundance of natural biological communities, including rates of change in response to natural environmental variation.

Midway Atoll Special Management Area means the area of the sanctuary surrounding Midway Atoll out to a distance of 12 nautical miles. The coordinates are listed in Appendix C to this subpart.

Native Hawaiian practices means cultural activities conducted for the purposes of perpetuating traditional knowledge, caring for and protecting the environment and strengthening cultural and spiritual connections to the Northwestern Hawaiian Islands that have demonstrable benefits to the Native Hawaiian community. This may include, but is not limited to, the non-commercial use of sanctuary resources for direct personal consumption while in the sanctuary.

Non-commercial fishing means fishing that does not meet the definition

of commercial fishing in the Magnuson-Stevens Fishery Conservation and Management Act, and includes, but is not limited to, sustenance, subsistence, traditional indigenous, and recreational fishing.

Office of Law Enforcement (OLE) means NOAA, National Marine Fisheries Service, Office of Law Enforcement.

Outer Sanctuary Zone means the waters and submerged lands extending from approximately 50 nautical miles from all islands and emergent lands of the Northwestern Hawaiian Islands to the extent of the seaward limit of the United States Exclusive Economic Zone (U.S. EEZ) west of 163° West Longitude. The precise boundary coordinates for the Outer Sanctuary Zone are listed in Appendix B to this subpart.

Particularly Sensitive Sea Area (PSSA) means an area that needs special protection through action by the International Maritime Organization because of its significance for recognized ecological, socio-economic, or scientific attributes where such attributes may be vulnerable to damage by international shipping activities.

Pelagic species means Western Pacific Pelagic Management Unit Species as defined at 50 CFR 665.800.

Pono means appropriate, correct, and deemed necessary by traditional standards in Hawaiian culture.

Recreational activity means an activity conducted for personal enjoyment that does not result in the extraction of sanctuary resources and that does not involve a fee-for-service transaction. This includes, but is not limited to, wildlife viewing, SCUBA diving, snorkeling, and boating.

Reporting area means the area of the sanctuary that extends outward ten nautical miles from the Particularly Sensitive Sea Area boundary, as designated by the International Maritime Organization, and excludes the Areas to be Avoided that fall within the Particularly Sensitive Sea Area boundary. The precise boundary coordinates for the reporting area are listed in Appendix E to this subpart.

Scientific instrument means a device, vehicle, or tool used for scientific purposes and is inclusive of structures, materials, or other matter incidental to proper use of such device, vehicle, or tool.

Special Preservation Area (SPA) means discrete, biologically important areas of the sanctuary within which uses are subject to certain conditions, restrictions, and prohibitions, including but not limited to access restrictions. The coordinates are listed in Appendix D to this subpart.

Stowed and not available for immediate use means not readily accessible for immediate use, *e.g.*, by being securely covered and lashed to a deck or bulkhead, tied down, unbaited, unloaded, or partially disassembled (*e.g.*, spear shafts being kept separate from spearguns).

Sustenance fishing means fishing for bottomfish or pelagic species in which all catch is consumed within the sanctuary, and that is incidental to an activity permitted under this part.

Vessel monitoring system (VMS) means a mobile transceiver unit as described in § 922.246 and approved by NOAA's Office of Law Enforcement for use on vessels permitted to access the sanctuary, as required by this part.

§ 922.242 Cooperative management.

(a) NOAA has primary responsibility for the management of the sanctuary pursuant to the National Marine Sanctuaries Act. As the sanctuary includes State waters, NOAA will co-manage Papahānaumokuākea National Marine Sanctuary with the State of Hawai'i.

(b) NOAA will also manage the sanctuary in partnership with the U.S. Fish and Wildlife Service and the Office of Hawaiian Affairs.

(c) Nothing in these regulations or establishment of the national marine sanctuary shall diminish U.S. Fish and Wildlife Service's authority to administer Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge under the National Wildlife Refuge System Administration Act, as amended, and other U.S. Fish and Wildlife Service authorities. Where Papahānaumokuākea National Marine Sanctuary overlays Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge, NOAA will implement the National Marine Sanctuaries Act to provide supplemental authority to protect resources.

(d) NOAA, in exercising its management authority under National Marine Sanctuaries Act Section 304(d), recognizes U.S. Fish and Wildlife Service's management authority over Midway Atoll National Wildlife Refuge and Hawaiian Islands National Wildlife Refuge under the National Wildlife Refuge System Administration Act, as amended.

§ 922.243 Access.

(a) Access to the Sanctuary is prohibited and thus unlawful except:

(1) When conducting emergency response actions, law enforcement activities, and activities and exercises of

the Armed Forces in accordance with § 922.244(b) and (c);

(2) Pursuant to a permit issued under § 922.245;

(3) When conducting non-commercial fishing activities in the Outer Sanctuary Zone authorized under the Magnuson-Stevens Fishery Conservation and Management Act in accordance with § 922.244 (d);

(4) When conducting scientific exploration or research activities by or for the Secretary of Commerce or the Secretary of the Interior in the Outer Sanctuary Zone in accordance with § 922.244 (f).

(5) When conducting passage without interruption in accordance with paragraphs (b), (c), and (d) of this section.

(b) A vessel may pass without interruption through the sanctuary without requiring a permit as long as the vessel does not stop or engage in the prohibited activities listed in § 922.244 within the sanctuary.

(c) For areas of the sanctuary that are contained within the reporting area surrounding the Particularly Sensitive Sea Area (PSSA) designated by the International Maritime Organization (IMO), a ship reporting system (CORAL SHIPREP) specified below shall be in effect. The coordinates for the Reporting Area are listed in Appendix E to this subpart.

(1) The following vessels, except vessels entitled to sovereign immunity under international law, passing through the reporting area of the sanctuary without interruption, must participate in the ship reporting system as specified in paragraphs (c)(2) through (6) of this section:

(i) Vessels of the United States of any size;

(ii) All other ships 300 gross tonnage or greater that are entering or departing a United States port or place; and

(iii) All other ships of any size entering or departing a United States port or place and experiencing an emergency while transiting through the reporting area.

(2) All vessels passing through the reporting area of the sanctuary without interruption other than those described in paragraph (c)(1) of this section are encouraged to participate in the ship reporting system set forth in paragraphs (c)(2) through (6) of this section.

(3) Immediately upon entering the reporting area, vessels described in paragraph (c)(1) of this section must provide the following information by email sent to nwhi.notifications@noaa.gov in the IMO standard reporting format and data syntax shown in Appendix F to this subpart:

(i) Vessel name, call sign or ship station identity, flag, and IMO identification number if applicable, and either Federal documentation or State registration number if applicable;

(ii) Date, time (UTC) and month of entry;

(iii) Position;

(iv) True course;

(v) Speed in knots and tenths;

(vi) Destination and estimated time of arrival;

(vii) Intended route through the reporting area;

(viii) Vessel draft (in meters);

(ix) Categories of hazardous cargoes on board;

(x) Any vessel defects or deficiencies that restrict maneuverability or impair normal navigation;

(xi) Any pollution incident or goods lost overboard within the PSSA, the reporting area, or the U.S. EEZ;

(xii) Contact information for the vessel's agent or owner;

(xiii) Vessel size (length overall, gross tonnage) and type; and

(xiv) Total number of persons on board.

(4) Immediately upon leaving the reporting area, vessels described in paragraph (c)(1) of this section must provide the following information by email sent to nwhi.notifications@noaa.gov in the IMO standard reporting format and data syntax shown in Appendix F to this subpart:

(i) Vessel name, call sign or ship station identity, flag, and IMO identification number if applicable, and either Federal documentation or State registration number if applicable;

(ii) Date, time (UTC), and month of exit;

(iii) Position; and

(iv) Any pollution incident or goods lost overboard within the PSSA, the reporting area, or the U.S. EEZ.

(5) For vessels that are not equipped with on-board email capability, advanced notice of entrance (as outlined in paragraph (c)(3) of this section) shall be provided at least 72 hours, but not more than one month, prior to entering the reporting area. Notification of departure (as outlined in paragraph (c)(4) of this section) must be provided within 12 hours of leaving the reporting area. Notification under this paragraph may be made by email, telephone, or fax, by contacting:

(i) Email: nwhi.notifications@noaa.gov;

(ii) Telephone: 1-808-395-6944 or 1-866-478-6944; or

(iii) Fax: 1-808-455-3093.

(6) Further reports shall be made by the vessels described in paragraph (c)(1) of this section, and are encouraged for

the vessels described in paragraph (c)(2) of this section, whenever there is a change in navigation status or circumstances, particularly in relation to the intended route, defects or deficiencies, pollution incidents, or goods lost overboard.

§ 922.244 Prohibited or otherwise regulated activities.

(a) The following activities are prohibited and thus are unlawful for any person to conduct or to cause to be conducted within the sanctuary, except as specified in paragraphs (b) through (f) of this section:

(1) Exploring for, developing, or producing oil, gas, or minerals, or any energy development activities;

(2) Using or attempting to use poisons, electrical charges, or explosives in the collection or harvest of a sanctuary resource;

(3) Introducing or otherwise releasing an introduced species from within or into the sanctuary;

(4) Deserting a vessel;

(5) Anchoring on or having a vessel anchored on any living or dead coral with an anchor, anchor chain, or anchor rope;

(6) Commercial fishing, or possessing commercial fishing gear except when stowed and not available for immediate use;

(7) Failing to comply with the vessel monitoring system requirements in violation of § 922.246.

(8) Failing to comply with ship reporting requirements in violation of § 922.243.

(9) Non-commercial fishing, or possessing non-commercial fishing gear except when stowed and not available for immediate use;

(10) Drilling into, dredging, or otherwise altering the submerged lands; or constructing, placing, or abandoning any structure, material, or other matter on the submerged lands;

(11) Removing, moving, taking, harvesting, possessing, injuring, disturbing, or damaging; or attempting to remove, move, take, harvest, possess, injure, disturb, or damage any living or nonliving sanctuary resource;

(12) Attracting any living sanctuary resource;

(13) Touching coral, living or dead;

(14) Swimming, snorkeling, or closed or open circuit SCUBA diving;

(15) Discharging or depositing any material or other matter into the sanctuary, or discharging or depositing any material or other matter outside of the sanctuary that subsequently enters the sanctuary and injures or has the potential to injure any resources of the sanctuary, except for:

(i) Fish, fish parts, or chumming materials (bait) used in or resulting from lawful fishing activity, provided that such discharge or deposit is during the conduct of lawful fishing activity within the sanctuary;

(ii) Discharge incidental to vessel operations such as approved marine sanitation device effluent, cooling water, and engine exhaust, consistent with Federal statute or regulation; and

(iii) Within Special Preservation Areas or the Midway Atoll Special Management Area, discharging or depositing material or other matter is limited to vessel engine cooling water, weather deck runoff, and vessel engine exhaust, consistent with Federal statute or regulation.

(16) Anchoring a vessel.

(b) The prohibitions in paragraph (a) of this section do not apply to activities necessary to respond to emergencies threatening life, property, or the environment, or to activities necessary for law enforcement purposes.

(c) The prohibitions in paragraph (a) of this section do not apply to activities and exercises of the U.S. Armed Forces (including those carried out by the U.S. Coast Guard). This includes the U.S. Armed Forces' response to emergencies posing an unacceptable threat to human health or safety or to the marine environment and admitting of no other feasible solution. All activities and exercises of the U.S. Armed Forces shall be carried out in a manner that avoids, to the extent practicable and consistent with operational requirements, adverse impacts on sanctuary resources and qualities. These regulations shall not limit or otherwise affect the U.S. Armed Forces discretion to use, maintain, improve, manage, or control any property under their administrative control or otherwise limit the availability of such property for military mission purposes, including, but not limited to, defensive areas and airspace reservations.

(d) The prohibitions in paragraph (a)(9) through (12), and (a)(14) of this section do not apply to non-commercial fishing activities in the Outer Sanctuary Zone authorized under the Magnuson-Stevens Fishery Conservation and Management Act provided that:

(1) Fish harvested, either in whole or in part, are not intended to enter commerce and shall not enter commerce through sale, barter, or trade, and that the resource is managed sustainably;

(2) Fish harvested, either in whole or in part, are not intended to be sold and shall not be sold for any purposes, including, but not limited to, cost-recovery; and

(3) The activities under paragraph (a)(9) through (12), and (a)(14) are only conducted as incidental to and necessary to conduct lawful non-commercial fishing activity.

(e) The prohibitions in paragraphs (a)(9) through (16) of this section, do not apply to any activity conducted under and in accordance with the scope, purpose, terms, and conditions of a sanctuary general permit, or special use permit issued pursuant to subpart D of this part. In no event, may the Director issue a National Marine Sanctuary general permit or special use permit authorizing or otherwise approving activities listed in paragraph (a)(10) of this section for anything other than scientific instruments, when the activity occurs within the Outer Sanctuary Zone.

(f) The prohibitions in paragraph (a) of this section shall not restrict scientific exploration or research activities by or for the Secretary of Commerce or the Secretary of the Interior when the activity occurs within the Outer Sanctuary Zone.

§ 922.245 Permit procedures and criteria.

(a) A person may conduct an activity otherwise prohibited by § 922.244(a)(9) through (16), if such activity is specifically allowed by and conducted in accordance with the scope, purpose, terms and conditions of a permit issued under this section and subpart D of this part, and any additional permit issuance criteria and requirements in paragraphs (a)(1) and (a)(2) of this section.

(1) Native Hawaiian Practices

(i) The activity is non-commercial and will not involve the sale of any organism or material collected;

(ii) The purpose and intent of this activity is appropriate and deemed necessary by traditional standards in the Native Hawaiian culture (pono), and demonstrates an understanding of, and background in, the traditional practice, and its associated values and protocols;

(iii) The activity benefits the resources of the Northwestern Hawaiian Islands and the Native Hawaiian community;

(iv) The activity supports or advances the perpetuation of traditional knowledge and ancestral connections of Native Hawaiians to the Northwestern Hawaiian Islands; and

(v) Any living sanctuary resource harvested from the sanctuary will be consumed or utilized in the sanctuary.

(2) Recreation permits

(i) The activity is limited to the Midway Atoll Special Management Area.

(ii) The activity is for the purpose of recreational activities as defined in § 922.241;

(iii) The activity is not associated with any for-hire operation;

(iv) The activity does not involve any extractive use; and

(b) Applications for permits should be addressed to the NOAA Inouye Regional Center, Office of National Marine Sanctuaries; ATT: Permit Coordinator, Papahānaumokuākea, 1845 Wasp Blvd., Building 176, Honolulu, HI 96818.

(c) The Secretary of Commerce may authorize sustenance fishing outside of any Special Preservation Area as a term or condition of any general permit or special use permit issued under this section and subpart D of this part. Sustenance fishing in the Midway Atoll Special Management Area shall not be allowed unless the activity has been determined by the Director of the U.S. Fish and Wildlife Service or their designee to be compatible with the purposes for which the Midway Atoll National Wildlife Refuge was established. Sustenance fishing must be conducted in a manner compatible with this part, including considering the extent to which the conduct of the activity may diminish Sanctuary resources, qualities, and ecological integrity, as well as any indirect, secondary, or cumulative effects of the activity and the duration of such effects. The Secretary of Commerce may develop procedures for systematic reporting of sustenance fishing.

(d) In addition to other applicable permit issuance criteria and requirements, a permit may not be issued under this section unless the applicant's vessel has been outfitted with a VMS unit approved by OLE and the applicant complies with the requirements of § 922.246.

§ 922.246 Requirements for a vessel monitoring system.

(a) *Requirement for use.* An owner or operator of a vessel that has been issued a general permit or special use permit under § 922.245 and subpart D of this part must ensure that such vessel is operating a NOAA OLE type-approved VMS on board when operating within the sanctuary. An operating VMS includes an operating mobile transmitting unit on the vessel and a functioning communication link between the unit and OLE as provided by an OLE-approved communication service provider. As a condition of authorized access to the sanctuary, a vessel owner or operator subject to the requirements for a VMS in this section must allow OLE, the U.S. Coast Guard, and their authorized officers and designees access to the vessel's position data obtained from the VMS. NOAA may have access to, and use of,

collected data for scientific, statistical, and management purposes, and to monitor implementation of this subpart.

(b) *Installing and activating the VMS.*

(1) OLE has approval authority over the type of VMS used and the installation and operation of the VMS unit.

(2) The owner or operator of a vessel must coordinate with OLE to install and activate an approved VMS prior to operating within the sanctuary. For the purposes of this section, the following contact information applies:

(i) *OLE.* Address: 1845 Wasp Blvd., Bldg. 176, Honolulu, HI 96818; telephone: 808-725-6100; facsimile: 808-725-6199; email: pidvms@noaa.gov; business hours: Monday through Friday, except Federal holidays, 8 a.m. to 4:30 p.m., Hawaii Standard Time.

(ii) *VMS Helpdesk.* Telephone: 888-219-9228; email: ole.helpdesk@noaa.gov; business hours: Monday through Friday, except Federal holidays, 7 a.m. to 11 p.m., Eastern Time.

(c) *Interruption of operation of the VMS.* When a vessel's VMS is not operating properly within the sanctuary, the owner or operator must immediately contact OLE, and follow instructions from that office. If notified by OLE that a vessel's VMS is not operating properly, the owner and operator must follow instructions from that office. In either event, such instructions may include, but are not limited to, manually communicating a vessel's location as directed by OLE; or exiting the sanctuary until the VMS is operable.

(d) *Activities Regarding VMS For Vessels Operating in the Sanctuary.* The following activities regarding vessel monitoring systems are prohibited and thus unlawful for any person to conduct or cause to be conducted:

(1) Operating any vessel within the sanctuary without an OLE type-approved VMS;

(2) Failing to install, activate, repair, or replace a VMS prior to entering the sanctuary;

(3) Failing to operate and maintain a VMS on board the vessel;

(4) Tampering with, damaging, destroying, altering, or in any way distorting, rendering useless, inoperative, ineffective, or inaccurate the VMS, or VMS signal, or attempting any of the same;

(5) Failing to contact OLE or follow OLE instructions when automatic position reporting has been interrupted;

(6) Registering a VMS to more than one vessel permitted to operate within the sanctuary at the same time;

(7) Connecting or leaving connected additional equipment to a VMS unit without the prior approval of OLE; and

(8) Making a false statement, oral or written, to an authorized officer regarding the installation, use, operation, or maintenance of a VMS unit or communication service provider.

§ 922.247 Sunken military craft.

Sunken military craft are administered by the respective Secretary concerned pursuant to the Sunken Military Craft Act (Pub. L. 108-375, Title XIV, sections 1401 to 1408; 10 U.S.C. 113 note). The Director will enter into a Memorandum of Agreement regarding collaboration with other Federal agencies charged with implementing the Sunken Military Craft Act that may address aspects of managing and protecting sunken military craft. The Director will request approval from the Secretary concerned for any terms and conditions of ONMS permits that may involve sunken military craft.

Appendix B to Subpart W of Part 922— Coordinates for the Outer Sanctuary Zone

[Coordinates listed in this appendix are unprojected (Geographic) and based on the North American Datum of 1983]

The boundaries for the areas listed in this appendix, unless otherwise described in this rule, begin at Point 1 as indicated in the particular area's coordinate table and continue to each successive point in numerical order until ending at the last point in the table.

Point No.	Longitude	Latitude
1	180.00000	25.38976
2	179.99985	25.38982

**Appendix C to Subpart W of Part 922—
Coordinates for the Midway Atoll
Special Management Area**

[Coordinates listed in this appendix are unprojected (Geographic) and based on the North American Datum of 1983]

The boundaries for the areas listed in this appendix, unless otherwise described in this rule, begin at Point 1 as indicated in the particular area's coordinate table and continue to each successive point in numerical order until ending at the last point in the table.

Point No.	Longitude	Latitude
1	– 177.31267	27.99792
2	– 177.36342	27.99124
3	– 177.41762	27.99216

Appendix E to Subpart W of Part 922—Coordinates for the Ship Reporting Area

[Coordinates listed in this appendix are unprojected (Geographic) and based on the North American Datum of 1983]

The Reporting Area Outer Boundary is defined by the following geographic coordinates and description as outlined in IMO Resolution MSC.279(85) Appendix 1—Outer Boundary adopted on 1 December 2008 that superseded and amended IMO Resolution MEPC.171(57) adopted on 4 April 2008.

The outer boundary of the CORALSHIPREP reporting area consists of lines connecting the following geographical positions:

- Starting at (1) 29° 24′.21 N, 178° 06′.45 W;
- A rhumb line to (2) 29° 12′.16 N, 177° 04′.25 W;
- Then a rhumb line to (3) 28° 43′.78 N, 175° 13′.76 W;
- Then a rhumb line to (4) 27° 00′.28 N, 173° 25′.37 W;
- Then a rhumb line to (5) 26° 44′.85 N, 171° 28′.22 W;
- Then a rhumb line to (6) 26° 23′.95 N, 170° 20′.25 W;
- Then a rhumb line to (7) 25° 56′.49 N, 167° 32′.03 W;
- Then a rhumb line to (8) 24° 50′.23 N, 165° 58′.56 W;
- Then a rhumb line to (9) 24° 02′.61 N, 161° 42′.30 W;
- Then an arc with a 60.25 nm radius centered at (21) 23° 03′.61 N, 161° 55′.22 W;
- To a point (10) 22° 04′.59 N, 162° 08′.14 W;
- Then a rhumb line to (11) 22° 35′.32 N, 164° 53′.46 W;
- Then a rhumb line to (12) 22° 47′.86 N, 166° 40′.44 W;
- Then a rhumb line to (13) 24° 03′.30 N, 168° 27′.53 W;

Then a rhumb line to (14) 24° 26′.59 N, 170° 50′.37 W;

Then a rhumb line to (15) 24° 46′.49 N, 171° 52′.87 W;

Then a rhumb line to (16) 25° 07′.23 N, 174° 30′.23 W;

Then a rhumb line to (17) 27° 05′.50 N, 176° 35′.40 W;

Then a rhumb line to (18) 27° 15′.11 N, 177° 35′.26 W;

Then a rhumb line to (19) 27° 26′.10 N, 178° 32′.23 W;

Then an arc with a 60.17 nm radius centered at (20) 28° 25′.23 N, 178° 19′.51 W;

Then to point (1) 29° 24′.21 N, 178° 06′.45 W.

The boundaries for the Inner Reporting Areas listed in this appendix, unless otherwise described in this rule, begin at Point 1 as indicated in the particular area's coordinate table and continue to each successive point in numerical order until ending at the last point in the table.

**Appendix F to Subpart W of Part 922—
IMO Standard Reporting Format and
Data Syntax for Ship Reporting System**

Telegraphy	Function	Information required	Example field text
	System identifier	CORAL SHIPREP //	CORAL SHIPREP //
A	Ship	Vessel name/call sign/flag/IMO number/Federal documentation or State registration number if applicable //	A/OCEAN VOYAGER/C5FU8/
B	Date, time (UTC), and month of entry.	A 6-digit group giving day of month (first two digits), hours and minutes (last four digits) in coordinated universal time, suffixed by the letter Z (indicating time in UTC), and three letters indicating month //	BAHAMAS/IMO 9359165/ B/271107Z DEC//.
C	Position	A 4-digit group giving latitude in degrees and minutes, suffixed with the letter N (indicating north), followed by a single /, and a five-digit group giving longitude in degrees and minutes, suffixed with the letter W (indicating west) // [Report in the World Geodetic System 1984 Datum (WGS–84)].	C/2728N/17356W//.
E	True course	3-digit number indicating true course //	E/180//.
F	Speed in knots and tenths	3-digit group indicating knots decimal tenths //	F/20.5//.
I	Destination and estimated time of arrival.	Name of port city/country/estimated arrival date and time group expressed as in (B) //	I/SEATTLE/USA/311230Z DEC//.
L	Intended route through the reporting area.	Route information should be reported as a direct rhumbline (RL) course through the reporting area and intended speed (expressed as in E and F) or a series of waypoints (WP). Each waypoint entry should be reported as latitude and longitude, expressed as in (C), and intended speed between waypoints (as in F) // (Note: As many “L” lines as needed may be used to describe the vessel’s intended route.).	L/RL/215/20.5// -OR- L/WP/2734N/17352W/20.5// L/WP/2641N/17413W/20.5// L/WP/2605N/17530W/20.5//.
O	Vessel draft in meters	Maximum present static draft reported in meters decimal centimeters //	O/11.50//.
P	Categories of Hazardous Cargoes*.	Classification Code (e.g., IMDG, IBC, IGC, INF) / and all corresponding Categories of Hazardous Cargoes (delimited by commas) // Note: If necessary, use a separate “P” line for each type of Classification Code.	P/IMDG/1.4G,2.1,2.2,2.3, 3.4.1,6.1,8,9//.
Q	Defects or deficiencies**	Brief details of defects, damage, deficiencies or limitations that restrict maneuverability or impair normal navigation // (If none, enter the number zero.).	Q/Include details as required//.
R	Pollution incident or goods lost overboard**.	Description of pollution incident or goods lost overboard within the Monument, the Reporting Area, or the U.S. Exclusive Economic Zone// (If none, enter the number zero.).	R/0//.
T	Contact information of ship’s agent or owner.	Name/address/and phone number of ship’s agent or owner // ..	T/JOHN DOE/GENERIC SHIP- PING COMPANY INC, 6101 ACME ROAD, ROOM 123, CITY, STATE, COUNTRY 12345/123–123–1234//.

Telegraphy	Function	Information required	Example field text
	System identifier	CORAL SHIPREP //	CORAL SHIPREP //
U	Ship size (length overall and gross tonnage) and type.	Length overall reported in meters decimal centimeters/number of gross tons/type of ship (e.g., bulk carrier, chemical tanker, oil tanker, gas tanker, container, general cargo, fishing vessel, research, passenger, OBO, RORO) //.	U/294.14/54592/CONTAINER SHIP//.
W	Persons	Total number of persons on board //	W/15//.

Table Notes:

* Categories of hazardous cargoes means goods classified in the International Maritime Dangerous Goods (IMDG) Code; substances classified in chapter 17 of the International Code for the Construction and Equipment of Ships Carrying Dangerous Chemicals in Bulk (IBC Code) and chapter 19 of the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk (IGC Code); oils as defined in MARPOL Annex I; noxious liquid substances as defined in MARPOL Annex II; harmful substances as defined in MARPOL Annex III; and radioactive materials specified in the Code for the Safe Carriage of the Irradiated Nuclear Fuel, Plutonium and High-Level Radioactive Wastes in Flasks on Board Ships (INF Code).

** In accordance with the provisions of the MARPOL Convention, ships must report information relating to defects, damage, deficiencies or other limitations as well as, if necessary, information relating to pollution incidents or loss of cargo. Safety related reports must be provided to CORAL SHIPREP without delay should a ship suffer damage, failure or breakdown affecting the safety of the ship (Item Q), or if a ship makes a marked deviation from a route, course or speed previously advised (Item L). Pollution or cargo lost overboard must be reported without delay (Item R).

RIN 1018-BH84

Endangered and Threatened Wildlife and Plants; Threatened Species Status With Section 4(d) Rule for Clear Lake Hitch

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Proposed rule.

SUMMARY: We, the U.S. Fish and Wildlife Service (Service), propose to list the Clear Lake hitch (*Lavinia exilicauda chi*), a freshwater fish subspecies in the North American minnow family that is restricted to the Clear Lake watershed in Lake County, California, as a threatened species under the Endangered Species Act of 1973, as amended (Act). This determination also serves as our 12-month finding on a petition to list the Clear Lake hitch. After a review of the best available scientific and commercial information, we find that listing the Clear Lake hitch is warranted. Accordingly, we propose to list the Clear Lake hitch as a threatened species with protective regulations issued under section 4(d) of the Act ("4(d) rule"). If we finalize this rule as proposed, it would add the Clear Lake hitch to the List of Endangered and Threatened Wildlife and extend the Act's protections to this subspecies.

DATES: We will accept comments received or postmarked on or before March 17, 2025. Comments submitted electronically using the Federal eRulemaking Portal (see **ADDRESSES**, below) must be received by 11:59 p.m. eastern time on the closing date. We must receive requests for a public hearing, in writing, at the address shown in **FOR FURTHER INFORMATION CONTACT** by March 3, 2025.

ADDRESSES: You may submit comments by one of the following methods:

(1) *Electronically:* Go to the Federal eRulemaking Portal: <https://www.regulations.gov>. In the Search box, enter FWS-R8-ES-2024-0161, which is the docket number for this rulemaking. Then, click on the Search button. On the resulting page, in the panel on the left side of the screen, under the Document Type heading, check the Proposed Rule box to locate this document. You may submit a comment by clicking on "Comment."

(2) *By hard copy:* Submit by U.S. mail to: Public Comments Processing, Attn: FWS-R8-ES-2024-0161, U.S. Fish and Wildlife Service, MS: PRB/3W, 5275 Leesburg Pike, Falls Church, VA 22041-3803.

We request that you send comments only by the methods described above. We will post all comments on <https://www.regulations.gov>. This generally means that we will post any personal information you provide us (see Information Requested, below, for more information).

Availability of supporting materials: Supporting materials, such as the species status assessment report, are available at <https://www.regulations.gov> at Docket No. FWS-R8-ES-2024-0161.

FOR FURTHER INFORMATION CONTACT:

Michael Fris, Field Supervisor, U.S. Fish and Wildlife Service, Sacramento Fish and Wildlife Office, 2800 Cottage Way, Sacramento, CA 95825; telephone 916-414-6700. Individuals in the United States who are deaf, deafblind, hard of hearing, or have a speech disability may dial 711 (TTY, TDD, or TeleBraille) to access telecommunications relay services. Individuals outside the United States should use the relay services offered within their country to make international calls to the point-of-contact in the United States. Please see Docket No. FWS-R8-ES-2024-0161 on <https://www.regulations.gov> for a document that summarizes this proposed rule.

SUPPLEMENTARY INFORMATION:

Executive Summary

Why we need to publish a rule. Under the Act, a species warrants listing if it meets the definition of an endangered species (in danger of extinction throughout all or a significant portion of its range) or a threatened species (likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range).

If we determine that a species warrants listing, we must list the species promptly and designate the species' critical habitat to the maximum extent prudent and determinable. We have determined that the Clear Lake hitch meets the Act's definition of a threatened species; therefore, we are proposing to list it as such. Listing a species as an endangered or threatened species can be completed only by issuing a rule through the Administrative Procedure Act rulemaking process (5 U.S.C. 551 *et seq.*).

What this document does. We propose to list the Clear Lake hitch as

a threatened species with a rule issued under section 4(d) of the Act.

The basis for our action. Under the Act, we may determine that a species is an endangered or threatened species because of any of five factors: (A) The present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; or (E) other natural or manmade factors affecting its continued existence. We have determined that the Clear Lake hitch meets the definition of a threatened species due to the following threats: habitat loss, degradation, and modifications (Factor A), predation (Factor C), competition (Factor E), and the effects of climate change (Factor E).

Section 4(a)(3) of the Act requires that the Secretary of the Interior (Secretary), to the maximum extent prudent and determinable, concurrently with listing designate critical habitat for the species. Section 3(5)(A) of the Act defines critical habitat as (i) the specific areas within the geographical area occupied by the species, at the time it is listed, on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protections; and (ii) specific areas outside the geographical area occupied by the species at the time it is listed, upon a determination by the Secretary that such areas are essential for the conservation of the species. Section 4(b)(2) of the Act states that the Secretary must make the designation on the basis of the best scientific data available and after taking into consideration the economic impact, the impact on national security, and any other relevant impacts of specifying any particular area as critical habitat. At this time, critical habitat for the Clear Lake hitch is not determinable.

Information Requested

We intend that any final action resulting from this proposed rule will be based on the best scientific and commercial data available and be as accurate and as effective as possible. Therefore, we request comments or information from other governmental agencies, Native American Tribes, the scientific community, industry, or any other interested parties concerning this proposed rule. We particularly seek comments concerning:

(1) The Clear Lake hitch's biology, range, and population trends, including:
(a) Biological or ecological requirements of the subspecies,

including habitat requirements for feeding, breeding, and sheltering;

(b) Genetics and taxonomy;

(c) Historical and current range, including distribution patterns and the locations of any additional areas occupied by the subspecies;

(d) Historical and current population levels, and current and projected trends; and

Past and ongoing conservation measures for the subspecies, its habitat, or both.

(2) Threats and conservation actions affecting the subspecies, including:

(a) Factors that may be affecting the continued existence of the subspecies, which may include habitat modification or destruction, overutilization, disease, predation, the inadequacy of existing regulatory mechanisms, or other natural or manmade factors;

(b) Biological, commercial trade, or other relevant data concerning any threats (or lack thereof) to this subspecies; and

(c) Existing regulations or conservation actions that may be addressing threats to this subspecies.

(3) Additional information concerning the historical and current status of this subspecies.

(4) Information to assist with applying or issuing protective regulations under section 4(d) of the Act that may be necessary and advisable to provide for the conservation of the Clear Lake hitch. In particular, we seek information concerning:

(a) The extent to which we should include any of the section 9 prohibitions in the 4(d) rule; or

(b) Whether we should consider any additional exceptions from the prohibitions in the 4(d) rule.

Please include sufficient information with your submission (such as scientific journal articles or other publications) to allow us to verify any scientific or commercial information you include.

Please note that submissions merely stating support for, or opposition to, the action under consideration without providing supporting information, although noted, do not provide substantial information necessary to support a determination. Section 4(b)(1)(A) of the Act directs that determinations as to whether any species is an endangered or a threatened species must be made solely on the basis of the best scientific and commercial data available.

You may submit your comments and materials concerning this proposed rule by one of the methods listed in **ADDRESSES**. We request that you send comments only by the methods described in **ADDRESSES**.

If you submit information via <https://www.regulations.gov>, your entire submission—including any personal identifying information—will be posted on the website. If your submission is made via a hardcopy that includes personal identifying information, you may request at the top of your document that we withhold this information from public review. However, we cannot guarantee that we will be able to do so. We will post all hardcopy submissions on <https://www.regulations.gov>.

Comments and materials we receive, as well as supporting documentation we used in preparing this proposed rule, will be available for public inspection on <https://www.regulations.gov>. Our final determination may differ from this proposal because we will consider all comments we receive during the comment period as well as any information that may become available after this proposal. Based on the new information we receive (and, if relevant, any comments on that new information), we may conclude that the Clear Lake hitch is endangered instead of threatened, or we may conclude that the subspecies does not warrant listing as either an endangered species or a threatened species. In addition, we may change the parameters of the prohibitions or the exceptions to those prohibitions in the 4(d) rule if we conclude it is appropriate in light of comments and new information received. For example, we may expand the prohibitions if we conclude that the protective regulation as a whole, including those additional prohibitions, is necessary and advisable to provide for the conservation of this subspecies. Conversely, we may establish additional exceptions to the prohibitions in the final rule if we conclude that the activities would facilitate or are compatible with the conservation and recovery of the subspecies. In our final rule, we will clearly explain our rationale and the basis for our final decision, including why we made changes, if any, that differ from this proposal.

Public Hearing

Section 4(b)(5) of the Act provides for a public hearing on this proposal, if requested. Requests must be received by the date specified in **DATES**. Such requests must be sent to the address shown in **FOR FURTHER INFORMATION CONTACT**. We will schedule a public hearing on this proposal, if requested, and announce the date, time, and place of the hearing, as well as how to obtain reasonable accommodations, in the **Federal Register** and local newspapers at least 15 days before the hearing. We

may hold the public hearing in person or virtually via webinar. We will announce any public hearing on our website, in addition to the **Federal Register**. The use of virtual public hearings is consistent with our regulations at 50 CFR 424.16(c)(3).

Previous Federal Actions

On September 25, 2012, we received a petition from the Center for Biological Diversity to list the Clear Lake hitch as an endangered or threatened species under the Act and to designate critical habitat. The Service issued a 90-day finding on April 10, 2015 (80 FR 19259), stating that the petition presented substantial information that listing the Clear Lake hitch may be warranted and initiating a status review of the subspecies. On December 3, 2020, we published our 12-month finding that the Clear Lake hitch was not warranted for listing under the Act (85 FR 78029).

The Center for Biological Diversity filed a complaint in the Northern District of California on August 17, 2021, challenging our 12-month not-warranted finding. By stipulated settlement agreement approved by the court on April 14, 2022, the Service agreed to submit to the **Federal Register** a new 12-month finding for the Clear Lake hitch on or before January 12, 2025 (*Center for Biological Diversity v. U.S. Fish and Wildlife Service, et al.*, No. 3:21-cv-06323-RS (N.D. Cal.)).

Peer Review

In 2020, a species status assessment (SSA) team prepared an SSA report (version 1.0; Service 2021, entire) for the Clear Lake hitch's 12-month finding (85 FR 78029; December 3, 2020). The SSA team was composed of Service biologists, in consultation with other species experts. In 2024, the SSA report was updated with new information (e.g., survey data, life history information, conservation actions) (version 2.0; Service 2024, entire). The SSA report (version 2.0; Service 2024, entire) represents a compilation of the best scientific and commercial data available concerning the status of the subspecies, including the impacts of past, present, and future factors (both negative and beneficial) affecting the subspecies.

In accordance with our joint policy on peer review published in the **Federal Register** on July 1, 1994 (59 FR 34270), and our August 22, 2016, memorandum updating and clarifying the role of peer review in listing and recovery actions under the Act (<https://www.fws.gov/sites/default/files/documents/peer-review-policy-directors-memo-2016-08-22.pdf>), we solicited independent

scientific review of the information contained in the Clear Lake hitch SSA report (version 2.0; Service 2024, entire). We sent the SSA report to three independent peer reviewers and we received responses from two reviewers. Results of this structured peer review process can be found at <https://www.regulations.gov>. In preparing this proposed rule, we incorporated the results of these reviews, as appropriate, into the SSA report, which is the foundation for this proposed rule.

Summary of Peer Reviewer Comments

As discussed above in Peer Review, we received comments from two peer reviewers on the draft SSA report, version 2.0. We reviewed all comments we received from the peer reviewers for substantive issues and new information regarding the information contained in the SSA report. The peer reviewers generally concurred with our methods and conclusions, and provided additional information, clarifications, and suggestions, including edits to improve the overall report. Otherwise, no substantive changes to our analysis and conclusions within the SSA report

were deemed necessary, and peer reviewer comments are incorporated in version 2.1 of the SSA report (Service 2024, entire).

I. Proposed Listing Determination

Background

A thorough review of the taxonomy, life history, and ecology of the Clear Lake hitch is presented in the SSA report (version 2.1; Service 2024, pp. 16–36) and in the previous 12-month finding (85 FR 78029; December 3, 2020). The Clear Lake hitch is a medium-sized freshwater fish subspecies classified in the *Lavinia* genus in the Leuciscidae family (Service 2024, p. 16). The subspecies is endemic to the Clear Lake watershed in the northern section of the California Coast Ranges.

Historically, Clear Lake hitch occurred in numerous lakes and ponds found throughout the Clear Lake watershed, including Clear Lake, Thurston Lake, Upper Blue Lake, Lower Blue Lake, and Lampson Pond. During the spring, the Clear Lake hitch could also be found spawning in the numerous tributaries to these larger

waterbodies, including Kelsey, Scott, Middle, Adobe, Seigler Canyon, Manning, Cole, Morrison, and Schindler creeks (figure 1). The subspecies still occurs in Clear and Thurston Lakes throughout the year until the spring, when reproductive adults migrate into tributaries to spawn. Annual surveys conducted in Clear Lake have shown that there are fluctuations in the estimated abundances from year to year. The Clear Lake hitch was thought to be extirpated from the Blue Lakes, but observations and fish rescue efforts in 2022 show evidence of hitch in both Upper Blue Lake and Lower Blue Lake (Ewing 2022a, entire; Santana 2022, entire). It is unclear whether Lampson Pond still exists (B. Ewing *in litt.* 2020); therefore, the status of the Clear Lake hitch in Lampson Pond is unknown. All of the described waterbodies besides Thurston Lake were hydrologically connected in the past, and it appears that Thurston Lake and its tributary, Thurston Creek, have always been isolated from the other waterways (B. Ewing *in litt.* 2020; P. Windrem *in litt.* 2020).

Figure 1. Clear Lake Hitch range map with tributaries and lakes.

Within the lacustrine habitats, the subspecies can be found in either the littoral zone (nearshore) as juveniles or the limnetic zone (sun-lit, offshore open water) as adults. During extreme drought conditions, the only successful reproduction may be within the lakes. Nonnative vegetative growth along the lake's shoreline can outcompete the growth of important native wetland plant species, such as tule. Nonnative plant species, such as Himalayan blackberry (*Rubus armeniacus*), growing along the tributaries can become so overgrown that they become passage barriers or they outcompete native species such as willows and cottonwoods.

Clear Lake hitch begin to migrate into spawning tributaries when there is sufficient runoff, typically between February and May, and sometimes into June if flows are sufficient (Macedo

1994, p. 2; California Department of Fish and Wildlife (CDFW) 2014, p. 1). Eggs are deposited on fine to medium-sized gravel that is along the margin or mid-channel of the stream (Shapovalov 1940 as cited in Murphy 1948b, p. 102; Kimsey 1960, p. 211; CDFW 2014, p. 8), where they hatch into larval fish called fry. Fry stay in the streams anywhere between 11 to 152 days, migrating to the lake once stream waters diminish (Murphy 1948b, pp. 105, 106, 109; Swift 1965, pp. 75, 77–79; Moyle et al. 1995, p. 154; Feyrer et al. 2019a, p. 1693). Juvenile hitch less than 2 inches (in., 50 millimeters (mm)) standard length (SL, length of a fish measured from the tip of their mouth/snout to the end of the tail, excluding the caudal (tail) fin) are found within the nearshore habitat of the lake, where they utilize stands of tule (*Schoenoplectus acutus*) and other submerged aquatic vegetation for cover

and feed on various diet items, including insects such as the Clear Lake gnat (*Chaoborus astictopus*), *Daphnia* and other planktonic crustaceans, and chironomid midges.

The Clear Lake hitch females are known to grow larger than males (Geary 1978, pp. 7, 9), and larger females produce more eggs (average annual fecundity is 36,000 eggs, with a range of 9,000–63,000) (Geary and Moyle 1980, p. 387). Males are sexually mature within their first or second year, whereas females are sexually mature in their second or third year (Murphy 1948b, pp. 103–104, 109; Moyle et al. 1995, p. 153). Hitch are thought to live 4 to 6 years based on scale analysis, but it is possible some individuals can live longer (Moyle 2002, p. 138; CDFW 2014, p. 8).

There is uncertainty around where current reproduction and recruitment

are successfully occurring, and whether other small waterbodies upstream of Clear Lake are supporting the Clear Lake population. In 2017 and 2018, 280 and 297 hitch were captured, respectively. The Clear Lake hitch was the fifth most abundant species/subspecies collected over the course of the 2017 survey and the most abundant species/subspecies captured during the 2018 effort (USGS 2018, p. 8). However, the number of hitch captured during the 2019, 2021, and 2022 surveys drastically declined to only 76, 40, and 6 individuals, respectively. In 2023, the number of individuals captured increased to 304 individuals and included multiple stage classes (Clear Lake Hitch Summit Agenda and Presentations 2023, p. 84; Palm et al. 2023, entire). There is a working hypothesis that the increase in the number of hitch seen in 2023 is due to hitch presence in smaller lakes in the watershed (e.g., Blue Lakes, Tule Lake). The theory is that small populations of the Clear Lake hitch are successfully reproducing in these other waterbodies, and during a wet year, like the historically wet year in 2023, individuals were washed from these smaller lakes into Clear Lake.

Regulatory and Analytical Framework

Regulatory Framework

Section 4 of the Act (16 U.S.C. 1533) and the implementing regulations in title 50 of the Code of Federal Regulations set forth the procedures for determining whether a species is an endangered species or a threatened species, issuing protective regulations for threatened species, and designating critical habitat for endangered and threatened species.

The Act defines an “endangered species” as a species that is in danger of extinction throughout all or a significant portion of its range, and a “threatened species” as a species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. The Act requires that we determine whether any species is an endangered species or a threatened species because of any of the following factors:

- (A) The present or threatened destruction, modification, or curtailment of its habitat or range;
- (B) Overutilization for commercial, recreational, scientific, or educational purposes;
- (C) Disease or predation;
- (D) The inadequacy of existing regulatory mechanisms; or
- (E) Other natural or manmade factors affecting its continued existence.

These factors represent broad categories of natural or human-caused

actions or conditions that could have an effect on a species’ continued existence. In evaluating these actions and conditions, we look for those that may have a negative effect on individuals of the species, as well as other actions or conditions that may ameliorate any negative effects or may have positive effects.

We use the term “threat” to refer in general to actions or conditions that are known to or are reasonably likely to negatively affect individuals of a species. The term “threat” includes actions or conditions that have a direct impact on individuals (direct impacts), as well as those that affect individuals through alteration of their habitat or required resources (stressors). The term “threat” may encompass—either together or separately—the source of the action or condition or the action or condition itself.

However, the mere identification of any threat(s) does not necessarily mean that the species meets the statutory definition of an “endangered species” or a “threatened species.” In determining whether a species meets either definition, we must evaluate all identified threats by considering the species’ expected response and the effects of the threats—in light of those actions and conditions that will ameliorate the threats—on an individual, population, and species level. We evaluate each threat and its expected effects on the species, then analyze the cumulative effect of all of the threats on the species as a whole. We also consider the cumulative effect of the threats in light of those actions and conditions that will have positive effects on the species, such as any existing regulatory mechanisms or conservation efforts. The Secretary determines whether the species meets the definition of an “endangered species” or a “threatened species” only after conducting this cumulative analysis and describing the expected effect on the species.

The Act does not define the term “foreseeable future,” which appears in the statutory definition of “threatened species.” Our implementing regulations at 50 CFR 424.11(d) set forth a framework for evaluating the foreseeable future on a case-by-case basis which is further described in the 2009 Memorandum Opinion on the foreseeable future from the Department of the Interior, Office of the Solicitor (M–37021, January 16, 2009; “M–Opinion,” available online at <https://www.doi.gov/sites/doi.opengov.ibmcloud.com/files/uploads/M-37021.pdf>). The foreseeable future extends as far into the future as the U.S.

Fish and Wildlife Service and National Marine Fisheries Service (hereafter, the Services) can make reasonably reliable predictions about the threats to the species and the species’ responses to those threats. We need not identify the foreseeable future in terms of a specific period of time. We will describe the foreseeable future on a case-by-case basis, using the best available data and consider the species’ life-history characteristics, threat-projection timeframes, and environmental variability. In other words, the foreseeable future is the period of time over which we can make reasonably reliable predictions. “Reliable” does not mean “certain”; it means sufficient to provide a reasonable degree of confidence in the prediction, in light of the conservation purposes of the Act.

Analytical Framework

The SSA report documents the results of our comprehensive biological review of the best scientific and commercial data regarding the status of the species, including an assessment of the potential threats to the species. The SSA report does not represent our decision on whether the species should be proposed for listing as an endangered or threatened species under the Act. However, it does provide the scientific basis that informs our regulatory decisions, which involve the further application of standards within the Act and its implementing regulations and policies.

To assess the Clear Lake hitch’s viability, we used the three conservation biology principles of resiliency, redundancy, and representation (Shaffer and Stein 2000, pp. 306–310). Briefly, resiliency is the ability of the species to withstand environmental and demographic stochasticity (for example, wet or dry, warm or cold years); redundancy is the ability of the species to withstand catastrophic events (for example, droughts, large pollution events); and representation is the ability of the species to adapt to both near-term and long-term changes in its physical and biological environment (for example, climate conditions, pathogens). In general, species viability will increase with increases in resiliency, redundancy, and representation (Smith et al. 2018, p. 306). Using these principles, we identified the Clear Lake hitch’s ecological requirements for survival and reproduction at the individual, population, and subspecies levels, and described the beneficial and risk factors influencing the subspecies’ viability.

The SSA process can be categorized into three sequential stages. During the

first stage, we evaluated the individual Clear Lake hitch's life-history needs. The next stage involved an assessment of the historical and current condition of the subspecies' demographics and habitat characteristics, including an explanation of how the subspecies arrived at its current condition. The final stage of the SSA involved making predictions about the subspecies' responses to positive and negative environmental and anthropogenic influences. Throughout all of these stages, we used the best available information to characterize viability as the ability of the Clear Lake hitch to sustain populations in the wild over time, which we then used to inform our regulatory decision.

The following is a summary of the key results and conclusions from the SSA report; the full SSA report can be found at Docket No. FWS-R8-ES-2024-0161 on <https://www.regulations.gov>.

Summary of Biological Status and Threats

In this discussion, we review the biological condition of the Clear Lake hitch and its resources, and the threats that influence the subspecies' current and future condition, in order to assess the subspecies' overall viability and the risks to that viability.

Additional information regarding the subspecies' needs can be found in the SSA report (Service 2024, pp. 24–36).

Subspecies Needs

The Clear Lake hitch has four life stages: egg/embryo, larvae/fry, juveniles, and adults. Below, we assess the best available information to identify the specific habitat components needed to support individual fitness at all four life stages for the Clear Lake hitch. Each life stage requires different environmental and habitat components according to the different habitats used throughout the species' lifetime for spawning, feeding, and sheltering. Once fertilized, Clear Lake hitch eggs require adequate stream flow to stay submerged and oxygenated; fine to medium-sized, clean gravel along the margin or within the mid-channel of the stream to hold position during development; and presumably temperatures between 55.4 and 64.4 degrees Fahrenheit (°F) (13 and 18 degrees Celsius (°C)) for successful development (Shapovalov 1940 in Murphy 1948b, p. 102; Kimsey 1960, p. 211; Swift 1965, pp. 75, 77; Moyle et al. 1995, p. 154; Moyle 2002, p. 138; CDFW 2014, p. 8; Feyrer 2019a, p. 227). To initiate hatching, water temperatures must be maintained at 59 to 71.6 °F (15 to 22 °C) for multiple days (Swift 1965, pp. 75, 77; Moyle 2002, p. 138).

Newly hatched larvae/fry have a small yolk sac that they require for nourishment until they are able to swim freely and capture aquatic invertebrate prey (Kimsey 1960, p. 212). For cover and temperature regulation, downstream migrating fry likely require instream and/or overhanging streamside vegetation. The fry life stage requires adequate stream flow to stay alive, and adequate flow needs to be maintained until the young of year are able to migrate downstream into the lake (Murphy 1948b, pp. 105, 106, 109; Swift 1965, pp. 75, 77–79; Moyle et al. 1995, p. 154; Feyrer et al. 2019a, p. 1693).

Within the lake, Clear Lake hitch fry and juveniles require stands of tule and/or other submerged aquatic vegetation to act as cover from predators and to provide for invertebrate prey items, including insects, planktonic crustaceans, and chironomid midges. Juveniles also require the lake water to be of sufficient quality (*i.e.*, well-oxygenated (more than 2 milligrams per liter (mg/L) of oxygen) and minimally contaminated) and for water temperatures to be 59 °F (15 °C) or greater for survival (Franson 2012, p. 15; CDFW 2014, p. 9). Juvenile hitch transition to adulthood when they reach about 2 in (50 mm) and they move from the lake's nearshore habitat out into the open water of the lake.

Adult Clear Lake hitch require a diet almost exclusively composed of *Daphnia*, but also other zooplankton species and adult midges and insects (Lindquist et al. 1943, p. 199; Geary 1978, pp. 17, 25; Geary and Moyle 1980, p. 388; Moyle et al. 1995, p. 153; Moyle 2002, pp. 137–138; Moyle et al. 2014, p. 3). Adult Clear Lake hitch also require well-oxygenated (more than 2 mg/L of oxygen) and minimally contaminated water within the lake to ensure survival (Franson 2012, p. 15; CDFW 2014, p. 9). Adult Clear Lake hitch are only found in the tributaries during the spawning season. A reproductive adult that is attempting to spawn requires an adequate amount of flow to migrate upstream to appropriate spawning locations and downstream back to the lake, and water temperatures between 55.4 and 64.4 °F (13 and 18 °C) to trigger spawning activity (Swift 1965, pp. 75, 77; Moyle 2002, p. 138; Feyrer 2019a, p. 227).

In addition to stream spawning, some reproductive adults spawn within the lake (or ponds) instead of migrating into the lake tributaries. Lake or pond spawning Clear Lake hitch have been documented spawning in areas with only a mud substrate that contains no gravel, so it is possible lake- or pond-spawning individuals do not require

gravel to successfully spawn (Kimsey 1960, p. 214; Geary 1978, p. 22).

Threats

In assessing the Clear Lake hitch's viability, we describe the threats acting on the subspecies and its habitat. We also provide a description of historical and ongoing activities or regulations that ameliorate the threats and provide conservation benefits to the subspecies. The threats acting on the Clear Lake hitch include habitat loss, degradation, and modification; predation; competition; mercury mining; and the effects of climate change. Due to the different aquatic habitats (lake and tributary) used by the subspecies, there are threats acting on different life stages of the subspecies. These threats along with other ongoing and future stressors acting on the species may act synergistically to cause declines in resiliency across populations and analysis units. An example includes the effects of climate change with increased temperatures and aridity, may lead to more fires in the area. Burned areas create more runoff into the lake and tributary systems, further degrading habitat and affecting all life stages of the Clear Lake hitch. We note here that Thurston Lake does not have the level of threats acting on the subspecies that are affecting the hitch in Clear Lake.

Habitat Loss, Degradation, and Modification

Habitat loss, degradation, and modification are affecting the subspecies in both the tributary and lake systems. Changes to the Clear Lake watershed have occurred since the mid-1800s. Various forms of past mining activities, agricultural and urban development, pesticide use, increased fire activity, past deforestation, and historical grazing practices have all contributed to the degradation of the Clear Lake watershed and are also the cause of toxic cyanobacteria blooms and periodic fish kills in the lake. The degradation of tributaries has changed their hydrology, reducing the amount of water retained in the streams over the Clear Lake hitch's spawning season. This loss of flow earlier in the season and the presence of numerous passage barriers in the tributaries have greatly reduced reproduction and early life stage survival (egg, larvae) of the Clear Lake hitch. The conversion of wetland habitats surrounding Clear Lake not only negatively impacted the lake's water quality but also reduced the amount of rearing habitat for any juvenile hitch that are able to migrate to the lake from their natal stream. This loss of rearing habitat also reduces early

life stage survival (juvenile), further reducing the likelihood of recruitment. The impacts to Clear Lake's water quality affect adult hitch survival, especially when poor lake conditions result in large fish kills.

The Clear Lake hitch relies on tributary habitat for spawning and early rearing (Murphy 1951, p. 480). It is estimated that, historically, the tributaries to Clear Lake ran until at least September; currently, however, besides a few tributaries, most are known to dry by early summer or late spring (Murphy 1951, p. 480; B. Ewing *in litt.* 2020; Ewing 2020, pp. 3–5; Ewing 2021, pp. 6–7; Ewing 2022b, p. 7; B. Ewing *in litt.* 2024). A combination of activities contributed, and are continuing to contribute, to the reduction in tributary flow during the Clear Lake hitch's spawning season. Increased fire activity and legacy effects from instream gravel removal and deforestation have likely increased the rate of runoff within the tributaries during the winter. For example, burned vegetation removes the root systems that hold soil in place and, with subsequent rainfall, increases runoff and sedimentation into the subspecies' habitat. Those same factors, possibly in conjunction with both in-creek and groundwater pumping for urban and agricultural uses, have greatly reduced the amount of flow that actually makes it to the lake during the summer (Murphy 1951, p. 480).

Gravel mining activities in the Clear Lake watershed first began in the latter half of the 19th century and occurred in most of the spawning tributaries to Clear Lake (Suchanek et al. 2003, pp. 1253–1254; Thompson et al. 2013, p. 19). Gravel mining originally occurred as scattered operations throughout the watershed until the early- to mid-20th century, when operations became centralized within the creeks (County of Lake 1992, p. 48; Richerson et al. 1994, p. III–19). This time period coincides with improved automobile technology and increased pressure to build more reliable roads (County of Lake 1992, p. 48). As the human population within the county grew in the 1960s and 70s, new houses and associated roads needed to be constructed to accommodate the new residents. Since the instream gravel was available as a convenient source of material, gravel was extracted from the tributaries and was used as building material for both homes and roads (County of Lake 1992, p. 48; Richerson et al. 1994, p. VIII–150). Until the 1981 partial moratorium on instream gravel extraction, approximately 1 million metric tons of instream gravel was extracted from the

watershed (Richerson et al. 1994, pp. III–19–III–20; CDFW 2014, p. 29). Although the amount of gravel mining within the Clear Lake tributaries has been reduced, mining and extraction are still known to occur in areas where the Clear Lake hitch occur, such as Scotts and Alley creeks (Murphy 1948b, p. 106; Richerson et al. 2008, p. A260; CDFW 2014, p. 29; B. Ewing *in litt.* 2020).

Past gravel mining in tributaries not only removed spawning substrate that the subspecies uses for reproduction and egg development, but it also lowered streambeds and destabilized channels, causing increased erosion, incision, and channelization. In addition, large swaths of riparian vegetation were removed from along the tributaries to allow access for gravel extraction, further exacerbating the issues with erosion. The flushing of eroded material not only negatively impacted tributaries by increasing the amount of suspended sediments and silt within the creek, ultimately increasing turbidity in some tributaries to zero visibility, but it also negatively impacted the lake ecosystem when those sediments eventually were transported into the lake (CDFG 1955, entire; Richerson et al. 1994, pp. III–19, VIII–2; Service 2024, pp. 44–48; Suchanek et al. 2003, p. 1254; CDFW 2014, pp. 29, 45).

In addition to gravel mining, agricultural practices have impacted, and still are impacting, the Clear Lake hitch's habitat. Agricultural production in the Clear Lake area has been important since the mid-1800s with crops that included apples, almonds, grapes, nectarines, peaches, pears, plums, and prunes, many of which are still grown today (Suchanek et al. 2003, p. 1256; U.S. Department of Agriculture (USDA) 2023, entire). Much of the land surrounding Clear Lake has been converted from forest lands to agricultural use. Large-scale deforestation and land conversion within the watershed began in the mid-19th century. The large-scale forest removal within the Clear Lake watershed increased the amount of erosion occurring in the tributaries, contributing to bank incision within the tributaries and causing increased sediment and nutrient transport into the lake (Suchanek et al. 2003, pp. 1247–1248). Increased erosion and bank cutting decrease the amount of time that water is retained within the tributaries, which affects water quantity and flow needed by the subspecies.

Agricultural development is found throughout the watershed; however, it is most concentrated in the southwestern

area of the watershed, primarily near Kelsey and Adobe creeks (USDA 2023, entire). The presence of agricultural production in the watershed not only has an impact on the amount of water flowing in the tributaries to Clear Lake, but it likely also increases the amounts of contaminants, in the form of pesticides and fertilizers, and sediment entering the lake.

Pesticides are used for agriculture production across the region. Pesticides not only affect the habitat but may also affect certain life stages of the Clear Lake hitch and affect the subspecies' prey species. The reported application of pesticides on agricultural lands in the region has increased from 2008 to 2021. In 2008, more than 589,500 pounds of different forms of chemicals used as pesticides were applied in Lake County (California Pesticide Information Portal (CALPIP) 2019, unpaginated). In 2021, that amount increased to almost 741,000 pounds (CALPIP 2021, unpaginated). Pesticides are also known to be used for illegal cannabis crops, and it is possible that pesticides associated with illegal grows could drain into the Clear Lake watershed, further exacerbating declining water quality conditions. The primary concerns of pesticide effects on Clear Lake hitch are the high toxicity. Growers can add these chemicals to their irrigation systems, causing the chemicals to seep into the surrounding soil and waterways (California Department of Pesticide Regulation 2021, p. 2; USDA 2023, entire). Pesticides are known to cause fish casualties, growth delays, and swimming abnormalities, making fish more susceptible to predation (Baker 2018, pp. 2–3).

Fertilizers that get into waterways can cause nutrient imbalances that affect oxygen levels in the water, causing cyanobacteria blooms and fish kills (Baker 2018, p. 6). Another concern is water diversions associated with these illegal cultivation sites, which can block fish passage, change flow regimes, and cause other secondary effects (Baker 2018, p. 6). However, it is unknown what effect agricultural pesticides or pesticides associated with illegal grows are having on the aquatic environment in Clear Lake or if pesticides are being transported through tributaries into the lake (Suchanek et al. 2003, p. 1252).

Herbicides Are Used To Control Nonnative Aquatic Vegetation in Clear Lake

Komeen™ (copper sulfate) and SONAR™ (fluridone) have been applied in the lake to control *Hydrilla verticillata*, a highly invasive, submerged aquatic weed (Suchanek et

al. 2003, p. 1250; CDFW 2014, p. 32). Two herbicides were used to target different parts of the plant; Komeen targets *Hydrilla* vegetative growth, while SONAR treats the tubers (Suchanek et al. 2003, p. 1250). SONAR is considered less toxic than Komeen because SONAR is a systemic herbicide that is slowly absorbed in the vascular system; SONAR also impacts similar non-target vegetation such as tule and other submerged vegetation (Bairrington 2000, pp. 64–65; CDFW 2014, p. 32). Because juvenile Clear Lake hitch require tule habitat for cover and prey, the use of Komeen can indirectly impact the hitch by reducing the amount of rearing habitat (CDFW 2014, p. 32). The use of the herbicide, SONAR, at high concentrations may have an impact on early hitch development.

To meet the needs for agricultural production, crops require sufficient water. Water extraction and the early drawdown of the tributaries, in conjunction with habitat modifications throughout the watershed, likely led to the extinction of the Clear Lake splittail (*Pogonichthys ciscooides*), another stream-spawning native fish restricted to the Clear Lake watershed (Moyle 2002, pp. 138–139; CDFW 2014, p. 27). The Clear Lake splittail spawned later in the season than the Clear Lake hitch does, and, as the tributaries began to dry earlier in the season, Clear Lake splittail young were not able to migrate to the lake (Cook et al. 1966, p. 146; Moyle 2002, pp. 138–139; CDFW 2014, p. 27).

Water extraction continues throughout the watershed today for agricultural and domestic purposes. Both surface and ground water are being diverted from Clear Lake tributaries (legally and illegally) (CDFW 2014, p. 27), with the primary supply, about 60 percent, coming from groundwater sources in an average year (County of Lake 2014, entire; Clear Lake Hitch Summit Agenda and Presentations 2023, p. 18). These particular diversions are legal extractions conducted under riparian and water rights associated with land ownership. Surface water is diverted via intake pumps, and groundwater is extracted via the installation of shallow wells near the tributary channel where they capture underflow (CDFW 2014, p. 27). In 2013 and 2014, water rights users in Kelsey Creek used 85 and 134.5 million gallons of water, respectively, as well as 31.4 million gallons in each of those years from Adobe Creek. In addition, from 2008 to 2014, 18 private water wells were permitted for installation along the two creeks. Although this amount of water withdrawal is legally permissible, it is unknown what effects this amount

of water extraction is having on the hydrology of these tributaries and the Clear Lake hitch (Big Valley 2015, p. 4).

Water extractions, both legal and illegal, are often cited as one of the primary reasons for the reduction in the Clear Lake hitch's population; however, although stream gauges are installed in some of the tributaries and continue to be installed, studies on the effects that water extraction is having on Clear Lake tributaries or the Clear Lake hitch are still in initial stages (Clear Lake Hitch Summit Agenda and Presentations 2023, pp. 63–72). The CDFW compared stream flow conditions at the U.S. Geological Survey (USGS) gauge on Kelsey Creek (USGS Station 11449500) and catch data from the early 1990s. Both 1990 and 1991 were considered dry water years with below average tributary flow during the spring; however, the highest number of hitch were captured during seining efforts during those years. Flow conditions improved to average or above average for the following 3 years, but the number of fish captured declined (CDFW 2014, p. 27). Clear Lake hitch abundance varies from year to year due to a number of factors, including streamflow. More data are needed to better understand the relationship between streamflow and population numbers as well as the effects that water extraction has on streamflow.

Historical land conversion was not only for the purposes of agricultural crops but also for livestock. The effects of livestock on the land can include overgrazing and the subsequent effects of exacerbated erosion and water quality degradation. Although overgrazing no longer appears to be occurring in the Clear Lake watershed, it was an issue until the mid-20th century. Past overgrazing in the watershed resulted in the loss of streamside vegetation, which decreased soil stability and increased the rate of runoff within the creeks, effectively reducing the amount of time water is retained within the channel (Murphy 1948b, p. 106; Suchanek et al. 2003, p. 1257). Although the amount of grazing pressure has decreased in the watershed, the impacts of past practices are still contributing to the issues seen in the watershed today.

Clear Lake hitch are affected by passage barriers that block the ability of the fish to move up and downstream. The lack of adequate tributary flow can act as a barrier to migrating fish, reducing the amount of available spawning habitat, and leaving young stranded before they can migrate to the lake. However, even when flow conditions allow for migration, most of the tributaries in the watershed contain physical barriers that prevent hitch

passage, reducing the amount of spawning and rearing habitat available.

The installation of dams, diversions, roadways, and crossings have had a negative impact on migrating hitch by eliminating access to portions of stream with suitable spawning habitat or impeding passage during certain years until specific flow conditions (*i.e.*, high flow) are met (Suchanek et al. 2003, p. 1254; CDFW 2014, pp. 45, 69–70). Using a variety of data sources, CDFW estimated that more than 92 percent of the Clear Lake hitch's historical 180 stream miles of tributary habitat is currently blocked or has reduced access due to the presence of barriers (CDFW 2014, pp. 24–25). In addition, since the presence of a barrier on a spawning stream reduces the amount of available spawning habitat, reproducing adults have to compete for available spawning substrate. Fertilized eggs have been known to accumulate just below a barrier to the point that they will die due to oxygen deprivation (Robinson Rancheria 2015, p. 1).

Numerous dam structures can be found throughout the Clear Lake watershed, including dams on Kelsey, Adobe, Highland Springs, and Manning creeks. These dams were installed in the mid- to late 20th century and were installed primarily for irrigation and recreation (Suchanek et al. 2003, p. 1248). In addition, CDFW identified potential barriers on Lyon's Creek, Scott's Creek, Seigler Canyon Creek, Clover Creek, and Kelsey Creek (Ewing 2016a, entire). Additional barriers in the watershed include flood and water infrastructure that are not regularly maintained that may block hitch passage (CDFW 2014, p. 69). Flood control projects have also contributed to increased nutrient and sediment transport in the watershed by channelizing and armoring tributaries with rip-rap and by reclaiming large portions of wetland habitat that once surrounded the lake (CDFW 2014, p. 29). There are almost 14 miles of levee structures that are maintained by the U.S. Army Corps of Engineers (USACE) on Scotts, Middle, Clover, and Alley creeks (USACE 2012, p. 3). The loss of wetland habitat and increased nutrient and sediment transport further exacerbates water quality issues within Clear Lake, likely reducing hitch survival. Further, the loss of wetland habitat to install the flood projects reduced the amount of rearing habitat for juvenile hitch, reducing the likelihood of successful recruitment. The lake habitat for the Clear Lake hitch is also affected by habitat loss, degradation, and modification through wetland/tule habitat loss, cyanobacteria

(blue- green algae) blooms, and fish kills. Because of the impacts from the historical land conversion, surrounding wetland habitats were lost, essentially removing Clear Lake's natural filter. Over time, increasing amounts of sediment and nutrients from the degraded tributaries were transported directly into the lake, and nutrient inputs from surrounding urban and agricultural development ended up in the lake. This increase in nutrients and sediments entering Clear Lake degraded its water quality, resulting in increased cyanobacteria blooms that contributed to or caused periodic fish kills.

With the loss of the extensive tule expanses within the lake's nearshore habitat, there has been an increase in the amount of sedimentation and nutrients entering the lake (Prine et al. 1975, p. 21). Wetlands act as a filter for sediments and nutrients transported from the tributaries into the lake and the loss of these large wetland complexes directly surrounding the lake has had negative consequences to Clear Lake's water quality (Richerson et al. 1994, pp. III-1, V-1, VIII-1; Suchanek et al. 2003, p. 1255). One result from the wetland loss and water quality impacts is blue-green algae blooms that occur in Clear Lake from phosphorus input.

The blue-green algae, a cyanobacteria and not an actual alga, will float to the surface of the lake during the day and can form large mats or scums. These mats will either be broken down or re-submerged into the lake via wind action or will deteriorate from sun exposure. Phosphorus is found naturally in underlying sediments within the Clear Lake watershed (Richerson et al. 1994, p. V-99), and the degradation of tributaries have exposed those sediments, allowing for transport into the lake during rain events. A major factor in the persistence and formation of cyanobacteria blooms in Clear Lake relates to periods of anoxia (deficiency of oxygen), and where phosphorus is released from sediments (Florea et al. 2022, p. ii). Blue-green algae blooms can be toxic to fish (Gorham 1960, p. 242; Prine et al. 1975, p. 23; Richerson et al. 1994, p. III-9); however, it is unknown what impact they have on the Clear Lake hitch.

Fires have occurred naturally in the Clear Lake watershed as part of the ecological cycle; however, with Euro-American settlement in the middle of the 19th century, widespread intentional burning occurred throughout the watershed to clear brush or promote grass growth for livestock grazing (Suchanek et al. 2003, pp. 1243-1245, 1246-1247). Numerous fires have occurred in the Clear Lake area during

the 20th century, with several large ((10,000+ acres (ac), 4047 hectares (ha)) fires occurring directly in the watershed (Suchanek et al. 2003, pp. 1244, 1248). The fire seasons in California during 2017, 2018, and 2020 were some of the worst on record. The 2018 Mendocino Fire Complex, a portion of which occurred in Lake County, was the third largest fire on record in California (CalFire 2022a, entire). Past fire suppression practices within the State of California have reduced the occurrence of fire, but due to the accompanying fuel accumulation, these practices have made fires more devastating when they do occur (Suchanek et al. 2003, p. 1247). Fire activity within the watershed results in increased erosion and bank incision, which channelize the stream and increase water turbidity; fire activity is likely to continue to increase within the Clear Lake watershed (CalFire 2022b, entire). Channelization can decrease the amount of time water is retained within the tributary channel (Murphy 1948b, p. 106; County of Lake 1992, p. 13). A reduction of flow in the tributaries during the spawning season can eliminate or greatly reduce the likelihood for successful reproduction and/or recruitment, and due to the Clear Lake hitch's very narrow range, the effects of channelization can impact the subspecies' viability.

Summary of Habitat Loss, Degradation, And Modification

Habitat loss, degradation, and modification due to agricultural and urban development, pesticide use, increased fire activity, and legacy impacts from past mining activities, past deforestation, and historical grazing practices will continue to affect the Clear Lake hitch at the individual, population, and subspecies level into the future throughout its range.

The Clear Lake hitch habitats that are affected include the tributaries and lake habitat. Impacts to both habitat types will affect the Clear Lake hitch by reducing survival and recruitment, which reduces resiliency by decreasing the size of the overall population. For the tributaries, the loss of consistent flow during the spawning season is seen throughout the Clear Lake hitch's range. This influence is affecting the hitch at the individual, population, and subspecies level and is likely to continue into the future. The loss of consistent tributary flow, loss of wetland/tule habitat, and reduced lake water quality, has reduced, and will continue to reduce, population resiliency by reducing reproductive success, early life stage survival, and the

likelihood of recruitment. Loss of resiliency may reduce the Clear Lake hitch's overall representation and redundancy because fewer individuals spawn in each of the tributaries and natal habitat types. The reduction in resiliency may result in a reduction to the hitch's overall representation and redundancy.

There are no existing regulatory mechanisms or management actions that fully ameliorate habitat loss, degradation, and modification within the watershed, primarily because much of the degradation occurred in the past, although the effects are still occurring today and will continue into the future. There are planned activities associated with the Clear Lake watershed, the Middle Creek Flood Damage Reduction and Ecosystem Restoration Project, that will benefit improve water quality, increase available wetland habitat for the Clear Lake hitch and mitigate some of the ongoing habitat loss, degradation, and modification.

Construction of this project would greatly benefit juvenile hitch by providing increased cover from predators and competitors, and increased prey abundance. The county's Clear Lake Shoreline Ordinance has prohibited the destruction of tule on residential properties along the shoreline around Clear Lake and requires full mitigation for any tule habitat that is destroyed. This ordinance benefits the Clear Lake hitch by providing a consistent amount of tule habitat for juveniles. In addition, the county recently began a tule planting initiative that informs the public about the importance of tule habitat and how to plant tule (Lake County 2024a, entire).

Predation

Non-native fish introduced into Clear Lake for recreational or biological control purposes are known to prey upon the Clear Lake hitch and all introduced piscivorous (fish-eating) fish species in Clear Lake are potential predators of Clear Lake hitch. Clear Lake hitch have been found in the stomach contents of nonnative fish species in the Clear Lake watershed including largemouth bass (*Micropterus nigricans*) and channel catfish (*Ictalurus punctatus*; Macedo 1994, p. 5; Moyle et al. 1995, pp. 154-155; Moyle et al. 2014, p. 10). Mississippi silversides (*Menidia audens*) are also known to prey on larval fish, so it is likely some predation of Clear Lake hitch larvae by silversides is occurring in Clear Lake (Bennett and Moyle 1996, pp. 526, 529; Moyle et al. 2014, p. 9-10). The nonnative species predation will

continue to affect the Clear Lake hitch at the individual, population, and subspecies level into the future throughout its range. Nonnative species predation pressure within Clear Lake impacts the hitch by reducing survival and recruitment, which reduces resiliency by decreasing the size of the overall population.

Predation pressure within the tributaries to Clear Lake impacts the hitch by reducing survival, reproduction, and recruitment, which further reduces resiliency by decreasing the size of the spawning population in any given year and by reducing the overall population altogether. This loss of resiliency may reduce the hitch's overall representation and redundancy because it results in fewer individuals spawning in each of the tributaries and natal habitat types.

Competition

Competition from other nonnative aquatic species affects the Clear Lake hitch by reducing the available resources for breeding, feeding, and sheltering. For example, largemouth bass (*Micropterus nigricans*) feed on insects and zooplankton, directly competing with both juvenile and adult hitch for food resources (Moyle and Holzhauser 1978, pp. 577–578, 581). Threadfin shad (*Dorosoma petenense*) and Mississippi silversides also compete with the Clear Lake hitch because they depend on the same aquatic prey base (Anderson et al. 1986, entire; Bairrington 2000, p. 33; CDFW 2014, p. 35). During years when silverside or threadfin shad abundances are especially high, they could reduce or deplete prey resources on which the hitch depends. A comparison of hitch trend data and abundances of silversides and threadfin shad suggests there may be a correlation between their abundances (CDFW 2014, p. 35), but more detailed studies need to be completed. There are currently no regulatory mechanisms that address competition by non-native species.

Mercury Mining Contaminants

Historically, small-scale commercial mining operations along the shores of Clear Lake occurred in 1864 and 1865. Originally, the mining included borax and sulfur (Suchanek et al. 2003, p. 1253). Large-scale commercial sulfur extraction along the eastern shore of Clear Lake began in 1865, when the Sulphur Bank Mercury Mine was established. The sulfur mining operation switched over to mercury mining in 1873, after mercury sulfide deposits were found beneath their sulfur source. Early extraction methods were

not as destructive; however, in 1927, the mine began to implement open-pit mining at a large-scale level and would bulldoze any waste products into the lake (Richerson et al. 2008, p. A259). The company continued to mine sporadically throughout the 1950s until the Sulphur Bank Mercury Mine was officially closed in 1957, although waste continued to contaminate the lake well into the 1990s (Suchanek et al. 2008, p. A153).

The highest concentrations of mercury were found in the Oaks Arm area, near the southeastern area of the lake, which is where the Sulphur Bank Mercury Mine is located; however, elevated mercury levels have also been detected lake-wide (Richerson et al. 2008, p. A271). The use of heavy ground-moving equipment associated with the open-pit mining also likely contributed to the algal blooms seen in the lake; this equipment can excavate and disturb large swaths of sediments, which increase nutrient runoff (Richerson et al. 2008, p. A260).

Mercury and other mining-associated contaminants have entered the lake via erosion of waste piles, purposeful dumping/bulldozing of mine waste, atmospheric deposition, and subsurface drainage (Richerson et al. 2008, p. A275). Since 1992, the Environmental Protection Agency (EPA) has implemented numerous remediation projects to address the continued mercury contamination originating from the Sulphur Bank Mercury Mine. The remediation projects include the removal of waste rock piles that erode and discharge mercury, removal of contaminated soil from residential areas, installation of diversions to prevent contaminated water and sediments from entering Clear Lake, closure of three abandoned geothermal wells, capping of mine waste used to build an old road, and installation of two test sediment covers to contain mercury-contaminated sediment within Clear Lake (Richerson et al. 2008, pp. A265, A275; EPA 2019, entire).

The Sulphur Bank Mercury Mine became an EPA Superfund Site in 1990, due to the elevated mercury levels found in Clear Lake's larger piscivorous fish (Curtis 1977, p. 1; Suchanek et al. 2003, p. 1253; Thompson et al. 2013, p. 19). Elevated levels of mercury in fish can significantly impair reproductive success; however, effects can vary based on a multitude of factors, including species and life stage, and there are no specific studies for the Clear Lake hitch (Crump and Trudeau 2008, pp. 902, 904; CDFW 2014, pp. 32–33). Mercury concentrations found in developed hitch caught in Clear Lake in 2019 and

2020 averaged 0.14 milligrams per kilogram (mg/kg) (Pierce et al. 2022, entire), which exceed the Regional Water Quality Control Board's proposed target of 0.09 mg/kg for fish in trophic level 3, which includes the Clear Lake hitch (CEPA 2008, p. 1). Although these levels may exceed the Regional Water Quality Control Board's target, the best available science does not provide the lethal concentration of mercury specific for Clear Lake hitch or levels that may cause acute or chronic health effects to the Clear Lake hitch, or whether they are currently exposed to those levels in Clear Lake. The threat of mercury mining contaminants impacts the Clear Lake population and has not affected the Thurston Lake population.

Climate Change

Climate change affects the Clear Lake hitch and its habitat due to shifts in normal weather patterns. Changes in temperature and precipitation regimes can affect water quality and quantity for the subspecies and can exacerbate other effects, such as increased drought and fire frequency. Annual average air temperatures in California have increased by 1.5 °F (0.83 °C) since the beginning of the 20th century (Bales 2013, p. 2).

Temperatures are expected to continue to increase in California's North Coast Region, which includes Lake County (Grantham 2018, entire). Drought conditions within the Clear Lake watershed can have detrimental effects on the Clear Lake hitch by reducing the amount of flow within the tributaries over the spawning season, reducing water quality in the lake, and possibly reducing emergent vegetation growth in the lake. In 1946 and 1947, there was almost a complete lack of spawning runs due to the lack of water flow in the tributaries (Murphy 1948b, p. 105). However, the hitch's ability to spawn along the lake shore provides an alternative to tributary spawning for at least a small proportion of the population.

More arid conditions can impact the Clear Lake hitch by reducing the amount of water that enters, and the time period that water is retained within, the tributaries and wetland habitats that the hitch requires for spawning and rearing. Increases in aridity also reduce wetland/emergent vegetation growth, which the hitch requires for rearing and for cover from predators. All of these factors can impact the reproductive success and recruitment of the hitch; these factors could also reduce the hitch's survival if flows drop too drastically in the tributaries and wetland habitats, or if

hitch are subject to increased predation due to a reduction in cover from aquatic vegetation.

A reduction of flow in the tributaries during the spawning season can eliminate or greatly reduce the likelihood for successful reproduction and/or recruitment, and due to the Clear Lake hitch's very narrow range, the effects of drought will impact the entire subspecies. The ability to spawn along the shore provides for some redundancy within each population, but it is unknown whether shore spawning would be able to support a viable population in the lakes over the long term. Having a longer lifespan (4 to 6+ years) is likely an adaptation to variable environmental conditions, but prolonged droughts can have devastating effects on the overall population, especially in conjunction with other factors that are currently acting on the Clear Lake hitch.

There have been numerous efforts over the last 10 years to save Clear Lake hitch that become stranded in pools within the tributaries when the tributaries began to rapidly dry up. In March 2014, 197 individuals were rescued from two pools within Adobe Creek, and the surviving fish were released into Kelsey Creek (Ewing 2014a, entire). A few months later, in June 2014, more than 1,400 hitch were rescued from Cooper Creek and 389 hitch were rescued from Adobe Creek when the flow within those creeks began to rapidly drop. The surviving individuals from both rescues were released into Rodman Slough and at the Konocti Vista Casino boat ramp, respectively (Ewing 2014e, pp. 3, 6). Unfortunately, during visual spawning surveys that same year, approximately 300 adult hitch were found dead in a portion of Adobe Creek that had dried (Ewing 2014c, p. 7).

During the spring of 2018, numerous young of year were stranded in a pool within Cole Creek when the water flow began to rapidly drop. The creek no longer had continuous flow into the lake, and the small pool where the fish were stranded would have eventually dried, killing all of the 3,100+ young fish. Fortunately, members of Robinson Rancheria and CDFW were able to rescue the fish and transport them for release at Clear Lake State Park, which is located where Cole Creek enters the lake (Ewing 2018a, p. 1). In April 2022, 268 individuals were rescued from two pools within Adobe Creek and transported to Konocti Casino Harbor on Clear Lake where they were released (Ewing 2022a, p. 1). On August 8, 2022, 295 hitch were rescued from a pool off of Cooper Creek; the rescued hitch were

translocated to Upper Blue Lake for release (Santana 2022, p. 2). The effects of climate change will continue to affect both Clear Lake hitch populations, Clear Lake and Thurston Lake.

Regulatory mechanisms and management actions that are or could potentially provide some protection from the effects of climate change include the California Global Warming Solutions Act. This Act addresses climate change by reducing greenhouse gas emissions within California. There are no regulatory mechanisms or management actions that fully address the effects of the climate change.

Synergistic Effects

Multiple influencing factors can act on a species or its habitat at the same time, which can result in impacts that are not accounted for when factors are analyzed separately. Factors that appear minor when considered alone may have greater impacts on individuals, populations, or habitat when analyzed in combination with other factors.

The Clear Lake hitch evolved in Lake County, California, which has always had a highly variable climate with natural periodic droughts. However, the degradation and loss of water retention within their spawning streams and the loss of large stretches of suitable spawning habitat due to various instream barriers has likely reduced reproductive success and recruitment. During drought conditions this can reduce or eliminate all tributary-based spawning in a given year. If drought conditions persist over multiple years, stream-based reproduction can also be reduced or eliminated for multiple years. Furthermore, climate change projections show the Clear Lake area will experience more varied precipitation and higher air temperatures during the spring, which could result in even less water flow being retained within the tributary streams during the hitch's spawning season (Pierce *et al.* 2013, pp. 842, 844, 848–850). Although the hitch has the ability to spawn within the lake, it is unknown whether that method of reproduction would be able to sustain a viable population of hitch in Clear Lake.

Additionally, groundwater extraction for agriculture and other uses likely affects the Clear Lake hitch and its habitat, particularly combined with other chronic threats, such as habitat loss, degradation, and modification along with climate change that are synergistically acting on the subspecies. Water extraction in the summer is likely to lower the water level in pool habitat that acts as refugia for the subspecies in disconnected tributaries until those

tributaries become reconnected by spring rains. It is the loss of this pool habitat that affects the Clear Lake hitch resiliency.

The combination of wetland habitat loss and drought can increase predation pressure and competition. Past habitat loss has left only a small proportion of wetland habitat surrounding Clear Lake and drought conditions can reduce the amount of emergent vegetation growth within those remaining wetland habitats. This reduction in emergent vegetative growth reduces the amount of cover the hitch uses to hide from predators, increasing predation pressure. It can also increase competition as more fish concentrate into this limited habitat type.

Conservation Efforts and Regulatory Mechanisms

The Clear Lake hitch is protected through existing regulatory mechanisms and management actions that result in conservation of the subspecies or its habitat or both. Additional actions from Tribes and other interested groups also provide a benefit to the subspecies. Below, we present some of the ongoing efforts that provide conservation benefits to the Clear Lake hitch or its habitat or both from Federal, State, Tribal, and local regulations and management plans.

I. Federal

U.S. Forest Service (USFS)

The Clear Lake hitch has been designated a USFS sensitive species. Species identified as sensitive by the USFS are species in which population viability is a concern, as evidenced by significant current or predicted downward trends in population numbers or density, or significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution, or both. The designation of sensitive species ensures USFS: assists States, including California, in achieving their goals for conservation of endemic species; as part of the process under the National Environmental Policy Act (NEPA; 42 U.S.C. 4321 *et seq.*), reviews programs and activities, through a biological evaluation, to determine their potential effect on sensitive species; avoids or minimizes impacts to species whose viability has been identified as a concern; if impacts cannot be avoided, analyzes the significance of potential adverse effects on the population or its habitat within the area of concern and on the species as a whole; establishes management objectives in cooperation with the States when projects on

National Forest System lands may have a significant effect on sensitive species population numbers or distributions; and establishes objectives for Federal candidate species, in cooperation with the Service or National Marine Fisheries Service, and the States. Most of the Clear Lake hitch's range is on private land and only the headwaters of a few tributaries to the east of Clear Lake fall within USFS lands.

II. State

California Endangered Species Act (CESA)

On August 6, 2014, the CFGC determined that the Clear Lake hitch warranted listing as a threatened species under the CESA due to the present or threatened modification or destruction of the subspecies' habitat, predation on and competition with the hitch, and the anticipated impacts of climate change (CDFW 2014, pp. 1–2). Section 2067 of the California Fish and Game Code defines a “threatened species” as a native species or subspecies of bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by the State. As a threatened species under the CESA, the take of Clear Lake hitch individuals is prohibited unless the take is authorized by a State-issued permit.

However, CESA regulations only apply to the take of individuals (*i.e.*, they do not apply to the destruction or modification of habitat). It should be noted that California's definition of take (see section 86 of the California Fish and Game Code) is not the same as the Act's definition of take (16 U.S.C. 1532(19)).

California Environmental Quality Act (CEQA) of 1970

The CEQA does not regulate land use but requires all local and State agencies in California to avoid or minimize environmental damage, where feasible, during the course of proposed projects. The CEQA provides protection for species that are State-listed or federally listed as endangered, threatened, or rare. Compliance with the CEQA may be required for watershed restoration work and any restoration work that requires a “lake or streambed alteration agreement” (also known as a “1600 agreement”; see sections 1600–1616 of the California Game and Fish Code).

Sustainable Groundwater Management Act (SGMA)

The SGMA is a California State law that provides a framework for sustainable groundwater management in California. Under section 10933(b) of the California Water Code, groundwater basins throughout the State have been classified into four categories of prioritization (high, medium, low, very low). Phase 1 of the categorization process was finalized in January 2019, and 458 basins were prioritized during that phase. Fifty-seven basins were categorized under phase 2, which was finalized on December 17, 2019 (DWR 2020, p. AD–3). The SGMA requires water agencies and governments of high- priority and medium-priority basins to reduce overdraft and bring groundwater basins into balance. The State of California ensures the SGMA goals are met as planned.

Several groundwater basins in the Clear Lake watershed were prioritized during the phase 1 prioritization. The Big Valley basin to the southwest of Clear Lake received a medium prioritization, whereas the other eight basins in the watershed (Scotts Valley, Upper Lake Valley, Middle Creek, Long Valley, High Valley, Clear Lake Cache Formation, Burns Valley, and Lower Lake Valley) were given a low priority. The high- priority and medium-priority basins will be managed by a group of local agencies, referred to as “groundwater sustainability agencies,” and they will be tasked with reaching sustainability in their basin within 20 years of implementing their groundwater sustainability plans. Groundwater sustainability agencies have been formed for the Big Valley and Scotts Valley basins, and a groundwater sustainability plan was developed for the Big Valley basin and published in January 2022 (DWR 2019a, entire; DWR 2019b, entire; DWR 2019c, entire; DWR 2022, entire). Reducing overdraft from groundwater pumping in the Big Valley basin could improve flow conditions in Thompson Creek, Adobe Creek, Kelsey Creek, Cole Creek, McGaugh Slough, and Manning Creek and could provide sufficient water quantity for the Clear Lake hitch to traverse the tributaries during their spawning season.

III. Local

Clear Lake Integrated Watershed Management Plan (CLIWMP)

The local resource conservation districts developed CLIWMP to document the historical and current conditions of the Clear Lake watershed and any management actions that have been, or are currently being,

implemented. Actions to enhance and/or protect the watershed are then identified using that background information and timeframes for each action are described. The CLIWMP describes specific implementation actions needed to create an environmentally and economically healthy watershed, both for the benefit of the existing local community and for future generations (County of Lake et al. 2010a, entire). Implementation of the actions described in the CLIWMP would benefit the Clear Lake hitch by increasing the amount of wetland habitat used for rearing, improving fish passage within the tributary streams, and restoring degraded tributary stream and lake habitats. In addition to the CLIWMP, the local conservation districts also developed watershed assessments for Scotts, Middle, and Kelsey creeks. The purpose of those assessments is similar to the CLIWMP; they document the historical and current conditions of those watersheds and any management actions implemented. The assessments will aid in educating watershed users and landowners on the condition of that particular watershed, the management and restoration actions that need to be implemented to improve conditions, and how the conditions of those particular watersheds impact the condition of Clear Lake (County of Lake et al. 2010b, entire; County of Lake et al. 2010c, entire; County of Lake et al. 2010d, entire). Aggregate Resources Management Plan

Lake County developed an Aggregate Resources Management Plan (County of Lake 1992, entire) to address concerns about the impacts of gravel mining on the watershed. The plan describes the policies regarding mining in specific areas, identifies areas deemed as suitable for future mining projects, and informs the public about mining in Lake County. The plan calls for a moratorium on mining in certain creeks and limits mining activities to certain areas (County of Lake 1992, pp. 83–86). The regulation of gravel mining in the county has reduced the rate of erosion in the tributaries and increased the amount of riparian habitat along the stream channels, where the Clear Lake hitch occurs. Although instream sources of gravel are no longer the primary source of aggregate in Lake County because gravel is now acquired from other sources, illegal gravel mining or extraction has been known to occur in the watershed (CEPA 2008, pp. 8, 89; B. Ewing *in litt.* 2020).

Middle Creek Flood Damage Reduction and Ecosystem Restoration Project

The Middle Creek Flood Damage Reduction and Ecosystem Restoration Project (Middle Creek Project) is both a flood risk reduction project for urban and agricultural areas along the northern end of Clear Lake and an ecosystem restoration project that will improve degraded wetland habitat and water quality in Clear Lake. The Middle Creek Project area was once approximately 1,400 ac (567 ha) of wetland habitat that was lost in the early 1900s through the construction of levees and conversion to agricultural use.

Because these levees are no longer functional and there is an urgent need to restore surrounding wetland habitats to improve the lake and the watershed, Lake County requested USACE assistance to evaluate the project in 1995. The Middle Creek Project consists of acquiring reclaimed land, breaching existing levees to flood historical wetland and floodplain areas, and reconnecting Scotts and Middle creeks. Final NEPA and CEQA review was completed in 2003 and 2004, respectively, and the Middle Creek Project was authorized under the Water Resources Development Act of 2007 (33 U.S.C. 2201 *et seq.*). Federal funding for the Middle Creek Project has not yet been appropriated to start project design; however, funding for land acquisition has been acquired (USACE 2012, pp. 1–2; USACE 2023, entire).

The Middle Creek Project will benefit the Clear Lake watershed by reducing the amount of sediment and nutrients entering Clear Lake, improving overall water quality. It will also increase the existing amount of wetland habitat within the Clear Lake watershed by approximately 79 percent (USACE 2012, p. 3). If the Middle Creek Project were to be implemented, it would benefit adult hitch by improving the water quality of Clear Lake, which would likely reduce the incidence of large fish kills. The Middle Creek Project would also greatly benefit juvenile hitch by increasing the amount of wetland habitat surrounding the lake, providing increased cover from predators and competitors, and increased prey abundance.

Clear Lake Shoreline Ordinance

The destruction of woody species and tule on residential properties along the shoreline around Clear Lake is prohibited under section 23–15 of the Clear Lake Shoreline Ordinance. These types of vegetation can be managed via mowing, pruning, or trimming, but

those activities cannot result in the death of the plant. In addition, the ordinance applies a no-net-loss program for commercial, resort, or public properties that require mitigation for any areas of vegetation cleared by providing replacement plantings (County of Lake et al. 2010a, pp. ES–16, 3–10; CDFW 2014, p. 42). The measures associated with this ordinance benefit the Clear Lake hitch by providing a consistent amount of tule habitat for juveniles.

Clear Lake Hitch Conservation Strategy

A group including local Tribes, local government, State agencies, and Federal agencies have been working on the development of a conservation strategy for the Clear Lake hitch. The strategy, which is still in draft form, documents the past and current status of the subspecies, describes the negative influences that have resulted in the subspecies' current status, and identifies the actions that will address those negative influences in order to maintain a viable population of Clear Lake hitch throughout the subspecies' range. This conservation strategy will provide benefits to the subspecies through public outreach regarding Clear Lake hitch conservation; it will also direct funds to implement actions or projects that will specifically benefit the hitch.

Clear Lake Hitch Task Force

In August 2022, Tribal leaders and members of the Tribal Environmental Protection Agencies representing the Big Valley Rancheria of Pomo Indians, Elem Indian Colony Pomo Tribe, Robinson Rancheria Band of Pomo Indians, and the Habematolel Pomo of Upper Lake went before the CFGC to express their concern for the status of the Clear Lake hitch. To address these concerns and focus attention on the subspecies, the Clear Lake Hitch Task Force (Task Force) was formed. The Task Force had its first meeting on September 14, 2022, and consisted of Tribal and CDFW representatives.

Since 2022, the Task Force has expanded to include the California Department of Water Resources, State Water Resources Control Board, Central Valley Regional Water Board, Lake County Water Resources Department, Fish and Game Commission, California Natural Resources Agency, Service, USGS, California Conservation Corps, Bureau of Land Management (BLM), USACE, and USFS. The Task Force's mission involves collaborative planning for long-term responses to the decline in the Clear Lake hitch population, coordinating projects, identifying funding sources, and facilitating

information exchange among agencies. The Task Force meets monthly and has held three summits to help relay information and coordinate projects between different agencies.

IV. Miscellaneous

Lake County, the California Department of Transportation, USFS, State Water Resources Control Board, and BLM have undertaken various actions to prevent or reduce nutrients and contaminants from entering Clear Lake, or to track the amount of water being used throughout the watershed (West Lake Resource Conservation District, undated, entire; CDFW 2014, p. 41). These actions include the Eightmile Valley Sediment Reduction and Habitat Enhancement Project, for which BLM and the Scotts Valley Band of Pomo Indians received a grant (CDFW 2014, p. 41). CDFW has two conceptual area protection plans (CAPPs) that cover different areas of the Clear Lake watershed. A CAPP allows different organizations and agencies to apply for land acquisition funding through the Wildlife Conservation Board. Both plans focus on the protection of wetland and riparian habitats, which would benefit the Clear Lake hitch during its early life stages (CDFW 2014, p. 42). Lastly, the State Water Resources Control Board issued draft emergency information order regulations for the Clear Lake watershed in September 2023. These regulations were adopted by the Water Resources Control Board on December 6, 2023. These regulations allow the Water Resources Control Board to gather information on water usage, particularly groundwater pumping, in the Clear Lake watershed and learn how, if at all, it influences surface tributary flow (State Water Resource Control Board 2023, entire).

Lastly, the CDFW has begun to address some of the fish passage barriers in the Clear Lake hitch's spawning tributaries by installing fish ladders. The reconstruction of one project included installation of holding pools for the fish to rest as they move upstream and breaks in the ladder to help slow the rate of water flow (Ewing 2017c, entire).

Cumulative Effects

We note that, by using the SSA framework to guide our analysis of the scientific information documented in the SSA report, we have analyzed the cumulative effects of identified threats and conservation actions on the subspecies. To assess the current and future condition of the subspecies, we evaluate the effects of all the relevant factors that may be influencing the

subspecies, including threats and conservation efforts. Because the SSA framework considers not just the presence of the factors, but to what degree they collectively influence risk to the entire subspecies, our assessment integrates the cumulative effects of the factors and replaces a standalone cumulative-effects analysis.

Current Condition

In order to evaluate the current condition of the Clear Lake hitch, we describe the resiliency of each population along with the redundancy and representation of the subspecies. We considered demographic factors and habitat elements to evaluate the population-level resiliency. We divided the population in Clear Lake to ensure a more focused analysis regarding how different areas of the lake contribute to the subspecies' survival.

We established that there are two separate populations of Clear Lake hitch within the Clear Lake watershed: one is found in Clear Lake and its associated tributaries and small lakes (*i.e.*, Blue Lakes and Tule Lake), and the other is in Thurston Lake and its associated tributary. Because Thurston Lake is not currently hydrologically connected to Clear Lake and possibly never was, we do not anticipate it to be connected in the future. The Clear Lake and Thurston Lake populations were further delineated into units to capture the aquatic habitat features at a local, sub-watershed level. We then grouped some of the smaller delineated units into five "analysis units" using otolith (calcium carbonate structure found in the inner ear of the Clear Lake hitch) strontium signatures that indicated natal origins can be assigned to one of five strontium isotope groups (SIGs) throughout the watershed (Feyrer *et al.* 2019a, entire). The use of adult otoliths for the natal habitat strontium groupings indicates that those areas associated with the SIGs are contributing to reproduction and recruitment. The terms "analysis unit" and "SIG" may be used interchangeably for this analysis.

We delineated six analysis units across the subspecies' range. Thurston Lake and Thurston Creek are described as a single analysis unit. The Clear Lake population includes five analysis units described according to the general location: Cole Creek; Kelsey Creek; Adobe Creek and Clear Lake; Rodman Slough; and Middle, Clover, and Siegler Canyon creeks (SIGs 1 through 5, respectively; Service 2024, p. 34). Additional description of the populations and analysis units can be found in the SSA report (Service 2024, pp. 26–28); see table 2, below, for a list of the AUs.

In order to determine resiliency, we assessed the conditions at the population and analysis unit levels. We used demographic and habitat factors associated with each population. The demographic factors include reproduction, recruitment, and survival at both the adult and juvenile life stages. The habitat factors we used include water quantity (tributaries) and quality (lake) and wetland/tule habitat condition.

Influencing those factors is the quality and accessibility of Clear Lake hitch habitat, which determines how well the spawning areas allow for successful reproduction, whether the nearshore nursery areas allow for young-of-year survival and subsequent recruitment, and whether individuals can move between tributary spawning habitats and the lake. Within the tributaries, water quantity and quality are important factors influencing survival at all life stages, reproductive success, and recruitment, and water quantity and quality are important for connectivity between the tributaries and lakes. Environmental stochastic events that have the potential to affect the subspecies include severe storms, drought, contaminant exposure, and the modification of habitat via natural (*i.e.*, fire, drought, etc.) and anthropogenic (*i.e.*, conversion to agriculture, vegetation management) means. Additional information regarding the

resiliency factors can be found in the SSA report (Service 2024, pp. 28–34).

We describe the population and analysis unit resiliency conditions using categories of high, medium, and low (with transitional stages). The methodology for determining the condition category includes assessment of the demographic and habitat factors within each analysis unit and within each population (Service 2024, p. 79). An overall high condition for a population is an indicator of high probability of population persistence. Populations in high condition have: accessible tributaries available throughout the spawning season, different natal habitats available for reproduction, individuals that are reproducing successfully and populations that are actively recruiting, and a sufficient amount and quality of spawning and rearing habitat to allow for varying population densities. An overall moderate condition is an indicator that probability of persistence for that population may be compromised by the lack and/or degradation of one or more of the subspecies' needs, and a low overall condition indicates low probability of population persistence due to the lack and/or degradation of multiple of the subspecies' needs. An extirpated condition indicates no probability of population persistence due to lack and/or degradation of all of the subspecies' needs. Conditions of low/extirpated, moderate/low, and high/moderate are transitional between each of the qualitative categories.

In order to determine the current population estimates and distribution, we used recent data (2015–2023) from surveys conducted on spawning in the tributaries, along the lake shore, and throughout Clear Lake. That data also informed the resiliency analysis for each population and analysis unit. The demographic and habitat parameters used in the resiliency analysis for each population and analysis unit is provided in table 1, below (Service 2024, p. 67).

TABLE 1—DEMOGRAPHIC AND HABITAT FACTORS CONDITION CATEGORIES FOR POPULATION AND ANALYSIS UNIT RESILIENCY WITH HIGH CONDITION AS THE BEST CONDITION AND ZERO AS THE LOWEST CONDITION

Condition category	Demographic factor—reproduction	Demographic factor—recruitment	Habitat element—tributary water quantity	Habitat element—lake water quality
High	Overall total from reproduction analysis is high.	Overall total from recruitment analysis is high.	Water is retained within the tributaries throughout the spawning season.	Lake water is well oxygenated and minimally contaminated.

TABLE 1—DEMOGRAPHIC AND HABITAT FACTORS CONDITION CATEGORIES FOR POPULATION AND ANALYSIS UNIT RESILIENCY WITH HIGH CONDITION AS THE BEST CONDITION AND ZERO AS THE LOWEST CONDITION—Continued

Condition category	Demographic factor—reproduction	Demographic factor—recruitment	Habitat element—tributary water quantity	Habitat element—lake water quality
Moderate	Overall total from reproduction analysis is moderate.	Overall total from recruitment analysis is moderate.	Water is retained within the tributaries throughout a large portion of the spawning season.	Lake water is oxygenated most of the time, hypoxic conditions do occur periodically. Some contaminants are present, but not at lethal levels.
Low	Overall total from reproduction analysis is low.	Overall total from recruitment analysis is low.	Water is retained within the tributaries throughout a small portion of the spawning season.	Lake water is not well oxygenated and hypoxic conditions occur frequently. Contaminants are present, sometimes at lethal levels.
0 (Zero)	No reproduction	No recruitment	Water is not retained within the tributaries during any portion of the spawning season.	Lake water quality is uninhabitable.

Of the six Clear Lake hitch analysis units, for reproduction, there are currently three analysis units that are in moderate condition (SIGs 1, 2, and 4), and two analysis units that are in low condition (SIGs 3 and 5). The current recruitment condition for SIG 3 is high, moderate for SIGs 2 and 4, and low for

SIGs 1 and 5. The current condition of lake water quality is at a low condition for all five analysis units, and the current condition for tributary water quantity is low for SIGs 1, 2, and 3, and moderate for SIGs 4 and 5. Currently, the Clear Lake population has three analysis units at a moderate condition

(SIGs 2, 3, and 4), and two units at a low condition (SIGs 1 and 5), for an overall Clear Lake population resiliency of moderate (Service 2024, p. 83). The Thurston Lake population is currently in high condition and, therefore, has high resiliency. See table 2, below.

TABLE 2—SUMMARY TABLE OF CURRENT AND FUTURE RESILIENCY FOR EACH POPULATION (P) AND ANALYSIS UNIT (AU)

Population	Analysis unit	Current condition	Future condition scenario 1	Future condition scenario 2
Clear Lake		Moderate	Moderate/Low	Low.
	Cole Creek (SIG 1)	Low	Low	Low.
	Kelsey Creek (SIG 2)	Moderate	Moderate/Low	Low.
	Clear Lake, Adobe Creek (SIG 3).	Moderate	Moderate/Low	Low.
	Rodman Slough (SIG 4) ...	Moderate	Moderate	Moderate/Low.
Thurston Lake	Middle Creek, Clover Creek, Seigler Canyon Creek (SIG 5).	Low	Low	Low.
	Thurston Lake	High	Moderate	Moderate.

In describing the overall current condition, we not only include resiliency of each population and analysis unit, but also consider the representation and redundancy across the range of the subspecies. Because both populations of the Clear Lake hitch are narrowly distributed and occupy the same ecological niche, the subspecies has likely never had much environmental diversity and likely does not have much genetic diversity due to its endemism to a single watershed, suggesting inherently limited representation. Given the subspecies' narrow range, both populations of the subspecies (Clear Lake and Thurston Lake) could be affected simultaneously by large-scale events. However, the

Clear Lake hitch uses different types of spawning habitats (tributary, lake, or interface between the two) across its narrow range, which may provide some current capacity to withstand a catastrophic drought event.

Because of the historical connectivity within a single, large watershed, Clear Lake provided better habitat conditions for the subspecies. Currently, Thurston Lake does not have the level of threats acting on the subspecies that are affecting the hitch in Clear Lake. Surveys in 2023 of the Clear Lake population show there is an influx of age classes, thus indicating there is reproduction occurring. This diverse demographic make- up of the subspecies' population in Clear Lake

indicates that there is redundancy across subspecies' range and bolsters the subspecies' resiliency. Currently, the Clear Lake hitch has two extant populations: the Clear Lake population, which has a moderate resiliency; and the Thurston Lake population, which has a high resiliency. Both of these populations are able to withstand stochastic environmental variation. Representation and redundancy are similar to historical conditions, with both populations narrowly distributed and occupying the same ecological niche.

The current resiliency analysis uses the best available information; however, we recognize there are some uncertainties around the subspecies' life

history, including recruitment, and the factors that influence its viability. Some of the uncertainties include the lack of robust, statistically valid population or abundance estimates for the historical population of the Clear Lake hitch. Further, current population estimates are still in initial stages, as local Tribes, CDFW, and USGS are accruing more data to provide a more accurate rangewide population estimate. Because this information is not available, there is no baseline to compare for our current condition analysis; therefore, we had to use available demographic and habitat data to inform our analysis, which could result in an overestimation or underestimation of population resiliency.

There is some uncertainty in how successful recruitment is in the lower Clear Lake watershed, including within Clear Lake itself. Our analysis in the SSA report assumes reproduction is successful when adults are documented in the tributaries over the spawning season and that some lake spawning is successful (Service 2024, p. 70). It is possible these assumptions are overestimating how successful reproduction is, resulting in an overestimation of population resiliency.

Future Condition

In order to determine the Clear Lake hitch's viability in the future, we assessed the condition of the subspecies' resiliency, redundancy, and representation within a timeframe that we can make reliable predictions about the threats and the subspecies' response to the threats. The future conditions projections were timeframe we applied for the future conditions' analyses found that the most reliable timeframe extends out to the next 40 to 50 years. We considered two plausible future scenarios that represent the extremes of a range of future changes in environmental conditions and success of implemented conservation efforts. Using these two scenarios allows us to consider the full range of future possibilities for forecasting future viability of the subspecies and incorporates any uncertainty regarding the impact of future environmental conditions and the success of implemented conservation efforts.

The future scenarios project the influences on viability into the future and consider how those influences would potentially impact the Clear Lake hitch's viability. As under Current Condition, we assessed the subspecies' resiliency, redundancy, and representation under each future scenario. For resiliency, we projected the impact to the subspecies'

reproduction, recruitment, water quantity (tributary), and water quality (lake) at the population level and the analysis unit level.

The following six factors affecting the Clear Lake hitch were included in both of the two plausible future scenarios:

1. The loss of spawning habitat due to past watershed modifications that have blocked access to or altered the flow regime of tributaries. The lack of consistent tributary flow will continue due to the effects of past instream gravel mining, deforestation, and grazing practices; existing flood control project infrastructure; fire activity; and water utilization for agricultural and urban uses. Because the rate of urban development has slowed in the last decade, we do not anticipate a significant amount of urban growth into the future. The timeframe for the current Lake County General Plan is 20 years and only projects growth out to 2028; however, we still do not expect growth to increase much after 2028. Although the amount of agricultural development increased substantially leading up to the 21st century, over the last 10 years or so the acreage of fruit, nut, field, seed, and vegetable crops in Lake County only slightly increased.

Therefore, we do not anticipate a substantial increase in the amount of agricultural production into the future (Service 2024, pp. 29, 34). Furthermore, future climate change is projected to further exacerbate the degradation and inaccessibility of tributaries by increasing the incidence of fire activity, flood events, and aridity. Various passage barriers, both physical barriers and lack of flow, will continue to persist in the watershed. And there are no there are no groundwater sustainability plans for low priority basins.

2. The loss of wetland/tule habitat. The current remaining wetland/tule habitat surrounding the lake will persist into the future, primarily due to the implementation of Lake County's Clear Lake Shoreline Ordinance.

3. Continued reductions in lake water quality due to the past loss of wetland/tule habitat surrounding the lake, contamination from past mercury mining along the lake's shore and from pesticide use for agricultural and urban uses, the input of sediment and nutrients from degraded tributaries, and nutrient inputs from surrounding urban and agricultural development. As mentioned above, we do not project agricultural production or urban development to increase substantially into the future. Elevated nutrient and sediment inputs continue to contribute to periodic cyanobacteria blooms,

further reducing water quality. Periodic fish kills continue to occur.

4. Nonnative fish species from past introductions are still established within the lakes.

5. Drought incidence and intensity increase due to climate change, reducing tributary flow during the spawning season in some years.

6. The continued implementation of current regulatory mechanisms (*e.g.*, CESA, Lake County's Clear Lake Shoreline Ordinance) and management actions (*e.g.*, Lake County's Aggregate Resources Management Plan, other miscellaneous restoration actions occurring throughout the watershed).

Scenario 1 assesses the viability of the subspecies if the trend and magnitude of threats were to continue at the current trajectory into the future with implemented management efforts being fully successful. Scenario 2 assesses the subspecies' future viability with an increase in the trend and magnitude of threats with implemented management efforts having mixed success. Additional details regarding the scenarios are described in the SSA report (Service 2024, pp. 89–91).

Under Scenario 1, many of the factors that are having an influence on each of the Clear Lake hitch populations continue at current rates, or slightly increase. The effects of climate change, specifically increased aridity, are already occurring throughout the watershed, although the effects of increased aridity are not apparent every year. Future drought conditions are projected to increase in both the number of years drought conditions persist and the intensity of drought. Due to the increased incidence of aridity, and because future climate projections show the timing of precipitation will change, in some years, the number of spawning tributaries available to the Clear Lake hitch over the spawning season will decrease. A slight increase in fire and flooding incidence will increase the amount of erosion occurring in the tributaries, further decreasing lake water quality. As conditions worsen in the tributaries, the hitch will have to increasingly rely on spawning in the lake or in the mouths of streams. Because the Clear Lake hitch is a State-listed species, direct take will continue to be prohibited without a permit. Due to Lake County's Clear Lake Shoreline Ordinance, the amount of existing wetland/tule habitats surrounding the lake will continue to persist. Under Scenario 1, the SGMA has been implemented, and general restoration projects, such as contaminant remediation, tributary function, and barrier removal, continue to be

implemented at a small scale throughout the watershed.

Under Scenario 1, both populations decline in resiliency; the Thurston Lake population is in moderate condition, and the Clear Lake population is in moderate/low condition. Each Clear Lake analysis unit is either unchanged from current condition, or declines. The resiliency for SIGs 1 and 5 remains in low condition. SIG 4 remains in moderate condition, and SIGs 2 and 3 decline from moderate to moderate/low condition. For representation, because both populations of Clear Lake hitch are narrowly distributed and occupy the same ecological niche, environmental and genetic diversity are not expected to change dramatically under Scenario 1. Therefore, representation for the Clear Lake hitch under current conditions is maintained under Scenario 1.

For redundancy, given the narrow range, both populations of the subspecies could be affected simultaneously by large-scale events. However, the Clear Lake hitch uses different types of spawning habitats (tributary, lake, or interface between the two) across its narrow range, which may increase the ability of the subspecies to withstand a catastrophic drought event, which is not expected to change dramatically under Scenario 1. Therefore, redundancy for the Clear Lake hitch under current conditions is maintained under Scenario 1.

Under Scenario 2, some of the factors that are having an influence on each of the Clear Lake hitch populations continue at current rates, while others will increase (Service 2024, pp. 92–94). In this scenario, climate change results in more arid conditions throughout the subspecies' range and impacts from increased fire and flooding increase erosion occurring in the tributaries, further decreasing water quality within the lake. As conditions worsen in the tributaries, the Clear Lake hitch will have to increasingly rely on spawning in the lake or in the mouths of streams. In addition, under this scenario, agricultural production slightly increases in areas currently not prioritized by the SGMA, small-scale restoration projects have been implemented but not all are successful, the Middle Creek Project has not been implemented, and few passage barriers have been removed. Under Scenario 2, Lake County's Clear Lake Shoreline Ordinance will continue to limit tule habitat loss, and the CESA will continue to limit the take of Clear Lake hitch individuals.

The overall resiliency of each population will decline under Scenario 2. The projections result in a moderate

condition for the Thurston Lake population and low condition for the Clear Lake population. Within Clear Lake, each SIG declines to or maintains a low condition except for Rodman Slough, which has a moderate/low condition.

Under Scenario 2, due to declines in abundance and recruitment predicted under this future scenario, we anticipate representation will be somewhat reduced from current conditions, and, therefore, the subspecies will be less able to adapt to changing environmental conditions. We also anticipate that redundancy will be somewhat reduced from current conditions due to predicted declines in abundance and recruitment, and, therefore, the subspecies will be more susceptible to a catastrophic event.

We also present uncertainties associated with the future conditions analyses for the Clear Lake hitch. As described above under *Current Condition*, there is uncertainty regarding some of the subspecies' life-history traits, including recruitment, and some of the factors influencing the subspecies' viability that were used in the future condition scenarios. Although there is a current population estimate for the subspecies, this estimate is in its initial stages and additional years of monitoring data are needed to provide a more accurate estimate. Because we do not have an accurate current number to compare to, and therefore cannot project changes in the size of either population, we must qualitatively describe how future influences will impact Clear Lake hitch populations. There is uncertainty in how successful recruitment is in the lower Clear Lake watershed, including within Clear Lake itself. Our analysis assumes reproduction is successful when adults are documented in the tributaries over the spawning season and that some lake spawning is successful. It is possible these assumptions are overestimating how successful reproduction is, resulting in an overestimation of population resiliency.

Lastly, there is uncertainty around the degree of impact from water extraction for agricultural use on the Clear Lake hitch and its habitat. Groundwater pumping can deplete surface water in streams and reduce flow and available water (USGS 2013, entire). Water extractions may be one of the reasons for the reduction in the Clear Lake hitch's population; however, the Clear Lake watershed is complex, and we do not fully understand how surface and ground water interact in most of the watershed because studies have not been completed. We also do not have a

full understanding of where water extractions are occurring or how much water is being extracted; however, there are ongoing studies to better understand the magnitude of impacts on the Clear Lake watershed (Santana 2024, pers. comm.). Although we do not fully understand if or how groundwater extraction is having an impact on the Clear Lake hitch, we do know that water extraction in the summer lowers the water level in pool habitat that acts as refugia for native fish in the disconnected streams until they become reconnected by spring rains. It is the loss of this pool habitat that affects the Clear Lake hitch. However, because groundwater extraction is likely affecting water availability for the subspecies, for our analysis, it is a logical assumption that groundwater pumping for agricultural production is likely having a negative impact on the subspecies. We also assumed the highest rates of pumping are occurring where the most agricultural production occurs. Therefore, it is possible we are overestimating the impact from this threat, resulting in an underestimate of current population resiliency.

Additional uncertainty is presented regarding future impacts to the subspecies and its habitat from climate change, the future trajectory of current negative influences to the subspecies (*i.e.*, agricultural production and urban development), the long-term success of current conservation actions, and the implementation and success of future conservation actions. Our overall future condition analysis assumes climate change will exacerbate the current negative influences (*e.g.*, drought) acting on the subspecies; both future scenarios capture the full risk of this influence within the 40-to-50-year timeline. For agricultural production and urban development, we assume future trends will be similar to trends over the last decade, which only showed slight increases. It is possible we underestimated the future trajectory of these influences, which would result in an overestimation of future population resiliency. The number of conservation actions being implemented in the watershed has increased over the past few years; however, we are uncertain about their success over the long term and whether the current trend in implementation will continue into the future. Since the two future condition scenarios consider the breadth of future implementation and success of conservation activities for the Clear Lake hitch, the overall future condition analysis captures the full benefits of this influence on the subspecies.

Determination of the Clear Lake Hitch's Status

Section 4 of the Act (16 U.S.C. 1533) and its implementing regulations (50 CFR part 424) set forth the procedures for determining whether a species meets the definition of an endangered species or a threatened species. The Act defines an “endangered species” as a species in danger of extinction throughout all or a significant portion of its range, and a “threatened species” as a species likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

The Act requires that we determine whether a species meets the definition of an endangered species or a threatened species because of any of the following factors: (A) The present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; or (E) other natural or manmade factors affecting its continued existence.

Status Throughout All of Its Range

After evaluating the threats to the Clear Lake hitch and assessing the cumulative effect of the threats under the Act's section 4(a)(1) factors, we have determined that the overall viability of the Clear Lake hitch has declined from historical levels due to the past and ongoing threats of habitat loss, degradation, and modifications (Factor A), predation (Factor C), competition (Factor E), and the effects of climate change (Factor E).

Currently, the subspecies has two extant populations: the Clear Lake population, which has a moderate resiliency, and the Thurston Lake population, which has a high resiliency. Both populations are able to withstand stochastic environmental variation. Representation and redundancy are similar to historical conditions, with both populations narrowly distributed and occupying the same ecological niche. Because of the historical connectivity within a single, large watershed, Clear Lake provided better habitat conditions for the subspecies. Currently, Thurston Lake does not have the level of threats acting on the subspecies that are affecting the hitch in Clear Lake. Surveys in 2023 of the Clear Lake population show there is an influx of age classes, thus indicating there is reproduction occurring. The diverse demographic makeup of the subspecies' population in Clear Lake provides support that there is redundancy across

the Clear Lake hitch's range and bolsters the subspecies' resiliency. Therefore, the Clear Lake hitch is not currently at risk of extinction throughout its range and does not meet the Act's definition of an endangered species.

However, under both future scenarios we see declines in population resiliency in the foreseeable future as a result of factors that will continue to affect the subspecies. Our analysis of the past, current, and future factors influencing viability revealed there are six primary factors affecting the viability of the Clear Lake hitch. These risks to viability are primarily related to habitat changes but also includes others with more direct effect to the subspecies:

1. The loss of spawning habitat due to past watershed modifications that have blocked access to or altered the flow regime of tributary streams.

2. The loss of wetland/tule habitat. The current remaining wetland/tule habitat surrounding the lake will persist into the future, primarily due to the implementation of Lake County's Clear Lake Shoreline Ordinance.

3. Continued reductions in lake water quality due to the past loss of wetland/tule habitat surrounding the lake, contamination from past mercury mining along the lake's shore and from pesticide use for agricultural and urban uses, the input of sediment and nutrients from degraded tributaries, and nutrient inputs from surrounding urban and agricultural development. As mentioned above, we do not project agricultural production or urban development to increase substantially into the future. Elevated nutrient and sediment inputs continue to contribute to periodic cyanobacteria blooms, further reducing water quality. Periodic fish kills continue to occur.

4. Nonnative fish species from past introductions are still established within Clear Lake.

5. Drought incidence and intensity increase due to climate change, reducing tributary flow during the spawning season in some years (Hayhoe *et al.* 2004, pp. 12424–12425, Pierce *et al.* 2013, pp. 848–850).

6. The continued implementation of current regulatory mechanisms (*e.g.*, CESA, Lake County's Clear Lake Shoreline Ordinance), management actions (*e.g.*, Lake County's Aggregate Resources Management Plan, and other miscellaneous restoration actions occurring throughout the watershed) that limits the amount of gravel extract.

Under both future scenarios, Thurston Lake declines to a moderate resiliency and Clear Lake declines to a moderate/low or low resiliency, suggesting the subspecies will be less likely to

withstand stochastic environmental variation in the future. Under future Scenario 1, redundancy and representation are mostly maintained but begin to be impacted by the declines in population resiliency. Under future Scenario 2, both redundancy and representation are reduced due to the limited availability of some spawning habitats and the subspecies being less able to adapt to changing environmental conditions. Because of this future reduction in resiliency, redundancy, and representation, the subspecies is likely to become endangered within the foreseeable future throughout its range and meets the Act's definition of a threatened species. Thus, after assessing the best scientific and commercial data available, we conclude that the Clear Lake hitch is not in danger of extinction but is likely to become in danger of extinction within the foreseeable future throughout all of its range.

Status Throughout a Significant Portion of Its Range

Under the Act and our implementing regulations, a species may warrant listing if it is in danger of extinction or likely to become so within the foreseeable future throughout all or a significant portion of its range. The court in *Center for Biological Diversity v. Everson*, 435 F. Supp. 3d 69 (D.D.C. 2020) (*Everson*), vacated the provision of the Final Policy on Interpretation of the Phrase “Significant Portion of Its Range” in the Endangered Species Act's Definitions of “Endangered Species” and “Threatened Species” (hereafter “Final Policy”; 79 FR 37578, July 1, 2014) that provided if the Services determine that a species is threatened throughout all of its range, the Services will not analyze whether the species is endangered in a significant portion of its range.

Therefore, we proceed to evaluating whether the species is endangered in a significant portion of its range—that is, whether there is any portion of the species' range for which both (1) the portion is significant; and (2) the species is in danger of extinction in that portion. Depending on the case, it might be more efficient for us to address the “significance” question or the “status” question first. We can choose to address either question first. Regardless of which question we address first, if we reach a negative answer with respect to the first question that we address, we do not need to evaluate the other question for that portion of the species' range.

Following the court's holding in *Everson*, we now consider whether the Clear Lake hitch is in danger of extinction in a significant portion of its

range. In undertaking this analysis for the Clear Lake hitch, we chose to address the significance question first. We identified Clear Lake and its tributaries as a significant portion of the subspecies' range; this portion is biologically meaningful to the subspecies due to its large geographical size (*i.e.*, it encompasses the greatest proportion of the subspecies' entire range and near 95 percent of the available lake habitat). Additionally, Clear Lake and its tributaries support the majority of the subspecies' entire population. We include the tributaries in this portion because the Clear Lake hitch uses them for spawning, and they are important for the reproduction aspect of the subspecies' lifecycle.

After determining the portion's significance, we evaluated the Clear Lake hitch's status within that portion. Since we found the subspecies meets the Act's definition of threatened across its entire range, we considered the status of the portion to determine if the subspecies within Clear Lake and its tributaries meets the Act's definition of an endangered species. The current resiliency of this population is scored as moderate (see table 2, above). Seasonal surveys conducted in Clear Lake from 2017 to 2023 indicate fluctuations in the populations; the 2023 surveys yielded the highest number (304) of individual hitch captured. The increase could possibly be due to more water available from a rainy year. The 2023 surveys also show there is an influx of age classes, thus indicating there is reproduction occurring across a range of years and climatic conditions. This diverse demographic makeup of the subspecies' population in Clear Lake provides support that there is currently redundancy within the portion and bolsters the subspecies' resiliency. Representation and redundancy in this portion are similar to historical conditions, with the population narrowly distributed and occupying the same ecological niche. The current resiliency is moderate for this portion, and this portion retains sufficient resiliency such that it will be able to withstand stochastic environmental variation in the near term. Therefore, the subspecies is not in danger of extinction within this portion of its range.

Therefore, no portion of the species' range provides a basis for determining that the species is in danger of extinction in a significant portion of its range, and we determine that the species is likely to become in danger of extinction within the foreseeable future throughout all of its range. This does not conflict with the courts' holdings in

Desert Survivors v. U.S. Department of the Interior, 321 F. Supp. 3d 1011, 1070–74 (N.D. Cal. 2018) and *Center for Biological Diversity v. Jewell*, 248 F. Supp. 3d 946, 959 (D. Ariz. 2017) because, in reaching this conclusion, we did not apply the aspects of the Final Policy, including the definition of “significant” that those court decisions held to be invalid.

Determination of Status

Based on the best scientific and commercial data available, we determine that the Clear Lake hitch meets the Act's definition of a threatened species throughout its range. Therefore, we propose to list the Clear Lake hitch as a threatened species in accordance with sections 3(20) and 4(a)(1) of the Act.

Available Conservation Measures

Conservation measures provided to species listed as endangered or threatened species under the Act include recognition as a listed species, planning and implementation of recovery actions, requirements for Federal protection, and prohibitions against certain practices. Recognition through listing results in public awareness, and conservation by Federal, State, Tribal, and local agencies, foreign governments, private organizations, and individuals. The Act encourages cooperation with the States and other countries and calls for recovery actions to be carried out for listed species. The protection required by Federal agencies, including the Service, and the prohibitions against certain activities are discussed, in part, below.

The primary purpose of the Act is the conservation of endangered and threatened species and the ecosystems upon which they depend. The ultimate goal of such conservation efforts is the recovery of these listed species, so that they no longer need the protective measures of the Act. Section 4(f) of the Act calls for the Service to develop and implement recovery plans for the conservation of endangered and threatened species. The goal of this process is to restore listed species to a point where they are secure, self-sustaining, and functioning components of their ecosystems.

The recovery planning process begins with development of a recovery outline made available to the public soon after a final listing determination. The recovery outline guides the immediate implementation of urgent recovery actions while a recovery plan is being developed. Recovery teams (composed of species experts, Federal and State agencies, nongovernmental

organizations, and stakeholders) may be established to develop and implement recovery plans. The recovery planning process involves the identification of actions that are necessary to halt and reverse the species' decline by addressing the threats to its survival and recovery. The recovery plan identifies recovery criteria for review of when a species may be ready for reclassification from endangered to threatened (“downlisting”) or removal from protected status (“delisting”), and methods for monitoring recovery progress. Recovery plans also establish a framework for agencies to coordinate their recovery efforts and provide estimates of the cost of implementing recovery tasks. Revisions of the plan may be done to address continuing or new threats to the species, as new substantive information becomes available. The recovery outline, draft recovery plan, final recovery plan, and any revisions will be available on our website as they are completed (<https://www.fws.gov/program/endangered-species>), or from our Sacramento Fish and Wildlife Office (see **FOR FURTHER INFORMATION CONTACT**).

Implementation of recovery actions generally requires the participation of a broad range of partners, including other Federal agencies, States, Tribes, nongovernmental organizations, businesses, and private landowners. Examples of recovery actions include habitat restoration (*e.g.*, restoration of native vegetation), research, captive propagation and reintroduction, and outreach and education. The recovery of many listed species cannot be accomplished solely on Federal lands because their range may occur primarily or solely on non-Federal lands. To achieve recovery of these species requires cooperative conservation efforts on private, State, and Tribal lands.

If the Clear Lake hitch is listed, funding for recovery actions will be available from a variety of sources, including Federal budgets, State programs, and cost-share grants for non-Federal landowners, the academic community, and nongovernmental organizations. In addition, pursuant to section 6 of the Act, the State of California would be eligible for Federal funds to implement management actions that promote the protection or recovery of the Clear Lake hitch. Information on our grant programs that are available to aid species recovery can be found at: <https://www.fws.gov/service/financial-assistance>.

Although the Clear Lake hitch is only proposed for listing under the Act at this time, please let us know if you are interested in participating in recovery

efforts for this subspecies. Additionally, we invite you to submit any new information on this subspecies whenever it becomes available and any information you may have for recovery planning purposes (see **FOR FURTHER INFORMATION CONTACT**).

Section 7 of the Act is titled, “Interagency Cooperation,” and it mandates all Federal action agencies to use their existing authorities to further the conservation purposes of the Act and to ensure that their actions are not likely to jeopardize the continued existence of listed species or adversely modify critical habitat. Regulations implementing section 7 are codified at 50 CFR part 402.

Section 7(a)(2) states that each Federal action agency shall, in consultation with the Secretary, ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of a listed species or result in the destruction or adverse modification of designated critical habitat. Each Federal agency shall review its action at the earliest possible time to determine whether it may affect listed species or critical habitat. If a determination is made that the action may affect listed species or critical habitat, formal consultation is required (50 CFR 402.14(a)), unless the Service concurs in writing that the action is not likely to adversely affect listed species or critical habitat. At the end of a formal consultation, the Service issues a biological opinion, containing its determination of whether the Federal action is likely to result in jeopardy or adverse modification.

In contrast, section 7(a)(4) of the Act requires Federal agencies to confer with the Service on any action that is likely to jeopardize the continued existence of any species proposed to be listed under the Act or result in the destruction or adverse modification of critical habitat proposed to be designated for such species. Although the conference procedures are required only when an action is likely to result in jeopardy or adverse modification, action agencies may voluntarily confer with the Service on actions that may affect species proposed for listing or critical habitat proposed to be designated. In the event that the subject species is listed or the relevant critical habitat is designated, a conference opinion may be adopted as a biological opinion and serve as compliance with section 7(a)(2) of the Act.

Examples of discretionary actions for the Clear Lake hitch that may be subject to conference and consultation procedures under section 7 of the Act are management of Federal lands

administered by BLM and USFS, as well as actions that require a Federal permit (such as a permit from USACE under section 404 of the Clean Water Act (33 U.S.C. 1251 *et seq.*) or actions funded by Federal agencies such as the Federal Highway Administration, Federal Aviation Administration, or the Federal Emergency Management Agency. Federal actions not affecting listed species or critical habitat—and actions on State, Tribal, local, or private lands that are not federally funded, authorized, or carried out by a Federal agency—do not require section 7 consultation. Federal agencies should coordinate with the Sacramento Fish and Wildlife Office (see **FOR FURTHER INFORMATION CONTACT**) with any specific questions on section 7 consultation and conference requirements.

Section 9 of the Act provides a specific list of prohibitions for endangered species but does not provide these same prohibitions for threatened species. Instead, pursuant to section 4(d) of the Act, for any species listed as a threatened species, the Secretary must issue protective regulations that are “necessary and advisable to provide for the conservation of such species” (these are referred to as “4(d) rules”). Additional measures for the Clear Lake hitch are described below (see Protective Regulations Under Section 4(d) of the Act, below).

We may issue permits to carry out otherwise prohibited activities involving threatened wildlife under certain circumstances. Regulations governing permits for threatened wildlife are codified at 50 CFR 17.32, and general Service permitting regulations are codified at 50 CFR part 13. With regard to threatened wildlife, a permit may be issued: for scientific purposes, for enhancing the propagation or survival of the species, or for take incidental to otherwise lawful activities. The statute also contains certain exemptions from the prohibitions, which are found in sections 9 and 10 of the Act.

II. Protective Regulations Under Section 4(d) of the Act

Background

As discussed in Available Conservation Measures, section 9 of the Act provides a specific list of prohibitions for endangered species but does not provide these same prohibitions for threatened species. Instead, pursuant to section 4(d) of the Act, for any species listed as a threatened species, the Secretary must issue protective regulations that are

“necessary and advisable to provide for the conservation of such species” (these are referred to as “4(d) rules”). Section 4(d) of the Act contains two sentences. The first sentence states that the Secretary shall issue such regulations as she deems necessary and advisable to provide for the conservation of species listed as threatened species.

Conservation is defined in the Act to mean the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to the Act are no longer necessary. Additionally, the second sentence of section 4(d) of the Act states that the Secretary may by regulation prohibit with respect to any threatened species any act prohibited under section 9(a)(1), in the case of fish or wildlife, or section 9(a)(2), in the case of plants. With these two sentences in section 4(d), Congress delegated broad authority to the Secretary to determine what protections would be necessary and advisable to provide for the conservation of threatened species, and even broader authority to put in place any of the section 9 prohibitions, for a given species. Courts have recognized the extent of the Secretary’s discretion under section 4(d) to develop rules that are appropriate for the conservation of a species. For example, courts have upheld, as a valid exercise of agency authority, rules developed under section 4(d) that included limited prohibitions against takings (see *Alsea Valley Alliance v. Lautenbacher*, 2007 WL 2344927 (D. Or. 2007); *Washington Environmental Council v. National Marine Fisheries Service*, 2002 WL 511479 (W.D. Wash. 2002)). Courts have also upheld 4(d) rules that do not address all of the threats a species faces (see *State of Louisiana v. Verity*, 853 F.2d 322 (5th Cir. 1988)). As noted in the legislative history when the Act was initially enacted, “once an animal is on the threatened list, the Secretary has an almost infinite number of options available to [them] with regard to the permitted activities for those species. [They] may, for example, permit taking, but not importation of such species. [They] may, for example, permit taking, but not importation of such species, or [they] may choose to forbid both taking and importation but allow the transportation of such species” (H.R. Rep. No. 412, 93rd Cong., 1st Sess. 1973).

Under our 4(d) authorities, we put in place protections intended to both prevent a threatened species from becoming an endangered species and to promote its recovery. We have two ways to put in place these protections for a

threatened species: (1) we can issue a species-specific 4(d) rule (at 50 CFR 17.40–17.47 or 17.73–17.74), which would contain all of the protective regulations for that species; or (2) we can apply a “blanket rule” (for more information, see 89 FR 23919, April 5, 2024), which extends to threatened species without a species-specific rule all of the prohibitions that apply to endangered species under section 9 (with certain exceptions applicable to threatened species).

Both “blanket rules” and species-specific 4(d) rules explain what is prohibited for a threatened species, thus making the activity unlawful without a permit or authorization under the Act for the prohibited activity unless otherwise excepted in the 4(d) rule (species-specific 4(d) rules may also include affirmative requirements). Section 4(d) rules are therefore directly related to what actions may require permits in the future. As discussed in Available Conservation Measures, permits may be issued for purposes described in our threatened species permitting regulations at 50 CFR 17.32 and 17.72, including for recovery actions, conservation benefit agreements (previously referred to as candidate conservation agreements with assurances and safe harbor agreements), or habitat conservation plans. We may also except otherwise prohibited activities through a 4(d) rule itself, in which case threatened species permits would not be required for those activities. For example, there are two categories of exceptions that we frequently include in 4(d) rules, and these are for otherwise prohibited acts or forms or amounts of “take” that are: (1) unavoidable while conducting beneficial actions for the species, or (2) considered inconsequential (de minimis) to the conservation of the species. For otherwise prohibited take activities that require section 10 permits, programmatic approaches—such as general conservation plans and template habitat conservation plans—may be available as another way for project proponents to comply with take prohibitions or requirements applicable to one or more species while reducing the time that would otherwise be associated with developing individual permit applications. In addition, the Service and project proponents can reduce the need for such permits by developing standardized conservation measures that avoid the risk of “take.”

The provisions of the Clear Lake hitch’s proposed protective regulations under section 4(d) of the Act are one of many tools that we would use to promote the conservation of the Clear

Lake hitch. The proposed protective regulations would apply only if and when we make final the listing of the Clear Lake hitch as a threatened species. Nothing in 4(d) rules change in any way the recovery planning provisions of section 4(f) of the Act or the consultation requirements under section 7 of the Act. As mentioned previously in Available Conservation Measures, section 7(a)(2) of the Act requires Federal agencies, including the Service, to ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of designated critical habitat of such species. In addition, even before the listing of any species or the designation of its critical habitat is finalized, section 7(a)(4) of the Act requires Federal agencies to confer with the Service on any agency action which is likely to jeopardize the continued existence of any species proposed to be listed under the Act or result in the destruction or adverse modification of critical habitat proposed to be designated for such species. These requirements are the same for a threatened species regardless of what is included in its 4(d) rule.

Whether a threatened species is protected through a “blanket rule” or a species-specific 4(d) rule, protective regulations do not alter section 7 obligations, including the criteria for informal or formal consultations or the analytical process used for biological opinions or concurrence letters. Section 7 consultation is required for Federal actions that “may affect” a listed species regardless of whether take caused by the activity is prohibited or excepted by a 4(d) rule (the “blanket rule” or a species-specific 4(d) rule).

For example, as with an endangered species, if a Federal agency determines that an action is “not likely to adversely affect” a threatened species, this will require the Service’s written concurrence (50 CFR 402.13(c)). Similarly, if a Federal agency determines that an action is “likely to adversely affect” a threatened species, the action will require formal consultation with the Service and the formulation of a biological opinion (50 CFR 402.14(a)). Because consultation obligations and processes are unaffected by 4(d) rules, we may consider developing tools to streamline future intra-Service and interagency consultations for actions that result in forms of take that are not prohibited by the 4(d) rule (but that still require consultation). These tools may include consultation guidance; streamlined,

online consultation processes via the Service’s digital project planning tool (Information for Planning and Consultation; <https://ipac.ecosphere.fws.gov/>); template language for biological opinions; or programmatic consultations.

Provisions of the Proposed 4(d) Rule

Exercising the Secretary’s authority under section 4(d) of the Act, we have developed a proposed rule that is designed to address the Clear Lake hitch’s conservation needs. As discussed above under Summary of Biological Status and Threats, we have concluded that the Clear Lake hitch is likely to become in danger of extinction within the foreseeable future primarily due to habitat loss, degradation, and modification; nonnative species’ predation; competition; and the effects of climate change. Section 4(d) requires the Secretary to issue such regulations as she deems necessary and advisable to provide for the conservation of each threatened species and authorizes the Secretary to include among those protective regulations any of the prohibitions that section 9(a)(1) of the Act prescribes for endangered species. We are not required to make a “necessary and advisable” determination when we apply or do not apply specific section 9 prohibitions to a threatened species (In re: Polar Bear Endangered Species Act Listing and 4(d) Rule Litigation, 818 F. Supp. 2d 214, 228 (D.D.C. 2011) (citing *Sweet Home Chapter of Cmty. for a Great Or. v. Babbitt*, 1 F.3d 1, 8 (D.C. Cir. 1993), *rev’d on other grounds*, 515 U.S. 687 (1995))). Nevertheless, even though we are not required to make such a determination, we have chosen to be as transparent as possible and explain below why we find that, if finalized, the protections, prohibitions, and exceptions in this proposed rule as a whole satisfy the requirement in section 4(d) of the Act to issue regulations deemed necessary and advisable to provide for the conservation of the Clear Lake hitch.

The protective regulations we are proposing for the Clear Lake hitch incorporate prohibitions from the Act’s section 9(a)(1) to address the threats to the subspecies. The prohibitions of section 9(a)(1) of the Act, and implementing regulations codified at 50 CFR 17.21, make it illegal for any person subject to the jurisdiction of the United States to commit, to attempt to commit, to solicit another to commit, or to cause to be committed any of the following acts with regard to any endangered wildlife: (1) import into, or export from, the United States; (2) take (which

includes harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct) within the United States, within the territorial sea of the United States, or on the high seas; (3) possess, sell, deliver, carry, transport, or ship, by any means whatsoever, any such wildlife that has been taken illegally; (4) deliver, receive, carry, transport, or ship in interstate or foreign commerce, by any means whatsoever and in the course of commercial activity; or (5) sell or offer for sale in interstate or foreign commerce. This protective regulation includes all of these prohibitions because the Clear Lake hitch is at risk of extinction within the foreseeable future and putting these prohibitions in place would help prevent further declines in the subspecies, preserve the species remaining populations, and decrease synergistic, negative effects from other ongoing or future threats.

In particular, this proposed 4(d) rule would provide for the conservation of the Clear Lake hitch by prohibiting the following activities, unless they fall within specific exceptions or are otherwise authorized or permitted: importing or exporting; take; possession and other acts with unlawfully taken specimens; delivering, receiving, carrying, transporting, or shipping in interstate or foreign commerce in the course of commercial activity; or selling or offering for sale in interstate or foreign commerce. Under the Act, “take” means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Some of these provisions have been further defined in regulations at 50 CFR 17.3. Take can result knowingly or otherwise, by direct and indirect impacts, intentionally or incidentally. Regulating take would help to sustain water quality and water flow within the tributaries and improve reproductive success, prevent further declines preserve or improve the resiliency of the remaining populations, and decrease synergistic, negative effects from other ongoing or future threats. Therefore, we propose to prohibit take of the Clear Lake hitch, except for take resulting from those actions and activities specifically excepted by the 4(d) rule.

Exceptions to the prohibition on take would include all of the general exceptions to the prohibition on take of endangered wildlife, as set forth in 50 CFR 17.21, and additional exceptions, as described below.

Despite these prohibitions regarding threatened species, we may under certain circumstances issue permits to carry out one or more otherwise

prohibited activities, including those described above. The regulations that govern permits for threatened wildlife state that the Director may issue a permit authorizing any activity otherwise prohibited with regard to threatened species. These include permits issued for the following purposes: for scientific purposes, to enhance propagation or survival, for economic hardship, for zoological exhibition, for educational purposes, for incidental taking, or for special purposes consistent with the purposes of the Act (50 CFR 17.32). The statute also contains certain exemptions from the prohibitions, which are found in sections 9 and 10 of the Act.

In addition, to further the conservation of the species, any employee or agent of the Service, any other Federal land management agency, the National Marine Fisheries Service, a State conservation agency, or a federally recognized Tribe, who is designated by their agency or Tribe for such purposes, may, when acting in the course of their official duties, take threatened wildlife without a permit if such action is necessary to: (i) Aid a sick, injured, or orphaned specimen; (ii) dispose of a dead specimen; (iii) salvage a dead specimen that may be useful for scientific study; or (iv) remove specimens that constitute a demonstrable but nonimmediate threat to human safety, provided that the taking is done in a humane manner; the taking may involve killing or injuring only if it has not been reasonably possible to eliminate such threat by live capturing and releasing the specimen unharmed, in an appropriate area.

We recognize the special and unique relationship that we have with our State natural resource agency partners in contributing to conservation of listed species. State agencies often possess scientific data and valuable expertise on the status and distribution of endangered, threatened, and candidate species of wildlife and plants. State agencies, because of their authorities and their close working relationships with local governments and landowners, are in a unique position to assist us in implementing all aspects of the Act. In this regard, section 6 of the Act provides that we must cooperate to the maximum extent practicable with the States in carrying out programs authorized by the Act. Therefore, any qualified employee or agent of a State conservation agency that is a party to a cooperative agreement with us in accordance with section 6(c) of the Act, who is designated by his or her agency for such purposes, would be able to conduct activities designed to conserve

the Clear Lake hitch that may result in otherwise prohibited take without additional authorization.

The proposed 4(d) rule would also provide for the conservation of the species by allowing exceptions that incentivize conservation actions or that, while they may have some minimal level of take of the Clear Lake hitch, are not expected to rise to the level that would have a negative impact (*i.e.*, would have only de minimis impacts) on the subspecies’ conservation. The proposed exceptions to these prohibitions include activities associated with the cleanup of illegal cannabis cultivation sites in the Clear Lake watershed, Tribal collection, fish rescues, fuels and fire management activities, habitat management and restoration, and nonnative fish species removal (described below) that are expected to have negligible impacts to the Clear Lake hitch and its habitat.

Cleanup of Illegal Cannabis Cultivation Sites

Illegal cannabis cultivation in California has been an ongoing problem, and illegal grows are known to occur in Lake County within the Clear Lake hitch’s range (Lake County News 2023, entire; California Statewide Law Enforcement Association 2020, entire). Although species-specific studies on the impact that illegal cannabis grows have on the Clear Lake hitch are not currently available, these illegal cannabis sites are known to impact fish and their habitats, not only during active operation but also when sites are left abandoned. As described above in the Threats section, many pesticides can be highly toxic and used illegally at cannabis grow sites. Fertilizers are also used at these sites. Growers can add these chemicals to their irrigation systems, causing the chemicals to seep into the surrounding soil and waterways (California Department of Pesticide Regulation 2021, p. 2; USDA 2023, entire). Fertilizers affect the water quality and may increase cyanobacteria blooms and fish kills (Baker 2018, p. 6). Water diversions associated with illegal cannabis cultivation sites, block fish passage, change flow regimes, and cause other secondary effects (Baker 2018, p. 6).

Cleanup efforts to address chemical contamination and water diversion structures from these illegal grow sites will help protect the surrounding ecosystem and discourage other growers from returning to the same sites (USDA 2023, entire). During cleanup efforts, some localized, short-term disturbances to Clear Lake hitch habitat may occur if activities occur within or adjacent to

that habitat. Implementation of these cleanup activities will not appreciably reduce the likelihood of survival and recovery of the Clear Lake hitch and will result in a long-term benefit to the subspecies and surrounding ecosystem. Therefore, we propose to except take incidental to otherwise lawful activities that remove toxicants, other chemicals, and related water diversion infrastructure from illegal cannabis cultivation sites in the Clear Lake watershed.

Tribal Collection

The Clear Lake area is one of the earliest known sites to be occupied by Native Americans, approximately 10,000 years ago (Richerson et al. 2008, p. A259). For their subsistence, the local Pomo Tribes historically relied on the large spawning runs of hitch and other native migrating fish during the spring, drying and storing them to eat throughout the year. Tribes continued to harvest hitch until the mid-1980s, when the spawning runs began to decline (Big Valley Environmental Protection Agency 2013 in CDFW 2014, p. 26). California State regulations allowed capture of Clear Lake hitch on tributaries by hand or dip-net until the subspecies was designated a candidate for State listing under the CESA (CDFW 2014, p. 26).

In recognizing the Tribe's long-standing relationship to the subspecies, we propose to except take caused by collection of Clear Lake hitch by members of federally recognized Tribes for ceremonial use or traditional consumption if the collection is conducted pursuant to a Tribal conservation plan.

Fish Rescues

Clear Lake hitch may become stranded during drought or at other times when there is low water availability. Due to their reliance on connectivity between tributaries and lakes for the reproductive cycle, a reduction of flow in the tributaries during the spawning season can completely eliminate or greatly reduce the likelihood for successful reproduction or recruitment or both. The effects of drought will affect the entire subspecies because of its inherently narrow range and will result in strandings. Several entities aid stranded Clear Lake hitch, including State, Federal, Tribal, local, and private individuals.

Therefore, we propose to except take caused by rescue of individual Clear Lake hitch that are at risk of stranding and eventual death in drying or warming pools, and the subsequent

transport and release into a flowing, connected tributary stream or into a larger waterbody (e.g., Clear Lake, Blue Lakes, Tule Lake).

Fuels and Fire Management Activities

In certain areas, the use of fire and wildfire management such as prescribed burns, fuel reduction activities, and maintenance of fuel breaks (not including the use of heavy equipment such as bulldozers, backhoes, or tractors) may assist in protecting and maintaining land adjacent to the aquatic systems used by the Clear Lake hitch.

Establishing and maintaining required minimum vegetation clearance from dwellings or structures to reduce wildland fire risks to human life and property may assist in protecting and maintaining habitat for the Clear Lake hitch by controlling erosion and improving water quality. This process includes activities necessary to maintain the minimum clearance (defensible space) requirement from any occupied dwelling or occupied structure, or to the property line, whichever is nearer, to provide reasonable fire safety and to reduce wildfire risks consistent with the State of California fire codes or local fire codes/ordinances. Therefore, we propose to except take incidental to an otherwise lawful activity caused by fuels and fire management activities (such as prescribed fire) to reduce the risk or severity of catastrophic wildfire, and when such activities will be carried out in accordance with an established and recognized fuels or forest management plan that includes measures to minimize impacts to the Clear Lake hitch or aquatic habitats and will result in conservation benefits to the Clear Lake hitch.

Habitat Management and Restoration

Clear Lake hitch individuals require connectivity to lakes and tributaries throughout their lives. Different life stages depend on different habitat types. Tributaries are used for spawning and successful reproduction. During the spawning season, most adults likely migrate into the connected tributaries; however, some reproductive adults may stay within the lake and spawn along the shore, the mouth of tributaries, or in backwater areas (e.g., Rodman Slough in Clear Lake). Outside of the spawning season, the Clear Lake hitch is primarily found in Clear Lake or Thurston Lake, but can also be found in Tule Lake, the Blue Lakes, and other permanent waterbodies such as reservoirs and ponds. Within the lacustrine habitats, the subspecies can be found in either the littoral zone (nearshore) as juveniles or the limnetic zone (sun-lit, offshore

open water) as adults. During extreme drought conditions, the only successful reproduction may be within the lakes.

Nonnative vegetative growth along the lake's shoreline can outcompete the growth of important native wetland plant species, such as tule. Nonnative plant species, such as Himalayan blackberry (*Rubus armeniacus*), growing along the tributaries can become so overgrown that they become passage barriers or they outcompete native species such as willows and cottonwoods. Removal and maintenance of excessive nonnative vegetation may assist the restoration of wetland and riparian habitats throughout the watershed so that these habitats can be used as breeding and rearing habitat for the Clear Lake hitch.

Therefore, we propose to except take incidental to otherwise lawful activity caused by habitat management and restoration efforts that specifically provide for the habitat needs of the Clear Lake hitch and include measures that minimize impacts to the subspecies and its habitat. These efforts must be carried out in accordance with finalized conservation plans or strategies for the Clear Lake hitch that have the approval of appropriate State or Federal agencies. These activities will most likely have some limited short-term impacts but overall will provide for conservation of the subspecies.

Nonnative Fish Species Removal

As noted earlier in this document, 25 different species of nonnative fish have been introduced into Clear Lake for recreational or biological control purposes, and although not all of them have become established, about 20 are still found in the lake today (Thompson et al. 2013, pp. 12–17). All of the piscivorous species in Clear Lake are potential predators of the Clear Lake hitch, and there have been accounts of the subspecies in the digestive tracts of both largemouth bass and channel catfish (Macedo 1994, p. 5; Moyle et al. 1995, pp. 154–155; Moyle et al. 2014, p. 10). Anecdotal reports suggest the Clear Lake hitch may be a main prey-item for largemouth bass. Predation and competition from the nonnative species will continue to affect the Clear Lake hitch at the individual, population, and subspecies level into the future throughout its range, reducing survival, reproduction, and recruitment, which reduces resiliency by decreasing the size of the spawning and overall population.

Nonnative species removal will significantly increase the viability of the Clear Lake hitch. Actions with the primary or secondary purpose of removing nonnative fish species that

compete with, predate upon, or degrade the habitat of the Clear Lake hitch are beneficial to the Clear Lake hitch. Therefore, we propose to exempt take incidental to otherwise lawful activity caused by removal or eradication of nonnative fish species. This exception does not include actions that disturb habitat or involve the use of chemicals.

III. Critical Habitat

Background

Section 4(a)(3) of the Act requires that, to the maximum extent prudent and determinable, we designate a species' critical habitat concurrently with listing the species. Critical habitat is defined in section 3 of the Act as:

(1) The specific areas within the geographical area occupied by the species, at the time it is listed in accordance with the Act, on which are found those physical or biological features:

(a) Essential to the conservation of the species, and

(b) Which may require special management considerations or protection; and

(2) Specific areas outside the geographical area occupied by the species at the time it is listed, upon a determination that such areas are essential for the conservation of the species.

Our regulations at 50 CFR 424.02 define the geographical area occupied by the species as an area that may generally be delineated around species' occurrences, as determined by the Secretary (*i.e.*, range). Such areas may include those areas used throughout all or part of the species' life cycle, even if not used on a regular basis (*e.g.*, migratory corridors, seasonal habitats, and habitats used periodically, but not solely by vagrant individuals).

Conservation, as defined under section 3 of the Act, means to use and the use of all methods and procedures that are necessary to bring an endangered or threatened species to the point at which the measures provided pursuant to the Act are no longer necessary. Such methods and procedures include, but are not limited to, all activities associated with scientific resources management such as research, census, law enforcement, habitat acquisition and maintenance, propagation, live trapping, and transplantation, and, in the extraordinary case where population pressures within a given ecosystem cannot be otherwise relieved, may include regulated taking.

Critical habitat receives protection under section 7 of the Act through the

requirement that each Federal action agency ensure, in consultation with the Service, that any action they authorize, fund, or carry out is not likely to result in the destruction or adverse modification of designated critical habitat. The designation of critical habitat does not affect land ownership or establish a refuge, wilderness, reserve, preserve, or other conservation area. Such designation also does not allow the government or public to access private lands. Such designation does not require implementation of restoration, recovery, or enhancement measures by non-Federal landowners. Rather, designation requires that, where a landowner requests Federal agency funding or authorization for an action that may affect an area designated as critical habitat, the Federal agency consult with the Service under section 7(a)(2) of the Act. If the action may affect the listed species itself (such as for occupied critical habitat), the Federal agency would have already been required to consult with the Service even absent the designation because of the requirement to ensure that the action is not likely to jeopardize the continued existence of the species. Even if the Service were to conclude after consultation that the proposed activity is likely to result in destruction or adverse modification of the critical habitat, the Federal action agency and the landowner are not required to abandon the proposed activity, or to restore or recover the species; instead, they must implement "reasonable and prudent alternatives" to avoid destruction or adverse modification of critical habitat.

Under the first prong of the Act's definition of critical habitat, areas within the geographical area occupied by the species at the time it was listed are included in a critical habitat designation if they contain physical or biological features (1) which are essential to the conservation of the species and (2) which may require special management considerations or protection. For these areas, critical habitat designations identify, to the extent known using the best scientific data available, those physical or biological features that are essential to the conservation of the species (such as space, food, cover, and protected habitat).

Under the second prong of the Act's definition of critical habitat, we can designate critical habitat in areas outside the geographical area occupied by the species at the time it is listed, upon a determination that such areas are essential for the conservation of the species.

Section 4(b)(2) of the Act requires that we designate critical habitat on the basis of the best scientific data available. Further, our Policy on Information Standards Under the Endangered Species Act (published in the **Federal Register** on July 1, 1994 (59 FR 34271)), the Information Quality Act (section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (Pub. L. 106–554; H.R. 5658)), and our associated Information Quality Guidelines provide criteria, establish procedures, and provide guidance to ensure that our decisions are based on the best scientific data available. They require our biologists, to the extent consistent with the Act and with the use of the best scientific data available, to use primary and original sources of information as the basis for recommendations to designate critical habitat.

When we are determining which areas should be designated as critical habitat, our primary source of information is generally the information compiled in the SSA report and information developed during the listing process for the species. Additional information sources may include any generalized conservation strategy, criteria, or outline that may have been developed for the species; the recovery plan for the species; articles in peer-reviewed journals; conservation plans developed by States and counties; scientific status surveys and studies; biological assessments; other unpublished materials; or experts' opinions or personal knowledge. Habitat is dynamic, and species may move from one area to another over time.

We recognize that critical habitat designated at a particular point in time may not include all of the habitat areas that we may later determine are necessary for the recovery of the species. For these reasons, a critical habitat designation does not signal that habitat outside the designated area is unimportant or may not be needed for recovery of the species. Areas that are important to the conservation of the species, both inside and outside the critical habitat designation, will continue to be subject to: (1) Conservation actions implemented under section 7(a)(1) of the Act; (2) regulatory protections afforded by the requirement in section 7(a)(2) of the Act for Federal agencies to ensure their actions are not likely to jeopardize the continued existence of any endangered or threatened species; and (3) the prohibitions found in the 4(d) rule. Federally funded or permitted projects affecting listed species outside their designated critical habitat areas may

still result in jeopardy findings in some cases. These protections and conservation tools will continue to contribute to recovery of the species. Similarly, critical habitat designations made on the basis of the best scientific data available at the time of designation will not control the direction and substance of future recovery plans, habitat conservation plans (HCPs), or other species conservation planning efforts if new information available at the time of those planning efforts calls for a different outcome.

Critical Habitat Determinability

Our regulations at 50 CFR 424.12(a)(2) state that critical habitat is not determinable when one or both of the following situations exist:

- (i) Data sufficient to perform required analyses are lacking, or
- (ii) The biological needs of the species are not sufficiently well known to identify any area that meets the definition of “critical habitat.”

We reviewed the available information pertaining to the biological needs of the subspecies and habitat characteristics where this subspecies is located, but sufficient data to perform the required consideration of economic impacts are lacking at this time.

Therefore, we conclude that the designation of critical habitat for the Clear Lake hitch is not determinable at this time. The Act allows the Service an additional year to publish a critical habitat designation that is not determinable at the time of listing (16 U.S.C. 1533(b)(6)(C)(ii)).

Required Determinations

Clarity of the Rule

We are required by E.O.s 12866 and 12988 and by the Presidential Memorandum of June 1, 1998, to write all rules in plain language. This means that each rule we publish must:

- (1) Be logically organized;
- (2) Use the active voice to address readers directly;
- (3) Use clear language rather than jargon;
- (4) Be divided into short sections and sentences; and
- (5) Use lists and tables wherever possible.

If you feel that we have not met these requirements, send us comments by one of the methods listed in ADDRESSES. To

better help us revise the rule, your comments should be as specific as possible. For example, you should tell us the numbers of the sections or paragraphs that are unclearly written, which sections or sentences are too long, the sections where you feel lists or tables would be useful, etc.

National Environmental Policy Act (42 U.S.C. 4321 et seq.)

