The PCoD model identifies the types of data that would be needed to assess population-level impacts. These data are lacking for many marine mammal species (Booth *et al.,* 2020). Southall *et al.* (2021) states that future modeling and population simulation studies can help determine population-wide long-term consequences and impact analysis. However, the method to do so is still developing, as there are gaps in the literature, possible sampling biases, and results are rarely ground-truthed, with a few exceptions (Booth *et al.,* 2022; Schwarz *et al.,* 2022). Nowacek *et al.* (2016) reviewed technologies such as passive acoustic monitoring, tagging, and the use of unmanned aerial vehicles which can improve scientists' abilities to study these model inputs and link behavioral changes to individual life functions and ultimately population-level effects. Relevant data needed for improving analyses of population-level consequences resulting from disturbances will continue to be collected during the 7-year period of the LOAs through projects funded by the Navy's Marine Species Monitoring Program. Multiple case studies across marine mammal taxonomic groups have been conducted following the PCoD framework. From these studies, Keen *et al.* (2021) identified themes and contextual factors relevant to assessing impacts to populations due to disturbance, which have been considered in the context of the impacts of the Action Proponents' activities.

A population's movement ecology determines the potential for spatiotemporal overlap with a disturbance. Resident populations or populations that rely on spatially limited habitats for critical life functions (*i.e.,* foraging, breeding) would be at greater risk of repeated or chronic exposure to disturbances than populations that are wide-ranging relative to the footprint of a disturbance (Keen *et al.,* 2021). Even for the same species, differences in habitat use between populations can result in different potential for repeated exposure to individuals for a similar stressor (Costa *et al.,* 2016a). The location and radius of disturbance can impact how many animals are exposed and for how long (Costa *et al.,* 2016b). While some models have shown the advantages of populations with larger ranges, namely the decreased chance of being exposed (Costa *et al.,* 2016b), it's important to consider that for some species, the energetic cost of a longer migration could make a population more sensitive to energy lost through disturbance (Villegas-Amtmann *et al.,* 2017). In addition to ranging patterns, a species' activity budgets and lunging rates can cause variability in their predicted cost of disturbance as well (Pirotta *et al.,* 2021).

Bioenergetics frameworks that examine the impact of foraging disruption on body reserves of individual whales found that rates of daily foraging disruption can predict the number of days to terminal starvation for various life stages (Farmer *et al.,* 2018b). Similarly, when a population is displaced by a stressor, and only has access to areas of poor habitat quality (*i.e.,* low prey abundance) for relocation, bioenergetic models may be more likely to predict starvation, longer recovery times, or extinction (Hin *et al.,* 2023). There is some debate over the use of blubber thickness as a metric of cetacean energy stores and health, as marine mammals may not use their fat stores in a similar manner to terrestrial mammals (Derous *et al.,* 2020).

Resource limitation can impact marine mammal population growth rate regardless of additional anthropogenic disturbance. Stochastic Dynamic Programming models have been used to explore the impact declining prey species has on focal marine mammal predators (McHuron *et al.,* 2023a; McHuron *et al.,* 2023b). A Stochastic Dynamic Programming model determined that a decrease in walleye pollock (*Gadus chalcogrammus*) availability increased the time and distance northern fur seal mothers had to travel offshore, which negatively impacted pup growth rate and wean mass, despite attempts to compensate with longer recovery time on land (McHuron *et al.,* 2023b). Prey is an important factor in long-term consequence models for many species of marine mammals. In disturbance models that predict habitat displacement or otherwise reduced foraging opportunities, populations are being deprived of energy dense prey or ''high quality'' areas which can lead to long-term impacts on fecundity and survival (Czapanskiy *et al.,* 2021; Hin *et al.,* 2019; McHuron *et al.,* 2023a; New *et al.,* 2013b). Prey density limits the energy available for growth, reproduction, and survival. Some disturbance models indicate that the immediate decrease in a portion of the population (*e.g.,* young lactating mothers) is not necessarily detrimental to a population, since as a result, prey availability increases and the population's overall improved body condition reduces the age at first calf (Hin *et al.,* 2021). The timing of a disturbance with seasonally available resources is also important; if a disturbance occurs during periods of low resource availability, the population-level consequences are greater and occur faster than if the disturbance occurs during periods when resource levels are high (Hin *et al.,* 2019). Further, when resources are not evenly distributed, populations with cautious strategies and knowledge of resource variation have an advantage (Pirotta *et al.,* 2020).

Even when modeled alongside several anthropogenic sources of disturbance (*e.g.,* vessel strike, vessel noise, chemical contaminants, sonar), several species of marine mammals are most influenced by lack of prey (Czapanskiy *et al.,* 2021; Murray *et al.,* 2021). Some species like killer whales are especially sensitive to prey abundance due to their limited diet (Murray *et al.,* 2021). The short-term energetic cost of eleven species of cetaceans and mysticetes exposed to mid-frequency active sonar was influenced more by lost foraging opportunities than increased locomotor effort during avoidance (Czapanskiy *et al.,* 2021). Additionally, the model found that mysticetes incurred more energetic cost than odontocetes, even during mild behavioral responses to sonar. These results may be useful in the development of future Population Consequences of Multiple Stressors and PCoD models since they should seek to qualify cetacean health in a more ecologically relevant manner.

PCoD models have been used to assess the impacts of multiple and recurring stressors. A marine mammal population that is already subject to chronic stressors will likely be more vulnerable to acute disturbances. Models that have looked at populations of cetaceans who are exposed to multiple stressors over several years have found that even one major chronic stressor (*e.g.,* epizootic disease, oil spill) has severe impacts on population size. A layer of one or more stressor (*e.g.,* seismic surveys) in addition to a chronic stressor (*e.g.,* an oil spill) can yield devastating impacts on a population. These results may vary based on species and location, as one population may be more impacted by chronic shipping noise, while another population may not. However, just because a population doesn't appear to be impacted by one chronic stressor (*e.g.,* shipping noise), does not mean they aren't affected by others (*e.g.,* disease) (Reed *et al.,* 2020). Recurring or chronic stressors can impact population abundance even when instances of disturbance are short and have minimal behavioral impact on

an individual (Farmer *et al.,* 2018a; McHuron *et al.,* 2018b; Pirotta *et al.,* 2019). Some changes to response variables like pup recruitment (survival to age one) are not noticeable for several years, as the impacts on pup survival does not affect the population until those pups are mature but impacts to young animals will ultimately lead to population-wide declines. The severity of the repeated disturbance can also impact a population's long-term reproductive success. Scenarios with severe repeated disturbance (*e.g.,* 95 percent probability of exposure, with 95 percent reduction in feeding efficiency) can severely reduce fecundity and calf survival, while a weaker disturbance (25 percent probability of exposure, with 25 percent reduction in feeding efficiency) had no population-wide effect on vital rates (Pirotta *et al.,* 2019).

Farmer *et al.* (2018a) modeled how an oil spill led to chronic declines in a sperm whale population over 10 years, and if models included even one more stressor (*i.e.,* behavioral responses to air guns), the population declined even further. However, the amount of additional population decline due to acoustic disturbance depended on the way the dose-response of the noise levels were modeled. A single step-function led to higher impacts than a function with multiple steps and frequency weighting. In addition, the amount of impact from both disturbances was mediated when the metric in the model that described animal resilience was changed to increase resilience to disturbance (*e.g.,* able to make up reserves through increased foraging).

Not all stressors have the same impact for all species and all locations. Another model analyzed the effect of a number of chronic disturbances on two bottlenose dolphin populations in Australia over 5 years (Reed *et al.,* 2020). Results indicated that disturbance from fisheries interactions and shipping noise had little overall impact on population abundances in either location, even in the most extreme impact scenarios modeled. At least in this area, other factors (*e.g.,* epizootic scenarios) had the largest impact on population size and fecundity.

Recurring stressors can impact population abundance even when individual instances of disturbance are short and have minimal behavioral impact on an individual. A model on California sea lions introduced a generalized disturbance at different times throughout the breeding cycle, with their behavior response being an increase in the duration of a foraging trip by the female (McHuron *et al.,* 2018b). Very short duration disturbances or responses led to little change, particularly if the disturbance was a single event, and changes in the timing of the event in the year had little effect. However, with even relatively short disturbances or mild responses, when a disturbance was modeled as recurring there were resulting reductions in population size and pup recruitment (survival to age one). Often, the effects weren't noticeable for several years, as the impacts on pup survival did not affect the population until those pups were mature.

Stranding and Mortality

The definition for a stranding under title IV of the MMPA is an event in the wild in which (A) a marine mammal is dead and is (i) on a beach or shore of the United States; or (ii) in waters under the jurisdiction of the United States (including any navigable waters); or (B) a marine mammal is alive and is (i) on a beach or shore of the United States and is unable to return to the water; (ii) on a beach or shore of the United States and, although able to return to the water, is in need of apparent medical attention; or (iii) in the waters under the jurisdiction of the United States (including any navigable waters), but is unable to return to its natural habitat under its own power or without assistance (see 16 U.S.C. 1421h(6)). This definition is useful for considering stranding events even when they occur beyond lands and waters under the jurisdiction of the United States.

Marine mammal strandings have been linked to a variety of causes, such as illness from exposure to infectious agents, biotoxins, or parasites; starvation; unusual oceanographic or weather events; or anthropogenic causes including fishery interaction, vessel strike, entrainment, entrapment, sound exposure, or combinations of these stressors sustained concurrently or in series. Historically, the cause or causes of most strandings have remained unknown (*e.g.,* Odell *et al.,* 1980), but the development of trained, professional stranding response networks and improved analyses have led to a greater understanding of marine mammal stranding causes (Simeone and Moore 2018).

Numerous studies suggest that the physiology, behavior, habitat, social relationships, age, or condition of cetaceans may cause them to strand or might predispose them to strand when exposed to another phenomenon. These suggestions are consistent with the conclusions of numerous other studies that have demonstrated that combinations of dissimilar stressors commonly combine to kill an animal or dramatically reduce its fitness, even though one exposure without the other does not produce the same result (Bernaldo de Quiros *et al.,* 2019; Chroussos, 2000; Creel, 2005 Fair and Becker, 2000; Foley *et al.,* 2001; Moberg, 2000; Relyea, 2005a; 2005b, Romero, 2004; Sih *et al.,* 2004).

Historically, stranding reporting and response efforts have been inconsistent, although significant improvements have occurred over the last 25 years. Reporting forms for basic (''Level A'') information, rehabilitation disposition, and human interaction have been standardized nationally are available at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/level-data-collection-marine-mammal-stranding-events.* However, data collected beyond basic information varies by region (and may vary from case to case) and are not standardized across the United States. Logistical conditions such as weather, time, location, and decomposition state may also affect the ability of the stranding network to thoroughly examine a specimen (Carretta *et al.,* 2023; Moore *et al.,* 2013). While the investigation of stranded animals provides insight into the types of threats marine mammal populations face, full investigations are only possible and conducted on a small fraction of the total number of strandings that occur, limiting our understanding of the causes of strandings (Carretta *et al.,* 2016a). Additionally, and due to the variability in effort and data collected, the ability to interpret long-term trends in stranded marine mammals is complicated.

In the United States from 2006–2022, there were 27,781 cetacean strandings and 79,572 pinniped strandings (107,353 total) (P. Onens, NMFS, *pers comm.,* 2024). Several mass strandings (strandings that involve two or more individuals of the same species, excluding a single mother-calf pair) that have occurred over the past two decades have been associated with anthropogenic activities that introduced sound into the marine environment such as naval operations and seismic surveys. An in-depth discussion of strandings can be found in appendix D of the 2024 HCTT Draft EIS/OEIS and in the Navy's Technical Report on Marine Mammal Strandings Associated with U.S. Navy Sonar Activities (U.S. Navy Marine Mammal Program and Space and Naval Warfare Systems Command Center Pacific, 2017b).

Worldwide, there have been several efforts to identify relationships between cetacean mass stranding events and

military active sonar (Cox *et al.,* 2006, Hildebrand, 2004; Taylor *et al.,* 2004). D'Amico *et al.* (2009) reviewed beaked whale stranding data compiled primarily from the published literature, which provides an incomplete record of stranding events, as many are not written up for publication, along with unpublished information from some regions of the world.

Most of the stranding events reviewed by the IWC involved beaked whales. A mass stranding of goose-beaked whales in the eastern Mediterranean Sea occurred in 1996 (Frantzis, 1998), and mass stranding events involving Gervais' beaked whales, Blainville's beaked whales, and goose-beaked whales occurred off the coast of the Canary Islands in the late 1980s (Simmonds and Lopez-Jurado, 1991). The stranding events that occurred in the Canary Islands and Kyparissiakos Gulf in the late 1990s and the Bahamas in 2000 have been the most intensively-studied mass stranding events and have been associated with naval maneuvers involving the use of tactical sonar. Other cetacean species with naval sonar implicated in stranding events include harbor porpoise (Norman *et al.,* 2004, Wright *et al.,* 2013) and common dolphin (Jepson *et al.,* 2013).

Strandings Associated With Active Sonar

Over the past 21 years, there have been 5 stranding events coincident with naval MFAS use in which exposure to sonar is believed to have been a contributing factor: Greece (1996); the Bahamas (2000); Madeira (2000); Canary Islands (2002); and Spain (2006) (Cox *et al.,* 2006; Fernandez, 2006; U.S. Navy Marine Mammal Program and Space and Naval Warfare Systems Command Center Pacific, 2017). These five mass strandings have resulted in about 40 known cetacean deaths consisting mostly of beaked whales and with close linkages to MFAS activity. In these circumstances, exposure to non-impulsive acoustic energy was considered a potential indirect cause of death of the marine mammals (Cox *et al.,* 2006). Only one of these stranding events, the Bahamas (2000), was associated with exercises conducted by the U.S. Navy. Additionally, in 2004, during the RIMPAC exercises, between 150 and 200 usually pelagic melon-headed whales occupied the shallow waters of Hanalei Bay, Kaua'i, Hawaii for over 28 hours. NMFS determined that MFAS was a plausible, if not likely, contributing factor in what may have been a confluence of events that led to the Hanalei Bay stranding. A number of other stranding events coincident with the operation of MFAS, including the death of beaked whales or other species (*i.e.,* minke whales, dwarf sperm whales, pilot whales), have been reported; however, the majority have not been investigated to the degree necessary to determine the cause of the stranding. Most recently, the Independent Scientific Review Panel investigating potential contributing factors to a 2008 mass stranding of melon-headed whales in Antsohihy, Madagascar released its final report suggesting that the stranding was likely initially triggered by an industry seismic survey (Southall *et al.,* 2013). This report suggests that the operation of a commercial high-powered 12 kHz multibeam echosounder during an industry seismic survey was a plausible and likely initial trigger that caused a large group of melon-headed whales to leave their typical habitat and then ultimately strand as a result of secondary factors such as malnourishment and dehydration. The report indicates that the risk of this particular convergence of factors and ultimate outcome is likely very low but recommends that the potential be considered in environmental planning. Because of the association between tactical MFAS use and a limited number of marine mammal strandings, the Navy and NMFS have been considering and addressing the potential for strandings in association with Navy activities for years. In addition to the proposed mitigation measures intended to more broadly minimize impacts to marine mammals, the Navy will abide by the Notification and Reporting Plan, which sets out notification, reporting, and other requirements when dead, injured, or stranded marine mammals are detected in certain circumstances.

Greece (1996)—

Twelve goose-beaked whales stranded atypically (in both time and space) along a 23.7 mi (38.2 km) strand of the Kyparissiakos Gulf coast on May 12 and 13, 1996 (Frantzis, 1998). From May 11 through May 15, the North Atlantic Treaty Organization (NATO) research vessel Alliance was conducting sonar tests with signals of 600 Hz and 3 kHz and source levels of 228 and 226 dB re 1 µPa, respectively (D'Amico and Verboom, 1998; D'Spain *et al.,* 2006). The timing and location of the testing encompassed the time and location of the strandings (Frantzis, 1998).

Necropsies of eight of the animals were performed but were limited to basic external examination and sampling of stomach contents, blood, and skin. No ears or organs were collected, and no histological samples were preserved. No significant apparent abnormalities or wounds were found, however examination of photos of the animals, taken soon after their death, revealed that the eyes of at least four of the individuals were bleeding (Frantzis, 2004). Stomach contents contained the flesh of cephalopods, indicating that feeding had recently taken place (Frantzis, 1998).

All available information regarding the conditions associated with this stranding event was compiled, and many potential causes were examined including major pollution events, prominent tectonic activity, unusual physical or meteorological events, magnetic anomalies, epizootics, and conventional military activities (International Council for the Exploration of the Sea, 2005). However, none of these potential causes coincided in time or space with the mass stranding or could explain its characteristics (International Council for the Exploration of the Sea, 2005). The robust condition of the animals, plus the recent stomach contents, is inconsistent with pathogenic causes. In addition, environmental causes can be ruled out as there were no unusual environmental circumstances or events before or during this time period and within the general proximity (Frantzis, 2004).

Because of the rarity of this mass stranding of goose-beaked whales in the Kyparissiakos Gulf (first one in historical records), the probability for the two events (the military exercises and the strandings) to coincide in time and location, while being independent of each other, was thought to be extremely low (Frantzis, 1998). However, because full necropsies had not been conducted, and no abnormalities were noted, the cause of the strandings could not be precisely determined (Cox *et al.,* 2006). A Bioacoustics Panel convened by NATO concluded that the evidence available did not allow them to accept or reject sonar exposures as a causal agent in these stranding events. The analysis of this stranding event provided support for, but no clear evidence for, the cause-and-effect relationship of tactical sonar training activities and beaked whale strandings (Cox *et al.,* 2006).

Bahamas (2000)—

NMFS and the Navy prepared a joint report addressing the multi-species stranding in the Bahamas in 2000, which took place within 24 hours of U.S. Navy ships using MFAS as they passed through the Northeast and Northwest Providence Channels on March 15–16, 2000. The ships, which operated both AN/SQS–53C and AN/

SQS–56 sonar, moved through the channel while emitting pings approximately every 24 seconds. Of the 17 cetaceans that stranded over a 36-hour period (goose-beaked whales, Blainville's beaked whales, minke whales, and a spotted dolphin), 7 animals died on the beach (5 goose-beaked whales, 1 Blainville's beaked whale, and 1 spotted dolphin), while the other 10 were returned to the water alive (though their ultimate fate is unknown). As discussed in the Bahamas report (DOC/DON, 2001), there is no likely association between the minke whale and spotted dolphin strandings and the operation of MFAS.

Necropsies were performed on five of the stranded beaked whales. All five necropsied beaked whales were in good body condition, showing no signs of infection, disease, vessel strike, blunt trauma, or fishery related injuries, and three still had food remains in their stomachs. Auditory structural damage was discovered in four of the whales, specifically bloody effusions or hemorrhaging around the ears. Bilateral intracochlear and unilateral temporal region subarachnoid hemorrhage, with blood clots in the lateral ventricles, were found in two of the whales. Three of the whales had small hemorrhages in their acoustic fats (located along the jaw and in the melon).

A comprehensive investigation was conducted and all possible causes of the stranding event were considered, whether they seemed likely at the outset or not. Based on the way in which the strandings coincided with ongoing naval activity involving tactical MFAS use, in terms of both time and geography, the nature of the physiological effects experienced by the dead animals, and the absence of any other acoustic sources, the investigation team concluded that MFAS aboard U.S. Navy ships that were in use during the active sonar exercise in question were the most plausible source of this acoustic or impulse trauma to beaked whales. This sound source was active in a complex environment that included the presence of a surface duct, unusual and steep bathymetry, a constricted channel with limited egress, intensive use of multiple, active sonar units over an extended period of time, and the presence of beaked whales that appear to be sensitive to the frequencies produced by these active sonars. The investigation team concluded that the cause of this stranding event was the confluence of the Navy MFAS and these contributory factors working together and further recommended that the Navy avoid operating MFAS in situations where these five factors would be likely to occur. This report does not conclude that all five of these factors must be present for a stranding to occur, nor that beaked whales are the only species that could potentially be affected by the confluence of the other factors. Based on this, NMFS believes that the operation of MFAS in situations where surface ducts exist, or in marine environments defined by steep bathymetry and/or constricted channels may increase the likelihood of producing a sound field with the potential to cause cetaceans (especially beaked whales) to strand, and therefore, suggests the need for increased vigilance while operating MFAS in these areas, especially when beaked whales (or potentially other deep divers) are likely present.

Madeira, Portugal (2000)—

From May 10–14, 2000, three goose-beaked whales were found stranded on two islands in the Madeira Archipelago, Portugal (Cox *et al.,* 2006). A fourth animal was reported floating in the Madeiran waters by fisherman but did not come ashore (Ketten, 2005). Joint NATO amphibious training peacekeeping exercises involving participants from 17 countries and 80 warships, took place in Portugal during May 2–15, 2000.

The bodies of the three stranded whales were examined postmortem (Ketten, 2005), though only one of the stranded whales was fresh enough (24 hours after stranding) to be necropsied (Cox *et al.,* 2006). Results from the necropsy revealed evidence of hemorrhage and congestion in the right lung and both kidneys (Cox *et al.,* 2006). There was also evidence of intracochlear and intracranial hemorrhage similar to that which was observed in the whales that stranded in the Bahamas event (Cox *et al.,* 2006). There were no signs of blunt trauma, and no major fractures, and the cranial sinuses and airways were found to be clear with little or no fluid deposition, which may indicate good preservation of tissues (Woods Hole Oceanographic Institution, 2005).

Several observations on the Madeira stranded beaked whales, such as the pattern of injury to the auditory system, are the same as those observed in the Bahamas strandings. Blood in and around the eyes, kidney lesions, pleural hemorrhages, and congestion in the lungs are particularly consistent with the pathologies from the whales stranded in the Bahamas and are consistent with stress and pressure related trauma. The similarities in pathology and stranding patterns between these two events suggest that a similar pressure event may have precipitated or contributed to the strandings at both sites (Woods Hole Oceanographic Institution, 2005).

Even though no definitive causal link can be made between the stranding event and naval exercises, certain conditions may have existed in the exercise area that, in their aggregate, may have contributed to the marine mammal strandings (Freitas, 2004): Exercises were conducted in areas of at least 547 fathoms (1,000 m) depth near a shoreline where there is a rapid change in bathymetry on the order of 547 to 3,281 fathoms (1,000 to 6,000 m) occurring across a relatively short horizontal distance (Freitas, 2004); multiple ships were operating around Madeira, though it is not known if MFAS was used, and the specifics of the sound sources used are unknown (Cox *et al.,* 2006; Freitas, 2004); and exercises took place in an area surrounded by landmasses separated by less than 35 nmi (65 km) and at least 10 nmi (19 km) in length, or in an embayment. Exercises involving multiple ships employing MFAS near land may produce sound directed towards a channel or embayment that may cut off the lines of egress for marine mammals (Freitas, 2004).

Canary Islands, Spain (2002)—

The southeastern area within the Canary Islands is well known for aggregations of beaked whales due to its ocean depths of greater than 547 fathoms (1,000 m) within a few hundred meters of the coastline (Fernandez *et al.,* 2005). On September 24, 2002, 14 beaked whales were found stranded on Fuerteventura and Lanzarote Islands in the Canary Islands (International Council for Exploration of the Sea, 2005a). Seven whales died, while the remaining seven live whales were returned to deeper waters (Fernandez *et al.,* 2005). Four beaked whales were found stranded dead over the next three days either on the coast or floating offshore. These strandings occurred within close proximity of an international naval exercise that utilized MFAS and involved numerous surface warships and several submarines. Strandings began about four hours after the onset of MFAS activity (International Council for Exploration of the Sea, 2005a; Fernandez *et al.,* 2005).

Eight goose-beaked whales, one Blainville's beaked whale, and one Gervais' beaked whale were necropsied, six of them within 12 hours of stranding (Fernandez *et al.,* 2005). No pathogenic bacteria were isolated from the carcasses (Jepson *et al.,* 2003). The animals displayed severe vascular congestion and hemorrhage especially around the

tissues in the jaw, ears, brain, and kidneys, displaying marked disseminated microvascular hemorrhages associated with widespread fat emboli (Jepson *et al.,* 2003; International Council for Exploration of the Sea, 2005a). Several organs contained intravascular bubbles, although definitive evidence of gas embolism in vivo is difficult to determine after death (Jepson *et al.,* 2003). The livers of the necropsied animals were the most consistently affected organ, which contained macroscopic gas-filled cavities and had variable degrees of fibrotic encapsulation. In some animals, cavitary lesions had extensively replaced the normal tissue (Jepson *et al.,* 2003). Stomachs contained a large amount of fresh and undigested contents, suggesting a rapid onset of disease and death (Fernandez *et al.,* 2005). Head and neck lymph nodes were enlarged and congested, and parasites were found in the kidneys of all animals (Fernandez *et al.,* 2005).

The association of NATO MFAS use close in space and time to the beaked whale strandings, and the similarity between this stranding event and previous beaked whale mass strandings coincident with sonar use, suggests that a similar scenario and causative mechanism of stranding may be shared between the events. Beaked whales stranded in this event demonstrated brain and auditory system injuries, hemorrhages, and congestion in multiple organs, similar to the pathological findings of the Bahamas and Madeira stranding events. In addition, the necropsy results of the Canary Islands stranding event lead to the hypothesis that the presence of disseminated and widespread gas bubbles and fat emboli were indicative of nitrogen bubble formation, similar to what might be expected in decompression sickness (Jepson *et al.,* 2003; Fernández *et al.,* 2005).

Hanalei Bay (2004)—

On July 3 and 4, 2004, approximately 150 to 200 melon-headed whales occupied the shallow waters of Hanalei Bay, Kauaʻi, Hawaii for over 28 hours. Attendees of a canoe blessing observed the animals entering Hanalei Bay in a single wave formation at 7 a.m. on July 3, 2004. The animals were observed moving back into the shore from the mouth of the Bay at 9 a.m. The usually pelagic animals milled in the shallow bay and were returned to deeper water with human assistance beginning at 9:30 a.m. on July 4, 2004, and were out of sight by 10:30 a.m.

Only one animal, a calf, was known to have died following this event. The animal was noted alive and alone in Hanalei Bay on the afternoon of July 4, 2004, and was found dead in Hanalei Bay the morning of July 5, 2004. A full necropsy, magnetic resonance imaging, and computerized tomography examination were performed on the calf to determine the manner and cause of death. The combination of imaging, necropsy and histological analyses found no evidence of infectious, internal traumatic, congenital, or toxic factors. Cause of death could not be definitively determined, but it is likely that maternal separation, poor nutritional condition, and dehydration contributed to the final demise of the animal. Although it is not known when the calf was separated from its mother, the animals' movement into Hanalei Bay and subsequent milling and re-grouping may have contributed to the separation or lack of nursing, especially if the maternal bond was weak or this was an inexperienced mother with her first calf.

Environmental factors, abiotic and biotic, were analyzed for any anomalous occurrences that would have contributed to the animals entering and remaining in Hanalei Bay. The Bay's bathymetry is similar to many other sites within the Hawaiian Island chain and dissimilar to sites that have been associated with mass strandings in other parts of the United States. The weather conditions appeared to be normal for that time of year with no fronts or other significant features noted. There was no evidence of unusual distribution, occurrence of predator or prey species, or unusual harmful algal blooms, although Mobley (2007) suggested that the full moon cycle that occurred at that time may have influenced a run of squid into the Bay. Weather patterns and bathymetry that have been associated with mass strandings elsewhere were not found to occur in this instance.

The Hanalei Bay event was spatially and temporally correlated with RIMPAC. Official sonar training and tracking exercises in the PMRF warning area did not commence until approximately 8 a.m. on July 3 and were thus ruled out as a possible trigger for the initial movement into the bay. However, six naval surface vessels transiting to the operational area on July 2 intermittently transmitted active sonar (for approximately 9 hours total from 1:15 p.m. to 12:30 a.m.) as they approached from the south. The potential for these transmissions to have triggered the whales' movement into Hanalei Bay was investigated. Analyses with the information available indicated that animals to the south and east of Kauaʻi could have detected active sonar transmissions on July 2 and reached Hanalei Bay on or before 7 a.m. on July 3. However, data limitations regarding the position of the whales prior to their arrival in Hanalei Bay, the magnitude of sonar exposure, behavioral responses of melon-headed whales to acoustic stimuli, and other possible relevant factors preclude a conclusive finding regarding the role of sonar in triggering this event. Propagation modeling suggests that transmissions from sonar use during the July 3 exercise in the PMRF warning area may have been detectable at the mouth of the Hanalei Bay. If the animals responded negatively to these signals, it may have contributed to their continued presence in Hanalei Bay. The U.S. Navy ceased all active sonar transmissions during exercises in this range on the afternoon of July 3. Subsequent to the cessation of sonar use, the animals were herded out of Hanalei Bay.

While causation of this stranding event may never be unequivocally determined, NMFS considers the active sonar transmissions of July 2–3, 2004 a plausible, if not likely, contributing factor in what may have been a confluence of events. This conclusion is based on the following: (1) the evidently anomalous nature of the stranding; (2) its close spatiotemporal correlation with wide-scale, sustained use of sonar systems previously associated with stranding of deep-diving marine mammals; (3) the directed movement of two groups of transmitting vessels toward the southeast and southwest coast of Kauaʻi; (4) the results of acoustic propagation modeling and an analysis of possible animal transit times to the bay; and (5) the absence of any other compelling causative explanation. The initiation and persistence of this event may have resulted from an interaction of biological and physical factors. The biological factors may have included the presence of an apparently uncommon, deep-diving cetacean species (and possibly an offshore, non-resident group), social interactions among the animals before or after they entered the Bay, and/or unknown predator or prey conditions. The physical factors may have included the presence of nearby deep water, multiple vessels transiting in a directed manner while transmitting active sonar over a sustained period, the presence of surface sound ducting conditions, and/or intermittent and random human interactions while the animals were in Hanalei Bay.

A separate event involving melon-headed whales and rough-toothed dolphins took place over the same period of time in the Northern Mariana

Islands (Jefferson *et al.,* 2006), which is several thousand miles from Hawaii. Some 500 to 700 melon-headed whales came into Sasanhaya Bay on July 4, 2004, near the island of Rota and then left of their own accord after 5.5 hours; no known active sonar transmissions occurred in the vicinity of that event. The Rota incident led to scientific debate regarding what, if any, relationship the event had to the simultaneous events in Hawaii and whether they might be related by some common factor (*e.g.,* there was a full moon on July 2, 2004, as well as during other melon-headed whale strandings and nearshore aggregations (Brownell *et al.,* 2009; Lignon *et al.,* 2007; Mobley, 2007). Brownell *et al.* (2009) compared the two incidents, along with one other stranding incident at Nuka Hiva in French Polynesia and normal resting behaviors observed at Palmyra Island, in regard to physical features in the areas, melon-headed whale behavior, and lunar cycles. Brownell *et al.,* (2009) concluded that the rapid entry of the whales into Hanalei Bay, their movement into very shallow water far from the 328-ft (100-m) contour, their milling behavior (typical pre-stranding behavior), and their reluctance to leave the bay constituted an unusual event that was not similar to the events that occurred at Rota, which appear to be similar to observations of melon-headed whales resting normally at Palmyra Island. Additionally, there was no correlation between lunar cycle and the types of behaviors observed in the Brownell *et al.* (2009) examples.

Spain (2006)—

The Spanish Cetacean Society reported an atypical mass stranding of four beaked whales that occurred January 26, 2006, on the southeast coast of Spain, near Mojácar (Gulf of Vera) in the Western Mediterranean Sea. According to the report, two of the whales were discovered the evening of January 26 and were found to be still alive. Two other whales were discovered during the day on January 27 but had already died. The first three animals were located near the town of Mojácar and the fourth animal was found dead, a few kilometers north of the first three animals. From January 25–26, 2006, Standing NATO Response Force Maritime Group Two (five of seven ships including one U.S. ship under NATO Operational Control) had conducted active sonar training against a Spanish submarine within 50 nmi (93 km) of the stranding site.

Veterinary pathologists necropsied the two male and two female goose-beaked whales. According to the pathologists, the most likely primary cause of this type of beaked whale mass stranding event was anthropogenic acoustic activities, most probably anti-submarine MFAS used during the military naval exercises. However, no positive acoustic link was established as a direct cause of the stranding. Even though no causal link can be made between the stranding event and naval exercises, certain conditions may have existed in the exercise area that, in their aggregate, may have contributed to the marine mammal strandings (Freitas, 2004). Exercises were conducted in areas of at least 547 fathoms (1,000 m) depth near a shoreline where there is a rapid change in bathymetry on the order of 547 to 3,281 fathoms (1,000 to 6,000 m) occurring across a relatively short horizontal distance (Freitas, 2004). Multiple ships (in this instance, five) were operating MFAS in the same area over extended periods of time (in this case, 20 hours) in close proximity; and exercises took place in an area surrounded by landmasses, or in an embayment. Exercises involving multiple ships employing MFAS near land may have produced sound directed towards a channel or embayment that may have cut off the lines of egress for the affected marine mammals (Freitas, 2004).

Honaunau Bay (2022)—

On March 25, 2022, a beaked whale (species unknown) stranded in Honaunau Bay, Hawaii. The animal was observed swimming into shore and over rocks. Bystanders intervened to turn the animal off of the rocks, and it swam back out of Honaunau Bay on its own. Locals reported hearing a siren or alarm type of sound underwater on the same day, and a Navy vessel was observed from shore on the following day. The Navy confirmed it used CAS within 27 nmi (50 km) and 48 hours of the time of stranding, though the stranding has not been definitively linked to the Navy's CAS use, and there is no evidence to determine whether the animal had any further short- or long-term effects.

Behaviorally Mediated Responses to MFAS That May Lead to Stranding

Although the confluence of Navy MFAS with the other contributory factors noted in the 2001 NMFS/Navy joint report was identified as the cause of the 2000 Bahamas stranding event, the specific mechanisms that led to that stranding (or the others) are not well understood, and there is uncertainty regarding the ordering of effects that led to the stranding. It is unclear whether beaked whales were directly injured by sound (*e.g.,* acoustically mediated bubble growth, as addressed above) prior to stranding or whether a behavioral response to sound occurred that ultimately caused the beaked whales to be injured and strand.

Although causal relationships between beaked whale stranding events and active sonar remain unknown, several authors have hypothesized that stranding events involving these species in the Bahamas and Canary Islands may have been triggered when the whales changed their dive behavior in a startled response to exposure to active sonar or to further avoid exposure (Cox *et al.,* 2006; Rommel *et al.,* 2006). These authors proposed three mechanisms by which the behavioral responses of beaked whales upon being exposed to active sonar might result in a stranding event. These include the following: gas bubble formation caused by excessively fast surfacing; remaining at the surface too long when tissues are supersaturated with nitrogen; or diving prematurely when extended time at the surface is necessary to eliminate excess nitrogen. More specifically, beaked whales that occur in deep waters that are in close proximity to shallow waters (for example, the ''canyon areas'' that are cited in the Bahamas stranding event; see D'Spain and D'Amico, 2006), may respond to active sonar by swimming into shallow waters to avoid further exposures and strand if they were not able to swim back to deeper waters. Second, beaked whales exposed to active sonar might alter their dive behavior. Changes in their dive behavior might cause them to remain at the surface or at depth for extended periods of time which could lead to hypoxia directly by increasing their oxygen demands or indirectly by increasing their energy expenditures (to remain at depth) and increase their oxygen demands as a result. If beaked whales are at depth when they detect a ping from an active sonar transmission and change their dive profile, this could lead to the formation of significant gas bubbles, which could damage multiple organs or interfere with normal physiological function (Cox *et al.,* 2006; Rommel *et al.,* 2006; Zimmer and Tyack, 2007). Baird *et al.* (2006) found that slow ascent rates from deep dives and long periods of time spent within 164 ft (50 m) of the surface were typical for both goose-beaked and Blainville's beaked whales, the two species involved in mass strandings related to naval sonar. These two behavioral mechanisms may be necessary to purge excessive dissolved nitrogen concentrated in their tissues during

their frequent long dives (Baird *et al.,* 2005). Baird *et al.* (2005) further suggests that abnormally rapid ascents or premature dives in response to high-intensity sonar could indirectly result in physical harm to the beaked whales, through the mechanisms described above (gas bubble formation or non-elimination of excess nitrogen). In a review of the previously published data on the potential impacts of sonar on beaked whales, Bernaldo de Quirós *et al.* (2019) suggested that the effect of MFAS on beaked whales varies among individuals or populations, and that predisposing conditions such as previous exposure to sonar and individual health risk factors may contribute to individual outcomes (*e.g.,* decompression sickness).

Because many species of marine mammals make repetitive and prolonged dives to great depths, it has long been assumed that marine mammals have evolved physiological mechanisms to protect against the effects of rapid and repeated decompressions. Although several investigators have identified physiological adaptations that may protect marine mammals against nitrogen gas supersaturation (*i.e.,* alveolar collapse and elective circulation; Kooyman *et al.,* 1972; Ridgway and Howard, 1979), Ridgway and Howard (1979) reported that bottlenose dolphins that were trained to dive repeatedly had muscle tissues that were substantially supersaturated with nitrogen gas. Houser *et al.* (2001b) used these data to model the accumulation of nitrogen gas within the muscle tissue of other marine mammal species and concluded that cetaceans that dive deep and have slow ascent or descent speeds would have tissues that are more supersaturated with nitrogen gas than other marine mammals. Based on these data, Cox *et al.* (2006) hypothesized that a critical dive sequence might make beaked whales more prone to stranding in response to acoustic exposures. The sequence began with (1) very deep (to depths as deep as 1.2 mi (2 km)) and long (as long as 90 minutes) foraging dives; (2) relatively slow, controlled ascents; and (3) a series of ''bounce'' dives between 328 and 1,312 ft (100 and 400 m) in depth (see Zimmer and Tyack, 2007). They concluded that acoustic exposures that disrupted any part of this dive sequence (for example, causing beaked whales to spend more time at surface without the bounce dives that are necessary to recover from the deep dive) could produce excessive levels of nitrogen supersaturation in their tissues, leading to gas bubble and emboli formation that produces pathologies similar to decompression sickness.

Zimmer and Tyack (2007) modeled nitrogen tension and bubble growth in several tissue compartments for several hypothetical dive profiles and concluded that repetitive shallow dives (defined as a dive where depth does not exceed the depth of alveolar collapse, approximately 236 ft (72 m) for goose-beaked whale), perhaps as a consequence of an extended avoidance response to sonar sound, could pose a risk for decompression sickness and that this risk should increase with the duration of the response. Their models also suggested that unrealistically rapid rates of ascent from normal dive behaviors are unlikely to result in supersaturation to the extent that bubble formation would be expected. Tyack *et al.* (2006) suggested that emboli observed in animals exposed to mid-frequency range sonar (Jepson *et al.,* 2003; Fernandez *et al.,* 2005) could stem from a behavioral response that involves repeated dives shallower than the depth of lung collapse. Given that nitrogen gas accumulation is a passive process (*i.e.,* nitrogen is metabolically inert), a bottlenose dolphin was trained to repetitively dive a profile predicted to elevate nitrogen saturation to the point that nitrogen bubble formation was predicted to occur. However, inspection of the vascular system of the dolphin via ultrasound did not demonstrate the formation of asymptomatic nitrogen gas bubbles (Houser *et al.,* 2010). Baird *et al.* (2008), in a beaked whale tagging study off Hawaii, showed that deep dives are equally common during day or night, but ''bounce dives'' are typically a daytime behavior, possibly associated with visual predator avoidance. This may indicate that ''bounce dives'' are associated with something other than behavioral regulation of dissolved nitrogen levels, which would be necessary day and night.

Additional predictive modeling conducted to date has been performed with many unknowns about the respiratory physiology of deep-diving breath-hold animals. For example, Denk *et al.* (2020) found intra-species differences in the compliance of tracheobronchial structures of post-mortem cetaceans and pinnipeds under diving hydrostatic pressures, which would affect depth of alveolar collapse. Although, as hypothesized by Garcia Parraga *et al.* (2018) and reviewed in Fahlman *et al.,* (2021), mechanisms may exist that allow marine mammals to create a pulmonary shunt without the need for hydrostatic pressure-induced lung collapse (*i.e.,* by varying perfusion to the lung independent of lung collapse and degree of ventilation). If such a mechanism exists, then assumptions in prior gas models require reconsideration, the degree of nitrogen gas accumulation associated with dive profiles needs to be re-evaluated, and behavioral responses potentially leading to a destabilization of the relationship between pulmonary ventilation and perfusion should be considered. Costidis and Rommel (2016) suggested that gas exchange may continue to occur across the tissues of air-filled sinuses in deep diving odontocetes below the depth of lung collapse if hydrostatic pressures are high enough to drive gas exchange across into non-capillary veins.

If marine mammals respond to an Action Proponent vessel that is transmitting active sonar in the same way that they might respond to a predator, their probability of flight responses could increase when they perceive that Action Proponent vessels are approaching them directly, because a direct approach may convey detection and intent to capture (Burger and Gochfeld, 1981, 1990; Cooper, 1997; Cooper, 1998). The probability of flight responses could also increase as received levels of active sonar increase (and the ship is, therefore, closer) and as ship speeds increase (that is, as approach speeds increase). For example, the probability of flight responses in ringed seals (Born *et al.,* 1999), Pacific brant (*Branta bernicla nigricans*) and Canada geese (*B. canadensis*) increased as a helicopter or fixed-wing aircraft approached groups of these animals more directly (Ward *et al.,* 1999). Bald eagles (*Haliaeetus leucocephalus*) perched on trees alongside a river were also more likely to flee from a paddle raft when their perches were closer to the river or were closer to the ground (Steidl and Anthony, 1996).

Despite the many theories involving bubble formation (both as a direct cause of injury (see Non-Auditory Injury section) and an indirect cause of stranding), Southall *et al.* (2007) summarizes that there is either scientific disagreement or a lack of information regarding each of the following important points: (1) received acoustical exposure conditions for animals involved in stranding events; (2) pathological interpretation of observed lesions in stranded marine mammals; (3) acoustic exposure conditions required to induce such physical trauma directly; (4) whether noise exposure may cause behavioral responses (*e.g.,* atypical diving behavior) that secondarily cause bubble formation and tissue damage; and (5) the extent the post mortem artifacts introduced by

decomposition before sampling, handling, freezing, or necropsy procedures affect interpretation of observed lesions.

Strandings Associated With Explosive Use

Silver Strand (2011)—

During a Navy training event on March 4, 2011, at the Silver Strand Training Complex in San Diego, California, three or possibly four dolphins were killed in an explosion. During an underwater detonation training event, a pod of 100 to 150 long-beaked common dolphins were observed moving towards the 700-yard (yd) (640.1-m) exclusion zone around the explosive charge, monitored by personnel in a safety boat and participants in a dive boat. Approximately 5 minutes remained on a time-delay fuse connected to a single 8.76 lb (3.97 kg) explosive charge (C–4 and detonation cord). Although the dive boat was placed between the pod and the explosive in an effort to guide the dolphins away from the area, that effort was unsuccessful and three long-beaked common dolphins near the explosion died. The Navy recovered those animals and transferred them to the local stranding network for necropsy. In addition to the three dolphins found dead on March 4, the remains of a fourth dolphin were discovered on March 7, 2011, near Oceanside, California (3 days later and approximately 42 mi (68 km) north of the detonation), which might also have been related to this event. Upon necropsy, all four animals were found to have sustained typical mammalian primary blast injuries (Danil and St. Leger, 2011). Association of the fourth stranding with the training event is uncertain because dolphins strand on a regular basis in the San Diego area. Details such as the dolphins' depth and distance from the explosive at the time of the detonation could not be estimated from the 250 yd (228.6 m) standoff point of the observers in the dive boat or the safety boat.

These dolphin mortalities are the only known occurrence of a Navy training or testing event involving impulsive energy (underwater detonation) that caused mortality or injury to a marine mammal. Despite this being a rare occurrence, the Navy reviewed training requirements, safety procedures, and possible mitigation measures and implemented changes to reduce the potential for this to occur in the future. Discussions of procedures associated with underwater explosives training and other training events are presented in the Proposed Mitigation Measures section.

Kyle of Durness, Scotland (2011)—

On July 22, 2011, a mass stranding event involving long-finned pilot whales occurred at Kyle of Durness, Scotland. An investigation by Brownlow *et al.* (2015) considered unexploded ordnance detonation activities at a Ministry of Defense bombing range, conducted by the Royal Navy prior to and during the strandings, as a plausible contributing factor in the mass stranding event. While Brownlow *et al.* (2015) concluded that the serial detonations of underwater ordnance were an influential factor in the mass stranding event (along with the presence of a potentially compromised animal and navigational error in a topographically complex region), they also suggest that mitigation measures—which included observations from a zodiac only and by personnel not experienced in marine mammal observation, among other deficiencies—were likely insufficient to assess if cetaceans were in the vicinity of the detonations. The authors also cite information from the Ministry of Defense indicating ''an extraordinarily high level of activity'' (*i.e.,* frequency and intensity of underwater explosions) on the range in the days leading up to the stranding.

Strandings on the Hawaii and California Coasts

Stranded marine mammals are reported along the Hawaii and California coasts each year. Marine mammals strand due to natural or anthropogenic causes, and the majority of reported type of occurrences in marine mammal strandings in this region include fishery interactions, illness, predation, and vessel strikes (Carretta *et al.,* 2024).

Potential Effects of Vessel Strike

Vessel strikes of marine mammals can result in death or serious injury of the animal. Wounds resulting from vessel strike may include massive trauma, hemorrhaging, broken bones, or propeller lacerations (Knowlton and Kraus, 2001). An animal at the surface could be struck directly by a vessel, a surfacing animal could hit the bottom of a vessel, or an animal just below the surface could be cut by a vessel's propeller. Superficial strikes may not kill or result in the death of the animal. Lethal interactions are typically associated with large whales, which are occasionally found draped across the bulbous bow of large commercial ships upon arrival in port. Although smaller cetaceans are more maneuverable in relation to large vessels than are large whales, they may also be susceptible to strike. The severity of injuries typically depends on the size and speed of the vessel (Knowlton and Kraus, 2001; Laist *et al.,* 2001; Vanderlaan and Taggart, 2007; Conn and Silber, 2013). Impact forces increase with speed, as does the probability of a strike at a given distance (Silber *et al.,* 2010; Gende *et al.,* 2011).

The most vulnerable marine mammals are those that spend extended periods of time at the surface in order to restore oxygen levels within their tissues after deep dives (*e.g.,* the sperm whale; Jaquet and Whitehead, 1996; Watkins *et al.,* 1999). In addition, some baleen whales seem generally unresponsive to vessel sound, making them more susceptible to vessel strikes (Nowacek *et al.,* 2004). These species are primarily large, slow moving whales. Marine mammal responses to vessels may include avoidance and changes in dive pattern (NRC, 2003).

Wounds resulting from vessel strike may include massive trauma, hemorrhaging, broken bones, or propeller lacerations (Knowlton and Kraus, 2001). An animal at the surface could be struck directly by a vessel, a surfacing animal could hit the bottom of a vessel, or an animal just below the surface could be cut by a vessel's propeller. Impact forces increase with speed as does the probability of a strike at a given distance (Silber *et al.,* 2010; Gende *et al.,* 2011). An examination of all known vessel strikes from all shipping sources (civilian and military) indicates vessel speed is a principal factor in whether a vessel strike results in death or serious injury (Knowlton and Kraus, 2001; Laist *et al.,* 2001; Jensen and Silber, 2003; Pace and Silber, 2005; Vanderlaan and Taggart, 2007). In assessing records in which vessel speed was known, Laist *et al.* (2001) found a direct relationship between the occurrence of a whale strike and the speed of the vessel involved in the collision. The authors concluded that most deaths occurred when a vessel was traveling in excess of 13 kn (24 km/hr).

Jensen and Silber (2003) detailed 292 records of known or probable vessel strikes of all large whale species from 1975 to 2002. Of these, vessel speed at the time of collision was reported for 58 cases. Of these 58 cases, 39 (or 67 percent) resulted in serious injury or death (19 of those resulted in serious injury as determined by blood in the water, propeller gashes, or severed tailstock, and fractured skull, jaw, vertebrae, hemorrhaging, massive bruising or other injuries noted during necropsy, and 20 resulted in death).

Operating speeds of vessels that struck various species of large whales ranged from 2 to 51 kn (3.7 to 94.5 km/hr). The majority (79 percent) of these strikes occurred at speeds of 13 kn (24 km/hr) or greater. The average speed that resulted in serious injury or death was 18.6 kn (34.4 km/hr). Pace and Silber (2005) found that the probability of death or serious injury increased rapidly with increasing vessel speed. Specifically, the predicted probability of serious injury or death increased from 45 to 75 percent as vessel speed increased from 10 to 14 kn (18.5 to 25.9 km/hr) and exceeded 90 percent at 17 kn (31.5 km/hr). Higher speeds during strikes result in greater force of impact and also appear to increase the chance of severe injuries or death. While modeling studies have suggested that hydrodynamic forces pulling whales toward the vessel hull increase with increasing speed (Clyne, 1999; Knowlton *et al.,* 1995), this is inconsistent with Silber *et al.* (2010), which demonstrated that there is no such relationship (*i.e.,* hydrodynamic forces are independent of speed).

In a separate study, Vanderlaan and Taggart (2007) analyzed the probability of lethal mortality of large whales at a given speed, showing that the greatest rate of change in the probability of a lethal injury to a large whale as a function of vessel speed occurs between 8.6 and 15 kn (15.9 and 27.8 km/hr). The chances of a lethal injury decline from approximately 80 percent at 15 kn to approximately 20 percent at 8.6 kn (15.9 km/hr). At speeds below 11.8 kn (21.9 km/hr), the chances of lethal injury drop below 50 percent, while the probability asymptotically increases toward 100 percent above 15 kn (27.8 km/hr). Garrison *et al.* (2025) reviewed and updated available data on whale-vessel interactions in U.S. waters to determine the effects of vessel speed and size on lethality of strikes of large whales and found vessel size class had a significant effect on the probability of lethality. Decreasing vessel speeds reduced the likelihood of a lethal outcome for all vessel size classes modeled, with the strongest effect for vessels less than 354 ft (108 m) long. Notably, the probability that a strike by a very large (*i.e.,* in length) vessel will be lethal exceeded 0.80 at all speeds greater than 5 kn (9.26 km/hr) (Garrison *et al.,* 2025).

The Jensen and Silber (2003) report notes that the database represents a minimum number of strikes, because the vast majority probably goes undetected or unreported. In contrast, Action Proponent vessels are likely to detect any strike that does occur because of the required personnel training and Lookouts (as described in the Proposed Mitigation Measures section), and they are required to report all vessel strikes involving marine mammals.

In the HCTT Study Area, commercial traffic is heaviest in the nearshore waters, near major ports and in the shipping lanes along the California coast and in Hawaii (specifically Honolulu), including a lane of high intensity farther off the California coast running northwest–southeast, which is a great circle route between the Panama Canal and Asia. Military vessel traffic is primarily concentrated in the waters off San Diego, CA, and the coasts of the Hawaiian islands, particularly south of O'ahu and east of Hawaii Island (Navy 2025, unpublished data).

In the SOCAL portion of the Study Area, the U.S. Navy has struck a total of 19 marine mammals in the 32-year period from 1993 through 2025, an average of just under one per year. The species struck include gray whale, humpback whale, blue whale, and either fin or sei whale, though for some strikes, the species could not be determined.

In the HRC portion of the Study Area, the Navy struck a total of five marine mammals in the 22-year period from 1993 through 2025, an average of zero to one strikes per year. The Coast Guard has had one known marine mammal strike in Hawaii, a humpback whale in 2020. Of the five Navy vessel strikes over the 22-year period in the HRC, all were reported as injuries. The vessel struck species include: one humpback whale in 1998, one unknown species and one humpback whale in 2003, one sperm whale in 2007, and an unknown species in 2008. No more than two whales were struck by Navy vessels in any given year in the HRC portion of the HSTT within the last 32 years.

Between 2007 and 2009, the Navy developed and distributed additional training, mitigation, and reporting tools to Navy operators to improve marine mammal protection and to ensure compliance with permit requirements. In 2009, the Navy implemented Marine Species Awareness Training designed to improve effectiveness of visual observation for marine mammals and other marine resources. In subsequent years, the Navy issued refined policy guidance on vessel strikes in order to collect the most accurate and detailed data possible in response to a possible incident (also see the Notification and Reporting Plan for this proposed rule). For over a decade, the Navy has implemented the Protective Measures Assessment Protocol software tool, which provides operators with notification of the required mitigation and a visual display of the planned training or testing activity location overlaid with relevant environmental data.

Marine Mammal Habitat

The proposed training and testing activities could potentially affect marine mammal habitat through the introduction of impacts to the prey species of marine mammals, acoustic habitat (sound in the water column), water quality, and biologically important habitat for marine mammals. Each of these potential effects was considered in the 2024 HCTT Draft EIS/OEIS and was determined not to have adverse effects on marine mammal habitat. Based on the information below and the supporting information included in the 2024 HCTT Draft EIS/OEIS, NMFS has determined that the proposed training and testing activities would not have adverse or long-term impacts on marine mammal habitat.

Effects to Prey

Sound may affect marine mammals through impacts on the abundance, behavior, or distribution of prey species (*e.g.,* crustaceans, cephalopods, fish, zooplankton). Marine mammal prey varies by species, season, and location and, for some species, is not well-documented. Here, we describe studies regarding the effects of noise on known marine mammal prey.

Fish utilize the soundscape and components of sound in their environment to perform important functions such as foraging, predator avoidance, mating, and spawning (*e.g.,* Zelick *et al.,* 1999; Fay, 2009). The most likely effects on fishes exposed to loud, intermittent, low-frequency sounds are behavioral responses (*i.e.,* flight or avoidance). Short duration, sharp sounds (such as pile driving or air guns) can cause overt or subtle changes in fish behavior and local distribution. The response of fish to acoustic sources depends on the physiological state of the fish, past exposures, motivation (*e.g.,* feeding, spawning, migration), and other environmental factors. Key impacts to fishes may include behavioral responses, hearing damage, barotrauma (*i.e.,* pressure-related injuries), and mortality. While it is clear that the behavioral responses of individual prey, such as displacement or other changes in distribution, can have direct impacts on the foraging success of marine mammals, the effects on marine mammals of individual prey that experience hearing damage, barotrauma, or mortality is less clear,

though obviously population scale impacts that meaningfully reduce the amount of prey available could have more serious impacts.

Fishes, like other vertebrates, have a variety of different sensory systems to glean information from ocean around them (Astrup and Mohl, 1993; Astrup, 1999; Braun and Grande, 2008; Carroll *et al.,* 2017; Hawkins and Johnstone, 1978; Ladich and Popper, 2004; Ladich and Schulz-Mirbach, 2016; Mann, 2016; Nedwell *et al.,* 2004; Popper *et al.,* 2003; Popper *et al.,* 2005). Depending on their hearing anatomy and peripheral sensory structures, which vary among species, fishes hear sounds using pressure and particle motion sensitivity capabilities and detect the motion of surrounding water (Fay *et al.,* 2008), while terrestrial vertebrates generally only detect pressure. Most marine fishes primarily detect particle motion using the inner ear and lateral line system, while some fishes possess additional morphological adaptations or specializations that can enhance their sensitivity to sound pressure, such as a gas-filled swim bladder (Braun and Grande, 2008; Popper and Fay, 2011).

Hearing capabilities vary considerably between different fish species with data only available for just over 100 species out of the 34,000 marine and freshwater fish species (Eschmeyer and Fong, 2016). In order to better understand acoustic impacts on fishes, fish hearing groups are defined by species that possess a similar continuum of anatomical features which result in varying degrees of hearing sensitivity (Popper and Hastings, 2009a). There are four hearing groups defined for all fish species (modified from Popper *et al.,* 2014) within this analysis and they include: fishes without a swim bladder (*e.g.,* flatfish, sharks, rays, *etc.*); fishes with a swim bladder not involved in hearing (*e.g.,* salmon, cod, pollock, *etc.*); fishes with a swim bladder involved in hearing (*e.g.,* sardines, anchovy, herring, *etc.*); and fishes with a swim bladder involved in hearing and high-frequency hearing (*e.g.,* shad and menhaden). Most marine mammal fish prey species would not be likely to perceive or hear mid- or high-frequency sonars. While hearing studies have not been done on sardines and northern anchovies, it would not be unexpected for them to possess hearing similarities to Pacific herring (up to 2–5 kHz) (Mann *et al.,* 2005). Currently, less data are available to estimate the range of best sensitivity for fishes without a swim bladder.

In terms of physiology, multiple scientific studies have documented a lack of mortality or physiological effects to fish from exposure to low- and mid-frequency sonar and other sounds (Cox *et al.,* 2018; Halvorsen *et al.,* 2012; Jørgensen *et al.,* 2005; Kane *et al.,* 2010; Kvadsheim and Sevaldsen, 2005; Popper *et al.,* 2007; Popper *et al.,* 2016; Watwood *et al.,* 2016). Techer *et al.* (2017) exposed carp in floating cages for up to 30 days to low-power 23 and 46 kHz sources without any significant physiological response. Other studies have documented either a lack of TTS in species whose hearing range cannot perceive military sonar, or for those species that could perceive sonar-like signals, any TTS experienced would be recoverable (Halvorsen *et al.,* 2012; Ladich and Fay, 2013; Popper and Hastings, 2009a, 2009b; Popper *et al.,* 2014; Smith, 2016). Only fishes that have specializations that enable them to hear sounds above about 2,500 Hz (2.5 kHz) such as herring (Halvorsen *et al.,* 2012; Mann *et al.,* 2005; Mann, 2016; Popper *et al.,* 2014) would have the potential to receive TTS or exhibit behavioral responses from exposure to mid-frequency sonar. In addition, any sonar induced TTS to fish whose hearing range could perceive sonar would only occur in the narrow spectrum of the source (*e.g.,* 3.5 kHz) compared to the fish's total hearing range (*e.g.,* 0.01 kHz to 5 kHz). Overall, military sonar sources are much narrower in terms of source frequency compared to a given fish species full hearing range (Halvorsen *et al.,* 2012; Jørgensen *et al.,* 2005; Juanes *et al.,* 2017; Kane *et al.,* 2010; Kvadsheim and Sevaldsen, 2005; Popper *et al.,* 2007; Popper and Hawkins, 2016; Watwood *et al.,* 2016).

In terms of behavioral responses, Juanes *et al.* (2017) discuss the potential for negative impacts from anthropogenic soundscapes on fish, but the author's focus was on broader based sounds such as ship and boat noise sources. Watwood *et al.* (2016) also documented no behavioral responses by reef fish after exposure to MFAS. Doksaeter *et al.* (2009; 2012) reported no behavioral responses to mid-frequency naval sonar by Atlantic herring; specifically, no escape responses (vertically or horizontally) were observed in free swimming herring exposed to mid-frequency sonar transmissions. Based on these results (Doksaeter *et al.,* 2009; Doksaeter *et al.,* 2012; Sivle *et al.,* 2012), Sivle *et al.* (2015) created a model in order to report on the possible population-level effects on Atlantic herring from active naval sonar. The authors concluded that the use of naval sonar poses little risk to populations of herring regardless of season, even when the herring populations are aggregated and directly exposed to sonar. Finally, Bruintjes *et al.* (2016) commented that fish exposed to any short-term noise within their hearing range might initially startle, but would quickly return to normal behavior.

Occasional behavioral responses to intermittent explosions and impulsive sound sources are unlikely to cause long-term consequences for individual fish or populations. Fish that experience hearing loss as a result of exposure to explosions and impulsive sound sources may have a reduced ability to detect relevant sounds such as predators, prey, or social vocalizations. However, PTS has not been known to occur in fishes and any hearing loss in fish may be as temporary as the timeframe required to repair or replace the sensory cells that were damaged or destroyed (Popper *et al.,* 2005; Popper *et al.,* 2014; Smith *et al.,* 2006). It is not known if damage to auditory nerve fibers could occur, and if so, whether fibers would recover during this process.

It is also possible for fish to be injured or killed by an explosion in the immediate vicinity of the surface from dropped or fired ordnance, or near the bottom from shallow water bottom-placed underwater mine warfare detonations. Physical effects from pressure waves generated by underwater sounds (*e.g.,* underwater explosions) could potentially affect fish within proximity of training or testing activities. SPLs of sufficient strength have been known to cause injury to fish and fish mortality (summarized in Popper *et al.,* 2014). The shock wave from an underwater explosion is lethal to fish at close range, causing massive organ and tissue damage and internal bleeding (Keevin and Hempen, 1997). At greater distance from the detonation point, the extent of mortality or injury depends on a number of factors including fish size, body shape, orientation, and species (Keevin and Hempen, 1997; Wright, 1982). At the same distance from the source, larger fish are generally less susceptible to death or injury, elongated forms that are round in cross-section are less at risk than deep-bodied forms, and fish oriented sideways to the blast suffer the greatest impact (Edds-Walton and Finneran, 2006; O'Keeffe, 1984; O'Keeffe and Young, 1984; Wiley *et al.,* 1981; Yelverton *et al.,* 1975). Species with gas-filled organs are more susceptible to injury and mortality than those without them (Gaspin, 1975; Gaspin *et al.,* 1976; Goertner *et al.,* 1994). Barotrauma injuries have been documented during controlled exposure to impact pile driving (an impulsive noise source, as are explosives and air

guns) (Halvorsen *et al.,* 2012b; Casper *et al.,* 2013).

Fish not killed or driven from a location by an explosion might change their behavior, feeding pattern, or distribution. Changes in behavior of fish have been observed as a result of sound produced by explosives, with effect intensified in areas of hard substrate (Wright, 1982). However, Navy explosive use avoids hard substrate to the best extent practical during underwater detonations, or deep-water surface detonations. Stunning from pressure waves could also temporarily immobilize fish, making them more susceptible to predation. The abundances of various fish (and invertebrates) near the detonation point for explosives could be altered for a few hours before animals from surrounding areas repopulate the area. However, these populations would likely be replenished as waters near the detonation point are mixed with adjacent waters. Repeated exposure of individual fish to sounds from underwater explosions is not likely and exposures are expected to be short-term and localized. Long-term consequences for fish populations would not be expected. Several studies have demonstrated that air gun sounds might affect the distribution and behavior of some fishes, potentially impacting foraging opportunities or increasing energetic costs (*e.g.,* Fewtrell and McCauley, 2012; Pearson *et al.,* 1992; Skalski *et al.,* 1992; Santulli *et al.,* 1999; Paxton *et al.,* 2017).

For fishes exposed to military sonar, there would be limited sonar use spread out in time and space across large offshore areas such that only small areas are actually ensonified (tens of miles) compared to the total life history distribution of fish prey species. There would be no probability for mortality or physical injury from sonar, and for most species, no or little potential for hearing or behavioral effects, except to a few select fishes with hearing specializations (*e.g.,* herring) that could perceive mid-frequency sonar. Training and testing exercises involving explosions are dispersed in space and time; therefore, repeated exposure of individual fishes is unlikely. Mortality and injury effects to fishes from explosives would be localized around the area of a given in-water explosion, but only if individual fish and the explosive (and immediate pressure field) were co-located at the same time. Fishes deeper in the water column or on the bottom would not be affected by water surface explosions. Repeated exposure of individual fish to sound and energy from underwater explosions is not likely given fish movement patterns, especially schooling prey species. Most acoustic effects, if any, are expected to be short-term and localized. Long-term consequences for fish populations, including key prey species within the HCTT Study Area, would not be expected.

Vessels and in-water devices do not normally collide with adult fish, particularly those that are common marine mammal prey, most of which can detect and avoid them. Exposure of fishes to vessel strike stressors is limited to those fish groups that are large, slow-moving, and may occur near the surface, such as ocean sunfish, whale sharks, basking sharks, and manta rays. These species are distributed widely in offshore portions of the HCTT Study Area. Any isolated cases of a military vessel striking an individual could injure that individual, impacting the fitness of an individual fish. Vessel strikes would not pose a risk to most of the other marine fish groups, because many fish can detect and avoid vessel movements, making strikes rare and allowing the fish to return to their normal behavior after the ship or device passes. As a vessel approaches a fish, they could have a detectable behavioral or physiological response (*e.g.,* swimming away and increased heart rate) as the passing vessel displaces them. However, such responses are not expected to have lasting effects on the survival, growth, recruitment, or reproduction of these marine fish groups at the population level and therefore would not have an impact on marine mammal species as prey items.

In addition to fish, prey sources such as marine invertebrates could potentially be impacted by sound stressors as a result of the proposed activities. However, most marine invertebrates' ability to sense sounds is very limited. In most cases, marine invertebrates would not respond to impulsive and non-impulsive sounds, although they may detect and briefly respond to nearby low-frequency sounds. These short-term responses would likely be inconsequential to invertebrate populations.

Invertebrates appear to be able to detect sounds (Pumphrey, 1950; Frings and Frings, 1967) and are most sensitive to low-frequency sounds (Packard *et al.,* 1990; Budelmann and Williamson, 1994; Lovell *et al.,* 2005; Mooney *et al.,* 2010). Data on response of invertebrates such as squid, another marine mammal prey species, to anthropogenic sound is more limited (de Soto, 2016; Sole *et al.,* 2017). Data suggest that cephalopods are capable of sensing the particle motion of sounds and detect low frequencies up to 1–1.5 kHz, depending on the species, and so are likely to detect air gun noise (Kaifu *et al.,* 2008; Hu *et al.,* 2009; Mooney *et al.,* 2010; Samson *et al.,* 2014). Sole *et al.* (2017) reported physiological injuries to cuttlefish in cages placed at-sea when exposed during a controlled exposure experiment to low-frequency sources (315 Hz, 139 to 142 dB re: 1 μPa^2 and 400 Hz, 139 to 141 dB re: 1 μPa^2). Fewtrell and McCauley (2012) reported squids maintained in cages displayed startle responses and behavioral changes when exposed to seismic air gun sonar (136–162 re: 1 $\mu Pa^2 \cdot s$). However, the sources Sole *et al.* (2017) and Fewtrell and McCauley (2012) used are not similar and were much lower than typical Navy sources within the HCTT Study Area. Nor do the studies address the issue of individual displacement outside of a zone of impact when exposed to sound. Jones *et al.* (2020) found that when squid (*Doryteuthis (Amerigo) pealeii*) were exposed to impulse pile driving noise, body pattern changes, inking, jetting, and startle responses were observed and nearly all squid exhibited at least one response. However, these responses occurred primarily during the first eight impulses and diminished quickly, indicating potential rapid, short-term habituation.