Regulations adopted pursuant to section 4(a) of the Act are exempt from the National Environmental Policy Act (NEPA; 42 U.S.C. 4321 et seq.) and do not require an environmental analysis under NEPA. We published a notice outlining our reasons for this determination in the **Federal Register** on October 25, 1983 (48 FR 49244). This includes listing, delisting, and reclassification rules, as well as critical habitat designations and species-specific protective regulations promulgated concurrently with a decision to list or reclassify a species as threatened. The courts have upheld this position (e.g., *Douglas County v. Babbitt*, 48 F.3d 1495 (9th Cir. 1995) (critical habitat); *Center for Biological Diversity v. U.S. Fish and Wildlife Service*, 2005 WL 2000928 (N.D. Cal. Aug. 19, 2005) (concurrent 4(d) rule)).

Government-to-Government Relationship With Tribes

In accordance with the President’s memorandum of April 29, 1994 (Government-to-Government Relations with Native American Tribal Governments; 59 FR 22951, May 4, 1994), E.O. 13175 (Consultation and Coordination with Indian Tribal Governments), the President’s memorandum of November 30, 2022 (Uniform Standards for Tribal Consultation; 87 FR 74479, December 5, 2022), and the Department of the Interior’s manual at 512 DM 2, we readily acknowledge our responsibility to communicate meaningfully with federally recognized Tribes and Alaska Native Corporations (ANCs) on a government-to-government basis. In accordance with Secretary’s Order 3206 of June 5, 1997 (American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act), we readily acknowledge our responsibilities to work directly with Tribes in developing programs for

healthy ecosystems, to acknowledge that Tribal lands are not subject to the same controls as Federal public lands, to remain sensitive to Indian culture, and to make information available to Tribes. We contacted all federally recognized Tribes in the range of the Clear Lake hitch during the initiation of our SSA development process. Two of the local Tribes provided technical review of the SSA report. We will continue to work with relevant Tribal entities during the development of a final rule for listing of, and a proposed rule for the designation of critical habitat for, the Clear Lake hitch.

List of Subjects in 50 CFR Part 17

Endangered and threatened species, Exports, Imports, Plants, Reporting and recordkeeping requirements, Transportation, Wildlife.

Proposed Regulation Promulgation

Accordingly, we propose to amend part 17, subchapter B of chapter I, title 50 of the Code of Federal Regulations, as set forth below:

PART 17—ENDANGERED AND THREATENED WILDLIFE AND PLANTS

- 1. The authority citation for part 17 continues to read as follows:

Authority: 16 U.S.C. 1361–1407; 1531–1544; and 4201–4245, unless otherwise noted.

- 2. In § 17.11, in paragraph (h), amend the List of Endangered and Threatened Wildlife by adding an entry for “Hitch, Clear Lake” in alphabetical order under FISHES to read as follows:

§ 17.11 Endangered and threatened wildlife.

* * * * *
(h) * * *

Common name	Scientific name	Where listed	Status	Listing citations and applicable rules
* FISHES	*	*	*	*

Common name	Scientific name	Where listed	Status	Listing citations and applicable rules
* * * * *	* * * * *	* * * * *	* * * * *	* * * * *
Hitch, Clear Lake	<i>Lavinia exilicauda chi</i>	Wherever found	T	[Federal Register citation when published as a final rule]; 50 CFR 17.44(mm). ^{4d}
* * * * *	* * * * *	* * * * *	* * * * *	* * * * *

■ 3. Amend § 17.44 by adding paragraph (mm) to read as follows:

§ 17.44 Species-specific rules—fishes.

* * * * *

(mm) Clear Lake hitch (*Lavinia exilicauda chi*).

(1) *Prohibitions.* The following prohibitions that apply to endangered wildlife also apply to the Clear Lake hitch. Except as provided under paragraph (mm)(2) of this section and §§ 17.4 and 17.5, it is unlawful for any person subject to the jurisdiction of the United States to commit, to attempt to commit, to solicit another to commit, or cause to be committed any of the following acts in regard to this species:

(i) Import or export, as set forth at § 17.21(b) for endangered wildlife.

(ii) Take, as set forth at § 17.21(c)(1) for endangered wildlife.

(iii) Possession and other acts with unlawfully taken specimens, as set forth at § 17.21(d)(1) for endangered wildlife.

(iv) Interstate or foreign commerce in the course of a commercial activity, as set forth at § 17.21(e) for endangered wildlife.

(v) Sale or offer for sale, as set forth at § 17.21(f) for endangered wildlife.

(2) *Exceptions from prohibitions.* In regard to this species, you may:

(i) Conduct activities as authorized by a permit under § 17.32.

(ii) Take, as set forth at § 17.21(c)(2) through (4) for endangered wildlife.

(iii) Take, as set forth at § 17.31(b).

(iv) Possess and engage in other acts with unlawfully taken wildlife, as set forth at § 17.21(d)(2) for endangered wildlife.

(v) Take incidental to an otherwise lawful activity caused by:

(A) Activities that remove toxicants, other chemicals, and related water diversion infrastructure from illegal cannabis cultivation sites in the Clear Lake watershed.

(B) Fuels and fire management activities (such as prescribed fire) to reduce the risk or severity of catastrophic wildfire, and when such activities will be carried out in accordance with an established and recognized fuels or forest management plan that includes measures to minimize impacts to the Clear Lake hitch or aquatic habitats and will result in conservation benefits to the Clear Lake hitch. This exception does not include the use of heavy equipment, such as bulldozers, backhoes, or tractors, for fuels and fire management activities.

(C) Habitat management and restoration efforts that are specifically designed to provide for the conservation of the Clear Lake hitch's habitat needs

and include measures that minimize impacts to the Clear Lake hitch and its habitat. These efforts must be carried out in accordance with finalized conservation plans or strategies for the Clear Lake hitch that have the approval of appropriate State or Federal agencies.

(D) Removal or eradication of nonnative fish species, including, but not limited to, carp and goldfish, for the conservation benefit of the Clear Lake hitch. This exception does not include actions that disturb habitat or involve the use of chemicals.

(vi) Purposefully take associated with:

(A) Collection of Clear Lake hitch individuals by members of federally recognized Tribes for ceremonial use or traditional Tribal consumption if the collection is conducted pursuant to a Tribal conservation plan.

(B) Activities associated with rescuing Clear Lake hitch individuals that are at risk of stranding in drying or warming pools and relocating them into connected waterways.

50 CFR Part 218

Taking and Importing Marine Mammals; Taking Marine Mammals Incidental to the U.S. Navy Training and Testing Activities in the Hawaii-Southern California Training and Testing Study Area; Proposed Rule

DEPARTMENT OF COMMERCE**National Oceanic and Atmospheric Administration****50 CFR Part 218**

[Docket No. 241220–0334]

RIN 0648–BL72

Taking and Importing Marine Mammals; Taking Marine Mammals Incidental to the U.S. Navy Training and Testing Activities in the Hawaii-Southern California Training and Testing Study Area

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Final rule; notification of issuance of Letters of Authorization.

SUMMARY: NMFS, upon request from the U.S. Navy (Navy), issues these regulations pursuant to the Marine Mammal Protection Act (MMPA) to govern the taking of marine mammals incidental to the training and testing activities conducted in the Hawaii-Southern California Training and Testing (HSTT) Study Area between 2018 and 2025. In 2021, two separate U.S. Navy vessels struck unidentified large whales on two separate occasions, one whale in June 2021 and one whale in July 2021, in waters off Southern California. The takes by vessel strike of the two whales by the U.S. Navy were covered by the existing regulations and Letters of Authorization (LOAs), which authorize the U.S. Navy to take up to three large whales by serious injury or mortality by vessel strike between 2018 and 2025. The Navy reanalyzed the potential of vessel strike in the HSTT Study Area, including the recent strikes, and as a result, requested two additional takes of large whales by serious injury or mortality by vessel strike for the remainder of the current regulatory period. In May 2023, a U.S. Navy vessel struck a large whale in waters off Southern California. NMFS reanalyzed the potential for vessel strike based on new information, including the three strikes, and authorizes two additional takes of large whales by serious injury or mortality by vessel strike for the remainder of the current regulatory period (two takes in addition to the three takes authorized in the current regulations). The Navy's activities qualify as military readiness activities pursuant to the MMPA, as amended by the National Defense Authorization Act for Fiscal Year 2004 (2004 NDAA).

DATES: Effective from January 16, 2025 to December 20, 2025.

ADDRESSES: Copies of the Navy's applications, NMFS' proposed and final rules and subsequent LOAs for these regulations, NMFS' proposed and final rules and subsequent LOAs for the associated 5-year HSTT Study Area regulations, other supporting documents cited herein, and a list of the references cited in this document may be obtained online at: <https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>. SUPPLEMENTARY INFORMATION:**Purpose of Regulatory Action**

These regulations, promulgated under the authority of the MMPA (16 U.S.C. 1361 *et seq.*), modify previous regulations which allow for the authorization of take of marine mammals incidental to the Navy's training and testing activities (which qualify as military readiness activities) from the use of sonar and other transducers, in-water detonations, air guns, impact pile driving/vibratory extraction, and the movement of vessels throughout the HSTT Study Area (50 CFR part 218, subpart H; hereafter “2020 HSTT regulations”).

NMFS received a request from the Navy to modify the 2020 HSTT regulations and LOAs to authorize two additional takes of large whales by serious injury or mortality by vessel strike over the remainder of the HSTT regulatory period. The 2020 HSTT regulations and LOAs authorized the incidental take, by serious injury or mortality, of three large whales by vessel strike. Here, in consideration of the best available science, including updated information related to vessel strikes, NMFS analyzes and authorizes the incidental serious injury or mortality by vessel strike of five large whales over the effective period of the regulations (December 2018–December 2025). The effective period remains unchanged from the existing regulations. Further, the Navy's planned activities remain unchanged; however, this final rule includes two additional mitigation measures and revision of two existing mitigation measures to further reduce the probability of vessel strike, as well as two additional reporting measures (described below in the

Changes from the Proposed Rule to the Final Rule section) from that included in the 2020 HSTT regulations. With the exception of these new mitigation measures and revisions to two existing mitigation measures, the required mitigation and monitoring measures remain unchanged from the 2020 HSTT regulations.

Section 101(a)(5)(A) of the MMPA (16 U.S.C. 1371(a)(5)(A)) directs the Secretary of Commerce (as delegated to NMFS) to allow, upon request, the incidental, but not intentional taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if, after notice and public comment, the agency makes certain findings and issues regulations that set forth permissible methods of taking pursuant to that activity, as well as monitoring and reporting requirements. Section 101(a)(5)(A) of the MMPA and the implementing regulations at 50 CFR part 216, subpart I, provide the legal basis for issuing this final rule and the subsequent LOAs. As directed by this legal authority, this final rule contains mitigation, monitoring, and reporting requirements.

Summary of Major Provisions Within the Final Rule

The following is a summary of the major provisions of this final rule regarding the Navy's activities. Major provisions include, but are not limited to:

- The use of defined powerdown and shutdown zones (based on activity);
- Measures to reduce or eliminate the likelihood of ship strikes;
- Activity limitations in certain areas and times that are biologically important (*i.e.*, for foraging, migration, reproduction) for marine mammals;
- Implementation of a Notification and Reporting Plan (for dead, live stranded, or marine mammals struck by a vessel); and
- Implementation of a robust monitoring plan to improve our understanding of the environmental effects resulting from the Navy training and testing activities.

Additionally, the rule includes an adaptive management component that allows for timely modification of mitigation or monitoring measures based on new information, when appropriate.

Background

The MMPA prohibits the “take” of marine mammals, with certain exceptions. Sections 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1361 *et*

seq.) direct the Secretary of Commerce (as delegated to NMFS) to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and either regulations are issued or, if the taking is limited to harassment, the public is provided with notice of the proposed incidental take authorization and the opportunity to review and submit comments.

Authorization for incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s) and will not have an unmitigable adverse impact on the availability of the species or stock(s) for taking for subsistence uses (where relevant). Further, NMFS must prescribe the permissible methods of taking and other means of effecting the least practicable adverse impact on the affected species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stocks for taking for certain subsistence uses (referred to in this rulemaking as “mitigation”); and requirements pertaining to the monitoring and reporting of such takings. The MMPA defines “take” to mean to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal. The Analysis and Negligible Impact Determination section below discusses the definition of “negligible impact.”

The 2004 NDAA (Pub. L. 108–136) amended section 101(a)(5) of the MMPA to remove the “small numbers” and “specified geographical region” provisions indicated above and amended the definition of “harassment” as applied to a “military readiness activity.” The definition of harassment for military readiness activities (section 3(18)(B) of the MMPA) is (i) any act that injures or has the significant potential to injure a marine mammal or marine mammal stock in the wild (Level A Harassment); or (ii) any act that disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering, to a point where such behavioral patterns are abandoned or significantly altered (Level B harassment). In addition, the 2004 NDAA amended the MMPA as it relates to military readiness activities such that the least practicable adverse impact analysis shall include consideration of

personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity.

The NDAA for Fiscal Year 2019 (2019 NDAA) (Pub. L. 115–232), amended the MMPA to allow incidental take rules for military readiness activities under section 101(a)(5)(A) to be issued for up to 7 years. Prior to this amendment, all incidental take rules under section 101(a)(5)(A) were limited to 5 years.

Under the MMPA implementing regulations, incidental take regulations may be modified, in whole or in part, as new information is developed and after notice and opportunity for public comment (50 CFR 216.105). An LOA must be withdrawn or suspended if, after notice and opportunity for public comment, NMFS determines that the regulations are not being substantially complied with, or the taking is having, or may have, more than a negligible impact on species or stock. (*Id.* at 216.106(e)). Note, in its application, Navy relied on §§ 218.76, and 218.77. These sections outline the process for modification of an LOA without modifying the applicable incidental take regulation. These sections do not apply here because the Navy requested modification of the 2020 HSTT regulations.

Summary of Request

On December 27, 2018, NMFS issued a 5-year final rule governing the taking of marine mammals incidental to Navy training and testing activities conducted in the HSTT Study Area (83 FR 66846; hereafter “2018 HSTT final rule”). Previously, on August 13, 2018, and towards the end of the time period in which NMFS was processing the Navy’s request for the 2018 regulations, the 2019 NDAA amended the MMPA for military readiness activities to allow incidental take regulations to be issued for up to 7 years instead of the previous 5 years. The Navy’s training and testing activities conducted in the HSTT Study Area qualify as military readiness activities pursuant to the MMPA, as amended by the 2004 NDAA. On March 11, 2019, the Navy submitted an application requesting that NMFS extend the 2018 HSTT final rule (83 FR 66846, December 27, 2018) and associated LOAs such that they would cover take incidental to 7 years of training and testing activities instead of 5, extending the expiration date from December 20, 2023 to December 20, 2025. On July 10, 2020, NOAA Fisheries issued regulations (85 FR 41780) to govern the taking of marine mammals incidental to the training and testing activities conducted in the HSTT Study

Area over the course of 7 years, effectively extending the effective period from December 20, 2023 to December 20, 2025.

On March 31, 2022, NMFS received an adequate and complete application (2022 Navy application) from the Navy requesting that NMFS modify the existing regulations and LOAs to authorize two additional takes of large whales by serious injury or mortality by vessel strike over the remainder of the HSTT authorization period. The 2020 HSTT regulations (50 CFR part 218, subpart H) and LOAs authorize the take of marine mammals from the Navy’s training and testing activities in the HSTT Study Area through December 20, 2025. These regulations and LOAs authorize the take of three large whales by serious injury or mortality by vessel strike.

The Navy’s 2022 request is based upon new information regarding U.S. Navy vessel strikes off the coast of Southern California. As described in the 2022 Navy application, in 2021, two separate U.S. Navy vessels struck unidentified large whales off the coast of Southern California on two separate occasions, one whale in June 2021 and one whale in July 2021. Separately, a foreign naval vessel struck two fin whales off the coast of Southern California in May 2021.

In the 2022 Navy application, the Navy proposed no changes to the nature of the specified activities covered by the 2020 HSTT final rule. The Navy stated that the level of activity within and between years would be consistent with that previously analyzed in the 2020 HSTT final rule, and all activities would be conducted within the same boundaries of the HSTT Study Area identified in the 2020 HSTT final rule. The training and testing activities (*e.g.*, equipment and sources used, exercises conducted) are identical to those described and analyzed in the 2020 HSTT final rule, and the mitigation, monitoring, and reporting measures are similar to those described and analyzed in the 2020 HSTT final rule. The only changes included in the Navy’s request are for additional take by serious injury or mortality by vessel strike.

The Navy’s mission is to organize, train, equip, and maintain combat-ready naval forces capable of winning wars, deterring aggression, and maintaining freedom of the seas. This mission is mandated by Federal law (10 U.S.C. 8062), which ensures the readiness of the naval forces of the United States. The Navy executes this responsibility by establishing and executing training programs, including at-sea training and exercises, and ensuring naval forces

have access to the ranges, operating areas (OPAREAs), and airspace needed to develop and maintain skills for conducting naval activities.

For a summary of the training and testing activities within the HSTT Study Area, see the Navy's previous rulemaking and LOA applications submitted for HSTT Phase III activities (October 13, 2017 initial rulemaking and LOA application (hereafter "2017 Navy application") and March 11, 2019 extension rulemaking and LOA application (hereafter "2019 Navy application")) and the 2020 HSTT regulations that were subsequently promulgated, which can be found at: <https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>. These activities are deemed by the Navy necessary to accomplish military readiness requirements and are anticipated to continue into the reasonably foreseeable future. The 2022 Navy application and this rule cover training and testing activities that would occur over the remainder of the effective period of the current regulations, valid from the publication date of this final rule through December 20, 2025.

Summary of the Regulations

NMFS is modifying the incidental take regulations and associated LOAs to cover the same Navy activities covered by the 2020 HSTT regulations but authorize five takes of large whales by serious injury or mortality by vessel strike (two takes in addition to the three takes authorized in the 2020 HSTT regulations). In its 2022 application, the Navy proposed no additional changes and explained that its training and testing activities, including the level of vessel use, remain unchanged. Nearly all mitigation, monitoring, and reporting measures remain unchanged from the 2020 HSTT regulations (85 FR 41780, July 10, 2020) with the exception of two additional mitigation measures (see the Mitigation Measures section of this final rule), revision of two existing mitigation measures (see the Mitigation Measures section of this final rule), and two additional reporting measures resulting from discussions between the Navy and NMFS (see the Reporting section of this final rule).

In response to the Navy's request, we focus our analysis on the new information related to vessel strike. We also review any new information that may be pertinent to our analysis of the impacts from all other activities that comprise Navy's specified activity, and our analysis of mitigation, monitoring, and reporting. Where there is any new

information pertinent to the descriptions, analyses, or findings required to authorize the incidental take for military readiness activities under MMPA section 101(a)(5)(A), that information is provided in the appropriate sections below. Where there is no new information or any new information does not change our previous analysis or findings, we indicate as such and refer the reader to the original analysis in the 2018 HSTT proposed and final rule, 2020 HSTT final rule or the 2019 HSTT Final Environmental Impact Statement (FEIS)/Overseas Environmental Impact Statement (OEIS).

After reviewing all new information and as discussed below, we largely find that our previous analyses and findings remain current and applicable. For vessel strike, we provide a new analysis and authorize two additional takes of large whales, for a total of five takes by serious injury or mortality by vessel strike over the 7-year period. We authorize these additional takes after analyzing the best available scientific information and after considering the effects of the entire specified activity and the total taking as required by MMPA section 101(a)(5)(A). When setting forth the permissible methods of taking pursuant to the activity and other means of effecting the least practicable adverse impact on the species or stock, we require new and modified mitigation and also consider whether to require any new or modified mitigation for the entire specified activity.

The regulatory language included at the end of this final rule, which is published at 50 CFR part 218, subpart H, remains largely the same as that under the HSTT 2020 regulations, except for a small number of technical changes related to the Navy's 2022 request, new and revised mitigation measures, and two new reporting measures. Therefore, in this final rule, we refer the reader to complete analyses described in the 2018 HSTT final rule or an updated analysis in the 2020 HSTT final rule, where appropriate.

Description of the Specified Activity

The Navy requested authorization to take marine mammals incidental to conducting training and testing activities. The Navy has determined that acoustic and explosives stressors are most likely to result in impacts on marine mammals that could rise to the level of harassment. In addition to take by harassment, the Navy has determined that vessel movement may result in serious injury or mortality to marine mammals. Detailed descriptions of these activities are provided in chapter 2 of the 2018 HSTT FEIS/OEIS and in the 2017 Navy application.

Overview of Training and Testing Activities

The Navy routinely trains in the HSTT Study Area in preparation for national defense missions. Training and testing activities and components covered in the 2022 Navy application are described in detail in the *Overview of Training and Testing Activities* sections of the 2018 HSTT proposed rule, the 2018 HSTT final rule, and chapter 2 (*Description of Proposed Action and Alternatives*) of the 2018 HSTT FEIS/OEIS (<http://www.hstteis.com/>). Each military training and testing activity described meets mandated Fleet requirements to deploy ready forces. The Navy proposed no changes to the specified activities

described and analyzed in the 2018 HSTT final rule and subsequent 2020 HSTT final rule. The boundaries of the HSTT Study Area (see figure 2–1 of the 2019 Navy application); the dates and duration of the activities; and the training and testing activities (e.g., equipment and sources used, exercises conducted) analyzed in this final rule are identical to those described and analyzed in the 2020 HSTT final rule and therefore, are not repeated herein. Please see the 2020 HSTT final rule for more information. The manner of vessel movement presented in this final rule is also identical to that analyzed in the 2020 HSTT final rule.

Vessel Strike

Vessel strikes are not specific to any particular training or testing activity but rather, a limited, sporadic, and incidental result of Navy vessel movement within the HSTT Study Area. Vessel strikes from commercial, recreational, and military vessels are known to seriously injure and occasionally kill cetaceans (Abramson *et al.* 2011; Berman-Kowalewski *et al.* 2010; Calambokidis, 2012; Douglas *et al.* 2008; Laggner, 2009; Lammers *et al.* 2003; Van der Hoop *et al.* 2012; Van der Hoop *et al.* 2013; Crum *et al.* 2019), although reviews of the literature on vessel strikes mainly involve collisions between commercial vessels and whales (Jensen and Silber, 2003; Laist *et al.* 2001). Vessel speed, size, and mass are all important factors in determining both the potential likelihood and impacts of a vessel strike to marine mammals (Conn and Silber, 2013; Gende *et al.* 2011; Silber *et al.* 2010; Vanderlaan and Taggart, 2007; Wiley *et al.* 2016). For large vessels, speed and angle of approach can influence the severity of a strike.

Navy vessels transit at speeds that are optimal for fuel conservation or to meet training and testing requirements. Small craft (for purposes of this analysis, less than 18 meters (m) in length) have much more variable speeds (0–50+ knots (kn; 0–92.6 kilometers (km) per hour), dependent on the activity). Submarines generally operate at speeds in the range of 8–13 kn (14.8–24.1 km per hour), and the average speed of large Navy ships range between 10 and 15 kn (18.5 and 27.8 km per hour). While these speeds are considered averages and representative of most events, some vessels need to operate outside of these parameters for certain times or during certain activities. For example, to produce the required relative wind speed over the flight deck, an aircraft carrier engaged in flight operations must adjust its speed through the water

accordingly. Also, there are other instances when vessels would be dead in the water or moving slowly ahead to maintain steerage, such as launch and recovery of a small rigid hull inflatable boat; vessel boarding, search, and seizure training events; or retrieval of a target. There are a few specific events, including high-speed tests of newly constructed vessels, where vessels would operate at higher speeds. By comparison, this is slower than most commercial vessels where full speed for a container ship is typically 24 kn (44.4 km per hour; Bonney and Leach, 2010).

Large Navy vessels (greater than 18 m in length) within the offshore areas of range complexes and testing ranges operate differently from commercial vessels in ways that may reduce the probability of whale collisions. Surface ships operated by or for the Navy have multiple personnel assigned to stand watch at all times when a ship or surfaced submarine is moving through the water (underway). A primary duty of personnel standing watch on surface ships is to detect and report all objects and disturbances sighted in the water that may indicate a threat to the vessel and its crew, such as debris, a periscope, surfaced submarine, or surface disturbance. Per vessel safety requirements, personnel standing watch also report any marine mammals sighted in the path of the vessel as a standard collision avoidance procedure. All vessels proceed at a safe speed so they can take proper and effective action to avoid a collision with any sighted object or disturbance and can be stopped within a distance appropriate to the prevailing circumstances and conditions. As described in the *Standard Operating Procedures* section, the Navy utilizes Lookouts to avoid collisions, and Lookouts are also trained to spot marine mammals so that vessels may change course or take other appropriate action to avoid collisions. Should a vessel strike occur, we consider that it would likely result in incidental take in the form of serious injury and/or mortality and, accordingly, for the purposes of the analysis, we assume that any vessel strike would result in serious injury or mortality.

The Navy proposed no changes to the nature of the specified activities, the training and testing activities, the manner of vessel movement, the speeds at which vessels operate, the number of vessels that would be used during various activities, or the locations in which Navy vessel activity would be concentrated within the HSTT Study Area described in the 2018 HSTT final

rule and referenced in the 2020 HSTT final rule.

Vessel Movement

Vessels used as part of the planned activities include ships, submarines, unmanned vessels, and boats ranging in size from small, 22 feet (ft; 7 m) rigid hull inflatable boats to aircraft carriers with lengths up to 1,092 ft (333 m). The average speed of large Navy ships ranges between 10 and 15 kn (18.5 and 27.8 km per hour) and submarines generally operate at speeds in the range of 8–13 kn (14.8–24.1 km per hour) while a few specialized vessels can travel at faster speeds. Small craft (for purposes of this analysis, less than 18 m in length) have much more variable speeds (0–50+ kn (0–92.6 km per hour), dependent on the activity) but generally range from 10 to 14 kn (18.5 to 25.9 km per hour). From unpublished Navy data, average median speed for large Navy ships in the HSTT Study Area from 2011–2015 varied from 5–10 knots (kn; 9.2–18.5 km per hour) with variations by ship class and location (i.e., slower speeds close to the coast). While these speeds for large and small craft are representative of most events, some vessels need to temporarily operate outside of these parameters. Typical speed of Navy vessels in HSTT core high use areas from 2014–2018 were between 10 and 15 kn (18.5 and 27.8 km per hour; Starcovic and Mintz 2021). This core area is a region including the approaches to San Diego, and immediate offshore areas west of San Diego, centered north and south of San Clemente Island. A full description of Navy vessels that are used during training and testing activities can be found in the 2017 Navy application and chapter 2 (*Description of Proposed Action and Alternatives*) of the 2018 HSTT FEIS/OEIS.

The number of Navy vessels used in the HSTT Study Area varies based on military training and testing requirements, deployment schedules, annual budgets, and other dynamic factors. Most training and testing activities involve the use of vessels. These activities could be widely dispersed throughout the HSTT Study Area but would typically be conducted near naval ports, piers, and range areas. Navy vessel traffic would be especially concentrated near San Diego, California and Pearl Harbor, Hawaii. Based on historical data, we anticipate the annual number of at-sea hours by U.S. Navy vessels in the HSTT action area will be around 26,800 hours per year (Starcovic and Mintz 2021). We expect that about 25 percent of this vessel activity would occur within the Hawaii Range Complex

(HRC) and 75 percent within the Southern California Range Complex (SOCAL; Mintz 2016). There is no seasonal differentiation in Navy vessel use because of continual operational requirements from Combatant Commanders. The majority of large vessel traffic occurs between the installations and the OPAREAs. The transit corridor, notionally defined by the great circle route (*e.g.*, shortest distance) from San Diego to the center of the HRC, as depicted in the 2018 HSTT FEIS/OEIS, is generally used by ships transiting between SOCAL and HRC. While in transit, ships and aircraft would, at times, conduct basic and routine unit-level activities such as gunnery, bombing, and sonar training and maintenance. Of note, support craft would be more concentrated in the coastal waters in the areas of naval installations, ports, and ranges. Activities involving vessel movements occur intermittently and are variable in duration, ranging from a few hours up to weeks. More information on Navy and non-Navy vessel traffic patterns in the HSTT Study Area may be found in several studies prepared by the Navy (Starcovic and Mintz 2021; Mintz, 2016; Mintz and Filadelfo, 2011; Mintz, 2012; Mintz and Parker, 2006).

Foreign Navies

In addition, we note that in some cases, foreign militaries may participate in U.S. Navy training or testing activities in the HSTT Study Area. The Navy does not consider these foreign military activities as part of the “specified activity” under the MMPA, and NMFS defers to the applicant to describe the scope of its request for an authorization.

The participation of foreign navies varies from year to year, but overall is infrequent compared with Navy’s total training and testing activities. The most significant joint training event is the Rim of the Pacific (RIMPAC), a multinational training exercise held every-other-year primarily in the HRC. The participation level of foreign military vessels in U.S. Navy-led training or testing events within the HRC and within SOCAL differs greatly between RIMPAC and non-RIMPAC years. For example, in 2019 (a non-RIMPAC year), there were 0.1 foreign navy surface vessel at-sea days (*i.e.*, 1 day = 24 hours) within HRC and 20 foreign navy at-sea days within SOCAL (Navy 2021). Out of 56 U.S.-led training events in 2019, 4 involved foreign navy vessels, with an average time per event of 8.7 hours. In 2020, a RIMPAC year, foreign vessels participating in U.S. Navy-led events accounted for 32 at-sea days in the HRC

from August through September (some of this activity occurred after the RIMPAC exercise). During RIMPAC 2022, foreign vessels operated and/or transited through the HRC for 576 hours (24 days). In 2023 (another non-RIMPAC year), there was no foreign vessel participation within SOCAL. Even in a RIMPAC year, the days at sea for foreign militaries engaged in a Navy-led training or testing activity accounts for a small, but variable, percentage compared to the U.S. Navy activities. For instance, the 2020 foreign military participation (a RIMPAC-year) was 1.5 percent of the U.S. Navy’s average days at sea (32 days out of an estimated 2,056 days at sea). During RIMPAC 2024, twenty-five foreign surface vessels participated for a combined 5,000 hours in U.S.-led training events. Therefore, foreign surface vessel activity is estimated to conservatively account for up to 10 percent of the U.S. Navy’s annual at sea time in HSTT (205 days out of an estimated 2,056 days at sea).

According to the U.S. Navy, consistent with customary international law, when a foreign military vessel participates in a U.S. Navy exercise within the U.S. territorial sea (*i.e.*, 0 to 12 nautical miles (nmi); 0 to 22.2 km) from shore), the U.S. Navy will request that the foreign vessel follow the U.S. Navy’s mitigation measures for that particular event. When a foreign military vessel participates in a U.S. Navy exercise beyond the U.S. territorial sea but within the U.S. Exclusive Economic Zone, the U.S. Navy will encourage the foreign vessel to follow the U.S. Navy’s mitigation measures for that particular event (Navy 2022a; Navy 2022b). In either scenario (*i.e.*, both within and beyond the territorial sea), U.S. Navy personnel will provide the foreign vessels participating with a description of the mitigation measures to follow.

According to the U.S. Navy, the May 2021 vessel strike of two fin whales by an Australian navy vessel did not occur while that vessel was participating in a U.S. Navy-led training exercise. The Royal Australian Navy vessel was adhering to its standard operating procedures at the time of the strike. The Royal Australian Navy provided a report of the incident, which is discussed below to inform our analysis.

NMFS analyzes the effects of these foreign military activities. First, effects of all past foreign military activities are captured in the baseline for the analysis, through marine mammal abundance estimates and population trends found in the Stock Assessment Reports (SARs). Second, NMFS considers foreign military activities, including recent

strikes, qualitatively in this final rule. For instance, in preparing this rulemaking, NMFS and the U.S. Navy discussed the nature, frequency, and control over joint or U.S. Navy-led training and testing activities with foreign entities to identify opportunities to encourage foreign militaries to adopt mitigation. NMFS and the U.S. Navy examined the Royal Australian Navy 2021 strike report for any lessons that could inform U.S. Navy strike mitigation. NMFS considered the Royal Australian Navy strikes along with other recent U.S. Navy strikes to determine whether these strikes indicate an increased risk of strike by the U.S. Navy in this region during the early summer months. NMFS also considered the species struck in this incident, fin whales, along with other literature, when considering the likelihood of certain species to be struck by the U.S. Navy. NMFS considered the fact that two fin whales were struck by the Royal Australian Navy qualitatively when considering other fin whale population and mortality trends, as well as the authorized take, as part of the negligible impact analysis.

This final rule includes a new reporting measure that requires that the Navy’s annual HSTT reports shall include confirmation that foreign military use of sonar and explosives, when such militaries are participating in a U.S. Navy-led exercise or event, combined with the U.S. Navy’s use of sonar and explosives, would not cause exceedance of the analyzed levels (within each Navy Acoustic Effects Model (NAEMO) modeled sonar and explosive bin) used for estimating predicted impacts, which formed the basis of our acoustic impacts effects analysis that was used to estimate take in this final rule. This new reporting measure will allow NMFS to ensure that its analysis remains valid.

Standard Operating Procedures

For training and testing to be effective, personnel must be able to safely use their sensors and weapon systems as they are intended to be used in a real-world situation and to their optimum capabilities. While standard operating procedures (SOPs) are designed for the safety of personnel and equipment and to ensure the success of training and testing activities, their implementation often yields additional benefits on environmental, socioeconomic, public health and safety, and cultural resources. Because SOPs are essential to safety and mission success, the Navy considers them to be part of the proposed activities under the National Environmental Policy Act

(NEPA) and included them in the environmental analysis. We consider SOPs as part of Navy's specified activity for the purposes of MMPA but also, where procedures are utilized (even in part) to reduce impacts to marine mammal species and Navy's commitment to follow the measures are practicable, certain SOPs may also be required as mitigation. Details on SOPs were provided in the 2018 HSTT proposed rule; please see the 2018 HSTT proposed rule, the 2017 Navy application, and chapter 2 (*Description of Proposed Action and Alternatives*) of the 2018 HSTT FEIS/OEIS for more information.

As stated in its 2022 application, in 2018, the Navy updated its SOPs related to vessel safety to incorporate revised procedures regarding Lookouts for certain ship classes as per the 2021 Surface Ship Navigation Department Organization and Regulations Manual (NAVDORM). The 2021 NAVDORM requires the use of three Lookouts on Navy cruisers and destroyers as compared to the previous requirement of one Lookout when a vessel was underway and not engaged in sonar training or testing. However, as discussed in the Mitigation Measures section below, the Navy informed NMFS that requiring the additional Lookouts as mitigation is not practicable because this SOP may change in response to manning issues and national security needs. Further, since submission of its 2022 application, the Navy has updated its Lookout Training Handbook and implemented other training improvements, as described in the Mitigation Measures section (September 2022).

Comments and Responses

We published a proposed rule in the **Federal Register** on October 3, 2023 (88 FR 68290), with a 45-day comment period. That notice described, in detail, Navy's request for modification of the 2020 HSTT final rule and LOAs, new information regarding the occurrence of large whale strikes by naval vessels in the southern California portion of the HSTT Study Area and NMFS' proposal to authorize two additional takes of large whales by serious injury or mortality. In that notice, we requested public input on the proposed promulgation of modified regulations and associated LOAs for the Navy governing this additional incidental taking of marine mammals. During the 45-day comment period, we received 20 comment submissions. Of this total, one submission was from a non-governmental organization (NGO) and the remainder were from private

citizens. NMFS has reviewed and considered all public comments received on the proposed rule and issuance of the LOAs. All substantive comments and our responses are described below. We organize our comment responses by major categories.

Take Estimates

Comment 1: A commenter recommended ensuring that any modifications to existing regulations or authorizations are based on recent and rigorous scientific evaluations. This can be achieved by conducting regular environmental impact assessments to account for changes in marine mammal populations and habitat conditions.

Response: NMFS concurs with the commenter that modifications to existing regulations or authorizations must be based on rigorous scientific evaluations. NMFS has conducted a rigorous scientific evaluation in the promulgation of this rulemaking and has used the best available science to inform its analysis. These final regulations and LOAs include reporting provisions to ensure compliance and that the most value is obtained from the required monitoring. Monitoring results are considered annually through the adaptive management process described in the Adaptive Management section herein. Further, incidental take authorizations for military readiness activities can be effective for no more than 7 years. Therefore, at minimum, NMFS must reconduct its analysis every 7 years, and in doing so, it considers changes in marine mammal populations and habitats in its analyses. However, during the effective period of an LOA(s), if NMFS were to find that the Navy's activities are having more than a negligible impact on a species or stock, NMFS is required to withdraw or suspend the LOA(s) for a certain time (16 U.S.C. 1371(a)(5)(B)).

Comment 2: A commenter stated that the 2022 Navy application is based on 50 CFR 216.015 [the commenter is likely referring to section 216.105], which allows incidental take regulations to "be modified, in whole or in part, as new information is developed." The commenter asserted that the only "new information" in the 2022 application is the information that the Navy has already reached its 7-year take limit and that failure to meet our own standards does not constitute "new information" in the sense of 50 CFR 216.015. The commenter stated that "new information" for this purpose would be either (1) evidence that allowing two additional takes (and relaxing mitigation procedures as requested in the application) during this time period will

have no impact on threatened cetacean populations or (2) a dramatic increase in the level of military activity in HSTT.

Response: The MMPA provides for the authorization of incidental take caused by specified activities at the request of an applicant, provided certain findings are made. The law directs NMFS to process adequate and complete applications for incidental take authorization, and issue the authorization provided all statutory findings and requirements, as well as all associated legal requirements, are met. Under 50 CFR 216.105, as new information is developed, through monitoring, reporting, or research, the regulations may be modified, in whole or in part, after notice and opportunity for public review. On March 31, 2022, NMFS received an adequate and complete application from the Navy requesting that NMFS modify the existing regulations and LOAs to authorize two additional takes of large whales by serious injury or mortality by vessel strike over the remainder of the HSTT regulatory period based on probabilities derived from a Poisson distribution using new vessel strike data between 2009–2021 in the HSTT Study Area, as well as historical at-sea days in the HSTT Study Area from 2009–2015 and estimated at-sea days for the period from 2016 to 2025, informed by monitoring and reporting. NMFS independently analyzed the request based on updated vessel strike data and days-at-sea, as well as using updated probability methodology, and also determined that the strike of up to two large whales could occur over the remaining duration of the regulations. NMFS, following its own analysis and proposed rule, has determined it is appropriate to promulgate a revised final rule and LOAs pursuant to 16 U.S.C. 1371(a)(5)(A) and 50 CFR 216.105.

Comment 3: A commenter stated that Kuehne *et al.* (2020), referenced in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), indicates that noise from Navy aircraft penetrates more deeply into the water than the Navy or NMFS considered in their analyses. The commenter stated that the study found that noise from aircraft can permeate the water to at least 30 m and that the detected noise level (134 ± 3 dB re 1 μ Pa rms) exceeds volumes that can cause behavioral changes in marine mammals (Houser *et al.* 2013; Kastelein *et al.* 2012; Kuehne *et al.* 2020; Williams *et al.* 2002). The commenter asserted that, therefore, the Navy's reliance on this paper to assert that aircrafts do not impact marine mammals is misplaced, and the proposed rule's dismissal of the

study because it “did not include behavioral observations of wildlife, and the authors’ conclusions about potential impacts to wildlife were unsupported by data from the study” ignores the valid bases for these conclusions.

Response: NMFS disagrees with the commenter that Kuehne *et al.* (2020) shows impacts to marine mammals from Navy’s HSTT activities that were not considered by NMFS and the Navy in their respective analyses. As stated in the comment, the strongest one-second window of underwater sound measured by Kuehne *et al.* (2020) was 134 ± 3 dB RMS re 1 μ Pa rms at 30 m below the sea surface. While sound levels between the hydrophone and the surface may have been stronger than those measured at 30 m (Kuehne *et al.* 2020), for the reasons discussed in the 2023 HSTT proposed rule, there is no new information presented in this study to indicate that exposures closer to the surface or in air would have resulted in behavioral responses that would qualify as take by Level B harassment.

We conclude that the information presented in Kuehne *et al.* (2020) does not reveal effects of the action on marine mammals in a manner or to an extent not already considered. We reiterate that NMFS reviewed the Navy’s analysis and conclusions that aircraft noise will not result in incidental take of marine mammals and finds the analysis and conclusions remain complete and supportable, as stated in the 2018 HSTT final rule and in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023). Please see section 3.7 (Marine Mammals) of the 2018 HSTT FEIS/OEIS for additional information. Of note, even if the sound level in the water were to exceed the Level B harassment threshold, a marine mammal would need to cross the path of the aircraft while the animal is relatively close to the surface in order for a take to occur, which is unlikely.

In addition to Kuehne *et al.* (2020), the commenter referenced several other studies that it described as indicating that other Navy activities in the HSTT Study Area may affect listed species to an extent not previously considered. These studies include Goldbogen *et al.* (2013), Pirotta *et al.* (2019), Pirotta *et al.* (2021), Pirotta *et al.* (2022), Simonis *et al.* (2020), Southall *et al.* (2019), Southall *et al.* (2021), and Szesciorka *et al.* (2019). NMFS considered Pirotta *et al.* (2021), Pirotta *et al.* (2022), and Southall *et al.* (2021) in its 2023 HSTT proposed rule (88 FR 68290, October 3, 2023). NMFS considered Goldbogen *et al.* (2013) in the 2018 HSTT proposed rule (83 FR 29872, June 26, 2018) and 2018 HSTT final rule (83 FR 66846,

December 27, 2018), and NMFS considered Southall *et al.* (2019) in the 2019 HSTT proposed rule (84 FR 48388, September 13, 2019). Pirotta *et al.* (2019) found that environmental changes could severely affect a population’s vital rates, but that, depending on the context of a disturbance, individuals were tolerant of anthropogenic disturbance. Simonis *et al.* (2020) correlated strandings in the Mariana islands with naval activities. NMFS is aware of this study and has considered it along with global information related to the correlation of sonar with strandings in our analysis. In a case study of a close vessel encounter with a blue whale, Szesciorka *et al.* (2019) noted that the ship’s reduced speed (*i.e.*, 11.3 kn (20.9 km per hour)) may have played a role by giving the whale enough time to respond to the nearby vessel and that higher vessel speeds increase the risk that a whale could have been struck at the surface or get close enough to the ship’s draft that the propeller suction effect created by the ship’s hydrodynamic flow could pull the whale toward the hull. Additionally, feeding whales may be distracted and thus be less capable of detecting and avoiding approaching vessels (Szesciorka *et al.* 2019). NMFS determined that the information presented in these studies does not substantively affect our analysis of impacts on marine mammals and their habitat that appeared in the 2023 HSTT proposed rule, all of which remains applicable and valid for our assessment of the effects of the Navy’s activities during the 7-year period of this final rule. Please see NMFS’ response to Comment 14 regarding vessel speed restrictions.

Comment 4: A commenter expressed support for Navy use of marine mammals for military purposes through its Marine Mammal Program. However, the commenter stated that to “take” mammals simply as a training opportunity via severe injury or mortality is unethical and to allow the killing of innocent animals as cross-fire or training shouldn’t be tolerated.

Response: The actions the Navy takes through its Marine Mammal Program are outside the scope of this action; we note that no animals are intentionally exposed to serious injury or mortality through that program. For additional information about the Navy’s Marine Mammal Program, please see the Navy’s website at <https://www.niwc-pacific.navy.mil/About/Departments/Intelligence-Surveillance-and-Reconnaissance/Marine-Mammal-Program/>.

Comment 5: A commenter stated that the recent whale deaths indicate that (1) NMFS’ earlier assumptions that vessel strikes would be unlikely and easily detected if they did occur were proven wrong, (2) vessel strikes are occurring at rates well-above that analyzed in NMFS’ analyses, (3) whales cannot avoid vessel strike at the level NMFS assumed in issuing the regulations, (4) and that sonar affects blue whales in ways not adequately considered.

Response: In the 2018 HSTT final rule, 2020 HSTT final rule, and 2023 HSTT proposed rule, NMFS described why a strike by a Navy vessel is unlikely in comparison to a strike by a non-Navy vessel, and that, overall, it is unlikely that the Navy would hit a large whale for these reasons. However, even in consideration of these factors that make vessel strike unlikely, given the history of vessel strike by the U.S. Navy in the HSTT Study Area, NMFS, in the 2018 and 2020 HSTT final rules concluded that vessel strikes could occur and that authorization of three takes by vessel strike was appropriate. Therefore, NMFS disagrees that the recent vessel strikes disprove NMFS’ assumption that vessel strikes would be unlikely.

To date, NMFS is aware of three confirmed vessel strikes of large whales by U.S. Navy vessels during the current regulatory period. Therefore, the strikes that have occurred to date have been within what NMFS anticipated could occur, though, NMFS’ current analysis suggests that two additional strikes may occur during the current regulatory period based on the best available scientific information since promulgation of the 2020 HSTT final rule.

NMFS further disagrees that the recent vessel strikes disprove NMFS’ assumption that vessel strikes would be detected if they did occur. As demonstrated by the June 2021, July 2021, and May 2023 U.S. Navy strikes, NMFS is confident that whales struck by Navy vessels are detected and reported, and Navy strikes are the numbers used in NMFS’ analysis to support the authorized number of strikes. Navy ships have multiple Lookouts, including on the forward part of the ship that can visually detect a hit whale (which has occasionally occurred), in the unlikely event ship personnel do not feel the strike. The Navy’s strict internal procedures and mitigation requirements include reporting of any vessel strikes of marine mammals, and the Navy’s discipline, extensive training (not only for detecting marine mammals but for detecting and reporting any potential navigational obstruction), and strict

chain of command give NMFS a high level of confidence that all strikes are reported. Accordingly, NMFS is confident that the information used to support the analysis is accurate and complete. Regarding the 2021 Royal Australian Navy vessel strikes, while the U.S. Navy cannot speculate on the configurations of other ships bows and even sonar dome specifications (that may be at the bow), the Navy believes it would be implausible for a marine mammal to become lodged on the sonar dome of a U.S. Navy ship and remain undetected due to a technological standard operating procedure.

While the 2018 HSTT final rule, the 2020 HSTT final rule, and this final rule include mitigation to reduce the potential for vessel strike, NMFS neither states nor implies vessel strike avoidance of a particular “level”. However, it is important that NMFS and the Navy consider the new information regarding vessel strikes in southern California consistent with 50 CFR 216.105(c). Consideration of this new information in an updated analysis allows NMFS to reassess its negligible impact determination and to determine whether additional potential mortality would still constitute a negligible impact on the potentially affected stocks, as it has determined would be the case here.

The commenter referenced several studies related to blue whales and sonar. Please see NMFS’ response to Comment 3.

Comment 6: A commenter stated that NMFS should deny the Navy’s request for authorization of two additional takes of large whales by vessel strike because for at least two of the impacted marine mammal stocks (Eastern North Pacific stock of blue whale and Central America/Southern Mexico—California/Oregon/Washington stock of humpback whale) mortality and serious injury already exceeds potential biological removal (PBR). The commenter stated that NMFS’ reasoning for authorizing the take amounts to “take by a thousand cuts” and defies the stated purpose and objectives of the MMPA.

A commenter stated that NMFS may allow take of marine mammals incidental to military readiness activities only if the taking will have a “negligible impact” on an affected species or stock. The commenter further stated that as one court has explained, “[b]ecause any mortality level that exceeds PBR will not allow the stock to reach or maintain its optimum sustainable population (‘OSP’), such a mortality level could not be said to have only a ‘negligible impact’ on the stock.” (See *Conservation Council for Hawai’i v.*

Nat’l Marine Fisheries Serv., 97 F. Supp. 3d 1210, 1225 (D. Haw. 2015); see also 54 FR 40338, 40341, 40342 (Sept. 29, 1989) (“In order to make a negligible impact finding, the proposed incidental take must not prevent a depleted population from increasing toward its OSP.”)). Indeed, NMFS itself has previously recognized that when mortality of a species is above its PBR, “a negligible impact finding under section 101(a)(5)(A) cannot be made” (61 FR 54,157, October 17, 1996).

Response: The commenter is correct that PBR for the Eastern North Pacific stock of blue whales and the Central America/Southern Mexico—California/Oregon/Washington stock of humpback whales is currently exceeded. However, NMFS is not authorizing take by mortality of the Central America/Southern Mexico—California/Oregon/Washington stock of humpback whales. In this final rule, NMFS is authorizing take of the Mainland Mexico-CA/OR/WA stock of humpback whale, and PBR is not exceeded for this stock. A stock’s PBR is part of the best scientific information available and therefore, is considered in the negligible impact determination (see *Conservation Council for Hawai’i v. Nat’l Marine Fisheries Serv.*, 97 F. Supp. 3d 1210, 1228 (D. Haw. 2015)). However, exceedance of PBR does not inherently imply that a negligible impact determination cannot be made for an authorization that includes mortality or serious injury (M/SI) of that stock. As explained in the *Serious Injury or Mortality* subsection of the *Analysis and Negligible Impact Determination* section of the 2018 HSTT final rule and 2020 HSTT final rule, and referenced in the same section of this final rule, in the commercial fisheries setting for Endangered Species Act (ESA)-listed marine mammals (which is similar to the non-fisheries incidental take setting, in that a negligible impact determination is required that is based on the assessment of take caused by the activity being analyzed), NMFS may find the impact of the authorized take from a specified activity to be negligible even if total human-caused mortality exceeds PBR, if the authorized mortality is less than 10 percent of PBR and management measures are being taken to address serious injuries and mortalities from the other activities causing mortality (*i.e.*, other than the specified activities covered by the incidental take authorization in consideration). When those considerations are applied in the section 101(a)(5)(A) context here, the authorized lethal take (0.14 annually) of blue

whales from the Eastern North Pacific stock is less than 10 percent of PBR (4.1) and there are management measures in place to address the mortality and serious injury from the activities other than those the Navy is conducting. For the complete discussion of how NMFS carefully considered potential mortalities from the Navy’s activities in light of PBR levels, including an explanation for why mortality above PBR will not necessarily induce population-level non-negligible impacts, see the discussion in the *Analysis and Negligible Impact Determination* section of this rule, the 2020 HSTT final rule, and the 2018 HSTT final rule.

The commenter references a 1996 NMFS notice of receipt and request for comments (61 FR 54,157; October 17, 1996) that stated that a negligible impact finding under section 101(a)(5)(A) could not be made where PBR for the North Atlantic right whale stock was 0.4. The method that NMFS has articulated herein to evaluate negligible impact of potential mortality was adopted in 1999 to evaluate negligible impact pursuant to MMPA section 101(a)(5)(E). NMFS uses these same criteria adopted in 1999 to inform (*i.e.*, it is not the sole factor considered) our negligible impact analysis of potential mortality under section 101(a)(5)(A).

The 1996 decision that a negligible impact determination could not be made was regarding a request for take by mortality of North Atlantic right whale (61 FR 54,157; October 17, 1996)). PBR for North Atlantic right whale at that time was 0.4. If NMFS were to apply its current method for evaluating negligible impact of potential mortality to that request, the results would suggest that take by mortality should not be authorized (though again, the PBR evaluation is not the sole factor considered).

Comment 7: A commenter stated that the Navy and NMFS must consider serious injury and mortality that results from joint training exercises the Navy engages in with foreign nations as “take” under the regulations and that NMFS must reexamine the impacts of the Navy’s full suite of activities (including joint activities with foreign fleets) on marine mammals using the best available science. In the proposed rule, NMFS states that “[a]ccording to the U.S. Navy, the May 2021 vessel strike of two fin whales by an Australian navy vessel did not occur while that vessel was participating in a U.S. Navy-led training exercise. The Royal Australian Navy vessel was adhering to its standard operating procedures at the time of the strike.” The commenter stated that this contradicts coverage of

the incident, including by the Navy Times/AP that reported: “[t]he Sydney has been holding joint exercises with the U.S. Navy in the area since early April” (The Navy Times, 2021).

The commenter stated that elsewhere in the rule, NMFS appears to say that regardless of whether it considered vessel strikes that occurred during joint training or not, NMFS lets the Navy decide what activities it requests authorization for, and there is no reasoned explanation provided for this position. These joint activities led by the U.S. Navy pose serious threats to marine mammals, kill whales, and should be included as specified activities. The commenter recommended that NMFS not “defer to the applicant to describe the scope of its request for an authorization.”

Response: Under the MMPA, only a U.S. Citizen may request NMFS authorize the incidental take of marine mammals (16 U.S.C. 1371(a)(5)(A)). Further, the MMPA requires NMFS to authorize the incidental take caused by the applicant’s specified activities, provided certain findings are made (*Id.*). In some cases, foreign militaries may participate in U.S. Navy training or testing activities in the HSTT Study Area. As stated in the proposed rule, the HMAS Sydney most likely struck the two fin whales around 6:25 a.m. the morning of May 7, 2021 while the HMAS Sydney was getting into position to participate in a U.S. Navy-led exercise later that day but was not actively engaged in an exercise at the presumed time of the strike. The Navy does not consider the Royal Australian Navy’s vessel movements at the time of strike as part of the ‘specified activity’ under the MMPA, as the strike did not occur while the HMAS Sydney was actively participating in a joint training exercise with the U.S. Navy. The MMPA is necessarily an applicant-driven process (*Melone v. Coit*, 100 F.4th 21, 32 (1st Cir. 2024)) and NMFS has appropriately deferred to the Navy’s reasoned explanation of why the Royal Australian Navy’s operations were not part of the “specified activity.”

As explained in the *Foreign Navies* section of this final rule, in preparing this rulemaking, NMFS and the U.S. Navy discussed the nature, frequency, and control over joint or U.S. Navy-led training and testing activities with foreign entities. Consistent with customary international law, U.S. Navy requests or encourages participating foreign entities to follow U.S. Navy’s mitigation measures for that particular event, depending on whether the activity is in the U.S.’s territorial sea or the EEZ. NMFS and the U.S. Navy also

examined the Royal Australian Navy 2021 strike report, and NMFS concurred with U.S. Navy’s conclusion that the strike most likely occurred before, but not during, a joint exercise, and the Royal Australian Navy vessel was adhering to its standard operating procedures at the time of the strike.

As noted by the commenter in its letter, NMFS assessed the effects of foreign military activities. First, the impacts of all activities are captured in the baseline for the analysis, through marine mammal abundance estimates and population trends found in the SARs. Second, NMFS considers foreign military activities, including recent strikes, qualitatively in its analysis, as described in the *Foreign Navies* section of this final rule. For instance, NMFS and the U.S. Navy examined the Royal Australian Navy 2021 strike report for any lessons that could inform U.S. Navy strike mitigation.

This final rule includes a new reporting measure related to foreign vessels. The new measure requires that the Navy’s annual HSTT reports shall include confirmation that foreign military use of sonar and explosives, when such militaries are participating in a U.S. Navy-led exercise or event, combined with the U.S. Navy’s use of sonar and explosives, did not cause exceedance of the analyzed levels (within each NAEMO modeled sonar and explosive bin) used for estimating predicted impacts, which formed the basis of our acoustic impacts effects analysis that was used to estimate take in this final rule. This new reporting measure will allow NMFS to ensure that its analysis remains valid.

Comment 8: A commenter stated that it supports the Navy’s request for two additional incidental takes of large whales by vessel strike. The commenter discussed a U.S. Supreme Court case, *Winter v. NRDC, Inc.*, 555 U.S. 7 (2008), in support of its assertion that preparing for war still plainly outweighs the interests in the safety of marine life. Considering these interests, the commenter recommended that NMFS consider granting the Navy’s request for two additional incidental takes.

Response: NMFS has made the required findings on the Navy’s request consistent with the statutory criteria under the MMPA and has authorized two additional takes of large whales by serious injury or mortality by vessel strike for the remainder of the current regulatory period (two takes in addition to the three takes authorized in the current regulations). NMFS does not weigh the necessity of Navy training and testing against the risks to marine mammals as part of the required

analysis for issuance of take regulations under the MMPA. The MMPA requires NMFS to authorize the incidental take of marine mammals caused by specified activities upon request, provided certain findings are made (16 U.S.C.

1371(a)(5)(A)). NMFS’ least practicable adverse impact determination for military readiness activities must include consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity (16 U.S.C. 1371(a)(5)(a)(iii)).

Comment 9: A commenter noted NMFS’ reference to Cure *et al.* (2021) and Isojunno *et al.* (2020) in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023) discussing sperm whale behavioral responses to exposure to pulsed active sonar (PAS) and continuous active sonar (CAS). The commenter stated that physical trauma, sensory impairment (PTS, TTS, and acoustic masking), physiological responses (particularly stress responses), and behavioral disturbances are all part of the harassment of the whales and that these factors have not been included in the “take” of the three whales already, only the mortalities have been counted. The commenter stated that even brief and transient exposure to modest levels of mid-frequency military sonar has been observed to cause whales to strand or perish at sea within hours (Dave, D.M., & Dave, M., 2023). These studies do not include the permanent injuries to these marine mammals’ hearing and sonar capabilities. The commenter stated that effects on marine mammal hearing are not mentioned outside of some studies on stranding and should include more study and data collection by marine mammal experts when it comes to PTS and sonar damage to these animals due to the impact of the U.S. Navy’s military ocean noise pollution.

Response: In the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), NMFS included a discussion of relevant literature that had published since publication of the 2020 HSTT final rule (85 FR 41780, July 10, 2020), and in this final rule, NMFS has included a discussion of relevant literature that has published since publication of the 2023 HSTT proposed rule. Herein, and in the 2023 HSTT proposed rule, NMFS discussed all relevant literature, not just that related to vessel strike. (See the New Pertinent Science Since Publication of the 2020 HSTT Final Rule section of the 2023 HSTT proposed rule and the Potential Effects of Specified Activities on Marine Mammals and their Habitat section of this final rule.)

The commenter's statement that "even brief and transient exposure to modest levels of mid-frequency military sonar has been observed to cause whales to strand or perish at sea within hours" is not supported. The proposed rule discussed the limited examples of when tactical active sonar, in certain circumstances, have been found to have likely contributed to marine mammal stranding events. The reference that the commenter cites (Dave, D.M. & Dave, M., 2023) states that "even a brief and transient exposure to modest levels of mid-frequency military sonar has been observed to cause whales to strand or perish at sea within hours," citing Fernández *et al.* (2005) and NOAA and U.S. Department of the Navy (2001). These publications discuss two specific stranding events in the Canary Islands and the Bahamas, respectively. NMFS is aware of stranding events coincident with military MFAS use in which exposure to sonar is believed to have been a contributing factor and discussed these cases in detail in the 2018 HSTT proposed rule. While NMFS did not repeat this information in the 2023 proposed rule as the analyses remain unchanged, NMFS stated in the rule that we refer the reader to complete analyses described in the 2018 HSTT final rule or an updated analysis in the 2020 HSTT final rule, where appropriate.

It is unclear what the commenter means by physical trauma, sensory impairment (PTS, TTS, and acoustic masking), physiological responses (particularly stress responses), and behavioral disturbances not having been included in the "take" of the three whales already, and that only the mortalities have been counted. In the 2020 HSTT final rule, NMFS discussed all of the likely impacts to marine mammals, including PTS, TTS, masking, and stress, and authorized take of marine mammals by Level B harassment, Level A harassment, and mortality. The 2023 HSTT proposed rule and this final rule only discuss changes to NMFS' analysis regarding mortality of marine mammals in detail, and refer back to the 2018 HSTT proposed and final rules and the 2020 HSTT final rule regarding take by Level A harassment and Level B harassment. However, NMFS' analysis, including its negligible impact determination, takes into consideration the total authorized take, not just mortality.

Comment 10: A commenter stated that in addition to blue, humpback, and fin whales, the Navy also identifies other large whales in its request (Bryde's whales, gray whales, minke whales, sperm whales, and sei whales) which are also all vulnerable to vessel strikes

(Laist *et al.* 2001, Glass *et al.* 2008, and van der Hoop *et al.* 2015). NMFS' 2023 HSTT proposed rule (88 FR 68290, October 3, 2023) determined that the likelihood of vessel strikes to those whales is "discountable" due to their relatively low occurrence in the HSTT Study Area and the fact that they have rarely, if ever, been recorded struck by vessels. Due to the fact that reported collisions vastly underestimate actual strikes, the commenter asks NMFS and the Navy to approach vessel strikes and other harm very conservatively, particularly in light of how some of these whales are particularly vulnerable to vessel strike and at already-small population levels, as detailed in the commenter's July 1, 2022 letter.

Response: NMFS concurs with the commenter that all large whales are vulnerable to vessel strike, and that reported vessel strikes vastly underestimate actual strikes across many industries generally. However, NMFS has already conducted a conservative vessel strike analysis. While all large whales are vulnerable to vessel strike, it would be inappropriate to assume that all large whales that occur in the HSTT Study Area are likely to be struck by U.S. Navy vessels.

Of note, the commenter is correct that NMFS does not anticipate vessel strike of Bryde's whale, minke whale, or sperm whale. However, NMFS did propose to authorize take by M/SI by vessel strike of sei whale and Eastern North Pacific gray whale in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023) and would authorize such take in this final rule. NMFS proposed authorizing one take (0.14 takes annually) of sei whale (Eastern North Pacific stock) and four takes (0.57 takes annually) of Eastern North Pacific gray whale.

Regarding stocks for which take by M/SI by vessel strike was not proposed, as stated in the proposed rule, stocks that have no record of ever having been struck by any vessel are considered to have a zero percent likelihood of being struck by the Navy in the 7-year period of the rule. This includes Bryde's whale, minke whale, and the CA/OR/WA stock of sperm whale raised by the commenter (an individual of the Hawaii stock of sperm whale was struck in 2007; see table 7 of this final rule). Stocks that have never been struck by the Navy, have rarely been struck by other vessels, and have a low percent likelihood based on the historical vessel strike calculation are also considered to have a zero percent likelihood of being struck by the Navy during the 7-year rule. We note that while vessel strike records have not differentiated between Eastern

North Pacific and Western North Pacific gray whales, given their small population size and the comparative rarity with which individuals from the Western North Pacific stock are detected off the U.S. West Coast, it is highly unlikely that they would be encountered, much less struck. Further, it is unlikely that the Hawaii stock of sperm whale would be struck given the zero percent likelihood of striking a sperm whale as indicated by the quantitative analysis in the *Estimated Take From Vessel Strikes and Explosives by Serious Injury or Mortality Vessel Strike* section of the proposed rule and the *Authorized Take From Vessel Strikes and Explosives by Serious Injury or Mortality* section in this final rule. Vessel strikes of the Hawaii stock of sperm whale are also unlikely given the fact that the last U.S. Navy strike of a Hawaii stock sperm whale was in 2007, before the mitigation updates discussed above, and that, with the exception of humpback whales, vessel strikes (both military and non-military) of other large whale species in the HRC are extremely rare events (Carretta 2021b; Carretta 2022). Given this analysis, NMFS concludes that the proposed take by M/SI by vessel strike included in the proposed rule remains appropriately conservative, and has not included take by M/SI by vessel strike of Bryde's whale, Western North Pacific gray whale, minke whale, or sperm whale in this final rule.

Comment 11: A commenter stated that aside from excluding impacts from foreign vessels, the proposed rule looks at the impacts of vessel strikes on large whales almost in isolation and does not adequately assess new science on the combined impacts of the Navy's activities, in particular on large whales. The commenter asserted that while the Navy acknowledges that sonar and aircraft may affect whales, it does not adequately consider the extent of these impacts. Any analysis of the impacts of the Navy's exercises must include, in addition to vessel strike impacts, the impacts from sonar activities of domestic vessels and foreign vessels involved in joint training exercises and any other stressor caused by the Navy's activities. The commenter also asserted that the Navy's literature review does not adequately focus on the large baleen whales that are of concern in this most recent request.

The commenter stated that as it noted in its July 2022 letter, in its review of sound effects on animals, the Navy focuses heavily on pinnipeds (seals and sea lions) and odontocetes (dolphins and toothed whales), while their request for increased take focuses on mysticetes

(baleen whales). Mysticetes' hearing systems are different from those of pinnipeds and odontocetes, and so while they are closely related one cannot infer that each group will experience the same effects from sound pollution (Southall *et al.* 2019). Mysticetes' cochlea have their own unique shape, which in concert with the larger mass of baleen whales indicates that they are more sensitive to low-frequency sound (Southall *et al.* 2019). Though auditory capabilities in baleen whales are understudied (Southall *et al.* 2019), absence of literature on baleen whales does not indicate absence of effect. The commenter stated that furthermore, the Navy ignored key papers studying the effect of sonar on baleen whales. It specifically stated that the Navy failed to consider, and NMFS failed to address in its proposed rule, Goldbogen *et al.* (2013), and further references Southall *et al.* (2019) and Southall *et al.* (2021).

Response: NMFS disagrees with the commenter that the proposed rule looks at the impacts of vessel strikes on large whales almost in isolation and does not adequately assess new science on the combined impacts of the Navy's activities, in particular on large whales. While NMFS did not repeat discussion of a portion of the analysis that did not change (e.g., takes by harassment), this analysis was incorporated into the proposed rule and this final rule by reference, and NMFS considered those impacts in conjunction with the updated M/SI analysis in making its determinations.

NMFS further disagrees that the literature review should have focused on large baleen whales. In the proposed rule (88 FR 68290, October 3, 2023), and in this final rule, NMFS' literature review discussed recent literature concerning potential impacts from all of the Navy's activities, not just those related to vessel strike. As the commenter has noted in its letter, NMFS must consider the full range of effects of the Navy's activity, not just the potential for vessel strike of large whales in isolation. NMFS agrees with the commenter that an absence of literature on baleen whales does not indicate an absence of effects, nor has NMFS drawn such a conclusion. Rather, NMFS conducted a thorough analysis on the impacts of the Navy's activities, including sonar and explosive use, on mysticetes, as well as other taxa, as described in the proposed rule and this final rule, which in some cases, reference the 2018 (83 FR 66846, December 27, 2018) and 2020 HSTT final rules (85 FR 41780, July 10, 2020). Regarding the specific studies that the

commenter asserts NMFS failed to consider, while not directly cited to in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), NMFS considered and cited Goldbogen *et al.* (2013) in the 2018 (83 FR 66846, December 27, 2018) and 2020 HSTT final rules (85 FR 41780, July 10, 2020), and the Navy considered and cited this paper in the 2018 HSTT EIS/OEIS. NMFS considered and cited Southall *et al.* (2019) and Southall *et al.* (2021) in the 2023 HSTT proposed rule.

Please see NMFS' response to Comment 7 regarding foreign vessels.

Comment 12: A commenter stated that the rule overlooks the likelihood that the Navy's activities will take humpback whales from the endangered Central America distinct population segment (DPS). The commenter stated that its read of the science is that most of the humpback whale deaths that occur off California could be from the endangered Central America DPS. The commenter further stated that Wade *et al.* (2017) predicted a 67.2 percent movement probability for a whale in California to move to Central America. In other words, an estimated 7,056 Central America DPS humpback whales could die from vessel strikes off California annually (10.5 deaths * 0.672). The commenter stated in its letter that applying the Rockwood *et al.* (2021) model, 10.5 humpback mortalities occur annually off California from the January to April and July to November periods combined. The commenter stated that this does not include potential deaths from other sources or in other locations yet still represents a significant source of mortality for this already endangered population.

Response: NMFS carefully considered the potential for each stock of large whales to be taken by serious injury or mortality by vessel strike. As stated in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), regarding the likelihood of striking a humpback whale from a particular DPS, NMFS evaluated the relative abundance of each of these DPS in California waters. Curtis *et al.* (2022) estimated the abundance of the Central America DPS to be 1,496 whales. From Wade *et al.* (2017), about 93 percent (or 1,391 whales) of these humpbacks that winter in Central America will move to Oregon/California in the summer months. While there is currently no abundance estimate for the Mexico DPS, an estimated 3,477 whales from the Mexico DPS feed off the U.S. West Coast (Calambokidis and Barlow 2020; Curtis 2022). Based on this information, we estimate that approximately 30 percent of the humpback whales off the coast of

California may be from the Central America DPS and the remaining 70 percent are expected to be from the Mexico DPS. Therefore, we anticipate that if a Navy vessel strike of a humpback whale were to occur within SOCAL, it would likely be from the Mexico DPS.

The commenter is correct that Wade *et al.* (2017) predicts that 67.2 percent of whales that summer in Oregon and California will move to Central America for the winter. However, NMFS disagrees with the commenter's implication that it is more appropriate for NMFS to assume that 67.2 percent of humpbacks off of California are of the Central America DPS, and the commenter has not provided justification for doing so. (Of note, an updated paper from Wade (2021) shows that 58 percent of whales that summer in Oregon and California will move to Mexico (only 42 percent will move to Central America)). Rather, NMFS continues to find that it is appropriate to use the abundance estimates described above and the estimate that approximately 93 percent of humpbacks that winter in Central America will move to Oregon/California in the summer months to determine the relative abundance of each DPS off the coast of California. Therefore, NMFS continues to conclude that if a Navy vessel strike of a humpback whale were to occur within SOCAL, it would likely be from the Mexico DPS.

Mitigation and Monitoring

Comment 13: A commenter stated that in addition to strengthening the new and revised mitigation measures that NMFS included in the 2023 HSTT proposed rule, it should also require the following additional mitigation measures to ensure the least practicable adverse impact to marine mammals. The commenter noted that it and others have requested and expounded upon these measures in previous comment letters.

1. Reinstating more protective mitigation areas and restricted training exercises in key migration corridors, feeding habitat, and other biologically important areas (BIAs) and creating/expanding protective mitigation areas to protect newly recognized critical habitat and other BIAs. In a related comment, a separate commenter stated that the chances of an incidental take can be dramatically reduced by adjusting the time and location of exercises (e.g., minimizing activity in the vicinity of California's Channel Islands during July–October) and reducing speed in mitigation areas. The commenter further asserted that additional BIAs identified by Kratofil *et al.* 2023 provide new

information that necessitates reevaluation of mitigation measures, yet NMFS rejects adding these new mitigation areas as “impracticable.” A third commenter stated that it is crucial to integrate scientific research, public awareness, and proactive measures to ensure the sustained well-being of gray whales and the preservation of their migratory habitats.

2. Restricting activities when whale detection is particularly difficult, such as periods of low visibility (Williams *et al.* 2016).

3. Improving detection of marine mammals by adding alternative detection methods, including safe/ environmentally-sound drone, thermal, and/or acoustic technologies, to lookouts/observers (Verfuss *et al.* 2018). In a related comment, a commenter recommended utilizing existing acoustic detection systems to track marine mammals in near real-time.

4. Capping/reducing the level of naval activities authorized each year, in particular major exercises. In a related comment, a separate commenter stated that it is crucial to limit the [Navy]’s takes on marine mammals.

5. Halting training exercises when whale presence in the area is “High” or “Very High,” per WhaleSafe (see <https://whalesafe.com>).

Response: Under the MMPA, NMFS’ least practicable adverse impact determination for military readiness activities must include consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity (16 U.S.C. 1371(a)(5)(a)(iii)). NMFS has responded to these recommended measures, by corresponding number.

1. In the 2023 HSTT proposed rule, NMFS discussed that since publication of the 2020 HSTT final rule, Kratofil *et al.* (2023) identified updated BIAs in Hawaii. The HSTT Study Area overlaps the updated BIAs for small and resident populations of the following species in Hawaii: spinner dolphin, short-finned pilot whale, rough-toothed dolphin, pygmy killer whale, pantropical spotted dolphin, melon-headed whale, false killer whale, dwarf sperm whale, goose-beaked whale, common bottlenose dolphin, and Blainville’s beaked whale. Further, the HSTT Study Area overlaps updated BIAs for humpback whale reproduction in Hawaii. The updated BIAs overlap critical Navy training and testing areas within the HSTT Study Area, including most of the internal Navy operating areas. Please see Kratofil *et al.* (2023) for additional details about the BIAs.

Since publication of the 2023 HSTT proposed rule, Calambokidis *et al.* (2024) identified updated BIAs on the West Coast of the U.S. The HSTT Study Area overlaps feeding BIAs for blue whale and fin whale in SOCAL. Additionally, it overlaps a reproductive BIA as well as northbound and southbound migratory BIAs for gray whale. Please see Calambokidis *et al.* (2024) for additional details about the BIAs.

NMFS and the Navy considered additional mitigation areas (beyond those already identified with associated measures to reduce impacts to marine mammals, including odontocetes with small or resident populations in the HSTT Study Area, and large whales with feeding, reproductive, and migratory BIAs in the HSTT Study Area. This includes consideration of new mitigation areas that could be based on newly identified BIAs in Hawaii (Kratofil *et al.* 2023) and on the West Coast (Calambokidis *et al.* 2024). The HRC overlaps BIAs identified in Kratofil *et al.* (2023) for humpback whale, spinner dolphin, short-finned pilot whale, rough-toothed dolphin, pygmy killer whale, pantropical spotted dolphin, melon-headed whale, false killer whale, dwarf sperm whale, goose-beaked whale, common bottlenose dolphin, and Blainville’s beaked whale. All of the BIAs that overlap the HRC are small and resident population BIAs, with the exception of the humpback whale reproductive BIA. SOCAL overlaps BIAs identified in Calambokidis *et al.* (2024) for blue whale (feeding area), fin whale (feeding area), and gray whale (migratory route).

Additional restrictions in mitigation areas beyond those restrictions and areas included in the 2020 HSTT final rule (including mitigation to reduce vessel strike risk such as vessel speed restrictions, and in consideration of the newly identified BIAs (Kratofil *et al.* 2023 and Calambokidis *et al.* 2024)) is impracticable given overlap with critical Navy training areas in the HRC and SOCAL, including areas around the Channel Islands in SOCAL. However, many of the BIAs identified in Kratofil *et al.* 2023 and Calambokidis *et al.* (2024) partially or fully overlap the mitigation areas included in the 2020 HSTT final rule and this final rule and are aimed at reducing impacts to the same species for which Kratofil *et al.* 2023 and Calambokidis *et al.* (2024) identified BIAs. In the HRC, the existing mitigation areas are targeted and expected to reduce impacts to humpback whales, false killer whales, dwarf sperm whales, pygmy killer

whales, short-finned pilot whales, melon-headed whales, bottlenose dolphins, spotted dolphins, spinner dolphins, rough-toothed dolphins, goose-beaked whales, and Blainville’s beaked whales (*i.e.*, all species for which Kratofil *et al.* (2023) identified BIAs). In SOCAL, the existing mitigation areas are aimed at reducing impacts to blue whales, fin whales, and gray whales (*i.e.*, all species for which Calambokidis *et al.* (2024) identified BIAs). Further, as included in the 2023 HSTT proposed rule, this final rule requires that Navy personnel must issue real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in a select area of SOCAL, and that Navy personnel must send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area. Last, this final rule includes modification of two mitigation measures from the 2020 HSTT final rule (85 FR 41780; July 10, 2020) to further reduce the potential for vessel strike.

Beyond the papers described herein, NMFS is not aware of, nor have commenters provided, additional research that suggests other areas warrant additional mitigation. While NMFS agrees with the commenter that public awareness can be an important part of gray whale conservation, NMFS does not anticipate that additional public awareness would assist in mitigating effects of Navy’s activities on gray whales, and therefore, has not required the Navy to implement measures related to public awareness. For a discussion of the mitigation measures required by this final rule, please see the Mitigation Measures section.

Please see NMFS’ response to Comment 14 regarding vessel speed restrictions.

2. Anti-submarine warfare training involving the use of mid-frequency active sonar (MFAS) typically involves the periodic use of active sonar to develop the “tactical picture,” or an understanding of the battle space (*e.g.*, area searched or unsearched, presence of false contacts, and an understanding of the water conditions). Developing the tactical picture can take several hours or days, and typically occurs over vast waters with varying environmental and oceanographic conditions. Training during both high visibility (*e.g.*, daylight, favorable weather conditions) and low visibility (*e.g.*, nighttime, inclement weather conditions) is vital because sonar operators must be able to understand the environmental differences between day and night and

varying weather conditions and how they affect sound propagation and the detection capabilities of sonar. Temperature layers move up and down in the water column and ambient noise levels can vary significantly between night and day, affecting sound propagation and how sonar systems are operated. Reducing or securing power in low-visibility conditions as a mitigation would affect a commander's ability to develop the tactical picture and would prevent sonar operators from training in realistic conditions. Further, during integrated training multiple vessels and aircraft may participate in an exercise using different dimensions of warfare simultaneously (*e.g.*, submarine warfare, surface warfare, air warfare, *etc.*). If one of these training elements were adversely impacted (*e.g.*, if sonar training reflecting military operations were not possible), the training value of other integrated elements would also be degraded. Additionally, failure to test such systems in realistic military operational scenarios increases the likelihood these systems could fail during military operations, thus unacceptably placing sailors' lives and the Nation's security at risk. Some systems have a nighttime testing requirement; therefore, these tests cannot occur only in daylight hours. Reducing or securing power in low visibility conditions would decrease the Navy's ability to determine whether systems are operationally effective, suitable, survivable, and safe for their intended use by the fleet even in reduced visibility or difficult weather conditions.

3. The Navy has compiled information related to the effectiveness of certain equipment to detect marine mammals in the context of their activities, as well as the practicality and effect on mission effectiveness of using various equipment. NMFS has reviewed this evaluation and concurs with the characterizations and the conclusions below.

Thermal detection—Thermal detection systems are more useful for detecting marine mammals in some marine environments than others. Current technologies have limitations regarding water temperature and survey conditions (*e.g.*, rain, fog, sea state, glare, ambient brightness), for which further effectiveness studies are required. Thermal detection systems are generally thought to be most effective in cold environments, which have a large temperature differential between an animal's temperature and the environment. Current thermal detection systems have proven more effective at detecting large whale blows than the

bodies of small animals, particularly at a distance. The effectiveness of current technologies has not been demonstrated for small marine mammals. Thermal detection systems exhibit varying degrees of false positive detections (*i.e.*, incorrect notifications) due in part to their low sensor resolution and reduced performance in certain environmental conditions. False positive detections may incorrectly identify other features (*e.g.*, birds, waves, boats) as marine mammals. In one study, a false positive rate approaching one incorrect notification per 4 min of observation was noted.

The Navy has been investigating the use of thermal detection systems with automated marine mammal detection algorithms for future mitigation during training and testing, including on autonomous platforms. Thermal detection technology being researched by the Navy, which is largely based on existing foreign military grade hardware, is designed to allow observers and eventually automated software to detect the difference in temperature between a surfaced marine mammal (*i.e.*, the body or blow of a whale) and the environment (*i.e.*, the water and air). Although thermal detection may be reliable in some applications and environments, the current technologies are limited by their: (1) Low sensor resolution and a narrow field of view, (2) reduced performance in certain environmental conditions, (3) inability to detect certain animal characteristics and behaviors, and (4) high cost and uncertain long-term reliability.

Thermal detection systems for military applications are deployed on various Department of Defense (DoD) platforms. These systems were initially developed for night time targeting and object detection such as a boat, vehicle, or people. Existing specialized DoD infrared/thermal capabilities on Navy aircraft and surface ships are designed for fine-scale targeting. Viewing arcs of these thermal systems are narrow and focused on a target area. Furthermore, sensors are typically used only in select training events, not optimized for marine mammal detection, and have a limited lifespan before requiring expensive replacement. Some sensor elements can cost upward of \$300,000 to \$500,000 per device, so their use is predicated on a distinct military need. One example of trying to use existing DoD thermal systems is being proposed by the U.S. Air Force. The Air Force agreed to attempt to use specialized U.S. Air Force aircraft with military thermal detection systems for marine mammal detection and mitigation during a limited at-sea testing event. It should be

noted, however, that these systems are specifically designed for and integrated into a small number of U.S. Air Force aircraft and cannot be added or effectively transferred universally to Navy aircraft. The effectiveness remains unknown in using a standard DoD thermal system for the detection of marine mammals without the addition of customized system-specific computer software to provide critical reliability (enhanced detection, cueing for an operator, reduced false positive, *etc.*)

Finally, current DoD thermal sensors are not always optimized for marine mammal detections versus object detection, nor do these systems have the automated marine mammal detection algorithms the Navy is testing via its ongoing research program. The combination of thermal technology and automated algorithms are still undergoing demonstration and validation under Navy funding.

Thermal detection systems specifically for marine mammal detection have not been sufficiently studied both in terms of their effectiveness within the environmental conditions found in the HSTT Study Area and their compatibility with Navy training and testing (*i.e.*, polar waters vs. temperate waters). The effectiveness of even the most advanced thermal detection systems with technological designs specific to marine mammal surveys is highly dependent on environmental conditions, animal characteristics, and animal behaviors. At this time, thermal detection systems have not been proven to be more effective than, or equally effective as, traditional techniques currently employed by the Navy to observe for marine mammals (*i.e.*, naked-eye scanning, hand-held binoculars, high-powered binoculars mounted on a ship deck). Focusing on thermal detection systems could also provide a distraction from and compromise to the Navy's ability to implement its established observation and mitigation requirements. Last, the Navy does not have available manpower to add Lookouts to use thermal detection systems in tandem with existing Lookouts who are using traditional observation techniques.

The Defense Advanced Research Projects Agency funded six initial studies to test and evaluate infrared-based thermal detection technologies and algorithms to automatically detect marine mammals on an unmanned surface vehicle. Based on the outcome of these initial studies, the Navy is pursuing additional follow-on research efforts.

The Office of Naval Research Marine Mammals and Biology program funded a project (2013–2019) to test the thermal limits of infrared-based automatic whale detection technology. That project focused on capturing whale spouts at two different locations featuring subtropical and tropical water temperatures, optimizing detector/classifier performance on the collected data, and testing system performance by comparing system detections with concurrent visual observations. Results indicated that thermal detection systems in subtropical and tropical waters can be a valuable addition to marine mammal surveys within a certain distance from the observation platform (e.g., during seismic surveys, vessel movements), but have challenges associated with false positive detections of waves and birds (Boebel, 2017). While Zitterbart *et al.* (2020) reported on the results of land-based thermal imaging of passing whales, their conclusion was that thermal technology under the right conditions and from land can detect a whale within 3 km although there could also be lots of false positives, especially if there are birds, boats, and breaking waves at sea.

The Navy's Living Marine Resources program is funding one ongoing thermal imaging project entitled "Thermal Imaging for Vessel Strike Mitigation on Autonomous Vessels Project 68". The project is focused on adapting and testing two thermal imaging-based whale detection systems to reduce the potential for vessel strike during navigation of unmanned Navy surface vessels. Phase one is planned for 2024 and 2025. The schedule for subsequent phases will be determined as work progresses. Project details are available at: https://exwc.navfac.navy.mil/Portals/88/Documents/EXWC/Environmental_Security/Living%20Marine%20Resources/LMRFactSheet_Project68.pdf.

The Navy plans to continue researching thermal detection systems for marine mammal detection to determine their effectiveness and compatibility with Navy applications. If the technology matures to the state where thermal detection is determined to be an effective mitigation tool during training and testing, NMFS and the Navy will assess the practicability of using the technology during training and testing events and retrofitting the Navy's observation platforms with thermal detection devices. The assessment will include an evaluation of the budget and acquisition process (including costs associated with designing, building, installing, maintaining, and manning the

equipment); logistical and physical considerations for device installment, repair, and replacement (e.g., conducting engineering studies to ensure there is no electronic or power interference with existing shipboard systems); manpower and resource considerations for training personnel to effectively operate the equipment; and considerations of potential security and classification issues. New system integration on Navy assets can entail up to 5 to 10 years of effort to account for acquisition, engineering studies, and development and execution of systems training. The Navy will provide information to NMFS about the status and findings of Navy-funded thermal detection studies and any associated practicability assessments at the annual adaptive management meetings.

Passive Acoustic Monitoring—Regarding the recommendation to utilize existing acoustic detection systems to track marine mammals in near real-time, the Navy does employ passive acoustic monitoring when practicable to do so (*i.e.*, when assets that have passive acoustic monitoring capabilities are already participating in the activity). For other explosive events, there are no platforms participating that have passive acoustic monitoring capabilities. Adding a passive acoustic monitoring capability (either by adding a passive acoustic monitoring device to a platform already participating in the activity, or by adding a platform with integrated passive acoustic monitoring capabilities to the activity, such as a sonobuoy) for mitigation is not practicable. As discussed in chapter 5 (Mitigation), section 5.5.3 (Active and Passive Acoustic Monitoring Devices) of the 2018 HSTT FEIS/OEIS, there are significant manpower and logistical constraints that make constructing and maintaining additional passive acoustic monitoring systems or platforms for each training and testing activity impracticable. Additionally, diverting platforms that have passive acoustic monitoring platforms would impact their ability to meet their Title 10 requirements for maintaining military readiness and reduce the service life of those systems.

The use of real-time PAM for mitigation at the Southern California Anti-submarine Warfare Range (SOAR) exceeds the capability of current technology. The Navy has a significant research investment in the Marine Mammal Monitoring on Navy Ranges (M3R) system at three ocean locations including SOAR. However, this system was designed and intended to support marine mammal research for select species, and not as a mitigation tool.

Marine mammal PAM using instrumented hydrophones is still under development and while it has produced meaningful results for marine species monitoring, abundance estimation, and research, it was not developed for, nor is it appropriate for, real-time mitigation. The ability to detect, classify, and develop an estimated position (and the associated area of uncertainty) differs across species, behavioral context, animal location vs. receiver geometry, source level, *etc.*

Based on current capabilities, and given adequate time, vocalizing animals within an indeterminate radius around a particular hydrophone are detected, but obtaining an estimated position for all individual animals passing through a predetermined area is not assured. Detecting vocalizations on a hydrophone does not determine whether vocalizing individuals would be within the established mitigation zone in the timeframes required for mitigation. Since detection ranges are generally larger than current mitigation zones for many activities, this would unnecessarily delay events due to uncertainty in the animal's location and put at risk event realism. If an event were to be moved based upon low-confidence localizations, it may inadvertently be moved to an area where non-vocalizing animals of undetermined species are present.

To develop an estimated position for an individual, it must be vocalizing and its vocalizations must be detected on at least three hydrophones. The hydrophones must have the required bandwidth, and dynamic range to capture the signal. In addition, calls must be sufficiently loud so as to provide the required signal to noise ratio on the surrounding hydrophones. Typically, small odontocetes echolocate with a directed beam that makes detection of the call on multiple hydrophones difficult. Developing an estimated position of selected species requires the presence of whistles which may or may not be produced depending on the behavioral state. Beaked whales at SOAR vocalize only during deep foraging dives which occur at a rate of approximately 10 per day. They produce highly directed echolocation clicks that are difficult to simultaneously detect on multiple hydrophones. Current real-time systems cannot follow individuals and at best produce sparse positions with multiple false locations. The position estimation process must occur in an area with hydrophones spaced to allow the detection of the same echolocation click on at least three hydrophones. Typically, a spacing of less than 4 km

in water depths of approximately 2 km is preferred. In the absence of detection, the analyst can only determine with confidence if a group of beaked whales is somewhere within 6 km of a hydrophone. Beaked whales produce stereotypic click trains during deep (500 m) foraging dives. The presence of a vocalizing group can be readily detected by an analyst by examining the click structure and repetition rate. However, estimating position is possible only if the same train of clicks is detected on multiple hydrophones which is often precluded by the animal's narrow beam pattern. Currently, this is not an automated routine.

In summary, the analytical and technical capabilities required to use PAM such as M3R at SOAR as a required mitigation tool are not sufficiently robust to rely upon due to limitations with near real-time classification and determining estimated positions. The level of uncertainty as to a species presence or absence and location are too high to provide the accuracy required for real-time mitigation. As discussed in chapter 5 (Mitigation) of the 2018 HSTT FEIS/OEIS, existing Navy visual mitigation procedures and measures, when performed by individual units at-sea, still remain the most effective and practical means of protection for marine species.

NMFS is not requiring drones to be used at this time and the commenters did not provide information supporting the recommendation that they be used when considering the extensive monitoring by Lookouts required.

4. The commenters neither offer a rationale for why a cap on the level of activities is needed nor do they suggest what an appropriate cap might be. The Navy is responsible under Title 10 of the U.S. Code for conducting the needed amount of testing and training to maintain military readiness, which is what they have proposed and NMFS has analyzed. Further, the MMPA states that NMFS shall issue MMPA authorizations if the necessary findings can be made, as they have been here. Importantly, as described in the Mitigation Measures section, the Navy has determined that it is practicable to limit activities (active sonar, explosive use, *etc.*) to varying degrees in five areas that are important to sensitive species or for important behaviors in order to minimize impacts that are more likely to lead to adverse effects on rates of recruitment or survival and is required by this final rule to do so.

5. During the promulgation of this rule, NMFS and the Navy fully explored the potential for the Navy to incorporate

WhaleSafe into its mitigation methods. However, the current WhaleSafe operational areas (Santa Barbara Channel and off the coast of San Francisco) do not overlap the HSTT Study Area. As such, while WhaleSafe can inform whale occurrence in other areas of Southern California, it is not an appropriate tool for determining mitigation actions in the HSTT Study Area, and NMFS has not required the Navy to halt training exercises when WhaleSafe indicates that whale presence in the area is "high" or "very high" as suggested by the commenter. However, NMFS has recommended to the Navy, including as a conservation recommendation in the 2024 reinitiated Biological and Conference Opinion, that it explore funding options and seek partnership opportunities for the development of a mapping and analysis tool that integrates acoustic and visual whale detections with model predictions to display near real-time whale presence data within the SOCAL and nearby surrounding areas. Information generated by such a tool could then be used by Navy, and potentially non-military, vessels to reduce the risk of large whale vessel strike in Southern California.

Comment 14: A commenter stated that NMFS must substantially strengthen mitigation measures, including requiring more effective measures to protect large whales from vessel strikes, before issuing any additional take authorizations to the Navy. The commenter stated that NMFS rejected other mitigation measures, such as requiring vessels used in the Navy's activities to slow to 10 kn (18.5 km per hour) or less in certain BIAs to reduce the risk of vessel strikes, by downplaying the risk of vessel strikes to endangered whales and other species impacted by the Navy's activities. The commenter stated that NMFS' proposed modifications to the mitigation measures fall short of meeting the least practicable adverse impact standard. Commenters provided several specific recommendations for mitigation measures.

1. The 2023 HSTT proposed rule included a revised mitigation measure that states "if marine mammals are observed, Navy personnel must maneuver (which may include reducing speed as the mission or circumstances allow) to maintain distance." The reference to reducing speed as the mission or circumstances allow is a revision from the measure in the 2020 HSTT final rule. The commenter stated that this measure should be mandatory in important whale habitat, where whales are known to occur, and where

vessel strikes have occurred or are expected to occur, and should be implemented in these areas even when whales have not been observed by Lookouts. Another commenter recommended focusing on vessel speeds and their impact on marine mammal safety to mitigate the risks associated with high-speed vessel travel and including revised protocols.

2. The 2023 HSTT proposed rule also requires that Navy personnel must send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area. The commenter stated that NMFS should attach specific actions required of other vessels in the area, including a 10 kn (18.5 km per hour) ship speed, when a Navy vessel strike has been reported, in order to reduce the risk of further strikes. The commenter stated that these alerts should also go to non-Navy vessels in the vicinity that pose a risk to whales.

3. The 2023 HSTT proposed rule modified the requirement for awareness messages disseminated in Southern California. The commenter stated that it supports the use of more accurate seasonal information to inform large whale awareness messages, but expects awareness and alerts to be tied to more robust mitigation action, and recommends that if a marine mammal is spotted, NMFS should require a mandatory 10 kn (18.5 km per hour) ship speed limit.

4. The 2023 HSTT proposed rule also contains a new mitigation measure in which Navy personnel would issue real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in a select area of SOCAL (Of note, the four whales do not have to be the same species and do not have to be part of the same group (e.g., two whales of one species sighted at a distance off the port side at 500 yards (yd; 457.2 m) and two more whales of another species sighted off the starboard side at 500 yd (457.2 m) would be considered an aggregation under this measure)). The commenter recommended that (a) this should apply any time a whale is sighted (*i.e.*, Navy should not have to observe at least four whales to trigger this measure), (b) this should have no geographic limitation, and (c) this should trigger a mandatory 10 kn (18.5 km per hour) ship speed limit.

5. A commenter stated that the Navy will evaluate future revisions to online or DVD Marine Species Awareness Training (MSAT) video training to emphasize that when a protected species is spotted, this may be an indicator that additional marine

mammals are present and nearby, and the vessel should take this into consideration when transiting. The commenter stated that this purported mitigation measure should be more forceful; when a protected species is spotted, protective actions must result.

Response: Under the MMPA, NMFS' least practicable adverse impact determination for military readiness activities must include consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity (16 U.S.C. 1371(a)(5)(a)(iii)). The recommendation for NMFS to require, in some cases a reduction in speed, and in other cases a 10 kn (18.5 km per hour) speed limit, generally speaking, is impracticable because these speed reductions and further reductions to Navy vessel speeds negatively impact mission effectiveness. The Navy is unable to impose a 10 kn (18.5 km per hour) ship speed limit because it would not be practical to implement and would impact the effectiveness of Navy's activities by putting constraints on training and testing. The Navy requires flexibility in the use of variable ship speeds for training, testing, operational, safety, and engineering qualification requirements. Navy ships typically use the lowest speed practical given individual mission needs. NMFS has reviewed the Navy's analysis of these additional restrictions and the impacts they would have on military readiness and concurs with the Navy's assessment that they are impracticable. That said, NMFS has strengthened its mitigation requirement requiring Navy personnel to maneuver if marine mammals are observed to add "which may include reducing speed as the mission or circumstances allow" to emphasize that reduction of speeds should be considered where appropriate. Of note, current Navy Standard Operating Procedures and mitigations require a minimum of at least three Lookouts on duty on Navy cruisers and destroyers while underway and, so long as safety of navigation is maintained, to keep 500 yards away from large whales and 200 yards away from other marine mammals (except for bow-riding dolphins and pinnipeds hauled out on shore or man-made navigational structures, port structures, and vessels).

Previously, the Navy commissioned a vessel density and speed report based on an analysis of Navy ship traffic in the HSTT Study Area between 2011 and 2015. Median speed of all Navy vessels within the HSTT Study Area is typically already low, with median speeds between 5 and 12 kn (9.2 to 22.2 km per

hour). Further, the presence and transits of commercial and recreational vessels, annually numbering in the thousands, poses a more significant risk to large whales than the presence of Navy vessels. The *Vessel Strike* subsection of the *Estimated Take of Marine Mammals* section of the 2020 HSTT final rule and this rule and the 2018 HSTT FEIS/OEIS chapter 3 (Affected Environment and Environmental Consequences) section 3.7.3.4.1 (Impacts from Vessels and In-Water Devices) and Appendix K, section K.4.1.6.2 (San Diego (Arc) Blue Whale Feeding Area Mitigation Considerations), explain the important differences between most Navy vessels and their operation and commercial ships that make Navy vessels much less likely to strike a whale.

When developing Phase III mitigation measures, the Navy analyzed the potential for implementing additional types of mitigation, such as vessel speed restrictions within the HSTT Study Area. The Navy determined that based on how the training and testing activities will be conducted within the HSTT Study Area, vessel speed restrictions would be incompatible with practicability criteria for safety, sustainability, and training and testing missions, as described in chapter 5 (Mitigation), section 5.3.4.1 (Vessel Movement) of the 2018 HSTT FEIS/OEIS. NMFS fully reviewed this analysis and concurs with the Navy's conclusions. During the promulgation of this final rule, NMFS again discussed the potential for vessel speed restrictions, including during limited times and areas, and Navy continued to assert that such restrictions are not practicable. After thorough discussion, NMFS again concurs with the Navy's conclusions.

Regarding the recommendation for Navy to send alerts of increased risk of strike to non-Navy vessels (such as through the WhaleAlert app), Navy has informed NMFS that transmitting information between Navy and civilian vessels poses security risks that make sending alerts to non-Navy vessels impracticable.

Regarding the recommendations for the measure described in number 4 to be implemented when a single whale is sighted and in all areas, Navy asserts that doing so is not practicable as it would interfere with its mission success. Four whales was determined to be the appropriate trigger for this measure as it represents an increased strike risk without occurring so often that this measure becomes impracticable for the Navy to implement. Regarding the geographic limitations, this measure would apply to the area between 32–33

degrees North and 117.2–119.5 degrees West, which includes the locations where recent (2009, 2021, 2023) strikes occurred, and historic locations where strikes occurred when precise latitude and longitude were known. Given that this area includes the location where all known strikes have occurred, NMFS anticipates that this measure is of particular importance in this area, and Navy asserted that implementing this measure more broadly would be impracticable, as it could divert the attention of bridge personnel from other critical tasks.

As stated by the commenter, the Navy will evaluate future revisions to online or DVD MSAT video training to emphasize that when a protected species is spotted, this may be an indicator that additional marine mammals are present and nearby, and the vessel should take this into consideration when transiting. NMFS does not dictate exactly what measure must be taken, as different situations warrant different actions and may have different safety and practicability considerations.

The 2023 HSTT proposed rule and this final rule include two new mitigation measures beyond that required by the 2020 HSTT final rule and modification of two existing mitigation measures. Please see NMFS' response to Comment 15.

With the exception of the recommended mitigation measures discussed within this Comments and Responses section, the commenter has not demonstrated why NMFS has not met the least practicable adverse impact standard. As described in the Mitigation Measures section of this final rule, NMFS has included the mitigation requirements necessary to achieve the least practicable adverse impact on the affected species or stocks and their habitat.

Comment 15: Multiple commenters stated that, rather than authorizing additional take by serious injury or mortality by vessel strike, NMFS should require the Navy to implement additional mitigation measures to avoid harassment and future vessel strikes of large whales. Commenters specifically referenced the 2021 Royal Australian Navy vessel strikes of fin whales, with one commenter referencing what it describes as NMFS' acknowledgement of the susceptibility of fin whales to vessel strike year-round, and another stating that the Royal Australian Navy vessel strikes should be factored into the take calculation for the HSTT Study Area.

In a related comment, a commenter questioned whether the Navy can

continuously keep asking for more takes if they continue to reach their authorized number.

Response: Based on the available information at the time that the 2020 HSTT final rule was promulgated, NMFS' analysis suggested that three takes by serious injury or mortality by vessel strike over the 7-year duration of the HSTT rule could occur. To date, NMFS is aware of three confirmed vessel strikes of large whales by U.S. Navy vessels during the current regulatory period. While those three takes are within what NMFS anticipated could occur, given that three years remained of the effective period of the rule when the first two strikes occurred, the Navy reanalyzed the potential for take by mortality and serious injury by vessel strike over the duration of the rule, and that analysis suggested that additional takes could occur. NMFS' subsequent analysis also suggested that two additional takes could occur over the remainder of the regulatory period. NMFS requires the Navy to implement mitigation measures to reduce the potential for vessel strike; however, this mitigation is not quantitatively incorporated into NMFS' analysis, and therefore, does not reduce the number of takes that NMFS authorizes.

Regarding mitigation, the 2023 HSTT proposed rule and this final rule include two new mitigation measures beyond that required by the 2020 HSTT final rule and modification of two existing mitigation measures. The new measures include:

- Navy personnel must issue real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in a select area of SOCAL; and
- Navy personnel must send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area.

Additionally, the 2020 HSTT final rule (85 FR 41780, July 10, 2020) requires Navy personnel to issue seasonal awareness notification messages to alert ships and aircraft to the possible presence of blue whales, humpback whales, gray whales, and fin whales in the seasons that they are most likely to occur in the HSTT Study Area. These messages assist in maintaining safety of navigation and in avoiding interactions with large whales during transits. This final rule requires the Navy to re-title the spring blue whale message (released in June) to a large whale awareness message inclusive of typical spring-summer large whales in southern California (mainly blue, fin, and humpback whales), as included in the 2023 HSTT proposed rule.

Furthermore, rather than tying the message release to a specific month, the message would be for a period based on predicted oceanographic conditions for a given year.

For vessel movement, the 2020 HSTT final rule (85 FR 41780, July 10, 2020) required that "when underway, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must maneuver to maintain distance." This measure has been updated to state that reducing speed may be an appropriate way to maneuver, as included in the 2023 HSTT proposed rule. Please see the Mitigation Measures section for a full discussion of these new and revised measures.

NMFS anticipates that additional vessel strike of large whales could still occur even in consideration of these additional and modified mitigation measures (noting that the mitigation measures are not quantitatively included in the vessel strike calculation). Therefore, NMFS is authorizing two additional takes of large whales by serious injury or mortality by vessel strike over the 7-year duration of the HSTT rule (two takes in addition to the three takes authorized in the current regulations). In the 2023 HSTT proposed rule and this final rule, NMFS describes factors that make fin whales particularly susceptible to vessel strike by the Navy in southern California (e.g., occurrence, Navy vessel strike history in SOCAL, year-round occurrence). As such, NMFS analysis suggests that of the five total takes by serious injury or mortality by vessel strike of large whales, up to four of those takes could be of the CA/OR/WA stock of fin whale. Regarding the suggestion that the Royal Australian Navy vessel strike of two fin whales should be factored into the take calculation for the HSTT Study Area, as explained in the 2023 HSTT proposed rule and in the Vessel Strike section of this final rule, according to the U.S. Navy, the May 2021 vessel strike of two fin whales by a Royal Australian Navy vessel did not occur while that vessel was participating in a U.S. Navy-led training exercise, and the strike of those two fin whales is not included in the estimated take by vessel strike calculation. Instead, NMFS considered the 2021 vessel strike by the Royal Australian Navy along with other strike information when determining which species could be among the estimated large whales struck.

Regarding a commenter's concern about whether the Navy can continuously keep asking for more takes if they continue to reach their authorized number, as stated in the

Background section of this final rule, an authorization for incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stocks and will not have an unmitigable adverse impact on the availability of the species or stocks for taking for subsistence uses (where relevant) (16 U.S.C. 1371(a)(5)(A)). Further, NMFS must prescribe the permissible methods of taking and other means of effecting the least practicable adverse impact on the affected species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stocks for taking for certain subsistence uses (referred to in this rule as "mitigation measures"); and requirements pertaining to the monitoring and reporting of such takings (16 U.S.C. 1371(a)(5)(A)). NMFS has made the required findings, and therefore, it must issue the requested incidental take authorization to the Navy.

Comment 16: The 2023 HSTT proposed rule (88 FR 68290, October 3, 2023) states: "The 2021 NAVDORM requires the use of three Lookouts on Navy cruisers and destroyers as compared to the previous requirement of one Lookout when a vessel was underway and not engaged in sonar training or testing. However, as discussed in the Mitigation Measures section below, the Navy informed NMFS that requiring the additional Lookouts as mitigation is not practicable because this SOP may change in response to manning issues and national security needs." A commenter stated that NMFS should reject the Navy's explanation for why three lookouts on cruisers and destroyers are not practicable. In a related comment, a commenter stated that the 2023 HSTT proposed rule seeks to reduce the number of lookouts (the simplest and cheapest mitigation strategy) from three to one, and recommended increased numbers of lookouts as a mitigation measure. This commenter also recommended enhancing bridge resource management. A commenter also recommended training for Lookouts.

Response: Neither the 2023 HSTT proposed rule nor this final rule propose a reduction in the number of lookouts required on Navy vessels, and it is unclear what the commenter means by enhancing bridge resource management, though it is important to note that all bridge watchstanders including Lookouts take the Navy's Marine Species Awareness Training that NMFS has reviewed and approved. The

commenter did not suggest what additional training Lookouts should receive. As a general matter, NMFS' evaluation of least practicable adverse impact appropriately relies heavily on input from the applicant regarding the practicability of any given measure provided the explanation is reasonable and clear. Further, the 2004 NDAA amended the MMPA as it relates to military readiness activities and the incidental take authorization process such that a determination of "least practicable adverse impact" shall include consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity and consultation with the Department of Defense on these considerations (see 16 U.S.C. 1371(a)(5)(A)(iii)). The Navy has clearly indicated the need for flexibility to effectively carry out foreseeable military readiness activities, such that requiring additional Lookouts at all times would be impracticable, and we concur with that assessment.

Comment 17: A commenter stated that if the Navy is allowed a greater number of incidental takes on marine life, it must enforce strategies to avoid such incidents and suggested that the Navy expand its existing precautions to protect marine life and minimize takes of marine animals. The commenter encourages the Navy to (1) continue implementing state-of-the-art technology and best practices to reduce underwater noise and disturbance during training exercises, particularly in areas where marine mammals are known to inhabit, (2) collaborate with marine biologists and conservation experts to continually monitor the effects of Navy activities on marine life and suggest corrective actions when necessary, (3) consider adjusting the timing or location of training exercises to minimize their impact on critical marine habitats and migration paths, and (4) promote transparency and cooperation by engaging with environmental organizations and local communities to develop and assess mitigation strategies collaboratively. In a related comment, another commenter stated that advanced technologies should allow the United States military to maintain readiness standards and protect wildlife.

Response: NMFS worked closely with the Navy to investigate the recent vessel strikes and to identify ways to improve mitigation measures. This final rule includes revision to two existing mitigation measures and two new mitigation measures beyond that included in the 2020 HSTT final rule (85 FR 41780, July 10, 2020; described

further in response to Comment 15). Of note, this final rule authorizes additional take by serious injury or mortality by vessel strike beyond that authorized by the 2020 HSTT final rule. This final rule does not authorize additional take by Level A or Level B harassment. However, as discussed in the Mitigation Measures section of this final rule, elsewhere in this section, and in chapter 5 (Mitigation) of the 2018 HSTT FSEIS/OEIS, the Navy will implement extensive mitigation, both procedural mitigation and mitigation areas, to avoid or reduce potential impacts from the HSTT activities on marine mammals, including impacts from sonar and explosives. (Note that additional measures and revisions to some existing measures have been made since publication of this FEIS/OEIS). Specifically, the Navy would use a combination of delayed starts, powerdowns, and shutdowns to minimize the likelihood of M/SI, minimize the likelihood or severity of PTS or other injury, and reduce instances of TTS or more severe behavioral disruption caused by acoustic sources or explosives. The Navy will limit activities (active sonar, explosive use, major training exercises (MTEs), *etc.*) to varying degrees in multiple areas that are important to sensitive species or for critical behaviors in order to minimize impacts that are more likely to lead to adverse effects on rates of recruitment or survival. The mitigation measures would reduce the probability and/or severity of impacts expected to result from acute exposure to acoustic sources or explosives, vessel strike, and impacts to marine mammal habitat. Please see the Mitigation Measures section of this final rule for additional detail regarding required mitigation measures.

Regarding best practices to reduce underwater noise, most of the Navy's vessels already have state of the art quieting technologies employed to reduce their sound profile to assist them in avoiding detection by enemy forces, therefore, they are much quieter than commercial/recreational vessels of similar sizes.

Regarding monitoring the effects of Navy activities on marine life and the commenter's recommendation to take corrective actions when necessary, as required by this final rule, the Navy implements a robust monitoring program. Although the Navy has been conducting research and monitoring in the HSTT Study Area for over 20 years, it developed a formal marine species monitoring program in support of the MMPA and ESA authorizations for the Hawaii and Southern California range

complexes in 2009. This robust program has resulted in hundreds of technical reports and publications on marine mammals that have informed Navy and NMFS analyses in environmental planning documents, rules, and Biological Opinions. The reports are made available to the public on the Navy's marine species monitoring website (www.navy-marine-species-monitoring.us) and the data on the Ocean Biogeographic Information System Spatial Ecological Analysis of Megavertebrate Populations (OBIS-SEAMAP) (www.seamap.env.duke.edu). For additional information about the Navy's monitoring program, please see the Monitoring section herein and the websites listed above.

Further, the regulations governing the take of marine mammals incidental to Navy training activities in the HSTT Study Area contain an adaptive management component. Our understanding of the effects of Navy training and testing activities (*e.g.*, acoustic and explosive stressors) on marine mammals continues to evolve, which makes the inclusion of an adaptive management component both valuable and necessary within the context of 7-year regulations. Please see the Adaptive Management section of this final rule for additional information.

Regarding transparency and cooperation, the MMPA does not require an independent review of mitigation measures. It does require notice and opportunity for public comment (16 U.S.C. 1371(a)(5)(A)(i)). The public comment period is a means by which the public (*e.g.*, environmental organizations and local communities) are able to provide NMFS with mitigation measure recommendations supported by scientific evidence that NMFS takes into consideration when finalizing the rulemaking.

Comment 18: A commenter stated that measures should be taken to cease any more actions potentially impacting marine mammals. The 2023 HSTT proposed rule (88 FR 68290, October 3, 2023) states that results of a study indicated that Navy Lookout Teams, which include lookouts and other crew members, have approximately an 80 percent chance of failing to detect a pod of large whales beyond 200 yd (182.9 m), compared with a 49 percent chance for trained marine mammal observers. The commenter recommended that the Navy hire trained marine mammal observers to keep the incidents of whale take to the original take numbers or less, and not need to have modifications to the LOA for additional animal take. The

commenter also recommended having experts that can accurately assess the physical and mental health of these animals. In a related comment, a commenter stated that the rule calls into question whether the three vessel strikes that have occurred were due to the crew not spotting the whales, not spotting them before the strike, or the Navy not emphasizing the importance of spotting and avoiding marine wildlife to its personnel.

Response: As described in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), a recent study by Oedekoven and Thomas (2022) was designed to evaluate the effectiveness of Navy Lookouts at detecting marine mammals before they entered a defined set of mitigation zones (*i.e.*, 200, 500, and 1,000 yd (182.9, 457.2, and 914.4 m)) during MFAS training activities. This study also compared Lookout effectiveness with that of trained marine mammal observers. Lookout teams were comprised of varying numbers of Lookouts depending on the type of ship and the training activity that was occurring (noting that the data was collected prior to the Navy's change in its SOPs to require the use of three Lookouts on Navy cruisers and destroyers). Marine mammal observer teams consisted of two dedicated observers. As noted by the commenter, results of this study indicate that Navy Lookout Teams, which include Lookouts and other crew members, have approximately an 80 percent chance of failing to detect a pod of large baleen whales (rorquals) before they come closer than a mitigation range of 200 yd (182.9 m), compared with a 49 percent chance for trained marine mammal observers. The probability of a pod remaining undetected by Lookouts was greater for larger mitigation zones (*i.e.*, 85 percent at 500 yd (457.2 m); 91 percent at 1,000 yd (914.4 m)). These values require some level of interpretation with regard to the numerical results. For instance, the study's statistical model assumed that Navy ships moved in a straight line at a set speed for the duration of the field trials, and that animals could not move in a direction perpendicular to a ship. Violation of this model assumption would underestimate Lookout effectiveness for some data points. The values for both Navy Lookouts and the Marine Mammal Observers include animals under the water that would not have been available for detection by a Lookout. This study suggests that detection of marine mammals is less certain than previously assumed at certain distances. While this study

suggests that trained marine mammal observers are more effective than Navy Lookouts, the Navy has asserted that it is impracticable to station independent marine mammal observers on Navy vessels. When making the least practicable adverse impact determination for military readiness activities, NMFS must consider personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activities and must consult with the Department of Defense on these considerations (16 U.S.C. 1371(a)(5)(A)(iii)). As described in section 5.5.5 (Third-Party Observers) of the 2018 HSTT FEIS/OEIS, use of third-party observers on Navy vessels or aircraft would result in safety and security clearance issues, berthing shortages or exceedance of other space limitations, impacts to Lookouts' abilities to complete their other mission-essential duties, and unsustainable costs, among other issues. Please see the 2018 HSTT FEIS/OEIS for additional detail.

Lookouts remain an important component of the Navy's mitigation strategy, especially as it relates to minimizing exposure to the more harmful impacts that may occur within closer proximity to the source, where Lookouts are most effective. Further, NMFS and the Navy are also considering, through the adaptive management process, whether there are additional measures that would be practicable to implement that would improve effectiveness of Lookouts, such as enhanced personnel training.

As described in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), the 2021 U.S. Navy vessel strikes were the first known U.S. Navy vessel strikes in the HSTT Study Area since 2009. Historically, military vessel strikes of large whales within the HSTT Study Area have been rare events with only seven such strikes occurring over the past 14 years, five U.S. Navy strikes, and two Royal Australian Navy strikes. Based on the Navy and NMFS' investigation of these recent strike incidents, NMFS found that the Navy was substantially following the required mitigation protocols, consistent with 16 U.S.C. 1371(a)(5)(B). These recent vessel strike reports (2021, 2023) appear to reflect the sporadic, episodic, or clustered nature of vessel strike or may reflect a trend of increased large whale presence in this area in the early summer months. Given the size of Navy vessels and the need to maintain specific speeds during certain activities, even if a whale is detected, a U.S. Navy vessel may not be able to avoid a strike.

Therefore, given the potential shift in factors contributing to vessel strike, and the challenges in avoiding potential strikes, it is important to ensure that the compliance process addresses the appropriate number of potential strikes and that they are considered in the negligible impact determination, which is why it was necessary to evaluate the authorization of an additional two takes by strike. The MMPA provides for the authorization of incidental take caused by specified activities, provided certain findings are made. The law directs NMFS to process adequate and complete applications for incidental take authorization, and issue the authorization provided all statutory findings and requirements, as well as all associated legal requirements, are met.

It is unclear how having experts that can accurately assess the physical and mental health of these animals, as suggested by the commenter, would assist in mitigating the effects of the Navy's activities, nor has the commenter provided detail explaining how. The required procedural mitigation measures are implemented within defined ranges based on established criteria, and implementation does not rely on a visual assessment of behavioral or physiological effects to animals. In its analysis, NMFS does consider the potential impacts of stress on marine mammals from exposure to the Navy's activities. Please see the Stress Response section of the 2018 HSTT Proposed Rule for a discussion of stress responses in marine mammals. Further, since that discussion, additional information about stress responses has become available (*e.g.*, Houser *et al.* (2020); Houser *et al.* (2021)). However, the additional studies do not change the expected potential impacts of stress on marine mammals from exposure to the Navy's activities.

NMFS thoroughly discussed each of the strikes with the Navy, and summarized the circumstances surrounding each strike in the *Estimated Take From Vessel Strikes and Explosives by Serious Injury or Mortality* section of the 2023 HSTT proposed rule ((88 FR 68290, October 3, 2023) and the *Authorized Take From Vessel Strikes and Explosives by Serious Injury or Mortality* section of this final rule. The circumstances surrounding whale detection ahead of each strike varied. However, of note, Navy vessels routinely successfully maneuver to avoid large whales. Between 2009 and 2021 (the most recent year for which data is available), U.S. Navy vessels in the SOCAL portion of the HSTT Study Area maneuvered 316 times to avoid large whales during MTEs. The years

2017 and 2021 had the highest number of maneuvers ($n = 64$ and $n = 82$, respectively). In all years for which data is available (2009 to 2021), Navy cruisers and destroyers account for 51 to 100 percent of maneuvers during MTEs to avoid whales.

Comment 19: A commenter, referencing two news articles, stated that new information indicates that the Navy is increasingly using unmanned systems, which cannot replace human monitoring, even if useful in addition to the lookouts and observers NMFS relies on to mitigate and monitor the impacts of the Navy's activities on marine mammals.

Response: As stated in the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023), the Navy's proposed activities have not changed from that analyzed in the 2018 final rule (83 FR 66846, December 27, 2018) or the 2020 final rule (85 FR 41780, July 10, 2020). Impacts from all unmanned systems that would be used in training and testing activities under this proposed rule have been accounted for in the analysis. Neither NMFS nor the Navy have proposed to replace human marine mammal monitoring with monitoring by unmanned systems.

Determinations

Comment 20: A commenter stated that NMFS has neither adequately evaluated nor met the negligible impact standard for the following reasons:

1. The negligible impact determination dismisses the important fact that vessel strikes already pose a substantial threat to large whales in the region, and several populations are already exceeding PBR. Endangered blue whales, threatened and endangered humpback whales, and endangered fin whales off the coast of Southern California are particularly vulnerable, with even one additional ship strike constituting a significant impact.

2. NMFS has failed to consider the impacts of the full scope of training exercises over 7 years on marine mammals, including joint training exercises with foreign fleets. The commenter further asserted that what is not unsaid in the rule, but is critically important, is that the Navy's activities over 7 years (in contrast to the five already authorized) has never been evaluated under the MMPA, ESA, or NEPA. The commenter stated that this underscores that NMFS has not taken the measures needed to ensure the Navy's activities in the HSTT Study Area will have no more than a negligible impact on endangered whales and other marine mammals in the Pacific Ocean over the full 7 years of the proposed

authorization. NMFS must reexamine the increased risk and incidence of vessel strikes in light of the Navy's full suite of impacts on large whales and other marine mammals (over this extended period of time) and decline to authorize this additional take.

Response: NMFS disagrees with the commenter's assertion that it has not adequately evaluated nor met the negligible impact standard. NMFS assessed all of the best available information about the relative risk of vessel strikes by commercial, recreational, and military vessels in the Vessel Strike section of this final rule. As explained in the Serious Injury or Mortality subsection of the *Analysis and Negligible Impact Determination* section of the 2018 HSTT final rule, the 2020 HSTT final rule, and this final rule, NMFS may find the impact of the authorized take from a specified activity to be negligible even if total human-caused mortality exceeds PBR, if the authorized mortality is less than 10 percent of PBR and management measures are being taken to address serious injuries and mortalities from the other activities causing mortality (*i.e.*, other than the specified activities covered by the incidental take authorization in consideration, including vessel strike from other actions). When those considerations are applied in the section 101(a)(5)(A) context here, the authorized lethal take (0.14 annually) of humpback whales from the Mainland Mexico- CA/OR/WA stock, and blue whales from the Eastern North Pacific stock are less than 10 percent of PBR (less than 1 percent for humpback whales from the Mainland Mexico- CA/OR/WA stock and 3 percent for blue whales from the Eastern North Pacific stock). The authorized lethal take (0.57 annually) of fin whales from the CA/OR/WA stock is less than 10 percent of PBR also (less than 1 percent). There are management measures in place to address the mortality and serious injury from the activities other than those the Navy is conducting. For the complete discussion of how NMFS carefully considered potential mortalities from the Navy's activities in light of PBR levels, including an explanation for why mortality above PBR will not necessarily induce population-level non-negligible impacts, see the discussion in this rule, the 2020 HSTT final rule, and the 2018 HSTT final rule.

NMFS acknowledges that the removal of a reproductive female (or any female) could be more impactful to the status of a population than the removal of a male. However, the PBR framework that supports the negligible impact finding

inherently considers the likelihood that the human-caused mortalities being considered may consist of a random distribution of individuals of different sex in different life stages. Also, beyond the low likelihood of striking a whale at all, the likelihood of hitting a female is even lower.

It is important to note that the only change to the number of takes proposed by the 2023 HSTT proposed rule was to the take by vessel strike to account for new information since publication of the 2020 HSTT final rule. The 2020 HSTT final rule analyzed and authorized take of marine mammals over a 7-year period, not 5 years as noted by the commenter, and NMFS conducted the appropriate level of MMPA, ESA, and NEPA analysis to comply with both statutes during the promulgation of the 2020 HSTT final rule.

As stated in the Preliminary Analysis and Negligible Impact Determination section of the 2023 HSTT proposed rule (88 FR 68290, October 3, 2023) and the Analysis and Negligible Impact Determination section of this final rule, while this rule consists of a modification of take by M/SI by vessel strike, NMFS considers the impacts of the entire specified activity and the total taking in the negligible impact determination. In consideration of the total taking, including take by mortality, Level A harassment, and Level B harassment, NMFS finds that the incidental take from the specified activities will have a negligible impact on all affected marine mammal species and stocks. Consistent with 40 CFR 1502.9 and the information and analysis contained in this final rule, the Navy and NMFS as a cooperating agency made a determination that this final rule and the subsequent LOAs will not result in significant impacts that were not fully considered in the 2018 HSTT FEIS/OEIS. As indicated in the 2023 HSTT proposed rule, the Navy has made no substantial changes to the activities nor are there significant new circumstances or information relevant to environmental concerns or their impacts.

NMFS and the Navy reinitiated consultation under the ESA. NMFS issued a reinitiated Biological and Conference Opinion on June 3, 2024 concluding that the issuance of the 2024 HSTT final rule and subsequent LOAs are not likely to jeopardize the continued existence of the threatened and endangered species under NMFS' jurisdiction and are not likely to result in the destruction or adverse modification of critical habitat in the HSTT Study Area. The opinion is

available at <https://doi.org/10.25923/7y9x-vw84>.

Please also see NMFS' response to Comment 7 regarding foreign vessels.

Comment 21: Commenters stated that they oppose this proposed promulgation of modified regulations and associated LOAs for the Navy because it is not consistent with MMPA mandates that require NMFS to ensure activities have no more than a negligible impact on marine mammal species or stocks and that they have the least practicable adverse impact on marine mammal species, stocks, and habitat. In a related comment, a commenter stated that this rule would disregard the previously established boundaries between the Navy and NMFS and would also disregard the push the United States claims to have for the protection of marine wildlife. The commenter stated that it perceives the request to be heavily hypocritical of the same government that implemented regulations to protect marine wildlife that teeter on the edge of the endangered species list, to reach for an exception for its military, and further that the proposed amendment is unethical, hypocritical, and unnecessary.

Response: The MMPA requires NMFS to authorize the incidental take of marine mammals by specified activities upon request if certain findings are made (16 U.S.C. 1371(a)(5)(A)). Here, the Navy submitted an application requesting two additional takes of large whales by serious injury or mortality by vessel strike through modification of the existing regulations and LOAs. As required by the MMPA, NMFS conducted the analysis described in the 2023 HSTT proposed rule and this final rule and made all required findings (preliminarily, in the case of the 2023 HSTT proposed rule), including finding that the Navy's activities will have a negligible impact on marine mammals and that the required mitigation measures will effect the least practicable adverse impact on marine mammals. Therefore, promulgation of this final rule is appropriate.

Please see the Mitigation Measures section of this final rule for additional discussion of the required mitigation measures and NMFS' least practicable adverse impact finding.

Other Regulatory Processes

Comment 22: A commenter stated that the Navy issued an EIS purporting to analyze the environmental impacts of its training and testing activities in the HSTT Study Area. NMFS was a cooperating agency for the 2018 HSTT FEIS/OEIS. The EIS considered only three alternatives in detail: the No

Action Alternative under which the Navy's training activities would not occur; Alternative 1 that considered fluctuations in training cycles, testing requirements, and deployment schedules based on global demand and other factors and included the Navy's entire suite of mitigation measures; and Alternative 2 that considered a higher number of training exercises and sonar hours than in Alternative 1 and included the Navy's entire suite of mitigation measures. Alternative 1 was the preferred and adopted alternative. The commenter stated that none of the Navy's alternatives considered in detail an alternative that would require mandatory speed limits to avoid collisions with endangered whales.

Response: While none of the Navy's alternatives considered in the 2018 HSTT FEIS/OEIS include mandatory vessel speed limits, the Navy conducted an operational analysis of potential mitigation throughout the entire Study Area to consider a wide range of mitigation options, including but not limited to vessel speed restrictions. As discussed in chapter 3, section 3.0.3.3.4.1 (Vessels and In-Water Devices) of the 2018 HSTT FEIS/OEIS, Navy ships transit at speeds that are optimal for fuel conservation or to meet operational requirements. Operational input indicated that implementing additional vessel speed restrictions beyond what is identified in chapter 5 (Mitigation), section 5.4 (Mitigation Areas to be Implemented) of the 2018 HSTT FEIS/OEIS would be impracticable to implement due to implications for safety and sustainability. In its assessment of potential mitigation, the Navy considered implementing additional vessel speed restrictions (e.g., expanding the 10 kn (18.5 km per hour) restriction to other activities). The Navy determined that implementing additional vessel speed restrictions beyond what is described in chapter 5 (Mitigation), section 5.5.2.2 (Restricting Vessel Speed) of the 2018 HSTT FEIS/OEIS would be impracticable due to implications for safety (the ability to avoid potential hazards), sustainability (maintain readiness), and the Navy's ability to continue meeting its Title 10 requirements to successfully accomplish military readiness objectives.

Additionally, as described in chapter 5 (Mitigation), section 5.5.2.2 (Restricting Vessel Speed) of the 2018 HSTT FEIS/OEIS, any additional vessel speed restrictions would prevent vessel operators from gaining skill proficiency, would prevent the Navy from properly testing vessel capabilities, or would

increase the time on station during training or testing activities as required to achieve skill proficiency or properly test vessel capabilities, which would significantly increase fuel consumption. As discussed in chapter 5 (Mitigation), section 5.3.4.1 (Vessel Movement) of the 2018 HSTT FEIS/OEIS, the Navy implements mitigation to avoid vessel strikes throughout the Study Area. Additionally, this final rule includes two new mitigation measures beyond that required by the 2020 HSTT final rule and modification of two existing mitigation measures. These measures are described in response to Comment 15 and the Mitigation Measures section of this final rule.

Comment 23: A commenter stated that agencies must prepare supplemental EISs if: "(i) The agency makes substantial changes in the proposed action that are relevant to environmental concerns; or (ii) There are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts" (40 CFR 1502.9(d)(1)). The commenter stated that because these triggers have been met, it urges NMFS to prepare a supplemental EIS on the basis of the new information that has come to light since 2018, including on the impacts of vessel strikes on large whales and on alternatives that reduce vessel strike impacts to marine mammals.

Response: NMFS disagrees with the commenter that supplemental NEPA evaluation is warranted. As described in the *National Environmental Policy Act* section herein, consistent with 40 CFR 1502.9(d) and the information and analysis contained in this rule, the Navy and NMFS as a cooperating agency have determined that this final rule and any subsequent LOAs would not result in significant impacts that were not fully considered in the 2018 HSTT FEIS/OEIS. As indicated in this final rule and a supplemental information report prepared by NMFS, the Navy has made no substantial changes to the activities that are relevant to environmental concerns; nor are there substantial new circumstances or information about the significance of adverse effects that bear on the analysis.

Comment 24: A commenter stated that despite the new 2020 authorization—and the additional extensive take and other impacts it enables—NMFS has not completed new ESA consultation or a supplemental NEPA evaluation. The Navy is operating under the 2018 BiOp and 2018 EIS. Since NMFS issued the 2018 BiOp and EIS, a slew of new information—in addition to the expanded scope of the Navy's

activities—indicates that the Navy’s activities in the HSTT Study Area are likely affecting ESA-listed species to an extent not previously considered.

In a related comment regarding ESA compliance, a commenter stated that the proposed rule states, “NMFS has also reinitiated consultation internally on the issuance of these proposed, revised regulations and LOAs under section 101(a)(5)(A) of the MMPA.” The commenter noted that when reinitiation is required, “the original opinion loses its validity, as does its accompanying incidental take statement, which then no longer shields the action agency from penalties for takings” (*Ctr. for Biological Diversity v. BLM*, 698 F.3d 1101, 1108 (9th Cir. 2012)). A commenter stated that it awaits the conclusion of this reinitiated consultation and expects a revised biological opinion that fully complies with the ESA’s standards.

Response: NMFS has fully complied with the ESA and NEPA. NMFS described the ESA section 7 consultation history for this action in the *Endangered Species Act* section of the 2023 HSTT proposed rule and this final rule. As described in that section, NMFS consulted internally on the issuance of the 2018 HSTT regulations and LOAs under section 101(a)(5)(A) of the MMPA.

NMFS issued a Biological Opinion on December 10, 2018 concluding that the issuance of the 2018 HSTT final rule and subsequent LOAs are not likely to jeopardize the continued existence of the threatened and endangered species under NMFS’ jurisdiction and are not likely to result in the destruction or adverse modification of critical habitat in the HSTT Study Area. The 2018 Biological Opinion included specified conditions under which NMFS would be required to reinitiate section 7 consultation. NMFS reviewed these specified conditions for the 2020 HSTT rulemaking and determined that reinitiation of consultation was not warranted. The incidental take statement that accompanied the 2018 Biological Opinion was amended to cover the 7-year period of the 2020 HSTT rule. The 2018 Biological Opinion for this action is available at <https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>.

The 2018 Biological Opinion reinitiation clause (2), states that formal consultation should be reinitiated if “new information reveals effects of the agency action that may affect ESA-listed species or critical habitat in a manner or to an extent not previously considered.” Given the new information regarding

the recent occurrence of large whale strikes by naval vessels in the southern California portion of the HSTT Study Area, as described herein, the Navy has reinitiated consultation with NMFS pursuant to section 7 of the ESA for HSTT Study Area activities, and NMFS has also reinitiated consultation internally on the issuance of the revised regulations and LOAs under section 101(a)(5)(A) of the MMPA. On June 3, 2024, NMFS issued a 2024 reinitiated Biological and Conference Opinion concluding that the issuance of the rule and subsequent LOAs is not likely to jeopardize the continued existence of the threatened and endangered species under NMFS’ jurisdiction and are not likely to result in the destruction or adverse modification of critical habitat in the HSTT Study Area. The 2024 reinitiated Biological and Conference Opinion for this action is available at <https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>.

NMFS is aware of the statement in *Ctr. for Biological Diversity v. BLM*, 698 F.3d 1101, 1108 (9th Cir. 2012) referenced by the commenter. NMFS’ position is that a biological opinion, including its Incidental Take Statement, for which formal consultation has been re-initiated remains valid and effective during the consultation and until a new biological opinion is issued. When the new biological opinion with a new ITS is issued, it supersedes and replaces the previous opinion and ITS.

Please see NMFS’ response to Comment 23 regarding NEPA compliance.

Changes From the Proposed Rule to the Final Rule

NMFS has added two additional reporting requirements since publication of the 2023 HSTT proposed rule. First, the Navy’s annual HSTT Training Exercise Report and Testing Activity Report must include information that tracks the Navy’s implementation of the new SOCAL large whale aggregation real-time reporting mitigation measure. The report must include the following information for each instance that an aggregation of large whales is reported: (1) the date, time and general location (e.g., approximately 10–12 nmi SE of San Clemente Island) of the whales when the aggregation was first sighted; (2) the total number of whales observed within 1 nmi of a Navy vessel that make up the aggregation; and (3) the approximate distance (or distances if more than one group of whales is sighted) of the vessel from the whales in the aggregation when

the whales were first sighted. To the extent practicable, this information should be provided in the Navy’s unclassified version of these reports.

Second, the Navy’s annual HSTT Training Exercise Report and Testing Activity Report must include a confirmation that foreign military use of sonar and explosives, when such militaries are participating in a U.S. Navy-led exercise or event, combined with the U.S. Navy’s use of sonar and explosives, would not cause exceedance of the analyzed levels (within each NAEMO modeled sonar and explosive bin) used for estimating predicted impacts, which formed the basis of the acoustic impacts effects analysis used to estimate take in this final rule.

NMFS has also made a non-substantive name change in the final rule. *Ziphius cavirostris* has multiple common names. In the 2018 HSTT final rule, 2020 HSTT final rule, and 2023 HSTT proposed rule, NMFS used the common name Cuvier’s beaked whale. In this final rule, NMFS uses the common name goose-beaked whale instead.

Last, NMFS made several non-substantive changes to the regulations to add clarity and improve readability.

Description of Marine Mammals and Their Habitat in the Area of the Specified Activities

Marine mammal species and their associated stocks that have the potential to occur in the HSTT Study Area are presented in table 1 along with the best/minimum abundance estimate and associated coefficient of variation value. Consistent with the 2018 HSTT final rule and 2020 HSTT final rule, the Navy anticipates the take of individuals from 38 marine mammal species by Level A harassment and Level B harassment incidental to training and testing activities from the use of sonar and other transducers, in-water detonations, air guns, and impact pile driving/vibratory extraction activities. As described in detail later, serious injury or mortality of six species is also analyzed and authorized. Two marine mammal species, the Hawaiian monk seal and the Main Hawaiian Islands Insular DPS of false killer whale, have critical habitat designated under the ESA (16 U.S.C. 1531 *et seq.*) in the HSTT Study Area.

In the 2018 HSTT proposed rule and 2018 HSTT final rule, we presented a detailed discussion of marine mammals and their occurrence in the HSTT Study Area, inclusive of important marine mammal habitat (e.g., ESA-designated critical habitat), BIAs, national marine sanctuaries (NMSs), and unusual

mortality events (UMEs). Please see these rules and the 2017 and 2019 Navy applications for additional information beyond what is provided herein. While there have been some minor changes described here, there have been no changes to important marine mammal habitat, NMSs, or ESA-designated critical habitat since the issuance of the 2018 HSTT final rule that change our determination of which species or stocks have the potential to be affected by the Navy's activities or the information in the *Description of Marine Mammals and Their Habitat in the Area of the Specified Activities* section in the 2019 HSTT proposed rule and 2020 HSTT final rule. Therefore, the information presented in those sections of the 2019 HSTT proposed rule and 2020 HSTT final rule remains current and valid with the exception of the information about UMEs, BIAs, and revised humpback whale stock structures, discussed below.

On April 21, 2021, NMFS designated critical habitat for the endangered Western North Pacific DPS, the endangered Central America DPS, and the threatened Mexico DPS of humpback whales (86 FR 21082). Areas proposed as critical habitat include specific marine areas located off the coasts of California, Oregon, Washington, and Alaska. None of the designated critical habitat overlaps with the HSTT Study Area. One of the proposed areas, critical habitat Unit 19,

would have overlapped with the SOCAL range in the HSTT Study Area but was excluded after consideration of potential national security and economic impacts of designation. NMFS, in the final rule designating critical habitat for humpback whales, identified prey species, primarily euphausiids and small pelagic schooling fishes of sufficient quality, abundance, and accessibility within humpback whale feeding areas to support feeding and population growth, as an essential habitat feature. NMFS, through a critical habitat review team (CHRT), also considered inclusion of migratory corridors and passage features, as well as sound and the soundscape, as essential habitat features. NMFS did not include either in the final critical habitat, however, as the CHRT concluded that the best available science did not allow for identification of any consistently used migratory corridors or definition of any physical, essential migratory or passage conditions for whales transiting between or within habitats of the three DPSs. The best available science also currently does not enable NMFS to identify particular sound levels or to describe a certain soundscape feature that is essential to the conservation of humpback whales. Regardless of whether critical habitat is designated for a particular area, NMFS has considered all applicable information regarding marine mammals and their habitat in

the analysis supporting these final regulations.

NMFS has reviewed the 2023 SARs (Carretta *et al.* 2024, Young *et al.* 2024). For all species except humpback whale, NMFS determined that neither the SARs nor any other new information changes our determination in the 2020 HSTT final rule of which species or stocks have the potential to be affected by the Navy's activities. For humpback whale, the 2023 final SARs include a revision to the humpback whale stock structure in the Pacific Ocean. In the 2020 HSTT final rule, NMFS authorized take of the CA/OR/WA stock and Central North Pacific stock of humpback whale. Given the revised stock structure, in this final rule, NMFS has reanalyzed the potential for take of each stock of humpback whale and determined that the Central America/Southern Mexico-CA/OR/WA, Mainland Mexico-CA/OR/WA stock, and Hawaii stocks are likely to be taken by the Navy's activities. Please refer to the 2023 Alaska and Pacific Ocean SARs for additional information about these new stocks.

The species considered but not carried forward for analysis are two American Samoa stocks of spinner dolphins—(1) the Kure and Midway stock and (2) the Pearl and Hermes stock. There is no potential for overlap with any stressors from Navy activities and therefore there would be no incidental takes, therefore, these stocks are not considered further.

TABLE 1—MARINE MAMMAL OCCURRENCE WITHIN THE HSTT STUDY AREA

Common name	Scientific name	Stock	Status		Occurrence	Seasonal absence	Stock abundance (CV)/minimum population
			MMPA	ESA			
Blue whale	<i>Balaenoptera musculus</i>	Eastern North Pacific ...	Strategic, Depleted	Endangered	Southern California.	-	1,898 (0.085)/1,767.

Northern fur seal	<i>Callorhinus ursinus</i>	California	Depleted	-	Southern California.	-	14,050 (NA)/7,524.

Note: A “-” indicates that this column does not apply.

¹ The Mainland Mexico—CA/OR/WA stock and the Mexico—North Pacific stock (which does not occur in the HSTT Study Area) of humpback whale comprise the Mexico DPS. The Hawai'i stock comprises the Hawai'i DPS. The Central America/Southern Mexico—CA/OR/WA stock comprises the Central America DPS.

² *Ziphius cavirostris* has multiple common names. In the 2018 HSTT final rule, 2020 HSTT final rule, and 2023 HSTT proposed rule, NMFS used the common name Cuvier's beaked whale. In this final rule, NMFS uses the common name goose-beaked whale instead.

³ The “4-Islands” stocks of common bottlenose dolphin and pantropical spotted dolphin are now the “Maui Nui” stocks.

⁴ NMFS relied on the 2022 final SAR for this stock.

⁵ NSD—No stock designation. Rough-toothed dolphin has a range known to include the waters off Southern California, but there is no recognized stock or data available for the U.S. West Coast.

Unusual Mortality Events

An UME is defined under section 410(6) of the MMPA as a stranding that is unexpected, involves a significant die-off of any marine mammal population, and demands immediate response. From 1991 to the present, there have been 17 formally recognized UMEs affecting marine mammals in California and Hawaii and involving species under NMFS' jurisdiction.

At the time of publication of the 2023 HSTT proposed rule, there was an active UME for gray whales which NMFS fully considered in its analysis (88 FR 68290, October 3, 2023). This UME was closed on November 9, 2023. The UME involved 690 gray whale strandings, including 347 in the United States, 316 in Mexico, and 27 in Canada. Strandings occurred from Alaska to Mexico along the west coast of North America, including in the whale's wintering, migratory, and feeding areas. The Investigative Team concluded that the preliminary cause of the UME was localized ecosystem changes in the whale's Subarctic and Arctic feeding areas that led to changes in food, malnutrition, decreased birth rates, and increased mortality all documented during the UME. Please see <https://www.fisheries.noaa.gov/national/marine-life-distress/2019-2023-eastern-north-pacific-gray-whale-ume-closed> for additional information on this UME.

Biologically Important Areas

Kratofil *et al.* (2023) identified updated BIAs in Hawaii. The HSTT Study Area overlaps the updated BIAs for small and resident populations of the following species in Hawaii: spinner dolphin, short-finned pilot whale, rough-toothed dolphin, pygmy killer whale, pantropical spotted dolphin, melon-headed whale, false killer whale, dwarf sperm whale, goose-beaked whale, common bottlenose dolphin, and Blainville's beaked whale. Further, the HSTT Study Area overlaps updated BIAs for humpback whale reproduction in Hawaii. The updated BIAs overlap critical Navy training and testing areas within the HSTT Study Area, including most of the internal Navy operating areas. Please see Kratofil *et al.* (2023) for additional details about the BIAs.

Since publication of the 2023 HSTT proposed rule, Calambokidis *et al.* (2024) identified updated BIAs on the West Coast of the U.S. The HSTT Study Area overlaps feeding BIAs for blue whale and fin whale in SOCAL. Additionally, it overlaps a reproductive BIA as well as northbound and southbound migratory BIAs for gray whale. Please see Calambokidis *et al.* (2024) for additional details about the BIAs.

Potential Effects of Specified Activities on Marine Mammals and Their Habitat

This section provides a discussion of the ways in which components of the specified activity may impact marine mammals and their habitat. The Estimated Take section later in this document includes a quantitative analysis of the number of individuals that are expected to be taken by this activity. The Analysis and Negligible Impact Determination section considers the content of this section, the Estimated Take section, and the Mitigation Measures section, to draw conclusions regarding the likely impacts of these activities on the reproductive success or survivorship of individuals and whether those impacts are reasonably expected to, or reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival. In the *Potential Effects of Specified Activities on Marine Mammals and Their Habitat* section of the 2018 HSTT proposed and final rules, and as updated by the 2020 HSTT final rule, NMFS provided a description of the ways marine mammals may be affected by the same activities that the Navy will be conducting during the 7-year period analyzed in this rulemaking in the form of serious injury or mortality, physical trauma, sensory impairment (permanent and temporary threshold shifts and acoustic masking),

physiological responses (particularly stress responses), behavioral disturbance, or habitat effects. Further, in the 2023 HSTT proposed rule, we summarized any new relevant information from the scientific literature since publication of the 2020 HSTT final rule. We do not repeat the information here, all of which remains current and applicable, but refer the reader to those rules and the 2018 HSTT FEIS/OEIS (chapter 3, section 3.7 *Marine Mammals*), which NMFS participated in the development of via our cooperating agency status and adopted to meet our NEPA requirements.

In the *Potential Effects of Specified Activities on Marine Mammals and Their Habitat* section of the 2018 HSTT final rule, we stated that it has been speculated for some time that beaked whales might have unusual sensitivities to sonar sound due to their likelihood of stranding in conjunction with MFAS use, although few definitive causal relationships between MFAS use and strandings have been documented, and no such findings have been documented with Navy use in Hawaii and southern California. On March 25, 2022, a beaked whale (species unknown) stranded in Honaunau Bay, Hawaii. The animal was observed swimming into shore and over rocks. Bystanders intervened to turn the animal off of the rocks, and it swam back out of the Bay on its own. Locals reported hearing a siren or alarm type of sound underwater on the same day, and a Navy vessel was observed from shore on the following day. The Navy confirmed it used CAS within 50 km (27 nmi) and 48 hours of the time of stranding, though the stranding has not been definitively linked to the Navy's CAS use.

An initial study of another deep diving odontocete, the sperm whale, found similar behavioral responses and reductions in foraging when whales were exposed to PAS and CAS at similar cumulative Sound Exposure Levels (SEL_{cum}), even though the CAS signal had a lower source level than the PAS signal. This may indicate that animals were, in this case, responding to the cumulative energy of a signal rather than the instantaneous amplitude (Cure *et al.* 2021, Isojunno *et al.* 2020). If a beaked whale were inshore of a Navy vessel using either PAS or CAS MFAS, and responded by moving away from the vessel, they could find themselves in shallow water and become disoriented, as may have happened in the case of Honaunau Bay. In addition, the animal was not seen after it returned to sea, so blood tissue samples could not be obtained. There has been a growing

body of literature about the impacts of new pathogens on the health and stranding of marine mammals, including beaked whales in Hawaii and other locations in the Pacific (e.g., Clifton *et al.* 2023 and West *et al.* 2013).

NMFS has reviewed new relevant information from the scientific literature since publication of the 2023 HSTT proposed rule. Further, in the 2023 HSTT proposed rule, we summarized any new relevant information from the scientific literature since publication of the 2020 HSTT final rule. Summaries of the new key scientific literature reviewed since publication of the 2023 HSTT proposed rule are presented below. The literature generally falls into the following topic areas: Vessel Strike; Hearing, Vocalization, and Masking; Hearing Loss (Temporary Threshold Shift (TTS) and Permanent Threshold Shift (PTS)); Behavioral Reactions; Stranding; Population Consequences of Disturbance and Cumulative Stressors; Methodology for Assessing Acoustic Impacts.

Vessel Strike

Dunlop (2024) studied migrating east Australian humpback whales' response to approaching vessels to determine if individuals exhibited an avoidance response. While some select groups did display changes in their movements, the sampled collective did not display any consistent vessel avoidance response. Furthermore, the degree of avoidance was lower as vessels approached at faster speeds. Overall, the results showed that humpbacks were generally unresponsive to approaching vessels regardless of the speed or noise level at which they approached. Female-calf pairs proved to be the biggest exception to this pattern; though this demographic did not exhibit a consistent response as a whole, these pairs were more likely to change their travel pattern more than any other group. Due to the lack of response from the population, the results suggest that implementation of vessel strike avoidance protocols is critical for successfully conserving large whale populations.

Redfern *et al.* (2024) developed a new metric for analyzing vessel strike risk reduction ("PLETHd") and applied it to North Atlantic right, humpback, fin, and sei whale distributions along the U.S. East Coast. The metric is calculated using three parameters: the relationship between vessel speed and the probability that a strike is lethal, vessel transit distance, and whale distributions. The authors compared the impact of a 14 kn (25.9 km/hr) vs. 10 kn (18.5 km/hr) speed restriction and found that only the 10 kn (18.5 km/hr)

reduction substantially reduced risk. The authors also found that applying a 10 kn (18.5 km/hr) speed restriction within multiple whale species' critical habitat zones was almost as effective as enacting the same speed restriction along the entire East Coast Exclusive Economic Zone (EEZ). The results suggest that 10 kn (18.5 km/hr) speed restrictions are a robust method for reducing vessel strike risk and that vessel restrictions within high-density core areas of a marine mammal's habitat can be highly impactful.

Hearing, Vocalization, and Masking

Parnell *et al.* (2024) studied the soundscapes of four underwater Hawaiian monk seal critical habitats, including measurement of ambient noise and characterization of detected sound sources. The authors observed diel patterns in both anthropogenic and biological sound sources that mask acoustic communication in Hawaiian monk seals. The measurements collected for this study provide a baseline for future research on impacts of anthropogenic activities on these soundscapes.

A multi-national team of scientists (U.S. and Norway) obtained the first hearing measurements of a mysticete species through auditory evoked potential (AEP) tests. During the 2023 field season, AEP tests were conducted on two adolescent female minke whales in Norway (Houser *et al.* 2024). Houser *et al.* (2024) indicate that the minke whale's upper-frequency limit of hearing occurs somewhere between 45 to 90 kHz. Minke whale's high-frequency sensitivity is hypothesized to support detection of the echolocation clicks of one their predators, the killer whale. The bandwidth of the tone-bursts used in the Houser *et al.* (2024) AEP testing was too broad to define the precise upper-frequency limit, but indicates this species is more sensitive to higher frequencies than previously predicted based on inner ear anatomy and vocalization data (Southall *et al.* 2019; NMFS 2024). Results from their final 2024 field season, which included further examination of the upper-frequency limit of hearing, are expected to be published in 2025, with preliminary data from two additional whales indicating that minke whale hearing is best around 32 kHz.

Hearing Loss (TTS and PTS)

Gransier and Kastelein (2024) examined TTS susceptibility in harbor porpoises and harbor seals based on exposures varying in frequency range and level. Specifically, exposures consisted of 100% duty cycle one-sixth-

octave noise bands at frequencies covering the entire hearing range of each species. Despite these species having different audiograms and regions of best sensitivity (*i.e.*, underwater pinnipeds are sensitive to sounds ranging from approximately 0.01 to 40–60 kHz, while most odontocetes are sensitive sounds ranging from approximately 0.25 to 80–125 kHz), the frequency-specific susceptibility to TTS was similar amongst both species, with the greatest susceptibility to TTS occurring at frequencies from 22.5 to 50 kHz and least susceptible to sounds below 10 kHz. The frequency of minimum TTS for the harbor seal aligns with its frequency of best hearing, while frequency of minimum TTS for the harbor porpoise is well below the frequency of best hearing. This study illustrates that the audiogram does not always serve as a good predictor of frequency-dependent susceptibility to TTS, with the pattern of susceptibility to TTS in these two species being more comparable than their audiograms.

Brewer *et al.* (2023) described 41 call types of Cook Inlet beluga vocal behavior and classified them into three categories: (1) whistles, (2) pulsed calls, and (3) combined calls. These are the first descriptions of vocal repertoire of this species in two critical habitat locations and across multiple seasons. Call types were then used to investigate the potential for masking from commercial ship noise. It was found that call types (0–12 kHz) were partially masked by distant ship noise and completely masked by close ship noise. This study provides evidence that ship noise can impact vocal communication of this population. Specifically Cook Inlet beluga vocalizations in the Susitna area, seven of the beluga's most common calls are either partially or fully masked by commercial ship traffic.

Kastelein *et al.* (2024) examined TTS in two California sea lions exposed to one-sixth-octave noise band centered at 32 kHz for 60-minutes of exposure, resulting in cumulative sound exposure levels (SEL_{cum}) ranging from 168 to 192 dB. Hearing after exposure was examined at the center frequency of the fatiguing sound (32 kHz) and at half an octave (44.8 kHz) and one octave above the center frequency (63 kHz). Higher SEL_{cum} resulted in greater threshold shifts. Furthermore, the greatest TTS occurred at half an octave above the center frequency, with TTS onset (6 dB threshold shift) measured at 44.8 kHz occurring at a 179 dB SEL_{cum} . TTS patterns and recovery was similar between the two individuals, with TTSs up to 6.7 dB recovering within 8 minutes of exposure, TTSs up to 12 dB

recovering within an hour, and only the highest TTS measured (12.9 dB) taking over an hour to recover. The results of this study were directly incorporated in the Navy's updated Phase IV AUD INJ/TTS criteria and indicate that California sea lions have lower AUD INJ/TTS onset than previously predicted (Southall *et al.* 2019).

Behavioral Reactions

Ceciarini *et al.* (2023) tested the efficacy of Acoustic Deterrent Devices for minimizing common bottlenose dolphin interactions with trammel nets in the Northern Tyrrhenian Sea. The authors used interactive pingers which emitted output signals “from 5 up to 500 kHz at 168 dB re 1 μ Pa at 1 m as random high-speed tones FM ranging from 100 μ s up to seconds”. The study found that catch damage from dolphins was significantly lower in nets where pingers were used.

Elmegaard *et al.* (2023) exposed six harbor porpoises to Acoustic Harassment Devices (AHDs), commonly referred to as “seal scarers”, to determine if they would exhibit any physiological or behavioral reactions. The AHDs pulsed at 14 kHz with a source level of 189 dB re 1 μ Pa (rms) or sound exposure level of 184 dB re 1 μ Pa²s, with porpoise RLs ranging from 98–132 dB re 1 μ Pa. All individuals sampled exhibited a mixture of behavioral or physiological responses, including startling, increased distance from the sound source, increased swim speed, diving, altered echolocation patterns, cardiac responses, or altered respiration patterns. Overall, responses were observed in every individual up to 7 km or down to an RL of 98 dB re 1 μ Pa.

Frankish *et al.* (2023) followed ten harbor porpoises for 5 to 10 days to observe their reactions to ship traffic around Denmark. The porpoises spent over half of the study period within 10 km of a ship, and a third of the study period exposed to noise levels above ambient. The porpoises responded by moving away from ships during the day, and diving deep during the night. They had a higher likelihood of altering their movements when louder ships were nearby (maximum probability of deterrence = 12.2 percent during the day and 14.9 percent at night), and moved an average of 3.2 km away from 13.6 different ships every day. Deeper dives occurred less frequently, at a rate of 5.7 different ships per individual per night. The porpoises also reacted to loud ships that were far away (>2 km at 93 $\pm$ 14 dB re 1 μ Pa²), though responses occurred less frequently (5 to 9 percent of the

time vs. up to 14.9 percent of the time at close range).

Southall *et al.* (2023) used control exposure experiments (CEEs) to provide the first results in examining the impact of mid-frequency navy sonar (3.5–4.1 kHz) or pseudorandom noise (similar frequency, duration and source and received level compared to mid-frequency sonar) on fin whale behavior in feeding habitats of the Southern California Bight. Of the 15 exposed fin whales, only five individuals demonstrated a mild to moderate behavioral changes (avoidance, changes in feeding, diving, or respiration), with no changes demonstrated for whales in the six control exposures. Compared to blue whales, fin whale behavioral responses were more limited in occurrence, severity and duration and were found to be less dependent upon contextual aspects of exposure, with received level as the primary factor associated with behavioral responses. Additionally, foraging success was not compromised by exposures from this study. The authors note that differences observed between behavioral response in fin whales in this study and blue whales in previously published studies may be attributed to the smaller sample size associated with this study. However, as seen in blue whales, fin whale behavior returned to baseline conditions after noise exposure ended.

Methodology for Assessing Acoustic Impacts

Indeck *et al.* (2024) assessed North Atlantic right whale, fin, and blue whale detectability by Slocum gliders near heavily used shipping lanes in the Gulf of St. Lawrence, Canada. The goal of the study was to evaluate the gliders' suitability as a passive acoustic monitoring platform for whale detection in areas with high anthropogenic noise levels. The authors found that shipping lane noise did not substantially impact whale detectability, as calls from the highly trafficked areas were not masked significantly more than calls in quieter areas nearby. The gliders were therefore identified as a viable PAM platform to use in and around busy shipping areas. These results suggest that gliders could be an important tool for monitoring mysticetes in highly industrialized areas and assisting in ongoing dynamic management initiatives.

Conclusion for New Pertinent Science Since Publication of the 2023 HSTT Proposed Rule

Having considered the best scientific information available, specifically new relevant information published since the 2023 HSTT proposed rule, we have

determined that there is no new information that substantively affects our analysis of impacts on marine mammals and their habitat that appeared in the 2020 HSTT final rule, all of which remains applicable and valid for our assessment of the effects of the Navy's activities during the 7-year period of this rulemaking.

Estimated Take of Marine Mammals

This section indicates the number of takes that NMFS is authorizing, which are based on the amount of take that NMFS anticipates could occur or is likely to occur, depending on the type of take and the methods used to estimate it, as described below. NMFS coordinated closely with the Navy in the development of their incidental take application and agrees that the methods the Navy has put forth described herein, in the 2019 HSTT proposed rule, 2020 HSTT final rule, and in the 2018 HSTT proposed and final rules to estimate take (including the model, thresholds, and density estimates), and the resulting numbers are based on the best available science and appropriate for authorization, with the exception of that of humpback whales, discussed further below. The number and type of incidental takes that could occur or are likely to occur annually remain identical to those authorized in the 2018 HSTT regulations and 2020 HSTT regulations, with the exception of authorized takes by serious injury or mortality by vessel strike and harassment takes of humpback whale stocks in Southern California (due to the new stock structure).

Takes are predominantly in the form of harassment, but a small number of serious injuries or mortalities could occur. For military readiness activities, the MMPA defines "harassment" as (i) any act that injures or has the significant potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or (ii) any act that disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering, to a point where such behavioral patterns are abandoned or significantly altered (Level B harassment).

Authorized takes will primarily be in the form of Level B harassment, as use of the acoustic and explosive sources (i.e., sonar, air guns, pile driving, explosives) is more likely to result in the disruption of natural behavior patterns to a point where they are abandoned or significantly altered (as defined specifically at the beginning of

this section but referred to generally as behavioral disturbance) or TTS for marine mammals. There is also the potential for Level A harassment in the form of auditory injury and/or tissue damage (the latter from explosives only) to result from exposure to the sound sources utilized in training and testing activities. Additionally, serious injuries or mortalities of mysticetes (except for sei whales, minke whales, Bryde's whales, Central North Pacific stock of blue whales, Hawaii stock of fin whales, Western North Pacific stock of gray whales, and sperm whales) could occur through vessel strike. Mitigation and monitoring measures are expected to minimize the severity of the taking to the extent practicable.

Generally speaking, for acoustic impacts, NMFS estimates the amount and type of harassment by considering: (1) acoustic thresholds above which NMFS believes the best available science indicates marine mammals would experience behavioral disturbance or incur some degree of temporary or permanent hearing impairment; (2) the area or volume of water that will be ensonified above these levels in a day or event; (3) the density or occurrence of marine mammals within these ensonified areas; and (4) the number of days of activities or events.

Acoustic Thresholds

Using the best available science, NMFS, in coordination with the Navy, has established acoustic thresholds that identify the most appropriate received level of underwater sound above which marine mammals exposed to these sound sources could be reasonably expected to experience a disruption in behavior patterns to a point where they are abandoned or significantly altered, either directly or via the effects of TTS (both equated to Level B harassment) or PTS of some degree (equated to Level A harassment). Thresholds have also been developed to identify the pressure levels above which animals may incur non-auditory injury from exposure to pressure waves from explosive detonation. We described the acoustic thresholds and the methods used to determine thresholds in detail in the *Acoustic Thresholds* section of the 2018 HSTT final rule; please see the 2018 HSTT final rule for detailed information. Further, in the 2020 HSTT final rule, and 2023 HSTT proposed rule, we described new relevant information from the scientific literature since publication of the 2018 HSTT final rule and 2020 HSTT final rule, respectively. Since publication of the 2023 HSTT proposed rule, NMFS has

updated our Technical Guidance (NMFS, 2024) containing updated acoustic criteria for auditory injury (89 FR 36762, October 24, 2024). The Technical Guidance provides updated auditory injury thresholds, where appropriate, as well as revised weighting functions, in some cases. For impulsive sources, the Updated Technical Guidance's auditory injury thresholds generally remain identical or are higher compared to our 2018 Technical Guidance, meaning that received levels would need to be higher in order for marine mammals to be expected to incur auditory injury. The exceptions are for phocid pinnipeds (PW), where the cumulative SEL threshold, in the Updated Technical Guidance, is 2 dB lower and for otariid pinnipeds (OW) where the peak sound pressure level threshold is 2 dB lower and the cumulative SEL threshold is 18 dB lower. As for the Updated Technical Guidance's weighting functions, for MF cetaceans (now called HF cetaceans in the updated document) and HF cetaceans (now called VHF cetaceans in the updated document), the weighting functions reflect a higher susceptibility to auditory injury at frequencies below 10 kHz, as compared to the 2018 Technical Guidance. Other minor changes/shifts to weighting functions (e.g., for LF cetaceans, PW pinnipeds, OW pinnipeds) were also included. This new information was not available in a timeframe in which NMFS could have incorporated it into the quantitative analysis supporting this final rulemaking; however, NMFS did consider the information qualitatively. While these changes in the auditory injury thresholds and weighting functions could result in minor increases in PTS exposure estimates for some species, given the conservative assumptions built into the take estimate methodology, they would not be expected to result in meaningful, if any, changes in take estimates and would not be expected to change any of the findings.