Cephalopods have a specialized sensory organ inside the head called a statocyst that may help an animal determine its position in space (orientation) and maintain balance (Budelmann, 1992). Packard *et al.* (1990) showed that cephalopods were sensitive to particle motion, not sound pressure, and Mooney *et al.* (2010) demonstrated that squid statocysts act as an accelerometer through which particle motion of the sound field can be detected. Auditory injuries (lesions occurring on the statocyst sensory hair cells) have been reported upon controlled exposure to low-frequency sounds, suggesting that cephalopods are particularly sensitive to low-frequency sound (Andre *et al.,* 2011; Sole *et al.,* 2013). Behavioral responses, such as inking and jetting, have also been reported upon exposure to low-frequency sound (McCauley *et al.,* 2000b; Samson *et al.,* 2014). Squids, like most fish species, are likely more sensitive to low frequency sounds, and may not perceive mid- and high-frequency sonars such as Navy sonars. Cumulatively for squid as a prey species, individual and population impacts from exposure to Navy sonar and explosives, like fish, are not likely to be significant, and explosive impacts would be short-term and localized.

Explosions and pile driving would likely kill or injure nearby marine invertebrates. Vessels also have the potential to impact marine invertebrates by disturbing the water column or sediments, or directly striking organisms (Bishop, 2008). The propeller wash (water displaced by propellers used for propulsion) from vessel movement and water displaced from vessel hulls can potentially disturb marine invertebrates in the water column and is a likely cause of zooplankton mortality (Bickel *et al.,* 2011). The localized and short-term exposure to explosions or vessels could displace, injure, or kill zooplankton, invertebrate eggs or larvae, and macro-invertebrates. However, mortality or long-term consequences for a few animals is unlikely to have measurable effects on overall populations. Long-term consequences to marine invertebrate populations would not be expected as a result of exposure to sounds of vessels in the HCTT Study Area.

Impacts to benthic communities from impulsive sound generated by active acoustic sound sources are not well documented. (*e.g.,* Andriguetto-Filho *et al.,* 2005; Payne *et al.,* 2007; 2008; Boudreau *et al.,* 2009). There are no published data that indicate whether temporary or permanent threshold shifts, auditory masking, or behavioral effects occur in benthic invertebrates (Hawkins *et al.,* 2014) and some studies showed no short-term or long-term effects of air gun exposure (*e.g.,* Andriguetto-Filho *et al.,* 2005; Payne *et al.,* 2007; 2008; Boudreau *et al.,* 2009). Exposure to air gun signals was found to significantly increase mortality in scallops, in addition to causing significant changes in behavioral patterns during exposure (Day *et al.,* 2017). However, the authors state that the observed levels of mortality were not beyond naturally occurring rates. Explosions and pile driving could potentially kill or injure nearby marine invertebrates; however, mortality or long-term consequences for a few animals is unlikely to have measurable effects on overall populations.

There is little information concerning potential impacts of noise on zooplankton populations. However, one study (McCauley *et al.,* 2017) investigated zooplankton abundance, diversity, and mortality before and after exposure to air gun noise, finding that the mortality rate for zooplankton after air gun exposure was two to three times more compared with controls for all taxa. The majority of taxa present were copepods and cladocerans; for these taxa, the range within which effects on abundance were detected was up to approximately 0.75 mi (1.2 km). In order to have significant impacts on *r*-selected species (*i.e.,* species that produce a large number of offspring and contribute few resources to each individual offspring) such as plankton, the spatial or temporal scale of impact must be large in comparison with the ecosystem concerned (McCauley *et al.,* 2017).

Notably, a recently described study produced results inconsistent with those of McCauley *et al.* (2017). Researchers conducted a field and laboratory study to assess if exposure to air gun noise affects mortality, predator escape response, or gene expression of the copepod *Calanus finmarchicus* (Fields *et al.,* 2019). Immediate mortality of copepods was significantly higher, relative to controls, at distances of 16.4 ft (5 m) or less from the air guns. Mortality one week after the air gun blast was significantly higher in the copepods placed 32.8 ft (10 m) from the air gun but was not significantly different from the controls at a distance of 65.6 ft (20 m) from the air gun. The increase in mortality, relative to controls, did not exceed 30 percent at any distance from the air gun. Moreover, the authors caution that even this higher mortality in the immediate vicinity of the air guns may be more pronounced than what would be observed in free-swimming animals due to increased flow speed of fluid inside bags containing the experimental animals. There were no sublethal effects on the escape performance or the sensory threshold needed to initiate an escape response at any of the distances from the air gun that were tested. Whereas McCauley *et al.* (2017) reported an SEL of 156 dB at a range of 1,670–2,158.8 ft (509–658 m), with zooplankton mortality observed at that range, Fields *et al.* (2019) reported an SEL of 186 dB at a range of 82 ft (25 m), with no reported mortality at that distance. The large scale of effect observed here is of concern—particularly where repeated noise exposure is expected—and further study is warranted.

Military expended materials resulting from training and testing activities could potentially result in minor long-term changes to benthic habitat; however, the impacts of small amount of expended materials are unlikely to have measurable effects on overall populations. Military expended materials may be colonized over time by benthic organisms that prefer hard substrate and would provide structure that could attract some species of fish or invertebrates.

Overall, the combined impacts of sound exposure, explosions, vessel strikes, and military expended materials resulting from the proposed activities would not be expected to have measurable effects on populations of marine mammal prey species. Prey species exposed to sound might move away from the sound source, experience TTS, experience masking of biologically relevant sounds, or show no obvious direct effects. Mortality from decompression injuries is possible in close proximity to a sound, but only limited data on mortality in response to air gun noise exposure are available (Fields *et al.,* 2019, Hawkins *et al.,* 2014, McCauley *et al.,* 2017). The most likely impacts for most prey species in a given area would be temporary avoidance of the area. Surveys using towed air gun arrays move through an area relatively quickly, limiting exposure to multiple impulsive sounds. In all cases, sound levels would return to ambient once a survey ends and the noise source is shut down and, when exposure to sound ends, behavioral and/or physiological responses are expected to end relatively quickly (McCauley *et al.,* 2000b). The duration of fish avoidance of a given area after survey effort stops is unknown, but a rapid return to normal recruitment, distribution, and behavior is anticipated. While the potential for disruption of spawning aggregations or schools of important prey species can be meaningful on a local scale, the mobile and temporary nature of most surveys and the likelihood of temporary avoidance behavior suggest that impacts would be minor. Long-term consequences to marine invertebrate populations would not be expected as a result of exposure to sounds or vessels in the HCTT Study Area.

Acoustic Habitat

Acoustic habitat is the soundscape which encompasses all of the sound present in a particular location and time, as a whole when considered from the perspective of the animals experiencing it. Animals produce sound for, or listen for sounds produced by, conspecifics (*e.g.,* communication during feeding, mating, and other social activities), other animals (*e.g.,* finding prey or avoiding predators), and the physical environment (*e.g.,* finding suitable habitats, navigating). Together, sounds made by animals and the geophysical environment (*e.g.,* produced by earthquakes, lightning, wind, rain, waves) make up the natural contributions to the total acoustics of a place. These acoustic conditions, termed acoustic habitat, are one attribute of an animal's total habitat.

Soundscapes are also defined by, and acoustic habitat influenced by, the total

contribution of anthropogenic sound. This may include incidental emissions from sources such as vessel traffic or may be intentionally introduced to the marine environment for data acquisition purposes (*e.g.,* the use of air gun arrays) or for military training and testing purposes (*e.g.,* the use of sonar and explosives and other acoustic sources). Anthropogenic noise varies widely in its frequency, content, duration, and SPL, and these characteristics greatly influence the potential habitat-mediated effects to marine mammals (please also see the previous discussion in the Masking section), which may range from local effects for brief periods of time to chronic effects over large areas and for long durations. Depending on the extent of effects to habitat, animals may alter their communications signals (thereby potentially expending additional energy) or miss acoustic cues (either conspecific or adventitious). Problems arising from a failure to detect cues are more likely to occur when noise stimuli are chronic and overlap with biologically relevant cues used for communication, orientation, and predator/prey detection (Francis and Barber, 2013). For more detail on these concepts see, *e.g.,* Barber *et al.,* 2009; Pijanowski *et al.,* 2011; Lillis *et al.,* 2014.

The term ''listening area'' refers to the region of ocean over which sources of sound can be detected by an animal at the center of the space. Loss of communication space concerns the area over which a specific animal signal (used to communicate with conspecifics in biologically important contexts such as foraging or mating) can be heard, in noisier relative to quieter conditions (Clark *et al.,* 2009). Lost listening area concerns the more generalized contraction of the range over which animals would be able to detect a variety of signals of biological importance, including eavesdropping on predators and prey (Barber *et al.,* 2009). Such metrics do not, in and of themselves, document fitness consequences for the marine animals that live in chronically noisy environments. Long-term population-level consequences mediated through changes in the ultimate survival and reproductive success of individuals are difficult to study, and particularly so underwater. However, it is increasingly well documented that aquatic species rely on qualities of natural acoustic habitats, with researchers quantifying reduced detection of important ecological cues (*e.g.,* Francis and Barber, 2013; Slabbekoorn *et al.,* 2010) as well as survivorship consequences in several species (*e.g.,* Simpson *et al.,* 2015; Nedelec *et al.,* 2015).

The sounds produced during training and testing activities can be widely dispersed or concentrated in small areas for varying periods. Sound produced from training and testing activities in the HCTT Study Area is temporary and transitory. Any anthropogenic noise attributed to training and testing activities in the HCTT Study Area would be temporary and the affected area would be expected to immediately return to the original state when these activities cease.

Water Quality

Training and testing activities may introduce constituents into the water column. Based on the analysis of the 2024 HCTT Draft EIS/OEIS, military expended materials (*e.g.,* undetonated explosive materials) would be released in quantities and at rates that would not result in a violation of any water quality standard or criteria. NMFS has reviewed this analysis and concurs that it reflects the best available science. High-order explosions consume most of the explosive material, creating typical combustion products. For example, in the case of Royal Demolition Explosive, 98 percent of the products are common seawater constituents and the remainder is rapidly diluted below threshold effect level. Explosion by-products associated with high order detonations present no secondary stressors to marine mammals through sediment or water. However, low order detonations and unexploded ordnance present elevated likelihood of impacts on marine mammals.

Indirect effects of explosives and unexploded ordnance to marine mammals via sediment is possible in the immediate vicinity of the ordnance. Degradation products of Royal Demolition Explosive are not toxic to marine organisms at realistic exposure levels (Rosen and Lotufo, 2010). Relatively low solubility of most explosives and their degradation products means that concentrations of these contaminants in the marine environment are relatively low and readily diluted. Furthermore, while explosives and their degradation products were detectable in marine sediment approximately 6–12 inches (0.15–0.3 m) away from degrading ordnance, the concentrations of these compounds were not statistically distinguishable from background beyond 3–6 ft (1–2 m) from the degrading ordnance. Taken together, it is possible that marine mammals could be exposed to degrading explosives, but it would be within a very small radius of the explosive (1–6 ft (0.3–2 m)).

Equipment used by the Action Proponents within the HCTT Study Area, including ships and other marine vessels, aircraft, and other equipment, are also potential sources of by-products. All equipment is properly maintained in accordance with applicable Navy, Coast Guard, Army, and legal requirements. All such operating equipment meets Federal water quality standards, where applicable.

Estimated Take of Marine Mammals

This section indicates the number of takes that NMFS is proposing to authorize, which is based on the amount of take that NMFS anticipates is reasonably likely to occur. NMFS coordinated closely with the Action Proponents in the development of their incidental take application, and preliminarily agrees that the methods the Action Proponents have put forth described herein to estimate take (including the model, thresholds, and density estimates), and the resulting numbers are based on the best available science and appropriate for authorization.

Takes would be predominantly in the form of harassment, but a limited number of mortalities are also possible. For this military readiness activity, the MMPA defines ''harassment'' as (1) any act that injures or has the significant potential to injure a marine mammal or marine mammal stock in the wild (Level A harassment); or (2) any act that disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering, to a point where the behavioral patterns are abandoned or significantly altered (Level B harassment) (16 U.S.C. 1362(18)(B)).

Proposed authorized takes would primarily be in the form of Level B harassment, as use of the acoustic (*e.g.,* active sonar, pile driving, and seismic air guns) and explosive sources and missile launches is most likely to result in disruption of natural behavioral patterns to a point where they are abandoned or significantly altered (as defined specifically at the beginning of this section, but referred to generally as behavioral disturbance) for marine mammals, either via direct behavioral disturbance or TTS. There is also the potential for Level A harassment, in the form of auditory injury to result from exposure to the sound sources utilized in military readiness activities. Lastly, no more than 7 serious injuries or mortalities total (over the 7-year period)

of large whales could potentially occur through vessel strikes, and 40 serious injuries or mortalities (over the 7-year period) from explosive use. Although we analyze the impacts of these potential serious injuries or mortalities that are proposed for authorization, the proposed mitigation and monitoring measures are expected to minimize the likelihood (*i.e.,* further lower the already low probability) that vessel strike (and the associated serious injury or mortality) would occur, as well as the severity of other takes.

Generally speaking, for acoustic impacts NMFS estimates the amount and type of harassment by considering: (1) acoustic thresholds above which NMFS believes the best available science indicates marine mammals would experience behavioral disturbance or incur some degree of temporary or permanent hearing impairment; (2) the area or volume of water that would be ensonified above these levels in a day or event; (3) the density or occurrence of marine mammals within these ensonified areas; and (4) the number of days of activities or events.

Acoustic Thresholds

Using the best available science, NMFS, in coordination with the Navy, has established acoustic thresholds that identify the most appropriate received level of underwater sound above which marine mammals exposed to these sound sources could be reasonably expected to directly incur a disruption in behavior patterns to a point where they are abandoned or significantly altered (equated to onset of Level B harassment), or to incur TTS onset (equated to Level B harassment via the indirect disruptions of behavioral patterns) or AUD INJ onset (equated to Level A harassment). Thresholds have also been developed to identify the pressure and impulse levels above which animals may incur non-auditory injury or mortality from exposure to explosive detonation.

Hearing Impairment (TTS/AUD INJ), Non-Auditory Injury, and Mortality

NMFS' 2024 Technical Guidance (NMFS, 2024) identifies dual criteria to assess AUD INJ (Level A harassment) to five different marine mammal groups (based on hearing sensitivity) as a result of exposure to noise from two different types of sources (impulsive or non-impulsive). The Updated Technical Guidance also identifies criteria to predict TTS, which is not considered injury and falls into the Level B harassment category. The Action Proponents' specified activities include the use of non-impulsive (*i.e.,* sonar, vibratory pile driving) and impulsive (*i.e.,* explosives, air guns, impact pile driving) sources.

For the consideration of impacts on hearing in Phase IV, marine mammals were divided into nine groups for analysis: VLF, LF, HF, VHF, SI, PCW and PCA, and OCW and OCA. For each group, a frequency-dependent weighting function and numeric thresholds for the onset of TTS and the onset of AUD INJ were estimated. The onset of TTS is defined as a TTS of 6 dB measured approximately 2–5 minutes after exposure. A TTS of 40 dB is used as a proxy for the onset of AUD INJ (*i.e.,* it is assumed that exposures beyond those capable of causing 40 dB of TTS have the potential to result in PTS or other auditory injury (*e.g.,* loss of cochlear neuron synapses)). Exposures just sufficient to cause TTS or AUD INJ are denoted as ''TTS onset'' or ''AUD INJ onset'' exposures. Onset levels are treated as step functions or ''all-or-nothing'' thresholds: exposures above the TTS or AUD INJ onset level are assumed to always result in TTS or AUD INJ, while exposures below the TTS or AUD INJ onset level are assumed to not cause TTS or AUD INJ. For non-impulsive exposures, onset levels are specified in frequency-weighted sound exposure level (SEL); for impulsive exposures, dual metrics of weighted SEL and unweighted peak sound pressure level (SPL) are used.

To compare Phase IV weighting functions and TTS/AUD INJ SEL thresholds to those used in Phase III, both the weighting function shape and the weighted threshold values were considered; the weighted thresholds by themselves only indicate the TTS/AUD INJ threshold at the most susceptible frequency (based on the relevant weighting function). In contrast, the TTS/AUD INJ exposure functions incorporate both the shape of the weighting function and the weighted threshold value and provide the best means of comparing the frequency-dependent TTS/AUD INJ thresholds for Phase III and Phase IV.

The most significant differences between the Phase III and Phase IV functions and thresholds include the following:

- Mysticetes were divided into two groups (VLF and LF), with the upper hearing limit for the LF group increased from Phase III to match recent hearing measurements in minke whales (Houser *et al.,* 2024);
- Group names were changed from Phase III to be consistent with Southall *et al.* (2019). Specifically, the Phase III mid-frequency (MF) cetacean group is now designated as the high-frequency (HF) cetacean group, and the group previously designated as high-frequency (HF) cetaceans is now the very-high frequency (VHF) cetacean group;
- For the HF group, Phase IV onset TTS/AUD INJ thresholds are lower compared to Phase III at frequencies below approximately 10 kHz. This is a result of new TTS onset data for dolphins at low frequencies (Finneran *et al.,* 2023);
- For the PCW group, new TTS data for harbor seals (Kastelein *et al.,* 2020a; Kastelein *et al.,* 2020b) resulted in slightly lower TTS/AUD INJ thresholds at high frequencies compared to Phase III; and
- For group OCW, new TTS data for California sea lions (Kastelein *et al.,* 2021b; Kastelein *et al.,* 2022a, 2022b) resulted in significantly lower TTS/AUD INJ thresholds compared to Phase III.

Of note, the thresholds and weighting function for the LF cetacean hearing group in NMFS' 2024 Technical Guidance (NMFS, 2024) match the Navy's VLF cetacean hearing group. However, the weighting function for those hearing groups differs between the two documents (*i.e.,* the Navy's LF cetacean group has a different weighting function from NMFS) due to the Houser *et al.* (2024) minke whale data incorporated into Navy 2024, but not NMFS (2024). While NMFS' 2024 Technical Guidance differs from the criteria that the Action Proponents used to assess AUD INJ and TTS for low-frequency cetaceans, NMFS concurs that the criteria the Action Proponents applied are appropriate for assessing the impacts of their proposed action. The criteria used by the Action Proponents are conservative in that those criteria show greater sensitivity at higher frequencies (*i.e.,* application of those criteria result in a higher amount of estimated take by higher frequency sonars than would result from application of NMFS' 2024 Technical Guidance) which is where more of the take is expected.

These thresholds (table 18 and table 19) were developed by compiling and synthesizing the best available science and soliciting input multiple times from both public and peer reviewers. The references, analysis, and methodology used in the development of the thresholds are described in Updated Technical Guidance, which may be accessed at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/marine-mammal-acoustic-technical-guidance.*

TABLE 18—ACOUSTIC THRESHOLDS IDENTIFYING THE ONSET OF TTS

Group	TTS threshold SEL (weighted)	AUD INJ threshold SEL (weighted)
Very low-frequency (VLF)	177	197
Low-frequency (LF)	177	197
High-frequency (HF)	181	201
Very high-frequency (VHF)	161	181
Phocid carnivores in water (PW)	175	195
Otariid carnivores in water (OW)	179	199
Phocid carnivores in air (PA)	134	154
Otariid carnivores in air (OA)	157	177

Note: SEL thresholds in dB re 1 μPa^2 s underwater and dB re 20 μPa^2 s in air.

Based on the best available science, the Action Proponents (in coordination with NMFS) used the acoustic and pressure thresholds indicated in table 18 to predict the onset of behavioral harassment, AUD INJ, TTS, tissue damage, and mortality due to explosive sources.

For explosive activities using single detonations (*i.e.,* no more than one detonation within a day), such as those described in the proposed activity, NMFS uses TTS onset thresholds to assess the likelihood of behavioral harassment, rather than the Level B harassment threshold for multiple detonations indicated in table 19. While marine mammals may also respond to single explosive detonations, these responses are expected to more typically be in the form of startle response, rather than a more meaningful disruption of a behavioral pattern. On the rare occasion that a single detonation might result in a behavioral response that qualifies as Level B harassment, it would be expected to be in response to a comparatively higher received level. Accordingly, NMFS considers the potential for these responses to be quantitatively accounted for through the application of the TTS criteria, which, as noted above, is 5 dB higher than the behavioral harassment threshold for multiple explosives.

TABLE 19—EXPLOSIVE THRESHOLDS FOR MARINE MAMMALS FOR AUD INJ, TTS, AND BEHAVIOR

[Multiple detonations]

Hearing group	AUD INJ impulsive threshold *	TTS impulsive threshold *	Behavioral threshold (multiple detonations)
Low-Frequency (LF) Cetaceans	*Cell 1:* $L_{p,0\text{-}pk,flat}$*:* 222 dB; $L_{E,p,LF,24h}$*:* 183 dB.	*Cell 2:* $L_{p,0\text{-}pk,flat}$*:* 216 dB; $L_{E,LF,24h}$*:* 168 dB.	*Cell 3:* $L_{E,LF,24h}$*:* 163 dB.
High-Frequency (HF) Cetaceans	*Cell 4:* $L_{p,0\text{-}pk,flat}$*:* 230 dB; $L_{E,p,HF,24h}$*:* 193 dB.	*Cell 5:* $L_{p,0\text{-}pk,flat}$*:* 224 dB; $L_{E,HF,24h}$*:* 178 dB.	*Cell 6:* $L_{E,HF,24h}$*:* 173 dB.
Very High-Frequency (VHF) Cetaceans.	*Cell 7:* $L_{p,0\text{-}pk,flat}$*:* 202 dB; $L_{E,p,VHF,24h}$*:* 159 dB.	*Cell 8:* $L_{p,0\text{-}pk,flat}$*:* 196 dB; $L_{E,VHF,24h}$*:* 144 dB.	*Cell 9:* $L_{E,VHF,24h}$*:* 139 dB.
Phocid Pinnipeds (PW) (Underwater).	*Cell 10:* $L_{p,0\text{-}pk,flat}$*:* 223 dB; $L_{E,p,PW,24h}$*:* 183 dB.	*Cell 11:* $L_{p,0\text{-}pk,flat}$*:* 217 dB; $L_{E,PW,24h}$*:* 168 dB.	*Cell 12:* $L_{E,PW,24h}$*:* 163 dB.
Otariid Pinnipeds (OW) (Underwater).	*Cell 13:* $L_{p,0\text{-}pk,flat}$*:* 230 dB; $L_{E,p,OW,24h}$*:* 185 dB.	*Cell 14:* $L_{p,0\text{-}pk,flat}$*:* 224 dB; $L_{E,OW,24h}$*:* 170 dB.	*Cell 15:* $L_{E,OW,24h}$*:* 165 dB.
Phocid Pinnipeds (PA) (In-Air)	*Cell 16:* $L_{p,0\text{-}pk,flat}$*:* 162 dB; $L_{E,p,PA,24h}$*:* 140 dB.	*Cell 17:* $L_{p,0\text{-}pk,flat}$*:* 156 dB; $L_{E,PA,24h}$*:* 125 dB.	*Cell 18:* N/A.
Otariid Pinnipeds (OA) (In-Air)	*Cell 19:* $L_{p,0\text{-}pk,flat}$: 177 dB; $L_{E,p,OA,24h}$*:* 163 dB.	*Cell 20:* $L_{p,0\text{-}pk,flat}$: 171 dB; $L_{E,OA,24h}$*:* 148 dB.	*Cell 21:* N/A.

Note: N/A = Not Applicable. Peak sound pressure level ($L_{p,0\text{-}pk}$) has a reference value of 1 µPa, and weighted cumulative sound exposure level ($L_{E,p}$) has a reference value of 1 μPa^2s. In this table, criteria are abbreviated to be more reflective of International Organization for Standardization standards (ISO, 2017; ISO, 2020). The subscript ''flat'' is being included to indicate peak sound pressure are flat weighted or unweighted within the generalized hearing range of marine mammals underwater (*i.e.,* 7 Hz to 165 kHz) or in air (*i.e.,* 42 Hz to 52 kHz). The subscript associated with cumulative sound exposure level criteria indicates the designated marine mammal auditory weighting function (LF, HF, and VHF cetaceans, and PW and OW pinnipeds) and that the recommended accumulation period is 24 hours. The weighted cumulative sound exposure level criteria could be exceeded in a multitude of ways (*i.e.,* varying exposure levels and durations, duty cycle). When possible, it is valuable for action proponents to indicate the conditions under which these criteria will be exceeded.

* Dual metric criteria for impulsive sounds: Use whichever criteria results in the larger isopleth for calculating AUD INJ onset. If a non-impulsive sound has the potential of exceeding the peak sound pressure level criteria associated with impulsive sounds, the PK SPL criteria are recommended for consideration for non-impulsive sources.

The criterion for mortality is based on severe lung injury observed in terrestrial mammals exposed to underwater explosions as recorded in Goertner (1982). The criteria for non-auditory injury are based on slight lung injury or gastrointestinal (commonly referred to as G.I.) tract injury observed in the same data set. Mortality and slight lung injury impacts to marine mammals are estimated using impulse thresholds based on both calf/pup/juvenile and adult masses (see the Criteria and Thresholds Technical Report). The peak pressure threshold applies to all species and age classes. Unlike the prior analysis (Phase III), this analysis relies on the onset rather than the mean estimated threshold for these effects. This revision results in a small increase in the predicted non-auditory injuries and mortalities for the same event versus prior analyses. Thresholds are provided in table 20 for use in non-auditory injury assessment for marine mammals exposed to underwater explosives. Of note, non-auditory injury and mortality from land-based missile and target launches are so unlikely as to

be discountable under normal conditions.

TABLE 20—NON-AUDITORY INJURY THRESHOLDS FOR UNDERWATER EXPLOSIVES

Hearing group	Mortality—impulse *	Injury—impulse *	Injury—peak pressure
All Marine Mammals	*Cell 1:* Modified Goertner model; Equation 1.	*Cell 2:* Modified Goertner model; Equation 2.	*Cell 3:* $L_{p0\text{-}pk,flat}$*:* 237 dB.

Note: Peak sound pressure (L_{pk}) has a reference value of 1 µPa. In this table, thresholds are abbreviated to reflect ANSI (2013). However, ANSI defines peak sound pressure as incorporating frequency weighting, which is not the intent for this Technical Guidance. Hence, the subscript ''flat'' is being included to indicate peak sound pressure should be flat weighted or unweighted within the overall marine mammal generalized hearing range.

* Lung injury (severe and slight) thresholds are dependent on animal mass (Recommendation: table C.9 from U.S. Department of the Navy (2017a) based on adult and/or calf/pup mass by species).

Modified Goertner Equations for severe and slight lung injury (pascal-second)

Equation 1: $103M^{1/3}(1 + D/10.1)^{1/6}$ Pa-s

Equation 2: $47.5M^{1/3}(1 + D/10.1)^{1/6}$ Pa-s

M animal (adult and/or calf/pup) mass (kg) (table C.9 in DoN 2017)

D animal depth (meters).

Level B Harassment by Behavioral Disturbance

Though significantly driven by received level and distance, the onset of Level B harassment by behavioral disturbance from anthropogenic noise exposure is also informed to varying degrees by other factors and can be difficult to predict (Southall *et al.,* 2007; Ellison *et al.,* 2012). As discussed in the Potential Effects of Specified Activities on Marine Mammals and Their Habitat section, marine mammal responses to sound (some of which are considered disturbances that qualify as take under the MMPA) are highly variable and context specific (*i.e.,* they are affected by differences in acoustic conditions; differences between species and populations; differences in gender, age, reproductive status, or social behavior; and other prior experience of the individuals). This means there is support for considering alternative approaches for estimating Level B behavioral harassment.

Despite the rapidly evolving science, there are still challenges in quantifying expected behavioral responses that qualify as take by Level B harassment, especially where the goal is to use one or two predictable indicators (*e.g.,* received level and distance) to predict responses that are also driven by additional factors that cannot be easily incorporated into the thresholds (*e.g.,* context). So, while the criteria that identify Level B harassment by behavioral disturbance (referred to *as* ''behavioral harassment thresholds'') have been refined to better consider the best available science (*e.g.,* incorporating both received level and distance), they also still have some built-in factors to address the challenge noted. For example, while duration of observed responses in the data are now considered in the thresholds, some of the responses that are informing take thresholds are of a very short duration, such that it is possible some of these responses might not always rise to the level of disrupting behavior patterns to a point where they are abandoned or significantly altered. We describe the application of this behavioral harassment threshold as identifying the maximum number of instances in which marine mammals could be reasonably expected to experience a disruption in behavior patterns to a point where they are abandoned or significantly altered. In summary, we believe these behavioral harassment criteria are the most appropriate method for predicting Level B harassment by behavioral disturbance given the best available science and the associated uncertainty.

Sonar—

In its analysis of impacts associated with sonar acoustic sources (which was coordinated with NMFS), the Action Proponents used an updated approach, as described below. Many of the behavioral responses identified using the Action Proponents' quantitative analysis are most likely to be of moderate severity as described in the Southall *et al.* (2021) behavioral response severity scale. These ''moderate'' severity responses were considered significant if they were sustained for the duration of the exposure or longer. Within the Action Proponents' quantitative analysis, many responses are predicted from exposure to sound that may exceed an animal's Level B behavioral harassment threshold for only a single exposure (lasting a few seconds) to several minutes, and it is likely that some of the resulting estimated behavioral responses that are counted as Level B harassment would not constitute ''significantly altering or abandoning natural behavioral patterns'' (*i.e.,* the estimated number of takes by Level B harassment due to behavioral disturbance and response is likely somewhat of an overestimate).

As noted above, the Action Proponents coordinated with NMFS to develop behavioral harassment thresholds specific to their military readiness activities utilizing active sonar that identify at what received level and distance Level B harassment by behavioral disturbance would be expected to result. These behavioral harassment thresholds consist of behavioral response functions (BRFs) and associated distance cut-off conditions, and are also referred to, together, as ''the criteria.'' These criteria are used to estimate the number of animals that may exhibit a behavioral response that qualifies as take under the MMPA when exposed to sonar and other transducers. The way the criteria were derived is discussed in detail in the Criteria and Thresholds Technical Report. Developing these behavioral harassment criteria involved multiple steps. All peer-reviewed published behavioral response studies conducted both in the field and on captive animals were examined in order to understand the breadth of behavioral responses of marine mammals to sonar and other transducers. Marine mammals were divided into four groups for analysis: mysticetes (all baleen whales); odontocetes (most toothed whales, dolphins, and porpoises); sensitive species (beaked whales and harbor porpoise); and pinnipeds and other marine carnivores (true seals, sea lions, walruses, sea otters, polar bears). These groups are like the groups used in the behavioral response analysis (Phase III), with the exception of combining beaked whales and harbor porpoise into a single curve. For each group, a biphasic BRF was developed using the best available data and Bayesian dose response models

developed at the University of St. Andrews. The BRF base probability of response on the highest SPL (RMS) received level.

The analysis of BRFs differs from the previous phase (Phase III) due to the addition of new data and the separation of some species groups. Figure 10 in the Criteria and Thresholds Technical Report indicates the changes in BRFs from Phase III to Phase IV. The sensitive species BRF is more sensitive at lower received levels but less sensitive at higher received levels than the prior beaked whale and harbor porpoise functions. The odontocete BRF is less sensitive overall due to additional behavioral response research, which will result in a lower number of behavioral responses than in the prior analysis for the same event, but also reduces the avoidance of auditory effects. The pinnipeds (in-water) BRF is more sensitive due to the inclusion of additional captive pinniped data (only three behavioral studies using captive pinnipeds were available for the derivation of the BRF). Behavioral studies of captive animals can be difficult to extrapolate to wild animals due to several factors (*e.g.,* use of trained subjects). This means the pinniped BRF likely overestimates effects compared to observed responses of wild pinnipeds to sound and anthropogenic activity. The mysticete BRF is less sensitive across most received levels due to including additional behavioral response research. This will result in a lower number of behavioral responses than in the prior analysis for the same event, but also reduces the avoidance of auditory effects.

The BRFs only relate the highest received level of sound to the probability that an animal will have a behavioral response. The BRFs do not account for the duration or pattern of use of any individual sound source or of the activity as a whole, the number of sound sources that may be operating simultaneously, or how loud the animal may perceive the sonar signal to be based on the frequency of the sonar versus the animal's hearing range.

Criteria for assessing marine mammal behavioral responses to sonars use the metric of highest received sound level (RMS) to evaluate the risk of immediate responses by exposed animals. Currently, there are limited data to develop criteria that include the context of an exposure, characteristics of individual animals, behavioral state, duration of an exposure, sound source duty cycle, and the number of individual sources in an activity (although these factors certainly influence the severity of a behavioral response) and, further, even where certain contextual factors may be predictive where known, it is difficult to reliably predict when such factors will be present.

The BRFs also do not account for distance. At moderate to low received levels the correlation between probability of response and received level is very poor and it appears that other variables mediate behavioral responses (*e.g.,* Ellison *et al.,* 2012) such as the distance between the animal and the sound source. For this analysis, distance between the animal and the sound source (*i.e.,* range) was initially included, however, range was too confounded with received level and therefore did not provide additional information about the possibility of response.

Data suggest that beyond a certain distance, significant behavioral responses are unlikely. At shorter ranges (less than 10 km) some behavioral responses have been observed at received levels below 140 dB re 1 µPa. Thus, proximity may mediate behavioral responses at lower received levels. Since most data used to derive the BRFs are within 10 km of the source, probability of response at farther ranges is not well-represented. Therefore, the source-receiver range must be considered separately to estimate likely significant behavioral responses.

This analysis applies behavioral cut-off conditions to responses predicted using the BRFs. Animals within a specified distance and above a minimum probability of response are assumed to have a significant behavioral response. The cut-off distance is based on the farthest source-animal distance across all known studies where animals exhibited a significant behavioral response. Animals beyond the cut-off distance but with received levels above the sound pressure level associated with a probability of response of 0.50 on the BRF are also assumed to have a significant behavioral response. The actual likelihood of significant behavioral responses occurring beyond the distance cut-off is unknown. Significant behavioral responses beyond 100 km are unlikely based on source-animal distance and attenuated received levels. The behavioral cut-off conditions and additional information on the derivation of the cut-off conditions can be found in table 2.2–3 of the Criteria and Thresholds Technical Report.

The Action Proponents used cutoff distances beyond which the potential of significant behavioral responses (and therefore Level B harassment) is considered to be unlikely (see table 21). These distances were determined by examining all available published field observations of behavioral responses to sonar or sonar-like signals that included the distance between the sound source and the marine mammal. Behavioral effects calculations are based on the maximum SPL to which a modeled marine mammal is exposed. There is empirical evidence to suggest that animals are more likely to exhibit significant behavioral responses to moderate levels sounds that are closer and less likely to exhibit behavioral responses when exposed to moderate levels of sound from a source that is far away. To account for this, the Action Proponents have implemented behavioral cutoffs that consider both received sound level and distance from the source. These updated cutoffs conditions are unique to each behavioral hearing group and are outlined in table 21.

TABLE 21—BEHAVIORAL CUT-OFF CONDITIONS FOR EACH BEHAVIORAL HEARING GROUP

Behavioral group	Received level associated with p(0.50) on the behavioral response function (dB RMS)	Cut-off range (km)
Sensitive Species	133	40
Odontocetes	168	15
Mysticetes	185	10
Pinnipeds	156	5

Note: Sensitive Species includes beaked whales and harbor porpoises.

The Action Proponents and NMFS have used the best available science to address the challenging differentiation between significant and non-significant behavioral responses (*i.e.,* whether the behavior has been abandoned or significantly altered such that it qualifies as harassment), but have erred on the cautious side where uncertainty exists (*e.g.,* counting these lower duration responses as take), which likely results in some degree of overestimation of Level B harassment by behavioral disturbance. We consider application of these behavioral harassment thresholds, therefore, as identifying the maximum number of instances in which marine mammals could be reasonably expected to experience a disruption in behavior patterns to a point where they are abandoned or significantly altered (*i.e.,* Level B harassment). NMFS has carefully reviewed the criteria (*i.e.,* BRFs and cutoff distances for the species), and agrees that it is the best available science and is the appropriate method to use at this time for determining impacts to marine mammals from military sonar and other transducers and for calculating take and to support the determinations made in this proposed rule. Because this is the most appropriate method for estimating Level B harassment given the best available science and uncertainty on the topic, it is these numbers of Level B harassment by behavioral disturbance that are analyzed in the Preliminary Analysis and Negligible Impact Determination section and would be authorized.

Air Guns, Pile Driving, and Explosives—

Based on what the available science indicates and the practical need to use a threshold based on a factor that is both predictable and measurable for most activities, NMFS uses generalized acoustic thresholds based on received level to estimate the onset of behavioral harassment for sources other than active sonar. NMFS predicts that marine mammals are likely to be behaviorally harassed in a manner we consider Level B harassment when exposed to underwater anthropogenic noise above received levels of 120 dB re 1 µPa (RMS) for continuous (*e.g.,* vibratory pile-driving, drilling) and above 160 dB re 1 µPa (RMS) for non-explosive impulsive (*e.g.,* seismic air guns) or intermittent (*e.g.,* scientific sonar) sources. For the Action Proponents' activities, to estimate behavioral effects from air guns, the threshold of 160 dB re 1 µPa (RMS) is used and the root mean square calculation for air guns is based on the duration defined by 90 percent of the cumulative energy in the impulse. The indicated thresholds were also applied to estimate behavioral effects from impact and vibratory pile driving (see table 22). These thresholds are the same as those applied in the prior analysis (Phase III) of these stressors in the Study Area, although the explosive behavioral threshold has shifted, corresponding to changes in the TTS thresholds.

TABLE 22—BEHAVIORAL RESPONSE THRESHOLDS FOR AIR GUNS, PILE DRIVING, AND EXPLOSIVES

Sound source	Behavioral threshold
Air gun	160 dB RMS re 1 µPa SPL.
Impact pile driving	160 dB RMS re 1 µPa SPL.
Vibratory pile driving	120 dB RMS re 1 µPa SPL.
Single explosion (underwater)	TTS onset threshold (weighted SEL).
Multiple explosions (underwater)	5 dB less than the TTS onset threshold (weighted SEL).
Explosion in Air*	100 dB 20 µPa (otariid and phocid).

*Estimated takes from land-based missile and rocket launches are based on pinniped observations during prior activities rather than in-air thresholds.

While the best available science for assessing behavioral responses of marine mammals to impulsive sounds relies on data from seismic and pile driving sources, it is likely that these predicted responses using a threshold based on seismic and pile driving represent a worst-case scenario compared to behavioral responses to explosives used in military readiness activities, which would typically consist of single impulses or a cluster of impulses rather than long-duration, repeated impulses (*e.g.,* large-scale air gun arrays).

For single explosions at received sound levels below hearing loss thresholds, the most likely behavioral response is a brief alerting or orienting response. Since no further sounds follow the initial brief impulses, significant behavioral responses would not be expected to occur. If a significant response were to occur, the Action Proponents' analysis assumes it would be as a result of an exposure at levels within the range of auditory impacts (TTS and AUD INJ). Because of this approach, the number of auditory impacts is higher than the number of behavioral impacts in the quantified results for some stocks.

If more than one explosive event occurs within any given 24-hour period during a military readiness activity, behavioral disturbance is considered more likely to occur and specific criteria are applied to predict the number of animals that may have a behavioral response. For events with multiple explosions, the behavioral threshold used in this analysis is 5 dB less than the TTS onset threshold. This value is derived from observed onsets of behavioral response by test subjects (bottlenose dolphins) during non-impulse TTS testing (Schlundt *et al.,* 2000).

Navy Acoustic Effects Model

The Navy Acoustic Effects Model (NAEMO) is their standard model for assessing acoustic effects on marine mammals. NAEMO calculates sound energy propagation from sonar and other transducers, air guns, and explosives during military readiness activities and the sound received by animat dosimeters. Animat dosimeters are virtual representations of marine mammals distributed in the area around the modeled activity and each dosimeter records its individual sound ''dose.'' The model bases the distribution of animats over the HCTT Study Area on the density values in the Navy Marine Species Density Database (NMSDD) and distributes animats in the water column proportional to the known time that species spend at varying depths.

The model accounts for environmental variability of sound propagation in both distance and depth when computing the sound level received by the animats. The model conducts a statistical analysis based on multiple model runs to compute the estimated effects on animals. The number of animats that exceed the thresholds for effects is tallied to provide an estimate of the number of marine mammals that could be affected.

Assumptions in NAEMO intentionally err on the side of overestimation when there are unknowns. The specified activities are modeled as though they would occur regardless of proximity to marine mammals, meaning that the implementation of power downs or shutdowns are not modeled or, thereby, considered in the take estimates. For more information on this process, see the discussion in the *Estimated Take from Acoustic Stressors* section below. Many explosions from ordnance such as bombs and missiles actually occur upon impact with above-water targets. However, for this analysis, sources such as these were modeled as exploding underwater. This overestimates the amount of explosive and acoustic energy entering the water.

The model estimates the acoustic impacts caused by sonars and other transducers, explosives, and air guns during individual military readiness activities. During any individual modeled event, impacts to individual animats are considered over 24-hour periods. The animats do not represent actual animals, but rather they represent a distribution of animals based on density and abundance data, which allows for a statistical analysis of the number of instances that marine mammals may be exposed to sound levels resulting in an effect. Therefore, the model estimates the number of instances in which an effect threshold was exceeded over the course of a year, but does not estimate the number of individual marine mammals that may be impacted over a year (*i.e.,* some marine mammals could be impacted several times, while others would not experience any impact). A detailed explanation of NAEMO is provided in the Acoustic Impacts Technical Report.

As NAEMO interrogates the simulation data in the Animat Processor, exposures that are both outside the distance cutoff and below the received level cutoff are omitted when determining the maximum SPL for each animat. This differs from Phase III, in which only distance cutoffs were applied, meaning that all exposures outside the distance cutoffs were omitted, with no consideration of received level.

The presence of the two cutoff criteria in Phase IV provides a more accurate and conservative estimation of behavioral effects because louder exposures that would have been omitted previously, when only a distance cutoff was applied, are considered in Phase IV, while the estimation of behavioral effects still omits exposures at distances and received levels that would be unlikely to produce a significant behavioral response. NAEMO retains the capability of calculating behavioral effects without the cutoffs applied, depending on user preference.

The impulsive behavioral criteria are not based on the probability of a behavioral response but rather on a single SPL metric. For consideration of impulsive behavioral effects, the cutoff conditions in table 21 are not applied.

Pile Driving

The Action Proponents performed a quantitative analysis without NAEMO to estimate the number of times marine mammals could be affected by pile driving and extraction used during port damage repair activities at Port Hueneme. The analysis considered details of the activity, sound exposure criteria, and the number and distribution of marine mammals. This information was then used in an ''area*density'' model in which the areas within each footprint (*i.e.,* harassment zone) that encompassed a potential effect were calculated for a given day's activities. The effects analyzed included behavioral response, TTS, and AUD INJ for marine mammals.

Then, these areas were multiplied by the density of each marine species within the Port Hueneme area (California sea lion and harbor seal) to estimate the number of effects. Uniform density values for species expected to be present in the nearshore areas where pile driving could occur were estimated using the NMSDD or available survey data specific to the activity location. More detail is provided in the 2024 HCTT Draft EIS/OEIS. Since the same animal can be ''taken'' every day (*i.e.,* 24-hour reset time), the number of predicted effects from a given day were multiplied by the number of days for that activity. This generated a total estimated number of effects over the entire activity, which was then multiplied by the maximum number of times per year this activity could happen. The result was the estimated effects per species and stock in a year.

Range to Effects

This section provides range (distance) to effects for sonar and other active acoustic sources as well as explosives to specific acoustic thresholds determined using NAEMO. Ranges are determined by modeling the distance that noise from a source will need to propagate to reach exposure level thresholds specific to a hearing group that will cause behavioral response, TTS, AUD INJ, non-auditory injury, and mortality. Ranges to effects (table 23 through table 36) are utilized to help predict impacts from acoustic and explosive sources and assess the benefit of mitigation zones. Marine mammals exposed within these ranges for the shown duration are predicted to experience the associated effect. Range to effects is important information in not only predicting acoustic impacts, but also in verifying the accuracy of model results against real-world situations and determining adequate mitigation ranges to avoid higher level effects, especially physiological effects to marine mammals.

Sonar

Ranges to effects for sonar were determined by modeling the distance that sound would need to propagate to reach exposure level thresholds specific to a hearing group that would cause behavioral response, TTS, and AUD INJ, as described in the Criteria and Thresholds Technical Report. The ranges do not account for an animal avoiding a source nor for the movement of the platform, both of which would influence the actual range to onset of auditory effects during an actual exposure.

Table 23 through table 28 below provide the ranges to TTS and AUD INJ for marine mammals from exposure durations of 1, 30, 60, and 120 seconds (s) for six sonar systems proposed for use (see also appendix A of the application). Due to the lower acoustic thresholds for TTS versus AUD INJ, ranges to TTS are larger. Successive pings can be expected to add together, further increasing the range to the onset of TTS and AUD INJ.

TABLE 23—VERY LOW-FREQUENCY CETACEAN RANGES TO EFFECTS FOR SONAR

Sonar type	Depth (m)	Duration (s)	Range to TTS (SD)	Range to AUD INJ (SD)
Dipping sonar	≤200	1	160 m (30 m)	12 m (4 m).
Dipping sonar	≤200	30	312 m (75 m)	21 m (6 m).
Dipping sonar	≤200	60	423 m (97 m)	25 m (5 m).

TABLE 23—VERY LOW-FREQUENCY CETACEAN RANGES TO EFFECTS FOR SONAR—Continued

Sonar type	Depth (m)	Duration (s)	Range to TTS (SD)	Range to AUD INJ (SD)
Dipping sonar	≤200	120	628 m (135 m)	35 m (6 m).
Dipping sonar	>200	1	140 m (20 m)	0 m (1 m).
Dipping sonar	>200	30	260 m (49 m)	0 m (8 m).
Dipping sonar	>200	60	340 m (70 m)	23 m (10 m).
Dipping sonar	>200	120	500 m (112 m)	35 m (15 m).
MF1 ship sonar	≤200	1	1,069 m (252 m)	90 m (17 m).
MF1 ship sonar	≤200	30	1,069 m (252 m)	90 m (17 m).
MF1 ship sonar	≤200	60	1,528 m (465 m)	140 m (24 m).
MF1 ship sonar	≤200	120	1,792 m (636 m)	180 m (32 m).
MF1 ship sonar	>200	1	1,000 m (85 m)	85 m (3 m).
MF1 ship sonar	>200	30	1,000 m (85 m)	85 m (3 m).
MF1 ship sonar	>200	60	1,500 m (252 m)	130 m (7 m).
MF1 ship sonar	>200	120	1,944 m (484 m)	170 m (9 m).
MF1C ship sonar	≤200	1	1,069 m (252 m)	90 m (17 m).
MF1C ship sonar	≤200	30	1,792 m (636 m)	180 m (32 m).
MF1C ship sonar	≤200	60	2,319 m (1,021 m)	260 m (56 m).
MF1C ship sonar	≤200	120	2,845 m (1,479 m)	390 m (72 m).
MF1C ship sonar	>200	1	1,000 m (85 m)	85 m (3 m).
MF1C ship sonar	>200	30	1,944 m (484 m)	170 m (9 m).
MF1C ship sonar	>200	60	2,792 m (1,103 m)	250 m (21 m).

Note: Median ranges are shown with standard deviation (SD) in parentheses.

Air Guns

Ranges to effects for air guns were determined by modeling the distance that sound would need to propagate to reach exposure level thresholds specific to a hearing group that would cause behavioral response, TTS, and AUD INJ, as described in the Criteria and Thresholds Technical Report. The air gun ranges to effects for TTS and AUD INJ in table 29 are based on the metric (*i.e.,* SEL or SPL) that produced larger ranges.

TABLE 29—RANGE TO EFFECTS FOR AIR GUNS

Functional hearing group	Depth (m)	Cluster size	Behavioral disturbance	Range to TTS (SD)	Range to AUD INJ (SD)
VLF	≤200	1	N/A	5 m (0 m)	1 m (1 m).
VLF	≤200	10	114 m (6 m)	81 m (1 m)	14 m (0 m).
VLF	>200	1	N/A	5 m (0 m)	1 m (1 m).
VLF	>200	10	115 m (7 m)	81 m (1 m)	14 m (0 m).
LF	≤200	1	N/A	5 m (0 m)	2 m (0 m).
LF	≤200	10	104 m (10 m)	36 m (1 m)	6 m (0 m).
LF	>200	1	N/A	5 m (0 m)	2 m (0 m).
LF	>200	10	107 m (11 m)	35 m (1 m)	6 m (0 m).
HF	≤200	1	N/A	2 m (1 m)	0 m (0 m).
HF	≤200	10	111 m (10 m)	2 m (1 m)	0 m (0 m).

TABLE 29—RANGE TO EFFECTS FOR AIR GUNS—Continued

Functional hearing group	Depth (m)	Cluster size	Behavioral disturbance	Range to TTS (SD)	Range to AUD INJ (SD)
HF	>200	1	N/A	2 m (1 m)	0 m (0 m).
HF	>200	10	112 m (13 m)	2 m (1 m)	0 m (0 m).
VHF	≤200	1	N/A	51 m (2 m)	25 m (0 m).
VHF	≤200	10	111 m (13 m)	51 m (2 m)	25 m (0 m).
VHF	>200	1	N/A	50 m (1 m)	25 m (0 m).
VHF	>200	10	119 m (14 m)	50 m (1 m)	25 m (0 m).
PCW	≤200	1	N/A	5 m (2 m)	2 m (1 m).
PCW	≤200	10	110 m (11 m)	7 m (3 m)	2 m (1 m).
PCW	>200	1	N/A	5 m (2 m)	2 m (1 m).
PCW	>200	10	113 m (23 m)	7 m (3 m)	2 m (1 m).
OCW	≤200	1	N/A	2 m (0 m)	1 m (0 m).
OCW	≤200	10	112 m (18 m)	2 m (0 m)	1 m (0 m).
OCW	>200	1	N/A	2 m (0 m)	1 m (0 m).
OCW	>200	10	118 m (19 m)	2 m (0 m)	1 m (0 m).

Note: N/A = Not Applicable. The values listed for TTS and AUD INJ are the greater of the respective SPL and SEL ranges. Median ranges are shown with standard deviation (SD) in parentheses. The Action Proponents split the LF functional hearing group into LF and VLF based on Houser *et al.,* (2024). NMFS updated acoustic technical guidance (NMFS, 2024) does not include these data but we have included the VLF group here for reference.

Pile Driving

Only California sea lions (U.S. stock) and harbor seals (California stock) are expected to be present in the waters of Port Hueneme, where impact and vibratory pile driving and extraction is proposed to occur up to 12 times per year. Table 30 shows the predicted ranges to AUD INJ, TTS, and behavioral response for the otariid carnivore in water and phocid carnivore in water hearing groups (the only functional hearing groups expected in the vicinity of pile driving and extraction activities) that were analyzed for their exposure to impact and vibratory pile driving. These ranges were estimated based on activity parameters described in the Acoustic Stressors section of the Explosive and Acoustic Analysis Report (see appendix A of the application) and using the calculations described in the Acoustic Impacts Technical Report.

TABLE 30—RANGE TO EFFECTS FOR PINNIPEDS FROM PILE DRIVING

Pile type	Method	Functional hearing group	Behavioral response (m)	Range to TTS (m)	Range to AUD INJ (m)
20-inch (51 cm) round timber/plastic	Impact	OCW	46	43	4
20-inch (51 cm) H steel	Impact	OCW	215	201	20
20-inch (51 cm) round or H steel/timber/plastic	Impact	OCW	858	685	69
27.5-inch (70 cm) sheet or Z steel	Vibratory	OCW	3,981	12	1
20-inch (51 cm) round steel/timber/plastic	Vibratory	OCW	3,981	36	2
20-inch (51 cm) round timber/plastic	Impact	PCW	46	116	12
20-inch (51 cm) H steel	Impact	PCW	215	538	54
20-inch (51 cm) round or H steel/timber/plastic	Impact	PCW	858	1,839	184
27.5-inch (70 cm) sheet or Z steel	Vibratory	PCW	11,659	35	2
20-inch (51 cm) round steel/timber/plastic	Vibratory	PCW	11,659	105	5

Note: cm = centimeter.

Explosives

This section provides the range (*i.e.,* distance) over which specific physiological or behavioral effects are expected to occur based on the explosive criteria (see section 6.2.1 (Impacts from Explosives) of the application and the Criteria and Thresholds Technical Report and the explosive propagation calculations from NAEMO. The range to effects are shown for a range of explosive bins, from E1 (0.1–0.25 lb (0.045–0.113 kg) NEW) to E16 (greater than 7,250–14,500 lb (3,288–6,577 kg) NEW (ship shock trial only)) (table 31 through table 36). Ranges are determined by modeling the distance that noise from an explosion would need to propagate to reach exposure level thresholds specific to a hearing group that would cause behavioral response (to the degree of Level B behavioral harassment), TTS, and AUD INJ. NMFS has reviewed the range distance to effect data provided by the Action Proponents and concurs with the analysis. Range to effects is important information in not only predicting impacts from explosives, but also in verifying the accuracy of model results against real-world situations and determining appropriate mitigation ranges to avoid higher level effects, especially injury to marine mammals. For additional information on how ranges to impacts from explosions were estimated, see the Acoustic Impacts Technical Report.

Table 31 through table 36 show the minimum, average, and maximum ranges to onset of auditory and likely behavioral effects that qualify as Level B harassment for all functional hearing groups based on the developed thresholds. Ranges are provided for a representative source depth and cluster size (*i.e.,* the number of rounds fired, or buoys dropped, within a very short duration) for each bin. Ranges for behavioral response are only provided if more than one explosive cluster occurs. As noted previously, single explosions at received sound levels below TTS and AUD INJ thresholds are most likely to result in a brief alerting or orienting

response. For events with multiple explosions, sound from successive explosions can be expected to accumulate and increase the range to the onset of an impact based on SEL thresholds. Modeled ranges to TTS and AUD INJ based on peak pressure for a single explosion generally exceed the modeled ranges based on SEL even when accumulated for multiple explosions. Peak pressure-based ranges are estimated using the best available science; however, data on peak pressure at far distances from explosions are very limited. The explosive ranges to effects for TTS and AUD INJ that are in the tables are based on the metric (*i.e.,* SEL or SPL) that produced larger ranges.

Table 37 shows ranges to non-auditory injury and mortality as a function of animal mass and explosive bin. For non-auditory injury, the larger of the ranges to slight lung injury or gastrointestinal tract injury was used as a conservative estimate, and the boxplots in appendix A to the application present ranges for both metrics for comparison. For the non-auditory metric, ranges are only available for a cluster size of one. Animals within water volumes encompassing the estimated range to non-auditory injury would be expected to receive minor injuries at the outer ranges, increasing to more substantial injuries, and finally mortality as an animal approaches the detonation point.

TABLE 31—VERY LOW-FREQUENCY CETACEAN RANGES TO EFFECTS FOR EXPLOSIVES

Bin	Depth (m)	Cluster size	Range to behavioral disturbance (SD)	Range to TTS (SD)	Range to AUD INJ (SD)
E1	≤200	1	N/A	206 m (73 m)	95 m (2 m).

Marine Mammal Density

A quantitative analysis of impacts on a species or stock requires data on their abundance and distribution that may be affected by anthropogenic activities in the potentially impacted area. The most appropriate metric for this type of analysis is density, which is the number of animals present per unit area. Marine species density estimation requires a significant amount of effort to both collect and analyze data to produce a reasonable estimate. Unlike surveys for terrestrial wildlife, many marine species spend much of their time submerged and are not easily observed. In order to collect enough sighting data to make reasonable density estimates, multiple observations are required, often in areas that are not easily accessible (*e.g.,* far offshore). Ideally, marine mammal species sighting data would be collected for the specific area and time period (*e.g.,* season) of interest and density estimates derived accordingly. However, in many places, poor weather conditions and high sea states prohibit the completion of comprehensive visual surveys.

For most cetacean species, abundance is estimated using line-transect surveys or mark-recapture studies (*e.g.,* Barlow, 2010; Barlow and Forney, 2007; Calambokidis *et al.,* 2008). This is the general approach applied in estimating cetacean abundance in NMFS SARs. Although the single value provides a good average estimate of abundance (*i.e.,* total number of individuals) for a specified area, it does not provide information on the species distribution or concentrations within that area, and it does not estimate density for other timeframes or seasons that were not surveyed. More recently, spatial habitat modeling has been used to estimate cetacean densities (*e.g.,* Becker *et al.,* 2022a, Becker *et al.,* 2022b, Becker *et al.,* 2021, Becker *et al.,* 2020a; Becker *et al.,* 2020b). These models estimate cetacean density as a continuous function of habitat variables (*e.g.,* sea surface temperature, seafloor depth, *etc.*) and thus allow predictions of cetacean densities on finer spatial scales than traditional line-transect or mark recapture analyses, and for areas that have not been surveyed. Within the geographic area that was modeled, densities can be predicted wherever these habitat variables can be measured or estimated.

Ideally, density data would be available for all species throughout the Study Area year-round, in order to best

estimate the impacts of specified activities on marine species. However, in many places, vessel availability, lack of funding, inclement weather conditions, and high sea states prevent the completion of comprehensive year-round surveys. Even with surveys that are completed, poor conditions may result in lower sighting rates for species that would typically be sighted with greater frequency under favorable conditions. Lower sighting rates preclude having an acceptably low uncertainty in the density estimates. A high level of uncertainty, indicating a low level of confidence in the density estimate, is typical for species that are rare or difficult to sight. In areas where survey data are limited or non-existent, known or inferred associations between marine habitat features and the likely presence of specific species are sometimes used to predict densities in the absence of actual animal sightings. Consequently, there is no single source of density data for every area, species, and season because of the fiscal costs, resources, and effort involved in providing enough survey coverage to sufficiently estimate density.

To characterize the marine species density for large oceanic regions, the Action Proponents review, critically assess, and prioritize existing density estimates from multiple sources, requiring the development of a systematic method for selecting the most appropriate density estimate for each combination of species/stock, area, and season. The selection and compilation of the best available marine species density data resulted in the NMSDD, which includes seasonal density values for every marine mammal species and stock present within the HCTT Study Area. This database is described in the ''U.S. Navy Marine Species Density Database Phase IV for the Hawaii-California Training and Testing Study Area'' technical report (U.S. Department of the Navy, 2024), hereafter referred to as the Density Technical Report. NMFS reviewed all marine mammal densities provided by the Action Proponents prior to use in their acoustic analysis for the current rulemaking process.

A variety of density data and density models are needed to develop a density database that encompasses the entirety of the HCTT Study Area. Because these data are collected using different methods with varying amounts of accuracy and uncertainty, the Action Proponents have developed a hierarchy to ensure the most accurate data are used when available. The Density Technical Report describes these models in detail and provides detailed explanations of the best available density estimate for each species. The list below describes possible sources of density data in order of preference:

1. Density spatial models are preferred and used when available because they provide spatially-explicit density estimates (typically at 10 km by 10 km (5.4 nmi by 5.4 nmi) spatial resolution) throughout the study area with the least amount of uncertainty). These models (see Becker *et al.,* 2022a, Becker *et al.,* 2022b, Becker *et al.,* 2021, Becker *et al.,* 2020a; Becker *et al.,* 2020b, Becker *et al.,* 2018, Forney *et al.,* 2015) predict spatial variability of animal density based on habitat variables (*e.g.,* sea surface temperature, seafloor depth, *etc.*). Density spatial models are developed for areas, species, and, when available, specific timeframes (*e.g.,* months or seasons) with sufficient survey data; therefore, these models cannot be used for species with low numbers of sightings.

2. Stratified design-based density estimates use line-transect survey data with the sampling area divided (*i.e.,* stratified) into sub-regions, and a density is derived for each sub-region (see Barlow, 2016; Barlow and Forney, 2007; Bradford *et al.,* 2021). While geographically stratified density estimates provide a better indication of a species' distribution within the study area, the uncertainty is typically high because each sub-region estimate is based on a smaller stratified segment of the overall survey effort.

3. Design-based density estimations use line-transect survey data collected from ship or aerial surveys designed to cover a specific geographic area (see Carretta *et al.,* 2024). These estimates use the same survey data as stratified design-based estimates, but are not segmented into sub-regions and instead provide one estimate for a large, surveyed area.

When interpreting the results of the quantitative analysis, as described in the Density Technical Report for the Phase III Atlantic Fleet Training and Testing Study Area (U.S. Department of the Navy, 2017a), ''it is important to consider that even the best estimate of marine species density is really a model representation of the values of concentration where these animals might occur. Each model is limited to the variables and assumptions considered by the original data source provider. No mathematical model representation of any biological population is perfect and with regards to marine species biodiversity, any single model method will not completely explain the actual distribution and abundance of marine mammal species. It is expected that there would be anomalies in the results that need to be evaluated, with independent information for each case, to support if we might accept or reject a model or portions of the model.''

The Action Proponents' estimates of abundance (based on density estimates used in the HCTT Study Area) utilize NMFS' SARs. For some species, the stock assessment for a given species may exceed the Navy's density prediction because those species' home range extends beyond the study area boundaries. For other species, the stock assessment abundance may be much less than the number of animals in the Navy's modeling given that the HCTT Study Area extends beyond the U.S. waters covered by the SAR abundance estimate. The primary source of density estimates are geographically specific survey data and either peer-reviewed line-transect estimates or habitat-based density models that have been extensively validated to provide the most accurate estimates possible.

NMFS coordinated with the Navy in the development of its take estimates and concurs that the Navy's approach for density appropriately utilizes the best available science. Later, in the Preliminary Analysis and Negligible Impact Determination section, we assess how the estimated take numbers compare to stock abundance in order to better understand the potential number of individuals impacted, and the rationale for which abundance estimate is used is included there.

Estimated Take From Acoustic Stressors

The 2024 HCTT Draft EIS/OEIS considered all military readiness activities proposed to occur in the HCTT Study Area that have the potential to result in the MMPA defined take of marine mammals. The Action Proponents determined that the four stressors below could result in the incidental taking of marine mammals. NMFS has reviewed the Action Proponents' data and analysis and determined that it is complete and accurate and agrees that the following stressors have the potential to result in takes by harassment of marine mammals from the specified activities:

- Acoustics (*i.e.,* sonars and other transducers, air guns, pile driving/extraction);
- Explosives (*i.e.,* explosive shock wave and sound, assumed to encompass the risk due to fragmentation);
- Land-based launch noise from missile and target launches at SNI and weapons firing and launch noise at PMRF; and
- Vessel strike.

Acoustic and explosive sources and land-based launch noise are likely to result in incidental takes of marine mammals by harassment. Vessel strikes have the potential to result in incidental take from injury, serious injury, and/or mortality.

The quantitative analysis process used for the 2024 HCTT Draft EIS/OEIS and the application to estimate potential exposures to marine mammals resulting from acoustic and explosive stressors is detailed in the Acoustic Impacts Technical Report.

Regarding how avoidance of loud sources is considered in the take estimation, NAEMO does not simulate horizontal animat (*i.e.,* a virtual animal) movement during an event. However, NAEMO approximates marine mammal avoidance of high sound levels due to exposure to sonars in a one-dimensional calculation that scales how far an animat would be from a sound source based on sensitivity to disturbance, swim speed, and avoidance duration. This process reduces the SEL, defined as the accumulation for a given animat, by reducing the received SPL of individual exposures based on a spherical spreading calculation from sources on each unique platform in an event. The onset of avoidance was based on the behavioral response functions. Avoidance speeds and durations were informed by a review of available exposure and baseline data. This method captures a more accurate representation of avoidance by using the received sound levels, distance to platform, and species-specific criteria to calculate potential avoidance for each animat than the approach used in Phase III. However, this avoidance method may underestimate avoidance of long-duration sources with lower sound levels because it triggers avoidance calculations based on the highest modeled SPL received level exceeding p(0.5) on the BRF, rather than on cumulative exposure. This is because initiation of the avoidance calculation is based on the highest modeled SPL received level over p(0.5) on the BRF. Please see section 4.4.2.2 of the Acoustic Impacts Technical Report.

Regarding the consideration of mitigation effectiveness in the take estimation, during military readiness activities, there is typically at least one, if not numerous, support personnel involved in the activity (*e.g.,* range support personnel aboard a torpedo retrieval boat or support aircraft). In addition to the Lookout posted for the purpose of mitigation, these additional personnel observe and disseminate marine species sighting information amongst the units participating in the activity whenever possible as they conduct their primary mission responsibilities. However, unlike in previous phases of HCTT, this quantitative analysis does not reduce model-estimated impacts to account for activity-based mitigation. While the activity-based mitigation is not quantitatively included in the take estimates (which, of note, would result in a reduction in the number of takes), table A–6 of appendix A of the application indicates the percentage of the instances of take where an animal's closest point of approach was within a mitigation zone and, therefore, AUD INJ could potentially be mitigated. Note that these percentages do not account for other factors, such as the sightability of a given species or viewing conditions.

Unlike activity-based mitigation, in some cases, implementation of the proposed geographic mitigation areas are incorporated into the quantitative analysis. The extent to which the mitigation areas reduce impacts on the affected species is addressed in the Preliminary Analysis and Negligible Impact Determination section.

For additional information on the quantitative analysis process, refer to the Acoustic Impacts Technical Report and sections 6 and 11 of the application.

As a general matter, NMFS does not prescribe the methods for estimating take for any applicant, but we review and ensure that applicants use the best available science, and methodologies that are logical and technically sound. Applicants may use different methods of calculating take (especially when using models) and still get to a result that is representative of the best available science and that allows for a rigorous and accurate evaluation of the effects on the affected populations. There are multiple pieces of the Navy's take estimation methods—propagation models, animat movement models, and behavioral thresholds, for example. NMFS evaluates the acceptability of these pieces as they evolve and are used in different rules and impact analyses. Some of the pieces of the Action Proponents' take estimation process have been used in Navy incidental take rules since 2009 and undergone multiple public comment processes; all of them have undergone extensive internal Navy review, and all of them have undergone comprehensive review by NMFS, which has sometimes resulted in modifications to methods or models.