Navy's Acoustic Effects Model

The Navy proposed no changes to the Acoustic Effects Model as described in the 2018 HSTT final rule (and incorporated by reference in the 2020 HSTT final rule), and there is no new information that would affect the applicability or validity of the model. Please see the 2018 HSTT final and proposed rules and Appendix E of the 2018 HSTT FEIS/OEIS for detailed information, and see the discussion of the 2024 Technical Guidance in the *Acoustic Thresholds* section above.

Range to Effects

The Navy proposed no changes from the 2018 HSTT final rule (and subsequent 2020 HSTT final rule) to the type and nature of the specified activities to be conducted during the 7-year period analyzed in this final rule, including equipment and sources used and exercises conducted.

As described above in the *Acoustic Thresholds* section, since publication of the 2023 HSTT proposed rule, NMFS has updated our Technical Guidance (NMFS, 2024) containing updated acoustic criteria for auditory injury (89 FR 36762). Please see that section for a full discussion of the updates. This new information was not available in a timeframe in which NMFS could have incorporated it into the quantitative analysis supporting this final rulemaking; however, NMFS did consider the information qualitatively. While these changes in the auditory injury thresholds and weighting functions could result in minor increases in PTS exposure estimates for some species, given the conservative assumptions built into the take estimate methodology, they would not be expected to result in meaningful, if any, changes in take estimates and would not be expected to change any of the findings.

Therefore, the ranges to effects in this final rule are identical to those described and analyzed in the 2018 HSTT final rule and 2020 HSTT final rule, including received sound levels that may cause onset of significant behavioral response and TTS and PTS in hearing for each source type or explosives that may cause non-auditory injury. Please see the *Range to Effects* section and tables 24 through 40 of the 2018 HSTT final rule for detailed information.

Marine Mammal Density

The Navy proposed no changes to the methods used to estimate marine mammal density described in the 2018 HSTT final rule, and there is no new information that would affect the applicability or validity of these methods or change the results in a manner that would change the necessary determinations supporting the issuance of these regulations. The Navy's estimate of marine mammal density as described in the 2018 HSTT final rule remains valid, though, as described herein, NMFS has incorporated new information regarding humpback whale stock structure into its analysis. Please see the 2018 HSTT final rule, and below, for detailed information.

As noted above, NMFS regularly updates SARs, and in this rulemaking considers the 2023 final SARs (Carretta *et al.* 2024, Young *et al.* 2024). While these SARs contain updated information, the Navy's estimate of marine mammal density as described in the 2018 HSTT final rule remains valid for the following reasons. The Navy uses its Marine Species Density Database (NMSDD) for its analysis, which is derived from multiple sources, including but not limited to SARs. In contrast, for most cetacean species, the SAR is estimated using line-transect surveys or mark-recapture studies (*e.g.*, Barlow, 2010; Barlow and Forney, 2007; Calambokidis *et al.* 2008). The result provides one single abundance value for each species across broad geographic areas, but it does not provide information on the species density or concentrations within that area, and it does not estimate density for other timeframes or seasons that were not surveyed. A change in a stock's abundance indicated in a SAR does not necessarily indicate a change in that stock's density in any given area. Therefore, stocks in the HSTT Study Area with higher abundance estimates in the most recent SARs in comparison to the abundance estimates at the time that marine mammal densities were derived for the HSTT Study Area do not necessarily now occur in higher densities in the HSTT Study Area. For humpback whale, while the stock structure in the Pacific Ocean was revised in the 2022 final SARs (Carretta *et al.* 2023, Young *et al.* 2023), the discussion above remains true regarding density of humpback whales in the HSTT Study Area across all stocks.

Take Requests

As in the 2018 HSTT final rule and 2020 HSTT final rule, the Navy determined that the three stressors below could result in the incidental taking of marine mammals. NMFS has reviewed the Navy's data and analysis and determined that it is complete and accurate, and NMFS agrees that the following stressors have the potential to result in takes of marine mammals from the Navy's planned activities:

- Acoustics (sonar and other transducers; air guns; pile driving/extraction);
- Explosives (explosive shock wave and sound, assumed to encompass the risk due to fragmentation); and
- Physical Disturbance and Strike (vessel strike).

NMFS reviewed and agrees with the Navy's conclusion that acoustic and explosive sources have the potential to result in incidental takes of marine

mammals by harassment, serious injury, or mortality. NMFS carefully reviewed the Navy's analysis and conducted its own analysis of vessel strikes, determining that the likelihood of any particular species of large whale being struck is quite low. However, as noted previously, in 2021, two separate U.S. Navy vessels struck unidentified large whales on two separate occasions, one whale in June 2021 and one whale in July 2021. In May 2023, the U.S. Navy struck a large whale, which based on available photos and video, NMFS and the Navy have determined was either a fin whale or sei whale. NMFS agrees that vessel strikes have the potential to result in incidental take from serious injury or mortality for certain species of large whales, and the Navy has specifically requested coverage for these species. Therefore, the likelihood of vessel strikes, and later the effects of the incidental take that is being authorized, has been fully analyzed and is described below.

Regarding the quantification of expected takes from acoustic and explosive sources (by Level A and Level B harassment, as well as mortality resulting from exposure to explosives), the number of takes are based directly on the level of activities (days, hours, counts, *etc.*, of different activities and events) in a given year. In the 2020 HSTT final rule, take estimates across the 7 years were based on the Navy conducting 4 years of a representative level of activity and 3 years of maximum level of activity. As in the 2020 HSTT final rule, the Navy uses the maximum annual level to calculate annual takes (which would remain identical to what was determined in the 2020 HSTT final rule, with the exception of attribution of takes to humpback whale stocks), and the sum of all years (4 representative and 3 maximum) to calculate the 7-year totals for this rulemaking.

The quantitative analysis process used for the 2018 HSTT FEIS/OEIS and the 2017 and 2019 Navy applications to estimate potential exposures to marine mammals resulting from acoustic and explosive stressors is detailed in the technical report titled *Quantifying Acoustic Impacts on Marine Mammals and Sea Turtles: Methods and Analytical Approach for Phase III Training and Testing* (U.S. Department of the Navy, 2018). The Navy Acoustic Effects Model estimates acoustic and explosive effects without taking mitigation into account; therefore, the model overestimates predicted impacts on marine mammals within mitigation zones. To account for mitigation for marine species in the take estimates, the

Navy conducts a quantitative assessment of mitigation. The Navy conservatively quantifies the manner in which procedural mitigation is expected to reduce the risk for model-estimated PTS for exposures to sonars and for model-estimated mortality for exposures to explosives, based on species sightability, observation area, visibility, and the ability to exercise positive control over the sound source. Where the analysis indicates mitigation would effectively reduce risk, the model-estimated PTS are considered reduced to TTS and the model-estimated mortalities are considered reduced to injury. For a complete explanation of the process for assessing the effects of mitigation, see the 2017 Navy application and the *Take Requests* section of the 2018 HSTT final rule. The extent to which the mitigation areas reduce impacts on the affected species and stocks is addressed separately in the Analysis and Negligible Impact Determination section.

No changes have been made to the quantitative analysis process to estimate potential exposures to marine mammals resulting from acoustic and explosive stressors and calculate take estimates, with the exception of take of humpback whales to account for the change in stock structure. Please see the documents described in the paragraph above, the 2018 HSTT proposed rule, the 2018 HSTT final rule, and below for detailed descriptions of these analyses. While Oedekoven and Thomas (2022) suggest that detection of marine mammals is less certain than previously assumed at certain distances, NMFS has independently evaluated the Navy's method for application of mitigation effectiveness in estimating take and agrees that it is appropriately applied to augment the model in the prediction and authorization of injury and mortality as described in the rule, including after consideration of Oedekoven and Thomas (2022). In summary, we believe the Navy's methods, including the method for incorporating mitigation and avoidance, are the most appropriate methods for predicting PTS, TTS, and behavioral disturbance. But even with the consideration of mitigation and avoidance, given some of the more conservative components of the methodology (e.g., the thresholds do not consider ear recovery between pulses), we would describe the application of these methods as identifying the maximum number of instances in which marine mammals would be reasonably expected to be taken through PTS, TTS, or behavioral disturbance.

Summary of Authorized Take From Training and Testing Activities

Based on the methods discussed in the previous sections and the Navy's model and quantitative assessment of mitigation, the Navy provided its take estimate and request for authorization of takes incidental to the use of acoustic and explosive sources for training and testing activities both annually (based on the maximum number of activities that could occur per 12-month period) and over the 7-year period in its 2019 rulemaking/LOA application. With the exception of changes to humpback whale take, described below, annual takes (based on the maximum number of activities that could occur per 12-month period) from the use of acoustic and explosive sources are identical to those presented in tables 41 and 42 and in the *Explosives* subsection of the *Take Requests* section of the 2018 HSTT final rule. The 2022 Navy application includes the Navy's updated take estimate and request for take by vessel strike due to vessel movement in the HSTT Study Area. NMFS reviewed the Navy's data, methodology, and analysis and determined that it was complete, but NMFS has reanalyzed the potential for vessel strike following the May 2023 strike, as described in the *Authorized Take From Vessel Strikes and Explosives by Serious Injury or Mortality* section. NMFS agrees that the estimates for incidental takes by harassment from all sources as well as the incidental takes by serious injury or mortality from explosives requested for authorization are the maximum number of instances in which marine mammals are reasonably expected to be taken at the time of Navy's request, and continues to be for all stocks other than humpback whales, for which changes are described below. NMFS also agrees that the takes by serious injury or mortality as a result of vessel strikes could occur. Note that, consistent with the 2020 HSTT final rule, the total amount of estimated incidental take from acoustic and explosive sources over the total 7-year period covered by the 2019 Navy application is less than the annual total multiplied by seven. Although the annual estimates are based on the maximum number of activities per year and therefore, the maximum possible estimated takes, the 7-year total take estimates are based on the sum of 3 maximum years and 4 representative years, with the exception of humpback whale stocks that occur in SOCAL for which 7-year total take is conservatively estimated as the annual total multiplied by seven. Not all activities occur every year. Some activities would occur

multiple times within a year, and some activities would occur only a few times over the course of the 7-year period. Using 7 years of the maximum number of activities each year would vastly overestimate the amount of incidental take that would occur over the 7-year period where the Navy knows that it will not conduct the maximum number of activities each and every year for the 7 years.

As described above in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the 2022 final SARs include a revision to the humpback whale stock structure in the Pacific Ocean. In the 2020 HSTT final rule, NMFS authorized take of the CA/OR/WA stock and Central North Pacific stock of humpback whale. Given the revised stock structure, in this final rule, NMFS has reanalyzed the potential for take of each stock of humpback whale and determined that the Central America/Southern Mexico-CA/OR/WA, Mainland Mexico-CA/OR/WA stock, and Hawaii stocks are likely to be taken by the Navy's activities.

Under the new stock structure, the Hawaii stock (Hawaii DPS) is the only stock that would occur in Hawaii. Therefore, the Hawaii stock of humpback whale is the only humpback whale stock anticipated to be taken by the Navy's activities in the HRC, and all takes of the Central North Pacific stock of humpback whale that were authorized in the 2020 HSTT final rule are anticipated to be of individuals from the new Hawaii stock. In SOCAL, the takes of individuals from the former CA/OR/WA stock that were authorized in the 2020 HSTT final rule are anticipated to be of individuals from the new Central America/Southern Mexico-CA/OR/WA and Mainland Mexico-CA/OR/WA stock.

Please see the Authorized Harassment Take from Testing Activities and Authorized Harassment Take from Training Activities sections below for the authorized annual and 7-year total number and type of Level A harassment and Level B harassment for each humpback whale stock.

Authorized Harassment Take From Training Activities

For training activities, table 11 of the 2020 HSTT final rule summarizes the Navy's take estimate and request in the 2019 Navy application and the maximum amount and type of Level A harassment and Level B harassment that NMFS concurred is reasonably expected to occur by species or stock and authorized in the 2020 HSTT LOA. In the 2022 Navy application, the Navy

requested no change to this authorized take, though as described above, NMFS has since published the 2023 final, which include a revision to humpback whale stock structure. For the estimated 7-year total amount and type of Level A harassment and Level B harassment, see table 11 of the 2020 HSTT final rule for all species other than humpback whale.

For the estimated amount and type of Level A harassment and Level B harassment annually, see table 41 in the 2018 HSTT final rule for all species other than humpback whale. Note that take by Level B harassment includes both behavioral disturbance and TTS. Navy figures 6–12 through 6–50 in section 6 of the 2017 Navy application

illustrate the comparative amounts of TTS and behavioral disturbance for each species annually, noting that if a modeled marine mammal was “taken” through exposure to both TTS and behavioral disturbance in the model, it was recorded as a TTS.

TABLE 2—HUMPBACK WHALE TAKE FROM ACOUSTIC AND EXPLOSIVE EFFECTS FOR ALL TRAINING ACTIVITIES IN THE HSTT STUDY AREA

Species	Stock	Annual		7-year total	
		Level B harassment	Level A harassment	Level B harassment	Level A harassment
Humpback whale ^a	Hawaii	5,604	1	34,437	12
	Central America/Southern Mexico-CA/OR/WA (Central America DPS).	585	0	^b 4,095	0
	Mainland Mexico—CA/OR/WA (Mexico DPS).	669	1	^b 4,683	7

^a Combined takes from the Central America/Southern Mexico- CA/OR/WA stock and the Mainland Mexico CA/OR/WA stock are equal to takes of the CA/OR/WA stock authorized in the 2020 HSTT final rule.

^b Unlike other species and stocks, for the Central America/Southern Mexico-CA/OR/WA stock and Mainland Mexico-CA/OR/WA stock, NMFS estimated the 7-year take by Level B harassment by multiplying the annual estimated take by seven. However, between the two stocks, NMFS does not anticipate that the total number of takes by Level B harassment across all 7 years would exceed the 7,962 takes by Level B harassment from training activities that were authorized for the CA/OR/WA stock of humpback whales in the 2020 HSTT final rule.

Authorized Harassment Take From Testing Activities

For testing activities, table 12 of the 2020 HSTT final rule summarizes the Navy’s take estimate and request in the 2019 Navy application and the maximum amount and type of Level A harassment and Level B harassment that NMFS concurred is reasonably expected to occur by species or stock and

authorized in the 2020 HSTT LOA. In the 2022 Navy application, the Navy requested no change to this authorized take. For the estimated 7-year total amount and type of Level A harassment and Level B harassment, see table 12 of the 2020 HSTT final rule. For the estimated amount and type of Level A harassment and Level B harassment annually, see table 42 in the 2018 HSTT final rule. Note that take by Level B

harassment includes both behavioral disturbance and TTS. Navy figures 6–12 through 6–50 in section 6 of the 2017 Navy application illustrate the comparative amounts of TTS and behavioral disturbance for each species annually, noting that if a modeled marine mammal was “taken” through exposure to both TTS and behavioral disturbance in the model, it was recorded as a TTS.

TABLE 3—HUMPBACK WHALE TAKE FROM ACOUSTIC AND EXPLOSIVE EFFECTS FOR ALL TESTING ACTIVITIES IN THE HSTT STUDY AREA

Species	Stock	Annual		7-year total	
		Level B harassment	Level A harassment	Level B harassment	Level A harassment
Humpback whale ^a	Hawaii	3,522	2	23,750	19
	Central America/Southern Mexico-CA/OR/WA.	291	0	^b 2,037	0
	Mainland Mexico—CA/OR/WA	449	0	^b 3,143	0

^a Combined takes from the Central America/Southern Mexico- CA/OR/WA stock and the Mainland Mexico CA/OR/WA stock are equal to takes of the CA/OR/WA stock authorized in the 2020 HSTT final rule.

^b Unlike other species and stocks, for the Central America/Southern Mexico-CA/OR/WA stock and Mainland Mexico-CA/OR/WA stock, NMFS estimated the 7-year take by Level B harassment by multiplying the annual estimated take by seven. However, between the two stocks, NMFS does not anticipate that the total number of takes by Level B harassment across all 7 years would exceed the 4,961 takes by Level B harassment from testing activities that were authorized for the CA/OR/WA stock of humpback whales in the 2020 HSTT final rule.

Authorized Take From Vessel Strikes and Explosives by Serious Injury or Mortality

Vessel Strike

Vessel strikes from commercial, recreational, and military vessels are known to affect large whales and have resulted in serious injury and fatalities

to cetaceans (Abramson *et al.* 2011; Berman-Kowalewski *et al.* 2010; Calambokidis, 2012; Douglas *et al.* 2008; Laggner, 2009; Lammers *et al.* 2003; Van der Hoop *et al.* 2012; Van der Hoop *et al.* 2013; Crum *et al.* 2019). Records of collisions date back to the early 17th century, and the worldwide number of collisions appears to have increased

steadily during recent decades (Laist *et al.* 2001; Ritter 2012) due to increases in the number and speed of large vessels, increased reporting of strikes, and increased abundance of some large whales (Ransome *et al.* 2021), among other factors.

Numerous studies of interactions between surface vessels and marine

mammals have demonstrated that free-ranging marine mammals often, but not always (*e.g.*, McKenna *et al.* 2015; Smultea *et al.* 2022; Szesciorka *et al.* 2019), engage in avoidance behavior when surface vessels move toward them. It is not clear whether these responses are caused by the physical presence of a surface vessel, the underwater noise generated by the vessel, or an interaction between the two (Amaral and Carlson, 2005; Au and Green, 2000; Bain *et al.* 2006; Bauer 1986; Bejder *et al.* 1999; Bejder and Lusseau, 2008; Bejder *et al.* 2009; Bryant *et al.* 1984; Corkeron, 1995; Erbe, 2002; Félix, 2001; Goodwin and Cotton, 2004; Lemon *et al.* 2006; Lusseau, 2003; Lusseau, 2006; Magalhaes *et al.* 2002; Nowacek *et al.* 2001; Richter *et al.* 2003; Scheidat *et al.* 2004; Simmonds, 2005; Watkins, 1986; Williams *et al.* 2002; Wursig *et al.* 1998). Several authors suggest that the noise generated during vessel movement is probably an important factor (Blane and Jackson, 1994; Evans *et al.* 1992; Evans *et al.* 1994). Water disturbance may also be a factor. These studies suggest that the behavioral responses of marine mammals to surface vessels are similar to their behavioral responses to predators. Avoidance behavior is expected to be even stronger in the subset of instances during which the Navy is conducting training or testing activities using active sonar or explosives.

The marine mammals most vulnerable to vessel strikes are those that spend extended periods of time at the surface to restore oxygen levels within their tissues after deep dives (*e.g.*, sperm whales). In addition, some baleen whales seem generally unresponsive to vessel sound, making them more susceptible to vessel collisions (Nowacek *et al.* 2004). These species are primarily large whales.

Some researchers have suggested the relative risk of a vessel strike can be assessed as a function of animal density and the magnitude of vessel traffic (*e.g.*, Fonnesebeck *et al.* 2008; Vanderlaan *et al.* 2008). Differences among vessel types also influence the probability of a vessel strike. The ability of any ship to detect a marine mammal and avoid a collision depends on a variety of factors, including environmental conditions, ship design, size, speed, and ability and number of personnel observing, as well as the behavior of the animal. Vessel speed, size, and mass are all important factors in determining if injury or death of a marine mammal is likely due to a vessel strike. For large vessels, speed and angle of approach can influence the severity of a strike. For example,

Vanderlaan and Taggart (2007) found that between vessel speeds of 8.6 and 15 kn (15.9 and 27.8 km per hour), the probability that a vessel strike is lethal increases from 0.21 to 0.79. Large whales also do not have to be at the water's surface to be struck. Silber *et al.* (2010) found when a whale is below the surface (about one to two times the vessel draft), there is likely to be a pronounced propeller suction effect. This suction effect may draw the whale into the hull of the ship, increasing the probability of propeller strikes.

There are some key differences between the operation of military and non-military vessels, which make the likelihood of a military vessel striking a whale lower than some other vessels (*e.g.*, commercial merchant vessels). Key differences include:

- Many military ships have their bridges positioned closer to the bow, offering better visibility ahead of the ship (compared to a commercial merchant vessel);
- There are often aircraft associated with the training or testing activity (which can serve as Lookouts), which can more readily detect cetaceans in the vicinity of a vessel or ahead of a vessel's present course before crew on the vessel would be able to detect them;
- Military ships are generally more maneuverable than commercial merchant vessels, and if cetaceans are spotted in the path of the ship, could be capable of changing course more quickly;
- The crew size on military vessels is generally larger than merchant ships, allowing for stationing more trained Lookouts on the bridge. At all times when vessels are underway, trained Lookouts and bridge navigation teams are used to detect objects on the surface of the water ahead of the ship, including cetaceans. Additional Lookouts, beyond those already stationed on the bridge and on navigation teams, are positioned as Lookouts during some training events; and
- When submerged, submarines are generally slow moving (to avoid detection), and therefore, marine mammals at depth with a submarine are likely able to avoid collision with the submarine. When a submarine is transiting on the surface, there are Lookouts serving the same function as they do on surface ships.

Vessel strike to marine mammals is not associated with any specific training or testing activity but is rather a limited and sporadic, but possible, accidental result of Navy vessel movement within the HSTT Study Area or while in transit.

In 2009, the Navy began implementing additional mitigation measures to further reduce the likelihood of vessel strikes. Prior to the recent strikes in 2021 and 2023, there were two recorded U.S. Navy vessel strikes of large whales in the HSTT Study Area between 2009 and April 2021, a period of approximately 12 years.

Since 2021 there have been five strikes of large whales in SOCAL attributed to naval vessels, three by the U.S. Navy and two by the Royal Australian Navy. As stated previously, the U.S. Navy struck a large whale in waters off Southern California in May 2023. Based on available photos and video, NMFS and the Navy have determined this whale was either a fin whale or sei whale. The U.S. Navy struck two unidentified large whales during the months of June and July 2021, and prior to that, on May 7, 2021, the Royal Australian Navy HMAS Sydney, a 147.5 m (161.3 yd) Hobart Class Destroyer, struck and killed two fin whales (a mother and her calf) while operating within SOCAL. In the case of the Royal Australian Navy strike, the carcasses were first sighted under the bow of the vessel while it was approaching the Naval Base in San Diego. The whales had been pinned to a sonar dome in the front of the vessel due to the force of water as the ship was underway. Based on interviews with HMAS Sydney personnel, the most likely time of impact with the two whales would have been around 6:25 a.m. when the vessel was located near Cortes Bank, and visibility was poor. The reported vessel speed at the estimated time of strike was 9 kn (16.7 km per hour). One minute before the estimated strike time a lookout reported whales off the starboard bow. The officer on-watch verbally acknowledged the report, slowed speed, and visually tracked the whales passing clear down the starboard side until they were clear of the ship. The morning of the strike, the HMAS Sydney was getting into position to participate in a U.S. Navy-led exercise later that day. Of note, throughout the remainder of the day visibility was poor and the vessel had implemented mitigation measures in multiple instances due to whale occurrence. In addition to being the only documented occurrence of a foreign military vessel strike of a large whale within the HSTT Study Area, the HMAS Sydney vessel strike was also somewhat unique, as compared to other reported military vessel strikes, in that two whales were apparently struck at one time, and both remained pinned to

the front of the vessel until the vessel approached the port.

On June 29, 2021, a U.S. Navy cruiser struck an unknown whale species approximately 95 nmi (176 km) west of San Diego. The ship was returning from Hawaii, heading to a rendezvous with a fuel replenishment vessel (oiler) for an Underway Replenishment. Off-duty sailors noticed a group of whales approaching the ship from the port quarter (*i.e.*, left rear of the ship), an area unique to cruisers with some equipment structures blocking close aboard sight. The first indication of a whale within the 500-yd mitigation zone immediately prior to the strike was when an off-duty sailor on the flight deck witnessed the whale briefly surface on the aft port quarter before diving. Shortly after this occurred blood was noticed in the wake, and a floating whale body was eventually observed behind the ship. The ship's speed was 25 kn (46.3 km per hour) at the estimated time the strike occurred. The Navy also noted that, on the morning before the strike occurred, the ship had maneuvered several times to avoid whale blows beyond the 500-yd (457.2 m) mitigation zone, closer to 1,000 yd (914.4 m).

On July 11, 2021, a U.S. Navy cruiser struck an unknown whale species approximately 90 nmi (166.7 km) south-southwest of San Diego. The vessel was a participant in a MTE (Large Integrated Anti-Submarine Warfare—Composite Unit Training Exercise) within the SOCAL portion of the action area. The vessel was maneuvering for pending flight operations to receive an inbound helicopter. At 2:27 p.m., the starboard lookout sighted what they believed to be a whale crossing immediately under the vessel's bow. The conning officer attempted to maneuver the vessel by turning to port but internal watchstanders subsequently felt the ship shudder aft. The vessel's combat center observed a red slick 600 yd (548.6 m) astern on a flight deck camera and a brief surfacing of the whale itself, but no carcass was observed. There had not been any sightings of large whales off the bow leading up to the incident. Although the ship was traveling at 25–30 kn (46.3–55.6 km per hour) 1 hour before the estimated strike time, at 10 minutes before, the vessel changed course and reduced its speed to 17 kn (31.5 km per hour). These 2021 incidents were the first known U.S. Navy vessel strikes in the HSTT Study Area since 2009.

On May 20, 2023, a U.S. Navy aircraft carrier was at sea conducting independent, unit-level flight training for the embarked airwing approximately 70 nmi (129.6 km) west of San Diego.

Training exercises concluded for the day at approximately 7:44 p.m. local time. Navy personnel discovered a whale impinged on the bow of the vessel at approximately 8:00 p.m. local time. The vessel was traveling at approximately 5 kn (9.3 km per hour) and had recently made a turn to reset position for the evening when the Navy personnel discovered the whale. Navy personnel captured video and photos of the carcass, and based on those images, NMFS and the Navy have determined this whale was either a fin whale or sei whale; the two species are very similar morphologically and are difficult to distinguish from one another at sea. Navy personnel stopped the vessel to allow lack of momentum to dislodge the carcass from the bow, and based on lack of further observations after the carcass dislodged, it is believed to have sunk around 9:30 p.m. local time. Navy personnel on board the vessel reported that they did not feel an impact from striking the whale. Prior to the strike, between 6:45 p.m. and 7:45 p.m., the forward Lookouts on the vessel observed two whales crossing the vessel's bow but did not provide a distance between the vessel and the whales. One Lookout reported seeing the blow and the other reported seeing 'humps' (presumably the dorsal of the animal). Both whales were sighted past the ship's course to the northwest. Within the same time window, one of the aft Lookouts observed a single whale swimming parallel to the ship and soon passed astern of the ship. During the same time, independent of the sightings and for general movement reasons, the ship changed speed from 17 kn (31.5 km per hour) to 10 kn (18.5 km per hour) at 7:22 p.m.

While in this incident a whale was discovered impinged on the bow of a Navy vessel, this incident is very different from the discovery of two fin whales discovered impinged on the sonar dome of a Royal Australian Navy vessel in 2021 when the vessel came to port at Naval Base San Diego. While U.S. Navy cannot speculate on the configurations of other ships bows and even sonar dome specifications (that may be at the bow), the Navy believes it would be implausible for a marine mammal to become lodged on the sonar dome of a U.S. Navy ship and remain undetected due to a technological standard operating procedure. Sonar domes on U.S. Navy ships have a pressurized rubber window that maintains 150 pound-force per square inch (PSI) through the ship's fire main. If anything affects the pressure, an alarm sounds in the sonar control room. In the

event of a whale strike in that location, this alarm would alert personnel that something hit the sonar dome. Further, the shape, hydrodynamic design, construction using a non-abrasive material, and regular hull cleaning procedures to remove barnacles and other growth on U.S. Navy ships also make it unlikely that a whale would become lodged and remain undetected on a U.S. Navy ship's bow or even sonar dome. While in the case of the May 2023 strike, described above, a whale also became lodged on the ship's bow, the aircraft carrier that struck the whale does not have active or passive sonar capabilities (*i.e.*, no sonar dome), nor does it have a bulbous bow, and the whale was more quickly discovered by Navy personnel.

In March 2024 a dead fin whale was discovered off of Pier 10 in Naval Station San Diego within the Navy's security barrier. The security barrier, which consists of a series of connected floating sections, is intended to discourage unauthorized boat entry to the piers. The necropsy indicated that vessel strike was the most likely cause of death. Given the location the whale was discovered, this could have been the result of a military vessel strike. However, the Navy reviewed its vessel activity during that time frame and available observations of those vessels coming and going to port, as well as at port, and determined it was unlikely that the whale was carried into port by a Navy vessel. Based on this and other information from Navy's investigation, we cannot determine whether this whale was struck by a Navy vessel during HSTT activities or was struck by a commercial or other vessel and drifted into the Navy pier area.

For the same reasons listed above describing why the likelihood of a military vessel striking a whale is lower than that of some other vessels striking whales, it is also highly unlikely that a Navy vessel would strike a whale, dolphin, porpoise, or pinniped without detecting it. Specifically, Navy vessels have Lookouts, including on the forward part of the ship that can visually detect a hit animal in the event ship personnel do not feel the strike (which has occurred). Accordingly, NMFS is confident that the Navy's reported strikes are accurate and appropriate for use in the analysis. The Navy has strict internal procedures and mitigation requirements include reporting of any vessel strikes of marine mammals, and the Navy's discipline, extensive training (not only for detecting marine mammals, but for detecting and reporting any potential navigational obstruction), and strict

chain of command give NMFS a high level of confidence that all strikes are reported.

In order to better account for the accidental nature of vessel strikes to large whales in general and the potential risk from U.S. Navy vessel movement within the HSTT Study Area during the remaining period of the HSTT rule in particular, the Navy requested the HSTT rule be modified to authorize additional incidental takes by vessel strike based on probabilities derived from a Poisson distribution using vessel strike data between 2009–2021 in the HSTT Study Area (the time period from when current mitigations were instituted until the Navy conducted the analysis for the 2022 Navy application), as well as historical at-sea days in the HSTT Study Area from 2009–2015 and estimated at-sea days for the period from 2016 to 2025 covered by the current regulations. This distribution predicted the probabilities of a specific number of strikes ($n = 0, 1, 2, \text{etc.}$) over the remaining period of the regulations at the time of the Navy's analysis (2022–2025).

The Navy used the two fin whale strikes (2009) and two unidentified large whale strikes (2021) in their calculations to determine the number of strikes likely to result from its activities over the remaining 3 years of the rule (2023–2025, although worldwide strike information from all Navy activities and other sources was used to inform the species that may be struck). The Navy

evaluated data beginning in 2009 as that was the start of the Navy's Marine Species Awareness Training and adoption of additional mitigation measures to address vessel strike, which will remain in place along with additional and modified mitigation measures during the 7 years of this rulemaking. From this analysis, the Navy concluded that there was a 27 percent chance that zero whales would be struck by Navy vessels over the remaining period of the rule (which, at the time that the application was submitted, was 4 years), and a 35, 23, and 10 percent chance that one, two, or three whales, respectively, would be struck over the remaining 4 years of the rule. Therefore, the Navy estimated that there was some probability that the Navy could strike, and take by serious injury or mortality, up to three large whales incidental to training and testing activities within the HSTT Study Area over what would have been the remaining 4 years of the current authorization, and the Navy requested authorization of two additional takes of large whales by serious injury or mortality by vessel strike, beyond the three takes authorized by the 2020 HSTT final rule (85 FR 41780, July 10, 2020).

NMFS has since updated this analysis to reflect that an additional strike of an unidentified large whale occurred in May 2023 (either a fin whale or sei whale, as stated above) and that additional time has passed since the

Navy submitted the 2022 Navy application. Based on further discussions with the Navy, NMFS has also updated the way it calculated at-sea days. This is a different manner of calculating at-sea days for the purposes of the strike analysis rather than a change in Navy's activity levels. For 2010–2015, the at-sea days used in NMFS' calculation reflected historic at-sea days in the HSTT action area based on positional vessel data records (Mintz, 2016). While the actual annual at-sea days from 2016–present are currently classified, NMFS' updated calculation reflects an extrapolation of the 2010–2015 at-sea days (using the formula $y = -64x + 131555$) to estimate the number of at-sea days in 2016 (Navy, 2022). The number of at-sea days derived for 2016 was 2,056 at-sea days, which reflects the downward trend in HSTT vessel activity from 2010–2015. Since we do not have sufficient information to say whether or not this downward trend continued for the years 2017–2023, we conservatively estimate the average over these years was the same as the 2016 extrapolated value of 2,056 at-sea days. This analysis only included at-sea days for Navy warships greater than 65 feet (*i.e.*, destroyers are the smallest ship class included). Navy vessels smaller than 65 feet have never reported a whale strike in the Pacific, and therefore, we consider it unlikely that this would occur in the remaining period of the regulations.

TABLE 4—HSTT 2009 THROUGH MID-2023 AT-SEA DAYS USED FOR THE VESSEL STRIKE PROBABILITY CALCULATION

Year	At-Sea days	Derivation
2009	4,233	Estimated average based on 2010–2015 data.
2010	5,207	Based on positional vessel data.
2011	4,483	Based on positional vessel data.
2012	4,081	Based on positional vessel data.
2013	4,041	Based on positional vessel data.
2014	4,272	Based on positional vessel data.
2015	3,311	Based on positional vessel data.
2016	2,056	Extrapolated from 2010–2015 regression.
2017	2,056	Extrapolated from 2010–2015 regression.
2018	2,056	Extrapolated from 2010–2015 regression.
2019	2,056	Extrapolated from 2010–2015 regression.
2020	2,056	Extrapolated from 2010–2015 regression.
2021	2,056	Extrapolated from 2010–2015 regression.
2022	2,056	Extrapolated from 2010–2015 regression.
2023 (first half of year)	1,028	Extrapolated from 2010–2015 regression, then reduced by half.
2009– Mid-2023 total	45,048	

NMFS then used the number of past Navy vessel strikes and the at-sea days to calculate a vessel strike rate for 2009 through mid-2023. The estimated total number of Navy at-sea days (for vessels greater than 65 feet) for 2009 through mid-2023 was 45,048 days. Dividing the five known strikes during that period by

the at-sea days (*i.e.*, 5 strikes/45,048 at-sea days) results in a strike rate of 0.000111 strikes per day.

As described above, NMFS conservatively assumed that the average number of at-sea days from mid-2023 through 2025 (the remaining period of the regulations at the time that the

analysis was conducted) will be the same as the 2016 extrapolated value of 2,056. Therefore, the estimated at-sea days within the action area for the period from mid-2023 through 2025 is 5,140 days. NMFS multiplied the historic daily strike rate by the estimated at-sea days from mid-2023

through 2025 (0.000111 strikes per day $\times$ 5,140 days) to estimate the number of whale strikes anticipated during that period. This calculation predicts an estimated 0.57 strikes over the remaining 2.5 years of the regulations at the time the analysis was conducted (mid-2023 through 2025).

As explained above, according to the U.S. Navy, the May 2021 vessel strike of two fin whales by a Royal Australian Navy vessel did not occur while that vessel was participating in a U.S. Navy-led training exercise, and the strike of those two fin whales is not included in the estimated take by vessel strike calculation. Instead, as noted below, NMFS considered the 2021 vessel strike by the Royal Australian Navy along with other strike information when determining which species could be among the estimated large whales struck.

NMFS used a Poisson distribution to derive the probabilities of a specific number of strikes ($n=0, 1, 2, \text{etc.}$) from mid-2023 through 2025, given the estimated 0.57 strikes during that period. NMFS' probability analysis concluded that there is a 57 percent chance that zero whales would be struck by U.S. Navy vessels from mid-2023 through 2025, and a 32, 9, and 2 percent chance that one, two, or three whales, respectively, would be struck over that period. Further, there is an estimated 11 percent chance that the Navy would strike more than one large whale from mid-2023 through 2025. We have assessed these probabilities and determined that the strike of up to two large whales could occur over the remaining duration of the regulations, for a total of five takes by serious injury or mortality of large whales by vessel strike total over the 7-year duration of the regulations (three takes authorized in the 2020 HSTT final rule (85 FR 41780, July 10, 2020) which have occurred, plus two additional takes).

In addition to the reasons listed above that make it unlikely that the Navy will hit a large whale (more maneuverable ships, larger crew, *etc.*), vessel strike of dolphins, small whales, porpoises, and pinnipeds is considered very unlikely. Dating back more than 20 years and for as long as it has kept records, the Navy has no records of any pinnipeds being struck by a vessel as a result of Navy activities. Over the same time period, NMFS and the Navy have only one record of a dolphin, porpoise, or small whale being struck by a vessel as a result of Navy activities. A dolphin was accidentally struck by a Navy small boat in fall 2021 in Saint Andrew's Pass, Florida. The smaller size and maneuverability of dolphins, small

whales, and pinnipeds generally make such strikes very unlikely. Other than this one reported strike of a dolphin in 2021, NMFS has never received any reports from other LOA or Incidental Harassment Authorization holders indicating that these species have been struck by vessels. In addition, worldwide vessel strike records show little evidence of strikes of these groups from the shipping sector and larger vessels, and the majority of the Navy's activities involving faster-moving vessels (that could be considered more likely to hit a marine mammal) are located in offshore areas where smaller delphinid, porpoise, and pinniped densities are lower. Based on this information, NMFS concurs with the Navy's assessment and recognizes the potential for (and is authorizing) incidental take by vessel strike of large whales only (*i.e.*, no dolphins, small whales, porpoises, or pinnipeds) over the course of the 7-year regulations from training and testing activities as discussed below.

Next, after determining that take of up to five large whales could occur, NMFS considered which species could be among the five large whales struck. As noted in the 2018 HSTT proposed and final rules, the 2019 HSTT proposed rule, 2020 HSTT final rule, and 2023 HSTT proposed rule, in the 2017 Navy rulemaking/LOA application, the Navy initially considered a weight of evidence approach that considered relative abundance, historical strike data over many years, and the overlap of Navy activities with the stock distribution in their request. NMFS updated this analysis to consider several factors, in addition to the overlap of Navy activities with stock distribution: (1) The relative likelihood of striking one stock versus another based on available strike data from all vessel types as denoted in the Carretta *et al.* (2021; referenced in the Pacific SARs), the Pacific and Alaska SARs (Carretta *et al.* 2024 and Young *et al.* 2024), and unpublished NMFS vessel strike data for 2019–2021; and (2) whether the Navy has ever struck an individual from a particular species or stock in the HSTT Study Area, and if so, how many times. (Note that since publication of the 2023 HSTT proposed rule, Carretta *et al.* (2023), which includes vessel strike data through 2021 has published, but NMFS included this data in its analysis through the unpublished NMFS vessel strike data for 2019–2021, referenced above). NMFS did not consider relative abundance, as was considered in previous analyses, given that the relative abundance of a stock does not necessarily inform its

occurrence in a specific area. Further, NMFS did not consider the historical strike data from older years (prior to 2015), given that more recent data is more relevant to determining occurrence of, and strike risk to, various stocks. NMFS updated the analysis with NMFS' vessel strike probability analysis for the remaining period of the rule (2.5 years at the time of the analysis) and included new/updated vessel strike data from the SARs and NMFS records for California and Hawaii.

To address number (1) above, for SOCAL, NMFS compiled information from Carretta *et al.* (2021) and unpublished NMFS vessel strike data for 2020–2021 (since published in Carretta *et al.* (2023)) for California on known annual rates of large whale serious injury or mortality from vessel collisions (this data includes the strike of two fin whales by the Royal Australian Navy in 2021, but does not include Navy strikes in 2021 and 2023 because the species struck is not known). Use of Carretta *et al.* (2021) rather than the Pacific SAR allows NMFS to separate strikes that occurred in California from strikes to the same stocks that occurred in other locations. For the HRC, NMFS compiled information from the Pacific and Alaska SARs and unpublished NMFS vessel strike data for 2019–2021 for Hawaii on known annual rates of large whale serious injury or mortality from vessel collisions. The annual rates of large whale serious injury or mortality from vessel collisions from those sources help inform the relative susceptibility of large whale species to vessel strike in SOCAL and the HRC; therefore, we considered only reported strikes where the species struck was identified with sufficient certainty (*i.e.*, “known strikes”). Additionally, the M/SI in the 2023 SAR considers modeled takes for some, but not most species and stocks (*i.e.*, M/SI for humpback whale includes modeled takes from Rockwood *et al.* (2017)). Using known strike data for all species and stocks allows us to consider-like metrics for this comparative analysis. (Note we rely on the M/SI estimates from the 2023 SAR (or draft 2023 SAR, where relevant) in our negligible impact analysis. We also consider modeled takes of species from Rockwood *et al.* (2017) in table 7). We summed the annual rates of serious injury or mortality from vessel collisions in California and Hawaii as calculated above and then divided each species' annual rate by this sum to get the proportion of strikes for each species/stock (table 5).

TABLE 5—ANNUAL RATES OF SERIOUS INJURY AND MORTALITY FROM VESSEL STRIKE AND PERCENTAGE OF TOTAL STRIKES BY SPECIES IN SOCIAL AND THE HRC

ESA status	Species	Stock	SOCAL annual known strikes (2015–2021)	HRC annual known strikes (2015–2021)	Percentage of total annual strikes
Listed	Blue whale	Central North Pacific	0	0	0.0
		Eastern North Pacific	0.57		6.5
	Fin whale ^a	California, Oregon, & Washington	1.57		17.8
		Hawaiian		0	0.0
	Humpback whale	Central America/Southern Mexico-CA/OR/WA (Central America DPS).	1 ^b		11.3
		Mainland Mexico- CA/OR/WA (Mexico DPS).			
	Sei whale	Eastern North Pacific	0.14		1.6
		Hawaiian		0	0.0
	Gray whale	Western North Pacific	0		0.0
	Sperm whale	California, Oregon, & Washington	0		0.0
Not listed		Hawaiian		0	0.0
	Gray whale	Eastern North Pacific	2.14		24.3
	Bryde's whale	ETP stock	0		0.0
		Hawaiian		0	0.0
	Minke whale	CA/OR/WA	0		0.0
		Hawaii		0	0.0
Total	Humpback whale	Hawaii (Hawaii DPS)		3.4	38.5
			8.82		

^a This includes the two fin whales struck by the Royal Australian Navy in May 2021.

^b This strike occurred to an individual of the CA/OR/WA stock under the previous stock structure. As such, in its analysis, NMFS assumed that this strike could have been of either stock.

To inform the likelihood of striking a particular species of large whale, we multiplied the percent of total annual strikes for a given species in table 5, by the total percent likelihood of striking at least one whale during the remaining period of the rule (2023–2025 at the time of the analysis; *i.e.*, 43 percent, as described by the probability analysis above). We also calculated the percent

likelihood of striking a particular species of large whale twice during the remaining period of the rule by squaring the value estimated for the probability of striking a particular species of whale once (*i.e.*, to calculate the probability of an event occurring twice, multiply the probability of the first event by the second). The results of these calculations are reflected in the last two

columns of table 6. We note that these probabilities vary from year to year as the average annual mortality changes depending on the specific range of time considered; however, over the years and through updated data in the SARs and unpublished NMFS records, stocks tend to consistently maintain a relatively higher or relatively lower likelihood of being struck.

TABLE 6—PERCENT LIKELIHOOD OF STRIKING EACH STOCK ONE OR TWO TIMES OVER 2.5 YEARS AND TOTAL KNOWN U.S. NAVY STRIKES IN THE HSTT STUDY AREA

Species	Stock	Total known U.S. Navy strikes in HSTT study area	Percent likelihood of 1 strike over 2.5 years	Percent likelihood of 2 strikes over 2.5 years
Blue whale	Central North Pacific	0	0.00	0.00
	Eastern North Pacific	1 in SOCAL (2004)	2.81	0.08
Fin whale	CA/OR/WA	3 in SOCAL (2009, 2023 ^a)	7.74 ^b	0.60 ^b
	Hawaiian	0	0.00	0.00
Humpback whale	Central America/Southern Mexico-CA/OR/WA (Central America DPS).	0	4.93	0.24
	Mainland Mexico- CA/OR/WA (Mexico DPS).			
Sei whale	Eastern North Pacific	1 in SOCAL (2023 ^a)	0.69	0.00
	Hawaiian	0	0.00	0.00
Gray whale	Western North Pacific	0	0.00	0.00
Sperm whale	CA/OR/WA	0.00	0.00	
	Hawaiian	1 in HRC (2007)	0.00	0.00
Gray whale	Eastern North Pacific	3 in SOCAL (1993, 1998)	10.55	1.11
Bryde's whale	ETP stock	0	0.00	0.00
	Hawaiian	0	0.00	0.00
Minke whale	CA/OR/WA	0	0.00	0.00
	Hawaii	0	0.00	0.00

TABLE 6—PERCENT LIKELIHOOD OF STRIKING EACH STOCK ONE OR TWO TIMES OVER 2.5 YEARS AND TOTAL KNOWN U.S. NAVY STRIKES IN THE HSTT STUDY AREA—Continued

Species	Stock	Total known U.S. Navy strikes in HSTT study area	Percent likelihood of 1 strike over 2.5 years	Percent likelihood of 2 strikes over 2.5 years
Humpback whale	Hawaii (Hawaii DPS)	2 in HRC (2003)	16.76	2.81

^aBased on available photos and video, NMFS and the Navy have determined the May 2023 strike was of either a fin whale or sei whale. In the analysis herein, NMFS has assumed that this strike could have been of either species, and has therefore, accounted for it in both the fin whale and sei whale strike totals. Given that we are unable to identify the species of the whales struck by the U.S. Navy in 2021, NMFS did not include the two 2021 strikes in this part of the analysis.

^bThis includes the two fin whales struck by the Royal Australian Navy in May 2021.

The percent likelihood calculated as described above are then considered in combination with the information indicating the known species that the Navy has hit in the HSTT Study Area since 1991 (since they started tracking consistently; table 6). We note that for the lethal take of species specifically denoted in table 7 below, 47 percent of those struck by the Navy (8 of 17 in the Pacific) remained unidentified (including the May 2023 strike, which as stated above, NMFS and the Navy have determined was of either a fin

whale or sei whale). However, given the information on known stocks struck, the analysis below remains appropriate. We also note that Rockwood *et al.* (2017) modeled the likelihood of vessel strike of blue whales, fin whales, and humpback whales on the U.S. West Coast (discussed in more detail in the *Serious Injury or Mortality* subsection of the Analysis and Negligible Impact Determination section), and those numbers help inform the relative likelihood that the Navy could hit those stocks.

For each indicated stock, table 7 includes the percent likelihood of striking an individual whale from a particular stock during the remaining 2.5 years of the rule once based on SAR data, Carretta *et al.* (2021), and unpublished NMFS vessel strike data from 2019–2021 for Hawaii; total strikes from Navy vessels in the HSTT Study Area, and modeled vessel strikes from Rockwood *et al.* (2017). The last column indicates the authorized annual mortality.

TABLE 7—SUMMARY OF FACTORS CONSIDERED IN DETERMINING THE NUMBER OF INDIVIDUALS IN EACH STOCK POTENTIALLY STRUCK BY A VESSEL

ESA status	Species	Stock	Percent likelihood of one strike over 2.5 years	Total known U.S. Navy strikes in HSTT study area (1993–2009)	Rockwood <i>et al.</i> 2017 modeled vessel strikes ¹	Annual authorized take from 2020 HSTT final rule	Annual authorized take
Listed	Blue whale	Central North Pacific	0.00	0			0
		Eastern North Pacific	2.81	1 in SOCAL (2004)	18	0.14	0.14
	Fin whale	CA/OR/WA	7.74 ²	3 in SOCAL (2009, 2023 ³)	43	0.29	0.57
		Hawaii	0.00	0			0
	Humpback whale ⁴	Central America/Southern Mexico- CA/OR/WA (Central America DPS).	4.93	0	22	0.14	0
		Mainland Mexico-CA/OR/WA (Mexico DPS).					0.14
		Eastern North Pacific	0.69	1 in SOCAL(2023) ³			0.14
	Sei whale	Hawaii	0.00	0			0
	Gray whale	Western North Pacific	0.00	0			0

		Eastern North Pacific	10.55	3 in SOCAL (1993, 1998) ...		0.29	0.57
	Bryde's whale	Eastern Tropical Pacific	0.00	0			0
		Hawaii	0.00	0			0
	Minke whale	CA/OR/WA	0.00	0			0
		Hawaii	0.00	0			0
	Humpback whale	Hawaii (Hawaii DPS) ⁵	16.76	2 in HRC (2003)		0.29	0.29

¹ Rockwood *et al.* modeled likely annual vessel strikes off the West Coast for these three species only.

² This includes the two fin whales struck by the Royal Australian Navy in May 2021.

³ Based on available photos and video, NMFS and the Navy have determined the May 2023 strike was of either a fin whale or sei whale. In the analysis herein, NMFS has assumed that this strike could have been of either species, and has therefore, accounted for it in both the fin whale and sei whale strike totals.

⁴ In the 2020 HSTT final rule, take of humpback whale by serious injury and mortality by vessel strike in SOCAL was attributed to the former CA/OR/WA stock and the Mexico DPS. Text explains why takes in SOCAL come from the Mexico DPS, and therefore the Mainland Mexico-CA/OR/WA stock.

⁵ The 2023 final SAR reports vessel strike data for the Hawaii stock of humpback whales in Alaska, Washington, and Hawaii. Only vessel strike data from Hawaii was incorporated into our analysis as Alaska and Washington are outside of the HSTT Study Area.

Accordingly, stocks that have no record of ever having been struck by any vessel are considered to have a zero percent likelihood of being struck by the Navy in the 7-year period of the rule. Stocks that have never been struck by the Navy, have rarely been struck by

other vessels, and have a low percent likelihood based on the historical vessel strike calculation are also considered to have a zero percent likelihood to be struck by the Navy during the 7-year rule. We note that while vessel strike records have not differentiated between

Eastern North Pacific and Western North Pacific gray whales, given their small population size and the comparative rarity with which individuals from the Western North Pacific stock are detected off the U.S. West Coast, it is highly unlikely that

they would be encountered, much less struck. This rules out all but seven stocks. Further, it is unlikely that the Hawaii stock of sperm whale would be struck given the zero percent likelihood of striking a sperm whale as indicated by the quantitative analysis above, the fact that the last U.S. Navy strike of a Hawaii stock sperm whale was in 2007, before the mitigation updates discussed above, and that, with the exception of humpback whales, vessel strikes (both military and non-military) of other large whale species in the HRC are extremely rare events (Carretta 2021b; Carretta 2022). (The 2020 HSTT final rule authorized one take (0.14 annual take) by mortality of the Hawaii stock of sperm whale.)

As stated previously, based on available photos and video of the whale struck by the U.S. Navy in Southern California in 2023, NMFS and the Navy have determined this whale was either a fin whale or sei whale. While the species of the two whales struck by the U.S. Navy in 2021 are unknown, given the following factors, NMFS expects these strikes may have been CA/OR/WA fin whales or Eastern North Pacific (ENP) gray whales, or some combination of these two stocks. These species have the highest annual rates of M/SI from vessel collision in California (1.57, 2.14, respectively, as noted above; which is approximately one and a half to two times higher than the species with the next highest strike rate, humpback whale, and approximately two to four times higher than the strike rate of blue whale). Additionally, gray whale and fin whale have the most recorded vessel strike incidents by military vessels in SOCAL and are the only stocks known to have been hit more than one time by naval vessels in the SOCAL portion of the HSTT Study Area (three gray whale strikes by the U.S. Navy (1993, 1998), two or three fin whale strikes by the U.S. Navy (2009, potentially 2023), and two fin whale strikes by the Royal Australian Navy (2021)). Further, accounting for undocumented vessel strikes, Rockwood *et al.* (2021) estimated that in their study area off Southern California from 2012–2018, on average 8.9 blue, 4.6 humpback, and 9.7 fin whales were killed by civilian vessel strikes from June to November each year. In addition, they estimated that, on average, 5.7 humpback whales were killed by civilian vessel strike from January–April per year (Rockwood *et al.* 2021). For fin whales in particular, model-predicted densities of large whales in the Southern California Bight from May to July 2021 (the time period during which the 2021 strikes of two

unidentified whales by the U.S. Navy occurred) estimated fin whale abundance as being nearly an order of magnitude higher than either blue or humpback whale abundance during this time period (Becker *et al.* 2020; Zickel *et al.* 2021). Ship-whale encounter models for the U.S. West Coast Exclusive Economic Zone also indicated that vessel strike mortality estimates for fin whales were significantly higher than for blue whales and humpback whales (Rockwood *et al.* 2017). The comparatively higher modeled vessel strike rates for fin whales result from both the larger population as well as the more offshore distribution that overlaps significantly with several major shipping routes for a much greater spatial extent (Rockwood *et al.* 2017). Based on 1,243 visual boat-based sightings of 2,638 fin whales from 1991–2011, Calambokidis *et al.* (2015) found fin whale concentration areas included the San Clemente Basin where the 2021 Navy vessel strikes occurred (Tanner and Cortez Banks area and the shelf edge west of San Nicolas Island were also reported as fin whale concentration areas). There are two different populations of fin whales that occur in the Southern California Bight: a seasonal population, and a population that occurs year-round with offshore/inshore movements (Campbell *et al.* 2015; Falcone *et al.* 2022). This would likely make fin whales more susceptible to vessel strike year-round, as compared to other large whale species that may occur seasonally within SOCAL. Based on all of these factors, there is a reasonable likelihood that the CA/OR/WA stock of fin whales or ENP stock of gray whales could be struck twice during the remaining period of the rule. Therefore, we find that, of the five total takes by serious injury or mortality by vessel strike of large whales authorized over the course of the 7-year rule, up to four of those takes could be of the CA/OR/WA stock of fin whale or the ENP stock of gray whale given that the two strikes of unidentified large whales in 2021 could have been of either stock. Further, consistent with the 2020 HSTT final rule, we expect that, of the five total takes by serious injury or mortality by vessel strike of large whales authorized, up to two of those takes could occur in Hawaii, and therefore be of individuals of the Hawaii stock of humpback whale.

Based on the information summarized in table 7 and the fact that there is the potential for up to two large whales to be struck over the remaining period of the rule (five strikes over the full 7-year rule period), one individual from the

Eastern North Pacific stock of blue whale, Mainland Mexico-CA/OR/WA stock of humpback whale, or Eastern North Pacific stock of sei whale could be among the two whales struck during the remaining effective period of the regulations (2023–2025 at the time of the analysis). The total strikes of Eastern North Pacific blue whales and the percent likelihood of striking one based on the historic strike calculation above can both be considered moderate compared to other stocks, and the Navy struck a blue whale in 2004 (based on the historic strike calculation, the likelihood of striking two blue whales is well below one percent (table 6)). Therefore, we consider it reasonably likely that the Navy could strike one individual over the course of the 7-year rule, and given that we do not expect that the 2023 strike nor either of the 2021 U.S. Navy strikes of unidentified large whales were blue whales, we expect that this strike could occur during the remaining period of the rule. The total strikes of Eastern North Pacific sei whales are low compared to other stocks, but NMFS and the Navy think it is possible that the Navy may have struck a sei whale in SOCAL in 2023. Therefore, we consider it reasonably likely that the Navy could strike a sei whale over the remaining period of the rule. The Navy has not hit a humpback whale in the SOCAL portion of the HSTT Study Area. However, in 2016 a U.S. Coast Guard vessel participating in a Navy event struck a humpback whale in Hood Canal, and as a species, humpbacks have a moderate to high number of total strikes and percent likelihood of being struck. Although the likelihood of Central America/Southern Mexico- CA/OR/WA (Central America DPS) or Mainland Mexico-CA/OR/WA (Mexico DPS) humpback whales being struck by any vessel type is moderate to high relative to other stocks, the distribution of the Mexico DPS versus the Central America DPS, as well as the distribution of overall vessel strikes inside versus outside of the SOCAL area (the majority are outside), supports the reasonable likelihood that the Navy could strike one individual humpback whale from the Mainland Mexico-CA/OR/WA stock (Mexico DPS) over the 7-year duration of the rule, as described below.

Regarding the likelihood of striking a humpback whale from a particular DPS, we evaluated the relative abundance of each of these DPS in California waters. Curtis *et al.* (2022) estimated the abundance of the Central America DPS to be 1,496 whales. From Wade *et al.* (2017), about 93 percent (or 1,391

whales) of these humpbacks that winter in Central America will move to Oregon/California in the summer months. While there is currently no abundance estimate for the Mexico DPS, an estimated 3,477 whales from the Mexico DPS feed off the U.S. West Coast (Calambokidis and Barlow 2020; Curtis 2022). Based on this information, we estimate that approximately 30 percent of the humpback whales off the coast of California may be from the Central America DPS with the remaining 70 percent expected to be from the Mexico DPS. Therefore, we anticipate that if a Navy vessel strike of a humpback whale were to occur within SOCAL, it would likely be from the Mexico DPS. Last, Rockwood *et al.* (2017) supports a relative likelihood of 1:1:2 for striking blue whales, humpback whales, and fin whales off the U.S. West Coast (though as noted above, more recent data suggests that the relative likelihood of striking a fin whale is higher and suggests that the two 2021 U.S. Navy vessel strikes of unidentified large whales may have been fin whales), which, in consideration of more recent data also supports the authorized take included in this rule, which is 1, 1, and 4, respectively over the 7-year period. For these reasons, one lethal take of a Mainland Mexico-CA/OR/WA humpback whale (Mexico DPS) could occur and is authorized.

For Hawaii stocks, given that all known vessel strikes between 2015 and 2021 were of humpback whales, we anticipate that any vessel strike of a large whale in Hawaii would be of the Hawaii stock of humpback whale. Given that this stock has the highest percentage of total annual strikes (38.5 percent) and a 2.81 percent chance of being struck twice over the remaining period of the rule (more than twice that of the species with the next highest percentage, gray whale), NMFS authorizes two lethal takes of Hawaii humpback whales.

As described above, the Navy's analysis suggests and NMFS' analysis concurs that the likelihood of vessel strikes to the stocks below is discountable due to the stocks' relatively low occurrence in the HSTT Study Area, particularly in core HSTT training and testing subareas, and the fact that the stocks have not been struck by the Navy and are rarely, if ever, recorded struck by other vessels. Therefore, NMFS is not authorizing lethal take for the following stocks: Blue whale (Central North Pacific stock), Bryde's whale (Eastern Tropical Pacific stock and Hawaii stock), fin whale (Hawaii stock), gray whale (Western North Pacific stock), humpback whale

(Central America/Southern Mexico-CA/OR/WA stock, Central America DPS), minke whale (CA/OR/WA stock and Hawaii stock), sei whale (Hawaii stock), and sperm whale (CA/OR/WA stock and Hawaii stock).

Also of note, while information on past Navy vessel strikes can serve as a reasonable indicator of future vessel strike risk, future conditions may differ from the past in ways that could influence the likelihood of a large whale vessel strike occurring. In general, the magnitude of vessel strike risk may be increasing over time as many whale populations are gradually recovering from centuries of commercial whaling (Redfern *et al.* 2020). Increased vessel strike risk off California in recent decades has been associated with increases in the abundance of fin and humpback whale populations in the North Pacific (Redfern *et al.* 2020). It has also been suggested that the blue whale population in the Eastern North Pacific, inclusive of the SOCAL portion of the HSTT Study Area, is at carrying capacity and recovered to pre-whaling levels (Monnahan *et al.* 2014). In addition, the magnitude of risk may also be affected by shifts in whale distributions over time in response to environmental factors including climate change, marine heatwaves, and associated changes in prey distribution.

Historically, military vessel strikes of large whales within the HSTT Study Area have been rare events with only seven such strikes occurring over the past 14 years, five U.S. Navy strikes, and two Royal Australian Navy strikes. However, the fact that four of these strikes occurred within a 3-month period (May-July) in 2021, and two occurred within a 4-month period (February-May) in 2009, suggests that military vessel strikes in SOCAL can be both highly episodic and clustered. The four large whale strikes in 2021 (two strikes of unidentified large whales by the U.S. Navy and two fin whale strikes by the Royal Australian Navy) appear to be outliers in the time series of military vessel strikes in SOCAL for that period. However, particularly in consideration of the 2023 U.S. Navy strike, these strikes could also represent an early indicator of an increased military vessel strike risk within SOCAL based on the factors discussed above. Results from a survey of whale watching vessel operators and crew in Southern California, combined with remote sensing data in the area, suggest that the number of large whales may have been greater in May through July of 2021 compared with previous years in certain high military vessel traffic and "core" use HSTT areas off southern California,

particularly farther offshore as well as closer to shore off San Diego Bay (Zickel MJ *et al.* 2021).

In conclusion, while take by vessel strike across any given year is sporadic, based on the information and analysis above, including consideration of the 2021 and 2023 strikes by the U.S. Navy, NMFS anticipates no more than five takes of large whales by M/SI could occur over the 7-year period of the rule. Of those five whales over the 7-years, no more than four may come from the following stocks: gray whale (Eastern North Pacific stock) and fin whale (CA/OR/WA stock). No more than two may come from the Hawaii stock of humpback whales. No more than one may come from the following stocks: blue whale (Eastern North Pacific stock), sei whale (Eastern North Pacific), and humpback whale (Mexico-North Pacific stock or Mainland Mexico-CA/OR/WA, Mexico DPS). Accordingly, NMFS has evaluated under the negligible impact standard the M/SI of 0.14, 0.29, or 0.57 whales annually from each of these species or stocks (*i.e.*, one, two, or four takes, respectively, divided by 7 years to get the annual number), along with the expected incidental takes by harassment.

Explosives

The Navy's model and quantitative analysis process used for the 2018 HSTT FEIS/OEIS and in the Navy's 2017 and 2019 applications to estimate potential exposures of marine mammals to explosive stressors is detailed in the technical report titled *Quantifying Acoustic Impacts on Marine Mammals and Sea Turtles: Methods and Analytical Approach for Phase III Training and Testing report* (U.S. Department of the Navy, 2018). Specifically, over the course of a modeled maximum year of training and testing, the Navy's model and quantitative analysis process estimates M/SI of two short-beaked common dolphin and one California sea lion as a result of exposure to explosive training and testing activities (please see section 6 of the 2017 Navy application where it is explained how maximum annual estimates are calculated). Over the 7-year period of the 2020 HSTT regulations, M/SI of 8 short-beaked common dolphins and 5 California sea lions (13 marine mammals in total) is estimated as a result of exposure to explosive training and testing activities. NMFS makes no changes to the authorization of take by M/SI as a result of explosive use as the Navy made no changes to its activities from that described in the 2018 HSTT final rule, and after reviewing all new information,

we find that our previous analyses remain applicable. Please refer to the 2018 HSTT final rule and 2020 HSTT final rule for additional information.

Mitigation Measures

Under section 101(a)(5)(A) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to the activity, and other means of effecting the least practicable adverse impact on the species or stock(s) and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of the species or stock(s) for subsistence uses (“least practicable adverse impact”). NMFS does not have a regulatory definition for least practicable adverse impact. The 2004 NDAA amended the MMPA as it relates to military readiness activities and the incidental take authorization process such that a determination of “least practicable adverse impact” shall include consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity. For the full discussion of how NMFS interprets least practicable adverse impact, including how it relates to the negligible-impact standard, see the Mitigation Measures section in the 2018 HSTT final rule.

Section 101(a)(5)(A)(i)(II) requires NMFS to issue, in conjunction with its authorization, binding—and enforceable—restrictions (in the form of regulations) setting forth how the activity must be conducted, thus ensuring the activity has the “least practicable adverse impact” on the affected species or stocks. In situations where mitigation is specifically needed to reach a negligible impact determination, section 101(a)(5)(A)(i)(II) also provides a mechanism for ensuring compliance with the “negligible impact” requirement. Finally, the least practicable adverse impact standard also requires consideration of measures for marine mammal habitat, with particular attention to rookeries, mating grounds, and other areas of similar significance, and for subsistence impacts, whereas the negligible impact standard is concerned solely with conclusions about the impact of an activity on annual rates of recruitment and survival.¹ In evaluating what mitigation measures are appropriate, NMFS considers the potential impacts of the Specified Activities, the availability of measures to minimize those potential

impacts, and the practicability of implementing those measures, as we describe below. This final rule includes all mitigation measures required by the 2020 HSTT final rule (though two have been modified in this final rule), and our discussion in that rule remains complete and accurate (including reference to the 2018 HSTT final rule), except as described below.

Implementation of Least Practicable Adverse Impact Standard

Our evaluation of potential mitigation measures includes consideration of two primary factors:

(1) The manner in which, and the degree to which, implementation of the potential measure(s) is expected to reduce adverse impacts to marine mammal species or stocks, their habitat, and their availability for subsistence uses (where relevant). This analysis considers such things as the nature of the potential adverse impact (such as likelihood, scope, and range), the likelihood that the measure will be effective if implemented, and the likelihood of successful implementation; and

(2) The practicability of the measure(s) for applicant implementation. Practicability of implementation may consider such things as cost, impact on activities, and, in the case of a military readiness activity, specifically considers personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity.

While the language of the least practicable adverse impact standard calls for minimizing impacts to affected species or stocks, we recognize that the reduction of impacts to those species or stocks accrues through the application of mitigation measures that limit impacts to individual animals. Accordingly, NMFS’ analysis focuses on measures that are designed to avoid or minimize impacts on individual marine mammals that are likely to increase the probability or severity of population-level effects.

While direct evidence of impacts to species or stocks from a specified activity is rarely available, and additional study is still needed to understand how specific disturbance events affect the fitness of individuals of certain species, there have been improvements in understanding the process by which disturbance effects are translated to the population. With recent scientific advancements (both marine mammal energetic research and the development of energetic frameworks), the relative likelihood or

degree of impacts on species or stocks may often be inferred given a detailed understanding of the activity, the environment, and the affected species or stocks—and the best available science has been used here. This same information is used in the development of mitigation measures and helps us understand how mitigation measures contribute to lessening effects (or the risk thereof) to species or stocks. We also acknowledge that there is always the potential that new information, or a new recommendation could become available in the future and necessitate reevaluation of mitigation measures (which may be addressed through adaptive management) to see if further reductions of population impacts are possible and practicable.

In the evaluation of specific measures, the details of the specified activity will necessarily inform each of the two primary factors discussed above (expected reduction of impacts and practicability), and are carefully considered to determine the types of mitigation that are appropriate under the least practicable adverse impact standard. Analysis of how a potential mitigation measure may reduce adverse impacts on a marine mammal stock or species, consideration of personnel safety, practicality of implementation, and consideration of the impact on effectiveness of military readiness activities are not issues that can be meaningfully evaluated through a yes/no lens. The manner in which, and the degree to which, implementation of a measure is expected to reduce impacts, as well as its practicability in terms of these considerations, can vary widely. For example, a time/area restriction could be of very high value for decreasing population-level impacts (e.g., avoiding disturbance of feeding females in an area of established biological importance) or it could be of lower value (e.g., decreased disturbance in an area of high productivity but of less firmly established biological importance). Regarding practicability, a measure might involve restrictions in an area or time that impede the Navy’s ability to certify a strike group (higher impact on mission effectiveness), or it could mean delaying a small in-port training event by 30 minutes to avoid exposure of a marine mammal to injurious levels of sound (lower impact). A responsible evaluation of “least practicable adverse impact” will consider the factors along these realistic scales. Accordingly, the greater the likelihood that a measure will contribute to reducing the probability or severity of adverse impacts to the

¹ Outside of the military readiness context, mitigation may also be appropriate to ensure compliance with the “small numbers” language in MMPA sections 101(a)(5)(A) and (D).

species or stock or its habitat, the greater the weight that measure is given when considered in combination with practicability to determine the appropriateness of the mitigation measure, and vice versa. In the evaluation of specific measures, the details of the specified activity will necessarily inform each of the two primary factors discussed above (expected reduction of impacts and practicability), and will be carefully considered to determine the types of mitigation that are appropriate under the least practicable adverse impact standard. For more detail on how we apply these factors, see the discussion in the Mitigation Measures section of the 2018 HSTT final rule.

Assessment of Mitigation Measures for HSTT Rule

NMFS fully reviewed the Navy's specified activities and the mitigation measures for the 2020 HSTT final rule and determined, with the addition of the new and modified measures discussed herein, and after consideration of the new information and studies described above, that the mitigation measures would result in the least practicable adverse impact on marine mammals (see the 2019 Navy application and the 2018 HSTT final rule for detailed information on the Navy's mitigation measures, with the exception of the new and modified measures described herein). NMFS worked with the Navy in the development of the Navy's mitigation measures, which were informed by years of implementation and monitoring. A complete discussion of the Navy's evaluation process used to develop, assess, and select mitigation measures, which was informed by input from NMFS, can be found in chapter 5 (*Mitigation*) of the 2018 HSTT FEIS/OEIS. The process described in chapter 5 (*Mitigation*) of the 2018 HSTT FEIS/OEIS robustly supports NMFS' independent evaluation of whether the mitigation measures would meet the least practicable adverse impact standard. The Navy has implemented the mitigation measures under the 2020 HSTT regulations and will be required to continue implementation of the mitigation measures identified in this rulemaking for the full 7 years it covers to avoid or reduce potential impacts from acoustic, explosive, and physical disturbance and vessel strike stressors.

The Navy also evaluated numerous measures in the 2018 HSTT FEIS/OEIS that were not included in the 2017 Navy application, and NMFS independently reviewed and considered all new information, and continues to concur

with Navy's analysis that their inclusion was not appropriate under the least practicable adverse impact standard. The Navy considered these additional potential mitigation measures in two groups. First, chapter 5 (*Mitigation*) of the 2018 HSTT FEIS/OEIS, in the Measures Considered but Eliminated section, includes an analysis of an array of different types of mitigation that have been recommended over the years by NGOs or the public, through scoping or public comment on environmental compliance documents. Appendix K (Geographic Mitigation Assessment) of the 2018 HSTT FEIS/OEIS includes an in-depth analysis of time/area restrictions that have been recommended over time or previously implemented as a result of litigation.

Below, we summarize the mitigation measures (organized into procedural measures and mitigation areas) that NMFS has determined will ensure the least practicable adverse impact on all affected species and stocks and their habitat, including the specific considerations for military readiness activities, and including several measures that are new or modified since publication of the 2020 HSTT final rule.

In its 2022 application, the Navy proposed no changes to the procedural or geographic mitigation measures in the 2020 HSTT final rule. NMFS reviewed new information potentially pertinent to mitigation of the Navy's training and testing activities. While Lookouts are essential to detecting the potential for and potentially avoiding a vessel strike of a marine mammal, NMFS and the Navy have always acknowledged that Lookouts cannot prevent all vessel strikes. The recent U.S. Navy and Royal Australian Navy vessel strikes appear to confirm this, as these strikes occurred when Lookouts were posted. As acknowledged above, these recent incidents may represent an early indicator of an increased military vessel strike risk within SOCAL. Recent reports appear to reflect the sporadic, episodic, or clustered nature of vessel strike or may reflect a trend of increased large whale presence in this area in the early summer months. NMFS and the Navy have discussed the circumstances of each of the recent strikes, including the Royal Australian Navy strike, and discussed ways of improving strike mitigation. In these further conversations, NMFS and the Navy developed several new and modified mitigation measures in comparison to those included in the 2020 HSTT final rule.

For vessel movement, the 2020 HSTT final rule required that "When underway Navy personnel must observe

the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must maneuver to maintain distance." This measure has been updated to state that reducing speed may be an appropriate way to maneuver. The revised measure states that "When underway, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must maneuver (which may include reducing speed as the mission or circumstances allow) to maintain distance." Of note, between 2009 and 2021 (the most recent year for which data is available), U.S. Navy vessels in the SOCAL portion of the HSTT Study Area maneuvered 316 times to avoid large whales during MTEs. The years 2017 and 2021 had the highest number of maneuvers (n=64 and n=82, respectively). In all years for which data is available (2009 to 2021), Navy cruisers and destroyers account for 51 to 100 percent of maneuvers during MTEs. With this modified measure, NMFS is emphasizing that Navy personnel should consider reducing speed (as mission or circumstances allow) when maneuvering to avoid marine mammals, though this modified measure does not require reduction of vessel speed for reasons explained in chapter 5 (*Mitigation*) of the 2018 HSTT FEIS/OEIS, in the Measures Considered but Eliminated section (*i.e.*, requirements to reduce vessel speeds would have significant direct negative effects on mission effectiveness).

This final rule also requires that Navy personnel must send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area.

Further, the 2020 HSTT final rule included a requirement for Navy personnel to issue seasonal awareness notification messages to alert ships and aircraft to the possible presence of blue whales (June–October), humpback whales (November–April), gray whales (November–March), or fin whales (November–May). These messages assist in maintaining safety of navigation and in avoiding interactions with large whales during transits. Platforms must use the information from the awareness notification messages to assist their visual observation of applicable mitigation zones during training and testing activities and to aid in the implementation of procedural mitigation. This final rule requires the Navy to re-title the spring blue whale message (released in June) to a large whale awareness message inclusive of typical spring-summer large whales in southern California (mainly blue, fin,

and humpback whales). Furthermore, rather than tying the message release to a specific month, the message would be for a period based on predicted oceanographic conditions for a given year (e.g., May–November, April–November, *etc.*). The Navy will also evaluate information obtained from NMFS' Southwest Fisheries Science Center scientists, recently published West Coast BIAs (Calambokidis *et al.* 2024), and other oceanographic or predictive models for guiding message text descriptions of whale occurrence in Southern California. The improvement will emphasize that when a marine mammal is spotted, this may be an indicator that additional marine mammals are present and nearby, and increased vigilance and awareness of Navy personnel is warranted.

This final rule also contains a new mitigation measure in which Navy personnel would issue real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in a select area of SOCAL (Of note, the four whales do not have to be the same species and do not have to be part of the same group (e.g., two whales of one species sighted at a distance off the port side at 500 yd (457.2 m) and two more whales of another species sighted off the starboard side at 500 yd (457.2 m) will be considered an aggregation under this measure)). This measure will apply to the area between 32–33 degrees North and 117.2–119.5 degrees West, which includes the locations where recent (2009, 2021, 2023) strikes occurred, and historic locations where strikes occurred when precise latitude and longitude were known.

Of note, in order to improve mitigation effectiveness, in fall 2022 the Navy made several changes to its Lookout training. The Navy revised its basic Lookout training materials to improve marine mammal awareness and spotting techniques through updates to the Marine Mammal chapter of the Navy's September 2022 Lookout Training Handbook. Further, the Navy integrated improved Lookout training into a new generation of a shipboard simulator at its recruit training center in the Great Lakes. This simulator enhances new sailor knowledge and skill under realistic training scenarios. Last, the Navy will evaluate future revisions to online or DVD Marine Species Awareness Training video training to emphasize that when a protected species is spotted, this may be an indicator that additional marine mammals are present and nearby, and

the vessel should take this into consideration when transiting.

In addition to Lookouts required under this rule, the Navy mandates the number of Lookouts on underway vessels per internal policy documents, including the Surface Ship NAVDORM. As described in the *Standard Operating Procedures* section, in 2021, NAVDORM policy changed to require three Lookouts on most classes of surface ship, including destroyers and cruisers. However, the Navy asserts that always including three Lookouts on these vessels in the future as a required mitigation measure is not practicable because lookout numbers are subject to change based on national security needs, including manning and staffing requirements. As such, although the Navy describes these additional Lookouts in its application under the mitigation section, NMFS has not considered the potential presence of two additional lookouts when considering Navy's mitigation effectiveness. Please see the Reporting section for additional detail on this requirement.

With the exception of Oedekoven and Thomas (2022) described above, there is no new information that affects NMFS' assessment of the applicability or effectiveness of the measures included in the 2018 HSTT final rule over the remainder of the 7-year period. As stated above in the Potential Effects of Specified Activities on Marine Mammals and Their Habitat section, while (Oedekoven and Thomas, 2022) suggests that detection of marine mammals is less certain than previously assumed at certain distances, model assumptions may still underestimate Lookout effectiveness in some cases. Additionally, maneuvering data summarized above demonstrates that Navy vessels are successfully maneuvering to avoid striking sighted marine mammals in most cases, despite the Oedekoven and Thomas (2022) results. Further, as described above, Navy and NMFS have developed modified or new mitigation in this final rule which are anticipated to further reduce the risk of vessel strike of large whales.

In summary, and as described in more detail above regarding vessel strike, the Navy has agreed to procedural mitigation measures that will reduce the probability and/or severity of impacts expected to result from acute exposure to acoustic sources or explosives, vessel strike, and impacts to marine mammal habitat. Specifically, the Navy will use a combination of delayed starts, powerdowns, and shutdowns to minimize or avoid M/SI and minimize the likelihood or severity of PTS or

other injury, and reduce instances of TTS or more severe behavioral disturbance caused by acoustic sources or explosives. The Navy will also implement multiple time/area restrictions (several of which were added in the 2018 HSTT final rule since the previous HSTT MMPA incidental take rule) that would reduce take of marine mammals in areas or at times where they are known to engage in important behaviors, such as feeding or calving, where the disruption of those behaviors would have a higher probability of resulting in impacts on reproduction or survival of individuals that could lead to population-level impacts. Table 8 provides the Navy's required procedural mitigation measures for environmental awareness and education and vessel movement as well as summaries of the Navy's procedural mitigation measures for other activities. Table 9 provides summaries of mitigation areas for the HSTT Study Area.

NMFS and the Navy considered additional mitigation areas (beyond those already identified with associated measures to reduce impacts to marine mammals) to further protect marine mammals, including odontocetes with small or resident populations in the HSTT Study Area, and large whales with feeding, reproductive, and migratory BIAs in the HSTT Study Area. This includes consideration of new mitigation areas that could be based on newly identified BIAs in Hawaii (Kratofil *et al.* 2023) and on the West Coast (Calambokidis *et al.* 2024). The HRC overlaps BIAs identified in Kratofil *et al.* (2023) for humpback whale, spinner dolphin, short-finned pilot whale, rough-toothed dolphin, pygmy killer whale, pantropical spotted dolphin, melon-headed whale, false killer whale, dwarf sperm whale, goose-beaked whale, common bottlenose dolphin, and Blainville's beaked whale. All of the BIAs that overlap the HRC are small and resident population BIAs, with the exception of the humpback whale reproductive BIA. SOCAL overlaps BIAs identified in Calambokidis *et al.* (2024) for blue whale (feeding area), fin whale (feeding area), and gray whale (migratory route).

Additional restrictions in mitigation areas beyond those restrictions and areas included in the 2020 HSTT final rule (including mitigation to reduce vessel strike risk such as vessel speed restrictions, and in consideration of the newly identified BIAs (Kratofil *et al.* 2023 and Calambokidis *et al.* 2024)) is impracticable given overlap with critical Navy training areas in the HRC and SOCAL. However, many of the BIAs

identified in Kratofil *et al.* 2023 and Calambokidis *et al.* (2024) partially or fully overlap the mitigation areas included in the 2020 HSTT final rule and this final rule and are aimed at reducing impacts to the same species for which Kratofil *et al.* 2023 and Calambokidis *et al.* (2024) identified BIAs. In the HRC, the existing mitigation areas are targeted and expected to reduce impacts to humpback whales, false killer whales, dwarf sperm whales, pygmy killer whales, short-finned pilot whales,

melon-headed whales, bottlenose dolphins, spotted dolphins, spinner dolphins, rough-toothed dolphins, goose-beaked whales, and Blainville's beaked whales (*i.e.*, all species for which Kratofil *et al.* (2023) identified BIAs). In SOCAL, the existing mitigation areas are aimed at reducing impacts to blue whales, fin whales, and gray whales (*i.e.*, all species for which Calambokidis *et al.* (2024) identified BIAs). Further, as included in the 2023 HSTT proposed rule, this final rule requires that Navy personnel must issue

real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in a select area of SOCAL, and that Navy personnel must send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area. Last, this final rule includes modification of two mitigation measures from the 2020 HSTT final rule (85 FR 41780; July 10, 2020) to further reduce the potential for vessel strike.

TABLE 8—SUMMARY OF PROCEDURAL MITIGATION

Stressor or activity	Mitigation zone sizes and other requirements
Environmental Awareness and Education	- This mitigation applies to all training and testing activities, as applicable. - Mitigation Requirements: - Appropriate Navy personnel (including civilian personnel) involved in mitigation and training or testing activity reporting under the specific activities must complete one or more modules of the U.S. Navy Afloat Environmental Compliance Training Series, as identified in their career path training plan. Modules include: - Introduction to the U.S. Navy Afloat Environmental Compliance Training Series. The introductory module provides information on environmental laws (<i>e.g.</i>, ESA, MMPA) and the corresponding responsibilities that are relevant to Navy training and testing activities. The material explains why environmental compliance is important in supporting the Navy's commitment to environmental stewardship. - Marine Species Awareness Training. All bridge watch personnel, Commanding Officers, Executive Officers, maritime patrol aircraft aircrews, anti-submarine warfare and mine warfare rotary-wing aircrews, Lookouts, and equivalent civilian personnel must successfully complete the Marine Species Awareness Training prior to standing watch or serving as a Lookout. The Marine Species Awareness Training provides information on sighting cues, visual observation tools and techniques, and sighting notification procedures. Navy biologists developed Marine Species Awareness Training to improve the effectiveness of visual observations for biological resources, focusing on marine mammals and sea turtles, and including floating vegetation, jellyfish aggregations, and flocks of seabirds. - U.S. Navy Protective Measures Assessment Protocol. This module provides the necessary instruction for accessing mitigation requirements during the event planning phase using the Protective Measures Assessment Protocol software tool. - U.S. Navy Sonar Positional Reporting System and Marine Mammal Incident Reporting. This module provides instruction on the procedures and activity reporting requirements for the Sonar Positional Reporting System and marine mammal incident reporting.
Active Sonar	Depending on sonar source: 1,000 yd (914.4 m) power down, 500 yd (457.2 m) power down, and 200 yd (182.9 m) shut down. 200 yd (182.9 m) shut down.
Air Guns	150 yd (137.2 m).
Pile Driving	100 yd (91.4 m).
Weapons Firing Noise	30 degrees on either side of the firing line out to 70 yd (64 m).
Explosive Sonobuoys	600 yd (548.6 m).
Explosive Torpedoes	2,100 yd (1,920.2 m).
Explosive Medium-Caliber and Large-Caliber Projectiles.	1,000 yd (914.4 m; large-caliber projectiles). 600 yd (548.6 m; medium-caliber projectiles during surface-to-surface activities). 200 yd (182.9 m; medium-caliber projectiles during air-to-surface activities).
Explosive Missiles and Rockets	2,000 yd (1,828.8 m; 21–500 lb. net explosive weight). 900 yd (823 m; 0.6–20 lb. net explosive weight). 2,500 yd (2,286 m). 2.5 nmi (4.6 km).
Explosive Bombs	2,100 yd (1,929.2 m; 6–650 lb net explosive weight).
Sinking Exercises	600 yd (548.6 m; 0.1–5 lb net explosive weight).
Explosive Mine Countermeasure and Neutralization Activities.	1,000 yd (914.4 m; 21–60 lb net explosive weight for positive control charges and charges using time-delay fuses).
Explosive Mine Neutralization Activities Involving Navy Divers.	500 yd (457.2 m; 0.1–20 lb net explosive weight for positive control charges).
Underwater Demolition Multiple Charge—Mat Weave and Obstacle Loading.	700 yd (640.1 m).
Maritime Security Operations—Anti-Swimmer Grenades.	200 yd (182.9 m).
Vessel Movement	- The mitigation must not be applied if: (1) The vessel's safety is threatened, (2) the vessel is restricted in its ability to maneuver (<i>e.g.</i>, during launching and recovery of aircraft or landing craft, during towing activities, when mooring), (3) the vessel is operated autonomously, or (4) when impractical based on mission requirements (<i>e.g.</i>, during Amphibious Assault—Battalion Landing exercises). - Number of Lookouts and Observation Platform: - Lookout must be on the vessel that is underway.¹ - Mitigation Requirements: - Mitigation zones:—500 yd (457.2 m) around whales.—200 yd (182.9 m) around other marine mammals (except bow-riding dolphins and pinnipeds hauled out on man-made navigational structures, port structures, and vessels). - When a vessel is underway, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must maneuver (which may include reducing speed as the mission or circumstances allow) to maintain distance. - Additional requirements: - If a marine mammal vessel strike occurs, Navy personnel must follow the established incident reporting procedures. Navy personnel must also send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area.

TABLE 8—SUMMARY OF PROCEDURAL MITIGATION—Continued

Stressor or activity	Mitigation zone sizes and other requirements
Towed In-Water Devices	○ Navy personnel must issue real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in the area between 32–33 degrees North and 117.2–119.5 degrees West. These notifications would be issued to Navy vessels within this boundary only.
Small-, Medium-, and Large-Caliber Non-Explosive Practice Munitions.	• 250 yd (228.6 m; marine mammals). • 200 yd (182.9 m).
Non-Explosive Missiles and Rockets	• 900 yd (823 m).
Non-Explosive Bombs and Mine Shapes	• 1,000 yd (914.4 m).

Note: lb: pounds; nmi: nautical miles; yd: yards; m: meters.

¹ Underway vessels will maintain at least one Lookout. For ship classes required to maintain more than one Lookout, the specific requirement is subject to change over time in accordance with Navy navigation instruction (e.g., the Surface Ship NAVDORM). Navy personnel will notify NMFS as soon as practicable should its Lookout policies change, including in the NAVDORM.

TABLE 9—SUMMARY OF MITIGATION AREAS FOR MARINE MAMMALS

Summary of mitigation area requirements
Hawaii Island Mitigation Area (year-round) • Navy personnel must not conduct more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of MF4 dipping sonar, or use explosives that could potentially result in takes of marine mammals during training and testing.¹ 4-Islands Region Mitigation Area (November 15–April 15 for active sonar; year-round for explosives) • Navy personnel must not use MF1 surface ship hull-mounted mid-frequency active sonar or explosives that could potentially result in takes of marine mammals during training and testing.¹ Humpback Whale Special Reporting Areas (December 15–April 15) • Navy personnel must report the total hours of surface ship hull-mounted mid-frequency active sonar used in the special reporting areas in its annual training and testing activity reports submitted to NMFS. San Diego Arc, San Nicolas Island, and Santa Monica/Long Beach Mitigation Areas (June 1–October 31) • Navy personnel must not conduct more than a total of 200 hours of MF1 surface ship hull-mounted mid-frequency active sonar in the combined areas, excluding normal maintenance and systems checks, during training and testing.¹ • Within the San Diego Arc Mitigation Area, Navy personnel must not use explosives that could potentially result in the take of marine mammals during large-caliber gunnery, torpedo, bombing, and missile (including 2.75" rockets) activities during training and testing.¹ • Within the San Nicolas Island Mitigation Area, Navy personnel must not use explosives that could potentially result in the take of marine mammals during mine warfare, large-caliber gunnery, torpedo, bombing, and missile (including 2.75" rockets) activities during training.¹ • Within the Santa Monica/Long Beach Mitigation Area, Navy personnel must not use explosives that could potentially result in the take of marine mammals during mine warfare, large-caliber gunnery, torpedo, bombing, and missile (including 2.75" rockets) activities during training and testing.¹ Santa Barbara Island Mitigation Area (year-round) • Navy personnel must not use MF1 surface ship hull-mounted mid-frequency active sonar during training and testing, or explosives that could potentially result in the take of marine mammals during medium-caliber or large-caliber gunnery, torpedo, bombing, and missile (including 2.75" rockets) activities during training.¹ Awareness Notification Message Areas (seasonal according to species) • Navy personnel must issue spring awareness notification messages to alert ships and aircraft to the possible presence of large whales during a period based on predicted oceanographic conditions for a given year. The message must emphasize to personnel on vessels that when a marine mammal is spotted, this may be an indicator that additional marine mammals are present and nearby, and increased vigilance and awareness of Navy personnel is warranted. Navy personnel must also issue awareness notification messages to alert ships and aircraft to the possible presence of gray whales (November–March) and fin whales (November–May).

¹ If Naval units need to conduct more than the specified amount of training or testing, they will obtain permission from the appropriate designated Command authority prior to commencement of the activity. The Navy will provide NMFS with advance notification and include the information in its annual activity reports submitted to NMFS.

Mitigation Conclusions

NMFS has carefully evaluated the Navy's mitigation measures from the 2020 rule—many of which were developed with NMFS' input during the previous phases of Navy training and testing authorizations and none of which have changed since our evaluation during the 2018 HSTT rulemaking, with the exception of the changes described herein—and considered a broad range of other measures (*i.e.*, the measures considered but eliminated in the 2018 HSTT FEIS/OEIS, which reflect many of the comments that have arisen via NMFS or public input in past years) in the context of ensuring that NMFS prescribes the means of effecting the least practicable adverse impact on the affected marine mammal species and stocks and their habitat. Our evaluation of potential measures included

consideration of the following factors in relation to one another: the manner in which, and the degree to which, the successful implementation of the mitigation measures is expected to reduce the likelihood and/or magnitude of adverse impacts to marine mammal species and stocks and their habitat; the proven or likely efficacy of the measures; and the practicability of the measures for applicant implementation, including consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity. After considering all new information, including consideration of new information regarding vessel strike, NMFS is requiring two additional mitigation measures and revision of two existing mitigation measures as described above.

Based on our evaluation of the Navy's current mitigation measures (which are being implemented under the 2020 HSTT regulations), as well as modified and new measures described above, NMFS has determined that the mitigation measures are appropriate means of effecting the least practicable adverse impact on marine mammal species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and considering specifically personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity. Additionally, as described in more detail below, the 2020 HSTT final rule includes an adaptive management provision, which NMFS has included in this final rule, which ensures that mitigation is regularly assessed and

provides a mechanism to improve the mitigation, based on the factors above, through modification as appropriate.

Monitoring

Section 101(a)(5)(A) of the MMPA states that in order to authorize incidental take for an activity, NMFS must set forth requirements pertaining to the monitoring and reporting of such taking. The MMPA implementing regulations at 50 CFR 216.104(a)(13) indicate that requests for incidental take authorizations must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present.

In its 2022 application, the Navy proposed no changes to the monitoring described in the 2018 HSTT final rule and 2020 HSTT final rule. They would continue implementation of the robust Integrated Comprehensive Monitoring Program and Strategic Planning Process described in the 2018 HSTT final rule. The Navy's monitoring strategy, currently required by the 2018 HSTT regulations, is well-designed to work across Navy ranges to help better understand the impacts of the Navy's activities on marine mammals and their habitat by focusing on learning more about marine mammal occurrence in different areas and exposure to Navy stressors, marine mammal responses to different sound sources, and the consequences of those exposures and responses on marine mammal populations. Similarly, these modified regulations would include identical adaptive management provisions and reporting requirements as the 2018 HSTT regulations. There is no new information that would indicate that the monitoring measures put in place under the 2018 HSTT final rule would not remain applicable and appropriate for the 7-year period of this rule. See the *Monitoring* section of the 2018 HSTT final rule for more details on the monitoring program that would be required under this rule. In addition, please see the 2019 Navy application, which references chapter 13 of the 2017 Navy application for full details on the monitoring and reporting proposed by the Navy.

Within the SOCAL portion of HSTT, the Navy has been primarily focused on beaked whale monitoring since 2018 through two separate ongoing projects that are expected to continue until 2025. These projects use passive acoustic devices, visual surveys, satellite tagging, genetic analysis, photoID, and response

to anthropogenic sounds to refine population status of beaked whales in SOCAL. There is also one concurrent project with fin whales using visual surveys, satellite tagging, and photoID to gather additional data on fin whale populations in Southern California. Finally, the Navy continues to fund marine mammal sighting data collected during California Cooperative Oceanic Fisheries Investigations (CALCOFI) <https://calcofi.org/>. These data are collected on a much more frequent basis than NMFS' West Coast visual survey which typically occur once every 5 years in the summer. CALCOFI surveys occur quarterly every year to include winter and spring seasons NMFS does not survey. Sufficient marine mammal sightings have been accumulated since the Navy started funding in 2004 for the data to be incorporated into ongoing NMFS spatial habitat models, including new models for select species. The Navy also annually funds continued NMFS spatial habitat model improvements as new data and techniques become available. These models benefit the Navy and other Federal partners such as the Bureau of Ocean Energy Management and NMFS, for use in future regional marine mammal density derivation. For additional information, please see the Navy's Marine Species Monitoring program website, <https://www.navy.marin-speciesmonitoring.us/regions/pacific/current-projects/>.

Adaptive Management

The 2020 HSTT regulations governing the take of marine mammals incidental to Navy training and testing activities in the HSTT Study Area contain an adaptive management component. Our understanding of the effects of Navy training and testing activities (e.g., acoustic and explosive stressors) on marine mammals continues to evolve, which makes the inclusion of an adaptive management component both valuable and necessary within the context of 7-year regulations. The 2022 Navy application proposed no changes to the adaptive management component included in the 2020 HSTT final rule.

The reporting requirements associated with this rule are designed to provide NMFS with monitoring data from the previous year to allow NMFS to consider whether any changes to existing mitigation and monitoring requirements are appropriate. The use of adaptive management allows NMFS to consider new information from different sources to determine (with input from the Navy regarding practicability) on an annual or biennial basis if mitigation or monitoring measures should be modified (including additions or

deletions). Mitigation measures could be modified if new data suggests that such modifications would have a reasonable likelihood of more effectively accomplishing the goals of the mitigation and monitoring and if the measures are practicable. If the modifications to the mitigation, monitoring, or reporting measures are substantial, NMFS will publish a notice of the planned LOA in the **Federal Register** and solicit public comment.

The following are some of the possible sources of applicable data to be considered through the adaptive management process: (1) results from monitoring and exercises reports, as required by MMPA authorizations; (2) compiled results of Navy funded R&D studies; (3) results from specific stranding investigations; (4) results from general marine mammal and sound research; and (5) any information which reveals that marine mammals may have been taken in a manner, extent, or number not authorized by these regulations or subsequent LOAs. The results from monitoring reports and other studies may be viewed at <https://www.navy.marin-speciesmonitoring.us>.

Reporting

In order to issue incidental take authorization for an activity, section 101(a)(5)(A) of the MMPA states that NMFS must set forth requirements pertaining to the monitoring and reporting of such taking. Effective reporting is critical both to compliance as well as ensuring that the most value is obtained from the required monitoring. Reports from individual monitoring events, results of analyses, publications, and periodic progress reports for specific monitoring projects will be posted to the Navy's Marine Species Monitoring web portal: <http://www.navy.marin-speciesmonitoring.us>. The 2019 Navy application and 2022 Navy application proposed no changes to the reporting requirements, though as noted above, the Navy has since proposed to report changes to Lookout SOPs to NMFS. Except as discussed below, reporting requirements would remain identical to those described in the 2018 HSTT final rule and 2020 HSTT final rule, and there is no new information that would indicate that the reporting requirements put in place under the 2020 HSTT final rule would not remain applicable and appropriate for the remaining duration of the 7-year period of this rule. See the *Reporting* section of the 2018 HSTT final rule for more details on the reporting that would be required under this rulemaking. In addition, the 2018 HSTT proposed and final rules unintentionally failed to

include the requirement for the Navy to submit a final activity “close out” report at the end of the regulatory period. That oversight was corrected through the 2020 HSTT final rule. Please see the 2020 HSTT final rule for the detailed requirements for that report.

In addition to the reporting requirements included in the 2020 HSTT final rule, in 2023, we proposed requiring the Navy to report changes in its Lookout policies to NMFS as soon as practicable after a change is made. This final rule requires the Navy to implement that reporting measure, as well as two new measures that were not included in the 2023 HSTT proposed rule, described below.

The Navy’s annual HSTT Training Exercise Report and Testing Activity Report must include information that tracks the Navy’s implementation of the new SOCAL large whale aggregation real-time reporting mitigation measure. The report must include the following information for each instance that an aggregation of large whales is reported: (1) the date, time and general location (*e.g.*, approximately 10–12 nmi (18.5 to 22.2 km) SE of San Clemente Island) of the whales when the aggregation was first sighted; (2) the total number of whales observed within 1 nmi (1.8 km) of a Navy vessel that make up the aggregation; and (3) the approximate distance (or distances if more than one group of whales is sighted) of the vessel from the whales in the aggregation when the whales were first sighted. To the extent practicable, this information should be provided in the Navy’s unclassified version of these reports.

The Navy’s annual HSTT Training Exercise Report and Testing Activity Report must include a confirmation that foreign military use of sonar and explosives, when such militaries are participating in a U.S. Navy-led exercise or event, combined with the U.S. Navy’s use of sonar and explosives, would not cause exceedance of the analyzed levels (within each NAEMO modeled sonar and explosive bin) used for estimating predicted impacts, which formed the basis of the acoustic impacts effects analysis used to estimate take in this final rule. The purpose of this new reporting measure is for the Navy to confirm annually that the Navy has accounted for foreign military participation in its annual report, without requiring the Navy to quantitatively account for foreign military activity. The Navy informed NMFS that it would be difficult for the Navy to quantify foreign military activities as a subset of its total activities because the Navy does not track activities conducted by foreign vessels

in this manner. Furthermore, the annual reported takes from Navy activities are calculated the same regardless of whether the activity was conducted by a foreign military or not.

Analysis and Negligible Impact Determination

NMFS has defined negligible impact as an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival (50 CFR 216.103). A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (*i.e.*, population-level effects). While this final rule consists of a modification of take by M/SI by vessel strike, NMFS considers the impacts of the entire specified activity and the total taking in the negligible impact determination. An estimate of the number of takes alone is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be taken through mortality, serious injury, and Level A or Level B harassment (as presented in tables 11 and 12 of the 2020 HSTT final rule), NMFS considers other factors, such as the likely nature of any responses (*e.g.*, intensity, duration), the context of any responses (*e.g.*, critical reproductive time or location, migration), as well as effects on habitat, and the likely effectiveness of the mitigation. We also assess the number, intensity, and context of estimated takes by evaluating this information relative to population status. Consistent with the 1989 preamble for NMFS’ implementing regulations (54 FR 40338, September 29, 1989), the impacts from other past and ongoing anthropogenic activities (including foreign military activities) are incorporated into this analysis via their impacts on the environmental baseline (*e.g.*, as reflected in the regulatory status of the species, population size and growth rate where known, other ongoing sources of human-caused mortality, ambient noise levels, and specific consideration of take by Level A harassment or M/SI previously authorized for other NMFS activities).

In the Estimated Take of Marine Mammals sections of this final rule and the 2020 HSTT final rule (where the activities, species and stocks, potential effects, and mitigation measures (except as modified above) are the same as for this rulemaking), we identified the subset of potential effects that would be expected to rise to the level of takes

both annually and over the 7-year period covered by this rulemaking and then identified the number of each of those mortality takes that we believe could occur or the maximum number of harassment takes that are reasonably expected to occur based on the methods described. The impact that any given take will have is dependent on many case-specific factors that need to be considered in the negligible impact analysis (*e.g.*, the context of behavioral exposures such as duration or intensity of a disturbance, the health of impacted animals, the status of a species that incurs fitness-level impacts to individuals, *etc.*). For this final rule, we evaluated the likely impacts of the enumerated maximum number of harassment takes that were reasonably expected to occur and are authorized, in the context of the specific circumstances surrounding these predicted takes. We also assessed M/SI takes that could occur, as well as considering the traits and statuses of the affected species and stocks. Last, we collectively evaluated this information, as well as other more taxa-specific information and mitigation measure effectiveness, in group-specific assessments that support our negligible impact conclusions for each stock or species. Because all of the Navy’s specified activities would occur within the ranges of the marine mammal stocks identified in the rule, all negligible impact analyses and determinations are at the stock level (*i.e.*, additional species-level determinations are not needed).

The Navy proposed no changes to the nature or level of the specified activities or the boundaries of the HSTT Study Area, and therefore, the training and testing activities (*e.g.*, equipment and sources used, exercises conducted) are the same as those analyzed in the 2020 HSTT final rule. In addition, the mitigation, monitoring, and nearly all reporting measures are identical to those described and analyzed in the 2018 HSTT final rule with the exception of changes to mitigation measures and the additional reporting requirements described previously. There is no new information since the publication of the 2020 HSTT final rule regarding the impacts of the specified activities on marine mammals, the status and distribution of any of the affected marine mammal species or stocks, or the effectiveness of the mitigation and monitoring measures that would change the content of our analyses, with the exception of that described below. First, naval vessel strikes have occurred in the HSTT and Atlantic Fleet Training and Testing (AFTT) Study Areas since

publication of the 2020 HSTT final rule (one fin or sei whale struck by the U.S. Navy in the HSTT Study Area (2023), two unidentified large whales struck by the U.S. Navy in the HSTT Study Area (2021), two fin whales struck by a foreign navy in the HSTT Study Area (2021), and one dolphin struck by the U.S. Navy in the AFTT Study Area (2021)). Second, for gray whales, we have considered the latest effects of the recently closed UME on the west coast of North America along with the effects of the Navy's activities in the negligible impact analysis. Third, a new study suggests that Lookout detection of marine mammals is less certain than previously assumed (Oedekoven and Thomas, 2022). Fourth, stock assessments have been updated for multiple stocks in the 2023 Pacific and Alaska SARs (Carretta *et al.* 2024; Young *et al.* 2024).

As described above, since publication of the 2023 HSTT proposed rule, NMFS has updated our Technical Guidance (NMFS, 2024) containing updated acoustic criteria for auditory injury (89 FR 36762, October 24, 2024). The Technical Guidance provides updated auditory injury thresholds, where appropriate, as well as revised weighting functions, in some cases. For impulsive sources, the Updated Technical Guidance's auditory injury thresholds generally remain identical or are higher compared to our 2018 Technical Guidance, meaning that received levels would need to be higher in order for marine mammals to be expected to incur auditory injury. The exceptions are for phocid pinnipeds (PW), where the cumulative SEL threshold, in the Updated Technical Guidance, is 2 dB lower and for otariid pinnipeds (OW) where the peak sound pressure level threshold is 2 dB lower and the cumulative SEL threshold is 18 dB lower. As for the Updated Technical Guidance's weighting functions, for MF cetaceans (now called HF cetaceans in

the updated document) and HF cetaceans (now called VHF cetaceans in the updated document), the weighting functions reflect a higher susceptibility to auditory injury at frequencies below 10 kHz, as compared to the 2018 Technical Guidance. Other minor changes/shifts to weighting functions (e.g., for LF cetaceans, PW pinnipeds, OW pinnipeds) were also included. This new information was not available in a timeframe in which NMFS could have incorporated it into the quantitative analysis supporting this final rulemaking; however, NMFS did consider the information qualitatively. While these changes in the auditory injury thresholds and weighting functions could result in minor increases in PTS exposure estimates for some species, given the conservative assumptions built into the take estimate methodology, they would not be expected to result in meaningful, if any, changes in take estimates and would not be expected to change any of the findings.

Harassment

As described in the Estimated Take of Marine Mammals section, the annual number of takes authorized and reasonably expected to occur by Level A harassment and Level B harassment (based on the maximum number of activities per 12-month period) are identical to those presented in tables 41 and 42 in the *Take Requests* section of the 2018 HSTT final rule, with the exception of humpback whale, which are presented in tables 2 and 3 herein. As such, the negligible impact analyses and determinations of the effects of the estimated Level A harassment and Level B harassment takes on annual rates of recruitment or survival for each species and stock are nearly identical to and substantively unchanged from those presented in the 2020 HSTT final rule. The differences in the analysis is our removal of consideration of California Sea Lion UME and gray whale UME,

which have been closed since publication of the 2020 HSTT final rule and 2023 HSTT proposed rule, respectively, and incorporation of the revised stock structure for humpback whales. This does not affect the results of the analyses or our determinations. For detailed discussion of the impacts that affected individuals may experience given the specific characteristics of the specified activities and required mitigation (e.g., from behavioral disruption, masking, and temporary or permanent threshold shift), along with the effects of the expected Level A harassment and Level B harassment take on reproduction and survival, see the applicable subsections in the *Analysis and Negligible Impact Determination* section of the 2018 HSTT final rule (83 FR 66977–67018; also incorporated by reference in the 2020 HSTT final rule).

Serious Injury or Mortality

Based on the information and methods discussed in the Estimated Take of Marine Mammals section (which are identical to those used in the 2018 HSTT final rule for explosives and revised for vessel strike), NMFS is authorizing five mortalities of large whales due to vessel strike over the 7-year period of this rulemaking, two more strikes than what was authorized in the 2018 HSTT final rule and 2020 HSTT final rule. Across the 7-year duration of the rule, take of an annual average of 0.57 gray whales (Eastern North Pacific stock) and fin whales (CA/OR/WA stock), an annual average of 0.29 humpback whales (Hawaii stock) and an annual average of 0.14 blue whales (Eastern North Pacific stock), sei whales (Eastern North Pacific stock) and humpback whales (Mainland Mexico-CA/OR/WA stock, Mexico DPS), as described in table 7 (*i.e.*, one, two, or four take(s) over 7 years divided by seven to get the annual number) could occur and are authorized.

TABLE 10—SUMMARY INFORMATION RELATED TO MORTALITIES REQUESTED FOR VESSEL STRIKE, 2018–2025

Species (stock)	Stock abundance (Nbest) *	Annual authorized take by serious injury or mortality ¹	Total annual M/ SI * ²	Fisheries interactions (Y/N); annual rate of M/SI from fisheries interactions *	Annual rate of M/SI from vessel collision *	PBR *	Residual PBR (PBR minus annual M/SI) ³	Stock trend * ⁴	Recent UME (Y/N); number and year (since 2007)
Fin whale (CA/OR/WA stock).	11,065	0.57	≥43.4	Y; ≥0.41	Y, 43	80	36.6	↑	N
Gray whale (Eastern North Pacific stock).	26,960	0.57	131	Y, 9.3	Y, 1.8	801	670	⁵ ↑	Y; 690; 2019
Humpback whale (Mainland Mexico-CA/OR/WA stock, Mexico DPS).	3,477	0.14	22	Y; 11.4	⁶ Y, 10.15	65	⁷ 43	Unknown	N
Humpback whale (Hawaii stock).	11,278	0.29	27.09	Y; 8.39	⁸ Y, 10.59	127	99.91	Unknown	Y; 52; 2015

* Presented in the 2023 final SARs.

¹ This column represents the annual take by serious injury or mortality (M/SI) by vessel collision and was calculated by the number of mortalities authorized divided by 7 years (the length of the rule and LOAs).

² This column represents the total number of incidents of M/SI that could potentially accrue to the specified species or stock. This number comes from the SAR, but deducts the takes accrued from either Navy strikes or NMFS' Southwest Fisheries Science Center (SWFSC) takes in the SARs to ensure not double-counted against PBR. However, for these species, there were no takes from either other Navy activities or SWFSC in the SARs to deduct that would be considered double-counting.

³ This value represents the calculated PBR less the average annual estimate of ongoing anthropogenic mortalities (*i.e.*, total annual human-caused M/SI, which is presented in the SARs).

⁴ See relevant SARs for more information regarding stock status and trends.

⁵ The Pacific 2023 SAR indicates that the stock trend is increasing. However, recent (2023–2024) surveys conducted by NMFS' Southwest Fisheries Science Center indicated that the estimated total abundance of gray whales during the 2023–2024 southbound migration was 19,260, though the authors note that this stock has historically shown a pattern of population growth and decline that has not impacted the population in the long term (Eguchi *et al.* 2024).

⁶ Vessel strike of the Mainland Mexico-CA/OR/WA stock was calculated by applying a prorated portion of humpback whale strikes modeled by Rockwood *et al.* (2017) to this stock.

⁷ For this stock, PBR is currently set at 43 for U.S. waters and 65 for the stock's entire range. As the HSTT Study Area extends beyond U.S. waters and activities have the potential to impact the entire stock, we present the analysis using the PBR for the stock's entire range.

⁸ Annual vessel strike for this stock reported in the 2023 final SAR was calculated by summing vessel strike data from Hawaii, Alaska, and Washington. All observed strikes in Hawaii were assigned to the Hawaii stock, and a portion of observed strikes in Alaska were assigned to the Hawaii stock. Vessel strike of the Hawaii stock in Washington waters was calculated by applying a prorated portion of humpback whale strikes modeled by Rockwood *et al.* (2017) to the Hawaii stock.

The Navy also requested a small number of takes by M/SI from explosives in the 2017 Navy application. To calculate the annual average of mortalities for explosives in table 11, we used the same method as described for vessel strikes. The annual average is the total number of takes over 7 years divided by seven. Specifically,

NMFS is authorizing the following M/SI takes from explosives: five California sea lions and eight short-beaked common dolphins over the 7-year period (therefore 0.71 mortalities annually for California sea lions and 1.14 mortalities annually for short-beaked common dolphin), as described in table 11. As this annual number is the

same as that analyzed and authorized in the 2020 HSTT final rule, and no other relevant information about the status, abundance, or effects of mortality on each species or stock has changed, the analysis of the effects of explosives is identical to that presented in the 2020 HSTT final rule.

TABLE 11—SUMMARY INFORMATION RELATED TO MORTALITIES FROM EXPLOSIVES, 2018–2025

Species (stock)	Stock abundance (nbest) *	Annual authorized take by serious injury or mortality ¹	Total annual M/SI * ²	Fisheries interactions (Y/N); annual rate of M/SI from fisheries interactions *	PBR *	SWFSC authorized take (annual) ³	Residual PBR-PBR minus annual M/SI and SWFSC ⁴	Stock trend * ⁵	UME (Y/N); number and year
California sea lion (U.S. stock)	257,606	0.71	≥321	Y; ≥197	14,011	6	13,684	↑	N
Short-beaked common dolphin (CA/OR/WA stock).	1,056,308	1.14	≥30.5	Y; ≥30.5	8,889	2.8	8,855.7	unknown	N

* Presented in the 2023 SARs.

¹ This column represents the annual take by serious injury or mortality (M/SI) during explosive detonations and was calculated by the number of mortalities planned for authorization divided by 7 years (the length of the rule and LOAs).

² This column represents the total number of incidents of M/SI that could potentially accrue to the specified species or stock. This number comes from the SAR.

³ This column represents annual take authorized through NMFS' SWFSC rulemaking/LOAs (86 FR 3840, January 15, 2021).

⁴ This value represents the calculated PBR less the average annual estimate of ongoing anthropogenic mortalities (*i.e.*, total annual human-caused M/SI column and the annual authorized take from the SWFSC column. In the case of California sea lion the M/SI column (321) and the annual authorized take from the SWFSC (6) were subtracted from the calculated PBR of 14,011. In the case of short-beaked common dolphin the M/SI column (30.5) and the annual authorized take from the SWFSC (2.8) were subtracted from the calculated PBR of 8,889.

⁵ See relevant SARs for more information regarding stock status and trends.

See the *Serious Injury or Mortality* subsection in the *Analysis and Negligible Impact Determination* section of the 2018 HSTT final rule (83 FR 66985–66993, December 27, 2018) for detailed discussions of the impacts of M/SI, including a description of how the agency uses the PBR metric and other factors to inform our analysis and an analysis of the impacts on each species and stock for which M/SI is

authorized, including the relationship of potential mortality for each species to the insignificance threshold and residual PBR, except as updated below.

Stocks With M/SI Below the Insignificance Threshold

As noted in the *Serious Injury or Mortality* subsection of the *Analysis and Negligible Impact Determination* section in the 2018 HSTT final rule and 2020

HSTT final rule, for a species or stock with incidental M/SI less than 10 percent of residual PBR, we consider M/SI from the specified activities to represent an insignificant incremental increase in ongoing anthropogenic M/SI that alone (*i.e.*, in the absence of any other take and barring any other unusual circumstances) will clearly not adversely affect annual rates of recruitment and survival. In this case, as

shown in table 10 and table 11, the following species or stocks have potential or estimated M/SI from vessel strike and explosive takes, respectively, and authorized below their insignificance threshold: fin whale (CA/OR/WA stock), gray whale (Eastern North Pacific stock), humpback whale (Hawaii stock and Mainland Mexico-CA/OR/WA stock), California sea lion (U.S stock), and short-beaked common dolphin (CA/OR/WA stock). While the authorized M/SI of gray whales (Eastern North Pacific stock) is below the insignificance threshold, because of the recent UME, we further address how the authorized M/SI and the UME inform the negligible impact determination immediately below. For the other five stocks with authorized M/SI below the insignificance threshold, there are no other known factors, information, or unusual circumstances that indicate anticipated M/SI below the insignificance threshold could have adverse effects on annual rates of recruitment or survival and they are not discussed further. For the remaining stocks with anticipated potential M/SI above the insignificance threshold, how that M/SI compares to residual PBR, as well as additional factors, as appropriate, are discussed below as well.

Gray Whales (Eastern North Pacific Stock)

The estimated and authorized lethal take of gray whale (Eastern North Pacific stock) is well below the insignificance threshold (0.57 as compared to a residual PBR of 670). Nonetheless, we consider here how the 2019–2023 West Coast Gray Whale UME informs our negligible impact determination. Strandings of eastern North Pacific gray whales occurred in the United States, Canada and Mexico along the west coast of North America. They occurred in wintering, migratory, and feeding areas. Stranding rates have returned back to normal and expected levels, and the prevalence of thin live or thin dead whales has also decreased. The Investigative Team concluded localized ecosystem changes, including both access to and quality of prey, in the northern Bering and Chukchi seas caused the UME. These changes contributed to the poor nutritional condition observed in live whales in the wintering areas of Mexico and dead stranded gray whales in all three countries. This malnutrition led to increased mortality during the whales' annual northward migration (from Mexico to Alaska) and decreased production of calves. This resulted in an overall decline in population

abundance. Because of the abundance and residual PBR of this stock, as well as the fact that the UME is closed and increased mortality stopped in late 2023 (with peak strandings ending in December 2020), this UME is not expected to have any impacts on individuals during the period of this final rule, nor is it thought to have had impacts on the population rate when it was occurring that would influence our evaluation of the effects of the mortality authorized on the stock.

Stocks with M/SI Above the Insignificance Threshold

Blue Whale (Eastern North Pacific Stock)

For blue whales (Eastern North Pacific stock), PBR is currently set at 4.1 and the total annual M/SI is estimated at greater than or equal to 18.6, yielding a residual PBR of – 14.5. This is slightly higher than the 2020 HSTT final rule (– 16.7) and 2023 HSTT proposed rule (– 15.4). NMFS authorizes one M/SI for the Navy over the 7-year duration of the rule (indicated as 0.14 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival), which means that residual PBR is exceeded by 14.5. However, as described in the 2018 and 2020 rules, given that the negligible impact determination is based on the assessment of take of the activity being analyzed, when total annual mortality from human activities is higher, but the impacts from the specific activity being analyzed are very small, NMFS may still find the impact of the authorized take from a specified activity to be negligible even if total human-caused mortality exceeds PBR if the authorized mortality is less than 10 percent of PBR and management measures are being taken to address serious injuries and mortalities from the other activities causing mortality (*i.e.*, other than the specified activities covered by the incidental take authorization in consideration). When those considerations are applied here, the authorized lethal take (0.14 annually) of blue whales from the Eastern North Pacific stock is less than 10 percent of PBR (which is 4.1), and there are management measures in place to address M/SI from activities other than those the Navy is conducting (as discussed below). Perhaps more importantly, the available data suggests that the current number of vessel strikes is not likely to have an adverse impact on the population, despite the fact that it exceeds PBR, with the Navy's minimal additional mortality of one

whale in the 7 years not creating the likelihood of adverse impact. Immediately below, we explain the information that supports our finding that the Navy's authorized M/SI is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.*, harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the stock-specific conclusion sections.

As discussed in the 2018 HSTT final rule and the 2020 HSTT final rule, the 2018 draft SAR and the more recent SARs rely on a new method to estimate annual deaths by vessel strike utilizing an encounter theory model that combined species distribution models of whale density, vessel traffic characteristics, and whale movement patterns obtained from satellite-tagged animals in the region to estimate encounters that would result in mortality (Rockwood *et al.* 2017). The model predicts 18 annual mortalities of blue whales from vessel strikes, which, with the additional M/SI of 1.54 from fisheries interactions, results in the current estimate of residual PBR being – 15.4. Although NMFS' Permits and Conservation Division in the Office of Protected Resources has independently reviewed the vessel strike model and its results and agrees that it is appropriate for estimating blue whale mortality by vessel strike on the U.S. West Coast, for analytical purposes we also note that if the historical method were used to predict vessel strike (*i.e.*, using observed mortality by vessel strike, or 0.6, instead of 18), then total human-caused mortality including the Navy's potential take would not exceed PBR. We further note that the authors (Rockwood *et al.* 2017) do not suggest that vessel strike suddenly increased to 18 recently. In fact, the model is not specific to a year, but rather offers a generalized prediction of vessel strike off the U.S. West Coast. Therefore, if the Rockwood *et al.* (2017) model is an accurate representation of vessel strike, then similar levels of vessel strike have been occurring in past years as well. Put another way, if the model is correct, for some number of years total-human-caused mortality has been significantly underestimated and PBR has been similarly exceeded by a notable amount, and yet, the Eastern North Pacific stock of blue whales remains stable nevertheless.

NMFS' 2023 SAR states that the current population trend is unknown, though there may be evidence of a population size increase since the 1990s. The SAR further cites to Monnahan *et al.* (2015), which used a population dynamics model to estimate that the Eastern North Pacific blue whale population was at 97 percent of carrying capacity in 2013 and to suggest that the observed lack of a population increase since the early 1990s was explained by density dependence, not impacts from vessel strike. This would mean that this stock of blue whales shows signs of stability and is not increasing in population size because the population size is at or nearing carrying capacity for its available habitat. In fact, we note that this population has maintained this status throughout the years that the Navy has consistently tested and trained at similar levels (with similar vessel traffic) in areas that overlap with blue whale occurrence, which would be another indicator of population stability.

Monnahan *et al.* (2015) modeled vessel numbers, vessel strikes, and the population of the Eastern North Pacific blue whale population from 1905 out to 2050 using a Bayesian framework to incorporate informative biological information and assign probability distributions to parameters and derived quantities of interest. The authors tested multiple scenarios with differing assumptions, incorporated uncertainty, and further tested the sensitivity of multiple variables. Their results indicated that there is no immediate threat (*i.e.*, through 2050) to the population from any of the scenarios tested, which included models with 10 and 35 strike mortalities per year. Broadly, the authors concluded that, unlike other blue whale stocks, the Eastern North Pacific blue whales have recovered from 70 years of whaling and are in no immediate threat from vessel strikes. They further noted that their conclusion conflicts with the depleted and strategic designation under the MMPA as well as PBR specifically.

As discussed, we also take into consideration management measures in place to address M/SI caused by other activities. The Channel Islands NMS staff coordinates, collects, and monitors whale sightings in and around the Vessel Speed Reduction (VSR) zones and the Channel Islands NMS region. Redfern *et al.* (2013) note that the most risky area for blue whales is the Santa Barbara Channel, where shipping lanes intersect with common feeding areas. The seasonally established Southern California VSR zone spans from Point

Arguello to Dana Point, including the Traffic Separation Schemes in the Santa Barbara Channel and San Pedro Channel. Vessels transiting the area from May 1 through December 15, 2023 are recommended to exercise caution and voluntarily reduce speed to 10 kn (18.5 km per hour) or less for blue, humpback, and fin whales. (Note this is an expanded timeframe from the Whale Advisory Zone discussed in the 2020 HSTT final rule, which spanned June through November, though the effective period could change in future years.) Channel Island NMS observers collect information from aerial surveys conducted by NOAA, the U.S. Coast Guard, California Department of Fish and Game, and U.S. Navy chartered aircraft. Information on seasonal presence, movement, and general distribution patterns of large whales is shared with mariners, NMFS Office of Protected Resources, U.S. Coast Guard, California Department of Fish and Game, the Santa Barbara Museum of Natural History, the Marine Exchange of Southern California, and whale scientists. Real time and historical whale observation data collected from multiple sources can be viewed on the Point Blue Whale Database.

In this case, 0.14 M/SI means one mortality in 1 of the 7 years and zero mortalities in 6 of those 7 years. Therefore, the Navy would not be contributing to the total human-caused mortality at all in 6 of the 7, or 85.7 percent, of the years covered by this rulemaking. That means that even if a blue whale were to be struck, in 6 of the 7 years there could be no effect on annual rates of recruitment or survival from Navy-caused M/SI. Additionally, the loss of a male would have far less, if any, effect on population rates and absent any information suggesting that one sex is more likely to be struck than another, we can reasonably assume that there is a 50 percent chance that the single strike authorized by this rulemaking would be a male, thereby further decreasing the likelihood of impacts on the population rate. In situations like this where potential M/SI is fractional, consideration must be given to the lessened impacts anticipated due to the absence of M/SI in 6 of the 7 years and the fact that the single strike could be a male. Lastly, we reiterate that PBR is a conservative metric and also not sufficiently precise to serve as an absolute predictor of population effects upon which mortality caps would appropriately be based. This is especially important given the minor difference between zero and one across the 7-year period covered by this

rulemaking, which is the smallest distinction possible when considering mortality. As noted above, Wade *et al.* (1998), authors of the paper from which the current PBR equation is derived, note that "Estimating incidental mortality in 1 year to be greater than the PBR calculated from a single abundance survey does not prove the mortality will lead to depletion; it identifies a population worthy of careful future monitoring and possibly indicates that mortality-mitigation efforts should be initiated." The information included here indicates that the current population trend of this blue whale stock is unknown but likely approaching carrying capacity and has leveled off because of density-dependence, not human-caused mortality, in spite of what might be otherwise indicated from the calculated PBR. Further, potential (and authorized) M/SI is below 10 percent of PBR and management actions are in place to minimize vessel strike from other vessel activity in one of the highest-risk areas for strikes. Based on the presence of the factors described above, we do not expect lethal take from Navy activities, alone, to adversely affect Eastern North Pacific blue whales through effects on annual rates of recruitment or survival. Nonetheless, the fact that total human-caused mortality exceeds PBR necessitates close attention to the remainder of the impacts (*i.e.*, harassment) on the Eastern North Pacific stock of blue whales from the Navy's activities to ensure that the total authorized takes have a negligible impact on the species or stock. Therefore, this information will be considered in combination with our assessment of the impacts of authorized harassment takes in the *Group and Species-Specific Analyses* section that follows.

Sei Whale (Eastern North Pacific Stock)

For sei whales (Eastern North Pacific stock), PBR is currently set at 1.25. The total annual M/SI is estimated at greater than or equal to 0 in the 2023 SAR, yielding a residual PBR of 1.25. NMFS authorizes one M/SI for the Navy over the 7-year duration of the rule (indicated as 0.14 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival), which means that residual PBR is 1.11.

We acknowledge that the 2023 vessel strike by the U.S. Navy could have been of a sei whale or a CA/OR/WA fin whale, and this strike is not quantitatively included in this PBR analysis (nor is it quantitatively included in the PBR analysis for CA/

OR/WA fin whale if both of the 2021 U.S. Navy strikes were fin whales) which relies on the 2023 SARs. However, consideration of the 2023 strike would not change the total M/SI which NMFS compares to PBR, as the 2023 U.S. Navy strike occurred outside of the time period considered in the vessel strike analysis in the 2023 SAR. Therefore, while we acknowledge the 2023 U.S. Navy strike, in the quantitative analysis it is treated the same as other non-U.S. Navy strikes that occurred outside of the timeframe reflected in the total M/SI.

Immediately below, we explain the information that supports our finding that the Navy's authorized M/SI is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.*, harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the stock-specific conclusion sections.

Of note, management measures are in place to address M/SI caused by other activities. The Channel Islands NMS staff coordinates, collects, and monitors whale sightings in and around the VSR zones and the Channel Islands NMS region. The seasonally established Southern California VSR zone spans from Point Arguello to Dana Point, including the Traffic Separation Schemes in the Santa Barbara Channel and San Pedro Channel. Vessels transiting the area from May 1 through December 15, 2023 are recommended to exercise caution and voluntarily reduce speed to 10 kn (18.5 km per hour) or less. While the VSR zone is aimed at reducing risk of fatal vessel strike of blue, humpback, and fin whales, this measure is also anticipated to reduce risk to sei whales (note, this is an expanded timeframe from the Whale Advisory Zone discussed in the 2020 HSTT final rule, which spanned June through November, though the effective period could change in future years). Channel Island NMS observers collect information from aerial surveys conducted by NOAA, the U.S. Coast Guard, California Department of Fish and Game, and U.S. Navy chartered aircraft. Information on seasonal presence, movement, and general distribution patterns of large whales is shared with mariners, NMFS Office of Protected Resources, U.S. Coast Guard, California Department of Fish and Game, the Santa Barbara Museum of Natural History, the Marine Exchange of

Southern California, and whale scientists. Real time and historical whale observation data collected from multiple sources can be viewed on the Point Blue Whale Database.

Further, as stated in the 2023 SAR, the California swordfish drift gillnet fishery is the most likely U.S. fishery to interact with Eastern North Pacific sei whales, though there are zero estimated annual takes from this fishery given no observed entanglements from 1990–2021 across 9,246 observed fishing sets (Carretta *et al.* (2022)). NMFS established the Pacific Offshore Cetacean Take Reduction Team in 1996 and prepared an associated Plan (PCTRP) to reduce the risk of M/SI via fisheries interactions. In 1997, NMFS published final regulations formalizing the requirements of the PCTRP, including the use of pingers following several specific provisions and the employment of Skipper education workshops.

In this case, 0.14 M/SI means one authorized mortality in 1 of the 7 years and zero authorized mortalities in 6 of those 7 years. Therefore, the Navy's authorized take would not be contributing to the total human-caused mortality at all in 6 of the 7, or 85.7 percent, of the years covered by this rulemaking. That means that even if a sei whale were to be struck, in 6 of the 7 years there could be no effect on annual rates of recruitment or survival from Navy-caused M/SI. Additionally, the loss of a male would have far less, if any, effect on population rates and absent any information suggesting that one sex is more likely to be struck than another, we can reasonably assume that there is a 50 percent chance that the single strike authorized by this rulemaking would be a male, thereby further decreasing the likelihood of impacts on the population rate. In situations like this where potential M/SI is fractional, consideration must be given to the lessened impacts anticipated due to the absence of M/SI in 6 of the 7 years and the fact that the single strike could be a male.

Lastly, we reiterate that PBR is a conservative metric and also not sufficiently precise to serve as an absolute predictor of population effects upon which mortality caps would appropriately be based. This is especially important given the minor difference between zero and one across the 7-year period covered by this rulemaking, which is the smallest distinction possible when considering mortality. As noted above, Wade *et al.* (1998), authors of the paper from which the current PBR equation is derived, note that “Estimating incidental

mortality in 1 year to be greater than the PBR calculated from a single abundance survey does not prove the mortality will lead to depletion; it identifies a population worthy of careful future monitoring and possibly indicates that mortality-mitigation efforts should be initiated.” Even after qualitatively considering the possibility that the whale struck by Navy in 2023 was a sei whale, and based on the presence of the factors described above, we do not expect one authorized lethal take from Navy activities, alone, to adversely affect Eastern North Pacific sei whales through effects on annual rates of recruitment or survival. This information will be considered in combination with our assessment of the impacts of authorized harassment takes in the *Group and Species-Specific Analyses* section that follows.

Group and Species-Specific Analyses

In addition to broader analyses of the impacts of the Navy's activities on mysticetes, odontocetes, and pinnipeds, the 2018 HSTT final rule contained detailed analyses of the effects of the Navy's activities in the HSTT Study Area on each affected species and stock and was updated, as appropriate, in the 2020 HSTT final rule. All of that information and analyses remain applicable and valid for our analyses of the effects of the same Navy activities on the same species and stocks, with the exception of humpback whale, for which the stock structure has been revised, and NMFS has updated its analyses accordingly for this final rule. See the *Group and Species-Specific Analyses* subsection in the *Analysis and Negligible Impact Determination* section of the 2018 HSTT final rule (83 FR 66993–67018). In addition, apart from the additional authorized incidental take by vessel strike of two large whales, the resulting changes to the average annual mortality estimates discussed above, and the revised humpback whale stock structure, no new information has been received since the publication of the 2020 HSTT final rule that significantly changes the analyses of the effects of the Navy's activities on each species and stock presented in the 2020 HSTT final rule (new information regarding vessel strike, the potential impact of the gray whale UME (now closed), and the revised humpback whale stock structure were discussed earlier in the rule).

In the discussions below, the estimated Level B harassment takes represent instances of take, not the number of individuals taken (the much lower and less frequent Level A harassment takes are far more likely to

be associated with separate individuals), and in many cases, some individuals are expected to be taken more than one time while in other cases, a portion of individuals will not be taken at all. Below, we compare the total take numbers (including PTS, TTS, and behavioral disturbance) for species or stocks to their associated abundance estimates to evaluate the magnitude of impacts across the species or stock and to individuals. Specifically, when an abundance percentage comparison is below 100, it means that percentage or less of the individuals in the stock will be affected (*i.e.*, some individuals will not be taken at all), that the average for those taken is 1 day per year, and that we would not expect any individuals to be taken more than a few times in a year. When it is more than 100 percent, it means there will definitely be some number of repeated takes of individuals. For example, if the percentage is 300, the average would be each individual is taken on 3 days in a year if all were taken, but it is more likely that some number of individuals will be taken more than three times and some number of individuals fewer times or not at all. While it is not possible to know the maximum number of days across which individuals of a stock might be taken, in acknowledgement of the fact that it is more than the average, for the purposes of this analysis, we assume a number approaching twice the average. For example, if the percentage of take compared to the abundance is 800, we estimate that some individuals might be taken as many as 16 times. Those comparisons are included in the sections below. For some stocks, these numbers have been adjusted slightly (with these adjustments being in the single digits) so as to more consistently apply this approach, but these minor changes did not change the analysis or findings.

To assist in understanding what this analysis means, we clarify a few issues related to estimated takes and the

analysis here. An individual that incurs a PTS or TTS take may sometimes, for example, also be subject to behavioral disturbance at the same time. As described in the *Harassment* subsection of the *Analysis and Negligible Impact Determination* section of the 2018 HSTT final rule, the degree of PTS, and the degree and duration of TTS, expected to be incurred from the Navy's activities are not expected to impact marine mammals such that their reproduction or survival could be affected. Similarly, data do not suggest that a single instance in which an animal accrues PTS or TTS and is also subjected to behavioral disturbance would result in impacts to reproduction or survival. Alternately, we recognize that if an individual is subjected to behavioral disturbance repeatedly for a longer duration and on consecutive days, effects could accrue to the point that reproductive success is jeopardized (as discussed below in the stock-specific summaries). Accordingly, in analyzing the number of takes and the likelihood of repeated and sequential takes (which could result in reproductive impacts), we consider the total takes, not just the Level B harassment takes by behavioral disturbance, so that individuals potentially exposed to both threshold shift and behavioral disturbance are appropriately considered. We note that the same reasoning applies with the potential addition of behavioral disturbance to tissue damage from explosives, the difference being that we do already consider the likelihood of reproductive impacts whenever tissue damage occurs. Further, the number of Level A harassment takes by either PTS or tissue damage are so low compared to abundance numbers that it is considered highly unlikely that any individual would be taken at those levels more than once.

Having considered all of the information and analyses previously presented in the 2018 HSTT final rule, including the *Group and Species-*

Specific Analyses discussions organized by the different groups and species, below we present tables showing instances of total take as a percentage of stock abundance for each group, updated with the new vessel strike calculations and humpback stock structure. We then summarize the information for each species or stock, considering the analysis from the 2018 HSTT final rule, 2020 HSTT final rule, and any new analysis. The analyses below in some cases address species collectively if they occupy the same functional hearing group (*i.e.*, low, mid, and high-frequency cetaceans and pinnipeds in water), share similar life history strategies, and/or are known to behaviorally respond similarly to acoustic stressors. Because some of these groups or species share characteristics that inform the impact analysis similarly, it would be duplicative to repeat the same analysis for each species or stock. In addition, animals belonging to each stock within a species typically have the same hearing capabilities and behaviorally respond in the same manner as animals in other stocks within the species.

Mysticetes

In tables 12 and 13 below for mysticetes, we indicate the total annual mortality, Level A harassment, and Level B harassment, and a number indicating the instances of total take as a percentage of abundance. Tables 12 and 13 have been updated from tables 18 and 19 in the 2020 HSTT final rule, as appropriate, with the 2023 final SARs and updated information on mortality, as discussed above. For additional information and analysis supporting the negligible-impact analysis, see the *Mysticetes* discussion in the *Group and Species-Specific Analyses* section of the 2018 HSTT final rule, all of which remains applicable to this rule unless specifically noted.

TABLE 12—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR MYSTICETES IN THE HRC PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)				Total takes ^a		Abundance		Instance of total take as percent of abundance		
		Level B harassment		Level A harassment		Total takes (entire study area)	Takes (within Navy EEZ)	Total Navy abundance inside and outside of EEZ (HRC)	Within EEZ Navy abundance (HRC)	Total take as percentage of total Navy abundance (HRC)	EEZ take as percentage of Navy EEZ abundance (HRC)	
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage							Mortality ^b
Blue whale	Central North Pacific	15	33	0	0	0	48	40	43	33	112	121

TABLE 12—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR MYSTICETES IN THE HRC PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE—Continued

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes ^a		Abundance		Instance of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality ^b	Total takes (entire study area)	Takes (within Navy EEZ)	Total Navy abundance inside and outside of EEZ (HRC)	Within EEZ Navy abundance (HRC)	Total take as percentage of total Navy abundance (HRC)	EEZ take as percentage of Navy EEZ abundance (HRC)
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage							
Bryde's whale.	Hawaii	40	106	0	0	0	146	123	108	89	135	138
Fin whale	Hawaii	21	27	0	0	0	48	41	52	40	92	103
Humpback whale.	Hawaii	2,837	6,289	3	0	0.29	9,129	7,389	5,078	4,595	180	161
Minke whale.	Hawaii	1,233	3,697	2	0	0	4,932	4,030	3,652	2,835	135	142
Sei whale	Hawaii	46	121	0	0	0	167	135	138	107	121	126

Note: For the Hawaii take estimates, we compare predicted takes to abundance estimates generated from the same underlying density estimates (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule), both in and outside of the U.S. EEZ. Because the portion of the Navy's study area inside the U.S. EEZ is generally concomitant with the area used to generate the abundance estimates in the SARs, and the abundance predicted by the same underlying density estimates is the preferred abundance to use, there is no need to separately compare the take to the SARs abundance estimate.

^a Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

^b The annual mortality of 0.29 is the result of no more than two mortalities over the course of 7 years from vessel strikes as described above in the *Estimated Take of Marine Mammals* section.

TABLE 13—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR MYSTICETES IN THE SOCAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes ^a	Abundance		Instance of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality ^b	Total takes (entire study area)	Navy abundance in action area (SOCAL)	NMFS SARs abundance	Total take as percentage of total Navy abundance in action area	Total take as percentage of total SAR abundance
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage

Sei whale	Eastern North Pacific.	27	52	0	0	0.14	79	3	864	2,633	9
Gray whale	Eastern North Pacific.	1,316	3,355	7	0	0.57	4,679	193	26,960	2,424	17
Gray whale	Western North Pacific.	2	4	0	0	0	6	0	290	0	2

Note: For the SOCAL take estimates, because of the manner in which the Navy study area overlaps the ranges of many MMPA stocks (i.e., a stock may range far north to Washington state and beyond and abundance may only be predicted within the U.S. EEZ, while the Navy study area is limited to Southern California and northern Mexico, but extends beyond the U.S. EEZ), we compare predicted takes to both the abundance estimates for the study area, as well as the SARs (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule).

^a Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

^b The annual mortality of 0.14 is the result of no more than one mortality over the course of 7 years from vessel strikes as described above in the *Estimated Take of Marine Mammals* section. The annual mortality of 0.57 is the result of no more than four mortalities over the course of 7 years from vessel strikes.

^c In the 2020 HSTT final rule, NMFS reported a Navy abundance in Action Area (SOCAL) of 247 CA/OR/WA humpback whales. As explained in more detail in the *Authorized Take From Vessel Strikes and Explosives by Serious Injury or Mortality* section, NMFS estimates that approximately 30 percent of the humpback whales off the coast of California may be from the Central America DPS with the remaining 70 percent are expected to be from the Mexico DPS. Therefore, of the estimated 247 humpback whales in SOCAL, NMFS anticipates that 74 would be of the Central America/Southern Mexico-CA/OR/WA stock (Central America DPS), and 173 would be of the Mainland Mexico-CA/OR/WA stock (Mexico DPS).

Below we compile and summarize the information that supports our determination that the Navy's activities will not adversely affect any species or stocks through effects on annual rates of recruitment or survival for any of the affected mysticete species and stocks.

Blue Whale (Eastern North Pacific Stock)

Blue whales are listed as endangered under the ESA, and the current population trend for the Eastern North Pacific stock is unknown. We further note that this stock was originally listed under the ESA as a result of the impacts from commercial whaling, which is no longer affecting the species. NMFS authorizes one mortality over the 7 years covered by this rulemaking or 0.14 mortality annually. With the addition of this 0.14 annual mortality, residual PBR is exceeded, resulting in the total human-caused mortality exceeding PBR by 14.5. However, as described in more detail in the *Serious Injury or Mortality* section above, when total human-caused mortality exceeds PBR, we consider whether the incremental addition of a small amount of authorized mortality from the specified activity may still result in a negligible impact, in part by identifying whether it is less than 10 percent of PBR. In this case, the authorized mortality is well below 10 percent of PBR, management measures are in place to reduce mortality from other sources, and the incremental addition of a single mortality over the course of the 7-year Navy rule is not expected to, alone, lead to adverse impacts on the stock through effects on annual rates of recruitment or survival.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 253 and 105 percent, respectively (table 13). Given the range of blue whales, this information suggests that only some portion of individuals in the stock are likely impacted, but that there will likely be some repeat exposure (maybe 5 or 6 days within a year) of some subset of individuals that spend extended time within SOCAL. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Additionally, the Navy implements time/area mitigation in

SOCAL in the majority of the BIAs identified by Calambokidis *et al.* (2015). These areas overlap a portion of the blue whale feeding BIAs (parent and child; see Harrison *et al.* 2023) identified in Calambokidis *et al.* (2024) and will reduce the severity of impacts to blue whales by reducing interference in feeding that could result in lost feeding opportunities or necessitate additional energy expenditure to find other good opportunities. Regarding the severity of TTS takes, we have explained in the 2018 HSTT final rule that they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with blue whale communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For similar reasons (as described in the 2018 HSTT final rule) the single estimated Level A harassment take by PTS for this stock is unlikely to have any effect on the reproduction or survival of that one individual, even if it were to be experienced by an animal that also experiences one or more Level B harassment takes by behavioral disturbance.

Altogether, only a small portion of the stock is anticipated to be impacted and any individual blue whale is likely to be disturbed at a low-moderate level, with likely many animals exposed only once or twice and a subset potentially disturbed across 5 or 6 days but minimized in BIAs. This low magnitude and severity of harassment effects is not expected to result in impacts on the reproduction or survival of any individuals and, therefore, when combined with the authorized mortality (which our earlier analysis indicated will not, alone, have more than a negligible impact on this stock of blue whales), the total take is not expected to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Eastern North Pacific stock of blue whales.

Bryde's Whale (Eastern Tropical Pacific Stock)

Little is known about this stock or its status, and it is not listed under the ESA. No mortality or Level A harassment is anticipated or authorized. Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance is 3,154 percent; however,

the abundance upon which this percentage is based (1.3 whales from the Navy estimate, which is extrapolated from density estimates based on very few sightings) is clearly erroneous and the SAR does not include an abundance estimate because all of the survey data is outdated (table 13). However, the abundance in the early 1980s was estimated as 22,000 to 24,000, a portion of the stock was estimated at 13,000 in 1993, and the minimum number in the Gulf of California was estimated at 160 in 1990. Given this information and the fact that 41 total takes of Bryde's whales were estimated, this information suggests that only a small portion of the individuals in the stock are likely impacted, and few, if any, are likely taken over more than 1 day. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with Bryde's whale communication or other important low-frequency cues. Any associated lost opportunities and capabilities are not at a level that will impact reproduction or survival.

Altogether, only a small portion of the stock is anticipated to be impacted and any individual Bryde's whale is likely to be disturbed at a low-moderate level, with few, if any, individuals exposed over more than 1 day in the year. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, much less annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Eastern Tropical Pacific stock of Bryde's whales.

Fin Whale (CA/OR/WA Stock)

The SAR identifies this stock as “increasing,” even though the larger species is listed as endangered under the ESA. NMFS authorizes four mortalities over the 7 years covered by this rulemaking, or 0.57 mortality annually. The addition of this 0.57 annual mortality still leaves the total human-caused mortality well under residual PBR.

We acknowledge the 2021 vessel strike of two fin whales by the Royal Australian Navy, and that the 2021 and 2023 vessel strikes by the U.S. Navy could have been CA/OR/WA fin whales. While the Royal Australian Navy strikes are not quantitatively included in the estimated take by vessel strike, even if they were, and if we presumed that the 2021 and 2023 U.S. Navy strikes were all fin whales, M/SI of this stock would still fall well below PBR (80).

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 613 and 20 percent, respectively (table 13). This information suggests that only some portion (less than 25 percent) of individuals in the stock are likely impacted but that there is likely some repeat exposure (perhaps up to 12 days within a year) of some subset of individuals that spend extended time within the SOCAL complex. Some of these takes could occur on a few sequential days for some small number of individuals, for example, if they resulted from a multi-day exercise on a range while individuals were in the area for multiple days feeding. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Additionally, Calambokidis *et al.* (2024) identifies feeding BIAs for fin whales in SOCAL. The Navy implements time/area mitigation in SOCAL in blue whale BIAs identified by Calambokidis *et al.* (2015), and fin whales are known to sometimes feed in some of the same areas. Additionally, these mitigation areas designed for blue whales overlap a portion of the fin whale feeding BIAs (parent and child; see Harrison *et al.* 2023) identified by Calambokidis *et al.* (2024) which means fin whales could potentially accrue some benefits from the mitigation. Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with fin whale communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For similar reasons (as described in the 2018 HSTT final rule) the single estimated Level A

harassment take by PTS for this stock is unlikely to have any effects on the reproduction or survival of that one individual.

Altogether, this population is increasing, only a small portion of the stock is anticipated to be impacted, and any individual fin whale is likely to be disturbed at a low-moderate level, with the taken individuals likely exposed between 1 and 12 days, with a few individuals potentially taken on a few sequential days. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, and therefore, when combined with the authorized mortality (which our earlier analysis indicated will not, alone, have more than a negligible impact on this stock of fin whales), the total take is not expected to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the CA/OR/WA stock of fin whales.

Humpback Whale (Central America/Southern Mexico-CA/OR/WA Stock)

The SAR identifies this stock as increasing, though the growth rate is uncertain. Animals in this stock are of the Central America DPS which is designated as endangered under the ESA.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 1,184 and 59 percent, respectively (table 13). Given the range of humpback whales, this information suggests that only some portion of individuals in the stock are likely impacted but that there is likely some repeat exposure (perhaps up to 23 days within a year) of some subset of individuals that spend extended time within the SOCAL complex. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Some of these takes could occur on several sequential days for some small number of individuals, for example, if they resulted from a multi-day exercise on a range while individuals were in the

area for multiple days feeding. However, these amounts are still not expected to adversely impact reproduction or survival of any individuals.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with humpback whale communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. Altogether, only a small portion of the stock is anticipated to be impacted and any individual humpback whale is likely to be disturbed at a low-moderate level, with likely many animals exposed only once or twice and a subset potentially disturbed up to 23 days, but with no reason to think that more than a few of those days would be sequential. This low magnitude and severity of harassment effects is not expected to result in impacts on the reproduction or survival of any individuals and, therefore, the total take is not expected to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Central America/Southern Mexico-CA/OR/WA stock of humpback whales.

Humpback Whale (Mainland Mexico-CA/OR/WA Stock)

The status of this stock is unknown. Animals in this stock are of the Mexico DPS which is designated as threatened under the ESA. NMFS authorizes one mortality over the 7 years covered by this rulemaking, or 0.14 mortality annually. The addition of this 0.14 annual mortality still leaves the total human-caused mortality well under residual PBR.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 647 and 32 percent, respectively (table 13). Given the range of humpback whales, this information suggests that only some portion of individuals in the stock are likely impacted but that there is likely some repeat exposure (perhaps up to 13 days within a year) of some subset of individuals that spend extended time within the SOCAL complex. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between

minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Some of these takes could occur on several sequential days for some small number of individuals, for example, if they resulted from a multi-day exercise on a range while individuals were in the area for multiple days feeding. However, these amounts are still not expected to adversely impact reproduction or survival of any individuals.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with humpback whale communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For similar reasons (as described in the 2018 HSTT final rule) the single estimated Level A harassment take by PTS for this stock is unlikely to have any effects on the reproduction or survival of that one individual.

Altogether, only a small portion of the stock is anticipated to be impacted and any individual humpback whale is likely to be disturbed at a low-moderate level, with likely many animals exposed only once or twice and a subset potentially disturbed up to 13 days, but with no reason to think that more than a few of those days would be sequential. This low magnitude and severity of harassment effects is not expected to result in impacts on the reproduction or survival of any individuals and, therefore, when combined with the authorized mortality (which our earlier analysis indicated will not, alone, have more than a negligible impact on this stock of humpback whales), the total take is not expected to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the CA/OR/WA stock of humpback whales.

Minke Whale (CA/OR/WA Stock)

The status of this stock is unknown and it is not listed under the ESA. No mortality from vessel strike or tissue damage from explosive exposure is anticipated or authorized for this species. Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured

against both the Navy-estimated abundance and the SAR) is 568 and 101 percent, respectively (table 13). Based on the behaviors of minke whales, which often occur along continental shelves and sometimes establish home ranges along the West Coast, this information suggests that only a portion of individuals in the stock are likely impacted but that there is likely some repeat exposure (perhaps up to 11 days within a year) of some subset of individuals that spend extended time within the SOCAL complex. Some of these takes could occur on a few sequential days for some small number of individuals, for example, if they resulted from a multi-day exercise on a range while individuals were in the area for multiple days feeding. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with minke whale communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For similar reasons (as described in the 2018 HSTT final rule) the single estimated Level A harassment take by PTS for this stock is unlikely to have any effects on the reproduction or survival of that individual.

Altogether, only a portion of the stock is anticipated to be impacted and any individual minke whale is likely to be disturbed at a low-moderate level, with the taken individuals likely exposed between 1 and 11 days, with a few individuals potentially taken on a few sequential days. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, much less annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the CA/OR/WA stock of minke whales.

Sei Whale (Eastern North Pacific Stock)

The status of this stock is unknown, and sei whales are listed under the ESA. NMFS authorizes one mortality over the 7 years covered by this rulemaking or

0.14 mortality annually. The addition of this 0.14 annual mortality still leaves the total human-caused mortality under residual PBR. After additionally considering several qualitative factors described above, including that the 2023 strike could have been a sei whale (or fin whale), we do not expect one authorized lethal take from Navy activities, alone, to adversely affect Eastern North Pacific sei whales through effects on annual rates of recruitment or survival. No Level A harassment is anticipated or authorized.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 2,633 and 9 percent, respectively (table 13), however, the abundance upon which the Navy percentage is based (3 from the Navy estimate, which is extrapolated from density estimates based on very few sightings) is likely an underestimate of the number of individuals in the HSTT study Area, resulting in an overestimated percentage. Given this information and the large range of sei whales, and the fact that only 79 total Level B harassment takes of sei whales were estimated, it is likely that some very small number of sei whales would be taken repeatedly, potentially up to 15 days in a year (typically 2,633 percent would lead to the estimate of 52 days/year, however, given that there are only 79 sei whale total takes, we used the conservative assumption that five individuals might be taken up to 15 times, with the few remaining takes distributed among other individuals). Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Some of these takes could occur on a few sequential days for some small number of individuals, for example, if they resulted from a multi-day exercise on a range while individuals were in the area for multiple days feeding, however, these amounts are still not expected to adversely impact reproduction or survival of any individuals. Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with sei whale communication or other important low-frequency cues—and that

the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival.

Altogether, only a small portion of the stock is anticipated to be impacted and any individual sei whale is likely to be disturbed at a low-moderate level, with only a few individuals exposed over one to 15 days in a year, with no more than a few sequential days. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, and therefore, when combined with the authorized mortality (which our earlier analysis indicated will not, alone, have more than a negligible impact on this stock of sei whales), the total take is not expected to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Eastern North Pacific stock of sei whales.

Gray Whale (Eastern North Pacific Stock)

The Eastern North Pacific stock of gray whale is not ESA-listed and the SAR indicates that the stock is increasing. However, recent (2021–2022) surveys conducted by NMFS' Southwest Fisheries Science Center estimated that the population has declined to 16,650 whales, though the authors note that this stock has historically shown a pattern of population growth and decline that has not impacted the population in the long term (Eguchi *et al.* 2022). NMFS is authorizing four mortalities over the 7 years covered by this rulemaking, or 0.57 mortality annually. The addition of this 0.57 annual mortality still leaves the total human-caused mortality well under the insignificance threshold of residual PBR (670). We acknowledge that the 2021 vessel strikes by the U.S. Navy could have been Eastern North Pacific gray whales. If we presumed that the 2021 U.S. Navy strikes were both gray whales, M/SI of this stock would still fall well below PBR (801).

We also consider here how the 2019–2023 West Coast Gray Whale UME informs our negligible impact determination. Because of the abundance and residual PBR of this stock, as well as the fact that the UME is closed and increased mortality stopped in late 2023 (with peak strandings ending in December 2020), this UME is not expected to have any impacts on individuals during the period of this final rule, nor is it thought to have had impacts on the population

rate when it was occurring that would influence our evaluation of the effects of the mortality authorized on the stock.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 2,424 and 17 percent, respectively (table 13). (Note that in comparison to the recent Eguchi *et al.* 2024 abundance estimate, the number of estimated total instances of take compared to the abundance would be 24 percent.) This information suggests that only some small portion of individuals in the stock are likely impacted (less than 17 percent) but that there is likely some level of repeat exposure of some subset of individuals that spend extended time within the SOCAL complex. Typically 2,424 percent would lead to the estimate of 48 days/year, however, given that a large number of gray whales are known to migrate through the SOCAL complex and the fact that there are 4,679 total takes, we believe that it is more likely that a larger number of individuals will be taken one to a few times, while a small number staying in an area to feed for several days may be taken on 5–10 days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Some of these takes could occur on a couple of sequential days for some small number of individuals; however, these amounts are still not expected to adversely impact reproduction or survival of any individuals.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with gray whale communication or other important low-frequency cues and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, at the expected scale the seven estimated Level A harassment takes by PTS for gray whales are unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with

reproductive success or survival of any individuals.

Altogether, we have considered the impacts of the recent (now closed) gray whale UME, the Eastern North Pacific stock of gray whales is not endangered or threatened under the ESA. The SAR indicates that the stock is increasing. However, recent (2023–2024) surveys conducted by NMFS' Southwest Fisheries Science Center estimated that the population has declined since the most recent Eastern North Pacific gray whale SAR was published (Eguchi *et al.* 2024). Only a small portion of the stock is anticipated to be impacted and any individual gray whale is likely to be disturbed at a low-moderate level, with likely many animals exposed only once or twice and a subset potentially disturbed across 5 to 10 days. This low magnitude and severity of harassment effects is not expected to result in impacts to reproduction or survival for any individuals and, therefore, when combined with the authorized mortality of four whales over the 7 year period (which our earlier analysis indicated will not, alone, have more than a negligible impact on this stock of gray whales), the total take is not expected to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Eastern North Pacific stock of gray whales.

Gray Whale (Western North Pacific Stock)

The Western North Pacific stock of gray whales is reported as increasing in the 2023 final SAR but is listed as endangered under the ESA. No mortality or Level A harassment is anticipated or authorized. This stock is expected to incur the very small number of 6 Level B harassment takes (2 behavioral disruption and 4 TTS) to a stock with a SAR-estimated abundance of 290 (table 13). These takes will likely accrue to different individuals, the behavioral disturbances will be of a low-moderate level, and the TTS instances will be at a low level and short duration. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, much less to adversely affect this stock through impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Western North Pacific stock of gray whales.

Humpback Whale (Hawaii Stock)

The status of this stock is unknown. Animals in this stock are of the Hawaii DPS which is not listed under the ESA. No Level A harassment by tissue damage is authorized. NMFS authorizes two mortalities over the 7 years covered by this rulemaking, or 0.29 mortalities annually. The addition of this 0.29 annual mortality still leaves the total human-caused mortality well under the insignificance threshold for residual PBR.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated instances of take compared to the abundance, both throughout the HSTT Study Area and within the U.S. EEZ, respectively, is 180 and 161 percent (table 12). This information and the complicated far-ranging nature of the stock structure suggests that some portion of the stock (but not all) are likely impacted, over 1 to several days per year, with little likelihood of take across sequential days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Additionally, as noted above, there are two mitigation areas implemented by the Navy that span a large area of the important humpback reproductive areas (BIA, parent and child; see Harrison *et al.* (2023) identified in Kratofil *et al.* (2023) and minimize impacts by limiting the use of MF1 active sonar and explosives, thereby reducing both the number and severity of takes of humpback whales. Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with humpback whale communication or other important low-frequency cues, and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, at the expected scale the 3 estimated Level A harassment takes by PTS for humpback whales are unlikely to impact behaviors,

opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals.

Altogether, this stock's status is unknown and the DPS is not listed as endangered or threatened under the ESA. Only a small portion of the stock is anticipated to be impacted and any individual humpback whale is likely to be disturbed at a low-moderate level, with the taken individuals likely exposed between 1 to several days per year, with little likelihood of take across sequential days. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, and therefore, when combined with the authorized mortality (which our earlier analysis indicated will not, alone, have more than a negligible impact on this stock of humpback whales), the total take is not expected to adversely affect this stock through effects on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Hawaii stock of humpback whales.

Blue Whale (Central North Pacific Stock) and the Hawaii Stocks of Bryde's Whale, Fin Whale, Minke Whale, and Sei Whale

The status of these stocks are not identified in the SARs. Blue whale (Central North Pacific stock) and the Hawaii stocks of fin whale and sei whale are listed as endangered under the ESA; the Hawaii stocks of minke whales and Bryde's whales are not listed under the ESA. No mortality or Level A harassment by tissue damage is anticipated or authorized for any of these stocks.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated instances of take compared to the abundance, both throughout the HSTT Study Area and within the U.S. EEZ, respectively, is 92–135 and 103–142 percent (table 12). This information suggests that some portion of the stocks (but not all) are likely impacted, over 1 to several days per year, with little likelihood of take across sequential days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178

dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with mysticete communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For similar reasons (as described in the 2018 HSTT final rule) the two estimated Level A harassment takes by PTS for the Hawaii stock of minke whales are unlikely to have any effects on the reproduction or survival of any individuals.

Altogether, only a portion of these stocks are anticipated to be impacted and any individuals of these stocks are likely to be disturbed at a low-moderate level, with the taken individuals likely exposed between 1 and several days, with little chance that any are taken across sequential days. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, much less have impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on these stocks.

*Odontocetes**Sperm Whale, Dwarf Sperm Whale, and Pygmy Sperm Whale*

In table 14 and table 15 below for sperm whale, dwarf sperm whale, and pygmy sperm whale, we indicate the total annual mortality (0 for all stocks; the 2020 HSTT final rule included 0.14 annual takes by mortality of the Hawaii stock of sperm whale), Level A and Level B harassment, and a number indicating the instances of total take as a percentage of abundance. Table 14 and table 15 are unchanged from tables 20 and 21 in the 2020 HSTT final rule, except for updated information on mortality for the Hawaii stock of sperm whales, as discussed above. For additional information and analysis supporting the negligible-impact analysis, see the *Odontocetes* discussion as well as the *Sperm Whales, Dwarf Sperm Whales, and Pygmy Sperm Whales* discussion in the *Group and Species-Specific Analyses* section of the 2018 HSTT final rule, all of which remains applicable to this rule unless specifically noted.