The Navy uses rigorous review processes (verification, validation, and accreditation processes; peer and public review) to ensure the data and methodology it uses represent the best available science. For instance, NAEMO is the result of a NMFS-led Center for Independent Experts review of the components used in earlier models. The acoustic propagation component of NAEMO (titled CASS/GRAB) is accredited by the Oceanographic and Atmospheric Master Library (OAML), and many of the environmental variables used in NAEMO come from approved OAML databases and are based on in-situ data collection. The animal density components of NAEMO are base products of the NMSDD, which includes animal density components that have been validated and reviewed by a variety of scientists from NMFS Science Centers and academic institutions. Several components of the model, for example, habitat-based density model results for species off Hawaii and California have been published in several peer-reviewed journals (Becker *et al.,* 2020; Becker *et al.,* 2021; Becker *et al.,* 2022a; Becker *et al.,* 2022b). Additionally, NAEMO simulation components underwent quality assurance and quality control (commonly referred to as QA/QC) review and validation for model parts such as the scenario builder, acoustic builder, scenario simulator, *etc.,* conducted by qualified statisticians and modelers to ensure accuracy. Other models and methodologies have gone through similar review processes.

In summary, we believe the Action Proponents' methods, including the method for incorporating avoidance, are the most appropriate methods for predicting AUD INJ, non-auditory injury, TTS, and behavioral disturbance. But even with the consideration of avoidance, given some of the more conservative components of the methodology (*e.g.,* the thresholds do not consider ear recovery between pulses), we would describe the application of these methods as identifying the maximum number of instances in which marine mammals would be reasonably expected to be taken through AUD INJ, non-auditory injury, TTS, or behavioral disturbance.

Based on the methods discussed in the previous sections and NAEMO, the Action Proponents provided their take estimate and request for authorization of takes incidental to the use of acoustic and explosive sources for military readiness activities annually (based on the maximum number of activities that could occur per 12-month period) and over the 7-year period, as well as the Navy's take request for ship shock trials, covered by the application. The following species/stocks present in the HCTT Study Area were modeled by the Navy and estimated to have 0 takes of

any type from any activity source: killer whale (Eastern North Pacific Southern Resident stock) and spinner dolphin (Midway Atoll/Kure stock and Pearl and Hermes stock). NMFS has reviewed the Action Proponents' data, methodology, and analysis and determined that it is complete and accurate. NMFS agrees that the estimates for incidental takes by harassment from all sources requested for authorization are the maximum number of instances in which marine mammals are reasonably expected to be taken and that the takes by mortality requested for authorization are for the maximum number of instances mortality or serious injury could occur, as in the case of ship shock trials and vessel strikes.

Table 38, table 39, table 40, and table 41 summarize the maximum annual and 7-year total amount and type of Level A harassment and Level B harassment that NMFS concurs is reasonably expected to occur by species and stock for Navy training activities, Navy testing activities, Coast Guard training activities, and Army training activities, respectively.

TABLE 38—INCIDENTAL TAKE ESTIMATE BY STOCK DUE TO ACOUSTIC AND EXPLOSIVE SOURCES DURING NAVY TRAINING ACTIVITIES

Estimated Take From Sonar and Other Transducers

Table 42, table 43, and table 44 provide estimated effects from sonar and other transducers, including the comparative amounts of TTS and behavioral disturbance for each species and stock annually, noting that if a modeled marine mammal was ''taken'' through exposure to both TTS and behavioral disturbance in the model, it was recorded as a TTS. Of note, a higher proportion of the takes by Level B harassment of mysticetes include the potential for TTS (as compared to other taxa and prior rules) due to a combination of the fact that mysticetes are relatively less sensitive to behavioral disturbance and the number of auditory impacts from sonar (both TTS and AUD INJ) have increased for some species since the Phase III analysis (84 FR 70712, December 23, 2019) largely due to changes in how avoidance was modeled; for some stocks, changes in densities in areas that overlap activities have also contributed to increased or decreased impacts compared to those modeled in Phase III.

Compared to the prior analysis, the Action Proponents propose to use more hours of hull-mounted surface ship sonar, and these activities are newly analyzed in the NOCAL range complex and in PMSR. Compared to the prior analysis, this analysis considers increased use of MF1 (regular duty cycle) and MF1C (continuous duty cycle) associated with Navy training activities and decreased use of MF1 and MF1C associated with Navy testing activities. This analysis also considers the training and testing usage of these sonars across an expanded study area. For the maximum analyzed year of training and testing activities under this proposed action, MF1 has increased 20 percent and MF1C has increased 50 percent in the expanded California Study Area (which now includes PMSR and NOCAL). In the Hawaii Study Area MF1 and MF1C is proposed to increase greater than 10 percent and 60 percent respectively when compared to the prior HSTT analysis.

Additionally, the updated HF cetacean criteria reflect greater susceptibility to auditory effects at low and mid-frequencies than previously analyzed. Consequently, the predicted auditory effects due to sources under 10 kHz, including but not limited to MF1 hull-mounted sonar and other anti-submarine warfare sonars, are substantially higher for this auditory group than in prior analyses of the same activities. Thus, for activities with sonars, some modeled exposures that would previously have been categorized as significant behavioral responses may now instead be counted as auditory effects (TTS and AUD INJ). Similarly, the updated HF cetacean criteria reflect greater susceptibility to auditory effects at low and mid-frequencies in impulsive sounds. For VHF cetaceans, susceptibility to auditory effects has not changed substantially since the prior analysis.

Note: Zero (0) impacts indicate total less than 0.5 and a dash (-) is a true zero. In some cases where the estimated take within a cell is equal to 1, that value has been rounded up from a value that is less than 0.5 to avoid underestimating potential impacts to a species or stock based on the 7-year rounding rules discussed in section 2.4 of appendix E (Explosive and Acoustic Analysis Report) of the 2024 HCTT Draft EIS/OEIS.

*The Baja California Peninsula Mexico and California—Baja California Peninsula Mexico populations of false killer whale, pantropical spotted dolphin, and pygmy killer whales are not recognized stocks in NMFS Pacific stock assessment report (Carretta *et al.,* 2024), but separate density estimates were derived to support the Navy's analysis.

Estimated Take From Air Guns and Pile Driving

Table 45 provides estimated effects from air guns, including the comparative amounts of TTS and behavioral disturbance for each species and stock annually, noting that if a modeled marine mammal was ''taken'' through exposure to both TTS and behavioral disturbance in the model, it was recorded as a TTS.

TABLE 45—ANNUAL AND 7-YEAR ESTIMATED TAKE OF MARINE MAMMAL STOCKS FROM AIR GUNS DURING NAVY TRAINING AND TESTING ACTIVITIES

Note: Zero (0) impacts indicate total less than 0.5 and a dash (-) is a true zero. In some cases where the estimated take within a cell is equal to 1, that value has been rounded up from a value that is less than 0.5 to avoid underestimating potential impacts to a species or stock based on the 7-year rounding rules discussed in section 2.4 of appendix E (Explosive and Acoustic Analysis Report) of the 2024 HCTT Draft EIS/OEIS.

Table 46 provides the estimated effects from pile driving and extraction, including the comparative amounts of TTS and behavioral disturbance for each species and stock annually, noting that if a modeled marine mammal was ''taken'' through exposure to both TTS and behavioral disturbance in the model, it was recorded as a TTS.

TABLE 46—ANNUAL AND 7-YEAR ESTIMATED TAKE OF MARINE MAMMAL STOCKS FROM PILE DRIVING DURING NAVY TRAINING ACTIVITIES

Species	Stock	Maximum annual behavioral	Maximum annual TTS	Maximum annual AUD INJ	Maximum 7-year behavioral	Maximum 7-year TTS	Maximum 7-year AUD INJ
California Sea Lion	U.S	16,992	1,891	61	118,938	13,237	423
Harbor Seal	California	952	183	20	6,664	1,281	138

Estimated Take From Target and Missile Launch Activities

Table 47 provides the estimated effects from target and missile launch activities at SNI and PMRF, including the amounts of behavioral disturbance for each species and stock annually. Pinnipeds hauled out on the shoreline of SNI have been observed to behaviorally react to the sound of launches of targets and missiles from launch pads on the island (Naval Air Warfare Center Weapons Division, 2018; U.S. Department of the Navy, 2020b, 2022b, 2023). The estimate of the number of behavioral effects that would be expected due to in-air noise from launches was based on observations of pinnipeds over three monitoring seasons (2015–2017) divided by the number of launch events over that same time period. The Navy determined that the numbers presented in table 46 (see table 5–6 of the application) represent the number of pinnipeds expected to be hauled out at SNI based on surveys over the five-year period from 2014 to 2019 (U.S. Department of the Navy, 2020a) and the average number of effects observed per launch event (U.S. Department of the Navy, 2020b, 2022b, 2023). Of note, the estimated behavioral effects presented in table 47 are the same as those authorized in the July 2022 PMSR LOA (87 FR 40888, July 8, 2022).

For California sea lions, take estimates at SNI were derived from three monitoring seasons (2015 to 2017) where an average of 274.44 instances of take of sea lions by Level B harassment occurred per launch event. Therefore, 275 sea lions was multiplied by 40 launch events, for a take estimate of 11,000 instances of take by Level B harassment of California sea lions annually (table 47). Of note, the Navy has not conducted more than 25 launch events in a given year since 2001. For harbor seals, a total of 12 takes were derived from the 2016 and 2017 monitoring seasons and multiplied by 40 launch events for a total of 480 instances of take by Level B harassment annually (table 47). For northern elephant seals, take estimates were derived from three monitoring seasons (2015 to 2017) where an average of 0.61 instances of take of northern elephant seals by Level B harassment occurred per launch event. Therefore, one northern elephant seal was multiplied by 40 launch events for a take estimate of 40 instances of take by Level B harassment of northern elephant seals annually (table 47). Generally, northern elephant seals do not react to launch events other than simple alerting responses such as raising their heads or temporarily going from sleeping to being awake; however, to account for the rare instances where they have reacted, the Navy considered that some northern elephant seals could be taken during launch events.

At PMRF from 2020 to 2023, an annual average of 215 monk seals have been counted hauled out on the beach (unpublished Navy data). The maximum number of seals observed during a single observation was five and the minimum was zero; on most observations no hauled out seals were observed. Based on the annual average number of animals documented at the site, the Action Proponents estimate that weapons firing noise at PMRF would result in 215 behavioral effects annually on hauled out monk seals (table 47; see table 5–7 of the application). The analysis conservatively assumes that: (1) at least one monk seal is hauled out when a launch or firing event would occur, an assumption contradicted by the observational data, which indicates that most frequently no monk seals are hauled out on the beach; and (2) that a monk seal would be disturbed and behaviorally respond during each event. This estimate is well beyond the anticipated take due to the 35 missile, rocket, drone launches and 3 artillery events (38 total) events on average per year. Monk seal in-air hearing is less sensitive than hearing in other phocid seals (Ruscher *et al.,* 2021; Ruscher *et al.,* 2025), suggesting that monk seals may be less likely to respond to in-air noise.

Neither TTS nor auditory injury is anticipated from missile and launch activities, as marine mammals are not anticipated to be exposed to noise from these activities that exceed the TTS or auditory injury thresholds (see the 2024 HCTT Draft EIS/OEIS appendix E.1, In-Air Acoustic Effects on Pinnipeds from Weapons Firing Noise).

TABLE 47—ANNUAL AND 7-YEAR ESTIMATED TAKE OF MARINE MAMMAL STOCKS FROM IN-AIR ACOUSTIC STRESSORS FROM MISSILE, AERIAL TARGET, AND AIR VEHICLE LAUNCHES AND ARTILLERY FIRING

Species	Stock	Maximum annual behavioral	Maximum 7-year behavioral
California sea lion	U.S	11,000	77,000
Harbor seal	California	480	3,360
Hawaiian monk seal	Hawai'i	215	1,505
Northern elephant seal	California	40	280

Note: California sea lion, harbor seal, and northern elephant seal are expected at San Nicolas Island only. Hawaiian monk seal is expected at the Pacific Missile Range Facility only.

Estimated Take From Explosives

Table 48 provides estimated effects from explosives during Navy training activities and table 49 provides estimated effects from explosives including small ship shock trials from Navy testing activities. Table 50 provides estimated effects from small ship shock trials over a maximum year (*i.e.,* one event) of Navy testing activities, which is a subset of the information included in table 49. Table 51 provides estimated effects from explosives during Coast Guard training activities, and table 52 provides estimated effects from explosives during Army training activities.

*The Baja California Peninsula Mexico and California—Baja California Peninsula Mexico populations of false killer whale, pantropical spotted dolphin, and pygmy killer whales are not recognized stocks in NMFS Pacific stock assessment report (Carretta *et al.,* 2024), but separate density estimates were derived to support the Navy's analysis.

Estimated Take From Vessel Strike by Serious Injury or Mortality

Vessel strikes from commercial, recreational, and military vessels are known to affect large whales and have resulted in serious injury and fatalities to cetaceans (Abramson *et al.,* 2011; Berman-Kowalewski *et al.,* 2010a; Calambokidis, 2012; Douglas *et al.,* 2008; Laggner, 2009; Lammers *et al.,* 2003; Van der Hoop *et al.,* 2013; Van der Hoop *et al.,* 2012). Records of vessel strikes of large whales date back to the early 17th century, and the worldwide number of vessel strikes of large whales appears to have increased steadily during recent decades (Laist *et al.,* 2001; Ritter 2012).

Numerous studies of interactions between surface vessels and marine mammals have demonstrated that free-ranging marine mammals often, but not always (*e.g.,* McKenna *et al.,* 2015), engage in avoidance behavior when surface vessels move toward them. It is not clear whether these responses are caused by the physical presence of a surface vessel, the underwater noise generated by the vessel, or an interaction between the two (Amaral and Carlson, 2005; Au and Green, 2000; Bain *et al.,* 2006; Bauer 1986; Bejder *et al.,* 1999; Bejder and Lusseau, 2008; Bejder *et al.,* 2009; Bryant *et al.,* 1984; Corkeron, 1995; Erbe, 2002; Félix, 2001; Goodwin and Cotton, 2004; Greig *et al.,* 2020; Guilpin *et al.,* 2020; Keen *et al.,* 2019; Lemon *et al.,* 2006; Lusseau, 2003; Lusseau, 2006; Magalhaes *et al.,* 2002; Nowacek *et al.,* 2001; Redfern *et al.,* 2020; Richter *et al.,* 2003; Scheidat *et al.,* 2004; Simmonds, 2005; Szesciorka *et al.,* 2019; Watkins, 1986; Williams *et al.,* 2002; Wursig *et al.,* 1998). Several authors suggest that the noise generated during motion is probably an important factor (Blane and Jaakson, 1994; Evans *et al.,* 1992; Evans *et al.,* 1994). These studies suggest that the behavioral responses of marine mammals to surface vessels are similar to their behavioral responses to predators. Avoidance behavior is expected to be even stronger in the subset of instances during which the Action Proponents are conducting military readiness activities using active sonar or explosives.

The marine mammals most vulnerable to vessel strikes are those that spend extended periods of time at the surface in order to restore oxygen levels within their tissues after deep dives (*e.g.,* sperm whales). In addition, some baleen whales seem generally unresponsive to vessel sound, making them more susceptible to vessel strikes (Nowacek *et al.,* 2004). These species are primarily large, slow moving whales. There are 8 species (17 stocks) of large whales that are known to occur within the HCTT Study Area (table 14): gray whale, blue whale, Bryde's whale, fin whale, humpback whale, minke whale, sei whale, and sperm whale.

Some researchers have suggested the relative risk of a vessel strike can be assessed as a function of animal density and the magnitude of vessel traffic (*e.g.,* Fonnesbeck *et al.,* 2008; Vanderlaan *et al.,* 2008). Differences among vessel types also influence the probability of a vessel strike. The ability of any vessel to detect a marine mammal and avoid a collision depends on a variety of factors, including environmental conditions, vessel design, size, speed, and ability and number of personnel observing, as well as the behavior of the animal. Vessel speed, size, and mass are all important factors in determining if injury or death of a marine mammal is likely due to a vessel strike. For large vessels, speed and angle of approach can influence the severity of a strike. Large whales also do not have to be at the water's surface to be struck. Silber *et al.* (2010) found that when a whale is below the surface (about one to two times the vessel draft), under certain circumstances (vessel speed and location of the whale relative to the ship's centerline), there is likely to be a pronounced propeller suction effect. This suction effect may draw the whale into the hull of the ship, increasing the probability of propeller strikes.

There are some key differences between the operation of military and non-military vessels which make the likelihood of a military vessel striking a whale lower than some other vessels (*e.g.,* commercial merchant vessels). Key differences include:

- Military vessels have personnel assigned to stand watch at all times, day and night, when moving through the water (*i.e.,* when the vessel is underway). Watch personnel undertake extensive training and are certified to stand watch only after demonstrating competency in all necessary skills. While on watch, personnel employ visual search and reporting procedures in accordance with the U.S. Navy Lookout Training Handbook, the Coast Guard's Shipboard Lookout Manual, or civilian equivalent.
- The bridges of many military vessels are positioned closer to the bow, offering better visibility ahead of the vessel (compared to a commercial merchant vessel);
- Military readiness activities often involve aircraft (which can serve as part of the Lookout team), that can more readily detect cetaceans in the vicinity of a vessel or ahead of a vessel's present course, often before crew on the vessel would be able to detect them;
- Military vessels are generally more maneuverable than commercial merchant vessels, and are therefore capable of changing course more quickly in the event cetaceans are spotted in the vessel's path;
- Military vessels operate at the slowest speed practical consistent with operational requirements. While minimum speed is intended as a fuel conservation measure particular to a certain ship class, secondary benefits include a better ability to detect and avoid objects in the water, including marine mammals;
- Military ships often operate within a defined area for a period of time, in contrast to point-to-point commercial shipping over greater distances;
- The crew size on military vessels is generally larger than merchant vessels, allowing for stationing more trained Lookouts on the bridge. At all times when the Action Proponents' vessels are underway, trained Lookouts and bridge navigation teams are used to detect objects on the surface of the water ahead of the ship, including cetaceans. Some events may have additional personnel (beyond the minimum number of required Lookouts) who are already standing watch in or on the platform conducting the event or additional participating platforms and would have eyes on the water for all or part of an event. These additional personnel serve as members of the Lookout team; and
- When submerged, submarines are generally slow moving (to avoid detection); as a result, marine mammals at depth with a submarine are likely able to avoid collision with the submarine. When a submarine is transiting on the surface, the Navy posts Lookouts serving the same function as they do on surface vessels.

Vessel strike to marine mammals is not associated with any specific military readiness activity. Rather, vessel strike is a limited and sporadic, but possible, accidental result of military vessel movement within the HCTT Study Area or while in transit.

There were two recorded U.S. Navy vessel strikes of large whales in the HSTT (now HCTT) Study Area in 2009. There were no known strikes from June 2009 until May 2021, a period of approximately 12 years. (Of note, between 2009–2024, the Navy documented 384 U.S. Navy vessel movements in HSTT to avoid marine mammals during MTEs.) Since 2021 there have been five strikes of large whales in SOCAL attributed to naval vessels, three by the U.S. Navy and two by the Royal Australian Navy. As stated

previously, the U.S. Navy struck a large whale in waters off Southern California in May 2023. Based on available photos and video, NMFS and the Navy have determined this whale was either a fin whale or sei whale. The U.S. Navy struck two unidentified large whales during the months of June and July 2021, and prior to that, on May 7, 2021, the Royal Australian Navy HMAS Sydney, a 147.5 m (161.3 yd) Hobart Class Destroyer, struck and killed two fin whales (a mother and her calf) while operating within SOCAL. Please see the *Authorized Take From Vessel Strikes and Explosives by Serious Injury or Mortality* section of the 2025 HSTT final rule (90 FR 4944, January 16, 2025) for detailed descriptions of the naval vessel strikes that occurred in 2021 and 2023.

In March 2024 a dead fin whale was discovered off of Pier 10 in Naval Station San Diego within the Navy's security barrier. The security barrier, which consists of a series of connected floating sections, is intended to discourage unauthorized boat entry to the piers. The necropsy indicated that vessel strike was the most likely cause of death. Given the location the whale was discovered, this could have been the result of a military vessel strike. However, the Navy reviewed its vessel activity during that time frame and available observations of those vessels coming and going to port, as well as at port, and determined it was unlikely that the whale was carried into port by a Navy vessel. Based on this and other information from Navy's investigation, we cannot determine whether this whale was struck by a Navy vessel during HSTT activities or was struck by a commercial or other vessel and drifted into the Navy pier area.

There has been one recorded Coast Guard vessel strike of a large whale (humpback) in the HCTT Study Area since 2009. The strike occurred in 2020 off Maui, HI. There have been no known strikes within the California portion of the HCTT Study Area. However, there were two Coast Guard strikes outside of and inshore of the California portion of the HCTT Study Area, a humpback whale in 2023 and a gray whale in 2024. The vessels involved in the 2023 and 2024 strikes were moving at slow speed less than 6 kn and no obvious injury to the whales were observed after the strikes.

In light of the key differences between the operation of military and non-military vessels discussed above, it is highly unlikely that a military vessel would strike any type of marine mammal without detecting it. Specifically, Lookouts posted on or near the ship's bow can visually detect a strike in the absence of other indications that a strike has occurred. The Action Proponents' internal procedures and mitigation requirements include reporting of any vessel strikes of marine mammals, and the Action Proponents' discipline, extensive training (not only for detecting marine mammals, but for detecting and reporting any potential navigational obstruction), and strict chain of command give NMFS a high level of confidence that all strikes are reported. Accordingly, NMFS is confident that the Navy and Coast Guard's reported strikes are accurate and appropriate for use in the analysis.

When generally compared to mysticetes, odontocetes are more capable of physically avoiding a vessel strike and since some species occur in large groups, they are more easily seen when they are closer to the water surface. The smaller size and maneuverability of dolphins, small whales (not including large whale calves), porpoises, and pinnipeds generally make vessel strike very unlikely. For as long as records have been kept, neither the Navy nor the Coast Guard have any record of any small whales or pinnipeds being struck by a vessel as a result of military readiness activities. Over the same time period, NMFS, the Navy, and the Coast Guard have only one record of a dolphin being struck by a vessel as a result of Navy or Coast Guard activities. The dolphin was accidentally struck by a Navy small boat in fall 2021 in Saint Andrew's Pass, Florida. Other than this one reported strike of a dolphin in 2021, NMFS has never received any reports from other LOA or IHA holders indicating that these species have been struck by vessels. Worldwide vessel strike records show little evidence of strikes of these groups or marine mammals from the shipping sector and larger vessels (though for many species, records do exist (*e.g.,* West *et al.* 2024, Van Waerebeek *et al.,* 2007)), and the majority of the Action Proponents' activities involving faster-moving vessels (that could be considered more likely to hit a marine mammal) are located in offshore areas where smaller delphinid, porpoise, and pinniped densities are lower.

In order to account for the accidental nature of vessel strike to large whales in general, and the potential risk from vessel movement within the HCTT Study Area within the 7-year period of this proposed authorization, the Action Proponents requested incidental takes based on probabilities derived from a Poisson distribution. A Poisson distribution is often used to describe random occurrences when the probability of an occurrence is small. Count data, such as cetacean sighting data, or in this case strike data, are often described as a Poisson or over-dispersed Poisson distribution. The Poisson distribution was calculated using vessel strike data between 2009–2024 in the HCTT Study Area, historical at-sea days in the HCTT Study Area for the Navy and the Coast Guard (described in detail in section 6 of the application), and estimated potential at-sea days for both Action Proponents during the 7-year period from 2025–2032 covered by the requested regulations. The analysis incorporates data beginning in 2009 as that was the start of the Navy's Marine Species Awareness Training and adoption of additional mitigation measures to address vessel strike, which will remain in place along with additional and modified mitigation measures during the 7 years of this proposed rulemaking. The analysis for the period of 2025 to 2032 is described in detail below and in section 6.3.2 (Probability of Vessel Strike of Large Whale Species) of the application.

Between 2009 and early 2024, there were a total of 35,006 Navy at-sea days for Navy manned vessels greater than 127 m (418 ft, or Littoral Combat Ship size and above) in the HCTT Study Area, an average 2,188 days per year. This estimate is based on positional tracking data records from the Navy's Authoritative Maritime Services database for the years 2016–2023. The Navy used the average of the 2016–2023 annual values as a surrogate for annual at-sea days for each year between 2009 and 2015. Given variation in vessel traffic from year to year, the Navy anticipates that the annual average from this period is a sufficient prediction of future at-sea days for manned surface ships for the period of this proposed rule (*i.e.,* 2025–2032) (*i.e.,* 2,188 days per year). In addition, this vessel strike analysis considers the potential for larger sized USVs (longer than 61 m (200 ft)) to strike a large whale, as these vessels would be used for military readiness activities during the proposed effective period of this proposed rule. While there have been no known vessel strikes from USVs, this analysis incorporates an estimated 728 at-sea days for large USVs, for a predicted total of 2,916 annual at-sea days from large, manned vessels and large USVs from 2025–2032 (*i.e.,* 20,412 at-sea days over the 7-year period).

Between 2009 and early 2024, there were a total of 4,179 Coast Guard at-sea days for vessels larger than 100 m (328 ft) in the HCTT Study Area, an average of 262 days per year. To account for limitations in data availability particular

to Coast Guard vessel size classes, future new vessel or repositioning home port assignments, in consideration of documented strikes from Coast Guard medium sized vessels <100 m, and out of an abundance of caution, the Coast Guard predicted that there could be up to 60 additional at-sea days per year for the 2025–2032 period, for a predicted total of 322 annual at-sea days for vessels that may strike a large whale from 2025–2032 (*i.e.,* 2,254 at-sea days over the 7-year period).

As described above, during the same 2009 to 2024 period, there were five Navy vessel strikes of large whales and one Coast Guard vessel strike of a large whale. To calculate a vessel strike rate for each Action Proponent for the period of 2009 through 2024, the Action Proponents used the respective number of past vessel strikes of large whales and the respective number of at-sea days. Navy at-sea days (for vessels greater than 65 ft (19.8 m)) from 2009 through 2024 was estimated to be 35,006 days. Dividing the five known Navy strikes during that period by the at-sea days (*i.e.,* 5 strikes/35,006 at-sea days) results in a strike rate of 0.000143 strikes per at-sea day. Coast Guard at-sea days from 2009 through 2024 was estimated to be 4,179 days. Dividing the one known Coast Guard strike during that period by the at-sea days (*i.e.,* 1 strike/4,179 at-sea days) results in a strike rate of 0.000239 strikes per day.

As described above, the Action Proponents estimated that 20,412 Navy and 2,254 Coast Guard at-sea days would occur over the 7-year period associated with the requested authorization. Given a strike rate of 0.000143 Navy strikes per at-sea day, and 0.000239 Coast Guard strikes per at-sea day, the predicted number of vessel strikes over a 7-year period would be 2.9 strikes by the Navy and 0.5 strikes by the Coast Guard.

Using this predicted number of strikes, the Poisson distribution predicted the probabilities of a specific number of strikes (n = 0, 1, 2, *etc.*) from 2025 through 2032 for each Action Proponent. The probability analysis concluded that there is a 95 percent chance that a Navy vessel would strike at least one whale over the 7-year period, and a 79, 56, 34, 17, or 8 percent chance that more than one, two, three, four, or five whales, respectively, would be struck by the Navy over the 7-year period.

The probability analysis concluded that there is a 42 percent chance that a Coast Guard vessel would strike at least one whale over the 7-year period, and a 10 or 1 percent chance that more than one or two whales, respectively, would be struck by the Coast Guard over the 7-year period.

Based on this analysis, the Navy is requesting authorization to take five large whales by serious injury or mortality by vessel strike incidental to Navy training and testing activities, and the Coast Guard is requesting authorization to take two large whales by serious injury or mortality by vessel strike incidental to Coast Guard training activities. NMFS concurs that take by serious injury or mortality by vessel strike of up to five large whales by the Navy and two large whales by the Coast Guard (seven large whales total) could occur over the 7-year regulations and, based on the information provided earlier in this section, NMFS concurs with the Action Proponents' assessment and recognizes the potential for incidental take by vessel strike of large whales only (*i.e.,* no dolphins, small whales (not including large whale calves), porpoises, or pinnipeds) over the course of the 7-year regulations from military readiness activities.

While the Poisson distribution allows the Action Proponents and NMFS to determine the likelihood of vessel strike of all large whales, it does not indicate the likelihood of each strike occurring to a particular species or stock. As described above, the Action Proponents have not always been able to identify the species of large whale struck during previous known vessel strikes. However, based on the information available, the Navy requested authorization for take by serious injury or mortality by vessel strike of five whales, and of those five, no more than the following numbers from these stocks: one blue whale (Eastern North Pacific stock), four fin whales (California/Oregon/Washing (CA/OR/WA) stock), two gray whales (Eastern North Pacific stock), two humpback whale (one each of the Mainland Mexico-CA/OR/WA stock and the Central North Pacific stock), and one sperm whale (Hawaii stock). The Coast Guard requested authorization for take by serious injury or mortality by vessel strike of two whales, and of those two, no more than the following numbers from these stocks: one blue whale (Eastern North Pacific stock), two fin whales (CA/OR/WA stock), two gray whales (Eastern Pacific stock), and two humpback whales (one each of the Mainland Mexico-CA/OR/WA stock and Central North Pacific stock).

After concurring that take of up to seven large whales could occur (five takes by Navy, two by Coast Guard), and in consideration of the Action Proponents' request, NMFS considered which species could be among the seven large whales struck. NMFS conducted an analysis that considered several factors, in addition to the overlap of Navy activities with stock distribution: (1) the relative likelihood of striking one stock versus another based on available strike data from all vessel types as denoted in the SARs, and (2) whether each Action Proponent has ever struck an individual from a particular species or stock in the HCTT Study Area, and if so, how many times.

To address number (1) above, for SOCAL, NMFS compiled information from the 2023 SARs (Carretta *et al.,* 2024, Young *et al.,* 2024) on detected annual rates of large whale M/SI from vessel strike (table 53). (Of note, these data include the strike of two fin whales by the Royal Australian Navy in 2021, but do not include Navy strikes in 2021 and 2023 because the species struck is not known.) The M/SI in the 2023 SAR considers modeled takes (accounting for undetected vessel strike mortality) for some, but not most species and stocks (*i.e.,* M/SI for humpback whale includes modeled takes from Rockwood *et al.* (2017)). Using known strike data for all species and stocks allows NMFS to consider similar metrics for this comparative analysis. (Note that we rely on the M/SI estimates from the 2023 SAR (or draft 2024 SAR, where relevant) in our negligible impact analysis.) We also consider modeled takes of species from Rockwood *et al.* (2017) in table 53. The annual rates of large whale serious injury or mortality from vessel strike reported in the SARs help inform the relative susceptibility of large whale species to vessel strike in HCTT Study Area as recorded systematically over the five-year period used for the SARs. We summed the annual rates of serious injury or mortality from vessel strikes as reported in the SARs (excluding strikes that the SAR indicates occurred outside of the Study Area (*e.g.,* in Alaska)) and then divided each species' annual rate by this sum to get the percentage of total annual strikes for each species/stock (table 53).

TABLE 53—SUMMARY OF FACTORS CONSIDERED IN DETERMINING THE NUMBER OF INDIVIDUALS IN EACH STOCK POTENTIALLY STRUCK BY A VESSEL

Species	Stock	Total known U.S. Navy or Coast Guard strikes in HCTT study area	Rockwood *et al.* (2017) modeled vessel strikes [a]	Annual rate of M/SI from vessel strike [b]	Percentage of total annual strikes	Percent likelihood of 1 strike over 7 years	Percent likelihood of 2 strikes over 7 years	Percent likelihood of 3 strikes over 7 years
Blue whale	Eastern North Pacific.	Navy 2004	18	0.6	6.06	5.76	0.33	0.02
Fin whale	California/Oregon/Washington.	Navy 2009; Navy 2009; Navy 2023 (fin or sei).	43	1.6	16.16	15.35	2.36	0.36
Humpback whale	Mainland Mexico-California-Oregon-Washington.	Coast Guard 2016 (northern California) [c].	22	2.6	26.26	24.95	6.22	1.55
Humpback whale	Central America/Southern Mexico-California-Oregon-Washington.							
Sperm whale	Hawaii	Navy 2007		0.0	0.00	UNK	UNK	UNK
Gray whale	Eastern North Pacific.	Navy 1993; Navy 1998; Navy 1998.		1.8	18.18	17.27	2.98	0.52
Humpback whale	Hawaii	Navy 1998; Navy 2003; Coast Guard 2020.		3.3	33.33	31.67	10.03	3.18
Sei whale	Eastern North Pacific.	Navy 2023 (fin or sei).		0.0	0.0	0.00	0.00	0.00
Sei whale	Hawaii			0.0	0.0	0.00	0.00	0.00
Sperm whale	California/Oregon/Washington.			0.0	0.0	0.00	0.00	0.00
Bryde's whale	Eastern Tropical Pacific.			0.0	0.0	0.00	0.00	0.00
Bryde's whale	Hawaii			0.0	0.0	0.00	0.00	0.00
Minke whale	Hawaii			0.0	0.0	0.00	0.00	0.00
Minke whale	California/Oregon/Washington.			0.0	0.0	0.00	0.00	0.00

[a] Rockwood *et al.* (2017) modeled likely annual vessel strikes off the West Coast for these three species only.
[b] Values are from the most recent stock assessment report (Carretta *et al.,* 2024).
[c] The strike by the Coast Guard in 2016 was in San Francisco Bay, CA, outside the boundary of the HCTT Study Area.

To inform the likelihood of a single action proponent striking a particular species of large whale, we multiplied the percent of total annual strikes for a given species in table 53 by the total percent likelihood of a single action proponent striking at least one whale (*i.e.,* 95 and 42 percent for the Navy and Coast Guard, respectively, as described by the probability analysis above). We also calculated the percent likelihood of a single action proponent striking a particular species of large whale two or three times by squaring or cubing, respectively, the value estimated for the probability of striking a particular species of whale once (*i.e.,* to calculate the probability of an event occurring twice, multiply the probability of the first event by the second). The results of these calculations are reflected in the last three columns of table 53. We note that these probabilities vary from year to year as the average annual mortality changes depending on the specific range of time considered; however, over the years and through updated data in the SARs, stocks tend to consistently maintain a relatively higher or relatively lower likelihood of being struck.

The percent likelihood calculated (as described above) are then considered in combination with the information indicating the known species that the Navy or Coast Guard has struck in the HCTT Study Area since 1991 (since they started tracking consistently) (see table 53). We note that for the lethal take of species specifically denoted in table 53, 47 percent of those struck by the Navy (8 of 17 in the Pacific) remained unidentified (including the May 2023 strike, which as stated above, NMFS and the Navy have determined was of either a fin whale or sei whale), and 20 percent of those struck by the Coast Guard (1 of 5 in the Pacific) remained unidentified. However, given the information on known stocks struck, the analysis below remains appropriate. We also note that Rockwood *et al.* (2017) modeled the likelihood of vessel strike of blue whales, fin whales, and humpback whales on the U.S. West Coast (discussed in more detail in the *Serious Injury or Mortality* subsection of the Preliminary Analysis and Negligible Impact Determination section), and those numbers help inform the relative likelihood that the Navy or Coast Guard could strike those stocks.

Accordingly, stocks that have no record of ever having been struck by any vessel are considered to have a zero percent likelihood of being struck by the Navy or Coast Guard in the 7-year period of the proposed rule. Marine mammal stocks that have never been struck by the Navy or Coast Guard, have rarely been struck by other vessels, and have a low percent likelihood based on the historical vessel strike calculation are also considered to have a zero percent likelihood to be struck by the Navy or Coast Guard during the 7-year rule. We note that while vessel strike records have not differentiated between Eastern North Pacific and Western North Pacific gray whales, given their small population size and the comparative rarity with which individuals from the Western North Pacific stock are detected off the U.S. West Coast, it is highly unlikely that they would be encountered, much less struck. This rules out all but eight stocks. This leaves the following stocks for further analysis: blue whale (Eastern North Pacific stock), fin whale (CA/OR/WA stock), gray whale (Eastern North Pacific stock), humpback whale (Mainland Mexico-CA/OR/WA, Central America/Southern Mexico-CA/OR/WA, and Hawaii stocks), sei whale (Eastern North Pacific stock), and sperm whale (Hawaii stock).

As stated previously, based on available photos and video of the whale struck by the U.S. Navy in Southern

California in 2023, NMFS and the Navy have determined this whale was either a fin whale or sei whale. While the species of the two whales struck by the U.S. Navy in 2021 are unknown, given the following factors, NMFS expects these strikes may have been CA/OR/WA fin whales or Eastern North Pacific gray whales, or some combination of these two stocks. These species have the highest annual rates of M/SI from vessel collision in California (1.6, 1.8, respectively, as noted above). Additionally, gray whale and fin whale have the most recorded vessel strike incidents by military vessels in California and are the only stocks known to have been hit more than one time by naval or Coast Guard vessels in the California portion of the study area (three gray whale strikes by the U.S. Navy (1993, 1998), two or three fin whale strikes by the U.S. Navy (2009, potentially 2023), and two fin whale strikes by the Royal Australian Navy (2021)). Further, accounting for undocumented vessel strikes, Rockwood *et al.* (2021) estimated that in their study area off Southern California from 2012–2018, on average 8.9 blue, 4.6 humpback, and 9.7 fin whales were killed by civilian vessel strikes from June to November each year. In addition, they estimated that, on average, 5.7 humpback whales were killed by civilian vessel strike from January–April per year (Rockwood *et al.* 2021). For fin whales in particular, model-predicted densities of large whales in the Southern California Bight from May to July 2021 (the time period during which the 2021 strikes of two unidentified whales by the U.S. Navy occurred) estimated fin whale abundance as being nearly an order of magnitude higher than either blue or humpback whale abundance during this time period (Becker *et al.* 2020b; Zickel *et al.* 2021). Ship-whale encounter models for the U.S. West Coast Exclusive Economic Zone also indicated that vessel strike mortality estimates for fin whales were significantly higher than for blue whales and humpback whales (Rockwood *et al.* 2017). The comparatively higher modeled vessel strike rates for fin whales result from both the larger population as well as the more offshore distribution that overlaps significantly with several major shipping routes for a much greater spatial extent (Rockwood *et al.* 2017). Based on 1,243 visual boat-based sightings of 2,638 fin whales from 1991–2011, Calambokidis *et al.* (2015) found fin whale concentration areas included the San Clemente Basin where the 2021 Navy vessel strikes occurred. Tanner and Cortes Banks area and the shelf edge west of SNI were also reported as fin whale concentration areas. There are two different populations of fin whales that occur in the Southern California Bight: a seasonal population, and a population that occurs year-round with offshore/inshore movements (Campbell *et al.* 2015; Falcone *et al.* 2022). This would likely make fin whales more susceptible to vessel strike year-round, as compared to other large whale species that may occur seasonally within SOCAL. Therefore, we find that, of the five total takes by serious injury or mortality by vessel strike of large whales proposed for authorization for the Navy over the course of the 7-year rule, up to three of those takes could be of the CA/OR/WA stock of fin whale and up to two could be of the Eastern North Pacific stock of gray whale given that the two strikes of unidentified large whales in 2021 could have been of either stock. Further, we expect that, of the five total takes by serious injury or mortality by vessel strike of large whales proposed for authorization for the Navy, up to two of those takes could occur in Hawaii, and therefore be of individuals of the Hawaii stock of humpback whale. NMFS expects that, of the two total takes by serious injury or mortality by vessel strike of large whales proposed for authorization for the Coast Guard, one of those takes could be of the CA/OR/WA stock of fin whale, Eastern North Pacific stock of gray whale, or Hawaii stock of humpback whale. (Coast Guard struck a humpback whale in Hawaii in 2020.)

For U.S. Navy vessel strikes in California, based on the information summarized in table 53 and the fact that there is the potential for up to five large whales to be struck by the Navy over the 7-year rule, one individual from the Eastern North Pacific stock of blue whale, Mainland Mexico-CA/OR/WA and Central America/Southern Mexico CA/OR/WA stocks of humpback whale, or Eastern North Pacific stock of sei whale could be among the five whales struck. The total strikes of Eastern North Pacific blue whales and the percent likelihood of striking one based on the historic strike calculation above can both be considered moderate compared to other stocks, and the Navy struck a blue whale in 2004 (based on the historic strike calculation, the likelihood of striking two blue whales is well below one percent (table 52)). Therefore, we consider it reasonably likely that the Navy could strike one individual over the course of the 7-year proposed rule. The total strikes of Eastern North Pacific sei whales are low (*i.e.,* 0) compared to other stocks, but NMFS and the Navy think it is possible that the Navy may have struck a sei whale in SOCAL in 2023. Therefore, we consider it reasonably likely that the Navy could strike a sei whale over the period of the rule. The Navy has not struck a humpback whale in the California portion of the HCTT Study Area. However, in 2016 a U.S. Coast Guard vessel struck a humpback whale heading out of San Francisco Bay, and as a species, humpbacks have a high number of total strikes and percent likelihood of being struck. The likelihood of Central America/Southern Mexico-CA/OR/WA (Central America DPS) or Mainland Mexico-CA/OR/WA (Mexico DPS) humpback whales being struck by any vessel type is moderate to high relative to other stocks, and NMFS anticipates that the Navy could strike one individual humpback whale from the Mainland Mexico-CA/OR/WA stock (Mexico DPS) and/or one individual from the Central America/Southern Mexico- CA/OR/WA (Central America DPS) over the 7-year duration of the rule.

For Coast Guard vessel strikes in California, NMFS anticipates that the Coast Guard may potentially strike the same species as listed above for the Navy. Based on the information summarized in table 53 and the fact that there is the potential for up to two large whales to be struck by the Coast Guard over the 7-year rule, one individual from the Eastern North Pacific stock of blue whale, CA/OR/WA stock of fin whale, Mainland Mexico-CA/OR/WA and Central America/Southern Mexico CA/OR/WA stocks of humpback whale, Eastern North Pacific stock of gray whale, or Eastern North Pacific stock of sei whale could be among the two whales struck. While, as noted above, NMFS anticipates that the U.S. Navy is more likely to strike a fin whale than some other stocks, NMFS does not anticipate that the same is true for the Coast Guard, as its vessel traffic is not concentrated in the area where previous known Navy vessel strikes of fin whales have occurred. Given the lower potential total number of vessel strikes by the Coast Guard, NMFS does not anticipate that the Coast Guard is likely to strike more than one of any given species.

For Hawaii stocks, given that all known vessel strikes between 2015 and 2021 were of humpback whales, we anticipate that any vessel strike of a large whale in Hawaii would likely be of the Hawaii stock of humpback whale. Given that this stock has the highest percentage of total annual strikes (33.3 percent) and a 10.3 percent chance of

being struck twice over the effective period of the rule, NMFS is proposing to authorize two lethal takes of Hawaii humpback whales for the Navy and one for the Coast Guard. NMFS also anticipates that the Navy may strike up to one Hawaii sperm whale given the 2007 sperm whale strike. Given the already lower likelihood of striking the Hawaii stock of sperm whales, the relatively lower vessel activity in the Hawaii portion of the HCTT Study Area, and the relatively lower Coast Guard vessel traffic compared to Navy vessel traffic, NMFS neither anticipates, nor proposes to authorize, a Coast Guard strike of this stock.

As described above, the Navy's analysis suggests and NMFS' analysis concurs that the likelihood of vessel strikes to the stocks below is discountable due to the stocks' relatively low occurrence in the HCTT Study Area, particularly in core HCTT training and testing subareas, and the fact that the stocks have not been struck by the Navy and are rarely, if ever, recorded struck by other vessels. Therefore, NMFS is not authorizing lethal take for the following stocks: blue whale (Central North Pacific stock), Bryde's whale (Eastern Tropical Pacific stock and Hawaii stock), fin whale (Hawaii stock), gray whale (Western North Pacific stock), minke whale (CA/OR/WA stock and Hawaii stock), sei whale (Hawaii stock), and sperm whale (CA/OR/WA stock).

Also of note, while information on past Navy vessel strikes can serve as a reasonable indicator of future vessel strike risk, future conditions may differ from the past in ways that could influence the likelihood of a large whale vessel strike occurring. In general, the magnitude of vessel strike risk may be increasing over time as many whale populations are gradually recovering from centuries of commercial whaling (Redfern *et al.* 2020). Increased vessel strike risk off California in recent decades has been associated with increases in the abundance of fin and humpback whale populations in the North Pacific (Redfern *et al.* 2020). It has also been suggested that the blue whale population in the Eastern North Pacific, inclusive of the California portion of the HCTT Study Area, is at carrying capacity and recovered to pre-whaling levels (Monnahan *et al.* 2014). In addition, the magnitude of risk may also be affected by shifts in whale distributions over time in response to environmental factors including marine heatwaves and associated changes in prey distribution.

Historically, military vessel strikes of large whales within the HCTT Study Area have been rare events with only eight such strikes occurring over the past 14 years, five U.S. Navy strikes, one Coast Guard strike, and two Royal Australian Navy strikes. However, the fact that four of these strikes occurred within a 3-month period (May–July) in 2021, and two occurred within a 4-month period (February–May) in 2009, suggests that military vessel strikes in California can be both highly episodic and clustered. The four large whale strikes in 2021 (two strikes of unidentified large whales by the U.S. Navy and two fin whale strikes by the Royal Australian Navy) appear to be outliers in the time series of military vessel strikes in SOCAL for that period. Particularly in consideration of the 2023 U.S. Navy strike, these strikes could also represent an early indicator of an increased military vessel strike risk within SOCAL based on the factors discussed above. Results from a survey of whale watching vessel operators and crew in Southern California, combined with remote sensing data in the area, suggest that the number of large whales may have been greater in May through July of 2021 compared with previous years in certain high military vessel traffic and ''core'' use HCTT areas off southern California, particularly farther offshore as well as closer to shore off San Diego Bay (Zickel *et al.,* 2021).

In conclusion, while take by vessel strike across any given year is sporadic, based on the information and analysis above, including consideration of the 2021 and 2023 strikes by the U.S. Navy, NMFS anticipates no more than seven takes of large whales by M/SI could occur over the 7-year period of the rule (no more than five by Navy, no more than two by Coast Guard). Of those seven whales over the 7-years, no more than four may come from the CA/OR/WA stock of fin whale. No more than three may come from the following stocks: gray whale (Eastern North Pacific stock); and humpback whale (Hawaii stock). No more than two may come from the following stocks: blue whale (Eastern North Pacific stock); sei whale (Eastern North Pacific); and humpback whale (Mainland Mexico-CA/OR/WA and Central America/Southern Mexico-CA/OR/WA stocks (Mexico and Central America DPSs, respectively)). No more than one may come from the Hawaii stock of sperm whale. (Note that these species and stock conclusions vary slightly from that requested by Navy and Coast Guard.) Accordingly, NMFS has evaluated under the negligible impact standard the M/SI of 0.14, 0.29, 0.43, or 0.57 whales annually from each of these species or stocks (*i.e.,* one, two, three, or four takes, respectively, divided by 7 years to get the annual number), along with the expected incidental takes by harassment.

Summary of Requested Take From Military Readiness Activities

Table 54 and table 55 summarize the Action Proponents' take proposed by harassment type and effect type, respectively.

TABLE 54—TOTAL ANNUAL AND 7-YEAR INCIDENTAL TAKE PROPOSED BY STOCK DURING ALL ACTIVITIES BY HARASSMENT TYPE

Species	Stock	Maximum annual Level B harassment	Maximum annual Level A harassment	Maximum annual mortality	7-Year total Level B harassment	7-Year total Level A harassment	7-Year total mortality

Note: Zero (0) impacts indicate total less than 0.5 and a dash (-) is a true zero. In some cases where the estimated take within a cell is equal to 1, that value has been rounded up from a value that is less than 0.5 to avoid underestimating potential impacts to a species or stock based on the 7-year rounding rules discussed in section 2.4 of appendix E (Explosive and Acoustic Analysis Report) of the 2024 HCTT Draft EIS/OEIS.

*The Baja California Peninsula Mexico and California—Baja California Peninsula Mexico populations of false killer whale, pantropical spotted dolphin, and pygmy killer whales are not recognized stocks in NMFS Pacific stock assessment report (Carretta *et al.,* 2024), but separate density estimates were derived to support the Navy's analysis.

Proposed Mitigation Measures

Under section 101(a)(5)(A) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to the activity, and other means of effecting the least practicable adverse impact on the species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of the species or stocks for subsistence uses (''least practicable adverse impact''). NMFS does not have a regulatory definition for least practicable adverse impact. The 2004 NDAA amended the MMPA as it relates to military readiness activities and the incidental take authorization process such that a determination of ''least practicable adverse impact'' shall include consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity. For additional discussion of NMFS' interpretation of the least practicable adverse impact standard, see the Mitigation Measures section of the Gulf of Alaska Study Area final rule (88 FR 604, January 4, 2023).

Implementation of Least Practicable Adverse Impact Standard

Here, we discuss how we determine whether a measure or set of measures meets the ''least practicable adverse impact'' standard. Our separate analysis of whether the take anticipated to result from the Action Proponents' activities meets the ''negligible impact'' standard appears in the Preliminary Analysis and Negligible Impact Determination section below.

Our evaluation of potential mitigation measures includes consideration of two primary factors: (1) The manner in which, and the degree to which, implementation of the potential measure(s) is expected to reduce adverse impacts to marine mammal species or stocks, their habitat, or their availability for subsistence uses (where relevant). This analysis considers such things as the nature of the potential adverse impact (*e.g.,* likelihood, scope, and range), the likelihood that the measure will be effective if implemented, and the likelihood of successful implementation. (2) The practicability of the measure(s) for applicant implementation. Practicability of implementation may consider such things as cost, impact on activities, and, in the case of a military readiness activity, specifically considers personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity.

While the language of the least practicable adverse impact standard calls for minimizing impacts to affected species or stocks, we recognize that the reduction of impacts to those species or stocks accrues through the application of mitigation measures that limit impacts to individual animals. Accordingly, NMFS' analysis focuses on measures that are designed to avoid or minimize impacts on individual marine mammals that are more likely to increase the probability or severity of population-level effects.

While direct evidence of impacts to species or stocks from a specified activity is rarely available, and additional study is still needed to understand how specific disturbance events affect the fitness of individuals of certain species, there have been improvements in understanding the process by which disturbance effects are translated to the population. With recent scientific advancements (both marine mammal energetic research and the development of energetic frameworks), the relative likelihood or degree of impacts on species or stocks may often be inferred given a detailed understanding of the activity, the environment, and the affected species or stocks—and the best available science has been used here. This same information is used in the development of mitigation measures and helps us understand how mitigation measures contribute to lessening effects (or the risk thereof) to species or stocks. We also acknowledge that there is always the potential that new information, or a new recommendation, could become available in the future and necessitate reevaluation of mitigation measures (which may be addressed through adaptive management) to see if further reductions of population impacts are possible and practicable.

In the evaluation of specific measures, the details of the specified activity will necessarily inform each of the two primary factors discussed above (expected reduction of impacts and practicability) and are carefully considered to determine the types of mitigation that are appropriate under the least practicable adverse impact standard. Analysis of how a potential mitigation measure may reduce adverse impacts on a marine mammal stock or species, consideration of personnel safety, practicality of implementation, and consideration of the impact on effectiveness of military readiness activities are not issues that can be meaningfully evaluated through a yes/no lens. The manner in which, and the degree to which, implementation of a measure is expected to reduce impacts, as well as its practicability in terms of these considerations, can vary widely. For example, a time/area restriction could be of very high value for decreasing population-level impacts (*e.g.,* avoiding disturbance of feeding females in an area of established biological importance) or it could be of lower value (*e.g.,* decreased disturbance in an area of high productivity but of less biological importance). Regarding practicability, a measure might involve restrictions in an area or time that impede the Navy's ability to certify a strike group (higher impact on mission effectiveness), or it could mean delaying a small in-port training event by 30 minutes to avoid exposure of a marine mammal to injurious levels of sound (*i.e.,* lower impact). A responsible evaluation of ''least practicable adverse impact'' will consider the factors along these realistic scales. Accordingly, the greater the likelihood that a measure will contribute to reducing the probability or severity of adverse impacts to the species or stock or its habitat, the greater the weight that measure is given when considered in combination with practicability to determine the appropriateness of the mitigation measure, and vice versa. We discuss consideration of these factors in greater detail below.

1. Reduction of adverse impacts to marine mammal species or stocks and their habitat.

The emphasis given to a measure's ability to reduce the impacts on a species or stock considers the degree, likelihood, and context of the anticipated reduction of impacts to individuals (and how many individuals) as well as the status of the species or stock.

The ultimate impact on any individual from a disturbance event (which informs the likelihood of adverse species- or stock-level effects) is dependent on the circumstances and associated contextual factors, such as duration of exposure to stressors. Though any proposed mitigation needs to be evaluated in the context of the specific activity and the species or stocks affected, measures with the following types of effects have greater value in reducing the likelihood or severity of adverse species- or stock-level impacts: avoiding or minimizing injury or mortality; limiting interruption of known feeding, breeding, mother/young, or resting behaviors; minimizing the abandonment of important habitat (temporally and spatially); minimizing the number of individuals subjected to these types of disruptions; and limiting

degradation of habitat. Mitigating these types of effects is intended to reduce the likelihood that the activity will result in energetic or other types of impacts that are more likely to result in reduced reproductive success or survivorship. It is also important to consider the degree of impacts that are expected in the absence of mitigation in order to assess the added value of any potential measures. Finally, because the least practicable adverse impact standard gives NMFS discretion to weigh a variety of factors when determining appropriate mitigation measures and because the focus of the standard is on reducing impacts at the species or stock level, the least practicable adverse impact standard does not compel mitigation for every kind of take, or every individual taken, if that mitigation is unlikely to meaningfully contribute to the reduction of adverse impacts on the species or stock and its habitat, even when practicable for implementation by the applicant.

The status of the species or stock is also relevant in evaluating the appropriateness of potential mitigation measures in the context of least practicable adverse impact. The following are examples of factors that may, alone or in combination, result in greater emphasis on the importance of a mitigation measure in reducing impacts on a species or stock: the stock is known to be decreasing or status is unknown, but believed to be declining; the known annual mortality (from any source) is approaching or exceeding the PBR level (as defined in MMPA section 3(20)); the affected species or stock is a small, resident population; or the stock is involved in a UME or has other known vulnerabilities (*e.g.,* recovering from an oil spill).

Habitat mitigation, particularly as it relates to rookeries, mating grounds, and areas of similar significance, is also relevant to achieving the standard and can include measures such as reducing impacts of the activity on known prey utilized in the activity area or reducing impacts on physical habitat. As with species- or stock-related mitigation, the emphasis given to a measure's ability to reduce impacts on a species or stock's habitat considers the degree, likelihood, and context of the anticipated reduction of impacts to habitat. Because habitat value is informed by marine mammal presence and use, in some cases there may be overlap in measures for the species or stock and for use of habitat.

We consider available information indicating the likelihood of any measure to accomplish its objective. If evidence shows that a measure has not typically been effective nor successful, then either that measure should be modified or the potential value of the measure to reduce effects should be lowered.

2. Practicability.

Factors considered may include cost, impact on activities, and, in the case of a military readiness activity, will include personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity (see 16 U.S.C. 1371(a)(5)(A)(iii)).

Assessment of Mitigation Measures for the HCTT Study Area

NMFS has fully reviewed the specified activities and the mitigation measures included in the application and the 2024 HCTT Draft EIS/OEIS to determine if the mitigation measures would result in the least practicable adverse impact on marine mammals and their habitat. NMFS worked with the Action Proponents in the development of their initially proposed measures, which are informed by years of implementation and monitoring. A complete discussion of the Action Proponents' evaluation process used to develop, assess, and select mitigation measures, which was informed by input from NMFS, can be found in chapter 5 (Mitigation) and appendix K (Geographic Mitigation Assessment) of the 2024 HCTT Draft EIS/OEIS. The process described in chapter 5 (Mitigation) and appendix A (Activity Descriptions) of the 2024 HCTT Draft EIS/OEIS robustly supported NMFS' independent evaluation of whether the mitigation measures would meet the least practicable adverse impact standard. The Action Proponents would be required to implement the mitigation measures identified in this proposed rule for the full 7 years to avoid or reduce potential impacts from acoustic, explosive, and physical disturbance and strike stressors.

As a general matter, where an applicant proposes measures that are likely to reduce impacts to marine mammals, the fact that they are included in the application indicates that the measures are practicable, and it is not necessary for NMFS to conduct a detailed analysis of the measures the applicant proposed (rather, they are simply included). However, it is still necessary for NMFS to consider whether there are additional practicable measures that would meaningfully reduce the probability or severity of impacts that could affect reproductive success or survivorship.

The Action Proponents have agreed to mitigation measures that would reduce the probability and/or severity of impacts expected to result from acute exposure to acoustic sources or explosives, vessel strike, and impacts to marine mammal habitat. Specifically, the Action Proponents would use a combination of delayed starts, powerdowns, and shutdowns to avoid mortality or serious injury, minimize the likelihood or severity of AUD INJ or non-auditory injury, and reduce instances of TTS or more severe behavioral disturbance caused by acoustic sources or explosives. The Action Proponents would also implement multiple time/area restrictions that would reduce take of marine mammals in areas or at times where they are known to engage in important behaviors (*e.g.,* calving, where the disruption of those behaviors would have a higher probability of resulting in impacts on reproduction or survival of individuals that could lead to population-level impacts.

The Action Proponents assessed the practicability of the proposed measures in the context of personnel safety, practicality of implementation, and their impacts on the Action Proponents' ability to meet their Congressionally mandated requirements and found that the measures are supportable. As described in more detail below, NMFS has independently evaluated the measures the Action Proponents proposed in the manner described earlier in this section (*i.e.,* in consideration of their ability to reduce adverse impacts on marine mammal species and their habitat and their practicability for implementation). We have determined that the measures would significantly reduce impacts on the affected marine mammal species and stocks and their habitat and, further, be practicable for implementation by the Action Proponents. We have preliminarily determined that the mitigation measures assure that the Action Proponents' activities would have the least practicable adverse impact on the species or stocks and their habitat.

The Action Proponents also evaluated numerous measures in the 2024 HCTT Draft EIS/OEIS that were not included in the application, and NMFS independently reviewed and preliminarily concurs with the Action Proponents' analysis that their inclusion was not appropriate under the least practicable adverse impact standard based on our assessment. The Action Proponents considered these additional potential mitigation measures in the context of the potential benefits to marine mammals and whether they are practical or impractical.

Section 5.9 (Measures Considered but Eliminated) of chapter 5 (Mitigation) of the 2024 HCTT Draft EIS/OEIS, includes

an analysis of an array of different types of mitigation that have been recommended over the years by non-governmental organizations or the public, through scoping or public comment on environmental compliance documents. These recommendations generally fall into three categories, discussed below: reduction of activity; activity-based operational measures; and time/area limitations.

As described in section 5.9 (Measures Considered but Eliminated) of the 2024 HCTT Draft EIS/OEIS, the Action Proponents considered reducing the overall amount of training, reducing explosive use, modifying sound sources, completely replacing live training with computer simulation, and including time of day restrictions. Many of these mitigation measures could potentially reduce the number of marine mammals taken via direct reduction of the activities or amount of sound energy put in the water. However, as described in chapter 5 (Mitigation) of the 2024 HCTT Draft EIS/OEIS, the Action Proponents need to train in the conditions in which they fight—and these types of modifications fundamentally change the activity in a manner that would not support the purpose and need for the training (*i.e.,* are entirely impracticable) and therefore are not considered further. NMFS finds the Action Proponents' explanation of why adoption of these recommendations would unacceptably undermine the purpose of the training persuasive. After independent review, NMFS finds the Action Proponents' judgment on the impacts of these potential mitigation measures to personnel safety, practicality of implementation, and the effectiveness of training persuasive, and for these reasons, NMFS finds that these measures do not meet the least practicable adverse impact standard because they are not practicable.

In chapter 5 (Mitigation) of the 2024 HCTT Draft EIS/OEIS, the Action Proponents also evaluated additional potential activity—based mitigation measures, including increased mitigation zones, ramp-up measures, additional passive acoustic and visual monitoring, and decreased vessel speeds. Some of these measures have the potential to incrementally reduce take to some degree in certain circumstances, though the degree to which this would occur is typically low or uncertain. However, as described in the Action Proponents' analysis, the measures would have significant direct negative effects on mission effectiveness and are considered impracticable. NMFS independently reviewed the Action Proponents' evaluation and concurs with this assessment, which supports NMFS' preliminary findings that the impracticability of this additional mitigation would greatly outweigh any potential minor reduction in marine mammal impacts that might result; therefore, these additional mitigation measures are not warranted.

Lastly, chapter 5 (Mitigation) of the 2024 HCTT Draft EIS/OEIS also describes a comprehensive analysis of potential geographic mitigation that includes consideration of both a biological assessment of how the potential time/area limitation would benefit the species and its habitat (*e.g.,* is a key area of biological importance or would result in avoidance or reduction of impacts) in the context of the stressors of concern in the specific area and an operational assessment of the practicability of implementation (*e.g.,* including an assessment of the specific importance of an area for training, considering proximity to training ranges and emergency landing fields and other issues). In some cases, potential benefits to marine mammals were non-existent, while in others the consequences on mission effectiveness were too great.

NMFS has reviewed the Action Proponents' analysis in chapter 5 (Mitigation) and appendix A (Activity Descriptions) of the 2024 HCTT Draft EIS/OEIS, which consider the same factors that NMFS considers to satisfy the least practicable adverse impact standard, and concurs with the analysis and conclusions. Therefore, NMFS is not proposing to include any of the measures that the Action Proponents ruled out in the 2024 HCTT Draft EIS/OEIS. Below are the mitigation measures that NMFS has preliminarily determined would ensure the least practicable adverse impact on all affected species and their habitat, including the specific considerations for military readiness activities. Table 56 describes the information designed to aid Lookouts and other applicable personnel with their observation, environmental compliance, and reporting responsibilities. The following sections describe the mitigation measures that would be implemented in association with the activities analyzed in this document. The mitigation measures are organized into two categories: activity-based mitigation and geographic mitigation areas.

Of note, according to the U.S. Navy, consistent with customary international law, when a foreign military vessel participates in a U.S. Navy exercise within the U.S. territorial sea (*i.e.,* 0 to 12 nmi (0 to 22.2 km) from shore), the U.S. Navy will request that the foreign vessel follow the U.S. Navy's mitigation measures for that particular event. When a foreign military vessel participates in a U.S. Navy exercise beyond the U.S. territorial sea but within the U.S. Exclusive Economic Zone, the U.S. Navy will encourage the foreign vessel to follow the U.S. Navy's mitigation measures for that particular event (Navy 2022a; Navy 2022b). In either scenario (*i.e.,* both within and beyond the territorial sea), U.S. Navy personnel will provide the foreign vessels participating with a description of the mitigation measures to follow.

TABLE 56—ENVIRONMENTAL AWARENESS AND EDUCATION

Stressor or Activity: All training and testing activities, as applicable.
Requirements: Navy personnel (including civilian personnel) involved in mitigation and training or testing activity reporting under the specified activities must complete one or more modules of the U.S. Navy Afloat Environmental Compliance Training Series, as identified in their career path training plan. Modules include: • Introduction to Afloat Environmental Compliance Training Series. The introductory module provides information on environmental laws (*e.g.,* ESA, MMPA) and the corresponding responsibilities that are relevant to military readiness activities. The material explains why environmental compliance is important in supporting the Action Proponents' commitment to environmental stewardship. • Marine Species Awareness Training. All bridge watch personnel, Commanding Officers, Executive Officers, maritime patrol aircraft aircrews, anti-submarine warfare and mine warfare rotary-wing aircrews, Lookouts, and equivalent civilian personnel must successfully complete the Marine Species Awareness Training prior to standing watch or serving as a Lookout. The Marine Species Awareness Training provides information on sighting cues, visual observation tools and techniques, and sighting notification procedures. Navy biologists developed Marine Species Awareness Training to improve the effectiveness of visual observations for biological resources, focusing on marine mammals and sea turtles, and including floating vegetation, jellyfish aggregations, and flocks of seabirds. • Protective Measures Assessment Protocol. This module provides the necessary instruction for accessing mitigation requirements during the event planning phase using the Protective Measures Assessment Protocol (PMAP) software tool.

TABLE 56—ENVIRONMENTAL AWARENESS AND EDUCATION—Continued

• Sonar Positional Reporting System and Marine Mammal Incident Reporting. This module provides instruction on the procedures and activity reporting requirements for the Sonar Positional Reporting System and marine mammal incident reporting.

Activity-Based Mitigation

Activity-based mitigation is mitigation that the Action Proponents would implement whenever and wherever an applicable military readiness activity takes place within the HCTT Study Area. Previously referred to as ''Procedural Mitigation,'' the primary objective of activity-based mitigation is to reduce overlap of marine mammals with stressors that have the potential to cause injury or mortality in real time. Activity-based mitigations are fundamentally consistent across stressor activity, although specific variations account for differences in platform configuration, event characteristics, and stressor types. The Action Proponents customize mitigation for each applicable activity category or stressor. Activity-based mitigation generally involves: (1) the use of one or more trained Lookouts to diligently observe for marine mammals and other specific biological resources (*e.g.,* indicator species like floating vegetation, jelly aggregations, large schools of fish, and flocks of seabirds) within a mitigation zone; (2) requirements for Lookouts to immediately communicate sightings of marine mammals and other specific biological resources to the appropriate watch station for information dissemination; and (3) requirements for the watch station to implement mitigation (*e.g.,* halt an activity) until certain recommencement conditions have been met. The remainder of the mitigation measures are activity-based mitigation measures (table 57 through table 76) organized by stressor type and activity category and include acoustic stressors (*i.e.,* active sonar, air guns, pile driving, weapons firing noise), explosive stressors (*i.e.,* bombs, gunnery, underwater demolition, mine counter-measure and neutralization activities, missiles and rockets, sonobuoys and research-based sub-surface explosives, ship shock trials, and sinking exercises), and physical disturbance and strike stressors (*i.e.,* aerial-deployed mines and non-explosive bombs, non-explosive gunnery, non-explosive torpedoes missiles and rockets, vessel movement, towed in-water devices, and net deployment).

The Action Proponents must implement the proposed mitigation measures described in table 57 through table 76, as appropriate, in response to an applicable sighting within, or entering into, the relevant mitigation zone for acoustic stressors, explosives, and non-explosive munitions. Each table describes the activities that the requirements apply to, the required mitigation zones in which the action proponents must take a mitigation action, the required number of Lookouts and observation platform, the required mitigation actions that the action proponents must take before, during, and/or after an activity, and a required wait period prior to commencing or recommencing an activity after a delay, power down, or shutdown of an activity.

The Action Proponents proposed wait periods because events cannot be delayed or ceased indefinitely for the purpose of mitigation due to impacts on safety, sustainability, and the ability to meet mission requirements. Wait periods are designed to allow animals the maximum amount of time practical to resurface (*i.e.,* become available to be observed) before activities resume. The action proponents factored in an assumption that mitigation may need to be implemented more than once when developing wait period durations. Wait periods are 10 minutes, 15 minutes, or 30 minutes depending on the fuel constraints of the platform and feasibility of implementation. NMFS concurs with these proposed wait periods.

If an applicable species (identified in the relevant mitigation tables) is observed within a required mitigation zone prior to the initial start of the activity, the Action Proponents must: (1) relocate the event to a location where applicable species are not observed; or (2) delay the initial start of the event (or stressor use) until one of the ''Mitigation Zone All-Clear Conditions'' (defined below) has been met. If an applicable stressor is observed within a required mitigation zone during the event (*i.e.,* during use of the indicated source) the Action Proponents must take the action described in the ''Mitigation Zones'' section of the table until one of the Mitigation Zone All-Clear Conditions has been met.

For all activities, an activity may not commence or recommence until one of the following ''Mitigation Zone All-Clear Conditions'' have been met: (1) a Lookout observes the applicable species exiting the mitigation zone; (2) a Lookout concludes that the animal has exited the mitigation zone based on its observed course, speed, and movement relative to the mitigation zone; (3) a Lookout affirms the mitigation zone has been clear from additional sightings for a designated ''wait period''; or (4) for mobile events, the stressor has transited a distance equal to double the mitigation zone size beyond the location of the last sighting.

Activity-Based Mitigation for Active Acoustic Stressors

Mitigation measures for acoustic stressors are provided below and include active acoustic sources (table 57), pile driving and extraction (table 58), and weapons firing noise (table 59). For this proposed action, the following ranges apply to the use of small, medium, and large caliber: small is up to and including 50 caliber machine gun rounds; medium is greater than 50 caliber and less than 57 millimeter (mm; 2.24 inch); and large is 57 mm (2.24 inch) and larger. Small caliber items are solid projectiles (*i.e.,* bullets). Medium caliber items are 30–57 mm (1.18–2.24 inch) and can have both inert non-explosive rounds and high explosive rounds. High caliber items are greater than or equal to 57 mm (2.24 inch) and can have both inert non-explosive rounds and high explosive rounds. Activity-based mitigation for acoustic stressors does not apply to:

- sources not operated under positive control (*e.g.,* moored oceanographic sources);
- sources used for safety of navigation (*e.g.,* fathometers);
- sources used or deployed by aircraft operating at high altitudes (*e.g.,* bombs deployed from high altitude (since personnel cannot effectively observe the surface of the water));
- sources used, deployed, or towed by unmanned platforms except when escort vessels are already participating in the event and have positive control over the source;
- sources used by submerged submarines (*e.g.,* sonar (since they cannot conduct visual observation));
- de minimis sources (*e.g.,* those >200 kHz); and
- vessel-based, unmanned vehicle-based, or towed in-water sources when marine mammals (*e.g.,* dolphins) are determined to be intentionally swimming at the bow or alongside or

directly behind the vessel, vehicle, or device (*e.g.,* to bow-ride or wake-ride).

TABLE 57—MITIGATION FOR ACTIVE ACOUSTIC SOURCES

Stressor or Activity: Active acoustic sources with power down and shut down capabilities:
- Low-frequency active sonar ≥200 dB.
- Mid-frequency active sonar sources that are hull mounted on a surface ship (including surfaced submarines).
- Broadband and other active acoustic sources >200 dB.

- Mitigation Zones:
  - 1,000 yd (914.4 m) from active acoustic sources (power down of 6 dB total).
  - 500 yd (457.2 m) from active acoustic sources (power down of 10 dB total).
  - 200 yd (182.9 m) from active acoustic sources (shut down).
- Mitigation Requirements:
  - One Lookout in/on one of the following:
    - Aircraft.
    - Pierside, moored, or anchored vessel
    - Underway vessel with space/crew restrictions (including small boats).
    - Underway vessel already participating in the event that is escorting (and has positive control over sources used, deployed, or towed by) an unmanned platform.
  - Two Lookouts on an underway vessel without space/crew restrictions.
  - Lookouts would use information from passive acoustic detections to inform visual observations when passive acoustic devices are already being used in the event.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of using active acoustic sources (*e.g.,* while maneuvering on station).
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals during use of active acoustic sources.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

Stressor or Activity: Active acoustic sources with shut down (but not power down) capabilities:
- Low-frequency active sonar <200 dB.
- Mid-frequency active sonar sources that are not hull mounted on a surface ship (*e.g.,* dipping sonar, towed arrays).
- High-frequency active sonar.
- Air guns.
- Broadband and other active acoustic sources <200 dB.

- Mitigation Zones:
  - 200 yd (182.9 m) from active acoustic sources (shut down).
- Mitigation Requirements:
  - One Lookout in/on one of the following:
    - Aircraft.
    - Pierside, moored, or anchored vessel.
    - Underway vessel with space/crew restrictions (including small boats).
    - Underway vessel already participating in the event that is escorting (and has positive control over sources used, deployed, or towed by) an unmanned platform.
  - Two Lookouts on an underway vessel without space/crew restrictions.
  - Lookouts would use information from passive acoustic detections to inform visual observations when passive acoustic devices are already being used in the event.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of using active acoustic sources (*e.g.,* while maneuvering on station).
  - Action Proponent personnel must observe the mitigation zone for marine mammals during use of active acoustic sources.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 58—MITIGATION FOR PILE DRIVING AND EXTRACTION

Stressor or Activity: Vibratory and impact pile driving and extraction.

- Mitigation Zone:
  - 5 yd (4.6 m) from piles being driven or extracted (cease pile driving or extraction).
- Mitigation Requirements:
  - One Lookout on one of the following:
    - Shore.
    - Pier.
    - Small boat.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation for 15 minutes prior to the initial start of pile driving or pile extraction.
  - Action Proponent personnel must observe the mitigation zone for marine mammals during pile driving or extraction.
- Wait Period:
  - 15 minutes.

TABLE 59—MITIGATION FOR WEAPONS FIRING NOISE

Stressor or Activity: Explosive and non-explosive large-caliber gunnery firing noise (surface-to-surface and surface-to-air).

- Mitigation Zone:
  - 30 degrees on either side of the firing line out to 70 yd (64 m) from the gun muzzle (cease fire).
- Mitigation Requirements:
  - One Lookout on a vessel.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of large-caliber gun firing (*e.g.,* during target deployment).
  - Action Proponent personnel must observe the mitigation zone for marine mammals during large-caliber gun firing.
- Wait Period:
  - 30 minutes.

Activity-Based Mitigation for Explosive Stressors

Mitigation measures for explosive stressors are provided below and include explosive bombs (table 60), explosive gunnery (table 61), explosive underwater demolition multiple charge—mat weave and obstacle loading (table 62), explosive mine countermeasure and neutralization without divers (table 63), explosive mine neutralization with divers (table 64), explosive missiles and rockets (table 65), explosive sonobuoys and research-based sub-surface explosives (table 66), explosive torpedoes (table 67), ship shock trials (table 68), and SINKEX (table 69). After the event, the Action Proponents must observe the area for marine mammals. Post-event observations are intended to aid incident reporting requirements for marine mammals. Practicality and the duration of post-event observations will be determined on site by fuel restrictions and mission-essential follow-on commitments. For example, it is more challenging to remain on-site for extended periods of time for some activities due to factors such as range from the target or altitude of an aircraft. For all activities involving explosives, if a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately. Activity-based mitigation for explosive stressors does not apply to explosives:

- deployed by aircraft operating at high altitudes;
- deployed by submerged submarines, except for explosive torpedoes;
- deployed against aerial targets;
- during vessel- or shore-launched missile or rocket events;
- used at or below the de minimis threshold; and
- deployed by unmanned platforms except when escort vessels are already participating in the event and have positive control over the explosive.

TABLE 60—MITIGATION FOR EXPLOSIVE BOMBS

Stressor or Activity: Any NEW.

- Mitigation Zone:
  - 2,500 yd (2,286 m) from the intended target (cease fire).
- Mitigation Requirements:
  - One Lookout in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of bomb delivery (*e.g.,* when arriving on station).
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals during bomb delivery.
  - After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 10 minutes.

TABLE 61—MITIGATION FOR EXPLOSIVE GUNNERY

Stressor or Activity: Air-to-surface medium-caliber, surface-to-surface medium-caliber, surface-to-surface large-caliber.

- Mitigation Zones:
  - Air-to-surface medium-caliber:
    - 200 yd (182.9 m) from the intended impact location (cease fire).
  - Surface-to-surface medium-caliber:
    - 600 yd (548.6 m) from the intended impact location (cease fire).
  - Surface-to-surface large-caliber:
    - 1,000 yd (914.4 m) from the intended impact location (cease fire).
- Mitigation Requirements:
  - One Lookout on a vessel or in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of gun firing (*e.g.,* while maneuvering on station).
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals during gunnery fire.

TABLE 61—MITIGATION FOR EXPLOSIVE GUNNERY—Continued

- After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 62—MITIGATION FOR EXPLOSIVE UNDERWATER DEMOLITION MULTIPLE CHARGE—MAT WEAVE AND OBSTACLE LOADING

Stressor or Activity: Any NEW.

- Mitigation Zones:
  - 700 yd (640 m) from the detonation site (cease fire).
- Mitigation Requirements:
  - Two Lookouts: one on a small boat and one on shore from an elevated platform.
- Mitigation Requirement Timing:
  - The Lookout positioned on a small boat must observe the mitigation zone for marine mammals and floating vegetation for 30 minutes prior to the first detonation.
  - The Lookout positioned onshore must use binoculars to observe for marine mammals for 10 minutes prior to the first detonation.
  sbull; Action Proponent personnel must observe the mitigation zone for marine mammals during detonations.
  - After the event, when practical, Action Proponent personnel must observe the detonation vicinity for 30 minutes for marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 10 minutes (determined by the shore observer).

TABLE 63—MITIGATION FOR EXPLOSIVE MINE COUNTERMEASURE AND NEUTRALIZATION

[No divers]

Stressor or Activity: 0.1–5 lb (0.05–2.3 kg) NEW, >5 lb (2.3 kg) NEW.

- Mitigation Zones:
  - 0.1–5 lb (0.05–2.3 kg) NEW:
    - 600 yd (548.6 m) from the detonation site (cease fire).
  - >5 lb (2.3 kg) NEW:
    - 2,100 yd (1,920.2 m) from the detonation site (cease fire).
- Mitigation Requirements:
  - 0.1–5 lb (0.05–2.3 kg) NEW:
    - One Lookout on a vessel or in an aircraft.
  - >5 lb (2.3 kg) NEW:
    - Two Lookouts: one on a small boat and one in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of detonations (*e.g.,* while maneuvering on station; typically, 10 or 30 minutes depending on fuel constraints).
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals, concentrations of seabirds, and individual foraging seabirds (in the water and not on shore) during detonations or fuse initiation.
  - After the event, when practical, Action Proponent personnel must observe the detonation vicinity for 10 or 30 minutes (depending on fuel constraints) for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 64—MITIGATION FOR EXPLOSIVE MINE NEUTRALIZATION

[With divers]

Stressor or Activity: 0.1–20 lb (0.05–9.1 kg) NEW (positive control), 0.1–29 lb (0.05–13.2 kg) NEW (time-delay), >20–60 lb (9.1–27.2 kg) NEW (positive control).

- Mitigation Zones:
  - 0.1–20 lb (0.05–9.1 kg) NEW (positive control).
    - 500 yd (457.2 m) from the detonation site (cease fire).
  - 0.1–29 lb (0.05–13.2 kg) NEW (time-delay), >20–60 lb (9.1–27.2 kg) NEW (positive control).
    - 1,000 yd (914.4 m) from the detonation site (cease fire).
- Mitigation Requirements:
  - 0.1–20 lb (0.05–9.1 kg) NEW (positive control).
    - Lookouts in two small boats (one Lookout per boat), or one small boat and one rotary-wing aircraft (with one Lookout each), and one Lookout on shore for shallow-water events during 0.1–20 lb (0.05–9.1 kg) NEW (positive control) use.
  - 0.1–29 lb (0.05–13.2 kg) NEW (time-delay), >20–60 lb (9.1–27.2 kg) NEW (positive control).
    - Four Lookouts in two small boats (two Lookouts per boat), and one additional Lookout in an aircraft if used in the event.
- Mitigation Requirement Timing:

TABLE 64—MITIGATION FOR EXPLOSIVE MINE NEUTRALIZATION—Continued

[With divers]

- Time-delay devices must be set not to exceed 10 minutes.
- Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of detonations or fuse initiation for positive control events (*e.g.,* while maneuvering on station) or for 30 minutes prior for time-delay events.
- Action Proponent personnel must observe the applicable mitigation zone for marine mammals, concentrations of seabirds, and individual foraging seabirds (in the water and not on shore) during detonations or fuse initiation.
- When practical based on mission, safety, and environmental conditions:
  - Boats must observe from the mitigation zone radius mid-point.
  - When two boats are used, boats must observe from opposite sides of the mine location.
  - Platforms must travel a circular pattern around the mine location.
  - Boats must have one Lookout observe inward toward the mine location and one Lookout observe outward toward the mitigation zone perimeter.
  - Divers must be part of the Lookout Team.
- After the event, when practical, Action Proponent personnel must observe the detonation vicinity for 30 minutes for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 65—MITIGATION FOR EXPLOSIVE MISSILES AND ROCKETS

Stressor or Activity: 0.6–20 lb (0.3–9.1 kg) NEW (air-to-surface), >20–500 lb (9.1–226.8 kg) NEW (air-to-surface).

- Mitigation Zones:
  - 0.6–20 lb (0.3–9.1 kg) NEW (air-to-surface).
    - 900 yd (823 m) from the intended impact location (cease fire).
  - >20–500 lb (9.1–226.8 kg) NEW (air-to-surface).
    - 2,000 yd (1,828.8 m) from the intended impact location (cease fire).
- Mitigation Requirements:
  - One Lookout in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of missile or rocket delivery (*e.g.,* during a fly-over of the mitigation zone).
  - Action Proponent personnel must observe the applicable mitigation zone for marine mammals during missile or rocket delivery.
  - After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 66—MITIGATION FOR EXPLOSIVE SONOBUOYS AND RESEARCH-BASED SUB-SURFACE EXPLOSIVES

Stressor or Activity: Any NEW of sonobuoys, 0.1–5 lb (0.05–2.3 kg) NEW for other types of sub-surface explosives used in research applications.

- Mitigation Zone:
  - 600 yd (548.6 m) from the device or detonation sites (cease fire).
- Mitigation Requirements:
  - One Lookout on a small boat or in an aircraft.
  - Conduct passive acoustic monitoring for marine mammals; use information from detections to assist visual observations.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of detonations (*e.g.,* during sonobuoy deployment, which typically lasts 20–30 minutes).
  - Action Proponent personnel must observe the mitigation zone for marine mammals during detonations.
  - After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 67—MITIGATION FOR EXPLOSIVE TORPEDOES

Stressor or Activity: Any NEW.

- Mitigation Zone:
  - 2,100 yd (1,920.2 m) from the intended impact location (cease fire).
- Mitigation Requirements:
  - One Lookout in an aircraft.
  - Conduct passive acoustic monitoring for marine mammals; use information from detections to assist visual observations.
- Mitigation Requirement Timing:

TABLE 67—MITIGATION FOR EXPLOSIVE TORPEDOES—Continued

- Action Proponent personnel must observe the mitigation zone for marine mammals, floating vegetation, and jellyfish aggregations immediately prior to the initial start of detonations (*e.g.,* during target deployment).
- Action Proponent personnel must observe the mitigation zone for marine mammals during torpedo launches.
- After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 68—MITIGATION FOR SHIP SHOCK TRIALS

Stressor or Activity: Any NEW.

- Mitigation Zone:
  - 3.5 nmi (6.5 km) from the target ship hull (cease fire).
- Mitigation Requirements:
  - On the day of the event, 10 observers (Lookouts and third-party observers combined), spread between aircraft or multiple vessels as specified in the event-specific mitigation plan.
- Mitigation Requirement Timing:
  - Action Proponent personnel must develop a detailed, event-specific monitoring and mitigation plan in the year prior to the event and provide it to NMFS for review.
  - Beginning at first light on days of detonation, until the moment of detonation (as allowed by safety measures) Action Proponent personnel must observe the mitigation zone for marine mammals, floating vegetation, jellyfish aggregations, large schools of fish, and flocks of seabirds.
  - If any dead or injured marine mammals are observed after an individual detonation, Action Proponent personnel must follow established incident reporting procedures and halt any remaining detonations until Action Proponent personnel or third-party observers can consult with NMFS and review or adapt the event-specific mitigation plan, if necessary.
  - During the 2 days following the event (minimum) and up to 7 days following the event (maximum), and as specified in the event-specific mitigation plan, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals.
- Wait Period:
  - 30 minutes.

TABLE 69—MITIGATION FOR SINKING EXERCISES (SINKEX)

Stressor or Activity: Any NEW.

- Mitigation Zone:
  - 2.5 nmi (4.6 km) from the target ship hull (cease fire).
- Mitigation Requirements:
  - Two Lookouts: one on a vessel and one in an aircraft.
  - Lookouts would use information from passive acoustic detections to inform visual observations when passive acoustic devices are already being used during weapon firing.
- Mitigation Requirement Timing:
  - During aerial observations for 90 minutes prior to the initial start of weapon firing, Action Proponent personnel must observe the mitigation zone for marine mammals, floating vegetation, and jellyfish aggregations.
  - From the vessel during weapon firing, and from the aircraft and vessel immediately after planned or unplanned breaks in weapon firing of more than 2 hours, Action Proponent personnel must observe the mitigation zone for marine mammals.
  - Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals for 2 hours after sinking the vessel or until sunset, whichever comes first. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.
- Wait Period:
  - 30 minutes.

Activity-Based Mitigation for Non-Explosive Ordnance

Mitigation measures for non-explosive ordnance are provided below and include aerial-deployed mines and non-explosive bombs (table 70), non-explosive gunnery (table 71), and non-explosive missiles and rockets (table 72). Explosive aerial-deployed mines do not detonate upon contact with the water surface and are therefore considered non-explosive when mitigating the potential for a mine shape to strike a marine mammal at the water surface. Activity-based mitigation for non-explosive ordnance does not apply to non-explosive ordnance:

- deployed by aircraft operating at high altitudes;
- deployed against aerial targets and land-based targets;
- deployed during vessel- or shore-launched missile or rocket events; and
- deployed by unmanned platforms except when escort vessels are already participating in the event and have positive control over ordnance deployment.

TABLE 70—MITIGATION FOR AERIAL-DEPLOYED MINES AND NON-EXPLOSIVE BOMBS

Stressor or Activity: Explosive aerial-deployed mines, non-explosive aerial-deployed mines and non-explosive bombs.

- Mitigation Zone:

TABLE 70—MITIGATION FOR AERIAL-DEPLOYED MINES AND NON-EXPLOSIVE BOMBS—Continued

- 1,000 yd (914.4 m) from the intended target (cease fire).
- Mitigation Requirements:
  - One Lookout in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of mine or bomb delivery (*e.g.,* when arriving on station).
  - Action Proponent personnel must observe the mitigation zone for marine mammals during mine or bomb delivery.
- Wait Period:
  - 10 minutes.

TABLE 71—MITIGATION FOR NON-EXPLOSIVE GUNNERY

Stressor or Activity: Non-explosive surface-to-surface large-caliber ordnance, non-explosive surface-to-surface and air-to-surface medium-caliber ordnance, non-explosive surface-to-surface and air-to-surface small-caliber ordnance.

- Mitigation Zone:
  - 200 yd (182.9 m) from the intended impact location (cease fire).
- Mitigation Requirements:
  - One Lookout on a vessel or in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the start of gun firing (*e.g.,* while maneuvering on station).
  - Action Proponent personnel must observe the mitigation zone for marine mammals during gunnery firing.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

TABLE 72—MITIGATION FOR NON-EXPLOSIVE MISSILES AND ROCKETS

Stressor or Activity: Non-explosives (air-to-surface).

- Mitigation Zone:
  - 900 yd (823 m) from the intended impact location (cease fire).
- Mitigation Requirements:
  - One Lookout in an aircraft.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the start of missile or rocket delivery (*e.g.,* during a fly-over of the mitigation zone).
  - Action Proponent personnel must observe the mitigation zone for marine mammals during missile or rocket delivery.
- Wait Period:
  - 10 or 30 minutes (depending on fuel constraints of the platform).

Activity-Based Mitigation for Physical Disturbance and Strike Stressors

Mitigation measures for physical disturbance and strike stressors are provided below and include crewed surface vessels (table 73), unmanned vehicles (table 74), towed in-water devices (table 75), and net deployment (table 76). Activity-based mitigation for physical disturbance and strike stressors will not be implemented:

- by submerged submarines;
- by unmanned vehicles except when escort vessels are already participating in the event and have positive control over the unmanned vehicle movements;
- when marine mammals (*e.g.,* dolphins) are determined to be intentionally swimming at the bow, alongside the vessel or vehicle, or directly behind the vessel or vehicle (*e.g.,* to bow-ride or wake-ride);
- when pinnipeds are hauled out on man-made navigational structures, port structures, and vessels;
- by manned surface vessels and towed in-water devices actively participating in cable laying during Modernization & Sustainment of Ranges activities; and
- when impractical based on mission requirements (*e.g.,* during certain aspects of amphibious exercises).

TABLE 73—MITIGATION FOR MANNED SURFACE VESSELS

Stressor or Activity: Manned surface vessels, including surfaced submarines.

- Mitigation Zones:
  - Underway manned surface vessels must maneuver themselves (which may include reducing speed) to maintain the following distances as mission and circumstances allow:
    - 500 yd (457.2 m) from whales.
    - 200 yd (182.9 m) from other marine mammals.
- Mitigation Requirements:
  - One or more Lookouts on manned underway surface vessels in accordance with the most recent navigation safety instruction.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals immediately prior to manned surface vessels getting underway and while underway.

TABLE 74—MITIGATION FOR UNMANNED VEHICLES

Stressor or Activity: Unmanned Surface Vehicles and Unmanned Underwater Vehicles already being escorted (and operated under positive control) by a manned surface support vessel.

- Mitigation Zones:
  - A surface support vessel that is already participating in the event, and has positive control over the unmanned vehicle, must maneuver the unmanned vehicle (which may include reducing its speed) to ensure it maintains the following distances as mission and circumstances allow:
    - 500 yd (457.2 m) from whales.
    - 200 yd (182.9 m) from other marine mammals.
- Mitigation Requirements:
  - One Lookout on a surface support vessel that is already participating in the event and has positive control over the unmanned vehicle.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals immediately prior to unmanned vehicles getting underway and while underway.

TABLE 75—MITIGATION FOR TOWED IN-WATER DEVICES

Stressor or Activity: In-water devices towed by an aircraft, a manned surface vessel, or an Unmanned Surface Vehicle or Unmanned Underwater Vehicle already being escorted (and operated under positive control) by a manned surface vessel.

- Mitigation Zone:
  - Manned towing platforms, or surface support vessels already participating in the event that have positive control over an unmanned vehicle that is towing an in-water device, must maneuver itself or the unmanned vehicle (which may include reducing speed) to ensure towed in-water devices maintain the following distances as mission and circumstances allow:
    - 250 yd (228.6 m) from marine mammals.
- Mitigation Requirements:
  - One Lookout on the manned towing vessel or aircraft, or on a surface support vessel that is already participating in the event and has positive control over an unmanned vehicle that is towing an in-water device.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals immediately prior to and while in-water devices are being towed.

TABLE 76—MITIGATION FOR NET DEPLOYMENT

Stressor or Activity: Nets deployed for testing of an Unmanned Underwater Vehicle.

- Mitigation Zone:
  - If a marine mammal is sighted within 500 yd of the deployment location, the support vessel must:
    - Delay deployment of nets until the mitigation zone has been clear for 15 minutes.
    - Recover nets if they are deployed.
- Mitigation Requirements:
  - One Lookout on the support vessel.
- Mitigation Requirement Timing:
  - Action Proponent personnel must observe the mitigation zone for marine mammals for 15 minutes prior to the deployment of nets and while the nets are deployed.
  - Nets must be deployed during daylight hours only.

Geographic Mitigation Areas

In addition to activity-based mitigation, the Action Proponents would implement mitigation measures within mitigation areas to avoid or minimize potential impacts on marine mammals (see figures 11–1 and 11–2 of the application). A full technical analysis of the mitigation areas that the Action Proponents considered for marine mammals is provided in appendix K (Geographic Mitigation Assessment) of the 2024 HCTT Draft EIS/OEIS. The Action Proponents took into account public comments received on the 2017 HSTT Draft EIS/OEIS, the best available science, and the practicability of implementing additional mitigation measures and has enhanced its mitigation areas and mitigation measures beyond those that were included in the 2018–2025 regulations to further reduce impacts to marine mammals.

Information on the mitigation measures that the Action Proponents propose to implement within mitigation areas is provided in table 77 through table 86. The mitigation applies year-round unless specified otherwise in the tables.

NMFS conducted an independent analysis of the mitigation areas that the Action Proponent proposed, which are described below. NMFS preliminarily concurs with the Action Proponents' analysis, which indicates that the measures in these mitigation areas are both practicable and will reduce the likelihood, magnitude, or severity of adverse impacts to marine mammals or their habitat in the manner described in the Action Proponents' analysis and this proposed rule. NMFS is heavily reliant on the Action Proponents' description of operational practicability, since the Action Proponents are best equipped to describe the degree to which a given mitigation measure affects personnel safety or mission effectiveness, and how practical it is to implement. The Action Proponents consider the measures in this proposed rule to be practicable, and NMFS concurs. We further discuss the manner in which the Geographic Mitigation Areas in the proposed rule will reduce the likelihood, magnitude,

or severity of adverse impacts to marine mammal species or their habitat in the Preliminary Analysis and Negligible Impact Determination section.

Geographic Mitigation Areas in Hawaii

Table 77 details geographic mitigation related to the use of active sonar and explosives off Hawaii Island. The mitigation is a continuation from Phase III.

TABLE 77—HAWAII ISLAND MARINE MAMMAL MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Acoustic	The Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of helicopter dipping sonar (a mid-frequency active sonar source) annually within the mitigation area.	Mitigation in this area is designed to reduce exposure of numerous small and resident marine mammal populations (including Blainville's beaked whales, bottlenose dolphins, goose-beaked whales, dwarf sperm whales, false killer whales, melon-headed whales, pantropical spotted dolphins, pygmy killer whales, rough-toothed dolphins, short-finned pilot whales, and spinner dolphins), humpback whales within important seasonal reproductive habitat, and Hawaiian monk seals within critical habitat, to levels of sound that have the potential to cause injurious or behavioral impacts.
Explosives	The Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) within the mitigation area.	Mitigation in this area is designed to prevent exposure of the species listed above to explosives that have the potential to cause injury, mortality, or behavioral disturbance.

Table 78 details geographic mitigation related to the use of active sonar and explosives off Molokaʻi, Maui, Lānaʻi, and Kahoʻolawe Islands. The mitigation is a continuation from Phase III.

TABLE 78—HAWAII 4-ISLANDS MARINE MAMMAL MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Acoustic	From November 15–April 15, the Action Proponents must not use MF1 surface ship hull-mounted mid-frequency active sonar within the mitigation area.	Mitigation in this area is designed to minimize exposure of humpback whales in high-density seasonal reproductive habitats (*e.g.,* north of Maui and Molokaʻi) and Main Hawaiian Islands insular false killer whales in high seasonal occurrence areas to levels of sound that have the potential to cause injurious or behavioral impacts.
Explosives	The Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) within the mitigation area (year-round).	Mitigation in this area is designed to prevent exposure of humpback whales in high-density seasonal reproductive habitats (*e.g.,* north of Maui and Molokaʻi), Main Hawaiian Islands insular false killer whales in high seasonal occurrence areas, and numerous small and resident marine mammal populations that occur year-round (including bottlenose dolphins, pantropical spotted dolphins, and spinner dolphins, and Hawaiian monk seals) to explosives that have the potential to cause injury, mortality, or behavioral disturbance.

Table 79 details special reporting requirements related to the use of active sonar off Oʻahu, Molokaʻi, and Hawaii Island. The mitigation is a continuation from Phase III with a modified geographic extent based on based available science.

TABLE 79—HAWAII HUMPBACK WHALE SPECIAL REPORTING MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Acoustic	The Action Proponents must report the total hours of MF1 surface ship hull-mounted mid-frequency active sonar used from November through May in the mitigation area in their training and testing activity reports submitted to NMFS.	Special reporting requirements are designed to aid NMFS' and the Action Proponents' analysis of potential impacts in the mitigation area, which contains the Hawaiian Islands Humpback Whale National Marine Sanctuary plus a 5-km (2.7 nmi) sanctuary buffer (excluding the PMRF).

Table 80 details awareness notification message requirements for the Hawaii Range Complex. The mitigation is a continuation from Phase III.

TABLE 80—HAWAII HUMPBACK WHALE AWARENESS MESSAGES

Category	Mitigation requirements	Mitigation benefits
Acoustic, Explosives, Physical disturbance and strike.	The Action Proponents must broadcast awareness messages to alert applicable assets (and their Lookouts) transiting and training or testing in the Hawaii Range Complex to the possible presence of concentrations of humpback whales from November through May. Lookouts must use that knowledge to help inform their visual observations during military readiness activities that involve vessel movements, active sonar, in-water explosives (including underwater explosives and explosives deployed against surface targets), or the deployment of non-explosive ordnance against surface targets in the mitigation area.	Mitigation in this area is designed to minimize potential humpback whale vessel interactions and exposure to acoustic, explosive, and physical disturbance and strike stressors that have the potential to cause mortality, injury, or behavioral disturbance during the reproductive season. The Hawaii Humpback Whale Awareness Messages apply to the entire Hawaii Range Complex; therefore, the mitigation described in table 77, table 78, and table 79 is in addition to the requirements described for this overlapping area.

Geographic Mitigation Areas in California

Table 81 details geographic mitigation related to the use of active sonar off the coast of northern California. The mitigation is new for this phase.

TABLE 81—NORTHERN CALIFORNIA LARGE WHALE MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Acoustic	From June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Central California Large Whale Mitigation Area, and the Southern California Blue Whale Mitigation Area.	Mitigation in this area is designed to reduce exposure of blue whales, fin whales, gray whales, and humpback whales in important seasonal foraging, migratory, and calving habitats to levels of sound that have the potential to cause injurious or behavioral impacts.

Table 82 details geographic mitigation related to the use of active sonar off the coast of Central California. The mitigation is a continuation from Phase III with a modified geographic extent based on best available science.

TABLE 82—CENTRAL CALIFORNIA LARGE WHALE MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Acoustic	From June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Northern California Large Whale Mitigation Area, and the Southern California Blue Whale Mitigation Area.	Mitigation in this area is designed to reduce exposure of blue whales, fin whales, gray whales, and humpback whales in important seasonal foraging, migratory, and calving habitats to levels of sound that have the potential to cause injurious or behavioral impacts.

Table 83 details geographic mitigation related to the use of active sonar and explosives off the coast of Southern California. The mitigation is a continuation from Phase III.

TABLE 83—SOUTHERN CALIFORNIA BLUE WHALE MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Acoustic	From June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Northern California Large Whale Mitigation Area, and the Central California Large Whale Mitigation Area.	Mitigation in this area is designed to reduce exposure of blue whales within important seasonal foraging habitats to levels of sound that have the potential to cause injurious or behavioral impacts.

TABLE 83—SOUTHERN CALIFORNIA BLUE WHALE MITIGATION AREA—Continued

Category	Mitigation requirements	Mitigation benefits
Explosives	From June 1–October 31, the Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) during large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) training and testing.	Mitigation in this area is designed to reduce exposure of blue whales within important seasonal foraging habitats to explosives that have the potential to cause injury, mortality, or behavioral disturbance.

Table 84 details awareness notification message requirements for the SOCAL Range Complex. The mitigation is a continuation from Phase III.

TABLE 84—CALIFORNIA LARGE WHALE AWARENESS MESSAGES

Category	Mitigation requirements	Mitigation benefits
Acoustic, Explosives, Physical disturbance and strike.	The Action Proponents must broadcast awareness messages to alert applicable assets (and their Lookouts) transiting and training or testing off the U.S. West Coast to the possible presence of concentrations of large whales, including gray whales (November–March), fin whales (November–May), and mixed concentrations of blue, humpback, and fin whales that may occur based on predicted oceanographic conditions for a given year (*e.g.,* May–November, April–November). Awareness messages may provide the following types of information which could vary annually: • While blue whales tend to be more transitory, some fin whales are year-round residents that can be expected in nearshore waters within 10 nmi (18.5 km) of the California mainland and offshore operating areas at any time. • Fin whales occur in groups of one to three individuals, 90 percent of the time, and in groups of four or more individuals, 10 percent of the time. • Unique to fin whales offshore southern California (including the Santa Barbara Channel and PMSR area), there could be multiple individuals and/or separate groups scattered within a relatively small area (1–2 nmi; 1.9–2.7 km) due to foraging or social interactions. • When a large whale is observed, this may be an indicator that additional marine mammals are present and nearby, and the vessel should take this into consideration when transiting. • Lookouts must use that knowledge to help inform their visual observations during military readiness activities that involve vessel movements, active sonar, in-water explosives (including underwater explosives and explosives deployed against surface targets), or the deployment of non-explosive ordnance against surface targets in the mitigation area.	Mitigation in this area is designed to minimize potential blue whale, gray whale, and fin whale vessel interactions and exposure to acoustic stressors, explosives, and physical disturbance and strike stressors that have the potential to cause mortality, injury, or behavioral disturbance during the foraging and migration seasons, and to resident whales.

Table 85 details real-time notification requirements for a designated area within the SOCAL Range Complex. The mitigation is a continuation from the 2025 HSTT Final Rule (90 FR 4944, January 16, 2025).

TABLE 85—CALIFORNIA LARGE WHALE REAL-TIME NOTIFICATION MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
Physical disturbance and strike.	The Action Proponents must issue real-time notifications to alert Action Proponent vessels operating in the vicinity of large whale aggregations (four or more whales) sighted within 1 nmi (1.9 km) of an Action Proponent vessel within an area of the Southern California Range Complex (between 32–33 degrees North and 117.2–119.5 degrees West).	The real-time notification area encompasses the locations of recent (2009, 2021, 2023) vessel strikes, and historic strikes where precise latitude and longitude were known.

TABLE 85—CALIFORNIA LARGE WHALE REAL-TIME NOTIFICATION MITIGATION AREA—Continued

Category	Mitigation requirements	Mitigation benefits
	The four whales that make up a defined ''aggregation'' would not all need to be from the same species, and the aggregation could consist either of a single group of four (or more) whales, or any combination of smaller groups totaling four (*e.g.,* two groups of two whales each or a group of three whales and a solitary whale) within the 1 nmi (1.9 km) zone. Lookouts must use the information from the real-time notifications to inform their visual observations of applicable mitigation zones. If Lookouts observe a large whale aggregation within 1 nmi (1.9 km) of the event vicinity within the area between 32–33 degrees North and 117.2–119.5 degrees West, the watch station must initiate communication with the designated point of contact to contribute to the Navy's real-time sighting notification system.	

Table 86 details geographic mitigation related to in-air vehicle launch noise and associated monitoring for pinniped haulout locations on San Nicolas Island, California. The mitigation is an adaptation of procedural mitigation for the same activities in the 2022 PMSR final rule (87 FR 40888, July 8, 2022).

TABLE 86—SAN NICOLAS ISLAND PINNIPED HAULOUT MITIGATION AREA

Category	Mitigation requirements	Mitigation benefits
In-air vehicle launch noise.	Navy personnel must not enter pinniped haulout or rookery areas. Personnel may be adjacent to pinniped haulouts and rookery prior to and following a launch for monitoring purposes. Missiles and targets must not cross over pinniped haulout areas at altitudes less than 305 m (1,000 ft), except in emergencies or for real-time security incidents. For unmanned aircraft systems (UAS), the following minimum altitudes will be maintained over pinniped haulout areas and rookeries: Class 0–2 UAS will maintain a minimum altitude of 92 m (300 ft); Class 3 UAS will maintain a minimum altitude of 153 m (500 ft); Class 4 or 5 UAS will not be flown below 305 m (1,000 ft). The Navy may not conduct more than 40 launch events annually. The Navy may not conduct more than 10 launch events at night annually. Launch events must be scheduled to avoid the peak pinniped pupping seasons (from January through July) to the maximum extent practicable. The Navy must implement a monitoring plan using video and acoustic monitoring of up to three pinniped haulout areas and rookeries during launch events that include missiles or targets that have not been previously monitored for at least three launch events. The Navy will review the launch procedure and monitoring methods, in cooperation with NMFS, if any incidents of injury or mortality of a pinniped are discovered during post-launch surveys, or if surveys indicate possible effects to the distribution, size, or productivity of the affected pinniped populations as a result of the specified activities. If necessary, appropriate changes will be made through modification to the Authorization prior to conducting the next launch of the same vehicle.	Mitigation is designed to minimize in-air launch noise and physical disturbance to pinnipeds hauled out on beaches, as well as to continue assessing baseline pinniped distribution/abundance and potential changes in pinniped use of these beaches after launch events.

Mitigation Conclusions

NMFS has carefully evaluated the Action Proponents' proposed mitigation measures—many of which were developed with NMFS' input during the previous phases of HCTT (formerly HSTT) authorizations but several of which are new since implementation of the 2018 to 2025 regulations—and considered a broad range of other measures (*i.e.,* the measures considered but eliminated in the 2024 HCTT Draft EIS/OEIS, which reflect many of the comments that have arisen from public input or through discussion with NMFS in past years) in the context of ensuring that NMFS prescribes the means of effecting the least practicable adverse impact on the affected marine mammal species and their habitat. Our evaluation of potential measures included consideration of the following factors in relation to one another: the manner in

which, and the degree to which, the successful implementation of the mitigation measures is expected to reduce the likelihood and/or magnitude of adverse impacts to marine mammal species and their habitat; the proven or likely efficacy of the measures; and the practicability of the measures for applicant implementation, including consideration of personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity.

Based on our evaluation of the Action Proponents' proposed measures, as well as other measures considered by the Action Proponents and NMFS (see section 5.9 (Measures Considered but Eliminated) of chapter 5 (Mitigation) of the 2024 HCTT Draft EIS/OEIS), NMFS has preliminarily determined that these proposed mitigation measures are appropriate means of effecting the least practicable adverse impact on marine mammal species and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and considering specifically personnel safety, practicality of implementation, and impact on the effectiveness of the military readiness activity. Additionally, an adaptive management component helps further ensure that mitigation is regularly assessed and provides a mechanism to improve the mitigation, based on the factors above, through modification as appropriate.

The proposed rule comment period provides the public an opportunity to submit recommendations, views, and/or concerns regarding the Action Proponents' activities and the proposed mitigation measures. While NMFS has preliminarily determined that the Action Proponents' proposed mitigation measures would effect the least practicable adverse impact on the affected species and their habitat, NMFS will consider all public comments to help inform our final determination. Consequently, proposed mitigation measures may be refined, modified, removed, or added prior to the issuance of the final rule based on public comments received and, as appropriate, analysis of additional potential mitigation measures.

Proposed Monitoring

Section 101(a)(5)(A) of the MMPA states that in order to authorize incidental take for an activity, NMFS must set forth requirements pertaining to the monitoring and reporting of such taking. The MMPA implementing regulations at 50 CFR 216.104(a)(13) indicate that requests for incidental take authorizations must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present.

Although the Navy has been conducting research and monitoring for over 20 years in areas where it has been training, it developed a formal marine species monitoring program in support of the HCTT Study Area MMPA and ESA processes in 2009. Across all Navy training and testing study areas, the robust marine species monitoring program has resulted in hundreds of technical reports and publications on marine mammals that have informed Navy and NMFS analyses in environmental planning documents, rules, and Biological Opinions. The reports are made available to the public on the Navy's marine species monitoring website (*https://www.navymarinespeciesmonitoring.us*) and the data on the Ocean Biogeographic Information System Spatial Ecological Analysis of Megavertebrate Populations (OBIS–SEAMAP) (*https://seamap.env.duke.edu/*).

The Navy would continue collecting monitoring data to inform our understanding of the occurrence of marine mammals in the HCTT Study Area, the likely exposure of marine mammals to stressors of concern in the HCTT Study Area, the response of marine mammals to exposures to stressors, the consequences of a particular marine mammal response to their individual fitness and, ultimately, populations, and the effectiveness of implemented mitigation measures. Taken together, mitigation and monitoring comprise the Navy's integrated approach for reducing environmental impacts from the specified activities. The Navy's overall monitoring approach seeks to leverage and build on existing research efforts whenever possible.

As agreed upon between the Action Proponents and NMFS, the monitoring measures presented here, as well as the mitigation measures described above, focus on the protection and management of potentially affected marine mammals. A well-designed monitoring program can provide important feedback for validating assumptions made in analyses and allow for adaptive management of marine mammals and their habitat, and other marine resources. Monitoring is required under the MMPA, and details of the monitoring program for the specified activities have been developed through coordination between NMFS and the Action Proponents through the regulatory process for previous Navy at-sea training and testing activities.

Navy Marine Species Research and Monitoring Strategic Framework

The initial structure for the U.S. Navy's marine species monitoring efforts was developed in 2009 with the Integrated Comprehensive Monitoring Program (ICMP). The intent of the ICMP was to provide an overarching framework for coordination of the Navy's monitoring efforts during the early years of the program's establishment. A Strategic Planning Process (U.S. Department of the Navy, 2013) was subsequently developed and together with the ICMP framework serves as a planning tool to focus marine species monitoring priorities defined by ESA and MMPA requirements, and to coordinate monitoring efforts across regions based on a set of common objectives. Using an underlying conceptual framework incorporating a progression of knowledge from occurrence to exposure/response, and ultimately consequences, the Strategic Planning Process was developed as a tool to help guide the investment of resources to address top level objectives and goals of the monitoring program most efficiently. The Strategic Planning Process identifies Intermediate Scientific Objectives (see *https://www.navymarinespeciesmonitoring.us/about/strategic-planning-process/*), which form the basis of evaluating, prioritizing, and selecting new monitoring projects or investment topics and serve as the basis for developing and executing new monitoring projects across the Navy's training and testing ranges (both Atlantic and Pacific).

Monitoring activities relating to the effects of military readiness activities on marine species are generally designed to address one or more of the following top-level goals:

- An increase in the understanding of the likely occurrence of marine mammals and ESA-listed marine species in the vicinity of the action (*i.e.,* presence, abundance, distribution, and density);
- An increase in the understanding of the nature, scope, or context of the likely exposure of marine mammals and ESA-listed species to any of the potential stressors associated with the action (*e.g.,* sound, explosive detonation, or military expended materials), through better understanding of one or more of the following:
  - the nature of the action and its surrounding environment (*e.g.,* sound-source characterization, propagation, and ambient noise levels),

○ the affected species (*e.g.,* life history or dive patterns),

○ the likely co-occurrence of marine mammals and ESA-listed marine species with the action (in whole or part), or

○ the likely biological or behavioral context of exposure to the stressor for the marine mammal and ESA-listed marine species (*e.g.,* age class of exposed animals or known pupping, calving, or feeding areas).

• An increase in the understanding of how individual marine mammals or ESA-listed marine species respond (behaviorally or physiologically) to the specific stressors associated with the action (in specific contexts, where possible (*e.g.,* at what distance or received level)).

• An increase in the understanding of how anticipated individual responses, to individual stressors or anticipated combinations of stressors, may impact either:

○ the long-term fitness and survival of an individual; or

○ the population, species, or stock (*e.g.,* through impacts on annual rates of recruitment or survival).

• An increase in the understanding of the effectiveness of mitigation and monitoring measures.

• A better understanding and record of the manner in which the authorized entity complies with the Incidental Take Authorization and Incidental Take Statement.

• An increase in the probability of detecting marine mammals (through improved technology or methods), both specifically within the mitigation zone (thus allowing for more effective implementation of the mitigation) and in general, to better achieve the above goals; and

• Ensuring that adverse impact of activities remains at the least practicable level.

The Navy's Marine Species Monitoring Program investments are evaluated through the Adaptive Management Review process to: (1) assess overall progress; (2) review goals and objectives; and (3) make recommendations for refinement and evolution of the monitoring program's focus and direction. The Marine Species Monitoring Program has developed and matured significantly since its inception and now supports a portfolio of several dozen active projects across a range of geographic areas and protected species taxa addressing both regional priorities (*i.e.,* particular species of concern), and Navy-wide needs such as the behavioral response of beaked whales to training and testing activities.

A Research and Monitoring Summit was held in early 2023 to evaluate the current state of the Marine Species Monitoring Program in terms of progress, objectives, priorities, and needs, and to solicit valuable input from meeting participants including NMFS, Marine Mammal Commission, Navy, and scientific experts. The overarching goal of the summit was to facilitate updating the ICMP framework for guiding marine species research and monitoring investments, and to identify data gaps and priorities to be addressed over the next 5–10 years across a range of basic research through applied monitoring. One of the outcomes of this summit meeting is a refreshed strategic framework effectively replacing the ICMP which will provide increased coordination and synergy across the Navy's protected marine species investment programs (see section 13.1 of the application). This will contribute to the collective goal of supporting improved assessment of effects from training and testing activities through development of first in class science and data.

For over a decade, the Navy has implemented the PMAP software tool, which provides operators with notification of the required mitigation and a visual display of the planned training or testing activity location overlaid with relevant environmental data. This module was developed by civilian marine biologists employed by the Navy and was reviewed and approved by NMFS. It provides information on marine species sighting cues, visual observation tools and techniques, and sighting notification procedures. It is a video-based complement to the U.S. Navy Lookout Training Handbook or equivalent. Since 2007, this module has been required for commanding officers, executive officers, equivalent civilian personnel, and personnel who will stand watch as a Lookout.

Additionally, the U.S. Navy Lookout Training Handbook was updated in 2022 to include a more robust chapter on environmental compliance, mitigation, and marine species observation tools and techniques. Environmental awareness and education training is also provided to Navy personnel through the Afloat Environmental Compliance Training program or equivalent. Training is designed to help personnel gain an understanding of their personal environmental compliance roles and responsibilities (including mitigation implementation). Finally, the Navy's current generation of land-based ship bridge simulators now incorporate marine mammal response in team training scenarios for bridge watch standers and Lookouts.

Past and Current Action Proponent Monitoring in the HCTT Study Area

The Navy's monitoring program has undergone significant changes since the first rules were issued for the HRC and SOCAL Study Areas in 2009 through the process of adaptive management. The monitoring program developed for the first cycle of environmental compliance documents (*e.g.,* U.S. Department of the Navy, 2008a, 2008b) utilized effort-based compliance metrics that were somewhat limiting. Through adaptive management discussions, the Navy designed and conducted monitoring studies according to scientific objectives and eliminated specific effort requirements.

Progress has also been made on the conceptual framework categories from the Scientific Advisory Group for Navy Marine Species Monitoring (U.S. Department of the Navy, 2011), ranging from occurrence of animals, to their exposure, response, and population consequences. The Navy continues to manage the Atlantic and Pacific program as a whole, with monitoring in each range complex taking a slightly different but complementary approach. The Navy has continued to use the approach of layering multiple simultaneous components in many of the range complexes to leverage an increase in return of the progress toward answering scientific monitoring questions. For example, in later Phase I HRC monitoring through Phase III HSTT monitoring, several monitoring efforts coincided on the instrumented Navy training range off PMRF during an actual anti-submarine warfare training exercise. This included: (1) deploying civilian marine mammal observers aboard a Navy destroyer employing mid-frequency active sonar; (2) a civilian marine mammal aerial survey aircraft orbiting the destroyer during the course of the exercise; (3) Navy acousticians monitoring the exercise participants and animals via the hydrophones of the instrumented range during the exercise; and (4) having satellite tagging of animals performed on the training range just prior to the exercise.

Numerous publications, dissertations, and conference presentations have resulted from research conducted under the marine species monitoring program (*https://www.navymarinespecies monitoring.us/reading-room/*), leading to a significant contribution to the body of marine mammal science. Publications on occurrence, distribution, and density

have fed the modeling input, and publications on exposure and response have informed Navy and NMFS analysis of behavioral response and consideration of mitigation measures.

Furthermore, collaboration between the monitoring program and the Navy's research and development (*e.g.,* the ONR) and demonstration-validation (*e.g.,* Living Marine Resources (LMR)) programs has been strengthened, leading to research tools and products that have already transitioned to the monitoring program. These include Marine Mammal Monitoring on Ranges, controlled exposure experiment behavioral response studies, acoustic sea glider surveys, and global positioning system-enabled satellite tags. Recent progress has been made with better integration with monitoring across all Navy at-sea study areas, including the HCTT Study Area and various other ranges. Publications from the LMR and ONR programs have also resulted in significant contributions to hearing, acoustic criteria used in effects modeling, exposure, and response, as well as in developing tools to assess biological significance (*e.g.,* consequences).

NMFS and the Navy also consider data collected during mitigations as monitoring. Data are collected by shipboard personnel on hours spent training and hours of sonar use. Additionally, during MTEs, data are collected when marine mammals are observed within the mitigation zones when mitigations are implemented. These data are provided to NMFS in both classified and unclassified annual exercise reports, which would continue under this proposed rule.

NMFS has received multiple years' worth of annual exercise and monitoring reports addressing active sonar use and explosive detonations within the HCTT Study Area and other Navy range complexes. The data and information contained in these reports have been considered in developing mitigation and monitoring measures for the proposed military readiness activities within the HCTT Study Area. The Navy's annual exercise and monitoring reports may be viewed at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities* and *https://www.navymarinespeciesmonitoring.us/reporting/.*

The Navy's marine species monitoring program supports several monitoring projects in the HCTT Study Area at any given time. Additional details on the scientific objectives for each project can be found at: *https://www.navymarinespeciesmonitoring.us/regions/pacific/current-projects/.* Some projects may only require one or two years of field effort. Other projects could entail multi-year field efforts (2–5 years). Most current HCTT projects are multi-year ongoing studies such as odontocete tagging and behavioral response to sonar in Hawaii, and beaked whale distribution and response to sonar in California.

Specific monitoring under the 2018–2025 regulations included the following projects:

- Pacific Marine Assessment Program for Protected Species (PACMAPPS) survey;
- Effectiveness of Navy Lookout Teams in Detecting Cetaceans;
- Long Term Acoustic Monitoring of Marine Mammals Utilizing the Instrumented Range at Pacific Missile Range Facility (PMRF) (ongoing);
- Pacific Islands comprehensive stranding investigations (ongoing);
- North Pacific Humpback Whale Tagging;
- Estimation of Received Levels of MFAS and Behavioral Response of Marine Mammals at PMRF (ongoing);
- Marine Mammal Monitoring on Navy Ranges (ongoing);
- Marine Mammal Sightings During CalCOFI Cruises (ongoing);
- Blue and Fin Whale Satellite Tagging;
- Guadalupe Fur Seal Satellite Tracking;
- Passive Acoustic Monitoring of Marine Mammals in SOCAL Range Complex (ongoing); and
- Cuvier's Beaked Whale and Fin Whale Population Dynamics and Impact Assessment at the Southern California Offshore Antisubmarine Warfare Range (SOAR) (ongoing).

Future monitoring efforts by the Action Proponents in the HCTT Study Area are anticipated to continue along the same objectives: establish the baseline habitat uses and movement patterns; establish the baseline behavior (*e.g.,* foraging, dive patterns, *etc.*); and evaluate potential exposure and behavioral responses of marine mammals exposed to training and testing activities.

Currently planned monitoring projects and their Intermediate Scientific Objective for the 2025–2032 rule are listed below, many of which are continuations of projects currently underway. Other than those ongoing projects, monitoring projects are typically planned one year in advance; therefore, this list does not include all projects that will occur over the entire period of the rule.

- Long Term Acoustic Monitoring of Marine Mammals Utilizing the Instrumented Range at Pacific Missile Range Facility (PMRF) (ongoing)—The objectives are: (1) determine what species and populations of marine mammals and ESA-listed species are present in Navy range complexes, testing ranges, and in specific training and testing areas; (2) establish the baseline habitat uses, seasonality, and movement patterns of marine mammals and ESA-listed species where Navy training and testing activities occur; (3) evaluate potential exposure of marine mammals and ESA-listed species to Navy training and testing activities; (4) establish the regional baseline vocalization behavior, including seasonality and acoustic characteristics, of marine mammals where Navy training and testing activities occur; (5) apply passive acoustic tools and techniques for detecting, classifying, locating, and tracking marine mammals; (6) apply analytic methods to evaluate exposure and/or behavioral response of marine mammals to Navy training and testing activities; (7) evaluate acoustic exposure levels associated with behavioral responses of marine mammals to support development and refinement of acoustic risk functions; (8) evaluate trends in distribution and abundance for populations of marine mammals and ESA-listed species that are regularly exposed to Navy training and testing activities; and (9) leverage existing data with newly developed analysis tools and techniques.
- Pacific Islands comprehensive stranding investigations (ongoing)—The objectives are to: (1) determine what species and populations of marine mammals and ESA-listed species are present in Navy range complexes, testing ranges, and in specific training and testing areas; and (2) establish the baseline habitat uses, seasonality, and movement patterns of marine mammals and ESA-listed species where Navy training and testing activities occur.
- Estimation of Received Levels of MFAS and Behavioral Response of Marine Mammals at PMRF (ongoing)—The objectives are to: (1) determine what species and populations of marine mammals and ESA-listed species are exposed to U.S. Navy training and testing activities; (2) establish the baseline habitat uses, seasonality, and movement patterns of marine mammals and ESA-listed species where Navy training and testing activities occur; (3) establish the regional baseline vocalization behavior, including seasonality and acoustic characteristics, of marine mammals where Navy training and testing activities occur; (4) determine what behaviors can most effectively be assessed for potential

response to Navy training and testing activities; (5) evaluate behavioral responses of marine mammals exposed to Navy training and testing activities to support PCoD development and application; (6) application of passive acoustic tools and techniques for detecting, classifying, locating, and tracking marine mammals; (7) evaluate trends in distribution and abundance for populations of marine mammals and ESA-listed species that are regularly exposed to Navy training and testing activities; and (8) leverage existing data with newly developed analysis tools and techniques.

- Marine Mammal Monitoring on Navy Ranges (ongoing)—The objectives are to: (1) estimate the distribution, abundance, and density of marine mammals and ESA-listed species in Navy range complexes, testing ranges, and in specific training and testing areas; (2) establish the regional baseline vocalization behavior, including seasonality and acoustic characteristics, of marine mammals where Navy training and testing activities occur; (3) application of passive acoustic tools and techniques for detecting, classifying, locating, and tracking marine mammals; (4) application of analytic methods to evaluate exposure and/or behavioral response of marine mammals to Navy training and testing activities; and (5) evaluate trends in distribution and abundance for populations of marine mammals and ESA-listed species that are regularly exposed to Navy training and testing activities.
- Marine Mammal Sightings During CalCOFI Cruises (ongoing)—The objectives are to: (1) determine what species and populations of marine mammals and ESA-listed species are present in Navy range complexes, testing ranges, and in specific training and testing areas; (2) estimate the distribution, abundance, and density of marine mammals and ESA-listed species in Navy range complexes, testing ranges, and in specific training and testing areas; and (3) establish the baseline habitat uses, seasonality, and movement patterns of marine mammals and ESA-listed species where Navy training and testing activities occur.
- Passive Acoustic Monitoring of Marine Mammals in SOCAL Range Complex (ongoing)—The objectives are to: (1) determine what species and populations of marine mammals and ESA-listed species are present in Navy range complexes, testing ranges, and in specific training and testing areas; (2) establish the baseline habitat uses, seasonality, and movement patterns of marine mammals and ESA-listed species where Navy training and testing activities occur; (3) establish the regional baseline vocalization behavior, including seasonality and acoustic characteristics, of marine mammals where Navy training and testing activities occur; and (4) apply passive acoustic tools and techniques for detecting, classifying, locating, and tracking marine mammals.
- Cuvier's Beaked Whale and Fin Whale Population Dynamics and Impact Assessment at the Southern California Offshore Antisubmarine Warfare Range (SOAR) (ongoing)—The objectives are to: (1) determine what species and populations of marine mammals and ESA-listed species are present in Navy range complexes, testing ranges, and in specific training and testing areas; (2) establish the baseline habitat uses, seasonality, and movement patterns of marine mammals and ESA-listed species where Navy training and testing activities occur; (3) establish the regional baseline vocalization behavior, including seasonality and acoustic characteristics, of marine mammals where Navy training and testing activities occur, (4) determine what behaviors can most effectively be assessed for potential response to Navy training and testing activities; (5) apply passive acoustic tools and techniques for detecting, classifying, locating, and tracking marine mammals; (6) evaluate behavioral responses of marine mammals exposed to Navy training and testing activities to support PCoD development and application; (7) evaluate trends in distribution and abundance for populations of marine mammals and ESA-listed species that are regularly exposed to Navy training and testing activities; and (8) leverage existing data with newly developed analysis tools and techniques.

Adaptive Management

The proposed regulations governing the take of marine mammals incidental to military readiness activities in the HCTT Study Area contain an adaptive management component. Our understanding of the effects of military readiness activities (*e.g.,* acoustic and explosive stressors) on marine mammals continues to evolve, which makes the inclusion of an adaptive management component both valuable and necessary within the context of 7-year regulations.

The reporting requirements associated with this proposed rule are designed to provide NMFS with monitoring data from the previous year to allow NMFS to consider whether any changes to existing mitigation and monitoring requirements are appropriate. The use of adaptive management allows NMFS to consider new information from different sources to determine (with input from the Action Proponents regarding practicability) on an annual or biennial basis if mitigation or monitoring measures should be modified (including additions or deletions). Mitigation measures could be modified if new data suggests that such modifications would have a reasonable likelihood of more effectively accomplishing the goals of the mitigation and monitoring and if the measures are practicable. If the modifications to the mitigation, monitoring, or reporting measures are substantial, NMFS would publish a notice of the planned LOAs in the **Federal Register** and solicit public comment.

The following are some of the possible sources of applicable data to be considered through the adaptive management process: (1) results from monitoring and exercise reports, as required by MMPA authorizations; (2) compiled results of Navy-funded research and development studies; (3) results from specific stranding investigations; (4) results from general marine mammal and sound research; and (5) any information which reveals that marine mammals may have been taken in a manner, extent, or number not authorized by these regulations or subsequent LOAs. The results from monitoring reports and other studies may be viewed at: *https://www.navymarinespeciesmonitoring.us.*

Proposed Reporting

In order to issue incidental take authorization for an activity, section 101(a)(5)(A) of the MMPA states that NMFS must set forth requirements pertaining to the monitoring and reporting of such taking. Effective reporting is critical both to compliance as well as ensuring that the most value is obtained from the required monitoring. Reports from individual monitoring events, results of analyses, publications, and periodic progress reports for specific monitoring projects will be posted to the Navy's Marine Species Monitoring web portal at: *https://www.navymarinespeciesmonitoring.us.*

There are several different reporting requirements for the Navy pursuant to the current regulations. All of these reporting requirements would be continued for the Navy under this proposed rule for the 7-year period.

Special Reporting for Geographic Mitigation Areas

The Action Proponents must report the total hours of MF1 surface ship hull-mounted mid-frequency active sonar used from November through May in

the Hawaii Humpback Whale Special Reporting Mitigation Area in their annual training and testing activity reports. Special reporting for this area is designed to aid the Action Proponents and NMFS in continuing to analyze potential impacts of training and testing in the mitigation areas. In addition to the mitigation area-specific requirement, for all mitigation areas, should national security require the Action Proponents to exceed the activity restrictions in a given mitigation area, Action Proponent personnel must provide NMFS with advance notification and include the information (*e.g.,* sonar hours, explosives usage, or restricted area use) in its annual activity reports submitted to NMFS.

Notification of Injured, Live Stranded, or Dead Marine Mammals

The Action Proponents would consult the Notification and Reporting Plan, which sets out notification, reporting, and other requirements when injured, live stranded, or dead marine mammals are detected. The Notification and Reporting Plan is available for review at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities.*

Annual HCTT Study Area Marine Species Monitoring Report

The Action Proponents would submit an annual report of the HCTT Study Area marine species monitoring, which would be included in a Pacific-wide monitoring report, describing the implementation and results from the previous calendar year. Data collection methods will be standardized across range complexes and the HCTT Study Area to allow for comparison in different geographic locations. The draft report must be submitted to the Director of the Office of Protected Resources of NMFS annually as specified in the LOAs. NMFS will submit comments or questions on the report, if any, within 3 months of receipt. The report will be considered final after the Action Proponents have addressed NMFS' comments, or 3 months after submittal of the draft if NMFS does not provide comments on the draft report. The report would describe progress of knowledge made with respect to intermediate scientific objectives within the HCTT Study Area associated with the ICMP. Similar study questions would be treated together so that progress on each topic can be summarized across all Navy ranges. The report need not include analyses and content that do not provide direct assessment of cumulative progress on the monitoring plan study questions.

Annual HCTT Training and Testing Reports

In the event that the analyzed sound levels were exceeded, the Action Proponents would submit a preliminary report(s) detailing the exceedance within 21 days after the anniversary date of issuance of the LOAs. Regardless of whether analyzed sound levels were exceeded, the Navy would submit a detailed report (HCTT Annual Training Exercise Report and Testing Activity Report) and Coast Guard and Army would each submit a detailed report (HCTT Annual Training Exercise Report) to NMFS annually as specified in the LOAs. NMFS will submit comments or questions on the reports, if any, within 1 month of receipt. The reports will be considered final after the Action Proponents have addressed NMFS' comments, or 1 month after submittal of the drafts if NMFS does not provide comments on the draft reports. The annual report shall contain information on MTEs, ship shock trials, SINKEX events, and a summary of all sound sources used (total hours or quantity (per the LOA)) of each bin of sonar or other non-impulsive source; total annual number of each type of explosive exercises; and total annual expended/detonated rounds (*e.g.,* missiles, bombs, sonobuoys, *etc.*) for each explosive bin). The annual reports will also contain cumulative sonar and explosive use quantity from previous years' reports through the current year. Additionally, if there were any changes to the sound source allowance in the reporting year, or cumulatively, the reports would include a discussion of why the change was made and include analysis to support how the change did or did not affect the analysis in the 2024 HCTT Draft EIS/OEIS and MMPA final rule. The annual reports would also include the details regarding specific requirements associated with specific mitigation areas. The analysis in the detailed report would be based on the accumulation of data from the current year's report and data collected from previous annual reports. The detailed reports shall also contain special reporting for the Hawaii Humpback Whale Special Reporting Mitigation Area, as described in the LOAs.

The final annual reports at the conclusion of the authorization period (year 7) will also serve as the comprehensive close-out reports and include both the final year annual use compared to annual authorization as well as a cumulative 7-year annual use compared to 7-year authorization. NMFS must submit comments on the draft close-out report, if any, within 3 months of receipt. The reports will be considered final after the Action Proponents have addressed NMFS' comments, or 3 months after submittal of the drafts if NMFS does not provide comments.

Other Reporting and Coordination

The Action Proponents would continue to report and coordinate with NMFS for the following:

- Annual marine species monitoring technical review meetings that also include researchers and the Marine Mammal Commission; and
- Annual Adaptive Management meetings that also include the Marine Mammal Commission (and could occur in conjunction with the annual marine species monitoring technical review meetings).

Preliminary Analysis and Negligible Impact Determination

General Negligible Impact Analysis

Introduction

NMFS has defined negligible impact as an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival (50 CFR 216.103). A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (*i.e.,* population-level effects). An estimate of the number of takes alone is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be taken by Level A harassment or Level B harassment (as presented in table 37, table 38, table 39, and table 40), NMFS considers other factors, such as the likely nature of any responses (*e.g.,* intensity, duration) and the context of any responses (*e.g.,* critical reproductive time or location, migration), as well as effects on habitat and the likely effectiveness of the mitigation. We also assess the number, intensity, and context of estimated takes by evaluating this information relative to population status. Consistent with the 1989 preamble for NMFS' implementing regulations (54 FR 40338, September 29, 1989), the impacts from other past and ongoing anthropogenic activities are incorporated into this analysis via their impacts on the environmental baseline (*e.g.,* as reflected in the regulatory status of the species, population size and growth rate where known, other ongoing

sources of human-caused mortality, and ambient noise levels).

In the Estimated Take of Marine Mammals section, we identified the subset of potential effects that would be expected to qualify as take under the MMPA both annually and over the 7-year period covered by this proposed rule, and then identified the maximum number of takes we believe could occur (mortality) or are reasonably expected to occur (harassment) based on the methods described. The impact that any given take will have is dependent on many case-specific factors that need to be considered in the negligible impact analysis (*e.g.,* the context of behavioral exposures such as duration or intensity of a disturbance, the health of impacted animals, the status of a species that incurs fitness-level impacts on individuals, *etc.*). For this proposed rule we evaluated the likely impacts of the enumerated maximum number of harassment takes that are proposed for authorization and reasonably expected to occur, in the context of the specific circumstances surrounding these predicted takes. We also include a specific assessment of M/SI takes that could occur, as well as consideration of the traits and statuses of the affected species and stocks. Last, we collectively evaluated this information, as well as other more taxa-specific information and mitigation measure effectiveness, in group-specific assessments that support our negligible impact conclusions for each stock or species. Because all of the Action Proponents' specified activities would occur within the ranges of the marine mammal stocks identified in the rule, all negligible impact analyses and determinations are at the stock level (*i.e.,* additional species-level determinations are not needed).