TABLE 14—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR SPERM WHALES, DWARF SPERM WHALES, AND PYGMY SPERM WHALES IN THE HRC PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes		Abundance		Instances of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Takes (within NAVY EEZ)	Total Navy abundance inside and outside EEZ (HRC)	Within EEZ Navy abundance (HRC)	Total take as percentage of total Navy abundance (HRC)	EEZ take as percentage of EEZ abundance (HRC)
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage							
Dwarf sperm whale.	Hawaii	5,870	14,550	64	0	0	20,484	15,310	8,218	6,379	249	240
Pygmy sperm whale.	Hawaii	2,329	5,822	29	0	0	8,180	6,098	3,349	2,600	244	235
Sperm whale.	Hawaii	2,466	30	0	0	0	2,496	1,317	1,656	1,317	151	147

Note: For the Hawaii take estimates, we compare predicted takes to abundance estimates generated from the same underlying density estimates (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule), both in and outside of the U.S. EEZ. Because the portion of the Navy's study area inside the U.S. EEZ is generally concomitant with the area used to generate the abundance estimates in the SARs, and the abundance predicted by the same underlying density estimates is the preferred abundance to use, there is no need to separately compare the take to the SARs abundance estimate. Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

TABLE 15—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR SPERM WHALES, DWARF SPERM WHALES, AND PYGMY SPERM WHALES IN THE SOCIAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes	Abundance		Instances of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Navy abundance in action area	NMFS SARS abundance	Total take as percentage of total Navy abundance in action area	Total take as percentage of total SAR abundance
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage						
Kogia whales ...	CA/OR/WA	2,779	6,353	38	0	0	9,170	757	4,111	1,211	223
Sperm whale ...	CA/OR/WA	2,437	56	0	0	0	2,493	273	2,606	913	96

Note: For the SOCIAL take estimates, because of the manner in which the Navy study area overlaps the ranges of many MMPA stocks (*i.e.*, a stock may range far north to Washington state and beyond and abundance may only be predicted within the U.S. EEZ, while the Navy study area is limited to Southern California and northern Mexico, but extends beyond the U.S. EEZ), we compare predicted takes to both the abundance estimates for the study area, as well as the SARs (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule).

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

Below we compile and summarize the information that supports our determination that the Navy's activities will not adversely affect any species or stocks through effects on annual rates of recruitment or survival for any of the affected species and stocks addressed in this section. Sperm Whale, Dwarf Sperm Whale, and Pygmy Sperm Whale (CA/OR/WA Stocks)

The SAR identifies the CA/OR/WA stock of sperm whales as "stable", and the species is listed as endangered under the ESA. The status of the CA/OR/WA stocks of pygmy and dwarf sperm whales is unknown and neither are listed under the ESA. Neither mortality nor Level A harassment by tissue damage from exposure to explosives is expected or authorized for any of these three stocks.

Due to their pelagic distribution, small size, and cryptic behavior, pygmy

sperm whales and dwarf sperm whales are rarely sighted during at-sea surveys and are difficult to distinguish between when visually observed in the field. Many of the relatively few observations of *Kogia* spp. off the U.S. West Coast were not identified to species. All at-sea sightings of *Kogia* spp. have been identified as pygmy sperm whales or *Kogia* spp. Stranded dwarf sperm and pygmy sperm whales have been found on the U.S. West Coast, however dwarf sperm whale strandings are rare. NMFS SARs suggest that the majority of *Kogia* sighted off the U.S. West Coast were likely pygmy sperm whales. As such, the stock estimate in the NMFS SAR for pygmy sperm whales is the estimate derived for all *Kogia* spp. in the region (Barlow, 2016), and no separate abundance estimate can be determined for dwarf sperm whales, though some low number likely reside in the U.S.

EEZ. Due to the lack of abundance estimate, it is not possible to predict the take of dwarf sperm whales and take estimates are identified as *Kogia* spp. (including both pygmy and dwarf sperm whales). We assume only a small portion of those takes are likely to be dwarf sperm whales as the density and abundance in the U.S. EEZ is thought to be low.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is, respectively, 913 and 96 for sperm whales and 1,211 and 223 for *Kogia* spp., with a large proportion of these anticipated to be pygmy sperm whales due to the low abundance and density of dwarf sperm whales in the HSTT Study Area (table 15). Given the

range of these stocks (which extends the entire length of the West Coast, as well as beyond the U.S. EEZ boundary), this information suggests that some portion of the individuals in these stocks will not be impacted but that there is likely some repeat exposure (perhaps up to 24 days within a year for *Kogia* spp. and 18 days a year for sperm whales) of some small subset of individuals that spend extended time within the SOCAL Range. Additionally, while interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options in the relative vicinity. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB (*i.e.*, of a lower, to occasionally moderate, level and less likely to evoke a severe response). However, some of these takes could occur on a fair number of sequential days for some number of individuals.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with sperm whale communication or other important low-frequency cues, and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity (PTS) may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, at the expected scale the estimated Level A harassment takes by PTS for the dwarf and pygmy sperm whale stocks are unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals. Thus, the 38 total Level A harassment takes by PTS for these 2 stocks are unlikely to affect rates of recruitment and survival for the stocks.

Altogether, most members of the stocks will likely be taken by Level B harassment (at a low to occasionally moderate level) over several days a year, and some smaller portion of the stocks are expected to be taken on a relatively moderate to high number of days (up to 18 or 24) across the year, some of which could be sequential days. Though the majority of impacts are expected to be of a lower to sometimes moderate severity, the larger number of takes for a subset of individuals makes it more

likely that a small number of individuals could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year. Energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal. As discussed in the 2020 HSTT final rule, however, foregone reproduction (especially for 1 year, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality, and a small number of instances of foregone reproduction are not expected to adversely affect these stocks through effects on annual rates of recruitment or survival. We also note that residual PBR is 19 for pygmy sperm whales and 3.5 for sperm whales. Both the abundance and PBR are unknown for dwarf sperm whales, however, we know that take of this stock is likely significantly lower in magnitude and severity (*i.e.*, lower number of total takes and repeated takes any individual) than pygmy sperm whales. For these reasons, in consideration of all of the effects of the Navy's activities combined, we have determined that the authorized take will have a negligible impact on the CA/OR/WA stocks of sperm whales and pygmy and dwarf sperm whales.

Sperm Whale (Hawaii Stock)

The SAR does not identify a trend for this stock and the species is listed as endangered under the ESA. No mortality or Level A harassment by PTS or tissue damage is expected or authorized.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated instances of take compared to the abundance, both throughout the HSTT Study Area and within the U.S. EEZ, respectively, is 151 and 147 percent (table 14). This information and the sperm whale stock range suggest that likely only a smaller portion of the stock will be impacted, over 1 to several days per year, with little likelihood of take across sequential days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between

minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB (*i.e.*, of a lower, to occasionally moderate, level and less likely to evoke a severe response). Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with sperm whale communication or other important low-frequency cues, and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival.

Altogether, a relatively small portion of this stock is anticipated to be impacted and any individuals are likely to be disturbed at a low-moderate level, with the taken individuals likely exposed between 1 and several days, with little chance that any are taken across sequential days. This low magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, much less annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Hawaii stock of sperm whales.

Pygmy and Dwarf Sperm Whales (Hawaii Stocks)

The SAR does not identify a trend for these stocks and the species are not listed under the ESA. No Level A harassment by tissue damage is anticipated or authorized. Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated instances of take compared to the abundance, both throughout the HSTT Study Area and within the U.S. EEZ, respectively, is 244–249 and 235–240 percent (table 14). This information and the pygmy and dwarf sperm whale stock ranges (at least throughout the U.S. EEZ around the entire Hawaiian Islands) suggest that likely a fair portion of each stock is not impacted, but that a subset of individuals may be taken over one to perhaps 5 days per year, with little likelihood of take across sequential days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB (*i.e.*, of a lower, to occasionally moderate, level and less likely to evoke a severe response). Additionally, as discussed earlier, within the Hawaii Island Mitigation

Area, explosives are not used and the use of MF1 and MF4 active sonar is limited, greatly reducing the severity of impacts within the small and resident population BIA for dwarf sperm whales (Kratofil *et al.* 2023), which is entirely contained within this mitigation area.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with sperm whale communication or other important low-frequency cues—and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, at the expected scale, estimated Level A harassment takes by PTS for dwarf and pygmy sperm whales are unlikely to impact

behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals, even if it were to be experienced by an animal that also experiences one or more instances of Level B harassment by behavioral disturbance. Thus the 29 and 64 total Level A harassment takes by PTS for dwarf and pygmy sperm whales, respectively, are unlikely to affect rates of recruitment and survival for these stocks.

Altogether, a portion of these stocks are likely to be impacted and any individuals are likely to be disturbed at a low-moderate level, with the taken individuals likely exposed between 1 and 5 days, with little chance that any are taken across sequential days. This low magnitude and severity of Level A and Level B harassment effects is not expected to result in impacts on individual reproduction or survival, much less impacts on annual rates of recruitment or survival. For these

reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the expected and authorized take will have a negligible impact on the Hawaii stocks of pygmy and dwarf sperm whales.

Beaked Whales

In table 16 and table 17 below for beaked whales, we indicate the total annual mortality, Level A and Level B harassment, and a number indicating the instances of total take as a percentage of abundance. Table 16 and table 17 are unchanged from table 22 and table 23 in the 2020 HSTT final rule, with the exception of a correction to a rounding error as noted. For additional information and analysis supporting the negligible-impact analysis, see the *Odontocetes* discussion as well as the *Beaked Whales* discussion in the *Group and Species-Specific Analyses* section of the 2018 HSTT final rule, all of which remains applicable to this rule unless specifically noted.

TABLE 16—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR BEAKED WHALES IN THE HRC PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes		Abundance		Instances of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Takes (within Navy EEZ)	Total Navy abundance inside and outside EEZ (HRC)	Within EEZ Navy abundance (HRC)	Total take as percentage of total Navy abundance (HRC)	EEZ take as percentage of EEZ abundance (HRC)
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage							
Blainville's beaked whale.	Hawaii	5,369	16	0	0	0	5,385	4,140	989	768	^a 544	539
Goose-beaked whale.	Hawaii	1,792	4	0	0	0	1,796	1,377	345	268	521	514
Longman's beaked whale.	Hawaii	19,152	81	0	0	0	19,233	14,585	3,568	2,770	539	527

Note: For the Hawaii take estimates, we compare predicted takes to abundance estimates generated from the same underlying density estimates (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule), both in and outside of the U.S. EEZ. Because the portion of the Navy's study area inside the U.S. EEZ is generally concomitant with the area used to generate the abundance estimates in the SARs, and the abundance predicted by the same underlying density estimates is the preferred abundance to use, there is no need to separately compare the take to the SARs abundance estimate.

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

^a The 2020 final rule unintentionally presented this percentage as 545. The correct value is provided here. This error does not affect the conclusions in the 2020 HSTT final rule.

TABLE 17—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR BEAKED WHALES IN THE SOCAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)				Total takes	Abundance		Instances of total take as percent of abundance		
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Navy abundance in action area	NMFS SARs abundance	Total take as percent of abundance	
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage					Total take as percentage of total Navy abundance in action area	Total take as percentage of total SAR abundance
Baird's beaked whale.	CA/OR/WA	2,030	14	0	0	0	2,044	74	1,363	2,762	150
Goose-beaked whale	CA/OR/WA	11,373	127	1	0	0	11,501	520	5,454	2,212	211

TABLE 17—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR BEAKED WHALES IN THE SOCAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE—Continued

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes	Abundance		Instances of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Navy abundance in action area	NMFS SARs abundance	Total take as percent-age of total Navy abundance in action area	Total take as percent-age of total SAR abundance
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage						
Mesoplodon species.	CA/OR/WA	6,125	68	1	0	0	6,194	89	3,044	6,960	203

Note: For the SOCAL take estimates, because of the manner in which the Navy study area overlaps the ranges of many MMPA stocks (*i.e.*, a stock may range far north to Washington state and beyond and abundance may only be predicted within the U.S. EEZ, while the Navy study area is limited to Southern California and northern Mexico, but extends beyond the U.S. EEZ), we compare predicted takes to both the abundance estimates for the study area, as well as the SARs (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule).

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

Below we compile and summarize the information that supports our determination that the Navy's activities will not adversely affect any species or stocks through effects on annual rates of recruitment or survival for any of the affected species or stocks addressed in this section.

Blainville's, Goose-Beaked, and Longman's Beaked Whales (Hawaii Stocks)

The SAR does not identify a trend for these stocks and the species are not listed under the ESA. No mortality or Level A harassment are expected or authorized for any of these three stocks. Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated instances of take compared to the abundance, both throughout the HSTT Study Area and within the U.S. EEZ, respectively, is 521–544 and 514–539 percent (table 16). This information and the stock ranges (at least of the small, resident island associated stocks around Hawaii) suggest that likely a fair portion of the stocks (but not all) will be impacted, over 1 to perhaps 11 days per year, with little likelihood of much take across sequential days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 160 dB, though with beaked whales, which are considered somewhat more sensitive, this could mean that some individuals will leave preferred habitat for a day or 2 (*i.e.*, moderate level takes). However, while interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options nearby. Additionally, as

noted earlier, within the Hawaii Island mitigation area (which overlaps a large portion of the BIAs for goose-beaked and Blainville's beaked whales identified in Kratofil *et al.* 2023), explosives are not used and the use of MF1 and MF4 active sonar is limited, greatly reducing the severity of impacts within these two small resident populations.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere with beaked whale communication or other important low-frequency cues, and that the associated lost opportunities and capabilities are not at a level that will impact reproduction or survival.

Altogether, a fair portion of these stocks are anticipated to be impacted and any individuals are likely to be disturbed at a moderate level, with the taken individuals likely exposed between 1 and 11 days, with little chance that individuals are taken across more than a few sequential days. This low, to occasionally moderate, magnitude and severity of harassment effects is not expected to result in impacts on individual reproduction or survival, much less have impacts on annual rates of recruitment or survival. For these reasons, we have determined, in consideration of all of the effects of the Navy's activities combined, that the authorized take will have a negligible impact on the Hawaii stocks of beaked whales.

Baird's Beaked Whale, Goose-Beaked Whale and *Mesoplodon* Species (All CA/OR/WA Stocks)

The species are not listed under the ESA and their populations have been identified as “increasing,” “decreasing,” and “increasing,” respectively. No

mortality is expected or authorized for any of these three stocks and only two takes by Level A harassment (PTS) are authorized.

No methods are available to distinguish between the six species of *Mesoplodon* beaked whale CA/OR/WA stocks (Blainville's beaked whale (*M. densirostris*), Perrin's beaked whale (*M. perrini*), Lesser beaked whale (*M. peruvianus*), Stejneger's beaked whale (*M. stejnegeri*), Ginkgo-toothed beaked whale (*M. ginkgodens*), and Hubbs' beaked whale (*M. carlhubbsi*)) when observed during at-sea surveys (Carretta *et al.* 2018a). Bycatch and stranding records from the region indicate that the Hubbs' beaked whale is most commonly encountered (Carretta *et al.* 2008, Moore and Barlow, 2013). As indicated in the SAR, no species-specific abundance estimates are available, the abundance estimate includes all CA/OR/WA *Mesoplodon* spp., and the six species are managed as one unit. Due to the lack of species-specific abundance estimates, it is not possible to predict the take of individual species and take estimates are identified as *Mesoplodon* spp.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance for these stocks is 2,762, 2,212, and 6,960 percent (measured against Navy-estimated abundance) and 150, 211, and 203 percent (measured against the SAR) for Baird's beaked whales, goose-beaked beaked whales, and *Mesoplodon* spp., respectively (table 17). Given the ranges of these stocks, this information suggests that some smaller portion of the individuals of these stocks will be taken, and that some subset of individuals within the stock will be taken repeatedly within the year (perhaps up to 20–25 days, and potentially more for goose-beaked)—

potentially over a fair number of sequential days, especially where individuals spend extensive time in the SOCAL Range. Note that we predict lower days of repeated exposure for these stocks than their percentages might have suggested because of the number of overall takes—*i.e.*, using the higher percentage would suggest that an unlikely portion of the takes are taken up by a small portion of the stock incurring a very large number of repeat takes, with little room for take resulting from few or moderate numbers of repeats, which is unlikely. While interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options in the relative vicinity. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, we have explained that the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 160 dB, though with beaked whales, which are considered somewhat more sensitive, this could mean that some individuals will leave preferred habitat for a day or 2 (*i.e.*, of a moderate level). In addition, as noted, some of these takes could occur on a fair number of sequential days for these stocks.

The severity of TTS takes is expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere significantly with conspecific communication, echolocation, or other important low-frequency cues. Therefore, the associated lost opportunities and capabilities are not expected to impact reproduction or survival. For similar reasons (as described in the 2020 HSTT final rule) the single estimated Level A harassment take by PTS for this stock is unlikely to have any effects on the reproduction or survival of any individuals.

Altogether, a portion of these stocks will likely be taken (at a moderate or sometimes low level) over several days

a year, and some smaller portion of the stock is expected to be taken on a relatively moderate to high number of days across the year, some of which could be sequential days. Though the majority of impacts are expected to be of a moderate severity, the repeated takes over a potentially fair number of sequential days for some individuals makes it more likely that a small number of individuals could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year. Energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal. As noted previously, however, foregone reproduction (especially for 1 year, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality and a small number of instances of foregone reproduction are not expected to adversely affect these stocks through effects on annual rates of recruitment or survival, especially given the residual PBR of these three beaked whale stocks (8.7, 41.9, and 19.9, respectively).

Further, Navy activities have been conducted in SOCAL for many years at similar levels and the SAR considers *Mesoplodon* spp. and Baird's beaked whales as increasing. While NMFS' SAR indicates that goose-beaked whales on the U.S. West Coast are declining based on a Bayesian trend analysis of NMFS' survey data collected from 1991 through 2014, results from passive acoustic monitoring and other research have estimated regional goose-beaked whale densities that were higher than

indicated by NMFS' broad-scale visual surveys for the U.S. West Coast (Debach *et al.* 2015a; Debach *et al.* 2015b; Falcone and Schorr, 2012, 2014; Hildebrand *et al.* 2009; Moretti, 2016; Širović *et al.* 2016; Smultea and Jefferson, 2014). Research also indicates higher than expected residency in the Navy's instrumented Southern California Anti-Submarine Warfare Range in particular (Falcone and Schorr, 2012) and photo identification studies in the SOCAL have identified approximately 100 individual goose-beaked whale individuals with 40 percent having been seen in one or more prior years, with re-sightings up to 7 years apart (Falcone and Schorr, 2014). The documented residency by many goose-beaked whales over multiple years suggests that a stable population may exist in that small portion of the stock's overall range (Falcone *et al.* 2009; Falcone and Schorr, 2014; Schorr *et al.* 2017).

For these reasons, in consideration of all of the effects of the Navy's activities combined, we have determined that the authorized take will have a negligible impact on the CA/OR/WA stocks of Baird's and goose-beaked whales, as well as all six species included within the *Mesoplodon* spp.

Small Whales and Dolphins

In tables 18 and 19 below for dolphins and small whales, we indicate the total annual mortality, Level A and Level B harassment, and a number indicating the instances of total take as a percentage of abundance. Tables 18 and 19 are updated from tables 24 and 25 in the 2020 HSTT final rule as appropriate with the 2023 final SARs. For additional information and analysis supporting the negligible-impact analysis, see the *Odontocetes* discussion as well as the *Small Whales and Dolphins* discussion in the *Group and Species-Specific Analyses* section of the 2018 HSTT final rule, all of which remains applicable to this rule unless specifically noted.

TABLE 18—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR DOLPHINS AND SMALL WHALES IN THE HRC PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes		Abundance		Instance of total take as percent of abundance

Striped dolphin.	Hawaii	7,379	405	0	0	0	7,784	6,034	4,779	3,646	163	165

Note: For the Hawaii take estimates, we compare predicted takes to abundance estimates generated from the same underlying density estimates (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule), both in and outside of the U.S. EEZ. Because the portion of the Navy's study area inside the U.S. EEZ is generally concomitant with the area used to generate the abundance estimates in the SARs, and the abundance predicted by the same underlying density estimates is the preferred abundance to use, there is no need to separately compare the take to the SARs abundance estimate.

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

^a The 2020 final rule unintentionally presented these percentages as 1,169 and 1,130. The correct values are provided here. These errors do not affect the conclusions in the 2020 HSTT final rule.

^b The 2020 final rule unintentionally presented this percentage as 400. The correct value is provided here. This rounding error does not affect the conclusions in the 2020 HSTT final rule.

TABLE 19—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR DOLPHINS AND SMALL WHALES IN THE SOCAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Note: For the SOCAL take estimates, because of the manner in which the Navy study area overlaps the ranges of many MMPA stocks (*i.e.*, a stock may range far north to Washington state and beyond and abundance may only be predicted within the U.S. EEZ, while the Navy study area is limited to Southern California and northern Mexico, but extends beyond the U.S. EEZ), we compare predicted takes to both the abundance estimates for the study area, as well as the SARs (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule).

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

For mortality takes there is an annual average of 1.14 short-beaked common dolphins (*i.e.*, where eight takes could potentially occur divided by 7 years to get the annual number of mortalities/serious injuries).

Below we compile and summarize the information that supports our determination that the Navy's activities will not adversely affect any species or stocks through effects on annual rates of recruitment or survival for any of the affected species or stocks addressed in this section.

Long-Beaked Common Dolphin (California Stock), Northern Right Whale Dolphin (CA/OR/WA Stock), and Short-Beaked Common Dolphin (CA/OR/WA Stock)

None of these stocks are listed under the ESA and their stock statuses are considered "increasing," "unknown," and "increasing," respectively. Eight mortalities or serious injuries of short-beaked common dolphins are authorized over the 7-year rule, or 1.14 M/SI annually. The addition of this 1.14 annual mortality still leaves the total human-caused mortality well under the insignificance threshold for residual

PBR. The 3 stocks are expected to accrue 2, 1, and 10 Level A harassment takes from tissue damage resulting from exposure to explosives, respectively. As described in detail in the 2018 HSTT final rule, the impacts of a Level A harassment take by tissue damage could range in impact from minor to something just less than M/SI that could seriously impact fitness. However, given the Navy's procedural mitigation, exposure closer to the source and more severe end of the spectrum is less likely and we cautiously assume some moderate impact for these takes that could lower the affected individual's fitness within the year such that a female (assuming a 50 percent chance of it being a female) might forego reproduction for 1 year. As noted previously, foregone reproduction has less of an impact on population rates than death (especially for only 1 year in 7, which is the maximum predicted because the small number anticipated in

any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low), and 1 to 10 instances would not be expected to impact annual rates of recruitment or survival for these stocks.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 2,411, 1,273, and 571 percent (relative to the stocks listed in the heading) and 297, 335, and 141 percent (relative to the stocks listed in the heading) (table 19). Given the range of these stocks, this information suggests that likely some portion (but not all or even the majority) of the individuals in the northern right whale dolphin and short-beaked common dolphin stocks are likely impacted while it is entirely possible that most or all of the range-limited long-beaked common dolphin is

taken. All three stocks likely will experience some repeat Level B harassment exposure (perhaps up to 48, 25, or 11 days within a year, respectively to the stocks listed in the heading) of some subset of individuals that spend extended time within the SOCAL range complex. While interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options in the relative vicinity. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB with a portion up to 178 dB (*i.e.*, of a moderate or lower level, less likely to evoke a severe response). However, some of these takes could occur on a fair number of sequential days for long-beaked common dolphins or northern right whale dolphins, or even some number of short-beaked common dolphins, given the high number of total takes (*i.e.*, the probability that some number of individuals get taken on a higher number of sequential days is higher, because the total take number is relatively high, even though the percentage is not that high).

The severity of TTS takes is expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere significantly with conspecific communication, echolocation, or other important low-frequency cues, and the associated lost opportunities and capabilities are not expected to impact reproduction or survival. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, as discussed in the 2020 HSTT final rule, it is unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals.

Altogether and as described in more detail above, 1.14 annual lethal takes of short-beaked common dolphins are authorized, all three stocks may experience a very small number of takes by tissue damage or PTS (relative to the stock abundance and PBR), and a moderate to large portion of all three stocks will likely be taken (at a low to occasionally moderate level) over several days a year, and some smaller portion of these stocks is expected to be taken on a relatively moderate to high number of days across the year, some of

which could be sequential days. Though the majority of impacts are expected to be of a lower to sometimes moderate severity, the larger number of takes (in total and for certain individuals) makes it more likely (probabilistically) that a small number of individuals could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year. Energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal. As noted previously, however, foregone reproduction (especially for only 1 year out of 7, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality and a small number of instances of foregone reproduction (including in combination with that which might result from the small number of tissue damage takes) are not expected to adversely affect the stocks through effects on annual rates of recruitment or survival, especially given the very high residual PBRs of these stocks (638.3, 156.4, and 8,858.5, respectively). For these reasons, in consideration of all of the effects of the Navy's activities combined (mortality, Level A harassment, and Level B harassment), we have determined that the authorized take will have a negligible impact on these three stocks of dolphins.

All Other SOCAL Dolphin Stocks (Except Long-Beaked Common Dolphin, Northern Right Whale Dolphin, and Short-Beaked Common Dolphin)

None of these stocks are listed under the ESA and their stock statuses are considered "unknown," except for the bottlenose dolphin (California coastal stock) and killer whale (Eastern North Pacific stock), which are considered "stable." No M/SI or Level A harassment via tissue damage from exposure to explosives is expected or authorized for these stocks.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is from 440 to 2,675 percent and

36 to 1,993 percent, respectively (table 19). Given the range of these stocks (along the entire U.S. West Coast, or even beyond, with some also extending seaward of the HSTT Study Area boundaries), this information suggests that some portion (but not all or even the majority) of the individuals of any of these stocks will be taken, with the exception that most or all of the individuals of the more range-limited California coastal stock of bottlenose dolphin may be taken. It is also likely that some subset of individuals within most of these stocks will be taken repeatedly within the year (perhaps up to 10–15 days within a year) but with no more than several potentially sequential days, although the CA/OR/WA stocks of bottlenose dolphins, Pacific white-sided dolphins, and Risso's dolphins may include individuals that are taken repeatedly within the year over a higher number of days (up to 57, 22, and 40 days, respectively) and potentially over a fair number of sequential days, especially where individuals spend extensive time in the SOCAL range complex. Note that though percentages are high for the Eastern North Pacific stock of killer whales and short-finned pilot whales, given the low overall number of takes, it is highly unlikely that any individuals would be taken across the number of days their percentages would suggest. While interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options in the relative vicinity. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, we have explained that the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB (*i.e.*, of a lower, or sometimes moderate level, less likely to evoke a severe response). However, as noted, some of these takes could occur on a fair number of sequential days for the three stocks listed earlier.

The severity of TTS takes is expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere significantly with conspecific communication, echolocation, or other important low-frequency cues. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, it is unlikely to impact

behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals.

Altogether, a portion of all of these stocks will likely be taken (at a low to occasionally moderate level) over several days a year, and some smaller portion of CA/OR/WA stocks of bottlenose dolphins, Pacific white-sided dolphins, and Risso's dolphins, specifically, are expected to be taken on a relatively moderate to high number of days across the year, some of which could be sequential days. Though the majority of impacts are expected to be of a lower to sometimes moderate severity, the larger number of takes (in total and for certain individuals) for the CA/OR/WA stocks of bottlenose dolphins, Pacific white-sided dolphins, and Risso's dolphins makes it more likely (probabilistically) that a small number of individuals could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year. Energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal. As noted previously, however, foregone reproduction (especially for only 1 year in 7, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality and a small number of instances of foregone reproduction are not expected to adversely affect the stocks through effects on annual rates of recruitment or survival, especially given the residual PBRs of the CA/OR/WA stocks of bottlenose dolphins, Pacific white-sided dolphins, and Risso's dolphins (18.9, 272, and 42.3, respectively). For these reasons, in consideration of all of the effects of the Navy's activities combined, we have determined that the authorized take will have a negligible impact on these stocks of dolphins.

All HRC Dolphin Stocks

With the exception of the Main Hawaiian Island stock of false killer whales (listed as endangered under the ESA, with the MMPA stock identified as "decreasing"), none of these stocks are listed under the ESA and their stock statuses are considered "unknown." No

M/SI or Level A harassment via tissue damage from exposure to explosives is expected or authorized for these stocks.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is from 46 to 1,166 percent and 14 to 2,130 percent, respectively (table 18). Given the ranges of these stocks (many of them are small, resident, island-associated stocks), this information suggests that a fairly large portion of the individuals of many of these stocks will be taken but that most individuals will only be impacted across a smaller to moderate number of days within the year (1–15), and with no more than several potentially sequential days, although two stocks (the Oahu stocks of bottlenose dolphin and pantropical spotted dolphin) have a slightly higher percentage, suggesting they could be taken up to 23 days within a year, with perhaps a few more of those days being sequential. We note that although the percentage is higher for the tropical stock of pygmy killer whale within the U.S. EEZ (2,130), given (1) the low overall number of takes (760) and (2) the fact that the small within-U.S. EEZ abundance is not a static set of individuals, but rather individuals moving in and out of the U.S. EEZ making it more appropriate to use the percentage comparison for the total takes versus total abundance—it is highly unlikely that any individuals would be taken across the number of days the within-U.S. EEZ percentage suggests (42). While interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options in the relative vicinity. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB (*i.e.*, of a lower, or sometimes moderate level, less likely to evoke a severe response). However, as noted, some of these takes could occur on a fair number of sequential days for the Oahu stocks of bottlenose dolphin and pantropical spotted dolphins.

Within the Hawaii Island mitigation area (which overlaps a large portion of the BIAs for common bottlenose dolphin, dwarf sperm whale, false killer whale, melon-headed whale, pantropical spotted dolphin, pygmy killer whale, rough-toothed dolphin, short-finned pilot whale, and spinner dolphin identified in Kratofil *et al.*

2023), the Navy will not use explosives and will limit the use of MF1 and MF4 active sonar. The 4-Islands mitigation area overlaps a portion of the BIAs identified in Kratofil *et al.* (2023) for common bottlenose dolphin, false killer whale, pantropical spotted dolphin, rough-toothed dolphin, and spinner dolphin. Within the 4-Islands mitigation area (November 15–April 15), the Navy will not use MF1 surface ship hull-mounted mid-frequency active sonar or explosives that could potentially result in takes of marine mammals. The mitigation required in these two areas will reduce the severity of impacts within these small and resident populations.

Regarding the severity of TTS takes, they are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere significantly with conspecific communication, echolocation, or other important low-frequency cues. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, they are unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals, even if accrued to individuals that are also taken by behavioral harassment at the same time.

Altogether, most of these stocks (all but the Oahu stocks of bottlenose dolphin and pantropical spotted dolphins) will likely be taken (at a low to occasionally moderate level) over several days a year, with some smaller portion of the stock potentially taken on a more moderate number of days across the year (perhaps up to 15 days for Fraser's dolphin, though others notably less), some of which could be across a few sequential days, which is not expected to affect the reproductive success or survival of individuals. For the Oahu stocks of bottlenose dolphin and pantropical spotted dolphins, some subset of individuals could be taken up to 23 days in a year, with some small number being taken across several sequential days, such that a small number of individuals could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year. Energetic impacts to males are generally meaningless to population rates unless

they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal. As noted previously, however, foregone reproduction (especially for 1 year, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality and a small number of instances of foregone reproduction are

not expected to adversely affect these two stocks through effects on annual rates of recruitment or survival. For these reasons, in consideration of all of the effects of the Navy's activities combined, we have determined that the authorized take will have a negligible impact on all of the stocks of dolphins found in the vicinity of the HRC.

Dall's Porpoise

In table 20 below for porpoises, we indicate the total annual mortality, Level A harassment and Level B

harassment, and a number indicating the instances of total take as a percentage of abundance. Table 20 is updated from table 26 in the 2020 HSTT final rule with the 2023 final SARs. For additional information and analysis supporting the negligible-impact analysis, see the *Odontocetes* discussion as well as the *Dall's Porpoise* discussion in the *Group and Species-Specific Analyses* section of the 2018 HSTT final rule, all of which remains applicable to this rule unless specifically noted.

TABLE 20—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR PORPOISES IN THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)				Total takes	Abundance		Instances of total take as percent of abundance		
		Level B harassment		Level A harassment		Total takes (entire study area)	Navy abundance in Action Area	NMFS SARs abundance	Total take as percent-age of total Navy abundance in Action Area	Total take as percent-age of total SAR abundance	
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage						Mortality
Dall's porpoise	CA/OR/WA	14,482	29,891	209	0	0	44,582	2,054	16,498	2,170	270

Note: For the SOCAL take estimates, because of the manner in which the Navy study area overlaps the ranges of many MMPA stocks (*i.e.*, a stock may range far north to Washington state and beyond and abundance may only be predicted within the U.S. EEZ, while the Navy study area is limited to Southern California and northern Mexico, but extends beyond the U.S. EEZ), we compare predicted takes to both the abundance estimates for the study area, as well as the SARs (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule).

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

Below we compile and summarize the information that supports our determination that the Navy's activities will not adversely affect Dall's porpoises through effects on annual rates of recruitment or survival.

Dall's porpoise is not listed under the ESA and the stock status is considered "unknown." No M/SI or Level A harassment via tissue damage from exposure to explosives is expected or authorized for this stock.

Most Level B harassments to Dall's porpoise from hull-mounted sonar (MF1) in the HSTT Study Area will result from received levels between 154 and 166 dB SPL (85 percent). While harbor porpoises have been observed to be especially sensitive to human activity, the same types of responses have not been observed in Dall's porpoises. Dall's porpoises are typically notably longer than and weigh more than twice as much as harbor porpoises making them generally less likely to be preyed upon and likely differentiating their behavioral repertoire somewhat from harbor porpoises. Further, they are typically seen in large groups and feeding aggregations or exhibiting bow-riding behaviors, which is very different from the group dynamics observed in the more typically solitary, cryptic harbor porpoises, which are not often

seen bow-riding. For these reasons, Dall's porpoises are not treated as especially sensitive species (as compared to harbor porpoises, which have a lower threshold for Level B harassment by behavioral disturbance and more distant cutoff) but, rather, are analyzed similarly to other odontocetes. Therefore, the majority of Level B harassment takes are expected to be in the form of milder responses compared to higher level exposures. As discussed more fully in the 2018 HSTT final rule, we anticipate more severe effects from takes when animals are exposed to higher received levels.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 2,170 and 270 percent, respectively (table 20). Given the range of this stock (up the U.S. West Coast through Washington and sometimes beyond the U.S. EEZ), this information suggests that some smaller portion of the individuals of this stock will be taken, and that some subset of individuals within the stock will be taken repeatedly within the year (perhaps up to 42 days)—potentially over a fair number of sequential days,

especially where individuals spend extensive time in the SOCAL range complex. While interrupted feeding bouts are a known response and concern for odontocetes, we also know that there are often viable alternative habitat options in the relative vicinity. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB (*i.e.*, of a lower, or sometimes moderate level, less likely to evoke a severe response). However, as noted, some of these takes could occur on a fair number of sequential days for this stock.

The severity of TTS takes is expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere significantly with conspecific communication, echolocation, or other important low-frequency cues. Therefore, the associated lost opportunities and capabilities are not expected to impact reproduction or survival. For these same reasons (low level and the likely frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may

mean some small loss of opportunities or detection capabilities, the estimated 209 takes by Level A harassment by PTS for Dall's porpoise are unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival for most individuals. Because of the high number of PTS takes, however, we acknowledge that a few animals could potentially incur permanent hearing loss of a higher degree that could potentially interfere with their successful reproduction and growth. Given the status of the stock, even if this occurred, it would not adversely impact rates of recruitment or survival.

Altogether, a portion of this stock will likely be taken (at a low to occasionally moderate level) over several days a year, and some smaller portion of the stock is expected to be taken on a relatively moderate to high number of days across the year, some of which could be sequential days. Though the majority of impacts are expected to be of a lower to sometimes moderate severity, the larger number of takes (in total and for certain individuals) for the Dall's porpoise makes it more likely (probabilistically) that a small number of individuals

could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year. Energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal. Similarly, we acknowledge the potential for this to occur to a few individuals out of the 209 total that might incur a higher degree of PTS. As noted previously, however, foregone reproduction (especially for only 1 year in 7, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality. Further, the small number of instances of foregone reproduction that could potentially result from PTS and/or the few repeated, more severe Level B harassment takes by behavioral

disturbance are not expected to adversely affect the stock through effects on annual rates of recruitment or survival, especially given the status of the species (not endangered or threatened; minimum population of 10,286 just within the U.S. EEZ) and residual PBR of Dall's porpoise (98.3). For these reasons, in consideration of all of the effects of the Navy's activities combined, we have determined that the authorized take will have a negligible impact on Dall's porpoise.

Pinnipeds

In tables 21 and 22 below for pinnipeds, we indicate the total annual mortality, Level A harassment and Level B harassment, and a number indicating the instances of total take as a percentage of abundance. Tables 21 and 22 have been updated from tables 27 and 28 in the 2020 HSTT final rule with the 2023 final SARs. For additional information and analysis supporting the negligible-impact analysis, see the *Pinnipeds* discussion in the *Group and Species-Specific Analyses* section of the 2018 HSTT final rule, all of which remains applicable to this rule unless specifically noted.

TABLE 21—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR PINNIPEDS IN THE HRC PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total takes		Abundance		Instance of total take as percent of abundance	
	Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Takes (within Navy EEZ)	Total Navy abundance inside and outside of EEZ (HRC)	Within EEZ Navy abundance (HRC)	Total take as percentage of total Navy abundance (HRC)	EEZ take as percentage of Navy EEZ abundance (HRC)
	Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage							
Hawaiian monk seal.	143	62	1	0	0	206	195	169	169	122	115

Note: For the Hawaii take estimates, we compare predicted takes to abundance estimates generated from the same underlying density estimates (as described in the *Estimated Take of Marine Mammals* section of the 2018 HSTT final rule), both in and outside of the U.S. EEZ. Because the portion of the Navy's study area inside the U.S. EEZ is generally concomitant with the area used to generate the abundance estimates in the SARs, and the abundance predicted by the same underlying density estimates is the preferred abundance to use, there is no need to separately compare the take to the SARs abundance estimate.

Total takes inside and outside U.S. EEZ represent the sum of annual Level A and Level B harassment from training and testing activities.

TABLE 22—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR PINNIPEDS IN THE SOCAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total Takes	Abundance		Instance of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Navy abundance in action area (SOCAL)	NMFS SARs abundance	Total take as percentage of total Navy abundance in action area	Total take as percentage of total SAR abundance
		Behavioral disturbance	TTS (may also include disturbance)	PTS	Tissue damage						
California sea lion.	U.S.	113,419	4,789	87	9	0.71	118,305	4,085	257,606	2,896	46
Guadalupe fur seal.	Mexico	1,442	15	0	0	0	1,457	1,171	34,187	124	4

TABLE 22—ANNUAL ESTIMATED TAKES BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY FOR PINNIPEDS IN THE SOCAL PORTION OF THE HSTT STUDY AREA AND NUMBER INDICATING THE INSTANCES OF TOTAL TAKE AS A PERCENTAGE OF STOCK ABUNDANCE—Continued

Species	Stock	Instances of indicated types of incidental take (not all takes represent separate individuals, especially for disturbance)					Total Takes	Abundance		Instance of total take as percent of abundance	
		Level B harassment		Level A harassment		Mortality	Total takes (entire study area)	Navy abundance in action area (SOCAL)	NMFS SARs abundance	Total take as percent- age of total Navy abundance in action area	
		Behavioral disturbance	TTS (may also include dis- turbance)	PTS	Tissue damage					Total take as percent- age of total Navy abundance in action area	Total take as percent- age of total SAR abun- dance
Northern fur seal.	California	15,167	124	1	0	0	15,292	886	14,050	1,726	109
Harbor seal	California	2,450	2,994	8	0	0	5,452	321	30,968	1,698	18
Northern ele- phant seal.	California	42,916	17,955	97	2	0	60,970	4,108	187,386	1,484	33

Note: For the SOCAL take estimates, because of the manner in which the Navy action area overlaps the ranges of many MMPA stocks (*i.e.*, a stock may range far north to Washington state and beyond and abundance may only be predicted within the U.S. EEZ, while the Navy action area is limited to Southern California and northern Mexico, but extends beyond the U.S. EEZ), we compare predicted takes to both the abundance estimates for the action area, as well as the SARs.

For mortality takes there is an annual average of 0.71 California sea lions (*i.e.*, where five takes could potentially occur divided by 7 years to get the annual number of mortalities/serious injuries).

Below we compile and summarize the information that supports our determination that the Navy's activities would not adversely affect any pinnipeds through effects on annual rates of recruitment or survival for any of the affected species or stocks addressed in this section.

Five M/SI takes of California sea lions are authorized and when this mortality is combined with the other human-caused mortality from other sources, it still falls well below the insignificance threshold for residual PBR (13,684). A small number of Level A harassment takes by tissue damage are also authorized (nine and two for California sea lions and northern elephant seals, respectively), which, as discussed in the 2020 HSTT final rule, could range in impact from minor to something just less than M/SI that could seriously impact fitness. However, given the Navy's mitigation, exposure at the closer to the source and more severe end of the spectrum is less likely. Nevertheless, we cautiously assume some moderate impact on the individuals that experience these small numbers of take that could lower the individual's fitness within the year such that a female (assuming a 50 percent chance of it being a female) might forego reproduction for 1 year. As noted previously, foregone reproduction has less of an impact on population rates than death (especially for only one within 7 years, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) and these low numbers of instances (especially assuming the likelihood that only 50 percent of the takes would affect females) are not

expected to impact annual rates of recruitment or survival, especially given the population sizes of these species.

Regarding the magnitude of Level B harassment takes (TTS and behavioral disturbance), for Hawaiian monk seals and Guadalupe fur seals, the two species listed under the ESA, the estimated instances of takes as compared to the stock abundance does not exceed 124 percent, which suggests that some portion of these two stocks would be taken on 1 to a few days per year. For the remaining stocks, the number of estimated total instances of take compared to the abundance (measured against both the Navy-estimated abundance and the SAR) is 1,484 to 2,896 percent and 18 to 46 percent, respectively (table 22). Given the ranges of these stocks (*i.e.*, very large ranges, but with individuals often staying in the vicinity of haulouts), this information suggests that some very small portion of the individuals of these stocks will be taken, but that some subset of individuals within the stock will be taken repeatedly within the year (perhaps up to 58 days)—potentially over a fair number of sequential days. Regarding the severity of those individual Level B harassment takes by behavioral disturbance, the duration of any exposure is expected to be between minutes and hours (*i.e.*, relatively short) and the received sound levels largely below 172 dB, which is considered a relatively low to occasionally moderate level for pinnipeds. However, as noted, some of these takes could occur on a fair number of sequential days for this stock.

As described in the 2018 HSTT final rule and 2020 HSTT final rule, the Hawaii and 4-Islands mitigation areas protect (by not using explosives and limiting MFAS within) a significant

portion of the designated critical habitat for Hawaiian monk seals in the Main Hawaiian Islands, including all of it around the islands of Hawaii and Lanai, most around Maui, and good portions around Molokai and Kaho'olawe. As discussed, this protection reduces the overall number of takes and further reduces the severity of effects by minimizing impacts near pupping beaches and in important foraging habitat.

The severity of TTS takes are expected to be low-level, of short duration, and mostly not in a frequency band that would be expected to interfere significantly with conspecific communication, echolocation, or other important low-frequency cues that would affect the individual's reproduction or survival. For these same reasons (low level and frequency band), while a small permanent loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, the one to eight estimated Level A harassment takes by PTS for monk seals, northern fur seals, and harbor seals are unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival of any individuals. Because of the high number of PTS takes for California sea lions and northern elephant seals (87 and 97, respectively), we acknowledge that a few animals could potentially incur permanent hearing loss of a higher degree that could potentially interfere with their successful reproduction and growth. Given the status of the stocks, even if this occurred, it would not adversely impact rates of recruitment or

survival (residual PBR of 13,684 and 5,108, respectively).

Altogether, an individual Hawaiian monk seal and Guadalupe fur seal would be taken no more than a few days in any year with none of the expected take anticipated to affect individual reproduction or survival, let alone annual rates of recruitment and survival. With all other stocks, only a very small portion of the stock will be taken in any manner. Of those taken, some individuals will be taken by Level B harassment (at a moderate or sometimes low level) over several days a year, and some smaller portion of those taken will be on a relatively moderate to high number of days across the year (up to 58), a fair number of which will likely be sequential days. Though the majority of impacts are expected to be of a lower to sometimes moderate severity, the repeated takes over a potentially fair number of sequential days for some individuals makes it more likely that some number of individuals could be interrupted during foraging in a manner and amount such that impacts to the energy budgets of females (from either losing feeding opportunities or expending considerable energy to find alternative feeding options) could cause them to forego reproduction for a year (energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal). As noted previously, however, foregone reproduction (especially for only 1 year within 7, which is the maximum predicted because the small number anticipated in any 1 year makes the probability that any individual would be impacted in this way twice in 7 years very low) has far less of an impact on population rates than mortality and a relatively small number of instances of foregone reproduction (as compared to the stock abundance and residual PBR) are not expected to adversely affect the stock through effects on annual rates of recruitment or survival, especially given the status of these stocks. Accordingly, we do not anticipate the relatively small number of individual northern fur seals or harbor seals that might be taken over repeated days within the year in a manner that results in 1 year of foregone reproduction to adversely affect the stocks through effects on rates of recruitment or survival, given the status of the stocks, which are respectively increasing and stable with abundances

and residual PBRs of 14,050/30,968 and 449/1,598.

For California sea lions, given the very high abundance and residual PBR (257,606 and 13,684, respectively), as well as the increasing status of the stock in the presence of similar levels of Navy activities over past years—the impacts of 0.71 annual mortalities, potential foregone reproduction for up to nine individuals in a year taken by tissue damage, and some relatively small number of individuals taken as a result of repeated behavioral harassment over a fair number of sequential days are not expected to adversely affect the stock through effects on annual rates of recruitment or survival. Similarly, for northern elephant seals, given the very high abundance and residual PBR (187,386 and 5,108, respectively), as well as the increasing status of the stock in the presence of similar levels of Navy activities over past years, the impacts of potential foregone reproduction for up to 2 individuals in a year taken by tissue damage and some relatively small number of individuals taken as a result of repeated behavioral harassment over a fair number of sequential days are not expected to adversely affect the stock through effects on annual rates of recruitment or survival. For these reasons, in consideration of all of the effects of the Navy's activities combined (M/SI, Level A harassment, and Level B harassment), we have determined that the authorized take will have a negligible impact on all pinniped species and stocks.

Determination

The 2018 HSTT final rule included a detailed discussion of all of the anticipated impacts on the affected species and stocks from serious injury or mortality, Level A harassment, and Level B harassment; impacts on habitat; and how the Navy's mitigation and monitoring measures reduce the number and/or severity of adverse effects. We have evaluated how these impacts as well as additional take of two large whales by serious injury or mortality by vessel strike, and the required mitigation measures are expected to combine, annually, to affect individuals of each species and stock. Those effects were then evaluated in the context of whether they are reasonably likely to impact reproductive success or survivorship of individuals and then, if so, further analyzed to determine whether there would be effects on annual rates of recruitment or survival that would adversely affect the species or stock.

As described above, the basis for the negligible impact determination is the

assessment of effects on annual rates of recruitment and survival. Accordingly, the analysis included in the 2018 HSTT final rule and 2020 HSTT final rule used annual activity levels, the best available science, and approved methods to predict the annual impacts to marine mammals, which were then analyzed in the context of whether each species or stock would incur more than a negligible impact based on anticipated adverse impacts to annual rates of recruitment or survival. As we have described above, none of the factors upon which the conclusions in the 2020 HSTT final rule were based have changed, with the exception of estimated take by vessel strike. Therefore, even though this final rule includes two additional takes by vessel strike, little has changed that would change our 2018 HSTT final rule and subsequent 2020 HSTT final rule analyses, and it is appropriate to rely on those analyses, as well as the new information and analysis discussed above, for this final rule.

Based on the applicable information and analysis from the 2018 HSTT final rule and 2020 HSTT final rule, as updated with the information and analysis contained herein on the potential and likely effects of the specified activities on the affected marine mammals and their habitat, and taking into consideration the implementation of the monitoring and mitigation measures, NMFS finds that the incidental take from the specified activities will have a negligible impact on all affected marine mammal species and stocks.

Subsistence Harvest of Marine Mammals

There are no subsistence uses or harvest of marine mammals in the geographic area affected by the specified activities. Therefore, NMFS has determined that the total taking affecting species or stocks would not have an unmitigable adverse impact on the availability of such species or stocks for taking for subsistence purposes.

Classification

Endangered Species Act

There are nine marine mammal species under NMFS jurisdiction that are listed as endangered or threatened under the ESA with confirmed or possible occurrence in the HSTT Study Area: blue whale, fin whale, gray whale (Western North Pacific DPS), humpback whale (Mexico and Central America DPSs), sei whale, sperm whale, false killer whale (Main Hawaiian Islands Insular DPS), Hawaiian monk seal, and

Guadalupe fur seal. There is also ESA-designated critical habitat for Hawaiian monk seals and Main Hawaiian Islands Insular false killer whales. The Navy consulted with NMFS pursuant to section 7 of the ESA for HSTT activities. NMFS also consulted internally on the issuance of the 2018 HSTT regulations and LOAs under section 101(a)(5)(A) of the MMPA.

NMFS issued a Biological Opinion on December 10, 2018 concluding that the issuance of the 2018 HSTT final rule and subsequent LOAs are not likely to jeopardize the continued existence of the threatened and endangered species under NMFS' jurisdiction and are not likely to result in the destruction or adverse modification of critical habitat in the HSTT Study Area. The 2018 Biological Opinion included specified conditions under which NMFS would be required to reinstate section 7 consultation. NMFS reviewed these specified conditions for the 2020 HSTT rulemaking and determined that reinstatement of consultation was not warranted. The incidental take statement that accompanied the 2018 Biological Opinion was amended to cover the 7-year period of the 2020 HSTT rule. The 2018 Biological Opinion for this action is available at <https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>.

The 2018 Biological Opinion reinstatement clause (2), states that formal consultation should be reinstated if "new information reveals effects of the agency action that may affect ESA-listed species or critical habitat in a manner or to an extent not previously considered." Given the new information regarding the recent occurrence of large whale strikes by naval vessels in the southern California portion of the HSTT Study Area, as described herein, the Navy reinstated consultation with NMFS pursuant to section 7 of the ESA for HSTT Study Area activities, and NMFS also reinstated consultation internally on the issuance of these revised regulations and LOAs under section 101(a)(5)(A) of the MMPA.

NMFS issued a reinstated Biological and Conference Opinion on June 3, 2024 concluding that the issuance of the 2024 HSTT final rule and subsequent LOAs are not likely to jeopardize the continued existence of the threatened and endangered species under NMFS' jurisdiction and are not likely to result in the destruction or adverse modification of critical habitat in the HSTT Study Area. The opinion is available at <https://doi.org/10.25923/7y9x-vw84>.

National Marine Sanctuaries Act

Federal agency actions that are likely to injure national marine sanctuary resources are subject to consultation with the Office of National Marine Sanctuaries (ONMS) under section 304(d) of the National Marine Sanctuaries Act (NMSA). There are two national marine sanctuaries in the HSTT Study Area, the Hawaiian Islands Humpback Whale National Marine Sanctuary and the Channel Islands National Marine Sanctuary. NMFS has fulfilled its responsibilities and completed all requirements under the NMSA.

National Environmental Policy Act

To comply with the National Environmental Policy Act of 1969 (NEPA; 42 U.S.C. 4321 *et seq.*) and NOAA Administrative Order (NAO) 216-6A, NMFS must evaluate our proposed actions and alternatives with respect to potential impacts on the human environment. NMFS participated as a cooperating agency on the 2018 HSTT FEIS/OEIS (published on October 26, 2018, <http://www.hstteis.com>) which evaluated impacts from Navy training and testing activities in the HSTT Study Area for the reasonably foreseeable future (including through 2025). In accordance with 40 CFR 1506.3, NMFS independently reviewed and evaluated the 2018 HSTT FEIS/OEIS and determined that it was adequate and sufficient to meet our responsibilities under NEPA for the issuance of the 2018 HSTT final rule and associated LOAs. NMFS therefore adopted the 2018 HSTT FEIS/OEIS.

In accordance with 40 CFR 1502.9 and the information and analysis contained in this final rule, NMFS has determined that this final rule and any subsequent LOAs will not result in impacts that were not fully considered in the 2018 HSTT FEIS/OEIS. As indicated in this final rule, the Navy has made no substantial changes to the activities that are relevant to environmental concerns nor are there substantial new circumstances or information about the significance of adverse effects that bear on the analysis. Therefore, NMFS has determined that the 2018 HSTT FEIS/OEIS remains valid, and there is no need to supplement the document for this rulemaking. NOAA therefore, has adopted the 2018 HSTT FEIS/OEIS. NMFS has prepared a separate Record of Decision. NMFS' Record of Decision for adoption of the 2018 HSTT FEIS/OEIS and issuance of this final rule and subsequent LOAs can be found at

<https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>.

Regulatory Flexibility Act

The Office of Management and Budget has determined that this rule is not significant for purposes of Executive Order 12866.

Pursuant to the Regulatory Flexibility Act (RFA), the Chief Counsel for Regulation of the Department of Commerce has certified to the Chief Counsel for Advocacy of the Small Business Administration during the proposed rule stage that this action would not have a significant economic impact on a substantial number of small entities. The factual basis for the certification was published in the proposed rule and is not repeated here. No comments were received regarding this certification. As a result, a regulatory flexibility analysis was not required and none was prepared.

Waiver of Delay in Effective Date Under the Administrative Procedure Act

NMFS has determined that there is good cause under the Administrative Procedure Act (5 U.S.C. 553(d)) to waive the 30-day delay of the effective date for this rule. This rule relieves the Navy from the restrictions of the take prohibitions under the MMPA by granting the Navy's request for incidental take authorization under MMPA section 101(a)(5)(A). In addition, there is good cause to waive the 30-day effective date period because a delay would be contrary to the public interest and unnecessary. A delay in effectiveness is contrary to public interest because this rule allows the Navy to continue training and testing activities that are necessary for national security in compliance with the MMPA. Further, a delay is unnecessary because this rule is not generally applicable to the public. The Navy is the only entity affected by the regulations, the Navy specifically requested the modification to the regulations, and the Navy has fully agreed to the requirements included herein. The Navy is anticipating finalization of the rule and, as such, is ready to comply immediately upon publication. As such, there is good cause to waive the 30-day delay in effective date.

List of Subjects in 50 CFR Part 218

Administrative practice and procedure, Endangered and threatened species, Fish, Fisheries, Marine mammals, Penalties, Reporting and recordkeeping requirements, Transportation, Wildlife.

Dated: December 23, 2024.

Samuel D. Rauch III,

*Deputy Assistant Administrator for
Regulatory Programs, National Marine
Fisheries Service.*

For reasons set forth in the preamble,
50 CFR part 218 is amended as follows:

**PART 218—REGULATIONS
GOVERNING THE TAKING AND
IMPORTING OF MARINE MAMMALS**

■ 1. The authority citation for part 218
continues to read as follows:

Authority: 16 U.S.C. 1361 *et seq.*

■ 2. Revise subpart H to read as follows:

**Subpart H—Taking and Importing Marine
Mammals; U.S. Navy’s Hawaii-Southern
California Training and Testing (HSTT)**

Sec.

218.70 Specified activity and geographical
region.

218.71 Effective dates.

218.72 Permissible methods of taking.

218.73 Prohibitions.

218.74 Mitigation requirements.

218.75 Requirements for monitoring and
reporting.

218.76 Letters of Authorization (LOA).

218.77 Renewals and modifications of
Letters of Authorization.

218.78–218.79 [Reserved]

**Subpart H—Taking and Importing
Marine Mammals; U.S. Navy’s Hawaii-
Southern California Training and
Testing (HSTT)**

**§ 218.70 Specified activity and
geographical region.**

(a) Regulations in this subpart apply
only to the U.S. Navy (Navy) for the

taking of marine mammals that occurs
in the area described in paragraph (b) of
this section and that occurs incidental
to the activities listed in paragraph (c)
of this section.

(b) The taking of marine mammals by
the Navy under this subpart may be
authorized in Letters of Authorization
(LOAs) only if it occurs within the
Hawaii-Southern California Training
and Testing (HSTT) Study Area, which
includes established operating and
warning areas across the north-central
Pacific Ocean, from the mean high tide
line in Southern California west to
Hawaii and the International Date Line.
The HSTT Study Area includes the at-
sea areas of three existing range
complexes, the Hawaii Range Complex
(HRC), the Southern California Range
Complex (SOCAL), and the Silver
Strand Training Complex, and overlaps
a portion of the Point Mugu Sea Range
(PMSR). Also included in the HSTT
Study Area are Navy pierside locations
in Hawaii and Southern California,
Pearl Harbor, San Diego Bay, and the
transit corridor on the high seas where
sonar training and testing may occur.

(c) The taking of marine mammals by
the Navy is only authorized if it occurs
incidental to the Navy conducting
training and testing activities:

- (1) *Training.* (i) Amphibious warfare;
- (ii) Anti-submarine warfare;
- (iii) Electronic warfare;
- (iv) Expeditionary warfare;
- (v) Mine warfare;
- (vi) Surface warfare; and
- (vii) Pile driving.

(2) *Testing.* (i) Naval Air Systems
Command Testing Activities;

(ii) Naval Sea System Command
Testing Activities;

(iii) Office of Naval Research Testing
Activities; and

(iv) Naval Information Warfare
Systems Command.

§ 218.71 Effective dates.

This subpart is effective from January
16, 2025, through December 20, 2025.

§ 218.72 Permissible methods of taking.

(a) Under LOAs issued pursuant to
§§ 216.106 of this chapter and 218.76,
the Holder of the LOAs (hereinafter
“Navy”) may incidentally, but not
intentionally, take marine mammals
within the area described in § 218.70(b)
by Level A harassment and Level B
harassment associated with the use of
active sonar and other acoustic sources
and explosives as well as serious injury
or mortality associated with vessel
strikes and explosives, provided the
activity is in compliance with all terms,
conditions, and requirements of these
regulations in this subpart and the
applicable LOAs.

(b) The incidental take of marine
mammals by the activities listed in
§ 218.70(c) is limited to the following
species:

TABLE 1 TO PARAGRAPH (b)

Species	Stock
Blue whale	Central North Pacific
Blue whale	Eastern North Pacific
Bryde’s whale	Eastern Tropical Pacific
Bryde’s whale	Hawaii
Fin whale	CA/OR/WA
Fin whale	Hawaii
Humpback whale	Central America/Southern Mexico-CA/OR/WA
Humpback whale	Mainland Mexico-CA/OR/WA
Humpback whale	Hawaii
Minke whale	CA/OR/WA
Minke whale	Hawaii
Sei whale	Eastern North Pacific
Sei whale	Hawaii
Gray whale	Eastern North Pacific
Gray whale	Western North Pacific
Sperm whale	CA/OR/WA
Sperm whale	Hawaii
Dwarf sperm whale	Hawaii
Pygmy sperm whale	Hawaii
Kogia whales	CA/OR/WA
Baird’s beaked whale	CA/OR/WA
Blainville’s beaked whale	Hawaii
Goose-beaked whale	CA/OR/WA
Goose-beaked whale	Hawaii
Longman’s beaked whale	Hawaii
Mesoplodon spp.	CA/OR/WA

TABLE 1 TO PARAGRAPH (b)—Continued

<i>Species</i>	<i>Stock</i>
Bottlenose dolphin	California Coastal
Bottlenose dolphin	CA/OR/WA Offshore
Bottlenose dolphin	Hawaii Pelagic
Bottlenose dolphin	Kauai & Niihau
Bottlenose dolphin	Oahu
Bottlenose dolphin	4-Island
Bottlenose dolphin	Hawaii
False killer whale	Hawaii Pelagic
False killer whale	Main Hawaiian Islands Insular
False killer whale	Northwestern Hawaiian Islands
Fraser's dolphin	Hawaii
Killer whale	Eastern North Pacific (ENP) Offshore
Killer whale	ENP Transient/West Coast Transient
Killer whale	Hawaii
Long-beaked common dolphin	California
Melon-headed whale	Hawaiian Islands
Melon-headed whale	Kohala Resident
Northern right whale dolphin	CA/OR/WA
Pacific white-sided dolphin	CA/OR/WA
Pantropical spotted dolphin	Hawaii Island
Pantropical spotted dolphin	Hawaii Pelagic
Pantropical spotted dolphin	Oahu
Pantropical spotted dolphin	4-Island
Pygmy killer whale	Hawaii
Pygmy killer whale	Tropical
Risso's dolphin	CA/OR/WA
Risso's dolphin	Hawaii
Rough-toothed dolphin	Hawaii
Short-beaked common dolphin	CA/OR/WA
Short-finned pilot whale	CA/OR/WA
Short-finned pilot whale	Hawaii
Spinner dolphin	Hawaii Island
Spinner dolphin	Hawaii Pelagic
Spinner dolphin	Kauai & Niihau
Spinner dolphin	Oahu & 4-Island
Striped dolphin	CA/OR/WA
Striped dolphin	Hawaii
Dall's porpoise	CA/OR/WA
California sea lion	U.S.
Guadalupe fur seal	Mexico
Northern fur seal	California
Harbor seal	California
Hawaiian monk seal	Hawaii
Northern elephant seal	California

Note to Table 1: CA/OR/WA = California/Oregon/Washington.

§ 218.73 Prohibitions.

Except for incidental takings contemplated in § 218.72(a) and authorized by LOAs issued under §§ 216.106 of this chapter and 218.76, it is unlawful for any person to do any of the following in connection with the activities listed in § 218.70(c):

(a) Violate, or fail to comply with, the terms, conditions, and requirements of this subpart or an LOA issued under §§ 216.106 of this chapter and 218.76;

(b) Take any marine mammal not specified in § 218.72(b);

(c) Take any marine mammal specified in § 218.72(b) in any manner other than as specified in the LOAs; or

(d) Take a marine mammal specified in § 218.72(b) after NMFS determines such taking results in more than a negligible impact on the species or stocks of such marine mammal.

§ 218.74 Mitigation requirements.

When conducting the activities identified in § 218.70(c), the mitigation measures contained in any LOAs issued under §§ 216.106 of this chapter and 218.76 must be implemented. These mitigation measures include, but are not limited to:

(a) *Procedural mitigation.* Procedural mitigation is mitigation that the Navy must implement whenever and wherever an applicable training or testing activity takes place within the HSTT Study Area for each applicable activity category or stressor category and includes acoustic stressors (*i.e.*, active sonar, air guns, pile driving, weapons firing noise), explosive stressors (*i.e.*, sonobuoys, torpedoes, medium-caliber and large-caliber projectiles, missiles and rockets, bombs, sinking exercises,

mines, anti-swimmer grenades, and mat weave and obstacle loading), and physical disturbance and strike stressors (*i.e.*, vessel movement; towed in-water devices; small-, medium-, and large-caliber non-explosive practice munitions; non-explosive missiles and rockets; and non-explosive bombs and mine shapes).

(1) *Environmental awareness and education.* Navy personnel (including civilian personnel) involved in mitigation and training or testing activity reporting under the specified activities will complete one or more modules identified in their career path training plan, as specified in the LOAs.

(2) *Active sonar.* Active sonar includes low-frequency active sonar, mid-frequency active sonar, and high-frequency active sonar. For vessel-based

activities, mitigation applies only to sources that are positively controlled and deployed from manned surface vessels (e.g., sonar sources towed from manned surface platforms). For aircraft-based activities, mitigation applies only to sources that are positively controlled and deployed from manned aircraft that do not operate at high altitudes (e.g., rotary-wing aircraft). Mitigation does not apply to active sonar sources deployed from unmanned aircraft or aircraft operating at high altitudes (e.g., maritime patrol aircraft). For active sonar subject mitigation requirements:

(i) *Number of Lookouts and observation platform*—(A) *Hull-mounted sources*. One Lookout is required for hull-mounted sources for platforms with space or manning restrictions while underway (at the forward part of a small boat or ship) and for platforms using active sonar while moored or at anchor (including pierside). Two Lookouts are required for hull mounted-sources for platforms without space or manning restrictions while underway (at the forward part of the ship).

(B) *Sources that are not hull-mounted sources*. One Lookout is required on the ship or aircraft conducting the activity for sources that are not hull-mounted.

(ii) *Mitigation zone and requirements*. During active sonar use, the following requirements apply:

(A) *Powerdown for marine mammals at 1,000 yards*. At 1,000 yards (yd) (914.4 m) from a marine mammal, Navy personnel must power down by 6 decibels (dB).

(B) *Powerdown for marine mammals at 500 yards*. At 500 yd (457.2 m) from a marine mammal, Navy personnel must power down by an additional 4 dB (for a total of 10 dB).

(C) *Shutdowns for marine mammals at 200 yards*. At 200 yd (182.9 m) from a marine mammal, Navy personnel must shut down low-frequency active sonar ≥ 200 dB and hull-mounted mid-frequency active sonar; or Navy personnel must shut down low-frequency active sonar < 200 dB, mid-frequency active sonar sources that are not hull-mounted, and high-frequency active sonar.

(D) *Prior to activity*. Prior to the start of the active sonar activity (e.g., when maneuvering on station), Navy personnel must observe the 1,000 yd (914.4 m) mitigation zone for floating vegetation; if floating vegetation is observed in the mitigation zone, Navy personnel must relocate or delay the start of active sonar transmission until the mitigation zone is clear. Navy personnel must also observe the mitigation zone for marine mammals; if

marine mammals are observed, Navy personnel must relocate or delay the start of active sonar transmission.

(E) *During the activity for low-frequency active sonar at or above 200 dB and hull-mounted mid-frequency active sonar*. When using low-frequency active sonar at or above 200 dB and hull-mounted mid-frequency active sonar, Navy personnel must observe the 1,000 yd (914.4 m) mitigation zone for marine mammals and power down active sonar transmission by 6 dB if marine mammals are observed within 1,000 yd (914.4 m) of the sonar source; power down by an additional 4 dB (for a total of 10 dB total) if marine mammals are observed within 500 yd (457.2 m) of the sonar source; and cease transmission if marine mammals are observed within 200 yd (182.9 m) of the sonar source.

(F) *During the activity for low-frequency active sonar below 200 dB, mid-frequency active sonar sources that are not hull mounted, and high-frequency active sonar*. During the activity for low-frequency active sonar below 200 dB, mid-frequency active sonar sources that are not hull mounted, and high-frequency active sonar, Navy personnel must observe the 1,000 yd (914.4 m) mitigation zone for marine mammals and cease active sonar transmission if marine mammals are observed within 200 yd (182.9 m) of the sonar source.

(G) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity*. Navy personnel must allow a sighted marine mammal to leave the mitigation zone indicated in § 218.74(a)(2)(ii) prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing or powering up active sonar transmission) until one of the following conditions has been met:

(1) *Observed exiting*. The animal is observed exiting the mitigation zone;

(2) *Thought to have exited*. The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the sonar source;

(3) *Clear from additional sightings*. The mitigation zone has been clear from any additional sightings for 10 minutes (min) for aircraft-deployed sonar sources or 30 min for vessel-deployed sonar sources;

(4) *Sonar source transit*. For mobile activities, the active sonar source has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting; or

(5) *Bow-riding dolphins*. For activities using hull-mounted sonar where a dolphin(s) is observed in the mitigation

zone, the Lookout concludes that the dolphin(s) are deliberately closing in on the ship to ride the ship's bow wave, and are therefore out of the main transmission axis of the sonar (and there are no other marine mammal sightings within the mitigation zone).

(3) *Air guns*. For activities using air guns:

(i) *Number of Lookouts and observation platform*. One Lookout must be positioned on a ship or pierside.

(ii) *Mitigation zone and requirements*. The mitigation zone is 150 yd (137.2 m) around the air gun.

(A) *Prior to activity*. Prior to the initial start of the activity (e.g., when maneuvering on station), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start until the mitigation zone is clear. Navy personnel must also observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of air gun use.

(B) *During activity*. During the activity, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease air gun use.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity*. Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing air gun use) until one of the following conditions has been met:

(1) *Observed exiting*. The animal is observed exiting the mitigation zone;

(2) *Thought to have exited*. The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the air gun;

(3) *Clear from additional sightings*. The mitigation zone has been clear from any additional sightings for 30 min; or

(4) *Air gun transit*. For mobile activities, the air gun has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting.

(4) *Pile driving*. For pile driving and pile extraction sound during Elevated Causeway System training:

(i) *Number of Lookouts and observation platform*. One Lookout must be positioned on the shore, the elevated causeway, or a small boat.

(ii) *Mitigation zone and requirements*. The mitigation zone is 100 yd (91.4 m) around the pile driver.

(A) *Prior to activity.* Prior to the initial start of the activity (for 30 min), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must delay the start until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must delay the start of pile driving or vibratory pile extraction.

(B) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease impact pile driving or vibratory pile extraction.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.*

Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing pile driving or pile extraction) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the pile driving location; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 30 minutes.

(5) *Weapons firing noise.* For weapons firing noise associated with large-caliber gunnery activities:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned on the ship conducting the firing. Depending on the activity, the Lookout could be the same as the one provided for under “Explosive medium-caliber and large-caliber projectiles” or under “Small-, medium-, and large-caliber non-explosive practice munitions” in paragraphs (a)(8)(i) and (a)(18)(i) of this section.

(ii) *Mitigation zone and requirements.* The mitigation zone is 30 degrees on either side of the firing line out to 70 yd (64 m) from the muzzle of the weapon being fired.

(A) *Prior to activity.* Prior to the start of the activity, Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of weapons firing until the mitigation zone is clear. Navy personnel must also observe the mitigation zone for marine mammals; if marine mammals are observed, Navy

personnel must relocate or delay the start of weapons firing.

(B) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease weapons firing.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.*

Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing weapons firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the firing ship;

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 30 min; or

(4) *Firing ship transit.* For mobile activities, the firing ship has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting.

(6) *Explosive sonobuoys.* For explosive sonobuoys:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned in an aircraft or on a small boat. If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements.* The mitigation zone is 600 yd (548.6 m) around an explosive sonobuoy.

(A) *Prior to activity.* Prior to the initial start of the activity (e.g., during deployment of a sonobuoy field, which typically lasts 20–30 min), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of sonobuoy or source/receiver pair detonations until the mitigation zone is clear. Navy personnel must conduct passive acoustic monitoring for marine mammals and use information from detections to assist visual observations. Navy personnel also must visually observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of sonobuoy or source/receiver pair detonations.

(B) *During activity.* During the activity, Navy personnel must observe

the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease sonobuoy or source/receiver pair detonations.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.*

Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing detonations) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the sonobuoy; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min when the activity involves aircraft that have fuel constraints (e.g., helicopter), or 30 min when the activity involves aircraft that are not typically fuel constrained.

(D) *After activity.* After completion of the activity (e.g., prior to maneuvering off station), when practical (e.g., when platforms are not constrained by fuel restrictions or mission-essential follow-on commitments), Navy personnel must observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(7) *Explosive torpedoes.* For explosive torpedoes:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned in an aircraft. If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements.* The mitigation zone is 2,100 yd (1,920.2 m) around the intended impact location.

(A) *Prior to activity.* Prior to the initial start of the activity (e.g., during deployment of the target), Navy personnel must observe the mitigation zone for floating vegetation and jellyfish aggregations; if floating vegetation or jellyfish aggregations are observed, Navy personnel must relocate or delay the start of firing until the mitigation zone

is clear. Navy personnel must conduct passive acoustic monitoring for marine mammals and use the information from detections to assist visual observations. Navy personnel also must visually observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of firing.

(B) *During activity.* During the activity, Navy personnel must observe for marine mammals and jellyfish aggregations; if marine mammals or jellyfish aggregations are observed, Navy personnel must cease firing.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended impact location; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min when the activity involves aircraft that have fuel constraints, or 30 min when the activity involves aircraft that are not typically fuel constrained.

(D) *After activity.* After completion of the activity (e.g., prior to maneuvering off station), Navy personnel must when practical (e.g., when platforms are not constrained by fuel restrictions or mission-essential follow-on commitments), observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(8) *Explosive medium-caliber and large-caliber projectiles.* For gunnery activities using explosive medium-caliber and large-caliber projectiles, the following mitigation applies to activities using a surface target:

(i) *Number of Lookouts and observation platform.* One Lookout must be on the vessel or aircraft conducting the activity. For activities using explosive large-caliber projectiles, depending on the activity, the Lookout

could be the same as the one described in “Weapons firing noise” in paragraph (a)(5)(i) of this section. If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements—(A) Air-to-surface activities.* The mitigation zone is 200 yd (182.9 m) around the intended impact location for air-to-surface activities using explosive medium-caliber projectiles.

(B) *Surface-to-surface activities, medium-caliber.* The mitigation zone is 600 yd (548.6 m) around the intended impact location for surface-to-surface activities using explosive medium-caliber projectiles.

(C) *Surface-to-surface activities, large-caliber.* The mitigation zone is 1,000 yd (914.4 m) around the intended impact location for surface-to-surface activities using explosive large-caliber projectiles.

(D) *Prior to activity.* Prior to the start of the activity (e.g., when maneuvering on station), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of firing until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of firing.

(E) *During activity.* During the activity, Navy personnel must observe for marine mammals; if marine mammals are observed, Navy personnel must cease firing.

(F) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended impact location;

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min for aircraft-based firing or 30 min for vessel-based firing; or for activities using mobile targets, the intended impact location has transited a distance equal

to double that of the mitigation zone size beyond the location of the last sighting.

(G) *After activity.* After completion of the activity (e.g., prior to maneuvering off station), Navy personnel must, when practical (e.g., when platforms are not constrained by fuel restrictions or mission-essential follow-on commitments), observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(9) *Explosive missiles and rockets.* For aircraft-deployed explosive missiles and rockets. Mitigation applies to activities using a surface target:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned in an aircraft. If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements—(A) Missiles or rockets with 0.6–20 lb net explosive weight.* The mitigation zone is 900 yd (823 m) around the intended impact location for missiles or rockets with 0.6–20 lb net explosive weight.

(B) *Missiles with 21–500 lb net explosive weight.* The mitigation zone is 2,000 yd (1,828.8 m) around the intended impact location for missiles with 21–500 lb net explosive weight.

(C) *Prior to activity.* Prior to the initial start of the activity (e.g., during a fly-over of the mitigation zone), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of firing until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of firing.

(D) *During activity.* During the activity, Navy personnel must observe for marine mammals; if marine mammals are observed, Navy personnel must cease firing.

(E) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the

activity (by delaying the start) or during the activity (by not recommencing firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended impact location; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min when the activity involves aircraft that have fuel constraints, or 30 min when the activity involves aircraft that are not typically fuel constrained.

(F) *After activity.* After completion of the activity (e.g., prior to maneuvering off station), Navy personnel must, when practical (e.g., when platforms are not constrained by fuel restrictions or mission-essential follow-on commitments), observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets will assist in the visual observation of the area where detonations occurred.

(10) *Explosive bombs.* For explosive bombs:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned in an aircraft conducting the activity. If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements.* The mitigation zone is 2,500 yd (2,286 m) around the intended target.

(A) *Prior to activity.* Prior to the initial start of the activity (e.g., when arriving on station), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of bomb deployment until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of bomb deployment.

(B) *During activity.* During the activity (e.g., during target approach), Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease bomb deployment.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.*

Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing bomb deployment) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended target;

(3) *Clear from additional sightings.*

The mitigation zone has been clear from any additional sightings for 10 min; or for activities using mobile targets, the intended target has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting.

(D) *After activity.* After completion of the activity (e.g., prior to maneuvering off station), Navy personnel must, when practical (e.g., when platforms are not constrained by fuel restrictions or mission-essential follow-on commitments), observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(11) *Sinking exercises.* For sinking exercises:

(i) *Number of Lookouts and observation platform.* Two Lookouts (one must be positioned in an aircraft and one must be positioned on a vessel). If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements.* The mitigation zone is 2.5 nautical miles (4.6 km) around the target ship hulk.

(A) *Prior to activity.* Prior to the initial start of the activity (90 min prior to the first firing), Navy personnel must conduct aerial observations of the mitigation zone for floating vegetation and jellyfish aggregations; if floating vegetation or jellyfish aggregations are observed, Navy personnel must delay the start of firing until the mitigation zone is clear. Navy personnel also must

conduct aerial observations of the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must delay the start of firing.

(B) *During activity.* During the activity, Navy personnel must conduct passive acoustic monitoring for marine mammals and use the information from detections to assist visual observations. Navy personnel must visually observe the mitigation zone for marine mammals from the vessel; if marine mammals are observed, Navy personnel must cease firing. Immediately after any planned or unplanned breaks in weapons firing of longer than 2 hours, Navy personnel must observe the mitigation zone for marine mammals from the aircraft and vessel; if marine mammals are observed, Navy personnel must delay recommencement of firing.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.*

Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the target ship hulk; or

(3) *Clear from additional sightings.*

The mitigation zone has been clear from any additional sightings for 30 minutes.

(D) *After activity.* After completion of the activity (for 2 hours after sinking the vessel or until sunset, whichever comes first), Navy personnel must observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets will assist in the visual observation of the area where detonations occurred.

(12) *Explosive mine countermeasure and neutralization activities.* For explosive mine countermeasure and neutralization activities:

(i) *Number of Lookouts and observation platform—(A) Smaller mitigation zone.* One Lookout must be positioned on a vessel or in an aircraft when implementing the smaller mitigation zone.

(B) *Larger mitigation zone.* Two Lookouts (one must be positioned in an aircraft and one must be on a small boat)

when implementing the larger mitigation zone.

(C) *Additional platforms.* If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements—(A) Activities using 0.1–5 lb net explosive weight.* The mitigation zone is 600 yd (548.6 m) around the detonation site for activities using 0.1–5 lb net explosive weight.

(B) *Activities using 6–650 lb net explosive weight.* The mitigation zone is 2,100 yd (1,920.2 m) around the detonation site for activities using 6–650 lb net explosive weight (including high explosive target mines).

(C) *Prior to activity.* Prior to the initial start of the activity (e.g., when maneuvering on station; typically, 10 min when the activity involves aircraft that have fuel constraints, or 30 min when the activity involves aircraft that are not typically fuel constrained), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of detonations until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of detonations.

(D) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals, concentrations of seabirds, and individual foraging seabirds; if marine mammals, concentrations of seabirds, or individual foraging seabirds are observed, Navy personnel must cease detonations.

(E) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity or a sighting of seabird concentrations or individual foraging seabirds during the activity.* Navy personnel must allow a sighted animal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing detonations) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to detonation site; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min

when the activity involves aircraft that have fuel constraints, or 30 min when the activity involves aircraft that are not typically fuel constrained.

(F) *After activity.* After completion of the activity (typically 10 min when the activity involves aircraft that have fuel constraints, or 30 min when the activity involves aircraft that are not typically fuel constrained), Navy personnel must observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(13) *Explosive mine neutralization activities involving Navy divers.* For explosive mine neutralization activities involving Navy divers:

(i) *Number of Lookouts and observation platform—(A) Smaller mitigation zone.* Two Lookouts (two small boats with one Lookout each, or one Lookout must be on a small boat and one must be in a rotary-wing aircraft) when implementing the smaller mitigation zone.

(B) *Larger mitigation zone.* Four Lookouts (two small boats with two Lookouts each), and a pilot or member of an aircrew must serve as an additional Lookout if aircraft are used during the activity, when implementing the larger mitigation zone.

(C) *Divers.* All divers placing the charges on mines will support the Lookouts while performing their regular duties and will report applicable sightings to their supporting small boat or Range Safety Officer.

(D) *Additional platforms.* If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements—(A) Activities under positive control using 0.1–20 lb net explosive weight.* The mitigation zone is 500 yd (457.2 m) around the detonation site during activities under positive control using 0.1–20 lb net explosive weight.

(B) *Activities under positive control using 21–60 lb net explosive weight charges.* The mitigation zone is 1,000 yd (914.4 m) around the detonation site during all activities using time-delay fuses (0.1–29 lb net explosive weight) and during activities under positive control using 21–60 lb net explosive weight charges.

(C) *Prior to activity.* Prior to the initial start of the activity (e.g., when maneuvering on station for activities under positive control; 30 min for activities using time-delay firing devices), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of detonations or fuse initiation until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of detonations or fuse initiation.

(D) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals, concentrations of seabirds, and individual foraging seabirds (in the water and not on shore); if marine mammals, concentrations of seabirds, or individual foraging seabirds are observed, Navy personnel must cease detonations or fuse initiation. To the maximum extent practicable depending on mission requirements, safety, and environmental conditions, Navy personnel must position boats near the mid-point of the mitigation zone radius (but outside of the detonation plume and human safety zone), must position themselves on opposite sides of the detonation location (when two boats are used), and must travel in a circular pattern around the detonation location with one Lookout observing inward toward the detonation site and the other observing outward toward the perimeter of the mitigation zone. If used, Navy aircraft must travel in a circular pattern around the detonation location to the maximum extent practicable. Navy personnel must not set time-delay firing devices (0.1–29 lb net explosive weight) to exceed 10 minutes.

(E) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity or a sighting of seabird concentrations or individual foraging seabirds during the activity.* Navy personnel must allow a sighted animal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing detonations) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the detonation site; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min during activities under positive control with aircraft that have fuel constraints, or 30 min during activities under positive control with aircraft that are not typically fuel constrained and during activities using time-delay firing devices.

(F) *After activity.* After completion of an activity (for 30 min), the Navy must observe for marine mammals for 30 minutes. Navy personnel must observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(14) *Maritime security operations—anti-swimmer grenades—(i) Number of Lookouts and observation platform.* One Lookout must be positioned on the small boat conducting the activity. If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements.* 200 yd (182.9 m) around the intended detonation location.

(A) *Prior to activity.* Prior to the initial start of the activity (e.g., when maneuvering on station), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of detonations until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of detonations.

(B) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease detonations.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing detonations) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended detonation location;

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 30 min; or

(4) *Detonation location transit.* The intended detonation location has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting.

(D) *After activity.* After completion of the activity (e.g., prior to maneuvering off station), Navy personnel must, when practical (e.g., when platforms are not constrained by fuel restrictions or mission-essential follow-on commitments), observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets will assist in the visual observation of the area where detonations occurred.

(15) *Underwater demolition multiple charge—mat weave and obstacle loading exercises.* For underwater demolition multiple charge—mat weave and obstacle loading exercises:

(i) *Number of Lookouts and observation platform.* Two Lookouts (one must be positioned on a small boat and one must be positioned on shore from an elevated platform). If additional platforms are participating in the activity, Navy personnel positioned in those assets (e.g., safety observers, evaluators) must support observing the mitigation zone while performing their regular duties.

(ii) *Mitigation zone and requirements.* The mitigation zone is 700 yd (640.1 m) around the intended detonation location.

(A) *Prior to activity.* Prior to the initial start of the activity, or 30 min prior to the first detonation, the Lookout positioned on a small boat must observe the mitigation zone for floating vegetation and marine mammals; if floating vegetation or marine mammals are observed, Navy personnel must delay the start of detonations until the mitigation zone is clear. For 10 min prior to the first detonation, the Lookout positioned on shore must use binoculars to observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must delay the start of detonations.

(B) *During activity.* During the activity, Navy personnel must observe

the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease detonations.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing detonations) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the detonation location; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min (as determined by the Navy shore observer).

(D) *After activity.* After completion of the activity (for 30 min), the Lookout positioned on a small boat must observe for marine mammals in the vicinity of where detonations occurred; if any injured or dead marine mammals are observed, Navy personnel must follow established incident reporting procedures. If additional platforms are supporting this activity (e.g., providing range clearance), these Navy assets must assist in the visual observation of the area where detonations occurred.

(16) *Vessel movement.* The following requirements apply to vessel movement, except mitigation will not be applied if: the vessel's safety is threatened; the vessel is restricted in its ability to maneuver (e.g., during launching and recovery of aircraft or landing craft, during towing activities, when mooring); the vessel is operated autonomously; or when impracticable based on mission requirements (e.g., during Amphibious Assault—Battalion Landing exercise).

(i) *Number of Lookouts and observation platform.* One Lookout must be on the vessel that is underway.

(ii) *Mitigation zone and requirements—(A) Whales.* The mitigation zone is 500 yd (457.2 m) around whales.

(B) *Marine mammals other than whales.* The mitigation zone is 200 yd (182.9 m) around all other marine mammals (except bow-riding dolphins and pinnipeds hauled out on man-made navigational structures, port structures, and vessels).

(iii) *During the activity.* When underway, Navy personnel must observe the mitigation zone for marine

mammals; if marine mammals are observed, Navy personnel must maneuver (which may include reducing speed as the mission or circumstances allow) to maintain distance.

(iv) *Incident reporting procedures.* If a marine mammal vessel strike occurs, Navy personnel must follow the established incident reporting procedures.

(v) *Post-strike alerts.* Navy personnel must send alerts to Navy vessels of increased risk of strike following any reported Navy vessel strike in the HSTT Study Area.

(vi) *Large whale aggregation alerts.* Navy personnel must issue real-time notifications to Navy vessels of large whale aggregations (four or more whales) within 1 nmi (1.9 km) of a Navy vessel in the area between 32–33 degrees North and 117.2–119.5 degrees West.

(17) *Towed in-water devices.* The following mitigation applies to devices that are towed from a manned surface platform or manned aircraft, except the mitigation will not be applied if the safety of the towing platform or in-water device is threatened:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned on a manned towing platform.

(ii) *Mitigation zone and requirements.* The mitigation zone is 250 yd (228.6 m) around marine mammals.

(iii) *During the activity.* During the activity (*i.e.*, when towing an in-water device), Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must maneuver to maintain distance.

(18) *Small-, medium-, and large-caliber non-explosive practice munitions.* For small-, medium-, and large-caliber non-explosive practice munitions, the following mitigation applies to activities using a surface target:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned on the platform conducting the activity. Depending on the activity, the Lookout could be the same as the one described for “Weapons firing noise” in paragraph (a)(5)(i) of this section.

(ii) *Mitigation zone and requirements.* The mitigation zone is 200 yd (182.9 m) around the intended impact location.

(A) *Prior to activity.* Prior to the start of the activity (*e.g.*, when maneuvering on station), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of firing until the

mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of firing.

(B) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must cease firing.

(C) *Commencement/recommencement conditions after a marine mammal sighting before or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended impact location;

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min for aircraft-based firing or 30 min for vessel-based firing; or

(4) *Impact location transit.* For activities using a mobile target, the intended impact location has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting.

(19) *Non-explosive missiles and rockets.* For aircraft-deployed non-explosive missiles and rockets, the following mitigation applies to activities using a surface target.

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned in an aircraft.

(ii) *Mitigation zone and requirements.* The mitigation zone is 900 yd (823 m) around the intended impact location.

(A) *Prior to activity.* Prior to the initial start of the activity (*e.g.*, during a fly-over of the mitigation zone), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of firing until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of firing.

(B) *During activity.* During the activity, Navy personnel must observe the mitigation zone for marine mammals; if marine mammals are

observed, Navy personnel must cease firing.

(C) *Commencement/recommencement conditions after a marine mammal sighting prior to or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing firing) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended impact location; or

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min when the activity involves aircraft that have fuel constraints, or 30 min when the activity involves aircraft that are not typically fuel constrained.

(20) *Non-explosive bombs and mine shapes.* For non-explosive bombs and non-explosive mine shapes during mine laying activities:

(i) *Number of Lookouts and observation platform.* One Lookout must be positioned in an aircraft.

(ii) *Mitigation zone and requirements.* The mitigation zone is 1,000 yd (914.4 m) around the intended target.

(A) *Prior to activity.* Prior to the initial start of the activity (*e.g.*, when arriving on station), Navy personnel must observe the mitigation zone for floating vegetation; if floating vegetation is observed, Navy personnel must relocate or delay the start of bomb deployment or mine laying until the mitigation zone is clear. Navy personnel also must observe the mitigation zone for marine mammals; if marine mammals are observed, Navy personnel must relocate or delay the start of bomb deployment or mine laying.

(B) *During activity.* During the activity (*e.g.*, during approach of the target or intended minefield location), Navy personnel must observe the mitigation zone for marine mammals and, if marine mammals are observed, Navy personnel must cease bomb deployment or mine laying.

(C) *Commencement/recommencement conditions after a marine mammal sighting prior to or during the activity.* Navy personnel must allow a sighted marine mammal to leave the mitigation zone prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing bomb deployment or mine laying) until one of the following conditions has been met:

(1) *Observed exiting.* The animal is observed exiting the mitigation zone;

(2) *Thought to have exited.* The animal is thought to have exited the mitigation zone based on a determination of its course, speed, and movement relative to the intended target or minefield location;

(3) *Clear from additional sightings.* The mitigation zone has been clear from any additional sightings for 10 min; or

(4) *Target transit.* For activities using mobile targets, the intended target has transited a distance equal to double that of the mitigation zone size beyond the location of the last sighting.

(b) *Mitigation areas.* In addition to procedural mitigation, Navy personnel must implement mitigation measures within mitigation areas to avoid or reduce potential impacts on marine mammals.

(1) *Mitigation areas for marine mammals in the Hawaii Range Complex for sonar, explosives, and vessel strikes—(i) Mitigation area requirements—(A) Hawaii Island Mitigation Area (year-round)—(1) MF1 surface ship hull-mounted mid-frequency active sonar, MF4 dipping sonar, or explosives.* Except as provided in paragraph (b)(1)(i)(A)(2) of this section, within the Hawaii Island Mitigation Area, Navy personnel must not conduct more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of MF4 dipping sonar annually, or use explosives that could potentially result in takes of marine mammals during training and testing.

(2) *National security exception.* Should national security require conduct of more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of MF4 dipping sonar, or use of explosives that could potentially result in the take of marine mammals during training or testing, Naval units must obtain permission from the appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., sonar hours or explosives usage) in its annual activity reports submitted to NMFS.

(B) *4-Islands Region Mitigation Area (November 15–April 15 for active sonar; year-round for explosives)—(1) MF1 surface ship hull-mounted mid-frequency active sonar or explosives.* Except as provided in paragraph (b)(1)(i)(B)(2) of this section, within the 4-Islands Region Mitigation Area, Navy personnel must not use MF1 surface ship hull-mounted mid-frequency active sonar from November 15–April 15 or

explosives that could potentially result in takes of marine mammals at any time during training and testing.

(2) *National security exception.* Should national security require use of MF1 surface ship hull-mounted mid-frequency active sonar or explosives that could potentially result in the take of marine mammals during training or testing, Naval units must obtain permission from the appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., sonar hours or explosives usage) in its annual activity reports submitted to NMFS.

(C) *Humpback Whale Special Reporting Areas (December 15–April 15).* Navy personnel must report the total hours of surface ship hull-mounted mid-frequency active sonar used in the Humpback Whale Special Reporting Areas established from December 15–April 15 in its annual training and testing activity reports submitted to NMFS.

(D) *Humpback Whale Awareness Notification Message Area (November–April).* The following requirements apply in the Humpback Whale Awareness Notification Message Area established from November–April.

(1) *Seasonal awareness notification message.* Navy personnel must issue a seasonal awareness notification message to alert ships and aircraft operating in the area to the possible presence of concentrations of large whales, including humpback whales.

(2) *Vessel instruction.* To maintain safety of navigation and to avoid interactions with large whales during transits, Navy personnel must instruct vessels to remain vigilant to the presence of large whale species (including humpback whales).

(3) *Awareness notification message use.* Platforms must use the information from the awareness notification message to assist their visual observation of applicable mitigation zones during training and testing activities and to aid in the implementation of procedural mitigation.

(ii) [Reserved]

(2) *Mitigation areas for marine mammals in the southern California portion of the study area for sonar, explosives, and vessel strikes—(i) Mitigation area requirements—(A) San Diego Arc, San Nicolas Island, and Santa Monica/Long Beach Mitigation Areas (June 1–October 31)—(1) MF1 surface ship hull-mounted mid-frequency active sonar.* Except as provided in paragraph (b)(2)(i)(A)(2) of this section, within the San Diego Arc,

San Nicolas Island, and Santa Monica/Long Beach Mitigation Areas from June 1–October 31, Navy personnel must not conduct more than a total of 200 hours of MF1 surface ship hull-mounted mid-frequency active sonar in the combined areas, excluding normal maintenance and systems checks, during training and testing.

(2) *National security exception.* Should national security require conduct of more than 200 hours of MF1 surface ship hull-mounted mid-frequency active sonar in the combined areas during training and testing (excluding normal maintenance and systems checks), Naval units must obtain permission from the appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., sonar hours) in its annual activity reports submitted to NMFS.

(3) *Explosives in San Diego Arc Mitigation Area.* Except as provided in paragraph (b)(2)(i)(A)(4) of this section, within the San Diego Arc Mitigation Area, Navy personnel must not use explosives that could potentially result in the take of marine mammals during large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training and testing.

(4) *National security exception.* Should national security require use of explosives that could potentially result in the take of marine mammals during large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training or testing within the San Diego Arc Mitigation Area, Naval units must obtain permission from the appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., explosives usage) in its annual activity reports submitted to NMFS.

(5) *Explosives in San Nicolas Island Mitigation Area.* Except as provided in paragraph (b)(2)(i)(A)(6) of this section, within the San Nicolas Island Mitigation Area, Navy personnel must not use explosives that could potentially result in the take of marine mammals during mine warfare, large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training.

(6) *National security exception.* Should national security require use of explosives that could potentially result in the take of marine mammals during mine warfare, large-caliber gunnery,

torpedo, bombing, and missile (including 2.75-inch rockets) activities during training in the San Nicolas Island Mitigation Area, Naval units must obtain permission from the appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., explosives usage) in its annual activity reports submitted to NMFS.

(7) *Explosives in the Santa Monica/Long Beach Mitigation Area.* Except as provided in paragraph (b)(2)(i)(A)(8) of this section, within the Santa Monica/Long Beach Mitigation Area, Navy personnel must not use explosives that could potentially result in the take of marine mammals during mine warfare, large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training and testing.

(8) *National security exception.* Should national security require use of explosives that could potentially result in the take of marine mammals during mine warfare, large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training or testing in the Santa Monica/Long Beach Mitigation Area, Naval units must obtain permission from the appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., explosives usage) in its annual activity reports submitted to NMFS.

(B) *Santa Barbara Island Mitigation Area (year-round)*—(1) *MF1 surface ship hull-mounted mid-frequency active sonar or explosives.* Except as provided in paragraph (b)(2)(i)(B)(2) of this section, within the Santa Barbara Island Mitigation Area, Navy personnel must not use MF1 surface ship hull-mounted mid-frequency active sonar during training or testing, or explosives that could potentially result in the take of marine mammals during medium-caliber or large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training.

(2) *National security exception.* Should national security require use of MF1 surface ship hull-mounted mid-frequency active sonar during training or testing, or explosives that could potentially result in the take of marine mammals during medium-caliber or large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) activities during training, Naval units must obtain permission from the

appropriate designated Command authority prior to commencement of the activity. Navy personnel must provide NMFS with advance notification and include the information (e.g., sonar hours or explosives usage) in its annual activity reports submitted to NMFS.

(C) *Spring Large Whale Awareness Notification Message*—(1) *Awareness notification message.* Navy personnel must issue an awareness notification message during the spring to alert ships and aircraft within the eastern Pacific to the possible presence of concentrations of large whales, including blue whales, fin whales, and humpback whales.

(2) *Applicable period.* This message must apply to a period that is based on predicted oceanographic conditions for a given year.

(3) *Marine mammals and vessel transit.* To maintain safety of navigation and to avoid interactions with large whales during transits, Navy personnel must instruct personnel on vessels that when a marine mammal is spotted, this may be an indicator that additional marine mammals are present nearby, and increased vigilance and awareness of Navy personnel is warranted.

(4) *Platform use of message.* Platforms must use the information from the awareness notification messages to assist their visual observation of applicable mitigation zones during training and testing activities and to aid in the implementation of procedural mitigation.

(D) *Gray Whale (November–March) and Fin Whale (November–May) Awareness Notification Message Areas.* The following requirements apply in the Gray Whale Awareness Notification Areas from November–March and Fin Whale Awareness Notification Message Areas from November–May.

(1) *Seasonal awareness message.* Navy personnel must issue a seasonal awareness notification message to alert ships and aircraft operating in the area to the possible presence of concentrations of large whales, including gray whales, and fin whales.

(2) *Marine mammals and vessel transit.* To maintain safety of navigation and to avoid interactions with large whales during transits, Navy personnel must instruct personnel on vessels to remain vigilant to the presence of large whale species.

(3) *Platform use of message.* Platforms must use the information from the awareness notification messages to assist their visual observation of applicable mitigation zones during training and testing activities and to aid in the implementation of procedural mitigation.

(ii) [Reserved]

§ 218.75 Requirements for monitoring and reporting.

(a) *Unauthorized take.* Navy personnel must notify NMFS immediately (or as soon as operational security considerations allow) if the specified activity identified in § 218.70 is thought to have resulted in the mortality or serious injury of any marine mammals, or in any Level A harassment or Level B harassment of marine mammals not identified in § 218.72(b).

(b) *Monitoring and reporting under the LOAs.* The Navy must conduct all monitoring and reporting required under the LOAs. Details on program goals, objectives, project selection process, and current projects are available at www.navy.mil/speciesmonitoring.us.

(c) *Notification of injured, live stranded, or dead marine mammals.* The Navy must comply with all notification and reporting requirements under the LOAs. The Notification and Reporting Plan, which sets out notification, reporting, and other requirements when dead, injured, or live stranded marine mammals are detected. The Notification and Reporting Plan is available at <https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities>.

(d) *Changes in Lookout policies.* The Navy must report changes in its Lookout policies to NMFS as soon as practicable after a change is made.

(e) *Annual HSTT Study Area marine species monitoring report.* The Navy must submit an annual report of the HSTT Study Area monitoring describing the implementation and results from the previous calendar year. Data collection methods must be standardized across range complexes and study areas to allow for comparison in different geographic locations. The report must be submitted to the Director, Office of Protected Resources, NMFS, either within 3 months after the end of the calendar year, or within 3 months after the conclusion of the monitoring year, to be determined by the Adaptive Management process. This report will describe progress of knowledge made with respect to intermediate scientific objectives within the HSTT Study Area associated with the Integrated Comprehensive Monitoring Program (ICMP). Similar study questions must be treated together so that progress on each topic can be summarized across all Navy ranges. The report need not include analyses and content that does not provide direct assessment of cumulative progress on the monitoring plan study questions. As an alternative,

the Navy may submit a multi-Range Complex annual Monitoring Plan report to fulfill this requirement. Such a report will describe progress of knowledge made with respect to monitoring study questions across multiple Navy ranges associated with the ICMP. Similar study questions must be treated together so that progress on each topic can be summarized across multiple Navy ranges. The report need not include analyses and content that does not provide direct assessment of cumulative progress on the monitoring study question. This will continue to allow the Navy to provide a cohesive monitoring report covering multiple ranges (as per ICMP goals), rather than entirely separate reports for the HSTT, Gulf of Alaska, Mariana Islands, and Northwest Study Areas.

(f) *Annual HSTT Study Area training exercise report and testing activity report.* Each year, the Navy must submit two preliminary reports (Quick Look Report) detailing the status of authorized sound sources within 21 days after the anniversary of the date of issuance of each LOA to the Director, Office of Protected Resources, NMFS. Each year, the Navy must submit detailed reports to the Director, Office of Protected Resources, NMFS, within 3 months after the 1-year anniversary of the date of issuance of the LOA. The HSTT annual Training Exercise Report and Testing Activity Report can be consolidated with other exercise reports from other range complexes in the Pacific Ocean for a single Pacific Exercise Report, if desired. The annual reports must contain information on major training exercises (MTEs), Sinking Exercise (SINKEX) events, and a summary of all sound sources used, including within specific mitigation reporting areas, as described in paragraphs (f)(3) through (5) of this section. The analysis in the detailed reports must be based on the accumulation of data from the current year's report and data collected from previous reports. The detailed reports must contain information identified in paragraphs (f)(1) through (9) of this section.

(1) *MTEs.* This section of the report must contain the following information for MTEs conducted in the HSTT Study Area.

(i) Exercise information (for each MTE).

(A) Exercise designator.

(B) Date that exercise began and ended.

(C) Location.

(D) Number and types of active sonar sources used in the exercise.

(E) Number and types of passive acoustic sources used in exercise.

(F) Number and types of vessels, aircraft, and other platforms participating in each exercise.

(G) Total hours of all active sonar source operation.

(H) Total hours of each active sonar source bin.

(I) Wave height (high, low, and average) during exercise.

(ii) Individual marine mammal sighting information for each sighting in each exercise where mitigation was implemented:

(A) Date, time, and location of sighting.

(B) Species (if not possible, indication of whale/dolphin/pinniped).

(C) Number of individuals.

(D) Initial Detection Sensor (*e.g.*, sonar, Lookout).

(E) Indication of specific type of platform observation was made from (including, for example, what type of surface vessel or testing platform).

(F) Length of time observers maintained visual contact with marine mammal.

(G) Sea state.

(H) Visibility.

(I) Sound source in use at the time of sighting.

(J) Indication of whether animal was less than 200 yd (182.9 m), 200 to 500 yd (182.9 to 457.2 m), 500 to 1,000 yd (457.2 m to 914.4 m), 1,000 to 2,000 yd (914.4 m to 1,828.8 m), or greater than 2,000 yd (1,828.8 m) from sonar source.

(K) Whether operation of sonar sensor was delayed, or sonar was powered or shut down, and the length of the delay.

(L) If source in use was hull-mounted, true bearing of animal from the vessel, true direction of vessel's travel, and estimation of animal's motion relative to vessel (opening, closing, parallel).

(M) Lookouts must report, in plain language and without trying to categorize in any way, the observed behavior of the animal(s) (such as animal closing to bow ride, paralleling course/speed, floating on surface and not swimming, *etc.*) and if any calves were present.

(iii) An evaluation (based on data gathered during all of the MTEs) of the effectiveness of mitigation measures designed to minimize the received level to which marine mammals may be exposed. This evaluation must identify the specific observations that support any conclusions the Navy reaches about the effectiveness of the mitigation.

(2) *SINKEXs.* This section of the report must include the following information for each SINKEX completed that year.

(i) Exercise information (gathered for each SINKEX).

(A) Location.

(B) Date and time exercise began and ended.

(C) Total hours of observation by Lookouts before, during, and after exercise.

(D) Total number and types of explosive source bins detonated.

(E) Number and types of passive acoustic sources used in exercise.

(F) Total hours of passive acoustic search time.

(G) Number and types of vessels, aircraft, and other platforms participating in exercise.

(H) Wave height in feet (high, low, and average) during exercise.

(I) Narrative description of sensors and platforms utilized for marine mammal detection and timeline illustrating how marine mammal detection was conducted.

(ii) Individual marine mammal observation (by Navy Lookouts) information for each sighting where mitigation was implemented.

(A) Date/Time/Location of sighting.

(B) Species (if not possible, indicate whale, dolphin, or pinniped).

(C) Number of individuals.

(D) Initial detection sensor (*e.g.*, sonar or Lookout).

(E) Length of time observers maintained visual contact with marine mammal.

(F) Sea state.

(G) Visibility.

(H) Whether sighting was before, during, or after detonations/exercise, and how many minutes before or after.

(I) Distance of marine mammal from actual detonations (or target spot if not yet detonated): Less than 200 yd (182.9 m), 200 to 500 yd (182.9 to 457.2 m), 500 to 1,000 yd (457.2 m to 914.4 m), 1,000 to 2,000 yd (914.4 m to 1,828.8 m), or greater than 2,000 yd (1,828.8 m).

(J) Lookouts must report, in plain language and without trying to categorize in any way, the observed behavior of the animal(s) (such as animal closing to bow ride, paralleling course/speed, floating on surface and not swimming *etc.*), including speed and direction and if any calves were present.

(K) The report must indicate whether explosive detonations were delayed, ceased, modified, or not modified due to marine mammal presence and for how long.

(L) If observation occurred while explosives were detonating in the water, indicate munition type in use at time of marine mammal detection.

(3) *Summary of sources used.* This section of the report must include the following information summarized from the authorized sound sources used in all training and testing events:

(i) Total annual hours or quantity (per the LOA) of each bin of sonar or other acoustic sources (*e.g.*, pile driving and air gun activities); and

(ii) Total annual expended/detonated ordinance (missiles, bombs, sonobuoys, *etc.*) for each explosive bin.

(4) *Humpback Whale Special Reporting Area (December 15–April 15)*. The Navy must report the total hours of operation of surface ship hull-mounted mid-frequency active sonar used in the Humpback Whale Special Reporting Area.

(5) *Mitigation areas*. The Navy must report any use of restricted acoustic and explosive sources identified in § 218.74(b). Information included in the classified annual reports may be used to inform future adaptive management of activities within the HSTT Study Area.

(6) *Geographic information presentation*. The reports must present an annual (and seasonal, where practical) depiction of training and testing bin usage (as well as pile driving activities) geographically across the HSTT Study Area.

(7) *Sonar exercise notification*. The Navy must submit to NMFS (contact as specified in the LOA) an electronic report within 15 calendar days after the completion of any MTE indicating:

- (i) Location of the exercise;
- (ii) Beginning and end dates of the exercise; and
- (iii) Type of exercise.

(8) *Large whale aggregations*. For each instance that an aggregation of large whales (4 or more whales within 1 nmi (1.9 km)) is reported in the area between 32–33 degrees North and 117.2–119.5 degrees West, Navy personnel must report the following information and to the extent practicable, this information should be provided in the Navy's unclassified version of these reports:

- (i) Date, time, and general location (*e.g.*, approximately 10–12 nmi (18.5 to 22.2 km) Southeast of San Clemente Island) of the whales when the aggregation was first sighted
- (ii) Total number of whales observed within 1 nmi (1.9 km) of a Navy vessel that make up the aggregation
- (iii) Approximate distance (or distances if more than 1 group of whales is sighted) of the vessel from the whales in the aggregation when the whales were first sighted.

(9) *Foreign military sonar and explosives*. Navy personnel must confirm that foreign military use of sonar and explosives, when such militaries are participating in a U.S. Navy-led exercise or event, combined with the U.S. Navy's use of sonar and explosives, would not cause exceedance of the analyzed levels within each

NAEMO modeled sonar and explosive bin used for estimating predicted impacts.

(g) *7-year close-out comprehensive training and testing activity report*. This report must be included as part of the 2025 annual training and testing report. This report must provide the annual totals for each sound source bin with a comparison to the annual allowance and the 7-year total for each sound source bin with a comparison to the 7-year allowance. Additionally, if there were any changes to the sound source allowance, this report must include a discussion of why the change was made and include the analysis to support how the change did or did not result in a change in the 2018 HSTT FEIS/OEIS and final rule determinations. The draft report must be submitted within 3 months after the expiration of this subpart to the Director, Office of Protected Resources, NMFS. NMFS must submit comments on the draft close-out report, if any, within 3 months of receipt. The report will be considered final after the Navy has addressed NMFS' comments, or 3 months after the submittal of the draft if NMFS does not provide comments.

§ 218.76 Letters of Authorization (LOA).

(a) To incidentally take marine mammals pursuant to the regulations in this subpart, the Navy must apply for and obtain LOAs in accordance with § 216.106 of this chapter.

(b) LOAs, unless suspended or revoked, may be effective for a period of time not to exceed December 20, 2025.

(c) If an LOA expires prior to December 20, 2025, the Navy may apply for and obtain a renewal of the LOA.

(d) In the event of projected changes to the activity or to mitigation, monitoring, or reporting (excluding changes made pursuant to the adaptive management provision of § 218.77(c)(1)) required by an LOA issued under this subpart, the Navy must apply for and obtain a modification of the LOA as described in § 218.77.

(e) Each LOA must set forth:

- (1) Permissible methods of incidental taking;
- (2) Geographic areas for incidental taking;
- (3) Means of effecting the least practicable adverse impact (*i.e.*, mitigation) on the species or stocks of marine mammals and their habitat; and
- (4) Requirements for monitoring and reporting.

(f) Issuance of the LOA(s) must be based on a determination that the level of taking is consistent with the findings made for the total taking allowable under the regulations in this subpart.

(g) Notice of issuance or denial of the LOA(s) must be published in the **Federal Register** within 30 days of a determination.

§ 218.77 Renewals and modifications of Letters of Authorization.

(a) An LOA issued under §§ 216.106 of this chapter and 218.76 for the activity identified in § 218.70(c) may be renewed or modified upon request by the applicant, provided that:

(1) The planned specified activity and mitigation, monitoring, and reporting measures, as well as the anticipated impacts, are the same as those described and analyzed for the regulations in this subpart (excluding changes made pursuant to the adaptive management provision in paragraph (c)(1) of this section); and

(2) NMFS determines that the mitigation, monitoring, and reporting measures required by the previous LOA(s) were implemented.

(b) For LOA modification or renewal requests by the applicant that include changes to the activity or to the mitigation, monitoring, or reporting measures (excluding changes made pursuant to the adaptive management provision in paragraph (c)(1) of this section) that do not change the findings made for the regulations or result in no more than a minor change in the total estimated number of takes (or distribution by species or stock or years), NMFS may publish a notice of planned LOA in the **Federal Register**, including the associated analysis of the change, and solicit public comment before issuing the LOA.

(c) An LOA issued under §§ 216.106 of this chapter and 218.76 may be modified by NMFS under the following circumstances:

(1) After consulting with the Navy regarding the practicability of the modifications, NMFS may modify (including adding or removing measures) the existing mitigation, monitoring, or reporting measures if doing so creates a reasonable likelihood of more effectively accomplishing the goals of the mitigation and monitoring.

(i) Possible sources of data that could contribute to the decision to modify the mitigation, monitoring, or reporting measures in an LOA include:

- (A) Results from the Navy's monitoring from the previous year(s);
- (B) Results from other marine mammal and/or sound research or studies; or

(C) Any information that reveals marine mammals may have been taken in a manner, extent, or number not authorized by the regulations in this subpart or subsequent LOAs.

(ii) If, through adaptive management, the modifications to the mitigation, monitoring, or reporting measures are substantial, NMFS will publish a notice of planned LOA in the **Federal Register** and solicit public comment.

(2) If NMFS determines that an emergency exists that poses a significant risk to the well-being of the species or stocks of marine mammals specified in LOAs issued pursuant to §§ 216.106 of this chapter and 218.76, an LOA may be modified without prior notice or

opportunity for public comment. Notice would be published in the **Federal Register** within 30 days of the action.

§§ 218.78–218.79 [Reserved]

Tobacco Product Standard for Nicotine Yield of Cigarettes and Certain
Other Combusted Tobacco Products; Proposed Rule

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 1160

[Docket No. FDA-2024-N-5471]

RIN 0910-A176

Tobacco Product Standard for Nicotine Yield of Cigarettes and Certain Other Combusted Tobacco Products

AGENCY: Food and Drug Administration, Department of Health and Human Services (HHS).

ACTION: Proposed rule.

SUMMARY: The Food and Drug Administration (FDA, the Agency, or we) is proposing a tobacco product standard that would regulate nicotine yield by establishing a maximum nicotine level in cigarettes and certain other combusted tobacco products. FDA is proposing this action to reduce the addictiveness of these products, thus giving people who are addicted and wish to quit the ability to do so more easily. The proposed product standard is anticipated to benefit the population as a whole. For example, it would help to prevent people who experiment with cigarettes and cigars from developing addiction and using combusted tobacco products regularly.

DATES: Either electronic or written comments on the proposed rule must be submitted by September 15, 2025. Submit comments (including recommendations) on the collection of information under the Paperwork Reduction Act of 1995 (PRA) by September 15, 2025.

ADDRESSES: You may submit comments as follows. Please note that late, untimely filed comments will not be considered. The <https://www.regulations.gov> electronic filing system will accept comments until 11:59 p.m. Eastern Time at the end of September 15, 2025. Comments received by mail/hand delivery/courier (for written/paper submissions) will be considered timely if they are received on or before that date.

Electronic Submissions

Submit electronic comments in the following way:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <https://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are

solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <https://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public, submit the comment as a written/paper submission and in the manner detailed (see "Written/Paper Submissions" and "Instructions").

Written/Paper Submissions

Submit written/paper submissions as follows:

- **Mail/Hand Delivery/Courier (for written/paper submissions):** Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Dockets Management Staff, FDA will post your comment, as well as any attachments, except for information submitted, marked, and identified, as confidential, if submitted as detailed in "Instructions."

Instructions: All submissions received must include the Docket No. FDA-2024-N-5471 for "Tobacco Product Standard for Nicotine Yield of Cigarettes and Certain Other Combusted Tobacco Products." Received comments, those filed in a timely manner (see **ADDRESSES**), will be placed in the docket and, except for those submitted as "Confidential Submissions," publicly viewable at <https://www.regulations.gov> or at the Dockets Management Staff between 9 a.m. and 4 p.m., Monday through Friday, 240-402-7500.

- **Confidential Submissions**—To submit a comment with confidential information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states "THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION." The Agency will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <https://www.regulations.gov>. Submit

both copies to the Dockets Management Staff. If you do not wish your name and contact information to be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify this information as "confidential." Any information marked as "confidential" will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <https://www.govinfo.gov/content/pkg/FR-2015-09-18/pdf/2015-23389.pdf>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <https://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the "Search" box and follow the prompts and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852, 240-402-7500.

Go to the Federal eRulemaking Portal at <https://www.regulations.gov> for access to the rulemaking docket, including any background documents and the plain-language summary of the proposed rule of not more than 100 words in length required by the Providing Accountability Through Transparency Act of 2023.

Submit comments on the information collection under the Paperwork Reduction Act of 1995 to the Office of Management and Budget (OMB) at <https://www.reginfo.gov/public/do/PRAMain>. Find this particular information collection by selecting "Currently under Review—Open for Public Comments" or by using the search function. The title of this proposed collection is "Tobacco Product Standard for Nicotine Yield of Cigarettes and Certain Other Combusted Tobacco Products."

I. Executive Summary**A. Purpose of the Proposed Rule**

Each year, 480,000 people die prematurely from a smoking-attributable disease, making tobacco use the leading cause of preventable disease and death in the United States (Ref. 1). Nearly all these adverse health effects are ultimately the result of addiction to the nicotine in combusted tobacco products, leading to repeated exposure to toxicants from those products. Nicotine, the primary addictive constituent in tobacco products, can be delivered through a variety of products along a continuum of risk. To protect youth and reduce tobacco-related disease and death, the Agency utilizes a comprehensive approach to tobacco and nicotine regulation (<https://www.fda.gov/media/174911/download>). As part of this comprehensive approach, FDA is proposing a tobacco product standard that would regulate nicotine yield by establishing a maximum nicotine level in cigarettes¹ and certain

¹ Throughout this document, FDA generally uses the term “cigarettes” to refer to combusted cigarettes, unless specifically stated or context indicates that noncombusted cigarettes are referenced. In general, the term is not meant to include any noncombusted tobacco products that meet the definition of cigarette in section 900(3) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 387(3)).

other combusted tobacco products (proposed product standard).

As the U.S. District Court for the District of Columbia recognized in *United States v. Philip Morris USA, Inc. et al.*, 449 F.Supp.2d 1 (D.D.C. 2006), *aff'd in relevant part*, 566 F.3d 1095 (D.C. Cir. 2009), the tobacco industry has long known that nicotine creates and sustains addiction, and the industry is dependent on maintaining this addiction. *Id.* at 307. The court noted how cigarette companies have engaged in extensive research to understand how nicotine operates within the human body and then designed their cigarettes to precisely control nicotine delivery and provide nicotine doses to create and sustain addiction. *Id.* at 307–309. Moreover, the court confirmed that industry documents supported the conclusion that these companies “knew early on in their research that if a cigarette did not deliver a certain amount of nicotine, new smokers would not become addicted, and ‘confirmed’ smokers would be able to quit.” *Id.* at 219. In fact, the tobacco industry has had programs in place since the 1960s to obtain “any level of nicotine desired” (Ref. 2). These companies sought to identify the “optimum” dose needed to “satisfy” people who smoke cigarettes and, thereby, assure their continued smoking. *Philip Morris*, 449 F.Supp.2d at 309–10. This proposed product standard would seek to set a maximum nicotine level such that cigarettes and certain other combusted tobacco products could no longer create and sustain this addiction among people who smoke cigarettes and certain other combusted tobacco products.

The proposed product standard would limit the addictiveness of the most toxic and widely used tobacco products, which would have significant public health benefits for all age groups. The proposal would have cessation benefits for adults who use cigarettes and certain other combusted tobacco products, most of whom want to quit but are repeatedly unsuccessful because of the highly addictive nature of these products (see section IV.A of this document). Because these products would not create and sustain addiction, users would be able to quit when they would like, something many who use these products currently do not have the ability to do. Additionally, combusted tobacco products at minimally addictive or nonaddictive levels of nicotine would remain on the market for those who currently smoke and would like to continue to do so.

It would also help prevent people who experiment with cigarettes or certain other combusted tobacco

products (mainly youth) from moving beyond experimentation, developing an addiction to nicotine, and progressing to regular use of combusted tobacco products as a result of that addiction (see section VIII.B of this document). Reducing the number of people who experiment with cigarettes or certain other combusted tobacco products who then transition to regular use of these products would prevent severe adverse health consequences of long-term smoking at the individual level and result in public health benefits at the population level. Based on FDA's population health model, by the year 2100, in the United States, approximately 48 million youth and young adults who would have otherwise initiated habitual cigarette smoking would not as a result of the proposed product standard. The model also projects that more than 12.9 million additional people who smoke cigarettes would quit smoking cigarettes² 1 year after implementation of the proposed product standard; this estimate increases to 19.5 million additional people within 5 years of implementation (this includes people who exclusively smoke cigarettes quitting all tobacco products or completely switching to noncombusted tobacco product use, as well as people who engage in dual use of cigarettes and noncombusted tobacco products quitting cigarette use). In addition, the model estimates that, by the year 2060, in the United States, this proposed product standard would result in 1.8 million tobacco-related deaths averted, rising to 4.3 million deaths averted by the end of the century. The reduction in premature deaths attributable to the proposed product standard would result in 19.6 million life years gained by 2060 and 76.4 million life years gained by 2100. For the reasons discussed in the preamble, FDA finds that the proposed product standard would be appropriate for the protection of the public health.

As explained in section VIII.A., the population health model uses inputs derived from available empirical evidence and expert opinion to estimate the impact of this proposed rule. To obtain expert opinion for the model inputs, FDA conducted a formal expert elicitation process in 2015 and repeated it in 2018. FDA is conducting another expert elicitation process and intends to publish the results of this update for public review and additional comment

on this proposed standard in light of that update.

B. Summary of the Major Provisions of the Proposed Rule

There are currently no tobacco product standards regulating nicotine in tobacco products. The proposed rule would establish a maximum level of nicotine in cigarettes and certain other combusted tobacco products. FDA issued an Advance Notice of Proposed Rulemaking regarding a potential nicotine tobacco product standard (Nicotine ANPRM), and the Agency reviewed and analyzed the comments to that ANPRM (83 FR 11818 (March 16, 2018)). FDA also conducted an extensive and robust review of the relevant scientific literature, as discussed throughout this document. FDA is proposing the following provisions based on the comments received and the Agency's analysis of relevant scientific literature.

Proposed scope—Given that approximately 28 million adults and 380,000 youth in the United States currently smoke cigarettes and the toxicity and addictiveness of these products, cigarettes are the tobacco product category that causes the largest amount of harm to public health in the United States (Refs. 3 and 4). However, if a product standard were to cover only cigarettes, it is likely that a significant number of addicted people who smoke cigarettes would migrate to other similar combusted tobacco products after the standard went into effect to maintain their nicotine exposure, thereby undermining the public health benefits of the standard (Ref. 5) (see also section VI.B of this document). Therefore, to increase the public health benefits, we are proposing to cover the following products under this proposed product standard: Cigarettes (other than noncombusted cigarettes, such as heated tobacco products (HTPs)³ that meet the definition of a cigarette), cigarette tobacco, roll-your-own (RYO) tobacco, cigars (including little cigars, cigarillos, and large cigars but excluding premium cigars⁴), and pipe tobacco (other than waterpipe tobacco⁵). FDA requests

³ Tobacco products that meet the statutory or regulatory definition of a cigarette but are not combusted (do not exceed 350 °C) are categorized as "heated tobacco products" (HTPs) for purposes of FDA's premarket review. HTPs that meet the definition of a cigarette must be in compliance with the applicable statutory and regulatory requirements for cigarettes, unless otherwise noted in a marketing authorization order (Ref. 6).

⁴ See section III.B.3 of this document.

⁵ Waterpipe tobacco (also known as hookah tobacco) is a type of tobacco product that produces smoke that people inhale when a hookah device is heated. Hookah tobacco (also known as waterpipe

comments, data, and research regarding this proposed scope.

FDA is proposing to exclude noncombusted cigarettes, such as HTPs that meet the definition of a cigarette in section 900(3) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. 387(3)) from the scope of this proposed product standard (proposed § 1160.3 includes a definition of cigarette). Therefore, "cigarettes" in this proposed rule refers to combusted cigarettes, not HTPs. Based on FDA's experience with application review, certain noncombusted cigarettes produce fewer or lower levels of some toxicants than combusted cigarettes. FDA recognizes that tobacco products exist on a continuum of risk, with combusted cigarettes being the deadliest, and that certain noncombusted cigarettes pose less risk to individuals who use cigarettes or certain other combusted tobacco products or to population health than other products meeting the definition of a cigarette. Accordingly, FDA requests comments, data, and research regarding the proposal to exclude noncombusted cigarettes from the scope of this proposed rule, including any data that could justify otherwise.

FDA also proposes to exclude waterpipe tobacco from the proposed product standard because, unlike cigarette tobacco, pipe tobacco, RYO tobacco, and cigars (other than premium cigars), FDA believes there is little risk of switching under the proposed product standard. Waterpipes as currently marketed and used generally require substantial time for preparation and use (*i.e.*, an approximately 1-hour session with waterpipes compared to 5–7 minutes with cigarettes). In addition, they are generally large and unwieldy and thus ill-suited for mobile usage, such as while driving or walking. FDA requests comments, data, and research regarding the proposal to exclude waterpipe tobacco from the scope of this proposed rule, including any data that could justify otherwise.

FDA is also not including noncombusted non-cigarette tobacco products, such as electronic nicotine delivery systems (ENDS) (which include e-cigarettes) and smokeless tobacco products, in the scope of this proposed product standard. As discussed throughout this document, nicotine is the primary addictive constituent in

tobacco, maassel, shisha, narghile, or argileh) typically contains a mixture of tobacco, sweeteners, and flavoring. The hookah device (or waterpipe) used to smoke the hookah tobacco works by passing charcoal or electric heated air through the tobacco mixture and ultimately through a water-filled chamber (Ref. 7).

² For the purposes of this proposed rule, where describing expected transition behaviors, we also use the shorter phrase "quit smoking" to refer to stopping use of combusted cigarettes.

tobacco products, and it is the nicotine in such products that both creates and sustains addiction and ultimately leads to the significant adverse health effects caused by these products. While these effects raise concerns in the context of any tobacco product—none of which is without risk—at this time, FDA is focusing this proposed rule on nicotine levels in cigarettes and certain other combusted tobacco products because combusted tobacco products are responsible for the majority of death and disease due to tobacco use. FDA expects that, if this proposed rule is finalized as proposed, many people who smoke cigarettes will quit smoking, either by quitting all tobacco use or by completely switching to a noncombusted tobacco product. Those who switch completely to use of a noncombusted tobacco product may sustain their nicotine dependence but may significantly reduce their risk of tobacco-related death and disease because switching completely to a noncombusted tobacco product would reduce exposure to the chemical constituents created through combustion, which are currently the primary contributors of tobacco-related harm (Ref. 8). Importantly, this action would also help to prevent people who experiment with cigarettes and cigars (mainly youth) from moving beyond experimentation, developing an addiction to nicotine, and progressing to regular use of combusted tobacco products as a result of that addiction. We request comments, data, and research regarding the proposed scope of this rule.

For further discussion regarding considerations and request for comments on the proposed scope of this rule, see section IX.C of this document.

Proposed product standard for nicotine—FDA is proposing to make cigarettes and certain other combusted tobacco products minimally addictive or nonaddictive⁶ by limiting the nicotine yield of these products. We propose to limit nicotine yield by setting a maximum nicotine content level of 0.70 milligrams (mg) of nicotine per gram of total tobacco in these tobacco products. For comparison, the average nicotine content in the top 100 cigarette brands for 2017 is 17.2 mg/g of total tobacco (Ref. 9). Nicotine yield is the amount of

nicotine in smoke, in other words, the amount of nicotine to which a smoker potentially is exposed. While nicotine yield can be measured through machine-generated smoking methods (e.g., International Organization for Standardization (ISO) machine smoking method, Canadian Intense (CI) smoking method, Federal Trade Commission (FTC) smoking method), it can vary due to a user's compensatory behaviors—e.g., inhaling more deeply, taking larger puffs, and blocking cigarette features designed to reduce nicotine yield—such that users can increase the amount of nicotine yield compared to the machine-generated yield. In contrast, nicotine “content,” which refers to the amount of nicotine present in tobacco filler, is not affected by smoking behavior or cigarette design features. Reducing the nicotine content to the proposed 0.70 mg of nicotine per gram of total tobacco limit in the finished tobacco products subject to this proposed product standard places an absolute maximum limit on the amount of nicotine present in tobacco smoke available for intake by users of these products. There are many different tobacco product characteristics that can be manipulated to affect nicotine yield, one of which is nicotine content. Setting a limit on nicotine content and measuring that content is more effective in reducing yield (i.e., the amount of nicotine the user is exposed to) than setting a limit based on a direct measurement of yield under standardized smoking-machine protocols because nicotine content cannot be affected by the compensatory behavior described above. Therefore, limiting nicotine yield through a maximum nicotine content level would better achieve the public health benefits that come from reducing the amount of the nicotine to which a user is exposed than would setting a limit based on a measurement of the maximum machine-measured yield of tobacco products. For further discussion, see section VII.A.

The proposed limit of 0.70 mg of nicotine per gram of total tobacco is based on FDA's analysis of studies regarding the likely effects of reducing nicotine, which shows that extended exposure to very low nicotine content (VLNC) combusted cigarettes is associated with reduced addiction potential, dependence levels, number of cigarettes smoked per day and increased quit attempts among people who currently smoke cigarettes, without increasing toxicant exposure, craving, withdrawal, or compensatory smoking. Throughout this preamble, “VLNC cigarettes” refers to combusted cigarettes that have been reported to

contain ≤ 1.0 mg nicotine per gram of total tobacco, “low nicotine content (LNC) cigarettes” refers to cigarettes with > 1.0 mg and < 11.4 mg nicotine per gram of total tobacco, and “normal nicotine content (NNC) cigarettes” refers to cigarettes with ≥ 11.4 mg nicotine per gram of total tobacco.⁷ FDA uses these acronyms in places where we have confirmed that the nicotine content of the cigarettes referenced meets these definitions. In documents that reference nicotine content in tobacco, but do not specify the levels of nicotine and therefore cannot be confirmed to meet these definitions, we have maintained the full description that best reflects what was used in the original document (e.g., low nicotine content tobacco).

FDA is not seeking to require the reduction of nicotine yields in any tobacco product to zero, which would violate section 907(d)(3) of the FD&C Act (21 U.S.C. 387g(d)(3)). FDA requests comments, data, and research regarding this proposed maximum nicotine level.

Immediate nicotine reduction approach—FDA is proposing an immediate nicotine reduction (i.e., single target) approach to reach the proposed maximum nicotine level (rather than a gradual reduction, or stepped-down, approach) to limit additional toxicant exposure. Based on studies involving VLNC cigarettes and other reduced nicotine content (RNC) cigarettes, we expect that there would be very little or no compensatory smoking (and, consequently, additional limited toxicant exposure) with an immediate reduction approach, as opposed to a gradual reduction approach which showed evidence of increased compensatory smoking. As such, an immediate reduction approach would increase the benefits of the proposed product standard. FDA also notes that this immediate nicotine reduction approach would reduce manufacturing costs for those products covered by the proposed standard because manufacturers would not have reason to formulate multiple products and then prepare and submit premarket review applications at each phase of a gradual reduction approach. We request comments, data, and information regarding the selection of an immediate reduction approach.

Analytical test method—To assist FDA in determining compliance with this rule, the proposed product standard would require manufacturers to analyze

⁶ FDA is using the term “nonaddictive” throughout this preamble specifically in the context of the available data on very low nicotine content cigarettes. We acknowledge the highly addictive potential of nicotine itself depending upon the route of delivery. As discussed elsewhere in this preamble, questions remain with respect to the precise level of nicotine in cigarettes that might render them either minimally addictive or nonaddictive for specific individual members or segments of the population.

⁷ The term VLNC should not be confused with the cigarette brand name “VLN;” “VLN” refers to cigarette products authorized for marketing by FDA in 2019. See <https://www.fda.gov/media/133633/download?attachment> and <https://www.fda.gov/media/133635/download?attachment>.

the nicotine levels of cigarettes and certain other combusted tobacco products covered by the rule using an analytical test method that has been validated in an analytical test laboratory. In addition, FDA is proposing to require product testing prior to commercial distribution in the United States to prevent nonconforming tobacco products from entering the stream of commerce and reaching consumers.

Sampling plan—The proposed product standard would require tobacco product manufacturers to design and implement a sampling plan that covers each batch of finished tobacco product⁸ that they manufacture. This sampling plan would be based on a valid scientific rationale (such as representative sampling) to ensure that each product complies with the proposed product standard. This sampling plan would provide procedures for the manufacturer to select samples to demonstrate conformance to the proposed product standard requirement. The required procedures would help ensure that products that do not conform to the product standard are not sold or distributed to consumers.

Nonconforming tobacco product—The proposed product standard would require tobacco product manufacturers to establish procedures for the control and disposition of tobacco products that do not conform to the requirements of this rule. These procedures are necessary to help prevent the distribution of nonconforming tobacco products by ensuring that all potential nonconforming products are identified, investigated, and segregated and that appropriate disposition and followup are taken for products determined to be nonconforming. This proposed requirement would ensure that any reports of nonconforming products, whether as a result of manufacturer testing or otherwise, are examined and investigated and that appropriate measures are taken to ensure that nonconforming products are not distributed to consumers and to prevent future nonconformity.

Manufacturing code—Currently, there is no requirement for the use of a

manufacturing code for tobacco products. However, the proposed regulation Requirements for Tobacco Product Manufacturing Practice (TPMP) (see <https://www.federalregister.gov/documents/2023/03/10/2023-04591/requirements-for-tobacco-product-manufacturing-practice>) includes a requirement for a manufacturing code, and this rulemaking's provision is modeled on the proposed TPMP provision. The proposed product standard would require the use of a manufacturing code to serve as a common identifier for production and distribution records. The purpose of the manufacturing code is to allow manufacturers and FDA to identify the production batch of a particular finished product that has been released for distribution. This information is intended to help determine the product's history (e.g., batch production records) and assist manufacturers and FDA in the event of a nonconforming tobacco product investigation and any corrective actions to be taken by a manufacturer as a result of the investigation.

Recordkeeping requirements—To assist FDA in determining compliance with the rule and aid in nonconforming product investigations, the proposed product standard would require that manufacturers establish and maintain records regarding the results of testing conducted on each batch to determine conformance with the proposed standard. In addition, this proposed product standard would require that manufacturers maintain records of sampling plans and sampling procedures, records related to manufacturing controls, and all records related to its analytical test method validation. FDA also is proposing to require that it be possible to identify the production batch of a particular finished product that has been released for distribution.

Proposed effective date—FDA proposes that any final rule that may issue based on this proposed rule become effective 2 years after the date of publication of the final rule. Therefore, after the effective date no person could distribute, sell, or offer for sale or distribution within the United States finished tobacco products that are not in compliance with part 1160 (21 CFR part 1160). Prior to the effective date of any final rule that may issue based on this proposed rule, wholesalers, retailers, and related entities would be able to sell available stock of finished tobacco products were not in compliance with part 1160 while transitioning inventory in anticipation of the effective date of the final rule;

however, they would not be permitted to sell off such stock after the effective date. FDA believes this approach would allow adequate time for developing any necessary changes in technology or inputs to comply with a finalized product standard. It also would provide sufficient time for tobacco product manufacturers to submit, and FDA to review, applications for new tobacco products that comply with the finalized product standard. Additionally, FDA believes that this approach would allow adequate time for making any changes to tobacco purchasing choices and curing methods, and for preparation or changes needed in facilities and processes. FDA requests comments and data on this proposed effective date. For further discussion regarding considerations and request for comments on the proposed effective date of this rule, see section XI of this document.

Given that any new tobacco products that comply with this product standard would be required to undergo premarket review, FDA is considering options for addressing any influx of applications.

C. Legal Authority

Section 907 of the FD&C Act authorizes FDA to adopt tobacco product standards, including product standards that include provisions for nicotine yields; for the reduction or elimination of other constituents (including smoke constituents) or harmful components; respecting the construction, components, ingredients, additives, constituents (including smoke constituents), and properties of tobacco products; for the testing of tobacco products; and for restricting the sale of tobacco products to the extent consistent with section 906 (21 U.S.C. 387f) (section 907(a)(3), (a)(4)(A)(i) to (iii), and (a)(4)(B)(i) to (ii) and (iv) to (v)). The FD&C Act also establishes FDA's authority to require tobacco product manufacturers to establish and maintain records in section 909 (21 U.S.C. 387i); authority related to adulterated and misbranded tobacco products in sections 902 and 903 (21 U.S.C. 387b and 387c); authority regarding premarket review of new tobacco products in section 910 (21 U.S.C. 387j); authority related to prohibited acts in section 301 (21 U.S.C. 331); and FDA's rulemaking and inspection authorities in sections 701 and 704 (21 U.S.C. 371 and 374).

D. Costs and Benefits

The main quantified benefits come from averted mortality and morbidity as a result of reduced prevalence for people who currently use combusted

⁸ For the purpose of this document, the term "finished tobacco product" refers to those products subject to this proposed rule. FDA proposes to define a "finished tobacco product" to mean a tobacco product, including all components and parts, sealed in final packaging (e.g., filters or filter tubes sold to consumers separately or as part of kits) or in the final form in which it is intended to be sold to consumers. For a discussion of products FDA proposes to include within the scope of this product standard, see sections IX.C and X.A.1 of this document.

tobacco products, and reduced mortality from reduced exposure to secondhand smoke among people. Unquantified benefits include medical cost savings, productivity loss savings, reduced exposure to thirdhand smoke, and environmental impacts. We expect this proposed rule, if finalized, to impose costs on industry to follow the product standard, on the broader economy to repurpose land, labor, and capital, on consumers impacted by the product

standard, and on FDA to enforce this product standard. In addition to benefits and costs, this rule would cause transfers from the Federal Government and State governments in the form of tax revenue, from firms in the form of reduced revenue, and transfers between or within firms to cover shifts in user fee obligations.

The annualized monetized benefits over a 40-year time horizon far exceed the annualized monetized costs over the same time. We estimate that the

annualized benefits over a 40-year time horizon would be \$1.1 trillion at a 2 percent discount rate, with a low estimate of \$0.27 trillion and a high estimate of \$1.2 trillion. Over a 40-year time horizon, we estimate that the annualized costs would be \$2.07 billion at a 2 percent discount rate, with a low estimate of \$0.7 billion and a high estimate of \$2.73 billion.

II. Table of Abbreviations/Commonly Used Acronyms in This Document

Abbreviation/ acronym	What it means
3-HPMA	3-hydroxypropyl mercapturic acid.
AI/AN	American Indians/Alaska Native.
ANPRM	Advance Notice of Proposed Rulemaking.
BAP	Benzo[a]pyrene.
CDC	Centers for Disease Control and Prevention.
CFR	Code of Federal Regulations.
CISNET	Cancer Intervention and Surveillance Modeling Network.
CO	Carbon monoxide.
COHb	Carboxyhemoglobin.
COPD	Chronic obstructive pulmonary disease.
CORESTA	Cooperation Centre for Scientific Research Relative to Tobacco.
CPD	Cigarettes per day.
CPS-I	Cancer Prevention Study I.
CPS-II	Cancer Prevention Study II.
CRM	CORESTA Recommended Method.
DSM	Diagnostic and Statistical Manual of Mental Disorders.
ENDS	Electronic nicotine delivery systems.
E.O.	Executive Order.
FD&C Act	Federal Food, Drug, and Cosmetic Act.
FDA	Food and Drug Administration.
FR	Federal Register.
FTCD	Fagerström Test for Cigarette Dependence.
FTND	Fagerström Test for Nicotine Dependence.
GC-MS	Gas chromatography-mass spectrometry.
HHS	U.S. Department of Health and Human Services.
HPHCs	Harmful and potentially harmful constituents.
HTP	Heated tobacco product.
IOM	Institute of Medicine.
LGBTQI+	Lesbian, gay, bisexual, transgender, queer, and intersex.
LNC	Low nicotine content.
mg	milligram.
MINWS	Minnesota Nicotine Withdrawal Scale.
MRI	Magnetic resonance imaging.
nAChR	Nicotinic acetylcholine receptor.
NATS	National Adult Tobacco Survey.
NCI	National Cancer Institute.
NDSS	Nicotine Dependence Syndrome Scale.
NHANES	National Health and Nutrition Examination Survey.
NHIS	National Health Interview Survey.
NHIS-LMF	National Health Interview Survey-Linked Mortality Files.
NIDA	National Institute on Drug Abuse.
NIH	National Institutes of Health.
NJATS	New Jersey Adult Tobacco Survey.
NLMS	National Longitudinal Mortality Study.
NNAL	4-(methylnitrosamino)-1-(3-pyridyl)-1-butanol.
NNC	Normal nicotine content.
NNN	N-Nitrosornicotine.
NPRM	Notice of proposed rulemaking.
NRC	National Research Council.
NRT	Nicotine replacement therapy.
NSDUH	National Survey on Drug Use and Health.
NYTS	National Youth Tobacco Survey.
OOS	Out-of-specification.
PAH	Polycyclic aromatic hydrocarbon.
PATH	Population Assessment of Tobacco and Health.
PET	Position emission tomography.
PD	Product static ID number.
QALYs	Quality-adjusted life years.

Abbreviation/ acronym	What it means
QSU	Questionnaire of Smoking Urges.
RCT	Randomized clinical trial.
RNC	Reduced nicotine content.
RR	Relative risk.
RYO	Roll-your-own.
S-PMA	S-phenylmercapturic acid.
SE	Substantial Equivalence.
SES	Socioeconomic status.
STN	Submission tracking number.
TNE	Total nicotine equivalents.
TPSAC	Tobacco Products Scientific Advisory Committee.
TUS-CPS	Tobacco Use Supplement to the Current Population Survey.
U.S.	United States.
VLNC	Very low nicotine content.
WISDM	Wisconsin Inventory of Smoking Dependence Motives.
YRBS	Youth Risk Behavior Survey.

III. Background

A. Need for the Regulation

Cigarettes are responsible for the majority of tobacco-related death and disease in the United States. Each year, 480,000 people die prematurely from a smoking-attributable disease, putting a substantial burden on the U.S. healthcare system and causing massive economic losses to society (Ref. 1). In terms of a monetary measure of the impact of cigarette smoking on the public health, in 2018, cigarette smoking cost the United States more than \$600 billion, including more than \$240 billion in healthcare spending (Ref. 10), nearly \$185 billion in lost productivity from smoking-related illnesses and health conditions (Ref. 10), nearly \$180 billion in lost productivity from smoking-related premature death (Refs. 1 and 10), and \$7 billion in lost productivity from premature death from secondhand smoke exposure (Refs. 1 and 11). The mortality rate among people who currently smoke cigarettes is 2 to 3 times as high as that among individuals who never smoked (Ref. 12). Nicotine, the primary addictive constituent in tobacco products, can be delivered through a variety of products along a continuum of risk, with combusted tobacco products at the most harmful end of this continuum. To protect youth and reduce tobacco-related disease and death, FDA utilizes a comprehensive approach to tobacco and nicotine regulation. Shortly after FDA announced its comprehensive approach in 2017 (<https://www.fda.gov/news-events/press-announcements/fda-announces-comprehensive-regulatory-plan-shift-trajectory-tobacco-related-disease-death>), the Agency began a public dialogue about lowering nicotine levels in combusted cigarettes to minimally addictive or nonaddictive levels through achievable product

standards. On March 16, 2018, FDA issued a Nicotine ANPRM to seek input on the potential public health benefits and any possible adverse effects of regulating nicotine yield by lowering nicotine levels in cigarettes and invited comments on many issues associated with the development of a product standard to establish a maximum nicotine level (83 FR 11818). The Nicotine ANPRM also acknowledged that if FDA were to establish a nicotine tobacco product standard that covered only cigarettes, some number of people who smoke cigarettes could migrate to other similar combusted tobacco products to maintain their nicotine dependence (or engage in dual use with other combusted tobacco products), potentially reducing the positive public health impact of such a rule. FDA sought comments on whether the standard therefore should cover other combusted tobacco products. Based on FDA's scientific knowledge, extensive research regarding VLNC cigarettes, and comments submitted in response to this Nicotine ANPRM, FDA is proposing a tobacco product standard that would regulate nicotine yield by establishing a maximum nicotine level in cigarettes and certain other combusted tobacco products.

As the U.S. District Court for the District of Columbia recognized in *United States v. Philip Morris USA, Inc. et al.*, 449 F.Supp.2d 1 (D.D.C. 2006), *aff'd in relevant part*, 566 F.3d 1095 (D.C. Cir. 2009), the tobacco industry has long known that nicotine creates and sustains addiction, and the industry is dependent on maintaining this addiction. *Id.* at 307. The court noted how cigarette companies have engaged in extensive research to understand how nicotine operates within the human body and then designed their cigarettes to precisely control nicotine delivery and provide nicotine doses to create and

sustain addiction. *Id.* at 307–309. Moreover, the court confirmed that industry documents supported the conclusion that these companies “knew early on in their research that if a cigarette did not deliver a certain amount of nicotine, new smokers would not become addicted, and ‘confirmed’ smokers would be able to quit.” *Id.* at 219. In fact, the tobacco industry has had programs in place since the 1960s to obtain “any level of nicotine desired” (Ref. 2). These companies sought to identify the “optimum” dose needed to “satisfy” people who smoke cigarettes and, thereby, assure their continued smoking. *Philip Morris* 449 F.Supp.2d at 309–11. This proposed product standard would seek to set a maximum nicotine level requirement such that cigarettes and certain other combusted tobacco products would no longer be able to create and sustain this addiction among people who smoke cigarettes.

The proposed product standard would limit the addictiveness of the most toxic and widely used products, which would have significant benefits for all age groups. Adults who use tobacco products, most of whom want to quit, are often unsuccessful because of the highly addictive nature of these products (Ref. 13). Researchers estimate that each year, only between 5.4 and 5.6 percent of adults who use cigarettes successfully quit for good (Ref. 14). Similar analysis of 2022 NHIS data indicates that only 8.8 percent of adults who formerly smoked cigarettes had quit smoking cigarettes in the past year (Ref. 4). Lowering nicotine to minimally addictive or nonaddictive levels would improve their ability to successfully quit using the products within the proposed scope of this rule. It also would prevent people who experiment with cigarettes and non-premium cigars, including youth, from moving beyond experimentation, developing an

addiction to nicotine, and progressing to regular use as a result of that addiction. Furthermore, it is well-established that secondhand tobacco smoke causes premature death and disease in children and in adults who do not smoke (Ref. 15 at p.11). It is estimated that exposure to secondhand smoke caused 41,280 deaths per year in the United States from 2005 to 2009 (Ref. 1 at Table 12.4). This increased cessation and reduced initiation, in turn, would result in a significant decrease in harms from the products to people who currently or would otherwise use cigarettes and certain other combusted tobacco products, as well as harms to people who do not use the products, including harms caused by secondhand smoke to both adults and children, harmful perinatal effects due to parental tobacco use, and fires.

Preventing people who do not smoke cigarettes, particularly youth, from regularly smoking cigarettes due to nicotine addiction would allow them to avoid the severe adverse health consequences of smoking and would result in significant public health benefits. Without changes like those proposed here, an estimated 3.66 million youth under the age of 18 who were alive in 2018—and 2.54 million youth who are alive in 2024, accounting for the projected continued decline in smoking prevalence—will die prematurely later in life from a smoking-related disease (Ref. 16). As a result of the proposed product standard, many youth and young adults would not be subjected to the impacts of nicotine addiction from cigarette smoking and certain other combusted tobacco products (which have a significantly stronger effect on youth due, in part, to their developing brains, as described in sections IV.B and IV.C of this document), nor would they suffer from the adverse health effects and mortality that these products cause.

Nicotine is powerfully addictive, and youth and young adults⁹ are particularly susceptible to developing a nicotine addiction. Multiple Surgeon General's Reports on smoking and health have noted that almost 90 percent of adults who regularly smoke cigarettes initiated smoking by age 18, and 98 percent initiated smoking by age 26, which is notable given that 25 is the approximate age at which the brain has

completed development (Refs. 1, 17 to 19). The developing brain is more vulnerable to nicotine dependence than the adult brain is, and the earlier an individual begins smoking the less likely they are to quit (Ref. 20). Generally, those who begin smoking before the age of 18 are not aware of the degree of addictiveness and the full extent of the consequences of smoking (Ref. 21). It is clear that many youth who smoke cigarettes want to quit but have difficulty doing so. An analysis of data from the 2015 Youth Risk Behavior Survey (YRBS) looking at youth cigarette quit attempts found that 45.4 percent of high school students currently smoking cigarettes had sought to quit in the previous year (Ref. 22); 2020 National Youth Tobacco Survey (NYTS) data were congruent, indicating that 68.1 percent of middle and high school students who smoke cigarettes had sought to quit in the previous year (Ref. 23).

More than half (52.2 percent) of U.S. middle and high school students who use cigarettes, cigars, smokeless tobacco—including those with low levels of use—report experiencing at least one symptom of nicotine dependence (Ref. 24). Notably, 12.7 percent of youth using tobacco products 1 to 2 days per month and 21.2 percent of youth using tobacco products 3 to 5 days per month reported sometimes/often/always feeling irritable or restless when not using tobacco products for a while, and 15.6 percent of youth using tobacco products 1 to 2 days per month and 32.0 percent of youth using tobacco products 3 to 5 days per month reported having strong cravings for a tobacco product during the past 30 days (Ref. 24). Additionally, other researchers analyzing data from the 2021 NYTS found that a sizeable proportion of high school students using tobacco products in the past 30 days report symptoms of nicotine dependence, including 27.2 percent reporting a strong craving for tobacco use and 19.5 percent reporting wanting to first use tobacco products within 30 minutes of waking (Refs. 25 and 26). While prevalence rates of youth use of noncombusted tobacco products (e.g., ENDS) in recent years have exceeded those of cigarettes and other combusted tobacco products (Refs. 25 and 26), FDA expects that this proposed product standard would have significant benefits for youth by reducing the risk that youth who experiment with cigarettes and certain other combusted tobacco products, or who may consider using these products as an alternative to noncombusted tobacco products, would

progress to regular use of these products as a result of nicotine dependence.

The adolescent and young adult brain is more vulnerable to developing nicotine dependence than the adult brain is; data indicate that nicotine has stronger rewarding effects in adolescents than in adults (Ref. 17). Adolescents who use tobacco and initiated use at earlier ages were more likely than those initiating at older ages to report symptoms of tobacco dependence, putting them at greater risk for maintaining tobacco product use into adulthood (Ref. 24). Additionally, the earlier that individuals begin smoking—and therefore the greater amount of time that individuals experience nicotine dependence—the less likely they are to successfully quit (Ref. 27). Evidence indicates that exposure to substances such as nicotine can disrupt brain development and have long-term consequences for executive cognitive functioning (such as decreased attention and working memory and increased impulsivity) and for the risk of developing a substance use disorder and various mental health problems (particularly affective disorders such as anxiety and depression) as an adult (Ref. 27). Furthermore, the 2010 Surgeon General's report noted that adolescents report symptoms of dependence even at low levels of cigarette smoking, and thus may be particularly vulnerable to addiction (Ref. 28). FDA expects that this proposed product standard, therefore, would have significant benefits for youth and young adults by reducing the risk that those who experiment with cigarettes and certain other combusted tobacco products would progress to regular use as a result of nicotine dependence.

Research studies involving VLNC cigarettes—defined previously in this document as cigarettes containing up to 1.0 mg of nicotine per gram of total tobacco—demonstrate that setting the maximum nicotine level we are proposing here, would lead to a reduction in nicotine dependence, which would help people who smoke cigarettes quit smoking. In studies that immediately reduced the nicotine content of cigarettes by switching participants from usual brand cigarettes to LNC or VLNC cigarettes, dependence decreased in people who smoked cigarettes who were not interested in quitting compared to those who smoked normal nicotine content (NNC) or usual brand cigarettes for 6 weeks (Ref. 29), 10 weeks (Ref. 30), or 12 weeks (Ref. 31). In smoking cessation studies in which participants endorsed wanting to quit, VLNC cigarettes were also associated

⁹ Though age ranges for youth and young adults vary across studies, in general, "youth" or "adolescent" encompasses those ages 11–17, while those who are ages 18–25 are considered "young adults" (even though, developmentally, the period between 18–20 years of age is often labeled late adolescence); those ages 26 and older are considered "adults" (Ref. 17).

with reductions in nicotine dependence over time (Refs. 32 to 35).

FDA is issuing this proposal because the tobacco products subject to this proposed product standard remain addictive due to the nicotine yield they offer users and because combusted tobacco products are responsible for the majority of tobacco-related death and disease (see section IV.D of this document for a discussion regarding the serious negative health effects of smoking cigarettes and other combusted tobacco products). Cigarettes have been precisely designed to create and maintain addiction among people who smoke. *United States v. Philip Morris USA, Inc. et al.*, 449 F.Supp.2d 1, 307 (D.D.C. 2006). To protect the public health, particularly youth, FDA is proposing this standard, in part, to ensure that people who smoke these products would be less likely to: (1) initiate regular use; (2) become addicted to these products; and (3) suffer from the many diseases and debilitating effects, including death, caused by combusted tobacco product use.

Similarly, FDA expects that the proposed product standard would have significant benefits for adults who use combusted tobacco products, most of whom want to quit but are often unsuccessful because of the highly addictive nature of these products (Ref. 13). Data from the 2022 National Health Interview Survey (NHIS) and 2018–2019 Tobacco Use Supplement to the Current Population Survey (TUS–CPS) indicate that 67.7 and 76.6 percent, respectively, of adults who smoke cigarettes wanted to quit (Ref. 36), while 2022 NHIS data (Ref. 4) and 2018–2019 TUS–CPS data (Ref. 36) show that 53.3 and 51.3 percent, respectively, of adults who smoke cigarettes in the United States actually made a quit attempt within the past year. However, analyses of NHIS and TUS–CPS data for these years indicate that only 8.8 and 7.5 percent of adults had successfully quit smoking cigarettes, respectively (Refs. 4 and 36). Adults who smoke cigarettes may make 30 or more quit attempts before succeeding (Ref. 37). FDA expects that decreasing the nicotine yield of cigarettes and certain other combusted tobacco products covered by this rule, by reducing nicotine content, so that they are minimally addictive or nonaddictive would likely help people who smoke reduce their dependence on combusted tobacco products, thereby making it easier for them to quit smoking. As discussed throughout this document, FDA also expects that decreasing the nicotine content in these products, and thus the nicotine yield offered to users, would prevent people

who experiment with cigarettes and cigars (mainly youth) from moving beyond experimentation, developing an addiction to nicotine, and progressing to regular use as a result of that addiction.

Although many factors contribute to an individual's initial experimentation with tobacco products, the addictive nature of tobacco is the key reason people progress to regular use, and scientists agree that it is the presence of nicotine that causes addiction and sustains a person's tobacco use (Refs. 1 HHS at p. 113 and 28). While nicotine is the primary addictive chemical in tobacco, sensorimotor stimuli (e.g., smell/taste of smoke; airway sensations; holding the cigarette) repeatedly occur during smoking (Ref. 38). These stimuli often act as secondary or conditioned reinforcers that contribute to the cycle of nicotine dependence by motivating and maintaining smoking behavior (Ref. 38). Once people who use tobacco become addicted to nicotine, they require nicotine to avoid withdrawal symptoms. In the process of obtaining their nicotine, people who use combusted tobacco products are exposed to an array of toxicants in tobacco and tobacco smoke that lead to a substantially increased risk of morbidity and mortality (Ref. 28). Because of their nicotine addiction, many people who smoke cigarettes struggle to stop using these toxic tobacco products despite their stated desire to quit (Ref. 28).

An advisory report from the World Health Organization notes that the ultimate health benefits of a nicotine reduction strategy, like the one FDA is proposing here, would require that the standard cover other combusted tobacco products—not just cigarettes (Ref. 39). In alignment with this recommendation from the World Health Organization, this proposed rule would cover combusted cigarettes and certain other combusted tobacco products (i.e., cigarette tobacco, RYO tobacco, cigars other than premium cigars, pipe tobacco). The World Health Organization report also noted that such a strategy should be accompanied by the provision of cessation treatments to help people quit, including behavioral support and nicotine replacement therapy (NRT) or other medications (Ref. 39). FDA remains committed to facilitating the development and use of therapeutic nicotine products for tobacco product cessation and increased availability of services alongside enhanced outreach efforts to support tobacco use cessation. For example, FDA's Nicotine Steering Committee, which helps to develop and implement nicotine policy and regulation for the

Agency, held a 21 CFR part 15 hearing in early 2018 on the Agency's approach to evaluating the safety and efficacy of NRT products, including how they should be used and labeled (82 FR 56759 (November 30, 2017)). Also, in May 2023, FDA's Center for Drug Evaluation and Research announced the availability of a final guidance for industry entitled "Smoking Cessation and Related Indications: Developing Nicotine Replacement Therapy Drug Products," which provides guidance to assist sponsors in the clinical development of NRT drug products, including but not limited to those intended for smoking cessation and related chronic conditions (88 FR 26559, May 1, 2023; see <https://www.fda.gov/media/167599/download>). Additionally, as described further below, the Agency is contributing to a comprehensive effort coordinated by the U.S. Department of Health and Human Services (HHS or the Department) to support tobacco use cessation.

Rendering cigarettes and certain other combusted tobacco products minimally addictive or nonaddictive through a nicotine product standard would address the principal reason that people who smoke cigarettes have difficulty quitting smoking. If this proposed product standard is finalized, people who use cigarettes and other combusted tobacco products covered by this rule would be unable to obtain enough nicotine from those products to sustain addiction no matter how they smoked the products (e.g., more frequent smoking, intensive puffing) (Refs. 32, 40, and 41), facilitating people who currently smoke cigarettes to make more successful quit attempts.¹⁰ At the same time, combusted tobacco products at minimally addictive or nonaddictive levels of nicotine would remain on the market for those who currently smoke and would like to continue to do so.

FDA expects that, if this proposed rule is finalized and a nicotine product standard for cigarettes and certain other combusted tobacco products is in place, many people who smoke cigarettes will either quit all tobacco-product use or switch to a noncombusted tobacco product. Those who switch completely to use of a noncombusted tobacco product may sustain their nicotine dependence but may significantly

¹⁰ As stated throughout this preamble, in the event that a nicotine product standard addresses only cigarettes, FDA expects that, to maintain their nicotine dependence, some number of people who are addicted to cigarettes would likely migrate to other similar combusted tobacco products (or engage in dual use with such products) after the product standard goes into effect, reducing the benefits of the standard.

reduce their risk of tobacco-related death and disease because switching completely to a noncombusted tobacco product would reduce exposure to the chemical constituents created through combustion, which are the primary contributors of tobacco-related harm (Ref. 8).

The benefits of this rule have been determined without taking into consideration the impact of any smoking cessation services that may be coordinated by HHS, and are expected to be significant. Also, FDA expects that unassisted cessation attempts, *i.e.*, those made by people who smoke without help, may be more successful in an environment in which the product being quit is no longer addictive as compared to historic quitting success rates where it has been easy to relapse to the same highly addictive product. Nevertheless, FDA recognizes that increasing and improving cessation resources, particularly in communities where access to cessation resources have been historically lacking, may provide an opportunity to further increase the expected benefits of this proposed product standard and to enhance the degree to which such benefits are experienced by people in populations that are disproportionately impacted by combusted tobacco use. Accordingly, FDA is contributing to a comprehensive effort being coordinated by HHS to support and accelerate cessation of combusted tobacco products.¹¹ With input from subject matter experts from across HHS Operating Divisions, the Department has finalized the “HHS Framework To Support and Accelerate Smoking Cessation” (Framework). The Framework aims to accelerate smoking cessation and reduce smoking-related disparities by building on current activities and collaborations across the Department. The Framework vision is to ensure that every person in America has access to comprehensive, evidence-based cessation treatment and can benefit from HHS cessation supports, programs, and policies. Specific Framework goals are to: (1) reduce smoking and cessation-related disparities; (2) increase awareness and knowledge related to smoking and cessation; (3) strengthen, expand, and sustain cessation services and supports; (4) increase access to and coverage of comprehensive, evidence-based cessation treatment; (5) advance, expand, and sustain surveillance and

strengthen performance measurement and evaluation; and (6) promote ongoing and innovative research to support and accelerate smoking cessation (<https://www.hhs.gov/about/news/2024/03/08/hhs-announces-new-smoking-cessation-framework-support-quitting.html>). With increased availability and accessibility of services, more people who smoke may be motivated to take advantage of cessation resources, whether they smoke cigarettes or other combusted tobacco products. Additionally, FDA has numerous processes and tools at its disposal to communicate directly with consumers, including communities that are underserved by cessation services and/or are disproportionately impacted by tobacco use, and will continue to evaluate the need for additional public outreach, including targeted education initiatives, in support of this proposed rule. However, the Agency does not have evidence to suggest that such an effort is necessary at this time in order to experience the public health benefits of this proposed product standard.

For the reasons stated here and throughout this document, FDA is proposing this tobacco product standard to: (1) reduce the risk of progression to regular use and nicotine dependence for those who experiment with such tobacco products, especially youth and (2) make it easier for people who are addicted to cigarettes and certain other combusted tobacco products and who are interested in quitting to quit by reducing the nicotine in these products to minimally addictive or nonaddictive levels. FDA expects that this proposed product standard would significantly reduce the morbidity and mortality caused by smoking. Based on FDA’s population health model, by the year 2100, in the United States, approximately 48 million youth and young adults who would have otherwise initiated smoking would not start as a result of the proposed product standard. The model also projects that more than 12.9 million additional people who smoke cigarettes would quit smoking (including those who switch to noncombusted tobacco products) 1 year after implementation of the proposed product standard, increasing to 19.5 million additional people who formerly smoked cigarettes within 5 years of implementation. Section XII discusses that the main quantified benefits come from averted mortality and morbidity, as a result of tobacco use transitions, including switching. In terms of mortality benefits, the model considers a higher risk for people who switch to noncombusted products compared to those who quit tobacco product use

entirely. Specifically, the model assumes that the risk for people who switch to noncombusted product use is 8 percent higher than the risk for those who quit tobacco use entirely. Details of this approach can be found in the FDA’s modeling document (Ref. 42). In addition, the model estimates that, by the year 2060, in the United States, this proposed product standard would result in 1.8 million tobacco-related deaths averted, rising to 4.3 million deaths averted by the end of the century (Ref. 42). The reduction in premature deaths attributable to the proposed product standard would result in 19.6 million life years gained by 2060 and 76.4 million life years gained by 2100 (see section VIII.A of this document for further discussion of the model) (Ref. 42).

B. Relevant Regulatory History

In its implementation of the Family Smoking Prevention and Tobacco Control Act (Tobacco Control Act) (Pub. L. 111–31) since its passage in 2009, FDA has engaged in close study and careful consideration of the scientific evidence and complex policy issues related to nicotine in cigarettes and other combusted tobacco products. FDA issued an ANPRM to solicit data and information for consideration in developing a tobacco product standard to regulate nicotine yield by setting the maximum nicotine level for cigarettes, conducted a robust scientific assessment related to a nicotine product standard for combusted tobacco products, developed a population health model to assess the potential public health impacts of such a product standard, and sponsored research on a variety of nicotine-related topics through contracts and interagency agreements with Federal partners, including the National Institutes of Health (NIH).¹² FDA has considered the comments and information received in response to the ANPRM, scientific assessment, and population health model in developing this proposed rule. Please see the remainder of this section for further discussion.

1. ANPRM

In July 2017, FDA announced a comprehensive approach to tobacco and nicotine regulation to protect youth and reduce tobacco-related disease and death (Ref. 43). As part of the public dialogue on the comprehensive approach, in March 2018, FDA issued three ANPRMs related to the regulation

¹¹ See, for *e.g.*, https://www.fda.gov/tobacco-products/ctp-newsroom/fda-and-nih-joint-public-meeting-advancing-smoking-cessation-priorities-registration-open?utm_campaign=ctp-research&utm_content=landingpage&utm_medium=email&utm_source=govdelivery&utm_term=stratcomms.

¹² Information on specific projects supported by FDA is available at <https://www.fda.gov/tobacco-products/tobacco-science-research/research>.

of nicotine in combusted cigarettes (83 FR 11818), flavors (including menthol) in tobacco products (83 FR 12294, March 21, 2018) (Flavors ANPRM), and premium cigars (83 FR 12901, March 26, 2018). In addition, FDA announced the availability of a draft concept paper entitled “Illicit Trade in Tobacco Products After Implementation of a Food and Drug Administration Product Standard,” and sought public comment (83 FR 11754, March 16, 2018). This paper analyzes the potential for illicit trade markets to develop in response to a tobacco product standard (Ref. 44).

The Nicotine ANPRM requested data and information for consideration in developing a tobacco product standard to set a maximum nicotine level for cigarettes to make them minimally addictive or nonaddictive. Specifically, FDA sought comments, evidence, and other information regarding whether a potential tobacco product standard should cover tobacco products other than cigarettes (*e.g.*, cigarette tobacco, RYO tobacco, some or all cigars, pipe tobacco, waterpipe tobacco); what maximum level of nicotine would be appropriate for the protection of the public health, in light of scientific evidence about the addictive properties of nicotine in cigarettes; whether such a standard should propose either a single target (*i.e.*, an immediate reduction, where the nicotine is reduced all at once) or a stepped-down approach (*i.e.*, a gradual reduction, where the nicotine is reduced gradually over time) to reach the desired maximum nicotine level; whether such a product standard should specify a method for manufacturers to use to detect the level of nicotine in their products; the technical feasibility of current as well as more recent, novel nicotine reduction techniques; and the proper timeframe for implementation of a possible nicotine tobacco product standard to allow adequate time for industry to comply. The Nicotine ANPRM also requested comment on possible negative effects that could diminish the population health benefits expected as a result of a nicotine product standard, such as continued combusted tobacco product use, where people who currently use tobacco products subject to a nicotine tobacco product standard could turn to other combusted tobacco products to maintain their nicotine dependence, both in combination with cigarettes (*i.e.*, dual use) or in place of cigarettes (*i.e.*, switching); the potential for increased harm due to continued VLNC cigarette smoking with altered smoking behaviors (*e.g.*, increase in number of cigarettes smoked, increased depth of inhalation);

people seeking to add nicotine in liquid or other form to their combusted tobacco product; and whether illicit trade could occur as a result of a nicotine product standard and how that could impact public health. Finally, FDA also sought comments, data, research results, and other information regarding economic impacts of a potential nicotine tobacco product standard.

FDA received over 7,700 comments on the Nicotine ANPRM, with approximately 6,700 of those comments submitted as part of 20 different organized campaigns. The key ANPRM areas of comments are covered in the relevant sections in this document and include the possible scope of products covered by the rule (section IX.C), technical achievability (section VII.E), illicit trade (section IX.D), and implementation/effective date (section XI). Some of the issues raised in the comments to the ANPRM are highlighted below.

Comments generally in support of setting a maximum nicotine level in cigarettes stated that a nicotine product standard would be appropriate for the protection of the public health. In particular, many comments argued that reducing the nicotine content in cigarettes to minimally addictive or nonaddictive levels would be appropriate for the following reasons: (1) reduced nicotine content in cigarettes will contribute to smoking cessation, as well as decreased initiation and addiction by people newly using cigarettes and certain other combusted tobacco products and youth and (2) such increased cessation and decreased initiation will reduce the instances of preventable deaths and other negative health effects caused by smoking. Some comments also urged FDA to issue a nicotine product standard as part of a comprehensive package of tobacco regulatory measures, including increasing consumer access to reduced risk products, regulating flavors in tobacco products, taking action as soon as possible, fully reviewing premarket applications for new tobacco products, and making effective smoking cessation treatments and ongoing cessation support accessible and affordable to people who smoke cigarettes.

FDA received many comments expressing concern about the effect of nicotine on the adolescent brain and its role in addicting those who experiment with tobacco products, particularly youth and young adults, leading them to progress to regular use. Some comments recommended extending the scope of a nicotine product standard to noncombusted tobacco products (*e.g.*,

smokeless, ENDS) to prevent migration to such products, particularly among youth; a significant number of comments urged FDA to extend the scope of a nicotine product standard to combusted tobacco products other than cigarettes. Citing national survey data trends and various recent studies, numerous comments—including those from public health associations, government agencies, and advocacy groups—asserted that including all combusted tobacco products, not only cigarettes, would prevent potential youth initiation of, migration to, and dual use with other combusted products with higher nicotine content that may be harmful to health, thus aligning with the public health goals of a nicotine product standard. Additionally, citing studies relating to tobacco use patterns by young people, a joint submission from several nicotine and tobacco researchers stated that adolescents who use tobacco are particularly prone to dual and multiple tobacco product use; therefore, the potential for adolescents to shift to other nicotine-containing tobacco products underscores the need for a nicotine reduction policy to cover all combusted tobacco products. The joint submission comment further stated that if the scope of a nicotine product standard only covered combusted cigarettes, there is evidence from adult studies that cigars—and in particular little cigars—would be an attractive substitute for full nicotine content combusted cigarettes. These researchers noted, if the scope of a proposed nicotine product standard included combusted cigarettes and other combusted products, it would increase the likelihood that people who use combusted cigarettes, including youth and young adults, who migrate to other nicotine-containing products (rather than quit), would transition to noncombusted products, thereby increasing the health benefits of the policy.

FDA also received comments from individuals, advocacy groups, and members of the tobacco industry generally opposing efforts to reduce nicotine levels in cigarettes to minimally addictive or nonaddictive levels. These comments generally stated that such a regulation would stifle free enterprise or would negatively limit consumer freedom of choice and that the regulation would result in a *de facto* ban on cigarettes that would have a devastating impact on tobacco farming, as well as the manufacturing, distribution, and retail sectors. Some comments discussed the technical feasibility of achieving lower nicotine

levels. Some comments opposed to a nicotine product standard stated that there is not enough scientific research to support reducing nicotine in cigarettes. Other comments argued that FDA should instead focus on giving adults who smoke cigarettes access to a wider choice of less harmful tobacco products and truthful information about the benefits of switching to those products, as well as focus resources on a plan to reduce harm through proven strategies to prevent initiation and encourage cessation.

FDA has reviewed and closely considered the comments to the Nicotine ANPRM, as well as additional evidence and information not available at the time of the Nicotine ANPRM, in developing this proposed rule.

2. Scientific Review

As the body of evidence has continued to grow, FDA undertook a robust systematic review of the scientific evidence regarding the likely effects of reducing nicotine in combusted tobacco products. This review, entitled “The Science of a Nicotine Standard for Combusted Tobacco Products” (Ref. 45), covers peer-reviewed, publicly available literature and focuses on the likely effects of reducing nicotine in combusted tobacco products. This scientific assessment has been peer reviewed by independent external experts. Taking into consideration comments from this peer review (Ref. 46), FDA revised the scientific assessment, and the final peer-reviewed document is available in the docket for this proposed rule (Ref. 45). Additionally, this final peer-reviewed document and other related documents such as FDA’s response to the peer review comments can be found at <https://www.fda.gov/science-research/peer-review-scientific-information-and-assessments/completed-peer-reviews>.

FDA’s peer reviewed scientific assessment examined the effects of reducing the level of nicotine in combusted tobacco products on use behavior, dependence, and toxicant exposure, as well as the knowledge, beliefs, and perceptions around nicotine and VLNC cigarettes. This scientific review found that the totality of the evidence supports that extended exposure to combusted cigarettes containing VLNC tobacco filler is associated with reduced addiction potential, dependence levels, and number of cigarettes smoked per day, and increased quit attempts among people who currently smoke cigarettes, without evidence of increased toxicant exposure, craving, withdrawal, or

compensatory smoking. The review also determined that if FDA were to establish a nicotine product standard that covered only cigarettes, a portion of people who are currently addicted to cigarettes would likely migrate to other, similar combusted tobacco products to maintain their nicotine dependence (or engage in dual use without substantially reducing their combusted tobacco product use), thereby reducing the positive public health impact of such a rule. Based on FDA’s review of the literature on combusted tobacco products, including cigarettes, cigarette tobacco, RYO tobacco, cigars, and pipe tobacco, the final scientific assessment concluded that use of any of these combusted products is sufficient to create or sustain nicotine dependence and would therefore continue to expose people who use these products to toxicants. Further, FDA’s scientific assessment concluded that the establishment of a maximum nicotine level in combusted tobacco products that would render them minimally addictive or nonaddictive could increase the likelihood of successful quit attempts and help prevent people who experiment with cigarettes and cigars (mainly youth) from progressing to regular use, thereby significantly reducing the morbidity and mortality caused by smoking. FDA has considered the scientific assessment conclusions in the development of this proposed product standard.

In addition, to assess the potential public health impacts of a nicotine product standard, FDA developed a population health model using inputs derived from available empirical evidence and expert opinion to estimate the impact of changes in tobacco product initiation, cessation, switching, and dual use on tobacco use prevalence, morbidity, and mortality in the United States. Details of this modeling approach have been previously published in two peer-reviewed publications (Refs. 47 and 48), which describe the overall model in terms of the inputs, transition behaviors, and outputs that it contains, along with results from simulation studies. In preparation for this proposed product standard, FDA updated a previously-published model (Ref. 47), which describes the impact of a potential product standard that limits the level of nicotine in cigarettes, RYO tobacco, non-premium cigars, and pipe tobacco so that they are minimally addictive or nonaddictive. In this updated modeling document, entitled “Methodological Approach to Modeling the Potential Impact of a Nicotine Product Standard

on Tobacco Use, Morbidity, and Mortality in the U.S.” (Ref. 42), we estimated the potential impacts of a nicotine product standard by modeling a baseline scenario of use of cigarettes and noncombusted tobacco products including smokeless tobacco, e-cigarettes, and HTPs. These product classes (cigarettes and noncombusted products) were selected because of the magnitude of population health effects from cigarette smoking and the likelihood of product switching to noncombusted products, especially e-cigarettes. Estimates of changes in mortality from other exposures including non-premium cigar and pipe tobacco use are not produced directly by the model but are derived from model outputs instead. We then compared the baseline scenario to a product standard scenario characterized by the introduction of a potential nicotine product standard that would apply to cigarettes, cigarette tobacco, RYO tobacco, non-premium cigars, and pipe tobacco. FDA’s modeling framework and methodological approach and the associated data inputs and assumptions have been peer reviewed by independent external experts. Taking into consideration comments from this peer review (Ref. 49), FDA revised the modeling document, and the final modeling document is available in the docket for this proposed product standard (Ref. 42). FDA’s modeling work informed the development of this proposed product standard. Additionally, the modeling document, model code, and inputs are publicly available at <https://www.fda.gov/science-research/peer-review-scientific-information-and-assessments/completed-peer-reviews>. Further discussion of FDA’s estimates of the public health impact of this proposed product standard can be found in section VIII of this document.

3. Premium Cigars

On August 9, 2023, the U.S. District Court for the District of Columbia issued an order vacating FDA’s rule deeming tobacco products to be subject to FDA’s tobacco product authorities “insofar as it applies to premium cigars.”¹³ *Cigar*

¹³ For purposes of its ruling, the court specified that a premium cigar is a cigar that: (1) is wrapped in whole tobacco leaf; (2) contains a 100 percent leaf tobacco binder; (3) contains at least 50 percent (of the filler by weight) long filler tobacco (*i.e.*, whole tobacco leaves that run the length of the cigar); (4) is handmade or hand rolled (*i.e.*, no machinery was used apart from simple tools, such as scissors to cut the tobacco prior to rolling); (5) has no filter, nontobacco tip, or nontobacco mouthpiece; (6) does not have a characterizing flavor other than tobacco; (7) contains only tobacco,

Continued

Ass'n of Am. v. FDA, No. 16–cv–01460, 2023 WL 5094869 (D.D.C. Aug. 9, 2023), *appeal docketed*, No. 23–5220 (D.C. Cir. argued Sept. 13, 2024). The government has appealed this decision. When the deemed status of premium cigars is resolved, FDA will consider any impacts with respect to this proposed rule and take additional steps as warranted, including for example, by reopening the comment period and/or issuing a supplemental notice of proposed rulemaking. References to premium cigars in this document serve merely to clarify the current proposed scope of products covered, evaluate the scientific evidence related to non-premium cigars, and describe FDA's approach to modeling the projected public health impacts of this proposed standard.

C. Legal Authority

1. Product Standard Authority

The Tobacco Control Act was enacted on June 22, 2009, amending the FD&C Act and providing FDA with the authority to regulate tobacco products. Section 901 of the FD&C Act (21 U.S.C. 387a) granted FDA the authority to regulate the manufacture, marketing, and distribution of cigarettes, cigarette tobacco, RYO tobacco, and smokeless tobacco to protect the public health and to reduce tobacco use by youth. The Tobacco Control Act also gave the Agency authority to conduct rulemaking to “deem” any other tobacco products subject to chapter IX of the FD&C Act (21 U.S.C. 387 to 387t). In 2016, FDA issued a final rule deeming products meeting the statutory definition of “tobacco product” (including cigars and pipe tobacco), except accessories of the newly deemed products, to be subject to chapter IX of the FD&C Act, as amended by the Tobacco Control Act (81 FR 28974) (deeming final rule).

Among the tobacco product authorities provided to FDA is the authority to adopt tobacco product standards where FDA determines that such standard is appropriate for the protection of the public health (section 907(a)(3)(A) of the FD&C Act). To establish a tobacco product standard, section 907(a)(3)(A) and (B) of the FD&C Act requires that FDA find that the standard is appropriate for the protection of the public health, taking into consideration scientific evidence concerning:

- The risks and benefits to the population as a whole, including users

water, and vegetable gum with no other ingredients or additives; and (8) weighs more than 6 pounds per 1,000 units.

and nonusers of tobacco products, of the proposed standard;

- The increased or decreased likelihood that existing users of tobacco products will stop using such products; and
- The increased or decreased likelihood that those who do not use tobacco products will start using such products.

2. Authority To Establish a Maximum Nicotine Level and Related Provisions

Section 907 of the FD&C Act authorizes FDA to adopt tobacco product standards that are appropriate for the protection of the public health, including expressly authorizing FDA to adopt product standards with provisions for nicotine yields; for the reduction or elimination of other constituents (including smoke constituents) or harmful components; and respecting the construction, components, ingredients, additives, constituents (including smoke constituents), and properties of tobacco products (section 907(a)(3), (a)(4)(A)(i) to (iii), and (a)(4)(B)(i)). This includes the authority to issue a new product standard to establish a maximum level of nicotine in tobacco products.

FDA is proposing to limit nicotine yield by setting a maximum nicotine content level for finished cigarettes and certain other finished combusted tobacco products not to exceed 0.70 mg of nicotine per gram of total tobacco. FDA is not seeking to require the reduction of nicotine yields in any tobacco product to zero, which is prohibited under section 907(d)(3) of the FD&C Act. To ensure that tobacco products subject to the product standard comply with the proposed maximum nicotine level, FDA also is including provisions that would require manufacturers to test their products using an analytical test method for conformance with the maximum nicotine level pursuant to section 907(a)(4)(B)(ii) and (iv) of the FD&C Act.

3. Sale and Distribution Restrictions

Section 907(a)(4)(B)(v) of the FD&C Act states that product standards shall, where appropriate for the protection of the public health, include provisions requiring that the sale and distribution of tobacco products be restricted but only to the extent that the sale and distribution of a tobacco product may be restricted under section 906(d) of the FD&C Act. Similar to section 907, section 906(d) of the FD&C Act gives FDA authority to require restrictions on the sale and distribution of tobacco products by regulation if the Agency determines that such regulation would

be appropriate for the protection of the public health. The finding as to whether a regulation is appropriate for the protection of the public health must be determined with respect to the risks and benefits to the population as a whole, including users and nonusers of the tobacco products, and must take into account:

- The increased or decreased likelihood that existing users of tobacco products will stop using such products; and
- The increased or decreased likelihood that those who do not use tobacco products will start using such products (see section 906(d)(1) of the FD&C Act).

Under these authorities and section 701 of the FD&C Act, which provides FDA with the authority to promulgate regulations for the efficient enforcement of the FD&C Act, FDA is proposing provisions that would restrict the manufacture, sale, and distribution of cigarettes and certain other combusted tobacco products that are not in compliance with this standard. These provisions are not intended to restrict the manufacture of cigarettes intended for export. Consistent with section 801(e)(1) of the FD&C Act (21 U.S.C. 381(e)(1)), a tobacco product intended for export shall not be deemed to be in violation of section 907 of the FD&C Act or this product standard, if it meets the criteria enumerated in section 801(e)(1) of the FD&C Act, including not being sold or offered for sale in domestic commerce. These provisions are critical to maintain the purpose of the standard by helping to ensure that the tobacco products conform to the proposed maximum nicotine level when used by consumers.

FDA is also proposing, under these authorities and others described herein regarding testing and recordkeeping, a requirement that the labels of tobacco products covered under this proposed product standard contain a manufacturing code to identify, among other things, the date of manufacture of a production batch, so that FDA can determine whether a product on store shelves is in conformance with the proposed product standard. The proposed manufacturing code would allow manufacturers and FDA to identify the production batch of a particular finished product that has been released for distribution. This information is intended to help determine the product's history (*e.g.*, batch production records) and assist manufacturers and FDA in the event of a nonconforming tobacco product investigation and any corrective actions to be taken by a manufacturer as a result

of the investigation. The manufacturing code must also contain an “-NS” designation. The “-NS” designation will enable retailers to readily identify that a finished tobacco product conforms with this standard. Finished tobacco products that do not have this designation do not conform to this standard. The manufacturing code information also would aid FDA in ensuring compliance with this proposed product standard by clearly identifying those products that conform to the standard and linking those products to records that substantiate their conformance.

4. Testing Requirements

This proposal contains provisions regarding testing requirements pursuant to sections 907(a)(4)(A)(iii) and 907(a)(4)(B) of the FD&C Act to help ensure that finished cigarettes and certain other finished combusted tobacco products conform to the requirements of the proposed product standard before they are distributed to consumers.

Section 907(a)(4)(A)(iii) states that product standards shall include provisions that are appropriate for the protection of the public health, including provisions, where appropriate, relating to any requirement under section 907(a)(4)(B) of the FD&C Act. Section 907(a)(4)(B)(ii) of the FD&C Act, in turn, provides that a product standard shall, where appropriate for the protection of the public health, include provisions for testing the tobacco product. In addition, section 907(a)(4)(B)(iv) of the FD&C Act provides that, where appropriate for the protection of the public health, a product standard shall include provisions requiring that the results of test(s) required under section 907(a)(4)(B)(ii) show that the product is in conformity with the portions of the standard for which the test(s) were required. FDA is proposing testing requirements because it finds that such requirements are appropriate for the protection of the public health.

Consistent with these statutory provisions, proposed §§ 1160.12, 1160.14, and 1160.16 would establish product testing and sampling plan requirements. Proposed § 1160.12 would require that a manufacturer conduct testing on each batch of finished cigarettes and certain other finished combusted tobacco products to determine whether the products conform to the proposed maximum nicotine level requirement and would also require the manufacturer to document all testing. Proposed § 1160.14 would require manufacturers

to use an analytical test method and to demonstrate that the test method was validated in an analytical test laboratory. Proposed § 1160.16 would require that manufacturers design and implement a sampling plan for finished cigarettes and certain other finished combusted tobacco products to ensure the batch consistently conforms to the proposed maximum nicotine level.

To support these proposed requirements, proposed § 1160.18(b) would require each tobacco product manufacturer to investigate all potential nonconforming tobacco products to determine if the product is nonconforming. For example, if any representative samples from a batch of finished cigarettes or certain other finished combusted tobacco products are determined to be out of conformance or if FDA notifies a tobacco product manufacturer that a finished tobacco product in commercial distribution does not conform to the requirements of this part, the manufacturer must conduct an investigation to determine the extent of the nonconformity and locations to which nonconforming tobacco products have been distributed. This proposed requirement would ensure that any reports of nonconforming products, whether as a result of manufacturer testing or otherwise, are examined and investigated and that appropriate measures are taken to ensure that nonconforming products are not distributed to consumers and to prevent future nonconformity.

5. Recordkeeping

Section 909 of the FD&C Act authorizes FDA to require tobacco product manufacturers to establish and maintain records, make reports, and provide such information as the Agency may by regulation reasonably require to assure that a tobacco product is not adulterated or misbranded and to otherwise protect public health.

FDA is proposing a requirement that manufacturers maintain certain records, including the results of batch testing and analyses conducted to determine conformance with the proposed product standard, records of sampling plans and sampling procedures, records related to manufacturing controls, and all records related to the analytical test method used to assess finished cigarettes and certain other finished combusted tobacco products for conformance with the proposed maximum nicotine level requirement. FDA is also proposing to require that manufacturers use a manufacturing code, from which the Agency must be able to identify the production batch of finished cigarettes and certain other finished combusted

tobacco products that have been released for distribution. The maintenance of these records for the time period specified in this proposed product standard is necessary to help ensure that such tobacco products are in conformance with the proposed product standard and are not adulterated or misbranded, consistent with the authority provided in section 909 of the FD&C Act. FDA has authority to inspect manufacturers, including access to these records, under, among other authorities, section 704 of the FD&C Act. In addition, the recordkeeping and record access requirements would help FDA with the efficient enforcement of the Act, consistent with the rulemaking authority provided by section 701(a) of the FD&C Act.

IV. Nicotine in Cigarettes and Other Combusted Tobacco Products: Addiction, Initiation, Dependence, Cessation, Relapse, Health Effects, and Consumer Perceptions

Tobacco products are addictive, primarily due to the presence of nicotine, and the magnitude of public health harm caused by tobacco products is inextricably linked to their addictive nature (Ref. 50 at p. xi). Some evidence suggests that nicotine is more addictive than many other addictive substances. For example, one study showed the probability of transitioning from first use to dependence was 68 percent for nicotine, but less than 23 percent for alcohol, cocaine, and cannabis (Ref. 51). While cigarettes are the most widely used tobacco products among adults, other combusted tobacco products that are possible targets of product migration (*i.e.*, alternatives that allow people who smoke cigarettes to maintain their nicotine addiction) or dual use have similar adverse health effects, and also cause nicotine dependence (Refs. 52 and 53). For example, persons who use cigars and pipe tobacco are still subject to the addictive effects of nicotine through nicotine absorption (and to the health impacts of long-term use that may follow from regular use due to addiction) even if they report that they do not inhale (Refs. 54 to 56).

A. Nicotine Is Addictive

The scientific evidence is clear that nicotine is the primary chemical in tobacco products that causes addiction through its psychoactive and reinforcing effects (Ref. 57). Since 1988, the U.S. Surgeon General has determined that there is a causal relationship between smoking and addiction to nicotine (Refs. 1 and 57), and the earlier that individuals begin smoking, the less likely they are to successfully quit (Ref.

27). Upon inhaling smoke from a burning cigarette, nicotine is absorbed into the lungs and rapidly travels to the brain. Once in the brain, nicotine produces its initial effects by binding to nicotinic receptors—the primary targets for nicotine in the brain—and inducing release of the chemical dopamine (Refs. 58 and 59). Dopamine plays a major role in the pleasurable and reinforcing effects of smoking that promote continued use (Refs. 58 and 59). Nicotine addiction occurs as the result of repeated exposure to nicotine, which induces changes in the brain (Refs. 58 to 60). Addiction to nicotine can lead to symptoms of nicotine dependence, which may include tolerance to the effects of nicotine, withdrawal symptoms upon cessation of use, and craving cigarettes (Refs. 1 and 58).

The addiction potential of a nicotine delivery system varies as a function of its total nicotine dosing capability, the speed at which it can deliver nicotine, the rate of absorption, its palatability and sensory characteristics, how easy it is for the person using the product to extract nicotine, and its cost (Ref. 61). The amount of nicotine delivered and the means through which it is delivered can either reduce or enhance a product's potential for abuse and physiological effects (Ref. 28 at p.113). Quicker delivery, higher rate of absorption, and higher resulting concentration of nicotine increase the potential for addiction (Ref. 28 at p.113). A cigarette is an inexpensive and extremely effective nicotine delivery system that maximizes the cigarette's addicting and toxic effects (Ref. 61).

Tobacco use disorder is a psychiatric disorder, defined by the Diagnostic and Statistical Manual of Mental Disorders (DSM) as being characterized by tolerance to the effects of tobacco products, withdrawal symptoms that are mitigated by the self-administration of nicotine-containing products, and unsuccessful attempts at reducing or quitting the use of nicotine-containing products (Ref. 62). Researchers consider several behaviors indicative of a substance with addictive properties. These behaviors include reinforcement, tolerance, withdrawal, and craving—all of which support the fact that nicotine is the primary addictive constituent in tobacco products. The scientific evidence is clear that nicotine is the primary chemical in tobacco products that causes and maintains addiction.

1. Reinforcement

The reinforcement threshold for nicotine can be defined as the lowest nicotine level that would maintain or increase nicotine self-administration

behavior. Currently, most marketed cigarettes are above that threshold; people who smoke cigarettes develop and maintain their addiction through continued smoking (Refs. 17 and 63). Evidence supports that VLNC cigarettes (see table 1 of this document) are below that threshold, as studies show a reduction in the level of addiction based on dependence scales (Ref. 32) and cigarettes per day (CPD) (Refs. 32, 64, and 65). The maximum nicotine level included in this proposed product standard is based on FDA's analysis of studies regarding the likely effects of reducing nicotine, which demonstrates that extended exposure to VLNC cigarettes, which result in very low nicotine yield that cannot be overcome by use behaviors, is associated with reduced addiction potential, dependence levels, number of cigarettes smoked per day, and increased quit attempts among people who currently smoke cigarettes, without evidence of increased toxicant exposure, craving, withdrawal, or compensatory smoking (Ref. 45).

2. Tolerance

Tolerance is defined as a state in which, after repeated exposure, a substance produces less of an effect than previously (Ref. 66) and increasing amounts are required to achieve the effect observed with the first exposure. Both clinical and preclinical research has shown that nicotine has euphoric effects, produces a "pleasurable buzz," and directly enhances positive affect or indirectly increases the reward value of pleasurable situations (Refs. 67 to 70). With repeated exposure to nicotine, neuroadaptation occurs to some of these positive effects, and symptoms of craving and withdrawal begin during periods of abstinence (Ref. 58). Nicotine addiction results from a combination of positive reinforcement from smoking and avoidance of these withdrawal symptoms (Ref. 58). Evidence of tolerance in people who smoke cigarettes is demonstrated as they tend to progressively increase the number of cigarettes they smoke over a period of several years before plateauing to a relatively constant level of use (Ref. 71).

3. Withdrawal and Craving

Nicotine produces a characteristic withdrawal syndrome manifested by irritability/anger/frustration, anxiety, depressed mood, difficulty concentrating, increased appetite, insomnia, and restlessness (Ref. 72). Symptoms typically emerge within the first 1–2 days following abstinence, peak within the first week, and last 2–4 weeks (Ref. 73). The symptoms and

time course are consistent with most prototypical addictive substances (*e.g.*, alcohol, benzodiazepines, opioids, amphetamines, cocaine, caffeine) (Ref. 74). While some have asserted that people smoke cigarettes as a "tool" or "resource" that provides them with needed "psychological benefits," such as increased mental alertness and anxiety reduction (Ref. 75), this view is not borne out by the scientific evidence. In fact, the claimed "psychological benefits" (*i.e.*, increased mental alertness, anxiety reduction, coping with stress) that have been ascribed to a smoking "habit" are actually symptoms of withdrawal suppression (Ref. 76). Craving or urge is described as a motivation for substance use, which is seen in people who use nicotine (Refs. 77 to 79). Although craving is often characterized as a symptom of nicotine and tobacco withdrawal, it is also a prominent symptom of nicotine dependence (Ref. 72), and it can occur in the absence of other withdrawal symptoms.

4. Nicotine Use Is an Addiction, Not a Habit

A few individual reports have challenged the conclusion that nicotine is the constituent in tobacco products that causes addiction, stating that nicotine only causes habitual behavior (Refs. 67 and 75), and that the craving associated with nicotine is determined by nonpharmacological factors that are disassociated from smoking withdrawal (Ref. 80). However, nicotine has been extensively studied and the evidence overwhelmingly demonstrates that nicotine is an addictive drug and the fundamental reason that individuals continue using tobacco products (Refs. 57 and 28). Since 1988, the U.S. Surgeon General has concluded that nicotine is the substance in tobacco products that causes addiction through its psychoactive effects, reinforcing effects, tolerance, and physical dependence/withdrawal, and that nicotine use is not habitual (Ref. 57). The tobacco industry also has acknowledged that nicotine is addictive (Refs. 81 and 82).

For these reasons, FDA concludes that the addictiveness of nicotine in tobacco products leads to regular use (even when people wish to quit), which is at the root of tobacco-related disease and death from cigarettes and certain other combusted tobacco products.

B. The Developing Brain's Vulnerability to the Effects of Nicotine Leads to Progression to Regular Cigarette Use Among Youth and Young Adults Who Experiment

Youth and young adults are particularly susceptible to developing an addiction to nicotine. Due to the brain's ongoing development during adolescence and young adulthood—until about age 25—it is more vulnerable to nicotine's effects than the adult brain is (Refs. 83 to 85). The 1994, 2012, 2014, and 2020 Surgeon General's Reports on smoking and health note that almost 90 percent of adults who currently and regularly smoke initiated smoking by age 18, and 98 percent initiated smoking by age 26, which is notable given that 25 is the approximate age at which the brain has completed development (Refs. 1, 17 to 19). The developing brain is more vulnerable to developing nicotine dependence than the adult brain is, and the earlier an individual begins smoking the less likely they are to quit (Ref. 20). The maximum nicotine level requirement included in this proposed product standard to regulate nicotine yield would make cigarettes and certain other combusted tobacco products minimally addictive or nonaddictive, limiting the number of youth and young adults who progress from experimentation to regular use and reducing their risk for smoking-related diseases.

There are three primary stages that occur as an individual transitions from never smoking to smoking cigarettes regularly: initiation, experimentation, and regular use. An individual initiates smoking once he or she first tries a cigarette, even one or two puffs (Ref. 17). The vast majority of smoking initiation occurs during adolescence (Ref. 17). Initiation can progress to experimentation, where individuals continue to occasionally try cigarettes, but do not smoke every day, and then to smoking regularly (*i.e.*, smoking daily or on most days) (Ref. 17).

Adolescence is a period of development when individuals who experiment with tobacco products are more susceptible to transitioning to regular use and developing addiction to nicotine. Data from the 2024 NYTS found that 10.1 percent of high school students and 5.4 percent of middle school students reported current use of any tobacco product (Ref. 3). Each day, approximately 1,200 youth (ages 18 and below) try their first cigarette (Ref. 86 at Table A.13A). The transition to regular cigarette use (*i.e.*, smoking on ≥ 20 of the past 30 days) can occur relatively quickly and can be achieved by smoking

as few as 100 cigarettes (Ref. 17). Longitudinal and nationally representative cross-sectional data indicate that an established pattern of cigarette use—including those who “rapidly escalate” to regular use—typically occurs by early adulthood (ages 20–22) (Refs. 87 and 88). The Centers for Disease Control and Prevention (CDC) and other researchers have estimated that 30 percent or more of people who experiment with cigarettes transition to regular cigarette use (Refs. 89 to 92). Researchers applied the 30 percent estimate to the number of adolescents who were at the early experimentation stage in 2000, translating to approximately 2.9 million of these adolescents who have or will become people who regularly smoke cigarettes (Ref. 91). Based on the number of persons under the age of 18 in 2012 in the United States, the U.S. Surgeon General estimated that 17,371,000 of that group would begin smoking cigarettes regularly and 5,557,000 will die from a smoking-related disease (Ref. 1 at Table 12.2.1). These concerning high numbers speak to the extreme vulnerability of youth and young adults to the health harms of tobacco use resulting from addiction to nicotine.

Nicotine addiction is a critical factor in the transition of people who smoke cigarettes from experimentation to regular smoking and in the continuation of smoking for those who want to quit (Ref. 28 at p.113, Ref. 1). Although the majority of adolescents who smoke daily meet the criteria for nicotine dependence, one study found that the most susceptible youth lose autonomy (*i.e.*, independence in their actions) regarding tobacco within 1 or 2 days of first inhaling from a cigarette (Refs. 93 and 94). Another study found that 19.4 percent of adolescents (initially ages 12–13 and followed over 6 years) who smoked weekly were dependent on nicotine (Ref. 95). In a study regarding nicotine dependence among adolescents who recently initiated smoking (9th and 10th grade students), adolescents who smoked cigarettes at the lowest levels (*i.e.*, smoking on only 1 to 3 days of the past 30 days) experienced nicotine dependence symptoms such as loss of control over smoking (42 percent) and irritability after not smoking for a while (23 percent) (Ref. 96). Researchers in a 4-year study of 6th grade students also found that “[e]ach of the nicotine withdrawal symptoms appeared in some subjects *prior* to daily smoking” (Ref. 93) (emphasis added). Ten percent of the study participants showed signs of tobacco dependence within 1 or 2 days

of first inhaling from a cigarette, and half had done so by the time they were smoking seven cigarettes per month (Ref. 93).

Similarly, researchers have found that among the 3.9 million middle and high school students who reported current use of tobacco products (including cigarettes and cigars) in 2012, 2 million of those students—including those who used intermittently (*e.g.*, smoking cigarettes on a monthly basis)—reported at least one symptom of dependence (Ref. 24). Other researchers analyzing data from the 2021 NYTS found that a sizeable proportion of high school students using tobacco products in the past 30 days report symptoms of nicotine dependence, including 27.2 percent reporting a strong craving for tobacco use and 19.5 percent reporting wanting to first use tobacco products within 30 minutes of waking (Ref. 25). Overall, these findings demonstrate that youth and young adults who experiment with cigarettes (and other tobacco products) are particularly vulnerable to the effects of nicotine on progression to regular use and dependence, leading to maintained tobacco product use into adulthood.

C. Youth and Adult Cigarette Smoking Cessation and Relapse

Like adults, many youths who smoke cigarettes want to quit but have difficulty doing so. An analysis of data from the 2015 YRBS looking at youth cigarette quit attempts found that 45.4 percent of high school students currently smoking cigarettes had sought to quit in the previous year (Ref. 22); 2012 NYTS data were congruent, indicating that 51.5 percent of middle and high school students who smoke cigarettes had sought to quit all tobacco use in the previous year (Ref. 22).

For adults who smoke who report quit attempts, few are successful. As of 2019, researchers estimate that only between 5.4 and 5.6 percent of people who smoked cigarettes successfully quit for good, according to data from the NHIS and National Survey on Drug Use and Health (NSDUH), respectively (Ref. 14). According to recent data regarding adult quit attempts, analyses of 2022 NHIS and 2018–2019 TUS–CPS data indicate that 67.7 and 76.6 percent of adults, respectively, who smoke cigarettes were interested in quitting (Refs. 4 and 36), while the 2022 NHIS data and 2018–2019 TUS–CPS data show that only 53.3 and 51.3 percent, respectively, of U.S. adults who smoke actually made a quit attempt within the past year (Refs. 4 and 36). Analyses of 2022 NHIS and 2018–2019 TUS–CPS data indicates that only 8.8 and 7.5 percent of adults who

formerly smoked cigarettes had successfully quit smoking cigarettes, respectively (Ref. 4 and 36). Adults who smoke may make 30 or more quit attempts before succeeding (Ref. 37). Some population groups are less successful than others: for example, adults with education levels at or below the equivalent of a high school diploma have the highest smoking prevalence levels but the lowest quit ratios (*i.e.*, the ratio of persons who have smoked at least 100 cigarettes during their lifetime but do not currently smoke to persons who report smoking at least 100 cigarettes during their lifetime) (Ref. 97). Nicotine addiction and associated withdrawal symptoms make it difficult for people who smoke cigarettes to quit, and quit rates rarely exceed 25 percent (Ref. 98).

Relapse is the principal limiting factor in the transition from smoking to nonsmoking status (Ref. 28). Relapse refers to the point after an attempt to stop smoking when a person's tobacco use again becomes ongoing and persistent (Ref. 28 citing Brandon et al., 1986). Most people who relapse do so soon after their quit attempt (Ref. 28). One study found that 80 to 90 percent of individuals who were smoking at 6 months following a quit attempt had resumed smoking within 2 weeks following their quit attempt (Ref. 99). However, even those who quit smoking for longer periods of time frequently relapse. Long-term studies of individuals trying to quit smoking reveal that 30 to 40 percent of those who quit smoking for 1 year eventually relapsed (Ref. 99). In addition, one study following 840 participants for more than 8 years found that approximately one-half of people who smoke who stopped smoking for 1 year relapsed to regular smoking within the subsequent 7 years (Ref. 100). Researchers have found that a higher frequency of smoking is associated with earlier lapses after cessation (*e.g.*, smoking on the first day of cessation or within the first 2 weeks), which in turn is strongly associated with an increased risk of relapse, and is also associated with more severe withdrawal symptoms and earlier relapse after an attempt to quit smoking (Ref. 28 at p.119). These findings confirm the powerful addictive properties of nicotine in tobacco products, a principal factor limiting the ability to quit for a person who uses combusted tobacco products, and further underscore the public health importance of decreasing the addictiveness of these products by decreasing nicotine yield, particularly for youth and young adults who

experiment with smoking and for people currently smoking and who hope to quit.

D. Smoking Cigarettes and Other Combusted Tobacco Products Causes Serious Negative Health Effects

Nicotine is a powerfully addictive chemical. The effects of nicotine on the central nervous system occur rapidly after absorption (Ref. 57 at p.12). People who use cigarettes and other combusted tobacco products absorb nicotine readily from tobacco smoke through the lungs (Ref. 57 at p. iii), and, from the lungs, nicotine is then rapidly transmitted to the brain (Ref. 57 at p.13). In the case of cigars, nicotine is also absorbed through the mouth. With regular use, nicotine levels accumulate in the body during the day from tobacco product use and the nicotine persists overnight, allowing for continuous exposure throughout the entire 24-hour period (Ref. 57 at p.38). While mild nicotine intoxication can occur among people who are smoking for the first time (Ref. 57 at p. 15–16), tolerance to the effects of nicotine develops rapidly.

Cigarette smoking is responsible for 480,000 premature deaths every year from many diseases, puts a substantial burden on the U.S. healthcare system, and causes massive economic losses to society (Ref. 1 at p. 659–666). In terms of a monetary measure of the impact of cigarette smoking on the public health, in 2018 smoking cost the United States more than \$600 billion, including more than \$240 billion in healthcare spending (Ref. 10), nearly \$185 billion in lost productivity from smoking-related illnesses and health conditions (Ref. 10), nearly \$180 billion in lost productivity from smoking-related premature death (Refs. 1 and 10), and \$7 billion in lost productivity from premature death from secondhand smoke exposure (Refs. 1 and 11). Current evidence shows that, while nicotine itself is not the direct cause of most smoking-related diseases, addiction to the nicotine in tobacco products is the proximate driver of tobacco-related death and disease because it sustains tobacco use even when people who smoke want to quit (which most people who smoke report wanting to do) (Refs. 1, 13, 28, 58, and 61). Inhalation of smoke from cigarettes and other combusted tobacco products exposes people who use the products to over 7,000 chemicals, many known to be hazardous to health and lead to disease (Ref. 28). According to the 2014 Surgeon General's Report, which summarizes thousands of peer-reviewed scientific studies and is itself peer-reviewed, smoking remains the leading preventable cause of disease and death

in the United States, and cigarettes have been shown to cause an ever-expanding number of diseases and health conditions (Ref. 1). Every year, cigarette smoking is the primary causal factor for 163,700 deaths from cancer, 160,600 deaths from cardiovascular and metabolic diseases, and 131,100 deaths from pulmonary diseases (Ref. 1 at p.659). In the United States, about 87 percent of all lung cancer deaths, 32 percent of coronary heart disease deaths, and 79 percent of all cases of chronic obstructive pulmonary disease (COPD) are attributable to cigarette smoking (Ref. 1). Smoking during pregnancy can result in negative outcomes for a newborn baby, such as low birth weight, lungs that fail to develop properly, birth defects such as cleft lip and/or cleft palate, and Sudden Infant Death Syndrome (Ref. 101). As stated in the 2014 Surgeon General's Report, "[c]igarette smoking has been causally linked to diseases of nearly all organs of the body, to diminished health status, and to harm to the fetus . . . [and] the burden of death and disease from tobacco use in the United States is overwhelmingly caused by cigarettes and other combusted tobacco products" (Ref. 1 at p.7).

Tobacco and cigarette smoking-related morbidity and mortality also have been experienced differentially across different sociodemographic characteristics, such as race, ethnicity, socioeconomic status, educational attainment, mental health status, and homelessness. Black¹⁴ adults, and in particular Black men, experience the highest rates of incidence and mortality from many tobacco-related cancers, such as lung and bronchus cancer and head and neck cancer, compared to those from other racial and ethnic groups (Refs. 102 to 104). Deaths from other tobacco-related conditions such as heart disease, stroke, and hypertension are higher among Black individuals compared to other racial and ethnic groups regardless of tobacco use status (Refs. 105 to 110). Compared to persons identifying as non-Hispanic White, Hispanic and Black persons smoke fewer cigarettes (Refs. 111 to 113) and are more likely to be people who do not smoke daily (Refs. 111 and 114), yet

¹⁴ Throughout this document, FDA uses both the terms "Black" and "African American." The term "African American" is used to describe or refer to a person of African ancestral origins or who identifies as African American. "Black" is used to broadly describe or refer to a person who identifies with that term. Though these terms may overlap, they are distinct concepts (*e.g.*, a Black person may not identify as African American). As a result, FDA relies on the specific term used by researchers when citing to specific studies. FDA uses the term "Black" when not citing to a specific study.

have greater risk of lung cancer morbidity and mortality (Refs. 1, 115 to 118). Additionally, American Indian/Alaska Native (AI/AN) populations have the highest cigarette use prevalence (Refs. 119 to 121) and are more likely to suffer disproportionate rates of tobacco-related death (Ref. 119). An analysis of 2001–2009 mortality data for people living in the Indian Health Service Contract Health Service Delivery Area counties in the United States indicated that age-adjusted death rates, smoking-attributable fractions, and smoking-attributable mortality for all-cause mortality were statistically significantly higher among AI/AN populations than among White populations for adult men and women aged 35 years and older (Ref. 122). Cigarette smoking caused 21 percent of ischemic heart disease, 15 percent of other heart disease, and 17 percent of stroke deaths in AI/AN men, compared with 15 percent, 10 percent, and 9 percent, respectively, for White men (Ref. 122). Among AI/AN women, smoking caused 18 percent of ischemic heart disease deaths, 13 percent of other heart disease deaths, and 20 percent of stroke deaths, compared with 9 percent, 7 percent, and 10 percent, respectively, among White women (Ref. 122). Some Asian populations, Native Hawaiians, and other Pacific Islander populations also suffer from disproportionate rates of tobacco-related mortality as compared to non-Hispanic White persons (Refs. 115, 117, 123, and 124).

Disparities in tobacco-related morbidity and mortality have also been observed for additional population groups that have higher levels of tobacco use. Those with low household income and/or educational attainment bear a disproportionate burden of myocardial infarction prevalence and coronary heart disease-related mortality (Ref. 125). National Health and Nutrition Examination Survey (NHANES) data from 2007 to 2010 indicate that prevalence of co-occurring obesity and smoking was linearly associated with educational attainment as women with the lowest levels of education had greater likelihood of being obese and smoking than women with the highest levels of education (Ref. 126). Some research also indicates that race/ethnicity status interacts with the effects of higher educational attainment on the likelihood of current smoking. The protective effect of higher education against current smoking was shown to be a stronger effect for White as compared to Black respondents (Ref. 127). Research has also demonstrated that individuals with behavioral health conditions and other medical

comorbidities have higher prevalence of combusted tobacco use compared to those without these conditions (Refs. 128 and 129) and have increased risk of tobacco-related morbidity and mortality (Refs. 120, 130, and 131). Inpatient hospital admission data from 1990 to 2005 from California indicate that approximately half of the deaths in those who had been hospitalized for schizophrenia, bipolar disorder, or major depressive disorder were due to diseases causally linked to tobacco use (Ref. 130) and that the majority of deaths for those hospitalized for opioid-related conditions were related to tobacco and alcohol, not to opioids (Ref. 132). Tobacco-related cancers are a leading cause of death among adults experiencing homelessness (Ref. 133). While cigarette smoking and exposure to cigarette smoke are responsible for significant mortality—480,000 premature deaths annually, as previously stated—this estimate does not include deaths caused by other tobacco products, such as cigars and pipes (Ref. 1 at p. 665).¹⁵ Additionally, for every person who dies from a smoking-related disease in the United States, approximately 30 more people will suffer from at least one smoking-related disease (Ref. 1).

Inhalation of the chemicals produced by combustion results in numerous adverse health outcomes through mechanisms that include DNA damage, inflammation, and oxidative stress (Ref. 28). The three leading causes of smoking-attributable death for people who currently and formerly smoke cigarettes are lung cancer, heart disease, and COPD (Ref. 1 at p. 660). Cigarette smoking results in a chronic inflammatory state in the cardiovascular system that is known to be a powerful predictor of cardiovascular events including heart disease (Ref. 28). For COPD, although studies have shown that the disease can be almost completely prevented with the elimination of smoking (Ref. 63), for those who have already developed the disease, evidence indicates that the related morbidity persists long after cessation of smoking (Ref. 28). In addition, it has been established that more than 85 percent of lung cancers are due to smoking, and lung cancer is the

country's leading cause of cancer death (Refs. 1, 28, 63, and 136).

Cigarettes and other combusted tobacco products also have deadly effects on people who do not smoke because they produce secondhand smoke. It is well-established that secondhand tobacco smoke causes premature death and disease in children and in adults who do not smoke (Ref. 15 at p.11). Secondhand smoke exposure is currently estimated to be responsible for over 41,000 deaths annually in the United States (Ref. 1). For example, an estimated 7,300 lung cancer deaths and nearly 34,000 coronary heart disease deaths annually can be attributed to secondhand smoke (Ref. 1). Additionally, productivity losses due to secondhand smoke-attributable deaths are estimated to cost the United States \$5.6 billion each year (Ref. 1).

Secondhand smoke is particularly harmful to children. For instance, the 2014 Surgeon General's Report estimated that each year, secondhand smoke is associated with 150,000 to 300,000 lower respiratory tract infections in infants and children under 18 months of age, 790,000 doctor's office visits related to ear infections, and 202,000 asthma cases (Refs. 1 and 137). In addition, thirdhand smoke—the chemical residue from combusted tobacco smoke that can become embedded in the environment (*e.g.*, carpet, dust)—results in exposure to harmful constituents such as tobacco specific nitrosamines (Ref. 138). Exposure to thirdhand smoke is especially concerning for young children given their size and behaviors, like crawling on the ground and frequently putting their hands in their mouths.

Additionally, the burden of secondhand smoke exposure is experienced disproportionately among members of some racial and ethnic groups and people with lower household income and educational attainment. Among people who do not smoke, ages 3 and older, findings from 2011 to 2018 NHANES data indicate that non-Hispanic Black respondents and those living below the poverty level had the highest levels of secondhand smoke exposure compared to people of other races and those living above the poverty level, respectively; these disparities persisted across all years of the study analysis from 2011 to 2018 (Ref. 139). From 1999 to 2012, the percentage of persons who do not smoke (ages 3 and older) with detectable serum

¹⁵ Regular cigar smoking was responsible for approximately 9,000 premature deaths and more than 140,000 years of potential life lost among adults aged 35 years or older in 2010 (Ref. 134). The 2014 Surgeon General's Report states that the methodology for estimating the current population burden for use of combusted tobacco products other than cigarettes remains under discussion, but the number of added deaths is expected to be in the thousands per year (Refs. 1 and 135).

cotinine¹⁶ levels (defined in the study as levels ≥ 0.05 nanogram per milliliter to indicate secondhand smoke exposure) declined across all racial and ethnic groups (Ref. 141). However, a higher proportion of non-Hispanic Black individuals who do not smoke continued to have detectable serum cotinine levels, compared to Hispanic and non-Hispanic White individuals who do not smoke. For example, in 2017–2018, nearly 50 percent of non-Hispanic Black people who do not smoke had detectable serum cotinine levels, compared with 22 percent of non-Hispanic White and 17 percent of Mexican American people who do not smoke (Ref. 141). Moreover, disparities in trends in detectable serum cotinine levels among people who do not use cigarettes over time have been observed on the basis of race/ethnicity. One analysis of NHANES data and found that from 1999 to 2012 among children ages 3–11, comparable levels of decline were observed among non-Hispanic White (percentage change: 41.2 percent) and Mexican American (percentage change: 39.0 percent) youth, but a lesser decline was observed among non-Hispanic Black youth (percentage change: 19.8 percent) (Ref. 141). A more recent analysis of NHANES data also indicated that, between 2011 and 2018, the percentage of people who do not use cigarettes with detectable serum cotinine levels increased among non-Hispanic Black youth ages 12–19 but remained stagnant among non-Hispanic White youth of the same ages (Ref. 142).

Moreover, there is also some scientific evidence supporting disparities in secondhand smoke exposure by sexual orientation. An analysis of NHANES data from 2003–2010 found that secondhand smoke exposure (defined as a serum cotinine¹⁷ levels ≥ 0.05 nanogram per milliliter) differed by sexual orientation among women 20–59 years of age (Ref. 143). This study found that among women 20–59 years of age, secondhand smoke exposure was higher among non-smoking women who identified as lesbian (56.2 percent) or who reported a lifetime experience with a same-gender partner (47.7 percent) than those women who identified as exclusively heterosexual (33.0 percent; $p < 0.001$) (Ref. 143). However, among men 20–59 years of age, exposure to secondhand smoke did not significantly differ by sexual orientation.

Disparities in the secondhand smoke exposure are found across various environmental settings. These disparities speak to the interrelated influences of individual factors (*e.g.*, age, race and ethnicity, sexual orientation, income) and existing inequities in places where members of communities disproportionately impacted by tobacco-related health disparities are likely to reside, spend time, and work (Refs. 53 and 120). For example, an analysis of NHANES data from 2017–2018 found that 87.8 percent of non-smoking persons 3 years of age and older who lived with someone who smoked inside the home was exposed to secondhand smoke based on serum cotinine values of 0.05–10.00 nanogram per milliliter compared to 21.4 percent of non-smoking persons 3 years of age and older not living with someone who smoked inside the home (Ref. 142). In terms of race and ethnicity, findings drawn from the 2013–2016 NHANES data indicate that compared to non-Hispanic White respondents, non-Hispanic Black respondents had higher odds of secondhand smoke exposure in homes other than their own (Ref. 144). An analysis of NYTS data indicates that non-Hispanic Black and non-Hispanic White students both had higher prevalence of secondhand smoke exposure at home and in vehicles than Hispanic and non-Hispanic other race/ethnicity students (Ref. 145). While secondhand smoke exposure in homes and vehicles declined from 2011 to 2018, secondhand smoke exposure in homes among non-Hispanic Black students did not change (Ref. 145). Additionally, a study using data from Wave 1 (2013–2014) of the Population Assessment of Tobacco and Health (PATH) Study found that the odds of exposure to secondhand smoke at home were higher for Black adults (OR=1.12, 95 percent CI:1.00–1.24; p -value=0.042) than White adults; and higher for those adults who self-identified as being LGBT (OR=1.30, 95 percent CI:1.11–1.52; p -value=0.001) than for heterosexual adults (Ref. 146). Home smoking bans (*i.e.*, when people decide to have their own rules that restrict or ban smoking inside their own home)—can reduce secondhand smoke exposure. For example, a study using data from the 2009–2010 National Adult Tobacco Survey (NATS) found the prevalence of exposure to secondhand smoke varied based on the presence (or absence) of smokefree rules in the home (Ref. 147). This study found that overall, 1.4 percent of people who did not smoke and had a smokefree rule at home were exposed to secondhand

smoke in their homes in the past 7 days, compared with 43.9 percent of people who did not smoke and did not have a smokefree rule at home (Ref. 147). A similar pattern was observed across age groups, race and ethnicity, and levels of educational attainment. For example, a higher percentage of Black and Hispanic people were exposed to secondhand tobacco smoke in homes with and without smokefree rules than White people. Additionally, a study using 1995–2007 TUS–CPS data found that among two parent households, higher levels of parental educational level and annual household income were associated with the higher reporting of a complete home ban as compared to lower levels of parental educational and annual household income (Ref. 148). Such findings emphasize the degree to which certain aspects of disadvantage (such as lower family income, lack of access to single-family housing, or lack of autonomy over the home environment) may compound tobacco-related health disparities.

Individuals who live in multi-unit housing, including apartments, are particularly susceptible to involuntary secondhand smoke exposure in the home, as secondhand smoke can infiltrate throughout a building along various pathways (Refs. 149 to 153). Exposures to secondhand smoke in multi-unit housing are potentially concerning given a study drawing on the 2013–2014 National Adult Tobacco Survey (NATS) found that tobacco use was higher among adults living in multi-unit housing (24.7 percent) than those in single-family housing (18.9 percent) (Ref. 154). This study also found that smoke-free home rules (*i.e.*, home smoking bans) were higher among adults living in single-family housing (86.7 percent) than those in multi-unit housing (80.9 percent) (Ref. 154). However, more than a third (34.4 percent) of multi-unit housing residents with home smoking bans have experienced secondhand smoke incursions (Ref. 154). Recent estimates indicate that approximately 80 million residents in the United States are currently living in some type of multi-unit housing (Ref. 150). Among those living in multi-unit housing with a home smoking ban, an estimated 27.6–28.9 million are exposed to secondhand smoke incursions from neighboring units and/or shared common areas (Ref. 150). Moreover, a 2013 nationally representative study conducted among U.S. adults living in multi-unit housing found that 25.2 percent of non-smoking residents who had no smoking in the home for at least 3 months and who also

¹⁶ Cotinine is an alkaloid found in tobacco leaves and is the main metabolite of nicotine. Measuring cotinine in people's blood is a reliable way to determine exposure to nicotine for both people who smoke and those exposed to environmental tobacco smoke (Ref. 140).

had a child in the home had a recent secondhand smoke incursion into their unit; 99 percent of these residents also reported being bothered by the incursion (Ref. 155). Multi-unit housing secondhand smoke incursions have also been found to be greater among specific populations that are already disproportionately burdened by tobacco-related disease and death, including women, younger adults, and non-Hispanic Black, Hispanic, and lower income populations (Ref. 154).

Workplace secondhand smoke exposure has also been shown to vary across population groups. A study using data from the 2009–2010 NATS show the prevalence of secondhand smoke exposure from employed nonsmoking adults was higher among males, non-Hispanic Black, Hispanic, and AI/AN people compared with White people, and people with low education and low income (Ref. 156). Similarly, data from the 2010 and 2015 NHIS show that exposure to secondhand smoke in the workplace was disproportionately high among non-Hispanic Black respondents, Hispanic respondents, and workers with low education and low income (Ref. 157). Additionally, the study findings indicated that “blue-collar workers” (defined as those who performed manual labor such as manufacturing, mining, sanitation, and construction) experienced higher prevalence of secondhand smoke exposure compared to “white-collar workers” (defined as those who primarily work in an office, with computer and desk setting, and perform professional, managerial, or administrative work) (Ref. 157).

The disparities observed in tobacco use, as well as disparities in secondhand smoke exposure, contribute to the disparities in tobacco-related morbidity and mortality experienced by some population groups. This proposed product standard is anticipated to reduce smoking-related morbidity and mortality for the population as a whole, including these populations that use tobacco or are exposed to secondhand smoke at disproportionately high levels.

Other combusted tobacco products, particularly those that could serve as alternatives to cigarettes if people who smoke cigarettes no longer had access to normal nicotine cigarettes (NNC), cause similar negative health effects. For example, cigar smoke contains many of the same harmful constituents as cigarette smoke, and cigar smoke may have even higher levels of several harmful compounds compared to cigarette smoke (Refs. 1, 134 and 158). For example, cigar smoke contains higher amounts of carcinogenic, tobacco-specific N-nitrosamines than

cigarette smoke due to the relatively high concentration of nitrate in cigar tobacco, which leads to formation of cancer-causing nitrosamines during the fermentation process (Refs. 1; 53 at Chapter 3; and 158). Researchers have found urinary concentrations of 4-(methylnitrosamino)-1-(3-pyridyl)-1-butanol (NNAL) (a hazardous tobacco-specific nitrosamine) measured in people who smoke cigars daily to be as high as those measured in people who smoke cigarettes daily (Refs. 159 and 160). Like exposure to cigarette smoke, exposure to higher levels of cigar smoke for longer time periods increases the adverse health risks caused by cigar smoking (Ref. 28).

Consequently, there is a long-standing body of research, including reports from the U.S. Surgeon General and National Cancer Institute (NCI), demonstrating that cigar use causes serious adverse health effects (Ref. 53 at p.119–155; Refs. 55; 161, and 162). NCI’s Smoking and Tobacco Control Monograph No. 9 (“Cigars: Health Effects and Trends”), which provides a comprehensive, peer-reviewed analysis of the trends in cigar smoking and potential public health consequences, as well as other research, demonstrates that cigar smoking leads to an increased risk of oral, laryngeal, esophageal, pharyngeal, and lung cancers, as well as coronary heart disease and aortic aneurysm, with the magnitude of risk a function of the amount smoked and depth of inhalation (Ref. 53 at p.119–155). Likewise, a systematic review of the mortality risks associated with cigar smoking that identified 22 studies found that people who regularly smoke cigars are at increased risk for many of the same diseases as people who smoke cigarettes, including oral, laryngeal, esophageal, and lung cancer; cardiovascular diseases; and COPD (Ref. 163).

Research indicates that most people who smoke cigars do inhale some amount of smoke, even when they do not intend to inhale, and are not aware of doing so (Refs. 54 and 55). Even when people who smoke cigars do not breathe smoke into their lungs, they are still subject to the addictive effects of nicotine through nicotine absorption (Refs. 55 and 56). This nicotine absorption occurs because cigar smoke dissolves in saliva, allowing the person smoking the cigar to absorb sufficient nicotine by holding the smoke in their mouths, even if the smoke is not inhaled (Refs. 53, 56, and 164). Cigar and/or pipe smoking causes cancers of the lung and upper aerodigestive tract, including the oral cavity, oropharynx, hypopharynx, larynx and esophagus

(Ref. 158). Additional evidence suggests that cigar and/or pipe smoking is causally associated with cancers of the pancreas, stomach, and bladder (Ref. 165). People who smoke cigars also have increased risks for coronary heart disease and COPD compared with people who never used tobacco (Ref. 166).

One study using NATS data from 2009 to 2010 found that regular cigar smoking (defined as use on at least 15 of the past 30 days) was responsible for approximately 9,000 premature deaths and more than 140,000 years of potential life lost among adults aged 35 years or older in 2010 (Ref. 134). A study of healthcare expenditures from 2000 to 2015 found that cigar-attributable healthcare expenditures for adults totaled \$1.75 billion per year, with \$284 million attributed to exclusive cigar smoking and \$1.5 billion attributed to poly tobacco use (*i.e.*, use of multiple tobacco products) involving cigar smoking plus cigarette or smokeless tobacco use (Ref. 167). In addition, overall mortality rates for all people who smoked cigars (*i.e.*, those who report inhaling as well as those who report not inhaling cigar smoke) are higher than rates for those who have never smoked, although they are generally lower than the rates observed for people who smoke cigarettes (Ref. 53 at p. 112). In an analysis of National Longitudinal Mortality Study (NLMS) data, researchers also found that the risk of dying from tobacco-related cancers is higher for people who currently exclusively use pipe tobacco and those who currently exclusively smoke cigars than for those who reported never using combusted tobacco products (Ref. 168). Another similar analysis using the restricted-use National Health Interview Survey-Linked Mortality Files (NHIS–LMF), following participants for mortality from 2000 through 2015, observed that people who currently smoked cigars daily had elevated risk of all-cause mortality compared to those who had never used tobacco (Ref. 169). In addition, researchers studying people who smoke cigars in 2009 and 2010 found that the average person who smokes cigars or pipes loses approximately 15 life years (Ref. 134).

Disparities in cigar-related health outcomes have also been observed by gender and race/ethnicity. Likely due to the greater prevalence of cigar use among men versus women, one analysis observed a significantly greater number of years of potential life lost for men than women (117,440 for men; 22,284 for women) associated with cigar use, as well as disparate monetary losses associated with cigar use (\$19.5 billion

for men; \$3.4 billion for women) based on the value of a statistical life year (Ref. 134). Studies have shown that levels of nicotine and other carcinogens in cigars can be higher than those in cigarettes and may be at levels that lead to increased risk of morbidity and mortality from conditions such as cancer, cardiovascular disease, and COPD (Refs. 134, 163, and 164). The prevalence of cigar smoking among AI/AN populations is lower than prevalence among Black populations, but higher than among Hispanic and Asian populations (Refs. 120 and 121), contributing to the disproportionate prevalence of lung cancer and cardiovascular diseases in these populations (Refs. 170 and 171).

E. Tobacco Product Marketing Has Contributed to Disparities in Use and Health Outcomes

Tobacco companies have long understood the complexities of nicotine addiction (Ref. 172) and have capitalized on the psychological and sociological aspects of tobacco use to market their products disproportionately to specific populations, such as youth and young adults, some racial and ethnic populations, individuals who identify as lesbian, gay, bisexual, transgender, queer, and intersex (LGBTQI+),¹⁷ those with lower household income and educational attainment, and individuals with behavioral health conditions (Refs. 173 and 174). For example, retail advertising for tobacco products is more common in neighborhoods with greater proportions of Black residents and in lower income neighborhoods (Refs. 175 to 179). Storefront and outdoor tobacco marketing, as well as point-of-sale marketing, are all disproportionately present in Black, Hispanic/Latino, AI/AN, and low-income communities (Refs. 175, 179, 180 to 187). Higher exposure to tobacco advertisements and retailing is associated with tobacco use susceptibility and tobacco use among youth, with observed disparities impacting youth who are Black, Hispanic, or lower socioeconomic status (Refs. 188 to 192). For example, a systematic review of 35 studies found that a higher density of tobacco retailers near the home is associated with

increased combustible tobacco product use among youth (Ref. 193).

Industry marketing tactics have also included the incorporation of culture-specific imagery, traditional practices, and events that target specific racial and ethnic groups. For instance, tobacco companies have sponsored cultural events such as Cinco de Mayo celebrations, Chinese New Year celebrations, and activities related to Black History Month (Refs. 173 and 194) and have used the cultural significance of traditional tobacco to validate the authenticity of commercially available cigarettes, exploiting the traditions of Native people to encourage cigarette use (Ref. 195). Tobacco industry documents show that tobacco companies have strategically marketed their products to women with lower income, particularly Black and Hispanic women, (Ref. 196), people experiencing homelessness and people with mental illness (Refs. 197 and 198), and the LGBTQI+ community (Refs. 199 to 201). Research also demonstrates that since at least the 1960s, the tobacco industry has made strategic donations to organizations representing and affiliated with these communities (Refs. 120, 202 to 205). Internal industry documents reveal that at least one tobacco company considered such donations to be a “quid pro quo,” because they could result in the normalization of tobacco use, development of brand loyalty, and opposition to health-protective tobacco control policies (Ref. 206).

The industry’s practices have resulted in long-term consequences for communities. Tobacco marketing influences social norms around tobacco use, making it more socially acceptable and increasing the likelihood of use (Refs. 207 to 209). In communities where the tobacco industry has disproportionately marketed to historically marginalized populations over decades, these social norms are transferred through peers and family generations, perpetuating the use of harmful combusted tobacco products, and contributing to present-day tobacco-related health disparities in these populations (Refs. 207, 210, and 211). Moreover, recent scientific evidence indicates that tobacco companies continue to target populations that experience tobacco-related health disparities with tobacco marketing (Refs. 178, 180, 191, 207, 212 to 226).

Although targeted marketing is only one factor in the development and perpetuation of combusted tobacco product use and related harms, it contributes to disparities that affect public health and are of great concern to FDA. Advancing health equity is a

policy priority and an important component of fulfilling FDA’s mission to protect and promote public health. FDA and the Federal Government recognize the advancement of health equity as “both a moral imperative and pragmatic policy,” as Executive Order 13995 states. Considerations related to health equity helped inform FDA’s decision to prioritize this proposed product standard.

F. Consumer Knowledge, Attitudes, Beliefs, and Perceptions About Nicotine

The science on consumer knowledge, attitudes, beliefs, and perceptions about nicotine demonstrates that a majority of consumers correctly understand that nicotine is the substance in cigarettes that causes addiction. Nationally representative studies that examined nicotine addiction beliefs in the general population reported that the belief that nicotine is addictive was endorsed by approximately 85.8 percent of the population, and the belief that nicotine is responsible for driving continued cigarette use was endorsed by approximately 82.9 percent of the population (Refs. 227 to 233). A nationally representative survey found that 88 percent of people who currently smoke cigarettes and 91 percent of people who use e-cigarettes agreed that nicotine makes people want to smoke (Ref. 227). A nationally representative study of youth suggests that about 77.1 percent of respondents believe that nicotine definitely or probably causes addiction (Ref. 234).

However, in contrast to high rates of correct beliefs about the addictiveness of nicotine, there are high rates of incorrect beliefs about the harms of nicotine. Studies that examined nicotine harm beliefs in the general population reported that the belief that nicotine causes cancer was endorsed by 40 to 78 percent of adult participants (Refs. 227, 228, 232, 233, 235 to 245). Additionally, a nationally representative study of youth suggests that about 74.7 percent believe that nicotine definitely or probably causes cancer (Ref. 234). Multiple nationally representative studies that examined nicotine harm perceptions by tobacco use status found that 52 to 61 percent of people who currently use cigarettes and up to 84 percent of people who do not use cigarettes endorsed the belief that nicotine itself causes cancer or that nicotine is the major contributing constituent in cigarettes that causes cancer (Refs. 228, 241, and 245). A more recent qualitative study of people who currently use little cigars and cigarillos suggests that the misperception that nicotine has significant adverse health

¹⁷ Throughout this document, FDA uses the term “LGBTQI+” broadly when referring to lesbian, gay, bisexual, transgender, queer, and intersex communities. When we describe findings from the published literature, we refer specifically to the groups that are studied. For example, some authors examine tobacco-related outcomes for members who identify as lesbian, gay, bisexual, or transgender only; as such, the data are limited to those who identify as LGBT, and authors interpret the findings for those specific groups.

effects is also common among people who use these products (Refs. 228, 241, 245, and 246). Although nicotine creates and sustains addiction and therefore is the driver of the death and disease associated with smoking, it is the repeated exposure to toxicants from tobacco products that directly causes most of the serious health effects among those who use tobacco products, including fatal lung diseases, such as COPD, and cancer (Ref. 28).

Consumer misperceptions regarding the harms associated with nicotine may lead to inaccurate judgments about the risks of using products that contain nicotine, including NRT. For example, individuals who hold a misperception about nicotine may be less likely to use NRT as a smoking cessation aid. Furthermore, there is evidence that misperceptions of nicotine harm vary by gender, ethnicity, and age, and may contribute to unequal health outcomes (Ref. 233). FDA recognizes the importance of addressing nicotine misperceptions in the context of a proposed product standard that limits the level of nicotine in cigarettes and certain other combusted tobacco products in order to make those products minimally addictive or nonaddictive. FDA will continue to conduct research and develop communication tools (e.g., consumer outreach, public education initiatives, engagement with interested parties) to ensure that consumers are informed of the risks of using tobacco products that contain nicotine, including the products covered under this proposed product standard.

V. History and Perceptions of VLNC Cigarettes

A. History of LNC and VLNC Cigarettes

Tobacco companies had the technical expertise to manipulate the nicotine content in tobacco as early as the 1920s and then began to market products that may have met very low nicotine content (VLNC)¹⁸ cigarette levels throughout the late 1970s and early 1980s (Ref. 247). As discussed above, the term “VLNC cigarettes” generally refers to combusted cigarettes that have been reported to contain ≤ 1.0 mg nicotine per gram of total tobacco. For a detailed discussion of the scientific evidence that supports the technical achievability of this proposed product standard, see section VII.E of this document. In this

section, we describe some of the industry’s early and continuing efforts to develop VLNC cigarettes.

Some of the earliest VLNC cigarettes studied by academic researchers were produced by Philip Morris and marketed under the brand name “Next,” which was reported to contain 0.4 mg nicotine per gram of total tobacco (Ref. 248). Later, the National Institute on Drug Abuse (NIDA) contracted with the Ultratech/Lifetech Corporation¹⁹ to produce VLNC cigarettes for research purposes only (Refs. 249 and 250). The two types of cigarettes produced were: (1) 8.0–10.3 mg nicotine per gram of total tobacco and (2) 0.6–0.7 mg nicotine per gram of total tobacco (Ref. 250).

Commercially available Quest cigarettes were produced and marketed by Vector Tobacco in the early 2000s and utilized genetically engineered tobacco to create cigarettes with three distinct nicotine content levels (i.e., Quest 1 (12.7 mg/g), Quest 2 (7.3 mg/g), Quest 3 (0.9 mg/g)) (table 1). These cigarettes were used in much of the VLNC research conducted prior to the development of SPECTRUM Nicotine Research Cigarettes; they are no longer on the market. Philip Morris also manufactured cigarettes with varying nicotine levels for research only (Ref. 251). In a public statement issued on July, 2018, 22nd Century Group, Inc. stated that they were already using genetic engineering and plant breeding to produce VLNC tobacco for cigarettes (Ref. 252). In 2014, the company was granted patents for its process to dramatically reduce the nicotine in tobacco plants (Ref. 253). This tobacco has been used to generate low nicotine content research cigarettes, produced and distributed by RTI International, under a contract with the NIDA Drug Supply Program (Ref. 254). 22nd Century Group, Inc. acts as a vendor for RTI for this contract, manufacturing SPECTRUM Nicotine Research Cigarettes that were reported to contain 0.4 mg nicotine per gram of tobacco (Ref. 254), and they also manufacture cigarettes with other reduced levels of nicotine. These SPECTRUM Nicotine Research Cigarettes are similar in many sensory characteristics to NNC cigarettes, but with VLNC (Refs. 255 and 256).

In 2019, 22nd Century Group, Inc. received FDA marketing authorization and, in 2021, received exposure modification orders for their VLNC cigarettes under the names VLN King and VLN Menthol King. VLN cigarettes

are currently being marketed and sold to consumers in select U.S. markets as cigarettes with 95 percent less nicotine than conventional cigarettes. From January 1, 2023, to November 22, 2024, 22nd Century VLN cigarette dollar sales accounted for less than 0.001 percent of total cigarette dollar sales in any 4-week period. Menthol flavored 22nd Century VLN cigarettes over the same time accounted for less than 0.001 percent of any 4-week menthol flavored cigarette dollar sales.²⁰

Currently, these are the only authorized VLNC cigarettes. As we discuss in other parts of this document (see section VII.E), we believe the scientific evidence supports the technical achievability of the proposed standard; additionally, the tobacco industry and consumer product companies have developed a range of brands with differing nicotine levels. Thus, it appears there would be opportunities for any manufacturer who chooses to enter the market for products covered by this proposed product standard.

Although many of the studies discussed in this section investigated the effects of VLNC cigarettes, some studies also investigated the effects of cigarettes with higher levels of nicotine, often as comparators. Table 1 displays the reduced nicotine content cigarettes that were administered in studies summarized in this document and their reported nicotine levels. The nicotine content values in table 1 are approximate, and they are primarily based on published reports from the peer-reviewed scientific literature. Most studies that investigated the clinical effects of reduced nicotine content cigarettes did not chemically analyze the study cigarettes. For example, many studies that examined the effects of VLNC SPECTRUM Nicotine Research Cigarettes did not chemically characterize these cigarettes, but the authors of these studies reported that the nicotine content of the cigarettes was 0.4 mg nicotine per gram of

²⁰ FDA’s own analyses, calculations and conclusions informed in part by the NielsenIQ Retail Measurement Service (RMS) data through NielsenIQ’s RMS for the tobacco product category “Cigarettes” for the time period January 1, 2023 through November 2, 2024 for Total US Expanded All Outlets Combined (xAOC) and convenience stores are those of FDA and do not reflect the views of NielsenIQ. NielsenIQ is not responsible for, had no role in, and was not involved in analyzing and preparing the results reported herein, or in developing, reviewing, or confirming the research approaches used in connection with this report. NielsenIQ RMS data consist of weekly purchase and pricing data generated from participating retail store point-of-sale systems in all U.S. markets. See <https://NielsenIQ.com/global/en/> for more information.

¹⁸ As previously noted in footnote 7, the term VLNC should not be confused with the cigarette brand name “VLN.” “VLN” refers to cigarette products authorized for marketing by FDA in 2019. See <https://www.fda.gov/media/133633/download?attachment> and <https://www.fda.gov/media/133635/download?attachment>.

¹⁹ Both Ultratech and Lifetech have been reported as being the company through which NIDA manufactured research cigarettes.

tobacco. The actual nicotine content of these cigarettes is expected to vary around this value. For example, the results of one study that chemically characterized SPECTRUM Nicotine Research Cigarettes showed that the nicotine content of the sampled VLNC cigarettes ranged between 0.28 and 0.33 mg nicotine per gram (Ref. 256), which

is lower than the 0.4 mg nicotine per gram level typically reported in the literature. In 22nd Century Group, Inc.'s modified risk tobacco product applications, the company reported that after 9 years of sampling by the company, the average nicotine content of its genetically engineered VLNC tobacco is 0.6 mg nicotine per gram of

total tobacco, with a range of 0.4 to 0.7 mg nicotine per gram of total tobacco. It is likely that the Quest and SPECTRUM Nicotine Research Cigarettes, used throughout the scientific literature, also contained between 0.4 to 0.7 mg nicotine per gram of total tobacco (Ref. 257).

TABLE 1—NICOTINE CONTENT FOR NORMAL, LOW, AND VERY LOW NICOTINE CONTENT CIGARETTES USED IN THE RESEARCH STUDIES CITED IN THIS DOCUMENT

⁵ Nicotine content from (Ref. 29) (supplement).

⁶ Nicotine content estimated by FDA based on nicotine yield data from (Ref. 250).

⁷ Nicotine content from (Ref. 41).

* For these cigarettes, FDA calculated milligrams of nicotine per gram of total tobacco based on reports of milligrams of nicotine per cigarette. Calculations were based on an estimate of 0.7 grams of tobacco per cigarette.

B. Consumer Knowledge, Attitudes, Beliefs, and Perceptions Regarding VLNC Cigarettes and FDA Regulation of Levels of Nicotine in Tobacco

In this section we describe the science related to consumer knowledge, attitudes, and beliefs about reduced nicotine content (RNC)²¹ cigarettes and consumers' perceptions about a hypothetical policy reducing nicotine levels in cigarettes and certain combustible tobacco products. These concepts are important because they are

²¹ RNC cigarettes in this context refers to any cigarette with a lower amount of nicotine than NNC cigarettes. FDA notes that studies focusing on consumer perceptions of RNC cigarettes typically do not differentiate between RNC, LNC, and VLNC cigarettes. However, when describing studies that focus on consumer behavior and perceptions of VLNC cigarettes specifically, FDA uses the term VLNC cigarettes. FDA notes that studies in this domain typically use consumer perceptions of RNC cigarettes to form conclusions about consumer perceptions about VLNC cigarettes and FDA's proposed reduction of nicotine more broadly.

associated with the behavioral responses consumers believe they would take if such a policy is in effect.

The science on consumer knowledge, attitudes, beliefs, and perceptions about RNC cigarettes demonstrates that a majority of consumers perceive that RNC cigarettes are equally or more harmful than NNC cigarettes. Nationally representative studies suggest that 50 to 71 percent of consumers perceive RNC cigarettes to be as or more harmful to health than NNC cigarettes, while 25 to 35 percent perceive them to be less harmful than NNC cigarettes (Refs. 260 to 262). Recent nationally representative findings estimate that between 12 and 25 percent of people who smoke or use e-cigarettes believe RNC cigarettes are less harmful than NNC cigarettes (Refs. 227 and 236). In studies where participants actually use VLNC cigarettes, they tend to perceive them as significantly less harmful to health and

less likely to cause cancer than NNC cigarettes (Refs. 230, 263 to 265). Furthermore, there is evidence that perceptions about the harms of VLNC cigarettes relative to NNC cigarettes vary by race and age (Refs. 236, 266 to 268). The science on consumer knowledge, attitudes, beliefs, and perceptions about RNC cigarettes also demonstrates that there are widespread misperceptions about the addictiveness of RNC cigarettes relative to NNC cigarettes. Studies that use nationally representative surveys report that 60 to 77 percent of consumers incorrectly believe that RNC cigarettes are equally or more addictive than NNC cigarettes (Refs. 260 and 261). Tobacco use status does not appear to significantly change misperceptions about the addictiveness of RNC cigarettes (Ref. 228).

A 2019 nationally representative study of consumer support for a policy "requiring cigarette makers to lower the

nicotine levels in cigarettes so that they are less addictive” reported that 81 percent of study participants favored the policy (52.4 percent strongly favored, 28.6 somewhat favored) and 19 percent opposed the policy (10.3 percent somewhat opposed, 8.7 percent strongly opposed) (Ref. 269). However, consumer misperceptions about the harm and addictiveness of reduced nicotine content combustible tobacco products impact understanding of the purpose of a reduced nicotine product standard. For example, respondents in some studies did not understand why FDA would choose to remove nicotine from cigarettes or little cigars and cigarillos but not remove other chemicals that are harmful (Ref. 229, 270, and 271). Respondents also stated that they believed other chemicals besides nicotine make cigarettes addictive, and that removing nicotine from cigarettes would not eliminate their addictiveness (Refs. 229 and 270). Misperceptions may also serve as potential determinants of consumer responses to a reduced nicotine product standard. For example, one study suggests that misperceptions among people who smoke regarding the harm of RNC cigarettes is correlated with quit intentions in responses to a hypothetical government policy reducing most of the nicotine in cigarettes (Ref. 267). FDA recognizes the importance of addressing consumers’ misperceptions about the relative harm and addictiveness of VLNC cigarettes as compared to other products. FDA will continue to conduct research (e.g., assess changes over time in knowledge, attitudes, and perceptions relative to tobacco product characteristics including nicotine content) to inform regulatory decisions and other actions.

VI. Rationale for Products Covered by the Proposed Product Standard

FDA has reviewed and closely considered the comments to the Nicotine ANPRM, as well as additional evidence and information not available at the time of the ANPRM, in developing the scope of products for this proposed product standard. Specifically, we considered several factors, such as the strength and breadth of the available data on the likely effects of reducing nicotine derived from studies of VLNC cigarettes; current prevalence and initiation rates for different classes of tobacco products; the available data on product toxicity, addictiveness, and appeal; product use topography²² (including quantity,

intensity, and duration of use); and the potential for migration to different products. These data indicate that reduction of nicotine in cigarettes would reduce addiction potential, dependence levels, number of cigarettes smoked per day, and increase quit attempts among people who currently smoke cigarettes. In light of these data, FDA also expects that reduction of nicotine would prevent people who experiment with cigarettes and cigars from developing an addiction to tobacco and progressing to regular tobacco use.

This proposed product standard is intended to address one of our nation’s greatest public health challenges: the death and disease caused by combusted tobacco use. Approximately 480,000 people die every year from smoking cigarettes (Ref. 1 at p. 659) and another 9,000 die from smoking cigars (Ref. 1 at p. 659; Ref. 134). Cigarettes are the tobacco product category that causes the greatest amount of harm to the public health as a result of the prevalence of cigarette use among adults and cigarette toxicity and addictiveness. This proposed product standard is expected to increase cessation and switching to potentially less harmful tobacco products and prevent people who are experimenting with use—mainly youth and young adults—from transitioning to regular use of cigarettes. However, if the product standard were only to cover cigarettes, it would likely be less effective. Specifically, a significant number of people who are addicted to smoking cigarettes would likely migrate to similar combusted tobacco products after the standard went into effect to maintain their nicotine exposure, thereby undermining the significant health benefits of the proposed product standard (Ref. 5) (see also section VI.B of this document for further discussion of the potential for non-cigarette combusted tobacco product switching). Therefore, to increase public health benefits, FDA also is proposing to cover certain other combusted tobacco products in addition to cigarettes.

Based on these considerations, FDA is proposing to cover the following products under this product standard:

- Cigarettes (other than noncombusted cigarettes, such as HTPs that meet the definition of a cigarette),
- Cigarette tobacco,
- RYO tobacco,
- Cigars (including little cigars, cigarillos, and large cigars but excluding premium cigars), and

- Pipe tobacco (other than waterpipe tobacco).

FDA has determined that research regarding the public health impacts of potential maximum nicotine level policies applies across the tobacco products covered under this proposed product standard. As discussed in greater detail in section VII.B.12 of this document, given that cigarette tobacco, RYO tobacco, and pipe tobacco can be effectively used in cigarettes, the VLNC cigarette research discussed in this proposed rule applies to these products, and any expected benefits that would accrue as a result of instituting the proposed product standard for cigarettes would also be expected to accrue for these product categories. FDA also concludes that the VLNC cigarette research applies to cigars, given the similarities between cigarettes and most cigars (e.g., use topography). For further discussion of FDA’s findings that VLNC cigarette research applies to other covered products under this proposed product standard, see section VII.B.12 of this document. In addition, as discussed in section VI.A.3 of this document, FDA finds that the non-cigarette combusted products within the proposed scope of this rule (i.e., RYO tobacco, cigars, pipe tobacco) could function as acceptable substitutes for many people who smoke cigarettes while exposing them to similar risks and toxicity as cigarettes.

As discussed in section VIII of this document, FDA finds that the proposed product standard, with this scope, is appropriate for the protection of the public health and would provide substantial benefits for people who currently use cigarettes and certain other combusted tobacco products and for people who experiment with cigarettes and cigars and people who do not use such tobacco products. FDA seeks comments on this proposed scope, particularly on how it may affect youth initiation and use of combusted tobacco products.

A. Prevalence and Abuse Potential of Cigarettes and Other Combusted Tobacco Products

Cigarettes, the most frequently used tobacco products, are the tobacco product category that causes the greatest burden of harm to public health given that approximately 28 million adults and 380,000 youth currently smoke cigarettes (Ref. 3); the toxicity and addictiveness of these products; and the resulting tobacco-related disease and death across the population, including among people who do not smoke. Cigarettes are highly addictive and harmful tobacco products; however, the other combusted tobacco products

²² Smoking topography measures provide data on various aspects of smoking behavior, including number of puffs per cigarette, total time spent

smoking, puff volume (i.e., puff size), puff velocity (i.e., puff intensity), puff duration, and inter-puff interval (i.e., length of time between puffs).

covered in this proposed product standard are similarly addictive and harmful. If the proposed product standard covered only cigarettes, some number of people who smoke cigarettes and are addicted to nicotine would likely migrate to similar combusted tobacco products to maintain their nicotine exposure (or engage in dual use with other similar combusted tobacco products), thus reducing the positive public health impact of this proposed product standard.

Regulating the nicotine yield of cigarettes and certain other combusted tobacco products through setting a maximum nicotine level for them would make these dangerous combusted products minimally addictive or nonaddictive, making cessation easier and helping to prevent people who are experimenting with smoking from developing nicotine dependence and progressing to regular use. As stated elsewhere in this document, FDA's approach in proposing this product standard for cigarettes and certain other combusted tobacco products protects public health by reducing combusted tobacco product use (and therefore reducing exposure to harmful toxicants created through combustion) by making it considerably easier for people who want to quit cigarette use to quit all tobacco products or switch to potentially less harmful, noncombusted tobacco products which remain available. Therefore, to increase the public health benefits, FDA is focusing this proposed rule on nicotine levels in cigarettes and certain other combusted tobacco products because combusted products are responsible for the majority of death and disease due to tobacco use.

1. Cigarettes

Data from the 2024 NYTS indicate that 1.7 percent of high school students (approximately 250,000) and 1.1 percent of middle school students (approximately 120,000) reported current use of cigarettes (*i.e.*, smoked at least once during the past 30 days) (Ref. 3). In addition, 11.6 percent of adults reported that they currently smoked cigarettes in 2022 (*i.e.*, smoked at least 100 cigarettes during their lifetime and now smoke cigarettes every day or some days); this means an estimated 28.8 million adults in the United States currently smoke cigarettes (Ref. 4). Although cigarette smoking is present in all population groups in the United States, the prevalence of cigarette use differs based on sociodemographic characteristics.

Findings from the 2024 NYTS show that, among middle and high school students, 1.4 percent of non-Hispanic

White students, 0.9 percent of non-Hispanic Black students, and 1.6 percent of Hispanic students currently smoked cigarettes (Ref. 3). Additionally, data from the 2022 NHIS show differences in smoking prevalence on the basis of race/ethnicity among adults (age 18 and over). Specifically, 4.6 percent of non-Hispanic Asian, 8.0 percent of Hispanic, 12.7 percent of non-Hispanic White, 14.2 percent of non-Hispanic Black, 19.3 percent of non-Hispanic AI/AN, and 11.9 percent of non-Hispanic Other participants reported current cigarette smoking (Ref. 272). Data from the 2005 and 2015 NHIS also indicate that the prevalence of cigarette smoking has statistically significantly declined over this time period for non-Hispanic white, Black, Asian, and AI/AN adults and Hispanic adults (Ref. 273).

Data from an analysis of the 2005 and 2015 NHIS indicate that the prevalence of smoking has declined significantly over that time period among both adult male and female participants (29.9 and 25.2 percent relative decrease, respectively) (Ref. 273). Currently, according to data from the 2022 NHIS, smoking remains more prevalent among males (13.2 percent) as compared to females (10.0 percent) in the United States (Ref. 272).

Study findings indicate that individuals who identify as lesbian, gay, or bisexual are more likely to report smoking cigarettes as compared to those who identify as heterosexual (Refs. 274 to 277). Among adults in the 2022 NHIS, cigarette smoking among persons identifying as lesbian, gay, and bisexual was 12.8 percent and among those identifying as heterosexual/straight it was 11.6 percent (Ref. 272), and smoking was more prevalent among youth identifying as lesbian, gay, and bisexual (7.0 percent) in the 2020 NYTS than among those "not sure" of their sexual identity (3.5 percent) or youth identifying as heterosexual (2.7 percent) (Ref. 275). Current tobacco use for lesbian, gay, bisexual, and transgender youth in the 2022 NYTS was reported for "any" tobacco use (*i.e.*, current use of one or more of the following: e-cigarettes, cigarettes, cigars, smokeless tobacco, hookah, HTPs, nicotine pouches, pipe tobacco, or bidis), but not for individual tobacco products (Ref. 278). Pooled data from the 2015 to 2019 NSDUH indicate that compared to heterosexual/straight respondents, respondents who identified as gay males, lesbian/gay females, or bisexual females reported higher prevalence of past 30-day smoking (Ref. 279). Additionally, in data from the 2015/2016 NSDUH, relative to same-age

heterosexual men, lifetime rates of daily cigarette smoking were significantly elevated among gay men ages 18–25 (30 percent versus 23 percent) and ages 35–49 years (44 percent versus 38 percent) (Ref. 277). Similarly, relative to same-age heterosexual women, lifetime daily cigarette smoking was significantly greater among lesbian/gay women ages 18–25 (37.7 percent versus 16.3 percent), ages 26–34 (42.2 percent versus 30.3 percent), and ages 35–49 (42.7 percent versus 32.6 percent) (Ref. 277).

As evidenced in a systematic review and meta-analysis (Ref. 280), studies have consistently shown a relationship between socioeconomic status and the prevalence of cigarette smoking, such that greater levels of educational attainment and greater total family income are inversely associated with the prevalence of smoking. Specifically, in 2021 NHIS data, the prevalence of cigarette smoking was 18.3 percent for adults with a low income, 12.3 percent for those with a medium income, and 6.7 percent for those with a high income (Ref. 274). Similarly, by and large, there is an inverse relationship between educational attainment and the prevalence of smoking. For instance, according to the 2021 NHIS, the prevalence of smoking was 20.1 percent among adults with some high school education but no degree, 30.7 percent among persons with a general equivalency degree, 17.1 percent among those with a high school diploma, 13.7 percent among persons with an associate's degree, 5.3 percent among those with an undergraduate degree, and 3.2 percent among persons who had received a graduate degree (Ref. 274).

The prevalence of cigarette smoking is also higher among adults with mental health symptoms or substance use disorder (Refs. 281 to 284). Findings from the 2022 NHIS show that 27.2 percent of persons reporting severe generalized anxiety disorder (GAD) currently smoke cigarettes, as compared with 10.1 percent who report no or minimal GAD (Ref. 272). Similarly, 27.1 percent of adults who report severe depression currently smoke cigarettes, versus 10.1 percent among those who report no or minimal depression (Ref. 281). Additionally, findings from the 2021 NHIS show that 28.1 percent of persons reporting serious psychological distress also reported smoking cigarettes, compared to 10.9 percent of persons not reporting serious psychological distress (Ref. 274). Analyses of data from the 2015 NSDUH for individuals aged 12 years and over also show that cigarette smoking is significantly more prevalent among

persons who use cannabis (daily cannabis use: 54.6 percent; nondaily cannabis use: 40.2 percent) as compared to those who do not use cannabis (15.1 percent) (Ref. 282). An analysis of 2016 NSDUH data indicates that cigarette smoking is more than twice as prevalent among persons with alcohol use disorder, as compared to those without (37.8 percent versus 16.3 percent) (Ref. 283), while data from the 2014 NSDUH show that the prevalence of cigarette smoking is also more than twice as high among persons with mental health and/or substance use problems than among persons without (38.5 percent versus 15.4 percent) (Ref. 284).

2. Cigars

Cigar smoke contains many of the same constituents as cigarette smoke, including nicotine, many of which can cause significant harm to those who use cigars (Ref. 53). According to the 2024 NYTS, 330,000 middle and high school students,²³ including 1.5 percent (an estimated 230,000) of high school students (grades 9–12) and 0.8 percent (an estimated 80,000) of middle school students (grades 6–8), had smoked a cigar (cigar, cigarillo, or little cigar) on at least 1 day during the past 30 days (Ref. 3). Overall, the prevalence of cigar smoking among middle and high school students is comparable to the prevalence of cigarette smoking, with 1.7 percent (an estimated 250,000) of high school students and 1.1 percent (an estimated 120,000) of middle school students having smoked cigarettes on at least 1 day during the past 30 days (Ref. 3). Cigars are also a popular tobacco product among adults. In the 2022 NHIS, 3.7 percent of adults aged 18 or older reported currently using cigars some or every day, behind cigarettes (11.6 percent) and e-cigarettes (6.0 percent) (Ref. 272).

Evidence from national surveys—including the Monitoring the Future study and NSDUH—indicate that, similar to cigarettes, cigar use has been on the decline among U.S. youth and adults in recent years (Refs. 285 to 287). However, among youth, this decrease has not been equitably experienced. The popularity of cigar use is disproportionately high among groups such as lesbian, gay, and bisexual youth and young adults (3.2 percent among transgender youth, 3.2 percent among sexual minority females, and 3.9 percent

among sexual minority males) (Ref. 288), and youth with disabilities (7.0 percent among those who reported using little cigars and 2.6 percent among those who reported using large cigars) (Ref. 289). Cigar smoking also occurs disproportionately among specific populations of adults as well, with greater prevalence of cigar smoking reported among non-Hispanic Black adults (5.1 percent) (Ref. 274), individuals of lower educational attainment and lower annual household income (Refs. 290 and 291), and LGBTQI+ adults (Refs. 292 to 296).

Additionally, when comparing data from 2011 to 2019, while past month cigarette smoking and cigar use were both statistically significantly lower in young adults (ages 18–25), the absolute and relative declines in cigar use were less than the declines in cigarette use (33.5 percent in 2011 to 17.5 percent in 2019 for cigarettes; 10.9 percent in 2011 to 7.7 percent in 2019 for cigars) (Ref. 286). For adults (ages 26 or older), cigarette use in 2011 was statistically significantly higher compared to in 2019; however, cigar use remained relatively stable and did not significantly change (21.9 percent in 2011 to 18.2 percent in 2019 for cigarettes; 4.2 percent in 2011 to 4.0 percent in 2019 for cigars) (Ref. 286). The 2023 NSDUH found that among adults ages 26 or older in 2019, 1,847 individuals initiated cigar use each day, considerably more than the 282 who initiated cigarette smoking each day in that year (Ref. 86).

While these data indicate a high burden of current cigar smoking, the true prevalence of cigar use is likely higher. Little cigars often closely resemble cigarettes, given their shape, size, filters, and packaging, and are perceived by many as being healthier than cigarettes (Refs. 297 and 298). Several studies have shown that youth tend to underreport cigar smoking if brand name identifiers are not provided (Refs. 299 to 301). For example, in one study of Virginia high school students, the reported prevalence of cigar use nearly doubled after accounting for students who reported smoking Black & Mild (a brand name of cigarillos); in the original survey results, more than half of the students who used Black & Mild cigarillos did not report using cigars, cigarillos, or little cigars (Ref. 299).

Research indicates that most people who smoke cigars unknowingly inhale some amount of smoke, including people who smoke cigars who report that they do not inhale (Refs. 54 and 55). Youth more commonly use cigarillos and little filtered cigars that are designed to be inhaled, which may

increase their risk of poor health outcomes as well as addiction (Refs. 53 and 163). Even if people who smoke cigars do not breathe or inhale smoke into their lungs, they are still subject to nicotine's addictive effects through buccal (oral) absorption of nicotine or nicotine absorption through the lips due to cigar tobacco's alkalinity, as well as other harmful health effects (Refs. 55, 56, 302 and 303). Cigar smoke dissolves in saliva and makes it possible for people who smoke cigars to absorb sufficient amounts of nicotine to create dependence even if the user does not inhale (Ref. 56).

Nicotine can exist in protonated and freebase (unprotonated) forms. In the freebase form, it is most addictive because it is readily absorbed by the buccal mucosa, respiratory tissues, skin, and the gastrointestinal tract (Refs. 28 and 57). Freebase nicotine amounts are generally higher in cigars than cigarettes due to the higher pH of cigar smoke (Ref. 53). Nicotine absorbed across the buccal mucosa, the mouth's membrane lining, can provide sustained amounts of freebase nicotine to the person using the tobacco product (Ref. 53). Cigars can deliver nicotine much like chewing tobacco or oral snuff, with nicotine extraction absorbed directly through the buccal mucosa and lips (Ref. 53).

A 1998 NCI Monograph chapter (NCI Monograph 9) on cigar pharmacology and abuse potential concluded that the nicotine delivery characteristics and daily patterns of smoking among people who smoke cigars indicate that cigars produce dependence (Refs. 53 and 164). Since the publication of NCI Monograph 9, several in-person laboratory studies, where participants use products under observation and have outcome measures assessed, have provided additional evidence to support that nicotine exposure from cigar smoking is sufficient to create or sustain nicotine dependence among people who use cigars. Through cigar smoke, nicotine can be absorbed by inhalation (like cigarettes) or through the buccal mucosa (like smokeless tobacco). Multiple studies found that people who smoke cigars inhale (as evidenced by carbon monoxide (CO) levels and smoking topography) and that plasma nicotine levels are similar to those of people who smoke cigarettes (Refs. 304 to 308). Furthermore, using the Questionnaire of Smoking Urges, a commonly used measure of tobacco craving, several studies found that cigars reduce craving and urge to smoke to a similar magnitude as cigarettes (Refs. 306 to 308). Cigars have also been shown to decrease acute nicotine withdrawal

²³ The weighted population estimate reported in the scientific publication is 500,000 students. As noted in the scientific publication, overall population estimates might not sum to corresponding population estimates because of rounding or inclusion of students who did not self-report sex, race and ethnicity, or grade level.

symptoms (e.g., craving, anxiousness) (Ref. 304).

Several additional studies have used epidemiological data to compare nicotine dependence levels among people who use multiple tobacco products (*i.e.*, poly tobacco use), people who exclusively use cigarettes, and people who exclusively use cigars (Refs. 309 to 311). The data show that a significant proportion of people who exclusively use cigars display characteristics of tobacco dependence such as craving (Ref. 309); however, people who use multiple tobacco products and people who exclusively use cigarettes showed the highest levels of dependence, followed by people who exclusively use cigars (Refs. 309 to 311).

3. Loose Tobacco (Pipe and RYO Tobacco)

Laboratory and survey studies have provided evidence to conclude that RYO and pipe tobacco smoking is sufficient to create or sustain nicotine dependence among people who use RYO or pipe tobacco (Ref. 312). Studies show that people who use RYO and pipe tobacco inhale (as evidenced by smoking topography) (Refs. 312 to 314) and plasma nicotine levels are similar to those of people who smoke factory-made cigarettes (Ref. 313). Furthermore, RYO tobacco reduces craving and urge to smoke at a similar magnitude and is rated similarly with regard to subjective appeal as factory-made cigarettes (Ref. 313). Evidence also suggests that RYO tobacco is at least as harmful to health as factory-made cigarettes (Refs. 315 to 318).

According to data from the 2024 NYTS, 0.5 percent of high school students (or approximately 70,000 students) reported using pipe tobacco within the previous 30 days and 0.5 percent of middle school students (or approximately 50,000 students) reported pipe tobacco use in the prior 30 days (Ref. 3). Data from the 2021 NHIS indicated that 0.9 percent of adults ages 18 and older (or approximately 2.3 million adults) currently used pipes (Ref. 274). However, FDA notes that pipe tobacco prevalence data are likely an underestimate, as the NHIS survey does not include the number of people who use pipe tobacco to roll their own cigarettes.²⁴ There is also evidence that young adults who smoke cigarettes are

engaging in RYO use for financial reasons (Ref. 319). Studies of RYO tobacco use among youth are limited, but prevalence of RYO tobacco use among U.S. middle and high school students in the 2012 NYTS was 3.4 percent (Ref. 320).

The lack of data on RYO and pipe tobacco use and the limitations in how national surveys assess loose tobacco use impact our ability to draw conclusions regarding appeal of loose tobacco among youth and adults at this time. However, if such products were not included within the scope of this proposed product standard, some number of people who smoke cigarettes and/or cigars and are addicted to nicotine would likely easily migrate to such products to maintain their nicotine exposure given that RYO and pipe tobacco have the same addictive properties and health consequences as factory-made cigarettes (Refs. 168 and 321). For example, more people who smoke cigarettes could use RYO or pipe tobacco to make NNC cigarettes (or engage in dual use with certain other combusted tobacco products), reducing the positive public health impact of this proposed product standard (see section VI.B.1 of this document) (Ref. 322).

Taken together, these data demonstrate that if FDA did not include certain other combusted tobacco products within the scope of this proposed product standard, many people who smoke cigarettes likely would migrate to, or increase use of, such other tobacco products in an attempt to replace or supplement the reduction of nicotine in their VLNC cigarettes.

B. Potential for Non-Cigarette Combusted Tobacco Product Switching

Nicotine can be delivered through products that represent a continuum of risk, with combusted tobacco products at the most harmful end of this continuum. FDA's approach in proposing this product standard for cigarettes and certain other combusted tobacco products protects public health by reducing combusted tobacco product use (and therefore reducing exposure to harmful toxicants created through combustion) while potentially less harmful, noncombusted tobacco products remain available for people who have not quit all tobacco products. FDA expects that, if this proposed rule is finalized and a nicotine product standard for cigarettes and certain other combusted tobacco products is in place, many people who smoke cigarettes will either quit smoking or switch to a noncombusted tobacco product. Those who switch completely to use of a

noncombusted tobacco product may sustain their nicotine dependence and may significantly reduce their risk of tobacco-related death and disease to the extent that the products they switch to result in less harm. That is, while dependence on any tobacco product remains a health concern, nicotine alone is not directly responsible for tobacco-related cancer, lung disease, and heart disease (Ref. 323). Switching completely to a noncombusted tobacco product would reduce exposure to the chemical constituents created through combustion, which are the primary contributors of combusted tobacco-related harm (Refs. 28 and 324).

However, as discussed throughout this document, if a nicotine tobacco product standard were to apply to cigarettes only, it likely would have substantially less impact on improving health outcomes for people who use tobacco products. Specifically, FDA expects that, to maintain their nicotine exposure, some people who smoke cigarettes and are addicted to nicotine would likely migrate to other combusted tobacco products (or begin to engage in dual use with such other products) with similar toxicological risks after such a cigarette-only standard was in effect. FDA also would expect that people who use non-cigarette combusted tobacco products would continue their existing use patterns, thereby maintaining their risk of tobacco-related death and disease. To ensure maximum benefits for this nicotine tobacco product standard, FDA is proposing that it apply to cigarettes and certain other combusted tobacco products.

1. Tobacco Product Switching in Behavioral Intention and Clinical Studies

Studies involving people who currently use cigarettes predict a range of tobacco use behaviors in response to a nicotine product standard. When presented with a hypothetical nicotine reduction policy, most people who use cigarettes report that they would continue to smoke VLNC cigarettes or use other combusted tobacco products, or that they would quit; only a small portion report that they would consider switching to a noncombusted tobacco product (Refs. 262 and 264). One experimental study using a nationally representative sample examined the intended behaviors of people who currently smoke cigarettes if a nicotine product standard were put in place; overall, 30.5 percent of the participants intended to quit using all tobacco products, 5.8 percent intended to switch to noncombusted tobacco products, and 61.0 percent indicated they would

²⁴ People who smoke RYO and pipe tobacco are susceptible to similar negative health consequences as people who smoke traditional cigarettes. While there is a paucity of research examining RYO and pipe tobacco use, FDA is not aware of any data indicating that RYO cigarettes or pipe tobacco are associated with fewer adverse health consequences than traditional cigarettes.

smoke VLNC cigarettes or other combusted tobacco products (Ref. 262). An in-depth qualitative study assigned a small number of people who use cigarettes to use VLNC cigarettes for 5 days, then examined their intended behaviors in response to a nicotine product standard (Ref. 264). Most participants reported that if a product standard was put in place, they would use VLNC cigarettes if they were the only cigarettes available, and a few said that they would use VLNC cigarettes to reduce their smoking over time to eventually quit. Some participants discussed the possibility of switching to ENDS or other combusted products if a product standard was put in place. Self-reported intentions to use tobacco products are a useful predictor of individuals' future tobacco use behavior (Refs. 325 and 326) and these two studies support FDA assessments of the likelihood of switching in response to the nicotine product standard.

In clinical studies that investigated the effects of VLNC cigarettes, researchers typically instructed participants assigned to VLNC cigarette groups to use only study-provided cigarettes (*i.e.*, to refrain from using usual brand cigarettes or other tobacco products during experimental conditions). Noncompliance with these instructions during a clinical trial may also indicate the likelihood that people who smoke VLNC cigarettes would use alternative nicotine-containing products if a nicotine product standard is implemented. Several studies reviewed in this document assessed biochemical or self-reported measures of VLNC cigarette noncompliance (*i.e.*, ongoing NNC cigarette or other tobacco product use) and showed high levels of noncompliance with smoking only VLNC cigarettes during the study. Since participants were provided with VLNC cigarettes at no cost and continued to use non-study provided tobacco products (particularly NNC cigarettes), these data suggest that VLNC cigarettes have lower appeal and abuse potential compared to NNC cigarettes (Refs. 327 to 331). These findings suggest that once a nicotine product standard covering solely cigarettes is in place and VLNC cigarettes are the only cigarettes available, people are likely to use alternative nicotine-containing products including other combusted products. However, if cigarettes and certain other combusted products are covered by a product standard, people who use combusted products are likely to use non-combusted products, therefore benefitting public health.

A clinical study conducted to compare the use of alternative nicotine-

containing products (*i.e.*, smokeless tobacco, ENDS, NRT, cigars, cigarillos) and smoking behavior in 136 people who smoked cigarettes and were unwilling to quit randomly assigned participants to one of three conditions and instructed them to use only study-assigned tobacco products for 8 weeks (Ref. 5). The "LNC1" group received LNC cigarettes combined with noncombusted tobacco products (*i.e.*, smokeless tobacco, ENDS, NRT) and combusted non-cigarette tobacco products (*i.e.*, cigars, cigarillos), the "LNC2" group received LNC cigarettes combined with only noncombusted tobacco products, and the NNC cigarette group received NNC cigarettes combined with noncombusted and combusted non-cigarette products. Participants who received LNC cigarettes (both the LNC1 and LNC2 groups) used more alternative combusted tobacco products and more noncombusted tobacco products (the LNC2 group) than participants in the NNC cigarette group. However, these participants also smoked fewer total combusted tobacco products and had more quit attempts than participants in the NNC cigarette group. The findings from this study demonstrate that when people who smoke cigarettes are switched to LNC cigarettes and provided with alternative sources of nicotine, they will readily use the alternative sources of nicotine. Moreover, the LNC cigarette group (the LNC2 group) that had access to noncombusted nicotine sources only (*i.e.*, smokeless tobacco, ENDS, NRT) had statistically significantly lower biomarker levels of certain harmful constituents (N-Nitrosornicotine (NNN) and NNAL) than those who continued to smoke NNC cigarettes and had access to noncombusted and combusted non-cigarette products (the LNC1 group) (Ref. 5). The NNN and NNAL biomarker levels in the LNC1 group with access to both combusted and noncombusted tobacco products resembled the NNC group (Ref. 5).

Taken together, these findings suggest that if the proposed product standard reduces the nicotine level in cigarettes only, but people who smoke cigarettes still have access to other NNC combusted tobacco products, they likely would substitute with the NNC combusted tobacco products. This behavior would negate a significant proportion of the public health impact of the product standard. If other combusted tobacco products also are covered by this proposed product standard, however, data suggest that people who smoke cigarettes would

likely switch from combusted tobacco product use to potentially less harmful tobacco products. For further discussion of switching to a potentially less harmful nicotine delivery product, see section VIII.D.3 of this document.

2. Cigarette Price Increases

Studies investigating the effects of changes in cigarette prices on product substitution may also be used as an indicator of potential product switching in response to the proposed nicotine tobacco product standard, because a reduction in nicotine content could be conceptualized as an increase in the unit price of nicotine, as the cost to consumers is increased per unit of nicotine (Ref. 332). Therefore, studies assessing cigarette taxation may be useful because they are assessing the influence of changes in the unit price of cigarettes, through increases in cost, on behavior among people who use the products. Price increases, including taxation, represent one of the most effective tobacco control policies associated with significant declines in overall tobacco consumption as well as reductions in youth initiation rates (Ref. 333). However, taxation and price increases are also associated with a range of tax avoidance behaviors, such as substitution with a less expensive product, purchasing from low or untaxed sources, or purchasing in bulk (Ref. 334), and this behavior is more likely to occur among people who smoke and are of lower socioeconomic status (Ref. 335). It is this potential substitution that FDA is seeking to mitigate by proposing to cover certain other combusted tobacco products in addition to cigarettes. FDA expects that by reducing the nicotine in cigarettes and certain other combusted tobacco products through this proposed product standard, the effect on people who smoke will be similar to increasing the price, and, as is seen in examples of taxation and price increases, people who smoke would likely turn to alternative sources of nicotine.

An epidemiological study used data from the 2001 and 2002 New Jersey Adult Tobacco Survey (NJATS) to determine whether people who smoke cigarettes switched to cigars following an increase in the state cigarette excise tax (U.S. \$0.80 to U.S. \$1.50 per pack) (Ref. 336). In 2001, the cigarette smoking prevalence in New Jersey was 22.1 percent. Following a large cigarette excise tax increase, the cigarette prevalence decreased to 18 percent (Ref. 336). There were no statistically significant differences in the cigar smoking prevalence between 2001 and 2002; however, ever cigar use increased

statistically significantly for people who currently smoked cigarettes (50.9 percent versus 60.3 percent, respectively) and increased slightly for people who recently quit smoking (48.4 percent versus 56.4 percent, respectively). In 2001, people who currently smoked cigarettes had the highest prevalence of current cigar use (13.9 percent), while people who had recently quit cigarette use had the lowest prevalence (2.6 percent). In contrast, in 2002, while people who currently smoked cigarettes again reported the greatest prevalence of current cigar use (13.2 percent), people who had recently quit cigarette smoking had the second highest prevalence of current cigar use (11.1 percent). The authors concluded that after a cigarette excise tax increase, a small but notable proportion of people who had recently quit cigarette smoking tried cigars, substituted cigars for cigarettes, or continued using combusted tobacco products in the form of cigars (Ref. 336). Additional indirect evidence assessing trends in internet searches following the 2009 U.S. Federal tobacco tax increase showed that after the tax was announced, search queries increased for both combusted and noncombusted non-cigarette tobacco products (Ref. 337).

Similarly, several studies assessed changes in loose tobacco sales following a large tax increase in RYO tobacco and found decreases in RYO tobacco sales and increases in pipe tobacco sales as soon as the tax rate changed (Refs. 322, 338 to 340). Researchers analyzing publicly available Federal excise tax data from 2000 to 2015 found that total RYO tobacco sales statistically significantly decreased by 70.0 percent; however, total pipe tobacco sales increased by 556.4 percent (Ref. 340). Another study found a similar increase in pipe tobacco sales and decrease in RYO tobacco sales in response to tax differences between the products; however, self-reported pipe tobacco use, assessed via the NSDUH, remained consistent, and RYO consumption increased (Ref. 338). The authors suggested that people who smoke cigarettes may have bought loose tobacco labeled as pipe tobacco for use as RYO cigarettes as a tax avoidance strategy. These data suggest that following the implementation of a new tobacco control policy, manufacturers may modify their products and a significant proportion of consumers may modify their behavior to adapt to the changes (e.g., switching to a similar combusted tobacco product if a final nicotine tobacco product standard

covered cigarettes only), which would reduce the rule's potential public health effects. If cigarettes were the only product covered by the proposed product standard, a proportion of people who smoke cigarettes would likely to turn to certain other combusted products, thereby reducing the significant public health impact of this rule. Similarly, people who use certain other combusted products would not be affected by the reduction in nicotine in cigarettes and would also not benefit. Further, if cigarettes were the only product covered by the proposed product standard, the negative health effects of second- and thirdhand smoke from these other combusted products would still affect other non-smoking individuals exposed to these combusted products. However, if these certain other combusted products are covered, then the alternative products for those who switch (instead of quitting) likely would not be combusted, therefore benefitting public health.

3. Behavioral Economics Data

Behavioral economics utilizes principles of psychology and economics to predict purchasing behavior as a function of different market constraints (Ref. 341). Several studies have used real or hypothetical scenarios to investigate the impact of a change in price or availability of a given tobacco product on subsequent purchasing or use of another tobacco product. Purchasing behaviors observed in behavioral economics studies have been shown to be concordant with actual tobacco consumption and real purchase estimates (Refs. 342 to 344).

Studies have used retail sales data to investigate tobacco substitution as a function of price (Refs. 345 to 347). One study investigated relationships between purchasing patterns and price of cigarettes and little cigars. In 2013, a pack of little cigars was approximately 32 to 37 percent less expensive than a pack of cigarettes (Ref. 345). A 10 percent increase in the price of little cigars was associated with a 31.7 percent decrease in per capita little cigar sales, while a 10 percent increase in the price of cigarettes was associated with a 27.3 percent increase in per capita little cigar sales. The authors concluded that people who smoke cigarettes are price sensitive and avoided the higher cost of cigarettes by switching to little cigars. Another study estimated demand for cigarettes, little cigars/cigarillos, large cigars, e-cigarettes, smokeless tobacco, and loose tobacco using Nielsen's Convenience Track retail scanner database (Ref. 347). In this study, a 10 percent increase in the price of

cigarettes resulted in an 18.6 percent increase in e-cigarette demand, showing that e-cigarettes substituted for cigarettes (Ref. 347). Although, in this study, large cigars, smokeless tobacco, and loose smoking tobacco were not associated with increased use in response to increasing cigarette prices, Nielsen retail sales data that were analyzed in another study showed that little cigars, RYO tobacco, and pipe tobacco each serve as substitutes for cigarettes (Ref. 346).

Studies have also used hypothetical purchase tasks to investigate responses by people who smoke cigarettes to potential tobacco policy changes or price increases (Refs. 348 and 349). One study used a simulated tobacco marketplace to measure purchasing behaviors among people who smoke cigarettes (Ref. 349). Participants could purchase cigarettes, e-cigarettes, cigarillos, gum, dip, lozenges, and snus. When cigarette prices increased, e-cigarette purchasing statistically significantly increased (Ref. 349). A study conducted in the Netherlands utilized a similar hypothetical tobacco marketplace to investigate hypothetical purchases for VLNC cigarettes as a function of varying scenarios (Ref. 348). Most relevant was the scenario where participants made hypothetical purchases for VLNC cigarettes, e-cigarettes, and NRT in a marketplace where NNC cigarettes were unavailable. VLNC cigarettes had the highest rate of purchase, followed by e-cigarettes, and then NRT. Approximately 20 percent of participants reported that they would not purchase any of the products if NNC cigarettes were unavailable (Ref. 348).

These data demonstrate that people who smoke cigarettes are willing to shift consumption toward both noncombusted and combusted non-cigarette tobacco products in times of economic or product constraint. Moreover, this evidence supports the conclusion that many people who smoke cigarettes likely would switch to other combusted tobacco products that contain nicotine if a nicotine product standard covered only cigarettes. Of additional concern is the potential for increased combusted non-cigarette tobacco product substitution among certain populations that may be price sensitive, such as individuals with low socioeconomic status compared to those with higher socioeconomic status (Ref. 335). One study showed that individuals of low socioeconomic status are 85 percent more likely to report using discount brands/RYO compared to participants with higher socioeconomic status (SES) in order to avoid an increase in the cost of their

preferred product, combusted cigarettes, and therefore, these individuals have a history of and comfort with switching to alternative combusted products when available at a lower cost (Ref. 335). Given that the research highlighted above has shown that a change in the availability of a tobacco product influences subsequent purchasing or use of other tobacco products, FDA is concerned that if the proposed nicotine product standard is limited to cigarettes, a large portion of individuals will seek out alternative sources of nicotine by using other combusted tobacco products if those products are not included within the scope of this rule.

VII. Discussion of Nicotine-Related Topics

A. Approach To Limiting User Exposure to Nicotine

Nicotine is the primary addictive constituent in all tobacco products, including cigarettes. FDA is proposing a tobacco product standard that would limit nicotine yield by establishing a maximum nicotine level in cigarettes and certain other combusted tobacco products to make these products minimally addictive or nonaddictive, using the best available science to determine a level that is appropriate for the protection of the public health.

After consideration of the scientific literature, comments submitted in response to the Nicotine ANPRM, and the measured levels of nicotine content in research cigarettes (as reported in the literature, as well as in information submitted to FDA from industry), FDA is proposing that the maximum nicotine level in cigarettes and certain other combusted tobacco products not exceed 0.70 mg of nicotine content per gram of total tobacco in order to limit user exposure to nicotine.

Nicotine “yield” is the amount of nicotine in smoke, in other words, the amount of nicotine to which a smoker potentially is exposed. Nicotine yield is measured by a machine-generated protocol where the product is smoked by a machine in a prescribed manner and the smoke is collected in order to measure nicotine with another instrument, such as a gas chromatograph. Nicotine content refers to the total amount of nicotine present in the tobacco filler and is typically conveyed as either milligrams of nicotine per gram of total tobacco or milligrams of nicotine per product. The nicotine content of a tobacco product serves as a ceiling on nicotine yield, as it denotes the maximum amount of nicotine that a user can be exposed to when they smoke the cigarette or other

tobacco product, and it cannot be manipulated by user behavior.

Setting a limit on nicotine content and measuring that content is more effective in reducing yield (*i.e.*, the amount of nicotine the user is exposed to) than setting a limit based on a direct measurement of yield under standardized smoking-machine protocols. This is because the way yield is measured by smoking machines does not accurately capture the amount of nicotine that is taken in by a person using the tobacco products. For example, manufacturers have developed “low-yield” cigarettes designed to markedly reduce yield results as measured by the Federal Trade Commission (FTC) testing method (Ref. 350). They decreased yields by manipulating various characteristics of the cigarettes (*e.g.*, decreasing the length of the available tobacco column, increasing the burn rate of the column, increasing filter efficiency, increasing air dilution in mainstream smoke, decreasing density of tobacco, or changing the concentration of nicotine in the tobacco) (Ref. 350 at Table 2–2). Many of these design changes led to the amount of nicotine measured in the machine-generated yield being different from—and less than—the amount of nicotine received by the smoker (Ref. 350). This disconnect is a result of smoking compensatory behaviors, such as smoking more cigarettes per day, increasing the number of puffs (with a smoker’s last few puffs on a cigarette delivering disproportionately more nicotine than delivered in a smoking machine’s standardized number of puffs), increasing puff volume and frequency, inhaling more deeply, and covering ventilation holes with fingers or lips, that enable smokers to overcome, intentionally or unintentionally, many of these design changes and, thereby, increase the amount of their nicotine intake compared to the machine-generated yield. They often do this to obtain adequate nicotine to satisfy their nicotine cravings (Ref. 350).

While standardized smoking machine puffing regimes in a controlled laboratory environment are effective in producing reproducible measurements of nicotine yield, as noted above, human behavior—how people smoke, including in response to cigarette-design features—influences the nicotine intake from a cigarette and can overcome features of a cigarette that lowered the machine-generated nicotine yield. For example, combusted cigarettes that were once referred to as “light” cigarettes achieved a reduction in machine-measured nicotine yield (*e.g.*, ISO

machine smoking method, CI smoking method, FTC smoking method) through a variety of design changes to the cigarette, including the use of ventilation holes—although the actual nicotine content of the tobacco filler was not low. These design changes led to lower tar and nicotine yields in machine-generated smoke, and therefore, these products were labeled and marketed as low nicotine yield or “light,” “low,” or “mild” cigarettes. However, often unconsciously cigarette users could and did modify their use behaviors to compensate for these design changes and extract more nicotine from the products compared to the machine-generated yields, often to levels comparable to conventional cigarettes. For example, cigarette makers generally design cigarettes with ventilation holes far enough down the cigarette that they are not blocked during the FTC smoking test, but are easily blocked by users’ fingers or mouths, and larger or more frequent puffs could be taken by consumers (Ref. 351). Through such compensatory smoking behaviors, cigarette users were able to overcome the changes in ventilation in these products, resulting in no benefit to public health (Ref. 350). There is ample research demonstrating that people who use ventilated cigarettes change their smoking behavior to increase their smoke intake, including taking larger puffs, inhaling more deeply, taking more frequent puffs, or increasing the number of cigarettes they smoke per day²⁵ (Refs. 350 to 361). As a result, evidence shows that many people are exposed to higher yields of smoke constituents, including nicotine, than the yields estimated by standardized smoking machine methods (Refs. 362 to 364). Further, researchers have reviewed the extensive body of literature on filter ventilation and health effects and concluded that there is strong evidence to suggest that filter ventilation has contributed to the rise in lung adenocarcinomas among people who smoke (Ref. 365). Studies that measure nicotine pharmacokinetics have also found that the relative percentage of free nicotine in smoke may increase with percent of filter ventilation (Ref. 366), which suggests that greater filter ventilation may expose smokers to greater free nicotine levels that can lead to greater total nicotine exposure while smoking as this form of nicotine is more easily absorbed by the body.

²⁵ See section VII.B 4., Smoking Topography, of this document for further discussion of compensatory smoking and VLNC cigarettes.

In contrast, reducing the nicotine content in cigarettes and certain other combusted tobacco products places an absolute maximum limit on the amount of nicotine that can be extracted (*i.e.*, yielded) by the user. VLNC cigarettes, in contrast to low nicotine yield cigarettes generated by other design changes, are associated with minimal and transient compensatory smoking because people who smoke these cigarettes are unable to obtain adequate amounts of nicotine through these behaviors; therefore, they stop trying to do so. In sum, limiting nicotine yield through a maximum nicotine content level would be more effective in achieving the public health benefits that come from reducing the amount of the nicotine to which a user is exposed than would setting a limit based on a measurement of the maximum yield of tobacco products.²⁶

B. Scientific Evidence Supports the Target Level of Nicotine

Many studies have investigated the effects of VLNC cigarettes on behavioral outcomes, including smoking cessation, use behaviors, biomarkers of exposure, and physiological effects. Findings from these studies are discussed in this section, and they suggest that individuals who smoke VLNC cigarettes with nicotine levels similar to what FDA is proposing here are more likely to make a quit attempt, reduce smoking, demonstrate reduced exposure to harmful and potentially harmful constituents (HPHCs), and demonstrate similar or reduced physiological responses to cigarettes relative to individuals who smoke usual brand or NNC cigarettes. Results from these and other studies suggest that switching to VLNC cigarettes does not lead to compensatory smoking (see this section and VII.B.4 of this document for further discussion of compensatory smoking).

Therefore, the data reported in the scientific literature support a tobacco product standard limiting nicotine yield by setting a maximum nicotine content level in cigarettes and certain other combusted tobacco products to a maximum of 0.70 mg of nicotine per gram of total tobacco. FDA believes that this maximum nicotine level would provide the appropriate flexibility to account for variations in tobacco growing seasons and variations in analytical testing. FDA requests

comments, data, and research regarding this proposed maximum nicotine level.

1. Origin of the Proposed Product Standard

In 1994, Benowitz and Henningfield proposed the idea of Federal regulation of nicotine content in combusted tobacco products to a level too low to sustain addiction (Ref. 367). They considered the smoking habits of a small population of people who smoke cigarettes intermittently and who demonstrate reduced nicotine dependence (a group sometimes referred to as tobacco “chippers”) to inform indirect estimates of a nicotine level that they proposed would be too low to sustain addiction in most people who smoke cigarettes. Chippers are typically characterized by smoking five or fewer CPD, with limited or no withdrawal symptoms, and by being able to skip smoking for days at a time (Ref. 368). Based on their estimates of nicotine exposure among chippers, the researchers proposed a level of nicotine per cigarette—approximately 0.5 mg of nicotine per cigarette—that should be low enough to prevent or limit the development of nicotine addiction in most young people. The nicotine level proposed by Benowitz and Henningfield was an initial estimation based on observational data, and there is individual variability in dose sensitivity to all addictive substances; however, the initial estimate posed by Benowitz and Henningfield paved the way for subsequent prospective clinical studies designed to evaluate the addiction potential of VLNC cigarettes.

Several brands of commercial and research cigarettes were manufactured to contain a nicotine content similar to that originally proposed by Benowitz and Henningfield (see table 1 of this document). Using these cigarettes, researchers have consistently demonstrated that VLNC cigarettes have reduced addiction potential compared to NNC cigarettes.

22nd Century Group Inc., the company that developed SPECTRUM Nicotine Research Cigarettes and whose genetically engineered tobacco was used to make Quest cigarettes, submitted modified risk tobacco product applications to FDA that reported that the actual average value of nicotine content in its genetically engineered VLNC tobacco is 0.6 mg nicotine per gram of total tobacco, with a range of 0.4 to 0.7 mg nicotine per gram of total tobacco (see section V.A of this document for a discussion of the history of LNC and VLNC cigarettes, including the SPECTRUM Nicotine Research

Cigarettes).²⁷ The natural variation of this agricultural product resulted in the slight variation in the nicotine content of the tobacco filler within the company’s internal range of acceptable values. The average value and range were compiled by the company from 9 years of sampling data of the genetically engineered tobacco that was used to make SPECTRUM and Quest cigarettes. It is likely that the cigarettes used throughout the scientific literature, reported as having 0.4 mg nicotine per gram of total tobacco, may have, in actuality, been between 0.4 and 0.7 mg of nicotine per gram of total tobacco. This range is consistent with the scientific evidence to support a minimally addictive or nonaddictive level of nicotine content in cigarettes and certain other combusted tobacco products, and FDA took these data from 22nd Century Group Inc.’s VLNC cigarettes into consideration when determining the appropriate, technically feasible maximum level of nicotine content to propose in this product standard.

2. Smoking Cessation

A number of studies investigated the effects of VLNC or LNC cigarettes alone or in combination with NRT on smoking cessation among people who smoke but are interested in quitting (Refs. 32, 35, 41, 369 to 373) and those uninterested in quitting (Refs. 31, 40, 258, and 374). As stated throughout this document, most adults who use tobacco products wish to quit but are unsuccessful because of the highly addictive nature of these products (Refs. 1, 13, 28, 58, and 61) (see section IV.A of this document for a discussion of the addictiveness of nicotine). Taken together, results from these studies demonstrate that people who smoke and are interested in quitting who are given VLNC cigarettes are more likely to achieve initial smoking abstinence compared to those who continue to smoke their usual brand or NNC cigarettes. In addition, provision of NRT and/or behavioral intervention with VLNC cigarettes may further increase smoking cessation among individuals interested in quitting (Ref. 19).

Research demonstrates the benefits of VLNC cigarettes for those people who smoke and are interested in quitting. In one of the clinical trials that has examined the effects of VLNC cigarettes

²⁶ Consistent with the proposed limit on nicotine content, FDA is also proposing testing for nicotine content only, rather than both content and yield. This testing requirement is less burdensome yet still effective in measuring the maximum nicotine yield, *i.e.*, the maximum amount of nicotine to which a user can be exposed.

²⁷ On December 23, 2021, FDA issued exposure modification orders to 22nd Century Group Inc. for VLN King and VLN Menthol King combusted, filtered cigarettes. See <https://www.fda.gov/tobacco-products/advertising-and-promotion/22nd-century-group-inc-modified-risk-tobacco-product-mrtp-applications>.

alone on smoking cessation in people who smoke cigarettes who were interested in quitting, 165 people who smoke were randomized to use LNC cigarettes, VLNC cigarettes, or 4 mg nicotine lozenges for 6 weeks (Ref. 32). While there were no statistically significant differences between groups in CO-verified point prevalence abstinence (*i.e.*, quit) rates at 1–4-week followup visits, abstinence rates at the week 6 followup visit were statistically significantly higher in the VLNC cigarette group (47.2 percent) and nicotine lozenge group (36.7 percent) relative to the LNC cigarette group (23.1 percent) (Ref. 32). In another randomized clinical trial (RCT), 346 people who smoked and were interested in quitting were randomized to receive 6 weeks of (1) a combination of VLNC cigarettes (nicotine was gradually reduced from NNC to LNC to VLNC cigarettes every 2 weeks) and nicotine patch (VLNC cigarettes + NRT); (2) VLNC cigarettes and a placebo patch (VLNC cigarettes only); or (3) NNC cigarettes and NRT after their quit date (NNC cigarettes + NRT) (Ref. 369). Following their quit date at week 7, the VLNC cigarettes + NRT group continued to receive NRT, the VLNC cigarettes only group received placebo patches, and the NNC cigarettes + NRT group was provided with NRT during weeks 7–10. Biochemically confirmed continuous abstinence rates were 32.8 percent in the VLNC cigarettes + NRT group, 16.4 percent in the VLNC cigarettes only group, and 21.9 percent in the NNC cigarettes + NRT group (Ref. 369), suggesting that the combination of VLNC cigarettes and NRT is more effective at promoting continuous abstinence than VLNC cigarettes alone. However, abstinence at 3- and 6-month followups could not be adequately assessed due to attrition (Ref. 369).

Many other studies conducted in individuals interested in quitting investigated the effects of LNC or VLNC cigarettes combined with NRT (Refs. 41, 35, 371 to 373, and 375). For example, in a study conducted in New Zealand, 1,410 callers to a quitline were randomized to receive VLNC cigarettes with usual quitline care (8 weeks of NRT and behavioral support via a quitline) or usual care alone (Ref. 373). Six months after the quit date, 7-day point-prevalence abstinence rates²⁸ were statistically significantly greater in participants using VLNC cigarettes with

usual quitline care (33 percent) compared to the group who received usual quitline care alone (28 percent). Continuous abstinence rates at month 6 also were statistically significantly higher for participants who received VLNC cigarettes with usual quitline care (23 percent) compared to those who received usual quitline care alone (15 percent). Likewise, in another study, 98 persons who reported heavy smoking (*i.e.*, greater than or equal to 20 CPD) received either VLNC cigarettes and a 21 mg nicotine patch or NNC cigarettes for 2 weeks prior to quitting (Ref. 372). After the quit date, all study participants wore nicotine patches for up to 8 weeks. Participants who smoked VLNC cigarettes and received patches reported less frequent and less intense cravings during the 2 weeks before and after the quit date, suggesting that use of VLNC cigarettes plus NRT may aid in cessation by reducing cigarette craving during a quit attempt. Participants in the VLNC cigarettes + NRT group had a higher self-reported quit rate compared to those in the NNC cigarettes + NRT group at 3 months (43 percent vs. 34 percent, respectively) and 6 months (28 percent vs. 21 percent, respectively), but these quit rates did not differ statistically significantly between groups, likely due to a small sample size precluding sufficient statistical power.

Several other studies have investigated the effects of VLNC or LNC cigarettes on smoking cessation among individuals uninterested in quitting (Refs. 31, 40, 258 and 374). In an RCT, participants received either NNC cigarettes or VLNC cigarettes (double-blinded, *i.e.*, neither the participants nor the researchers knew which type of cigarette participants received), and either received or did not receive a transdermal nicotine patch (open-label, *i.e.*, participants and researchers were aware of whether participants received NRT) for 7 weeks. At week 7, participants were provided a daily descending monetary bonus for refraining from using any cigarettes. Participants randomized to receive NRT were encouraged to continue using their patches. Although participants who received VLNC cigarettes smoked statistically significantly fewer total CPD than participants who received NNC cigarettes, during the abstinence period, no groups differed statistically significantly from the NNC cigarette-only group in time to lapse or number of days abstinent; however, these results were likely influenced by low adherence to VLNC cigarette use in this study (Ref. 376). In another series of studies, participants received gradually

reduced nicotine content cigarettes over a period of 6 months, beginning with NNC cigarettes and ending with VLNC cigarettes (Refs. 258 and 374). In the first study, a statistically significantly greater proportion of participants who received VLNC cigarettes considered quitting at the end of the study, compared to those in a control group who smoked their usual brand cigarettes throughout the study (Ref. 258). In a followup study in which a subset of participants was followed for 2 years, cotinine levels in the gradual nicotine reduction group rose to baseline levels or levels similar to those of the control group after 12 months during which both groups could freely smoke usual brand cigarettes (Ref. 374). Although 7.5 percent of participants in the gradual reduction group quit smoking, compared to only 2 percent of participants in the usual brand control group, this difference was not statistically significant (Ref. 374). In another study, 33 participants were randomized to receive VLNC cigarettes or to continue to smoke their usual brand cigarettes for 12 weeks (Ref. 31). The availability of VLNC cigarettes increased quit attempts in people who smoked cigarettes and had no intention of quitting (Ref. 31).

Furthermore, several extended duration VLNC studies demonstrated how VLNC cigarettes can increase cessation by assessing self-reported quit attempts as a secondary study aim. While one study showed no statistically significant differences in quit rates among people who smoke cigarettes on a nondaily basis who used VLNC or NNC cigarettes for 10 weeks (Ref. 377), other studies showed that participants who smoked VLNC cigarettes were more likely to report a quit attempt after 6 weeks of use (Ref. 29) and had a greater number of cigarette-free days after 12 (Ref. 378) and 18 weeks (Ref. 379) compared to those who smoked NNC cigarettes. However, a secondary analysis of the 18 week study (Ref. 379) found that there were no significant differences in quit rates or intention to quit at the 6-month followup timepoint (Ref. 380).

Among the studies evaluating smoking cessation following VLNC cigarette use, few utilized a randomized controlled trial design, and results were sometimes inconsistent, particularly related to long-term followup. However, the weight of evidence from these studies suggests that among people who smoke and are interested in quitting, using VLNC cigarettes can facilitate initial smoking abstinence, particularly when used along with NRT and/or behavioral intervention. Among people

²⁸ Seven-day point prevalence abstinence is a measure of, in this case, tobacco cessation outcomes for quitlines. At a given point in time (in this case, 6 months after the quit date), study participants are asked whether they have used cigarettes or other forms of tobacco in the past 7 days.

who smoke but are uninterested in quitting, VLNC cigarette use did not increase quit rates; however, it did increase quit attempts. It is important to note that studies evaluating smoking cessation following VLNC cigarette use took place in an environment where NNC cigarettes and other combusted tobacco products remained readily available. For this reason, the available data likely underestimates the likelihood of increased cessation rates following the implementation of a nicotine product standard because NNC cigarettes would no longer be available, making relapse to these cigarettes no longer possible.

3. Cigarettes Per Day (CPD)

One concern raised by some with regard to a reduced nicotine policy is whether people who smoke might alter their smoking behavior by smoking additional cigarettes in order to attempt to compensate for the lower amounts of nicotine, but studies show that extended use of VLNC cigarettes does not produce increases in CPD. Researchers typically assess CPD via participant self-reporting or by counting cigarette filters or packs returned by participants. By measuring CPD during an extended exposure trial, researchers can determine whether switching to VLNC cigarettes produces changes in CPD compared to usual brand or NNC cigarette conditions. Research conducted in the absence of the proposed standard shows that switching to LNC or VLNC cigarettes can produce modest decreases in CPD. However, as noted previously, studies evaluating changes in CPD following VLNC cigarette use took place in an environment where NNC cigarettes and other combusted tobacco products remained readily available, likely underestimating the potential reductions in CPD following implementation of a nicotine product standard because NNC cigarettes and other combusted tobacco products would no longer be legally available. These findings suggest that, if the proposed product standard were finalized and implemented, people who smoke VLNC cigarettes would not increase CPD to compensate for reduced nicotine exposure, and FDA expects that for many CPD would decrease over time.

Many studies measured VLNC CPD under conditions of extended exposure (e.g., several consecutive weeks or longer). These studies varied in sample size, duration of exposure, average CPD requirements to enter the study, participants' intentions to quit smoking, and the method in which participants transitioned from usual brand cigarettes

to VLNC cigarettes (i.e., gradual versus immediate reduction in nicotine content). Despite these differences in study methods and participant characteristics, nearly all the studies came to a similar conclusion: relative to usual brand or NNC cigarette conditions, CPD was similar (i.e., there was no compensatory smoking) (Refs. 31, 35, 329, 369, 374, 381 to 385,) or lower in VLNC cigarette conditions (Refs. 29, 32, 41, 265, 386, and 387). Notably, studies that found lower CPD while participants smoked VLNC cigarettes tended to have larger sample sizes (Refs. 29 and 379), which may have had more statistical power to detect relatively small but consistent differences in CPD across conditions.

One limitation of some studies that examined the effects of VLNC cigarette smoking on CPD is that comparisons between VLNC CPD and usual brand or NNC CPD were made without taking into account the number of non-study cigarettes smoked per day in experimental conditions. A measure of "total CPD" in VLNC cigarette conditions would include the number of study-assigned VLNC cigarettes plus the number of usual brand or non-study cigarettes smoked by participants who were not fully compliant with study procedures. Few studies have compared total CPD across VLNC and usual brand or NNC cigarette conditions. However, one study found that, relative to usual brand and NNC cigarette conditions, the combination of study- and non-study-assigned CPD was lower in VLNC and LNC cigarette conditions when nicotine content was less than or equal to 2.4 mg nicotine per gram of total tobacco, and that those participants who used VLNC cigarettes (i.e., 0.4 mg nicotine per gram of total tobacco), demonstrated reduced use and dependence with minimal evidence of withdrawal-related discomfort or safety concerns (Ref. 29). Another study found that fewer combusted tobacco products were smoked during LNC cigarette conditions relative to an NNC cigarette condition (Ref. 5). A study where participants were confined to a hotel in order to limit their access to non-study products assessed the potential effects of VLNC cigarettes on compensatory smoking behaviors (Ref. 388). Participants completed two 4-night stays; during their first stay, they were randomized to receive either NNC or VLNC cigarettes and were randomized to the other group during their second stay. Furthermore, participants were given an "account balance" where they could purchase study cigarettes from a "cigarette store" during the study. Investigators found

that by the end of the four night stays the number of cigarettes participants smoked did not differ statistically significantly between the NNC and VLNC cigarette groups, indicating that people who smoke may not engage in compensatory smoking behavior when only VLNC cigarettes are available (Ref. 388). Another study compared the effects of VLNC and NNC cigarettes on CPD in people who smoke who inhabited a residential research facility throughout the study. The results showed that when participants had access to only VLNC cigarettes for 11 days, they smoked statistically significantly fewer CPD than those who had access to only NNC cigarettes (Ref. 64).

Taken together, these studies indicate that extended use of VLNC cigarettes does not produce increases in CPD in an attempt to compensate for the reduced nicotine levels. FDA expects that this may result in reductions in CPD among people who do not quit, particularly in an environment where NNC cigarettes are not legally available.

4. Smoking Topography

Smoking topography refers to various aspects of smoking behavior, including number of puffs per cigarette, total time spent smoking, puff volume (i.e., puff size), puff velocity (i.e., puff intensity), puff duration, and inter-puff interval (i.e., length of time between puffs). Although some of these outcomes (e.g., puffs per cigarette) can be measured via direct observation, smoking topography is typically assessed with an electronic puff topography unit attached directly to a cigarette. Smoking topography measures that indicate more intense smoking behavior may be attributed to compensatory smoking. A concern raised by some with regard to a nicotine reduction policy is whether people who smoke might engage in compensatory smoking behavior to try to extract more nicotine from the cigarettes, thus increasing exposure to tobacco-related toxicants. Smoking topography study results are mixed, but the majority of studies show that individuals who smoke VLNC cigarettes demonstrate no statistically significant differences in smoking topography relative to those who smoke usual brand or NNC cigarettes, or they demonstrate changes in smoking topography measures that are associated with reductions in tobacco smoke exposure (e.g., lower total puff volume) rather than increased compensatory smoking.

Some studies found no differences in smoking topography between VLNC and NNC or usual brand cigarette conditions (Refs. 389 to 391). However, many other

studies found that smoking topography differed between cigarette conditions. Some of the more reliable findings replicated across studies were the effects of VLNC cigarettes on total puff volume and number of puffs per cigarette. Under conditions of both brief (*e.g.*, several hours) and extended (*e.g.*, several weeks) exposure, studies found that total puff volume was lower (Refs. 29, 34, 383, 384, and 392) and number of puffs per cigarette was lower (Refs. 329, 384, 392, and 393) when participants smoked VLNC cigarettes, relative to usual brand or NNC cigarettes. However, two brief exposure studies showed higher puff volumes (Refs. 393 and 394) and puff duration (Ref. 394) when participants smoked VLNC cigarettes in short laboratory sessions. Another brief exposure study conducted in adolescents showed that VLNC cigarettes produced higher numbers of puffs relative to NNC cigarettes; however, additional measures were not collected to determine whether this was a transient or lasting effect (Ref. 395). An extended exposure study showed initial decreases in puff volume when participants smoked VLNC cigarettes relative to NNC cigarettes, but these differences dissipated over the course of 7 days (Ref. 383). Finally, limited evidence suggests that VLNC cigarettes are smoked faster (Refs. 259 and 396), are smoked with increased peak velocity (Ref. 384) and may decrease inter-puff intervals when compared to NNC cigarettes (Ref. 392).

In all, while smoking topography study results are mixed, the majority of studies show that individuals who smoke VLNC cigarettes demonstrate no statistically significant differences in smoking topography relative to those who smoke usual brand or NNC cigarettes, or they demonstrate changes in smoking topography measures that are associated with reductions in tobacco smoke exposure (*e.g.*, lower total puff volume) rather than increased compensatory smoking.

5. Abuse Potential

Abuse potential refers to the ability of a product to promote continued use and the development of dependence. Choice studies are commonly used to measure abuse potential, where preference for one tobacco product over another indicates greater abuse potential. When participants are asked to make a real or hypothetical choice between VLNC cigarettes and NNC cigarettes in research studies, they reliably choose NNC cigarettes (Refs. 391, 397 to 401). Combined with data showing that VLNC cigarettes are associated with significantly lower plasma nicotine

exposure (Ref. 402) and decreased positive subjective effects compared to NNC and usual brand cigarettes (Ref. 391), these data indicate lower abuse potential of VLNC cigarettes. However, research has also shown that the choice between VLNC and NNC cigarettes can be influenced by factors such as cost or effort, such that when the effort required to obtain NNC cigarettes increases, some people who smoke cigarettes will switch their preference from NNC cigarettes to VLNC cigarettes (Ref. 398). For example, one laboratory study investigating tobacco product choice when participants were provided with an experimental income found that, although participants rated VLNC cigarettes as less satisfying than both LNC and NNC cigarettes, they purchased statistically significantly more puffs of the VLNC cigarettes when LNC and NNC cigarettes were more expensive (Ref. 403). Thus, if the proposed product standard is implemented and the cost, effort, or risk associated with obtaining NNC cigarettes increases, individual preference may shift to VLNC cigarettes or more readily available tobacco products rather than attempting to seek out illicitly marketed NNC products. If the proposed product standard were to apply only to cigarettes, these findings also indicate that people who smoke cigarettes who do not quit after a final rule goes into effect would likely be willing to switch to other NNC combusted tobacco products rather than using VLNC cigarettes. If this were the case, the public health benefit of the proposed product standard would be reduced.

Hypothetical choice tasks (*e.g.*, cigarette purchase task, multiple choice questionnaire) are used to characterize reinforcing efficacy by determining how changes in the cost of a commodity affect its consumption. These tasks typically involve prior experience with the product or brief laboratory exposure, followed by a series of questions asking participants to either (1) report how many cigarettes they would consume at a variety of escalating prices; or (2) choose between cigarettes or money at a variety of prices. Studies that used hypothetical choice tasks to assess VLNC cigarette reinforcement showed that participants find VLNC cigarettes to be less reinforcing than NNC cigarettes (Refs. 265, 343, and 391). In one study, the reinforcing efficacy of cigarettes varying in nicotine content following 6 weeks of access to the products was examined (Ref. 343). Compared to the NNC cigarette group, those in the VLNC cigarette group estimated that they

would smoke fewer cigarettes even if the cigarettes were free, spend less for the VLNC cigarettes, and quit smoking VLNC cigarettes at a lower price point (*i.e.*, a price point at which participants would continue to pay for NNC cigarettes). Responses on the hypothetical choice task were highly correlated with the actual number of cigarettes smoked during week 6 of the study.

Hypothetical choice tasks can also be used to investigate the substitutability of tobacco products. For example, another study employed a cross-price elasticity task in which the price of VLNC cigarettes was held constant while the price for usual brand cigarettes was manipulated (Ref. 404). When usual brand cigarette price increased, demand for VLNC cigarettes increased and demand for usual brand cigarettes decreased, indicating that VLNC cigarettes are a partial substitute for usual brand cigarettes (Ref. 404).

Rather than directly assessing choice between tobacco products, some studies evaluate how much people who smoke are willing to work to earn puffs from cigarettes when the number of responses required to earn a puff progressively increases (*i.e.*, a progressive ratio task). One study that used this method found that participants assigned to an NNC cigarette group were willing to work statistically significantly harder to earn puffs from their NNC cigarette than participants assigned to a VLNC cigarette group, indicating greater abuse liability (*i.e.*, ability to promote continued use and the development of dependence) of the NNC cigarette (Ref. 64).

These studies demonstrate that VLNC cigarettes are consistently shown to be of lower abuse potential compared to NNC cigarettes, as evidenced by responses to behavioral and hypothetical choice procedures. Behavioral and hypothetical choice research has also shown that the choice between VLNC and NNC cigarettes can be influenced such that some people will switch their preference from NNC cigarettes to VLNC cigarettes when the price or effort required to obtain the products increases. See section VI.B of this document for further discussion on the impact of cigarette price on switching behavior.

6. Biomarkers of Exposure

Research demonstrates that, following VLNC cigarette use, some biomarkers of exposure (*e.g.*, CO, measured as breath CO or carboxyhemoglobin (COHb)) are typically similar to those observed following NNC cigarette use, while other biomarkers (*e.g.*, total nicotine

equivalents (TNE), which are a combination of nicotine, cotinine, and other nicotine metabolites collected through plasma, saliva, or urine) are typically lower following VLNC cigarette use. However, no biomarkers of exposure are reliably observed to be higher following VLNC cigarette use relative to NNC cigarette use, meaning that study participants are not engaging in compensatory smoking behaviors.

Some of the most commonly measured biomarkers of tobacco smoke exposure are CO, plasma nicotine, cotinine (collected through plasma, saliva, or urine), TNE, and other HPHCs or their metabolites (*e.g.*, NNN, NNAL, Benzof[a]pyrene (BAP), 3-hydroxypropyl mercapturic acid (3-HPMA), S-phenylmercapturic acid (S-PMA)). While nicotine and its metabolites would be expected to decrease in individuals who switch from NNC to VLNC cigarettes, other biomarkers of exposure would be expected to remain the same if smoking behavior remained unchanged. Thus, any changes in biomarker levels observed between NNC and VLNC cigarette conditions in clinical studies may indicate differences in smoking behavior (*e.g.*, changes in CPD or smoking topography) between these two groups. Notably, due to the short half-lives of some biomarkers (*e.g.*, breath CO), decreases in smoking can produce decreases in these biomarkers during brief exposure studies. However, decreases in smoking may not produce decreases in some biomarkers (*e.g.*, NNAL) under such conditions due to the prolonged half-lives of these biomarkers.

Most studies have found no differences in CO exposure between participants who smoke VLNC cigarettes and those who smoke usual brand or NNC cigarettes (Refs. 5, 29, 32, 34, 40, 258, 374, 376, 383, 387, 388, 390, 391, 393, 395, 396, 402, 405 to 417.). This finding may be somewhat unexpected as many studies have found that participants smoke fewer CPD when they smoke VLNC cigarettes relative to NNC or usual brand cigarettes. However, although CO is positively associated with CPD, research has shown that the correlation may only be of moderate strength (Ref. 418). Furthermore, CO may be impacted by noncompliance with study cigarettes (see section VI.B of this document for a discussion about noncompliance).

Nevertheless, differences were observed between VLNC and NNC cigarette conditions in a few studies. Two brief exposure studies in which participants were given limited access to reduced nicotine content cigarettes over the course of several hours under

controlled laboratory conditions found increases in breath CO following VLNC cigarette use relative to NNC cigarette use (Refs. 419 and 420). In addition, an extended exposure study (over the course of 35 days) showed that CO levels initially increased when participants switched from usual brand cigarettes during baseline to VLNC cigarettes; however, these effects dissipated over time as CO levels eventually returned to baseline levels (Ref. 384). As discussed in section VIII.D.7 of this document, these limited increases in CO exposure may be due to changes in smoking topography. At least one extended exposure study found decreases in CO boost (the difference between measured CO levels before and after smoking a cigarette) after VLNC cigarette use compared to usual brand cigarettes (Ref. 329). In another study, one group of participants smoked NNC cigarettes throughout the study, a second group smoked study cigarettes with gradually reduced nicotine contents, and a third group immediately switched to VLNC cigarettes (Ref. 421). This study found that subjects in the immediate VLNC cigarette group had statistically significantly lower CO than did the NNC cigarette or gradual reduction groups. Breath CO for participants in the NNC cigarette and gradual reduction groups did not differ statistically significantly from each other (Ref. 421). Moreover, the only study to date that examined the effects of VLNC cigarettes on breath CO in people who smoke who inhabited a residential research facility found that when participants only had access to study cigarettes for 11 days, those who were assigned VLNC cigarettes had statistically significantly lower breath CO than those who were assigned NNC cigarettes. Furthermore, these differences increased over the course of each day such that they were much larger in the afternoon than in the morning (Ref. 64).

Notwithstanding the differing CO studies, studies that examined nicotine, cotinine, or TNE levels had overwhelming concurrence regarding the effects of either brief or extended exposure to VLNC cigarettes compared to usual brand or NNC cigarettes. VLNC cigarette use resulted in substantially lower levels of nicotine, cotinine, and TNE than usual brand or NNC cigarettes (Refs. 5, 29, 32 to 34, 40, 258, 329, 370, 374, 376, 382 to 384, 387, 388, 390, 402, 403, 406, 407, 410, 413, 417, and 419 to 425). One within-subjects laboratory study compared the nicotine pharmacokinetic profile of VLNC, LNC, NNC, and usual brand cigarettes in 12

participants who smoked cigarettes daily (Ref. 402). While each of the four cigarettes produced statistically significant increases in plasma nicotine boost (*i.e.*, peak plasma nicotine level minus baseline level) after smoking, the VLNC and LNC cigarettes had statistically significantly lower plasma nicotine boost and AUC₀₋₁₂₀ (*i.e.*, plasma nicotine area under the curve calculated for the first 120 minutes following product use, indicating extent of exposure to nicotine and its clearance rate from the body) compared to the NNC and usual brand cigarettes. These data show that although VLNC cigarettes are associated with significantly lower nicotine uptake compared to NNC and usual brand cigarettes, the cigarettes still deliver a measurable amount of nicotine.

The effects of VLNC cigarette exposure on other HPHCs were less reliable across studies. Nevertheless, studies consistently found that VLNC cigarette exposure either reduced or did not change exposure to NNN, NNAL, urinary 1-hydroxypyrene, or BAP relative to NNC or usual brand cigarettes (Refs. 5, 29, 32, 40, 258, 382, 384, and 329). Two studies also examined 3-HPMA and S-PMA levels and found that these biomarkers decreased in VLNC cigarette conditions compared to LNC and NNC cigarette conditions (Ref. 32). Another study found that an immediate switch to VLNC cigarettes statistically significantly reduced exposure to acrolein and phenanthrene tetraol (both are biomarkers of smoke exposure) throughout a 20-week study duration compared to a gradual reduction approach (Ref. 379). The reductions in biomarkers that were observed in some of these studies following VLNC cigarette exposure were typically correlated with decreases in CPD or other smoking behaviors. Thus, as expected, VLNC cigarette use resulted in fewer CPD, which resulted in overall reductions in HPHC exposure. Importantly, none of the studies found that VLNC cigarette use resulted in increases in any of these other HPHCs or their biomarkers. Taken together, these studies support that VLNC cigarette use is associated with biomarker exposure that is similar to or lower than NNC cigarette use.

7. Physiological Effects

Physiological measures may be proxy measures for the stimulant effects of nicotine. Pharmacodynamic effects of nicotine include central and peripheral nervous system stimulation, arousal, and increased heart rate or blood pressure. Nicotine is a known stimulant, but physiological effects may occur in

response to combusted tobacco products even in the absence of nicotine in those who regularly use cigarettes and certain other combusted tobacco products due to behavioral conditioning or other psychoactive chemicals in tobacco smoke. Data show that physiological effects related to VLNC cigarettes are similar or less pronounced than those produced by NNC cigarettes, suggesting that the nicotine in the VLNC cigarettes is able to produce physiological effects.

There is slight variability in the data assessing the physiological effects of VLNC cigarettes. Some studies show that, regardless of nicotine content, acute cigarette smoking is associated with an increase in baseline heart rate (Refs. 259, 407, 411, and 419); however, these increases were either less pronounced following VLNC cigarette use compared to NNC cigarette use (Refs. 259 and 407) or were less consistent (*i.e.*, observed at some but not all time points following use) (Ref. 411). Some research has shown that escalations in heart rate dissipate after repeated exposure to VLNC cigarettes but not usual brand cigarettes (Ref. 407). In contrast, other studies did not observe increases in heart rate when participants smoked VLNC cigarettes (Refs. 250, 413, 417, and 426), and several studies showed statistically significantly reduced escalations in heart rate compared to acute LNC, NNC, or usual brand cigarette administration (Refs. 64, 249, 265, 390, 405, 415, 427, and 428).