Harassment

The specified activities reflect representative levels of military readiness activities. The Description of the Proposed Activity section describes annual activities. There may be some flexibility in the exact number of hours, items, or detonations that may vary from year to year, but take totals would not exceed the maximum annual totals and 7-year totals indicated in table 37, table 38, table 39, and table 40. We base our analysis and negligible impact determination on the maximum number of takes that would be reasonably expected to occur annually and are proposed to be authorized, although, as stated before, the number of takes are only one part of the analysis, which includes extensive qualitative consideration of other contextual factors that influence the degree of impact of the takes on the affected individuals. To avoid repetition, we provide some general analysis immediately below that applies to all the species listed in table 37, table 38, table 39, and table 40, given that some of the anticipated effects of the Action Proponents' military readiness activities on marine mammals are expected to be relatively similar in nature. Below that, we provide additional information specific to mysticetes, odontocetes, and pinnipeds and, finally, break our analysis into species (and/or stocks), or groups of species (and the associated stocks) where relevant similarities exist, to provide more specific information related to the anticipated effects on individuals of a specific stock or where there is information about the status or structure of any species that would lead to a differing assessment of the effects on the species or stock. Organizing our analysis by grouping species or stocks that share common traits or that will respond similarly to effects of the Action Proponents' activities and then providing species- or stock-specific information allows us to avoid duplication while assuring that we have analyzed the effects of the specified activities on each affected species or stock.

The Action Proponents' harassment take request is based on one model for pile driving, a second model for land-based missile and target launches, and a third model (NAEMO) for all other acoustic stressors, which NMFS reviewed and concurs appropriately estimates the maximum amount of harassment that is reasonably likely to occur. As described in more detail above, NAEMO calculates sound energy propagation from sonar and other transducers, air guns, and explosives during military readiness activities; the sound or impulse received by animat dosimeters representing marine mammals distributed in the area around the modeled activity; and whether the sound or impulse energy received by a marine mammal exceeds the thresholds for effects. Assumptions in the Navy models intentionally err on the side of overestimation when there are unknowns. The effects of the specified activities are modeled as though they would occur regardless of proximity to marine mammals, meaning that no activity-based mitigation is considered (*e.g.,* no power down or shut down). However, the modeling does quantitatively consider the possibility that marine mammals would avoid continued or repeated sound exposures to some degree, based on a species' sensitivity to behavioral disturbance. NMFS provided input to, independently reviewed, and concurred with the Action Proponents on this process. The Action Proponents' analysis, which is described in detail in section 6 of the application, was used to quantify harassment takes for this proposed rule.

The Action Proponents and NMFS anticipate more severe effects from takes resulting from exposure to higher received levels (though this is in no way a strictly linear relationship for behavioral effects throughout species, individuals, or circumstances) and less severe effects from takes resulting from exposure to lower received levels. However, there is also growing evidence of the importance of distance in predicting marine mammal behavioral response to sound, *i.e.,* sounds of a similar level emanating from a more distant source have been shown to be less likely to elicit a response of equal magnitude (DeRuiter 2012). The estimated number of takes by Level A harassment and Level B harassment does not equate to the number of individual animals the Action Proponents expect to harass (which is lower), but rather to the instances of take (*i.e.,* exposures above the Level A harassment and Level B harassment threshold) that are anticipated to occur over the 7-year period. These instances may represent either brief exposures (*i.e.,* seconds or minutes) or, in some cases, longer durations of exposure within a day. In some cases, an animal that incurs a single take by AUD INJ or TTS may also experience a direct behavioral harassment from the same exposure. Some individuals may experience multiple instances of take (meaning over multiple days) over the course of the year, which means that the number of individuals taken is smaller than the total estimated takes. Generally speaking, the higher the number of takes as compared to the population abundance, the more repeated takes of individuals are likely, and the higher the actual percentage of individuals in the population that are likely taken at least once in a year. We look at this comparative metric (number of takes to population abundance) to give us a relative sense of where a larger portion of a species is being taken by the specified activities, where there is a likelihood that the same individuals are being taken across multiple days, and whether the number of days might be higher or more likely sequential. Where the number of instances of take is less than 100 percent of the abundance, and there is no information to specifically suggest that some subset of animals is known to congregate in an area in which

activities are regularly occurring (*e.g.,* a small resident population, takes occurring in a known important area such as a BIA, or a large portion of the takes occurring in a certain region and season), the overall likelihood and number of repeated takes is generally considered low, as it could, on one extreme, mean that every take represents a separate individual in the population being taken on one day (a minimal impact to an individual) or, more likely, that some smaller number of individuals are taken on one day annually and some are taken on a few, not likely sequential, days annually, and of course some are not taken at all.

In the ocean, the use of sonar and other active acoustic sources is often transient and is unlikely to repeatedly expose the same individual animals within a short period, for example within one specific exercise. However, for some individuals of some species, repeated exposures across different activities could occur over the year, especially where events occur in generally the same area with more resident species. In short, for some species, we expect that the total anticipated takes represent exposures of a smaller number of individuals of which some would be exposed multiple times, but based on the nature of the specified activities and the movement patterns of marine mammals, it is unlikely that individuals from most stocks would be taken over more than a few days within a given year. This means that even where repeated takes of individuals are likely to occur, they are more likely to result from non-sequential exposures from different activities, and, even if sequential, individual animals are not predicted to be taken for more than several days in a row, at most. As described elsewhere, the nature of the majority of the exposures would be expected to be of a less severe nature, and based on the numbers, it is likely that any individual exposed multiple times is still only taken on a small percentage of the days of the year. The greater likelihood is that not every individual is taken, or perhaps a smaller subset is taken with a slightly higher average and larger variability of highs and lows, but still with no reason to think that, for most species or stocks, any individuals would be taken a significant portion of the days of the year.

Behavioral Response

The estimates calculated using the BRF do not differentiate between the different types of behavioral responses that qualify as Level B harassment. As described in the application, the Action Proponents identified, with NMFS' input, that moderate behavioral responses, as characterized in Southall *et al.* (2021), would be considered a take. The behavioral responses predicted by the BRFs are assumed to be moderate severity exposures (*e.g.,* altered migration paths or dive profiles, interrupted nursing, breeding or feeding, or avoidance) that may last for the duration of an exposure. The Action Proponents then compiled the available data indicating at what received levels and distances those responses have occurred, and used the indicated literature to build biphasic behavioral response curves and cut-off conditions that are used to predict how many instances of Level B behavioral harassment occur in a day (see the Criteria and Thresholds Technical Report). Take estimates alone do not provide information regarding the potential fitness or other biological consequences of the responses on the affected individuals. We therefore consider the available activity-specific, environmental, and species-specific information to determine the likely nature of the modeled behavioral responses and the potential fitness consequences for affected individuals.

Use of sonar and other transducers would typically be transient and temporary. The majority of acoustic effects to individual animals from sonar and other active sound sources during military readiness activities would be primarily from anti-submarine warfare events. It is important to note although anti-submarine warfare is one of the warfare areas of focus during MTEs, there are significant periods when active anti-submarine warfare sonars are not in use. Nevertheless, behavioral responses are assumed more likely to be significant during MTEs than during other anti-submarine warfare activities due to the duration (*i.e.,* multiple days), scale (*i.e.,* multiple sonar platforms), and use of high-power hull-mounted sonar in the MTEs. In other words, in the range of potential behavioral effects that might be expected as part of a response that qualifies as an instance of Level B behavioral harassment (which by nature of the way it is modeled/counted, occurs within 1 day), the less severe end might include exposure to comparatively lower levels of a sound, at a detectably greater distance from the animal, for a few or several minutes, and that could result in a behavioral response such as avoiding an area that an animal would otherwise have chosen to move through or feed in for some amount of time or breaking off one or a few feeding bouts. More severe effects could occur when the animal gets close enough to the source to receive a comparatively higher level, is exposed continuously to one source for a longer time, or is exposed intermittently to different sources throughout a day. Such effects might result in an animal having a more severe flight response and leaving a larger area for a day or more or potentially losing feeding opportunities for a day. However, such severe behavioral effects are expected to occur infrequently.

To help assess this, for sonar (LFAS/MFAS/HFAS) used in the HCTT Study Area, the Action Proponents provided information estimating the instances of take by Level B harassment by behavioral disturbance under each BRF that would occur within 6-dB increments (discussed below in the *Group and Species-Specific Analyses* section), and by distance in 5-km bins in section 2.3.3 of appendix A of the application. As mentioned above, all else being equal, an animal's exposure to a higher received level is more likely to result in a behavioral response that is more likely to lead to adverse effects, which could more likely accumulate to impacts on reproductive success or survivorship of the animal, but other contextual factors (*e.g.,* distance, duration of exposure, and behavioral state of the animals) are also important (Di Clemente *et al.,* 2018; Ellison *et al.,* 2012; Moore and Barlow, 2013; Southall *et al.,* 2019; Wensveen *et al.,* 2017, *etc.*). The majority of takes by Level B harassment are expected to be in the form of comparatively milder responses (*i.e.,* lower-level exposures that still qualify as take under the MMPA, but would likely be less severe along the continuum of responses that qualify as take) of a generally shorter duration. We anticipate more severe effects from takes when animals are exposed to higher received levels of sound or at closer proximity to the source. Because species belonging to taxa that share common characteristics are likely to respond and be affected in similar ways, these discussions are presented within each species group below in the *Group and Species-Specific Analyses* section. As noted previously in this proposed rule, behavioral response is likely highly variable between species, individuals within a species, and context of the exposure. Specifically, given a range of behavioral responses that may be classified as Level B harassment, to the degree that higher received levels of sound are expected to result in more severe behavioral responses, only a smaller percentage of the anticipated Level B harassment from the specified

activities might result in more severe responses (see the *Group and Species-Specific Analyses* section below for more detailed information).

Physiological Stress Response

Some of the lower level physiological stress responses (*e.g.,* orientation or startle response, change in respiration, change in heart rate) discussed earlier would likely co-occur with the predicted harassments, although these responses are more difficult to detect and fewer data exist relating these responses to specific received levels of sound. Level B harassment takes, then, may have a stress-related physiological component as well; however, we would not expect the Action Proponents' generally short-term, intermittent, and (typically in the case of sonar) transitory activities to create conditions of long-term continuous noise leading to long-term physiological stress responses in marine mammals that could affect reproduction or survival.

Diel Cycle

Many animals perform vital functions, such as feeding, resting, traveling, and socializing on a diel cycle (24-hour cycle). Behavioral responses to noise exposure, when taking place in a biologically important context, such as disruption of critical life functions, displacement, or avoidance of important habitat, are more likely to be significant if they last more than one diel cycle or recur on subsequent days (Southall *et al.,* 2007). Henderson *et al.* (2016) found that ongoing smaller scale events had little to no impact on foraging dives for Blainville's beaked whale, while multi-day training events may decrease foraging behavior for Blainville's beaked whale (Manzano-Roth *et al.,* 2016). Consequently, a behavioral response lasting less than one day and not recurring on subsequent days is not considered severe unless it could directly affect reproduction or survival (Southall *et al.,* 2007). Note that there is a difference between multiple-day substantive behavioral responses and multiple-day anthropogenic activities. For example, just because an at-sea exercise lasts for multiple days does not necessarily mean that individual animals are either exposed to those exercises for multiple days or, further, exposed in a manner resulting in a sustained multiple day substantive behavioral response. Large multi-day Navy exercises, such as anti-submarine warfare activities, typically include vessels moving faster than while in transit (typically 10–15 kn (18.5–27.8 km/hr) or higher) and generally cover large areas that are relatively far from shore (typically more than 3 nmi (5.6 km) from shore) and in waters greater than 600 ft (182.9 m) deep. Marine mammals are moving as well, which would make it unlikely that the same animal could remain in the immediate vicinity of the ship for the entire duration of the exercise. Further, the Action Proponents do not necessarily operate active sonar the entire time during an exercise. While it is certainly possible that these sorts of exercises could overlap with individual marine mammals multiple days in a row at levels above those anticipated to result in a take, because of the factors mentioned above, it is considered unlikely for the majority of takes. However, it is also worth noting that the Action Proponents conduct many different types of noise-producing activities over the course of the year and it is likely that some marine mammals will be exposed to more than one activity and taken on multiple days, even if they are not sequential.

Durations of Navy activities utilizing tactical sonar sources and explosives vary and are fully described in chapter 2 of the 2024 HCTT Draft EIS/OEIS. Sonar used during anti-submarine warfare would impart the greatest amount of acoustic energy of any category of sonar and other transducers analyzed in the application and include hull-mounted, towed, line array, sonobuoy, helicopter dipping, and torpedo sonars. Most anti-submarine warfare sonars are MFAS (1–10 kHz); however, some sources may use higher or lower frequencies. Anti-submarine warfare training and testing activities using hull-mounted sonar proposed for the HCTT Study Area generally last for only a few hours. However, anti-submarine warfare testing activities range from several hours, to days, to more than 10 days for large integrated anti-submarine warfare MTEs (see table 2, table 3, and table 7). For these multi-day exercises there will typically be extended intervals of non-activity in between active sonar periods. Because of the need to train in a large variety of situations, the Navy conducts anti-submarine warfare activities in varying locations. Given the average length and dynamic nature of anti-submarine warfare activities (times of sonar use) and typical vessel speed, combined with the fact that the majority of the cetaceans would not likely remain in proximity to the sound source, it is unlikely that an animal would be exposed to LFAS/MFAS/HFAS at levels or durations likely to result in a substantive response that would then be carried on for more than one day or on successive days.

Most planned explosive events are instantaneous or scheduled to occur over a short duration (less than 2 hours) and the explosive component of these activities only lasts for minutes. Although explosive activities may sometimes be conducted in the same general areas repeatedly, because of their short duration and the fact that they are in the open ocean and animals can easily move away, it is similarly unlikely that animals would be exposed for long, continuous amounts of time, or demonstrate sustained behavioral responses. Although SINKEXs may last for up to 48 hours (4–8 hours typically, possibly 1–2 days), they are almost always completed in a single day and only a maximum of one event is planned annually for SOCAL and 2–3 annually in Hawaii (see table 3). They are stationary and conducted in deep, open water (where fewer marine mammals would typically be expected to be randomly encountered), and they have rigorous monitoring (see table 69) and shutdown procedures all of which make it unlikely that individuals would be exposed to the exercise for extended periods or on consecutive days, though some individuals may be exposed on multiple days.

Assessing the Number of Individuals Taken and the Likelihood of Repeated Takes

As described previously, Navy modeling uses the best available science to predict the instances of exposure above certain acoustic thresholds, which are equated, as appropriate, to harassment takes. As further noted, for active acoustics it is more challenging to parse out the number of individuals taken by Level B harassment and the number of times those individuals are taken from this larger number of instances, though factors such as movement ecology (*e.g.,* is the species resident and more likely to remain in closer proximity to ongoing activities, versus nomadic or migratory; Keen *et al.* (2021)) or whether there are known BIAs where animals are known to congregate can help inform this. One method that NMFS uses to help better understand the overall scope of the impacts is to compare these total instances of take against the abundance of that species (or stock if applicable). For example, if there are 100 harassment takes in a population of 100, one can assume either that every individual was exposed above acoustic thresholds once per year, or that some smaller number were exposed a few times per year, and a few were not exposed at all. Where the

instances of take exceed 100 percent of the population, multiple takes of some individuals are predicted and expected to occur within a year. Generally speaking, the higher the number of takes as compared to the population abundance, the more multiple takes of individuals are likely, and the higher the actual percentage of individuals in the population that are likely taken at least once in a year. We look at this comparative metric to give us a relative sense of where larger portions of the species are being taken by the Action Proponents' activities and where there is a higher likelihood that the same individuals are being taken across multiple days and where that number of days might be higher. It also provides a relative picture of the scale of impacts on each species.

In the ocean, unlike a modeling simulation with static animals, the transient nature of sonar use makes it unlikely to repeatedly expose the same individual animals within a short period, for example, within one specific exercise. However, some repeated exposures across different activities could occur over the year with more resident species. In short, we expect the total anticipated takes represent exposures of a smaller number of individuals of which some could be exposed multiple times, but based on the nature of the Action Proponents' activities and the movement patterns of marine mammals, it is unlikely that any particular subset would be taken over more than several sequential days (with a few possible exceptions discussed in the species-specific conclusions). In other cases, such as activities that overlap habitat of small and resident populations, repeated exposures of the same individuals may be more likely given the likelihood that a smaller number of animals would routinely use the affected habitat.

When calculating the proportion of a population taken (*e.g.,* the number of takes divided by population abundance), which can also be helpful in estimating the number of days over which some individuals may be taken, it is important to choose an appropriate population estimate against which to make the comparison. Herein, NMFS considers two potential abundance estimates, the SARs and the NMSDD abundance estimates. The SARs, where available, provide the official population estimate for a given species or stock in U.S. waters in a given year. These estimates are typically generated from the most recent shipboard and/or aerial surveys conducted, and in some cases, the estimates show substantial year-to-year variability. When the stock is known to range well outside of U.S. Exclusive Economic Zone (EEZ) boundaries, population estimates based on surveys conducted only within the U.S. EEZ are known to be underestimates. The NMSDD-derived abundance estimates are abundances for within the boundaries described for the density database for the California and Hawaii Study Areas only and, therefore, differ from some SAR abundance estimates. For the California Study Area, the NMSDD abundances are based on the extent of the west coast density models, which include areas off the Baja California peninsula of Mexico to the south but are truncated to the north and west of the California portion of the Study Area as shown in the Density Technical Report. For some species, the NMSDD abundances are based on density models that extend up to the northern extent of the west coast U.S. EEZ, beyond the HCTT Study Area. These are noted in the table. In some instances, even this larger extent does not cover the full range of a species or stock. For the Hawaii Study Area, the NMSDD abundances are based on a buffer around the Hawaiian island chain. Thus, island-associated species are encompassed, but abundances of wider-ranging species may be underestimated.

The SAR and NMSDD abundance estimates can differ substantially because these estimates may be based on different methods and data sources. For example, the SARs only consider data from the past 8 year period, whereas the NMSDD considers a longer data history. Further, the SARs estimate the number of animals in a population but not spatial densities. NMSDD uses predictive density models to estimate species presence, even where sighting data is limited or lacking altogether. Each density model is limited to the variables and assumptions considered by the original data source provider. NMFS considered these factors and others described in the Density Technical Report when comparing the estimated takes to current population abundances for each species or stock.

In consideration of the factors described above, to estimate repeated impacts across large areas relative to species geographic distributions, comparing the impacts predicted in NAEMO to abundances predicted using the NMSDD models is usually preferable. By comparing estimated take to the NMSDD abundance estimates, impacts and abundance estimates are based on the same underlying assumptions about a species' presence. NMFS has compared the estimated take to the NMSDD abundance estimates herein for all stocks, with the exception of stocks where the abundance information fits into one of the following scenarios, in which case NMFS concluded that comparison to the SAR abundance estimate is more appropriate: (1) a species' or stocks' range extends beyond the U.S. EEZ and the SAR abundance estimate is greater than the NMSDD abundance. For highly migratory species (*e.g.,* large whales) or those whose geographic distribution extends beyond the boundaries of the HCTT Study Area (*e.g.,* Alaska stocks), comparisons to the SAR are appropriate. Many of the stocks present in the HCTT Study Area have ranges significantly larger than the HCTT Study Area, and that abundance is captured by the SAR. Therefore, comparing the estimated takes to an abundance, in this case the SAR abundance, which represents the total population, may be more appropriate than modeled abundances for only the HCTT Study Area; and (2) when the current minimum population estimate in the SAR is greater than the NMSDD abundance, regardless of whether the stock range extends beyond the EEZ. The NMSDD and SAR abundance estimates are both included in table 89, table 91, table 93, table 95, table 97, and table 99, and each table indicates which stock abundance estimate was selected for comparison to the take estimate for each species or stock.

Temporary Threshold Shift

NMFS and the Navy have estimated that all species of marine mammals may incur some level of TTS from active sonar. As mentioned previously, in general, TTS can last from a few minutes to days, be of varying degree, and occur across various frequency bandwidths, all of which determine the severity of the impacts on the affected individual, which can range from minor to more severe. Table 41 through table 51 indicate the number of takes by TTS that may be incurred by different species from exposure to active sonar, air guns, pile driving, and explosives. The TTS incurred by an animal is primarily characterized by three characteristics:

1. Frequency—Available data suggest that most TTS occurs in the frequency range of the source up to one octave higher than the source (with the maximum TTS at ½ octave above) (Finneran 2015; Southall *et al.,* 2019). The Navy's MF anti-submarine warfare sources, which are the highest power and most numerous sources and the ones that cause the most take by TTS, utilize the 1–10 kHz frequency band, which suggests that if TTS were to be

induced by any of these MF sources it would be in a frequency band somewhere between approximately 1 and 20 kHz, which is in the range of communication calls for many odontocetes, but below the range of the echolocation signals used for foraging. There are fewer hours of HF source use and the sounds would attenuate more quickly, plus they have lower source levels, but if an animal were to incur TTS from these sources, it would cover a higher frequency range (sources are between 10 and 100 kHz, which means that TTS could range up to the highest frequencies audible to VHF cetaceans, approaching 200 kHz), which could overlap with the range in which some odontocetes communicate or echolocate. However, HF systems are typically used less frequently and for shorter time periods than surface ship and aircraft MF systems, so TTS from HF sources is less likely than from MF sources. There are fewer LF sources and the majority are used in the more readily mitigated testing environment, and TTS from LF sources would most likely occur below 2 kHz, which is in the range where many mysticetes communicate and also where other auditory cues are located (waves, snapping shrimp, fish prey). Also of note, the majority of sonar sources from which TTS may be incurred occupy a narrow frequency band, which means that the TTS incurred would also be across a narrower band (*i.e.,* not affecting the majority of an animal's hearing range).

2. Degree of the shift (*i.e.,* by how many dB the sensitivity of the hearing is reduced)—Generally, both the degree of TTS and the duration of TTS will be greater if the marine mammal is exposed to a higher level of energy (which would occur when the peak SPL is higher or the duration is longer). The threshold for the onset of TTS was discussed previously in this proposed rule. An animal would have to approach closer to the source or remain in the vicinity of the sound source appreciably longer to increase the received SEL, which would be difficult considering the Lookouts and the nominal speed of an active sonar vessel (10–15 kn (18.5–27.8 km/hr)) and the relative motion between the sonar vessel and the animal. In the TTS studies discussed in the Potential Effects of Specified Activities on Marine Mammals and Their Habitat section, some using exposures of almost an hour in duration or up to 217 SEL, most of the TTS induced was 15 dB or less, though Finneran *et al.* (2007) induced 43 dB of TTS with a 64-second exposure to a 20 kHz source measured via auditory steady-state response (auditory evoked potential measurement). The SQS–53 (MFAS) hull-mounted sonar (MF1) nominally emits a short (*i.e.,* 1-second) ping typically every 50 seconds, incurring those levels of TTS due to this source is highly unlikely. Sources with higher duty cycles, such as MF1C (high duty cycle hull-mounted sonar) produce longer ranges to effects and contribute to auditory effects from this action. Since most hull-mounted sonar, such as the SQS–53, engaged in anti-submarine warfare training would be moving at between 10 and 15 kn (18.5 to 27.8 km/hr) and nominally pinging every 50 seconds, the vessel will have traveled a minimum distance of approximately 843.2 ft (257 m) during the time between those pings. For a Navy vessel moving at a nominal 10 kn (18.5 km/hr), it is unlikely a marine mammal would track with the ship and could maintain speed parallel to the ship to receive adequate energy over successive pings to suffer TTS. In general, there is a higher potential for TTS associated with sources with higher duty cycles, like continuous hull-mounted sonars, compared to those sources that are intermittent or have lower duty cycles (Kastelein *et al.,* 2015). Though high duty cycle or continuous hull-mounted sonars make up a small percentage of the Navy's overall MFAS activities.

In short, given the anticipated duration and levels of sound exposure, we would not expect marine mammals to incur more than relatively low levels of TTS in most cases for sonar exposure. To add context to this degree of TTS, individual marine mammals may regularly experience variations of 6 dB differences in hearing sensitivity in their lifetime (Finneran *et al.,* 2000; Finneran *et al.,* 2002; Schlundt *et al.,* 2000).

3. Duration of TTS (recovery time)—As discussed in the Potential Effects of Specified Activities on Marine Mammals and Their Habitat section, TTS laboratory studies using exposures of up to an hour in duration or up to 217 dB SEL, most individuals recovered within 1 day (or less, often in minutes) (Kastelein, 2020b). One study resulted in a recovery that took 4 days (Finneran *et al.,* 2015; Southall *et al.,* 2019). However, there is evidence that repeated exposures resulting in TTS could potentially lead to residual threshold shifts that persist for longer durations and can result in PTS (Reichmuth *et al.,* 2019).

Compared to laboratory studies, marine mammals are likely to experience lower SELs from sonar used in the HCTT Study Area due to movement of the source and animals, and because of the lower duty cycles typical of higher power sources (though some of the Navy MF1C sources have higher duty cycles). Therefore, TTS resulting from MFAS would likely be of lesser magnitude and duration compared to laboratory studies. Also, for the same reasons discussed in the Preliminary Analysis and Negligible Impact Determination—Diel Cycle section, and because of the short distance between the source and animals needed to reach high SELs, it is unlikely that animals would be exposed to the levels necessary to induce TTS in subsequent time periods such that hearing recovery is impeded. Additionally, though the frequency range of TTS that marine mammals might incur would overlap with some of the frequency ranges of their vocalization types, the frequency range of TTS from MFAS would not usually span the entire frequency range of one vocalization type, much less span all types of vocalizations or other critical auditory cues.

As a general point, the majority of the TTS takes are the result of exposure to hull-mounted MFAS, with fewer from explosives (broad-band lower frequency sources), and even fewer from LFAS or HFAS sources (narrower band). As described above, we expect the majority of these takes to be in the form of mild, short-term (minutes to hours), narrower band (only affecting a portion of the animal's hearing range) TTS. This means that for one to several times per year, for several minutes, maybe a few hours, or at most in limited circumstances a few days, a taken individual will have diminished hearing sensitivity (*i.e.,* more than natural variation, but nowhere near total deafness). More often than not, such an exposure would occur within a narrower mid- to higher frequency band that may overlap part (but not all) of a communication, echolocation, or predator range, but sometimes across a lower or broader bandwidth. The significance of TTS is also related to the auditory cues that are germane within the time period that the animal incurs the TTS. For example, if an odontocete has TTS at echolocation frequencies, but incurs it at night when it is resting and not feeding, it may not be as impactful. In short, the expected results of any one of these limited number of mild TTS occurrences could be that: (1) it does not overlap signals that are pertinent to that animal in the given time period; (2) it overlaps parts of signals that are important to the animal, but not in a manner that impairs interpretation; or (3) it reduces detectability of an important signal to a small degree for a

short amount of time—in which case the animal may be aware and be able to compensate (but there may be slight energetic cost), or the animal may have some reduced opportunities (*e.g.,* to detect prey) or reduced capabilities to react with maximum effectiveness (*e.g.,* to detect a predator or navigate optimally). However, it is unlikely that individuals would experience repeated or high degree TTS overlapping in frequency and time with signals critical for behaviors that would impact overall fitness.

Auditory Masking or Communication Impairment

The ultimate potential impacts of masking on an individual (if it were to occur) are similar to those discussed for TTS, but an important difference is that masking only occurs during the time of the signal, versus TTS, which continues beyond the duration of the signal. Fundamentally, masking is referred to as a chronic effect because one of the key harmful components of masking is its duration—the fact that an animal would have reduced ability to hear or interpret critical cues becomes much more likely to cause a problem the longer it occurs. Also inherent in the concept of masking is the fact that the potential for the effect is only present during the times that the animal and the source are in close enough proximity for the effect to occur (and further, this time period would need to coincide with a time that the animal was utilizing sounds at the masked frequency). As our analysis has indicated, because of the relative movement of vessels and the sound sources primarily involved in this proposed rule, we do not expect the exposures with the potential for masking to be of a long duration.

Masking is fundamentally more of a concern at lower frequencies, because low frequency signals propagate significantly farther than higher frequencies and because they are more likely to overlap both the narrower LF calls of mysticetes, as well as many non-communication cues such as fish and invertebrate prey, and geologic sounds that inform navigation. Masking is also more of a concern from continuous sources (versus intermittent sonar signals) where there is no quiet time between pulses and detection and interpretation of auditory signals is likely more challenging. For these reasons, dense aggregations of, and long exposure to, continuous LF activity are much more of a concern for masking, whereas comparatively short-term exposure to the predominantly intermittent pulses of often narrow frequency range MFAS or HFAS, or explosions are not expected to result in a meaningful amount of masking. While the Action Proponents occasionally use LF and more continuous sources, it is not in the contemporaneous aggregate amounts that would be expected to accrue to degrees that would have the potential to affect reproductive success or survival. Additional detail is provided below.

Standard hull-mounted MFAS typically pings every 50 seconds. Some hull-mounted anti-submarine sonars can also be used in an object detection mode known as ''Kingfisher'' mode (*e.g.,* used on vessels when transiting to and from port) where pulse length is shorter but pings are much closer together in both time and space since the vessel goes slower when operating in this mode, and during which an increased likelihood of masking in the vicinity of vessel could be expected. For the majority of other sources, the pulse length is significantly shorter than hull-mounted active sonar, on the order of several microseconds to tens of milliseconds. Some of the vocalizations that many marine mammals make are less than 1 second long, so, for example with hull-mounted sonar, there would be a 1 in 50 chance (only if the source was in close enough proximity for the sound to exceed the signal that is being detected) that a single vocalization might be masked by a ping. However, when vocalizations (or series of vocalizations) are longer than the 1 second pulse of hull-mounted sonar, or when the pulses are only several microseconds long, the majority of most animals' vocalizations would not be masked.

Most anti-submarine warfare sonars and countermeasures use MF frequencies and a few use LF and HF frequencies. Most of these sonar signals are limited in the temporal, frequency, and spatial domains. The duration of most individual sounds is short, lasting up to a few seconds each. A few systems operate with higher duty cycles or nearly continuously, but they typically use lower power, which means that an animal would have to be closer, or in the vicinity for a longer time, to be masked to the same degree as by a higher level source. Nevertheless, masking could occasionally occur at closer ranges to these high-duty cycle and continuous active sonar systems, but, as described previously, it would be expected to be of a short duration. While data are lacking on behavioral responses of marine mammals to continuously active sonars, mysticete species are known to habituate to novel and continuous sounds (Nowacek *et al.,* 2004), suggesting that they are likely to have similar responses to high-duty cycle sonars. Furthermore, most of these systems are hull-mounted on surface ships with the ships moving at least 10 kn (18.5 km/hr), and it is unlikely that the ship and the marine mammal would continue to move in the same direction and the marine mammal subjected to the same exposure due to that movement. Most anti-submarine warfare activities are geographically dispersed and last for only a few hours, often with intermittent sonar use even within this period. Most anti-submarine warfare sonars also have a narrow frequency band (typically less than one-third octave). These factors reduce the likelihood of sources causing significant masking. HF signals (above 10 kHz) attenuate more rapidly in the water due to absorption than do lower frequency signals, thus producing only a very small zone of potential masking. If masking or communication impairment were to occur briefly, it would more likely be in the frequency range of MFAS (the more powerful source), which overlaps with some odontocete vocalizations (but few mysticete vocalizations); however, it would likely not mask the entirety of any particular vocalization, communication series, or other critical auditory cue, because the signal length, frequency, and duty cycle of the MFAS/HFAS signal does not perfectly resemble the characteristics of any single marine mammal species' vocalizations.

Other sources used in the Action Proponents' training and testing that are not explicitly addressed above, many of either higher frequencies (meaning that the sounds generated attenuate even closer to the source) or used less frequently, would be expected to contribute to masking over far smaller areas and/or times. For the reasons described here, any limited masking that could potentially occur would be minor and short-term.

In conclusion, masking is more likely to occur in the presence of broadband, relatively continuous noise sources such as from vessels; however, the duration of temporal and spatial overlap with any individual animal and the spatially separated sources that the Action Proponents use would not be expected to result in more than short-term, low impact masking that would not affect reproduction or survival.

Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives

Table 41 through table 51 indicate the number of takes of each species by Level A harassment in the form of auditory injury resulting from exposure to active sonar and/or explosives is estimated to

occur, and table 54 indicates the totals across all activities. The number of takes estimated to result from auditory injury annually from sonar, air guns, and explosives for each species/stock from all activities combined ranges from 0 to 1,235 (the 1,235 is for the CA/OR/WA stock of Dall's porpoise). Thirty-two stocks have the potential to incur non-auditory injury from explosives, and the number of individuals from any given stock from all activities combined ranges from 1 to 71 (the 71 is for the CA/OR/WA stock of short-beaked common dolphin). As described previously, the Navy's model likely overestimates the number of injurious takes to some degree. Nonetheless, these Level A harassment take numbers represent the maximum number of instances in which marine mammals would be reasonably expected to incur auditory and/or non-auditory injury, and we have analyzed them accordingly.

If a marine mammal is able to approach a surface vessel within the distance necessary to incur auditory injury in spite of the mitigation measures, the likely speed of the vessel (nominally 10–15 kn (18.5–27.8 km/hr)) and relative motion of the vessel would make it very difficult for the animal to remain in range long enough to accumulate enough energy to result in more than a mild case of auditory injury. As discussed previously in relation to TTS, the likely consequences to the health of an individual that incurs auditory injury can range from mild to more serious and is dependent upon the degree of auditory injury and the frequency band associated with auditory injury. The majority of any auditory injury incurred as a result of exposure to Navy sources would be expected to be in the 2–20 kHz range (resulting from the most powerful hull-mounted sonar) and could overlap a small portion of the communication frequency range of many odontocetes, whereas other marine mammal groups have communication calls at lower frequencies. Because of the broadband nature of explosives, auditory injury incurred from exposure to explosives would occur over a lower, but wider, frequency range. Permanent loss of some degree of hearing is a normal occurrence for older animals, and many animals are able to compensate for the shift, both in old age or at younger ages as the result of stressor exposure. While a small loss of hearing sensitivity may include some degree of energetic costs for compensating or may mean some small loss of opportunities or detection capabilities, at the expected scale it would be unlikely to impact behaviors, opportunities, or detection capabilities to a degree that would interfere with reproductive success or survival.

The Action Proponents implement mitigation measures (described in the Proposed Mitigation Measures section) during explosive activities, including delaying detonations when a marine mammal is observed in the mitigation zone. Nearly all explosive events would occur during daylight hours thereby improving the sightability of marine mammals and mitigation effectiveness. Observing for marine mammals during the explosive activities would include visual and passive acoustic detection methods (the latter when they are available and part of the activity) before the activity begins, in order to cover the mitigation zones that can range from 200 yd (183 m) to 2,500 yd (2,286 m) depending on the source (*e.g.,* explosive sonobuoy, explosive torpedo, explosive bombs), and 2.5 nmi (4.6 km) for sinking exercises (see table 60 through table 69).

The type and amount of take by Level A harassment are indicated for all species and species groups in table 89, table 91, table 93, table 95, table 97, and table 99. Generally speaking, non-auditory injuries from explosives could range from minor lung injuries (which is the most sensitive organ and first to be affected) that consist of some short-term reduction of health and fitness immediately following the injury that heals quickly and will not have any discernible long-term effects, up to more impactful permanent injuries across multiple organs that may cause health problems and negatively impact reproductive success (*i.e.,* increase the time between pregnancies or even render reproduction unlikely) but fall just short of a ''serious injury'' by virtue of the fact that the animal is not expected to die. Nonetheless, due to the Navy's mitigation and detection capabilities, we would not expect marine mammals to typically be exposed to a more severe blast located closer to the source—so the impacts likely would be less severe. In addition, most non-auditory injuries and mortalities or serious injuries are predicted for stocks with medium to large group sizes, mostly delphinids, which increases sightability. It is still difficult to evaluate how these injuries may or may not impact an animal's fitness; however, these effects are only seen in limited numbers (single digits for all but three stocks) and mostly in species of moderate, high, and very high abundances. In short, it is unlikely that any, much less all, of the limited number of injuries accrued to any one stock would result in reduced reproductive success of any individuals; even if a few injuries did result in reduced reproductive success of individuals, the status of the affected stocks are such that it would not be expected to adversely impact rates of reproduction (and auditory injury of the low severity anticipated here is not expected to affect the survival of any individual marine mammals).

Serious Injury and Mortality

NMFS is authorizing a very limited number of serious injuries or mortalities that could occur in the event of a vessel strike or as a result of marine mammal exposure to explosive detonations. We note here that the takes from potential vessel strikes or explosive exposures enumerated below could result in non-serious injury, but their worst potential outcome (*i.e.,* mortality) is analyzed for the purposes of the negligible impact determination.

The MMPA requires that PBR be estimated in SARs and that it be used in applications related to the management of take incidental to commercial fisheries (*i.e.,* the take reduction planning process described in section 118 of the MMPA and the determination of whether a stock is ''strategic'' as defined in section 3 of the MMPA). While nothing in the statute requires the application of PBR outside the management of commercial fisheries interactions with marine mammals, NMFS recognizes that as a quantitative metric, PBR may be useful as a consideration when evaluating the impacts of other human-caused activities on marine mammal stocks. Outside the commercial fishing context, and in consideration of all known human-caused mortality, PBR can help inform the potential effects of M/SI requested to be authorized under section 101(a)(5)(A) of the MMPA. As noted by NMFS and the U.S. FWS in our implementing regulations for the 1986 amendments to the MMPA (54 FR 40341, September 29, 1989), the Services consider many factors, when available, in making a negligible impact determination, including, but not limited to, the status of the species or stock relative to OSP (if known); whether the recruitment rate for the species or stock is increasing, decreasing, stable, or unknown; the size and distribution of the population; and existing impacts and environmental conditions. In this multi-factor analysis, PBR can be a useful indicator for when, and to what extent, the agency should take an especially close look at the circumstances associated with the potential mortality, along with any other factors that could influence annual rates of recruitment or survival.

Below we describe how PBR is considered in NMFS M/SI analysis. Please see the 2020 Northwest Training and Testing Final Rule (85 FR 72312, November 12, 2020) for a background discussion of PBR and how it was adopted for use authorizing incidental take under MMPA section 101(a)(5)(A) for specified activities such as the Action Proponent's training and testing in the HCTT Study Area.

When considering PBR during evaluation of effects of M/SI under MMPA section 101(a)(5)(A), we utilize a two-tiered analysis for each stock for which M/SI is proposed for authorization:

Tier 1: Compare the total human-caused average annual M/SI estimate from all sources, including the M/SI proposed for authorization from the specific activity, to PBR. If the total M/SI estimate is less than or equal to PBR, then the specific activity is considered to have a negligible impact on that stock. If the total M/SI estimate (including from the specific activity) exceeds PBR, conduct the Tier 2 analysis.

Tier 2: Evaluate the estimated M/SI from the specified activity relative to the stock's PBR. If the M/SI from the specified activity is less than or equal to 10 percent of PBR and other major sources of human-caused mortality have mitigation in place, then the individual specified activity is considered to have a negligible impact on that stock. If the estimate exceeds 10 percent of PBR, then, absent other mitigating factors, the specified activity could be considered likely to have a non-negligible impact on that stock and additional analysis is necessary.

Additional detail regarding the two tiers of the evaluation are provided below.

As indicated above, the goal of the Tier 1 assessment is to determine whether total annual human-caused mortality, including from the specified activity, would exceed PBR. To aid in the Tier 1 evaluation and get a clearer picture of the amount of annual M/SI that remains without exceeding PBR, for each species or stock, we first calculate a ''residual PBR,'' which equals PBR minus the ongoing annual human-caused M/SI (*i.e.,* Residual PBR = PBR − (annual M/SI estimate from the SAR + other M/SI authorized under section 101(a)(5)(A) of the MMPA). If the ongoing human-caused M/SI from other sources does not exceed PBR, then residual PBR is a positive number, and we consider how the proposed authorized incidental M/SI from the specified activities being evaluated compares to residual PBR using the Tier 1 framework in the following paragraph. If the ongoing anthropogenic mortality from other sources already exceeds PBR, then residual PBR is a negative number and we move to the Tier 2 discussion further below to consider the M/SI from the specific activities.

To reiterate, the Tier 1 analysis overview in the context of residual PBR, if the M/SI from the specified activity does not exceed PBR, the impacts of the authorized M/SI on the species or stock are generally considered to be negligible. As a simplifying analytical tool in the Tier 1 evaluation, we first consider whether the M/SI from the specified activities could cause incidental M/SI that is less than 10 percent of residual PBR, which we consider an ''insignificance threshold.'' If so, we consider M/SI from the specified activities to represent an insignificant incremental increase in ongoing anthropogenic M/SI for the marine mammal stock in question that alone will clearly not adversely affect annual rates of recruitment and survival and for which additional analysis or discussion of the anticipated M/SI is not required because the negligible impact standard clearly will not be exceeded on that basis alone.

When the M/SI from the specified activity is above the insignificance threshold in the Tier 1 evaluation, it does not indicate that the M/SI associated with the specified activities is necessarily approaching a level that would exceed negligible impact. Rather, it is used as a cue to look more closely if and when the M/SI for the specified activity approaches residual PBR, as it becomes increasingly necessary (the closer the M/SI from the specified activity is to 100 percent residual PBR) to carefully consider whether there are other factors that could affect reproduction or survival, such as take by Level A and/or Level B harassment that has been predicted to impact reproduction or survival of individuals, or other considerations such as information that illustrates high uncertainty involved in the calculation of PBR for some stocks. Recognizing that the impacts of harassment of any authorized incidental take (by Level A or Level B harassment from the specified activities) would not combine with the effects of the authorized M/SI to adversely affect the stock through effects on recruitment or survival, if the proposed authorized M/SI for the specified activity is less than residual PBR, the M/SI, alone, would be considered to have a negligible impact on the species or stock. If the proposed authorized M/SI is greater than residual PBR, then the assessment should proceed to Tier 2.

For the Tier 2 evaluation, recognizing that the total annual human-caused M/SI exceeds PBR, we consider whether the incremental effects of the proposed authorized M/SI for the specified activity, specifically, would be expected to result in a negligible impact on the affected species or stocks. For the Tier 2 assessment, consideration of other factors (positive or negative), including those described above (*e.g.,* the certainty in the data underlying PBR and the impacts of any harassment authorized for the specified activity), as well as the mitigation in place to reduce M/SI from other activities is especially important to assessing the impacts of the M/SI from the specified activity on the species or stock. PBR is a conservative metric and not sufficiently precise to serve as an absolute predictor of population effects upon which mortality caps would appropriately be based. For example, in some cases stock abundance (which is one of three key inputs into the PBR calculation) is underestimated because marine mammal survey data within the U.S. EEZ are used to calculate the abundance even when the stock range extends well beyond the U.S. EEZ. An underestimate of abundance could result in an underestimate of PBR. Alternatively, we sometimes may not have complete M/SI data beyond the U.S. EEZ to compare to PBR, which could result in an overestimate of residual PBR. The accuracy and certainty around the data that feed any PBR calculation, such as the abundance estimates, must be carefully considered to evaluate whether the calculated PBR accurately reflects the circumstances of the particular stock.

As referenced above, in some cases the ongoing human-caused mortality from activities other than those being evaluated already exceeds PBR and, therefore, residual PBR is negative. In these cases, any additional mortality, no matter how small, and no matter how small relative to the mortality caused by other human activities, would result in greater exceedance of PBR. PBR is helpful in informing the analysis of the effects of mortality on a species or stock because it is important from a biological perspective to be able to consider how the total mortality in a given year may affect the population. However, section 101(a)(5)(A) of the MMPA indicates that NMFS shall authorize the requested incidental take from a specified activity if we find that ''the total of such taking [*i.e.,* from the specified activity] will have a negligible impact on such species or stock.'' In other words, the task under

the statute is to evaluate the impact of the applicant's anticipated take on the species or stock, not the impact of take by other entities. Neither the MMPA nor NMFS' implementing regulations call for consideration of other unrelated activities and their impacts on the species or stock.

Accordingly, we may find that the impacts of the taking from the specified activity may (alone) be negligible even when total human-caused mortality from all activities exceeds PBR (in the context of a particular species or stock). Specifically, where the authorized M/SI would be less than or equal to 10 percent of PBR and management measures are being taken to address M/SI from the other contributing activities (*i.e.,* other than the specified activities covered by the incidental take authorization under consideration), the impacts of the authorized M/SI would be considered negligible. In addition, we must also still determine that any impacts on the species or stock from other types of take (*i.e.,* harassment) caused by the applicant do not combine with the impacts from mortality or serious injury addressed here to result in adverse effects on the species or stock through effects on annual rates of recruitment or survival.

As noted above, while PBR is useful in informing the evaluation of the effects of M/SI in MMPA section 101(a)(5)(A) determinations, it is one consideration to be assessed in combination with other factors and is not determinative. For example, as explained above, the accuracy and certainty of the data used to calculate PBR for the species or stock must be considered. And we reiterate the considerations discussed above for why it is not appropriate to consider PBR an absolute cap in the application of this guidance. Accordingly, we use PBR as a trigger for concern while also considering other relevant factors to provide a reasonable and appropriate means of evaluating the effects of potential mortality on rates of recruitment and survival, while acknowledging that it is possible for total human-caused M/SI to exceed PBR (or for the M/SI from the specified activity to exceed 10 percent of PBR in the case where other human-caused mortality is exceeding PBR, as described in the last paragraph) by some small amount and still make a negligible impact determination under MMPA section 101(a)(5)(A).

We note that on June 17, 2020, NMFS finalized Procedure 02–204–02, Criteria for Determining Negligible Impact under MMPA section 101(a)(5)(E) (see *https://www.fisheries.noaa.gov/national/laws-policies/protected-resources-policy-directives*). The guidance explicitly notes the differences in the negligible impact determinations required under section 101(a)(5)(E), as compared to sections 101(a)(5)(A) and 101(a)(5)(D), and specifies that the procedure in that document is limited to how the agency conducts negligible impact analyses for commercial fisheries under section 101(a)(5)(E). In this proposed rule, NMFS has described its method for considering PBR to evaluate the effects of potential mortality in the negligible impact analysis. NMFS has reviewed the 2020 guidance and determined that our consideration of PBR in the evaluation of mortality as described above and in the proposed rule remains appropriate for use in the negligible impact analysis for the Action proponent's activities under section 101(a)(5)(A).

Our evaluation of the M/SI for each of the species and stocks for which mortality or serious injury could occur follows.

We first consider maximum potential incidental M/SI from the vessel strike analysis for the affected large whales (table 87) and from the Action Proponents' explosive detonations for the affected small cetaceans and pinnipeds (table 88) in consideration of NMFS' threshold for identifying insignificant M/SI take. By considering the maximum potential incidental M/SI in relation to PBR and ongoing sources of anthropogenic mortality, as described above, we begin our evaluation of whether the potential incremental addition of M/SI through vessel strikes and explosive detonations may affect the species' or stocks' annual rates of recruitment or survival. We also consider the interaction of those mortalities with incidental taking of that species or stock by harassment pursuant to the specified activity.

Based on the methods discussed previously, NMFS is proposing to authorize seven mortalities of large whales due to vessel strike over the course of the 7-year rule, five by the Navy and two by the Coast Guard (table 87). Across the 7-year duration of the rule, four takes by mortality (annual average of 0.57 takes) of fin whale (CA/OR/WA stock) could occur and are proposed for authorization; three takes by mortality (annual average of 0.43 takes) of gray whale (Eastern North Pacific stock) and humpback whale (Hawaii stock) could occur and are proposed for authorization; two takes by mortality (annual average of 0.29 takes) of blue whale (Eastern North Pacific stock), sei whale (Eastern North Pacific), and humpback whale (Mainland Mexico-CA/OR/WA and Central America/Southern Mexico-CA/OR/WA stocks (Mexico and Central America DPSs, respectively)) could occur and are proposed for authorization; one take by mortality (annual average of 0.14 takes) of the Hawaii stock of sperm whale could occur and is proposed for authorization. To calculate the annual average of M/SI by vessel strike, we divided the 7-year proposed take by serious injury or mortality by seven.

TABLE 87—SUMMARY INFORMATION RELATED TO MORTALITIES REQUESTED FOR VESSEL STRIKE, 2025–2032

Common name	Stock	Stock abundance	Total annual M/SI [a]	Fisheries interactions (Y/N); annual rate of M/SI from fisheries interactions	Annual M/SI due to vessel collision	NWTT authorized take (annual)	Potential biological removal (PBR)	Residual PBR (PBR minus annual M/SI)	Recent UME (Y/N); number of strandings, year declared (since 2014)	Annual proposed authorized take (Navy)	7-Year proposed authorized take (Navy)	Annual proposed authorized take (Coast Guard)	7-Year proposed authorized take (Coast Guard)	Total annual proposed authorized take	Total 7-year proposed authorized take

Note: Unk = Unknown. N/A = Not Applicable. NMFS is proposing to authorize seven takes by serious injury or mortality by vessel strike total across the 7-year duration of the proposed rule, five takes by the Navy and two takes by the Coast Guard.

* Stock abundance from NMSDD.

[a] This column represents the total number of incidents of M/SI that could potentially accrue to the specified species or stock as indicated in the SAR and includes M/SI from fisheries interactions and other sources.

[b] In 2022, the Central North Pacific stock of humpback whale was split into the Mainland Mexico-California-Oregon-Washington and Hawaii stocks. The 2020 NWTT final rule (85 FR 72312, November 12, 2020) authorized two takes of the Central North Pacific stock. Given the stock structure change, NMFS has assumed that the two strikes could occur to either the Mainland Mexico—CA/OR/WA stock or the Hawaii stock.

[c] The 2020 NWTT final rule (85 FR 72312, November 12, 2020) authorized two takes of the CA/OR/WA stock of humpback whale. Given the stock structure change, NMFS has assumed that the two strikes could occur to the Central America/Southern Mexico- CA/OR/WA stock.

The Action Proponents also requested a limited number of takes by M/SI from explosives. Across the 7-year duration of the rule, NMFS is proposing to authorize 107 takes by M/SI (annual average of 15.29 takes) of short-beaked common dolphin (CA/OR/WA stock), 27 takes by M/SI (annual average of 3.86 takes) of California sea lion (U.S. stock), 17 takes by M/SI (annual average of 2.43 takes) of long-beaked common dolphin (California stock), 7 takes by M/SI (annual average of 1 take) of harbor seal (California stock), 4 takes by M/SI (annual average of 0.57 takes) of short-finned pilot whale (CA/OR/WA stock), 2 takes by M/SI (annual average of 0.29 takes) of bottlenose dolphin (Hawaii pelagic stock), Pacific white-sided dolphin (CA/OR/WA stock), pantropical spotted dolphin (Baja California Peninsula Mexico population), and rough-toothed dolphin (Hawaii stock), and 1 take by M/SI (annual average of 0.14 takes) of bottlenose dolphin (Oʻahu stock), Northern right whale dolphin (CA/OR/WA stock), striped dolphin (CA/OR/WA stock), and Guadalupe fur seal (Mexico stock) (table 88). To calculate the annual average of M/SI from explosives, we divided the 7-year proposed take by serious injury or mortality by seven (table 88), the same method described for vessel strikes.

TABLE 88—SUMMARY INFORMATION RELATED TO HCTT SERIOUS INJURY OR MORTALITY FROM EXPLOSIVES
[2025–2032]

[a] This column represents the total number of incidents of M/SI that could potentially accrue to the specified species or stock as indicated in the SAR and includes M/SI from fisheries interactions and other sources.
[b] These columns represents the annual authorized take by mortality in the 2021 LOA for Southwest Fisheries Science Center (SWFSC) Fisheries and Ecosystem Research Activities and the 2020 LOAs for U.S. Navy Northwest Training and Testing (NWTT) Study Area.
[c] The SWFSC final rule (86 FR 3840, January 15, 2021) authorizes 41 takes by M/SI of Pacific white-sided dolphin over the 5-year duration of the final rule (*i.e.,* 8.2 annually). These takes could be of multiple stocks; however, NMFS has conservatively assumed that all of the takes would occur to the CA/OR/WA stock.
[d] The SWFSC final rule (86 FR 3840, January 15, 2021) authorizes 14 takes by M/SI of harbor seals over the 5-year duration of the final rule (*i.e.,* 2.8 annually). These takes could be of multiple stocks; however, NMFS has conservatively assumed that all of the takes would occur to the California stock.

As described above, NMFS M/SI analysis includes two Tiers and our discussion is organized into sections that mirror that framework, as applicable. Specifically, we standardly first address stocks analyzed within Tier 1 (*i.e.,* those for which total known human-caused M/SI is below PBR (*i.e.,* the M/SI from the specified activity is below residual PBR)), considering those with proposed M/SI both below and above the insignificance threshold. Then, if applicable, we discuss stocks for which total mortality exceeds PBR in a Tier 2 analysis in which we compare the proposed M/SI of the specified activity alone against PBR and consider other factors as necessary. Of note, for some stocks total M/SI is not known, in which case a Tier 1 analysis is not possible and, therefore, we move directly to a Tier 2 analysis. In rare cases, PBR itself cannot be calculated, in which case we consider other known factors and/or surrogate stocks to inform the NID analysis.

Stocks With Total Average Annual Human-Caused M/SI Below PBR (Tier 1) and Proposed M/SI Is Below the Insignificance Threshold—

As noted above, for a species or stock with M/SI proposed for authorization less than 10 percent of residual PBR, we consider M/SI from the specified activities to represent a clearly insignificant incremental increase in ongoing anthropogenic M/SI that alone (*i.e.,* in the absence of any other take and barring any other unusual circumstances) will clearly not adversely affect annual rates of recruitment and survival. In this case, as shown in table 87 and table 88, the following species or stocks have potential or estimated take by M/SI from vessel strike and explosives, respectively, and proposed for authorization below their insignificance threshold: fin whale (CA/OR/WA stock); humpback whale (Mainland Mexico-CA/OR/WA and Hawaii stocks); gray whale (Eastern North Pacific stock); sperm whale (Hawaii stock); bottlenose dolphin (Hawaii pelagic stock); long-beaked common dolphin (California stock); northern right whale dolphin (CA/OR/WA stock); Pacific white-sided dolphin (CA/OR/WA stock); rough-toothed dolphin (Hawaii stock); short-beaked common dolphin (CA/OR/WA stock); striped dolphin (CA/OR/WA stock); California sea lion (U.S. stock); Guadalupe fur seal (Mexico stock); and harbor seal (California stock). For the stocks with authorized M/SI below the insignificance threshold, there are no other known factors, information, or unusual circumstances that indicate anticipated M/SI below the insignificance threshold could have adverse effects on annual rates of recruitment or survival and they are not discussed further.

Stocks With Total Average Annual Human-Caused M/SI Below PBR (Tier 1) and Proposed Authorized M/SI Is Above the Insignificance Threshold—

Sei Whale (Eastern North Pacific Stock)

For sei whales (Eastern North Pacific stock), PBR is currently set at 1.25. The total annual M/SI is 0, yielding a residual PBR of 1.25. NMFS is proposing to authorize one M/SI for the Navy and one for the Coast Guard over the 7-year duration of the rule (two total; indicated as 0.29 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival), which leaves a PBR remainder of 0.96.

As described above, if the total M/SI estimate is less than or equal to PBR, which is the case here, then the specific activity is considered to have a negligible impact on that stock. Although the M/SI from take proposed here for the specified activity is above the insignificance threshold, as described above, that does not indicate that the M/SI associated with the specified activities is necessarily approaching a level that would exceed negligible impact. Rather, it is used as a cue to look more closely if and when the M/SI for the specified activity approaches residual PBR, as it becomes increasingly necessary (the closer the M/SI from the specified activity is to 100 percent residual PBR) to carefully consider whether there are other factors that could affect reproduction or survival. Here, the M/SI is not closely approaching residual PBR (PBR remainder is 0.96) and there are no other factors that would suggest that the authorized mortality (alone) would have more than a negligible impact on this stock.

As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

Additionally of note, management measures are in place to address M/SI caused by other activities. The Channel Islands NMS staff coordinates, collects, and monitors whale sightings in and around the Vessel Speed Reduction (VSR) zones and the Channel Islands NMS region. The seasonally established Southern California VSR zone spans from Point Arguello to Dana Point, including the Traffic Separation Schemes in the Santa Barbara Channel and San Pedro Channel. Vessels transiting the area from May 1 through December 15, 2025 are recommended to exercise caution and voluntarily reduce speed to 10 kn (18.5 km per hour) or less. While the VSR zone is aimed at reducing risk of fatal vessel strike of blue, humpback, and fin whales, this measure is also anticipated to reduce risk to sei whales (note, this is an expanded timeframe from the Whale Advisory Zone discussed in the 2020 HSTT final rule, which spanned June through November, though the effective period could change in future years). Channel Island NMS observers collect information from aerial surveys conducted by NOAA, the U.S. Coast Guard, California Department of Fish and Game, and U.S. Navy chartered aircraft. Information on seasonal presence, movement, and general distribution patterns of large whales is shared with mariners, NMFS Office of Protected Resources, U.S. Coast Guard, California Department of Fish and Game, the Santa Barbara Museum of Natural History, the Marine Exchange of Southern California, and whale scientists. Real time and historical whale observation data collected from multiple sources can be viewed on the Point Blue Whale Database.

As stated in the 2023 SAR, the California swordfish drift gillnet fishery is the most likely U.S. fishery to interact with Eastern North Pacific sei whales, though there are zero estimated annual takes from this fishery given no observed entanglements from 1990–2021 across 9,246 observed fishing sets (Carretta *et al.* (2022)). NMFS established the Pacific Offshore Cetacean Take Reduction Team (POCTRT) in 1996 and prepared an associated Plan to reduce the risk of M/SI via fisheries interactions incidental to the California/Oregon thresher shark/swordfish drift gillnet fishery. In 1997, NMFS published final regulations formalizing the requirements of the Plan, including the use of pingers following several specific provisions and the employment of Skipper education workshops. While the POCTRT is still active, the fishery is expected to be phased out entirely by 2027 following passage of the Driftnet Modernization and Bycatch Reduction Act by the U.S. Congress in 2022. As such, within 2 years of the effective period of this proposed rule, NMFS

does not anticipate mortality from this fishery.

Short-Finned Pilot Whale (CA/OR/WA Stock)

For the CA/OR/WA stock of short-finned pilot whale, PBR is currently set at 4.5, the total annual M/SI is estimated at 1.2, and the total annual authorized take from SWFSC Fisheries and Ecosystem Research Activities in the California Current is 0.4, yielding a residual PBR of 2.9. NMFS is proposing to authorize four M/SIs (U.S. Navy only) over the 7-year duration of the rule (indicated as 0.57 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival), which leaves a PBR remainder of 2.33.

As described above, if the total M/SI estimate is less than or equal to PBR, which is the case here, then the specific activity is considered to have a negligible impact on that stock. Although the M/SI from take proposed here for the specified activity is above the insignificance threshold, as described above, that does not indicate that the M/SI associated with the specified activities is necessarily approaching a level that would exceed negligible impact. Rather, it is used as a cue to look more closely if and when the M/SI for the specified activity approaches residual PBR, as it becomes increasingly necessary (the closer the M/SI from the specified activity is to 100 percent residual PBR) to carefully consider whether there are other factors that could affect reproduction or survival. Here, the M/SI is not closely approaching residual PBR (PBR remainder is 2.33) and there are no other factors that would suggest that the authorized mortality (alone) would have more than a negligible impact on this stock.

As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

As reported in the SAR, the total annual M/SI of this stock (1.2) is from the CA/OR thresher shark/swordfish drift gillnet fishery. NMFS established the POCTRT in 1996 and prepared an associated Plan to reduce the risk of M/SI via fisheries interactions incidental to the California/Oregon thresher shark/swordfish drift gillnet fishery. In 1997, NMFS published final regulations formalizing the requirements of the Plan, including the use of pingers following several specific provisions and the employment of Skipper education workshops. While the POCTRT is still active, the fishery is expected to be phased out entirely by 2027 following passage of the Driftnet Modernization and Bycatch Reduction Act by the U.S. Congress in 2022. As such, within 2 years of the effective period of this proposed rule, NMFS does not anticipate additional mortality from this fishery.

Stocks With Total Average Annual Human-Caused Mortality Above PBR (Tier 2)—

Blue Whale (Eastern North Pacific Stock)

For blue whales (Eastern North Pacific stock), PBR is currently set at 4.1 and the total annual M/SI is estimated at greater than or equal to 18.6, yielding a residual PBR of −14.5. NMFS is proposing to authorize one M/SI for the Navy and one for the Coast Guard over the 7-year duration of the rule (two total; indicated as 0.29 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival), which leaves a PBR remainder of −14.79. However, given that the negligible impact determination is based on the assessment of take of the activity being analyzed, when total annual mortality from human activities is higher, but the impacts from the specific activity being analyzed are very small, NMFS may still find the incremental impact of the authorized take from a specified activity is negligible even if total human-caused mortality exceeds PBR. Specifically, for example, if the authorized mortality is less than 10 percent of PBR and management measures are being taken to address serious injuries and mortalities from the other activities causing mortality (*i.e.,* other than the specified activities covered by the incidental take authorization in consideration). When those considerations are applied here, the lethal take proposed for authorization (0.29 annually) of blue whales from the Eastern North Pacific stock is less than 10 percent of PBR (which is 4.1), and there are management measures in place to address M/SI from activities other than those the Action Proponents are conducting (as discussed below). Immediately below, we explain the information that supports our finding that the Action Proponents' M/SI proposed for authorization is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

The 2018 draft SAR and the more recent SARs incorporate a method to estimate annual deaths by vessel strike utilizing an encounter theory model that combined species distribution models of whale density, vessel traffic characteristics, and whale movement patterns obtained from satellite-tagged animals in the region to estimate encounters that would result in mortality (Rockwood *et al.* 2017). The model predicts 18 annual mortalities of blue whales from vessel strikes, which, with the additional M/SI of 1.54 from fisheries interactions, results in the current estimate of residual PBR being −15.4. Although NMFS' Permits and Conservation Division in the Office of Protected Resources has independently reviewed the vessel strike model and its results and agrees that it is appropriate for estimating blue whale mortality by vessel strike on the U.S. West Coast, for analytical purposes we also note that if the historical method were used to predict vessel strike (*i.e.,* using observed mortality by vessel strike, or 0.6, instead of 18), then total human-caused mortality including the Action Proponents' potential take would not exceed PBR. We further note that the authors (Rockwood *et al.* 2017) do not suggest that vessel strike suddenly increased to 18 recently. In fact, the model is not specific to a year, but rather offers a generalized prediction of vessel strike off the U.S. West Coast. Therefore, if the Rockwood *et al.* (2017) model is an accurate representation of vessel strike, then similar levels of vessel strike have been occurring in past years as well. Put another way, if the model is correct, for some number of years total-human-caused mortality has been significantly underestimated and PBR has been similarly exceeded by a notable amount, and yet, the Eastern North Pacific stock of blue whales remains stable, nevertheless.

NMFS' 2023 SAR states that the current population trend is unknown, though there may be evidence of a population size increase since the 1990s. The SAR further cites to Monnahan *et al.* (2015), which used a population dynamics model to estimate that the Eastern North Pacific blue whale population was at 97 percent of carrying capacity in 2013 and to suggest

that the observed lack of a population increase since the early 1990s was explained by density dependence, not impacts from vessel strike. This would mean that this stock of blue whales shows signs of stability and is not increasing in population size because the population size is at or nearing carrying capacity for its available habitat. In fact, we note that this population has maintained this status throughout the years that the Navy has consistently tested and trained at similar levels (with similar vessel traffic) in areas that overlap with blue whale occurrence, which would be another indicator of population stability.

Monnahan *et al.* (2015) modeled vessel numbers, vessel strikes, and the population of the Eastern North Pacific blue whale population from 1905 out to 2050 using a Bayesian framework to incorporate informative biological information and assign probability distributions to parameters and derived quantities of interest. The authors tested multiple scenarios with differing assumptions, incorporated uncertainty, and further tested the sensitivity of multiple variables. Their results indicated that there is no immediate threat (*i.e.,* through 2050) to the population from any of the scenarios tested, which included models with 10 and 35 strike mortalities per year. Broadly, the authors concluded that, unlike other blue whale stocks, the Eastern North Pacific blue whales have recovered from 70 years of whaling and are in no immediate threat from vessel strikes. They further noted that their conclusion conflicts with the depleted and strategic designation under the MMPA as well as PBR specifically.

As discussed, we also take into consideration management measures in place to address M/SI caused by other activities. The Channel Islands NMS staff coordinates, collects, and monitors whale sightings in and around the VSR zones and the Channel Islands NMS region. Redfern *et al.* (2013) note that the most risky area for blue whales is the Santa Barbara Channel, where shipping lanes intersect with common feeding areas. The seasonally established Southern California VSR zone spans from Point Arguello to Dana Point, including the Traffic Separation Schemes in the Santa Barbara Channel and San Pedro Channel. Vessels transiting the area from May 1 through December 15, 2025 are recommended to exercise caution and voluntarily reduce speed to 10 kn (18.5 km per hour) or less for blue, humpback, and fin whales. Channel Island NMS observers collect information from aerial surveys conducted by NOAA, the U.S. Coast Guard, California Department of Fish and Game, and U.S. Navy chartered aircraft. Information on seasonal presence, movement, and general distribution patterns of large whales is shared with mariners, NMFS Office of Protected Resources, U.S. Coast Guard, California Department of Fish and Game, the Santa Barbara Museum of Natural History, the Marine Exchange of Southern California, and whale scientists. Real time and historical whale observation data collected from multiple sources can be viewed on the Point Blue Whale Database. In addition to management measures for vessel strike, NMFS is in the process of developing a new Take Reduction Team to address the incidental M/SI of humpback and blue whales in several trap/pot fisheries along the West Coast of the U.S. The Team is expected to be in place by November 30, 2025. Additional information is available on NMFS' website at: *https://www.fisheries.noaa.gov/west-coast/marine-mammal-protection/west-coast-take-reduction-team*

The loss of a male would have far less, if any, effect on population rates and, absent any information suggesting that one sex is more likely to be struck than another, we can reasonably assume that there is a 50 percent chance that each of the two strikes proposed for authorization by this proposed rulemaking would be a male, thereby further decreasing the likelihood of impacts on the population rate. In situations like this where potential M/SI is fractional, consideration must be given to the lessened impacts anticipated due to the likely absence of M/SI in 5 or 6 of the 7 years and the fact that each of the strikes could be a male.