Some studies also investigated the effects of VLNC cigarettes on blood pressure. Several studies found no differences in blood pressure after smoking a VLNC cigarette compared to an LNC cigarette (Refs. 249 and 419), NNC cigarette (Ref. 259), or usual brand cigarette (Refs. 249, 259, and 419). However, other studies showed statistically significantly greater increases in blood pressure after smoking NNC or usual brand cigarettes relative to VLNC cigarettes (Refs. 265 and 390).

A small number of studies examined the effects of VLNC cigarettes on skin temperature and skin conductance (a measure of sympathetic nervous system activity indicating psychological or physiological arousal). Although one study showed that skin temperature decreased to a greater extent with NNC cigarettes compared to VLNC cigarettes (Ref. 259), another study found no differences in skin temperature as a function of nicotine content in cigarettes (Ref. 426). Another study found no statistically significant differences in skin conductance between VLNC and NNC cigarettes (Ref. 429).

Taken together, findings from these studies suggest that VLNC cigarettes produce physiological responses that are similar to or less pronounced than those produced by NNC cigarettes. These data suggest that the nicotine in the VLNC cigarettes is able to elicit physiological responses in people who smoke cigarettes, although a portion of the response may also be due to sensorimotor cues, or other stimuli associated with smoking, that may have conditioned participants to produce these physiological effects due to the historical repeated pairings with nicotine.

8. Neurological Effects

The main target of nicotine in the central nervous system is the nicotinic acetylcholine receptor (nAChR). Positron emission tomography (PET) and magnetic resonance imaging (MRI) data obtained from humans who smoke using an nAChR-specific radiotracer indicates that after smoking a VLNC cigarette, nAChR receptors located in numerous areas of the brain are occupied despite the lower nicotine content of VLNC cigarettes (Ref. 430).

Nicotine also activates the dopaminergic brain reward system, which results in dopamine release and a pleasure response. The release of dopamine also initiates an adaptive process in which an individual forms learned associations between the subjective state (*e.g.*, pleasure) and the object or context that led to that state (*e.g.*, the act of smoking a cigarette) (Ref. 389). Through this process, both nicotine administration and smoking stimuli (*e.g.*, a cigarette, a lighter) contribute to the cycle of nicotine dependence (Ref. 38). Smoking NNC cigarettes to satiety results in near-complete occupancy of nAChRs in the brain (Refs. 431 and 432). In contrast, although studies have shown there is enough nicotine in VLNC cigarettes to bind to nAChRs in the brain (Ref. 430) and to release dopamine (Ref. 389), results from these studies have also shown the effects are smaller than those observed from smoking NNC cigarettes. These differences in nAChR occupancy and dopamine release between VLNC and NNC cigarettes may explain, in part, why many studies have shown smoking VLNC cigarettes does not consistently produce the same magnitude of subjective craving and withdrawal responses observed following use of NNC cigarettes (Refs. 398, 406, 407, 411, 413, 415, 417, 419, 422, 433 to 439). Taken together, these findings demonstrate that nicotine from smoking VLNC cigarettes binds to nAChRs located in numerous areas of the brain;

however, nAChR receptor occupancy and the magnitude of craving and withdrawal responses observed following use of VLNC cigarettes are not as high as those following use of NNC cigarettes.

9. Dependence

Combusted tobacco product use can lead to symptoms of nicotine dependence, which may include tolerance to the effects of nicotine, withdrawal upon cessation of use, craving, and unsuccessful efforts to quit smoking. Because dependence may take time to develop or change, it is often measured under conditions of extended exposure. Studies typically assess dependence with questionnaires, including the Fagerström Test for Nicotine Dependence (FTND), Fagerström Test for Cigarette Dependence (FTCD), Nicotine Dependence Syndrome Scale (NDSS), and Wisconsin Inventory of Smoking Dependence Motives (WISDM). Although some studies found no evidence of a change in dependence when the nicotine content of cigarettes was gradually reduced, most studies found evidence indicating that switching to VLNC cigarettes decreases dependence. Moreover, the evidence suggests that immediate nicotine reduction is more likely to lead to decreases in dependence than gradual reduction. These findings support the hypothesis that lowering the nicotine levels in cigarettes and certain other combusted tobacco products would reduce nicotine exposure and, thereby, nicotine dependence in people who do not switch to another nicotine-containing tobacco product.

In studies that gradually reduced the nicotine content of cigarettes over the course of weeks or months, the effects of VLNC cigarettes on dependence were somewhat mixed. In a study wherein nicotine content was gradually reduced (using NNC, LNC, and VLNC cigarettes) over the course of 4 weeks, there was a trend towards statistical significance (*i.e.*, if more participants had been tested, the results may have become statistically significant) in overall reduction of dependence scores across conditions (Ref. 329). Another gradual reduction study found no difference in dependence when comparing data from baseline to week 26 in 135 participants who smoked either gradually reduced nicotine content cigarettes over the course of 6 months or their own brand cigarettes for the same duration (Ref. 258). However, when comparing only data from week 14 to week 26, while participants were primarily smoking VLNC cigarettes, there was a statistically

significant decrease in dependence in the group that received gradually reduced nicotine content cigarettes (Ref. 258). A secondary analysis of data from 51 people who smoke demonstrated that participants with higher FTND scores at baseline were more likely to demonstrate signs of dependence during the study, regardless of the nicotine content of their study cigarettes (Ref. 381). In a followup study, participants assigned to receive gradually reduced nicotine content cigarettes were given VLNC cigarettes for an additional 6 months, and no statistically significant changes in dependence were observed (Ref. 374).

In studies that immediately reduced the nicotine content of cigarettes by switching participants from usual brand cigarettes to LNC or VLNC cigarettes, dependence decreased in people who smoked cigarettes who were not interested in quitting compared to those who smoked NNC or usual brand cigarettes for 6 weeks (Ref. 29), 10 weeks (Ref. 30), or 12 weeks (Ref. 31). In smoking cessation studies in which participants endorsed wanting to quit, VLNC cigarettes were also associated with reductions in nicotine dependence over time (Refs. 32 to 35). Conversely, a trial in which people with serious mental illness who smoke and were not seeking smoking cessation treatment were randomized to use either VLNC or NNC cigarettes for 6 weeks showed no statistically significant differences in FTCD scores across VLNC and NNC cigarette groups (Ref. 440). However, these results may be explained by the high level of noncompliance (*i.e.*, ongoing use of NNC cigarettes or other tobacco products) reported in the VLNC cigarette condition (Ref. 440) (see section VI.B of this document for further discussion of noncompliance).

To date, one study compared the effects of gradual versus immediate nicotine reduction on FTND and WISDM dependence scores (Ref. 379). In a 20-week double-blind, parallel design study, adults who smoke cigarettes ($n=1,250$) were randomized to an immediate reduction group that received VLNC cigarettes, a gradual reduction group that received cigarettes containing progressively decreased nicotine content every 4 weeks (15.5, 11.7, 5.2, 2.4, and 0.4 mg nicotine per gram of total tobacco, respectively), or a control group that received NNC cigarettes. At the conclusion of 20 weeks, the immediate reduction group showed statistically significantly lower FTND and WISDM dependence scores compared with the gradual reduction group and the NNC cigarette control group; no statistically significant

differences in dependence scores were observed between the gradual reduction and control groups. These results suggest that immediate nicotine reduction is associated with reduced nicotine dependence compared to gradual reduction or continued use of NNC cigarettes (Ref. 379).

The delay to smoking the first cigarette of the day is a strong predictor of dependence. In the only study to date that examined the effects of VLNC cigarettes on latency (*i.e.*, delay) to smoke in participants inhabiting a residential research facility, time to first cigarette was statistically significantly longer among people who smoke who only had access to VLNC cigarettes for 11 days compared to those who only had access to NNC cigarettes, supporting the potential for less dependence over time among those who switch to VLNC cigarettes (Ref. 64).

Accordingly, despite some mixed results in studies using a gradual decrease in nicotine content, most evidence shows that switching to VLNC cigarettes decreases dependence among people who smoke cigarettes. The evidence also suggests that immediate nicotine reduction is more likely than gradual reduction to lead to decreases in dependence. For more discussion of the scientific evidence supporting an immediate nicotine reduction approach, see section VII.C of this document.

10. Subjective Effects of VLNC Cigarettes

Self-reported subjective effects (*e.g.*, drug “liking,” “satisfaction”) are widely used measures of reinforcing efficacy and abuse liability of drugs and tobacco products. Drug “liking” is associated with drug self-administration and has been shown to be the most sensitive and reliable subjective effects measure of abuse liability (Ref. 441). Many studies have compared the subjective effects of VLNC, LNC, NNC, and participants’ usual brand cigarettes using self-reported measures of drug effects (*e.g.*, Cigarette Evaluation Scale, Smoking Effects Questionnaire, Visual Analogue Scale items). These studies typically found that VLNC cigarettes are “liked” less than NNC and usual brand cigarettes and, therefore, subject to lower abuse potential than NNC cigarettes.

Under conditions of brief exposure when participants were given limited access to cigarettes that varied in nicotine content, typically over the course of several hours under controlled laboratory conditions, studies generally found that VLNC cigarettes were rated lower in cigarette “liking” compared to NNC or usual brand cigarettes (Refs.

265, 383, 398, 399, 403, 410, 413, 428, 435, 437, 440, 442 to 448). However, a few studies found no statistically significant differences in “liking” as a function of nicotine content in cigarettes (Refs. 415, 419, 420, and 449). Many studies also have evaluated other subjective effects (such as “good” or “positive” effects and “bad” or “negative” effects) and found that they vary together with drug “liking.” A number of studies have shown that VLNC cigarettes were rated lower on other positive subjective effects items (*e.g.*, “satisfaction,” “pleasure,” “taste,” “strength,” “stimulation”) compared to LNC cigarettes (Refs. 265, 412, 419, and 450), NNC cigarettes (Refs. 265, 394, 396, 437, and 451) and usual brand cigarettes (Refs. 390, 407, 413, and 452). VLNC cigarettes were also rated lower on effects such as “aversiveness,” “sickness,” and “dizziness” (Refs. 390, 396, 414, 453, and 454), and higher on items such as “dislike” and “unpleasant” compared to NNC or usual brand cigarettes (Refs. 265 and 383). These seemingly contradictory findings are likely due to the constructs that these subjective effects measure; “aversiveness,” “sickness,” and “dizziness” are used to measure direct sensory and physical effects of nicotine, while “dislike” and “unpleasant” are used to measure general product liking.

Although often assumed, recent findings confirm that greater immediate positive subjective effect ratings (*e.g.*, “liking,” “satisfaction”) predict greater acute reinforcing effects of cigarettes of varying nicotine content (Ref. 455). Several factors have been shown to influence subjective effects ratings of VLNC and NNC cigarettes. These factors include participants’ ability to discriminate the nicotine content of cigarettes. For example, NNC cigarettes have increased ratings of positive subjective effects when participants are able to discriminate them from VLNC cigarettes (Refs. 400 and 401). Individuals who smoke menthol cigarettes rated both VLNC and NNC cigarettes higher in positive subjective effects compared to people who smoke nonmenthol cigarettes (Ref. 456). In addition, positive subjective effects ratings are higher when participants are told that they are receiving a nicotine-containing cigarette, regardless of the actual nicotine content of the cigarette (Refs. 428, 435, 444, 445, and 457).

Several studies assessed subjective effects of VLNC cigarettes following extended exposure when participants were given less restricted access to cigarettes of varying nicotine content in their natural environments (*e.g.*, homes, workplaces), typically over the course of

several weeks. Findings from these studies were relatively similar to findings from brief exposure studies. On average, VLNC cigarettes were rated as less appealing (e.g., lower ratings of “liking,” “satisfaction,” or “pleasure”) compared to LNC and NNC cigarettes (Refs. 249 and 384). However, at least one study found no differences in subjective effects as a function of cigarette nicotine content (Ref. 258). Positive subjective effects ratings for VLNC cigarettes were shown to remain constant or decrease over time (Refs. 249 and 373).

In a study where people who smoke inhabited a residential research facility, during 11 days of exposure, participants who received NNC cigarettes rated positive subjective effects lower and negative subjective effects higher than baseline subjective effects of usual brand cigarettes (indicative of a general dislike of research cigarettes); however, subjective ratings of NNC study cigarettes increased and were similar to usual brand cigarettes by the end of the study (Ref. 64). In contrast, participants assigned to the VLNC cigarette group rated positive subjective effects of cigarettes (e.g., “enjoyable”) lower and negative subjective effects (e.g., “unpleasant”) higher than baseline subjective effects of usual brand cigarettes throughout the entire study period (Ref. 64).

Finally, gender may influence differences in subjective effects. In one study, women rated all cigarettes as more flavorful than men, and an interaction was observed between gender and nicotine content such that women demonstrated less sensitivity than men to the differential subjective effects of NNC and VLNC cigarettes (Ref. 447). Another study found that women reported increased satisfaction with VLNC or LNC cigarettes alone, while men reported greater satisfaction when these cigarettes were combined with NRT (Ref. 458). Finally, one study found that women reported higher psychological reward than men across all nicotine contents tested (Ref. 459).

In sum, subjective effects data consistently show that VLNC cigarettes have equal or lower abuse potential compared to NNC and usual brand cigarettes under conditions of brief and extended exposure. FDA is not aware of any studies that found that VLNC cigarettes had greater abuse potential than NNC or usual brand cigarettes.

11. The Effects of VLNC Cigarettes on Relief From Craving and Withdrawal Symptoms

Symptoms of nicotine and tobacco withdrawal may include irritability,

depression, insomnia, headache, and increased craving. Although craving is often characterized as a symptom of nicotine and tobacco withdrawal, it is also a symptom of dependence, and it can occur in the absence of other withdrawal symptoms. Thus, craving is usually measured and reported separately from withdrawal. Studies typically assess craving and withdrawal using the Questionnaire of Smoking Urges (QSU), QSU-Brief, Minnesota Nicotine Withdrawal Scale (MNWS), Shiffman-Jarvik Withdrawal Scale, and Visual Analogue Scale items. Despite their lower nicotine content, VLNC cigarettes typically do not produce greater reports of craving or other withdrawal symptoms. Although findings from some brief exposure studies are mixed, the results of many studies suggest that brief and extended exposure to VLNC cigarettes can suppress craving and withdrawal just as effectively as NNC and usual brand cigarettes. The ability of VLNC cigarettes to suppress craving and withdrawal in people who smoke cigarettes is likely at least partially due to the long history of pairings between nicotine and the sensorimotor stimuli associated with smoking. Through conditioning, these stimuli can suppress craving and some other withdrawal symptoms even in the absence of nicotine (Ref. 38).

In brief exposure studies where participants were given limited access to reduced nicotine content cigarettes, typically over the course of several hours under controlled laboratory conditions, VLNC cigarettes suppressed craving and withdrawal relative to baseline measures that were typically assessed following overnight abstinence (Refs. 452, 460 to 467). Furthermore, many studies showed that VLNC cigarettes can reduce craving and withdrawal as much as usual brand or NNC cigarettes (Refs. 391, 406, 407, 411, 413, 415, 417, 419, 422, 433 to 439). However, some studies observed that suppression of craving and withdrawal was lower after smoking VLNC cigarettes compared to usual brand or NNC cigarettes (Refs. 265, 396, 388, 402, 427, 440, 453, 454, 468, and 469). In addition, results from a few studies suggest that VLNC cigarettes influence craving more than withdrawal. One study found that VLNC cigarettes suppressed craving similarly to NNC cigarettes, but also produced an increase in other withdrawal symptoms (Ref. 470). Other studies have found no effects of VLNC cigarettes on withdrawal symptoms (Refs. 414, 428, and 448). Notably, some of these brief

exposure studies reported differences between genders and generally found that females who smoke experienced greater reductions in craving (Refs. 265, 463 and 464) or withdrawal (Refs. 436 and 462) compared to males who smoke after smoking VLNC cigarettes. However, another study found that, after smoking VLNC cigarettes, males who smoke had greater reductions in craving compared to females who smoke (Ref. 435).

During extended exposure studies, when participants smoked VLNC cigarettes from 4 days to 1 year, ratings of withdrawal (Refs. 249 and 258) and craving (Refs. 249 and 383) were generally similar to ratings observed in usual brand and NNC cigarette conditions. In one study, researchers found that, after switching to VLNC cigarettes from usual brand cigarettes for 1 week, withdrawal symptoms increased with no reported change in craving (Ref. 32). However, these effects were relatively brief, and, within 6 weeks, withdrawal symptoms returned to baseline levels, and craving steadily decreased below baseline levels. Results from another study showed that VLNC cigarettes can produce persistent reductions in craving characterized by participants as “moderate” or “a lot” after 3 and 6 weeks of exposure; however, some participants reported that no relief from craving occurred during the 6-week study (Ref. 373). In addition, one study demonstrated that 6 weeks of exposure to LNC and VLNC cigarettes resulted in less craving and no difference in other withdrawal symptoms compared to NNC cigarettes (Ref. 471). Finally, during week 1 of a 20-week trial, people who smoke and were randomized to immediately reduce nicotine with VLNC cigarettes reported statistically significantly more withdrawal symptoms compared to those who gradually reduced nicotine content every 4 weeks (15.5 (NNC), 11.7 (NNC), 5.2 (LNC), 2.4 (LNC), and 0.4 (VLNC) mg nicotine per gram of total tobacco, respectively) and compared to a control group using NNC cigarettes (Ref. 379). However, at the conclusion of 20 weeks, the immediate reduction group reported statistically significantly lower smoking urges compared with the gradual reduction group and the NNC cigarette control group. No statistically significant differences in smoking urges were observed between the gradual reduction group and the NNC cigarette control group, suggesting that gradual reduction may be less effective than immediate reduction in reducing urge to smoke. Similar to findings from brief exposure studies, female participants

experienced a reduction in craving after switching to LNC cigarettes for 1 week, whereas male participants showed no change in craving upon switching. Overall, withdrawal symptoms increased in both males and females who smoke cigarettes after 1 week. However, these differences from baseline were short-lived. Ratings of both craving and withdrawal symptoms were no different than baseline over the remaining 6 weeks of the study (Ref. 458).

Craving and withdrawal were also assessed in several smoking cessation studies wherein participants were provided VLNC cigarettes along with pharmacotherapies (*e.g.*, NRT, varenicline) before a designated quit date. In these studies, participants who received VLNC cigarettes plus a nicotine patch experienced less severe cravings, with no statistically significant difference in withdrawal (Ref. 472), a greater reduction in craving and withdrawal (Ref. 35), and less frequent and less intense cravings before and after the quit date (Ref. 372) compared to those who received NNC cigarettes before the quit date. Another study found that LNC cigarettes plus either varenicline or NRT resulted in decreases in craving compared to pharmacotherapy alone, with no differences in withdrawal across groups (Ref. 371).

Accordingly, findings from these studies suggest that the maximum nicotine level in this proposed product standard, consistent with VLNC cigarette levels, would not result in substantial increases in craving or other withdrawal symptoms.

12. VLNC Cigarette Data Applies to Other Covered Products Under This Proposed Product Standard

Research regarding the public health impacts of this proposed maximum nicotine level applies across the tobacco products covered under this proposed product standard. People who smoke cigarettes who have lower SES have a greater likelihood of choosing to use RYO tobacco as a cheaper alternative to factory-made cigarettes (Ref. 312, Ref. 319). Also, literature shows that tobacco manufactures reformulate or re-label pipe tobacco as “dual purpose” and sell it for RYO use to capitalize on disparities between tax rates on different types of tobacco products (Ref. 322). Given that cigarette tobacco, RYO tobacco, and pipe tobacco can be effectively used in cigarettes, the VLNC cigarette research applies to these products, and any expected benefits that would accrue as a result of instituting the proposed product standard for

cigarettes also would be expected to accrue for these product categories.

While the current published literature regarding very low nicotine products discusses only cigarettes, the many similarities between cigarettes and most cigars (in both appearance and use topography) support the application of VLNC cigarette research to the coverage of these cigars. For example, little cigars are often indistinguishable from cigarettes given their shape, size, filters, and packaging, and are perceived as being healthier than cigarettes (Refs. 297 and 298). Little cigars and certain cigarillos also “are packaged and consumed in a manner similar to cigarettes” (Ref. 473 at p. 584). The close resemblance of little cigars and many cigarillos to cigarettes have led consumers, particularly children and young adults, to mistake them for cigarettes (Ref. 474). Because they are physically similar to cigarettes, little cigars are generally smoked the same way as cigarettes, with deeper inhalation than large cigars (Refs. 53 and 475). Secondhand smoke from cigars also contains many of the same toxins and carcinogens as cigarette smoke, including carbon monoxide, nicotine, ammonia, benzene, nitrosamines, and formaldehyde, all of which are on FDA’s list of HPHCs (HPHC Established List, 77 FR 20034 (2012)). Moreover, people who smoke cigarettes who switch to products like cigars to sustain their addiction tend to engage in deeper inhalation, making them even more susceptible to the dangers associated with tobacco product use (Ref. 53).

Studies also suggest that people smoke some cigarillos like cigarettes, inhaling and smoking them every day (Refs. 53 and 475). Research has found that little cigars deliver nicotine levels similar to, and sometimes higher than, cigarettes, as well as similar or higher levels of carcinogens compared to cigarettes (Refs. 476 and 477). Large cigars can deliver as much as ten times the nicotine of a filtered cigarette (Ref. 53). Even if people who smoke cigars do not breathe or inhale smoke into their lungs, they are still subject to nicotine’s addictive effects through buccal absorption of nicotine or nicotine absorption through the lips due to cigar tobacco’s alkalinity (Refs. 54 to 56, 302 and 303). Cigar smoke dissolves in saliva and makes it possible for people who smoke cigars to absorb sufficient amounts of nicotine to create dependence (Ref. 56). People who smoke cigars regularly are at increased risk for many of the same diseases as people who smoke cigarettes, including oral, esophageal, laryngeal, and lung

cancer; cardiovascular diseases; and COPD (Ref. 163). Accordingly, FDA believes it is appropriate to bridge these VLNC cigarette studies to cigars.

C. An Immediate Nicotine Reduction Approach Is Strongly Supported by Scientific Evidence

Two approaches have been suggested for implementing a nicotine product standard that would limit nicotine yield by establishing a maximum level of nicotine content in cigarettes and certain other combusted tobacco products. One is a gradual reduction approach, which decreases the nicotine content in the tobacco products over time until it reaches minimally addictive or nonaddictive levels. The other is an immediate reduction approach, or single target approach, which would immediately reduce the nicotine content to minimally addictive or nonaddictive levels. Available research indicates that both approaches are associated with noncompliance (*i.e.*, use of NNC cigarettes) when participants reach the VLNC cigarette phase of the intervention, which supports findings from other studies that show people who use VLNC cigarettes are more likely to use alternative nicotine-containing products when such products are concurrently available. However, the available scientific evidence suggests that the gradual approach can lead to compensatory smoking during the intermediate steps when people are smoking products with low to moderate nicotine content.

Based on scientific evidence, as well as comments and information submitted in response to the Nicotine ANPRM, FDA is proposing an immediate reduction approach to reach the maximum nicotine level in this proposed product standard. We expect that there would be very little compensatory smoking with an immediate reduction approach and that any compensatory smoking would be self-limiting and transient (*i.e.*, research shows that people who smoke would be unable to obtain their nicotine dose from VLNC cigarettes no matter how they smoked them and would quickly stop trying to do so), which would increase the benefits of the proposed product standard. We anticipate most people who smoke will maintain usual smoking behavior during these 2 years. An attempt to taper nicotine intake could involve switching to VLNC cigarettes already on the commercial market (*i.e.*, VLN® cigarettes), reducing the number of cigarettes smoked per day, or switching to another tobacco product. Tapering nicotine intake while

NNC cigarettes are on the market may facilitate abstinence in smokers by increasing motivation to quit and quit attempts. However, we do not expect most people who smoke to switch to VLNC cigarettes while NNC cigarettes are available. We request comments, data, and information regarding the selection of an immediate reduction approach.

Several studies have investigated the effects of a gradual approach to reducing cigarette nicotine content on compensatory smoking (Refs. 40, 258, 329, and 384). In these studies, participants were not interested in quitting and did not receive NRT or alternative tobacco products. For example, a pilot study and a clinical trial examined whether a gradual reduction in cigarette nicotine content would increase exposure to tobacco smoke toxins due to compensatory smoking (Refs. 40 and 258). Participants smoked their usual brand cigarettes during baseline and then were switched to five types of research cigarettes containing gradually reduced nicotine content (*i.e.*, 10.3 (NNC), 6.5 (LNC), 3.9 (LNC), 1.7 (LNC), and 0.5 (VLNC) mg nicotine per cigarette). In the 10-week pilot study, participants were switched weekly, and in the 6-month trial, participants were switched monthly (Refs. 40 and 258). Little change in smoking behavior was observed; however, plasma cotinine concentration (a biomarker of nicotine exposure) decreased as a function of cigarette nicotine content, such that cotinine was lowest while participants were smoking VLNC cigarettes. The smaller pilot study showed little evidence of compensation, as calculated based on cigarette consumption, CO, and polycyclic aromatic hydrocarbon (PAH) metabolites (Ref. 40); however, the 6-month trial showed a slight increase in compensatory smoking, as measured by CO and CPD, while participants were in the intermediate phase of the study. This increase was no longer evident once participants reached the VLNC cigarette phase of the study (Ref. 258).

Another study showed that compensatory smoking may increase when participants smoke cigarettes with intermediate levels of nicotine (*e.g.*, LNC cigarettes) compared to usual brand cigarettes (Ref. 384). Taken together, these studies demonstrate that people who smoke cigarettes may engage in compensatory smoking during the early stages of a gradual reduction approach by smoking more intensely in an attempt to obtain their desired level of nicotine (Refs. 258, 329, and 369).

Several studies have investigated whether an immediate reduction

approach to nicotine reduction would increase compensatory smoking (Refs. 29 and 31). Like the gradual reduction studies discussed in this section, participants in these immediate reduction studies were not interested in quitting and did not receive NRT or alternative tobacco products. In the most comprehensive immediate nicotine reduction study to date, 839 participants were randomized to one 6-week condition, during which they smoked their usual brand cigarettes or immediately switched to research cigarettes containing either 15.8 (NNC), 5.2 (LNC), 2.4 (LNC), 1.3 (LNC), or 0.4 (VLNC) mg nicotine per gram of total tobacco (Ref. 29). Participants assigned to the LNC or VLNC cigarette groups, who received cigarettes with nicotine content less than or equal to 2.4 mg nicotine per gram of total tobacco, smoked statistically significantly fewer CPD than participants assigned to the usual brand and NNC cigarette groups. Those who received LNC or VLNC cigarettes containing 5.2 mg nicotine per gram of total tobacco or less had statistically significantly lower urinary TNE than those who received NNC cigarettes. There were no differences in breath CO measures, an indicator of compensatory smoking, between the cigarette groups. The total puff volume at week 6 was statistically significantly lower among participants who smoked VLNC cigarettes compared to those who smoked NNC cigarettes. However, much like the gradual reduction studies, a secondary analysis showed that noncompliance (*i.e.*, ongoing use of NNC cigarettes or other tobacco products) was high in participants randomized to the VLNC cigarette group, suggesting that VLNC cigarettes have lower appeal and abuse liability compared to NNC cigarettes and that people who smoke VLNC cigarettes are likely to obtain nicotine from other tobacco product use (Ref. 330).

In another study, 33 participants were randomized to receive VLNC cigarettes at no charge or to continue smoking their usual brand cigarettes for 12 weeks (Ref. 31). Overall, participants in both groups smoked a similar total number of CPD, even though only the participants in the VLNC cigarette group received free cigarettes. These data demonstrate that an immediate reduction in cigarette nicotine content is unlikely to lead to significant compensation or increased toxicant exposure.

A secondary analysis pooled data from five clinical studies to examine the relationship between compensatory smoking and gradual versus immediate nicotine reduction approaches (Ref. 387). Two of the studies utilized a

gradual reduction approach, and three of the studies utilized an immediate reduction approach. CPD, breath CO, and cotinine levels were compared between the immediate reduction group, the gradual reduction group, and a control group that received usual brand cigarettes. Relative to baseline, statistically significant decreases in CPD were observed in participants in the gradual reduction groups (5 percent decrease in CPD) and immediate reduction groups (11 percent decrease in CPD), whereas statistically significant increases in CPD were observed in participants in the usual brand groups (12 percent increase in CPD). Although statistically significant changes in breath CO were not observed relative to baseline in any group, statistically significant decreases in cotinine were observed among both gradual and immediate reduction groups, but not in the usual brand group.

The largest study designed to directly investigate gradual versus immediate nicotine reduction on toxicant exposure was a 10-site, randomized, double-blind clinical study in 1,250 adults who smoke and had no intention to quit (Ref. 379). Participants were randomly assigned to an immediate reduction group that received VLNC cigarettes for 20 weeks, a gradual reduction group that received cigarettes containing progressively decreased nicotine content every 4 weeks (15.5, 11.7, 5.2, 2.4, 0.4 mg nicotine per gram of total tobacco) for 20 weeks, or a control group that received NNC cigarettes for 20 weeks. Notably, in this study (and virtually all clinical studies of reduced nicotine content cigarettes), research cigarettes were free to participants. Any changes in biomarker levels observed between these two groups would indicate differences in smoking behavior (*e.g.*, CPD, smoking topography). Completion rates were statistically significantly lower for the immediate reduction group (68 percent) compared to the gradual reduction group (81 percent) and control group (86 percent). The immediate reduction group had statistically significantly lower levels of three primary biomarker outcomes (*i.e.*, CO, 3-HPMA, and *r*-1,*t*-2,3,*c*-4-tetrahydroxy-1,2,3,4-tetrahydrophenanthrene) compared to the gradual reduction group, which did not differ from the control group. In addition, statistically significantly lower levels of other biomarkers (*i.e.*, TNE, NNAL, 2-cyanoethylmercapturic acid, 3-hydroxy-1-methylpropylmercapturic acid, S-PMA) were observed in the immediate reduction group compared to the gradual reduction and the control

groups. The immediate reduction group smoked cumulatively fewer CPD over the course of the 20-week study and had lower nicotine dependence scores compared to the gradual reduction group, with no statistically significant differences in CPD or dependence in the gradual reduction versus control groups. While there was no statistically significant difference between the immediate and gradual reduction groups in the proportion of participants with any “cigarette-free days” during the study, the immediate reduction group had a statistically significantly higher number of “cigarette-free days” compared to the gradual reduction group. The immediate reduction group had statistically significantly higher withdrawal scores at week 1 compared to the gradual reduction group; however, these differences dissipated after the first week. The immediate reduction group had higher rates of noncompliance with non-study cigarette use and a higher drop-out rate, which may have impacted the various outcome measures (e.g., biomarkers of exposure). Additionally, the immediate reduction group had an increased number of adverse events (predominantly related to withdrawal) compared to the gradual reduction group. Nevertheless, this study provides further evidence that immediate nicotine reduction is associated with reduced toxicant exposure and nicotine dependence and increased smoking abstinence compared to gradual nicotine reduction. This suggests that with immediate nicotine reduction, the potential health benefits could occur sooner than gradual nicotine reduction. While the immediate reduction group had increased levels of nicotine withdrawal, this effect was time-limited, dissipating after 1 week (Ref. 379).

Higher study attrition and noncompliance with study cigarettes are common within VLNC cigarette conditions in clinical studies (Refs. 327, 329, and 330), especially studies such as the one described above (Ref. 379), wherein participants are not interested in quitting smoking, and they are asked to refrain from using alternative sources of nicotine. Because of the lower abuse liability of VLNC cigarettes, participants in these studies may drop out or use non-study cigarettes that contain nicotine. These conditions would not exist if the proposed product standard is implemented. People who smoke would not be able to readily obtain NNC cigarettes, but they would be able to obtain alternative noncombusted products with nicotine content that they

could switch to or use with VLNC cigarettes.

In sum, evidence from studies involving VLNC cigarettes suggests it is likely that there would be very little or no compensatory smoking with an immediate reduction approach to a maximum nicotine level, which would increase the public health impact of a nicotine reduction policy. Additionally, FDA believes an immediate reduction approach would have a lesser impact on manufacturers as compared to a gradual approach by limiting any changes necessary for compliance to a single occasion. Although FDA believes this is a benefit of the immediate reduction approach, it is not a determinative factor given the strength of the scientific evidence.

D. Scientific Evidence Supports the Use of an Analytical Test Method To Determine Nicotine Level

In its considerations regarding the use of an analytical test method, FDA determined that any analytical method to measure compliance must accurately and reliably detect nicotine at low concentrations (i.e., below 0.70 mg nicotine per gram of total nicotine). In addition, FDA determined that it is important that the proposed product standard permit comparison of test results among finished tobacco products and testing facilities. FDA also concluded that it is important that the test method demonstrate its suitability and reliability in accurately measuring a range of nicotine concentrations across a wide variety of tobacco blends and products. Accordingly, FDA is proposing to require manufacturers use an analytical test method that would satisfy these preceding factors and demonstrate that the test method was validated in an analytical test laboratory. In lieu of requiring a specified test method, we are recommending manufacturers consider using one of the three following analytical test methods FDA has determined satisfy the preceding factors: FDA’s Tobacco Products Laboratory method (Ref. 478), Cooperation Centre for Scientific Research Relative to Tobacco (CORESTA) Recommended Method (CRM) No. 62 (Determination of nicotine in tobacco and tobacco products by gas chromatographic analysis; (Ref. 479)), or CRM No. 87 (Determination of nicotine in tobacco products by gas chromatography-mass spectrometry (GC-MS); (Ref. 480)). However, an analytical test method that meets the requirements of the regulation, even if it is not one of the recommended methods, would be acceptable.

FDA’s Tobacco Products Laboratory, located in Atlanta, Georgia, has developed an analytical test method, entitled “Quantitation of Nicotine in Tobacco Products—Update to LIB No. 4550” (LIB #4692), that is capable of quantifying nicotine levels that include concentrations well above and below the proposed nicotine standard level and also meets formal intralaboratory validation criteria (Ref. 478). The method utilizes GC-MS with a run time of 4.1 minutes. Analysis is conducted on extracted tobacco or spiked surrogate matrix samples treated with a base (sodium hydroxide) to obtain the total nicotine content for each sample. Quinoline is used as the internal standard. Tomato leaves are used as a surrogate matrix for tobacco to examine recovery amounts for spiked samples. Validation was performed using Moonlight brand VLN Menthol King ground tobacco and NIST 1573a (Tomato Leaves) as a blank spiking matrix. The range of the method was 0.1 to 2.0 mg of nicotine per gram of total tobacco, meaning nicotine concentrations in this range can be accurately measured. Tobacco samples with nicotine concentrations expected to be higher than 2.0 mg nicotine per gram of total tobacco were analyzed after dilution of the extraction sample by a factor of ten. The method detection limit is 0.05 mg nicotine per gram of total tobacco, which is more than an order of magnitude below the proposed maximum nicotine concentration of 0.70 mg per gram of total tobacco. The limit of quantitation is 0.1 mg nicotine per gram of total tobacco, which is also well below the limit of the proposed product standard. Furthermore, this method was proven to be applicable to a wide range of tobacco products. Tobacco filler and total tobacco from various marketed tobacco products including cigarettes, large cigars, cigarillos, little cigars, RYO cigarettes and pipe tobacco were analyzed successfully using FDA’s Tobacco Products Laboratory method.

CORESTA updated CRM No. 62 (Determination of Nicotine in Tobacco and Tobacco Products by Gas Chromatographic Analysis) in December 2021 and CRM No. 87 (Determination of Nicotine in Tobacco Products by Gas Chromatography-Mass Spectrometry (GC-MS)) in April 2020 to extend the scope of the methods to include VLNC tobacco by lowering the calibration range for these analytical test methods (Refs. 479 and 480). A study determined that the updated versions of CRM No. 62 and CRM No. 87 are suitable for the analysis of nicotine content in VLNC

tobacco and tobacco products (Ref. 481). These methods can reliably measure nicotine content as low as 0.117 mg per gram of total tobacco.

FDA's Tobacco Products Laboratory method, entitled "Quantitation of Nicotine in Tobacco Products—Update to LIB No. 4550" (LIB #4692), is publicly available at <https://www.fda.gov/science-research/field-science-and-laboratories/laboratory-information-bulletins>. In addition to the Tobacco Products Laboratory method, CRM No. 62 (<https://www.coresta.org/determination-nicotine-tobacco-and-tobacco-products-gas-chromatographic-analysis-29185.html>) and CRM No. 87 (<https://www.coresta.org/determination-nicotine-tobacco-products-gc-ms-33537.html>) are also publicly available methods that include the proposed nicotine level in the range of concentrations that can be accurately measured. FDA recommends manufacturers use one of these analytical test methods to demonstrate compliance with this proposed product standard.

It is reasonable to expect some manufacturers may prefer to use other test methods. If developed and validated, such methods may have different advantages in ease of use, upper and lower bounds of detection, equipment, and expertise. We would evaluate data from analytical test methods as part of a premarket submission in accordance with section 910 of the FD&C Act.

FDA requests comments, including data or other scientific support, regarding FDA's Tobacco Products Laboratory method, CRM No. 62, CRM No. 87, or other available methods, that could test the proposed scope of tobacco products at the proposed maximum nicotine level.

E. Scientific Evidence Supports the Technical Achievability of the Proposed Maximum Nicotine Level Target

While FDA has analyzed various methods of technical achievability for this proposed product standard, section 907(b)(1) of the FD&C Act also requires FDA to consider information submitted in connection with the proposed product standard regarding the technical achievability of compliance. Therefore, pursuant to section 907(d)(2) of the FD&C Act, FDA requests comments by interested parties, including manufacturers and tobacco growers, regarding the technical achievability of compliance with this proposed product standard, including information concerning the existence of patents that may impact the ability to comply by the proposed 2-year effective

date of this proposed rule (see section XI of this document).

The tobacco industry has developed a range of brands with differing nicotine levels. Tobacco product manufacturers have extensive experience blending tobaccos with different nicotine levels to ensure that products will have precise levels of nicotine and using continuous quality testing throughout the entire process to ensure that nicotine levels vary only minimally within cigarette packs and from pack to pack (Ref. 482). A cigarette is an inexpensive and extremely effective nicotine delivery system that maximizes the cigarette's addicting and toxic effects (Ref. 61).

In fact, the tobacco industry has had programs in place since the 1960s to obtain "any level of nicotine desired" (Ref. 2) (see section V.A for a detailed discussion). Indeed, the tobacco industry conducted research on consumer perceptions of RNC cigarettes to determine the optimal amount of nicotine in cigarettes to maintain appeal. Reviews of industry documents indicate that user experience, such as poor taste and reduced throat sensations, impacted the commercial viability of VLNC cigarettes (Refs. 247, 483, and 484). Internal industry strategies to mitigate these issues and maintain VLNC cigarette appeal to consumers included adding menthol to enhance the flavor of RNC cigarettes (Ref. 484) and maintaining or increasing tar levels to improve taste (Ref. 483).

As discussed in this section, there are numerous methods for altering the concentration of nicotine in cigarettes and certain other combusted tobacco products, and FDA anticipates that manufacturers and tobacco farmers may choose to use a variety of approaches to meet the proposed maximum nicotine concentration. Significant reduction of nicotine in the tobacco products covered by this proposed product standard can be achieved principally through tobacco blending, chemical extraction, or genetic engineering. Other practices such as modified growing conditions (e.g., discontinue the practice of topping where the flowering head of the tobacco plant is removed to produce leaves with a significantly higher nicotine content, increase plant density, decrease nitrogen application), as well as more recent novel techniques, can also help to reduce nicotine levels. One or a combination of these processes can be used to achieve the nicotine target concentration in this proposed product standard.

1. Genetically Engineered Tobacco

Tobacco industry scientists have long recognized the potential for genetic engineering to control nicotine content (Ref. 485). The first practical application of biotechnology by a major tobacco manufacturer was the development of low nicotine content tobacco in the 1980s, which led to the receipt of a patent for biotechnology for altering nicotine in tobacco plants (Refs. 483 and 486). Other tobacco researchers and major manufacturers also recognized the value of biotechnology for developing low nicotine content tobacco for cigarettes, including for use as part of a smoking cessation program (Ref. 487).

In the 1930s, some Havana and Cuban cigar tobacco varieties were discovered to have naturally lower nicotine levels. Genetic analysis of these low nicotine containing plants identified a mutation in the *nic1* and *nic2* genes that are responsible for the production of reduced nicotine in some tobacco variety leaves (Ref. 488). These varieties of low nicotine content cigar tobacco were crossbred with burley tobacco to produce varieties of cigarette tobacco with low nicotine content to meet the health demands of the time (Ref. 489).

Several American and international tobacco companies genetically engineered low-nicotine strains in the 1960s and 1970s (Refs. 490 to 493), including a strain with a nicotine concentration as low as 0.15 percent (i.e., 1.5 mg nicotine per gram of total tobacco), which was much lower than the 3.15 percent (31.5 mg nicotine per gram of total tobacco) observed in the comparator strain (Ref. 492). During that time period, the Kentucky Tobacco Research Board worked on genetic strains of low nicotine content tobacco (with a nicotine content of 0.2 percent) to be used for experimental studies on the role of nicotine in smoking behavior (Refs. 493 to 497). In addition, Canadian researchers examined low nicotine strains of tobacco, particularly in association with efforts to develop a strain of flue-cured or air-cured tobacco that would be suitable as the base material for reconstituted tobacco (Refs. 493, 498, and 499). Although the early strains of low-nicotine tobacco that were developed by these researchers and companies contained far less nicotine than strains that were traditionally used to make cigarettes, the nicotine content is even lower in strains that have been developed more recently through genetic engineering.

Genetic engineering has resulted in up to a 98 percent reduction in nicotine levels (Ref. 483). In 2003, Vector Tobacco began marketing the Quest

cigarette produced from genetically modified tobacco containing only trace amounts of nicotine (this product is no longer on the market) (Ref. 483). In 2014, the U.S. Patent and Trademark Office granted a patent for two genes that may be suppressed to substantially decrease nicotine in tobacco plants (Ref. 500). Additionally, in 2020, the U.S. Patent and Trademark Office granted another patent for methods of manipulating plant metabolism and alkaloid levels by controlling transcription factor NbTF7, which regulates the nicotinic alkaloid biosynthetic pathway in the *Nicotiana tabacum* plant (Ref. 501). This method appears to be able to introduce very low nicotine traits in any variety of *Nicotiana tabacum*; therefore, this method may be applicable to other combusted tobacco products that use *Nicotiana tabacum* (e.g., cigars).

Significant progress has been made in the genetic modification of nicotine and other alkaloid production in tobacco. One powerful gene editing technology, CRISPR-Cas9, has been used to delete or silence various genes involved in the production of nicotine in tobacco plants resulting in several ultra-low nicotine CRISPR tobacco lines that have been grown experimentally (Ref. 502). However, challenges have presented themselves in transitioning these ultra-low nicotine content tobacco plants to fields, such as severely stunted plants and high insect infestation rates (Ref. 503). Studies on the impact of genetically engineered low-level nicotine are ongoing and this method has not been accomplished on a large scale.

FDA is aware that genetically engineered tobacco seed has been created and may be available for purchase on the market. If this proposed rule is finalized, licensing agreements may be needed to support production of VLNC tobacco, at least initially. FDA notes that similar agreements with tobacco manufacturers are common within the tobacco industry.

2. Chemical Extraction

Another method to achieve lower nicotine concentrations in tobacco products is through chemical extraction technology. By the 1970s, tobacco manufacturers were regularly practicing nicotine extraction as a method to control nicotine delivery (Refs. 493 and 504 to 506). Extraction methods include water extraction (coupled with steam or oven drying), solvent extraction, and extractions of nicotine without usable leaf (Ref. 493). For example, one company, Ultratech, Inc., produced VLNC cigarettes by extracting nicotine

with an alkaline solution (Ref. 507). Supercritical fluid extraction (which extracts chemical compounds using supercritical carbon dioxide instead of an organic solvent) also yielded success in the 1990s, allowing for optimum extraction times and the elimination of more time-consuming steps (Ref. 508). FDA notes that existing patents for chemical extraction reveal that more than 96 percent of nicotine can be successfully extracted from tobacco while retaining “a strong characteristic aroma . . . not different from the unextracted blend,” achieving a product that “was subjectively rated as average in nicotine characteristics” (Refs. 509 and 510). A major tobacco manufacturer also has used a high-pressure carbon dioxide process similar to the process used to decaffeinate coffee. In this process, tobacco leaf is treated with ammonium salt, and then treated with carbon dioxide/water vapor, to achieve a 95 to 98 percent reduction in nicotine (Refs. 483 and 511).

Water extraction also can be used for nicotine reduction. Although some manufacturers believe that some water extraction practices may have rendered the tobacco “unsuitable for use” in cigarettes, other water extraction projects have yielded suitable smoking material with sizeable nicotine reductions (80 to 85 percent reduction in leaf nicotine) (Refs. 493, 505, 512, and 513).

3. Tobacco Farming Practices

Different types of farming practices also can lower nicotine concentrations in tobacco plants. One example is alkaloid-minimizing farming practices. Industry studies have shown that changes to growing and harvesting practices affect the development of tobacco chemistry, including nicotine content (Ref. 493). Some manufacturers have revised their agricultural practices specifically to meet new product development goals, such as the production of low nicotine content tobacco (Ref. 493). For example, one manufacturer evaluated how various experimental agricultural practices including bulk-curing, once-over harvesting, and high plant density could affect the tobacco’s chemistry (Refs. 493 and 514). In other cases, chemical agents were observed to reduce nicotine content (Refs. 493, 515 to 517).

Modification of tobacco growth practices can result in reduced levels of nicotine in tobacco plants. In traditional tobacco production, plants are topped and suckered (removing the growth at the apex and axillary buds) to slow the ripening rate of the leaves resulting in increased nicotine content. Therefore,

discontinuing these practices results in a significant decrease in nicotine production (Ref. 518). It has been found that plant density is conversely correlated to nicotine production in the plant as increased plant density creates a competition for resources, particularly nitrogen. Therefore, higher plant densities lead to lower nitrogen availability and stunted plant growth, thus resulting in lower nicotine tobacco (Ref. 519).

Nightshades are a botanical family that naturally contain alkaloids, including nicotine. In addition to tobacco plants, tomatoes, eggplants, potatoes, and peppers are in the nightshade category. Nicotine synthesis begins in the root of the tobacco plant and researchers have studied whether replacing tobacco root with other nightshades via grafting could affect nicotine biosynthesis (Ref. 519). Studies have been performed where grafting tobacco shoots on rootstocks of eggplant was shown to reduce nicotine production drastically without significant changes to the development of the plants (Ref. 520). Eggplant grafting results in differential expression of hundreds of genes involved in the nicotine biosynthetic pathway (Ref. 520). In these studies, no significant differences in plant height, leaf length, leaf width, or stalk circumference were observed between the tobacco/tobacco and tobacco/eggplant groups up to 80 days after grafting. However, the grafted tobacco/eggplant leaves resulted in a 95 percent reduction in nicotine content as compared to the tobacco/tobacco control plants (Ref. 520).

4. Tobacco Blending/Crossbreeding

One way to achieve lower nicotine concentrations in tobacco products is to selectively blend the tobacco filler. Most cigarettes sold in the United States are blended from several different types of tobacco (Ref. 359). A tobacco industry executive previously testified that the main component of a cigarette that contributes to nicotine delivery is the tobacco blend, and year-to-year crop variation does not determine the nicotine content in a cigarette (Ref. 521). The term “leaf blending” describes the selection of tobaccos to be used in a product by tobacco type (e.g., flue-cured, burley, oriental), geographical origin, year, and tobacco grade (Ref. 493). Blend differences can produce significant variations in nicotine concentration in the tobacco rod, leading to differences in smoke composition and yield (Ref. 82 at p. 469).

Many tobacco strains are available, including approximately 1,000 different

tobacco varieties (Ref. 359). The tobacco industry has used breeding and cultivation practices to develop high nicotine tobacco plants to give manufacturers greater flexibility in blending and in controlling the amount of nicotine to be delivered (Ref. 522 at 41694). These practices could be used to develop low nicotine content tobacco plants as well. Tobacco industry documents show that in the 1960s, tobacco companies recognized the increasing demand for low nicotine content tobacco and began instituting projects that found low nicotine content cigarettes can be made by selecting grades of tobacco with low nicotine content (Refs. 523 and 524).

Because the nicotine content of tobacco plants varies, manufacturers could replace more commonly used nicotine-rich varieties like *Nicotiana rustica* with lower nicotine varieties (Ref. 525). For example, oriental Turkish-type cigarettes also deliver substantially less nicotine than cigarettes that contain air-cured burley tobacco (Refs. 82 and 526). Even without this selective breeding, manufacturers could use careful tobacco leaf purchasing plans to control the nicotine content in their products (Ref. 522 at 41694). By maintaining awareness of the differences and monitoring the levels in purchased tobacco, companies could produce cigarettes with nicotine deliveries consistent to one-tenth of 1 percent (despite annual variations of up to 25 percent in the nicotine content of the raw material grown in the same area) (Ref. 522 at 41694).

Grading, which is used to evaluate and identify differences within tobacco types, is a function of both plant position (*i.e.*, higher or lower leaf position on the stalk) and quality (*i.e.*, ripeness), and segregation of grades by nicotine content has become common practice (Ref. 493). The position of leaves on the plant stalk affects nicotine levels: tobacco leaves located near the top of the plant can contain higher concentrations of nicotine, and lower stalk leaves generally contain lower nicotine levels (Refs. 493, 525, and 527). For example, flue-cured tobacco leaves harvested from the lowest stalk position may contain from 0.08 to 0.65 percent nicotine (*i.e.*, 0.8 to 6.5 mg nicotine per gram of total tobacco), whereas leaves from the highest positions may contain from 0.13 to 4.18 percent nicotine (*i.e.*, 1.3 to 41.8 mg nicotine per gram of total tobacco) (Refs. 359, 528 and 529). Therefore, substituting leaves found lower on the plants (commonly called “priming”) could reduce the nicotine content of tobacco products (Ref. 525).

Internal tobacco industry documents describe the use of leaf blending and tobacco selection to control cigarette nicotine content (Ref. 493). For example, one company project determined that manufacturers could reduce cigarette nicotine content by selecting grades of tobacco with naturally low nicotine content (Ref. 523). Another observed that the demand for low nicotine content tobacco has increased worldwide and necessitated a shift in purchasing standards (Ref. 524).

5. Other Practices

After tobacco is harvested, it is cured and aged before being used in tobacco products. The aging process naturally changes the chemistry of the tobacco, including some reduction in nicotine content (Ref. 493). At least one manufacturer has explored efforts to speed the tobacco aging process, in part to alter or limit the changes in chemistry that naturally occur (Refs. 493 and 530). Other approaches to curing and fermenting tobacco have been explored as methods for altering nicotine content. For example, in one manufacturer’s report, researchers observed that the properties of tobacco, including nicotine content, could be altered without the need for nontobacco additives by modifying curing practices (Ref. 531). In addition, manufacturers have explored other approaches to identify microbial bacteria that actively degrade nicotine while leaving other components of the leaf intact (Refs. 532 and 533). Consumer product testing showed that the “product acceptability” of that tobacco was equal to that of untreated tobacco (Ref. 534).

Researchers also have developed novel approaches to reducing the nicotine in tobacco products in recent years. An example of one such approach is enzymatic digestion utilizing glucose oxidase harvested from the salivary excretion produced by a specific species of herbivorous caterpillar, *helioverpa zea* (Ref. 535). The extracted enzyme is applied to the harvested tobacco leaves, reducing the nicotine in the tobacco leaf by up to 75 percent, providing an “effective and economical system for producing tobacco products which contain about 0.01 mg nicotine per cigarette or less . . . while maintaining the other desirable ingredients for good taste and flavor” (Ref. 535). Another novel approach is the use of microwave-assisted technology to extract nicotine from tobacco, including cigar filler (Ref. 536), that also could be effective for reducing the nicotine content for other tobacco products such as RYO tobacco and pipe tobacco.

By using one or a combination of methods described above, FDA concludes there is ample evidence of the technical feasibility of complying with this proposed product standard to reduce the nicotine level in cigarettes and certain other combusted tobacco products.

6. Applicability to Other Combusted Tobacco Products and Smaller Manufacturers

FDA anticipates that manufacturers of non-cigarette tobacco products covered by this proposed product standard may also choose to use a variety of approaches to meet the proposed maximum nicotine level. Given the similarities between the tobacco used in cigarettes and in other combusted tobacco products that FDA proposes to include within the scope of this product standard, FDA expects that it is similarly technically feasible for non-cigarette tobacco products to comply with the proposed maximum nicotine level. FDA requests comments, data, and research regarding the feasibility of using the techniques discussed in this section, or other nicotine reduction techniques, for the non-cigarette products covered under this proposed product standard.

Although industry documents contain little information regarding feasibility of VLNC levels for non-cigarette products, an early 1962 patent does indicate a tobacco storage process that dramatically reduced nicotine levels, including in shade-grown Connecticut tobacco used for cigars, from 0.85 percent to 0.075 percent nicotine content (*i.e.*, from 8.5 to 0.75 mg nicotine per gram of total tobacco) (Ref. 537). In 1975, a large tobacco manufacturer also discussed development of a low nicotine cigar or cigarillo, including processed low nicotine content tobaccos such as a burley filler in the range of 0.34 percent nicotine (*i.e.*, 3.4 mg nicotine per gram of total tobacco) and methods for reducing nicotine in the cigar wrapper (Ref. 538).

FDA expects that smaller manufacturers may use a variety of methods to comply with the proposed product standard, including purchasing tobacco blends that are lower in nicotine or have already undergone extraction. FDA believes that the supply chain should be capable of adapting to the purchasing needs of smaller manufacturers as well as larger manufacturers, particularly given the prevalence of genetically engineered tobacco, as discussed in this section. FDA requests comments, including data and research, regarding the methods and

options smaller manufacturers may use to comply with this proposed product standard.

F. Proposal Does Not Seek To Limit Nicotine to Zero

Section 907(d)(3) of the FD&C Act expressly prohibits FDA from requiring the reduction of the nicotine yield of a tobacco product to zero, and consistent with that provision FDA is not seeking to do so. However, section 907(a)(4)(A)(i) of the FD&C Act expressly authorizes FDA to establish product standards with provisions “for nicotine yields,” which includes the authority to include a provision, such as the one in this proposed rule, to require reduction of nicotine yield to a level other than zero. The information provided in this section demonstrates that the proposed product standard does not require the level of nicotine to be zero. The level of nicotine proposed in this product standard is measurable in the tobacco filler and in the smoke yield. Research shows that after use of VLNC cigarettes, nicotine is measurable in the body via biomarkers of exposure and neurological receptor occupancy.

1. Nicotine Biomarkers of Exposure

Studies have shown that levels of nicotine biomarkers increase in people who smoke cigarettes containing nicotine equivalent to FDA’s proposed nicotine level, thereby demonstrating exposure to nicotine from smoking VLNC cigarettes (Refs. 259, 402, and 539). Short-term studies that measure nicotine exposure in people who smoke cigarettes who smoke one or two VLNC cigarettes have generally found increases in plasma nicotine levels that follow similar, but less dramatic, patterns seen following smoking regular nicotine cigarettes. For example, one study evaluated plasma nicotine exposure before and repeatedly after smoking a single NNC, LNC, VLNC, or usual brand cigarette (Ref. 402). While the LNC and VLNC cigarettes were associated with lower plasma nicotine levels compared to the NNC and usual brand cigarettes, all cigarettes were associated with statistically significant increases in plasma nicotine compared to baseline levels (Ref. 402). Similarly, 22nd Century Group, Inc. submitted modified risk tobacco product applications to FDA containing data from two clinical studies showing that peak plasma nicotine levels following use of a single VLNC cigarette ranged from 0.4–0.5 nanograms of nicotine per milliliter of plasma and total nicotine levels (*i.e.*, plasma nicotine area under the curve calculated using the trapezoidal rule to 180 minutes) ranged

from 26.2–30.4 nanograms of nicotine per milliliter of plasma (Ref. 539). Researchers observed similar effects among participants who smoked a single VLNC cigarette made by Philip Morris for research purposes only (Ref. 259).

Studies with longer exposure to VLNC cigarettes have also found evidence of nicotine exposure within study participants. For example, studies showed that after several days or weeks of smoking VLNC cigarettes, biomarkers of nicotine exposure—such as urinary cotinine and TNE (*i.e.*, the sum of nicotine and various nicotine metabolites)—in people who smoke cigarettes were drastically reduced but were still detectable (Refs. 32 and 265). Notably, if participants in these studies were noncompliant with study-assigned cigarettes, then some of the biomarkers of nicotine exposure could be attributed to the use of other tobacco products. However, evidence from studies in which participants were confined to hotels or residential research facilities without access to other tobacco products also demonstrate that extended exposure to VLNC cigarettes produces biomarkers of nicotine exposure and physiological responses consistent with nicotine exposure (Refs. 64 and 423). Taken together, these data consistently show that levels of nicotine biomarkers of exposure in people who smoke VLNC cigarettes are still detectable. For further discussion of biomarkers of exposure, see section VII.B.6 of this document.

2. Receptor Occupancy and Cerebral Response From the Use of VLNC Cigarettes

Studies have shown that the nicotine provided by VLNC cigarettes is enough to occupy sufficient numbers of nicotine receptors in the brain (*i.e.*, $\alpha 4\beta 2$ nAChRs) to mitigate feelings of withdrawal and craving. PET and MRI data obtained from people who smoke cigarettes indicate that after smoking a VLNC cigarette, nicotine receptors located in numerous areas of the brain are occupied despite the lower nicotine content of VLNC cigarettes, and these participants reported a statistically significant reduction in craving compared to before smoking the VLNC cigarette (Ref. 430). In another study that compared VLNC and NNC cigarettes, exposure to both types of cigarettes resulted in the binding of nicotine to receptors in the brain and the release of dopamine (Ref. 425). However, the magnitude of subjective craving or withdrawal responses observed following use of VLNC cigarettes was lower than use of NNC cigarettes (Refs. 425 and 461). For

further discussion of receptor occupancy, see section VII.B.8 of this document.

3. VLNC Cigarette Nicotine Smoke Yield

Nicotine “yield” refers to the amount of nicotine in tobacco smoke as measured through machine-generated smoking methods (*e.g.*, ISO machine smoking method, CI smoking method, FTC smoking method), and is typically measured and reported in milligrams per cigarette. The maximum level of nicotine set by this proposed product standard would result in nicotine yield in tobacco smoke that is at detectable levels above zero. For example, SPECTRUM NNC cigarettes that contain 15.8–16.6 mg of nicotine per gram tobacco filler have machine-measured nicotine yields of 0.7–0.8 mg of nicotine per cigarette. SPECTRUM VLNC research cigarettes that contain 0.3–0.4 mg of nicotine per gram tobacco filler have quantifiable machine-measured nicotine yields greater than zero, ranging from 0.03–0.04 mg of nicotine per cigarette (Ref. 254). Similarly, Quest® 3 VLNC cigarettes had quantifiable machine-measured nicotine yields of approximately 0.03 mg of nicotine per cigarette (Ref. 540).

In summary, the data indicate that nicotine is measurable in both the tobacco filler and the smoke yield of VLNC cigarettes and therefore does not equal zero. After using VLNC cigarettes, nicotine exposure has been shown to occur as evidenced by studies measuring biomarkers of nicotine exposure and neurological receptor occupancy. Consequently, FDA finds that the proposed product standard would not require the reduction of nicotine yields to zero.

VIII. Determination That the Standard Is Appropriate for the Protection of the Public Health

The Tobacco Control Act authorizes FDA to adopt tobacco product standards by regulation if it finds that such tobacco product standards are appropriate for the protection of the public health (section 907(a)(3)(A) of the FD&C Act). The notice of proposed rulemaking (NPRM) for such a product standard must set forth this finding with supporting justification, which FDA is providing here (section 907(c)(2)(A)) of the FD&C Act.

In order to make this finding, FDA must consider scientific evidence concerning:

- The risks and benefits to the population as a whole, including users and nonusers of tobacco products, of the proposed standard;

- The increased or decreased likelihood that existing users of tobacco products will stop using such products; and

- The increased or decreased likelihood that those who do not use tobacco products will start using such products.

Section 907(a)(3)(B)(i) of the FD&C Act.

FDA has considered scientific evidence related to all three factors. Based on these considerations, as discussed below, we find that the proposed standard is appropriate for the protection of the public health because it would increase the likelihood that many people who currently smoke cigarettes and/or certain other combusted tobacco products would stop smoking altogether, yielding significant health benefits from smoking cessation. Additionally, we find that the proposed standard is appropriate for the protection of the public health because it would decrease the likelihood that people who do not smoke cigarettes and/or use certain other combusted tobacco products—including youth and young adults—who experiment with combusted tobacco products will become addicted to these products, thereby decreasing progression to regular use, resulting in reduced tobacco-related morbidity and mortality associated with combusted tobacco product use. Increased cessation, as well as decreased initiation, progression to regular use, and consumption would lead to lower disease and death in the U.S. population, due to decreased use of cigarettes and certain other combusted tobacco products. Furthermore, the rule is appropriate for the protection of the public health because the population as a whole would likely experience additional health benefits as a result of reduced secondhand smoke exposure, smoking-related fires, and smoking-related perinatal conditions.

A. Approach To Estimating Impacts to the Population as a Whole

Current evidence shows that, while nicotine itself is not the direct cause of most smoking-related diseases, addiction to the nicotine in tobacco products is the proximate driver of tobacco-related death and disease because it sustains tobacco use (Refs. 1, 28, 58, and 61). The addiction caused by nicotine in tobacco products is critical in the transition of people who smoke cigarettes from experimentation to sustained smoking and in the maintenance of smoking for those who want to quit (Refs. 1 at p. 113 and 28). Combusted tobacco products, including cigarettes, are responsible for the overwhelming burden of disease and

death from tobacco product use (Refs. 1 and 28). As a result, FDA expects that making cigarettes and certain other combusted tobacco products minimally addictive or nonaddictive would reduce tobacco-related harms by promoting smoking cessation or complete migration to alternative, potentially less harmful noncombusted tobacco products and by reducing initiation. In this section, we summarize the approach used to estimate the possible impact of a potential nicotine tobacco product standard to the population as a whole and present the findings of this analysis.

To assess the potential public health impacts of a nicotine product standard, FDA developed a population health model using inputs derived from available empirical evidence and expert opinion to estimate the impact of changes in tobacco product initiation, cessation, switching, and dual use on tobacco use prevalence, morbidity, and mortality in the United States. Details of this modeling approach have been previously published in two peer-reviewed publications (Refs. 47 and 48), which describe the overall model in terms of the inputs, transition behaviors, and outputs that it contains, along with results from simulation studies. In preparation for this proposed product standard, FDA updated the model published previously (Ref. 47), which describes the impact of a potential product standard that limits the level of nicotine in cigarettes, RYO tobacco, non-premium cigars, and pipe tobacco so that they are minimally addictive or nonaddictive.²⁹ The details of this analysis are presented in an updated modeling document, entitled “Methodological Approach to Modeling the Potential Impact of a Nicotine Product Standard on Tobacco Use, Morbidity, and Mortality in the U.S.” (Ref. 42). We estimated the potential impacts of a nicotine product standard by modeling a baseline scenario of use of cigarettes and noncombusted tobacco products including smokeless tobacco, e-cigarettes, HTPs, and oral nicotine products. We then compared the baseline scenario to a product standard scenario characterized by the introduction of a potential nicotine product standard that would apply to

cigarettes, RYO tobacco, non-premium cigars, and pipe tobacco. FDA’s modeling framework and methodological approach and the associated inputs and assumptions have been peer reviewed by independent external experts. Taking into consideration comments from this peer review (Ref. 49), FDA revised the modeling document, and the final modeling document is available in the docket for this proposed rule (Ref. 42). FDA’s modeling work informed the development of this proposed product standard. FDA requests comments on the methodology and analysis (including the overall model in terms of the inputs, transition behaviors, and outputs) presented in the scientific modeling document.

FDA’s population health model incorporates the following tobacco use transitions to estimate the impact of the policy: (1) cigarette smoking cessation; (2) people who smoke cigarettes switching to noncombusted tobacco products rather than quitting tobacco use entirely; (3) people who continue to smoke cigarettes beginning dual use of cigarettes and noncombusted tobacco products; (4) people who do not smoke initiating regular cigarette smoking; and (5) people who do not smoke who have been dissuaded from smoking cigarettes and certain other combusted tobacco products, who instead initiate use of a noncombusted tobacco product. The model, based on input parameters derived from empirical evidence and expert estimates, projected the impact of a potential nicotine product standard on four main outcomes: (1) prevalence of cigarette smoking and noncombusted tobacco use; (2) tobacco-attributable mortality; (3) life years lost due to tobacco use; and (4) quality-adjusted life years (QALYs) lost due to cigarette smoking-attributable morbidity in the U.S. population over time. The model explores various baseline scenarios via sensitivity analyses, including with and without projections that incorporate implementations of other future tobacco product standards (e.g., flavored cigar and menthol cigarette product standards).

More detailed information regarding modeling study methodology, including descriptions of the model inputs, data sources, and assumptions used to derive estimates of the potential impact of a nicotine product standard on population health can be found in FDA’s modeling document (Ref. 42). Briefly, the simulation began with an initial population that reflected the sex and age (based on 2021 U.S. Census Bureau estimates) and cigarette use distribution (i.e., never, current, former

²⁹ The policy scenario presented in Apelberg et al. 2018 (Ref. 47) did not define a specific level of nicotine as minimally addictive or nonaddictive. Rather, the policy scenario simulated implementation of a hypothetical standard in which cigarettes and certain other combusted tobacco products were made minimally addictive or nonaddictive, informed by a formal expert elicitation process, and used to estimate the impact of decreasing the addictiveness of cigarettes on certain tobacco use behaviors.

use; estimated from the 2020 NHIS data and 2020 NYTS data) in the U.S. population. Next, we incorporated sex-specific rates for smoking initiation and cessation for year 2021 modeled using cigarette smoking histories for birth cohorts reconstructed from NHIS data by Cancer Intervention and Surveillance Modeling Network (CISNET) researchers (Ref. 541). Recent analyses using data from the Population Assessment of Tobacco and Health (PATH) Study (Ref. 542) provide data on initiation of ENDS from Wave 4 (2016–2017) to Wave 5 (2018–2019); however, those estimates are related to transitions from never use to ever use of a specific product at the current wave, rather than transitions to established use, as defined in the population model. In the absence of up-to-date estimates of exclusive noncombusted product initiation rates from the published scientific literature, data regarding exclusive initiation of noncombusted tobacco products and dual use were derived by scaling the sex- and age-specific smoking initiation rates from CISNET using youth (ages 9–17) prevalence estimates from the 2017–2020 NYTS, and young adult (ages 18–24) prevalence estimates from the 2020 NHIS (Ref. 542). NYTS prevalence estimates for noncombusted product use correspond to frequent use, defined as use at least 20 days in the past 30 days.³⁰ Additional details regarding the estimation of scaling factors to compute noncombusted product initiation rates can be found in FDA's modeling document (Ref. 42). CISNET sex- and age-specific cigarette smoking cessation rates derived from NHIS data were utilized as cessation rates for all product categories, including noncombusted tobacco use. Age-specific rates of switching from cigarettes to noncombusted tobacco products were derived from prior research (Ref. 543). Overall U.S. death rates from 2019 vital statistics data were used to reflect the death rates at baseline for individuals under age 35 who never smoked, since smoking-related mortality is minimal before this age (Ref. 544). For ages 35 and older at baseline, FDA estimated annual death rates from 2019 NHIS–LMF data among participants who have never smoked in NHIS from 1997 through 2018 who were followed for

mortality through linkage with the National Death Index from 2002 through 2019 (Ref. 545). NHIS–LMF never-user death rates are adjusted for low mortality in the NHIS's civilian noninstitutionalized population, due to the survey's exclusion of people in institutionalized settings such as long-term care institutions (e.g., nursing homes, hospitals for the chronically ill or physically or intellectually disabled, wards for abused or neglected children), persons in correctional facilities (e.g., prisons or jails, juvenile detention centers, halfway houses), and U.S. nationals living in foreign countries. The adjustment was done by using the ratio of U.S. death rates from the 2019 vital statistics data to NHIS–LMF death rates by sex and age (Ref. 546). Death rates for people who have never smoked cigarettes are projected for the period from 2022 through 2100 using mortality scaling factors obtained from the Lee-Carter mortality forecasting method (Refs. 547 to 549). To estimate mortality for e-cigarettes and other noncombusted tobacco products, we apply the same risks that are used for smokeless tobacco. Our assumptions about all-cause mortality risk among people who use smokeless tobacco in the United States were informed by the first NHANES, Cancer Prevention Study I (CPS–I), and Cancer Prevention Study II (CPS–II). Mortality probabilities for people who currently use and formerly used tobacco are obtained by multiplying never-user probabilities of dying by relative risk according to tobacco use status.

Quantitative inputs for tobacco use transitions following implementation of the proposed product standard were obtained through a formal expert elicitation process that was first conducted in 2015 and then repeated in 2018. FDA is conducting another expert elicitation to obtain updated quantitative inputs for tobacco use transitions and intends to publish the results for public review and comment. For the 2015 and 2018 expert elicitations, the methodology used to identify experts, develop the protocol, conduct the elicitation, and summarize the findings can be found in a previous peer-reviewed publication (Ref. 47) and in FDA's modeling document (Ref. 42). Briefly, the initial elicitation process centered around three online conferencing sessions held during January and February 2015, following a written protocol designed to elicit opinions using a structured, standardized approach. Briefing books with key papers on the topics of interest as well as background data on tobacco

use and policy were provided to a panel of eight experts prior to the conference sessions. Experts were asked to identify any other relevant information to share with the panel. Detailed written questionnaires were completed by each expert as independent take-home exercises. To maintain the independence of the experts and encourage open discussion, involvement of FDA staff was limited. This general process was repeated in 2018 to ensure that estimates reflected the experts' current assessment of the research literature and potential effects of a hypothetical product standard. Seven of the original eight experts agreed to participate in the second elicitation. Participants received updated briefing materials, and an online workshop was held in April 2018. The experts, once again, subsequently completed a detailed questionnaire.

To explore the possible impact of a hypothetical policy reducing nicotine levels, the experts were asked to assume that combusted tobacco products that could be viewed as highly likely to serve as substitutes for traditional cigarettes (*i.e.*, RYO tobacco, pipe tobacco, non-premium cigars) would be included in the policy, while other tobacco products (*i.e.*, premium cigars, waterpipe/hookah, e-cigarettes, smokeless tobacco) would be excluded. While the policy scenario presented in FDA's modeling document (Ref. 42) is based on a reduction of the nicotine level in cigarettes, cigarette tobacco, RYO tobacco, certain cigars and pipe tobacco, the estimated population impact in the main analysis is solely based on reductions in cigarette smoking. Cigarettes are the only one of these combusted products to be incorporated directly in the model, given that cigarette smoking is responsible for the bulk of morbidity and mortality caused by combusted tobacco product use. Estimates of mortality benefits due to reductions in non-premium cigar and pipe tobacco use are derived from model outputs, as explained below, although these estimates would not include other population health benefits such as reduced morbidity.

The experts were asked to predict and quantify the anticipated impact of the policy on the following model parameters: (1) cigarette smoking cessation rates; (2) switching from cigarette smoking to other tobacco products excluded from the hypothetical policy scenario (*i.e.*, premium cigars, waterpipe/hookah tobacco, smokeless tobacco, e-cigarettes or other ENDS); (3) dual use rates; (4)

³⁰ While past 30-day use is the conventional definition of current use of a tobacco product in the NYTS, we utilized the corresponding definition of frequent use (20 or more days of use in past 30 days) to correspond with initiation of regular use that is more closely associated with longer-term health outcomes. In this context, we have scaled the initiation rates to reflect the initiation of regular, longer-term use. This approach is consistent with that for adult initiation to regular use and long-term cessation as defined by CISNET.

cigarette smoking initiation rates; and (5) initiation rates for other tobacco products excluded from the hypothetical policy scenario. Each of the experts was asked to provide his or her best estimate of the parameters' true value, estimates of the minimum and maximum plausible values, and estimates of the 5th, 25th, 75th, and 95th percentile values. Experts were asked first about impacts in the first year immediately following the potential product standard's implementation and then about impacts in the years following the first full year of implementation. Experts had the option of providing separate estimates of impacts for males and females for the initial and subsequent years. For each question, experts were asked to provide the factors they considered pertinent to answering the question, including the studies and research findings most influential to informing their views, and to rate their familiarity with the relevant literature. The elicitation process provided the experts with opportunities to interact and discuss divergent views, from which each expert generated their initial and final estimates. In the updated elicitation, experts were also asked to assess the potential effects of an alternative product standard that would only apply to cigarettes, cigarette tobacco, and RYO tobacco, although they were not required to provide quantitative estimates of the effects of such a standard.

While parameter estimates and their probability distributions varied somewhat among participants, most experts had the view that making cigarettes and certain other combusted tobacco products minimally addictive would lead to substantial initial and long-term increases in smoking cessation among people who smoke cigarettes and decreased initiation among people who do not smoke cigarettes. The experts' parameter estimates fell within a broad range, although the updated estimates were often somewhat more consistent and found greater effects from the potential policy than in the original elicitation. In general, estimates of the effects of a nicotine product standard on use behaviors such as smoking cessation, product switching, and smoking initiation were greater in magnitude in the 2018 expert elicitation than in the previous 2015 elicitation. For example, the median estimates of smoking cessation were 36 percent in the first year following implementation of a nicotine product standard and 34 percent in subsequent years in the 2018 elicitation, compared to 25 and 22

percent, respectively, in 2015. For product switching (from cigarettes to noncovered tobacco products), the median estimates were 56 and 58 percent in the first and subsequent years following implementation in the 2018 expert elicitation and 41 and 40 percent in 2015. Median estimates of reductions in smoking initiation were 63 and 65 percent in the first and subsequent years in the 2018 elicitation, and 46 and 49 percent in 2015. Overall, the experts' estimates indicate that the proposed product standard would introduce substantial changes in tobacco use behaviors which would result in substantial public health benefits. Given the inherent uncertainty associated with projecting the long-term impact of a future regulatory action, FDA conducted a range of analyses to examine the impact of uncertainty around key model inputs and assumptions on tobacco use prevalence and premature mortality. First, in the main analysis, we examined uncertainty in the behavioral responses to a potential nicotine product standard by conducting a Monte Carlo simulation (Ref. 550). For the product standard scenario, a Latin hypercube sampling design with 1,000 simulations was conducted for each set of expert-defined distributions, resulting in a total of 7,000 simulations (Ref. 551 at p. 524). The resulting outputs were aggregated to create an overall set of output distributions, and distribution percentiles were calculated across all 7,000 simulations. For each simulation, the policy scenario was compared to the baseline scenario to estimate changes in the outcomes. Key distribution responses in FDA's modeling document highlight the positive impacts to the public health of the proposed product standard (Ref. 42). More information on this topic can be found throughout this document.

In addition, we conducted sensitivity analyses to assess the impact of specific data input assumptions, including those related to baseline trends in noncombusted product use, noncombusted product mortality risk, dual product use mortality risk, and switching to non-covered combusted products. Specifically, we conducted sensitivity analyses to examine the impact of increased initiation of noncombusted tobacco product use among those who would otherwise not have used tobacco; the impact of an increase in switching from cigarettes to noncombusted tobacco product use; the impact of a varying mortality risk associated with dual use of cigarettes and noncombusted tobacco products; the impact of lower and higher

noncombusted tobacco product risk; and the effects of a nicotine product standard, accounting for the emergence of an illicit market for normal nicotine content cigarettes. Additional detailed information concerning these sensitivity analyses can be found in FDA's modeling document (Ref. 42). Overall, the results from FDA's population health modeling, even accounting for the impacts of the factors utilized in FDA's sensitivity analyses, clearly demonstrate the public health benefit of the proposed product standard.

In 2022, FDA issued proposed product standards to prohibit menthol as a characterizing flavor in cigarettes (87 FR 26454, May 4, 2022) and to prohibit all characterizing flavors (other than tobacco) in cigars (87 FR 26396, May 4, 2022). If finalized, these rules are anticipated to reduce overall youth initiation and increase cessation among individuals who smoke cigarettes and non-premium cigars. In sections VIII.E and VIII.F of this document, we describe how we adjusted our model by utilizing estimates of the likely population health impact of these rules, quantified in peer-reviewed publications and discussed in the proposed rules, to adjust the baseline inputs for initiation of combusted and noncombusted products, as well as cessation of combusted products and likelihood of switching to incorporate the impact of the rules in this proposed nicotine product standard.

B. The Likelihood That Nonusers Would Start Using Cigarettes or Other Combusted Tobacco Products

Nicotine is an addictive chemical and the primary constituent in cigarettes and other tobacco products that causes and maintains addiction. It is a significant contributor to youth and young adult initiation of smoking cigarettes and other combusted tobacco products. In section IV.A of this document, we summarize evidence from multiple study designs, incorporating findings from experimental and laboratory-based studies, clinical trials, and pre-clinical research that illustrate the role that nicotine plays in facilitating initiation of and addiction to cigarettes and other combusted tobacco products. As discussed in section IV.B of this document, scientific research demonstrates that adolescence is a period of development when individuals who experiment with tobacco products are more susceptible to developing nicotine dependence and progressing to regular use of such products. Indeed, almost 90 percent of adults who currently and regularly smoke initiated smoking by age 18, and

98 percent initiated smoking by age 26, which is notable given that 25 is the approximate age at which the brain has completed development (Refs. 1 and 17 to 19). The developing brain is more vulnerable to developing nicotine dependence than the adult brain is, and the earlier an individual begins smoking the less likely they are to quit (Ref. 20). Compounding this are the findings described in section IV.C of this document that demonstrate that many youth and adults who smoke want to quit smoking but have difficulty doing so. Further, the scientific literature on relapse in those who try to quit confirms the powerful addictive properties of nicotine in tobacco products, a principal factor limiting a person who smokes' ability to quit, and further underscores the public health importance of decreasing the addictiveness of these products, particularly to reduce susceptibility to addiction for youth and young adults who experiment with smoking. In this section, we discuss how, given this scientific evidence, as well as the findings from our population health model, FDA expects the proposed nicotine product standard for cigarettes and certain other combusted tobacco products would decrease experimentation and progression to regular use of these products among people who currently do not use these products.

Data from the 2023 NSDUH found that, in the United States, approximately 452,000 youth (ages 12–17) smoked their first cigarette and approximately 245,000 youth tried a cigar for the first time during 2023 (Ref. 86 Table A.13A). The 2023 NSDUH also found that approximately 945,000 young adults (ages 18 to 25) initiated with cigarettes and 1,065,000 young adults initiated with cigars in 2021 (Ref. 552 see Table 4.7B). Additionally, nearly 90 percent of U.S. adults who currently smoke cigarettes daily report having smoked their first cigarette by age 18 (Ref. 1). Given that nicotine is highly addictive and present in all cigarettes and cigars, as people who experiment with cigarettes and cigars continue to use these products, there is a substantial risk of the development of nicotine

dependence and progression to regular use. Nicotine is a highly addictive substance, and multiple studies have shown that symptoms of nicotine dependence can arise early after youth start smoking cigarettes, even among people who infrequently use the products (Refs. 24, 93, and 553). Although the majority of adolescents who smoke daily meet the criteria for nicotine dependence, one study found that the most susceptible youth lose autonomy (*i.e.*, independence in their actions) regarding tobacco within 1 or 2 days of first inhaling from a cigarette (Ref. 93). Another study found that 19.4 percent of adolescents (initially aged 12–13 years and followed over 6 years) who smoked weekly were dependent on nicotine (Ref. 95). In a study regarding nicotine dependence among adolescents who recently initiated smoking (9th and 10th grade students), adolescents who smoked cigarettes at the lowest levels (*i.e.*, smoking on only 1 to 3 days of the past 30 days) experienced nicotine dependence symptoms such as loss of control over smoking (42 percent) and irritability after not smoking for a while (23 percent) (Ref. 96). Researchers in a 4-year study of 6th grade students also found that “[e]ach of the nicotine withdrawal symptoms appeared in some subjects *prior* to daily smoking” (Ref. 93) (emphasis added). Ten percent of the study participants showed signs of tobacco dependence within 1 or 2 days of first inhaling from a cigarette, and half had done so by the time they were smoking seven cigarettes per month (Ref. 93). Moreover, nicotine can disrupt brain development and have long-term consequences for executive cognitive functioning (*e.g.*, decreased attention and working memory and increased impulsivity) and increases the risk of developing a substance use disorder and various mental health problems—particularly affective disorders such as anxiety and depression—as an adult (Refs. 554 to 556). Therefore, progressing to regular use during adolescence can have lasting consequences and signs of nicotine dependence are evident in youth who smoke cigarettes. Taken together, this

research suggests that even infrequent experimentation can lead to early signs of dependence, which underscores the public health importance of decreasing the likelihood of cigarette experimentation among youth and young adults in the United States. If this proposed rule is finalized, cigarettes and the other combusted tobacco products covered would be rendered minimally addictive or nonaddictive, thereby breaking the link between experimentation, nicotine dependence, and progression to regular use. As a result, FDA expects a significant reduction in youth initiation and progression to regular cigarette smoking and use of other combusted tobacco products, which would ultimately protect youth from a lifetime of addiction, disease, and premature death attributable to combusted tobacco use. To the extent that youth and young adults in the United States who would have initiated use of cigarettes and other combusted tobacco products covered by the scope of this proposed rule do not initiate with such tobacco products, the proposed standard would prevent future cigarette- and combusted tobacco product-related disease and death. Findings from FDA’s population health model, previously described in section VIII.A of this document and in the docket (Ref. 42), estimate the likelihood that youth and young adults who do not smoke would initiate regular cigarette smoking use under the proposed standard. Table 2 provides an estimated projection of the cumulative number of youth and young adults who would not initiate regular cigarette use as a result of implementation of this proposed product standard over time (Ref. 42 Appendix J for annual estimates). Since a sustained decrease in smoking initiation rates is expected, the cumulative number of people dissuaded from initiating smoking would continue to increase over time. By 2100, we estimate that, as a result of this proposed nicotine product standard, over 47 million youth and young adults who would have otherwise initiated smoking would not start smoking.

TABLE 2—PROJECTED CUMULATIVE NUMBER OF YOUTH AND YOUNG ADULTS WHO WOULD NOT INITIATE SMOKING AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027

[Millions]

Year	Median	(5th, 95th percentiles)
2028	1.3	(0.4, 1.7)
2030	2.6	(0.7, 3.4)
2040	8.6	(2.3, 11.5)
2050	14.8	(4.0, 19.8)
2060	21.1	(5.6, 28.3)

TABLE 2—PROJECTED CUMULATIVE NUMBER OF YOUTH AND YOUNG ADULTS WHO WOULD NOT INITIATE SMOKING AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027—Continued

[Millions]

Year	Median	(5th, 95th percentiles)
2070	27.5	(7.3, 37.0)
2080	34.1	(9.1, 45.9)
2090	40.8	(10.8, 54.9)
2100	47.6	(12.6, 64.1)

For these reasons, FDA expects that establishing a maximum limit of the nicotine content in cigarettes and certain other combusted tobacco products, as described in this proposed rule, would reduce the likelihood that youth and young adults would initiate with and progress to regular cigarette smoking and use of other combusted tobacco products, thereby protecting many youth and young adults from a lifetime of addiction and disease, and premature death, attributable to the use of combusted tobacco (see section VIII.D of this document for a discussion of life years gained and other public health benefits as a result of decreased initiation). Thus, from the expected impact on people who would not initiate smoking cigarettes, especially youth and young adults, this proposed product standard is appropriate for the protection of public health.

C. The Likelihood That Existing Users Would Reduce Cigarette and Other Combusted Tobacco Product Consumption or Stop Smoking

In addition to the long-term public health benefits that would accrue from the prevention of cigarette smoking and other combusted tobacco use among youth and young adults, FDA anticipates that the proposed standard also would increase the likelihood that many people who currently smoke cigarettes and certain other combusted tobacco products would stop smoking altogether, yielding health benefits from smoking cessation. FDA expects that the proposed standard would result in substantial changes in tobacco use patterns among people who currently use tobacco. Given that tobacco products are addictive primarily due to the presence of nicotine, FDA expects that the proposed standard would lead many people who currently smoke cigarettes and certain other combusted tobacco products to: (1) quit using these tobacco products altogether, (2) transition to dual use of cigarettes or other combusted tobacco products with other potentially less harmful tobacco products, or (3) transition completely to

use of other potentially less harmful tobacco products.

As discussed in section IV of this document, the scientific evidence is clear that nicotine is an addictive chemical and is the primary constituent that causes and maintains addiction to cigarettes and other combusted tobacco products. The U.S. Surgeon General has concluded that there is a causal relationship between smoking and addiction to nicotine (Ref. 1), and the earlier that individuals begin smoking, the less likely they are to successfully quit (Ref. 27). FDA expects that, if this proposed rule is finalized, many people who smoke cigarettes will either quit smoking entirely, switch to a noncombusted tobacco product entirely, or transition to dual use. As discussed previously, those who switch completely to a noncombusted product may sustain their nicotine dependence but would significantly reduce their risk of tobacco-related death and disease to the extent that the products they switch to result in less harm. That is, while dependence on any tobacco product remains a health concern, the vast majority of tobacco-related cancer, lung disease, and heart disease is due to exposure to constituents of tobacco smoke (Ref. 323). Switching completely to a noncombusted tobacco product would reduce exposure to the chemical constituents created through combustion (Ref. 8).

There are multiple sources of evidence to inform FDA's analysis of how the proposed standard would affect the likelihood that people who smoke would reduce cigarette and combusted tobacco product consumption or stop smoking altogether. Findings from clinical studies offer insight into tobacco product switching, as well as cigarette smoking cessation behaviors occurring following the implementation of the proposed product standard. As described previously in section VI.B of this document, a clinical trial intended to assess the use of noncombusted and non-cigarette combusted tobacco products among participants randomized to receive LNC and NNC cigarettes found that participants who

received LNC cigarettes used alternative combusted and noncombusted tobacco products on a statistically significantly higher percentage of days compared to those who received NNC cigarettes (Ref. 5). Another analysis of switching behavior in the context of a clinical study examined the influence of LNC cigarette use on alternative tobacco product use in participants who did not smoke cigarettes daily. Among participants who did not use e-cigarettes at baseline, new use of e-cigarettes was statistically significantly more prevalent in the LNC cigarette group compared to the NNC cigarette group (Ref. 377). Both findings suggest that people who smoke cigarettes, and do not quit tobacco use altogether, are likely to seek alternative sources of nicotine once a nicotine product standard for combusted tobacco products is in place.

As discussed in section VII.B.2 of this document, numerous studies have investigated the effects of VLNC or LNC cigarettes—alone or in combination with NRT products—on smoking cessation among people who smoke cigarettes and are interested in quitting (Refs. 32, 35, 41, 369 to 373), as well as among samples of people who smoke cigarettes and are not interested in quitting (Refs. 31, 40, 258, and 374). Taken together, results from these studies demonstrate that people who smoke cigarettes and are interested in quitting who are given VLNC cigarettes are more likely to achieve initial smoking abstinence compared to those who continue to smoke their usual brand or NNC cigarettes. In addition, provision of NRT and/or behavioral intervention with VLNC cigarettes can further increase smoking cessation among individuals interested in quitting (Ref. 19).

Estimates from FDA's population health model—described in section VIII.A of this document—indicate that in the first year following the implementation of the proposed standard in 2027, smoking prevalence would decline from 9.1 percent in the baseline scenario to a median of 4.5 percent in the product standard scenario, due to the large increase in

smoking cessation in the first year after implementation. In subsequent years, the difference in smoking prevalence between the scenarios would continue to grow due to sustained increases in cessation and decreases in initiation relative to baseline. The projected smoking prevalence drops to 0.2 percent under the product standard scenario by 2050, compared to 5.3 percent under baseline. By 2100, smoking prevalence is estimated at 0.2 percent in the product standard scenario, compared to 4.6 percent under baseline. Estimates of the projected cumulative number of people who quit smoking are depicted in table 3. Within the first year of the proposed standard implementation, 12.9 million additional people who smoke

cigarettes are estimated to either quit tobacco altogether or switch from cigarette smoking to using noncombusted tobacco products, signifying a considerable gain over the estimated 1.6 million people who smoke that would have quit under the baseline scenario. The mortality risk of switching is greater than quitting all tobacco products, therefore the public health model assumes the risk for people who switch to noncombusted products as 8 percent higher than the risk for those who quit tobacco use entirely based on evidence in the literature (Ref. 557), see section VIII.D of this document for a more detailed discussion. The number of additional people who quit smoking would increase to approximately 19.5

million within 5 years after the implementation of the proposed standard, representing a gain of more than the 7.3 million people who quit smoking than would be anticipated under the baseline scenario. The median estimates grow closer to the 95th percentile estimates than to the 5th percentile estimates over time. A closer analysis of this pattern indicates that the 5th percentile estimates are affected by lower estimates given by two experts in the expert elicitation. Those estimates indicate that a lower percentage of people who currently use cigarettes will quit smoking cigarettes, following a nicotine product standard's implementation.

TABLE 3—CUMULATIVE NET PEOPLE WHO QUIT SMOKING ¹ (MILLIONS) AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027

Period	Median	(5th, 95th percentiles)
Within 1st year (2027)	12.9	(0.8, 24.8)
Within 2 years (2027–2028)	17.5	(1.2, 24.1)
Within 3 years (2027–2029)	19.3	(1.6, 23.2)
Within 4 years (2027–2030)	19.8	(1.8, 22.3)
Within 5 years (2027–2031)	² 19.5	(2.0, 21.4)

¹ Net people who quit smoking cigarettes (including those who switch to noncombusted tobacco products), defined as people who quit smoking cigarettes in addition to baseline, is computed as: (number of people who quit smoking cigarettes under the nicotine product standard scenario) – (number of people who quit smoking cigarettes under baseline scenario).

² Cumulative net people who quit smoking declines slightly in year 5 of the simulation because there are more people who quit smoking cigarettes in the baseline scenario compared with the product standard scenario. Since there are millions of fewer people smoking cigarettes in the product standard scenario as the years continue, eventually there are fewer people available to quit smoking cigarettes compared to baseline.

We also examined the potential for an illicit market for NNC cigarettes to develop in response to the proposed product standard (see section IX.D of this document for a discussion on illicit trade). In order to examine the potential impact of such an illicit market, sensitivity analyses were conducted for the effects of diversion from cessation to illicit trade, and initiation into illicit products, on the estimated benefits of a nicotine product standard. These

analyses demonstrate that increasing the assumed proportion of people who smoke who may divert to the use of illicit NNC cigarettes (for purposes of illustration, we use a low-end estimate (3.8 percent), a midpoint estimate (5.9 percent), and a high-end estimate (21.0 percent)),³¹ and allowing youth and young adults (who would have otherwise initiated NNC cigarette use) to initiate into illicit NNC cigarette use (0 percent, 2.6 percent, and 10 percent)³²

under the proposed nicotine standard, resulted in reductions in the projected cumulative net people who quit smoking following the implementation of the nicotine product standard policy (table 4). However, even in the case of significant diversion to illicit NNC cigarettes, the number of people projected to quit smoking remains substantial.

³¹ We use 3.8 percent as a low-end estimate based on 2017 estimates of illicit trade volume in cigarettes from (Ref. 558). This estimate excludes interstate smuggling for purposes of tax avoidance. For a midpoint estimate, using findings from the International Tobacco Control United States Survey (Ref. 559), we estimate that 5.9 percent of U.S. people who use cigarettes last purchased cigarettes from low-tax locations. We use these figures as proxies for the proportions of people who use cigarettes who may actively seek out illicit NNC cigarettes under a nicotine product standard, although we note that the product standard would be implemented nationwide, avoiding disparate pricing/availability between states. We use 21.0

percent as a high-end estimate based on the difference in non-compliance rates between reduced nicotine intervention groups (78 percent) and control groups assigned to NNC cigarettes (57 percent) in clinical trial data from (Ref. 29, Ref. 330). This estimate of 21.0 percent also represents the high-end of the range estimated in (Ref. 560), which reflected the methodology of the pack return survey by (Ref. 561). While FDA uses this 21.0 percent high-end estimate for the purpose of analyzing potential impacts, we note that it represents a highly unlikely upper bound, because for such a substantial percentage of people who use cigarettes to acquire NNC cigarettes, convenient and consistent access to an illicit market would be

needed, which is highly unlikely. We also note that basing a high-end estimate on non-compliance rates found in studies (where NNC cigarettes are legally available outside the confines of the study environment) is not equivalent to real-world conditions where NNC cigarettes would not be legally available in the U.S. marketplace.

³² We use findings from an expert elicitation developed to gauge the impact of a menthol cigarette and cigar prohibition in the United States (Ref. 562), which indicates that among people ages 12–24 who would have otherwise initiated menthol cigarette use, 2.6 percent would initiate illicit menthol cigarette use (estimate ranged from 0 percent to 10 percent).

TABLE 4—CUMULATIVE NET PEOPLE WHO QUIT SMOKING COMBUSTED CIGARETTES (MILLIONS) AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027 UNDER ILLICIT TRADE SCENARIOS. MEDIAN (5TH, 95TH PERCENTILES) ESTIMATES

Period	Illicit trade impact scenarios			
	Main scenario (no impact)	Low Impact ¹	Medium Impact ²	High Impact ³
Within 1st year (2027)	12.9 (0.8, 24.8)	12.4 (0.7, 24.6)	12.1 (0.7, 24.4)	9.9 (0.3, 22.6)
Within 5th year (2027–2031)	19.5 (2.0, 21.4)	19.3 (1.7, 21.3)	19.2 (1.5, 21.4)	18.1 (0.3, 21.4)

¹ Low Impact: 3.8 percent people who smoke would divert to use illicit NNC cigarettes, and 0 percent youth and young adults would initiate illicit NNC cigarettes.

² Medium Impact: 5.9 percent people who smoke would divert to use illicit NNC cigarettes, and 2.6 percent youth and young adults would initiate illicit NNC cigarettes.

³ High Impact: 21.0 percent people who smoke would divert to use illicit NNC cigarettes, and 10.0 percent youth and young adults would initiate illicit NNC cigarettes.

The sum of the available evidence—including the current use of cigarettes by millions of Americans, findings from studies assessing the effects of VLNC or LNC cigarettes on smoking cessation, and findings from FDA's population health model—supports FDA's finding that the proposed product standard would increase the likelihood that many people who smoke cigarettes and/or other combusted tobacco products would stop smoking altogether, yielding significant health benefits from smoking cessation. Additionally, we find that the proposed standard is appropriate for the protection of the public health because it would decrease the likelihood that people who do not smoke cigarettes and/or use certain other combusted tobacco products—particularly youth and young adults—who experiment with combusted tobacco products will become addicted to these products, thereby decreasing progression to regular use, resulting in reduced tobacco-related morbidity and mortality associated with combusted tobacco product use. As of 2021, more than 48 million people in the United States ages 12 and older used tobacco products within the past 30 days (Refs. 25 and 274). Further, in 2021, 35.6 million U.S. adults (14.5 percent) and nearly 1 million middle and high school students (3.2 percent) used any combustible tobacco product (Ref. 274). Thus, even small changes in initiation and cessation would result in a significant reduction in the burden of death and disease caused by smoking.

D. Benefits and Risks to the Population as a Whole

We expect that the proposed nicotine product standard, if finalized, would reduce tobacco-related harms. As discussed in section IV of this document, nicotine is the primary constituent in cigarettes and other tobacco products that causes and maintains addiction. By enacting a

product standard that would seek to limit the nicotine content in cigarettes and certain other combusted tobacco products to minimally addictive or nonaddictive levels, FDA anticipates that reductions in population harm would be realized through long-term health benefits resulting from prevention of cigarette uptake and progression to regular cigarette smoking among young people, as well as shorter-term health benefits resulting from increased cessation of cigarette smoking among people who currently smoke. Each of these impacts alone would result in significant health benefits to the U.S. population. In totality, they provide overwhelming evidence that the proposed standard would result in substantial health benefits over both the short- and long-term. In this section, we summarize the health benefits of never progressing to regular cigarette smoking and combusted tobacco product use, the health benefits of quitting smoking, the population health benefits of switching from cigarettes to potentially less harmful tobacco products, and the health benefits of not being exposed to secondhand smoke. We also describe additional public health benefits of the proposed standard not addressed in FDA's population health model. Finally, we describe potential risks or limiting effects of the product standard, including risks of compensatory smoking. Based on the available evidence, FDA concludes that any such potential risks or limiting effects would be significantly outweighed by the anticipated substantial benefits of this proposed nicotine product standard.

1. Given the Harmful Effects of Cigarette Smoking and Combusted Tobacco Use, Never Progressing to Regular Smoking Prevents Death and Disease and Improves Quality of Life

Never progressing to regular cigarette smoking prevents death and disease caused by smoking. Any effects of a

nicotine product standard in cigarettes and certain other combusted tobacco products on preventing youth, young adult, and even adults who have never smoked from initiating/experimenting and progressing to regular cigarette smoking will have a population health benefit. Youth and young adults would experience the greatest benefits from a nicotine product standard, because it is likely that most of them would not progress beyond experimentation or occasional use and, therefore, may not experience the dangerous and deadly tobacco-related health effects associated with combusted tobacco product use. Fetuses and children also would benefit if their parents quit smoking or using most combusted tobacco products, given the negative health consequences to the fetus of a smoking mother and the dangers of secondhand smoke (Ref. 19). Children of parents who smoke, when compared with children whose parents do not smoke, have an increased frequency of respiratory infections like pneumonia and bronchitis (Ref. 563). Smoking cessation reduces the rates of these respiratory symptoms and of respiratory infections among children (Ref. 63 at p. 467). Children exposed to tobacco smoke in the home also are more likely to develop acute otitis media (middle ear infections) and persistent middle ear effusions (thick or sticky fluid behind the eardrum) (Ref. 563). If parents were more readily able to quit because these products were minimally addictive or nonaddictive, the incidence of these health problems among youth would be expected to decline. Additionally, such health problems would not occur in future years, as fewer individuals would initiate and progress to regular smoking.

According to the 2014 Surgeon General's Report, which summarizes thousands of peer-reviewed scientific studies and is itself peer-reviewed, smoking remains the leading preventable cause of disease and death

in the United States, and cigarettes have been shown to cause an ever-expanding number of diseases and health conditions (Ref. 1). As stated in the report, “cigarette smoking has been causally linked to disease of nearly all organs of the body, to diminished health status, and to harm to the fetus” and “[t]he burden of death and disease from tobacco use in the United States is overwhelmingly caused by cigarettes and other combusted tobacco products” (Ref. 1). The 2014 Surgeon General’s Report estimates that 16 million people live with diseases caused by smoking cigarettes (Ref. 1). Additionally, the burden of tobacco-related addiction and disease disproportionately impacts certain populations, such as individuals experiencing poverty, those of lower educational attainment, in historically marginalized racial and ethnic groups, in the LGBTQI+ community, people living with a mental health condition, in the military, and in certain geographic areas (Ref. 120). In particular, Black individuals experience the highest rates of incidence and mortality from tobacco-related cancers compared to people from other racial and ethnic groups (Refs. 102 and 103). Additionally, mortality related to other tobacco-related diseases such as heart disease, stroke, and hypertension is higher among Black individuals than

other racial and ethnic groups (Refs. 105, 106, 108 to 110, and 123). Moreover, when comparing mortality to morbidity, for every person who dies from smoking, 30 more are living with a smoking-attributable disease (Ref. 1). Smoking is causally associated with a number of diseases affecting nearly all organs in the body, such as numerous types of cancer, heart disease, stroke, lung diseases such as COPD, and diabetes, in addition to putting individuals at increased risk for tuberculosis, certain eye diseases, and immune system issues (Ref. 1). One study estimated that individuals in the United States have had 14.0 million major smoking-attributable medical conditions, including more than 7.4 million cases of COPD, nearly 2.3 million heart attacks, 1.8 million cases of diabetes, nearly 1.2 million stroke events, more than 300,000 cases of lung cancer, and nearly 1 million cases of other smoking-attributable cancers (bladder, cervix, colon/rectum, kidney, larynx, mouth, tongue, lip, throat, pharynx, stomach) (Ref. 564). Therefore, increased smoking cessation, reduced cigarette consumption, and lower progression to regular use would reduce not only the mortality from smoking, but also the enormous burden of cigarette-attributable disease in the United States. In addition to the years of life gained due to reduced premature mortality

from tobacco, the substantial reductions in smoking initiation and increases in smoking cessation will result in improvements in quality of life for those who quit or do not initiate smoking because of the product standard. To estimate the potential impact of the proposed standard on morbidity and mortality, we used estimates from FDA’s population health model, which is described in section VIII.A of this document. Table 5 presents cumulative estimates of mortality and morbidity avoided as a result of the proposed nicotine product standard, for certain years in the simulation period (Ref. 42 at Appendix J). By 2060, we estimate that approximately 1.8 million deaths due to tobacco would be avoided, rising to 4.3 million by the end of the century. The reduction in premature deaths attributable to the proposed product standard would result in 19.6 million life years gained by 2060 and 76.4 million life years gained by 2100. Based on previously reported quality of life scores derived for people who do and do not smoke, stratified by age group (Ref. 565), we estimate that the proposed nicotine product standard would result in 24.0 million QALYs gained by 2060 due to reduced smoking morbidity. By 2100, this estimate is projected to increase to 53.1 million QALYs gained due to reduced smoking morbidity (Ref. 42 at Section 2.3).

TABLE 5—PROJECTED NUMBER OF TOBACCO-ATTRIBUTABLE DEATHS AVOIDED, LIFE YEARS GAINED, AND QALYs GAINED DUE TO REDUCED SMOKING AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027

Year	Scenario	Cumulative tobacco-attributable deaths avoided (millions)	Cumulative life years gained (millions)	Cumulative QALYs gained due to reduced smoking morbidity (millions)
2040	Median (5th, 95th)	0.4 (0.1, 0.5)	2.0 (0.2, 2.7)	9.6 (2.7, 10.0)
2060	Median (5th, 95th)	1.8 (0.4, 2.0)	19.6 (3.6, 22.7)	24.0 (10.1, 24.7)
2080	Median (5th, 95th)	3.1 (1.0, 3.4)	47.4 (12.5, 52.5)	38.2 (18.5, 39.2)
2100	Median (5th, 95th)	4.3 (1.6, 4.6)	76.4 (26.5, 82.5)	53.1 (27.5, 54.4)

In addition to the main analyses concerning projected death and disability, we examined the sensitivity of modeled results to underlying assumptions related to baseline product use projections and mortality risk estimates. Sensitivity analyses accounted for the following: an increase in noncombusted product initiation; different assumptions of people who smoke switching to noncombusted products per year; decrease in smoking initiation; lower and higher noncombusted product mortality risk compared to baseline; different assumptions for dual product use mortality risk; changes in baseline

mortality rate projections; and the potential impact of a substantial illicit market for NNC cigarettes. Changes to baseline inputs of noncombusted product use trajectories and health risks had minimal impact on smoking prevalence and attributable morbidity and mortality, and the nicotine product standard still resulted in substantial public health benefits. Assuming increasing initiation rates for noncombusted product use until year 2030 implies that the number of people who use tobacco will be higher under the baseline and nicotine product standard scenarios, with a higher

proportion being people who use noncombusted tobacco products. In terms of mortality risk, we applied a relative risk of 1.18 for people who use noncombusted tobacco products as compared with people who have never smoked (*i.e.*, the risk of death associated with noncombusted tobacco use is assumed to be 1.18 times greater than the risk of death associated with never smoking). For combusted cigarette smoking, the relative mortality risk varies with age, but is generally around 2.5, as compared to people who have never smoked (*i.e.*, the risk of death associated with smoking is estimated to be 2.5 times greater than the risk of

death associated with never smoking). Mortality risk for people who have never used tobacco is 1, so the excess mortality risk of using a product beyond that of those who have never used tobacco, and therefore related to the

product used, can be calculated by subtracting 1 from the mortality risk (*i.e.*, excess mortality risk for noncombusted tobacco use is $1.18 - 1 = 0.18$, and for combusted cigarette use it is $2.5 - 1 = 1.5$). Thus, in our main

modeling projections, we apply an excess risk of using noncombusted tobacco products that is 12 percent that of the excess risk associated with cigarette smoking (*i.e.*, $100 \times (0.18/1.5) = 12$ percent).

TABLE 6—IMPACT OF VARYING BASELINE ASSUMPTIONS ON PROJECTED SMOKING PREVALENCE AND AVOIDED MORTALITY AND MORBIDITY BY 2100. MEDIAN (5TH, 95TH PERCENTILES) ESTIMATES

Scenario	Projections through year 2100			
	Cigarette smoking prevalence (%)	Cumulative tobacco-attributable mortality avoided (millions)	Cumulative life years gained (millions)	Cumulative QALYs gained from reduced smoking morbidity (millions)
Main scenario	0.2 (0.1, 1.9)	4.3 (1.6, 4.6)	76.4 (26.5, 82.5)	53.1 (27.5, 54.4)
Baseline noncombusted tobacco product trajectory				
Increased noncombusted initiation	0.2 (0.1, 1.9)	4.3 (1.6, 4.6)	76.5 (26.7, 82.5)	53.1 (27.5, 54.4)
50% increased complete switching	0.13 (0.06, 1.7)	4.2 (1.7, 4.5)	74.9 (28.6, 80.7)	51.9 (29.0, 52.9)
100% increased complete switching	0.12 (0.06, 1.5)	4.2 (1.8, 4.4)	73.6 (30.3, 79.0)	50.8 (30.2, 51.6)
Baseline smoking initiation trajectory				
25% decrease in smoking initiation during the period 2021–2030	0.13 (0.1, 1.6)	4.1 (1.5, 4.4)	72.9 (24.3, 79.0)	45.2 (22.9, 46.4)
Baseline smoking cessation				
10% increase in smoking cessation	0.15 (0.1, 1.8)	4.0 (1.5, 4.3)	70.9 (24.9, 76.4)	50.1 (26.3, 51.2)
Baseline noncombusted mortality relative risk (RR)				
Higher RR than main scenario (RR = 1.3)	0.2 (0.1, 1.9)	4.3 (1.6, 4.6)	75.0 (26.0, 81.4)	53.1 (27.5, 54.4)
Lower RR than main scenario (RR = 1.1)	0.2 (0.1, 1.9)	4.4 (1.6, 4.7)	77.2 (26.9, 83.2)	53.1 (27.5, 54.4)
Baseline dual use RR				
Dual use RR is 18% greater than for cigarette smoking	0.2 (0.1, 1.9)	4.3 (1.6, 4.6)	75.9 (25.0, 82.4)	53.1 (27.5, 54.4)
Dual use RR is the average of cigarette and noncombusted use RR	0.2 (0.1, 1.9)	4.3 (1.6, 4.6)	77.0 (28.6, 82.6)	53.1 (27.5, 54.4)
Dual use RR is equal to the noncombusted use RR	0.2 (0.1, 1.9)	4.3 (1.6, 4.6)	77.6 (30.7, 82.7)	53.1 (27.5, 54.4)
Baseline mortality rate projections				
Keep mortality rates constant starting at 2060	0.2 (0.1, 2.0)	4.7 (1.9, 5.1)	77.9 (28.2, 83.9)	53.0 (27.4, 54.2)

As shown in table 6, varying baseline input parameter values had very small effects on estimates of the potential population health effects of a nicotine product standard. Assuming a 25 percent decrease in cigarette smoking initiation during the period from 2021 to 2030 resulted in modest decreases in smoking prevalence and health benefits, in particular reductions in morbidity due to smoking, by 2100 in the policy scenario compared to the main analysis. Increases in baseline complete switching to noncombusted tobacco product use resulted in similar small decreases in smoking prevalence and health benefits in terms of life years gained and reduced smoking morbidity by 2100 compared to the main analysis. Different assumptions about baseline relative risks also produced modest

changes in differences in life years gained. Additional details regarding the sensitivity analyses can be found in FDA's modeling document (Ref. 42).

Sensitivity analyses were also conducted examining assumptions about the potential effect of the nicotine product standard on smoking cessation. In addition to the modeling results obtained through expert-derived inputs, we also generated projections based on results from clinical studies of VLNC cigarette use and cessation. Based on these studies, we applied a two-fold increase in cessation (estimates ranged from 6.4 percent to 19.8 percent), as compared to the baseline cessation rate (estimates ranged from 3.2 percent to 9.9 percent), as an alternative estimate of the long-term impact of the proposed product standard on cessation, while

maintaining the median of the expert-derived values for the other parameters (Ref. 42 at Section 2.3). Given the wide variation in the expert-derived cessation rates, the projected health impacts assuming a two-fold increase in cessation fell within the range of results obtained from expert-derived inputs (see table 6).

Additionally, increasing the assumed proportion of people who smoke who may divert to the use of illicit NNC cigarettes (3.8 percent, 5.9 percent, and 21.0 percent),³³ and allowing youth and

³³ We use 3.8 percent as a low-end estimate based on 2017 estimates of illicit trade volume in cigarettes from Euromonitor International (Ref. 558). This estimate excludes interstate smuggling for purposes of tax avoidance. Using findings from the International Tobacco Control United States Survey, we estimate that 5.9 percent of U.S. people

young adults (who would have otherwise initiated NNC cigarette use) to initiate into illicit NNC cigarette use (0 percent, 2.6 percent, and 10 percent)³⁴ under the proposed nicotine standard resulted in reductions in the projected

cumulative attributable morbidity and mortality outcomes following the implementation of the policy (table 7). It is noteworthy that significant benefits in terms of reduced morbidity and mortality are realized as a result of this

product standard, even in a scenario in which greater proportions of the population who smoke are assumed to divert to use of illicit NNC cigarettes.

TABLE 7—PROJECTED HEALTH BENEFITS AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027 UNDER ILLICIT TRADE SCENARIOS

[Median (5th, 95th percentiles) estimates]

Year	Illicit trade impact scenarios			
	Main scenario (no impact)	Low impact ¹	Medium impact ²	High impact ³
Tobacco-Attributable Deaths Avoided (Millions)				
2040	0.4 (0.1, 0.5)	0.4 (0.04, 0.5)	0.4 (0.04, 0.5)	0.4 (0.01, 0.5)
2060	1.8 (0.4, 2.0)	1.8 (0.4, 2.0)	1.8 (0.3, 2.0)	1.7 (0.1, 2.0)
2080	3.1 (1.0, 3.4)	3.1 (0.8, 3.4)	3.1 (0.8, 3.4)	3.0 (0.4, 3.3)
2100	4.3 (1.6, 4.6)	4.3 (1.5, 4.6)	4.3 (1.4, 4.6)	4.2 (0.9, 4.5)
Cumulative Life Years Gained (Millions)				
2040	2.0 (0.2, 2.7)	2.0 (0.1, 2.7)	2.0 (0.1, 2.7)	1.8 (0.01, 2.6)
2060	19.6 (3.6, 22.7)	19.4 (3.2, 22.6)	19.3 (3.0, 22.6)	18.4 (1.2, 22.0)
2080	47.4 (12.5, 52.5)	47.1 (11.4, 52.4)	46.9 (10.7, 52.3)	45.3 (5.3, 51.5)
2100	76.4 (26.5, 82.5)	76.0 (24.6, 82.3)	75.8 (23.4, 82.2)	73.9 (13.7, 81.3)
Cumulative QALYs Gained from Reduced Smoking Morbidity (Millions)				
2040	9.6 (2.7, 10.0)	9.6 (2.5, 10.0)	9.5 (2.4, 10.0)	9.2 (1.5, 9.9)
2060	24.0 (10.1, 24.7)	24.0 (9.6, 24.7)	23.9 (9.2, 24.7)	23.4 (6.5, 24.6)
2080	38.2 (18.5, 39.2)	38.2 (17.7, 39.2)	38.0 (17.0, 39.2)	37.3 (12.6, 39.0)
2100	53.1 (27.5, 54.4)	53.0 (26.6, 54.4)	52.8 (25.5, 54.3)	51.9 (19.3, 54.1)

¹ Low Impact: 3.8 percent people who smoke would divert to use illicit NNC cigarettes, and 0 percent youth and young adults would initiate illicit NNC cigarettes.

² Medium Impact: 5.9 percent people who smoke would divert to use illicit NNC cigarettes, and 2.6 percent youth and young adults would initiate illicit NNC cigarettes.

³ High Impact: 21.0 percent people who smoke would divert to use illicit NNC cigarettes, and 10.0 percent youth and young adults would initiate illicit NNC cigarettes.

As previously discussed, nicotine is the primary driver of addiction in tobacco products and facilitates progression to regular cigarette smoking and other regular combusted tobacco product use. FDA anticipates that establishing a maximum level of nicotine in cigarettes and certain other combusted tobacco products will prevent a substantial number of youth and young adults who experiment with combusted tobacco products from developing an addiction to these products, thereby decreasing progression to regular use, resulting in reduced tobacco-related morbidity and mortality associated with combusted tobacco product use.

2. Given the Harmful Effects of Cigarette Smoking and Other Combusted Tobacco Product Use, Quitting Smoking Reduces Death and Disease

Although the health benefits are greater for people who stop smoking at earlier ages (Refs. 63 and 563), researchers estimate that people who regularly smoke can gain years of additional life expectancy no matter when they quit (Ref. 566). Quitting cigarette smoking and use of other combusted tobacco products substantially reduces the likelihood of tobacco-related death and disease. As stated in the 2004 Surgeon General's Report, "[q]uitting smoking has immediate as well as long-term benefits, reducing risks for diseases caused by

smoking and improving health in general" (Ref. 63). The 2020 Surgeon General's Report also concluded that "[s]moking cessation is beneficial at any age. Smoking cessation improves health status and enhances quality of life." (Ref. 19). As previously noted, FDA expects that, if this proposed rule is finalized, there will be a significant increase in smoking cessation in the U.S. population (see section VIII.C of this document).

The benefits associated with smoking cessation happen quickly (Ref. 63). Within 2 to 12 weeks of quitting smoking, an individual's lung function and blood circulation improve (Ref. 63). During the first 1 to 9 months following cessation, coughing and shortness of breath decrease (Ref. 63). Within several

who use cigarettes last purchased cigarettes from low-tax locations (Ref. 559). We use these figures as proxies for the proportions of people who use cigarettes who may actively seek out illicit NNC cigarettes under a nicotine product standard, although we note that the product standard would be implemented nationwide, avoiding disparate pricing/availability between states. We use 21 percent as a high-end estimate based on the

difference in non-compliance rates between reduced nicotine intervention groups (78 percent) and control groups assigned to NNC cigarettes (57 percent) in clinical trial data (Refs. 29 and 330). This estimate of 21 percent also represents the high-end of the range estimated by the National Research Council, which reflected the methodology of the pack return survey by Fix, et al. (Refs. 560 and 561).

³⁴ We use findings from an expert elicitation developed to gauge the impact of a menthol cigarette and cigar prohibition in the United States, which indicates that among people ages 12–24 who would have otherwise initiated menthol cigarette use, 2.6 percent would initiate illicit menthol cigarette use (estimate ranged from 0 percent to 10 percent) (Ref. 562).

months of quitting smoking, individuals can expect further improvement in lung function (Ref. 63). Additionally, the benefits of cessation continue for those who remain smoke-free. Smoking cessation reduces the risk of cancers and other diseases (Ref. 19). For example, the risk of fatal lung cancer in adults over age 55 is about 25 times higher among people who smoke cigarettes relative to people who have never smoked (Ref. 567). After 10–15 years of abstinence from smoking, the risk of lung cancer is about 50 percent of the risk for individuals who continue to smoke (Ref. 19). The risk of cancer of the mouth, throat, esophagus, stomach, bladder, cervix, pancreas, liver, kidney, colon, and rectum, and the risk of acute myeloid leukemia also decreases (Refs. 19 and 568). The evidence is also sufficient to infer that the risk of stroke decreases after smoking cessation and approaches that of people who have never smoked cigarettes over time (Ref. 569). Furthermore, the evidence is sufficient to infer that the relative risk of coronary heart disease among people who formerly smoked cigarettes falls rapidly after cessation and then declines more slowly (Ref. 19).

In addition, smoking cessation substantially reduces the risk of other dangerous diseases that can lead to death or disability and cause a financial strain on healthcare resources. For example, quitting smoking substantially reduces the risk of peripheral artery occlusive disease (which can cause complications that lead to loss of limbs) (Ref. 563). It also reduces the relative risk of coronary heart disease and stroke morbidity and mortality among people who formerly smoked compared with people who have never smoked (Ref. 19). People who formerly smoked cigarettes also have half the excess risk of experiencing an abdominal aortic aneurysm compared to people who currently smoke cigarettes (Ref. 563). Furthermore, cigarette smoking complicates many diseases (*e.g.*, people who smoke and have diabetes have higher risk of complications, including heart and kidney disease, poor blood flow in the legs and feet, retinopathy, and peripheral neuropathy), and smoking cessation can alleviate those complications as well (Ref. 28).

Even people who smoke and quit smoking after the onset of a life-threatening disease experience significant health benefits from cessation. Quitting smoking after a diagnosis reduces the chance of recurrences and future health problems. For example, people who quit smoking after having a heart attack can reduce their chances of having a second heart

attack by 50 percent (Ref. 568). For those persons who have already developed cancer, quitting smoking reduces the risk of developing a second cancer (Refs 563, 570 to 572). Additionally, quitting smoking after a diagnosis of lung cancer reduces the risk of cancer progression and mortality (Ref. 573). Researchers also estimate that for people who currently smoke and have been diagnosed with coronary heart disease, quitting smoking reduces the risk of death overall and reduces the risk of recurrent heart attacks and cardiovascular death by 30 to 40 percent (Refs. 19 and 563). The 2020 Surgeon General's Report concluded that quitting smoking reduces the risk of fatal and non-fatal stroke, and earlier reports have also stated that it is reasonable to assume that quitting smoking would reduce the risk of recurrent strokes (Refs. 19 and 563). Quitting smoking helps the body tolerate the surgery and treatments, such as chemotherapy and radiation, associated with certain smoking-related diseases, and quitting also improves the likelihood of responding to those treatments (Refs. 63, 563, 570, and 574) and reduces the risk of respiratory infections compared to continued smoking (Refs. 563 and 575).

Given the reduction in risk of smoking-related death and disease associated with cessation, those who successfully quit smoking also increase their life expectancy. Using data from the CPS-II—an ongoing study of 1.2 million adults—scientists have found that, among men who smoke cigarettes, men who smoked at age 35 and continued to smoke until death had a life expectancy of 69.3 years, compared with a life expectancy of 76.2 years for those who stopped smoking at age 35 (Ref. 576). After adjusting for the subsequent quit rate among people who currently smoke cigarettes at baseline (to account for the possibility that some people who currently smoke at baseline quit smoking or some people who formerly smoked relapsed during followup and, thus, were incorrectly classified as people who continue to smoke in the unadjusted analysis), the life expectancy for males who formerly smoked increased to 77.8 years (a life extension of 8.5 years) (Ref. 576). Women who smoked at age 35 and continued to smoke until death had a life expectancy of 73.8 years, compared with a life expectancy of 79.7 years for those who stopped smoking at age 35 (Ref. 576). After adjustment for the subsequent quit rate among people who currently smoke at baseline, the life expectancy for females who formerly smoked increased to 81 years (a life

extension of 7.7 years) (Ref. 576). Furthermore, a man aged 60–64 years who smokes 20 cigarettes (one pack) or more per day and then quits smoking reduces his risk of dying during the next 15 years by 10 percent (Ref. 563).

While cessation is beneficial for people of all ages, the health benefits are greatest for people who stop smoking at earlier ages (Refs. 63 and 563). Scientists in the United Kingdom found that people who quit smoking at age 30 reduce their risk of dying prematurely (*i.e.*, dying before their expected average life expectancy) from smoking-related diseases by more than 90 percent (Refs. 544 and 577). Those who quit at age 50 reduce their risk of dying prematurely by 50 percent compared to those who continue to smoke (Ref. 544). Using NHIS data, researchers also estimated that life expectancy in the United States would increase by 4 years among people who smoke who quit at ages 55–64, and 10 years among people who smoke who quit at ages 25–34 (Ref. 566). Scientists using the CPS-II data (while accounting for the possibility that some people who currently smoke at baseline quit smoking and some people who formerly smoked relapsed during followup) found that even people who smoke who quit at age 65 had an expected life increase of 2 years for men and 3.7 years for women (Ref. 576).

The benefits continue for those who remain smoke-free. At year one, an individual's risk of coronary heart disease becomes half that of a person who smokes cigarettes (Refs. 219 and 578). Beginning 2 and 5 years after cessation, an individual's stroke risk is reduced to that of a person who does not smoke cigarettes (Refs. 19 and 578). In addition, the risk of cancers of the mouth, throat, esophagus, and bladder for a person who formerly smoked is halved within 5 years (Ref. 578). By 10 years post-cessation, an individual's risk of cancers of the kidney and pancreas decreases (Ref. 578). The risk of coronary heart disease becomes that of a person who does not smoke after 15 years of abstinence (Ref. 578). FDA anticipates that limiting nicotine yield by setting a maximum level of nicotine in cigarettes and certain other combusted tobacco products would improve smoking cessation outcomes in adults who smoke and result in longer life expectancies for more individuals. Additionally, FDA anticipates that this proposed product standard will benefit populations that use tobacco products at disproportionately high levels by reducing tobacco-related morbidity and mortality by improving quitting and cessation among these populations.

Research has shown that people from specific population groups who smoke cigarettes bear a disproportionate burden of tobacco-related morbidity and mortality. Black individuals, and in particular Black men, experience the highest rates of incidence and mortality from tobacco-related cancers compared to people from other racial and ethnic groups (Refs. 102 and 103). Additionally, mortality due to tobacco-related disease such as heart disease, stroke, and hypertension is higher among Black individuals compared to other racial and ethnic groups (Refs. 105, 106, 108 to 110, 123, and 579). Furthermore, individuals with symptoms of mental health disorders and persons who have substance use disorders smoke cigarettes in disproportionately large numbers (Refs. 128, 580 to 585), resulting in increased risk for tobacco-related morbidity and mortality (Ref. 585). Based on these collective findings, FDA anticipates that the proposed product standard will improve smoking cessation outcomes across the U.S. population, including among populations at increased risk for tobacco-related morbidity and mortality, leading to a reduction in adverse tobacco-related health effects.

3. Given the Harmful Effects of Cigarette Smoking, Switching to a Potentially Less Harmful Nicotine Delivery Product May Reduce Death and Disease

Some people who smoke and who want to quit use NRT products, or other smoking cessation products that do not contain nicotine, that FDA has approved as safe and effective for smoking cessation. These products have been shown to significantly increase the success of smoking cessation (Ref. 586). FDA continues to be committed to enabling the development of safe and effective drug product innovations that help smokers quit combustible cigarettes and improve their health.

FDA also recognizes, however, that other people may seek to switch from cigarette smoking to using other noncombusted tobacco products that deliver nicotine. People who smoke and switch completely to a potentially less harmful noncombusted tobacco product to maintain their nicotine dependence also could, to the extent that use of those products result in less harm, significantly reduce their risk of tobacco-related death and disease (Ref. 8).

As described in section VI.B of this document, studies have reported on the ways in which people who use tobacco have predicted how their patterns of tobacco use would change in response to the implementation of a nicotine

product standard. While most people who use tobacco in these studies indicated that they would continue to smoke cigarettes—or other combusted products—or simply quit tobacco use, some participants reported that they would switch to using or increase use of a noncombusted product (Refs. 262, 264, and 587).

One clinical trial compared use of NRT and alternative tobacco products (*i.e.*, smokeless tobacco, e-cigarettes, cigars, cigarillos) among people who smoke cigarettes and were randomized to one of three groups (Ref. 5). One group received LNC cigarettes along with access to NRT, noncombusted tobacco products (*i.e.*, smokeless tobacco, e-cigarettes), and combusted non-cigarette products (*i.e.*, cigars, cigarillos); a second group received LNC cigarettes, and NRT, and noncombusted tobacco products only; and a third group received NNC cigarettes along with NRT, noncombusted tobacco products, and combusted tobacco products. Overall, those who received the LNC cigarettes used more alternative combusted and noncombusted tobacco products as well as NRT. These participants also smoked fewer total combusted tobacco products and had a greater number of quit attempts. Tobacco toxicant levels in participants who received LNC cigarettes and only NRT and noncombusted products were statistically significantly lower than those of participants who received NNC cigarettes, while toxicant levels in those who received LNC cigarettes and had access to NRT, combusted, and noncombusted products did not differ from the NNC cigarette group (Ref. 5). Findings demonstrate that when people who smoke cigarettes are switched to LNC cigarettes and are provided with alternative sources of nicotine, they will readily use the alternative sources of nicotine. Moreover, the LNC cigarette group that had access to NRT and noncombusted nicotine sources only had statistically significantly reduced biomarker levels of certain harmful constituents (NNN and NNAL) compared to those who continued to smoke NNC cigarettes (Ref. 5). The LNC cigarette group with access to NRT and both combusted and noncombusted tobacco products resembled the NNC cigarette group (Ref. 5).

Moreover, in general, the high levels of noncompliance with study-issued VLNC cigarettes in the context of clinical trials, and continued use of non-study provided tobacco products (particularly NNC cigarettes), suggest that VLNC cigarettes have lower appeal and abuse potential compared to NNC cigarettes (Refs. 327 to 331). As a result,

these findings suggest that people who smoke VLNC cigarettes are likely to use alternative nicotine-containing products, if such products are concurrently available, once a nicotine product standard for combusted tobacco products is in place.

Under FDA's population health model's product standard scenario, an increase in noncombusted product use would occur concurrently with a dramatic reduction in cigarette smoking. Although the model assumes that noncombusted product initiation would remain constant until the end of the projection period (*i.e.*, 2100), the product standard scenario shows that noncombusted use continues to climb due to higher switching rates from combusted products as compared to the baseline scenario. This is because the number of people who start using noncombusted tobacco products would be much higher compared to the number of people who quit using noncombusted products. That is, there would be more people who currently use noncombusted tobacco products every year than people who quit using noncombusted products, which would cause an increase in noncombusted tobacco use prevalence throughout the projection period. According to the model, adult noncombusted tobacco use would increase from 7.7 percent in the baseline scenario to 12.8 percent in the product standard scenario within 1 year after policy implementation, due to the increase in switching from cigarette smoking and dual use as a result of a nicotine product standard. The prevalence of noncombusted tobacco use would remain higher in the product standard scenario over time due both to increased uptake among people who smoke and increased initiation due to some dissuaded initiation of cigarette use, compared to those individuals taking up noncombusted products instead.

Under the product standard scenario in the model, dual use of cigarettes and noncombusted tobacco products also would increase immediately, since a greater proportion of people who continue to smoke cigarettes would take up noncombusted products than in the baseline scenario, but this pattern would not continue over time with dual use prevalence reaching levels below 0.1 percent by the year 2035. Although the increase in noncombusted tobacco product use trend changes over time (*i.e.*, results showed a spike increase in noncombusted use prevalence within the first 3 years after implementation of a nicotine product standard), the decrease in smoking prevalence becomes greater than the increase in

noncombusted use following the implementation of a nicotine product standard. Consequently, overall tobacco use under the product standard scenario would remain lower than in the baseline scenario.

As described in section VIII.A of this document, in addition to the aforementioned main analyses, FDA conducted a series of sensitivity analyses to examine the impact of key modeling assumptions on the main outcome metrics of interest. In these analyses, we examined the sensitivity of modeled results to underlying assumptions related to baseline product use projections and mortality risk estimates. Sensitivity analyses included examining the impact of increased initiation of noncombusted tobacco product use among those who would otherwise not have used tobacco, the impact of an increase in switching from cigarettes to noncombusted tobacco product use, the impact of a varying mortality risk associated with dual use of cigarettes and noncombusted tobacco products, the impact of lower and

higher noncombusted tobacco product risk, and the emergence of an illicit market for full nicotine content cigarettes.

In general, changes to baseline inputs of noncombusted product use trajectories and health risks had minimal impact on smoking prevalence and attributable morbidity and mortality and the nicotine product standard policy scenario still resulted in substantial public health benefits. In the main modeling analysis, we account for people who would have initiated on smoking cigarettes initiating on noncombusted tobacco products instead because of the product standard. It is also possible that there could be increased initiation of noncombusted tobacco use among those who would otherwise not have used tobacco under the product standard scenario; for example, due to increased marketing of noncombusted products because of the policy or changes in public perceptions of the harms of noncombusted products. In a sensitivity analysis, starting at 2027 (year of the proposed standard

implementation), we assumed a 20 percent increase in the initiation of noncombusted tobacco products among those who would otherwise have not used tobacco. Table 8 provides the projected impacts on tobacco-related mortality and morbidity through the year 2100. Compared with the main results, a 20 percent increase in initiation of noncombusted tobacco use had minimal impact in mortality outcomes given the substantial reduction in adverse health effects projected under a potential nicotine product standard. For example, by year 2100, cumulative life years gained decreased by less than 1 percent compared with the main results, while cumulative tobacco-attributable deaths avoided remained almost the same. It is important to note that, because we only have data on the effect of cigarette smoking (and not noncombusted product use) on quality of life, the projected changes in QALYs gained from reduced smoking morbidity are not affected by increasing noncombusted product use initiation.

TABLE 8—IMPACT OF INCREASED INITIATION OF NONCOMBUSTED TOBACCO PRODUCTS AS A RESULT OF THE PROPOSED NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027 ON PROJECTED SMOKING PREVALENCE AND TOBACCO-RELATED MORTALITY AND MORBIDITY BY 2100

[Median (5th, 95th percentiles) estimates]

Scenario	Projections through year 2100			
	Noncombusted tobacco use prevalence (%)	Cumulative tobacco-attributable mortality avoided (millions)	Cumulative life years gained (millions)	Cumulative QALYs gained from reduced smoking morbidity (millions)
Main scenario	14.1 (12.7, 14.9)	4.3 (1.6, 4.6)	76.4 (26.5, 82.5)	53.1 (27.5, 54.4)
20% increased initiation of noncombusted products	15.4 (14.0, 16.1)	4.3 (1.6, 4.6)	75.9 (26.1, 82.1)	53.1 (27.5, 54.4)

Taken together, findings from prior research, as well as FDA's population health model, suggest that if the proposed product standard reduces the nicotine yield by setting a maximum level of nicotine in cigarettes only, but people who smoke cigarettes still have access to other NNC combusted tobacco products, they likely would substitute with the NNC combusted tobacco products and negate a significant proportion of the public health impact of the product standard. If other combusted tobacco products also are covered by this proposed product standard, however, data suggest that people who smoke may switch from combusted tobacco product use to potentially less harmful tobacco products. Moreover, findings indicate that switching from combusted cigarette use to noncombusted tobacco product use has the potential to impart

significant health-related benefits on a population level. The population health model estimates that on average approximately 50 percent of people who smoke cigarettes will switch to noncombusted tobacco products use per year, and although we estimate that such switching carries an 8 percent higher risk than quitting tobacco use entirely (based on findings from Henley et al. 2007 (Ref. 557)), this is still a significant health-related benefit compared to continuing to use combusted tobacco products.

4. Having Fewer People Smoke Cigarettes and Other Combusted Tobacco Products Will Reduce Death and Disease Associated With Secondhand Smoke Exposure

Cigarettes and other combusted tobacco products also have deadly effects on people who do not smoke

because they produce secondhand smoke. It is well-established that secondhand tobacco smoke causes premature death and disease in children and in adults who do not smoke (Ref. 15 at p.11). Secondhand smoke exposure is currently estimated to be responsible for over 41,000 deaths annually in the United States (Ref. 1). For example, an estimated 7,300 lung cancer deaths and nearly 34,000 coronary heart disease deaths annually can be attributed to secondhand smoke (Ref. 1). Additionally, productivity losses due to secondhand smoke-attributable deaths are estimated to cost the United States \$5.6 billion each year (Ref. 1).

Children are one group disproportionately exposed to and impacted by secondhand smoke. The 2014 Surgeon General's Report estimated that secondhand smoke is

associated with 150,000 to 300,000 lower respiratory tract infections in infants and children under age 18 months, 790,000 doctor's office visits related to ear infections per year, and 202,000 asthma cases each year (Refs. 1 and 137). In 2014, the U.S. Surgeon General reported that 400 sudden infant death syndrome (SIDS) deaths annually are related to perinatal smoking or exposure to secondhand smoke; the "Reproductive Outcomes" section describes the impact of perinatal smoking (Ref. 1). Children of parents who smoke, when compared with children of parents who do not smoke, have an increased frequency of respiratory infections like pneumonia and bronchitis (Ref. 563). Children exposed to tobacco smoke in the home are also more likely to develop acute otitis media (middle ear infections) and persistent middle ear effusions (fluid behind the eardrum) (Ref. 563). More recent data from the 2013–2014 NHANES estimates that approximately 58 million Americans who do not smoke (1 in 4) were exposed to secondhand smoke, including 14 million children (Ref. 588). Approximately half of all U.S. children ages 3–18 are exposed to cigarette smoke regularly at home or other locations that still permit smoking (Ref. 1). In 2019, approximately one-quarter of middle and high school students reported breathing in secondhand smoke in their homes or in a vehicle (Ref. 145).

The burden of secondhand smoke exposure is experienced disproportionately among members of some racial and ethnic groups and lower income groups. Among people who do not smoke and were ages 3 and older, findings from 2011 to 2018 NHANES data indicate that non-Hispanic Black persons and those living below the poverty level had the highest levels of secondhand smoke exposure compared to people of other races and those living above the poverty level, respectively; these disparities persisted across all years of the study analysis from 2011 to 2018 (Ref. 139). From 1999 to 2012, the

percentage of people who do not smoke and were age 3 and older exposed to secondhand smoke (defined in the study as levels 0.05–10 nanogram per milliliter) declined across all racial and ethnic groups (Ref. 141). However, a significantly higher proportion of non-Hispanic Black persons who do not smoke continued to have detectable serum cotinine levels compared to Mexican American and non-Hispanic White persons who do not smoke. For example, in 2011–2012, nearly 50 percent of non-Hispanic Black people who do not smoke had detectable serum cotinine levels, compared with 22 percent of non-Hispanic White and 24 percent of Mexican American people who do not smoke (Ref. 141). Additionally, disparities in secondhand smoke exposure are found across various environmental settings, including homes, vehicles, workplaces, and public places. These disparities speak to the interrelated influences of individual factors (e.g., age, race and ethnicity, income) and existing inequities in places where members of communities impacted by tobacco-related health disparities are likely to reside, spend time, and work (Ref. 174). The proposed product standard is anticipated to reduce smoking-related morbidity and mortality for specific population groups that do not smoke that are disproportionately exposed to secondhand smoke, especially youth.

Moreover, there is also some scientific evidence supporting disparities in secondhand smoke exposure by sexual orientation. An analysis of NHANES data from 2003–2010 found that secondhand smoke exposure (defined as a serum cotinine¹⁷ levels ≥0.05 nanogram per milliliter) differed by sexual orientation among women 20–59 years of age (Ref. 143). This study found that among women 20–59 years of age, secondhand smoke exposure was higher among non-smoking women who identified as lesbian (56.2 percent) or who reported a lifetime experience with a same-gender partner (47.7 percent) than those women who identified as exclusively heterosexual (33.0 percent;

p<0.001) (Ref. 143). However, among men 20–59 years of age, exposure to secondhand smoke did not significantly differ by sexual orientation.

FDA anticipates that the overall public health benefits of this proposed nicotine product standard would be far greater than those described above once we account for the impacts of reduced cigarette smoking on secondhand smoke exposure. As evidenced by evaluations of smoke-free policies, decreasing exposure to secondhand smoke will decrease smoking-related death and disease among people who do not smoke (Refs. 589 and 590).

To estimate the potential impact of the proposed standard on morbidity and mortality, FDA evaluated the existing scientific literature as well as findings from our population health model, which is described in section VIII.A of this document. Estimation of the mortality benefits of a nicotine product standard for secondhand smoke exposure used a similar approach. This approach relied on scaling the estimate of 437,400 deaths annually attributable to direct cigarette smoking from 2005–2009 (Ref. 1), to the number of deaths attributed to secondhand smoke exposure. That ratio was then applied to the model-derived projected changes in avoided cigarette-attributable deaths under the main product standard scenario to project the number of avoided deaths over time from secondhand smoke exposure. In the population health model, the impacts of a nicotine product standard on mortality from secondhand smoke exposure were estimated by first calculating the ratio of secondhand smoke (41,280 deaths; (Ref. 1)) to primary smoking-attributable deaths. That value, 9.4 percent, was then applied to the projections of cigarette-attributable deaths avoided yielding an estimate of approximately 169,000 cumulative deaths from secondhand smoke exposure avoided by 2060, rising to approximately 415,600 cumulative deaths avoided by the end of the century (see table 9).

TABLE 9—PROJECTED NUMBER OF TOBACCO-ATTRIBUTABLE DEATHS AVOIDED FOR SECONDHAND SMOKE AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027

Year	Scenario	Cumulative secondhand smoking-attributable deaths avoided
2040	Median (5th, 95th)	39,800 (4,900, 49,200)
2060	Median (5th, 95th)	169,000 (38,500, 189,000)
2080	Median (5th, 95th)	297,000 (91,200, 323,200)
2100	Median (5th, 95th)	415,600 (159,700, 444,400)

5. Estimated Mortality Impact of Reduced Smoking-Related Fires, Smoking-Related Perinatal Conditions, and Use of Non-Premium Cigars and Pipe Tobacco as a Result of Implementation of the Proposed Standard

FDA anticipates that the overall public health benefits of this proposed nicotine product standard would be greater than those described above once we account for the impacts of reduced cigarette smoking on smoking-related fires and perinatal conditions, in addition to the impacts of reduced use of other combusted tobacco products. To estimate the potential impact of the proposed standard on mortality, FDA evaluated the existing scientific literature, as well as findings from the population health model—which is described in section VIII.A. of this document. Similar to the approach taken to estimate the mortality benefits of a nicotine product standard for secondhand smoke exposure, estimation of the mortality benefits of a nicotine product standard for smoking-related fires, smoking-related perinatal conditions, and use of non-premium cigars and pipe tobacco used a consistent approach. This approach relied on scaling the estimate of 437,400 deaths annually attributable to direct cigarette smoking from 2005–2009 (Ref. 1), to the number of deaths attributed to each of the following causes: smoking-related fires, smoking-related perinatal conditions, and use of non-premium cigars and pipe tobacco. That ratio was then applied to the model-derived projected changes in avoided cigarette-attributable deaths under the main product standard scenario to project the number of avoided deaths over time from each of these causes (*i.e.*, smoking-related fires, smoking-related perinatal conditions, and use of non-premium cigars and pipe tobacco) (see table 10).

During 2012–2016, an estimated annual average of 18,100 reported home structure fires in the United States were caused by smoking materials, which killed an average of 590 people annually (Ref. 591). Moreover, smoking materials remain a leading cause of fatal home fires in the United States, and people who smoke are not the only victims (Ref. 592). By one estimate, one out of every four fatal victims of smoking-material fires is not the person whose cigarette initiated the fire (Ref. 593). A lower prevalence of cigarette smoking and reduced cigarette consumption is likely to decrease the occurrence of fires caused by smoking materials, including cigarettes and other combusted tobacco products. To estimate the impact of a

nicotine product standard on the number of deaths caused by smoking-related fires, we applied the average of 590 deaths annually from 2012–2016 from home structure fires started by smoking materials (Ref. 591). We calculated the ratio of smoking-related fire deaths to cigarette-attributable deaths to be approximately 0.1 percent and applied that value to the projections of avoided cigarette-attributable deaths, yielding an estimate of approximately cumulative 2,400 deaths due to smoking-related fires avoided by 2060, rising to approximately cumulative 5,900 deaths avoided by the end of the century (table 10).

Cigarette smoking is responsible for approximately 1,000 deaths from perinatal conditions annually, including over 600 deaths from prenatal conditions and 400 deaths from SIDS (Ref. 1). Exposure to secondhand smoke can also cause adverse health effects in infants and children. Currently, approximately half of all U.S. children and adolescents ages 3–18 years are exposed to cigarette smoke regularly at home or other locations that still permit smoking (Ref. 1). Exposure to cigarette smoke among children and adolescents can trigger asthma attacks and lead to more frequent respiratory infections compared to those not exposed to smoke (Ref. 1). Prenatal tobacco exposure and postnatal secondhand smoke exposure increase the risks of fetal deaths, fetal growth restriction/low birth weight, respiratory conditions, and SIDS (Ref. 15, Ref. 1). In addition, thirdhand smoke—the chemical residue from combusted tobacco smoke that can become embedded in the environment (*e.g.*, carpet, dust)—results in exposure to harmful constituents, such as tobacco specific nitrosamines (Ref. 138). Exposure to thirdhand smoke is especially concerning for young children, given their size and behaviors, like crawling on the ground and frequently putting their hands in their mouths.

FDA estimated the impacts of a potential nicotine product standard on perinatal mortality by first calculating the ratio of perinatal deaths (1,013 deaths; (Ref. 1)) to primary smoking-attributable deaths. That value, 0.2 percent, was then applied to the projections of cigarette-attributable deaths avoided yielding an estimate of approximately 4,100 cumulative perinatal deaths avoided by 2060, rising to approximately 10,200 cumulative deaths avoided by the end of the century (table 10). Since decreases in cigarette smoking prevalence under the proposed product standard would have immediate, rather than lagged, impacts

on fetal health and the health of newborn children, we expect avoided smoking-attributable perinatal deaths to accrue more rapidly than the estimates presented here.

The smoke of other combusted tobacco products, particularly those that could be alternatives to cigarettes, such as cigars and pipes, contains many of the same toxic constituents as cigarette smoke, sometimes at even greater concentrations, and consequently carries significant health risks (Refs. 53 and 594). In fact, NNAL concentrations measured in people who smoke cigars daily were found to be as high as those measured in people who smoke cigarettes daily (Ref. 160). Cigar and/or pipe smoking cause cancers of the lung and upper aerodigestive tract, including the oral cavity, oropharynx, hypopharynx, larynx and esophagus (Ref. 158). Additional evidence suggests that cigar and/or pipe smoking is causally associated with cancers of the pancreas, stomach, and bladder (Ref. 165). People who smoke cigars also have increased risks for coronary heart disease and COPD compared with people who have never used tobacco (Ref. 166). In a 2014 publication, researchers estimated that regular cigar smoking was the cause of approximately 9,000 premature deaths in the year 2010, and more than 140,000 years of potential life lost in the United States in 2010 (Ref. 134). The total number of cigar-attributable deaths may be even larger for several reasons. For example, the analysis included only causes of death found to be statistically significantly higher in two cohorts that studied people who smoke cigars, although there may be additional causes of death that are attributable to cigar smoking. In addition, there may be increases in cigar smoking relative risks over time, due to greater variety of cigar products and differences in inhalation patterns (Ref. 134). Therefore, cessation and reduced initiation of combusted tobacco products other than cigarettes as a result of the proposed product standard could yield even greater public health impacts than those presented.

To estimate the impacts of a potential nicotine product standard on avoided deaths attributable to covered cigar products, we used estimates of premature deaths attributable to regular cigar smoking from a prior publication (Ref. 134). Given that the prior analysis included all cigar types in its estimate of 9,246 premature deaths for the year 2010 and that we did not include premium cigars in our current analysis, we estimated the fraction of deaths attributed to cigar products other than premium cigars. We estimate that

among people who ever smoked cigars fairly regularly and now smoke every day or some days in Wave 4 of the PATH Study, 80 percent reported smoking non-premium cigars and 20 percent reported smoking premium cigars, using a classification methodology described previously (Ref. 290) and subsequently updated (Ref. 595). On that basis, 7,397 (*i.e.*, $9,246 \times 0.8$) deaths annually are attributed to using non-premium cigar products. By considering a relatively stable trend in adult cigar use³⁵ and assuming that adult cigar use is the main driver of cigar-attributable deaths in the close future, we assumed that non-premium cigar-attributable mortality would remain constant at 7,397 cigar-attributable deaths per year through 2065 (or roughly the time at which people who use cigars aged 26 and older in 2021 would all have reached age 70 and older). However, as youth and young adult cigar smoking has declined in recent years, we adopt a different trend in baseline cigar-attributable mortality in the further future (after 2065). To obtain baseline non-premium cigar-attributable mortality from 2066 through the end of the modeling period (2100), we assume non-premium cigar-attributable mortality will eventually follow the observed relative decline in cigar use among young adults as they reach older ages. Specifically, we assume that non-premium cigar

smoking-attributable deaths among youth who initiate cigar smoking will decrease on average by 37.5 percent³⁶ over 40 years (from 2078 to 2117).³⁷ That is, the cigar smoking-attributable deaths will decrease on average to 4,600 ($\approx 7,397 \times (1 - 0.375)$) deaths per year over the period from 2078 to 2117. Assuming a linear decrease in cigar smoking-attributable mortality from 2065 to 2117, and an average of approximately 4,600 deaths per year over the period from 2078 to 2117, implies non-premium cigar smoking-attributable mortality will decline linearly from 7,397 in 2065 to approximately 4,390 deaths in 2100. We assume a linear decrease for simplicity and because trends for cigar use considered in this post-processing strategy come from a short interval (PATH Study data, Waves 1 to 5, and Waves 3 to 5). We then calculate the ratio of non-premium cigar to cigarette-attributable deaths for each year in the projection period and apply those values to the projections of avoided cigarette-attributable deaths to estimate non-premium cigar-attributable deaths under the nicotine policy scenario. Using this approach, by 2060, we estimate approximately 54,800 cumulative deaths due to non-premium cigar products would be avoided, rising to approximately 214,700 cumulative deaths avoided by 2100 (see table 10). Similar methods were used to calculate

estimates accounting for the mortality effects of a product standard prohibiting characterizing flavors other than tobacco in cigars. These estimates reduced baseline non-premium cigar-attributable deaths in a phased-in manner reaching a constant reduction of 780 deaths averted per year after 30 years (Ref. 597). These estimates and results are presented in detail in sections VIII.E and VIII.F of this document. To estimate the impacts of a nicotine product standard on avoided deaths attributable to pipe tobacco smoking, we used the estimate of 1,095 premature deaths per year provided by a prior analysis (Ref. 598). We calculated the ratio of pipe tobacco to cigarette-attributable deaths to be 0.3 percent and applied that value to the projections of avoided cigarette-attributable deaths, yielding an estimate of approximately 4,500 cumulative deaths due to pipe tobacco smoking avoided by 2060, rising to approximately 11,000 cumulative deaths avoided by the end of the century (see table 10). Based on these collective findings and estimates, FDA anticipates that the proposed product standard will further improve public health due to the impacts of reduced cigarette smoking on smoking-related fires and perinatal conditions, in addition to the impacts of reduced use of other, non-cigarette combusted tobacco products covered by this proposed rule.

TABLE 10—PROJECTED NUMBER OF TOBACCO-ATTRIBUTABLE DEATHS AVOIDED FOR SMOKING RELATED FIRES, SMOKING RELATED PERINATAL CONDITIONS, NON-PREMIUM CIGAR AND PIPE TOBACCO USE AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027

Year	Scenario	Cumulative smoking-related fire deaths avoided	Cumulative perinatal deaths avoided	Cumulative non-premium cigar-attributable deaths avoided	Cumulative pipe tobacco-attributable deaths avoided
2040	Median (5th, 95th)	600 (100, 700)	1,000 (100, 1,200)	8,900 (1,000, 11,000)	1,100 (130, 1,300)
2060	Median (5th, 95th)	2,400 (600, 2,700)	4,100 (900, 4,600)	54,800 (13,200, 60,500)	4,500 (1,000, 5,000)
2080	Median (5th, 95th)	4,200 (1,300, 4,600)	7,300 (2,200, 7,900)	134,700 (46,000, 144,100)	7,900 (2,400, 8,600)
2100	Median (5th, 95th)	5,900 (2,300, 6,400)	10,200 (3,900, 10,900)	214,700 (91,600, 225,800)	11,000 (4,200, 11,800)

6. Public Health Benefits of the Proposed Standard Not Addressed in FDA’s Population Health Model

While FDA’s population health model’s estimates of the potential impact from a nicotine product standard

³⁵ Adult cigar smoking has historically remained stable. Data from the NHIS over 2000–2015 has shown that prevalence of current cigar smoking has remained generally stable at around 2.3 percent among U.S. adults aged 18 years and older (Ref. 596). Adult (ages 26 or older) cigar use also remained relatively stable in NSDUH data for 2011 and 2019 and did not significantly change (4.2 percent in 2011 to 4.0 percent in 2019 for cigars) (Ref. 286).

³⁶ According to data from the PATH Study, young adult (ages 18–24) past 30-day cigar use declined

suggest a significant public health benefit to the United States resulting from substantial reductions in smoking prevalence, these analyses do not address other additional benefits. The overall public health benefits of this

from 15.7 percent during Wave 1 (2013–2014) to 11 percent during Wave 5 (2018–2019), representing a 30 percent relative decline in prevalence. Additionally, data from the PATH Study Waves 3 (2015–2016) and 5 (2018–2019) indicate that cigar use among 18-year-olds declined from 7.2 percent to 3.9 percent, implying a steeper decline of approximately 45 percent in more recent years within this smaller age cohort. We use these two data points to estimate the decrease in cigar smoking among young people because both provide relevant information from a national survey that is

proposed product standard are likely to be even greater than those quantified, since our analysis does not account for the full range of impacts that smoking has on public health in the United States.

specific to tobacco use and average them to produce an estimate of 37.5 percent (*i.e.*, $(30 + 45)/2$).

³⁷ For youth, we assume that initiation occurs by the age of 18, followed by a cigar smoking-attributable death 52 years later. We then assume cigar use initiation occurs during years 2025 to 2064 (40-year period), and cigar smoking-attributable deaths begin to occur a year after the period from 2077 (*i.e.*, 2025 + 52) through 2116 (*i.e.*, 2064 + 52); that is, over the period from 2078 to 2117.

First, although we estimated the impact of self-reported quality of life, this may not capture the full breadth and depth of smoking-attributable morbidity. Tobacco smoke exposure can cause immediate and long-term adverse health effects (Ref. 1). Cigarette smoking “has been causally linked to diseases of nearly all organs of the body, to diminished health status, and to harm to the fetus” (Ref. 1). Each year, an estimated 480,000 people in the United States die from smoking; the U.S. Surgeon General has reported that for every person that dies from smoking, about 30 individuals will suffer from at least one smoking-related disease (Ref. 1). One study estimated that individuals in the United States have had 14.0 million major smoking-attributable conditions, including more than 7.4 million cases of COPD, nearly 2.3 million heart attacks, 1.8 million cases of diabetes, nearly 1.2 million stroke events, more than 300,000 cases of lung cancer, and nearly 1 million cases of other smoking-attributable cancers (*i.e.*, bladder, cervix, colon/rectum, kidney, larynx, mouth, tongue, lip, throat, pharynx, stomach) (Ref. 564). Cigarette smoking, in addition to causing disease, can diminish overall health status leading to higher risks for surgical complications, including wound healing and respiratory complications, increased absenteeism from work, and greater use of healthcare services (Ref. 1). In terms of a monetary measure of the impact of cigarette smoking on the public health, in 2018, cigarette smoking cost the United States more than \$600 billion, including more than \$240 billion in healthcare spending (Ref. 10), nearly \$185 billion in lost productivity from smoking-related illnesses and health conditions (Ref. 10), nearly \$180 billion in lost productivity from smoking-related premature death (Refs. 1 and 10), and \$7 billion in lost productivity from premature death from secondhand smoke exposure (Refs. 1 and 11). Increased smoking cessation, reduced cigarette consumption, and lower progression to regular use will reduce both mortality from smoking and the enormous burden of cigarette-attributable diseases in the United States.

Second, the estimated impacts to public health do not include the reductions in morbidity associated with reduced exposure to secondhand smoke among infants and children. A report of the U.S. Surgeon General (Ref. 1) found that approximately half of all children and adolescents ages 3–18 in the United States are exposed to cigarette smoke regularly at home or other locations that

still permit smoking. Also, a recent study using NYTS data reported that, in 2019, 25.3 percent and 23.3 percent of students were exposed to home and vehicle secondhand smoke, respectively (Ref. 145). Exposure to cigarette smoke among children and adolescents can trigger asthma attacks and lead to more frequent respiratory infections compared to those not exposed to smoke (Ref. 1).

Third, a lower prevalence of cigarette smoking and reduced cigarette consumption will decrease the occurrence of fire-related injuries and damages caused by smoking materials, including cigarettes and other combusted tobacco products. From 2012 to 2016, an estimated average of 18,100 home structure fires in the United States annually were caused by smoking materials (Ref. 591). Reductions in smoking as a result of the proposed nicotine product standard are likely to lead to not only fewer fatalities (as described previously) but also reductions in the annual average of 1,130 injuries (Ref. 591).

Fourth, these projections did not include the potential health benefits associated with people who smoke cutting down on the number of cigarettes smoked as a result of the proposed nicotine product standard. Quitting cigarette smoking entirely clearly leads to the greatest reductions in disease risk, and duration of smoking has been shown to be a greater driver of disease risk than frequency of use (Ref. 28). Although some studies have not found evidence of lower disease risk after cutting down on cigarettes (Refs. 28, 266, 599 to 601), others have shown that substantial reductions in cigarette consumption can lead to some reductions in disease risk, especially for lung cancer, for those who would have otherwise continued to smoke (Ref. 602). Such studies have found decreased risk of lung cancer deaths (Ref. 603) and decreased risk of lung cancer among people who smoke who reduce cigarette consumption (Refs. 604 and 605). As described above, studies of VLNC cigarettes have shown that their use results in reductions in cigarettes smoked per day and exposure to toxic constituents among individuals who continue to smoke, which may reduce smoking-related disease risks. Consequently, additional public health benefits may be observed among those who continue to smoke cigarettes (but substantially fewer CPD) after a nicotine product standard is in place.

7. Potential Risks to the Population as a Whole of the Proposed Nicotine Product Standard Versus the Potential Benefits of the Proposed Product Standard

There are possible countervailing effects that could occur from the proposed product standard, if finalized, and potential factors that could limit its population health effect. Potential risks to the population, however, would generally only occur among individuals currently smoking cigarettes and other combusted tobacco products covered by the scope of this proposed rule, as FDA concludes there are little to no risks to those who do not use tobacco. These potential risks do not offset the anticipated benefits of the rule. The countervailing or limiting effects on people who currently use tobacco products could include compensatory smoking. As part of this rulemaking, FDA is required by the Tobacco Control Act to consider information submitted on such possible countervailing effects, including among populations that are disproportionately impacted by tobacco-related morbidity and mortality, such as adolescents who use tobacco and other populations.

With a lower level of nicotine in cigarettes, some people who use cigarettes and certain other combusted tobacco products could alter their smoking behavior in the form of compensatory smoking (*i.e.*, a change in normal smoking behavior that would increase exposure to cigarette smoke to compensate for reduced nicotine intake) when switching from usual brand or NNC cigarettes to VLNC cigarettes. This concern is echoed in qualitative research of people who currently use tobacco who report fears that a potential reduction in nicotine will cause them to engage in compensatory smoking (Refs. 264, 606 to 608). Compensatory smoking—or compensation—occurs when people who smoke seek to obtain the amount of nicotine needed to sustain their addiction by smoking more CPD, taking more and deeper puffs, or puffing with a faster draw rate. In both brief and extended exposure studies with VLNC cigarettes, compensation was measured using CPD, puff topography measures, and biomarkers of CO exposure, such as breath CO or COHb. Some transient compensatory smoking may occur following initial VLNC cigarette exposure. However, after continued use of VLNC cigarettes, people who smoke stop attempting to compensate for the reduced nicotine content, because they are unable to obtain adequate amounts of nicotine through these behaviors. The following

paragraphs discuss data demonstrating this outcome. See also section VII.B of this document discussing compensatory smoking with an immediate nicotine reduction approach versus a gradual reduction approach.

When exposure to VLNC cigarettes is brief (*e.g.*, the first few uses of VLNC cigarettes), transient compensatory smoking may occur. In brief exposure studies, changes in smoking topography (Refs. 393 to 395) and increases in CO (Refs. 393, 411, and 420) have been observed. For example, one study demonstrated the transient nature of compensatory smoking by showing increases in smoking topography and CO exposure during the first and second exposures to VLNC cigarettes, followed by the subsequent dissipation of these effects by the third and fourth exposures (Ref. 394). Similarly, another study found that during a 5-day study where participants checked into a hotel and were restricted to only study-issued cigarettes, mouth-level nicotine exposure indicated that participants initially puffed VLNC cigarettes with greater intensity than NNC cigarettes, although this effect diminished across sessions (Ref. 609). However, results from the majority of studies show no compensatory smoking as a result of switching from usual brand or NNC cigarettes to VLNC cigarettes. Although not all studies examined every measure of compensatory smoking, most studies found no differences between control and VLNC cigarette conditions regarding CPD (Refs. 5, 32, 34, 40, 41, 265, 331, 374, 387, 386, 390, 396, and 415), CO exposure (Refs. 5, 32, 34, 40, 41, 265, 374, 381, 390, 391, 396, 402, 409, 410, 412 to 414, 467, and 610), smoking topography (Refs. 381, 391, 403, 411, 415, and 611), or all three measures (Refs. 329, 382 to 384).

Notably, compensatory smoking has been observed with some reduced nicotine content cigarettes containing intermediate levels of nicotine (*e.g.*, LNC cigarettes). For example, in a study of 165 people who use cigarettes assigned to switch to LNC cigarettes or VLNC cigarettes, researchers found small but statistically significant differences in CPD between the LNC and VLNC cigarette conditions, such that LNC CPD increased over the course of the 6-week intervention, while VLNC CPD decreased (Ref. 32). However, one of the largest studies involving reduced nicotine content cigarettes found no compensatory smoking behavior for cigarettes containing intermediate levels of nicotine (Ref. 29). Therefore, FDA concludes the nicotine level proposed for this standard would result in limited, if any, compensatory smoking

that would likely dissipate over time. These data also support FDA's proposed immediate nicotine reduction approach (see section VII.C of this document).

Studies consistently report that consumers have misperceptions about the harms of nicotine and VLNC cigarettes (see sections IV.F and V.B of this document). A majority of U.S. consumers incorrectly believe that nicotine is the primary cause of cancer and health harms from cigarettes (Refs. 227 to 229, 232, 233, 235 to 245, 264, and 612 to 618), and a proportion of consumers with this misperception also believe that RNC cigarettes are less harmful than NNC cigarettes (Refs. 260 to 262). Additionally, while a majority of consumers understand that nicotine is addictive (Refs. 227 to 229, 232, 233, and 619), they do not necessarily believe that RNC cigarettes would be less addictive than NNC cigarettes (Refs. 260 and 261). There is also evidence from qualitative studies showing that some consumers do not understand the technical feasibility of reducing nicotine in cigarettes to minimally addictive or nonaddictive levels, which may impact consumers' ability to comprehend and accept messages communicating the policy (Refs. 270 and 229). FDA recognizes the importance of addressing consumer misperceptions of the harm and addictiveness of nicotine and VLNC cigarettes to minimize the unintended effects of a proposed product standard that limits the level of nicotine in cigarettes and certain other combusted tobacco products to make those products minimally addictive or nonaddictive. FDA will continue to conduct research on consumer perceptions of tobacco product harms, use communication tools (*e.g.*, consumer outreach, public education initiatives, engagement with interested parties), and consider further regulatory options within our authorities (*e.g.*, potential future labeling and advertising regulations) to ensure that all consumers are informed of the risks of using tobacco products that contain nicotine, including VLNC cigarettes.

Prior work also has explored whether the proposed product standard may have a differential impact on specific populations. Studies that have investigated the effects of VLNC cigarettes in adolescents who smoke cigarettes have done so under conditions of brief exposure (*e.g.*, single exposure to a VLNC cigarette in a laboratory setting). A study comparing VLNC and LNC cigarette smoking topography in adolescents who smoke cigarettes found that participants took statistically significantly more puffs from the VLNC cigarette compared to

the LNC cigarette, and a non-significant trend emerged such that increases in breath CO were higher after smoking the VLNC cigarette compared to the LNC cigarette (Refs. 395 and 416). However, the LNC cigarette was rated as statistically significantly more pleasant than the VLNC cigarette (Ref. 395).

Similar to studies in adults who smoke cigarettes, studies in youth and young adults who smoke cigarettes have shown that positive subjective effects ratings (*e.g.*, "satisfaction," "pleasure," "taste," "strength," and "stimulation") are lower for VLNC cigarettes compared to LNC and NNC cigarettes. A laboratory study of people ages 15–19 who smoke found no effect of nicotine content on withdrawal, negative affect, or CO boost; however, NNC cigarettes were associated with greater reductions in craving and increased smoking satisfaction relative to VLNC cigarettes (Ref. 442). A similar laboratory study in young adults (age 18–25) found no influence of nicotine content on total nicotine withdrawal score, affect, or smoking topography; however, NNC cigarettes were associated with increased subjective effects ratings compared to LNC and VLNC cigarettes (Ref. 620). Notably, a secondary analysis of data from a clinical trial (Ref. 29) found that, at the end of the 6-week trial, there was no influence of age on subjective effects, TNE levels, or puff volume in participants who smoked LNC or VLNC cigarettes (Ref. 621).

Several studies have examined the effects of nicotine content in cigarettes on adolescents and young adults who smoke. One laboratory study that assessed the effects of nicotine content and menthol preference among adolescents (ages 15–19) who smoke found that VLNC cigarettes were rated statistically significantly lower than NNC cigarettes, and menthol preference did not affect subjective effects ratings of VLNC cigarettes (Ref. 408). One study also found that young adults (ages 18–24) who smoke exhibited lower demand for LNC and VLNC cigarettes than adults, but there were no other differences between the two age groups in smoking topography, breath CO, cigarette puffs, craving, withdrawal, or smoking urge measures (Ref. 622). Another study investigating how nicotine exposure contributes to relief of craving and negative affect among young adults (ages 18–25) who smoke found that smoking reduced craving and negative affect regardless of nicotine content, and smoking topography did not vary as a function of nicotine content (Ref. 611). Finally, a study of youth and young adults who smoke found that two-thirds of participants

believed that study cigarettes had lower health risks than usual brand cigarettes, that they were largely concerned with compensatory smoking following a nicotine reduction policy, and that half stated an intention to quit smoking after the policy is put in place while the other half would continue to smoke or switch to another tobacco product (Ref. 606).

One study assessed longer duration effects (*i.e.*, 3 weeks) of VLNC cigarettes in adolescent daily smokers (ages 15–19) not currently intending to quit. Participants assigned to smoke VLNC cigarettes smoked significantly fewer total CPD than those in the NNC cigarette group. VLNC cigarettes were associated with lower levels of craving reduction than NNC cigarettes; however, there were no differences nicotine dependence or TNE levels among VLNC and NNC cigarette groups at the end of the study (Ref. 623). A secondary analysis of this study showed that participants assigned to smoke VLNC cigarettes had significantly lower demand for study cigarettes than those assigned to smoke NNC cigarettes, suggesting that a nicotine reduction policy may reduce the reinforcing value of combusted cigarettes in adolescents (Ref. 624).

In summary, while existing data suggest that adolescents prefer LNC cigarettes over VLNC cigarettes, and that they may display compensatory smoking behaviors in response to VLNC cigarettes, these data are limited. As discussed in section VII.B of this document, compensation typically dissipates after repeated exposure. Thus, in the absence of extended exposure studies, it is difficult to draw conclusions regarding the effects of VLNC cigarette use on compensatory smoking in adolescents and young adults.

Individuals with symptoms of mental health disorders smoke cigarettes in disproportionately large numbers. People with symptoms of mental health disorders who smoke cigarettes have increased nicotine withdrawal symptoms (Refs. 625 and 626) and are more likely to smoke to ameliorate negative mood (Ref. 627). As a result, this population has increased risk of tobacco-related mortality (Ref. 130).

Researchers have investigated the effects of VLNC cigarettes in people who use cigarettes with symptoms of mental health disorders to determine whether VLNC cigarettes are associated with differential effects on craving, withdrawal, smoking topography, or use behavior among this group compared to the general population. In this group, as in the general population, NNC

cigarettes were associated with greater reductions in craving and withdrawal symptoms compared to VLNC cigarettes. In this group, VLNC cigarettes were not associated with increased markers of compensatory smoking (*e.g.*, smoking topography, CO) compared to the general population. Researchers also assessed psychiatric symptomatology as a function of VLNC cigarette use and found that VLNC cigarettes were associated with improvements in mood symptoms, likely due to the anxiety-increasing properties of nicotine.

Several studies investigated the effects of LNC and VLNC cigarettes on mood following mood induction (*i.e.*, an experimental method for inducing a specific mood state) in people who use cigarettes with symptoms of mental health disorders (Refs. 434, 450, and 628). These studies found that, following positive mood induction, LNC cigarettes compared to VLNC cigarettes were associated with an enhancement of positive mood among people who smoke and are prone to depression, but not control participants (Refs. 450 and 628). In addition, LNC cigarettes, but not VLNC cigarettes, were associated with a worsening of negative mood in response to negative mood induction among people who smoke, regardless of baseline mental health status (Ref. 628). Similarly, following an anxiety-eliciting mood induction, participants with post-traumatic stress disorder self-reported greater relief of anxiety after smoking LNC cigarettes compared to VLNC cigarettes; however, LNC cigarettes increased physical autonomic symptoms of anxiety (*e.g.*, skin becomes a better conductor of electricity, heart rate) relative to VLNC cigarettes (Ref. 434).

A secondary analysis of an extended exposure study assessed the effects of cigarettes varying in nicotine content on changes in psychiatric symptomatology among those with and without elevated depression symptoms (Ref. 629). Among participants with elevated depression symptoms, those assigned to smoke LNC or VLNC cigarettes for 6 weeks had lower depressive symptoms at the end of the study compared to those assigned to smoke NNC cigarettes. Another study that assigned participants with serious mental illness to receive either NNC or VLNC cigarettes saw no change in participants' psychiatric symptoms at the end of 6 weeks (Ref. 440).

Several studies assessed the effects of VLNC cigarettes on smoking rates, nicotine craving, dependence, withdrawal, and subjective effects among those with symptoms of mental health disorders (Refs. 391, 409, 434, 467, 468, 629, and 630). While some

studies found no statistically significant differences in craving or withdrawal as a function of nicotine content following brief smoking abstinence in those with symptoms of mental health disorders (Refs. 391, 434, and 467), others showed that use of usual brand cigarettes was associated with larger decreases in craving and withdrawal compared to VLNC cigarettes (Ref. 468). An extended exposure study found that, relative to NNC cigarettes, use of LNC and VLNC cigarettes reduced smoking rates, nicotine dependence, and cigarette craving, and these effects were not moderated by baseline depressive symptoms (Ref. 629). In addition, similar to the general population, people who smoke with poor mental health rate NNC cigarettes as more rewarding (*e.g.*, taste, satisfaction) and reinforcing compared to VLNC cigarettes (Refs. 391, 450, 467, and 628). Additionally, a 33-week study that randomized participants to either NNC cigarettes or a gradual nicotine reduction to VLNC levels found that the gradual reduction group exhibited significantly lower cotinine levels, CPD, and exhaled CO compared to the NNC cigarette group. Mental health effects and adverse events did not significantly differ between the two groups, and significantly more participants in the gradual nicotine reduction group were abstinent at the end of the treatment compared to the NNC cigarette group (Ref. 631).

A study that compared the effects of VLNC, LNC, and NNC cigarettes on smoking behavior in people with opioid use disorder who smoke cigarettes, women of childbearing age with a high school education or less who smoke cigarettes, or individuals with affective disorders who smoke cigarettes found no statistically significant differences in smoking topography or breath CO as a function of nicotine content (Ref. 391). Subsequent analyses of this study also found that cannabis use status, presence of chronic health conditions, and sex did not correlate with differences in smoking topography or the reinforcing effects of nicotine among people who smoke (Refs. 459 and 632). A larger 12-week RCT among these same three populations found statistically significantly lower CPD and nicotine dependence levels across study weeks among those assigned to received VLNC or LNC cigarettes compared to those assigned to receive NNC cigarettes (Ref. 633). A secondary analysis of this study found no statistically significant effects of nicotine dose or population on tests of cognitive performance, suggesting that cognitive performance was not

significantly impaired with prolonged exposure to VLNC cigarettes among vulnerable populations (Ref. 634). A study among participants with schizophrenia found that both people with schizophrenia who smoke and control participants smoked fewer puffs and had lower total puff volumes, shorter inter-puff intervals, longer puff durations, and marginally higher individual puff volumes when smoking VLNC cigarettes compared to usual brand cigarettes (Ref. 467). However, a subsequent analysis using data from this same study showed that these differences were not associated with increases in breath CO boost (Ref. 392).

A 33-week randomized clinical study evaluated the effects of gradually reducing the nicotine content in cigarettes to VLNC cigarette levels on ratings of dependence, biomarkers, and cessation in 245 adults of low socioeconomic status. CPD, plasma cotinine, CO, and NNAL levels were significantly lower for the gradual reduction group compared to the NNC cigarette group; however, there were no significant differences in dependence or withdrawal as a function of group. Those who received VLNC cigarettes were statistically significantly more likely to make a quit attempt during the study compared to those in the NNC cigarette group; however, there was no statistically significant difference in quit rates as a function of group among those who chose to make a quit attempt (Ref. 635). A secondary analysis of this study showed that outcomes did not differ as a function of menthol status, except that those participants who smoked menthol cigarettes had less of a cotinine reduction (Ref. 636).

Several studies used laboratory paradigms to assess the effects of alcohol on specific components of smoking behavior for nicotine versus non-nicotine factors in people who consume alcohol heavily. One study found that alcohol increased smoking urge and subjective ratings of smoking for both NNC and VLNC cigarettes (Ref. 637), while another study found that NNC cigarettes were associated with increases in subjective effects and a greater reduction in cigarette craving than VLNC cigarettes, and these effects were enhanced by ethanol self-administration (Ref. 448). In addition, in a sample of people who smoked who also regularly consumed alcohol, NNC cigarettes reduced craving and increased cognitive performance compared to VLNC cigarettes (Ref. 448). Furthermore, several secondary analyses of clinical studies found no evidence that alcohol or marijuana use moderates the effects of VLNC cigarettes, and VLNC cigarette

use does not increase compensatory alcohol, marijuana, or other illicit drug use (Refs. 386, 632, and 638). However, one secondary analysis found that although 20-weeks of VLNC cigarette use reduced CPD compared to NNC cigarette use, co-users of marijuana and cigarettes showed increased marijuana use when assigned to VLNC cigarettes (Ref. 639).

In summary, research has shown that VLNC cigarettes reduce the number of cigarettes smoked per day among populations that use tobacco at disproportionately high levels, including those of low socioeconomic status, and those with mental or behavioral health conditions. Importantly, there has been little to no evidence that VLNC cigarettes increase risk of adverse effects (*e.g.*, exacerbations of psychiatric symptomatology, drug use) in these populations. The proposed nicotine product standard is not anticipated to be detrimental to these populations; rather, it is anticipated to benefit these groups, as well as the general population as a whole.

FDA recognizes that actors participating in illicit markets are unlikely to conform their products and sales to Federal, State, and local laws. As discussed elsewhere in this document, the available evidence suggests that the health impacts of counterfeit products should be minimal. As the National Research Council (NRC) and the Institute of Medicine (IOM) (NRC/IOM) Report notes, “Research on counterfeit cigarettes to date has shown some differences in levels of tar and selected toxicants in comparison with conventional cigarettes . . . but these elevated levels have not been shown to affect overall toxicity and, based on current evidence, are unlikely to significantly increase the health risk of an already dangerous product” (Ref. 560). Even in studies (Ref. 640) that suggest that counterfeit cigarettes can contain higher levels of harmful substances, the studies cannot make conclusions about the individual or population-wide health risks from such substances, in part because of the variations between them, inconsistent distribution of the products among the population, and inconsistent use among consumers. FDA will continue to monitor the best available science to determine if this changes in the future.

Based on the available evidence, FDA finds that, while there may be potential risks that could diminish the expected population health benefits of the proposed standard, such effects would be significantly outweighed by the potential benefits of the proposed

nicotine product standard. FDA requests additional information concerning the potential risks discussed in this section, as well as any other negative effects that could result from this rule, and how they could be minimized.

E. Approach Concerning Adjustments to Inputs to the Model Accounting for Other Tobacco Product Standards

In 2022, FDA issued proposed tobacco product standards to prohibit menthol as a characterizing flavor in cigarettes and to prohibit all characterizing flavors (other than tobacco) in cigars (87 FR 26454, May 4, 2022). If finalized, these rules are anticipated to reduce overall youth initiation and increase cessation among individuals who smoke cigarettes and cigars. In this adjusted model, we utilized estimates of the likely population health impact of these rules, quantified in peer-reviewed publications and discussed in the rules, to adjust the baseline inputs for initiation of combusted and noncombusted products, as well as cessation of combusted products and likelihood of switching to incorporate the impact of the final rules in this proposed nicotine product standard.

We quantified the potential impact of a menthol cigarette product standard on the U.S. population (87 FR 26454), assuming that the implementation of a rule prohibiting menthol affects baseline model input parameters associated with smoking initiation, smoking cessation, noncombusted initiation, and switching from cigarettes to noncombusted products. To avoid confusion with the main analysis baseline scenario, we called this new scenario a “menthol product standard baseline scenario.” First, we assumed that a menthol product standard is implemented in 2025, 2 years before the implementation of a potential nicotine product standard in 2027. Changes in tobacco use behaviors due to the implementation of a menthol product standard (primarily for people who would initiate future menthol cigarette use and people who currently use menthol cigarettes) were derived from an expert elicitation that was developed to assess the impact of a menthol product standard on smoking initiation and cessation, and on noncombusted use (Ref. 562). Specifically, 11 experts were asked to estimate anticipated behaviors under a menthol product standard, including transitioning to illicit menthol combusted products, switching to non-menthol combusted products, switching to ENDS products or HTPs, or quitting use of all tobacco products. We used the results of the expert elicitation (finalized in September 2020) to

compute factors that can be used to scale smoking initiation and cessation rates, as well as switching and noncombusted initiation, accounting for a potential reduction/increase in rates. People who currently smoke non-menthol cigarettes were assumed to be unaffected by a menthol product standard. We used the average impact scenario from Levy et al. 2023 (Ref. 562) to be consistent with the approach taken in the proposed menthol product standard rule. Details regarding the calculation of scaling factors, considering the expert elicitation data, can be found in Appendix K of FDA's modeling document (Ref. 42).

In the menthol product standard baseline scenario, baseline smoking initiation and noncombusted initiation rates were adjusted starting in 2025 (*i.e.*, year of a potential menthol prohibition implementation) until the end of the simulation period. Also, baseline smoking cessation and complete switching (from cigarettes to noncombusted products) were adjusted only at the first year of such a potential menthol product standard implementation. After the first year, when a sudden increase in smoking cessation and complete switching was incorporated, the remaining people who smoke initiated use of non-menthol or illicit menthol cigarettes, subject to the cessation and complete switching rates for people who smoke non-menthol cigarettes (Ref. 641). We conducted the analysis considering a mean decrease in cigarette smoking initiation (based on estimates from an expert elicitation), a mean increase in noncombusted product initiation, and a mean increase in smoking cessation and switching, as presented in Levy et al. 2023 (Ref. 562). It is important to note that the menthol-adjusted population health model does not directly estimate the public health impacts of a prohibition on menthol as characterizing flavor in cigarettes. In other words, the difference between the unadjusted baseline scenario and menthol-adjusted baseline scenario of the model should not be expected to approximate the impact of a potential menthol product standard. FDA's determination of the estimated public health impact of the menthol product standard is discussed in detail in the preamble to the proposed menthol product standard. In the nicotine population health model, FDA utilizes results from an expert elicitation (Ref. 562) developed to estimate changes in

tobacco use behaviors resulting from a menthol product standard (such as changes in smoking initiation or cessation) to adjust for the effect of a menthol rule over time. One important assumption of the FDA model is that the nicotine product standard would be implemented in 2027, whereas a menthol rule would be implemented in 2025. This is important to keep in mind as public health benefits attributable to a menthol rule (such as mortality and morbidity health impacts) will be accruing for 2 years before implementation of the nicotine product standard (and, therefore, not captured in this model).

A more comprehensive analysis of the public health impact of the menthol cigarette product standard can therefore be found in the proposed menthol product standard. There are also other important differences between the menthol-adjusted FDA model and the Levy et al. modeling approach that can impact comparability, such as input model parameters, modeling frameworks, assumptions, and source data. For these reasons, it is not appropriate to expect that the difference between public health impact estimates of the nicotine product standard with and without the menthol adjustment would directly approximate the potential public health benefits of the menthol product standard as presented in the proposed menthol product standard.

In 2022, FDA also issued a proposed product standard to prohibit characterizing flavors (other than tobacco) in cigars (87 FR 26396, May 4, 2022). It is estimated that such a standard would prevent 780 deaths due to cigar smoking in the United States each year (Ref. 134). A post-processing analysis of cumulative non-premium cigar-attributable deaths avoided was conducted to account for the effects of such a product standard, considering the adjustments due to the menthol cigarette product standard. For this analysis, we assumed both rules—the menthol cigarette and flavored cigar product standards—to be implemented in 2025. Specifically, we assumed that the avoided cigar-attributable deaths expected to result from the flavored cigar rule begin to occur 2 years after the rule's effective date (2027) and would increase in a phased-in manner over a 30-year period. We then assumed a full annual mortality benefit of 780 avoided deaths would continue after 30 years

(from 2026 to 2055), with a constant benefit of 780 deaths avoided until year 2064. We also assumed cigar-attributable deaths will increase from 780 in 2064 to 1,120 in 2100.

Details regarding the calculation of avoided cigar-attributable deaths because of the flavored cigar rule can be found in Appendix L of FDA's modeling document (Ref. 42). The estimated deaths averted by a flavored cigar product standard were subtracted from baseline non-premium cigar deaths in the United States each year to produce yearly estimates for non-premium cigar deaths with a flavored cigar standard. We used these estimates to calculate a ratio of non-premium cigar to cigarette-attributable deaths for each year in the projection period and applied those values to the projections of avoided cigarette-attributable deaths to estimate non-premium cigar-attributable deaths under the nicotine product standard scenario.

F. Benefits and Risks to the Population as a Whole Accounting for Other Tobacco Product Standards

Table 11 presents the impact results of the nicotine product standard using baseline assumptions adjusted for the effect of a menthol cigarette product standard for years 2040, 2060, 2080, and 2100. In general, changes to baseline inputs of initiation and cessation of combusted products as well as switching to noncombusted products as a result of implementation of a menthol cigarette product standard slightly reduced projected smoking prevalence and avoided mortality and morbidity, compared to the main analysis results. Specifically, we estimate that by 2060, the proposed nicotine product standard would avert approximately 1.6 million deaths due to tobacco, rising to approximately 3.4 million by 2100. These estimates are approximately 11 percent and 21 percent less than the corresponding estimates that do not account for the potential impact of a menthol product standard. The reduction in premature deaths as a result of the nicotine product standard, when accounting for a menthol product standard, would result in 17.9 million life years gained by 2060, raising to 60.6 million life years gained by 2100. These estimates represent a 9 percent and 21 percent reduction compared with the corresponding estimates under the main analysis.

TABLE 11—IMPACT OF PROPOSED NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027 ON PROJECTED SMOKING PREVALENCE AND AVOIDED MORTALITY AND MORBIDITY FROM THE MAIN ANALYSIS (UNADJUSTED BASELINE SCENARIO) AND WITH ADJUSTMENT FOR A MENTHOL CIGARETTE PRODUCT STANDARD IMPLEMENTED IN 2025

[Median (5th, 95th percentiles) estimates]

Year/period	Estimates from main analysis	Estimates with adjustment for a menthol cigarette standard
Cigarette Smoking Prevalence (%)		
2040	0.2 (0.07, 4.0)	0.1 (0.06, 2.8)
2060	0.2 (0.07, 2.2)	0.1 (0.05, 1.4)
2080	0.2 (0.06, 2.0)	0.1 (0.05, 1.3)
2100	0.2 (0.06, 1.9)	0.1 (0.05, 1.2)
Cumulative Tobacco-Attributable Deaths Avoided (Millions)		
2040	0.4 (0.1, 0.5)	0.4 (0.1, 0.5)
2060	1.8 (0.4, 2.0)	1.6 (0.4, 1.7)
2080	3.1 (1.0, 3.4)	2.6 (0.7, 2.8)
2100	4.3 (1.6, 4.6)	3.4 (1.1, 3.6)
Cumulative Life Years Gained (Millions)		
2040	2.0 (0.2, 2.7)	2.0 (0.2, 2.6)
2060	19.6 (3.6, 22.7)	17.9 (3.4, 20.4)
2080	47.4 (12.5, 52.5)	40.6 (10.3, 44.5)
2100	76.4 (26.5, 82.5)	60.6 (19.2, 65.3)
Cumulative QALYs Gained from Reduced Smoking Morbidity (Millions)		
2040	9.6 (2.7, 10.0)	7.8 (2.1, 8.1)
2060	24.0 (10.1, 24.7)	17.5 (7.0, 17.9)
2080	38.2 (18.5, 39.2)	26.1 (11.9, 26.6)
2100	53.1 (27.5, 54.4)	34.9 (17.0, 35.7)

Table 12 presents the impact results of the nicotine product standard implemented in 2027, using baseline assumptions adjusted for the effect of a flavored cigar product standard implemented in 2024. We estimate that

by 2060, in the United States, approximately 45,600 deaths due to non-premium cigar use will be averted, rising to approximately 164,000 deaths avoided by 2100 (table 12). In general, these estimates are approximately 17

and 30 percent less than the corresponding estimates without the potential impact of a product standard for flavored cigars.

TABLE 12—PROJECTED NUMBER OF TOBACCO-ATTRIBUTABLE DEATHS FROM NON-PREMIUM CIGAR USE AVOIDED FOR AS A RESULT OF A NICOTINE PRODUCT STANDARD IMPLEMENTED IN 2027 FROM THE MAIN ANALYSIS AND WITH ADJUSTMENT FOR FLAVORED CIGAR AND MENTHOL CIGARETTE PRODUCT STANDARDS IMPLEMENTED IN 2025

Year	Percentiles	Cumulative non-premium cigar-attributable deaths avoided from main analysis	Cumulative non-premium cigar-attributable deaths avoided with flavored cigar and menthol cigarette standards
2040	Median (5th, 95th)	8,900 (1,000, 11,000)	8,000 (1,000, 9,500)
2060	Median (5th, 95th)	54,800 (13,200, 60,500)	45,600 (11,100, 49,700)
2080	Median (5th, 95th)	134,700 (46,000, 144,100)	107,700 (35,000, 114,500)
2100	Median (5th, 95th)	214,700 (91,600, 225,800)	164,000 (65,000, 172,100)

G. Conclusion

FDA has considered scientific evidence related to the likely impact of the proposed rule establishing a maximum nicotine level in cigarettes and certain other combusted tobacco products on people who currently do not use these products, people who currently use these products, and the U.S. population as a whole. The impact of the proposed standard was

considered alone, as well as adjusted for the inclusion of other tobacco product standards: prohibition of menthol as a characterizing flavor in cigarettes and prohibition of all characterizing flavors (other than tobacco) in cigars. Based on these considerations, we find that the proposed tobacco product standard is appropriate for the protection of the public health because it would increase the likelihood that many people who

currently smoke cigarettes and/or certain other combusted tobacco products would stop smoking altogether, yielding significant health benefits from smoking cessation. Additionally, we find that the proposed standard is appropriate for the protection of the public health because it would decrease the likelihood that people who do not smoke cigarettes and/or use certain other combusted

tobacco products—particularly youth and young adults—who experiment with combusted tobacco products will become addicted to these products, thereby decreasing progression to regular use, resulting in reduced tobacco-related morbidity and mortality associated with combusted tobacco product use. The proposed standard would also yield benefits in terms of reduced mortality as a result of reduced secondhand smoke exposure, smoking-related fires, smoking-related perinatal conditions, and use of alternative tobacco products.

Tobacco use is the leading preventable cause of disease and death in the United States. Cigarettes are responsible for 480,000 premature deaths every year from many diseases, put a substantial burden on the U.S. healthcare system, and cause massive economic losses to society (Ref. 1 at p. 659–666). Even modest reductions in the percentage of people initiating and modest increases in the percentage of people quitting smoking would lead to substantial reductions in the annual smoking-attributable deaths and fewer cases of disease attributed to combustible tobacco products in the United States.

In the United States, approximately 362,000 youth (ages 12–17) smoked their first cigarette in 2021 (Ref. 552). Additionally, nearly 90 percent of adults who currently smoke cigarettes daily in the United States report having smoked their first cigarette by the age of 18 (Ref. 1). Nicotine is a highly addictive substance, and multiple studies have shown that symptoms of nicotine dependence can arise early after youth start smoking cigarettes, even among those who smoke cigarettes infrequently (Refs. 24, 65, and 93).

Reducing the addictive potential of combusted cigarettes and certain other tobacco products via establishing a maximum level of nicotine in these products would help to decrease the likelihood that people who do not smoke cigarettes and/or use certain other combusted tobacco products—particularly youth and young adults—who experiment with them will develop addiction to nicotine and progress to regular use, thereby greatly reducing the chances of suffering from tobacco-related disease and death. FDA anticipates that the proposed standard would produce substantial health benefits. Even small changes in initiation and cessation would result in a significant reduction in the burden of death and disease in the United States caused by smoking, including reductions in smoking-related morbidity and mortality, diminished exposure to

secondhand smoke among people who do not smoke cigarettes, decreased potential years of life lost, decreased disability, and improved quality of life for current and future generations to come.

While preventing initiation to regular cigarette smoking and combusted tobacco product use by even modest amounts carries the greatest potential from this proposed standard to improve population health in the long term, FDA anticipates that the proposed standard would produce substantial short- and long-term health benefits resulting from decreased consumption and increased cessation among people who currently smoke cigarettes or other combusted tobacco products and wish to decrease use or quit. In the United States, there are currently approximately 39 million people ages 12 and older who smoke combusted tobacco products (Refs. 275 and 281). As previously described, the health benefits of smoking cessation are substantial. FDA's population health model estimates that approximately 1.8 million deaths in the United States due to tobacco would be avoided by the year 2060, rising to 4.3 million by the end of the century. The reduction in premature deaths attributable to the product standard would result in 19.6 million life years gained by 2060 and 76.4 million life years gained by 2100. Beyond averted deaths, societal benefits would include reduced smoking-related morbidity and health disparities, diminished exposure to secondhand smoke among people who do not smoke cigarettes, decreased potential years of life lost, decreased disability, and improved quality of life among people who formerly smoked cigarettes.

FDA's finding that the proposed product standard would be appropriate for the protection of the public health is reasonable and well-supported by scientific evidence. Cigarettes are the most toxic consumer product when used as intended, and nicotine is the primary constituent in cigarettes and other tobacco products that causes and maintains addiction. Given the existing scientific evidence described in sections VIII.B and VIII.C of this document, FDA finds that the proposed product standard is appropriate for the protection of the public health because it would increase the likelihood that many people who currently smoke cigarettes and/or certain other combusted tobacco products who wish to stop smoking altogether, would be able to do so, yielding significant health benefits from smoking cessation. Additionally, we find that the proposed standard is appropriate for the protection of the public health because

it would decrease the likelihood that people who do not smoke cigarettes and/or certain other combusted tobacco products—particularly youth and young adults—who experiment with them and initiate use, develop an addiction to nicotine, and progress to regular use as result of that addiction, thereby greatly reducing the chances of suffering from tobacco-related disease or death. Across the population, these changes in cigarette smoking behavior and combusted tobacco product use would lead to lower disease and death in the United States in both the short-term and in the future, due to diminished exposure to tobacco smoke among both people who smoke cigarettes and people who do not smoke cigarettes.

In addition to the determination that the proposed product is appropriate for the public health, FDA anticipates the proposed product standard also will improve health outcomes among populations that are disproportionately impacted by tobacco use and tobacco-related morbidity and mortality, such as adolescents as well as those with mental health and substance use disorders. As previously described, adolescence is a period of significant vulnerability regarding the onset and progression of tobacco use. Additionally, cigarette smoking is disproportionately prevalent among persons with symptoms of mental health disorders and substance use disorders, resulting in increased risk of tobacco-related morbidity and mortality in these groups. Accordingly, the proposed product standard is anticipated to promote better public health outcomes across these population groups.

IX. Additional Considerations and Requests for Comment

A. Section 907 of the FD&C Act

FDA is required by section 907 of the FD&C Act to consider the following information submitted in connection with a proposed product standard:

- For a proposed product standard to require the reduction or elimination of an additive, constituent (including smoke constituent), or other component of a tobacco product because FDA has found that the additive, constituent (including a smoke constituent), or other component is or may be harmful, scientific evidence submitted by any party objecting to the proposed standard demonstrating that the proposed standard will not reduce or eliminate the risk of illness or injury (section 907(a)(3)(B)(ii) of the FD&C Act).
- Information submitted regarding the technical achievability of compliance with the standard, including with regard

to any differences related to the technical achievability of compliance with such standard for products in the same class containing nicotine not made or derived from tobacco and products containing nicotine made or derived from tobacco (section 907(b)(1) of the FD&C Act).

- All other information submitted, including information concerning the countervailing effects of the tobacco product standard on the health of adolescent tobacco users, adult tobacco users, or nontobacco users, such as the creation of a significant demand for contraband or other tobacco products that do not meet the requirements of chapter IX of the FD&C Act and the significance of such demand (section 907(b)(2) of the FD&C Act).

As required by section 907(c)(2) of the FD&C Act, FDA invites interested persons to submit a draft or proposed tobacco product standard for the Agency's consideration (section 907(c)(2)(B)) and comments on and information regarding structuring the standard so as not to advantage foreign-grown tobacco over domestically grown tobacco (section 907(c)(2)(C)) of the FD&C Act. In addition, FDA invites the Secretary of Agriculture to provide any information or analysis that the Secretary of Agriculture believes is relevant to the proposed tobacco product standard (section 907(c)(2)(D) of the FD&C Act).

With this proposed rule, FDA is requesting all relevant documents and information described in this section. Such documents and information may be submitted in accordance with the "Instructions" included in the preliminary information section of this document.

Section 907(d)(5) of the FD&C Act allows FDA to refer a proposed regulation for the establishment of a tobacco product standard to the Tobacco Products Scientific Advisory Committee (TPSAC) at the Agency's own initiative or in response to a request that demonstrates good cause for a referral and is made before the expiration of the comment period. Sections 917(c)(2) and (c)(3) (21 U.S.C. 387q(c)(2) and (c)(3)) also provide that TPSAC shall provide advice, information, and recommendations on the effects of the alteration of the nicotine yields from tobacco products and regarding whether there is a threshold level below which nicotine yields do not produce dependence on the tobacco product involved, respectively.

B. Pathways to Market

To legally market a new tobacco product³⁸ in the United States, a tobacco product must receive authorization from FDA permitting the marketing of the new tobacco product under one of three premarket review pathways: (1) the applicant obtains an order under section 910(c)(1)(A)(i) of the FD&C Act (order after review of a premarket tobacco product application under section 910(b)); (2) the applicant obtains an order finding the new tobacco product to be substantially equivalent to a predicate tobacco product and in compliance with the requirements of the FD&C Act under section 910(a)(2)(A)(i) (order after review of a Substantial Equivalence (SE) Report submitted under section 905(j) of the FD&C Act (21 U.S.C. 387e(j))); or (3) the applicant makes a request under 21 CFR 1107.1 and obtains an exemption from the requirements related to SE (section 905(j)(3)(A)), and at least 90 days before commercially marketing the product, submits a report under section 905(j) including the information required in section 905(j)(1)(A)(ii) and (B) of the FD&C Act.

Applicants may be able to use the SE pathway for products seeking to comply with this proposed product standard (if finalized) by making modifications to their products in a manner that FDA finds does not cause the new tobacco product to raise different questions of public health. Applicants may be able to submit a streamlined SE Report containing information sufficient to demonstrate that the changes to the subject of that SE Report do not cause the new tobacco product to raise different questions of public health and to certify that no other changes were made to the new tobacco product as compared with the predicate product and that all other characteristics are identical (see relevant provisions of the SE final rule codified at 21 CFR 1107.18(l)(2)). FDA has received numerous successful applications where the manufacturer described all modification(s) between the new and predicate tobacco product and provided a certification statement that all other characteristics are identical. For example, for products modified to comply with this product standard, the applicant could demonstrate how the modification was made to the tobacco filler, provide test data to show that the

modification reduced the nicotine content to meet the standard and did not cause the new product to raise any different questions of public health, and provide a certification that no other modifications were made to the new tobacco product other than those made to reduce the level of nicotine.

An applicant may also be able to use the SE Exemption pathway under section 905(j)(3)(A) of the FD&C Act to the extent the applicant is modifying a legally marketed tobacco product by adding or deleting a tobacco additive, or increasing or decreasing the quantity of an existing tobacco additive if such modification would be a minor modification. While the SE Exemption pathway may be a viable option in limited circumstances, FDA notes that the statutory definition of "additive" excludes tobacco or a pesticide chemical residue in or on raw tobacco or a pesticide chemical (section 900(1) of the FD&C Act). Therefore, to the extent modifications to a tobacco product involve changes to the tobacco (*e.g.*, changes to the nicotine content of the tobacco used in a tobacco product), such changes would render section 905(j)(3) of the FD&C Act inapplicable.

If a currently legally marketed tobacco product is already in compliance with this proposed product standard, a premarket authorization application would not be needed.

FDA requests comments regarding changes manufacturers may make to their tobacco products to comply with this proposed product standard and what information and evidence they might provide to satisfy the premarket review requirements of the Tobacco Control Act.

C. Considerations and Request for Comments on Scope of Products

As indicated throughout this document, FDA has determined that the proposed standard, which would apply to cigarettes and certain other combusted finished tobacco products, is appropriate for the protection of the public health. It would cover the products that are responsible for the greatest amount of tobacco-related morbidity and mortality. The proposed scope of this rule—applying to cigarettes (other than noncombusted cigarettes, such as HTPs that meet the definition of a cigarette), cigarette tobacco, RYO tobacco, cigars (other than premium cigars), and pipe tobacco—is appropriate to protect the public health and is justified by existing evidence. We request comments, data, and research regarding the proposed scope of this rule.

³⁸ Products that were commercially marketed in the United States as of February 15, 2007 (referred to as "pre-existing tobacco products," previously referred to as "grandfathered products"), are not considered new tobacco products and do not require prior authorization to be legally marketed (section 910(a) of the FD&C Act).

FDA is not proposing to include noncombusted cigarettes, such as HTPs that meet the definition of a cigarette in section 900(3) of the FD&C Act (proposed § 1160.3 includes a definition of cigarette), within the scope of this proposed product standard. While noncombusted cigarettes (such as HTPs) that meet the definition of cigarette in the FD&C Act must adhere to existing restrictions for cigarettes under FDA regulations, some of these products may deliver fewer or lower levels of some toxicants than combusted cigarettes (Ref. 642). FDA recognizes that tobacco products exist on a continuum of risk, with combusted cigarettes being the deadliest, and that certain specific products meeting the definition of a cigarette (e.g., some that are not combusted) may pose less risk to individuals who use these products or to population health than other products meeting the definition of a cigarette.

In general, as discussed in this document, nicotine is the primary addictive constituent in tobacco products, and it is the nicotine in such products that both creates and sustains addiction, playing a significant role in creating and perpetuating tobacco-related negative health consequences. While these effects raise concerns in the context of any tobacco product—none of which is without risk—FDA recognizes that certain products that meet the definition of cigarette in the FD&C Act may present different considerations with respect to this proposed product standard. Accordingly, FDA requests comments, data, and research regarding the proposal to exclude noncombusted cigarettes (such as HTPs that are cigarettes) from the scope of this proposed rule, including any data that could justify otherwise.

FDA considered including waterpipe tobacco products within the scope of this proposed product standard; however, the Agency has determined that waterpipe tobacco involves profoundly different use behaviors than combusted cigarettes, which makes it an unlikely substitute for cigarettes. We therefore do not propose including waterpipe tobacco products within the scope of this proposed rule.

Data on frequency of use differentiates waterpipe tobacco from cigarettes. For instance, according to the 2024 NYTS, 0.7 percent of middle and high school students (or approximately 190,000 students) reported using waterpipe tobacco within the previous 30 days, compared with estimates for previous 30-day cigarette use (1.4 percent; 380,000 students) and cigar use (1.2 percent; 330,000 students) (Ref. 3).

However, waterpipe tobacco is significantly less likely to be smoked daily. In fact, given the relative infrequency of waterpipe use, it is often reported in terms of monthly versus less than monthly use, rather than daily versus non-daily. Data from Waves 1 (2013–2014) and 2 (2014–2015) of the PATH Study indicated that, among adults who used waterpipes in the past year, 77.1 percent reported less than monthly use at Wave 1; by Wave 2, 44.9 percent of these adults continued using waterpipe less than monthly, while 6.4 percent progressed to monthly or more frequent use (Ref. 643). For comparison, 59.1 percent of adults in the 2018 NHIS who smoke cigarettes report daily use (Ref. 644). Wave 3 (2015–2016) PATH Study data also indicate the infrequency of daily waterpipe use: 0.1 percent of youth, 0.3 percent of young adults, and 0 percent of adults 25 and older reported daily waterpipe use (Ref. 645). Comparatively, analysis from Wave 3 of the PATH study found that 0.6 percent of youth, 11.4 percent of young adults, and 15.3 percent of adults older than 25 reported daily cigarette smoking (Ref. 646).

FDA acknowledges that the health consequences of waterpipe usage are far from innocuous. People who use waterpipes are exposed to many of the same toxicants as people who smoke cigarettes, and due to the extended duration of each waterpipe session (i.e., approximately 1 hour), waterpipe use may lead to higher toxicant exposure per session than toxicant exposure from one cigarette (Refs. 647 and 648). Thus, people who use waterpipes are likely subject to many of the same severe negative health effects as people who smoke cigarettes (Ref. 649).

However, FDA does not anticipate significant migration to waterpipe usage under the proposed product standard. Waterpipes as currently marketed are generally large and require time-consuming preparation, leading to an approximate waterpipe smoking session of 1 hour (Ref. 650). The limited accessibility and mobility of waterpipes as generally currently used contribute to their predominant intermittent usage patterns (Ref. 650). FDA assesses that these aspects of waterpipe design would similarly substantially limit their utility as a substitute for cigarettes and other combusted tobacco products that would be subject to the proposed product standard, especially as compared to the portability and ease of use of many HTP, ENDS, and other noncombusted tobacco products that are currently legally marketed and not subject to the proposed product standard.

FDA requests information and data regarding the proposal to exclude waterpipe tobacco from the scope of this proposed rule.

FDA is not including noncombusted tobacco products, such as ENDS (which include e-cigarettes) and smokeless tobacco products, in the scope of this proposed product standard. FDA's approach in proposing this product standard for cigarettes and certain other combusted tobacco products seeks to protect public health by reducing combusted tobacco product use (and therefore reducing exposure to harmful toxicants created through combustion) while potentially less harmful, noncombusted tobacco products remain available for people who do not quit all tobacco-product use. As such, at this time, FDA is focusing this proposed rule on nicotine levels in cigarettes and certain other combusted products because combusted tobacco products are responsible for the majority of death and disease due to tobacco use. Importantly, this action would also help to prevent people who experiment with cigarettes and cigars (mainly youth) from moving beyond experimentation, developing an addiction to nicotine, and progressing to regular use of combusted tobacco products as a result of that addiction. We request comments, data, and research regarding the proposed scope of this rule.

D. Considerations and Request for Comments on the Potential for Illicit Trade

The implementation of a maximum nicotine level in cigarettes and certain other combusted tobacco products could result in some people seeking NNC combusted tobacco products through illicit trade markets. FDA is also considering whether illicit trade could occur as a result of a nicotine product standard and whether such activity could significantly undermine the public health benefits of the product standard.

Since the enactment of the Tobacco Control Act, FDA has been committed to studying and understanding the potential effects of a product standard on the illicit tobacco market. As part of FDA's consideration of possible regulations, the Agency asked the NRC and IOM of the National Academy of Sciences (now the National Academies) to assess the international illicit tobacco market, including variations by country; the effects of various policy mechanisms on the market; and the applicability of international experiences to the United States (Ref. 560). In 2015, the NRC/IOM issued its final report entitled "Understanding the U.S. Illicit Tobacco

Market: Characteristics, Policy Context, and Lessons from International Experiences,” finding that, although there is insufficient evidence to draw firm conclusions regarding how the U.S. illicit tobacco market would respond to regulations requiring a reduction in the nicotine content of these products, demand for illicit cigarettes would be limited because some people who smoke would quit, and others would use modified products (*e.g.*, VLNC cigarettes) or seek legal alternatives (Ref. 560 2015 at p. 9). In addition, in March 2018, FDA issued a draft concept paper, entitled “Illicit Trade in Tobacco Products after Implementation of a Food and Drug Administration Product Standard,” as an initial step in assessing the possible health effects of a tobacco product standard in the form of demand for contraband or nonconforming tobacco products (83 FR 11754). Among other issues, the draft concept paper examined the factors that might support or hinder the establishment of a persistent illicit trade market related to a product standard (Ref. 44). Additionally, in the Nicotine ANPRM, FDA expressed interest in data regarding possible increases in illicit trade and its effect on the marketplace in the event that a nicotine tobacco product standard is finalized. Comments were submitted by members of the tobacco industry, public health organizations, academic researchers, and the public. Comments varied in their conclusions as to how significant illicit trade might be after implementation of an FDA product standard, but no information was submitted in response to the Nicotine ANPRM that caused FDA to revise its overall assessment about the difficulties in establishing sustained, significant illicit trade markets that are able to evade enforcement authorities.

Establishing and maintaining illicit markets in relevant tobacco products will be challenging, and to the extent that they emerge, it is unlikely they will be significant enough to outweigh the benefits of the product standard. Although some people who smoke may seek to purchase illicit products if available and accessible, the NRC/IOM report stated that this “would require established distribution networks and new sources of product (which would either have to be smuggled from other countries or produced illegally) to create a supply of cigarettes with prohibited features” (Ref. 560 at p. 9). The current illicit cigarette trade in the United States is predominantly based on tax evasion and is facilitated by ease of access to tobacco products close to where the

sales to consumers take place (*e.g.*, across State lines). Enforcement against such illicit trade is outside the scope of FDA’s authority (as FDA does not enforce tax laws) and is complicated by the inability to distinguish tax-paid from tax-evading cigarette packs in most instances. However, due to the reduction of nicotine in combusted tobacco products nationwide, a lack of supply would likely limit illicit trade of NNC cigarettes and certain other combusted tobacco products once a product standard is in place. Illicit manufacturing of NNC cigarettes at a scale large enough to diminish the public health benefits of this proposed product standard would be difficult to disguise from Federal, State, and local enforcement authorities. Moreover, importation across international borders is substantially more difficult than across State borders, particularly for the volume necessary to sustain nicotine addiction in people who smoke. Additionally, while it would remain legal for domestic cigarette manufacturers to produce NNC cigarettes and certain other combusted tobacco products for export (as previously described in section III.C of this document), it is unclear the extent to which there would be diversion of legally manufactured products for export that are subsequently sold illegally domestically. As noted in multiple FDA reports to Congress regarding U.S. tobacco product exports, after the product standard prohibiting characterizing flavors (other than tobacco or menthol) in cigarettes was implemented, the U.S. Census Bureau surveyed the vast majority of domestic manufacturers and found no evidence that any continued to manufacture flavored cigarettes or their components or parts (Ref. 651). Importantly, and relevant to any continued domestic manufacture for export, section 920(d) of the FD&C Act (21 U.S.C. 387t(d)) requires that manufacturers and distributors notify the Attorney General and the Secretary of the Treasury of illicit trade activities (such as import, export, distribution, or diversion), increasing the overall vigilance on the matter. Finally, as the NRC/IOM Report explains, comprehensive interventions by several countries show it is possible to reduce the size of the illicit tobacco market through enforcement mechanisms and collaborations across jurisdictions (Ref. 560).

Research also has shown that the choice between VLNC and NNC cigarettes can be influenced by factors such as cost (see section VI.B of this document for further discussion). It is

well-established that people who smoke are price-sensitive, and there is a direct correlation with the increased price of cigarettes and reductions in consumption (Ref. 652), showing for every ten percent increase in price, there is an overall reduction in consumption of 3–5 percent, and youth smoking decreases by 6–7 percent. This price sensitivity also contributes to the willingness of people who smoke cigarettes to shift consumption toward non-cigarette tobacco products in times of economic or product constraint (Refs. 345, 346, and 349). Additionally, there is an “inconvenience cost” to the purchase of illicit tobacco products that rises and falls depending upon the location of illegal sales, reliability of supply, fear of embarrassment and legal penalties, and more (Ref. 560 at p. 67). Although illicit NNC cigarettes and certain other combusted tobacco products will not be subject to taxes, participants in any illicit market will demand profits sufficient to cover both their costs as well as compensate for the risks of enforcement, limiting how low they can price the illicit tobacco products. As a result, when the cost or effort required to obtain illicit products increases, people who smoke may switch their preference from NNC combusted tobacco products to VLNC versions (Ref. 391), to other legal tobacco products, and/or renew their cessation efforts. Each of these alternatives reduces the number of potential buyers of illicit products, lowering the incentives to try, create, and sustain such markets.

Related to concerns about enforcement against individual consumers for possessing or using nonconforming tobacco products acquired through an illicit market, FDA’s enforcement will only address manufacturers, distributors, wholesalers, importers, and retailers. This regulation does not include a prohibition on individual consumer possession or use of nonconforming product acquired through an illicit market, and FDA cannot and will not enforce against individual consumers for possession or use of NNC cigarettes or other combusted tobacco products covered by this proposed product standard. In addition, State and local law enforcement agencies do not enforce the FD&C Act. These entities do not and cannot take enforcement actions against any violation of chapter IX of the Act or this regulation on FDA’s behalf. FDA recognizes concern about how State and local law enforcement agencies enforce their own laws in a manner that may impact equity and

community safety and seeks comments on how FDA can best make clear the respective roles of FDA and State and local law enforcement.

FDA is not proposing to ban any category of tobacco products with this proposed product standard, and authorized products that are not subject to the proposed product standard will remain legally available. Therefore, this proposed product standard is not expected to lead to a surge in illicit tobacco product use. In reaching this conclusion, FDA has considered several factors that are likely to affect the potential for illicit trade. For example, FDA anticipates that a nationwide standard that prohibits the manufacture (other than for export as previously described in section III.C of this document) and sale of cigarettes and certain other combusted tobacco products that exceed the maximum nicotine level set by this proposed product standard, coupled with FDA's authority to take enforcement actions and other steps regarding the sale and distribution of illicit tobacco products, would limit the manufacture and distribution of these products. FDA also expects that a nationwide product standard would eliminate the use of online retailers to purchase illicit tobacco products as well as any incentive to travel within the United States in search of jurisdictions without a nicotine product standard because no such jurisdictions would exist. FDA thus anticipates that the rule would result in much less illicit trade than observed in the case of a State or local requirement and that any such trade would be significantly outweighed by the benefits of the rule. Even if some amount of illicit trade develops (Refs. 42 and 653 discuss projected impacts of various rates of potential illicit trade), it would have to be of significantly greater magnitude than any previously seen illicit markets in order to outweigh the significant public health benefits of this proposed standard, and it would have to continue to exist at those levels despite the various enforcement agencies and tools involved.

FDA requests comments, including supporting data and research, regarding whether and to what extent this proposed rule would result in an increase in illicit trade in NNC cigarettes and certain other combusted tobacco products covered by the proposed nicotine product standard and how any such increase could impact public health. Data or other reliable information that do not rely on estimates of current, interstate tax-evading illicit trade would be particularly relevant. If an illicit market

develops after this proposed product standard is finalized, FDA has the authority to take enforcement actions and other steps regarding the sale and distribution of illicit tobacco products, including those imported or purchased online. FDA conducts routine surveillance of sales, distribution, marketing, and advertising related to tobacco products and takes appropriate actions when violations occur. If this product standard is finalized as proposed and goes into effect, it would be illegal to import cigarettes and certain other combusted tobacco products that exceed 0.70 mg nicotine per gram of total tobacco, and such products would be subject to import examination and refusal of admission under the FD&C Act. Similarly, it would be illegal to sell or distribute cigarettes and certain other combusted tobacco products that do not comply with this product standard, including those sold online, and doing so may result in FDA initiating enforcement or regulatory actions. We note that the Prevent All Cigarette Trafficking Act of 2009 establishes restrictions that make cigarettes generally nonmailable through the U.S. Postal Service, subject to certain exceptions (18 U.S.C. 1716E). Outside of these exceptions, the U.S. Postal Service cannot accept or transmit any package that it knows, or has reasonable cause to believe, contains nonmailable cigarettes, smokeless tobacco, or ENDS.³⁹

X. Description of Proposed Regulation

This proposed rule would establish a new part 1160 that would set a maximum level of nicotine in finished cigarettes and certain other finished combusted tobacco products. Part 1160 would describe the scope of the proposed regulation, applicable definitions, the establishment of a maximum nicotine level in products covered by this proposed rule, product testing and related requirements, and recordkeeping requirements.

A. General Provisions (Proposed Subpart A)

1. Scope (Proposed § 1160.1)

Proposed § 1160.1(a) would provide that this part sets out a tobacco product standard under the FD&C Act to limit nicotine yield by setting a maximum nicotine content level for certain finished tobacco products. We are proposing that this product standard would cover the following finished tobacco products: cigarettes (other than

noncombusted cigarettes, such as HTPs that meet the definition of a cigarette), cigarette tobacco, RYO tobacco, cigars (other than premium cigars), and pipe tobacco (other than waterpipe tobacco). These products are defined in proposed § 1160.3. As stated throughout this preamble, this proposed product standard focuses on cigarettes and certain other combusted tobacco products given their addictiveness, availability as migration and dual use candidates with cigarettes, and the extent of tobacco-related death and disease associated with such products. As stated in section IX.C of this document, FDA requests comment regarding the scope of products covered by this proposed rule.

Proposed § 1160.1(b) would prohibit the distribution, sale, or offering for distribution or sale within the United States finished tobacco products within the scope of the rule that are not in compliance with the tobacco product standard. For example, FDA would consider such finished tobacco products to be noncompliant if they contain a nicotine level that exceeds the proposed maximum nicotine level set forth in proposed § 1160.10. Additionally, manufacturers and importers would not be allowed to enter or introduce into domestic commerce any finished tobacco product (*i.e.*, cigarettes, cigarette tobacco, RYO tobacco, cigars, and pipe tobacco) that does not comply with the requirements of the final rule, irrespective of the date of manufacture.

Proposed § 1160.1(c) would prohibit the manufacture within the United States of finished tobacco products within the scope of the rule that are not in compliance with the tobacco product standard unless such tobacco products are intended for export and are eligible for export under section 801(e)(1) of the FD&C Act (21 U.S.C. 381(e)(1)). A tobacco product intended for export shall not be deemed to be in violation of section 907 of the FD&C Act or this product standard if it meets the criteria enumerated in section 801(e)(1), including not being sold or offered for sale in domestic commerce.

2. Definitions (Proposed § 1160.3)

Proposed § 1160.3 provides the definitions for the terms used in the proposed product standard. Several of these definitions are included in the FD&C Act or have been used in other regulatory documents.

- *Accessory*: Consistent with 21 CFR 1140.3 and the Consolidated Appropriations Act, 2022 (Pub. L. 117–103), FDA proposes to define “accessory” as any product that is intended or reasonably expected to be

³⁹ These restrictions were updated to include similar prohibitions on the shipment of ENDS in 2021 (86 FR 58399, October 21, 2021).

used with or for the human consumption of a tobacco product; does not contain tobacco or nicotine from any source and is not made or derived from tobacco; and meets either of the following: (1) is not intended or reasonably expected to affect or alter the performance, composition, constituents, or characteristics of a tobacco product; or (2) is intended or reasonably expected to affect or maintain the performance, composition, constituents, or characteristics of a tobacco product; but (i) solely controls moisture and/or temperature of a stored product; or (ii) solely provides an external heat source to initiate but not maintain combustion of a tobacco product. Accessories of cigarettes, cigarette tobacco, and RYO tobacco, as three of the originally-regulated products under the FD&C Act, are considered “tobacco products” and, therefore, would be subject to this proposed product standard (if finalized). However, accessories of other tobacco products (e.g., cigars) are not regulated as “tobacco products” pursuant to FDA’s final deeming rule (81 FR 28974 at 29015–29016, May 10, 2016) and, therefore, would not be subject to this proposed product standard. Examples of such accessories would be ashtrays, cigar clips, and pipe pouches, because they do not contain tobacco or nicotine from any source, are not made or derived from tobacco, and do not affect or alter the performance, composition, constituents, or characteristics of a tobacco product. However, if such a product was intended or reasonably expected to affect the performance of a tobacco product (e.g., nicotine impregnated ash tray), it would no longer be considered an accessory and would be subject to the proposed product standard.

- **Batch:** FDA proposes to define “batch” as a specific identified amount of a finished tobacco product produced in a unit of time or quantity and that is intended to have the same specifications. FDA proposes to give tobacco product manufacturers flexibility to determine what unit of time or quantity is appropriate for their product, and how batches would be designated. For example, manufacturers likely would have, as part of existing manufacturing processes, defined a “batch” for cigarette production, which is almost continuous, differently than a batch for smokeless tobacco, which likely would be defined based on the amount processed in a vat through the fermentation process. Currently, there is no definition of “batch” for tobacco products. However, the proposed regulation Requirements for Tobacco

Product Manufacturing Practice (TPMP) (see <https://www.federalregister.gov/documents/2023/03/10/2023-04591/requirements-for-tobacco-product-manufacturing-practice>) includes a proposed definition of “batch,” and this rulemaking’s provision is modeled on the proposed TPMP provision. Pursuant to proposed § 1160.12, manufacturers would be required to conduct batch testing and maintain those records.

- **Cigar:** FDA proposes to define a “cigar” as a tobacco product that: (1) is not a cigarette and (2) is a roll of tobacco wrapped in leaf tobacco or any substance containing tobacco. This definition was used in the seven consent orders that the FTC entered into with the largest mass marketers of cigars (see, e.g., *In re Swisher International, Inc.*, Docket No. C–3964 (FTC August 18, 2000)) and also is codified at 21 CFR 1143.1. The cigar wrapper would be considered a “component or part” of a cigar (see definition herein) and, therefore, would be covered by this proposed product standard. As discussed elsewhere in this document and in proposed § 1160.1, premium cigars are excluded from the scope of this proposed rule.

- **Cigarette:** As defined in section 900(3) of the FD&C Act, the term “cigarette”: (1) means a product that: (i) is a tobacco product; and (ii) meets the definition of the term “cigarette” in section 3(1) of the Federal Cigarette Labeling and Advertising Act (15 U.S.C. 1332(1)); and (2) includes tobacco, in any form, that is functional in the product, which, because of its appearance, the type of tobacco used in the filler, or its packaging and labeling, is likely to be offered to, or purchased by, consumers as a cigarette or as RYO tobacco.

- **Cigarette tobacco:** As defined in section 900(4) of the FD&C Act, the term “cigarette tobacco” means any product that consists of loose tobacco that is intended for use by consumers in a cigarette. Unless otherwise stated, the requirements applicable to cigarettes under this chapter also apply to cigarette tobacco.

- **Commercial distribution:** Consistent with 21 CFR 1107.12, FDA proposes to define “commercial distribution” as any distribution of a finished tobacco product, whether domestic or imported, to consumers or to any person, but does not include interplant transfers of a tobacco product between establishments within the same parent, subsidiary, and/or affiliate company, nor does it include providing a tobacco product for product testing where such product is not made available for consumption or resale. “Commercial distribution” does not

include the handing or transfer of a tobacco product from one consumer to another for personal consumption.

- **Component or part:** Consistent with 21 CFR 1140.3, FDA proposes to define “component or part” as any software or assembly of materials intended or reasonably expected: (1) to alter or affect the tobacco product’s performance, composition, constituents, or characteristics or (2) to be used with or for the human consumption of a tobacco product. The term excludes anything that is an accessory of a tobacco product. Components or parts of cigarettes, cigarette tobacco, and RYO tobacco, as three of the originally regulated products under the FD&C Act, are considered “tobacco products” and, therefore, would be subject to this proposed product standard (if finalized). Examples of cigarette components or parts that would be subject to this proposed product standard include cigarette paper and filters. In addition, components or parts of other tobacco products (e.g., cigars) are regulated as “tobacco products” pursuant to FDA’s final deeming rule (81 FR 28974 at 29015–29016) and, therefore, would be subject to this proposed product standard (if finalized). Some examples of such components or parts include cigar blunt wraps, removable tips, mouthpieces, and filters. These examples generally are intended or reasonably expected to alter or affect the performance, composition, constituents, or characteristics of a tobacco product. If a liquid nicotine product or other tobacco product is intended or reasonably expected to alter the nicotine content of any tobacco product covered by this proposed rule, such liquid nicotine or other tobacco product would be considered a component or part of a finished tobacco product covered under the rule’s scope and, therefore, would be in violation of the rule if the amount of nicotine in the finished tobacco product exceeds 0.70 mg of nicotine per gram of total tobacco. With respect to these definitions, FDA notes that “component” and “part” are separate and distinct terms within chapter IX of the FD&C Act. However, for purposes of this rule, FDA is using the terms “component” and “part” interchangeably and without emphasizing a distinction between the terms. FDA may clarify the distinctions between “component” and “part” in the future.

- **Finished tobacco product:** Consistent with 21 CFR 1107.12, FDA proposes to define a “finished tobacco product” to mean a tobacco product, including all components and parts, sealed in final packaging (e.g., filters or

filter tubes sold to consumers separately or as part of kits) or in the final form in which it is intended to be sold to consumers (*e.g.*, tobaccoists selling cigars individually from a box or pipe tobacco filler by weight). Examples of finished tobacco products include a pack of cigarettes or a bag of RYO or pipe tobacco.

- **Manufacturing code:** FDA proposes to define “manufacturing code” as any distinctive sequence or combination of letters, numbers, or symbols that begins with the manufacturing date, followed by the batch number, and concludes with “-NS.” This information would help determine the product’s history (*e.g.*, batch testing records) and assist manufacturers and FDA in the event of a nonconforming tobacco product investigation and any corrective actions that stem from such investigation.

- **Manufacturing date:** FDA proposes to define “manufacturing date” as the month, day, and year in 2-digit numerical values in the format (MMDDYY) that a finished tobacco product is packaged for distribution. The manufacturing date is included in the manufacturing code, which can be used by the manufacturer and FDA to help determine the product’s history (*e.g.*, batch testing history) in the event of a nonconforming tobacco product investigation. As stated in section X.C of this document, FDA requests comment regarding the manufacturing code requirements in this proposed rule.

- **Nicotine:** FDA proposes to define “nicotine” as the chemical substance named 3–1(1-methyl-2-pyrrolidinyl) pyridine or C[10]H[14]N[2], including any salt or complex of nicotine, derived from any source.

- **Nonconforming tobacco product:** FDA proposes to define “nonconforming tobacco product” as any tobacco product that does not meet the requirements of § 1160.10 (nicotine level specifications) or § 1160.30 (manufacturing code).

- **Package or packaging:** As defined in section 900(13) of the FD&C Act, the term “package” means a pack, box, carton, or container of any kind or, if no other container, any wrapping (including cellophane) in which a tobacco product is offered for sale, sold, or otherwise distributed to consumers.

- **Person:** As defined in section 201(e) of the FD&C Act (21 U.S.C. 321(e)), the term “person” includes an individual, partnership, corporation, or association.

- **Pipe tobacco:** FDA proposes to define the term “pipe tobacco” as any tobacco that, because of its appearance, type, packaging, or labeling, is suitable for use and likely to be offered to, or purchased by, consumers as tobacco to

be smoked in a pipe. However, this definition specifically excludes tobacco labeled and sold exclusively for use in a waterpipe (*i.e.*, hookah tobacco). As discussed in section IX.C of this document, FDA is not proposing to include waterpipe tobacco within the scope of this product standard.

- **Rework:** FDA proposes to define “rework” as action taken on a nonconforming tobacco product to ensure that the product meets the specifications and other requirements of this part before it is released for commercial distribution.

- **Roll-your-own tobacco:** As modeled after section 900(15) of the FD&C Act, FDA proposes to define the term “roll-your-own tobacco” (or RYO) as any tobacco product which, because of its appearance, type, packaging, or labeling, is suitable for use and likely to be offered to, or purchased by, consumers as tobacco for making cigarettes or cigars. This product is frequently used interchangeably with cigarette tobacco and pipe tobacco (as defined in this section).

- **Specification:** We propose to define “specification” as any requirement with which a product, process, service, or other activity must conform. A tobacco product specification is a requirement established by the manufacturer, including a requirement established to ensure that the tobacco product meets any applicable product standard under section 907 of the FD&C Act.

- **Tobacco filler:** FDA proposes to define “tobacco filler” as cut, ground, powdered, or leaf tobacco or other nicotine-containing substances in a finished tobacco product. For portioned tobacco products, the material enclosing any tobacco or nicotine-containing substances (*e.g.*, cigarette paper) is not considered tobacco filler.

- **Tobacco product:** As defined in section 201(rr) of the FD&C Act, the term “tobacco product” means any product made or derived from tobacco, or containing nicotine from any source, that is intended for human consumption, including any component, part, or accessory of a tobacco product (except for raw materials other than tobacco used in manufacturing a component, part, or accessory of a tobacco product). The term “tobacco product” does not mean an article that is: a drug under section 201(g)(1); a device under section 201(h); a combination product described in section 503(g) (21 U.S.C. 353(g)); or a food under section 201(f) of the FD&C Act if such article contains no nicotine, or no more than trace amounts of naturally occurring nicotine.

- **Tobacco product manufacturer:** As defined in section 900(20) of the FD&C Act, the term “tobacco product manufacturer” means any person, including a repacker or relabeler, who: (1) manufactures, fabricates, assembles, processes, or labels a tobacco product or (2) imports a finished tobacco product for sale or distribution in the United States.

- **Total tobacco:** FDA proposes to define the term “total tobacco” as the tobacco filler (defined in proposed § 1160.3) and any other tobacco or tobacco-derived material used as part of a tobacco product. For cigars (*i.e.*, those cigars that are covered by this proposed product standard, as defined in proposed § 1160.3), the tobacco included in the wrapper and binder would be part of the “total tobacco.” The nicotine content in the total tobacco of the finished tobacco product must not exceed the proposed maximum nicotine level.

- **United States:** As defined in section 900(22) of the FD&C Act, the term “United States” means the 50 States of the United States of America and the District of Columbia, the Commonwealth of Puerto Rico, Guam, the Virgin Islands, American Samoa, Wake Island, Midway Islands, Kingman Reef, Johnston Atoll, the Northern Mariana Islands, and any other trust territory or possession of the United States.

B. Product Requirements (Proposed Subpart B)

1. Maximum Nicotine Level (Proposed § 1160.10)

FDA is proposing to regulate nicotine yield by requiring that a finished tobacco product contain no more than 0.70 mg of nicotine per gram of total tobacco. As stated in proposed § 1160.3, the term “total tobacco” means both the tobacco filler and any other tobacco or tobacco-derived material used as part of a tobacco product. This level would be based on the nicotine content of the tobacco product, as the means to regulate nicotine yield in the tobacco smoke or emissions. If a liquid nicotine product or other tobacco product (including a tobacco product containing nicotine from any source) is intended or reasonably expected to alter the nicotine content of any tobacco product covered by this proposed rule, such liquid nicotine or other tobacco product would be considered a component or part of a tobacco product covered under the rule’s scope and, therefore, would be in violation of the rule if the total amount of nicotine in the finished tobacco

product exceeds 0.70 mg of nicotine per gram of total tobacco.

As stated previously, the term “finished tobacco product” refers to those products subject to this regulation, including any components, parts, or accessories that are regulated as tobacco products and sealed in a final package, except for components, parts, or accessories not made or derived from tobacco. For cigarettes, cigarette tobacco, and RYO tobacco, all of which were covered under Congress’s original grant of authority (section 901(b) of the FD&C Act), all components, parts, and accessories of such products would be covered under this proposed product standard and subject to the proposed maximum nicotine level. Accessories of deemed tobacco products (*i.e.*, accessories for cigars, pipe tobacco) would not be covered. FDA intends to use its premarket review authority under sections 905 and 910 of the FD&C Act to ensure that manufacturers do not reengineer their products in a way that would circumvent the proposed maximum nicotine level.

2. Product Testing (Proposed § 1160.12)

Proposed § 1160.12 contains provisions for the testing of finished tobacco products that would be subject to this proposed rule. Specifically, proposed § 1160.12(a) would require that tobacco product manufacturers conduct testing on each batch of finished tobacco products to ensure that the batch conforms with proposed § 1160.10. Under this provision, the manufacturer of the finished tobacco product would be required to use an analytical test method that meets the requirements set forth in proposed § 1160.14. FDA recommends manufacturers use one of three analytical test methods described in section VII.D of this document (*i.e.*, FDA’s Tobacco Products Laboratory method, CRM No. 62, or CRM No. 87). This section also states that samples for such testing would need to be selected in accordance with proposed § 1160.16.

Proposed § 1160.12(b) would require that a full report of the source data and results of all batch testing be maintained by the tobacco product manufacturer in accordance with proposed § 1160.32. These reports would be generated for test samples from each batch and would not be required for each individual finished tobacco product. This report would have to include the following information:

(1) Full identification of the finished tobacco product that is the subject of the report, including, if applicable, the submission tracking number (STN) associated with marketing authorization

(including the static product ID (PD), if applicable), product name(s) (including brand and subbrand and the original name described in the premarket application, if different), product category, subcategory, package type, package quantity, and nicotine source;

(2) Nicotine level of each sample tested from the batch and standard deviation;

(3) The batch manufacturing date and location, including facility name and address, for each sample;

(4) The testing date and location, including the facility name and address;

(5) The manufacturing code of each sample tested (in accordance with proposed § 1160.30(c));

(6) The test method and sampling procedure used;

(7) Names and qualifications of the person(s) conducting the testing and any laboratory accreditation;

(8) The manufacturing and testing equipment used (including documentation to show that the equipment is appropriate for its intended purpose and has been calibrated to ensure accurate and reliable results); and

(9) The criteria used to make a decision to accept or reject each batch and the decision made with respect to each batch (*e.g.*, accept, reject) based on the results of the product testing. This information would constitute the documentation of the source data and actual results of the product testing conducted on each batch.

The main purpose of this report would be to verify that products subject to this proposed product standard do not exceed the maximum nicotine level and to document the company’s decision for each batch with respect to acceptance, rejection, and reworking of the products. FDA expects that information collected pursuant to proposed § 1160.16(b) would be integrated into the proposed § 1160.12(b) records (*i.e.*, proposed § 1160.16(b) records would be the basis for documenting background information about the product being tested, including, for example, the product category and subcategory, brand and subbrand, packaging information, nicotine source, manufacturing date, and the manufacturing code). These proposed § 1160.12(b) records also would document the ultimate disposition of the batch based on the testing of the representative samples. Section III.C of this document describes FDA’s rulemaking and inspection authorities related to these records.

While the proposed batch testing and sampling requirements would provide FDA with critical information, the

Agency also recognizes concerns that it could be costly for certain manufacturers to test each batch. Therefore, FDA requests comment, including supporting data, regarding potential alternatives to batch testing and sampling to ensure finished tobacco product compliance with proposed § 1160.10 that would reduce costs for manufacturers.

3. Analytical Test Method (Proposed § 1160.14)

Proposed § 1160.14 would require that tobacco product manufacturers use an analytical test method and demonstrate that the test method was validated in an analytical test laboratory.

Validation means a process of demonstrating or confirming that the analytical test method is suitable and reliable for its intended purpose. Validation of an analytical method applies to a specific laboratory, for a specific product, and equipment performing the analytical test method for an intended use over a reasonable period. Although there are various approaches to demonstrate that an analytical test method is validated (*e.g.*, ICH Guideline Validation of Analytical Procedures: Text and Methodology Q2), FDA intends to use the approach outlined in the draft guidance entitled “Validation and Verification of Analytical Testing Methods Used for Tobacco Products” to determine if a submitted test method is fit-for-purpose. In March 2024, FDA published a final guidance for industry entitled “Q2(R2) Validation of Analytical Procedures” and although it is not specific to tobacco products, FDA’s approach under that guidance to determine if a method is fit-for-purpose is applicable for use under this tobacco product standard.⁴⁰

As described in section VII.D of this document, FDA recommends manufacturers use one of three publicly available analytical test methods—FDA’s Tobacco Products Laboratory method, CRM No. 62, or CRM No. 87—to demonstrate compliance with this proposed product standard. Each of these analytical test methods includes the proposed nicotine level in the range of levels that can be accurately measured.

⁴⁰ FDA has announced the availability of a draft guidance for industry entitled “Validation and Verification of Analytical Testing Methods Used for Tobacco Products” (86 FR 72603, December 22, 2021; see <https://www.fda.gov/media/155033/download>). The draft guidance, when finalized, would represent FDA’s current thinking on method validation for tobacco products. FDA final guidance “Q2(R2) Validation of Analytical Procedures” is available at <https://www.fda.gov/media/161201/download>.

It is reasonable to expect some manufacturers may prefer to use other test methods. If they are developed and validated, such methods may have different advantages in ease of use, upper and lower bounds of detection, equipment, and expertise. Thus, under this proposal we would evaluate analytical test methods and data as part of a manufacturer's premarket submission in accordance with section 910 of the FD&C Act.

4. Sampling Plans and Procedures (Proposed § 1160.16)

Proposed § 1160.16 would require each tobacco product manufacturer to design and implement a sampling plan that covers each finished tobacco product that it manufactures. This sampling plan must be based on a valid statistical rationale to ensure that the finished tobacco product complies with proposed § 1160.10. This sampling plan would be used in conjunction with the analytical test method in proposed § 1160.14 and would provide procedures for the manufacturer to select samples to demonstrate conformance to the proposed maximum nicotine level requirement.

The required procedures are intended to help ensure that tobacco products containing more than the maximum nicotine level are not sold or distributed to consumers. Manufacturers would be required to ensure that all finished tobacco products comply with the requirements of this proposed product standard. Products that do not conform to this standard would be deemed adulterated under section 902(5) of the FD&C Act and subject to enforcement action.

Proposed § 1160.16(a) provides the general requirements for sampling plans. The proposed provision would require manufacturers to design and implement a sampling plan or plans for each finished tobacco product based on a valid scientific rationale to ensure that the product consistently conforms to the requirements set forth in § 1160.10. This provision also explains that the sampling plan must ensure that samples taken are representative of an entire batch (*i.e.*, randomized or systematically selected across the entire batch) and collected from each batch for testing. To account for the variability of nicotine in finished tobacco products, the following factors must be based on adequate statistical criteria: the confidence intervals, the level of necessary precision, and the number of finished products sampled. The sampling plan must take into account the manufacturing quality history of the manufacturer (*e.g.*, batch testing records,

nonconforming tobacco product investigations). For example, a manufacturer that has a high number of nonconforming tobacco product investigations or a high number of batch rejections may decide to create a more robust sampling plan because of its history of producing nonconforming tobacco products.

The basic principles of an adequate sampling plan include the following: the samples are representative of the batch or quantity being sampled; the number of samples is based on a valid scientific rationale; and the number of samples is sufficient for the intended purpose. "Valid scientific rationale" refers to scientific techniques or methods used to establish the number of representative samples and should take into account tolerance for variability, confidence levels, and the degree of precision required (Refs. 654 to 656). FDA believes that requiring the number of samples to be based on a "valid scientific rationale" would provide manufacturers with the flexibility to determine the appropriate number of representative samples for any sampling plan. While FDA is proposing this flexibility, this provision would require that manufacturers have support for the scientific technique or methods used to establish the number of representative samples used and to show that the sampling size is representative of the material being sampled. FDA requests comment, including supporting data, regarding whether a final rule should provide a more detailed definition of or criteria for what constitutes "valid scientific rationale" (such as representative sampling) with regard to an adequate sampling plan.

Proposed § 1160.16(a) also would require that the sampling plan describe the sampling methodology (including scientific rationale), incorporate all sources of variability (including variability of the analytic method and nicotine levels), and describe the sample size needed (including a full description of how the sample size is calculated) consistent with the sampling plan to achieve the sampling objective. The sampling plan must also describe the criteria the manufacturer would use to make a decision to accept or reject each batch. FDA proposes to give tobacco product manufacturers flexibility to determine what unit of time or quantity is appropriate for their product and how batches would be designated. For example, manufacturers likely would define a batch for cigarette production, which is almost continuous, differently than a batch for machine or hand-rolled cigars.

With regard to the variability of the tobacco product, confidence intervals, level of necessary precision, and number of finished tobacco products sampled must be based on adequate statistical criteria. This provides manufacturers flexibility to determine the appropriate number of representative samples for any sampling plan. While FDA is proposing this flexibility, this provision would require that manufacturers have the support for the scientific technique or methods used to establish the representative samples used and to show that the sampling size is representative of the material being sampled. The manufacturer must maintain a nicotine content level no greater than 0.70 mg nicotine per gram of total tobacco for any products within the batch.

Proposed § 1160.16(b) would require that test samples from each batch be collected and examined in accordance with certain procedures. These procedures are consistent with ISO 8243, an international standard that specifies two methods of providing representative samples of a population of cigarettes manufactured for sale.

Under proposed § 1160.16(b)(1), test samples would have to consist of the finished tobacco product as it is intended to be sold or distributed to consumers and not of a separate production sample.

Proposed § 1160.16(b)(2) would require that all test samples be stored according to the intended storage conditions for the finished tobacco product. In addition, the manufacturer would have to include all of its factories, stock rooms, warehouses, and other locations containing finished tobacco products among the population to be sampled. Because a batch may include product that is in the warehouse and product that is in the factory, or in a place between the warehouse and factory, this requirement would ensure that the sample is representative of the entire population (batch) of finished tobacco products packaged for consumer use. This practice is consistent with the ISO 8243 standard (for sampling nicotine) and ensures that the samples are representative of the population of finished tobacco products packaged for consumer use.

Under proposed § 1160.16(b)(3), the manufacturer would have to take test samples from each batch within 30 calendar days of the date the product is manufactured. Based on FDA's experience, any protracted time between manufacturing and testing will add uncertainty in the accuracy of reported results. Thus, we are proposing a 30 calendar day timeframe from the

manufacture date for the manufacturer to take test samples from each batch. The amount of material acquired during sampling must be sufficient to complete all testing required by proposed § 1160.14, including any repeat testing that may be necessary. The sample materials would have to be selected from each batch in accordance with the applicable sampling plan. This would ensure that there has not been any degradation or change in part of the samples.

Proposed § 1160.16(b)(4) would require that sampling be performed by persons who have sufficient education, training, and experience to accomplish their assigned functions.

Under proposed § 1160.16(b)(5), each test sample would need to be identified so that the following information can be determined:

- Full identification of the finished tobacco product sampled, including, if applicable, the STN associated with marketing authorization (including the PD, if applicable), product name(s) (including brand and subbrand and the original name described in the premarket application, if different), product category, subcategory, package type, package quantity, and nicotine source;
- The manufacturing code;
- The date on which the sample was taken;
- The sampling location (including the address of the facility and specific location within the facility where the sample was taken);
- The name of the person(s) who collected the sample; and
- The location where the sample will be tested (including the facility name and address).

This information would be generated at the time the samples are pulled for testing and for each sample pulled, rather than reflecting aggregate information for all the samples in a particular batch. The purpose of this information is to fully identify each sample, including what the product is, when and where it was taken, and the batch from which it was taken. These records would serve dual purposes. First, they could be used to verify that a company is following its sampling plan and the required procedures in the codified including number of samples pulled, when they are pulled, and locations from where they are pulled. Second, these records would be used to generate some of the information for the records required under proposed § 1160.16(b)(8). They also would document the start of the chain of custody for the samples.

Proposed § 1160.16(b)(6) provides packaging requirements for when samples are sent for testing. Test samples would have to be packed securely with adequate protection against damage that might occur, including mechanical damage or adverse changes in humidity or temperature. The manufacturer also would have to send, under separate cover, a list of the samples included in each shipment to the testing facility. These samples should be identified by the relevant information required by proposed § 1160.16(b)(5).

Proposed § 1160.16(b)(7) would require that all samples from a single batch be tested at the same testing facility. This requirement is designed to ensure consistency in the procedures used and to protect against sample degradation.

Proposed § 1160.16(b)(8) provides sampling requirements for the testing facility. If samples will be transported to a different facility from the manufacturing facility for testing, once test samples arrive at the testing facility, samples must be inspected, accounted for, and properly stored under the finished tobacco product's intended storage conditions. The facility also would be responsible for generating a report for the batch test, maintained by the manufacturer in accordance with § 1160.32, which includes the information in proposed § 1160.16(b)(8)(i) through (vi):

- Full identification of the finished tobacco product sampled, including, if applicable, the STN associated with marketing authorization (including the PD, if applicable), product name(s) (including brand and subbrand and the original name described in the premarket application, if different), product category, subcategory, package type, package quantity; and nicotine source;
- The manufacturing code;
- The date on which the samples were taken, if available;
- The sampling location (including the address and specific locations within any facilities where the samples were taken);
- The number of test samples drawn from the batch; and
- Complete records of the samples received and tested, including the date of receipt, the identifier of all persons who tested the samples, and the test results.

This information would be generated once the test samples arrive at the testing facility. Unlike the information required under proposed § 1160.16(b)(5), this report would be an aggregate report for all the samples

taken from a batch. The primary purpose of this information, along with the information required by proposed § 1160.16(b)(5), would be to establish the chain of custody for the samples from the time they were taken through their transfer to the testing facility where they will be tested. FDA expects that this information would be integrated into the records required by proposed § 1160.12(b) to provide information across the batch.

Proposed § 1160.16(b)(9) explains that each batch must be withheld from commercial distribution until it has been sampled and tested, and a decision has been made by the tobacco product manufacturer that the batch conforms to the requirements of this part and may be released for commercial distribution. As discussed in proposed § 1160.18, the manufacturer would be required to reject any nonconforming tobacco products unless a disposition decision and justification to release the batch is made after an investigation determines that the batch meets the requirements of this part.

As noted in the discussion of proposed §§ 1160.12 and 1160.16, the reporting requirements in proposed §§ 1160.12(b), 1160.16(b)(5), and 1160.16(b)(8) are interrelated but intended for different purposes.

Because this tobacco product standard defines the amount of nicotine relative to the amount of total tobacco, manufacturers may be able to base sampling plans on batch sizes based on the tobacco filler. For example, cigarettes of two different lengths made from the same tobacco filler blend may be able to be considered a single batch for the purposes of calculating the sampling plan under proposed § 1160.16. Testing for nonconforming tobacco product under proposed § 1160.16 would require the manufacturer to adequately sample from the entire batch in proportion to production. For example, if two-thirds of the batch is produced as cigarette length A and one-third as cigarette length B, then two-thirds of the samples for testing for conformance would have to be sampled from cigarette length A and one-third from cigarette length B.

Manufacturers that purchase bulk tobacco filler can utilize results of filler testing by the seller in designing and implementing their sampling plan. Reliance on the seller's filler testing would not relieve the manufacturer of the finished tobacco product from its responsibility to test finished tobacco products or from responsibility for complying with this proposed product standard.

5. Nonconforming Tobacco Product (Proposed § 1160.18)

Proposed § 1160.18 would require finished tobacco product manufacturers to establish procedures for the control and disposition of nonconforming tobacco products. A “nonconforming tobacco product” is proposed to be defined as any tobacco product that does not meet the requirements of § 1160.10 (nicotine level specifications) or § 1160.30 (manufacturing code). These procedures are necessary to help prevent the distribution of nonconforming tobacco products by ensuring that all potential nonconforming products are identified, investigated, and segregated, and that appropriate disposition and followup are taken for products determined to be nonconforming. These provisions are also intended to help manufacturers determine the extent of any nonconformity and, in cases in which nonconforming product has already been released for distribution, determine where it was distributed.

Proposed § 1160.18 would require tobacco product manufacturers to establish and maintain procedures to identify, investigate, segregate, and make disposition decisions (*i.e.*, acceptance, rejection, rework) about nonconforming tobacco products to prevent their release for commercial distribution. “Establish and maintain” for purposes of proposed § 1160.18 means define, document (in writing or electronically), implement, follow, and, when necessary, update. This section allows manufacturers the flexibility to determine how they would perform these activities.

Proposed § 1160.18(a) would require tobacco product manufacturers to identify and segregate potential nonconforming tobacco product to prevent the commercial distribution of such products prior to investigation and disposition. Identification of potential nonconforming product can be accomplished in many ways (*e.g.*, applying a label with the relevant information directly to the product container; if an electronic system is utilized, associating the nonconforming product information with the relevant barcode). Identification is a critical first step to preventing further processing, production, or distribution of potential nonconforming tobacco products.

Proposed § 1160.18(a) also would require potential nonconforming tobacco product to remain segregated pending an investigation until it is determined to be conforming. If a potential nonconforming product is determined to be nonconforming, it

would need to remain segregated throughout investigation and disposition, including any rework. For purposes of proposed part 1160, “segregation” means setting the identified potential nonconforming product apart from other product (*i.e.*, placing it away from conforming finished product). This segregation could be accomplished by placing it in a quarantined or specifically marked-off area. Manufacturers should use prudence and segregate potential nonconforming tobacco product in a manner that is appropriate, given the nature of the potential nonconformity. The requirements to identify and segregate would be triggered upon discovery of a potential nonconforming product. For example, if a tobacco product manufacturer tests samples of finished tobacco product and determines that the representative samples from that batch do not conform to the requirement set forth in proposed § 1160.10, the manufacturer would determine that the batch and related products must be identified and segregated as they may be nonconforming products.

Proposed § 1160.18(b) would require tobacco product manufacturers to investigate all potential nonconforming tobacco products. This may include, for example if:

- The nicotine level of a test sample from any batch of finished tobacco products is determined to be out of conformance with the requirements of proposed § 1160.10;
- FDA notifies the manufacturer that a finished tobacco product in commercial distribution does not conform to the requirements of part 1160; or
- The manufacturer has come to know through any other means that a product is nonconforming.

In this context, a test sample would consist of a number of individual test units that are drawn based on a valid scientific rationale (such as representative sampling) and intended to ensure that the sample accurately reflects the material being sampled. The purpose of a nonconforming product investigation would be to determine the extent and the cause, if possible, of the nonconformity so that additional nonconforming products are not produced or released for commercial distribution. In addition, it would help to prevent recurrence of the nonconformity.

Under proposed § 1160.18(b), the manufacturer would be required to conduct an investigation to determine the extent of the nonconformity upon identification of a nonconforming

product and, as applicable, the locations where the nonconforming products have been distributed. We expect the manufacturer would be able to determine the locations of initial consignees (*e.g.*, wholesalers, distributors, retailers) where the affected products were shipped in the event a corrective action needs to be taken. The investigation would have to include an examination of all relevant processes and controls, laboratory testing, complaints, and any other relevant records and sources of information concerning the nonconforming product. For example, a manufacturer could determine the extent of the nonconformity by examining records and in-process control records for any batches, or portions of batches, that have been rejected during either in-process or finished inspection for failing to meet any or all of the product's specifications. Furthermore, in the event that a similar nonconforming product is identified in a different batch, a manufacturer's investigation could include any applicable information and records from the previous nonconforming product investigation that are relevant to determining the extent of the nonconformity of the affected batch.

Proposed § 1160.18(b) would also require that, for products determined to be nonconforming, the investigation must also determine the scope and cause of nonconformance. Examination of relevant production processes and controls and any other relevant records and sources of information could help a manufacturer determine if any other batches are affected or if nonconforming product has been distributed. For example, if a manufacturer's sampling plan and subsequent repeat testing under proposed § 1160.18 determines that a batch of finished cigarettes fail to meet the established nicotine level specification and acceptance criteria, the manufacturer will have to investigate the scope and cause of the nonconformance under this proposed section. If the investigation determines that the cause of the nonconformance is attributed to cut filler received from its supplier that contain nicotine levels that exceed the maximum nicotine level established by the proposed product standard, the manufacturer must also determine the scope of the nonconformance, such as all batches of finished cigarettes that used the affected cut filler.

The manufacturer would have to document any investigation, including any material review, name of the person(s) making the disposition decisions, justification for the

disposition decisions, results of retesting, decisions with respect to reworking, and followup results from the investigation (*e.g.*, corrective actions). FDA may inspect these records to verify that the manufacturer has performed an adequate investigation.

For example, if a manufacturer uses a laboratory to perform product testing under proposed § 1160.12, and there is an out-of-specification (OOS) laboratory test result, the manufacturer would need to investigate the OOS test result under proposed § 1160.18(b) to determine whether the product is nonconforming or the OOS result is due to another cause, such as laboratory error. Under proposed § 1160.18(b), the investigation would be required to include an examination of relevant processes, operations, and any other relevant sources of information such as the laboratory method and review of initial testing and calibration of the laboratory equipment. Such an investigation could determine that the OOS test results came from an aberration of the measurement process (*e.g.*, laboratory error, defective testing equipment, deviation from an established laboratory test method) and that the potential nonconforming tobacco product is not nonconforming. Alternatively, an investigation could conclude that the OOS test result was valid, and that the product was nonconforming as a result of, for example, the manufacturing process. If the manufacturer's nonconforming product investigation determines that the OOS result is due to a legitimate reason such as a testing aberration, *e.g.*, instrument malfunction, and the re-test or rework establishes that the finished tobacco product conforms to the nicotine level of the product standard, such product could be released for commercial distribution.

Proposed § 1160.18(c) would require tobacco product manufacturers to reject a batch of a finished tobacco product if the nicotine level of the test sample does not meet the requirements of § 1160.10, unless a disposition decision and justification to release the batch is made after an investigation shows the batch meets the requirements of part 1160. This might occur in the event of a laboratory or sampling error. Manufacturers would not be able to simply resample a batch until the batch conforms with the proposed maximum nicotine level in § 1160.10 if previous test samples did not meet the requirements of part 1160. If the initial test samples of the batch were not in conformance, the manufacturer must conduct a nonconforming tobacco product investigation. If the manufacturer, for instance, determines

that the nicotine levels were erroneously high due to a malfunction of the testing equipment, the manufacturer could determine that the batch is acceptable for release for commercial distribution.

Proposed § 1160.18(d) would require manufacturers to determine the disposition of all nonconforming tobacco products and any necessary followup. Under proposed § 1160.18(d), nonconforming product cannot be released for distribution without rework or an adequate justification (developed and maintained in accordance with § 1160.32). Thus, nonconforming product could be reworked, distributed with an adequate justification, or discarded. Additionally, nonconforming product could be exported if it meets the requirements of section 801(e)(1) of the FD&C Act. Proposed § 1160.18(d) also would require the manufacturer to develop an adequate written justification before releasing such product for commercial distribution. An adequate written justification would be required to address how the nonconforming product meets all requirements under this part. Nonconforming product cannot be released for commercial distribution without rework or an adequate written justification supporting its release. An example of reworking a nonconforming product would be a manufacturer rebinding the cut filler and retesting to ensure that it conforms to the established product standard.

Proposed § 1160.18(e) would require each tobacco product manufacturer to maintain records of all activities required under § 1160.18. Records must include the date and time of the activity, the individual performing the activity, the type of activity performed, any information that demonstrates the requirement was met, and any data or calculations necessary to reconstruct the results.

C. Manufacturing Code and Recordkeeping Requirements (Proposed Subpart C)

1. Manufacturing Code Requirements (Proposed § 1160.30)

Proposed § 1160.30 would require that the packaging of all finished tobacco products include a manufacturing code. The manufacturing code would allow manufacturers and FDA to identify the production batch of a particular finished product that has been released for distribution. This information is intended to help determine the product's history (*e.g.*, batch production records) and assist manufacturers and FDA in the event of

a nonconforming tobacco product investigation and any corrective actions to be taken by a manufacturer as a result of the investigation. The “-NS” designation will enable retailers to readily identify that a finished tobacco product conforms with this standard. Finished tobacco products that do not have this designation do not conform to this standard. The manufacturing code information also would aid FDA in ensuring compliance with this proposed product standard by clearly identifying those products that conform to the standard and linking those products to records that substantiate their conformance.

As stated in proposed § 1160.30(a), the manufacturing code would be required to be permanently affixed to the packaging or label of all finished tobacco products. The manufacturing code must be affixed in a manner that ensures it will remain on the packaging or label through the expected duration of use of the product by the consumer. In addition, proposed § 1160.30(b) would require that the manufacturing code be permanently affixed, legible, conspicuous, prominent, and appear in the English language.

As stated in proposed § 1160.30(c), the manufacturing code must contain the following information listed in the following order:

- The manufacturing date in 2-digit numerical values in the month-day-year format (MMDDYY);
- The finished tobacco product batch number; and
- The designation “-NS” at the end ⁴¹ (to signify that the product was manufactured in accordance with this nicotine product standard).

FDA requests comment on the manufacturing code requirements in this proposed rule.

2. Recordkeeping Requirements (Proposed § 1160.32)

Proposed § 1160.32 contains recordkeeping requirements. This information is necessary for FDA to ascertain and confirm that finished tobacco products are in compliance with the proposed product standard.

First, proposed § 1160.32(a) would require that each facility that manufactures tobacco products subject to this part (*i.e.*, cigarettes and certain other finished tobacco products) establish and maintain records related to compliance with this part, including the following:

⁴¹ The “-NS” designation will enable retailers to readily identify that a finished tobacco product conforms with this standard. Finished tobacco products that do not have this designation do not conform to this standard.

(1) The source data and results of analyses conducted to determine conformance with § 1160.10, including all information identified in § 1160.12(b);

(2) All source data used to validate an analytical test method;

(3) All sampling plans and sampling reports under § 1160.16;

(4) Documentation that the persons performing sampling under § 1160.16 have sufficient education, training, and experience to accomplish the assigned functions; and

(5) All nonconforming tobacco product identification, segregation, investigation, rework, and disposition decision procedures, including justifications under § 1160.18.

This information is necessary for FDA to ascertain and confirm that the products are in compliance with the proposed product standard.

Second, proposed § 1160.32(b) provides certain specifications for these records. All records required under this part, regardless of storage medium, would need to be attributable (*i.e.*, traceable to its source), legible (*i.e.*, in a readable format), contemporaneously recorded (*i.e.*, recorded at the time of performance), original (*i.e.*, first capture of the data), and accurate (*i.e.*, correct, truthful, complete, valid, and reliable). In addition, these records would be required to be written in English; alternatively, an accurate English translation must be made available upon request. Documents that have been translated from a foreign language into English would have to be accompanied by the foreign language version of the document and a certification by the manufacturer's authorized representative (which could be a U.S. agent for the manufacturer) that the English language translation is complete and accurate, and a brief statement of the qualifications of the person who made the translation (*e.g.*, education, experience). These records would need to be maintained at the manufacturing establishment or another location that is readily accessible to responsible officials of the manufacturer and to FDA. These records, including those not stored at the establishment, would need to be readily accessible to FDA during the retention period (as discussed in § 1160.32(c)) for inspection and photocopying or other means of reproduction. Original or true copies of these records that can be immediately retrieved from another location, including by computer or other electronic means, would satisfy the requirements of this section.

FDA expects that requested records that are maintained offsite would be

made available within 24 hours or, if that is not feasible, as soon as possible before the close of the inspection. While the Agency expects that most records can be made available to FDA within 24 hours, FDA recognizes that, in some cases, additional time may be needed to retrieve records from a third party or archival storage. Records that can be immediately retrieved from another location, including by computer or other electronic means, would meet the requirement that the records be readily available.

Proposed § 1160.32(c) would require that the records kept under this part be retained for at least 4 years from the date of commercial distribution of the finished tobacco product that is the subject of the record. FDA has selected 4 years to help ensure that the records would be available for at least one biennial FDA inspection under sections 704 and 905(g) of the FD&C Act.

FDA believes that detailed recordkeeping requirements are necessary to confirm that finished tobacco products are in compliance with the proposed product standard. For example, requiring manufacturers to document their test results would enable FDA to confirm that the manufacturer's analytical test method is adequate to meet the requirements of part 1160. In addition, requiring nonconforming tobacco product records would help the manufacturer and FDA determine the extent of the nonconformity with the product standard and, as applicable, the locations where the nonconforming products have been distributed, for example, in the event of a recall.

XI. Proposed Effective Date

In accordance with section 907(d)(2) of the FD&C Act,⁴² FDA proposes that any final rule that may issue based on this proposal become effective 2 years after the date of publication of the final rule. Therefore, after the effective date, no manufacturer or importer would be allowed to distribute, sell, or offer for distribution or sale within the United States any finished tobacco product that does not comply with proposed part 1160. After the effective date of the final rule, manufacturers and importers would not be allowed to enter or introduce into domestic commerce any finished tobacco product (*i.e.*, cigarettes,

cigarette tobacco, RYO tobacco, cigars, and pipe tobacco) that does not comply with the requirements of the final rule, irrespective of the date of manufacture. Prior to the effective date of any final rule that may issue based on this proposed rule, wholesalers, retailers, and related entities would be able to sell available stock of finished tobacco products that are not in compliance with part 1160 while transitioning inventory in anticipation of the effective date of the final rule; however, they would not be permitted to sell off such stock after the effective date. FDA notes that keeping products subject to this proposed rule with higher nicotine levels on the market for an extended period of time is not in the interest of public health.

The Nicotine ANPRM requested comment on a proposed effective date for a nicotine tobacco product standard. Several comments recommended that FDA establish a 1-year timeframe for implementation. Other comments urged FDA to set a 2-year timeframe for implementation, which they stated would be the minimum required by section 907 of the FD&C Act due to the impact on farmers. A few comments argued that an implementation period should be required for all manufacturers, regardless of the number of employees and/or annual revenues, because the long time to develop the regulation plus the implementation period would be sufficient warning for all companies. However, many comments argued that the implementation period should be significantly longer than a 1- or 2-year period to allow farmers, tobacco intermediaries, and manufacturers to develop and implement the methods of reduction.

The comments differed as to whether FDA should allow manufacturers any time to sell off nonconforming tobacco product. Several comments urged FDA to allow manufacturer sell-off of existing nonconforming inventory, with some stating that a 6-month or 12-month selloff period should be sufficient for nonconforming product to move through the supply chain. Nevertheless, several comments opposed provisions that would allow sell-off of existing inventory, arguing that the extensive period of the development of the standard combined with a 2-year phase-in period would give the companies more than enough time to sell-off or recall existing inventory. Some comments stated that a 60-day selloff period would be a sufficient selloff period while still maintaining the public health goals of the standard. FDA requests comments, including

⁴² Section 907(d)(2) of the FD&C Act states that a regulation establishing a tobacco product standard shall set forth the date or dates upon which the standard shall take effect, but no such regulation may take effect before 1 year after the date of its publication unless the Secretary determines that an earlier effective date is necessary for the protection of the public health.

supportive data and research, regarding a selloff period (e.g., 60 days after the effective date of the final rule) for retailers to sell through their current inventory of nonconforming product.

FDA considered many factors in determining an appropriate proposed effective date. Pursuant to section 907(d)(2) of the FD&C Act, FDA considered the technical achievability of compliance with the proposed product standard and the existence of patents that would make it impossible to comply in the proposed 2-year timeframe. For example, for manufacturers that may not want to use chemical extraction, FDA considered how long it would likely take for a tobacco product manufacturer to acquire sufficient VLNC tobacco to meet the proposed product standard. Industry documents indicate that the timing of availability of leaf once commercial seed is provided is one growing season (Ref. 657). Seed production and germination testing can be conducted in multiple seasons within a single year with small-scale trial to commercial availability taking place over the course of 1 year (Ref. 658). For example, industry documents indicate that a request for purchase of low alkaloid nicotine in March 1990 would be expected to result in leaf delivery during August and September (Ref. 657).

Once purchased, FDA considered how long tobacco must be stored prior to use in cigarettes and other combusted tobacco products. Industry documents suggest a minimum storage age (particularly for burley and flue-cured tobaccos) of around 12 months (Refs. 659 to 663). Other tobacco manufacturers suggest that tobaccos should be stored for 22 months, although other studies suggest that aging beyond 12 months has minimal effects (Refs. 662 and 664). Industry documents also indicate that processed tobaccos do not appear to require long-term inventory or aging in the same manner as whole-leaf tobaccos (Ref. 659). FDA requests comments, including supportive data and research, on the technical achievability of compliance with the proposed product standard and the existence of patents that would make it impossible to comply in the proposed 2-year timeframe.

FDA also finds that a 2-year effective date will “minimize, consistent with the public health, economic loss to, and disruption or dislocation of, domestic and international trade” pursuant to section 907(d)(2) of the FD&C Act. As discussed extensively throughout this document, tobacco use is the leading cause of preventable disease and death

in the United States, and nearly all of the adverse health effects are ultimately the result of addiction to the nicotine in cigarettes and certain other combusted tobacco products, which leads to repeated exposure to toxicants from these products. Given the tremendous public health risks presented—particularly to youth who experiment with these products, develop an addiction to nicotine, and progress to regular use—by combusted tobacco products, FDA finds that any balancing of impacts to domestic and international trade is far outweighed by the significant public health benefits of this proposed product standard for all age groups. FDA also believes that a 2-year effective date would allow adequate time for implementing any necessary changes in technology to achieve the proposed nicotine level, for making any changes to tobacco purchasing choices and curing methods, and for preparation or changes needed in facilities, which can be accomplished simultaneously. In addition, this timeframe should provide adequate time for manufacturers to seek and obtain marketing authorization from FDA for their new tobacco products. FDA believes that this 2-year period would provide sufficient time for a tobacco product manufacturer to submit, and FDA to review, applications for new tobacco products that comply with this provision. This is particularly true given our expectation that most manufacturers that reduce the nicotine levels of their products to comply with the proposed standard would be submitting SE Reports, which may decrease the amount of data required for authorization. See section IX.B of this document regarding pathways to market tobacco products that have been modified to meet the proposed standard. FDA requests comments, including supportive data and research, on the timeframe for manufacturers to prepare applications and obtain marketing authorization from FDA for their new tobacco products.

FDA finds this proposed effective date to be appropriate for the protection of the public health, given that current nicotine levels in the finished tobacco products cause addiction and repeated exposure to toxicants, which ultimately result in the majority of tobacco-related disease and death in the United States. Additional delay, past 2 years, would only increase the number of youth and young adults who transition to regular use of cigarettes and certain other combusted tobacco products and would delay switching to potentially less harmful tobacco products or cessation

by people who currently smoke cigarettes.

Pursuant to section 907(d)(2), FDA requests comments by interested parties, including manufacturers and tobacco growers, regarding the technical achievability of compliance with this proposed product standard, including information concerning the existence of patents that make it impossible to comply in the proposed 2-year timeframe. FDA also requests comment on the timeframe for manufacturers to prepare applications and obtain marketing authorization from FDA for their new tobacco products. Further, FDA requests comments and data regarding whether 2 years is sufficient to comply with this standard or whether this effective date should be later to provide additional time for manufacturers to develop any necessary changes in technology, facilities, farming methods, or other factors or business practices affecting compliance. FDA also requests comments and supporting data as to whether a shorter effective date would be necessary for the protection of the public health.

XII. Preliminary Economic Analysis of Impacts

A. Introduction

We have examined the impacts of the proposed rule under Executive Order 12866, Executive Order 13563, Executive Order 14094, the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4).

Executive Orders 12866, 13563, and 14094 direct us to assess all benefits, costs, and transfers of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). Rules are “significant” under Executive Order 12866 Section 3(f)(1) (as amended by Executive Order 14094) if they “have an annual effect on the economy of \$200 million or more (adjusted every 3 years by the Administrator of [the Office of Information and Regulatory Affairs (OIRA)] for changes in gross domestic product); or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, territorial, or tribal governments or communities.” OIRA has determined that this proposed rule is a significant regulatory action under Executive Order 12866 Section 3(f)(1).

The Regulatory Flexibility Act requires us to analyze regulatory options that would minimize any significant impact of a rule on small entities. Because businesses, including small businesses, would incur costs to comply with the proposed product standard, we find that the proposed rule will have a significant economic impact on a substantial number of small entities.

The Unfunded Mandates Reform Act of 1995 (section 202(a)) requires us to prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing “any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100,000,000 or more (adjusted annually for inflation) in any one year.” The 2023 threshold after adjustment for inflation is \$183 million, using the 2023 Implicit Price Deflator for the Gross Domestic Product. This proposed rule would result in an expenditure in at least 1 year that meets or exceeds this amount.

B. Summary of Costs and Benefits

We have developed a comprehensive Preliminary Economic Analysis of Impacts that assesses the impacts of the proposed rule. The full preliminary analysis of economic impacts is available in the docket for this proposed rule (Ref. 653) and at <https://www.fda.gov/about-fda/economics-staff/regulatory-impact-analyses-ria>. The summary of costs, benefits, and transfers is presented in table 13. Benefits occur because the proposed rule would discourage people who do not use tobacco products from initiating combusted tobacco products and progressing to regular use and increase cessation or switching to potentially lower risk tobacco products among people who currently use covered combusted tobacco products and wish to quit. Lower prevalence of combusted tobacco product use would lead to reduced health consequences for people who formerly used combusted tobacco products and those who were previously exposed to secondhand smoke. The main quantified benefits come from averted mortality and morbidity as a result of reduced prevalence for people who currently use combusted tobacco products, and reduced mortality from reduced exposure to secondhand smoke among people. As described in section VIII.A above, to assess the potential public health impacts of a nicotine product standard, FDA developed a population health model using inputs derived from available empirical evidence and expert

opinion to estimate the impact of changes in tobacco product initiation, cessation, switching, and dual use on tobacco use prevalence, morbidity, and mortality in the United States. We use output from this population health model to estimate averted mortality and preliminarily apply the value of a statistical life while requesting feedback about how to follow HHS guidance (see PRIA Section II.M.6). The morbidity estimates come from population health model output that evaluates the health difference for being in the state of smoking versus not smoking. Unquantified benefits include medical cost savings, productivity loss savings, reduced exposure to thirdhand smoke, and environmental impacts. We estimate that the present value of the quantified benefits over a 40-year time horizon ranges between \$7.6 trillion and \$33.2 trillion with a primary estimate of \$30.6 trillion at a 2 percent discount rate. The primary annualized quantifiable benefits equal \$1.1 trillion at a 2 percent discount rate.

As most of the benefits from avoided initiation among youth and young adults due to this proposed product standard are expected to fall outside of the 40-year time horizon of the main analysis, we present an extended analysis over a period beyond the 40-year time horizon to capture the impact on youth and young adults. The present value of quantified benefits, mostly attributable to youth and young adults, over this extended period range between \$8.4 trillion and \$19.7 trillion with a primary estimate of \$19.1 trillion at a 2 percent discount rate. Additionally, we present the incidence of benefits for specific populations in the Distributional Effects section.

We expect this proposed rule, if finalized, to impose costs on industry to follow the product standard, on the broader economy to repurpose land, labor, and capital, on consumers impacted by the product standard, and on FDA to enforce this product standard. The tobacco market faces a one-time primary cost with a present value of \$374 million at a 2 percent discount rate (low-impact scenario estimate of \$112 million to a high-impact scenario estimate of \$700 million) to read and understand the rule.⁴³ We also use population health

model output on prevalence to estimate the baseline and policy market size. These estimates feed into cost estimates, such as lost producer surplus. Producers of combusted tobacco products incur a primary annualized producer surplus loss of \$1.7 billion (low-impact scenario of \$0.2 billion and a high-impact scenario of \$2 billion) at a 2 percent discount rate. We expect that some manufacturers would reformulate their products to comply with this standard. We estimate a one-time reformulation cost with present value of \$0.6 billion (low-impact scenario estimate of \$8.8 billion to a high-impact scenario estimate of \$0.04 billion). Manufacturers that reformulate would collectively incur a one-time cost to submit their new tobacco product for FDA review, estimated at a present value \$1 million at a 2 percent discount rate (low-impact scenario estimate of \$15 million to a high-impact scenario estimate of \$0.1 million). In addition, these manufacturers would also incur recurring costs to test the nicotine level of their products with a primary annualized estimate of \$0.3 million (low-impact scenario estimate of \$1.9 million to a high-impact scenario estimate of \$0.1 million) at a 2 percent discount rate. We estimate a one-time cost for FDA to review submissions for new tobacco products at a present value of \$1.0 million at a 2 percent discount rate (low-impact scenario estimate of \$15.3 million to a high-impact scenario estimate of \$0.1 million). The economy faces a one-time economic transition cost with a present value of \$7.2 billion at a 2 percent discount rate (low-impact scenario estimate of \$4.3 billion to a high-impact scenario estimate of \$9.1 billion) to reallocate productive resources (such as labor and capital) currently devoted to the manufacture of NNC covered combusted tobacco products to other tobacco products or to non-tobacco products. We estimate transition cost based on average industry capital expenditures and literature on the cost of labor transition. Consumers of NNC covered combusted tobacco products would face a one-time search cost with a present value of \$1.4 billion at a 2 percent discount rate (low-impact scenario estimate of \$0.46 billion to a high-impact scenario estimate of \$2.8 billion) to find other tobacco products or NRT as a replacement for the prohibited NNC products. We estimate one-time withdrawal costs for

⁴³ For the purposes of our analysis, we use the population health model described in section VIII.A of this document to estimate impacts for a range of averted mortality and tobacco prevalence. The “high impact scenario”, generally referred to as the upper bound, corresponds to the scenario where the policy has 95th percentile averted mortality projected by the population health model, which also corresponds with the lowest (5th percentile)

post-policy combusted tobacco prevalence. For some costs (product reformulation, premarket submission, and review, and testing costs), the “upper bound” corresponds to the scenario with the fewest products and, thus, would reflect the lowest estimate of costs.

consumers who quit tobacco products, with a primary estimate of \$1.4 billion at a 2 percent discount rate (low-impact scenario estimate of \$0.02 billion to a high-impact scenario estimate of \$8.99 billion), at a 2 percent discount rate. We estimate additional costs associated with FDA enforcement of the product standard to range from an annualized value of \$3.3 million to \$7 million at a 2 percent discount rate. Unquantified costs may include changes in consumer surplus for some people who smoke NNC products, including potential utility changes for consumers who switch from NNC to VLNC combusted tobacco products. The present value of the costs over a 40-year time horizon has a primary estimate of \$58 billion (low-impact scenario estimate of \$19.3

billion to a high-impact scenario of \$76.2 billion) at a 2 percent discount rate. The primary estimates for the annualized costs are \$2.1 billion at a 2 percent discount rate.

In addition to benefits and costs, this rule would cause transfers from the Federal Government, State governments, and firms to consumers, who in turn would spend this money in other sectors of the economy (including savings), in the form of reduced revenue and tax revenue. We also estimate transfers between or within firms to cover shifts in user fee obligation. The primary estimate for the annualized transfers from the Federal Government, in the form of reduced excise tax, ranges from \$1.4 billion to \$4.3 billion, with a primary estimate of \$4.1 billion at a 2

percent discount rate. The primary estimate for the annualized transfers from State governments, in the form of reduced excise tax, ranges from \$2.8 billion to \$8.9 billion, with a primary estimate of \$8.4 billion at a 2 percent discount rate. The primary estimate for the annualized transfers from the firms, in the form of reduced revenue, is \$20.0 billion at a 2 percent discount rate (low-impact scenario of \$6.2 billion; high-impact scenario of \$17.6 billion). The primary estimate for the annualized user fee obligation shifted from combusted tobacco products to noncombusted tobacco products has a range from \$26.3 million to \$461.1 million with a primary estimate of \$332.6 million at a 2 percent discount rate. Transfers are summarized in table 13.

TABLE 13—SUMMARY OF BENEFITS, COSTS, AND DISTRIBUTIONAL EFFECTS OF THE PROPOSED RULE
[Millions of 2023 dollars over a 40-year time horizon]

Category	Primary estimate	Low estimate	High estimate	Dollar year	Discount rate (%)	Time horizon	Notes
Benefits							
Annualized monetized benefits	\$1,097,053	\$273,521	\$1,190,582	2023	2	2025–2064 (40 years)	See footnote. ⁴⁴
Annualized quantified, but non-monetized, benefits.							
Unquantified benefits	Medical cost savings, productivity loss savings, reductions in smoking-related fires (excluding mortality), reduced litter, and other associated harms to the environment						
Costs							
Annualized monetized costs	2,077	690	2,729	2023	2	2025–2064 (40 years).	
Annualized quantified, but non-monetized, costs.							
Unquantified costs	Changes in consumer surplus for some people who smoke normal nicotine content combusted tobacco products, including potential utility changes for consumers who switch from NNC to VLNC combusted tobacco products.						
Transfers							
Annualized monetized Federal budgetary transfers.	4,092	1,386	4,313	2023	2	2025–2064 (40 years).	
Bearers of transfer gain and loss?	Transfers of Excise Tax Revenues from Federal Governments to Consumers						
Annualized monetized State budgetary transfers.	8,414	2,848	8,877	2023	2	2025–2064 (40 years).	
Bearers of transfer gain and loss?	Transfers of Excise Tax Revenues from State Governments to Consumers						
Other annualized monetized transfers	19,964	6,235	17,603	2023	2	2025–2064 (40 years).	
Bearers of transfer gain and loss?	Transfers of Revenues from Tobacco Firms to Consumers						
Other annualized monetized transfers	333	26	461	2023	2	2025–2064 (40 years).	
Bearers of transfer gain and loss?	Transfers from User Fees Owed by Combusted Tobacco Firms to s Owed by Noncombusted Tobacco Firms						
Net benefits							
Annualized monetized net benefits	1,094,976	272,831	1,187,853	2023	2	2025–2064 (40 years).	
Category	Effects						Notes
Effects on State, local, or Tribal govern- ments.	Significant transfer of tax revenues for State governments. Potential transfer of tax revenue for local and Tribal governments.						
Effects on small businesses	Significant revenue reductions and compliance costs for small, combusted tobacco product manufacturers. We expect most small, combusted manufacturers would shut down or switch industries.						
Effects on wages	No significant wage impacts.						

TABLE 13—SUMMARY OF BENEFITS, COSTS, AND DISTRIBUTIONAL EFFECTS OF THE PROPOSED RULE—Continued
[Millions of 2023 dollars over a 40-year time horizon]

Category	Primary estimate	Low estimate	High estimate	Dollar year	Discount rate (%)	Time horizon	Notes
Category	Effects						Notes
Effects on growth	Anticipated growth in the noncombusted tobacco sector.						

We request comment on our estimates of benefits, costs, and transfers of this proposed rule.

XIII. Analysis of Environmental Impact

The Agency has carefully considered the potential environmental effects of this action. FDA has concluded that the action will not have a significant impact on the human environment, and that an environmental impact statement is not required. The Agency's finding of no significant impact and the evidence supporting that finding is available in the docket for this proposed rule (Refs. 665 and 666) and may be seen in Dockets Management Staff (see **ADDRESSES**) between 9 a.m. and 4 p.m., Monday through Friday; it is also available electronically at <https://www.regulations.gov>. Under FDA's regulations implementing the National Environmental Policy Act (21 CFR part 25), an action of this type would require an environmental assessment under 21 CFR 25.20.

XIV. Paperwork Reduction Act of 1995

This proposed rule contains information collection provisions that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3521). A description of these provisions is given in the *Description* section of this document

⁴⁴ FDA notes that these results hinge on an expert elicitation in which the experts were provided peer reviewed literature on VLNC and NNC cigarette use in experiments. The expert elicitation and much of the literature specifically referenced the nicotine level of 0.4 mg nicotine per gram total tobacco. However, in 22nd Century Group, Inc.'s modified risk tobacco product applications, the company reported that after 9 years of sampling by the company, the average nicotine content of its genetically engineered VLNC tobacco is 0.6 mg nicotine per gram of total tobacco, with a range of 0.4 to 0.7 mg nicotine per gram of total tobacco. It is likely that the Quest and SPECTRUM Nicotine Research Cigarettes, used throughout the scientific literature, also contained between 0.4 to 0.7 mg nicotine per gram of total tobacco (Ref. 257). This suggests the literature the experts reviewed studied cigarettes in the range of 0.4–0.7 mg nicotine per gram total tobacco as opposed to only 0.4 mg nicotine per gram total tobacco. Therefore, the results of the expert elicitation are still applicable to a nicotine level of 0.7 mg nicotine per gram total tobacco. For reference, nicotine content in the top 100 cigarette brands (2017) is 17.2 mg nicotine per gram total tobacco (Ref. 9).

with an estimate of the annual reporting, recordkeeping, and third-party disclosure burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information. If finalized, this proposed rule will seek approval of a new information collection.

FDA invites comments on these topics: (1) whether the proposed collection of information is necessary for the proper performance of FDA's functions, including whether the information will have practical utility; (2) the accuracy of FDA's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility, and clarity of the information to be collected; (4) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques, when appropriate, and other forms of information technology; and (5) the standard and customary business practices of tobacco manufacturers as it relates to capital, operating, and maintenance costs associated with this collection of information.

Title: Tobacco Product Standard for Nicotine Yield of Cigarettes and Certain Other Combusted Tobacco Products (0910–NEW).

Description: The FD&C Act authorizes FDA to adopt tobacco product standards, including product standards that include provisions for nicotine yields and for the reduction or elimination of other constituents (including smoke constituents) or harmful components (section 907(a)(3)(A) and (4) of the FD&C Act). FDA is proposing to limit nicotine yield by setting a maximum nicotine content level for finished cigarettes and certain other finished combusted tobacco products not to exceed 0.70 mg of nicotine per gram of total tobacco.

Subpart A contains the general provisions of this proposed product standard including scope, prohibited activities, and definitions.

Subpart B contains the proposed product standard requirements pertaining to finished tobacco products that cover product testing (§ 1160.12), sampling plans (§ 1160.16), analytical test methods (§ 1160.14), nonconforming tobacco products (§ 1160.18), package label requirements (§ 1160.30) and recordkeeping requirements (§ 1160.32).

Subpart C contains manufacturing code (§ 1160.14) and recordkeeping (§ 1160.32) requirements.

Proposed § 1160.12 contains provisions for the testing of finished tobacco products that would be subject to this proposed rule. Specifically, proposed § 1160.12(a) would require that tobacco product manufacturers conduct testing on each batch of finished tobacco products.

Proposed § 1160.12(b) would require that a full report of the source data and results of all batch testing be maintained by the tobacco product manufacturer. Based on FDA subject matter expertise and experience from tobacco inspections, we expect that manufacturers would discuss in these reports how their product is batched. These reports would be generated for test samples from each batch and would not be required for each individual finished tobacco product. This report would have to include the following information:

(1) Full identification of the finished tobacco product that is the subject of the report, including the product category, subcategory, product name (brand and subbrand), package type, package quantity, and nicotine source;

(2) Nicotine level of each sample tested from the batch and standard deviation;

(3) The batch manufacturing date and location, including facility name and address, for each sample;

(4) The testing date and location, including the facility name and address;

(5) The manufacturing code of each sample tested (in accordance with proposed § 1160.30(c));

(6) The test method and sampling procedure used;

(7) Names and qualifications of the person(s) conducting the testing and any laboratory accreditation;

(8) The equipment used (including documentation to show that the equipment is appropriate for its intended purpose and has been calibrated to ensure accurate and reliable results); and

(9) The criteria used to make a decision to accept or reject each batch and the decision made with respect to each batch (e.g., accept, reject) based on the results of the product testing. This information would constitute the documentation of the source data and actual results of the product testing conducted on each batch.

The main purpose of this report would be to verify that products subject to this proposed product standard do not exceed the maximum nicotine level and to document the company's decision for each batch with respect to acceptance, rejection, and reworking of the products. FDA expects that information collected pursuant to proposed § 1160.12(b) would be integrated with the proposed § 1160.18(b) records (*i.e.*, proposed § 1160.12(b) records regarding the product being tested, including, for example, the product category and subcategory, brand and subbrand, packaging information, nicotine source, manufacturing date, and the manufacturing code would inform the § 1160.18(b) investigation). These proposed § 1160.12(b) records also would document the ultimate disposition of the batch based on the testing of the representative samples.

Proposed § 1160.14 would require that manufacturers analyze the nicotine levels of cigarettes and certain other finished combusted tobacco products covered by the rule using a validated analytical test method. Manufacturers would be required to demonstrate that the test method used was validated in an analytical test laboratory. Proposed § 1160.16 would require each tobacco product manufacturer to design and implement a sampling plan that covers each finished tobacco product that it manufactures. This sampling plan would provide procedures for the manufacturer to select samples to demonstrate conformance to the proposed maximum nicotine level requirement. The required procedures would help ensure that products that exceed the maximum level of nicotine are not sold or distributed to consumers. This provision also explains that the sampling plan must ensure samples taken are representative of an entire batch and are randomly selected and collected from each batch for testing.

This section would also require test samples from each batch be collected and examined in accordance with

certain procedures (proposed § 1160.16(b)). Each test sample would need to be identified so that the following information can be determined:

- Full identification of the finished tobacco product sampled, including product category, subcategory, product name (brand and subbrand), package type, package quantity, and nicotine source;
- The manufacturing code;
- The date on which the sample was taken;
- The sampling location (including the address of the facility and specific location within the facility where the sample was taken);
- The name of the person(s) who collected the sample; and
- The location where the sample will be tested (including the facility name and address).

Proposed § 1160.18 would require finished tobacco product manufacturers to establish procedures for the control and disposition of nonconforming tobacco products. The proposed procedures would require tobacco product manufacturers to establish and maintain procedures to identify, investigate, segregate, and make disposition decisions (*i.e.*, acceptance, rejection, rework) about nonconforming finished tobacco products to prevent their release for commercial distribution. FDA interprets “establish and maintain” for purposes of proposed § 1160.18 to mean define, document (in writing or electronically), implement, follow, and, when necessary, update.

Identification of potential nonconforming product (*i.e.*, a tobacco product that does not conform to the proposed maximum nicotine level requirement) can be accomplished in many ways (e.g., applying a label with the relevant information directly to the product container; if an electronic system is utilized, associating the nonconforming product information with the relevant barcode). If a potential nonconforming product is determined to be nonconforming, it would need to remain segregated throughout investigation and disposition, including any rework. For purposes of proposed part 1160, “segregation” means setting the identified potential nonconforming product apart from other product (*i.e.*, placing it away from conforming finished product). This segregation could be accomplished by placing it in a quarantined or specifically marked-off area.

The manufacturer would be required to conduct an investigation to determine the extent of the nonconformity upon identification of a nonconforming

product and, as applicable, the locations where the nonconforming products have been distributed. We expect the manufacturer would be able to determine the locations of initial consignees (e.g., wholesalers, distributors, retailers) where the affected products were shipped in the event a corrective action needs to be taken. The investigation would have to include an examination of all relevant processes and controls, laboratory testing, complaints, and any other relevant records and sources of information concerning the nonconforming product. Tobacco product manufacturers would be required to reject a batch of a finished tobacco product if the nicotine level of the test sample does not meet the requirements unless a disposition decision and justification to release the batch is made after an investigation shows the batch meets the requirements.

Tobacco product manufacturers would be required to determine the disposition of all nonconforming tobacco products and any necessary followup. Nonconforming product cannot be released for commercial distribution without rework or an adequate justification (developed and maintained in accordance with § 1160.32). Thus, nonconforming product could be reworked, distributed with an adequate justification, or discarded. An adequate written justification would be required to address how the nonconforming product meets all requirements under this part.

Proposed § 1160.18(e) would require each tobacco product manufacturer to maintain records of all activities required under § 1160.18. Records must include the date and time of the activity, the individual performing the activity, the type of activity performed, any information that demonstrates the requirement was met, and any data or calculations necessary to reconstruct the results.

FDA expects that information collected pursuant to proposed § 1160.12(b) would be integrated with the proposed § 1160.18(b) records (*i.e.*, proposed § 1160.12(b) records regarding the product being tested, including, for example, the product category and subcategory, brand and subbrand, packaging information, nicotine source, manufacturing date, and the manufacturing code would inform the § 1160.18(b) investigation). These proposed § 1160.12(b) records also would document the ultimate disposition of the batch based on the testing of the representative samples.

Proposed § 1160.30 would require the use of a manufacturing code to serve as

a common identifier for production and distribution records. The purpose of the manufacturing code is to allow manufacturers and FDA to identify the production batch of a particular finished product that has been released for distribution. This information is intended to help determine the product's history (e.g., batch production records) and assist manufacturers and FDA in the event of a nonconforming product investigation and any corrective actions to be taken as a result of the investigation.

The manufacturing code would be required to be permanently affixed to the packaging or labeling of all finished tobacco products. The manufacturing code must be affixed in a manner that ensures it will remain on the packaging or label through the expected duration of use of the product by the consumer. In addition, proposed § 1160.30(b) would require that the manufacturing code be permanently affixed, legible, conspicuous, prominent, and appear in the English language.

As stated in proposed § 1160.30(c), the manufacturing code must contain the following information listed in the following order:

- The manufacturing date in 2-digit numerical values in the month-day-year format (MMDDYY);
- The finished tobacco product batch number; and
- The designation “-NS” at the end.

The manufacturing code would allow manufacturers and FDA to identify the production batch of a particular finished product that has been released for distribution. This information is intended to help determine the product's history (e.g., batch production records) and assist manufacturers and FDA in the event of a nonconforming product investigation and any corrective actions to be taken as a result of the investigation.

Proposed § 1160.32 contains recordkeeping requirements that are necessary for FDA to ascertain and confirm that finished tobacco products are in compliance with the proposed product standard. The proposed product standard would require that manufacturers establish and maintain records regarding the results of testing conducted on each batch to determine conformance with the proposed standard. In addition, this proposed product standard would require that manufacturers maintain records of batch testing, source data for analytical test method validation, sampling plans and sampling procedures, and nonconforming tobacco products.

First, proposed § 1160.32(a) would require that each facility that

manufactures tobacco products subject to this part (i.e., finished tobacco products) establish and maintain records related to compliance with this part, including the following:

- (1) The source data and results of analyses conducted to determine conformance with § 1160.10, including all information identified in § 1160.12(b);
- (2) All source data used for analytical test method validation;
- (3) All sampling plans and sampling reports under § 1160.16;
- (4) Documentation that the persons performing sampling under § 1160.16 have sufficient education, training, and experience to accomplish the assigned functions; and
- (5) All nonconforming tobacco product identification, segregation, investigation, rework, and disposition decision procedures, including justifications, under § 1160.18. This information is necessary for FDA to ascertain and confirm that the products are in compliance with the proposed product standard.

Second, proposed § 1160.32(b) provides certain specifications for these records. All records required under this part, regardless of storage medium, would need to be attributable, legible, contemporaneously recorded, original, and accurate. In addition, these records would be required to be written in English; alternatively, an accurate English translation must be made available upon request. Documents that have been translated from a foreign language into English would have to be accompanied by the foreign language version of the document and a certification by the manufacturer's authorized representative (which could be a U.S. agent for the manufacturer) that the English language translation is complete and accurate, and a brief statement of the qualifications of the person who made the translation (e.g., education, experience). These records would need to be maintained at the manufacturing establishment or another location that is readily accessible to responsible officials of the manufacturer and to FDA.

Proposed § 1160.32(c) would require that the records kept under this part be retained for at least 4 years from the date of commercial distribution of the finished tobacco product that is the subject of the record. FDA has selected 4 years as a means to help ensure that the records would be available for at least one biennial FDA inspection under sections 704 and 905(g) of the FD&C Act.

FDA believes that detailed recordkeeping requirements are

necessary to confirm that finished tobacco products are in compliance with the proposed product standard. For example, requiring manufacturers to document their test results would enable FDA to confirm the manufacturer's test method is adequate to meet the requirements of part 1160. In addition, requiring nonconforming product records would help the manufacturer and FDA determine the extent of the nonconformity with the product standard and, as applicable, the locations where the nonconforming products have been distributed; for example, in the event of a recall.

Description of Respondents: The information collection requirements in the proposed standard would apply to tobacco product manufacturers, which means any person, including a repacker or relabeler, who (1) manufactures, fabricates, assembles, processes, or labels a tobacco product; or (2) imports a finished tobacco product for sale or distribution in the United States. Specifically, the information collection would apply to manufacturers of cigarettes (other than noncombusted cigarettes, such as heated tobacco products that meet the definition of a cigarette), cigarette tobacco, roll-your-own (RYO) tobacco, cigars (including little cigars, cigarillos, and large cigars, but excluding “premium cigars”), and pipe tobacco (other than waterpipe tobacco). FDA recognizes that many of the proposed provisions of the proposed rule are in accordance with the quality control and manufacturing practices that manufacturers have already adopted on a voluntary basis.

Application requirements are set by the final Substantial Equivalence (0910–0673) and Premarket Tobacco Product Application (0910–0879) rules. For products covered by this proposed standard, we expect most manufacturers will seek authorization using the substantial equivalence premarket pathway, which may decrease the amount of data required for authorization. See section IX.B of this document regarding pathways to market tobacco products that have been modified to meet the proposed standard. Based on FDA's subject matter expertise and industry data, we recognize that between 85 and 90 percent of all cigarette production is conducted by large manufacturers. We also find that the other tobacco product categories, such as non-premium cigars, pipe, and RYO tobacco, have similar levels of market concentration. We assume that large tobacco product manufacturers represent the bulk of tobacco product

production capacity and so represent the majority of recordkeeping burden.

The proposed provision § 1160.12 (batch testing), is part of standard and customary business practices of tobacco manufacturers. As such, there are no capital costs or operating and maintenance costs associated with this collection of information. Batch testing is conducted either by the manufacturer in-house or by a 3rd-party accredited laboratory. If sent to a 3rd-party laboratory, we do not expect any capital, operating, or maintenance costs associated with batch testing to be incurred by the manufacturer. We expect a manufacturer would only test their products in-house if they already possess an in-house laboratory accredited to conduct scientific tests. We would not anticipate capital, operating, or maintenance costs for these in-house laboratories as capital and maintenance are components of maintaining accreditation. We do not expect any manufacturers currently without an in-house laboratory to newly establish an in-house accredited laboratory as a result of this product standard.

The proposed provision § 1160.14 (analytical test method), is also part of standard and customary business practices of tobacco manufacturers. As such, there are no capital costs or operating and maintenance costs associated with this collection of

information. Manufacturers are already required to submit test results of analytical testing for nicotine and other relevant harmful and potentially harmful constituents (HPHCs) as part of premarket submissions. As the establishment and use of analytical testing is already generally required for premarket submissions, we do not anticipate capital, operating, or maintenance cost from these provisions.

The proposed provision § 1160.16 (sampling plans), is part of standard and customary business practices of tobacco manufacturers. As such, there are no capital costs or operating and maintenance costs associated with this collection of information. Manufacturers already routinely conduct analytical testing to check for consistency in their finished products. To conduct such testing, manufacturers would have needed to establish a sampling plan to generate a representative sample of their product for testing. As such, we do not anticipate capital, operating, or maintenance cost from these provisions.

The proposed provision § 1160.18 (nonconforming tobacco products), is part of standard and customary business practices of tobacco manufacturers. As such, there are no capital costs or operating and maintenance costs associated with this collection of information. Based on FDA subject matter expertise and inspections, we find that almost all manufacturers

already check for consistency and conformance of their products and rework product as necessary to supply information for internal quality checks and distribution purposes, we do not anticipate capital, operating, or maintenance cost from these provisions.

The proposed provision § 1160.30 (manufacturing code labeling), is part of standard and customary business practices of tobacco manufacturers. As such, there are no capital costs or operating and maintenance costs associated with this collection of information. Based on FDA subject matter expertise and industry information, we find that almost all manufacturers already apply a manufacturing code to their products. Because a manufacturing code also supplies information that the manufacturer needs for internal quality and distribution purposes (standard and customary practices), we do not anticipate additional capital, operating, or maintenance cost from these provisions.

FDA specifically invites comments on our discussion of the standard and customary business practices of tobacco manufacturers as it relates to capital, operating, and maintenance costs associated with this collection of information.

FDA estimates the burden of this collection of information as follows:

TABLE 14—ESTIMATED ANNUAL RECORDKEEPING BURDEN ⁴⁵

21 CFR section or activity	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
§ 1160.12 Product Testing	143	50.84	7,270	9	65,430
§ 1160.14 Analytical Test Method	143	4	572	1	572
§ 1160.16 Sampling Plan	143	4	572	1	572
§ 1160.18 Procedures for Nonconforming Tobacco Products and Related Investigations; Procedures for Control and Disposition of Nonconforming Tobacco Products	143	1	143	14	2,002
§ 1160.30 Package Label Requirements (Manufacturing Code)	143	4	572	7	4,004
§ 1160.32 Recordkeeping Requirements (Batch Testing Records)	143	50.84	7,270	6	43,620
Total Annual Burden					116,200

Table 14 displays the recordkeeping burden associated with this proposed rule. Included in this estimate is the recordkeeping burden for establishing and maintaining records regarding the results of testing conducted on each batch to determine conformance with the proposed standard, sampling plans

⁴⁵ There are no capital costs or operating and maintenance costs associated with this collection of information.

and sampling procedures, and records related to manufacturing controls. FDA’s burden estimates are based on CTP’s Tobacco Registration and Listing Module Next Generation (TRLM NG) data and Dun & Bradstreet firm data (D&B). The requirements in the Tobacco Product Standard for Nicotine Yield of Cigarettes and Certain Other Combusted Tobacco Products proposed rule would apply to both domestic and foreign

manufacturers of finished tobacco products that are distributed or sold in the United States. We estimate the number of affected entities, by tobacco product category and size of operation group. We estimate that there are a total of 143 entities potentially affected by the proposed rule (domestic manufacturers and importers of impacted tobacco products, including 133 manufacturers and importers of

cigarettes, cigars, pipe tobacco, and RYO tobacco and 10 dual operation facilities that manufacture both combusted and noncombusted products). For purposes of the PRA estimates, FDA used the entities affected and a weighted average of the median hours to calculate the respondents and total burden hours.

We estimate a total of 7,270 batches per year are required to be tested under § 1160.12 (product testing). Based on information from inspections and other FDA subject matter expertise, including typical batch sizes and projected combusted tobacco production by year, FDA estimates that there will be 50.84 records per recordkeeper with 9 hours of average burden per recordkeeping. FDA assumes respondents will establish a total of 7,270 annual records for a total of annual 65,430 hours.

Based on information from inspections and other FDA subject matter expertise, we expect that core blends are the products that manufacturers will choose to reformulate to meet the product standard. Manufacturers would incur a burden to establish an analytical test method and sampling plan for each reformulated core blend. FDA experts assume that each manufacturer, on average, utilizes four different core blends per tobacco category that they manufacture. Under § 1160.14 (analytical test method), respondents

would determine an analytical test method to use for complying with the product standard. During validation of the analytical test method within the laboratory to be used, the respondent would record and collect the data generated and maintain these records. FDA estimates there will be 4 records per recordkeeper with 1 hour of average burden per recordkeeping and respondents will establish a total of 572 annual records for a total of annual 572 hours. Under § 1160.16 (sampling plan), FDA estimates there will be 4 records per recordkeeper with 1 hour of average burden per recordkeeping. FDA assumes respondents will establish a total of 572 annual records for a total of annual 572 hours.

Under § 1160.18 (procedures for nonconforming products), FDA assumes there will be 1 record per recordkeeper with 14 hours of average burden per recordkeeping for a total of 143 annual records and a total of annual 2,002 hours. This estimate is based on information from tobacco inspections and FDA experience in developing good manufacturing practices in non-tobacco industries. Further, as stated above, based on FDA subject matter expertise and inspections, we find that almost all manufacturers already check for consistency and conformance of their products and rework product as necessary to supply information for

internal quality checks and distribution purposes.

Proposed § 1160.30 would require manufacturers to apply a manufacturing code to the packaging and label of tobacco products. Based on FDA subject matter expertise and market tracking information, we find that almost all manufacturers already apply a manufacturing code to their products. FDA assumes 4 records per recordkeeper with 7 hours of average burden per recordkeeping, and a total of 572 annual records for a total of annual 4,004 hours.

Under § 1160.32 (batch testing records), FDA assumes 50.84 records per recordkeeper with 6 hours of average burden per recordkeeping. This estimate is based on establishing the format and maintaining batch test records for detailed recordkeeping requirements, including English translation and accessibility, that are necessary to confirm that finished tobacco products are in compliance with the proposed product standard. FDA assumes that respondents will maintain a total of 7,270 annual records for a total of annual 43,620 hours.

FDA expects the additional one-time (*i.e.*, occurring only in the first year) reporting burden for the information collection that will result from this rule, to be as follows:

TABLE 15—ESTIMATED ONE-TIME REPORTING BURDEN

Activity	Number of respondents	Number of responses per respondent	Total annual responses	Average burden per response	Total hours
Review and familiarization with the rule	1,465	1	1,465	10	14,650
Total One-Time Burden					14,650

Based on FDA subject matter expertise, we assume that all entities affected by this proposed rule would spend time to read and understand the rule, resulting in a one-time reporting burden. FDA estimates that there will be 293 entities and 5 individuals at each entity that will read the final rule. It is estimated that each respondent will spend up to 10 hours reading and understanding the rule for a total of 14,650 one-time burden hours. Per the requirements of this proposed rule, FDA estimates the total burden will be 130,850 hours (116,200 + 14,650).

FDA invites comments on the estimates in this section and specifically any burden specific to small manufacturers to whom this proposed standard would apply. To ensure that comments on information collection are

received, OMB recommends that written comments be submitted through [reginfo.gov](https://www.reginfo.gov) (see **ADDRESSES**). All comments should be identified with the title of the information collection.

In compliance with the Paperwork Reduction Act of 1995 (44 U.S.C. 3407(d)), we have submitted the information collection provisions of this proposed rule to OMB for review. These information collection requirements will not be effective until FDA publishes a final rule, OMB approves the information collection requirements, and the rule goes into effect. FDA will announce OMB approval of these requirements in the **Federal Register**.

XV. Federalism

We have analyzed this proposed rule in accordance with the principles set

forth in Executive Order 13132. Section 4(a) of the Executive order requires Agencies to “construe . . . a Federal statute to preempt State law only where the statute contains an express preemption provision or there is some other clear evidence that the Congress intended preemption of State law, or where the exercise of State authority conflicts with the exercise of Federal authority under the Federal statute.” We have determined that the proposed rule, if finalized, would not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, the Agency tentatively concludes that the rule does not contain policies that have

federalism implications as defined in the Executive order and, consequently, a federalism summary impact statement is not required.

This rule is being issued under section 907 of the FD&C Act, which enables FDA to prescribe regulations relating to tobacco product standards, and the sale and distribution restriction in this rule is also being issued under section 906(d) of the FD&C Act, which enables FDA to prescribe regulations restricting the sale and distribution of a tobacco product. If this proposed rule is made final, the final rule would create requirements whose preemptive effect would be governed by section 916 of the FD&C Act (21 U.S.C. 387p) entitled “Preservation of State and local authority.”

Section 916 of the FD&C Act broadly preserves the authority of States and localities to protect the public against the harms of tobacco use. Specifically, section 916(a)(1) of the FD&C Act establishes a general presumption that FDA requirements do not preempt or otherwise limit the authority of States, localities, or tribes to, among other things, enact and enforce laws regarding tobacco products that relate to certain activities (e.g., sale, distribution) and that are in addition to or more stringent than requirements established under chapter IX of the FD&C Act.

Section 916(a)(2)(A) of the FD&C Act is an express preemption provision that establishes an exception to the preservation of State and local governmental authority over tobacco products established in section 916(a)(1). Specifically, section 916(a)(2)(A) of the FD&C Act provides that “[n]o State or political subdivision of a State may establish or continue in effect with respect to a tobacco product any requirement which is different from, or in addition to, any requirement under the provisions of this chapter relating to tobacco product standards”

However, section 916(a)(2)(B) limits the applicability of section 916(a)(2)(A) of the FD&C Act, narrowing the scope of State and local requirements that are subject to express preemption. Paragraph (a)(2)(B) provides that preemption under paragraph (a)(2)(A) does not apply to State or local “requirements relating to the sale, distribution, possession, information reporting to the State, exposure to, access to, the advertising and promotion of, or use of, tobacco products by individuals of any age, or relating to fire safety standards for tobacco products.”

If this proposed rule is finalized as proposed, the final rule would create requirements that fall within the scope

of section 916(a)(2)(A) of the FD&C Act because they are “requirements under the provisions of the chapter relating to tobacco product standards.”

Accordingly, the preemptive effect of those requirements on any State or local requirement would be determined by the nature of the State or local requirement at issue—specifically, whether the State or local requirement is preserved under section 916(a)(1) of the FD&C Act, and/or excepted under section 916(a)(2)(B) of the FD&C Act (such as if it relates to the “sale, distribution, possession, information reporting to the State, exposure to, access to, the advertising and promotion of, or use of, tobacco products”). State and local prohibitions on the sale and distribution of tobacco products would not be preempted by this rule, if finalized, because such prohibitions would be preserved by section 916(a)(1) of the FD&C Act or, as applicable, excepted from express preemption by section 916(a)(2)(B) of the FD&C Act. FDA invites comments on how State or local laws may be implicated if this proposed rule is finalized.

XVI. Severability

In accordance with section 5 of the Tobacco Control Act, which provides for the severability of, *inter alia*, all “regulations promulgated under” the authorities provided by that Act, FDA would consider the various requirements and prohibitions established by this rule, if finalized, to be severable. It is FDA’s interpretation and position that the invalidity of any provision of a final rule would not affect the validity of any other part of the rule. In the event any court or other lawful authority were to temporarily or permanently invalidate, restrain, enjoin, or suspend any provision of a final rule, FDA intends for the remaining parts to continue to be valid. Additionally, as further stated in section 5 of the Tobacco Control Act, if certain applications of a final rule to persons or circumstances (discussed in the preamble or otherwise) are held to be invalid, application of such provisions to any other person or circumstance will not be affected and will continue to be enforced to the fullest extent possible. Each provision of the rule is independently supported by data and analysis as described or referenced in this preamble and, if issued separately, would remain a proper exercise of FDA authority.

XVII. Consultation and Coordination With Indian Tribal Governments

We have analyzed this proposed rule in accordance with the principles set

forth in Executive Order 13175. We have tentatively determined that the rule contains policies that may have a substantial direct effect on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. We expect some tribal governments to be impacted given that some are manufacturers and retailers of cigarettes. The Agency solicits comments from tribal officials on any potential impact on Indian Tribes from this proposed action.

List of Subjects in 21 CFR Part 1160

Administrative practice and procedure, Labeling, Smoke, Smoking, Tobacco, Tobacco products.

■ Therefore, under the Federal Food, Drug, and Cosmetic Act, and under authority delegated to the Commissioner of Food and Drugs, it is proposed that chapter I of title 21 of the Code of Federal Regulations be amended by adding part 1160 to subchapter K to read as follows:

PART 1160—TOBACCO PRODUCT STANDARD FOR NICOTINE YIELD OF CIGARETTES AND CERTAIN OTHER COMBUSTED TOBACCO PRODUCTS

Subpart A—General Provisions

Sec.

1160.1 Scope.

1160.3 Definitions.

Subpart B—Product Requirements

1160.10 Nicotine level.

1160.12 Product testing.

1160.14 Analytical test method.

1160.16 Sampling plans and procedures.

1160.18 Nonconforming tobacco product.

Subpart C—Manufacturing Code and Recordkeeping Requirements

1160.30 Manufacturing code requirements.

1160.32 Recordkeeping requirements.

Authority: 21 U.S.C. 331, 371(a), 374, 381(e), 381(p)(2), 387b, 387c, 387f(d), 387f(e), 387g, 387i, 387j.

Subpart A—General Provisions

§ 1160.1 Scope.

(a) This part sets forth the product standard to limit nicotine yield by setting a maximum nicotine content level for certain finished tobacco products. The provisions of this part are applicable to cigarettes (other than noncombusted cigarettes, such as heated tobacco products that meet the definition of a cigarette), cigarette tobacco, roll-your-own tobacco, cigars (other than premium cigars), and pipe tobacco (other than waterpipe tobacco).

(b) No person may distribute, sell, or offer for sale or distribution within the United States finished tobacco products, as described in paragraph (a) of this section, that are not in compliance with this part.

(c) No person may manufacture within the United States finished tobacco products, as described in paragraph (a) of this section, that are not in compliance with this part, unless such tobacco products are intended for export and are eligible for export under section 801(e)(1) of the Federal Food, Drug, and Cosmetic Act.

§ 1160.3 Definitions.

For purposes of this part:

Accessory means any product that is intended or reasonably expected to be used with or for the human consumption of a tobacco product; does not contain tobacco or nicotine from any source and is not made or derived from tobacco; and meets either of the following:

(1) Is not intended or reasonably expected to affect or alter the performance, composition, constituents, or characteristics of a tobacco product; or

(2) Is intended or reasonably expected to affect or maintain the performance, composition, constituents, or characteristics of a tobacco product; but

(i) Solely controls moisture and/or temperature of a stored tobacco product; or

(ii) Solely provides an external heat source to initiate but not maintain combustion of a tobacco product.

Batch means a specific identified amount of a finished tobacco product produced in a unit of time or quantity and that is intended to have the same specifications.

Cigar means a tobacco product that:

(1) Is not a cigarette; and

(2) Is a roll of tobacco wrapped in leaf tobacco or any substance containing tobacco.

Cigarette, as used in this part:

(1) Means a product that:
(i) Is a tobacco product; and
(ii) Meets the definition of the term “cigarette” in section 3(1) of the Federal Cigarette Labeling and Advertising Act; and

(2) Includes tobacco, in any form, that is functional in the product, which, because of its appearance, the type of tobacco used in the filler, or its packaging and labeling, is likely to be offered to, or purchased by, consumers as a cigarette or as roll-your-own tobacco.

Cigarette tobacco means any tobacco product that consists of loose tobacco that is intended for use by consumers in a cigarette. Unless otherwise stated, the requirements applicable to cigarettes under this chapter also apply to cigarette tobacco.

Commercial distribution means any distribution of a finished tobacco product, whether domestic or imported, to consumers or to any person, but does not include interplant transfers of a tobacco product between establishments within the same parent, subsidiary, and/or affiliate company, nor does it include providing a tobacco product for product testing where such product is not made available for personal consumption or resale. “Commercial distribution” does not include the handing or transfer of a tobacco product from one consumer to another for personal consumption.

Component or part means any software or assembly of materials intended or reasonably expected:

(1) To alter or affect the tobacco product’s performance, composition, constituents, or characteristics; or

(2) To be used with or for the human consumption of a tobacco product. The term excludes anything that is an accessory of a tobacco product.

Finished tobacco product means a tobacco product, including all components and parts, sealed in final packaging (e.g., filters or filter tubes sold to consumers separately or as part of kits) or in the final form in which it is intended to be sold to consumers.

Manufacturing code means any distinctive sequence or combination of letters, numbers, or symbols that begins with the manufacturing date, followed by the batch number, and concludes with “-NS.”

Manufacturing date means the month, day, and year in 2-digit numerical values in the format (MMDDYY) that a finished tobacco product is packaged for distribution.

Nicotine means the chemical substance named 3-(1-methyl-2-pyrrolidinyl) pyridine or C[10]H[14]N[2], including any salt or

complex of nicotine, derived from any source.

Nonconforming tobacco product means any tobacco product that does not meet the requirements of § 1160.10 or § 1160.30.

Package or packaging means a pack, box, carton, or container of any kind or, if no other container, any wrapping (including cellophane) in which a tobacco product is offered for sale, sold, or otherwise distributed to consumers.

Person includes an individual, partnership, corporation, or association.

Pipe tobacco means any tobacco product that, because of its appearance, type, packaging, or labeling, is suitable for use and likely to be offered to, or purchased by, consumers as tobacco to be smoked in a pipe.

Rework means action taken on a nonconforming tobacco product to ensure the product meets the specifications and other requirements of this part before it is released for commercial distribution.

Roll-your-own tobacco means any tobacco product which, because of its appearance, type, packaging, or labeling, is suitable for use and likely to be offered to, or purchased by, consumers as tobacco for making cigarettes or cigars.

Specification means any requirement with which a product, process, service, or other activity must conform.

Tobacco filler means cut, ground, powdered, or leaf tobacco or other nicotine-containing substances in a finished tobacco product.

Tobacco product means any product made or derived from tobacco, or containing nicotine from any source, that is intended for human consumption, including any component, part, or accessory of a tobacco product (except for raw materials other than tobacco used in manufacturing a component, part, or accessory of a tobacco product). The term “tobacco product” does not mean an article that under the Federal Food, Drug, and Cosmetic Act is: a drug (section 201(g)(1)); a device (section 201(h)); a combination product (section 503(g)); or a food under section 201(f) if such article contains no nicotine, or no more than trace amounts of naturally occurring nicotine.

Tobacco product manufacturer means any person, including a repacker or relabeler, who:

(1) Manufactures, fabricates, assembles, processes, or labels a tobacco product; or

(2) Imports a finished tobacco product for sale or distribution in the United States.

Total tobacco means tobacco filler and any other tobacco or tobacco-derived material used as part of a tobacco product.

United States means the 50 States of the United States of America and the District of Columbia, the Commonwealth of Puerto Rico, Guam, the Virgin Islands, American Samoa, Wake Island, Midway Islands, Kingman Reef, Johnston Atoll, the Northern Mariana Islands, and any other trust territory or possession of the United States.

Subpart B—Product Requirements

§ 1160.10 Nicotine level.

A finished tobacco product must not exceed a nicotine content of 0.70 milligrams of nicotine per gram of total tobacco.

§ 1160.12 Product testing.

(a) *Batch testing.* Tobacco product manufacturers must conduct testing on finished tobacco products to ensure that the batch conforms with § 1160.10. The manufacturer must use an analytical test method that meets the requirements set forth in § 1160.14. Samples for testing each batch to determine if it conforms with § 1160.10 must be selected in accordance with the requirements set forth in § 1160.16.

(b) *Documentation of test results.* A full report of the source data and results of all batch testing must be maintained by the tobacco product manufacturer in accordance with § 1160.32, including the following:

(1) Full identification of the finished tobacco product that is the subject of the report, including, if applicable, the submission tracking number (STN) associated with marketing authorization (including the static product ID (PD), if applicable), product name(s) (including brand and subbrand and the original name described in the premarket application, if different), product category, subcategory, package type, package quantity, and nicotine source;

(2) Nicotine level of each sample tested and standard deviation;

(3) The batch manufacturing date and location, including facility name and address, for each sample;

(4) The testing date and location, including the facility name and address;

(5) The manufacturing code of each sample tested;

(6) The test method and sampling procedure used;

(7) The names and qualifications of the person(s) conducting the testing and any laboratory accreditation;

(8) The equipment used (including documentation to show that the

equipment is appropriate for its intended purpose and has been calibrated to ensure accurate and reliable results); and

(9) The criteria used to make a decision to accept or reject each batch and the decision made with respect to each batch (e.g., accept, reject) based on the results of the product testing.

§ 1160.14 Analytical test method.

Tobacco product manufacturers must use an analytical test method and must demonstrate that the test method used was validated in an analytical test laboratory.

§ 1160.16 Sampling plans and procedures.

(a) *Sampling plans.* Each tobacco product manufacturer must design and implement a sampling plan or plans that cover each finished tobacco product based on a valid scientific rationale to ensure that the product consistently conforms to the requirement set forth in § 1160.10. The sampling plan must ensure that samples taken are representative of an entire batch (i.e., randomized or systematically selected across the entire batch) and collected from each batch for testing. To account for the variability of nicotine in finished tobacco products, the following factors must be based on adequate statistical criteria: the confidence intervals, the level of necessary precision, and the number of finished products sampled. The sampling plan must take into account the manufacturing quality history of the manufacturer (e.g., batch testing records, nonconforming tobacco product investigations). Each sampling plan must describe the sampling methodology, with scientific rationale, incorporate all sources of variability (including variability of the analytic method and nicotine levels), and describe the sample size needed (including a full description of how the sample size is calculated) consistent with the sampling plan to achieve the sampling objective. The sampling plan must also describe the criteria the tobacco product manufacturer will use to make a decision to accept or reject each batch.

(b) *Sampling procedures.* Test samples must be collected from each batch and examined in accordance with the following procedures:

(1) Test samples are to consist of the finished tobacco product as it is intended to be sold or distributed to consumers and not of a separate production sample.

(2) All test samples must be stored according to the intended storage conditions for the finished tobacco product. A tobacco product

manufacturer must include all of its factories, stock rooms, warehouses, and other locations containing finished tobacco products in the population to be sampled.

(3) Test samples must be taken from each batch and tested within 30 calendar days of the manufacturing date. The amount of material acquired during sampling must be sufficient for all testing required by § 1160.14, including any repeat testing that may be necessary. Samples must be selected from each batch in accordance with the applicable sampling plan.

(4) Sampling must be performed by persons who have sufficient education, training, and experience to accomplish the assigned functions.

(5) Each test sample must be identified so that the following information can be determined:

(i) Full identification of the finished tobacco product sampled, including, if applicable, the STN associated with marketing authorization (including the PD, if applicable), product name(s) (including brand and subbrand and the original name described in the premarket application, if different), product category, subcategory, package type, package quantity, and nicotine source;

(ii) The manufacturing code;

(iii) The date on which the sample was taken;

(iv) The sampling location (including the address of the facility and specific location within the facility where the sample was taken);

(v) The name of the person(s) who collected the sample; and

(vi) The location where the sample will be tested (including the facility name and address).

(6) Samples sent for testing must be packed securely with adequate protection against damage (e.g., mechanical damage, adverse changes in humidity or temperature). A list of the samples in each shipment must be sent to the testing facility under separate cover.

(7) All samples for a batch test must be tested at the same facility.

(8) If samples will be transported to a different facility from the manufacturing facility for testing, once test samples arrive at the testing facility, they must be inspected, accounted for, and properly stored under the finished tobacco product's intended storage conditions, and a report that includes the following information must be generated for the batch test and be maintained by the tobacco product manufacturer in accordance with § 1160.32:

(i) Full identification of the finished tobacco product sampled, including, if applicable, the STN associated with marketing authorization (including the PD, if applicable), product name(s) (including brand and subbrand and the original name described in the premarket application, if different), product category, subcategory, package type, package quantity, and nicotine source;

(ii) The manufacturing code;

(iii) The date on which samples were taken, if available;

(iv) The sampling location (including the address and specific locations within any facilities where samples were taken);

(v) The number of test samples drawn; and

(vi) Complete records of the samples received and tested, including the date of receipt, the identifier of all persons who tested the samples, and the test results.

(9) Each batch must be withheld from commercial distribution until it has been sampled and tested and a decision has been made by the tobacco product manufacturer that it conforms to the requirements of this part and may be released for commercial distribution.

§ 1160.18 Nonconforming tobacco product.

Each tobacco product manufacturer must establish and maintain procedures for the control and disposition of nonconforming tobacco product. The procedures must include the following requirements:

(a) *Identification and segregation.*

Each tobacco product manufacturer must identify and segregate potential nonconforming product in a manner that prevents commercial distribution of potential nonconforming product prior to investigation and disposition.

(b) *Investigation.* Each tobacco product manufacturer must investigate all potential nonconforming tobacco products to determine if the product is nonconforming. The investigation must include an examination of relevant production processes and controls, laboratory testing, complaints, and any other relevant records and sources of information. For products determined to be nonconforming, the investigation must also determine the scope and cause of nonconformance.

(c) *Rejection of nonconforming product.* Tobacco product manufacturers must reject a batch of a finished tobacco product if the nicotine level of a test sample from the batch does not conform to the requirements of this part unless a disposition decision and justification to release the batch is

made after an investigation determines that the batch meets the requirements of this part.

(d) *Disposition and followup.* Each tobacco product manufacturer must determine the disposition of all nonconforming tobacco products and any necessary followup. If the disposition decision is that the tobacco product can be released for distribution without rework, an adequate written justification must be developed and maintained in accordance with § 1160.32. An adequate written justification must address why releasing the nonconforming product would not result in the tobacco product being adulterated or misbranded. Nonconforming product cannot be released for distribution without rework or an adequate justification.

(e) *Records.* Each tobacco product manufacturer must maintain records of all activities required under this section. Records must include the date and time of the activity, the individual performing the activity, the type of activity performed, any information that demonstrates that the requirement was met, and any data or calculations necessary to reconstruct the results.

Subpart C—Manufacturing Code and Recordkeeping Requirements

§ 1160.30 Manufacturing code requirements.