Lastly, we reiterate that PBR is a conservative metric and also not sufficiently precise to serve as an absolute predictor of population effects upon which mortality caps would appropriately be based. As noted above, Wade *et al.* (1998), authors of the paper from which the current PBR equation is derived, note that ''[e]stimating incidental mortality in 1 year to be greater than the PBR calculated from a single abundance survey does not prove the mortality will lead to depletion; it identifies a population worthy of careful future monitoring and possibly indicates that mortality-mitigation efforts should be initiated.'' The information included here indicates that the current population trend of this blue whale stock is unknown but likely approaching carrying capacity and has leveled off because of density-dependence, not human-caused mortality, in spite of what might be otherwise indicated from the calculated PBR. Further, potential M/SI proposed for authorization is below 10 percent of PBR and management actions are in place to minimize vessel strike from other vessel activity in one of the highest-risk areas for strikes. Based on the presence of the factors described above, we do not expect lethal take from Action Proponents' activities, alone, to adversely affect Eastern North Pacific blue whales through effects on annual rates of recruitment or survival. Nonetheless, the fact that total human-caused mortality exceeds PBR necessitates close attention to the remainder of the impacts (*i.e.,* harassment) on the Eastern North Pacific stock of blue whales from the Navy's activities to ensure that the total takes proposed for authorization have a negligible impact on the species or stock. Therefore, this information will be considered in combination with our assessment of the impacts of harassment takes proposed for authorization in the *Group and Species-Specific Analyses* section that follows.

Humpback Whale (Central America/Southern Mexico CA/OR/WA Stock)

For humpback whales (Central America/Southern Mexico CA/OR/WA stock), PBR is currently set at 3.5, the total annual M/SI is estimated at greater than or equal to 14.9, and the 2020 NWTT final rule authorizes 0.29 takes by mortality annually, yielding a residual PBR of −11.69. NMFS is proposing to authorize one M/SI for the Navy and one for the Coast Guard over the 7-year duration of the rule (two total; indicated as 0.29 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival), which leaves a PBR remainder of −11.98.

However, given that the negligible impact determination is based on the assessment of take of the activity being analyzed, when total annual mortality from human activities is higher, but the impacts from the specific activity being analyzed are very small, NMFS may still find the incremental impact of the authorized take from a specified activity is negligible even if total human-caused mortality exceeds PBR. Specifically, for example, if the authorized mortality is less than 10 percent of PBR and management measures are being taken to address serious injuries and mortalities from the other activities causing mortality (*i.e.,* other than the specified activities covered by the incidental take authorization in consideration). When those

considerations are applied here, the lethal take proposed for authorization (0.29 annually) of humpback whales from the Central America/Southern Mexico CA/OR/WA stock is less than 10 percent of PBR (which is 3.5), and there are management measures in place to address M/SI from activities other than those the Action Proponents are conducting (as discussed below). Immediately below, we explain the information that supports our finding that the Action Proponents' M/SI proposed for authorization is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

The 2018 draft SAR and the more recent SARs rely on a new method to estimate annual deaths by vessel strike utilizing an encounter theory model that combined species distribution models of whale density, vessel traffic characteristics, and whale movement patterns obtained from satellite-tagged animals in the region to estimate encounters that would result in mortality (Rockwood *et al.* 2017). The model predicts 22 annual mortalities of humpback whales from vessel strikes, and the SAR attributes 6.45 of those strikes to the Central America/Southern Mexico-CA/OR/WA stock. With the additional M/SI of 8.1 from fisheries interactions, 0.35 from marine debris, recreational, and tribal fisheries, and 0.29 from vessel strike authorized in the NWTT final rule, results in the current estimate of residual PBR being −11.69. Although NMFS' Permits and Conservation Division in the Office of Protected Resources has independently reviewed the vessel strike model and its results and agrees that it is appropriate for estimating humpback whale mortality by vessel strike on the U.S. West Coast, for analytical purposes we also note that if the historical method were used to predict vessel strike (*i.e.,* using observed mortality by vessel strike, or 0.6, instead of 18), then total human-caused mortality including the Action Proponents' potential take would not exceed PBR. We further note that the authors (Rockwood *et al.* 2017) do not suggest that vessel strike suddenly increased to 22 recently. In fact, the model is not specific to a year, but rather offers a generalized prediction of vessel strike off the U.S. West Coast. Therefore, if the Rockwood *et al.* (2017) model is an accurate representation of vessel strike, then similar levels of vessel strike have been occurring in past years as well. Put another way, if the model is correct, for some number of years total-human-caused mortality has been significantly underestimated and PBR has been similarly exceeded by a notable amount, and yet, the Central America/Southern Mexico-CA/OR/WA stock of humpback whales is increasing nevertheless.

As discussed, we also take into consideration management measures in place to address M/SI caused by other activities. The Channel Islands NMS staff coordinates, collects, and monitors whale sightings in and around the VSR zones and the Channel Islands NMS region. The seasonally established Southern California VSR zone spans from Point Arguello to Dana Point, including the Traffic Separation Schemes in the Santa Barbara Channel and San Pedro Channel. Vessels transiting the area from May 1 through December 15, 2025 are recommended to exercise caution and voluntarily reduce speed to 10 kn (18.5 km per hour) or less for blue, humpback, and fin whales. Channel Island NMS observers collect information from aerial surveys conducted by NOAA, the U.S. Coast Guard, California Department of Fish and Game, and U.S. Navy chartered aircraft. Information on seasonal presence, movement, and general distribution patterns of large whales is shared with mariners, NMFS Office of Protected Resources, U.S. Coast Guard, California Department of Fish and Game, the Santa Barbara Museum of Natural History, the Marine Exchange of Southern California, and whale scientists. Real time and historical whale observation data collected from multiple sources can be viewed on the Point Blue Whale Database. In addition to management measures for vessel strike, NMFS is in the process of developing a new Take Reduction Team to address the incidental M/SI of humpback and blue whales in several trap/pot fisheries along the West Coast of the U.S. The Team is expected to be in place by November 30, 2025. Additional information is available on NMFS' website at: *https://www.fisheries.noaa.gov/west-coast/marine-mammal-protection/west-coast-take-reduction-team.*

The loss of a male would have far less, if any, effect on population rates and absent any information suggesting that one sex is more likely to be struck than another, we can reasonably assume that there is a 50 percent chance that each of the two strikes proposed for authorization by this proposed rulemaking would be a male, thereby further decreasing the likelihood of impacts on the population rate. In situations like this where potential M/SI is fractional, consideration must be given to the lessened impacts anticipated due to the likely absence of M/SI in 5 or 6 of the 7 years and the fact that each of the strikes could be a male.

Lastly, we reiterate that PBR is a conservative metric and also not sufficiently precise to serve as an absolute predictor of population effects upon which mortality caps would appropriately be based. As noted above, Wade *et al.* (1998), authors of the paper from which the current PBR equation is derived, note that ''[e]stimating incidental mortality in 1 year to be greater than the PBR calculated from a single abundance survey does not prove the mortality will lead to depletion; it identifies a population worthy of careful future monitoring and possibly indicates that mortality-mitigation efforts should be initiated.'' Further, potential M/SI proposed for authorization is below 10 percent of PBR and management actions are in place to minimize vessel strike from other vessel activity and efforts are underway to minimize M/SI from trap/pot fisheries along the U.S. West Coast. Based on the presence of the factors described above, we do not expect lethal take from Action Proponents' activities, alone, to adversely affect Central America/Southern Mexico-CA/OR/WA humpback whales through effects on annual rates of recruitment or survival. Nonetheless, the fact that total human-caused mortality exceeds PBR necessitates close attention to the remainder of the impacts (*i.e.,* harassment) on the Central America/Southern Mexico-CA/OR/WA stock of humpback whales from the Action Proponents' activities to ensure that the total takes proposed for authorization have a negligible impact on the species or stock. Therefore, this information will be considered in combination with our assessment of the impacts of harassment takes proposed for authorization in the *Group and Species-Specific Analyses* section that follows.

Stocks for Which Total Average Annual Mortality Is Not Known—

Bottlenose Dolphin (O'ahu Stock)

For bottlenose dolphin (O'ahu stock), PBR is currently set at 1. The total annual M/SI is unknown, and therefore a residual PBR cannot be calculated. NMFS is proposing to authorize one M/SI over the 7-year duration of the rule

(indicated as 0.14 annually for the purposes of comparing to PBR and evaluating overall effects on annual rates of recruitment and survival).

Given that the negligible impact determination is based on the assessment of take of the activity being analyzed, even if total annual mortality from human activities is higher, but the impacts from the specific activity being analyzed are very small, NMFS may still find the incremental impact of the authorized take from a specified activity is to be negligible even if total human-caused mortality exceeds PBR. As such, the incremental impact of the authorized take from a specified activity may also be negligible where total annual M/SI is unknown. An unknown total annual M/SI is a cue to look more closely if and when the M/SI for the specified activity approaches PBR (*e.g.,* consider whether there are mitigation measures in place for other potential sources of M/SI), as it becomes increasingly necessary (the closer the M/SI from the specified activity is to PBR) to carefully consider whether there are other factors that could affect reproduction or survival. Here, the M/SI proposed for authorization is 0.14 annually, which does not closely approach PBR (PBR is 1.0), there are management measures in place to address M/SI from activities other than those the Action Proponents are conducting (as discussed below), and there are no other factors that would suggest that the authorized mortality (alone) would have more than a negligible impact on this stock. Immediately below, we explain the information that supports our finding that the Action Proponents' M/SI proposed for authorization is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

As reported in the SAR, while information about fishery-related mortality is limited for this stock, Hawaii fisheries use gear types that cause mortality and serious injury to marine mammals in other U.S. fisheries, including gillnets and hook-and-line, and mortality reports indicate that nearshore fisheries are a risk for bottlenose dolphins in Hawaii. However, gillnetting around Maui and much of O'ahu is banned by state regulation, and in areas where gillnetting is permitted, fishermen are required to monitor their gillnets for bycatch every 30 minutes.

In this case, 0.14 M/SI means one mortality in 1 of the 7 years and zero mortalities in 6 of those 7 years. Therefore, the Action Proponents would not be contributing to the total human-caused mortality at all in 6 of the 7, or 85.7 percent, of the years covered by this proposed rulemaking. That means that even if an O'ahu bottlenose dolphin were to be lethally taken from explosives, in 6 of the 7 years, there could be no effect on annual rates of recruitment or survival from Navy-caused M/SI. Additionally, the loss of a male would have far less, if any, effect on population rates and absent any information suggesting that one sex is more likely to be struck than another, we can reasonably assume that there is a 50 percent chance that the single mortality proposed for authorization by this proposed rulemaking would be a male, thereby further decreasing the likelihood of impacts on the population rate. In situations like this where potential M/SI is fractional, consideration must be given to the lessened impacts anticipated due to the absence of M/SI in 6 of the 7 years and the fact that the single mortality could be a male. Lastly, we reiterate that PBR is a conservative metric and also not sufficiently precise to serve as an absolute predictor of population effects upon which mortality caps would appropriately be based. This is especially important given the minor difference between zero and one across the 7-year period covered by this proposed rulemaking, which is the smallest distinction possible when considering mortality. As noted above, Wade *et al.* (1998), authors of the paper from which the current PBR equation is derived, note that ''[e]stimating incidental mortality in 1 year to be greater than the PBR calculated from a single abundance survey does not prove the mortality will lead to depletion; it identifies a population worthy of careful future monitoring and possibly indicates that mortality-mitigation efforts should be initiated.'' Further, management actions are in place that minimize fishery interactions. Based on the presence of the factors described above, we do not expect lethal take from the Action Proponents' activities, alone, to adversely affect O'ahu bottlenose dolphins through effects on annual rates of recruitment or survival. Nonetheless, the fact that total human-caused mortality is unknown, and PBR is low, necessitates close attention to the remainder of the impacts (*i.e.,* harassment) on the O'ahu stock of bottlenose dolphins from the Action Proponents' activities to ensure that the total takes proposed for authorization have a negligible impact on the species or stock. Therefore, this information will be considered in combination with our assessment of the impacts of authorized harassment takes in the *Group and Species-Specific Analyses* section that follows.

Stocks for Which PBR Is Unknown—

Pantropical Spotted Dolphin (Baja California Peninsula Mexico Population)

The Baja California Peninsula Mexico population of pantropical spotted dolphins are not a NMFS-managed stock, and therefore, PBR and annual M/SI metrics are not available. NMFS is proposing to authorize two M/SIs over the 7-year duration of the rule (indicated as 0.29 annually for the purposes of evaluating overall effects on annual rates of recruitment and survival).

Immediately below, we explain the information that supports our finding that the Action Proponents' M/SI proposed for authorization is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

Given that this is not a NMFS-managed stock, some metrics are not available for this population, including PBR. PBR values are calculated by NMFS as the level of annual removal from a stock that will allow that stock to equilibrate within OSP at least 95 percent of the time, and is the product of factors relating to the minimum population estimate of the stock (N_{min}), the productivity rate of the stock at a small population size, and a recovery factor. The productivity rate is estimated as one-half of the estimated or theoretical maximum rate of population growth for the stock if it were small. In this case, NMFS estimates the productivity rate to be one half the default maximum net growth rate for cetaceans (one half of 4 percent). Recovery factors range from 0.1 to 1, with smaller factors applied to more at-risk species. Given the unknowns of this population NMFS used 0.1. N_{min} is not

available, and therefore, NMFS relies on the NMSDD abundance estimate of 70,889 to estimate PBR. As such, using the NMSDD abundance estimate, PBR is estimated to be 141.78 (70,889 × (0.5 × 4 percent) × (0.1). (Of note, if PBR was calculating using an estimated N_{min} of half of the NMSDD abundance estimate (35,445), PBR would be 70.89.)

Given that the negligible impact determination is based on the assessment of take of the activity being analyzed, even if total annual mortality from human activities is higher, but the impacts from the specific activity being analyzed are very small, NMFS may still find the incremental impact of the authorized take from a specified activity is to be negligible even if total human-caused mortality exceeds PBR. As such, the incremental impact of the authorized take from a specified activity may also be negligible where total annual M/SI is unknown. An unknown total annual M/SI is a cue to look more closely if and when the M/SI for the specified activity approaches PBR (*e.g.,* consider whether there are mitigation measures in place for other potential sources of M/SI), as it becomes increasingly necessary (the closer the M/SI from the specified activity is to PBR) to carefully consider whether there are other factors that could affect reproduction or survival. Here, the M/SI proposed for authorization is 0.29 annually, which does not closely approach our PBR estimate above (PBR is estimated as 141.78, potentially as low as 70.89), and there are no other factors that would suggest that the authorized mortality (alone) would have more than a negligible impact on this stock. Immediately below, we explain the information that supports our finding that the Action Proponents' M/SI proposed for authorization is not expected to result in more than a negligible impact on this stock. As described previously, NMFS must also ensure that impacts by the applicant on the species or stock from other types of take (*i.e.,* harassment) do not combine with the impacts from mortality to adversely affect the species or stock via impacts on annual rates of recruitment or survival, which occurs further below in the *Group and Species-Specific Analyses* section.

The loss of a male would have far less, if any, effect on population rates and absent any information suggesting that one sex is more likely to be struck than another, we can reasonably assume that there is a 50 percent chance that any single mortality proposed for authorization by this proposed rulemaking would be a male, thereby further decreasing the likelihood of impacts on the population rate. In situations like this where potential M/SI is fractional, consideration must be given to the lessened impacts anticipated due to the absence of M/SI in 5 or 6 of the 7 years and the fact that any single mortality could be a male.

Based on the presence of the factors described above, we do not expect lethal take from the Action Proponents' activities, alone, to adversely affect the Baja California Peninsula Mexico population of pantropical spotted dolphins through effects on annual rates of recruitment or survival. Nonetheless, the fact that total human-caused mortality is unknown necessitates close attention to the remainder of the impacts (*i.e.,* harassment) on the Baja California Peninsula Mexico population of pantropical spotted dolphins from the Action Proponents' activities to ensure that the total takes proposed for authorization have a negligible impact on the species or stock. Therefore, this information will be considered in combination with our assessment of the impacts of authorized harassment takes in the *Group and Species-Specific Analyses* section that follows.

Group and Species-Specific Analyses

In this section, we build on the general analysis that applies to all marine mammals in the HCTT Study Area from the previous sections. We first include information and analysis that applies to mysticetes or, separately, odontocetes or pinnipeds, and then within those three sections, more specific information that applies to smaller groups, where applicable, and the affected species or stocks. The specific authorized take numbers are also included in the analyses below, and so here we provide some additional context and discussion regarding how we consider the authorized take numbers in those analyses.

The maximum amount and type of incidental take of marine mammals reasonably likely to occur and therefore proposed to be authorized from exposures to sonar and other active acoustic sources and explosions during the 7-year activity period are shown in table 37, table 38, table 39, and table 40, and the subset attributable to ship shock trials is included in table 49.

In the discussions below, the estimated takes by Level B harassment represent instances of take, not the number of individuals taken (the much lower and less frequent Level A harassment takes are far more likely to be associated with separate individuals), and in some cases individuals may be taken more than one time. As part of our evaluation of the magnitude and severity of impacts to marine mammal individuals and the species, and specifically in an effort to better understand the degree to which the modeled and estimated takes likely represent repeated takes of the individuals of a given species/stock, we consider the total annual numbers of take by harassment (auditory injury, non-auditory injury, TTS, and behavioral disturbance) for species or stocks as compared to their associated abundance estimates—specifically, take numbers higher than the stock abundance clearly indicate that some number of individuals are being taken on more than one day in the year, and broadly higher or lower ratios of take to abundance may reasonably be considered to equate to higher or lower likelihood of repeated takes, respectively, other potentially influencing factors being equal. In addition to the mathematical consideration of estimated take compared to abundance, we also consider other factors or circumstances that may influence the likelihood of repeated takes, where known, such as circumstances where activities resulting in take are focused in an area and time (*e.g.,* instrumented ranges or a homeport, or long-duration activities such as MTEs) and/or where the same individual marine mammals are known to congregate over longer periods of time (*e.g.,* pinnipeds at a haulout, mysticetes in a known foraging area, or resident odontocetes with smaller home ranges). Similarly, and all else being equal, estimated takes that are largely focused in one region and/or season (see table 89, table 91, table 93, table 95, table 97, and table 99) may indicate a higher likelihood of repeated takes of the same individuals.

Occasional, milder behavioral responses are unlikely to cause long-term consequences for individual animals or populations, and even if some smaller subset of the takes are in the form of a longer (several hours or a day) and more severe response, if they are not expected to be repeated over a comparatively longer duration of sequential days, impacts to individual fitness are not anticipated. Nearly all studies and experts agree that infrequent exposures of a single day or less are unlikely to impact an individual's overall energy budget (Farmer *et al.,* 2018b; Harris *et al.,* 2018; King *et al.,* 2015; NAS, 2017; New *et al.,* 2014; Southall *et al.,* 2007; Villegas-Amtmann *et al.,* 2015; Hoekendijk *et al.,* 2018; Wisniewska *et al.,* 2018; Czapanskiy *et al.,* 2021; Pirotta, 2022). Generally speaking, and in the case of most

species impacted by the proposed activities, in the cases where some number of individuals may reasonably be expected to be taken on more than one day within a year, that number of days would be comparatively small and also with no reason to expect that those takes would occur on sequential days. In the rarer cases of species where individuals might be expected to be taken on a comparatively higher number of days of the year and there are reasons to think that these days might be sequential or clumped together, the likely impacts of this situation are discussed explicitly in the species discussions.

To assist in understanding what this analysis means, we clarify a few issues related to estimated takes and the analysis here. An individual that incurs AUD INJ or TTS may sometimes, for example, also be subject to behavioral disturbance at the same time. As described above in this section, the degree of auditory injury, and the degree and duration of TTS, expected to be incurred from the Navy's activities are not expected to impact marine mammals such that their reproduction or survival could be affected. Similarly, data do not suggest that a single instance in which an animal accrues auditory injury or TTS and is also subjected to behavioral disturbance would result in impacts to reproduction or survival. Alternately, we recognize that if an individual is subjected to behavioral disturbance repeatedly for a longer duration and on consecutive days, effects could accrue to the point that reproductive success is impacted. Accordingly, in analyzing the number of takes and the likelihood of repeated and sequential takes, we consider the total takes, not just the takes by Level B harassment by behavioral disturbance, so that individuals potentially exposed to both threshold shift and behavioral disturbance are appropriately considered. The number of takes by Level A harassment by auditory injury are so low (and zero in some cases) compared to abundance numbers that it is considered highly unlikely that any individual would be taken at those levels more than once.

Use of sonar and other transducers would typically be transient and temporary. The majority of acoustic effects to most marine mammal stocks from sonar and other active sound sources during the specified military readiness activities would be primarily from anti-submarine warfare events. On the less severe end, exposure to comparatively lower levels of sound at a detectably greater distance from the animal, for a few or several minutes, could result in a behavioral response such as avoiding an area that an animal would otherwise have moved through or fed in, or breaking off one or a few feeding bouts. More severe behavioral effects could occur when an animal gets close enough to the source to receive a comparatively higher level of sound, is exposed continuously to one source for a longer time or is exposed intermittently to different sources throughout a day. Such effects might result in an animal having a more severe flight response and leaving a larger area for a day or more or potentially losing feeding opportunities for a day. However, such severe behavioral effects are expected to occur infrequently. In addition to the proximity to the source, the type of activity and the season and location during which an animal is exposed can inform the impacts. These factors, including the numbers and types of effects that are estimated in areas known to be biologically important for certain species are discussed in the group and species-specific sections, below.

As described in the Proposed Mitigation Measures section, this proposed rule includes mitigation measures that would reduce the probability and/or severity of impacts expected to result from acute exposure to acoustic sources or explosives, vessel strike, and impacts to marine mammal habitat. Specifically, the Action Proponents would use a combination of delayed starts, powerdowns, and shutdowns to avoid mortality or serious injury, minimize the likelihood or severity of AUD INJ or non-auditory injury, and reduce instances of TTS or more severe behavioral disturbance caused by acoustic sources or explosives. The Action Proponents would also implement multiple time/area restrictions that would reduce take of marine mammals in areas or at times where they are known to engage in important behaviors, such as calving, where the disruption of those behaviors would have a higher probability of resulting in impacts on reproduction or survival of individuals that could lead to population-level impacts.

These time/area restrictions include a Hawaii Island Marine Mammal Mitigation Area, a Hawaii 4-Islands Marine Mammal Mitigation Area, Northern California Large Whale Mitigation Area, Central California Large Whale Mitigation Area, Southern California Blue Whale Mitigation Area, California Large Whale Real-Time Notification Mitigation Area, and San Nicolas Island Pinniped Haulout Mitigation Area as well as Hawaii Humpback Whale Awareness Messages and California Large Whale Awareness Messages. The Southern California Blue Whale Mitigation Area is discussed in the blue whale section below. However, it is important to note that measures in that area, while developed to protect blue whales, would also benefit other marine mammals in those areas. Therefore, they are discussed here also.

Within the Hawaii Island Marine Mammal Mitigation Area, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of helicopter dipping sonar (a mid-frequency active sonar source) annually and must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets). Mitigation in this area is designed to reduce exposure of numerous small and resident marine mammal populations (including Blainville's beaked whales, bottlenose dolphins, goose-beaked whales, dwarf sperm whales, false killer whales, melon-headed whales, pantropical spotted dolphins, pygmy killer whales, rough-toothed dolphins, short-finned pilot whales, and spinner dolphins), humpback whales within important seasonal reproductive habitat, and Hawaiian monk seals within critical habitat, to levels of sound that have the potential to cause injurious or behavioral impacts.

Within the Hawaii 4-Islands Marine Mammal Mitigation Area, from November 15–April 15, the Action Proponents must not use MF1 surface ship hull-mounted mid-frequency active sonar. The Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) within the mitigation area (year-round). This mitigation would prevent exposure of humpback whales in high-density seasonal reproductive habitats (*e.g.,* north of Maui and Moloka'i), Main Hawaiian Islands insular false killer whales in high seasonal occurrence areas, and numerous small and resident marine mammal populations that occur year-round (including bottlenose dolphins, pantropical spotted dolphins, and spinner dolphins, and Hawaiian monk seals) to explosives that have the potential to cause injury, mortality, or behavioral disturbance, and would minimize exposure of humpback whales in high-density seasonal reproductive habitats (*e.g.,* north of Maui and Moloka'i) and Main Hawaiian Islands insular false killer whales in high seasonal occurrence areas to levels of sound that have the potential to cause injurious or behavioral impacts.

Within the Northern California Large Whale Mitigation Area, Central California Large Whale Mitigation Area, and Southern California Blue Whale Mitigation Area, from June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within these three areas. This measure would reduce exposure of blue whales, fin whales, gray whales, and humpback whales in important seasonal foraging, migratory, and calving habitats to levels of sound that have the potential to cause injurious or behavioral impacts. Additionally, during the same June 1–October 31 period, within the portion of the mitigation area off San Diego, the Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) during large-caliber (≥57 mm (2.24 inch)) gunnery, torpedo, bombing, and missile (including 2.75-inch (7 cm) rockets) training and testing. This measure would reduce exposure of large whales within important seasonal foraging habitats to explosives that have the potential to cause injury, mortality, or behavioral disturbance.

Within the California Large Whale Real-Time Notification Mitigation Area, the Action Proponents would issue real-time notifications to alert Action Proponent vessels operating in the vicinity of large whale aggregations (four or more whales) sighted within 1 nmi (1.9 km) of an Action Proponent vessel within an area of the Southern California Range Complex (between 32–33 degrees North and 117.2–119.5 degrees West). Lookouts must use the information from the real-time notifications to inform their visual observations of applicable mitigation zones. The real-time notification area encompasses the locations of recent (2009, 2021, 2023) vessel strikes, and historic strikes where precise latitude and longitude were known.

Within the San Nicolas Island Pinniped Haulout Mitigation Area, Navy personnel must implement multiple measures that would minimize in-air launch noise and physical disturbance to pinnipeds hauled out on beaches, as well as to continue assessing baseline pinniped distribution/abundance and potential changes in pinniped use of these beaches after launch events.

Last, the Hawaii Humpback Whale Awareness Messages and California Large Whale Awareness Messages would alert applicable assets (and their Lookouts) transiting and training or testing in the Hawaii Range Complex or on the U.S. West Coast to the possible presence of concentrations of large whales during certain periods of the year. Lookouts must use that knowledge to help inform their visual observations during military readiness activities that involve vessel movements, active sonar, in-water explosives (including underwater explosives and explosives deployed against surface targets), or the deployment of non-explosive ordnance against surface targets in the mitigation area. These messages would minimize potential large whale vessel interactions and exposure to acoustic, explosive, and physical disturbance and strike stressors that have the potential to cause mortality, injury, or behavioral disturbance during reproductive seasons, foraging and migration seasons, and to resident whales.

In addition to the nature and context of the disturbance, including whether take occurs in a known BIA, species-specific factors affect the severity of impacts to individual animals and population consequences of disturbance. Keen *et al.* (2021) identifies three population consequences of disturbance themes: life history traits, environmental conditions, and disturbance source characteristics. Life history traits considered in Keen *et al.* (2021) include movement ecology (whether animals are resident, nomadic, or migratory), reproductive strategy (capital breeders, income breeders, or mixed), body size (based on size and life stage), and pace of life (slow or fast).

Regarding movement ecology, resident animals that have small home ranges relative to the size and duration of an impact zone would have a higher risk of repeated exposures to an ongoing activity. Animals that are nomadic over a larger range may have less predictable risk of repeated exposure. For resident and nomadic populations, overlap of a stressor with feeding or reproduction depends more on time of year rather than location in their habitat range. In contrast, migratory animals may have higher or reduced potential for exposure during feeding and reproduction based on both location, time of the year, and duration of an activity. The risk of repeated exposure during individual events may be lower during migration as animals maintain directed transit through an area.

Reproduction is energetically expensive for female marine mammals, and reproductive strategy can influence an animal's sensitivity to disturbance. Mysticetes and phocids are capital breeders. Capital breeders rely on their capital, or energy stores, to migrate, maintain pregnancy, and nurse a calf. Capital breeders would be more resilient to short-term foraging disruption due to their reliance on built-up energy reserves, but are vulnerable to prolonged foraging impacts during gestation. Otariids and most odontocetes are income breeders, which rely on some level of income, or regular foraging, to give birth and nurse a calf. Income breeders would be more sensitive to the consequences of disturbances that impact foraging during lactation. Some species exhibit traits of both, such as beaked whales.

Smaller animals require more food intake per unit body mass than large animals. They must consume food on a regular basis and are likely to be non-migratory and income breeders. The smallest odontocetes, the porpoises, must maintain high metabolisms to maintain thermoregulation and cannot rely on blubber stores for long periods of time, whereas larger odontocetes can more easily thermoregulate. The larger size of other odontocetes is an adaptation for deep diving that allows them to access high quality mesopelagic and bathypelagic prey. Both small and large odontocetes have lower foraging efficiency than the large whales. The filter-feeding large whales (*i.e.,* mysticetes) consume most of their food within several months of the year and rely on extensive lipid reserves for the remainder of the year. The metabolism of mysticetes allows for fasting while seeking prey patches during foraging season and prolonged periods of fasting outside of foraging season (Goldbogen *et al.,* 2023). Their energy stores support capital breeding and long migrations. The effect of a temporary feeding disturbance is likely to have inconsequential impacts to a mysticete, but may be consequential for small cetaceans. Despite their relatively smaller size, amphibious pinnipeds have lower thermoregulatory requirements because they spend a portion of time on land. For purposes of this assessment, marine mammals were generally categorized as small (less than 10 ft (3.05 m)), medium (10–30 ft (3.05–9.1 m)), or large (more than 30 ft (9.1 m)) based on length.

Populations with a fast pace of life are characterized by early age of maturity, high birth rates, and short life spans, whereas populations with a slow pace of life are characterized by later age of maturity, low birth rates, and long life spans. The consequences of disturbance in these populations differ. Although reproduction in populations with a fast pace of life are more sensitive to foraging disruption, these populations are quick to recover. Reproduction in populations with a slow pace of life is

resilient to foraging disruption, but late maturity and low birth rates mean that long-term impacts to breeding adults have a longer-term effect on population growth rates. Pace of life was categorized for each species in this analysis by comparing age at sexual maturity, birth rate interval, life span, body size, and feeding and reproductive strategy.

Southall *et al.* (2023) also identified factors that inform a population's vulnerability. The authors describe a framework to assess risk to populations from specific industry impact scenarios at different locations or times of year. While this approach may not be suitable for many military readiness activities, for which alternate spatial or seasonal scenarios are not usually feasible, the concepts considered in that framework's population vulnerability assessment are useful in this analysis, including population status (endangered or threatened), population trend (decreasing, stable, or increasing), population size, and chronic exposure to other anthropogenic or environmental stressors (*e.g.,* fisheries interactions, pollution, *etc.*). These factors are also considered when assessing the overall vulnerability of a stock to repeated effects from acoustic and explosive stressors.

In consideration of the factors outlined above, if impacts to individuals increase in magnitude or severity such that repeated and sequential higher severity impacts occur (the probability of this goes up for an individual the higher total number of takes it has) or the total number of moderate to more severe impacts increases substantially, especially if occurring across sequential days, then it becomes more likely that the aggregate effects could potentially interfere with feeding enough to reduce energy budgets in a manner that could impact reproductive success via longer cow-calf intervals, terminated pregnancies, or calf mortality. It is important to note that these impacts only accrue to females, which only comprise approximately 50 percent of the population. Based on energetic models, it takes energetic impacts of a significantly greater magnitude to cause the death of an adult marine mammal, and females will always terminate a pregnancy or stop lactating before allowing their health to deteriorate. Also, the death of an adult female has significantly more impact on population growth rates than reductions in reproductive success, while the death of an adult male has very little effect on population growth rates. However, as previously explained, such severe impacts from the specified activities would be very infrequent and not considered likely to occur at all for most species and stocks. We note that the negligible impact analysis is inherently a two-tiered assessment that first evaluates the anticipated impacts of the activities on marine mammals individuals, and then if impacts are expected to reproduction or survival of any individuals further evaluates the effects of those individual impacts on rates of reproduction and survival of the species or stock, in the context of the status of the species or stock. The analyses below in some cases address species collectively if they occupy the same functional hearing group (*i.e.,* very-low, low, high, and very high-frequency cetaceans), share similar life history strategies, and/or are known to behaviorally respond similarly to acoustic stressors. Because some of these groups or species share characteristics that inform the impact analysis similarly, it would be duplicative to repeat the same analysis for each species. In addition, similar species typically have the same hearing capabilities and behaviorally respond in the same manner.

Thus, our analysis below considers the effects of the specified activities on each affected species or stock even where discussion is organized by functional hearing group and/or information is evaluated at the group level. Where there are meaningful differences between a species or stock that would further differentiate the analysis, they are either described within the section or the discussion for those species or stocks is included as a separate part of each section. Specifically, we first give broad descriptions of the mysticete, odontocete, and pinniped groups and then differentiate into further groups as appropriate below.

Mysticetes

This section builds on the broader discussion above and brings together the discussion of the different types and amounts of take that different stocks will incur, the applicable mitigation for each stock, and the status and life history of the stocks to support the negligible impact determinations for each stock. We have already described above why we believe the incremental addition of the limited number of low-level auditory injury takes will not have any meaningful effect towards inhibiting reproduction or survival. We have also described in this section above the unlikelihood of any masking or habitat impacts having effects that would impact the reproduction or survival of any of the individual marine mammals affected by the Action Proponents' activities. For mysticetes, there is no predicted non-auditory injury from explosives for any stocks except the CA/OR/WA stock of fin whale and the Mainland Mexico-CA/OR/WA stock of humpback whale. Regarding the severity of individual takes by Level B harassment by behavioral disturbance for mysticetes, the majority of these responses are anticipated to occur at received levels below 172 dB, and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Much of the discussion below focuses on the behavioral effects and the mitigation measures that reduce the probability or severity of effects in biologically important areas or other habitat. Because there are multiple stock-specific factors in relation to the status of the species, as well as mortality take due to vessel strike for several stocks, at the end of the section we break out stock-specific findings.

In table 89 below for mysticetes, we indicate the total annual mortality, Level A harassment, and Level B harassment, and a number indicating the instances of total take as a percentage of abundance.

In table 90 below, we indicate the status, life history traits, important habitats, and threats that inform our analysis of the potential impacts of the estimated take on the affected mysticete stocks.

TABLE 89—ANNUAL ESTIMATED TAKE BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY AND RELATED INFORMATION FOR MYSTICETES IN THE HCTT STUDY AREA

Marine mammal species	Stock	NMFS stock abundance	NMSDD abundance	Maximum annual Level B harassment	Maximum annual Level A harassment	Maximum annual mortality	Maximum annual take	Maximum annual harassment as percentage of stock abundance	Season(s) with 50 percent of take or greater	Region(s) with 40 percent of take or greater
Gray Whale	Eastern North Pacific.	26,960	10,863	16,711	167	0.43	16,878	63	Cold (99 percent).	SOCAL (98 percent).

Gray Whale (Eastern North Pacific and Western North Pacific Stocks)—

Gray whales from the Eastern North Pacific stock are not listed under the ESA and are not considered as depleted or strategic under the MMPA, while gray whales from the Western North Pacific stock are listed as endangered under the ESA and depleted and strategic under the MMPA. Both stocks are migratory and most likely to be in the California Study Area during their migrations from winter to spring within 10 km (5.4 nmi) of the coast. Some gray whales transit further offshore in Southern California when making straight line transits south of Point Conception to and from Mexico. Gray whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strikes, fisheries interactions, habitat degradation, pollution, vessel disturbance, ocean noise, and subsistence hunting, among others.

The current stock abundance estimate of the Eastern North Pacific stock of gray whale is 26,960 animals and for the Western North Pacific stock is 290 animals. There are no UMEs or other factors that cause particular concern for these stocks. As described in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the HCTT Study Area overlaps eight BIAs for the Eastern North Pacific stock, including three feeding, four migratory, and one reproductive for the nearshore migratory corridor used by cow/calf pairs. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment are 167 and 16,711, respectively. As indicated, the rule also allows for up to three takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section.

There are no known biologically important areas for the Western North Pacific stock of gray whale in the HCTT Study Area, though the Western North Pacific stock may use the same migratory areas as the Eastern North Pacific stock while migrating to wintering areas in Mexico (Calambokidis *et al.,* 2024). As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment are 2 and 169, respectively. No mortality is anticipated or proposed for authorization, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with gray whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Gray whales are large-bodied capital breeders with a slow pace of life and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of take, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, given the number of takes by harassment as compared to the stock/species abundance (see table 89), and the fact that a portion of the takes of the Eastern North Pacific occur in BIAs, it is likely that some portion of the individuals taken are taken repeatedly over a limited number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Given the magnitude and severity of the impacts discussed above to the Western North Pacific stock (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are unlikely to result in impacts on the reproduction or survival of any individuals and, thereby, unlikely to affect annual rates of recruitment or survival. For the Eastern North Pacific stock, as analyzed and described in the Serious Injury and Mortality section, given the status of the stock and in consideration of other ongoing anthropogenic mortality (fisheries interactions, vessel strike), the M/SI proposed for authorization (three over the course of the 7-year rule, or 0.43 annually) would not, alone, nor in combination with the impacts of the take by harassment discussed above (which is not expected to impact the reproduction or survival of any individuals), be expected to adversely affect rates of recruitment and survival for any of this stock. For these reasons, we have determined that the total take (considering annual maxima and across 7 years) anticipated and proposed for authorization would have a negligible impact on the Eastern North Pacific and Western North Pacific stocks of gray whale.

Blue Whale (Central North Pacific and Eastern North Pacific Stocks)—

Blue whales are listed as endangered under the ESA and as both depleted and strategic under the MMPA. Both stocks of blue whales are migratory populations that can occur near the coast, over the continental shelf, and in oceanic waters. Blue whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strike, fisheries interactions, habitat degradation, pollution, vessel disturbance, and ocean noise, among others.

The Navy's NMSDD estimates the Central North Pacific stock abundance as 170, and the Eastern North Pacific stock abundance as 3,233. The Central North Pacific stock's primary range is outside of the HCTT Study Area. There are no UMEs or other factors that cause

particular concern for this stock, and there are no known biologically important areas for the Central North Pacific stock of blue whales in the HCTT Study Area. This stock migrates from their feeding grounds in the Gulf of Alaska to Hawaii in winter. While they occur in the Hawaii Study Area, they are not sighted frequently or year-round. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 1 and 92, respectively. No mortality is anticipated or proposed for authorization, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

For the Eastern North Pacific stock, there are no UMEs or other factors that cause additional concern for this stock. As described in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the HCTT Study Area overlaps a feeding BIA for the Eastern North Pacific stock (Calambokidis *et al.,* 2024). The Eastern North Pacific stock of blue whales is a migratory population that can occur near the coast, over the continental shelf, and in deep oceanic waters from the northern Gulf of Alaska to the eastern tropical Pacific. This stock forages in their hierarchical feeding BIAs off California in warmer months (June-November). In recent years, the Eastern North Pacific stock has been reported to spend more time (averaging over 8 months) on feeding grounds in the Southern California Bight. The highest densities of blue whales are predicted along nearshore southern California where most impacts would occur, so blue whales may be impacted while foraging in the designated BIAs. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A Harassment and Level B harassment is 27 and 4,571, respectively. As indicated, the rule also allows for up to two takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with blue whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Blue whales are large-bodied capital breeders with a slow pace of life, and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, for the Central North Pacific stock, given the lower number of takes by harassment as compared to the stock/species abundance (see table 89), their migratory movement pattern, and the absence of take concentrated in areas in which animals are known to congregate, it is unlikely that any individual blue whales from the Central North Pacific stock would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival. For the Eastern North Pacific stock, given the number of takes by harassment as compared to the stock/species abundance (see table 89) and the fact that a portion of the takes occur in BIAs, it is likely that some portion of the individuals taken are taken repeatedly over a limited number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas (*i.e.,* not concentrated within a specific region and season), and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Given the magnitude and severity of the impacts discussed above to the Central North Pacific stock of blue whales (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are not expected to result in impacts on the reproduction or survival of any individuals, much less affect annual rates of recruitment or survival. For the Eastern North Pacific stock, as analyzed and described in the Serious Injury and Mortality section, given the status of the stock, and in consideration of other ongoing anthropogenic mortality (fisheries interactions, vessel strike), the M/SI proposed for authorization (two over the course of the 7-year rule, or 0.29 annually) would not, alone, nor in combination with the impacts of the take by harassment discussed above (which is not expected to impact the reproduction or survival of any individuals), be expected to adversely affect rates of recruitment and survival for any of this stock. For these reasons, we have determined that the total take (considering annual maxima and across 7 years) anticipated and proposed for authorization would have a negligible impact on the Eastern North Pacific and Central North Pacific stocks of blue whale.

Bryde's Whale (Eastern Tropical Pacific and Hawaii Stocks)—

Little is known about the movements of Bryde's whales in the Study Area, but seasonal shifts in their distribution occur toward and away from the equator in winter and summer. Therefore, both populations of Bryde's whales are at least somewhat migratory populations that travel within their tropical and subtropical ranges year-round. There are no known biologically important areas for Bryde's whales in the HCTT Study Area. Bryde's whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strike, fisheries interactions,

habitat degradation, pollution, vessel disturbance, and ocean noise, among others.

Bryde's whales in the Eastern Tropical Pacific have not been designated as a stock under the MMPA, are not ESA-listed, and there is no current reported population trend. The Navy's NMSDD estimates the Eastern Tropical Pacific Bryde's whale is 69 animals. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 5 and 322, respectively. No mortality is anticipated or proposed for authorization, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

The Hawaii stock of Bryde's whale is not listed as threatened or endangered under the ESA and is not considered depleted or strategic under the MMPA. The current stock abundance estimate of the Hawaii stock of Bryde's whale is 791 animals. The stock's primary range extends outside of the HCTT Study Area. There are no UMEs or other factors that cause particular concern for this stock. Bryde's whales are the only baleen whale found in Hawaiian waters year-round, and the only mysticete in Hawaii that does not undergo predictable north-south seasonal migrations. However, Bryde's whales occur mostly in offshore waters of the North Pacific. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 3 and 409, respectively. No mortality is anticipated or proposed for authorization, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with Bryde's whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Bryde's whales are large-bodied capital breeders with a slow pace of life, and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts to the Hawaii stock through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, given the number of takes by harassment as compared to the stock/species abundance (see table 89), it is likely that some portion of the individuals taken from the Eastern Tropical Pacific stock are taken repeatedly over a moderate number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted. For the Hawaii stock, given the lower number of takes by harassment as compared to the stock/species abundance (see table 89), their migratory movement pattern, and the absence of take concentrated in areas in which animals are known to congregate, it is unlikely that any individual Bryde's whales from the Hawaii stock would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival.

Given the magnitude and severity of the impacts discussed above to Bryde's whales in the Eastern Tropical Pacific (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are not expected to result in impacts on the reproduction or survival of any individuals, much less affect annual rates of recruitment or survival. For these reasons, we have determined that the take anticipated and proposed for authorization would have a negligible impact on the Eastern Tropical Pacific and Hawaii stocks of Bryde's whale.

Fin Whale (Hawaii and CA/OR/WA Stocks)—

Fin whales are listed as endangered under the ESA and depleted and strategic under the MMPA. Fin whales have higher abundances in temperate and polar waters, and are not frequently seen in warm, tropical waters. Fin whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strike, fisheries interactions, habitat degradation, pollution, vessel disturbance, and ocean noise, among others.

The Navy's NMSDD estimates the abundance of the Hawaii stock of fin whale is 226 and the CA/OR/WA stock of fin whale is 12,304. There are no UMEs or other factors that cause particular concern for these stocks, and there are no known biologically important areas for the Hawaii stock of fin whale in the HCTT Study Area. The Hawaii stock of fin whales are not sighted frequently or year-round, and likely only migrate to the Hawaii portion of the HCTT Study Area during fall and winter. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A Harassment and Level B harassment is 1 and 86, respectively. No mortality is anticipated or proposed for authorization, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

For the CA/OR/WA stock, as described in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the HCTT Study Area overlaps a feeding BIA (Parent and Child) for this stock (Calambokidis *et al.,* 2024). This stock of fin whales is a migratory-resident population that travels along the entire U.S. west coast and may be present

throughout the year in southern and central California. There are generally higher densities farther offshore in the summer and fall, and closer to shore in winter and spring. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A Harassment and Level B harassment is 55 and 13,501, respectively. The rule allows for a limited number of takes by non-auditory injury (1 animal). As indicated, the rule also allows for up to four takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with fin whale communication and other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness. The rule also allows for a limited number of takes by non-auditory injury (*i.e.,* 1 animal) for this stock. As described above in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these non-auditory injuries are unlikely to be of a nature or level that would impact reproduction or survival.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Fin whales are large-bodied capital breeders with a slow pace of life and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, given the number of takes by harassment as compared to the stock/species abundance (see table 89) and the fact that a portion of the takes occur in BIAs for the CA/OR/WA stock, it is likely that some portion of the individuals of each stock are taken repeatedly over a limited number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Fin whales have the largest hierarchal feeding BIAs spanning the coast of California from June to November, which overlap more with PMSR and SOCAL compared to NOCAL, as the core BIAs are generally farther offshore in northern California. Impacts would be attributable to various activities in summer and fall (warm season), with most impacts occurring in southern California year-round. However, this stock is migratory and Navy activities are not anticipated to overlap a large portion of the BIAs, leaving large areas of important foraging habitat available.

Given the magnitude and severity of the impacts discussed above to the Hawaii stock of fin whales (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are unlikely to result in impacts on the reproduction or survival of any individuals and, thereby, unlikely to affect annual rates of recruitment or survival. For the CA/OR/WA stock, as analyzed and described in the Serious Injury and Mortality section, given the status of the stock and in consideration of other ongoing anthropogenic mortality (fisheries interactions, vessel strike), the M/SI proposed for authorization (three over the course of the 7-year rule, or 0.57 annually) would not, alone, nor in combination with the impacts of the take by harassment discussed above (which is not expected to impact the reproduction or survival of any individuals), be expected to adversely affect rates of recruitment and survival for any of this stock. For these reasons, we have determined that the total take (considering annual maxima and across 7 years) anticipated and proposed for authorization would have a negligible impact on the CA/OR/WA and Hawaii stocks of fin whale.

Humpback Whale (Central America/Southern Mexico—CA/OR/WA, Mainland Mexico—CA/OR/WA, and Hawaii Stocks)—

Humpback whales occur throughout the HCTT Study Area, and the two stocks (Central America/Southern Mexico—CA/OR/WA and Mainland Mexico—CA/OR/WA) found in the California portion of the Study Area most abundant in shelf and slope waters which are areas of high productivity and often sighted near shore, while also frequently moving through deep offshore waters during migration. In the Hawaii portion of the Study Area, the Hawaii of humpback whales occur seasonally in nearshore waters surrounding the main Hawaiian Islands during breeding season (typically December through May). The HCTT Study Area overlaps ESA-designated critical habitat for the endangered Central America DPS and the Mexico DPS of humpback whales along the west coast (86 FR 21082, April 21, 2021), as described in the Description of Marine Mammals in the Area of Specified Activities section. There are no UMEs or other factors that cause particular concern for these stocks. The HCTT Study Area overlaps a feeding BIA (Parent and Core) for the two stocks found in California (Calambokidis *et al.,* 2024), and a reproductive BIA (Parent and Child) for the Hawaii stock (Kratofil *et al.,* 2023). Humpback whales face several anthropogenic and non-anthropogenic risk factors, including vessel strikes, fisheries interactions, habitat degradation, pollution, vessel disturbance, and ocean noise, among others.

The Central America/Southern Mexico—CA/OR/WA stock (Central America DPS) of humpback whale is listed as endangered under the ESA and as both depleted and strategic under the MMPA. The Navy's NMSDD estimates this stock size is 1,603. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 19 and 1,888, respectively. As indicated, the rule also allows for up to two takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section.

The Mainland Mexico—CA/OR/WA stock (part of the Mexico DPS) of humpback whale is listed as threatened under the ESA and as both depleted and strategic under the MMPA. The Navy's NMSDD estimates this stock size is 3,741. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 44 and 4,449 respectively. The rule allows for a limited number of takes by non-auditory injury (*i.e.,* 1 animal). As described above, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these injuries are unlikely to impact reproduction or survival. As indicated, the rule also allows for up to two takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section.

The Hawaii stock of humpback whale is not listed as endangered under the ESA and as neither depleted nor strategic under the MMPA. The current stock abundance estimate of the Hawaii stock (Hawaii DPS) is 11,278. The stock's primary range extends outside of the HCTT Study Area. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 24 and 3,034, respectively. As indicated, the rule also allows for up to three takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section. The total take allowable for each stock across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with humpback whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness. The rule also allows for one take by non-auditory injury for the Mainland Mexico-CA/OR/WA stock. As described above, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, this non-auditory injury is unlikely to be of a nature or level that would impact reproduction or survival.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Humpback whales are large-bodied capital breeders with a slow pace of life and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat. In particular, for the Mainland Mexico-CA/OR/WA stock, this proposed rulemaking includes the Northern California Large Whale Mitigation Area and Central California Large Whale Mitigation Area. Within this area from June 1-October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Central California Large Whale Mitigation Area, and the Southern California Blue Whale Mitigation Area. These restrictions would reduce exposure of humpback whales in important seasonal foraging, migratory, and calving habitats to levels of sound that have the potential to cause injurious or behavioral impacts.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, for the Mainland Mexico-CA/OR/WA and Central America/Southern Mexico-CA/OR/WA stocks, given the number of takes by harassment as compared to the stock/species abundance (see table 89) and the fact that a portion of the takes of both stocks occur in BIAs, it is likely that some portion of the individuals taken are taken repeatedly over a limited number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted. Further, these stocks are migratory, and although some impacts to these stocks would occur in critical habitat and BIAs important for foraging off the coast of California, there are large areas available outside of the Study Area that contain high-quality foraging habitat for both stocks. Further, the majority of impacts to these stocks are anticipated to occur during the cold season, a portion of which (December to February) the BIAs for feeding are not considered to be active.

For the Hawaii stock, given the lower number of takes by harassment as compared to the stock/species abundance (see table 89), their migratory movement pattern, and the absence of take concentrated in areas in which animals are known to congregate, it is unlikely that any individual humpback whales from the Hawaii stock would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival.

For all three stocks, as described in the Serious Injury and Mortality section, given the status of the stocks, and in consideration of other ongoing

anthropogenic mortality, the amount of allowed M/SI take proposed here would not, alone, nor in combination with the impacts of the take by harassment discussed above (which is not expected to impact the reproduction or survival of any individuals), be expected to adversely affect rates of recruitment and survival. For these reasons, we have determined that the total take (considering annual maxima and across 7 years) anticipated and proposed for authorization would have a negligible impact on the Central America/Southern Mexico-CA/OR/WA, Mainland Mexico-CA/OR/WA, and Hawaii stocks of humpback whales.

Minke Whale (Hawaii and CA/OR/WA Stocks)—

Minke whales in the HCTT Study Area are not listed as threatened or endangered under the ESA, and neither the Hawaii stock nor the CA/OR/WA stock are considered depleted or strategic under the MMPA. There are no UMEs or other factors that cause particular concern for either stock and there are no known biologically important areas for minke whales in the HCTT Study Area. Minke whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strike, fisheries interactions, habitat degradation, pollution, vessel disturbance, and disease, among others.

The Navy's NMSDD estimates the abundance of the Hawaii stock of minke whale is 509 animals and the CA/OR/WA stock of minke whale is 1,342 animals. The stock's primary range extends outside of the HCTT Study Area. The Hawaii stock generally congregates in Hawaiian water in the colder months (fall to spring) and migrates to more productive areas in winter. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 3 and 296, respectively. The CA/OR/WA stock can be found year-round in southern California, generally congregating in nearshore waters over the continental shelf off California, and has low variability in annual distribution patterns. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 32 and 2,993, respectively. No mortality is anticipated or proposed for authorization for either stock, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration, and mostly not in a frequency band that would be expected to interfere with minke whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Minke whales are medium-to-large-bodied capital breeders with a slow pace of life and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, for the Hawaii stock, given the lower number of takes by harassment as compared to the stock/species abundance (see table 89), their migratory movement pattern, and the absence of take concentrated in areas in which animals are known to congregate, it is unlikely that any individual minke whales from the Hawaii stock would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival. For the CA/OR/WA stock, given the number of takes by harassment as compared to the stock/species abundance (see table 89), it is likely that some portion of the individuals taken are taken repeatedly over a limited to moderate number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Given the magnitude and severity of the impacts discussed above to the CA/OR/WA and Hawaii stocks of minke whale (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are not expected to result in impacts on the reproduction or survival of any individuals, much less affect annual rates of recruitment or survival. For these reasons, we have determined that the take by harassment anticipated and proposed for authorization would have a negligible impact on the Hawaii and CA/OR/WA stocks of minke whales.

Sei Whale (Hawaii and Eastern North Pacific Stocks)—

Sei whales are listed as endangered under the ESA and as both depleted and strategic under the MMPA. Sei whales generally have higher abundances in the cold and deep water of the open ocean. There are no UMEs or other factors that cause particular concern for either stock, and there are no known biologically important areas for sei whales in the HCTT Study Area. Sei whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strike, fisheries interactions, and ocean noise, among others.

The Navy's NMSDD estimates the abundance of the Hawaii stock is 452 and the Eastern North Pacific stock is 864 animals. The Hawaii stock's primary range is outside of the HCTT Study Area. This stock is migratory and not frequently detected in Hawaii, traveling from their cold subpolar latitudes to Hawaii in the winter, where they are more likely to be on the Hawaii Range Complex in the cold season. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 2 and 253, respectively. No mortality of the Hawaii

stock is anticipated or proposed for authorization, nor is any non-auditory injury.

The Eastern North Pacific stock occurs year-round in deep offshore waters of California and is likely to occur in the Transit Corridor of the HCTT Study Area. The Eastern North Pacific stock seasonally migrates, though to a lesser extent compared to other large whales. As shown in table 89, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 3 and 302, respectively. As indicated, the rule also allows for up to two takes by serious injury or mortality over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section. The total take allowable across all 7 years of the rule for both stocks is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with sei whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Sei whales are large-bodied capital breeders with a slow pace of life and are therefore generally less susceptible to impacts from shorter duration foraging disruptions. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, given the lower number of takes by harassment as compared to the stock/species abundance (see table 89), their migratory movement pattern, and the absence of take concentrated in areas in which animals are known to congregate, it is unlikely that any individual from either stock would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival.

Given the magnitude and severity of the impacts discussed above to the Hawaii stock of sei whales (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are not expected to result in impacts on the reproduction or survival of any individuals, much less affect annual rates of recruitment or survival. For the CA/OR/WA stock, as analyzed and described in the Serious Injury and Mortality section above, given the status of the stock, the M/SI proposed for authorization for CA/OR/WA sei whales (two over the course of the 7-year rule, or 0.29 annually) would not, alone, be expected to adversely affect the stock through rates of recruitment or survival. Given the magnitude and severity of the take by harassment discussed above and any anticipated habitat impacts, and in consideration of the required mitigation measures and other information presented, the take by harassment proposed for authorization is unlikely to result in impacts on the reproduction or survival of any individuals and, thereby, unlikely to affect annual rates of recruitment or survival either alone or in combination with the M/SI proposed for authorization. For these reasons, we have determined that the take by harassment anticipated and proposed for authorization would have a negligible impact on the Hawaii and CA/OR/WA stocks of sei whales.

Odontocetes

This section builds on the broader discussion above and brings together the discussion of the different types and amounts of take that different stocks will incur, the applicable mitigation for each stock, and the status and life history of the stocks to support the negligible impact determinations for each stock. We have already described above why we believe the incremental addition of the limited number of low-level auditory injury takes will not have any meaningful effect towards inhibiting reproduction or survival. We have also described above in this section the unlikelihood of any masking or habitat impacts having effects that would impact the reproduction or survival of any of the individual marine mammals affected by the Action Proponents' activities. Some odontocete stocks have predicted non-auditory injury from explosives, discussed further below. Regarding the severity of individual takes by Level B harassment by behavioral disturbance for odontocetes, the majority of these responses are anticipated to occur at received levels below 178 dB for most odontocete species and below 154 dB for sensitive species (*i.e.,* beaked whales and harbor porpoises, for which a lower behavioral disturbance threshold is applied), and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Much of the discussion below focuses on the behavioral effects and the mitigation measures that reduce the probability or severity of effects in biologically important areas or other habitats. Because there are multiple stock-specific factors in relation to the status of the species, as well as mortality take for several stocks, at the end of the section we break out stock- or group-specific findings.

In table 91 (sperm whales, dwarf sperm whales, and pygmy sperm whales), table 93 (beaked whales), table 95 (dolphins and small whales), table 97 (porpoises), and table 99 (pinnipeds) below, we indicate the total annual mortality, Level A harassment, and Level B harassment, and a number indicating the instances of total take as a percentage of abundance.

In table 92 (sperm whales, dwarf sperm whales, and pygmy sperm whales), table 94 (beaked whales), table 96 (dolphins and small whales), table 98 (porpoises), and table 100 (pinnipeds), below, we indicate the status, life history traits, important habitats, and threats that inform our analysis of the potential impacts of the estimated take on the affected odontocete stocks.

TABLE 91—ANNUAL ESTIMATED TAKE BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY AND RELATED INFORMATION FOR PACIFIC STOCKS OF SPERM WHALE, DWARF SPERM WHALE, AND PYGMY SPERM WHALE IN THE HCTT STUDY

Marine mammal species	Stock	NMFS stock abundance	NMSDD abundance	Maximum annual Level B harassment	Maximum annual Level A harassment	Maximum annual mortality	Maximum annual take	Maximum annual harassment as percentage of stock abundance	Season(s) with 50 percent of take or greater	Region(s) with 40 percent of take or greater
Sperm Whale	Hawaii	5,707	6,062	1,649	1	0.14	1,650	27	Cold (55 percent).	HRC (94 percent).
Sperm Whale	California/Oregon/Washington.	2,606	4,549	3,891	3	0	3,894	86	Cold (55 percent).	SOCAL (70 percent).

Sperm Whales, Dwarf Sperm Whales, and Pygmy Sperm Whales—

Sperm Whale (Hawaii and CA/OR/WA Stocks)

Sperm whales are listed as endangered under the ESA and are considered depleted and strategic under the MMPA. The Navy's NMSDD estimate for the Hawaii stock is 6,062 animals and for the CA/OR/WA stock is 4,549 animals. There are no UMEs or other factors that cause particular concern for these stocks, and there are no known biologically important areas for the sperm whales in the HCTT Study Area. Sperm whales generally have higher abundances in deep water and areas of high productivity and are somewhat migratory, but their movement ecology is demographically dependent. The Hawaii stock is residential and occurs in Hawaiian waters year-round, while the CA/OR/WA stock is somewhat migratory, with some individuals leaving warm waters in summer to travel north to their arctic feeding grounds and returning south in the fall and winter. Sperm whales face several chronic anthropogenic and non-anthropogenic risk factors, including vessel strike, fisheries interactions, pollution, ocean noise, and disease, among others.

As shown in table 91, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B harassment is 1 (Hawaii stock) and 3 (CA/OR/WA stock), and 1,649 (Hawaii stock) to 3,891 (CA/OR/WA stock), respectively. As indicated, the rule also allows for up to one take by serious injury or mortality of Hawaii sperm whales over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section. The total take allowable for each stock across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with sperm whale communication or other important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 178 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Sperm whales are large-bodied income breeders with a slow pace of life and are likely more resilient to missed foraging opportunities due to acoustic disturbance than smaller odontocetes. However, they may be more susceptible to impacts due to lost foraging opportunities during reproduction, especially if they occur during lactation (Farmer *et al.,* 2018b). Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. For both stocks of sperm whales, given the lower number of takes by harassment as compared to the stock/species abundance (see table 91), and the absence of take concentrated in areas in which animals are known to congregate, it is unlikely that any individual sperm whales would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival.

Given the magnitude and severity of the impacts discussed above to sperm whales (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the proposed take by harassment is not expected to impact the reproduction or survival of any individuals nor, as described previously, is the mortality proposed for authorization expected to adversely affect the species or stock. For these reasons, we have determined that the take anticipated and proposed for authorization would have a negligible impact on the Hawaii and CA/OR/WA stocks of sperm whale.

Dwarf Sperm Whale (Hawaii and CA/OR/WA Stocks) and Pygmy Sperm Whale (Hawaii and CA/OR/WA Stocks)

Neither dwarf sperm whales nor pygmy sperm whales are listed under the ESA, and none of the stocks are considered depleted or strategic under the MMPA. The current stock abundance of the CA/OR/WA stock of pygmy sperm whale is 4,111 animals, and the stock abundances from Navy's NMSDD are 2,426 (CA/OR/WA stock of dwarf sperm whale), 43,246 (Hawaii stock of dwarf sperm whale), and 48,589 (Hawaii stock of pygmy sperm whale). There are no UMEs or other factors that cause particular concern for these stocks. As described in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the HCTT Study Area overlaps two known BIAs for small and resident populations of the Hawaii stocks of dwarf and pygmy sperm whale. Dwarf and pygmy sperm whales face several chronic anthropogenic and non-anthropogenic risk factors, including fisheries interactions, marine debris, and ocean noise, among others.

As shown in table 91, the maximum annual allowable instances of take under this proposed rule by Level A Harassment and Level B harassment is: 915 and 45,224 for the Hawaii stock of dwarf sperm whale, respectively; 94 and 5,664 for the CA/OR/WA stock of dwarf sperm whale, respectively; 936 and 45,787 for the Hawaii stock of pygmy sperm whale, respectively; and 107 and 5,615 for the CA/OR/WA stock of pygmy sperm whale, respectively. No mortality is anticipated or proposed for authorization. The rule allows for a limited number of takes by non-auditory injury (one each for the Hawaii stocks of dwarf and pygmy sperm whales). As described above, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these injuries are unlikely to impact reproduction or survival. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be

lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with dwarf and pygmy sperm whale communication, overlap more than a relatively narrow portion of the vocalization range of any single species or stock, or preclude detection or interpretation of important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness. The rule also allows for a limited number of takes by non-auditory injury (one per stock) for the Hawaii stocks of dwarf and pygmy sperm whales. As described above in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these non-auditory injuries are unlikely to be of a nature or level that would impact reproduction or survival for either of the Hawaii stocks of dwarf and pygmy sperm whales.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 178 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Dwarf and pygmy sperm whales are small-to-medium-bodied income breeders with a fast pace of life. They are generally more sensitive to missed foraging opportunities than larger odontocetes, especially during lactation, but would be quick to recover given their fast pace of life. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat. In particular, this proposed rulemaking includes a Hawaii Island Marine Mammal Mitigation Area, within which the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of helicopter dipping sonar (a mid-frequency active sonar source) annually and must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets). These restrictions would reduce exposure of numerous small and resident marine mammal populations, including dwarf and pygmy sperm whales, to levels of sound from sonar or explosives that have the potential to cause injury or mortality, thereby reducing the likelihood of those effects and, further, minimizing the severity of behavioral disturbance.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, given the number of takes by harassment as compared to the stock/species abundance (see table 91) and the fact that a portion of the takes occur in BIAs for the Hawaii stocks, it is likely that some portion of the individuals taken are taken repeatedly over a limited to moderate number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Given the magnitude and severity of the impacts discussed above to dwarf and pygmy sperm whale stocks in the HCTT Study Area (considering annual take maxima and the total across 7 years) and their habitats, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are not expected to result in impacts on the reproduction or survival of any individuals, much less affect annual rates of recruitment or survival. For these reasons, we have determined that the take anticipated and proposed for authorization would have a negligible impact on the Hawaii and CA/OR/WA stocks of dwarf and pygmy sperm whales.

Beaked Whales—

This section builds on the broader odontocete discussion above (*i.e.,* that information applies to beaked whales as well), and brings together the discussion of the different types and amounts of take that different beaked whale species and stocks will likely incur, any additional applicable mitigation, and the status of the species and stocks to support the negligible impact determinations for each species or stock.

TABLE 93—ANNUAL ESTIMATED TAKE BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY AND RELATED INFORMATION FOR BEAKED WHALES IN THE HCTT STUDY AREA

Marine mammal species	Stock	NMFS stock abundance	NMSDD abundance	Maximum annual Level B harassment	Maximum annual Level A harassment	Maximum annual mortality	Maximum annual take	Maximum annual harassmen as percentage of stock abundance	Season(s) with 50 percent of take or greater	Region(s) with 40 percent of take or greater
Baird's Beaked Whale.	California/Oregon/Washington.	1,363	871	10,174	0	0	10,174	746	Cold (54 percent).	SOCAL (58 percent).

Note: N/A = Not Applicable, Unk = Unknown.

These stocks are not listed as endangered or threatened under the ESA, and they are not considered depleted or strategic under the MMPA. The stock abundance estimates range from 1,300 (Hawaii stock of Blainville's beaked whale, NMSDD) to 13,531 (CA/OR/WA stock of goose-beaked whale, NMSDD). There are no UMEs or other factors that cause particular concern for these stocks in the HCTT Study Area. As described in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the HCTT Study Area overlaps two known biologically important areas for small and resident populations for the Hawaii stocks of Blainville's and goose-beaked whales. Beaked whales face several chronic anthropogenic and non-anthropogenic risk factors, including fisheries interactions, and ocean noise, among others.

As shown in table 93, the maximum annual allowable instances of take under this proposed rule by Level A harassment and Level B Harassment range from 0 to 2, and 7,542 and 166,816, respectively. No mortality is anticipated or proposed for authorization, nor is any non-auditory injury. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with echolocation, overlap more than a relatively narrow portion of the vocalization range of any single species or stock, or preclude detection or interpretation of important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness on the CA/OR/WA stocks of goose- and mesoplodont beaked whales and the Hawaii stock of Longman's beaked whales.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 154 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Beaked whales are medium-to-large-bodied odontocetes with a medium pace of life and likely moderately resilient to missed foraging opportunities due to acoustic disturbance. They are mixed breeders (*i.e.,* behaviorally income breeders), and they demonstrate capital breeding strategies during gestation and lactation (Keen *et al.,* 2021), so they may be more vulnerable to prolonged loss of foraging opportunities during gestation. Further, as described in the *Group and Species-Specific Analyses* section above and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat. In particular, this proposed rulemaking includes a Hawaii Island Marine Mammal Mitigation Area, within which the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of helicopter dipping sonar (a mid-frequency active sonar source) annually and must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets). These restrictions would reduce exposure of numerous small and resident marine mammal populations, including the Hawaii stocks of Blainville's and goose-beaked whales, to levels of sound from sonar or explosives that have the potential to cause injury or mortality, thereby reducing the likelihood of those effects and, further, minimizing the severity of behavioral disturbance.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, given the number of takes by harassment as compared to the stock/species abundance (see table 93), it is likely that some portion of the individuals taken are taken repeatedly over a moderate number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Given the magnitude and severity of the impacts discussed above to beaked whale stock/species (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are not expected to result in impacts on the reproduction or survival of any individuals, much less affect annual rates of recruitment or survival. For these reasons, we have determined that the take anticipated and proposed for authorization would have a negligible impact on the CA/OR/WA stocks of Baird's, goose-, and mesoplodont beaked whales, and the Hawaii stocks of Blainville's, goose-, and Longman's beaked whale stocks.