(a) Each tobacco product manufacturer must permanently affix a manufacturing code to the packaging or labeling of all finished tobacco products. For a finished tobacco product, the manufacturing code must be affixed in a manner that assures it

will remain on the packaging or labeling through the expected duration of use of the tobacco product by the consumer.

(b) The manufacturing code for each finished tobacco product must be permanently affixed, legible, conspicuous, prominent, and appear in the English language.

(c) The manufacturing code must contain the following information listed in the following order:

(1) The manufacturing date in 2-digit numerical values in the month-day-year format (MMDDYY);

(2) The finished tobacco product batch number; and

(3) The designation “–NS” at the end.

§ 1160.32 Recordkeeping requirements.

(a) Each facility that manufactures tobacco products subject to this part must establish and maintain records related to compliance with this part, including the following:

(1) The source data and results of batch testing conducted to determine conformance with § 1160.10, including all information specified in § 1160.12(b);

(2) All source data for analytical test method validation;

(3) All sampling plans and reports under § 1160.16;

(4) Documentation that the persons performing sampling under § 1160.16 have sufficient education, training, and experience to accomplish the assigned functions; and

(5) All nonconforming tobacco product identification, segregation, investigation, rework, and disposition decision procedures, including justifications, under § 1160.18.

(b) All records required under this part, regardless of storage medium, must

be attributable, legible, contemporaneously recorded, original, and accurate. These records must be written in English, or an accurate English translation must be made available upon request. Documents that have been translated from another language into English must be accompanied by the original language version of the document, a signed statement by the authorized representative of the manufacturer certifying that the English language translation is complete and accurate, and a brief statement of the qualifications of the person that made the translation. These records must be maintained at the manufacturing establishment or another location that is readily accessible to responsible officials of the tobacco product manufacturer and to FDA. These records, including those not stored at the establishment, must be made readily accessible to FDA during the retention period for inspection and photocopying or other means of reproduction. Original or true copies of these records that can be immediately retrieved from another location, including by computer or other electronic means, meet the requirements of this paragraph.

(c) All records required under this part must be retained for a period of at least 4 years from the date of commercial distribution of the finished tobacco product that is the subject of the record.

Dated: January 6, 2025.

Robert M. Califf,

Commissioner of Food and Drugs.

Agricultural Marketing Service

9 CFR Part 201

Poultry Grower Payment Systems and Capital Improvement Systems; Final Rule

DEPARTMENT OF AGRICULTURE**Agricultural Marketing Service****9 CFR Part 201**

[Doc. No. AMS–FTPP–22–0046]

RIN 0581–AE18

Poultry Grower Payment Systems and Capital Improvement Systems**AGENCY:** Agricultural Marketing Service, U.S. Department of Agriculture.**ACTION:** Final rule.

SUMMARY: This final rule by the United States Department of Agriculture's (USDA or the Department) Agricultural Marketing Service (AMS or the Agency) amends the Agency's regulations under the Packers and Stockyards Act, 1921 (P&S Act or Act). The Act protects fair trade, financial integrity, and competitive markets for poultry. The final rule prohibits certain payment practices under poultry grower ranking systems (commonly known as tournaments) in contract poultry production for broiler chickens, requires live poultry dealers (LPDs) to adopt policies and procedures for operating a fair ranking system for broiler growers, and requires LPDs to provide certain information to broiler growers when the LPD requests or requires the grower to make additional capital investments. These regulations will increase transparency and address deception and unfairness in broiler grower payments, tournament operations, and capital improvement systems.

DATES: This rule is effective July 1, 2026.

FOR FURTHER INFORMATION CONTACT: S. Brett Offutt, Chief Legal Officer/Policy Advisor, Packers and Stockyards Division, USDA AMS Fair Trade Practices Program, 1400 Independence Ave. SW, Washington, DC 20250; phone: (202) 690–4355; or email: s.brett.offutt@usda.gov.

- I. Executive Summary
- II. Background
- III. Summary of the Proposed Rule and Changes in the Final Rule
- IV. Provisions of the Final Rule
- V. Comment Analysis
- VI. Regulatory Analysis

I. Executive Summary

The current broiler chicken industry is highly susceptible to both unfairness and deception. Within the last 40 years, the poultry industry has become highly integrated, with most LPDs operating as

“integrators” who frequently own or control all segments of the production process except growout. The growout stage of the production process consists of growers raising young poultry to harvest size under poultry growing arrangements (contracts). To pay the grower, most LPDs, which will also be referred to as “integrators” throughout this rule, use a relative performance or poultry grower ranking system, commonly known as a tournament. Under the tournament system, poultry growers compete against one another to determine payment for their services. As discussed throughout this rule, growers cannot reasonably avoid certain practices that cause them harm. Additionally, growers lack access to certain information, which inhibits their ability to meaningfully understand, negotiate, and enforce poultry growing contracts with LPDs, including in relation to capital investments that LPDs request.

The Packers and Stockyards Act, 1921, as amended (P&S Act or the Act) (7 U.S.C. 181 *et seq.*), authorizes USDA to issue regulations and orders to prohibit unfair and deceptive practices by LPDs.

In a June 8, 2022, advance notice of proposed rulemaking (ANPR), AMS sought comments and information to inform policy development and future rulemaking regarding the use of poultry grower ranking systems (87 FR 34814, June 8, 2022)). Commenters expressed both support and concern about the use of tournaments in poultry production, with the majority expressing support. Other commenters, especially advocacy associations, objected to the current tournament payment system, stating that tournament systems do not fulfill the integrators' claimed purposes and that the tournament payment systems exemplify the manipulative and unjust practices that Congress designed the Act to prevent. These commenters cited integrators' arbitrary, unjust, or punitive distribution of inputs and production variables, potentially punitive manipulation of the group composition, and penalties for small deviations below average performance. Some of these ANPR commenters also stated that the rulemaking could help address bargaining power imbalances for growers by providing proper enforcement, minimum base pay, and other provisions.

Trade organizations commented on the ways input variability affects pay and that LPDs lack incentives to take action to reduce unpredictability in grower inputs and pay outcomes. AMS has observed that monitoring and intervention to remedy unpredictability

requires an LPD to expend effort and incur cost, and that the LPD does not directly benefit from the increased fairness to growers. Without an explicit prohibition on unfair variability, LPDs lack compelling incentives to operate their tournament system contracts fairly. Comments in response to the ANPR, other available data and information, and AMS's Packers and Stockyards Division's (PSD) expertise provided the basis for a proposed rulemaking.

On June 10, 2024, AMS published the proposed rule, Poultry Grower Payment Systems and Capital Improvement Systems, in the **Federal Register** (89 FR 49002). In response to the proposed rule, AMS posted 755 comments, some with multiple signatories, over a 60-day comment period. Comments were submitted by a variety of stakeholders, including farmers' coalitions, government entities, advocacy organizations, industry trade organizations, processors, producers, and other individual interested parties. Stakeholders commented on the proposed rule, as well as several specific questions containing alternate proposals. The proposed rule covered, among other things, rate of compensation for growers, transition and implementation costs, the proposed duty of fair comparison, and reasonable recoupment for required additional capital investments. Farmers' coalitions, advocacy associations, government entities, and unaffiliated individual commenters broadly supported the proposed rule, while the regulated trade organizations and LPDs opposed the proposed rule. Live poultry growers both supported and opposed the proposed rule. Many growers who support the rule raised concerns of unfairness within the tournament system, including that pay rates are influenced by factors outside growers' control, that growers are forced to make new capital investments that have poor to nonexistent return while putting growers in more debt, and that growers must compete against fellow growers in an unfair manner. Those growers who opposed the proposed rule felt that the tournament system does a good job of rewarding effort, and that the rule would upset this system by shifting money away from high-performing growers and by reducing overall bird quality. However, several growers that opposed the rule expressed concern that LPDs force growers to make additional capital investments that do not produce an economic return for the grower.

Section 407(a) of the P&S Act (7 U.S.C. 228(a)) authorizes the Secretary of Agriculture (the Secretary) to make rules and regulations as necessary to

carry out the provisions of the Act (7 U.S.C. 181 *et seq.*), and the Secretary has delegated the responsibility for administering the Act to AMS. See 7 CFR 2.22(a)(3)(iii) (delegating authority to administer the Act from the Secretary to the Under Secretary for Marketing and Regulatory Programs); 7 CFR 2.79(a)(17) (in turn, delegating authority to administer the Act from the Under Secretary to the Administrator, Agriculture Marketing Service). Under this authority, AMS issues this rule to carry out the provisions of section 407 of the Act, as well as provisions of sections 202(a) (7 U.S.C. 192(a)) (which prohibits “any unfair, unjustly discriminatory, or deceptive practice or device”), 401 (7 U.S.C. 221) (which requires an LPD to “keep such accounts, records, and memoranda as fully and correctly disclose all transactions involved in his business”), and 410 (7 U.S.C. 228b) (which bans the failure to pay “the full amount due [to the] poultry grower on account of such poultry”).

In this final rule, AMS amends 9 CFR part 201, subpart N, by adding several new provisions, including: § 201.106 regarding LPD responsibilities for the design of broiler grower compensation arrangements; § 201.110 regarding the fair operation of broiler grower ranking systems; § 201.112 regarding disclosure requirements for LPDs when requesting additional capital investments from broiler growers; and § 201.290 regarding severability. In particular, the Agency is:

- Prohibiting LPDs from discounting or reducing a grower’s rate of compensation as disclosed in the broiler growing arrangement based on the grower’s grouping, ranking, or comparison to others (§ 201.106(a)).

- Establishing that it is a presumptive violation of the Act when aggregate gross annual payments based upon a grouping, ranking, or comparison of growers exceeds 25 percent of total gross payments to growers in a complex on an annual-calendar year basis (§ 201.106(b)).

- For each of the three calendar years following the publication date of the above-referenced provisions, requiring LPDs to submit certain documentation to the Secretary when any contract modification or renewal subject to the prohibition on discounts results in a decrease in the prior annual-calendar year’s complex-wide average gross payment to the grower (§ 201.106(c)).

- Establishing a duty of fair comparison that requires LPDs to design and operate their broiler grower ranking system to provide a fair comparison among growers, with particular attention to certain factors in the

methods of comparison, including the distribution of inputs and flock production practices, the time period of the comparison, the conditions and circumstances for the comparison, the reasonableness of efforts to resolve disputes, and how the LPD will compensate growers when the LPD cannot conduct a fair comparison (§ 201.110(a)).

- Requiring LPDs to establish and maintain written documentation of their processes for the design and operation of a broiler grower ranking system that is consistent with the duty of fair comparison and to retain all relevant written records for five years (§ 201.110(b)).

- Requiring LPDs to provide growers with a Capital Improvement Disclosure Document when an LPD requests that a grower make an additional capital investment and requiring that LPDs make reasonable efforts to assist the grower in translating the document, as well as ensure that the grower is aware of their right to request translation assistance (§ 201.112).

- Introducing a severability clause that specifies that it is USDA’s intent that the provisions in subpart N remain in effect even if any provision or component of any provision is deemed unenforceable (§ 201.290).

II. Background

A. Vertical Integration and Market Power

Today, the broiler chicken industry is highly vertically integrated. That is, a single entity owns or controls nearly all the steps of production and distribution, with the only partial exception being the growout stage, during which broiler growers raise chicks on their farms to slaughter weight. The USDA National Agricultural Statistics Service’s (NASS) Census of Agriculture (Agricultural Census) reported that 96.2 percent of broilers were raised and delivered under production contracts between LPDs and independent farmers, or broiler growers.¹ Under a production contract, the LPD provides the grower chicks, feed, and veterinary treatment services, which the grower uses to grow out the flock. The LPD maintains ownership of the chickens throughout the production process. The grower provides the poultry growing facility, flock management, labor, and utilities

required during flock growout.² At the end of growout, the LPD collects and weighs the mature poultry and pays the broiler grower for their services.

To grow broiler chickens on a commercial scale, a grower must make a substantial initial investment in housing. Over time, LPDs may request or require that growers make additional capital investments to upgrade housing and equipment, which are intended to improve efficiency or respond to customer preferences (e.g., relating to the use of antibiotics or other animal-raising concerns) during the contracting relationship. Growers generally finance these long-term assets against much shorter-term production contracts.³ This exposes growers to financial risk and uncertainty around debt repayment and the recoupment of their investments. For example, compared to other commodity producers, broiler growers registered among the highest share of farms in extreme financial stress, measured as carrying a term debt coverage ratio less than one and a debt-to-asset ratio greater than 55 percent.⁴ Growers are thus dependent on LPDs—who control most aspects of a grower’s production—to recoup their substantial initial and continuing investments.⁵ Growers also currently receive little to no information about the purpose, process, and outcomes expected around such investments.

Currently, most LPDs operate with the benefit of substantial market power and bargaining power in local markets to purchase grower services. Broiler grower operations must be close (usually less than 50 miles) to an LPD’s

² Growout period is defined as the period of time between placement of poultry at a grower’s facility and the harvest or delivery of such animals for slaughter, during which the feeding and care of such poultry are under the control of the grower.

⁴ Nigel Key, Christopher Burns, and Greg Lyons, “Financial Conditions in the U.S. Agricultural Sector: Historical Comparisons,” EIB-211, U.S. Department of Agriculture, Economic Research Service (2019), <https://www.ers.usda.gov/webdocs/publications/95238/eib-211.pdf?v=4876.5> (In 2017, compared to other commodity categories considered, poultry farms showed the greatest share of farms in extreme financial stress—around four times that of larger-scale general livestock and specialty crop, fruit, nut, and vegetable producers and twice that of large-scale grain and oilseed producers. Moreover, the percentage of poultry farmers in extreme financial stress has been increasing since 2006).

⁵ For a discussion the difficulty in adapting of broiler grow houses for other purposes see Tom Vukina and Poramet Leegomochai. “Oligopsony Power, Asset Specificity, and Hold-Up: Evidence from the Broiler Industry.” *American Journal of Agricultural Economics* 88 (2006).

¹ USDA, NASS, *2022 Census of Agriculture: United States Summary and State Data*, volume1, part 51, issued February 2024 pp. 51 and 411. https://www.nass.usda.gov/Publications/AgCensus/2022/Full_Report/Volume_1_Chapter_1_US/usv1.pdf.

feed mills, hatcheries, and processing plants due to the costs of transporting feed to the grower's farm and the costs (including death loss) associated with transporting finished chickens from the grower's farm to the processing plant. This results in poultry production that is often localized and regionally concentrated. Most growers have few LPDs in their area with whom they can contract. Even where multiple LPDs are present, there can be significant costs associated with switching to a different LPD, including adjustments for differences in technical specifications that LPDs may require. To switch LPDs, a grower may need to invest in new equipment and learn to apply different operational techniques for different breeds, target weights, and growout programs. Facility-specific investments may inhibit the ability of growers to switch to a competing LPD where different facility specifications are required. Growers have recently complained of at least one LPD penalizing growers that are trying to switch to an LPD's competition. AMS referred the complaint to the Department of Justice for enforcement under the Packers and Stockyards Act. The Department secured a consent decree that stopped the conduct, prohibited its recurrence, and compensated the harmed growers.⁶

Owing to the vertical integration in the system, LPDs exercise substantial control over growers' operations through the provision of inputs, control over production practices, their tournament settlement and comparison practices, and their level of performance in relation to communication and dispute resolution. In this rule, AMS uses the term "inputs" to mean resources supplied by LPDs, such as chicks or feed. Inputs often vary among growers, which impacts the growers' flock performance, thereby unfairly skewing relative performance measures. Likewise, LPDs determine production practices on growers' farms, and those production practices affect growers' pay. AMS uses the term "production practices" to refer to features of the on-farm production process that are determined by the LPD, such as density of bird placement (number of chicks delivered or placed with a grower per

square foot of broiler housing), age at harvest, and weight at harvest. These practices greatly impact grower compensation. If LPDs fail to apply production practices evenly across grower participants in tournaments, that unevenness also unfairly skews relative performance measures.

Additionally, information asymmetry in poultry contracting arrangements contributes to market inefficiencies and unfair and deceptive practices. Asymmetric information occurs when one party to a contract has more critical information than the other party. Information asymmetry leads to market failure in the broiler production industry as growers lack the information needed to make informed business decisions, whereas LPDs know what each grower makes. This increases LPDs' to set contractual terms in ways that benefit themselves, while the grower lacks the information needed to effectively negotiate compensation for the provision of growout services or to make a comparison and switch to a competitor that offers more competitive terms. Another feature of this information asymmetry is that while LPDs know the amounts they have fixed for grower compensation, growers do not know this amount, which can span a wide range. Similarly, LPDs know the distribution of inputs as well as which growers may be grouped together for settlement in the complex, while growers cannot easily track that information. Exploiting this information asymmetry, LPDs can adjust down compensation in ways that are difficult for growers to know or competitively discipline the LPD, *e.g.*, by switching out. As highlighted by grower comments and based on AMS's experience in evaluating grower concerns in this area, without an accurate projection of purposes, processes, and outcomes related to capital improvement programs, growers cannot accurately and effectively evaluate their allocation of resources to cover necessary expenses⁷ or engage in rational decision-making around whether to pursue (or resist) additional capital investments to improve and protect their own financial interests. Additionally, having widely variable income prevents growers from knowing which elements under their control they

can adjust, and how to adjust them, to correspondingly increase compensation. This can cause growers to futilely expend extraneous resources that do not yield proportionate increases in performance and compensation.⁸ Information asymmetry also facilitates abusive practices, whereas the provision of information would help growers and AMS identify and halt those practices sooner. Disclosure is not an absolute defense. Acts or practices can be unfair or deceptive and violate section 202(a) of the Act even if they have been disclosed.

LPDs often use incomplete contracts in broiler production. When a contract is incomplete, the LPD interprets material terms in their favor as the grower lacks the ability to require a fairer interpretation. Contracts are incomplete when key terms basic to its functioning are vague or missing. Incomplete contracts magnify risks with respect to the performance of the other contractual party, leading to other potential inefficiencies. For example, broiler production contracts regularly disclaim LPD responsibility for input quality or usability. Nor do they provide enforceable detail around LPD management of tournament operations, including tournament groupings or dispute resolution expectations. Moreover, the complexity of such pay systems makes it difficult for growers to fully understand the potential range of payments they are likely to receive or the ways in which LPD performance or nonperformance may affect that pay, preventing them from properly

⁸Numerous commenters described how they would make all of the upgrades recommended by the LPD technician and inexplicably place last compared to other growers: "Six months of down time spent installing several more thousands of dollars of equipment. We've grown two flocks since then and have failed to make enough money to even pay the bank each time. We've had to take out a loan to even survive our day-to-day life and are behind on all farm bills. We do everything the company tells us, but when we finish in the negative, were given all kinds of reasons for why our birds weren't good enough. When speaking with other farmers and techs from other companies, we're told that our weight and feed conversions are good, but a couple of farms seem to continuously have unexplained successful numbers. Basically, were losing money that goes to pay the ones at the top. On one flock, 12 farms were pitted against each other. Two farms performed at a level so high that isn't believable, and three farms performed below the bottom level we can be paid at. The integrator took the bottom three farms out of the tournament calculation and compared the remaining farms without them. How fair is it that they drop the bottom farms, but not the top ones? This resulted in the farms that were close to average being pushed down and making less money because the average was raised considerably with the highfliers included and the bottom places excluded. The company tells us that this helps us, but it doesn't. We've made the decision to sell because we can't continue to put our children through this").

⁶Final Judgment, *United States v. Koch Foods, Inc.*, No. 23-cv-15813, Dkt. No. 23 (N.D. Ill. Feb. 12, 2024). See also, Zimmerman, Sarah, "Department of Justice, 'Justice Department Files Lawsuit and Proposed Consent Decree to Prohibit Koch Foods from Imposing Unfair and Anticompetitive Termination Penalties in Contracts with Chicken Growers,'" <https://www.justice.gov/opa/pr/justice-department-files-lawsuit-and-proposed-consent-decree-prohibit-koch-foods-imposing>.

⁷For example, a grower without an accurate projection of future income may forgo making an expenditure that costs less long-term, *e.g.*, making a bundled purchase for two pieces of equipment at a reduced per-unit price. Instead, if they don't know if they can afford a future purchase, they purchase the minimum amount—one piece of equipment at a time at a higher unit price—to sustain operations short-term.

evaluating the fairness of the contract before signing. Preventing LPDs from injuring producers using these contracts is among the purposes of the Act.⁹ Contracts may be viewed as complete, with no material gaps, if the contract terms include the substantive legal, practical, and economic promises, obligations, and contingencies needed to operate in a poultry growing arrangement. These terms should be verifiable and legally enforceable.

Finally, contracts that require investments in contract-specific assets give rise to the hold-up problem. The economic concept of hold-up refers to a situation in which one or both parties to a transaction must make investments in such contract-specific assets, and the two parties may be unable to cooperate efficiently due to incomplete or asymmetric information and the inability to write, enforce, or commit to contracts. Once a party becomes locked into a transaction by making a transaction-specific investment, they lose bargaining leverage and become vulnerable to exploitation by the other party. Hold-ups occur in broiler production due to market failures associated with incomplete grower information, contract-specific investments, market power, relative capital leverage, as well as insufficient enforcement of law intended to maintain market integrity and prevent market abuses—including unfair breaches of contract. Growers are commonly unable to exercise contract rights to remedy LPD performance failures owing to the risk of hold-up and to the necessity of timely remedies when dealing with living birds. Examples from grower complaints include failure to correct improper or insufficient feed delivery, the delivery of successive inputs that are lower performing, or tournament groupings that are suspect.

B. Tournament Practices

Since the 1990s, the broiler industry overwhelmingly uses the tournament system to compensate growers. As

discussed above, under a tournament system the contract between the broiler grower and the LPD provides for payment to the grower based on a grouping, ranking, or comparison of broiler growers delivering broilers to the same company during a specified period (usually one week). AMS will refer to this as a settlement group. Under a typical tournament system, the broiler grower receives a fixed payment per pound of broilers produced, that LPDs often call a “base pay rate,” plus a calculation adjustment that is supposed to be based on how efficiently, compared to other growers, the grower used the resources provided by the LPD to produce each pound of broilers (informally referred to as a performance adjustment).¹⁰ LPDs typically calculate the performance adjustment primarily by comparing the feed conversion ratio (*i.e.*, the quantity of feed consumed by the flock divided by the weight of the flock delivered) to the average ratio of all growers in the tournament settlement group. Broiler growers whose feed conversion ratio is less than the average ratio for that tournament settlement group receive a bonus above the base pay rate, while those whose costs are above the average incur a discount from the base pay rate.

LPDs benefit from the tournament system in several ways. The tournament system provides LPDs control and certainty over total grower compensation as a group. For each tournament, the LPD knows and sets the total compensation that will be paid per pound of broilers produced by the group. In other words, the LPD is never concerned about paying an excess bonus for an individual flock because the LPD allocates the pool of payments among growers through performance adjustments for growers relative to the floating average performance (*i.e.*, in today’s system, amounts above, or deductions from, the base pay rate). LPDs (and growers, as discussed below) also get the benefit of utilizing a floating average (relative to external shocks, such as weather, as noted below) to incentivize performance. However, the tournament system comes at a cost to growers: that of seeing payment for the services they provide reduced for reasons outside of their control yet within the control of the LPD. This outcome is magnified by the fact that growers cannot easily switch over to a

competitor LPD—even if the competitor LPD offers more attractive compensation—due to the high barriers to switching imposed partly by LPDs.¹¹

LPDs have long claimed that tournaments systems reward growers financially for their experience, skill, effort, and investments in up-to-date and efficient housing and equipment.¹² The extent to which the tournament actually incentivizes additional grower effort and expenditure of resources, and whether those efforts and expenditures were necessary and fair to growers, depends on a range of factors, including the magnitude of the tournament but, in some circumstances, also the design of the housing specification (*e.g.*, the use of automation and other technology), the type of bird being raised (*e.g.*, some require special efforts), the availability of other payment incentives, and the absence of arbitrary distortions in the allocation of payments, among other factors. In theory, provided that all growers in a tournament grouping were treated materially the same and the variables within the tournament grouping were within the control of the growers, a tournament system could insulate growers to some degree against external shocks that affect all growers in the grouping. This is because, in this scenario, performance is based on an average that floats and adjusts to the particular external circumstances that all growers in the pool experienced during the period.¹³ In reality, the

¹⁰ There is some inconsistency in the use of payment terms across broiler contracts at different companies or complexes. Most grower contracts define the term base pay rate as it is described in this paragraph. However, some contracts instead use the term base pay when referring to a fixed amount plus the performance adjustment.

tournament system does not sufficiently protect from external shock. A range of shocks and factors external to the growers—some of which are within the control of the LPD—still adversely affect the overall weight of the broilers in a tournament and thereby reduce the compensation for all participating growers.

AMS has concluded that several widely adopted aspects of LPDs' operations are unfair, deceptive, or both. First, without a clearly stated base pay rate, LPDs deceive growers regarding their actual minimum pay. The complexity and unpredictability of LPDs' current operation of tournaments makes it difficult for growers to clearly understand before entering into a contract the minimum amount they could actually receive under the contract.¹⁴ For example, base pay can be, but is not commonly, a guaranteed minimum pay.¹⁵ Second, if performance pay—particularly performance pay that is based on comparisons with other growers—is substantial relative to total compensation, the arbitrary lottery-like aspects in a tournament system operation will, in most circumstances, undermine its effectiveness as a compensation scheme because compensation outcomes will not reflect the effort or performance of growers, and is unfair and deceptive. Third, arbitrary or unjustly discriminatory distribution of inputs, production practices, tournament groupings, or communications and dispute resolution—as key aspects of LPD performance under the contract—also can create a system in which compensation does not reflect the effort or performance of growers, deprives growers of the full amount due for their performance, and is unfair. These provisions are meant to be complementary and mutually

reinforcing. AMS explains each of these concerns in greater detail below, under section IV., “Provisions of the Final Rule.”

As noted above, many broiler growers operate in regions with just one to two LPDs.¹⁶ The local competitive conditions result in higher-risk, lower-paying grower contracts that commonly subject the grower to arbitrary and unfair payment; in particular, these contracts do not guarantee growers an adequate minimum base pay rate, flock placements and stocking densities, or length of contract in relation to the loan obligations commonly necessary to engage in broiler growing. Because LPDs control the distribution of inputs and assignment of production practices, growers repeatedly tell AMS that they experience unfair and deceptive operation of the contract. The typical tournament contract introduces levels of complexity and uncertainty for growers in the calculation of their compensation and in evaluating growers' return on investments so as to render the payment system unfair and deceptive. Furthermore, under that payment system, growers are commonly unable to discover unscrupulous conduct by LPDs, compare offers from competing LPDs, and plan and manage their businesses effectively. LPDs also say growers will operate “independently”—*i.e.*, their individual effort will produce commensurate higher compensation—though in practice their comparison-based compensation pay is heavily dependent on the LPD's inputs and comparison method, close supervision, responsiveness, and the performance of others in their LPD-determined settlement group.

AMS concludes that the “incentive system” in its current form does not excuse the unfair and deceptive operation of tournament systems because factors outside of the grower's

control impact performance. Without adequate regulation under the current system, LPDs fail to provide fair compensation for the grower's effort and deceive the grower regarding tournament operation and pay.

C. Debt and Financial Vulnerabilities

Requests by LPDs for growers to make additional capital investments are a pervasive part of the broiler growing industry such that Congress required that LPDs disclose the possibility of such requests to growers in their contracts (7 U.S.C. 197a(b)). These additional capital investment requests occur against a backdrop of significant financial vulnerability for growers, which implicates issues of potential unfairness and deception. Under this system of capital improvement, the LPD requests—and indeed, in practice, largely requires—growers to invest in housing improvements with little to no information regarding the purposes, processes, outcomes, or likely return to be achieved by the investment. These omissions of material information critical to growers' decision-making is unfair and deceptive. These additional capital investments are highly particularized, which leaves the growers investing in projects and investments that may be used only for growing broilers with a particular LPD. Growers have long complained to AMS that they face a perpetual cycle of debt owing to successive requests by LPDs for additional capital investments, suppressing their returns and leaving them even more vulnerable to the range of abuses outlined above.

Indeed, the Figures below show a declining rate of return on assets and higher debt to asset ratios carried by poultry operations compared to cattle, dairy, and hog operations.

BILLING CODE C

The higher debt to asset ratios carried by poultry operations are driven, in part, by LPD requests for additional capital investments and are also facilitated, partially, by loan guarantees authorized under Federal law. Additionally, the gains from upgrades commonly flow to LPDs, and so growers' higher debt levels are not always supported by efficiency gains that would result from the additional capital investments. Under those circumstances and because of the willingness of lenders to loan due to guarantees, when growers are asked by LPDs to make additional capital investments without critical information about their purposes, processes, or outcomes, they are deprived of key information relating to those decisions. This practice is both deceptive and unfair because it deprives growers of their ability to identify fundamentally coercive or otherwise unfair capital improvement programs at an early enough time to seek AMS enforcement assistance in halting them, if appropriate.

Accordingly, AMS adopts this final rule prohibiting practices that, in AMS's view, violate the Act. The overall tournament system is highly problematic for poultry growers, and it is crucial to implement some guardrails for the industry to prevent unfair and deceptive contracting practices.

III. Summary of the Proposed Rule and Changes in the Final Rule

In the June 2024 proposed rule, AMS proposed amending 9 CFR 201, subpart N, by adding several new provisions: § 201.106 regarding LPD responsibilities for the design of broiler grower compensation arrangements; § 201.110 regarding the fair operation of broiler grower ranking systems; § 201.112 regarding disclosure requirements for LPDs when requesting additional capital investments from broiler growers; and § 201.290 regarding severability.

AMS proposed adding § 201.106, titled "Broiler Grower Compensation Design," to prohibit the reduction, or discounting, of any compensation rate under the broiler growing arrangement based on a grower's performance relative to other growers. The proposed provision would have required broiler grower arrangements to clearly state the grower's rate of compensation and not reduce that rate based on the grower's performance relative to other growers. The arrangement could provide for the rate of compensation to be increased based on that comparison.

AMS proposed adding § 201.110, titled "Operation of Broiler Grower

Ranking Systems," to prevent unfair and deceptive practices in LPDs' operation of ranking systems for broiler growers. Proposed paragraph (a)(1) would have required LPDs to design and operate their poultry grower ranking system to provide a fair comparison among growers, and under proposed paragraph (a)(2), the Secretary would evaluate specific factors to determine if the poultry grower ranking system is reasonably designed to deliver a fair comparison among growers. Proposed § 201.110(a)(3) also included a requirement that, when LPDs could not conduct a fair comparison, they must compensate growers through a non-comparison method. Proposed paragraph (b)(1) would have required documentation regarding the processes (policies and procedures) the LPDs must establish and maintain for the design and operation of poultry grower ranking systems for broiler growers that is consistent with the duty of fair comparison. Under proposed paragraph (b)(2), LPDs would have been required to review their compliance with these processes, and under proposed paragraph (b)(3) they would have been required to retain all written records relevant to their compliance for no less than 5 years from the date of record creation.

AMS proposed adding § 201.112, titled "Broiler Grower Capital Improvement Disclosure Document," detailing in proposed paragraph (a) that an LPD would be required to provide the grower with a Capital Improvement Disclosure Document (Disclosure Document) upon requesting that the grower make an additional capital investment. Paragraph (b) of the proposed regulation described the disclosures that the LPD would be required to include in the Disclosure Document. These disclosures included a justification of the request, financial incentives for the grower, specifications for construction, and a thorough analysis of the grower's projected returns.

Lastly, AMS proposed adding § 201.290, titled "Severability," to ensure that if any provision of subpart N or component of any provision is declared invalid, or if the applicability of any of these provisions to any person or circumstances is held invalid, the validity of the remainder of this subpart or the applicability thereof to other persons or circumstances shall not be affected. Such a provision is typical in AMS regulations that cover several different topics and was proposed here as a matter of housekeeping.

Upon consideration of public comments on the proposed rule, AMS

has modified the proposed provisions as follows:

- Revised proposed § 201.106 by designating the proposed text as paragraph (a) and adding the paragraph heading "Rate transparency."
- Added a new § 201.106(b), "Excessive variability," that establishes a presumptive violation of the Act when aggregate gross annual payments based upon a grouping, ranking, or comparison of growers exceeds 25 percent of total gross payments to growers in a complex on an annual-calendar year basis.
- Added a new § 201.106(c), "Transition," that requires that LPDs, for each of the three calendar years commencing with and including the rule's effective date, submit to AMS a copy of the prior and modified contract and any LPD Disclosure Document prepared under § 201.102 for any modified or renewed contracts under specified conditions.
- Simplified proposed § 201.110(b)(1)(i) and (ii) (concerning LPDs' processes for determining inputs and production practices) by removing the subparagraphs that itemized each component of the required processes.
- Simplified proposed § 201.110(b)(1)(iii) (concerning LPDs' processes for grower comparison flexibility) by removing subparagraphs (A) through (C) and placing those requirements into three simple paragraphs: (b)(1)(iii), "League composition;" (b)(1)(iv), "Evaluation period;" and (b)(1)(v), "Non-comparison." Accordingly, AMS also redesignated proposed § 201.110(b)(1)(iv), "Communication and cooperation," as paragraph (b)(1)(vi).
- Removed proposed § 201.110(b)(2), "Compliance review" and redesignated proposed § 201.110(b)(3), "Record retention," as paragraph (b)(2).
- Revised proposed § 201.112(a) and (b) to include the paragraph headings "Disclosure requirement" and "Disclosure contents," respectively.
- Revised proposed § 201.112(b)(1) through (3) to remove the term "relevant" as a technical change, along with conforming grammatical edits.
- Revised proposed § 201.112(b)(5) to clarify that, in addition to disclosing any required or approved manufacturers or vendors, the Capital Improvement Disclosure Document must disclose all financial benefits, if any, that the LPD or other affiliated persons receives from the use of the required or approved manufacturer or vendor.
- Revised proposed § 201.112(b)(6) as a technical stylistic change.

- Added a new § 201.112(c) to require the LPDs to make reasonable efforts to ensure that growers are aware of their right to request translation assistance and to assist the grower in translating the Capital Improvement Disclosure Document.

Section IV. below explains in detail AMS's reasons for making these changes.

IV. Provisions of the Final Rule

Throughout this final rule, AMS's analysis of unfair and deceptive trade practices in poultry contracts is informed by prior P&S Act case law, States' unfair and deceptive practice laws, and, in particular, the Federal Trade Commission (FTC)'s encapsulation of principles governing unfairness, unfair methods of competition, and deception.¹⁷ AMS looks to the FTC's policy statements owing to the FTC's extensive experience enforcing prohibitions against unfair practices, unfair methods of competition, and deception arising under the FTC Act, which are similar to provisions prohibiting unfair and deceptive practices under section 202(a) of the P&S Act. Like section 202(a) of the Act, section 5 of the Federal Trade Commission (FTC) Act also prohibits unfair and deceptive practices and unfair methods of competition. In 1980, 1983, and 2022, the FTC adopted the aforementioned policy statements summarizing its longstanding approaches to these matters under its cases. While recognizing that the P&S Act is broader than the FTC Act, AMS references these policy statements because they offer useful guidance owing to the similarity of the statutory provisions and case law histories.¹⁸ In addition, AMS recognizes the benefits to

the practical application of this final rule by grounding it on the well-understood principles of unfairness, unfair methods of competition, and deception as identified in the FTC policy statements. It is for these reasons that the FTC Act has, in part, informed this final rule.

A. Broiler Grower Compensation Design (§ 201.106)

AMS is finalizing new § 201.106, "Broiler grower compensation design," with two notable changes from the proposed rule. In the final rule, AMS is retaining § 201.106 as proposed and designating it as paragraph (a), "Rate transparency." AMS is adding paragraph (b), "Excessive variability," and paragraph (c), "Transition." Paragraph (b) adds a presumption against excessive variability in performance compensation to growers competing in a tournament. Paragraph (c) provides for grower protections during the transition from the existing payment systems to systems compliant with this final rule. Each paragraph will be discussed further below.

Most large LPDs today include a tournament component as part of their grower compensation arrangements. Under this type of arrangement, if a grower's feed conversion ratio (*i.e.*, the quantity of feed consumed by the flock divided by the weight of the flock delivered) is above the average of other growers in the tournament, the grower receives a bonus; if the grower is below average, the LPD reduces the grower's compensation. Under the tournament system, the contract between the grower and LPD provides for payment to the grower based on a grouping, ranking, or comparison of growers delivering broilers to the same company during a specified period. These pay rates are generally expressed in cents per pound. Applying these adjustments, whether positive or negative, significantly affects growers' effective rates of compensation and net income.

In its current form, the tournament system operates unfairly and deceptively. Without clearly stated base rates of compensation, the complexity of the tournament makes it difficult for growers to clearly understand the minimum amount they could be paid. Moreover, compensation based on relative performance when LPDs control the operation of the tournament (such as the distribution of inputs and assignment of production practices) creates the potential for growers' performance to be determined by factors outside their control, thereby making the tournament system an ineffective incentive system that is arbitrary and

unfair to growers. The tournament system also introduces considerable complexity and uncertainty for growers in calculating their anticipated total compensation and evaluating the potential return on their investments. Furthermore, if the comparison-compensation factor (*i.e.*, the bonus or deduction) is a large percentage of total compensation, that variance in total grower compensation is no longer a legitimate business but simply shifts economic risk from processors onto poultry growers without a demonstrable countervailing benefit. Without additional guardrails, the current tournament system creates significant risk of deception or unfairness for growers under the Act.

AMS has not found any evidence that poultry tournament systems that include deductions from the base pay rate or excessive variability in grower compensation provide a benefit to growers or competition in the market for grower services that outweighs the harm to growers. Deductions in other livestock contracts commonly reflect performance attributes of the animal itself, which is owned by the producer. Here, the producer provides a service with no ownership interest in or role in the selection of the animal. These deceptive and unfair payment practices create an unfair competitive advantage for LPDs at the expense of growers. Therefore, the widespread adoption of these types of contracts has frustrated fair competition, instead of enhancing it. Such discounting and pay variability also reflect the market power and bargaining power of the LPD in dictating contract terms.

Section 201.106 will provide growers with greater clarity and protection regarding the minimum payments they can expect under broiler growing arrangements. This rule prohibits a range of unlawful behavior by establishing a threshold presumption against excessive pay variability, establishing a transition period to preserve existing pay, and making minimum pay clear for growers. This rule will better enable growers to compare contract terms, evaluate revenue generation, and assess the value of additional capital investments.

i. Section 201.106(a)—Rate Transparency

AMS is finalizing new § 201.106(a), which prohibits the reduction of any rate of compensation under the broiler growing arrangement on account of the grower's grouping, ranking, or comparison to other growers. This provision is identical to that which was proposed, except that the provision is

United States*, 402 F.2d 712 (7th Cir. 1968) ("Section 202(a) should be read liberally enough to take care of the types of anti-competitive practices properly deemed 'unfair' by the Federal Trade Commission (15 U.S.C. 45) and also to reach any of the special mischiefs and injuries inherent in livestock and poultry traffic").

¹⁸ Michael Kades, "Protecting livestock producers and chicken growers," Washington Center for Equitable Growth (May 2022).

now designated paragraph (a), with the paragraph heading “Rate transparency.” Under this provision, the broiler growing arrangement must clearly state the compensation rate. The arrangement may not provide for mechanisms or calculations that would reduce the compensation rate based on the grower’s performance relative to other growers, but it can provide for the rate to be increased based on the grower’s performance relative to others. The broiler growing arrangement could provide for the compensation rate to be increased based on the broiler grower’s performance relative to others, but in no event could the rate be decreased or discounted by that comparison.

“Rate of compensation” refers to any payment amount that the LPD utilizes to compensate the grower under a broiler growing arrangement, which could include “base pay,” “minimum pay,” or any other rate defined in the contract. That rate would have to be prominently and clearly defined as the guaranteed level of pay a grower will receive if the grower performs to the minimum specifications of the relevant provisions of the contract. To the extent that a broiler growing arrangement had more than one rate of compensation, none of the rates could be reduced or discounted by a comparison. Under existing AMS regulations, a broiler growing arrangement must include all payment terms in the contract (9 CFR 201.100(c)(2)).

Under section 202 of the P&S Act, AMS concludes that the practice of discounting disclosed “base” pay rates in broiler contracts is an unfair and deceptive practice. This practice forces growers to estimate potential earnings using contractually stated “base” pay rates that, under the tournament system, only half of the settlement group can achieve. This unfair and deceptive practice obscures the value of the contract, thereby frustrating comparisons with competing LPD contracts in markets where growers are fortunate enough to have more than one or two LPDs to contract with.

AMS expects that, under this regulation, LPDs will still be able to elicit a competitive level of performance using a broiler compensation design that conforms to the requirements of this final rule. The LPD could reward performance for feed efficiency relative to the growers in the settlement with a minimum base pay rate per pound and an upward adjustment to the payment formula. Depending upon the facts and circumstances, mere compliance with this regulation does not absolve an LPD of its other legal obligations. A compensation structure without a

penalty or reduction from a true guaranteed minimum pay rate may still—if the facts demonstrate it—result in other violations of the Act.

ii. Section 201.106(b)—Excessive Variability

In the final rule, AMS is adding new paragraph (b), “Excessive variability,” which establishes a presumption that an LPD has violated section 202 of the Act when aggregate gross annual payments based upon a grouping, ranking, or comparison of growers exceed 25 percent of total gross payments to growers in a complex on an annual-calendar year basis. AMS is adopting this approach because excessive variance in total grower compensation arising from comparison-based compensation would, generally, create excessive variability that is deceptive because growers cannot reasonably assess the risk they are undertaking or forecast, predict, or budget their business operations. Further, excessive pay variance makes compensation dependent on arbitrary criteria, random factors, or other criteria that the grower cannot control or affect. When the comparison performance pay too substantially affects compensation, it is unfair.

When growers perform reasonably under the terms of the production agreement, excessive variability in performance pay arises at least in part due to LPD-controlled factors or unavoidable inherent natural variability. These factors are outside of the grower’s control and cannot be completely offset by grower effort or skill. LPDs design ranking systems to allocate grower payments based upon grower effort and skill. When factors other than grower effort and skill are comingled with the metrics used to allocate pay, the practice is ripe for potential abuse and unfairness because excessive variability in performance payments unfairly reduces compensation to growers. This unfairness to growers is particularly pronounced owing to high indebtedness among growers, which leaves them more financially vulnerable to harms from excessive income variability that does not reasonably reflect their own efforts.¹⁹ That pay variability also frustrates growers’ ability to accurately assess, or reasonably control, their rates of compensation and the overall financial risk they undertake under a broiler growing arrangement, which is particularly problematic given the risk

¹⁹ In contrast to contributions by the grower, LPDs contribute much more significantly to overall performance by furnishing the inputs, *e.g.*, genetics, feed, nutrition, sex of chicks, and close supervision of the grower’s managing production.

they bear. The injury is not offset by attendant benefits, since the practice tends toward distorting the market’s true pay amount and reducing growers’ ability to accurately assess, or reasonably control, their finances and make informed business decisions.

Though § 201.106(a) addresses the problem of reductions to rates of compensation that arise owing to groupings, rankings, or comparisons of growers, it does not alleviate all potentially unfair aspects of the tournament system or of the integrated model of broiler production. The proposed rule indicated that AMS intended to engage in case-by-case enforcement to remedy other aspects of tournament system unfairness, including issues arising from excessive variability in payments. In addition to a prohibition on discounting rates of compensation, the proposed rule particularly highlighted the potential importance of a 25 percent presumption on total compensation based on a grouping, ranking, or a comparison (the tournament) to total of base pay rate plus performance compensation. As AMS indicated in the proposed rule, this approach could alleviate extreme variability as an aspect of existing tournament system unfairness.

In the proposed rule, AMS included questions containing additional proposals. One such proposal solicited comment on whether it is presumptively unfair for comparison-based compensation to equal or exceed 25 percent of total (base pay rate plus comparison-based) compensation for any grower and asked a range of questions around the appropriateness of the specific threshold, how to calculate it, and how it would affect the industry.²⁰ These questions included highlighting the role of the 25 percent presumption as a potentially binding constraint, and how LPDs might respond to the prohibition introduced in § 201.106(a) by modifying the compensation structures in grower contracts. AMS’s questions indicated that it could raise base pay and/or limit performance payments—thus reducing the difference between top and bottom performing growers—without increasing total grower compensation expenditures. It also left open the possibility that LPDs could potentially adjust their compensation structures in other ways, such as by providing non-comparison-based incentives to growers they might seek to reward (such as per pound or per square foot compensation for housing known to provide efficiencies to the LPD) or deploy other

²⁰ 89 FR 49002, 49011–49012 (June 10, 2024).

incentives (such as fixed performance bonuses).

In response to the proposed rule, growers and advocate commenters overwhelmingly supported the need for additional limitations on excessive variability in payment arising from rates of compensation, with a particularly strong endorsement of the 25 percent limitation on performance. Commenters underscored the importance of this limitation for some of the reasons that AMS indicated in the proposed rule: that it is necessary to protect growers from unfair reductions in payments.

To incentivize grower effort, LPDs allocate grower pay using relative performance metrics; however, grower effort alone is an insufficient determinant of grower performance. Growers' performance depends on many factors, some of which are under the control of growers while others are not. Some known factors, including a grower's skill and effort, are within a grower's control. Other factors are outside a grower's control, such as feed quality, chick quality, and the skill or other efforts of other growers in the comparison group. Even if all these known factors are accounted for, there is still some unavoidable inherent natural variation in performance that would explain growers' performance volatility, flock to flock, even if all the known factors remain constant. The nature of this variability creates harm to growers in reduced performance payments.

The use of flock performance metrics, specifically feed conversion, as a proxy to grower effort is imperfect. Feed conversion itself is affected by variables beyond grower effort. AMS is not aware of existing technological innovations that could serve to better isolate grower effort, which is exclusively under grower control. That is not to say flock performance metrics serve no purpose in assessment of grower effort and allocation of grower payments. AMS's experience in analyzing performance payments suggest that ranking systems can be a useful and reasonably equitable mechanism for pay allocation with proper regulation and in proper magnitude. Within a reasonably contained range—*i.e.*, presumptively 25 percent of total compensation—the tournament may offer a reasonable benefit to growers by enabling LPDs to efficiently measure grower performance and guard against natural forms of variability that would arise were compensation fixed rather than floating (*i.e.*, the comparison-based average of growers). Yet at too high a level, the potential harms of comparison-based compensation (performance pay

dominating grower pay allocation without rewarding commensurate differences in effort) outweigh the potential benefits. That is unfair under section 202(a) of the Act because compensation under the tournament becomes correlated to input distribution (and other circumstances under the control of the LPD, such as flock production practices or responsiveness to complaints), which is commonly arbitrary—or, in some cases when not arbitrary, can be punitive. Some growers who comply with the contract and are unfairly penalized for factors beyond their control suffer unavoidable harm; they are denied the full amount due for their growout services. While growers can benefit from participation in the tournament, excessive pay variability can cancel out those benefits as they are outweighed by the harms.

Based on previous analysis of grower compensation data for a small sample of broiler complexes, AMS is not aware of any complex with performance payments that are as much as 26 percent of total payments. Additionally, in *United States v. Cargill Meat Solutions Corp.*, commonly referred to as “Wayne-Sanderson,” the final judgment also contains a 25 percent limitation on performance payments.²¹ The Wayne-Sanderson settlement is significant because it was agreed to by one of the largest market participants and has not caused any demonstrable harm to the company or to the market, nor is there any evidence that it disincentivized grower effort or lowered performance. While Wayne-Sanderson had agreed to a 25 percent limitation on performance payments, this final rule establishes that performance payments above 25 percent are *presumed* to be unfair. This is because performance pay variability causes injury to growers when the magnitude of performance pay is so excessive. That is, the performance pay significantly affects whether the grower is successful, yet the amount depends on unavoidable variance and does not reflect grower performance. In those circumstances, compensation no longer correlates to factors within grower control, such as their effort and expertise. This deprives growers of the value, both real and expected, of their services. The vast majority of commenters who addressed the topic of comparison-based compensation endorsed the idea of 25 percent as an appropriate level for a presumption of this type.

We note that this presumption will provide guardrails in helping LPDs set

and maintain performance pay standards that achieve appropriate goals, such as rewarding effort and skill against a floating average that adjusts for common circumstances, like weather, without unduly denying growers the expected value of their growout services. This clarity will guide LPDs that need to modify existing contracts to comply with this final rule, such as with § 201.106(a). For example, absent the existence of § 201.106(b), LPDs could comply with § 201.106(a) by decreasing base pay and excessively increasing the proportion of pay that is dependent on performance compensation. Such contract modifications would supercharge pay variance in the tournament while penalizing growers under the guise of complying with reforms designed to improve transparency and fairness. The presumption under § 201.106(b) helps ensure continuity in compensation at an aggregate level because it guards against excessive variability of performance pay relative to total pay. To stay within the presumptive boundary set by § 201.106(b), an LPD must set a reasonable compensation rate for any new base payment under the contract. AMS underscores that nothing in the rule prevents LPDs from providing other forms of incentive compensation to growers for reasons other than relative performance, such as payments for improved facilities or utility subsidies. Overall, the 25 percent presumption against excessive variability is useful to provide clarity and consistency around when AMS may seek to investigate for case-by-case compliance and enhances the fairness and transparency of compensation rates in broiler growing arrangements. As such, it reflects a logical outgrowth of the proposed rule.

Separately, AMS notes that it also expects to examine for excessive variability other forms of performance payments that are based on how efficiently a grower uses inputs supplied by the LPD: such payments could emerge as a method for evading this provision's purpose. Examples of such performance payment systems include what are commonly called fixed metric performance payments, which predate the current tournament, whereby growers' performance payments are tied to their individual achievement of certain fixed metrics around efficient use of inputs. AMS expects to examine these types of performance systems for excessive variability for similar risks of unfairness, including because the LPD provides the inputs and production

²¹ *United States v. Cargill Meat Solutions Corp.*, 1:22-cv-01821-ELH (D. Md. July 25, 2022).

practices and in those circumstances would be setting the fixed metrics.

In review of the presumption, AMS will consider other complex-specific incentives as requested by the LPD that would otherwise not be appropriate to consider as part of the rates that make up base payment. For example, energy incentives may be considered differently because they vary significantly based on geographic location, and so would result in somewhat different application of the provision for growers at different complexes. Where a relatively high degree of variability in performance pay exists, even within the 25 percent, due in part to energy incentive payments, AMS may examine whether the tournament is unfair.

To rebut the presumption of unfairness triggered when comparison compensation payments exceed 25 percent of total compensation, the LPD may affirmatively demonstrate (i) that a given tournament's compensation system allows all growers to be economically successful without the need to receive any payments based upon a grouping, ranking, or comparison of growers that exceed the amount covered by the presumption; (ii) that payments to all growers that exceed the amount covered by the presumption are sufficient to reflect the increased risk of variability to all growers under that system; and (iii) that the system is not otherwise unfair or deceptive. The Agency would examine any rebuttal on a case-by-case basis to comport with the purposes of the presumption to prevent LPDs from engaging in unfair or deceptive practices or devices that harm poultry growers.

AMS adopted this provision after considering the case-by-case presumption set forth in the proposed rule and public comments that urged AMS to instead establish a greater limitation on excessive variability of payments arising from performance, especially comparison-based, compensation. Public comment regarding this provision, and AMS's response to those comments, are discussed in greater detail below in section V., "Comment Analysis."

iii. Section 201.106(c)—Transition

In the final rule, AMS is also adding new § 201.106(c), which requires that, for any contract modification or renewal subject to § 201.106(a) that results in a grower receiving less than the prior year's complex-wide average gross payment, the LPD must submit a copy of the prior contract and the modified contract, as well as any LPD Disclosure Document prepared under § 201.102

with respect to the prior and the modified contract, to the Secretary.

AMS will monitor contracts to identify signs of the unfair exercise of LPD bargaining power during this transition period. These could include, for example, a predatory method of competition whereby an LPD seeks to lower pay across the entire complex or discriminatory or retaliatory conduct that seeks to lower the pay of some subset of growers. Unfair conduct by the LPD could potentially arise where the LPD seeks to undermine contractually agreed-upon earnings from the previous contract irrespective of the tournament. One way for AMS to identify such conduct could be through LPD Disclosure Documents (currently required under existing 9 CFR 201.102), which would be required if LPDs modify or replace contracts in seeking compliance with this rule. The record-keeping and reporting requirements in this final rule will further help identify any potential illicit exertions of market power by allowing AMS to closely scrutinize contract modifications that jeopardize grower welfare during the transition period.

In keeping with the requirements in § 201.102(d)(2), AMS expects LPDs to explain why the annual gross payment averages for the previous five years may not provide an accurate representation of projected future payments. AMS also expects a distinct explanation of how any changes the LPD is proposing under the new contract are necessary to comply each part of final § 201.106. That is, changes made to comply with § 201.106(a) and (b) should be explained. AMS strongly encourages LPDs to explain changes needed to comply with § 201.106(b) first, and then apply a conversion scale from whatever updated approach is adopted to comply with § 201.106(a).

AMS will evaluate the reported contract modifications and associated documentation to assess grower welfare, given that growers will be particularly susceptible to economic hold-up concerns. In particular, AMS will consider the following variables: (1) the number of flock placements annually; (2) the stocking density; and (3) the distributional range of payments. If, upon consideration of these variables, AMS identifies contract modifications that negatively impact grower welfare or that include supply reductions from the complex, the Agency will closely scrutinize the modifications, including rates, for fairness and reasonableness.

It is crucial that growers are meaningfully informed about the terms of the grower arrangements and the expected compensation for their

services so that they can make financially sound decisions and identify potential economic hold-up. The reporting requirements will only be in effect for three years including and from the effective date of this rule.

During the three-year transition period, LPDs must evaluate average grower compensation at the complex level for each of the three calendar years commencing with and including the rule's effective date to determine if they need to submit their contract to AMS for review. The rule requires LPDs to use the average grower compensation across the complex, because this analysis shows if an LPD has cut grower compensation overall. The rule uses averages because performance-based compensation is unpredictable on a grower-by-grower basis and because using total grower compensation at the complex would be overinclusive. For example, grower turnover might skew an analysis based on total grower compensation. This makes the § 201.106(c) method of evaluation comparable to how unfair levels of performance-based compensation are defined under § 201.106(b).

AMS chose a transition period of three years for several reasons. First, it is nearly impossible to evaluate the changes to grower pay made to contracts within 180 days or even a single year with any level of confidence. Many contracts are three, five, or ten years in length, so it may take up to a year of payments to even begin evaluating the financial effect of changes. Reviewing payments within a 180-day period may not indicate what growers would earn in a year and would be limited in scope and value; any conclusions based on that limited review would be speculative, and violations of the Act cannot be based on speculation. After a full year of operation following contract modification, the realization of grower performance outcomes and practical application of the compensation structure are known and translated into actual grower payments. This will facilitate AMS's analysis of the actual distribution of grower payments and overall level of compensation that resulted from the new compensation structure and allow for a more fulsome evaluation of fairness concerns. It also allows AMS to consider the market environment as context for LPD actions.

Additionally, this new rule may necessitate adjustments to the compensation structures used in grower contracts, and it will take time for growers to become used to the new regulation. AMS needs to look at how the overall market is adjusting to this new reality and prevent evasion during

that adjustment period. For example, an LPD may make a series of small contract changes, which would require AMS to review the overall market adjustments, not just the initial changes. Failure to capture the full implications of the transition period would put growers at risk from LPD market power and bargaining imbalances between LPDs and growers.

AMS underscores that this is a monitoring and reporting requirement, owing to the ongoing risk to growers that the contracts could be modified and re-modified during this transition period. This contract review will help the Agency decide whether to conduct more specific oversight and enforcement while the new regulatory regime is implemented.

Three years is the period of financial information that banks request from borrowers, such as growers, and so it provides a reasonable period for AMS to engage in these market-monitoring activities. After three years, AMS agents will continue to monitor contracts and ensure they are following the requirements of this final rule, but LPDs will not need to submit contract modifications.

In the proposed rule, we asked for public comment on this issue, and received overall support for a provision to protect growers that rely on existing contracts from holdups and potential market abuse. Specifically, we asked the following question: “To minimize transition risks to growers, should AMS include a requirement that LPDs submit to AMS for review any contracts modified or revised to comply with new § 201.106?”¹⁷ The comments received in response to this specific question were mixed in their support and are addressed below in sections V.A.iv. and v.

Because the Secretary will subject the updated contracts to close scrutiny for unfairness, the Secretary would seek access to the dealer’s business records. During any investigation, AMS may examine any changes to average annual gross payment per pound for growers in the complex and any changes to average payment per square foot increased. Each investigation will consider the individual facts and circumstances of each situation, as these considerations are important in examining whether growers were held at least no worse off during the contract modification process. Although the final rule is designed to benefit growers and reduce unfair and deceptive practices, growers face a significant risk of unfair practices owing to the risk of hold-up when they may be required to change their contracts so that LPDs comply with this

rule. Based on AMS’s experience implementing rules, LPDs may seek during any compliance and implementation period to extract changes to the contract unrelated to the regulatory requirements of this rule. The purpose of providing contracts to AMS is to identify unfair practices or otherwise unlawful reductions to payment that are favorable to LPDs and harmful to growers.

B. Operation of Broiler Grower Ranking Systems (§ 201.110)

AMS is finalizing new § 201.110, “Operation of broiler grower ranking systems,” which regulates how LPDs operate ranking systems (*i.e.*, tournaments) for contract broiler growers, establishing a duty of fair comparison when calculating comparison-based compensation among a group of poultry growers in a settlement group. This section contains factors for the Secretary to consider when evaluating whether LPDs have abided by the duty of fair comparison requirement. When LPDs are unable to make a fair comparison for one or more growers, they are required to use a non-comparison compensation method as specified in the contract. LPDs are required to document how they design and operate their poultry grower ranking systems in a manner that is consistent with the duty of fair comparison. The documentation must show that LPDs take measures to mitigate the impact of inequitable distribution of inputs and flock production practices on grower performance and, hence, comparison-based compensation.

The purpose of the rule is to ensure that comparison-based compensation reflects grower effort, not factors that injure the grower, such as feed or chick quality or timing of feed delivery that are outside of grower control but within the control of LPDs. The problem this rule seeks to address is how LPDs manage variation in quality or timing of inputs, flock production practices, and how LPDs handle growers’ concerns (*i.e.*, groupings, responsiveness to problems). AMS certainly believes that rewarding grower effort is fair, but unfair and deceptive comparison systems are not.

For example, breeding hens have a lifecycle of 50 weeks. They produce optimal chicks between weeks 20–34, but they also produce chicks that have value outside the optimal window. The LPD has a financial incentive to grow all these chicks to maturity, and thus will distribute a mix of higher and lower quality chicks in any one settlement period to its growers. Those growers

receiving a higher proportion of suboptimal chicks are disadvantaged in a relative comparison to growers who received a higher proportion of optimal chicks.

In theory, LPDs would provide uniformly high-quality inputs (such as chicks and feed) and appropriate production practices (such as flock density) to all growers to ensure maximum efficiency, product quality, and profit. LPDs would also ensure tournament groupings are reasonably random or otherwise not biased and would also reasonably control for problems that growers faced (such as accidental delivery of the wrong feed). However, inputs are natural systems and, therefore, variation in input quality necessarily exists. This variation in input quality affects performance. Moreover, human error can be present in vertically integrated systems as well, for example, the accidental delivery of feed designed for older birds. LPDs want to obtain the full value from all usable inputs and are not inclined to dispose of lower quality chicks or feed to ensure growers only get the highest quality inputs. Thus, LPDs routinely distribute lower quality, lesser performing inputs to their contract growers, even though growers who receive those inputs will likely receive lower compensation than their peer growers in the same tournament that receive higher quality, higher performing inputs. Within a given poultry complex (group of growers serving a single processing plant), a significant share of each grower’s compensation is determined by their rank in tournaments between growers at the complex, even though a proportion of performance variation across growers is attributable to variation in inputs, including feed and chick quality, timing of feed delivery and flock pick-ups.

LPDs purport that this system works to promote fair competition in the market for grower services. From an LPD’s perspective, as outlined in several public comments, a grower receiving poorly performing inputs and a low rank in one tournament is how the system works; over the long term, according to the commenter, the grower will likely receive better-performing inputs that help to balance out one tournament’s losses. LPDs also stated in their public comments that they have no incentive to furnish a grower with poorly performing inputs and/or otherwise mistreat growers.

In practice, LPDs assertions do not bear out. LPDs have limited financial incentive to expend extra efforts to evenly distribute optimal inputs and production practices across growers in a

poultry settlement pool or even to some extent to promptly address problems. LPDs have not provided supporting evidence that long-term provision of inputs balance out uniformly. Even if over the long-term the variability, on average, balances out, there will be growers who do not benefit from the balancing or for whom the balancing comes too late to address the harms caused by variability. LPDs' assurances of long-term balancing out do not provide comfort to the grower facing decreasing ability to pay for immediate operating expenses—and who does not have the extra cash to buffer one tournament's losses. Furthermore, under the current compensation system, LPDs have little motivation to limit performance variability, exercise appropriate care in input distribution, or generally create reasonable uniformity regarding other aspects of tournament operations.

As growers and grower advocacy organizations have asserted, LPDs often provide the “noisy” grower (who exercises their dissatisfaction or seeks redress for bad treatment) “bad” or otherwise inappropriate or untimely inputs or flock production practices, or even organize them into comparison groupings designed to adversely affect their performance. This can even occur for those seeking timely assistance or correction for supposedly inadvertent mistakes (e.g., feed delivered to new chicks that is designed for older birds, and hence is not edible by the younger birds). Growers have consistently reported over the years that LPDs commonly exercise punitive control over inputs, production practices, tournament groupings, and the availability of assistance for ordinary problems. These circumstances suggest an environment characterized by unavoidable unfairness and oppressive methods that adversely affect growers' and even LPDs' ability to compete on the merits. Growers who receive bad treatment cannot competitively discipline an LPD by negotiating better terms or choosing a different LPD. They must accede to continued poor treatment by the LPD.

LPDs' practice of basing grower compensation on factors beyond growers' control distorts the competitive market for grower services. LPDs possess power—whether regionally, within the contract relationship with growers who depend on that relationship to pay down debt, and/or through information asymmetry (*i.e.*, through knowing detailed information about inputs and growers' finances while growers know relatively little). This power allows them to reduce

growers' compensation to unfair levels they know growers can barely bear; in turn, growers' reduced financial stability further reduces their countervailing power. Another feature of this practice is that LPDs are not actually allocating more funds to better compensate higher-performing growers: they fix overall compensation to their growers from tournament to tournament and deduct pay from those who performed below the average to reward those who performed above average. In so doing, they prevent growers from actually earning compensation commensurate to services—a circumstance that numerous commenters described experiencing but possessed little recourse to counterbalance, *i.e.*, “Take it or leave it.” This practice further erodes the competitive conditions in the market for grower services. Numerous commenters discussed how just a few below-average rankings caused them to not be able to afford operational expenses and perform worse and worse; and/or exit. By basing compensation on factors outside of actual grower services, LPDs also distort the actual price signal for grower services. And, by fixing overall compensation and deducting from the bottom to reward the top, they prevent honest competitors that actually allocate more funds for better-performing growers. Altogether, AMS believes these are unfair and deceptive practices under the Act.

LPDs harm growers when they compare growers where inputs, production practices, tournament groupings, and assistance are not equitably distributed. Grower pay becomes undeservedly low and fosters unlawful variability in both performance and compensation that have no relationship to the grower's work, initiative, or skill. Growers have no control over how inputs, production practices, tournament groupings and assistance are allocated, owing to the vertically integrated model of broiler chicken production. Unfair comparisons do not benefit growers or competition, and indeed frustrate the LPDs' claimed purpose of the tournament structure. The tournament is a form of performance payment that is intended to incentivize grower deployment of effort, skill, and investment to foster more efficient use of the inputs provided by the LPD. Purportedly, tournaments capture actual differences in grower performance during a given period, while adjusting for overall conditions affecting performance, such as adverse weather conditions, that affect all growers in the complex. The

rule sets out reasonable alternatives to these harms that do not undermine the benefits to growers from the vertically integrated production system or from using comparisons to establish flexible baselines for evaluating grower performance, within its appropriate limits.

AMS notes that growers get paid by the pound and start with a static number of chickens. Thus, they have contractually inherent incentives to grow their chickens to the target weight and to minimize the death loss of chickens, even in the absence of a performance payment. Yet AMS also acknowledges that ensuring growers' use of the minimum amount of inputs, such as feed, to achieve maximum growout is also an important part of the overall mix of cost efficiencies. AMS agrees, to the extent that the pool of growers in a tournament is sufficiently random and that the necessary conditions for equitable comparison are met, a tournament may spur growers to operate more efficiently as they seek higher comparison-based compensation, while reasonably guarding against commonly shared external conditions. Yet as discussed in the proposed rule and reflected in comments from grower groups and others, those conditions are often not met. Nor, indeed, are arbitrary or inequitable differences in inputs and production practices inherently essential features required to deliver the benefits of the poultry industry's vertically integrated production and comparison-based performance compensation system. In fact, arbitrary or inequitable practices undermine these benefits, producing instead arbitrary or otherwise inequitable grower pay differences that run contrary to the industry's avowed purpose of the tournament system.²²

Because the tournament system determines a component of grower pay, LPD practices that impair a fair comparison of grower performance cause a misallocation of performance compensation, thereby unfairly reducing the compensation that may otherwise be due to some growers. Studies²³ have shown that differences

²² See, e.g., “How the Tournament System Works,” National Chicken Council (informing farmers that: “1 All farmers are provided the same quality of chicks, the same feed, and access to veterinary care. 2 Farmers who invest in more advanced facilities, as well as use the best management practices will likely produce higher quality chickens more efficiently. 3 Farmers receive a base pay (per their contract) and potentially a bonus, based on the health and quantity of the flock (tournament system).”); available at <https://www.chickencheck.in/faq/tournament-system/> (last accessed May 22, 2024).

²³ Dozier III, W.A., et al. “Stocking Density Effects on Growth Performance and Processing Yields of

in production practices and inputs, such as stocking density, slaughter weight, bird gender, and breeder flock age, can impact the performance metrics used in determining the performance adjustments in tournament payment systems. If LPDs provide all growers in a tournament group similar-quality inputs and compare growers using similar flock production practices, or if they take steps to balance these differences over time or otherwise adjust pay to account for the relevant differences, these production factors under LPD control are unlikely to unfairly affect growers.

However, when LPDs rank growers who received lower quality (*i.e.*, lesser performing) inputs or less favorable flock production practices against growers who received higher quality (*i.e.*, higher performing) inputs or more favorable flock production practices the former group will likely receive lower pay than the latter group due to factors beyond their control. The ranking in the tournament will not reflect the grower's actual performance; it will reflect the inputs and flock distribution practices the grower received and the grower's performance relative to that of other growers. This is an unfair practice unless the LPD took effective steps to make appropriate adjustments to the compensation structure for this settlement group to reasonably neutralize the impact of the inequitable distribution of inputs and flock production practices within the ranking group. The problem this section of the rule addresses is how tournaments can be designed to effectively counteract the impact of inequitable tournament practices and lead to a fair comparison in poultry ranking systems.

Some LPDs have taken steps to design their compensation systems to appropriately account for the

maldistribution of inputs and production practices within a poultry ranking group. In response to the Advance Notice of Proposed Rulemaking that preceded the proposed rule for this final rule, LPDs and their trade associations described different steps LPDs have taken to correct for the inequitable distribution of inputs and production practices among growers and resulting comparisons. A meat industry trade organization indicated that LPDs are known to reduce unpredictability in grower outcomes by having contracts that evaluate performance over multiple flocks and adjust pay for factors outside growers' control. For example, some LPDs adjust payments for different densities of birds placed or provide credits for excess seven-day death loss.

Complementing these examples, AMS investigations have also found that some LPDs will attempt to ensure that broiler growers do not receive chicks from young laying hens too often because this can negatively affect growers' tournament performance. Some LPDs will communicate and correct ordinary problems on a timely basis. This helps growers avoid unintentionally punitive outcomes than would otherwise be the case. Yet, while LPDs assert that quality communication and fair operation are universal, AMS has found through interviews and comment review that LPD behavior currently depends extensively on the goodwill of the LPD, commonly via the manager of the local complex, and LPDs are not uniformly consistent in addressing issues that lead to unfair outcomes. Some local complexes make discretionary decisions that harm growers.

For instance, while LPDs regularly maintain extensive grower manuals, LPDs are not obligated to have their manuals address the range of situations that undermine a fair comparison or monitor whether the local complexes comply with that manual in practice. Growers need a poultry ranking system that meets a reasonably reliable standard. For there to be fair payments under sections 202(a) and 410 of the Act, LPDs must properly adjust their comparison-based compensation systems used in poultry grower ranking systems. Rules, like this final rule, must reasonably neutralize the impact of inequitable distribution of inputs and flock distribution practices on poultry grower compensation.

Because different inputs and flock production practices affect performance under the tournament, LPD decisions are an outsized component of grower payments. When an LPD operates a tournament that uses arbitrary or

inequitable delivery of inputs and production practices without establishing systems to mitigate material differences in inputs and production practices among growers in a comparison group or otherwise reasonably neutralize comparison impacts, the LPD has committed an unfair and deceptive practice under the Act. Such a practice is unfair because it uses criteria outside the growers' control to evaluate their performance. It is deceptive because it purports to evaluate growers on their effort when in fact it does not, often leading to payment rates that are wildly fluctuating and unpredictable. The duty of fair comparison established in this rule also arises out of the Act's prohibitions on unfair practices, unjust discrimination, the manipulation of prices, and failure to pay. Comparison-based compensation systems can be used to proactively cause harm to one or more growers by placing them in grower settlement groups that are inappropriate based on distribution of inputs or flock production practices. LPDs likewise can use league composition (*i.e.*, the formation of settlement groups) to manipulate prices downward for a given grower or group of growers. Finally, such practices can lead to a failure to pay for services provided. Violations of the Act include an LPD failing to maintain policies and procedures necessary to document the company's compliance with those fair comparison duties, owing to the Act's recordkeeping authorities (7 U.S.C. 221).

AMS is adding a new § 201.110, "Operation of broiler grower ranking systems," to regulate LPDs' operation of poultry grower ranking systems (*i.e.*, tournaments) for broiler growers. Paragraph (a) establishes an LPD duty of fair comparison in tournaments. This duty of fair comparison requires LPDs to structure their tournament system to provide a fair comparison among growers. AMS acknowledges that sometimes a fair comparison is not possible due to unforeseen differences in inputs or other circumstances, in which case an LPD must compensate growers through a non-comparison method specified in the contract that reflects a reasonable compensation to the grower for its services. Paragraph (b) establishes basic documentation that LPDs must maintain regarding how they design and operate their poultry grower ranking systems for broiler growers.

i. Section 201.110(a)—Fair Comparison

Paragraph (a)(1) requires LPDs that use comparison-based compensation systems for their poultry growers to design and operate their poultry grower

ranking system (*i.e.*, comparison-based compensations system) in a way that provides a fair comparison among growers. This final rule uses in various places the definition of “poultry grower ranking system”—commonly called the tournament contract—already set forth in PSD regulations at § 201.2.²⁴ Recognizing that LPDs have long claimed that tournament contracts are designed to promote efficiency, not frustrate it, AMS has written this rule to affirm the duty to fairly compare growers. Specifically, this rule requires LPDs to advance a fair comparison among growers in a poultry ranking group based on grower effort and skill. Measuring performance based on input quality—which is outside of the grower’s control—is unfair and deceptive. LPDs have a multitude of means to maintain fair comparisons. This includes correcting for: input quality variations, inappropriate feed type delivery, gaps in feed delivery, variation in production practices such as flock density, pick-up time or pick-up weight across the comparison group. LPDs can manage fair comparisons through extending the period over which the comparisons are made, adjusting payment for certain inputs or production practice differences, or removing growers from tournaments where a fair comparison is not possible. LPDs can ensure league composition (ranking groups) are reasonably random and robust enough to establish a fair comparison baseline. LPDs can also establish processes for responding to complaints in a timely manner or making appropriate adjustments to comparisons. But LPDs violate the Act when they do not design and operate their comparison poultry compensation system in a manner that delivers a fair comparison among growers within any given ranking group.

Paragraph (a)(2) of § 201.110 establishes the factors the Secretary will consider in determining whether an LPD reasonably designed or operated its poultry grower ranking system to deliver a fair comparison among growers or whether the LPD must utilize a non-comparison compensation method. This provision establishes a violation for either the LPD’s failure to design or failure to operate a poultry grower ranking system to deliver a fair comparison among growers. In the first instance, AMS could bring an enforcement action for an LPD’s failure

to design the ranking system in a manner that would deliver a fair comparison; such an action would be based upon the processes set forth in the documentation required under paragraph (b) of this section. In the second instance, AMS could bring an enforcement action based upon an LPD’s failure to operate the ranking system in a manner consistent with the duty of fair comparison. Such a failure could be because the LPD was not following the documented processes or because in practice the documented processes do not deliver a fair comparison. The factors listed in § 201.110 (a)(2)(i) through (vi) are designed to establish what constitutes reasonable delivery of a fair comparison. That is, the Secretary will examine these factors when determining whether the LPD has reasonably designed or operated their ranking system. Reasonableness should be viewed as an objective test that accounts for growers’ contract expectations, basic considerations of equity, and the LPD’s ability and willingness to prevent harms to growers resulting from factors outside growers’ control. However, it should also provide some flexibility to LPDs to achieve distinct goals provided they are well-designed, justified, and not otherwise unfair or deceptive.

Paragraphs (a)(2)(i) and (ii) of § 201.110 address whether an LPD’s distribution of inputs and assignment of flock production practices caused material differences in performance that growers cannot avoid, and whether the LPD made appropriate adjustments to compensation. Fair comparison of growers requires that growers do not receive a distribution of inputs or assignment of production practices that cause material differences in performance from other growers to whom they are being compared and are caused by factors outside of a grower’s control. Material differences in performance are differences that meaningfully (from the perspective of the grower) impact grower payments.

To comply with these requirements, LPDs must identify inputs and flock production practices under their control that impact grower payment and ensure that these factors do not meaningfully impact grower payments. LPDs also must improve their monitoring of how inputs and flock production practices are allocated across growers, and, as appropriate, adjust such allocations to reduce the unequal distribution among growers within a settlement group or across a given time period. An LPD could still provide certain growers with different inputs, for example because an LPD believed certain growers were

better at raising particular types or quality of birds (*e.g.*, chicks from older hens), provided it adjusted compensation if material differences in performance affected the comparison. The LPD would also be free to use a non-comparison method for those growers.

LPDs must adjust how grower pay is calculated if a fair comparison is impractical due to unavoidable inequitable allocations. For example, the LPD may determine that a five-flock average may be appropriate for determining a grower’s pay when the LPD provided chicks for that grower are later discovered to be diseased, and no fair comparison is reasonably possible, practical, or appropriate for that grower within the tournament for that flock. Any adjustment to how grower compensation is determined must use a non-comparison method specified in the contract that reflects reasonable compensation to the grower for its services. The contract should set forth the preferred approach(es) of the parties. Ensuring that agreed-to payment adjustments are fair will be part of regular AMS poultry compliance reviews. An average of the last five settlements by the grower is considered a non-comparison method for the purpose of the tournament settlement that the grower is being excluded from, even though the average is affected by the previous comparisons (unless unusual facts and circumstances call into question the fairness of such an approach).

Section 201.110(a)(2)(iii) addresses whether the designated time period used in an LPD’s comparison is appropriate, including whether the LPD uses one or more groupings, rankings, or comparisons of growers to mitigate the effects of any differences in inputs over the designated time period. Fair comparison of growers does not require that LPDs provide all growers precisely equal inputs and identical production practices for each flock. This rule permits LPDs to minimize production inefficiencies that would arise from a standard requiring strict equality in inputs, while avoiding an unfair comparison of grower performance. If the LPDs compare growers fairly over reasonable period of time, randomly selecting inputs is one way, in most cases, to minimize the effect of the flock-to-flock variance in inputs. Companies may use non-random distribution, including temporarily correct for what would otherwise be an inequitable distribution of inputs under an otherwise random system, provided they ensure comparisons are fair.

²⁴ Poultry grower ranking system means a system where the contract between the live poultry dealer and the poultry grower provides for payment to the poultry grower based upon a grouping, ranking, or comparison of poultry growers delivering poultry during a specified period.

AMS considers a period of one year or less to be a reasonable timeframe across which to compare growers' performance because it provides sufficient time to limit variation from one event while ensuring that LPDs treat growers fairly over a reasonable timeline. The one-year period coincides with commonly used five-flock averages and with one-year comparisons used in some live poultry growing arrangements.

Paragraph (a)(2)(iv) of § 201.110 addresses whether conditions and circumstances outside the control of the LPD render comparison impractical or inappropriate. A settlement group may have differences in LPD-provided inputs, LPD-assigned production practices, or other factors beyond the control of LPDs and growers that render a reliable comparison impossible. The Secretary will consider the facts and circumstances applicable to each case. One example might be the previously described situation where an LPD unknowingly delivered chicks to a grower that are later discovered to be diseased so that no fair comparison is possible.

Section 201.110(a)(2)(v) addresses whether an LPD has made reasonable efforts to resolve in a timely manner grower concerns regarding the LPD's exercise of discretion over the implementation of its fair comparison processes. In determining compliance with this requirement, through compliance reviews or in response to a complaint, AMS will consider whether an LPD has demonstrated enough responsiveness and commitment to resolving legitimate concerns to avoid potential secondary harm to the grower. What constitutes "reasonable efforts" and "timely" resolution of a grower's concerns will depend on the facts and circumstances of each case, with particular attention placed on whether and how the situation adversely impacts the fairness of the comparison(s) for the grower. For example, if a grower raises immediate and urgent concerns about feed quality, such as the delivery of feed meant for older chicks than the grower has, the LPD should have in place processes to—and in fact, actually—resolve this concern as soon as possible to minimize any additional undue damage to the grower's flock due to lack of proper nutrition. If a grower raises concerns about feed persistently being delivered late or in an insufficient quantity, the Agency will examine the LPD's "reasonable efforts" taken to adjust the delivery method. Additionally, an LPD is prohibited from retaliating against a grower in any manner for raising concerns as to

whether a fair comparison method was used.

Lastly, § 201.110(a)(2)(vi) states that the Secretary shall consider any other factor relevant to a fair comparison among broiler growers in a poultry ranking system. This provision gives AMS the authority to address any other facts or circumstances that adversely affected the fairness of the design or operation of the poultry grower ranking system. AMS will determine compliance by examining the facts and circumstances, and in particular, whether the LPD took specific actions to undermine the comparison process. For example, this prong allows AMS to consider whether an LPD's intentional grouping of certain growers in a poultry ranking group to manipulate or adversely affect comparison-based outcomes constitutes a violation of the Act.

When determining whether an LPD has designed and operated its broiler grower ranking system to provide a fair comparison among growers, AMS will consider the fair comparison factors set forth in § 201.110(a)(2) against how and to what degree comparison factors account for total grower compensation. When relative grower performance pay accounts for a very small portion of grower compensation, AMS expects differences in inputs and flock production practices to cause fewer material differences in pay. AMS expects this dynamic to operate on a sliding scale; the smaller the role of comparison pay in total grower compensation, the smaller the effect of variations in inputs and flock production practices on total compensation. AMS will also consider the design of the formula to determine its impact on the magnitude or distribution of compensation, if any.

In some situations, differences among LPD-provided inputs, LPD-assigned flock production practices, or factors beyond the control of both LPDs and growers make a reliable comparison impossible, impractical, or inappropriate for one or more growers. In such cases, § 201.110(a)(3) requires that an LPD must fairly compensate growers through a non-comparison method specified in the contract that reflects reasonable compensation to the grower or growers for their services. For example, if an LPD is unable to pick up a flock in a timely manner because of processing disruptions (as occurred during the COVID-19 pandemic), the LPD may remove the grower from the settlement rather than compare that grower's flock performance against growers delivering flocks of a significantly different age. In such cases,

the LPD must compensate the grower using a reasonable non-comparison alternative. Multiple approaches could be considered reasonable depending on the circumstances, and LPD costs are an appropriate consideration as part of those particular facts and circumstances. AMS is aware that LPDs often pay the grower an amount equal to the average rate they received over their previous five flocks. The non-comparison method is intended to fairly compensate the grower. Therefore, absent special circumstances where a rationale and an agreement to do otherwise are reasonable and appropriate (and documented as such), the non-comparison compensation method needs to equal or exceed the pay that the comparison-based compensation rate would have delivered. AMS will rely on the documentation of written processes set out in § 201.110(b), as well as the facts and circumstances of specific occurrences, to evaluate compliance.

ii. Section 201.110(b)—Documentation

Paragraph (b) of § 201.110 details the documentation an LPD must establish and maintain of its processes for the design and operation of its poultry grower ranking system for broiler growers that is consistent with the duty of fair comparison. This paragraph has changed considerably from the proposed rule to provide greater flexibility in meeting the terms of this regulation. AMS also revised paragraph (b) in response to commenters' concerns that the specific documentation requirements laid out in the proposed rule were very similar to documentation requirements delineated in existing regulations at § 201.102(b) and that burdening LPD service technicians with increased paperwork would take away from their core responsibilities of attending to the production needs of growers.

In the final rule, § 201.110(b) sets forth documentation requirements regarding LPDs' duty to ensure the fair design and operation of broiler grower ranking systems. Under section 401 of the Act, AMS is authorized to prescribe "the manner and form in which such accounts, records, and memoranda shall be kept" whenever the Secretary finds that the records of an LPD do not fully and correctly disclose the LPD's business transactions (7 U.S.C. 221). Paragraph (b)(1) requires that LPDs establish and maintain written documentation of their processes for the design and operation of a poultry grower ranking system that is consistent with the duty of fair comparison. This rule requires documentation to include

written processes, referred to as policies and procedures, regarding the process for (i) inputs under LPD control, (ii) flock production practices (iii) league composition, (iv) the evaluation period, (v) non-comparison factors, and (vi) LPD communication and cooperation with growers. These processes must provide a general description of the items that the rule requires to be included, with sufficient detail to provide a typical user of the documentation—such as a local poultry complex manager that directs the operation of the complex's tournament—with an understanding of how duty of fair comparison is to be operationalized within this complex's poultry grower ranking systems.

To simplify the documentation requirements and minimize paperwork burdens for poultry complex service technicians, AMS revised paragraph § 201.110(b)(1)(i), "Inputs under live poultry dealer control," from what was proposed by removing subparagraphs (b)(1)(i)(A) through (E), which delineated detailed requirements pertaining to identification, management, and adjustment of differences in input distribution to growers, and how LPDs adjust compensation calculations based on the inputs a grower receives. In the final rule, paragraph (b)(1)(i) contains no subparagraphs and simply requires that the LPD's written processes include how and when the LPD assigns, adjusts, or otherwise accounts for similarities and differences of quality and quantity in the delivery of inputs to growers. The removal of subparagraphs (A) through (E) simplifies the requirement by including one all-encompassing requirement that LPDs must explain how they assign, adjust or otherwise account for similarities and differences of quality and quantity in the delivery of inputs to growers. Revised paragraph (b)(1)(i) clearly requires that LPDs address all the ways that variation in inputs can impact a poultry growing ranking system, while giving LPDs flexibility in how to mitigate the impact of uneven distribution of LPD-provided inputs on fair comparison in the tournament and, hence, comparison-based grower pay. In sum, AMS determined that the deleted subparagraphs were not needed to establish that LPDs must explain in their written documentation how they account for the possible distortions and resulting inequities that can manifest in poultry grower ranking systems when they fail to properly account for variations in inputs.

Under paragraph (b)(1)(i), LPDs are required to create a written process for how and when the LPD assigns, adjusts,

or otherwise accounts for similarities and differences of quality and quantity in the delivery of inputs to growers. This provision requires LPDs to have a defined process governing how they will ensure the duty of fair comparison is met. Such a process needs to explain how the LPD will operate its poultry complex and its related poultry grower ranking system, so growers have fair opportunity to compete on a level playing field in individual flock settlements or in a comparison settlement that stretches beyond individual flocks, where the impact of variation in quality, quantity, or timing of inputs may be significantly reduced or eliminated. LPDs unfairly harm growers when they distribute inputs in a manner that disadvantages a grower relative to other growers in said tournament(s) and base their compensation accordingly. Growers cannot control the nature of the inputs they receive from their LPD, whether that be quality of chicks or feed, appropriateness of feed delivered for stage of growth, gaps in feed delivery, or delivery of veterinary services. Receipt of low-quality, insufficient, or inappropriate inputs can unfairly impact growers' performance in tournaments if the LPD does not have appropriate processes in place for mitigating such variation in input delivery. LPD processes required under paragraph (b)(1)(i) must include ongoing accounting and monitoring of inputs supplied to each producer using objective measures of quality and performance that are generally accepted in the industry. Such monitoring and accounting should aim for as minimal variation as possible in input delivery quality or quantity across the members of one or more grower poultry ranking groups, and appropriate mechanisms for detecting and correcting for input variations in a timely manner. Such processes should address key areas of concern, including allocation of chicks that differ in quality and performance, variation in quality or quantity of feed, or variation in medication across grower groupings. LPDs may include policies and procedures for balancing disparity of inputs either within a single flock or over multiple flocks as appropriate and feasible.

In the final rule, AMS also simplified § 201.110(b)(1)(ii), "Flock production practices," from that which was proposed. AMS removed subparagraphs (b)(1)(ii)(A) through (E), which described, in detail, the processes LPDs must include in the design and operation of their poultry grower ranking systems pertaining to

assignment of flock density at delivery, timing of pick-up, adjustment of comparison based on different assignment flock production practices, and adjustment of compensation calculations based on the grower's receipt of specific flock production practices. In the final rule, paragraph (b)(1)(ii) contains no subparagraphs and simply requires that written processes include how and when the LPD assigns, adjusts, or otherwise accounts for differences in production practices. The removal of subparagraphs (A) through (E) simplifies the requirement by including one all-encompassing requirement that LPDs must explain how they assign, adjust, or otherwise account for similarities and differences regarding assignment of flock production practices. Revised paragraph (b)(1)(ii) clearly requires that LPD address the ways that variation in flock production practices assigned to growers can impact a poultry growing ranking system, while providing flexibility on the appropriate processes LPDs can establish to mitigate the negative impact LPD-assigned production practices can have on fair comparison in the tournament(s) and, therefore, comparison-based grower pay. In sum, AMS determined that the deleted subparagraphs were not needed to establish that LPDs must explain how they account for the possible distortions and resulting inequities that can manifest in poultry grower ranking systems when LPDs fail to account for variations in flock production practices.

Under paragraph (b)(1)(ii), LPDs must maintain written documentation of its processes for how and when the LPD assigns, adjusts, or otherwise accounts for differences in production practices across growers in a poultry ranking system. Similar to paragraph (b)(1)(i), such processes should include ongoing monitoring of how flock production practices are allocated across different growers in one or more poultry grower ranking systems, and mechanisms for adjusting for disparities in flock production allocations in a reasonable time frame such that additional harm does not result. Such processes governing flock production processes should cover how and when the LPD assigns density at delivery; how and when the LPD manages pickup of birds with respect to slaughter weight and bird age; how and when the LPD adjusts how a grower is compared to other growers with different assigned flock production practices or otherwise adjusts the flock production practices the grower receives; any steps the LPD takes to adjust compensation

calculations based on suboptimal allocation of flock production practices to growers; and how and when the LPD minimizes, adjusts, or otherwise accounts for differences in production practices. LPDs can unfairly manipulate grower payments when they compare growers even within a single tournament settlement group within which the LPD has assigned different types of production practices to growers in the group. Under this rule, LPDs must develop policies and procedures that describe the processes for ongoing accounting and monitoring of LPD-determined flock production practices allocated to each producer. The LPD's processes must provide a consistent approach to minimize differences in production practice assignments and describe methods to compensate growers for differences that result in harms.

In the final rule, AMS also simplified paragraph (b)(1)(iii) of § 201.110 from what was proposed. In the final rule, AMS removed subparagraphs (A) through (C) from paragraph (b)(1)(iii) and instead separated out the requirements into three distinct paragraphs: (b)(1)(iii), "League composition;" (b)(1)(iv), "Evaluation period;" and (b)(1)(v), "Non-comparison."

Under the final rule, paragraph (b)(1)(iii), "League composition," requires LPDs to create written processes governing league composition, which is how LPDs assign groups of growers to settlement groups. AMS revised this paragraph for simplicity and readability. Formerly, the provision was contained in paragraph (b)(1)(iii)(C), reading, "If the live poultry dealer groups growers for settlement in any manner other than the one used in recent settlements, how the dealer determines such groupings." Settlement groupings, also called league composition, are most commonly based on their chronological availability for slaughter within the complex but could also be based on housing type or other commonalities across a group of growers. Generally, the settlement grouping is determined by flock placement timing, which commonly varies based on the timing needs of the growers. For example, growers may need additional time between flocks for cleaning, maintenance, vacation, or other similar reasons.

Paragraph (b)(1)(iii) of this rule serves to identify practices or circumstances that diverge from these ordinary reasons for determining settlement groupings. While legitimate reasons exist for deviating from a strict chronological availability-based grouping, this

provision is principally meant to ensure that LPDs do not use league composition to interfere with fair comparison by intentionally grouping specific growers together to lower the pay of one or more members of the settlement group, or to otherwise manipulate pay to deliberately benefit certain growers over others.

Under § 201.110(b)(1)(iv) of the final rule, "Evaluation period," the LPD is required to maintain written documentation of how it establishes a reasonable time period over which the LPD evaluates the duty of fair comparison. This provision was proposed with slightly different phrasing as paragraph (b)(1)(iii)(A). This provision requires the LPD to describe its process for how it determines the number of settlement groupings over which grower comparisons will be made. The duty of fair comparison requires that LPDs design and operate their poultry growing ranking systems to provide a fair comparison among growers. This means that the comparison must genuinely reflect effort by the growers, not variability in inputs or flock production practices, which are outside of the growers' control and thus not criteria that form the basis of a fair comparison. It may be that over the course of a year variations in inputs or flock production practices will cancel each other out. The evaluation period must account for the length of its growers' contracts and the reasonable expectation of renewal. If the duty of fair comparison requires five flocks, then the contracts need to span at least five flocks, or if they do not, there must be a very high likelihood that the contract will be renewed such that the growers will receive the five flocks and thus be subject to a fair comparison that evens out fluctuations in input quality or quantity or flock production practices.

In the final rule, § 201.110(b)(1)(v), "Non-comparison," requires that an LPD's written processes explain when the LPD might remove a grower from a ranking group, and how the LPD will compensate growers removed from a ranking group to satisfy the non-comparison compensation method required under § 201.110(a)(3). This provision was proposed as paragraph (b)(1)(iii)(B) in similar language. There are myriad reasons why an LPD may decide to remove a grower from a ranking group. For example, LPDs may not have enough comparable growers with which to make a reliable comparison in the current grouping and may use growers settling in previous periods to make a reliable comparison. Likewise, a specific grower may have

received undesirable inputs or an assignment of production practices that materially impacted the grower's performance, necessitating the removal of the grower from the grouping and compensation under a non-comparison compensation method. Under this provision, the LPD is required to explain how and when the LPD removes a grower from a ranking group because the grower received unfavorable inputs or production practices and how it will fairly compensate such growers through a non-comparison compensation method.

In the final rule, § 201.110(b)(1)(vi), "Communication and cooperation," is very similar to the provision as proposed, with the only notable change being the paragraph designation: in the proposed rule, the paragraph was designated paragraph (b)(1)(iv); in the final rule, the paragraph is designated paragraph (b)(1)(vi). This paragraph requires LPDs to create written processes for how the LPD will resolve a grower's concerns with the LPD's exercise of discretion over the implementation of the policies required by this section, including the timeliness of the resolution. A tournament system cannot be fair if it fails to permit growers to contest, without fear of retribution, negligent or malicious actions taken by the LPD that may impact grower performance. The rule provides flexibility on how LPDs can satisfy this requirement. A range of procedures are available, such as timely communication with complex management, communication with LPD headquarters, and grower councils, wherein disputes are resolved with input from other growers. The implementation of processes to manage and resolve grower disputes can serve to alert LPDs to potential unfairness in their comparison of growers and enable them to resolve issues in a timely manner.

In the final rule, AMS removed proposed § 201.110(b)(2), "Compliance review." In the proposed rule, this paragraph delineated detailed compliance review procedures for the processes set out in paragraph (b)(1) of this section. AMS removed this requirement in response to comments that such self-audits are a somewhat burdensome requirement for LPDs that can be eliminated with minimal effect on effective compliance. Rather than requiring self-audits, AMS will review the policies and procedures required under § 201.110(b)(1) through its ongoing compliance review process. This will ensure regular review of LPDs' compliance with the provisions of this

regulation with minimal additional recordkeeping burden on LPDs.

In the final rule, § 201.110(b)(2), “Record retention,” mirrors that which was proposed, with the only notable change being the paragraph designation: in the proposed rule, the paragraph was designated paragraph (b)(3); in the final rule, the paragraph is designated paragraph (b)(2). This paragraph requires LPDs to retain all written records relevant to their compliance with paragraph (b) for no less than five years from the date of record creation. These records should be made available to AMS upon request. Relevant records include, for example, copies of existing processes (policies and procedures); written documentation of LPD processes used within the last five years, including documentation of inputs and flock production practices provided to growers; written documentation of league composition; written documentation of grower complaints and their resolution; board minutes discussing compliance with this section for five years from the date of the board meeting; current and expired grower contracts for five years for the date of last effectiveness of the contract; disclosures provided to growers for five years from the date of the disclosure is provided to the grower; information on payments to growers or other forms of adjustment made to ensure a fair tournament, etc. Under the regulation, LPDs must retain these records for five years to enable the Agency to monitor the evolution of compliance practices over time in this area and to ensure that records are available for what may be complex evidentiary cases. As noted earlier in this section, section 401 of the P&S Act authorizes AMS to prescribe the manner and form in which LPDs keep business records. This recordkeeping requirement will enhance LPD management’s ability to establish and monitor compliance, as well as AMS’s ability to supervise and enforce the rule.

iii. Compliance and Enforcement

Compliance with § 201.110(b) requires LPDs to retain records that document the LPD’s design and operation of broiler grower ranking systems in a manner that is consistent with the duty of fair comparison. These policies and procedures are necessary to document compliance precisely because the options for delivering a fair comparison are so diverse. Policies and procedures developed pursuant to this rule should describe the LPD’s framework for assigning inputs and LPD-determined flock production practices, comparing grower

performance, and resolving growers’ concerns regarding the LPDs’ implementation of its policies and procedures. Recordkeeping should enable periodic review by the LPD to examine and report on the LPD’s compliance with its established written processes and, as such, with its compliance with the duty of fair comparison.

Enforcement of § 201.110 can occur in several ways. Growers can contact AMS–PSD to submit a complaint regarding an alleged violation of § 201.110. PSD would then investigate, which could lead to referral to DOJ for appropriate action or, where failure to pay is implicated, to USDA enforcement through administrative action.²⁵ AMS will also review LPD contracts, along with other required records from the LPD, in connection with routine compliance reviews and investigations to ensure LPD compliance. Injured individuals also have a right to proceed directly in Federal court.

C. Broiler Grower Capital Improvement Disclosure Document (§ 201.112)

AMS is finalizing new § 201.112, “Broiler grower Capital Improvement Disclosure Document,” which requires that LPDs provide growers with a Capital Improvement Disclosure Document (Disclosure Document). Paragraph (a) requires that when an LPD requests that a grower make an additional capital investment, the LPD must provide the grower with a Disclosure Document. Paragraph (b) describes the required disclosures in the Disclosure Document. AMS made slight modifications to provisions of paragraph (b), which will be described below. AMS also modified proposed § 201.112 in response to public comment by adding a new paragraph (c), which requires the LPD to assist with translating the Disclosure Document.

The inclusion of § 201.112 is necessary because LPDs often request or require that growers make costly additional capital investments, which may benefit LPDs and growers in some ways, but may also be problematic and unfair. The LPD requesting an additional capital investment may be deploying bargaining leverage and forcing the grower to bear unreasonable risk, and the purposes, processes, and outcomes of the additional capital investment may be opaque, complicated, or otherwise difficult to evaluate. Additional capital investments

can also further serve to lock in growers to specific LPDs, making it harder to switch. Growers, however, are often not in a position to choose not to make an additional capital investment. Many growers come under significant pressure from LPDs to make a requested additional capital investment. Even when a grower has sufficient bargaining leverage to negotiate the terms of compensation, the LPD may not provide sufficient information for the grower to assess the full risk and reward of undertaking the additional capital investment. Indeed, based on AMS’s knowledge of industry disclosure practices and decades of hearing complaints from growers, growers today often undertake additional capital investments for the LPD without the opportunity to fully understand the additional capital investment’s purpose, design, risks, and impacts on their financial well-being; or, are pressured in some way to make those investments.²⁶ Information asymmetry impairs growers’ ability to negotiate, effectively exercise independent decision-making to reject an additional capital investment, and, more broadly, manage their farming operation upon choosing

²⁶ MacDonald, James M. 2014, Technology, Organization, and Financial Performance in U.S. Broiler Production, EIB-126, USDA Economic Research Service, https://www.ers.usda.gov/webdocs/publications/43869/48159_eib126.pdf?v=1829.6 (In a 2011 survey of contract growers, sixty percent of growers making any capital expenditures reported that the LPD required those expenditures). AMS–FTTP–22–0046–0799 (“Poultry companies require capital improvements that do not improve my bottom line. I must pay for the capital improvements, which may not be a capital improvement that will benefit my operation. It will not benefit the quality of the bird. The benefit is not clearly proven or explained, just I am required to make the improvement or get paid less or dropped as a grower.”); AMS–FTTP–22–0046–0737 (“For years, I’ve been forced to upgrade my farms facilities at my own expense just to maintain contracts. These costly and often unnecessary upgrades, dictated by companies like [name redacted], have left me in debt and struggling to cover basic expenses. The financial burden is unsustainable and has made it incredibly challenging to keep my farm afloat”); AMS–FTTP–22–0046–0176 (“For way too long these poultry integrators have been let off the hook for bullying, forcing their contract growers into making large investments in upgrades that will never see a payback beyond the initial investment to build the infrastructure to keep their growers under their total control and blaming growers for everything that goes wrong . . .”). United States Department of Justice, United States Department of Agriculture, (May 2010), Public Workshops Exploring Competition in Agriculture, <https://www.justice.gov/archives/atr/events/public-workshops-agriculture-and-antitrust-enforcement-issues-our-21st-century-economy-10> (“It’s typical for growers to be asked to do expensive upgrades on their poultry houses before this first loan of this building has been paid off. I know because I was one of those growers. The threats put before you, the communication, the threat is put before you, if you do not do this, they’re not going to bring you any more chickens to grow”).

²⁵ Additional information on reporting violations of the P&S Act can be found here: <https://www.ams.usda.gov/services/enforcement/psd/reporting-violations> (last accessed 11/13/2023).

to make the additional capital investment. When information asymmetries prevent growers from evaluating whether they are able to recoup their investment or whether they can engage in other farming practices that could achieve the goals of the additional capital investment, growers cannot effectively protect their financial interests or freely exercise decision-making with respect to their farming operation. Growers and AMS may also be unable to identify circumstances where LPDs are seeking to compete through additional capital investment practices that shift or hide costs to growers, which subverts the competitive process.

AMS has identified as deceptive those LPD contracting practices that fail to disclose key information about additional capital investments. Growers make critical investment decisions in reliance on the information required by this rule, most of which is not currently provided by LPDs. AMS emphasizes that disclosure under new § 201.112 is not, and is not intended to be, a remedy to unfairness in and of itself; rather, disclosure provides AMS and growers with information necessary to enforce their rights under existing § 201.216, “Additional capital investments criteria,” and the P&S Act more broadly, when terms are unfair. Without sufficient, simple, and clear disclosures, growers cannot assess the benefits or risks of making the investment. Indeed, given the role of performance pay in determining total grower compensation under the tournament, some voluntary additional capital investments may seem mandatory if growers want to maintain existing revenue levels, even if growers don’t fully understand the purposes and expected outcomes of the requested additional capital investment. Furthermore, growers experience considerable pressure to accept LPDs’ additional capital investment requests given LPDs’ market power, or substantial bargaining power, and growers’ relatively weak market position, including commonly a lack of meaningful choice among LPDs. A majority of broiler growers cannot change LPDs if their current relationship sours.²⁷

AMS notes that the existing regulation in § 201.216 is intended to allow the

Agency to partially mitigate additional capital investment problems for growers. The existing regulation sets forth criteria for whether additional capital investments would be an unfair practice or other violation of the Act, including whether the grower can decide against the additional capital investments; whether the additional capital investments were a result of coercion, retaliation, or threats by the LPD; and whether the additional capital investments can result in reasonable recoupment, or adequate compensation for the additional capital investments, among other non-exhaustive criteria. However, AMS has found that the presence of the criteria alone is insufficient to effectively address problems stemming from additional capital investments. For example, insufficient information about additional capital investments impacts the criteria at § 201.216(a) that seek to preserve the grower’s discretion to decline an additional capital investment. Lacking sufficient information about additional capital investments, a grower cannot effectively assess whether they would still be able to compete against other growers without the additional capital investment.

The Act requires production contracts to disclose the possibility of additional capital investment (7 U.S.C. 197a(b)). However, the majority of contracts contain no information relating to when or how additional capital investments may be required, nor the costs or risks of any such additional capital investment, nor what, if any, limits there are on an LPD’s ability to unilaterally impose additional capital investments that do not materially improve production efficiency or meet consumer demands. To better enable growers and AMS to guard against unfairness and to prevent deception, LPDs must disclose more information regarding the purposes, processes, and outcomes of additional capital investments they request from broiler growers. The disclosures must occur before growers take on the financial burden and risks of the additional capital investment. The provision of such information is not, in and of itself, the cure for unfairness, but rather a key tool for AMS and growers to halt abusive practices by arming them with the ability to identify those challenges sooner. The disclosures required in § 201.112 accomplish these goals. Furthermore, the act of disclosing information does not, in and of itself, render the action lawful. Even if disclosed, certain actions may be unfair

or deceptive practices under the P&S Act. Disclosure alone does not mitigate the legal or ethical ramifications of such practices.

The Agency has an existing regulation, 9 CFR 201.216, which sets forth a non-exclusive list of criteria the Secretary may consider in determining if a required additional capital investment violates the Act. In future cases, the § 201.112 disclosures on additional capital investments will improve the Secretary’s analysis of § 201.216. Whether the Secretary considers recoupment of the additional capital investment to be reasonable includes consideration of the projected returns under § 201.112(b)(6), the contract terms, and the return to an average grower operating under the LPD’s contract. AMS underscores the importance of length of the contract to secure a full opportunity for recoupment. AMS recognizes that growers in many instances cannot avoid the LPD’s unfair exercise of market power or bargaining leverage, and that the LPD failing to sufficiently and fairly compensate growers for an additional capital investment is not a cognizable benefit to growers or to competition.

i. Section 201.112(a)—Disclosure Requirement

In the final rule, paragraph (a) of § 201.112 requires that when an LPD requests that a broiler grower make an additional capital investment, the LPD must provide the broiler grower with a Disclosure Document that contains the information required by paragraph (b) of this section. AMS slightly modified this provision from the proposed rule by adding the paragraph heading, “Disclosure requirement.” Information provided in the Disclosure Document will help growers protect themselves at an earlier stage—before the investment—from unfair practices, by enabling them to report to AMS potentially unfair additional capital investment practices or bring their own action. Improved documentation will also enable AMS to take earlier and more effective action against problematic additional capital investment practices. Transparency will also enable some growers, where sufficient choice exists, to make better additional investment decisions. Importantly, clear disclosure of additional capital investment parameters will enhance growers’ ability to enforce their rights relating to unfair practices under § 201.216 (such as recoupment and discretion to refuse to make an additional capital investment), as well as other provisions of the P&S Act and regulations. Disclosure alone is

²⁷ MacDonald, James M. 2014. Technology, Organization, and Financial Performance in U.S. Broiler Production, EIB-126, USDA Economic Research Service (Roughly 22 percent of growers operate in a pure monopsonistic local market, and that 52 percent of broiler growers (farms), accounting for 55 percent of broilers produced and 56 percent of total production, report having only one or two LPDs in their local areas).

not a remedy for an additional capital investment that is unfair, but the disclosures required by new § 201.112 will create a record that will facilitate the Agency's ability to enforce the Act under existing § 201.216.

This requirement applies prospectively to requests for additional capital investments. However, if the LPD has previously provided any disclosure to the grower that was incomplete or inaccurate, the company should consider revising it and providing an updated copy to the grower to minimize the risks of having engaged in a violation of deceptive practices.

ii. Section 201.112(b)—Disclosure Contents

Section 201.112(b) lists the items the Disclosure Document is required to disclose. AMS slightly modified this provision from the proposed rule by adding the paragraph heading, "Disclosure contents." The required disclosures must be prominently presented in a clear, concise, and understandable manner. Paragraph (b)(1) requires that the Disclosure Document provide the purpose of the additional capital investment for both the LPD and the grower and a summary of all research and other supporting material that the LPD has relied upon in justifying the additional capital investment. LPDs almost always have superior information regarding the outcomes of and risks around the contemplated additional capital investment. LPDs commonly research and design additional capital investments and usually have a plan or intended outcomes with respect to their request for the adoption of an additional capital investment. Growers have limited to no access to that information, yet they are often asked to expend hundreds of thousands or even millions of dollars to implement additional capital investments. As part of any assessment of risks or benefits relating to an additional capital investment, growers must be provided the information necessary to understand the intended purpose of the additional capital investment and have access to any research or other supporting material regarding that additional capital investment. For example, growers may make different decisions about their approach to additional capital investment depending on whether it is intended to be performance-enhancing (e.g., tunnel ventilation), whether it is intended to enable a change in the product offered (e.g., a switch to "No Antibiotics Ever"), or whether it changes the nature of the

controls and risks (e.g., automation and monitoring). Omissions of this information prevent growers from making an informed business decision, negotiating effectively for adequate compensation, or determining if and how the original bargain for exchange has been modified or altered. Thus, an LPD's failure to adequately disclose this information is deceptive and harmful to growers because that failure imposes undue financial risk and increases the likelihood of a poor financial outcome on the investment.

Paragraph (b)(2) of § 201.112 requires LPDs to provide clear additional capital investment financial incentives and schedules to growers. Under paragraph (b)(2), LPDs are required to disclose to the grower all financial incentives and compensation associated with the additional capital investment. The Disclosure Document shall clearly delineate how long such financial incentives or changes in grower compensation will last and the degree to which benefits accruing to growers making such investments are contingent on how widely they are adopted by other growers. Compensation and financial incentives are broad terms and may include changes to grower base pay or performance pay, payments specifically linked to adoption of the particular technology resulting from the additional capital investment, and any other changes to the economics of the grower's relationship with the poultry company associated with making the additional capital investment or its implementation once made. Clearly disclosing financial incentives will assist the grower in assessing the relative risks of non-recoupment, as the reliability of those incentives may vary based on the duration of the contract and whether other growers are likely to incorporate the additional capital investment technology in a way that would make recoupment through performance pay less reliable.

Paragraph (b)(3) of § 201.112 requires that LPDs disclose all construction schedules related to the request for the additional capital investment. Clearly disclosing expected grower construction schedules and other repayment schedules also will assist the grower in assessing incentives and risks relating to borrowing, construction, and payment timing. This disclosure will position growers to better analyze the business risk in undertaking an additional capital investment, including the operational risks relating to implementing the additional capital investment and risks of LPD strict enforcement of these implementation requirements. For example, comments (discussed in

further detail below in section V., "Comment Analysis") noted concerns about LPDs not being sufficiently lenient regarding construction schedules. By enabling growers to clearly understand each component of the additional capital investment requested by the LPD, the required disclosures will address key information asymmetries that exist between the LPD and the grower with respect to LPD's purposes, bases, and expectations for an additional capital investment. Growers will be better positioned to evaluate the true costs and risks from the additional capital investment, as well as the operational implications for their farming enterprise.

As proposed, paragraphs (b)(1) through (3) of § 201.112 included language requiring that LPDs describe within their Disclosure Document: (1) "any relevant" research or other supporting material that the LPD has relied upon in justifying the additional capital investment; (2) "all relevant" financial incentives and compensation for the grower associated with the additional capital investment; and (3) "all relevant" construction schedules related to the request for additional capital investment. After consideration and review of public comments, it became clear that the term "relevant" as proposed was ambiguous and confusing. Commenters expressed uncertainty regarding how to determine compliance with these requirements. Some stakeholders believed that the term "relevant" created an ambiguous requirement that could result in the inclusion of unnecessary documents that may not in fact be "relevant" to satisfy the required disclosures. AMS finds these comments persuasive and, thus, AMS has struck the term "relevant" from paragraphs (b)(1) through (3) of § 201.112. After the change, paragraphs (b)(1) through (3) require LPDs to submit: (1) all research and other supporting material that the LPD has relied upon in justifying the additional capital investment; (2) all financial incentives and compensation for the grower associated with the additional capital investment; and (3) all construction schedules related to the request for additional capital investment. The removal of the word "relevant" will ease the burden on LPDs by removing ambiguity regarding which disclosures are required to be included in the Disclosure Document. This technical change does not increase the burden of the disclosure requirement; it merely removes ambiguous phrasing while retaining the same disclosure requirement proposed in the proposed

rule. This change will prevent inconsistencies in LPDs' interpretation of what disclosures are required by paragraphs (b)(1) through (3).

In the final rule, § 201.112(b)(4) requires that LPDs disclose their expectations regarding housing specifications associated with the additional capital investment. LPD housing specifications are critical components to any additional capital investment. The provision of these basic details regarding the additional capital investment will enable a grower to understand the workings, process, and design characteristics of the requested additional capital investment. They thus would enable a grower to identify business risks associated with undertaking the additional capital investment, as well as any unfair or otherwise impermissible additional capital investment practices prohibited under § 201.216. This provision remains unchanged from the proposed rule.

In the final rule, AMS revised § 201.112(b)(5). As proposed, paragraph (b)(5) required that LPDs disclose any required or approved manufacturers or vendors. In the proposed rule, AMS solicited comment on whether paragraph (b)(5) should also require the disclosure of any material financial benefits that the LPD, or any officer, director, employee or family member of any such person, receives from the use of the required or approved vendor.²⁸ Commenters indicated that LPDs should not be allowed to require growers to use certain equipment or vendors, especially when those LPDs hold any amount of financial interest in those equipment companies or specifically required vendors. Therefore, in the final rule AMS expanded paragraph (b)(5) to require disclosure not only of required or approved manufacturers or vendors, but also all financial benefits that the LPD or any officer, director, decision-making employee, or close family member thereof receives from the use of the required or approved manufacturer or vendor.

In the additional capital investment Disclosure Document, the LPD must disclose any required or approved manufacturers or vendors, and any financial benefits that the LPD or its officers (such as CEO, President, Secretary, etc.), members of its board of directors, decision-making employees, or close family members of any such person, will receive from using such a manufacturer or vendor. Decision-making employees refers to those employees who are involved with the decision-making for the additional

capital investment and its implementation. A close family member covers an immediate or other family member where a reasonable person would question the impartiality of the business judgment of the decision-maker. This component of the Disclosure Document applies to possible conflicts of interest that may influence specifications for required or approved manufacturers or vendors.

The additional language is similar to an existing disclosure requirement under the Federal Trade Commission's Franchise Rule, but requires disclosure of benefits from more individuals.²⁹ AMS found this addition persuasive because it is designed to promote a similar purpose by protecting the more financially vulnerable party—who is making a significant investment—from incurring debt or otherwise expending scarce resources, not solely to achieve the investment's purpose, but rather as a reflection of the presence of a conflict of interest on the part of the less financially vulnerable party (the LPD).

Section 201.112(b)(6) requires that LPDs provide a financial analysis of projected returns the grower can expect related to the additional capital investment, including any assumptions, risks, or uncertainties, sufficient to allow the grower to make their own projections. The language of the final rule is slightly simplified from that proposed to remove the hyphenated text and incorporate that same language closer to the end of the sentence. This technical change improves the readability of the provision without changing its meaning as proposed. This provision is designed to enable the grower to evaluate the reliability of the financial returns that the grower could receive over the duration of the contract. Such information would include, where relevant, assumptions regarding the expected likelihood of whether other growers will adopt the additional capital investment and the impacts on the reliability of returns in relation to the incentives. Financial analysis of projected returns is critical to enabling growers to understand the opportunities, and hence the risks, they may be taking on. For example, revenue projections should include assumptions that can be relied upon by growers in relation to annual flock placements, stocking density, and the expected distribution of performance pay. Omission of this information is central to the inability for growers to effectively identify whether they can adequately recoup the additional capital investment

or whether the additional capital investment is otherwise unfair.

Disclosure under § 201.112 is more detailed than LPD disclosure under the existing regulation in § 201.102(d)(2). The existing disclosures provide guidance to the grower with respect to the relative risks associated with contracting with the LPD to prevent deception before it harms the producer. The disclosures required in this final rule focus on ensuring that growers are aware of known or reasonably expected sources of returns, risks, and costs (including costs such as labor, operating, maintenance, and other costs associated with a request for an additional capital investment). Thus, § 201.102(d)(2)(i) and (ii)³⁰ is a focused revenue disclosure, and references situations where contracts are modified due to additional capital investment or otherwise and requires a projection from LPDs when contract modifications dilute the value of the 5-year revenue tables required in § 201.102(d)(1). If § 201.112 is applicable to the LPD and incorporates what is otherwise required under § 201.102(d)(2)(i) and (ii), the LPD can use one set of disclosures for both § 201.112 and § 201.102(d)(2)(i) and (ii).

Finally, § 201.112(b)(7) requires that LPDs include in the Disclosure Document a specific statement that the Disclosure Document has not been reviewed by USDA, and that false and misleading statements or material omissions may violate State and/or Federal laws.³¹ The statement must also indicate that violations of Federal and State laws may be determined to be unfair, unjustly discriminatory, or

³⁰ (2) If poultry housing specifications for broiler growers under contract with the complex are modified such that an additional capital investment may be required, or if the 5-year averages provided under paragraph (d)(1) of this section do not accurately represent projected grower gross annual payments under the terms of the applicable broiler growing arrangement for any reason, the live poultry dealer must provide the following information:

(i) Tables providing projections of average annual gross payments to broiler growers under contract with the complex with the same housing specifications for the term of the broiler growing arrangement at five quintile levels or by mean and standard deviation expressed as dollars per farm facility square foot.

(ii) An explanation of why the annual gross payment averages for the previous 5 years, as provided under paragraph (d)(1) of this section, do not provide an accurate representation of projected future payments, including the basic assumptions underlying the projections provided under paragraph (d)(2)(i) of this section.

³¹ This mirrors language in the FTC Franchise Rule at 16 CFR 436(e)(2) that refers to the FTC's position on Franchise Disclosure Documents (FDDs), specifying that while the FTC requires franchisors to provide accurate disclosures, it does not verify the content of the FDD, nor does it endorse the franchise offering.

²⁸ 89 FR 49002, 49025 (June 10, 2024).

²⁹ 16 CFR 436.5(h)(6).

deceptive and unlawful under the P&S Act, as amended. AMS does not intend for the Disclosure Document to be a means by which LPDs may waive any unfairness provisions in law or regulation. AMS maintains that a determination of unfairness is dependent on the facts and circumstances of each case. The required statement must also include Packers and Stockyard Division contact information that growers can use to report violations and other concerns. Lastly, the statement must provide website contact information for those seeking additional information on rights and responsibilities under the P&S Act. This provision is unchanged from the proposed rule.

AMS underscores that the information required to be set out in the Disclosure Document is not currently provided to most growers or in all circumstances. These omissions present material risk of deceiving growers, as well as subjecting them to potentially unfair practices which they are unable to identify at an early enough stage to halt them in their incipency.

iii. Section 201.112(c)—Translation

In the final rule, § 201.112 contains a new paragraph (c). In the proposed rule, AMS asked commenters what considerations, if any, AMS should take into account with respect to the timing, delivery, or readability with respect to the Disclosure Document.³² AMS also specifically asked commenters whether it should include a provision requiring that LPDs make reasonable efforts to assist growers in translating the Disclosure Document and to ensure that growers are aware of their right to request translation assistance.³³ In response to the proposed rule, including specific questions posed related to translation, some commenters requested that translations of the Disclosure Document be made available in languages other than English. Therefore, AMS is adding paragraph (c) to § 201.112, which requires that, upon delivery of the Disclosure Document to the grower the LPD must make reasonable efforts to ensure that the grower is aware of their right to request translation assistance and must assist the grower in translating the Disclosure Document. Reasonable efforts include, but are not limited to, providing current contact information for professional translation service providers, trade associations with translator resources, relevant community groups, or any other person or organization that

provides translation services in the poultry grower's geographic area. Depending on the facts and circumstances (such as convenience, expense, and timeliness of the translation), reasonable efforts may also include allowing the grower access to a computer-generated translation of the Disclosure Document and additional time to review any translated Disclosure Document. An LPD may not restrict a broiler grower or prospective broiler grower from discussing or sharing the Disclosure Document for purposes of translation with a person or organization that provides language translation services. Nothing in the rule prevents companies from providing a translation, provided it is complete, accurate, and not misleading.

This addition of translation assistance is necessary because language barriers can prevent poultry growers from understanding the Disclosure Document, which would thwart the purpose of § 201.112. If growers do not have a reasonable opportunity to understand the Disclosure Document due to language barriers, the goal of remedying deception is thwarted. Notably, the translation requirements under § 201.102(g)(4) apply to § 201.112 if the latter is applicable to the LPD and incorporates what is otherwise required under § 201.102(d)(2)(i) and (ii) in a single disclosure that meets the requirements of both § 201.112 and § 201.102(d)(2)(i) and (ii).

iv. Compliance and Enforcement

Compliance with § 201.112 requires LPDs to include the information and topics described in § 201.112(b)(1) through (7) in the Disclosure Document and provide that document to growers when requesting an additional capital investment. LPDs are also required to inform growers of their right to request translation assistance and/or assist growers with translation of the Disclosure Document, if necessary.

Enforcement of § 201.112 could occur in several ways. Growers could contact AMS (PSD) to submit a complaint regarding an alleged violation of § 201.112. PSD would investigate, which could lead to a referral to DOJ for appropriate action or, where failure to pay is implicated, USDA enforcement through administrative action.⁴⁴ As necessary for compliance enforcement or during investigations, PSD will review Disclosure Documents to ensure completeness. Injured individuals also have a right to proceed in Federal court.

D. Severability (§ 201.290)

AMS is adding § 201.290, "Severability," to subpart N to confirm

that if any provision of this rule, any component of any provision, or any provision of subpart N is declared invalid or if the applicability thereof to any person or circumstances is held invalid, it is AMS's intention that the validity of the remainder of the provision or the applicability thereof to other persons or circumstances shall not be affected thereby with the remaining provision, or component of any provision, to continue in effect. Such a provision is typical in AMS regulations that cover different topics and is included here as a matter of housekeeping.

This rule aims to address different harms common in the broiler production industry: lack of payment transparency in broiler growing arrangements, unfairness in tournament operations, and lack of disclosure from LPDs regarding additional capital investments. Each of the new sections can operate independently in the absence of the others. Conduct that violates one section is not dependent on protections put in place by other sections. For example, if an LPD discounts the rate of compensation provided in a broiler grower arrangement in violation of § 201.106, the Agency would still be able to enforce this provision even if the provision requiring the fair operation of broiler grower ranking systems (§ 201.110) were struck down. These are not inextricably connected regulations: § 201.110 focuses on establishing a fair comparison among growers in a tournament, while the focus of § 201.106 is ensuring clear (no discounting) and reliable (not unreasonably variable) rates of compensation disclosed in the contract. As another example, if the provision regarding additional capital investments (§ 201.112) was struck, AMS would still retain criteria under § 201.216 to evaluate whether requiring an additional capital investment constitutes a violation of the P&S Act.

AMS intends that the severability provision operate to the fullest extent possible. For example, under § 201.110(b)(1), "Policies and procedures," if the league composition requirement in paragraph (b)(1)(iii) is severed, this does not necessarily negate the benefits or make unenforceable the other processes requirements contained in paragraphs (b)(1)(i) (inputs under LPD control), (ii) (flock production practices under LPD control), and (iv) (evaluation period), etc. Similarly, AMS intends that the severability provision apply to all of subpart N. If one of the new regulations implemented via this final rule is severed, this does not make

³² 89 FR 49002, 49025 (June 10, 2024).

³³ *Ibid.*

unenforceable the existing provisions in subpart N. In other words, if the benefits of a section in subpart N remain intact without the unenforceable provision, AMS's intent is to retain the enforceable provisions of the section. AMS notes that this discussion is illustrative and not exhaustive.

V. Comment Analysis

Overview

The Poultry Grower Payment Systems and Capital Improvement Systems proposed rule, published on June 10, 2024, received 758 comments, some with multiple signatories, over a 60-day comment period. Of these comments, 671 were in clear support of the rule (the majority of these consisting of form letters from advocacy campaigns), while 13 comments were in clear opposition to the rule and the remaining 74 were ambiguous or unclear. A variety of stakeholders commented on the proposed rule, including farmers' coalitions, government entities, advocacy organizations, industry trade organizations, processors, producers, and other non-affiliated, individual parties. Topics that garnered considerable attention in the proposed rule, both positive and negative, included the rate of compensation, transition and implementation costs, the duty of fair comparison, and reasonable recoupment of required additional capital investments. A common theme among the majority of supportive comments, particularly by growers, was the fear of retaliation underlying their concerns about LPD practices.

Many farmers' coalitions, advocacy groups, and individual producers argued that LPDs would easily find ways to deny producers fair payment, especially during the industry's transition to adopt the proposed changes. For example, while many commenters supported § 201.106's 25 percent comparison-based compensation presumption, most of these supporters requested other changes to the final rule, such as requiring performance-based pay to be applied at the individual level and pairing it with a requirement of a fair minimum base pay. Other common recommendations for financial safeguards included making the option for non-comparison-based pay more accessible to producers and requiring that producers' contracts be long enough to ensure a reasonable rate of return for their loans.

Another common theme among commenters was the fear of LPD retaliation against producers who made unfairness claims, requested non-

comparison-based pay, refused to take on an additional capital investment, etc. Many individual producers shared personal experiences of retaliation, often in the form of intentionally unequal inputs and threatened or actual contract termination, for speaking out against unfair practices. Many commenters emphasized the inherent power imbalance between both parties, pointing out that producers, who carry high amounts of debt, depend on LPDs for paying down the debt. Moreover, commenters described feeling or receiving intimidation against making unfairness claims and pressure to adhere to unfair terms. For instance, commenters described receiving unexpected deductions or variability in pay and had no choice but to accept their circumstance. Commenters recounted struggling to make ends meet as a result. If they ranked lower than other growers for one or more settlements, the resulting decrease(s) in compensation left them unable to afford necessary expenses. Some commenters stated that experiencing these losses forced them to sell their families' farms, driving them out of the industry entirely. Many commenters requested that the final rule include specific protections against retaliation for producers who made unfairness claims against their LPD or who refused to take on an additional capital investment required by their LPD. Many other commenters requested greater protections for producers who receive unequal inputs from their LPDs, describing numerous input variables that can be and have been exploited by LPDs to deliberately lower producers' placement in their tournament.

Conversely, comments in opposition, many from industry representatives, defended the current system and expressed concerns about the proposed rule. These commenters asserted that the rule is unfair to growers who are successfully operating in the current system and that the rule would unfairly punish high performers. These commenters also stated that the rule disregarded the self-interest of LPDs in ensuring grower success. Opposing commenters further stated the rule would be overly burdensome for the industry to implement.

A. Section 201.106

i. Transparency in Pay

Comment: Many commenters, especially growers and advocacy organizations, highlighted the need for stronger protections, greater transparency, and a more equitable balance of power within the poultry

industry. Commenters emphasized that greater transparency from LPDs is essential for a fair and equitable payment system. Specific concerns stemming from inadequate transparency included the inability to predict income due to fluctuations in flock-to-flock payments, and payments below the base price due to factors outside of growers' control. Commenters also suggested safeguards to prevent unfair payment deductions related to stocking density and other external factors. Advocacy groups raised concerns about the potential for LPDs to exploit the system and drive down grower base pay.

Other commenters, especially industry stakeholders, emphasized existing measures and cautioned against government intervention. These commenters asserted that growers face no uncertainty regarding income or input costs and opposed a fixed base price. They also asserted that most contracts already include minimum compensation floors and expressed concern that raising base pay would be unsustainable and lead to higher consumer prices. One commenter suggested that AMS identify and address potential gaps in grower education and outreach.

AMS response: AMS agrees with the comments that asserted the need for stronger protections, greater transparency, and a more equitable balance of power. Accordingly, AMS modified the proposed § 201.106 to include provisions that further these goals. Paragraph (a) will prevent LPDs from reducing a poultry grower's compensation based on the grower's ranking, grouping, or comparison to others. This will improve growers' ability to predict income. As discussed below, paragraph (b) will establish a presumptive limit on comparison-based performance pay, which will enhance growers' ability to predict their income from a contract by reducing variability from that rate due to fluctuations in flock-to-flock payments. Paragraph (c) works to prevent LPDs from exploiting their market power and associated bargaining power by requiring LPDs to notify the Administrator if there are any contract modifications that result in a reduced payment to poultry growers.

Existing regulation fails to protect poultry growers from injury in the manner Congress intended. Contrary to LPDs' claims, growers do face uncertainty regarding income, because the payment they will receive is not known until the growing cycle is complete and all growers' outputs are compared and performance payments are distributed. AMS has consistently heard reports from growers receiving

deductions or excessively variable compensation from LPDs such that their compensation does not align with the LPDs' initial representations.³⁴ Accordingly, a high percentage of growers' operations have sustained net negative incomes—an outcome that growers most likely do not anticipate before agreeing to contract with their LPDs.³⁵ Moreover, AMS has reviewed broiler growing contracts for decades during routine regulatory reviews of LPD's payment practices. While many contracts that AMS has reviewed already include minimum compensation provisions, these provisions are not an industry-wide practice, and do not cure the deception or unfairness arising from deductions in the rates of compensation in the contract, especially the base price, because the minimum price could be far below the base price or even the lower bounds of base plus performance pay. Moreover, requiring that minimum compensation be disclosed allows growers who have the option of contracting between multiple LPDs to meaningfully compare their options,

enhancing competition in the market for grower services in certain geographies. Nor is this an unworkable or unreasonable requirement; some LPDs have already adopted the reforms included in this final rule, and so this regulation builds on existing, successful models that that commenters said some LPDs have already found workable and effective.

Also, contrary to some commenters' claims, nothing in the regulation requires the base pay to be increased or otherwise be fixed in a manner that would affect supply or the price of chicken for consumers; rather, it is designed to address inadequate poultry grower compensation arising from deceptive and unfair practices by LPDs. Simply, § 201.106(a) enables LPDs to continue to set a base pay and provide bonuses based on a grower's grouping, ranking, or comparison to others, or through other payment incentives schemes. AMS acknowledges that grower education and outreach may be useful but believes that the responsibility to eliminate deception starts with the legal responsibilities Congress placed on the LPDs when it amended the Packers and Stockyards Act. This includes clear contract terms and transparent communication between LPDs and growers.

AMS notes that § 201.102 requires disclosure of stocking density in production contracts. Reductions in stocking density are best addressed under those disclosure requirements. AMS acknowledges that § 201.106 may not address every form of unfair practice that a grower may experience, such as reductions in flock placements or stocking density, and AMS remains committed to robust enforcement of section 202 of the Act to address the full range of potentially unfair practices that growers may face.

AMS agrees that USDA-sponsored education and outreach helps growers' make informed decisions. AMS is taking steps to increase producer education and outreach, including, for example, by establishing the *farmerfairness.gov* portal to facilitate ease of access for submitting complaints. AMS intends to expand education and outreach regarding this rule and other regulatory requirements. Disclosure and education, although beneficial, are unlikely to address unfairness because of the substantial difference in bargaining power between LPDs and growers. AMS's responsibility, however, is to enforce the Act. Better information concerning an unfair practice does not make the practice fair, nor alleviate the need for regulation.

ii. Performance Pay

Comment: Growers and supporting organizations highlighted the need for a more balanced system that protects growers from income volatility and unfair deductions related to factors outside of their control. Many commenters explicitly endorsed a 25 percent cap, citing the potential to curb the negative impacts of the tournament system while preserving performance-based incentives. Several advocacy groups supported calculating the variance at the individual grower level rather than the complex level to allow growers to make more informed financial calculations, better determine whether they are being treated unfairly by LPDs, and to limit the potential for favoritism and retaliation against individual growers. To strengthen fairness and transparency, commenters emphasized the need for objectively measurable bonus criteria and the importance of pairing the cap with a fair minimum base pay. One commenter suggested allowing exceptions for exceeding the 25 percent cap with proper justification. Another pointed to the bonus cap model in the turkey industry and a farm bureau suggested a 20 percent pay difference between growers. Several commenters indicated that bonuses should be linked to factors within a grower's control.

Some industry representatives emphasized the role of performance incentives in driving productivity. Commenters argued that limiting performance bonuses would disincentivize growers and negatively impact productivity. Some commenters questioned the basis for the 25 percent figure.

Many stakeholders expressed concern about the feasibility of case-by-case enforcement to ensure fair comparison-based bonuses. Comments reveal a consensus among stakeholders that case-by-case enforcement alone is insufficient to guarantee fair comparison-based compensation. Advocacy organizations argued that case-by-case enforcement is ineffective and inefficient and places an undue burden on growers who seek redress. These organizations cited past instances in which this approach failed to adequately protect grower interests. One commenter raised a concern about case-by-case enforcement's vulnerability to changing political landscapes, thereby creating uncertainty for growers and potentially discouraging them from reporting unfair practices. Many stakeholders advocated for clear regulations and proactive measures to prevent unfair bonuses rather than

³⁴ *United States v. Cargill Meat Solutions Corp.*, 1:22-cv-01821-ELH (D. Md. July 25, 2022) (LPDs did not adequately disclose the risk inherent in the tournament systems to growers, so growers could not reasonably evaluate the range of potential financial outcomes, manage their risks, or compare competing poultry processors); AMS-FTPP-22-0046-0777 (“[W]e were told our houses would be paid off raking in the money in 10 years[.] I am now out to twice that still in debt. . . .”); AMS-FTPP-22-0046-0876 (“In our communications with growers, we have learned that when they signed their initial poultry contract, most had expectations that their contract relationship with a poultry company would be one of mutual respect where both parties shared in the risks and rewards of producing chicken for consumers. They expected a transparent system that would reward them for their hard work and management services. Instead, what they quickly found was a dictatorial system that gives growers an unpredictable and often inadequate income stream, and allows poultry companies to shift risks onto growers, without fairly sharing in the economic rewards commensurate with their financial investment and services provided”); AMS-FTPP-22-0046-0156 (“Frequently, that deception begins even before poultry growers sign their contracts. It is a common story for growers to be attracted by unrealistic financial models and integrators’ promises of support. Once the contracts are signed, though, growers find themselves on the short end of a massive power imbalance”).

³⁵ MacDonald, James, Technology, Organization, and Financial Performance in U.S. Broiler Production, EIB-126, USDA Economic Research Service (2014), https://www.ers.usda.gov/webdocs/publications/43869/48159_eib126.pdf?v=1829.6 (In 2011, nearly a third of smaller farms and nearly a fifth of larger farms realized negative net farm income); AMS-FTPP-22-0046-0780 (“I’ve been a poultry grower for almost 15 years and it is a shame that you have to have multiple jobs just to make ends meet. . . . Everyone is struggling in this economy right now and we have massive debt loads, insurance and utilities have skyrocketed parts are extremely high and even just the basic necessities to live are at critical levels. . . .”).

relying solely on enforcement. For example, one commenter requested that USDA establish guidelines defining unfair performance payment structures, proposing a presumption of unfairness for bonuses exceeding 25 percent of total compensation. The commenter also suggested that contracts offered to indebted growers could serve as potential evidence of anti-competitive practices, particularly by processors with significant market power.

AMS response: In the proposed rule, AMS specifically inquired whether it is presumptively unfair for comparison-based compensation to equal or exceed 25 percent of total compensation (base pay rate plus comparison-based) for any grower and asked a range of questions around the appropriateness of the specific threshold, how to calculate it, and how it would affect the industry. These questions included inquiries highlighting the role of the 25 percent presumption as a potentially binding constraint and how LPDs might respond in the compensation structures.

AMS agrees with the majority of commenters suggesting that comparison-based performance pay should be presumptively limited in order to balance the interests of growers and LPDs and prevent unfair outcomes. Grower concerns regarding thin margins, debt load, input variability, and tournament composition invoke equity issues that must be balanced with performance and productivity incentives. While useful as an incentive and a means to allocate pay, flock performance metrics, specifically feed conversion, as a proxy to grower effort are imperfect. Feed conversion itself is affected by variables beyond grower effort. AMS is not aware of existing technological innovations that could serve to better isolate grower effort or a measurement that would be exclusively under grower control.

Flock performance metrics serve some purposes in the assessment of grower effort and the allocation of grower payments. AMS's experience in analyzing performance payments suggest that ranking systems can be a useful and reasonably equitable mechanism for pay allocation with proper regulation in magnitude. Performance payments can reward grower effort without being an unlawfully deceptive or unfair practice.

In considering the appropriate form of regulation, AMS considered the variety of grower ranking systems currently in practice and the possible evolution and redesign of those systems, such that the purpose of the regulation would be resistant to circumvention while also providing an appropriate level of

flexibility to maintain an incentive structure. As referenced in the proposed rule, a presumptive limitation on performance pay magnitude strikes that balance. As a presumption, enforcement will occur based on an inquiry into specific factual circumstances. Based on currently available information, a bright line standard is likely to be overly rigid and may serve to deprive successful growers of the expected value of their services. Allowing LPDs to provide a rebuttal to justify exceeding the prescribed performance pay magnitude is a desirable feature for growers and LPDs alike because payment systems may reflect different circumstances at different complexes. Again, facts and circumstances matter, in particular around the variability of performance for the birds in question, the housing specifications, etc., as 25 percent may still be an appropriate limit. Whether the LPD took appropriate measures to comply with the duty of fair comparison under § 201.110 or otherwise mitigated other identifiable risks of unfair variability relating to the larger magnitude of the tournament will also be important. To underscore, AMS expects the presumption will not be easily overcome.

AMS acknowledges that some commenters preferred application of the presumption at the individual settlement level. AMS is concerned that application at the individual level will be difficult to monitor and enforce and could also result in overly rigid limitations on individual performance outcomes in flock settlements. That could dilute or distort grower performance incentives, including through capturing statistical outliers, which could result in restriction of performance payments that reduce aggregate grower revenue in ways that AMS believes are not presently necessary to address unfairness and deception under the tournament. Applying the presumption as an aggregate analysis at the complex-wide level offers several benefits to LPDs and growers. It allows smoothing of outliers from individual settlements and allows LPDs to focus on the design of the incentive system without requiring compliance on a grower-by-grower, individual settlement basis. An application at the complex-wide level will, nevertheless, have sufficient limitation on the available funds for comparison-based performance payments for individuals—owing simply to the constraint on funds for those purposes—so as to achieve the desired goal of right-sizing the

magnitude of the tournament for individual growers.

In considering the appropriate threshold at which to institute the presumption, AMS first reviewed a limited sample of existing ranking systems. AMS reviewed one to five years of confidential grower compensation data for four individual broiler complexes that AMS gathered in prior investigations. This sample included small, medium, and large bird sizes and some of the largest broiler LPDs that operate several other complexes across the U.S. Aggregate performance payments at these four complexes were 11.4, 17.4, 20.5, and 25.4 percent of total grower payments. AMS is not aware of any complex with performance payments that are as much as 26 percent of total payments. As noted above, in the proposed rule, AMS solicited comment regarding a 25 percent limitation on comparison or “performance” payments. Additionally, Wayne-Sanderson Farms, one of the three largest LPDs, recently agreed to a similar performance pay limitation at the 25 percent.³⁶ Governmental commenters noted the 25 percent cap has proven workable for both a major LPD and the growers contracted with Wayne-Sanderson. As numerous LPDs will likely need to modify contracts to achieve compliance under § 201.106(a) of this rule, finding that the industry upper bound of performance pay magnitude approaches 25 percent is also a relevant data point in AMS's determination that 25 percent is appropriate as the presumptive threshold for this regulation.

With respect to objectively measurable bonus criteria, AMS agrees that comparisons must be fair, and § 201.110 below sets out AMS's approach to mitigating comparisons based on inappropriate approaches to inputs, production practices, and related matters. AMS is not adopting further specificity with respect to bonus criteria in § 201.106 because AMS has designed this portion of the rule to operate in a simpler, more easily enforceable manner, including § 201.106(a)'s prohibition on deductions to any rate of compensation and § 201.106(b)'s limitation on the magnitude of performance pay overall.

³⁶ *United States v. Cargill Meat Solutions Corp.*, 1:22-cv-01821-ELH (D. Md. July 25, 2022); *United States v. Cargill Meat Solutions Corp.*, et al. (2022). Proposed final judgments and competitive impact statement. **Federal Register**. Retrieved from <https://www.federalregister.gov/documents/2022/09/16/2022-20014/united-states-v-cargill-meat-solutions-corp-et-al-proposed-final-judgments-and-competitive-impact>.

With respect to the importance of pairing the cap with a fair minimum base pay, AMS has adopted transition rules under § 201.106(c) to monitor and guard against unfair changes to aggregate compensation for growers. AMS sets out additional views on rates of return below.

AMS appreciates the commenter's suggestion regarding the bonus cap model in the turkey industry and the farm bureau suggestion of a 20 percent pay difference between growers. AMS did not consider the turkey industry in this final rule because contracting practices in the turkey industry are more diverse, in part owing to the biological differences in the birds which to some extent mute differences in outcomes, and so this rule would not necessarily be sufficiently tailored for that sector. However, the comment underscores the reasonableness of AMS's approach of a presumptive 25 percent limitation on aggregate performance compensation.

iii. Rate of Return

Comment: Grower and grower association commenters expressed concern around ensuring a reasonable rate of return for their labor and investments. Many commenters expressed broad concerns of monopsony power suppressing grower compensation. Some commenters stated the minimum base pay should reflect more competitive conditions, such as geographies where growers have the option to contract with three or more LPDs. Commenters stated that the minimum base pay should be sufficient to allow growers to make a reasonable return over the course of the contract, provided that the grower follows the LPD's required management practices and contract guarantees. One commenter suggested defining reasonable return as, at a minimum, enough net income to compensate poultry growers' labor hours at the state minimum wage rate. Others called for set minimum base pay, minimum flock placements and flock densities combining to allow growers to comfortably make loan payments plus a reasonable return. Commenters called for a more equitable and transparent compensation system that guarantees a reasonable rate of return, provides greater financial security, and addresses the power imbalance between growers and LPDs.

Grower commenters reported being underpaid and struggling to cover production costs, service debt, and earn a livable wage. Commenters highlighted a lack of adjustments for inflation, and penalties for factors outside their

control as contributors to insufficient compensation. They assert that the current payment structure often makes necessary capital improvements financially risky for growers, thereby hindering their ability to reinvest in their operations. Commenters also claimed that the current payment system lacks transparency regarding how performance payments are determined, the minimum price per pound rates, feed quality and ingredient details, breeder flock age and health, and chick hatch times and temperatures. Some commenters urged AMS to include in the final rule a presumption that an LPD is in violation of the P&S Act if the LPD does not offer a minimum base pay rate that is reasonably expected to cover the costs of operation, service debt associated with initial investments and capital improvements, and provide a reasonable rate of return. Commenters also advocated for a fairer system of deductions for condemned birds, arguing that deductions should be based on the actual weight of condemned birds rather than the flock's average weight.

To ensure fairness and sustainability, commenters proposed several solutions to the proposed question regarding whether AMS should prescriptively require grower base pay to earn "reasonable return," assuming they follow production practices. Many commenters recommended establishing a minimum base pay that: (1) ensures a livable income and covers basic production costs; (2) includes provisions for inflation adjustments to maintain real income over time; (3) allows for debt service, enabling growers to invest in their operations without undue financial strain; and (4) provides an opportunity for a reasonable return on investment, recognizing the inherent risks and capital requirements in poultry growing. Several commenters suggested a shift toward a base pay based on square footage, potentially with a bonus component determined through a tournament system. This approach aims to provide a more stable and predictable income stream for growers. However, one producer expressed concern that square foot pay would lower bird quality and reduce animal welfare.

Commenters also called for increased transparency from LPDs, including more detailed documentation and reporting requirements. This would provide growers with a clearer understanding of how their pay is calculated and enable better monitoring of potential unfair practices. Finally, commenters emphasized the need for mechanisms that protect growers from debt burdens

and provide a greater assurance of a return on their investments. Suggested measures include limiting the financial burden on growers for capital improvements mandated by processors and establishing mechanisms to share the risks associated with market fluctuations or unforeseen events.

AMS response: AMS appreciates the challenges that many growers face in negotiating fair pay, especially given the levels of concentration in many local markets, the take-it-or-leave-it form of LPD contracts, and the prevalence of the reports on troubling practices in the poultry industry. AMS aims to promote an industry market structure that can secure payment rates and contract terms for all growers that: (1) ensure a livable income and covers basic production costs; (2) include provisions for inflation adjustments to maintain real income over time; (3) allow for debt service, enabling growers to invest in their operations without undue financial strain; and (4) provide an opportunity for a reasonable return on investment, recognizing the inherent risks and capital requirements in poultry growing. AMS also recognizes the value of basing payment, in many circumstances, on square footage, potentially with a bonus component determined through a tournament system. In many cases, such a compensation structure could create a more stable and predictable income stream for growers because there would be a guaranteed payment rate based on factor that does not change.

This final rule seeks to make targeted reforms based on the information and strategies available to AMS at this time. In this final rule, AMS does not purport to alleviate all potential unfair aspects of the tournament system or of the integrated model of broiler production in concentrated markets. AMS believes that general principles of unfairness prohibit an unlawful exercise of market power or bargaining power that injures growers, including by providing returns that are below a reasonable return. AMS does not, however, identify a strict framework that prescribes exactly how to ensure competitive compensation. Rather, at present, AMS will apply a case-by-case enforcement approach to protect growers from unfair and unlawful market power or bargaining that denies growers reasonable compensation. In conducting its analysis, AMS expects to rely heavily on the facts and circumstances, including but not limited to:

- Relative levels of market power (including the number of LPDs growers can contract with in a given geography, whether there is meaningful choice in

contracting practices among LPDs in a given locality, the extent to which risk or other unfair contract terms are shifted to growers, the extent to which contracts are meaningfully negotiated, etc.), and other differences in bargaining power between growers and relevant LPDs;

- The type and nature of the unfair conduct (e.g., express or tacit collusion via information sharing, the presence of express or implied no-poach agreements, whether the tournament system was being utilized in a manner to prevent growers from negotiating or securing competitive compensation, the LPD's treatment of days out and condemnation within the tournament system, etc.);

- What constitutes competitive pay for growout services, especially in geographies where more LPDs are present;

- The rates of payment under the contract; in particular, whether the base rate a grower can expect to receive for performing fully under the contract can ensure a reasonable return;

- The costs of providing growout services over the contract, including appropriately and reasonably measured labor costs;

- The levels of contractually guaranteed and otherwise relied upon flock placements and density;

- Whether the length of the contract and reliance expectations on renewal are sufficient to assure reasonable return;

- The inclusion of cost-of-living adjustments or opportunities to secure those adjustments in contract renewals; and

- Where additional capital investment is required, factors relevant to additional capital investment, including those set forth in § 201.216 and the information set forth as required under § 201.112.

AMS underscores that many growers face high levels of local market power or bargaining power by LPDs, exacerbated by hold-up concerns arising from high levels of investment and reliance on LPDs for critical inputs. Moreover, growers face limited opportunities to avoid take-it-or-leave-it terms from their LPDs, including cuts to flocks or nonrenewals of contracts. In general, AMS expects this enforcement approach will, in practice, reinforce the principle that an LPD must provide a reasonable opportunity for a grower that delivers under the contract to earn a reasonable return over the life of the contract if they comply generally with the specified production practices.

AMS appreciates the commenters' interest in further enhancing transparency. AMS notes that this final

rule increases transparency for growers around rates of compensation (§ 201.106) and additional capital investments (§ 201.112), and also sets more fair standards around, and enhances transparency into, LPD practices relating to input and production practice distribution. It also complements other regulatory initiatives that AMS has already finalized to provide transparency around contracting and input distribution (88 FR 83210, November 28, 2023). AMS intends now to turn its focus to the important task of monitoring the implementation of existing mandates to evaluate the remaining gaps and needs.

AMS also appreciates grower comments around the challenges that debt burdens place on growers and on the importance of more fairly sharing the burden of market fluctuations or unforeseen events. A central purpose of § 201.112 is to enhance the information available to growers and to AMS to ensure the fairness of additional capital investments, and therefore LPDs' accountability, under § 201.216 and section 202 of the Act. For example, an LPD's failure to ensure the reasonable ability for a grower to recoup the cost of a required (including ostensibly requested but in practice coerced) additional capital investment would, on its own, be dispositive to show a violation of § 201.216. AMS recognizes that growers cannot avoid the unfair exercise of market power. Failing to sufficiently and fairly compensate growers is not a cognizable benefit to growers or to competition. (AMS's approach is discussed below in section V.C.ii., "Additional capital investment unfairness.")

With respect to new housing, as opposed to additional capital investments, AMS has also separately finalized the *Transparency in Poultry Grower Contracting and Tournaments* (Transparency Rule) rule that provides significantly enhanced transparency over the preexisting system.³⁷ As described in the Transparency Rule, these disclosures include returns broken out by quintile and other information delivered in a disclosure document when the grower receives any housing specifications and would be contemplating making additional investments. AMS expects to monitor the implementation of that rule and would, for example, examine circumstances where the disclosures were deceptive or misleading relating to securing the new grower's commitment to invest in housing.

³⁷ 88 FR 83210, November 28, 2023.

iv. Transition and Implementation

Comment: AMS asked what risks growers and/or LPDs might face during any transition to the proposed § 201.106. Concerns about transition and implementation risks for growers and LPDs centered on potential shifts in the market power dynamics and the administrative compliance burdens. Some commenters, especially grower advocates, farmers' coalitions, and legal institutions, were concerned about the potential for LPDs to exploit the new regulations by arbitrarily lowering base pay rates. They argued that this could undermine the intended fairness that the rule aims to achieve and called for explicit prohibitions against such practices.

A governmental commenter suggested that, for the duration of a reasonable transition period, USDA require that current payments remain overall comparable, so that LPDs cannot arbitrarily lower grower base pay or overall compensation during the transition period or impose other unfair contract terms. This commenter also suggested that USDA require that modified contracts have, at a minimum, the same length as the period covered by the grower's initial contract.

Advocacy associations urged USDA to closely monitor the industry's transition and establish fair minimum rates that are not lower than the average pay under the current comparison system. To minimize transition risks to growers, one advocacy association noted that AMS should not require submission of all contracts that are modified to comply with new § 201.106, in order to avoid a bottleneck in contract negotiations. Instead, they recommend that AMS require LPDs to submit representative contracts that show how they are calculating a fair base pay. The commenter also suggested an accountability mechanism rather than a pre-approval process so that LPDs can deliver to AMS the information necessary for the Agency to determine whether contract modifications are happening in compliance with § 201.106 and the Act.

Another advocacy association urged AMS to presume undue buyer power exists whenever an LPD offers a grower in debt a contract that, based on the minimum income possible from the contract's guaranteed flock placements, stocking density, and firm base price, does not give the grower enough income to pay off their debt. The commenter also stated that AMS should include a requirement that LPDs submit to AMS for review any contracts modified or revised to comply with new § 201.106

and should also require all LPDs to submit compensation data for review. This data can be used as a basis for requiring all integrators to offer base prices that rise to a truly competitive level, and that are consistent with grower cash flow and loan servicing expectations under original contracts.

AMS response: In response to these concerns, AMS is adding paragraph (c) to the final rule, so that if an LPD modifies a contract and reduces aggregate compensation to growers,³⁸ the LPD must submit notice of the change to AMS and include copies of the original contract and new contract, as well as any related Disclosure Documents. AMS can then adequately assess that reductions in aggregate grower compensation does not violate section 202 of the Act. Aggregate compensation enables sufficient flexibility for LPDs to adjust supply and deliveries based on changing market conditions. In any case, AMS regularly conducts compliance reviews of LPDs.

AMS has also considered the concerns that industry stakeholders have presented regarding the importance of LPDs having the ability to adjust payment to maintain a functioning market. This regulation allows for reductions to compensation that do not otherwise violate section 202 of the P&S Act. The LPDs are required to submit the prior contract, the new contract, and any Disclosure Documents related thereto. This is not a time-consuming or costly requirement as this information is already readily available to LPDs. It also does not stifle innovation as it does not impact novel contracting practices so long as they are fair and not deceptive. The regulation does not prevent contracts from being updated; it only requires a minimum level of review to ensure that the changes are not unfair or deceptive.

AMS is not, at this time, specifically requiring that modified contracts have, at a minimum, the same length as the period covered by the grower's initial contract. Instead, AMS is focusing on ensuring the grower compensation in aggregate remain unchanged for the initial period of compliance, as AMS views that factor as being at greater risk of immediate, unavoidable abuse from LPDs than the length of contract per se.

v. Benefit, Burden, and Cost

Comment: Several commenters emphasized the need for safeguards against LPDs leveraging their market power or bargaining power to offset any

losses incurred due to the rule. They argued that such protections are needed to ensure fair compensation for growers. On the other hand, industry stakeholders were concerned about the administrative burden of compliance. Processor commenters were opposed to submitting revised contracts and compensation data to USDA on the grounds that it is unnecessary and could lead to delays and increased costs and stifle innovation in contract structures. They argued that allowing LPDs to adjust base pay rates, within reason, is necessary to maintain a functioning market. An industry commenter stated the rule would require renegotiation of thousands of grower contracts, a potentially disruptive and costly process. The commenter pointed to the potential for uncertainty, economic risk, and nullification of lawful contracts.

AMS response: AMS acknowledges that this regulation would require renegotiation of many existing grower contracts. Due to sunk capital costs and thin margins, poultry growers are generally at a distinct disadvantage in the face of contract renegotiation and renewal. As explained in this final rule, however, AMS has determined the current structure of many contracts is unfair and deceptive and therefore unlawful under the Act. AMS is providing an extended effective date for the provisions of this final rule to provide additional time for LPDs and growers to modify contracts or otherwise renew under a new, legally compliant system. In addition, AMS recognizes that growers may be at risk of unfairness during any transition period and, accordingly, is adopting a transition requirement for LPDs to submit contracts upon modification or renewal if those contract changes result in decreased grower compensation. This requirement is designed to enable a smooth transition to the new system. AMS review will not delay contracts, as AMS will not be approving the contracts under § 201.106(c), but rather will be identifying unfair practices and potentially commencing enforcement. AMS's purpose is, as commenters urged, to safeguard growers against LPDs leveraging their market power to offset any costs they incur due to the rule's fairer and less deceptive approach to payment systems.

AMS rejects the view that this rule would stifle innovation in contract structures. It provides a small number of basic safeguards for the protection of growers, but otherwise does not dictate the specific manner in which LPDs compensate growers for their services. AMS is aware of a wide variation of existing contractual approaches to

compensation which would remain permissible under this final rule. For example, some contracts compensate on a per pound base rate while others use a square footage contract for base payments or a combination. Performance pay will still be permitted at an appropriate magnitude, and LPDs may continue to use a range of approaches for comparison-based pay, including flock-by-flock comparisons or longer rolling averages as some contracts currently do.

LPDs are also free to adjust base pay rates upwards based on grouping, ranking or comparison, which aligns with some industry views that the tournament system, within reason, is necessary to maintain a functioning market. LPDs can also continue to deduct growers' payment for noncompliance with contractual requirements, provided it is not based on the outcomes of the tournament.

B. Section 201.110

i. Input Variability

Comment: Overall, commenters broadly agreed that input variability poses a significant challenge to fair grower compensation within performance-based payment systems. While commenters acknowledged the difficulty of controlling certain inputs such as chick quality, stakeholders disagreed on the degree of control and intentionality surrounding input variability. Generally, growers pointed to examples of inconsistencies that impacted their performance, including inconsistencies in chick quality and hen age, which suggest a lack of control and potential for unfair outcomes. Industry commenters emphasized the challenges of controlling the inputs, such as chick quality, countering that they also lack control over certain inputs, particularly when ordered in bulk, which would make intentional manipulation difficult. One commenter challenged the assumption that input variability is intentional, controllable, and material, and asserted that USDA lacked evidence to prove the assumptions.

Regarding the impact of input variability on grower performance and fairness, commenters argued that since growers have limited control over key inputs (e.g., chick quality, feed delivery, or disease management), basing payments on performance relative to these inputs is inherently unfair. They emphasized that settlement outcomes under these conditions do not accurately reflect grower management skills or effort. Other commenters expressed concern that excessive variability in inputs such as chick

³⁸ Defined as "less than the prior annual-calendar year's complex-wide average gross payment to the grower."

health, feed delivery, and flock pickup within a settlement group creates significant financial risk for growers, especially over multiple flocks.

Industry stakeholders argued that requiring LPDs to control all input variations is impractical and could lead to inflexible systems that ultimately harm growers.

AMS response: AMS has gathered significant evidence from poultry growers that input variability in poultry tournaments can lead to unfair comparisons, and lead to inappropriate burdening of risk onto growers. AMS does not need to find that input and production practice variability is intentional, fully controllable, or material in all instances by the LPD to reach the conclusion, based on academic evidence, regulatory experience, and complaints from growers, that it exists and can and should be mitigated by LPDs. AMS has identified at least the following differences that may affect grower performance: breed,³⁹ bird sex,⁴⁰ breeder stock age,⁴¹ stocking density,⁴²

consistency of feed availability,⁴³ and the type and administration of veterinary medicines.⁴⁴ AMS also notes that chick genetics are currently proprietary and largely controlled by two companies, one of which is owned by one of the nation's largest LPDs.⁴⁵

This rule aims to set conditions on performance-based payment systems in contract poultry growing such that poultry growers are compared based on factors under their control. When poultry companies take appropriate measures, as prescribed in this rule to ensure a fair comparison, then contract poultry growing reduces a significant amount of risk to growers because the LPD provides the inputs.

The purpose of this rule is to establish a framework for fair comparisons to prevent unfair and deceptive practices that reduce pay. To the extent that input variability is creating unfairness, the rule requires LPDs to mitigate the impacts of input variability on the comparison. AMS recognizes that LPDs have an incentive to get full economic value of less productive chicks. Yet it is incumbent upon them under the Packers and Stockyards Act—and this rule's explicit duty of fair comparison—to structure their comparison-based compensation system to make a fair comparison among growers. Input differences should not be a significant variable over time in the determination of grower compensation. As commenters noted, excessive variability in input quality, timing, and flock pickup can cause significant harm to growers, hence the inclusion of explicit duties imposed on LPDs in this rule with respect to the design and operation of comparison-based poultry compensation schemes. Furthermore, LPDs must institute a non-comparison-based system when it is impossible for the LPD to conduct a fair comparison due to extenuating circumstances.

ii. Application, Material Difference, and Non-Comparison Method

Comment: While there was broad agreement on the importance of fair compensation for all growers, some commenters expressed concern about the rule's practicality, administrative burdens, and potential confusion regarding the definition of "material differences in performance." Commenters, especially farmers' coalitions and advocacy groups, endorsed the duty of fair comparison, viewing it as a key step toward ensuring equitable treatment for growers operating outside of tournament systems. They emphasized the need for transparent, data-driven mechanisms that guarantee fair compensation regardless of payment model.

Commenters both in support of and in opposition to the proposed rule requested further clarity for the definition of "material differences in performance" so that growers know when they have suffered a specific prohibited harm and can confidently request an investigation. Commenters also favored a presumption of unfairness rather than a material threshold for change in pay. One commenter asserted that any material or numeric threshold for change in pay would be inappropriate, and that AMS should establish the presumption that providing unequal inputs to growers within the same settlement group is material to grower performance, and another commenter advocated for the use of a presumption to provide greater clarity and notify growers of problems to be addressed.