Dolphins and Small Whales—

Of the 39 stocks of dolphins and small whales (Delphinidae) for which incidental take is proposed for authorization (see table 95), one is listed as endangered under the ESA and depleted and strategic under the MMPA: the Main Hawaiian Islands Insular stock of false killer whale. While not ESA-listed, the Hawaii Pelagic stock of false killer whale is considered strategic under the MMPA. As shown in table 95 and table 96, these delphinids vary in stock abundance, body size, and movement ecology from, for example, the small-bodied, nomadic CA/OR/WA stock of short-beaked common dolphin with NMSDD abundance estimate of 1,049,117, to the medium-sized small and resident Main Hawaiian Islands Insular stock of false killer whale with an estimated abundance of 138. The HCTT Study Area overlaps ESA-designated critical habitat for the Main Hawaiian Islands Insular stock of false killer whale (83 FR 35062, July 24, 2018), as well as BIAs for the following small and resident populations: false killer whale (Main Hawaiian Islands Insular and Northwest Hawaiian Islands stocks), melon-headed whale (Hawaiian Islands and Kohala Resident stocks), short-finned pilot whale (Hawaii stock), bottlenose dolphin (Maui Nui, Hawaii Island, Kauaʻi/Niʻihau, and Oʻahu stocks), pantropical spotted dolphins (Maui Nui, Hawaii Island, and Oʻahu stocks), rough-toothed dolphin (Hawaii stock), and spinner dolphin (Hawaii Island, Kauaʻi/Niʻihau, and Oʻahu/4

Islands Region stocks). These areas are described in the Description of Marine Mammals and Their Habitat in the Area of Specified Activities section. Delphinids face a number of chronic anthropogenic and non-anthropogenic risk factors including fishery interactions, biotoxins, chemical contaminants, illegal feeding/harassment, ocean noise, oil spills and energy exploration, vessel strikes, and swim with dolphin programs, the impacts of which vary depending whether the stock is more coastal (*e.g.,* swim with dolphin programs occur mostly with coastally-distributed spinner dolphins), more or less deep-diving (*e.g.,* entanglement more common in deep divers like pygmy killer whales and pilot whales), and other behavioral differences (*e.g.,* vessels strikes more concern for killer whales). There are no known UMEs or other factors that cause particular concern for these stocks.

TABLE 95—ANNUAL ESTIMATED TAKE BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY AND RELATED INFORMATION FOR DOLPHINS IN THE HCTT STUDY AREA

Marine mammal species	Stock	NMFS stock abundance	NMSDD abundance	Maximum annual Level B harassment	Maximum annual Level A harassment	Maximum annual mortality	Maximum annual take	Maximum annual harassment as percentage of stock abundance	Season(s) with 50 percent of take or greater	Region(s) with 40 percent of take or greater	Greatest degree any individual expected to be taken repeatedly across multiple days
False Killer Whale	Main Hawaiian Islands Insular.	138	98	169	0	0	169	122	Warm (53 percent), Cold (46 percent).	HRC (100 percent).	Limited number of days.

Note: N/A = Not Applicable, UND = Undetermined, Unk = Unknown.

As shown in table 95, the maximum annual allowable instances of take by Level B harassment for delphinid stocks ranges from 9 (Hawaii Island stock of bottlenose dolphin) to 2,169,554 for the CA/OR/WA stock of short-beaked common dolphin, with 14 stocks below 2,000, five stocks above 70,000, and the remainder between 2,000 and 70,000. Take by Level A harassment is 0 for 9 of the 39 stocks, between 1 and 15 for 20 stocks, and above 15 for 10 stocks. As indicated, the rule also allows for take by M/SI for 10 stocks (the CA/OR/WA stocks of short-finned pilot whale, northern right whale dolphin, Pacific white-sided dolphin, short-beaked common dolphin, and striped dolphin; the Hawaii Pelagic and Oʻahu stocks of bottlenose dolphin; the California stock of long-beaked common dolphin; the Baja California Peninsula Mexico population of pantropical spotted dolphin; and the Hawaii stock of rough-toothed dolphin), the impacts of which are discussed above in the Serious Injury and Mortality section. The total take allowable across all 7 years of the rule is indicated in table 54.

All delphinid stocks are expected to incur some number of takes in the form of TTS. As described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, these temporary hearing impacts are expected to be lower-level, of short duration (from minutes to at most several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with delphinid echolocation, overlap more than a relatively narrow portion of the vocalization range of any single species or stock, or preclude detection or interpretation of important low-frequency cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. About three-quarters of the affected delphinid stocks will incur some number of takes by AUD INJ, over half of those stocks will incur take in the single digits, with only two stocks exceeding 45 (long- and short-beaked common dolphin). For reasons similar to those discussed for TTS, while auditory injury impacts last longer, given the anticipated effectiveness of mitigation measures and the likelihood that individuals are expected to avoid higher levels associated with more severe impacts, the lower anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to affect the fitness of any individuals. Two stocks are projected to incur notably higher numbers of take by AUD INJ (128 for the California stock of long-beaked common dolphin and 806 for the CA/OR/WA stock of short-beaked common dolphin) and while the conclusions above are still applicable, it is further worth noting that these two stocks have relatively large abundances and limited annual mortality as compared to PBR. The rule also allows for a limited number of takes by non-auditory injury (*i.e.,* 1–71) for 19 stocks (less than 5 takes for all stocks except for the California stock of long-beaked common dolphin and the CA/OR/WA stock of short-beaked common dolphin). As described above in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these non-auditory injuries are unlikely to be of a nature or level that would impact reproduction or survival, with the exception of long- and short-beaked common dolphins.

Due to the larger number of long- and short-beaked common dolphin individuals predicted to be exposed annually to levels associated with non-auditory injury (24 and 71, respectively), it is more likely that some subset of these individuals could potentially be injured in a manner that would result in them foregoing reproduction for a year (up to 4 long-beaked and 13 short-beaked common dolphins). A year of foregone reproduction for a male is generally meaningless to population rates unless the animal ultimately dies. M/SI have been modeled for this activity separately, and NMFS does not anticipate that these non-auditory injuries would result in mortality, for young or adults. Neither stock is considered depleted or strategic. While the population trends of these stocks are not known (though the SAR notes that the CA/OR/WA stock of short-beaked common dolphin is possibly increasing), they are not considered depleted or strategic, and total annual mortality is well below PBR for each stock. Importantly, the increase in a calving interval by a year would have far less of an impact on a population rate than a mortality would and, accordingly, the number of instances of foregone reproduction predicted here would not be expected to adversely affect this stock through effects on annual rates of recruitment or survival.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 178 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Delphinids are income breeders with a medium pace of life, meaning that while they can be sensitive to the consequences of disturbances that impact foraging during lactation, from a population standpoint, they can be moderately quick to recover. Further, as described in the *Group and Species-Specific Analyses* section (and the Proposed Mitigation Measures section), mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in higher value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In the case of over half of the delphinid stocks (see the ''Greatest degree any individual expected to be taken repeatedly across multiple days'' column in table 95), given the low number of takes by harassment as compared to the stock/species abundance alone, and also in consideration of their nomadic movement pattern and whether take is concentrated in areas in which animals are known to congregate, it is unlikely that these individual delphinids would be taken on more than a limited number of days within a year and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival. In the case of the rest of the stocks, given the number of takes by harassment as compared to the stock/species abundance, it is likely that some portion of the individuals taken are taken repeatedly over a small to moderate number of days (as indicated in the ''Greatest degree any individual expected to be taken repeatedly across multiple days'' column in table 95), with two stocks (Kauaʻi/Niʻihau and Oʻahu stocks of bottlenose dolphins) likely to be taken over a high number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at

different times and in different areas, and the fact that many result from transient activities conducted at sea, for all stocks except Kauaʻi/Niʻihau and Oʻahu stocks of bottlenose dolphins (addressed below), it is unlikely that the anticipated small to moderate number of repeated takes for a given individual would occur clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals are likely to be impacted. Further, many of these stocks are nomadic and, apart from the small resident populations, there are no known foraging areas or other areas within which delphinids are known to congregate for important behaviors, and for most stocks, the takes are not concentrated within a specific region and season.

Regarding the magnitude of repeated takes for the Kauaʻi/Niʻihau and Oʻahu stocks of bottlenose dolphins, given the number of takes by harassment as compared to the stock/species abundance and the small resident populations, it is more likely that some number of individuals would experience a comparatively higher number of repeated takes over a potentially fair number of sequential days. Due to the higher number of repeated takes focused within the stocks' limited ranges, it is thereby more likely that a portion of the individuals (approximately 50 percent of which would be female) could be repeatedly interrupted during foraging in a manner and amount such that impacts to the energy budgets of a limited number of females (from either losing feeding opportunities or expending considerable energy moving away from sound sources or finding alternative feeding options) could cause them to forego reproduction for a year (noting that bottlenose dolphin calving intervals are typically 3 or more years). Energetic impacts to males are generally meaningless to population rates unless they cause death, and it takes extreme energy deficits beyond what would ever be likely to result from these activities to cause the death of an adult marine mammal, male or female. The population trends of these stocks are unknown, and neither are considered depleted or strategic. Importantly, the increase in a calving interval by a year would have far less of an impact on a population rate than a mortality would and, accordingly, a limited number of instances of foregone reproduction would not be expected to adversely affect these stocks through effects on annual rates of recruitment or survival (noting also that no mortality is predicted or authorized for the Kauaʻi/Niʻihau stock, and 0.14 annual mortality is authorized for the Oʻahu stock). Further, of note, use of in-water explosives (including underwater explosives and explosives deployed against surface targets) is prohibited within the Hawaii 4-Islands Marine Mammal Mitigation Area. This measure would be prevent exposure of these stocks to explosives that have the potential to cause injury, mortality or behavioral disturbance within that area. Further, within the same area, mitigation from November 15 to April 15 prohibiting use of MF1 surface ship hull-mounted mid-frequency active sonar would reduce exposure of these stocks to levels of sound that have the potential to cause injurious or behavioral impacts.

Given the magnitude and severity of the take by harassment discussed above and any anticipated habitat impacts, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are unlikely to result in impacts on the reproduction or survival of any individuals of delphinid stocks, with the exception of the 10 stocks for which takes by M/SI are predicted and the 1 stock for which an increased calving interval could potentially occur. Regarding the Kauaʻi/Niʻihau and Oʻahu stocks of bottlenose dolphins, as described above, we do not anticipate the relatively limited number of individuals that might be taken over repeated days within the year in a manner that results in a year of foregone reproduction to adversely affect the stock through effects on rates of recruitment or survival, given the status of the stocks. Regarding the CA/OR/WA stock of short-finned pilot whale, Hawaii Pelagic and Oʻahu stocks of bottlenose dolphin, California stock of long-beaked common dolphin, CA/OR/WA stock of Northern right whale dolphin, CA/OR/WA stock of Pacific white-sided dolphin, Baja California Peninsula Mexico population of pantropical spotted dolphin, Hawaii stock of rough-toothed dolphin, CA/OR/WA stock of short-beaked common dolphin, and CA/OR/WA stock of striped dolphin, as described in the Serious Injury and Mortality section, given the status of the stocks and in consideration of other ongoing anthropogenic mortality (where known), the amount of allowed M/SI take proposed here would not alone, nor in combination with the impacts of the take by harassment discussed above (which are not expected to impact the reproduction or survival of any individuals for those stocks), be expected to adversely affect rates of recruitment and survival. For these reasons, we have determined that the total take (considering annual maxima and across 7 years) anticipated and proposed for authorization would have a negligible impact on all delphinid species and stocks.

Porpoises—

Neither Dall's porpoise nor harbor porpoise are listed as endangered or threatened under the ESA, and none of the porpoise stocks are considered depleted or strategic under the MMPA. The Navy's NMSDD estimate for the CA/OR/WA stock of Dall's porpoise is 61,840, and the stock abundances of harbor porpoises range from 3,885 (Navy's NMSDD) to 15,303 (SAR). There are no UMEs or other factors that cause particular concern for this stock. As described in the Description of Marine Mammals and Their Habitat in the Area of the Specified Activities section, the HCTT Study Area overlaps two small and resident population BIAs for the Monterey Bay and Morro Bay stocks of harbor porpoise (Calambokidis *et al.,* 2015). There is no ESA-designated critical habitat for Dall's or harbor porpoise as neither species is ESA-listed. Dall's porpoises can be found from Baja California, Mexico, to the northern Bering Sea. They shift their distribution southward during cooler-water periods on both interannual and seasonal time scales. They primarily congregate in shelf and slope waters and decrease substantially in waters warmer than 17°C (63 °F). Harbor porpoises generally have higher abundances in shallow waters (less than 200 m (656 ft)) and near shore, but they sometimes move into deeper offshore waters. However, this species has no overlap with nearshore or offshore areas in the SOCAL Range Complex (*e.g.,* San Diego, SOAR) or the southern nearshore portions of PMSR (*e.g.,* Port Hueneme). Dall's and harbor porpoises face several chronic anthropogenic and non-anthropogenic risk factors, including fishing gear, fisheries interactions, and ocean noise (including acoustic deterrent devices or ''seal bombs'' in the case of harbor porpoises), among others.

TABLE 97—ANNUAL ESTIMATED TAKE BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY AND RELATED INFORMATION FOR PORPOISES IN THE HCTT STUDY AREA

Marine mammal species	Stock	NMFS stock abundance	NMSDD abundance	Maximum annual level B harassment	Maximum annual level A harassment	Maximum annual mortality	Maximum annual take	Maximum annual harassment as percentage of stock abundance	Season(s) with 50 percent of take or greater	Region(s) with 40 percent of take or greater

Note: N/A = Not Applicable, UND = Undetermined, Unk = Unknown.

As shown in table 97, the maximum annual allowable instances of take of Dall's porpoise under this proposed rule by Level A harassment and Level B harassment is 1,237 and 59,619, respectively, while the maximum allowable take of harbor porpoise by Level A harassment and Level B harassment is 88 (Morro Bay stock) and 9,960 (San Francisco/Russian River stock), respectively. No mortality is anticipated or proposed for authorization. The rule allows for a limited number of takes by non-auditory injury (two for Dall's porpoise, one for the Morro Bay stock of harbor porpoise). As described above, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these injuries are unlikely to impact reproduction or survival. The total take allowable across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as VHF cetaceans, Dall's and harbor porpoises are more susceptible to auditory impacts in mid- to high frequencies and from explosives than other species. As described in the Temporary Threshold Shift section above, any takes in the form of TTS are expected to be lower-level, of short duration (even the longest recovering in less than a day), and mostly not in a frequency band that would be expected to interfere with porpoise communication or other important auditory cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness. The rule also allows for a limited number of takes by non-auditory injury for Dall's porpoise and the Morro Bay stock of harbor porpoise (two and one, respectively). As described above in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these non-auditory injuries are unlikely to be of a nature or level that would impact reproduction or survival for these stocks.

Harbor porpoises are more susceptible to behavioral disturbance than other species. They are highly sensitive to many sound sources and generally demonstrate strong avoidance of most types of acoustic stressors. The information currently available regarding harbor porpoises suggests a very low threshold level of response for both captive (Kastelein *et al.,* 2000; Kastelein *et al.,* 2005) and wild (Johnston, 2002) animals. Southall *et al.* (2007) concluded that harbor porpoises are likely sensitive to a wide range of anthropogenic sounds at low received levels (approximately 90 to 120 dB). Research and observations of harbor porpoises for other locations show that this species is wary of human activity and will display profound avoidance behavior for anthropogenic sound sources in many situations at levels down to 120 dB re: 1 µPa (Southall *et al.,* 2007). Harbor porpoises routinely avoid and swim away from large, motorized vessels (Barlow 1988; Evans *et al.,* 1994; Palka and Hammond, 2001; Polacheck and Thorpe, 1990). Accordingly, and as described in the Estimated Take of Marine Mammals section, the threshold for behavioral disturbance is lower for harbor porpoises, and the number of estimated takes is higher, with many occurring at lower received levels than other taxa. Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 154 dB SPL and last from a few minutes to a few hours, at most. Associated responses would likely include avoidance, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours and not likely to exceed 24 hours.

As small odontocetes and income breeders with a fast pace of life, Dall's and harbor porpoises are less resilient to missed foraging opportunities than larger odontocetes. Although reproduction in populations with a fast pace of life are more sensitive to foraging disruption, these populations are quick to recover. Further, as described in the *Group and Species-Specific Analyses* section and the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. In this case, for the Monterey Bay and Morro Bay stocks of harbor porpoise, given the number of takes by harassment as compared to the stock/species abundance (see table 97) and the small resident populations, it is likely that some portion of the individuals taken are taken repeatedly over a limited number of days. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted.

Given the magnitude and severity of the impacts discussed above to Dall's porpoises and harbor porpoises (considering annual take maxima and the total across 7 years) and their habitat, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are unlikely to result in impacts on the reproduction or survival of any individuals and, thereby, unlikely to affect annual rates of recruitment or survival. For these reasons, we have determined that the take by harassment anticipated and proposed for authorization would have a negligible impact on Dall's porpoise and all four stocks of harbor porpoises.

Pinnipeds

This section builds on the broader discussion above and brings together the discussion of the different types and amounts of take that different pinniped stocks will incur, the applicable mitigation for each stock, and the status and life history of the stocks to support the negligible impact determinations for each. We have already described above why we believe the incremental addition of the moderate number of low-level auditory injury takes will not have any meaningful effect towards inhibiting reproduction or survival. We have also described above in this section the unlikelihood of any masking or habitat impacts having effects that would impact the reproduction or survival of any of the individual marine mammals affected by the Action Proponents' activities. Regarding the severity of individual takes by Level B harassment by behavioral disturbance for pinnipeds, the majority of these

responses are anticipated to occur at received levels below 172 dB, and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours.

In table 99 below for pinnipeds, we indicate the total annual mortality, Level A harassment, and Level B harassment, and a number indicating the instances of total take as a percentage of abundance. In table 100 below, we indicate the status, life history traits, important habitats, and threats that inform our analysis of the potential impacts of the estimated take on the affected pinniped stocks.

TABLE 99—ANNUAL ESTIMATED TAKE BY LEVEL B HARASSMENT, LEVEL A HARASSMENT, AND MORTALITY AND RELATED INFORMATION FOR PINNIPEDS IN THE HCTT STUDY AREA

Marine mammal species	Stock	NMFS stock abundance	NMSDD abundance	Maximum annual Level B harassment	Maximum annual Level A harassment	Maximum annual mortality	Maximum annual take	Maximum annual harassment as percentage of stock abundance	Season(s) with 50 percent of take or greater	Region(s) with 40 percent of take or greater
California Sea Lion.	U.S	257,606	199,121	1,899,749	723	3.86	1,900,476	738	Cold (53 percent).	SOCAL (74 percent).
Guadalupe Fur Seal.	Mexico	63,850	48,780	347,553	54	0.14	347,607	544	N/A	SOCAL (82 percent).
Northern Fur Seal.	Eastern Pacific	612,765	89,110	33,195	12	0	33,207	5	Cold (86 percent).	NOCAL (47 percent), PMSR (53 percent).
Northern Fur Seal.	California	19,634	14,115	22,098	10	0	22,108	113	Cold (58 percent).	PMSR (71 percent).
Steller Sea Lion	Eastern	36,308	3,181	999	3	0	1,002	3	Cold (56 percent).	NOCAL (48 percent), SOCAL (49 percent).
Harbor Seal	California	30,968	13,343	71,463	261	1.00	71,725	232	N/A	SOCAL (92 percent).
Hawaiian Monk Seal.	Hawaii	1,605	967	1,104	6	0	1,110	69	Cold (54 percent).	HRC (99 percent).
Northern Elephant Seal.	California Breeding.	194,907	49,526	118,514	111	0	118,625	61	Cold (62 percent).	SOCAL (57 percent).

Note: N/A = Not Applicable, UNK = Unknown. NMSDD abundances are averages only within the U.S. EEZ.

* Indicates which abundance estimate was used to calculate the maximum annual take as a percentage of abundance, either the NMFS SARs (Carretta *et al.,* 2024; Young, 2024) or the NMSDD (table 2.4–1 in appendix A of the application). Please refer to the Pinnipeds section for details on which abundance estimate was selected.

TABLE 100—LIFE HISTORY TRAITS, IMPORTANT HABITAT, AND THREATS TO PINNIPEDS IN THE HCTT STUDY AREA

Marine mammal species	Stock	ESA status	MMPA status	Movement ecology	Body size	Reproductive strategy	Pace of life	Chronic risk factors	UME, oil spill, other	ESA-designated critical habitat	BIAs II for Hawaii (Kratofil *et al.*, 2023) and West Coast (Calambokidis *et al.*, 2024)	Population trend	PBR	Annual mortality/serious injury (from other human activities)
California Sea Lion.	U.S	Not listed	Not depleted, not strategic.	Resident-migratory.	Small	Income	Fast	Fisheries interactions, power plant entrainment, illegal harassment, habitat degradation, vessel strike, chemical contaminants.	No	No	No	Stable	14,011	>321

Note: N/A = Not Applicable, UND = Undetermined, Unk = Unknown.

The Hawaiian monk seal (a NMFS Species in the Spotlight) and Guadalupe fur seal are listed as endangered and threatened, respectively, under the ESA and are considered depleted and strategic under the MMPA. Northern fur seals are not listed as endangered or threatened under the ESA, but the Eastern Pacific stock is considered depleted and strategic under the MMPA. The remaining pinniped stocks for which incidental take is proposed for authorization (see table 99) are neither ESA-listed nor considered depleted or strategic under the MMPA.

As shown in table 99 and table 100, these pinnipeds vary in stock abundance and movement ecology from, for example, the resident Hawaii stock of Hawaiian monk seal with an estimated abundance of 1,605 animals to the migratory Eastern Pacific stock of Northern fur seal with an estimated abundance of 612,765 animals. The HCTT Study Area overlaps the Hawaiian monk seal ESA-designated critical habitat (51 FR 16047, April 30, 1986; 53 FR 18988, May 26, 1988; 80 FR 50925, August 21, 2015), as described in the Description of Marine Mammals in the Area of Specified Activities section, and there are no known BIAs for pinnipeds that overlap the HCTT Study Area. There are no UMEs or other factors that cause additional concern for these stocks. Pinnipeds face a number of chronic anthropogenic and non-anthropogenic risk factors including fisheries interactions, illegal harassment, habitat degradation, disease, intentional killing/harassment, chemical contaminants, power plant entrainment, vessel strike, harmful algal blooms, commercial aquaculture, and harassment/disturbance at rookeries.

As shown in table 99, the maximum annual allowable instances of take by Level B harassment for pinnipeds ranges from 999 (Eastern stock of Steller sea lion) to 1,899,749 (U.S. stock of California sea lion), with 3 stocks below 23,000, 5 stocks above 23,000, and California sea lion being the only stock over 348,000. Take by Level A harassment is at or below 12 for four stocks, and above 12 for four stocks. As described above, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these injuries are unlikely to impact reproduction or survival. No mortality is anticipated or proposed for authorization for any pinniped stocks except the U.S. stock of California sea lion, Mexico stock of Guadalupe fur seal, and California stock of harbor seal. For those three stocks, the rule also allows for up to 27, 1, and 7 takes by serious injury or mortality, respectively, over the course of the 7-year rule, the impacts of which are discussed above in the Serious Injury and Mortality section. The total take proposed for authorization across all 7 years of the rule is indicated in table 54.

Regarding the potential takes associated with auditory impairment, as described in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section above, any takes in the form of TTS are expected to be lower-level, of short duration (from minutes to, at most, several hours or less than a day), and mostly not in a frequency band that would be expected to interfere with pinniped communication or other important auditory cues. Any associated lost opportunities or capabilities individuals might experience as a result of TTS would not be at a level or duration that would be expected to impact reproductive success or survival. For similar reasons, while auditory injury impacts last longer, the low anticipated levels of AUD INJ that could be reasonably expected to result from these activities are unlikely to have any effect on fitness.

The rule also allows for a limited number of takes by non-auditory injury (1 to 57) for 7 of the 8 stocks (less than five takes for all stocks except for the U.S. stock of California sea lion and California stock of harbor seal). As described above in the Auditory Injury from Sonar Acoustic Sources and Explosives and Non-Auditory Injury from Explosives section, given the limited number of potential exposures and the anticipated effectiveness of the mitigation measures in minimizing the pressure levels to which any individuals are exposed, these non-auditory injuries are unlikely to be of a nature or level that would impact reproduction or survival of these stocks, with the exception of the U.S. stock of California sea lion and California stock of harbor seal.

Due to the larger number of California sea lion and California stock of harbor seal individuals predicted to be exposed annually to levels associated with non-auditory injury (57 and 7, respectively), it is more likely that some subset of these individuals could potentially be injured in a manner that would result in them foregoing reproduction for a year (up to 10 California sea lions and 1 harbor seal). A year of foregone reproduction for a male is generally meaningless to population rates unless the animal ultimately dies. M/SI have been modeled for this activity separately, and NMFS does not anticipate that these non-auditory injuries would result in mortality, for young or adults. The U.S. stock of California sea lion is considered stable. While the population trend of the California stock of harbor seal is decreasing, neither of these stocks are considered depleted or strategic, and total annual mortality is well below PBR for both stocks. Importantly, the increase in a pupping interval by a year would have far less of an impact on a population rate than a mortality would and, accordingly, the number of instances of foregone reproduction predicted here would not be expected to adversely affect this stock through effects on annual rates of recruitment or survival.

Regarding the likely severity of any single instance of take by behavioral disturbance, as described above, the majority of the predicted exposures are expected to be below 172 dB SPL and last from a few minutes to a few hours, at most, with associated responses most likely in the form of moving away from the source, foraging interruptions, vocalization changes, or disruption of other social behaviors, lasting from a few minutes to several hours. Pinnipeds are small-bodied (or small to medium-bodied) income breeders with a fast pace of life but have a relatively lower energy requirement for their body size, which may moderate any impact due to foraging disruption. Further, as described in the *Group and Species-Specific Analyses* section above and in the Proposed Mitigation Measures section, mitigation measures are expected to further reduce the potential severity of impacts through real-time operational measures that minimize higher level/longer duration exposures and time/area measures that reduce impacts in high value habitat. In particular, this proposed rulemaking includes a Hawaii Island Marine Mammal Mitigation Area and a Hawaii 4-Islands Marine Mammal Mitigation Area which would reduce exposure of Hawaiian monk seals to levels of sound that have the potential to cause injury or behavioral impacts, including within a portion of Hawaiian monk seal critical habitat.

As described above, in addition to evaluating the anticipated impacts of the single instances of takes, it is important to understand the degree to which individual marine mammals may be disturbed repeatedly across multiple days of the year. Given the number of takes by harassment as compared to the stock/species abundance alone (see table 99), and also in consideration of their movement pattern and whether

take is concentrated in areas in which animals are known to congregate, it is unlikely that these individual pinnipeds would be taken on more than a limited number of days within a year (with the exception of California sea lion for which some individuals may be taken on a limited to moderate number of days within a year) and, therefore, the anticipated behavioral disturbance is not expected to affect reproduction or survival. However, given the variety of activity types that contribute to take across separate exercises conducted at different times and in different areas, and the fact that many result from transient activities conducted at sea, it is unlikely that repeated takes would occur either in numbers or clumped across sequential days in a manner likely to impact foraging success and energetics or other behaviors such that reproduction or survival of any individuals is likely to be impacted. Further, many of these stocks are migratory and apart from the small resident populations, there are no known foraging areas or other areas within which animals are known to congregate for important behaviors, and for most stocks, the predicted takes are not concentrated within a specific region and season.

Given the magnitude and severity of the take by harassment discussed above and any anticipated habitat impacts, and in consideration of the required mitigation measures and other information presented, the Action Proponents' activities are unlikely to result in impacts on the reproduction or survival of any individuals of pinniped stocks, with the exception of the three stocks for which takes by M/SI are predicted and the two stocks for which an increased pupping interval could potentially occur. Regarding the U.S. stock of California sea lion and California stock of harbor seal, as described above, we do not anticipate the relatively limited number of individuals that might be taken by non-auditory injury in a manner that results in a year of foregone reproduction to adversely affect the stock through effects on rates of recruitment or survival, given the status of the stocks. Regarding the U.S. stock of California sea lion, Mexico stock of Guadalupe fur seal, and California stock of harbor seal, as described in the Serious Injury and Mortality section, given the status of the stocks and in consideration of other ongoing anthropogenic mortality, the amount of allowed M/SI take proposed here would not alone, nor in combination with the impacts of the take by harassment discussed above (which are not expected to impact the reproduction or survival of any individuals for those stocks), be expected to adversely affect rates of recruitment and survival. For these reasons, we have determined that the total take (considering annual maxima and across 7 years) anticipated and proposed for authorization would have a negligible impact on all pinniped species and stocks.

Preliminary Determination

Based on the analysis contained herein of the likely effects of the specified activities on marine mammals and their habitat, and taking into consideration the implementation of the proposed monitoring and mitigation measures, NMFS preliminarily finds that the total marine mammal take from the specified activity will have a negligible impact on all affected marine mammal species or stocks.

Unmitigable Adverse Impact Analysis and Determination

There are no relevant subsistence uses of the affected marine mammal stocks or species implicated by this action. Therefore, NMFS has determined that the total taking of affected species or stocks would not have an unmitigable adverse impact on the availability of such species or stocks for taking for subsistence purposes.

Classification

Endangered Species Act

There are 10 marine mammal species under NMFS jurisdiction that are listed as endangered or threatened under the ESA with confirmed or possible occurrence in the HCTT Study Area: blue whale, fin whale, gray whale, humpback whale, sei whale, sperm whale, killer whale, false killer whale, Guadalupe fur seal, and Hawaiian monk seal. The humpback whale (86 FR 21082, April 21, 2021), killer whale (71 FR 69054, November 29, 2006; revised August 2, 2021 (86 FR 41668)), false killer whale (83 FR 35062, July 24, 2018), and Hawaiian monk seal (51 FR 16047, April 30, 1986; revised in 1988 (53 FR 18988, May 26, 1988) and in 2015 (80 FR 50925, August 21, 2015)) have critical habitat designated under the ESA in the HCTT Study Area.

The Action Proponents will consult with NMFS pursuant to section 7 of the ESA for the HCTT Study Area activities. NMFS will also consult internally on the issuance of the regulations and three LOAs under section 101(a)(5)(A) of the MMPA.

National Marine Sanctuaries Act

The Action Proponents and NMFS will work with NOAA's Office of National Marine Sanctuaries to fulfill our responsibilities under the National Marine Sanctuaries Act as warranted and will complete any NMSA requirements prior to a determination on the issuance of the final rule and LOAs.

National Environmental Policy Act

To comply with the National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321 *et seq.*) and NOAA Administrative Order (NAO) 216–6A, NMFS must review its proposed actions with respect to potential impacts on the human environment. Accordingly, NMFS plans to adopt the 2024 HCTT Draft EIS/OEIS for the HCTT Study Area, provided our independent evaluation of the document finds that it includes adequate information analyzing the effects on the human environment of issuing regulations and LOAs under the MMPA. NMFS is a cooperating agency on the 2024 HCTT Draft EIS/OEIS and has worked extensively with the Navy in developing the document. The 2024 HCTT Draft EIS/OEIS was made available for public comment at: *https://www.nepa.navy.mil/hctteis/,* which also provides additional information about the NEPA process, from December 13, 2024, to February 11, 2025. We will review all comments prior to concluding our NEPA process and making a final decision on the MMPA rulemaking and request for LOAs.

We will review all comments submitted in response to this notice prior to concluding our NEPA process or making a final decision on the MMPA rule and request for LOAs.

Executive Order 12866

The Office of Management and Budget has determined that this proposed rule is not significant for purposes of Executive Order 12866.

Executive Order 14192

This proposed rule is not an Executive Order 14192 regulatory action because this rule is not significant under Executive Order 12866.

Regulatory Flexibility Act

Pursuant to the Regulatory Flexibility Act (RFA), the Chief Counsel for Regulation of the Department of Commerce has certified to the Chief Counsel for Advocacy of the Small Business Administration that this proposed rule, if adopted, would not have a significant economic impact on a substantial number of small entities.

The Regulatory Flexibility Act (RFA) requires Federal agencies to prepare an analysis of a rule's impact on small entities whenever the agency is required to publish a notice of proposed rulemaking. However, a Federal agency may certify, pursuant to 5 U.S.C. 605(b), that the action will not have a significant economic impact on a substantial number of small entities. The Action Proponents are the only entities that would be affected by this proposed rulemaking, and the Action Proponents are not a small governmental jurisdiction, small organization, or small business, as defined by the RFA. Any requirements imposed by an LOA issued pursuant to these regulations, and any monitoring or reporting requirements imposed by these regulations, would be applicable only to the Action Proponents. NMFS does not expect the issuance of these regulations or the associated LOAs to result in any impacts to small entities pursuant to the RFA. Because this action, if adopted, would directly affect only the Action Proponents and not any small entities, NMFS concludes that the action would not result in a significant economic impact on a substantial number of small entities. As a result, an initial regulatory flexibility analysis is not required and none has been prepared.

List of Subjects in 50 CFR Part 218

Administrative practice and procedure, Endangered and threatened species, Fish, Fisheries, Marine mammals, Penalties, Reporting and recordkeeping requirements, Transportation, Wildlife.

Dated: July 10, 2025.

Samuel D. Rauch III,

Deputy Assistant Administrator for Regulatory Programs, National Marine Fisheries Service.

For reasons set forth in the preamble, NMFS proposes to amend 50 CFR part 218 as follows:

PART 218—REGULATIONS GOVERNING THE TAKING AND IMPORTING OF MARINE MAMMALS

■ 1. The authority citation for part 218 continues to read as follows:

Authority: 16 U.S.C. 1361 *et seq.*

■ 2. Revise subpart H of part 218 to read as follows:

Subpart H—Taking and Importing Marine Mammals; Military Readiness Activities in the Hawaii-California Training and Testing Study Area

Sec.

218.70 Specified activity and geographical region.
218.71 Effective dates.
218.72 Permissible methods of taking.
218.73 Prohibitions.
218.74 Mitigation requirements.
218.75 Requirements for monitoring and reporting.
218.76 Letters of Authorization.
218.77 Modifications of Letters of Authorization.
218.78–218.79 [Reserved]

Subpart H—Taking and Importing Marine Mammals; Military Readiness Activities in the Hawaii-California Training and Testing Study Area

§ 218.70 Specified activity and geographical region.

(a) Regulations in this subpart apply only to the U.S. Navy (including the U.S. Marine Corps; Navy), U.S. Coast Guard (Coast Guard), and U.S. Army (collectively referred to as the ''Action Proponents'') for the taking of marine mammals that occurs in the area described in paragraph (b) of this section and that occurs incidental to the activities listed in paragraph (c) of this section. Requirements imposed on the Action Proponents must be implemented by those persons they authorize or funds to conduct activities on their behalf.

(b) The taking of marine mammals by the Action Proponents under this subpart may be authorized in Letters of Authorization (LOAs) only if it occurs within the Hawaii-California Training and Testing (HCTT) Study Area. The HCTT Study Area includes areas in the north-central Pacific Ocean, from California west to Hawaii and the International Date Line, and including the Hawaii Range Complex (HRC), Southern California (SOCAL) Range Complex, Point Mugu Sea Range (PMSR), Silver Strand Training Complex, and the Northern California (NOCAL) Range Complex. Figure 1 to this paragraph (b) shows the location of the HCTT Study Area.

(c) The taking of marine mammals by the Action Proponents is only authorized if it occurs incidental to the Action Proponents conducting military readiness activities, including the following:

(1) Amphibious warfare;

(2) Anti-submarine warfare;

(3) Expeditionary warfare;

(4) Mine warfare;

(5) Surface warfare;

(6) Vessel evaluation;

(7) Unmanned systems;

(8) Acoustic and oceanographic science and technology;

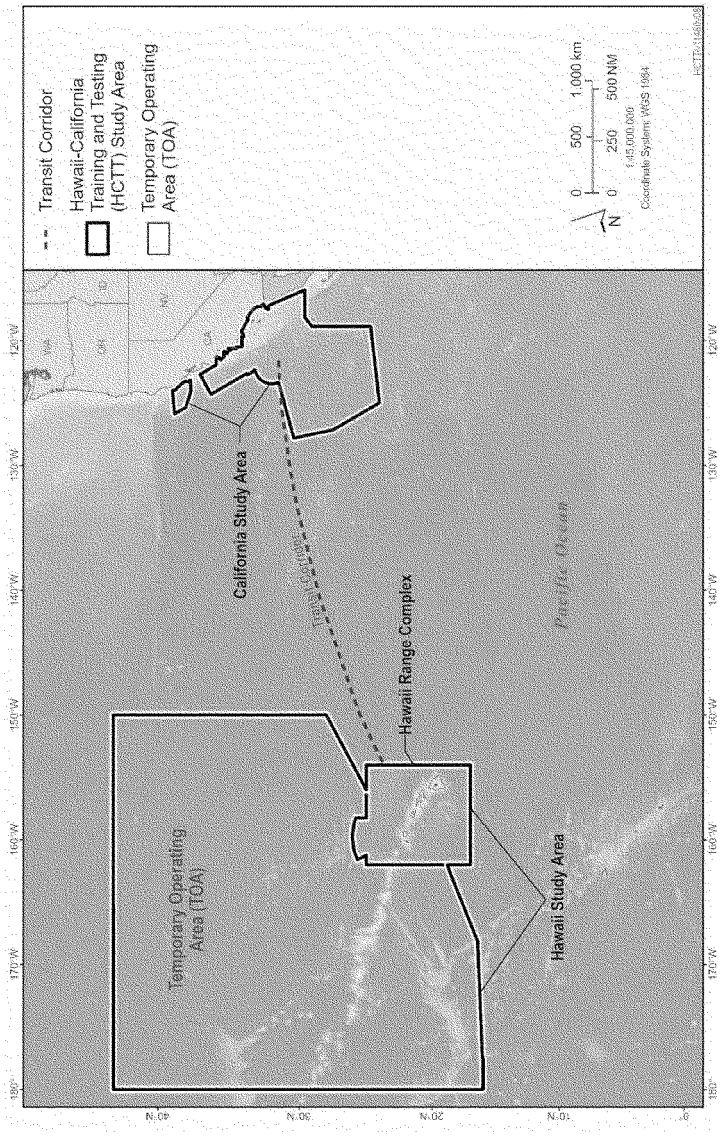
(9) Vessel movement;

(10) Land-based launches; and

(11) Other training and testing activities.

BILLING CODE 3510–22–P

Figure 1 to Paragraph (b)—HCTT Study Area



BILLING CODE 3510–22–C

§ 218.71 Effective dates.

Regulations in this subpart are effective from December 21, 2025, through December 20, 2032.

§ 218.72 Permissible methods of taking.

(a) Under LOAs issued pursuant to §§ 216.106 of this chapter and this subpart, the Holder of the LOA (hereinafter ''Action Proponent'') may incidentally, but not intentionally, take marine mammals within the area described in § 218.70(b) by Level A harassment and Level B harassment associated with the use of active sonar and other acoustic sources and explosives, as well as serious injury or mortality associated with vessel strikes and explosives, provided the activity is in compliance with all terms, conditions, and requirements of this subpart and the applicable LOAs.

(b) The incidental take of marine mammals by the activities listed in § 218.70(c) is limited to the following species:

TABLE 1 TO PARAGRAPH (b)

Species	Stock
Gray whale	Eastern North Pacific.
Gray whale	Western North Pacific.
Blue whale	Central North Pacific.
Blue whale	Eastern North Pacific.
Bryde's whale	Eastern Tropical Pacific.
Bryde's whale	Hawaii.
Fin whale	Hawaii.
Fin whale	California/Oregon/Washington.
Humpback whale	Central America/Southern Mexico-California-Oregon-Washington.
Humpback whale	Mainland Mexico-California-Oregon-Washington.

TABLE 1 TO PARAGRAPH (b)—Continued

Species	Stock
Humpback whale	Hawaii.
Minke whale	Hawaii.
Minke whale	California/Oregon/Washington.
Sei whale	Hawaii.
Sei whale	Eastern North Pacific.
Sperm whale	Hawaii.
Sperm whale	California/Oregon/Washington.
Dwarf sperm whale	Hawaii.
Dwarf sperm whale	California/Oregon/Washington.
Pygmy sperm whale	Hawaii.
Pygmy sperm whale	California/Oregon/Washington.
Baird's beaked whale	California/Oregon/Washington.
Blainville's beaked whale	Hawaii.
Goose-beaked whale	Hawaii.
Goose-beaked whale	California/Oregon/Washington.
Longman's beaked whale	Hawaii.
Mesoplodont beaked whale	California/Oregon/Washington.
False killer whale	Main Hawaiian Islands Insular.
False killer whale	Northwest Hawaiian Islands.
False killer whale	Hawaii Pelagic.
False killer whale	Baja California Peninsula Mexico population.
Killer whale	Hawaii.
Killer whale	Eastern North Pacific Offshore.
Killer whale	West Coast Transient.
Melon-headed whale	Hawaiian Islands.
Melon-headed whale	Kohala Resident (Hawaii).
Pygmy killer whale	Hawaii.
Pygmy killer whale	California-Baja California Peninsula Mexico population.
Short-finned pilot whale	Hawaii.
Short-finned pilot whale	California/Oregon/Washington.
Bottlenose dolphin	Maui Nui.
Bottlenose dolphin	Hawaii Island.
Bottlenose dolphin	Hawaii Pelagic.
Bottlenose dolphin	Kaua'i/Ni'ihau.
Bottlenose dolphin	O'ahu.
Bottlenose dolphin	California Coastal.
Bottlenose dolphin	California/Oregon/Washington Offshore.
Fraser's dolphin	Hawaii.
Long-beaked common dolphin	California.
Northern right whale dolphin	California/Oregon/Washington.
Pacific white-sided dolphin	California/Oregon/Washington.
Pantropical spotted dolphin	Maui Nui.
Pantropical spotted dolphin	Hawaii Island.
Pantropical spotted dolphin	Hawaii Pelagic.
Pantropical spotted dolphin	O'ahu.
Pantropical spotted dolphin	Baja California Peninsula Mexico population.
Risso's dolphin	Hawaii.
Risso's dolphin	California/Oregon/Washington.
Rough-toothed dolphin	Hawaii.
Short-beaked common dolphin	California/Oregon/Washington.
Spinner dolphin	Hawaii Pelagic.
Spinner dolphin	Hawaii Island.
Spinner dolphin	Kaua'i/Ni'ihau.
Spinner dolphin	O'ahu/4 Islands Region.
Striped dolphin	Hawaii Pelagic.
Striped dolphin	California/Oregon/Washington.
Dall's porpoise	California/Oregon/Washington.
Harbor porpoise	Monterey Bay.
Harbor porpoise	Morro Bay.
Harbor porpoise	Northern California/Southern Oregon.
Harbor porpoise	San Francisco/Russian River.
California sea lion	U.S.
Guadalupe fur seal	Mexico.
Northern fur seal	Eastern Pacific.
Northern fur seal	California.
Steller sea lion	Eastern.
Harbor seal	California.
Hawaiian monk seal	Hawaii.
Northern elephant seal	California Breeding.

§ 218.73 Prohibitions.

(a) Except incidental take described in § 218.72 and authorized by a LOA issued under this subpart, it shall be unlawful for any person to do the following in connection with the activities described in this subpart:

(1) Violate, or fail to comply with, the terms, conditions, and requirements of this subpart or a LOA issued under §§ 216.106 and this subpart;

(2) Take any marine mammal not specified in § 218.72(b);

(3) Take any marine mammal specified in § 218.72(b) in any manner other than as specified in the LOAs; or

(4) Take a marine mammal specified in § 218.72(b) after NMFS determines such taking results in more than a negligible impact on the species or stock of such marine mammal.

(b) [Reserved]

§ 218.74 Mitigation requirements.

(a) When conducting the activities identified in § 218.70(c), the mitigation measures contained in this section and any LOA issued under this subpart must be implemented by Action Proponent personnel or contractors who are trained according to the requirements in the LOA. If Action Proponent contractors are serving in a role similar to Action Proponent personnel, Action Proponent contractors must follow the mitigation applicable to Action Proponent personnel. These mitigation measures include, but are not limited to:

(1) *Activity-based mitigation.* Activity-based mitigation is mitigation that the Action Proponents must implement whenever and wherever an applicable military readiness activity takes place within the HCTT Study Area. The Action Proponents must implement the mitigation described in paragraphs (a)(1)(i) through (a)(1)(xxii) of this section, except as provided in paragraph (a)(1)(xxiii).

(i) *Active acoustic sources with power down and shut down capabilities.* For active acoustic sources with power down and shutdown capabilities (low-frequency active sonar ≥200 dB, mid-frequency active sonar sources that are hull mounted on a surface ship (including surfaced submarines), and broadband and other active acoustic sources >200 dB):

(A) *Mitigation zones and requirements.* During use of active acoustic sources with power down and shutdown capabilities, the following mitigation zone requirements apply:

(*1*) At 1,000 yd (914.4 m) from a marine mammal, Action Proponent personnel must power down active acoustic sources by 6 decibels (dB) total.

(*2*) At 500 yd (457.2 m) from a marine mammal, Action Proponent personnel must power down active acoustic sources by an additional 4 dB (10 dB total).

(*3*) At 200 yd (182.9 m) from a marine mammal, Action Proponent personnel must shut down active acoustic sources.

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in or on one of the following: aircraft; pierside, moored, or anchored vessel; underway vessel with space/crew restrictions (including small boats); or underway vessel already participating in the event that is escorting (and has positive control over sources used, deployed, or towed by) an unmanned platform.

(*2*) Two Lookouts on an underway vessel without space or crew restrictions.

(*3*) Lookouts must use information from passive acoustic detections to inform visual observations when passive acoustic devices are already being used in the event.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of using active acoustic sources (*e.g.,* while maneuvering on station).

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals during use of active acoustic sources.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing or powering up active sonar transmission). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(ii) *Active acoustic sources with shut down capabilities only (no power down capability).* For active acoustic sources with shut down capabilities only (no power down capability) (low-frequency active sonar <200 dB, mid-frequency active sonar sources that are not hull mounted on a surface ship (*e.g.,* dipping sonar, towed arrays), high-frequency active sonar, air guns, and broadband and other active acoustic sources <200 dB):

(A) *Mitigation zones and requirements.* During use of active acoustic sources with shut down capabilities only, the following mitigation zone requirements apply:

(*1*) At 200 yd (182.9 m) from a marine mammal, Action Proponent personnel must shut down active acoustic sources.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in or on one of the following: aircraft; pierside, moored, or anchored vessel; underway vessel with space/crew restrictions (including small boats); or underway vessel already participating in the event that is escorting (and has positive control over sources used, deployed, or towed by) an unmanned platform.

(*2*) Two Lookouts on an underway vessel without space or crew restrictions.

(*3*) Lookouts must use information from passive acoustic detections to inform visual observations when passive acoustic devices are already being used in the event.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of using active acoustic sources (*e.g.,* while maneuvering on station).

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals during use of active acoustic sources.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing or powering up active sonar transmission). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(iii) *Pile driving and extraction.* For pile driving and extraction:

(A) *Mitigation zones and requirements.* During vibratory and impact pile driving and extraction, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease pile driving or extraction if a marine mammal is sighted within 5 yd (4.6 m) of a pile being driven or extracted.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in or on one of the following: shore, pier, or small boat.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation for 15 minutes prior to the initial start of pile driving or pile extraction.

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals during pile driving or extraction.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing vibratory or impact pile driving or extraction). The wait period for this activity is 15 minutes.

(iv) *Weapons firing noise.* For weapons firing noise:

(A) *Mitigation zones and requirements.* During explosive and non-explosive large-caliber (57 mm and larger) gunnery firing noise (surface-to-surface and surface-to-air), the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease weapons firing if a marine mammal is sighted within 30 degrees on either side of the firing line out to 70 yd (64 m) from the gun muzzle (cease fire).

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on a vessel.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of large-caliber gun firing (*e.g.,* during target deployment).

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals during large-caliber gun firing.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing explosive and non-explosive large-caliber gunnery firing noise (surface-to-surface and surface-to-air)). The wait period for this activity is 30 minutes.

(v) *Explosive bombs.* For explosive bombs:

(A) *Mitigation zones and requirements.* During the use of explosive bombs of any net explosive weight (NEW), the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease explosive bomb use if a marine mammal is sighted within 2,500 yd (2,286 m) from the intended target.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in an aircraft.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of bomb delivery (*e.g.,* when arriving on station).

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals during bomb delivery. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of explosive bombs of any NEW). The wait period for this activity is 10 minutes.

(vi) *Explosive gunnery.* For explosive gunnery:

(A) *Mitigation zones and requirements.* During air-to-surface medium-caliber (larger than 50 caliber and less than 57 mm), surface-to-surface medium-caliber, and surface-to-surface large-caliber explosive gunnery, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease air-to-surface medium-caliber use if a marine mammal is sighted within 200 yd (182.9 m) of the intended impact location.

(*2*) Action Proponent personnel must cease surface-to-surface medium-caliber use if a marine mammal is sighted within 600 yd (548.6 m) of the intended impact location.

(*3*) Action Proponent personnel must cease surface-to-surface large-caliber use if a marine mammal is sighted within 1,000 yd (914.4 m) of the intended impact location.

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on a vessel or in an aircraft.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of gun firing (*e.g.,* while maneuvering on station).

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals during gunnery fire. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing air-to-surface medium-caliber, surface-to-surface medium-caliber, surface-to-surface large-caliber explosive gunnery). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(vii) *Explosive underwater demolition multiple charge—mat weave and obstacle loading.* For explosive underwater demolition multiple

charge—mat weave and obstacle loading:

(A) *Mitigation zones and requirements.* During the use of explosive underwater demolition multiple charge—mat weave and obstacle loading of any NEW, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease explosive underwater demolition multiple charge—mat weave and obstacle loading if a marine mammal is sighted within 700 yd (640 m) of the detonation site.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) Two Lookouts, one on a small boat and one on shore from an elevated platform.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) The Lookout positioned on a small boat must observe the mitigation zone for marine mammals and floating vegetation for 30 minutes prior to the first detonation.

(*2*) The Lookout positioned on shore must use binoculars to observe for marine mammals for 10 minutes prior to the first detonation.

(*3*) Action Proponent personnel must observe the mitigation zone for marine mammals during detonations. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*4*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of explosive underwater demolition multiple charge—mat weave and obstacle loading of any NEW). The wait period for this activity is 10 minutes (determined by the Lookout on shore).

(viii) *Explosive mine countermeasure and neutralization (no divers).* For explosive mine countermeasure and neutralization (no divers):

(A) *Mitigation zones and requirements.* During explosive mine countermeasure and neutralization using 0.1–5 pound (lb) (0.05–2.3 kilogram (kg)) NEW and >5 lb (2.3 kg) NEW, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease 0.1–5 lb (0.05–2.3 kg) NEW use if a marine mammal is sighted within 600 yd (548.6 m) from the detonation site.

(*2*) Action Proponent personnel must cease >5 lb (2.3 kg) NEW use if a marine mammal is sighted within 2,100 yd (1,920.2 m) from the detonation site.

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on a vessel or in an aircraft during 0.1–5 lb (0.05–2.3 kg) NEW use.

(*2*) Two Lookouts, one on a small boat and one in an aircraft during >5 lb (2.3 kg) NEW use.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of detonations (*e.g.,* while maneuvering on station; typically, 10 or 30 minutes depending on fuel constraints).

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals, concentrations of seabirds, and individual foraging seabirds (in the water and not on shore) during detonations or fuse initiation. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for 10 or 30 minutes (depending on fuel constraints) for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing explosive mine countermeasure and neutralization using 0.1–5 pound (lb) (0.05–2.3 kilogram (kg)) NEW and >5 lb (2.3 kg) NEW). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(ix) *Explosive mine neutralization (with divers).* For explosive mine neutralization (with divers):

(A) *Mitigation zones and requirements.* During explosive mine neutralization (with divers) using 0.1–20 lb (0.05–9.1 kg) NEW (positive control), 0.1–29 lb (0.05–13.2 kg) NEW (time-delay), and >20–60 lb (9.1–27.2 kg) NEW (positive control), the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease 0.1–20 lb (0.05–9.1 kg) NEW (positive control) use if a marine mammal is sighted within 500 yd (457.2 m) of the detonation site (cease fire).

(*2*) Action Proponent personnel must cease 0.1–29 lb (0.05–13.2 kg) NEW (time-delay) and >20–60 lb (9.1–27.2 kg) NEW (positive control) use if a marine mammal is sighted within 1,000 yd (914.4 m) of the detonation site (cease fire).

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) Lookouts in two small boats (one Lookout per boat), or one small boat and one rotary-wing aircraft (with one Lookout each), and one Lookout on shore for shallow-water events during 0.1–20 lb (0.05–9.1 kg) NEW (positive control) use.

(*2*) Four Lookouts in two small boats (two Lookouts per boat) and one additional Lookout in an aircraft if used in the event during 0.1–29 lb (0.05–13.2 kg) NEW (time-delay) and >20–60 lb (9.1–27.2 kg) NEW (positive control) use.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Time-delay devices must be set not to exceed 10 minutes.

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of detonations or fuse initiation for positive control events (*e.g.,* while maneuvering on station) or for 30 minutes prior for time-delay events.

(*3*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals, concentrations of seabirds, and individual foraging seabirds (in the water and not on shore) during detonations or fuse initiation. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*4*) When practical based on mission, safety, and environmental conditions:

(*i*) Boats must observe from the mitigation zone radius mid-point.

(*ii*) When two boats are used, boats must observe from opposite sides of the mine location.

(*iii*) Platforms must travel a circular pattern around the mine location.

(*iv*) Boats must have one Lookout observe inward toward the mine location and one Lookout observe outward toward the mitigation zone perimeter.

(*v*) Divers must be part of the Lookout Team.

(*5*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for 30 minutes for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing explosive mine neutralization (with divers) using 0.1–20 lb (0.05–9.1 kg) NEW (positive control), 0.1–29 lb (0.05–13.2 kg) NEW (time-delay), and >20–60 lb (9.1–27.2 kg) NEW (positive control)). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(x) *Explosive missiles and rockets.* For explosive missiles and rockets:

(A) *Mitigation zones and requirements.* During the use of explosive missiles and rockets using 0.6–20 lb (0.3–9.1 kg) NEW (air-to-surface) and >20–500 lb (9.1–226.8 kg) NEW (air-to-surface), the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease 0.6–20 lb (0.3–9.1 kg) NEW (air-to-surface) use if a marine mammal is sighted within 900 yd (823 m) of the intended impact location (cease fire).

(*2*) Action Proponent personnel must cease >20–500 lb (9.1–226.8 kg) NEW (air-to-surface) use if a marine mammal is sighted within 2,000 yd (1,828.8 m) of the intended impact location (cease fire).

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in an aircraft.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of missile or rocket delivery (*e.g.,* during a fly-over of the mitigation zone).

(*2*) Action Proponent personnel must observe the applicable mitigation zone for marine mammals during missile or rocket delivery. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of explosive missiles and rockets using 0.6–20 lb (0.3–9.1 kg) NEW (air-to-surface) and >20–500 lb (9.1–226.8 kg) NEW (air-to-surface)). The wait period for this activity is 30 minutes for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(xi) *Explosive sonobuoys and research-based sub-surface explosives.* For explosive sonobuoys and research-based sub-surface explosives:

(A) *Mitigation zones and requirements.* During the use of explosive sonobuoys and research-based sub-surface explosives using any NEW of sonobuoys and 0.1–5 lb (0.05–2.3 kg) NEW for other types of sub-surface explosives used in research applications, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease use of explosive sonobuoys and research-based sub-surface explosives using any NEW of sonobuoys and 0.1–5 lb (0.05–2.3 kg) NEW for other types of sub-surface explosives used in research applications if a marine mammal is sighted within 600 yd (548.6 m) of the device or detonation sites (cease fire).

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on a small boat or in an aircraft.

(*2*) Conduct passive acoustic monitoring for marine mammals; use information from detections to assist visual observations.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of detonations (*e.g.,* during sonobuoy deployment, which typically lasts 20–30 minutes).

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals during detonations. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of explosive sonobuoys and research-based sub-surface explosives using any NEW of sonobuoys and 0.1–5 lb (0.05–2.3 kg) NEW for other types of sub-surface explosives used in research applications). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(xii) *Explosive torpedoes.* For explosive torpedoes:

(A) *Mitigation zones and requirements.* During the use of explosive torpedoes of any NEW, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease use of explosive torpedoes of any NEW if a marine mammal is sighted within 2,100 yd (1,920.2 m) of the intended impact location.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in an aircraft.

(*2*) Conduct passive acoustic monitoring for marine mammals; use information from detections to assist visual observations.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals, floating vegetation, and jellyfish aggregations immediately prior to the initial start of detonations (*e.g.,* during target deployment).

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals and jellyfish aggregations during torpedo launches. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) After the event, when practical, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of explosive torpedoes of any NEW). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(xiii) *Ship shock trials.* For ship shock trials:

(A) *Mitigation zones and requirements.* During ship shock trials using any NEW, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease ship shock trials of any NEW if a marine mammal is sighted within 3.5 nmi (6.5 km) of the target ship hull (cease fire).

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) On the day of the event, 10 observers (Lookouts and third-party observers combined), spread between aircraft or multiple vessels as specified in the event-specific mitigation plan.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must develop a detailed, event-specific monitoring and mitigation plan in the year prior to the event and provide it to NMFS for review.

(*2*) Beginning at first light on days of detonation, until the moment of detonation (as allowed by safety measures) Action Proponent personnel must observe the mitigation zone for marine mammals, floating vegetation, jellyfish aggregations, large schools of fish, and flocks of seabirds. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) If any injured or dead marine mammals are observed after an individual detonation, Action Proponent personnel must follow established incident reporting procedures and halt any remaining detonations until Action Proponent personnel can consult with NMFS and review or adapt the event-specific mitigation plan, if necessary.

(*4*) During the 2 days following the event (minimum) and up to 7 days following the event (maximum), and as specified in the event-specific mitigation plan, Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing ship shock trials). The wait period for this activity is 30 minutes.

(xiv) *Sinking Exercises.* For Sinking Exercises (SINKEX):

(A) *Mitigation zones and requirements.* During SINKEX using any NEW, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease SINKEX of any NEW if a marine mammal is sighted within 2.5 nmi (4.6 km) of the target ship hull (cease fire).

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) Two Lookouts, one on a vessel and one in an aircraft.

(*2*) Conduct passive acoustic monitoring for marine mammals; use information from detections to assist visual observations.

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) During aerial observations for 90 minutes prior to the initial start of weapon firing, Action Proponent personnel must observe the mitigation zone for marine mammals, floating vegetation, and jellyfish aggregations.

(*2*) From the vessel during weapon firing, and from the aircraft and vessel immediately after planned or unplanned breaks in weapon firing of more than 2 hours, Action Proponent personnel must observe the mitigation zone for marine mammals. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(*3*) Action Proponent personnel must observe the detonation vicinity for injured or dead marine mammals for 2 hours after sinking the vessel or until sunset, whichever comes first. If any injured or dead marine mammals are observed, Action Proponent personnel must follow established incident reporting procedures.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing SINKEX). The wait period for this activity is 30 minutes.

(xv) *Non-explosive aerial-deployed mines and bombs.* For non-explosive aerial-deployed mines and bombs:

(A) *Mitigation zones and requirements.* During the use of non-explosive aerial-deployed mines and non-explosive bombs, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease using non-explosive aerial-deployed mines and non-explosive bombs if a marine mammal is sighted within 1,000 yd (914.4 m) of the intended target (cease fire).

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in an aircraft.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the initial start of mine or bomb delivery (*e.g.,* when arriving on station).

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals during mine or bomb delivery. If a marine mammal is visibly injured or killed as a result of detonation, explosives use in the event must be suspended immediately.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of non-explosive aerial-deployed mines and non-explosive bombs). The wait period for this activity is 10 minutes.

(xvi) *Non-explosive gunnery.* For non-explosive gunnery:

(A) *Mitigation zones and requirements.* During the use of non-explosive surface-to-surface large-caliber ordnance, non-explosive surface-to-surface and air-to-surface medium-caliber ordnance, and non-explosive surface-to-surface and air-to-surface small-caliber ordnance, the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease non-explosive surface-to-surface large-caliber ordnance, non-explosive surface-to-surface and air-to-surface medium-caliber ordnance, and non-explosive surface-to-surface and air-to-surface small-caliber ordnance use if a marine mammal is sighted within 200 yd (182.9 m) of the intended impact location (cease fire).

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on a vessel or in an aircraft.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the start of gun firing (*e.g.,* while maneuvering on station).

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals during gunnery firing.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of non-explosive surface-to-surface large-caliber ordnance, non-explosive surface-to-surface and air-to-surface medium-caliber ordnance, and non-explosive surface-to-surface and air-to-surface small-caliber ordnance). The wait period for this activity is 30 minutes for activities conducted from vessels and for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(xvii) *Non-explosive missiles and rockets.* For non-explosive missiles and rockets:

(A) *Mitigation zones and requirements.* During the use of non-explosive missiles and rockets (air-to-surface), the following mitigation zone requirements apply:

(*1*) Action Proponent personnel must cease non-explosive missile and rocket (air-to-surface) use if a marine mammal is sighted within 900 yd (823 m) of the intended impact location.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout in an aircraft.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals and floating vegetation immediately prior to the start of missile or rocket delivery (*e.g.,* during a fly-over of the mitigation zone).

(*2*) Action Proponent personnel must observe the mitigation zone for marine mammals during missile or rocket delivery.

(D) *Commencement or recommencement conditions.* Action Proponent personnel must ensure one of the commencement or recommencement conditions in § 218.74(a)(1)(xxii) is met prior to the initial start of the activity (by delaying the start) or during the activity (by not recommencing use of non-explosive missiles and rockets (air-to-surface)). The wait period for this activity is 30 minutes for activities conducted by aircraft that are not fuel constrained and 10 minutes for activities involving aircraft that are fuel constrained (*e.g.,* rotary-wing aircraft, fighter aircraft).

(xviii) *Manned surface vessels.* For manned surface vessels:

(A) *Mitigation zones and requirements.* During the use of manned surface vessels, including surfaced submarines, the following mitigation zone requirements apply:

(*1*) Underway manned surface vessels must maneuver themselves (which may include reducing speed) to maintain the following distances as mission and circumstances allow:

(*i*) 500 yd (457.2 m) from whales.

(*ii*) 200 yd (182.9 m) from other marine mammals.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One or more Lookouts on manned underway surface vessels in accordance with the most recent navigation safety instruction.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals immediately prior to manned surface vessels getting underway and while underway.

(*2*) [Reserved]

(xix) *Unmanned vehicles.* For unmanned vehicles:

(A) *Mitigation zones and requirements.* During the use of unmanned surface vehicles and unmanned underwater vehicles already being escorted (and operated under positive control) by a manned surface support vessel, the following mitigation zone requirements apply:

(*1*) A surface support vessel that is already participating in the event, and has positive control over the unmanned vehicle, must maneuver the unmanned vehicle (which may include reducing its speed) to ensure it maintains the following distances as mission and circumstances allow:

(*i*) 500 yd (457.2 m) from whales.

(*ii*) 200 yd (182.9 m) from other marine mammals.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on a surface support vessel that is already participating in the event, and has positive control over the unmanned vehicle.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals immediately prior to unmanned vehicles getting underway and while underway.

(*2*) [Reserved]

(xx) *Towed in-water devices.* For towed in-water devices:

(A) *Mitigation zones and requirements.* During the use of in-water devices towed by an aircraft, a manned surface vessel, or an Unmanned Surface Vehicle or Unmanned Underwater

Vehicle already being escorted (and operated under positive control) by a manned surface vessel, the following mitigation zone requirements apply:

(*1*) Manned towing platforms, or surface support vessels already participating in the event that have positive control over an unmanned vehicle that is towing an in-water device, must maneuver itself or the unmanned vehicle (which may include reducing speed) to ensure towed in-water devices maintain the following distances as mission and circumstances allow:

(*i*) 250 yd (228.6 m) from marine mammals.

(*ii*) [Reserved]

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on the manned towing vessel or aircraft, or on a surface support vessel that is already participating in the event and has positive control over an unmanned vehicle that is towing an in-water device.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals immediately prior to and while in-water devices are being towed.

(*2*) [Reserved]

(xxi) *Net deployment.* For net deployment:

(A) *Mitigation zones and requirements.* During net deployment for testing of an Unmanned Underwater Vehicle, the following mitigation zone requirements apply:

(*1*) If a marine mammal is sighted within 500 yd (457.2 m) of the deployment location, the support vessel will:

(*i*) Delay deployment of nets until the mitigation zone has been clear for 15 minutes.

(*ii*) Recover nets if they are deployed.

(*2*) [Reserved]

(B) *Lookout requirements.* The following Lookout requirements apply:

(*1*) One Lookout on the support vessel.

(*2*) [Reserved]

(C) *Mitigation zone observation.* Action Proponent personnel must observe the mitigation zones in accordance with the following:

(*1*) Action Proponent personnel must observe the mitigation zone for marine mammals for 15 minutes prior to the deployment of nets and while nets are deployed.

(*2*) Nets must be deployed during daylight hours only.

(xxii) *Commencement or recommencement conditions.* Action Proponents must not commence or recommence an activity after a marine mammal is observed within a relevant mitigation zone until one of the following conditions has been met:

(A) *Observed exiting.* A Lookout observes the animal exiting the mitigation zone;

(B) *Concluded to have exited.* A Lookout concludes that the animal has exited the mitigation zone based on its observed course, speed, and movement relative to the mitigation zone;

(C) *Clear from additional sightings.* A Lookout affirms the mitigation zone has been clear from additional sightings for the activity-specific wait period; or

(D) *Platform or target transit.* For mobile events, the platform or target has transited a distance equal to double the mitigation zone size beyond the location of the last sighting.

(xxiii) *Exceptions to activity-based mitigation for acoustic and explosive stressors and non-explosive ordnance.* Activity-based mitigation for acoustic and explosive stressors and non-explosive ordnance will not apply to:

(A) Acoustic sources not operated under positive control (*e.g.,* moored oceanographic sources);

(B) Acoustic sources used for safety of navigation (*e.g.,* fathometers);

(C) Acoustic sources used or deployed by aircraft operating at high altitudes (*e.g.,* bombs deployed from high altitude (since personnel cannot effectively observe the surface of the water));

(D) Acoustic sources used, deployed, or towed by unmanned platforms except when escort vessels are already participating in the event and have positive control over the source;

(E) Acoustic sources used by submerged submarines (*e.g.,* sonar (since they cannot conduct visual observation));

(F) De minimis acoustic sources (*e.g.,* those >200 kHz);

(G) Vessel-based, unmanned vehicle-based, or towed in-water acoustic sources when marine mammals (*e.g.,* dolphins) are determined to be intentionally swimming at the bow or alongside or directly behind the vessel, vehicle, or device (*e.g.,* to bow-ride or wake-ride);

(H) Explosives deployed by aircraft operating at high altitudes;

(I) Explosives deployed by submerged submarines, except for explosive torpedoes;

(J) Explosives deployed against aerial targets;

(K) Explosives during vessel-launched or shore-launched missile or rocket events;

(L) Explosives used at or below the de minimis threshold;

(M) Explosives deployed by unmanned platforms except when escort vessels are already participating in the event and have positive control over the explosive;

(N) Non-explosive ordnance deployed by aircraft operating at high altitudes;

(O) Non-explosive ordnance deployed against aerial targets and land-based targets;

(P) Non-explosive ordnance deployed during vessel- or shore-launched missile or rocket events; and

(Q) Non-explosive ordnance deployed by unmanned platforms except when escort vessels are already participating in the event and have positive control over ordnance deployment.

(xxiv) *Exceptions to activity-based mitigation for physical disturbance and strike stressors.* Activity-based mitigation for physical disturbance and strike stressors will not be implemented:

(A) By submerged submarines;

(B) By unmanned vehicles except when escort vessels are already participating in the event and have positive control over the unmanned vehicle movements;

(C) When marine mammals (*e.g.,* dolphins) are determined to be intentionally swimming at the bow, alongside the vessel or vehicle, or directly behind the vessel or vehicle (*e.g.,* to bow-ride or wake-ride);

(D) When pinnipeds are hauled out on man-made navigational structures, port structures, and vessels;

(E) By manned surface vessels and towed in-water devices actively participating in cable laying during Modernization & Sustainment of Ranges activities; and

(F) When impractical based on mission requirements (*e.g.,* during certain aspects of amphibious exercises).

(2) *Geographic mitigation areas.* The Action Proponents must implement the geographic mitigation requirements described in paragraphs (a)(2)(i) through (a)(2)(xi) of this section.

(i) *Hawaii Island marine mammal mitigation area.* Figure 1 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Hawaii Island marine mammal mitigation area, the following requirements apply (year-round):

(A) *Surface ship hull-mounted mid-frequency active sonar.* The Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar or 20 hours of helicopter dipping sonar (a mid-frequency active sonar source) annually within the mitigation area.

(B) *In-water explosives.* The Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) within the mitigation area.

(ii) *Hawaii 4-Islands marine mammal mitigation area.* Figure 1 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Hawaii 4-Islands marine mammal mitigation area, the following requirements apply:

(A) *Surface ship hull-mounted mid-frequency active sonar.* From November 15–April 15, the Action Proponents must not use MF1 surface ship hull-mounted mid-frequency active sonar within the mitigation area.

(B) *In-water explosives.* The Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) within the mitigation area (year-round).

(iii) *Hawaii humpback whale special reporting mitigation area.* Figure 1 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Hawaii humpback whale special reporting mitigation area, the following requirements apply:

(A) *Surface ship hull-mounted mid-frequency active sonar.* The Action Proponents must report the total hours of MF1 surface ship hull-mounted mid-frequency active sonar used from November through May in the mitigation area in their training and testing activity reports submitted to NMFS.

(B) [Reserved]

(iv) *Hawaii humpback whale awareness notification mitigation area.* Figure 1 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Hawaii humpback whale awareness notification mitigation area, the following requirements apply:

(A) *Hawaii humpback whale awareness notification mitigation area notifications.* The Action Proponents must broadcast awareness notification messages to alert applicable assets (and their Lookouts) transiting and training or testing in the Hawaii Range Complex to the possible presence of concentrations of humpback whales from November through May.

(B) *Visual observations.* Lookouts must use that knowledge to help inform their visual observations during military readiness activities that involve vessel movements, active sonar, in-water explosives (including underwater explosives and explosives deployed against surface targets), or the deployment of non-explosive ordnance against surface targets in the mitigation area.

(v) *Northern California large whale mitigation area.* Figure 2 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Northern California large whale mitigation area, the following requirements apply:

(A) *Surface ship hull-mounted mid-frequency active sonar.* From June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Central California Large Whale Mitigation Area, and the Southern California Blue Whale Mitigation Area.

(B) [Reserved]

(vi) *Central California large whale mitigation area.* Figure 2 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Central California large whale mitigation area, the following requirements apply:

(A) *Surface ship hull-mounted mid-frequency active sonar.* From June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Northern California Large Whale Mitigation Area, and the Southern California Blue Whale Mitigation Area.

(B) [Reserved]

(vii) *Southern California blue whale mitigation area.* Figure 2 to this paragraph (a)(2) shows the location of the mitigation areas. Within the Southern California blue whale mitigation area, the following requirements apply:

(A) *Surface ship hull-mounted mid-frequency active sonar.* From June 1–October 31, the Action Proponents must not use more than 300 hours of MF1 surface ship hull-mounted mid-frequency active sonar (excluding normal maintenance and systems checks) total during training and testing within the combination of this mitigation area, the Northern California Large Whale Mitigation Area, and the Central California Large Whale Mitigation Area.

(B) *In-water explosives.* From June 1–October 31, the Action Proponents must not detonate in-water explosives (including underwater explosives and explosives deployed against surface targets) during large-caliber gunnery, torpedo, bombing, and missile (including 2.75-inch rockets) training and testing.

(viii) *California large whale awareness messages.* Figure 2 to this paragraph (a)(2) shows the location of the mitigation areas. For California large whale awareness messages, the following requirements apply:

(A) *California large whale awareness messages.* The Action Proponents must broadcast awareness messages to alert applicable assets (and their Lookouts) transiting and training or testing off the U.S. West Coast to the possible presence of concentrations of large whales, including gray whales (November–March), fin whales (November–May), and mixed concentrations of blue, humpback, and fin whales that may occur based on predicted oceanographic conditions for a given year (*e.g.,* May–November, April–November).

(B) [Reserved]

(ix) *California large whale real-time notification mitigation area.* Figure 2 to this paragraph (a)(2) shows the location of the mitigation areas. Within the California large whale real-time notification mitigation area, the following requirements apply:

(A) *California large whale real-time notification mitigation area notifications.* The Action Proponents will issue real-time notifications to alert Action Proponent vessels operating in the vicinity of large whale aggregations (four or more whales) sighted within 1 nmi (1.9 km) of an Action Proponent vessel within an area of the Southern California Range Complex (between 32–33 degrees North and 117.2–119.5 degrees West).

(B) [Reserved]

(x) *San Nicolas Island pinniped haulout mitigation area.* Figure 2 to this paragraph (a)(2) shows the location of the mitigation areas. Within the San Nicolas Island pinniped haulout mitigation area, the following requirements apply:

(A) *Haulouts.* Navy personnel must not enter pinniped haulout or rookery areas. Personnel may be adjacent to pinniped haulouts and rookery prior to and following a launch for monitoring purposes.

(B) *Missile and target use.* Missiles and targets must not cross over pinniped haulout areas at altitudes less than 305 m (1,000 ft), except in emergencies or for real-time security incidents. For unmanned aircraft systems (UAS), the following minimum altitudes will be maintained over pinniped haulout areas and rookeries: Class 0–2 UAS will maintain a minimum altitude of 300 ft; Class 3 UAS will maintain a minimum altitude of

500 ft; Class 4 or 5 UAS will not be flown below 1,000 ft.

(C) *Number of events.* The Navy may not conduct more than 40 launch events annually and 10 launch events at night annually.

(D) *Scheduling.* Launch events must be scheduled to avoid the peak pinniped pupping seasons (from January through July) to the maximum extent practicable.

(E) *Monitoring plan.* The Navy must implement a monitoring plan using video and acoustic monitoring of up to three pinniped haulout areas and rookeries during launch events that include missiles or targets that have not been previously monitored for at least three launch events.

(F) *Review of launch procedure.* The Navy must review the launch procedure and monitoring methods, in cooperation with NMFS, if any incidents of injury or mortality of a pinniped are discovered during post-launch surveys, or if surveys indicate possible effects to the distribution, size, or productivity of the affected pinniped populations as a result of the specified activities. If necessary, appropriate changes will be made through modification to the LOA prior to conducting the next launch of the same vehicle.

(xi) *National security requirement.* Should national security require the Action Proponents to exceed a requirement(s) in paragraphs (a)(2)(i) through (a)(2)(x) of this section, Action Proponent personnel must provide NMFS with advance notification and include the information (*e.g.,* sonar hours, explosives usage) in its annual activity reports submitted to NMFS.

BILLING CODE 3510–22–P

Figure 1 to Paragraph (a)(2)—Geographic Mitigation Areas for Marine Mammals in the Hawaii Study Area

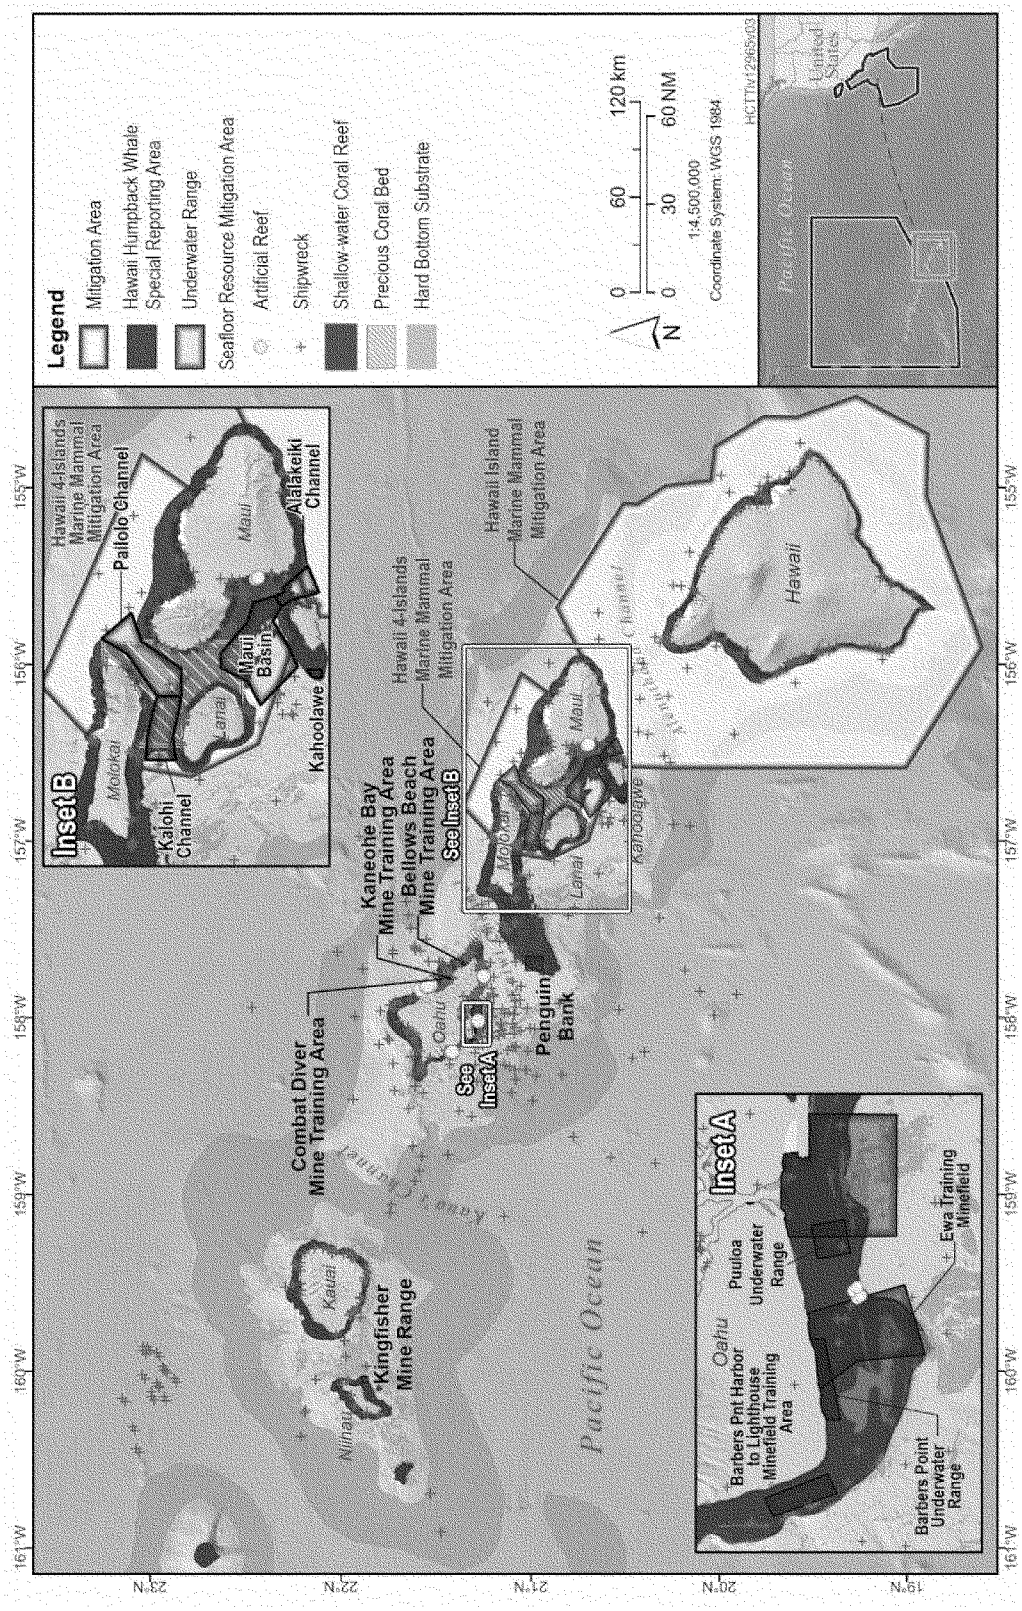


Figure 2 to Paragraph (a)(2)—Geographic Mitigation Areas for Marine Mammals in the California Study Area

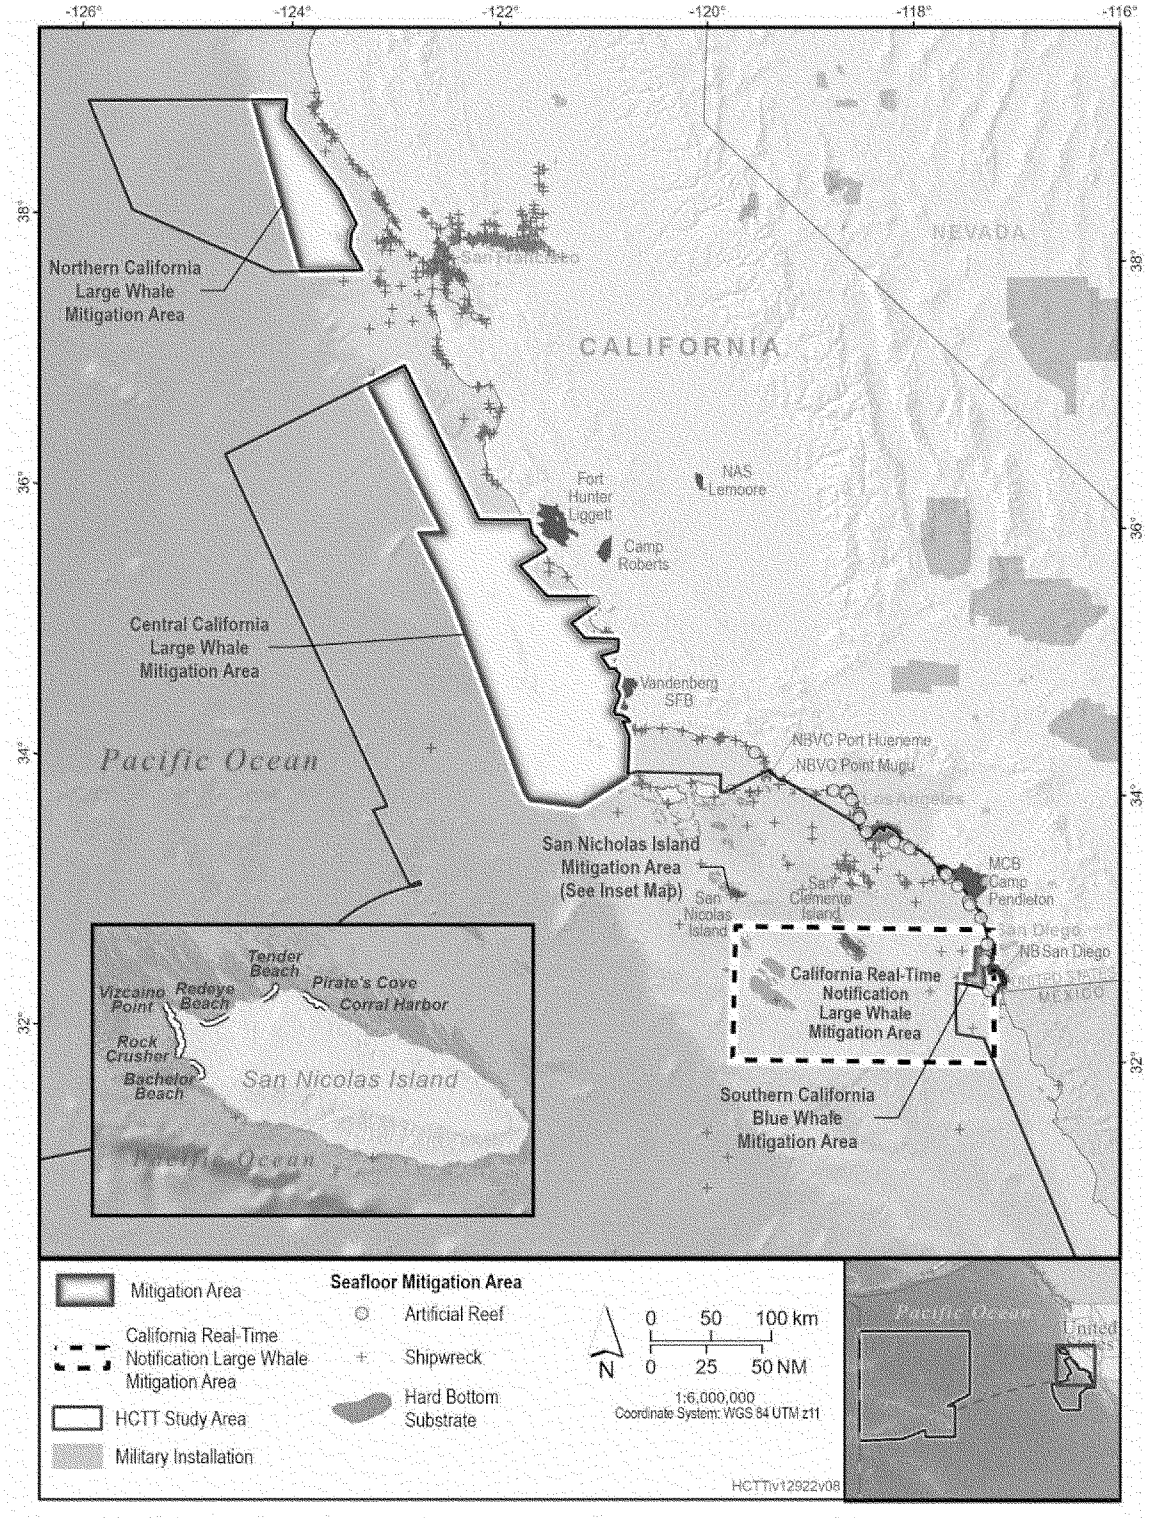

BILLING CODE 3510–22–C

(b) [Reserved]

§ 218.75 Requirements for monitoring and reporting.

The Action Proponents must implement the following monitoring and reporting requirements when conducting the specified activities:

(a) *Notification of take.* If the Action Proponent reasonably believes that the specified activity identified in § 218.70 resulted in the mortality or serious injury of any marine mammals, or in any Level A harassment or Level B harassment of marine mammals not identified in this subpart, then the Action Proponent shall notify NMFS immediately or as soon as operational security considerations allow.

(b) *Monitoring and reporting under the LOAs.* The Action Proponents must conduct all monitoring and reporting required under the LOAs.

(c) *Notification of injured, live stranded, or dead marine mammals.* Action Proponent personnel must abide by the Notification and Reporting Plan, which sets out notification, reporting, and other requirements when dead, injured, or live stranded marine mammals are detected. The Notification and Reporting Plan is available at: *https://www.fisheries.noaa.gov/national/marine-mammal-protection/incidental-take-authorizations-military-readiness-activities.*

(d) *Annual HCTT Study Area marine species monitoring report.* The Action Proponents must submit an annual HCTT Study Area marine species monitoring report describing the implementation and results from the previous calendar year. Data collection methods will be standardized across range complexes and the HCTT Study Area to allow for comparison in different geographic locations. The draft report must be submitted to the Director, Office of Protected Resources, NMFS, annually. NMFS will submit comments or questions on the report, if any, within 3 months of receipt. The report will be considered final after the Action Proponents have addressed NMFS' comments, or 3 months after submittal of the draft if NMFS does not provide comments on the draft report. The report must describe progress of knowledge made with respect to intermediate scientific objectives within the HCTT Study Area associated with the Integrated Comprehensive Monitoring Program (ICMP). Similar study questions must be treated together so that progress on each topic can be summarized across all Navy ranges. The report need not include analyses and content that do not provide direct assessment of cumulative progress on the monitoring plan study questions.

(e) *Quick look reports.* In the event that the sound levels analyzed in promulgation of these regulations were exceeded within a given reporting year, the Action Proponents must submit a preliminary report(s) detailing the exceedance within 21 days after the anniversary date of issuance of the LOAs.

(f) *Annual HCTT Training and Testing Reports.* Regardless of whether analyzed sound levels were exceeded, the Navy must submit a detailed report (HCTT Annual Training Exercise Report and Testing Activity Report) and the Coast Guard and Army must each submit a detailed report (HCTT Annual Training Exercise Report) to the Director, Office of Protected Resources, NMFS annually. NMFS will submit comments or questions on the reports, if any, within 1 month of receipt. The reports will be considered final after the Action Proponents have addressed NMFS' comments, or 1 month after submittal of the drafts if NMFS does not provide comments on the draft reports. The annual reports must contain a summary of all sound sources used (total hours or quantity (per the LOAs) of each bin of sonar or other non-impulsive source; total annual number of each type of explosive exercises; and total annual expended/detonated rounds (missiles, bombs, sonobuoys, *etc.*) for each explosive bin). The annual reports must also contain cumulative sonar and explosive use quantity from previous years' reports through the current year. Additionally, if there were any changes to the sound source allowance in the reporting year, or cumulatively, the reports would include a discussion of why the change was made and include analysis to support how the change did or did not affect the analysis in the 2024 HCTT Draft EIS/OEIS and MMPA final rule. The annual reports must also include the details regarding specific requirements associated with the mitigation areas listed in paragraph (f)(4) of this section. The analysis in the detailed report must be based on the accumulation of data from the current year's report and data collected from previous annual reports. The detailed reports shall also contain special reporting for the Hawaii Humpback Whale Special Reporting Mitigation Area, as described in the LOAs. The final annual/close-out reports at the conclusion of the authorization period (year 7) will also serve as the comprehensive close-out reports and include both the final year annual incidental take compared to annual authorized incidental take as well as a cumulative 7-year incidental take compared to 7-year authorized incidental take. The HCTT Annual Training and Testing Reports must include the specific information described in the LOAs.

(1) *MTEs.* This section of the report must contain the following information for MTEs completed that year in the HCTT Study Area.

(i) *Exercise information (for each MTE).* For exercise information (for each MTE):

(A) Exercise designator.

(B) Date that exercise began and ended.

(C) Location.

(D) Number and types of active sonar sources used in the exercise.

(E) Number and types of passive acoustic sources used in exercise.

(F) Number and types of vessels, aircraft, and other platforms participating in each exercise.

(G) Total hours of all active sonar source operation.

(H) Total hours of each active sonar source bin.

(I) Wave height (high, low, and average) during exercise.

(ii) *Individual marine mammal sighting information for each sighting in each exercise where mitigation was implemented.* For individual marine mammal sighting information for each sighting in each exercise where mitigation was implemented:

(A) Date, time, and location of sighting.

(B) Species (if not possible, indication of whale/dolphin/pinniped).

(C) Number of individuals.

(D) Initial Detection Sensor (*e.g.,* passive sonar, Lookout).

(E) Indication of specific type of platform observation was made from (including, for example, what type of surface vessel or testing platform).

(F) Length of time observers maintained visual contact with marine mammal.

(G) Sea state.

(H) Visibility.

(I) Sound source in use at the time of sighting.

(J) Indication of whether animal was less than 200 yd (182.9 m), 200 to 500 yd (182.9 to 457.2 m), 500 to 1,000 yd (457.2 m to 914.4 m), 1,000 to 2,000 yd (914.4 m to 1,828.8 m), or greater than 2,000 yd (1,828.8 m) from sonar source.

(K) Whether operation of sonar sensor was delayed, or sonar was powered or shut down, and the length of the delay.

(L) If source in use was hull-mounted, true bearing of animal from the vessel, true direction of vessel's travel, and estimation of animal's motion relative to vessel (opening, closing, parallel).

(M) Lookouts must report, in plain language and without trying to categorize in any way, the observed behavior of the animal(s) (such as animal closing to bow ride, paralleling course/speed, floating on surface and not swimming, *etc.*) and if any calves were present.

(iii) *An evaluation (based on data gathered during all of the MTEs) of the effectiveness of mitigation measures designed to minimize the received level to which marine mammals may be exposed.* For an evaluation (based on data gathered during all of the MTEs) of the effectiveness of mitigation measures designed to minimize the received level to which marine mammals may be exposed:

(A) This evaluation must identify the specific observations that support any conclusions the Navy reaches about the effectiveness of the mitigation.

(B) [Reserved]

(2) *Sinking Exercises.* This section of the report must include the following information for each SINKEX completed that year in the HCTT Study Area:

(i) *Exercise information.* For exercise information:

(A) Location.

(B) Date and time exercise began and ended.

(C) Total hours of observation by Lookouts before, during, and after exercise.

(D) Total number and types of explosive source bins detonated.

(E) Number and types of passive acoustic sources used in exercise.

(F) Total hours of passive acoustic search time.

(G) Number and types of vessels, aircraft, and other platforms participating in exercise.

(H) Wave height in feet (high, low, and average) during exercise.

(I) Narrative description of sensors and platforms utilized for marine mammal detection and timeline illustrating how marine mammal detection was conducted.

(ii) *Individual marine mammal observation (by Action Proponent Lookouts) information for each sighting where mitigation was implemented.* For individual marine mammal observation (by Action Proponent Lookouts) information for each sighting where mitigation was implemented:

(A) Date/Time/Location of sighting.

(B) Species (if not possible, indicate whale, dolphin, or pinniped).

(C) Number of individuals.

(D) Initial detection sensor (*e.g.,* sonar or Lookout).

(E) Length of time observers maintained visual contact with marine mammal.

(F) Sea state.

(G) Visibility.

(H) Whether sighting was before, during, or after detonations/exercise, and how many minutes before or after.

(I) Distance of marine mammal from actual detonations (or target spot if not yet detonated): Less than 200 yd (182.9 m), 200 to 500 yd (182.9 to 457.2 m), 500 to 1,000 yd (457.2 m to 914.4 m), 1,000 to 2,000 yd (914.4 m to 1,828.8 m), or greater than 2,000 yd (1,828.8 m).

(J) Lookouts must report the observed behavior of the animal(s) in plain language and without trying to categorize in any way (such as animal closing to bow ride, paralleling course/speed, floating on surface and not swimming *etc.*), including speed and direction and if any calves were present.

(K) The report must indicate whether explosive detonations were delayed, ceased, modified, or not modified due to marine mammal presence and for how long.

(L) If observation occurred while explosives were detonating in the water, indicate munition type in use at time of marine mammal detection.

(3) *Summary of sources used.* This section of the report must include the following information summarized from the authorized sound sources used in all training and testing events:

(i) *Totals for sonar or other acoustic source bins.* Total annual hours or quantity (per the LOA) of each bin of sonar or other acoustic sources (*e.g.,* pile driving and air gun activities); and

(ii) *Total for explosive bins.* Total annual expended/detonated ordnance (missiles, bombs, sonobuoys, *etc.*) for each explosive bin.

(4) *Special Reporting for Geographic Mitigation Areas.* This section of the report must contain the following information for activities conducted in geographic mitigation areas in the HCTT Study Area:

(i) *Hawaii Humpback Whale Special Reporting Mitigation Area.* The Action Proponents must report the total hours of MF1 surface ship hull-mounted mid-frequency active sonar used from November through May in the mitigation area.

(ii) *National security requirement.* If an Action Proponent(s) invokes the national security requirement described in § 218.74 (a)(2)(xi), the Action Proponent personnel must include information about the event in its Annual HCTT Training and Testing Report.

(g) *MTE sonar exercise notification.* The Action Proponents must submit to NMFS (contact as specified in the LOAs) an electronic report within 15 calendar days after the completion of any MTE indicating:

(1) *Location.* Location of the exercise;

(2) *Dates.* Beginning and end dates of the exercise; and

(3) *Type.* Type of exercise.

§ 218.76 Letters of Authorization.

(a) To incidentally take marine mammals pursuant to this subpart, the Action Proponents must apply for and obtain LOAs.

(b) An LOA, unless suspended or revoked, may be effective for a period of time not to exceed the expiration date of this subpart.

(c) In the event of projected changes to the activity or to mitigation, monitoring, or reporting measures (excluding changes made pursuant to the adaptive management provision of § 218.77(c)(1)) required by an LOA, the Action Proponent must apply for and obtain a modification of the LOA as described in § 218.77.

(d) Each LOA will set forth:

(1) Permissible methods of incidental taking;

(2) Geographic areas for incidental taking;

(3) Means of effecting the least practicable adverse impact (*i.e.,* mitigation) on the species and stocks of marine mammals and their habitat; and

(4) Requirements for monitoring and reporting.

(e) Issuance of the LOA(s) must be based on a determination that the level of taking is consistent with the findings made for the total taking allowable under the regulations of this subpart.

(f) Notice of issuance or denial of the LOA(s) will be published in the **Federal Register** within 30 days of a determination.

§ 218.77 Modifications of Letters of Authorization.

(a) An LOA issued under §§ 216.106 of this chapter and 218.76 for the activity identified in § 218.70(c) shall be modified, upon request by the LOA Holder, provided that:

(1) The specified activity and mitigation, monitoring, and reporting measures, as well as the anticipated impacts, are the same as those described and analyzed for the regulations in this subpart (excluding changes made pursuant to the adaptive management provision in paragraph (c)(1) of this section); and

(2) NMFS determines that the mitigation, monitoring, and reporting measures required by the previous LOAs under this subpart were implemented.

(b) For LOA modification requests by the applicants that include changes to the activity or to the mitigation, monitoring, or reporting measures (excluding changes made pursuant to the adaptive management provision in paragraph (c)(1) of this section), the LOA should be modified provided that:

(1) NMFS determines that the change(s) to the activity or the mitigation, monitoring or reporting do not change the findings made for the regulations and do not result in more than a minor change in the total estimated number of takes (or distribution by species or stock or years), and

(2) NMFS may publish a notice of proposed modified LOA in the **Federal Register**, including the associated analysis of the change, and solicit public comment before issuing the LOA.

(c) An LOA issued under §§ 216.106 and 218.76 of this chapter for the activities identified in § 218.70(c) may be modified by NMFS Office of Protected Resources under the following circumstances:

(1) After consulting with the Action Proponents regarding the practicability of the modifications, through adaptive management, NMFS may modify (including remove, revise or add to) the existing mitigation, monitoring, or reporting measures if doing so creates a reasonable likelihood of more effectively accomplishing the goals of the mitigation and monitoring measures set forth in this subpart.

(i) Possible sources of data that could contribute to the decision to modify the mitigation, monitoring, or reporting measures in an LOA include, but are not limited to:

(A) Results from the Action Proponents' monitoring report and annual exercise reports from the previous year(s);

(B) Results from other marine mammal and/or sound research or studies; or

(C) Any information that reveals marine mammals may have been taken in a manner, extent, or number not authorized by this subpart or subsequent LOAs.

(ii) If, through adaptive management, the modifications to the mitigation, monitoring, or reporting measures are substantial, NMFS shall publish a notice of proposed LOA(s) in the **Federal Register** and solicit public comment.

(2) If the NMFS Office of Protected Resources determines that an emergency exists that poses a significant risk to the well-being of the species or stocks of marine mammals specified in LOAs issued pursuant to §§ 216.106 of this chapter and 218.76, a LOA may be modified without prior notice or opportunity for public comment. Notice would be published in the **Federal Register** within 30 days of the action.

§§ 218.78–218.79 [Reserved]

Medicare and Medicaid Programs; CY 2026 Payment Policies Under the Physician Fee Schedule and Other Changes to Part B Payment and Coverage Policies; Medicare Shared Savings Program Requirements; and Medicare Prescription Drug Inflation Rebate Program

AGENCY: Centers for Medicare & Medicaid Services (CMS), Department of Health and Human Services (HHS).

ACTION: Proposed rule.

SUMMARY: This major proposed rule addresses: changes to the physician fee schedule (PFS); other changes to Medicare Part B payment policies to ensure that payment systems are updated to reflect changes in medical practice, relative value of services, and changes in the statute; codification of establishment of new policies for: the Medicare Prescription Drug Inflation Rebate Program under the Inflation Reduction Act of 2022; the Ambulatory Specialty Model; updates to the Medicare Diabetes Prevention Program expanded model; updates to drugs and biological products paid under Part B; Medicare Shared Savings Program requirements; updates to the Quality Payment Program; updates to policies for Rural Health Clinics and Federally Qualified Health Centers update to the Ambulance Fee Schedule regulations; codification of the Inflation Reduction Act and Consolidated Appropriations Act, 2023 provisions; updates to the Medicare Promoting Interoperability Program.

DATES: To be assured consideration, comments must be received at one of the addresses provided below, no later than 5 p.m. on September 12, 2025.

ADDRESSES: In commenting, please refer to file code CMS–1832–P.

Comments, including mass comment submissions, must be submitted in one of the following three ways (please choose only one of the ways listed):

1. *Electronically.* You may submit electronic comments on this regulation to *http://www.regulations.gov.* Follow the ''Submit a comment'' instructions.

2. *By regular mail.* You may mail written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1832–P, P.O. Box 8016, Baltimore, MD 21244–8016.

Please allow sufficient time for mailed comments to be received before the close of the comment period.

3. *By express or overnight mail.* You may send written comments to the following address ONLY: Centers for Medicare & Medicaid Services, Department of Health and Human Services, Attention: CMS–1832–P, Mail Stop C4–26–05, 7500 Security Boulevard, Baltimore, MD 21244–1850.

FOR FURTHER INFORMATION CONTACT: *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for any issues not identified below. Please indicate the specific issue in the subject line of the email. For all questions related to reporting a service on a claim, please contact your Medicare Administrative Contractor.

Michael Soracoe, Morgan Kitzmiller, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to practice expense, work RVUs, conversion factor, and PFS specialty-specific impacts.

Hannah Ahn, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to potentially misvalued services under the PFS.

Julie Rauch, or *MedicarePhysicianFeeSchedule@cms.hhs.gov, for issues related to Malpractice RVUs.*

Morgan Kitzmiller, Terry Simananda, or *MedicarePhysicianFeeSchedule@cms.hhs.gov* for issues related to Geographic Practice Cost Indices.

Mikayla Murphy, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to direct supervision using two-way audio/video communication technology, telehealth, and other services involving communications technology.

Erick Carrera, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to office/outpatient evaluation and management visit inherent complexity add-on and Digital Mental Health Treatment services.

Maya Peterson, Terry Simananda, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to payment for advanced primary care management services.

Sarah Leipnik, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to global surgery payment accuracy.

Pamela West, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to outpatient therapy services and KX modifier thresholds.

Michelle Cruse, Erick Carrera, Zehra Hussain, or Hannah Ahn *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to dental services inextricably linked to other covered medical services.

Zehra Hussain, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to payment of skin substitutes.

Laura Kennedy, (410) 786–3377, Rebecca Ray, (667) 414–0879, and Jae Ryu, (667) 414–0765 for issues related to Drugs and Biological Products Paid Under Medicare Part B. *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to complex drug administration.

Allison Cipro, (667) 414–0758, for issues related to Medicare Diabetes Prevention Program.

Sabrina Ahmed, (410) 786–7499, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to the Medicare Shared Savings Program (Shared Savings Program) quality performance standard and other quality reporting requirements.

Janae James, (410) 786–0801, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to Shared Savings Program beneficiary assignment and benchmarking methodology and shared losses mitigation.

Kari Vandegrift, (410) 786–4008, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to Shared Savings Program participation options, and ACO participant and SNF affiliate change of ownership requirements.

Elisabeth Daniel, (667) 290–8793, for issues related to the Medicare Prescription Drug Inflation Rebate Program.

Benjamin Picillo or Genevieve Kehoe, *AmbulatorySpecialtyModel@cms.hhs.gov,* or 1–844–711–2664 (Option 4) for issues related to the Ambulatory Specialty Model.

Amy Gruber, (410) 786–1542, for issues related to Ambulance Extender provisions.

Kati Moore, (410) 786–5471, for inquiries related to the Merit-based Incentive Payment System (MIPS) track of the Quality Payment Program (QPP).

Trevey Davis, (667) 290–8527, for inquiries related to the Advanced Alternative Payment Models (APMs) track of QPP.

Jessica Warren, (410) 786–7519, and Lisa Marie Gomez, (410) 786–1175, for inquiries related to the Medicare Promoting Interoperability Program.

Lisa Parker, (410) 786–4949, or *FQHC–PPS@cms.hhs.gov*, for issues related to FQHC payments.

Michele Franklin, (410) 786–9226, or *RHC@cms.hhs.gov*, for issues related to RHC payments.

SUPPLEMENTARY INFORMATION:

Addenda Available Only Through the Internet on the CMS Website: The PFS Addenda along with other supporting documents and tables referenced in this proposed rule are available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.* Click on the link on the left side of the screen titled, ''PFS Federal Regulations Notices'' for a chronological list of PFS **Federal Register** and other related documents. For the CY 2026 PFS proposed rule, refer to item CMS–1832–P. Readers with questions related to accessing any of the Addenda or other supporting documents referenced in this proposed rule and posted on the CMS website identified above should contact *MedicarePhysicianFeeSchedule@cms.hhs.gov.*

Plain Language Summary: In accordance with 5 U.S.C. 553(b)(4), a plain language summary of this rule may be found at *https://www.regulations.gov/.*

CPT (Current Procedural Terminology) Copyright Notice: Throughout this proposed rule, we use CPT codes and descriptions to refer to a variety of services. We note that CPT codes and descriptions are copyright 2020 American Medical Association. All Rights Reserved. CPT is a registered trademark of the American Medical Association (AMA). Applicable Federal Acquisition Regulations (FAR) and Defense Federal Acquisition Regulations (DFAR) apply.

Deregulation Request for Information (RFI):

On January 31, 2025, President Trump issued Executive Order (EO) 14192 ''Unleashing Prosperity Through Deregulation,'' which states the Administration policy to significantly reduce the private expenditures required to comply with Federal regulations to secure America's economic prosperity and national security and the highest possible quality of life for each citizen. We would like public input on approaches and opportunities to streamline regulations and reduce administrative burdens on providers, suppliers, beneficiaries, and other stakeholders participating in the Medicare program. CMS has made available a Request for Information (RFI) at: *https://www.federalregister.gov/documents/2025/04/11/2025-06316/request-for-information-deregulation.* Please submit all comments in response to this request for information through the provided weblink.

I. Executive Summary

A. Purpose

This major annual rule proposes to revise payment policies under the Medicare PFS and makes other policy changes, including proposals to implement certain provisions of the Full-Year Continuing Appropriations and Extensions Act, 2025 (Pub. L. 119–4, March 15, 2025), Further Continuing Appropriations and Other Extensions Act of 2024 (Pub. L. 118–22, November 16, 2023), Consolidated Appropriations Act, 2023 (Pub. L. 117–328, September 29, 2022), Inflation Reduction Act of 2022 (IRA) (Pub. L. 117–169, August 16, 2022), Consolidated Appropriations Act, 2022 (Pub. L. 117–103, March 15, 2022), Consolidated Appropriations Act, 2021 (CAA, 2021) (Pub. L. 116–260, December 27, 2020), Bipartisan Budget Act of 2018 (BBA of 2018) (Pub. L. 115–123, February 9, 2018) and the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment for Patients and Communities Act (SUPPORT Act) (Pub. L. 115–271, October 24, 2018), related to Medicare Part B payment. In addition, this proposed rule includes proposals regarding other Medicare payment policies described in sections III. and IV.

This rulemaking proposes to update policies for the Medicare Prescription Drug Inflation Rebate Program codified or finalized at parts 427 and 428 consistent with sections 1847A(i) and 1860D–14B of the Social Security Act (the Act). With respect to the Medicare Part B Drug Inflation Rebate Program, this rulemaking proposes to describe the identification of payment amount benchmark quarter in certain instances and the calculation for the Part B rebate amount in such instances. With respect to the Medicare Part D Drug Inflation Rebate Program, this rulemaking proposes to clarify the calculation of a Part D rebate amount, and proposes a methodology for removal of units for a Part D rebatable drug for which a manufacturer provides a discount under the 340B Program, as well as the establishment of a 340B data repository for Part D claims.

This rulemaking proposes to modify policies for the Shared Savings Program, which is a voluntary program that started in 2012. The program allows healthcare providers to form or participate in Accountable Care Organizations (ACOs), to be held accountable for the quality and total cost of care for an assigned population of Medicare fee-for-service (FFS) beneficiaries.

B. Summary of the Key Provisions

Section 1848 of the Act requires us to establish payments under the PFS, based on national uniform relative value units (RVUs) that account for the relative resources used in furnishing a service. The statute requires that RVUs be established for three categories of resources: work, practice expense (PE), and malpractice (MP) expense. In addition, the statute requires that each year we establish, by regulation, the payment amounts for physicians' services paid under the PFS, including geographic adjustments to reflect the variations in the costs of furnishing services in different geographic areas.

In this major proposed rule, we are proposing to establish RVUs for CY 2026 for the PFS to ensure that our payment systems are updated to reflect changes in medical practice and the relative value of services, as well as changes in the statute. This proposed rule also includes discussions and provisions regarding several other Medicare Part B payment policies, and other policies regarding programs administered by CMS.

Specifically, this proposed rule addresses:

- Background (section II.A.)
- Determination of PE RVUs (section II.B.)
- Potentially Misvalued Services Under the PFS (section II.C.)
- Payment for Medicare Telehealth Services Under Section 1834(m) of the Act (section II.D.)
- Valuation of Specific Codes (section II.E.)
- Evaluation and Management (E/M) Visits (section II.F.)
- Enhanced Care Management (section II.G.)
- Outpatient Therapy Services and KX Modifier Thresholds (section II.H.)
- Advancing Access to Behavioral Health Services (section II.I.)
- Provisions on Medicare Parts A and B Payment for Dental Services Inextricably Linked to Specific Covered Services (section II.J.)
- Payment for Skin Substitutes (section II.K.)
- Strategies for Improving Global Surgery Payment Accuracy (section II.L.)
- Determination of Malpractice Relative Value Units (RVUs) (section II.M.)
- Geographic Practice Cost Indices (GPCIs) (section II.N.)
- Drugs and Biological Products Paid Under Medicare Part B (section III.A.)
- Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs) (section III.B.)

- Ambulatory Specialty Model (ASM) (section III.C.)
- Medicare Diabetes Prevention Program (MDPP) (section III.D.)
- Medicare Prescription Drug Inflation Rebate Program (section III.E.)
- Medicare Shared Savings Program (section III.F.)
- Changes to the Regulations Associated with the Ambulance Fee Schedule (section III.G.)
- Updates to the Quality Payment Program and Medicare Promoting Interoperability Program (section IV.)
- Collection of Information Requirements (section V.)
- Responses to Comments (section VI.)
- Regulatory Impact Analysis (section VII.)

C. Summary of Costs and Benefits

Based on our estimates, the Office of Information and Regulatory Affairs in the Office of Management and Budget has determined that this proposed rule is economically significant under section 3(f)(1) of Executive Order 12866. As required by section 1848(d)(1)(A) of the Act, beginning in 2026, there will be two separate conversion factors (CFs): one for items and services furnished by a qualifying APM participant as defined in section 1833(z)(2) of the Act (referred to as the qualifying APM conversion factor) and another for other items and services (referred to as the nonqualifying APM conversion factor), equal to the respective conversion factor for the previous year (or, for CY 2026, equal to the single conversion factor for CY 2025) multiplied by the update established under section 1848(d)(20) of the Act for such respective conversion factor for such year. Under these proposals, the 2026 qualifying APM conversion factor represents a projected increase of $0.39 (1.2 percent) from the current conversion factor of $32.3465. Similarly, the 2026 nonqualifying APM conversion factor represents a projected increase of $0.23 (0.7 percent) from the current conversion factor of $32.3465.

For a detailed discussion of the economic impacts, see section VII., Regulatory Impact Analysis, of this proposed rule.

II. Provisions of the Proposed Rule for the PFS

A. Background

In accordance with section 1848 of the Social Security Act (the Act), CMS has paid for physicians' services under the Medicare physician fee schedule (PFS) since January 1, 1992. The PFS relies on national relative values that are established for work, practice expense (PE), and malpractice (MP), which are adjusted for geographic cost variations. These values are multiplied by a conversion factor (CF) to convert the relative value units (RVUs) into payment rates. The concepts and methodology underlying the PFS were enacted as part of the Omnibus Budget Reconciliation Act of 1989 (OBRA '89) (Pub. L. 101–239, December 19, 1989), and the Omnibus Budget Reconciliation Act of 1990 (OBRA '90) (Pub. L. 101–508, November 5, 1990). The final rule published in the November 25, 1991 **Federal Register** (56 FR 59502) set forth the first fee schedule used for Medicare payment for physicians' services.

We note that throughout this proposed rule, unless otherwise noted, the term ''practitioner'' is used to describe both physicians and nonphysician practitioners (NPPs) who are permitted to bill Medicare under the PFS for the services they furnish to Medicare beneficiaries.

B. Determination of PE RVUs

1. Overview

Practice expense (PE) is the portion of the resources used in furnishing a service that reflects the general categories of physician and practitioner expenses, such as office rent and personnel wages, but excluding malpractice (MP) expenses, as specified in section 1848(c)(1)(B) of the Act. As required by section 1848(c)(2)(C)(ii) of the Act, we use a resource-based system for determining PE RVUs for each physicians' service. We develop PE RVUs by considering the direct and indirect practice resources involved in furnishing each service. Direct expense categories include clinical labor, medical supplies, and medical equipment. Indirect expenses include administrative labor, office expenses, and all other expenses. The sections that follow provide more detailed information about the methodology for translating the resources involved in furnishing each service into service specific PE RVUs. We refer readers to the CY 2010 Physician Fee Schedule (PFS) final rule with comment period (74 FR 61743 through 61748) for a more detailed explanation of the PE methodology.

2. Practice Expense Methodology

a. Direct Practice Expense

We determine the direct PE for a specific service by adding the costs of the direct resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing that service. The costs of the resources are calculated using the refined direct PE inputs assigned to each CPT code in our PE database, which are generally based on our review of recommendations received from the American Medical Association (AMA))/ Specialty Society Relative Value Scale (RVS) Update Committee (referred to as the RUC) and those provided in response to public comment periods. For a detailed explanation of the direct PE methodology, including examples, we referred readers to the 5-year review of work RVUs under the PFS and proposed changes to the PE methodology in the CY 2007 PFS proposed rule (71 FR 37242) and the CY 2007 PFS final rule with comment period (71 FR 69629).

b. Indirect Practice Expense per Hour Data

We use survey data on indirect PEs incurred per hour worked to develop the indirect portion of the PE RVUs. Prior to CY 2010, we primarily used the PE/HR by specialty obtained from the AMA's Socioeconomic Monitoring System (SMS). The AMA administered a new survey in CY 2007 and CY 2008, the Physician Practice Information Survey (PPIS). The PPIS is a multispecialty, nationally representative, PE survey of physicians and NPPs paid under the PFS using a survey instrument and methods highly consistent with those used for the SMS and the supplemental surveys. The PPIS gathered information from 3,656 respondents across 51 physician specialty and health care professional groups. We have stated that we believe the PPIS is the most comprehensive source of PE survey information available. We used the PPIS data to update the PE/HR data for the CY 2010 PFS for almost all of the Medicare-recognized specialties that participated in the survey.

When we began using the PPIS data in CY 2010, we did not change the PE RVU methodology or how the PE/HR data are used. We only updated the PE/HR data based on the new survey. Furthermore, as we explained in the CY 2010 PFS final rule with comment period (74 FR 61751), because of the magnitude of payment reductions for some specialties resulting from the use of the PPIS data, we transitioned its use over a 4-year period from the previous PE RVUs to the PE RVUs developed using the new PPIS data. As provided in the CY 2010 PFS final rule with comment period (74 FR 61751), the transition to the PPIS data was complete for CY 2013. Therefore, PE RVUs from CY 2013 forward is developed based entirely on the PPIS data, except as noted in this section.

Section 1848(c)(2)(H)(i) of the Act requires us to use the medical oncology supplemental survey data submitted in 2003 for oncology drug administration services. Therefore, the PE/HR for medical oncology, hematology, and hematology/oncology reflects the continued use of these supplemental survey data.

Supplemental survey data on independent labs from the College of American Pathologists were implemented for payments beginning in CY 2005. Supplemental survey data from the National Coalition of Quality Diagnostic Imaging Services (NCQDIS), representing independent diagnostic testing facilities (IDTFs), were blended with supplementary survey data from the American College of Radiology (ACR) and implemented for payments beginning in CY 2007. Neither IDTFs nor independent labs participated in the PPIS. Therefore, we continue to use the PE/HR that was developed from their supplemental survey data.

Consistent with our past practice, the previous indirect PE/HR values from the supplemental surveys for these specialties were updated to CY 2006 using the Medicare Economic Index (MEI) to put them on a comparable basis with the PPIS data.

We also do not use the PPIS data for reproductive endocrinology and spine surgery since these specialties are not separately recognized by Medicare, nor do we have a method to blend the PPIS data with Medicare-recognized specialty data.

Previously, we established PE/HR values for various specialties without SMS or supplemental survey data by crosswalking them to other similar specialties to estimate a proxy PE/HR. For specialties that were part of the PPIS for which we previously used a crosswalked PE/HR, we instead used the PPIS based PE/HR. We use crosswalks for specialties that did not participate in the PPIS. These crosswalks have been generally established through notice and comment rulemaking and are available in the file titled ''CY 2026 PFS proposed rule PE/HR'' on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

For CY 2026, we have incorporated the available utilization data for one new specialty, Epileptologists, which we recognized effective July 1, 2024 through our established process. We are proposing to use proxy PE/HR values from Neurology for this new specialty, as there are no PPIS data for this specialty.

These updates are reflected in the ''CY 2026 PFS proposed rule PE/HR'' file available on the CMS website under the supporting data files for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

c. Allocation of PE to Services

To establish PE RVUs for specific services, it is necessary to establish the direct and indirect PE associated with each service.

(1) Direct Costs

The relative relationship between the direct cost portions of the PE RVUs for any two services is determined by the relative relationship between the sum of the direct cost resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing each of the services. The costs of these resources are calculated from the refined direct PE inputs in our PE database. For example, if one service has a direct cost sum of $400 from our PE database and another service has a direct cost sum of $200, the direct portion of the PE RVUs of the first service would be twice as much as the direct portion of the PE RVUs for the second service.

(2) Indirect Costs

We allocate the indirect costs at the code level based on the direct costs specifically associated with a code and the greater of either the clinical labor costs or the work RVUs. We also incorporate the survey data described earlier in the PE/HR discussion. The general approach to developing the indirect portion of the PE RVUs is as follows:

- For a given service, we use the direct portion of the PE RVUs calculated as previously described and the average percentage that direct costs represent of total costs (based on survey data) across the specialties that furnish the service to determine an initial indirect allocator. That is, the initial indirect allocator is calculated so that the direct costs equal the average percentage of direct costs of those specialties furnishing the service. For example, if the direct portion of the PE RVUs for a given service is 2.00 and direct costs, on average, represent 25 percent of total costs for the specialties that furnish the service, the initial indirect allocator would be calculated so that it equals 75 percent of the total PE RVUs. Thus, in this example, the initial indirect allocator would equal 6.00, resulting in a total PE RVU of 8.00 (2.00 is 25 percent of 8.00 and 6.00 is 75 percent of 8.00).
- Next, we add the greater of the work RVUs or clinical labor portion of the direct portion of the PE RVUs to this initial indirect allocator. In our example, if this service had a work RVU of 4.00 and the clinical labor portion of the direct PE RVU was 1.50, we would add 4.00 (since the 4.00 work RVUs are greater than the 1.50 clinical labor portion) to the initial indirect allocator of 6.00 to get an indirect allocator of 10.00. In the absence of any further use of the survey data, the relative relationship between the indirect cost portions of the PE RVUs for any two services would be determined by the relative relationship between these indirect cost allocators. For example, if one service had an indirect cost allocator of 10.00 and another service had an indirect cost allocator of 5.00, the indirect portion of the PE RVUs of the first service would be twice as great as the indirect portion of the PE RVUs for the second service.
- Then, we incorporate the specialty specific indirect PE/HR data into the calculation. In our example, if, based on the survey data, the average indirect cost of the specialties furnishing the first service with an allocator of 10.00 was half of the average indirect cost of the specialties furnishing the second service with an indirect allocator of 5.00, the indirect portion of the PE RVUs of the first service would be equal to that of the second service.

(3) Facility and Nonfacility Costs

For procedures that can be furnished in a physician's office, as well as in a facility setting, where Medicare makes a separate payment to the facility for its costs in furnishing a service, we establish two PE RVUs: facility and nonfacility. The methodology for calculating PE RVUs is generally the same for both the facility and nonfacility RVUs but is applied independently to yield two separate PE RVUs. In calculating the PE RVUs for services furnished in a facility, we do not include resources that would generally not be provided by physicians when furnishing the service. For this reason, the facility PE RVUs are generally lower than the nonfacility PE RVUs. We note, too, that in this proposed rule we are proposing a modification in the allocation of indirect PE, described in detail below.

(4) Services With Technical Components and Professional Components

Diagnostic services are generally comprised of two components: a

professional component (PC); and a technical component (TC). The PC and TC may be furnished independently or by different healthcare providers, or they may be furnished together as a global service. When services have separately billable PC and TC components, the payment for the global service equals the sum of the payment for the TC and PC. To achieve this, we use a weighted average of the ratio of indirect to direct costs across all the specialties that furnish the global service, TCs, and PCs; that is, we apply the same weighted average indirect percentage factor to allocate indirect expenses to the global service, PCs, and TCs for a service. (The direct PE RVUs for the TC and PC sum to the global.)

(5) PE RVU Methodology

For a more detailed description of the PE RVU methodology, we direct readers to the CY 2010 PFS final rule with comment period (74 FR 61745 through 61746). We also direct readers to the file titled ''Calculation of PE RVUs under Methodology for Selected Codes'' which is available on our website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.* This file contains a table that illustrates the calculation of PE RVUs as described in this proposed rule for individual codes.

(a) Setup File

First, we create a setup file for the PE methodology. The setup file contains the direct cost inputs, the utilization for each procedure code at the specialty and facility/nonfacility place of service level, and the specialty specific PE/HR data calculated from the surveys.

(b) Calculate the Direct Cost PE RVUs

Sum the costs of each direct input.

Step 1: Sum the direct costs of the inputs for each service.

Step 2: Calculate the aggregate pool of direct PE costs for the current year. We set the aggregate pool of PE costs equal to the product of the ratio of the current aggregate PE RVUs to current aggregate work RVUs and the projected aggregate work RVUs.

Step 3: Calculate the aggregate pool of direct PE costs for use in ratesetting. This is the product of the aggregate direct costs for all services from Step 1 and the utilization data for that service.

Step 4: Using the results of Step 2 and Step 3, use the CF to calculate a direct PE scaling adjustment to ensure that the aggregate pool of direct PE costs calculated in Step 3 does not vary from the aggregate pool of direct PE costs for the current year. Apply the scaling adjustment to the direct costs for each service (as calculated in Step 1).

Step 5: Convert the results of Step 4 to an RVU scale for each service. To do this, divide the results of Step 4 by the CF. Note that the actual value of the CF used in this calculation does not influence the final direct cost PE RVUs as long as the same CF is used in Step 4 and Step 5. Different CFs would result in different direct PE scaling adjustments, but this has no effect on the final direct cost PE RVUs since changes in the CFs and the associated direct scaling adjustments offset one another.

(c) Create the Indirect Cost PE RVUs

Create indirect allocators.

Step 6: Based on the survey data, calculate direct and indirect PE percentages for each physician specialty.

Step 7: Calculate direct and indirect PE percentages at the service level by taking a weighted average of the results of Step 6 for the specialties that furnish the service. Note that for services with TCs and PCs, the direct and indirect percentages for a given service do not vary by the PC, TC, and global service.

We generally use an average of the three most recent years of available Medicare claims data to determine the specialty mix assigned to each code. Codes with low Medicare service volume require special attention since billing or enrollment irregularities for a given year can result in significant changes in specialty mix assignment. We finalized a policy in the CY 2018 PFS final rule (82 FR 52982 through 59283) to use the most recent year of claims data to determine which codes are low volume for the coming year (those that have fewer than 100 allowed services in the Medicare claims data). For codes that fall into this category, instead of assigning a specialty mix based on the specialties of the practitioners reporting the services in the claims data, we use the expected specialty that we identify on a list developed based on medical review and input from expert interested parties. We display this list of expected specialty assignments as part of the annual set of data files we make available as part of notice and comment rulemaking and consider recommendations from the RUC and other interested parties on changes to this list annually. Services for which the specialty is automatically assigned based on previously finalized policies under our established methodology (for example, ''always therapy'' services) are unaffected by the list of expected specialty assignments. We also finalized in the CY 2018 PFS final rule (82 FR 52982 through 52983) a policy to apply these service-level overrides for both PE and MP, rather than one or the other category.

The full list of expected specialty assignments is included in the CY 2026 public use files, which are available on the CMS website under downloads for the CY 2026 PFS proposed rule at *http://www.cms.gov/Medicare/Medicare-Fee-for-ServicePayment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

Step 8: Calculate the service level allocators for the indirect PEs based on the percentages calculated in Step 7. The indirect PEs are allocated based on the three components: the direct PE RVUs; the clinical labor PE RVUs; and the work RVUs.

For most services the indirect allocator is: indirect PE percentage * (direct PE RVUs/direct percentage) + work RVUs.

There are two situations where this formula is modified:

- If the service is a global service (that is, a service with global, professional, and technical components), then the indirect PE allocator is: indirect percentage (direct PE RVUs/direct percentage) + clinical labor PE RVUs + work RVUs.
- If the clinical labor PE RVUs exceed the work RVUs (and the service is not a global service), then the indirect allocator is: indirect PE percentage (direct PE RVUs/direct percentage) + clinical labor PE RVUs.

(*Note:* For global services, the indirect PE allocator is based on both the work RVUs and the clinical labor PE RVUs. We do this to recognize that, for the PC service, indirect PEs would be allocated using the work RVUs, and for the TC service, indirect PEs would be allocated using the direct PE RVUs and the clinical labor PE RVUs. This also allows the global component RVUs to equal the sum of the PC and TC RVUs.)

For presentation purposes, in the examples in the download file titled ''Calculation of PE RVUs under Methodology for Selected Codes'', the formulas were divided into two parts for each service.

- The first part does not vary by service and is the indirect percentage (direct PE RVUs/direct percentage).
- The second part is either the work RVU, clinical labor PE RVU, or both depending on whether the service is a global service and whether the clinical PE RVUs exceed the work RVUs (as described earlier in this step).

We note that for CY 2026, we are proposing a change to the methodology so that when work RVUs are used to

allocate indirect PE to the facility RVUs, they are assigned at one-half the amount allocated to the nonfacility PE RVUs for that same service. This proposed change is detailed later in this section.

Apply a scaling adjustment to the indirect allocators.

Step 9: Calculate the current aggregate pool of indirect PE RVUs by multiplying the result of step 8 by the average indirect PE percentage from the survey data.

Step 10: Calculate an aggregate pool of indirect PE RVUs for all PFS services by adding the product of the indirect PE allocators for a service from Step 8 and the utilization data for that service.

Step 11: Using the results of Step 9 and Step 10, calculate an indirect PE adjustment so that the aggregate indirect allocation does not exceed the available aggregate indirect PE RVUs and apply it to indirect allocators calculated in Step 8.

Calculate the indirect practice cost index.

Step 12: Using the results of Step 11, calculate aggregate pools of specialty specific adjusted indirect PE allocators for all PFS services for a specialty by adding the product of the adjusted indirect PE allocator for each service and the utilization data for that service.

Step 13: Using the specialty specific indirect PE/HR data, calculate specialty specific aggregate pools of indirect PE for all PFS services for that specialty by adding the product of the indirect PE/HR for the specialty, the work time for the service, and the specialty's utilization for the service across all services furnished by the specialty.

Step 14: Using the results of Step 12 as the denominator and Step 13 as the numerator, calculate the specialty specific indirect PE scaling factors.

Step 15: Using the results of Step 14, calculate an indirect practice cost index at the specialty level by dividing each specialty specific indirect scaling factor by the average indirect scaling factor for the entire PFS.

Step 16: Calculate the indirect practice cost index at the service level to ensure the capture of all indirect costs. Calculate a weighted average of the practice cost index values for the specialties that furnish the service. (Note: For services with TCs and PCs, we calculate the indirect practice cost index across the global service, PCs, and TCs. Under this method, the indirect practice cost index for a given service (for example, echocardiogram) does not vary by the PC, TC, and global service.)

Step 17: Apply the service level indirect practice cost index calculated in Step 16 to the service level adjusted indirect allocators calculated in Step 11 to get the indirect PE RVUs.

(d) Calculate the Final PE RVUs

Step 18: Add the direct PE RVUs from Step 5 to the indirect PE RVUs from Step 17 and apply the final PE budget neutrality (BN) adjustment. The final PE BN adjustment is calculated by comparing the sum of steps 5 and 17 to the aggregate work RVUs scaled by the ratio of current aggregate PE and work RVUs. This adjustment ensures that all PE RVUs in the PFS account for the fact that certain specialties are excluded from the calculation of PE RVUs but included in maintaining overall PFS BN. (See ''Specialties excluded from ratesetting calculation'' later in this proposed rule.)

Step 19: Apply the phase-in of significant RVU reductions and its associated adjustment. Section 1848(c)(7) of the Act specifies that for services that are not new or revised codes, if the total RVUs for a service for a year would otherwise be decreased by an estimated 20 percent or more as compared to the total RVUs for the previous year, the applicable adjustments in work, PE, and MP RVUs shall be phased in over a 2-year period. In implementing the phase-in, we consider a 19 percent reduction as the maximum 1-year reduction for any service not described by a new or revised code. This approach limits the year one reduction for the service to the maximum allowed amount (that is, 19 percent), and then phases in the remainder of the reduction. To comply with section 1848(c)(7) of the Act, we adjust the PE RVUs to ensure that the total RVUs for all services that are not new or revised codes decrease by no more than 19 percent, and then apply a relativity adjustment to ensure that the total pool of aggregate PE RVUs remains relative to the pool of work and MP RVUs. For a more detailed description of the methodology for the phase-in of significant RVU changes, we refer readers to the CY 2016 PFS final rule with comment period (80 FR 70927 through 70931).

(e) Setup File Information

- Specialties excluded from ratesetting calculation: To calculate the PE and MP RVUs, we exclude certain specialties, such as NPPs paid at a percentage of the PFS and low volume specialties, from the calculation. These specialties are included to calculate the BN adjustment. They are displayed in Table 1.

BILLING CODE 4120–01–P

TABLE 1: Specialties Excluded from Ratesetting Calculation

Specialty Code	Specialty Description
49	Ambulatory surgical center
50	Nurse practitioner
51	Medical supply company with certified orthotist
52	Medical supply company with certified prosthetist
53	Medical supply company with certified prosthetist-orthotist
54	Medical supply company not included in 51, 52, or 53.
55	Individual certified orthotist
56	Individual certified prosthetist
57	Individual certified prosthetist-orthotist
58	Medical supply company with registered pharmacist
59	Ambulance service supplier, e.g., private ambulance companies, funeral homes, etc.
60	Public health or welfare agencies
61	Voluntary health or charitable agencies
73	Mass immunization roster biller
74	Radiation therapy centers
87	All other suppliers (e.g., drug and department stores)
88	Unknown supplier/provider specialty
89	Certified clinical nurse specialist
96	Optician
97	Physician assistant
A0	Hospital
A1	SNF
A2	Intermediate care nursing facility
A3	Nursing facility, other
A4	HHA
A5	Pharmacy
A6	Medical supply company with respiratory therapist
A7	Department store
A8	Grocery store
B1	Supplier of oxygen and/or oxygen related equipment (eff. 10/2/2007)
B2	Pedorthic personnel
B3	Medical supply company with pedorthic personnel
B4	Rehabilitation Agency
B5	Ocularist
C1	Centralized Flu
C2	Indirect Payment Procedure
C5	Dentistry

BILLING CODE 4120–01–C

- *Crosswalk certain low volume physician specialties:* Crosswalk the utilization of certain specialties with relatively low PFS utilization to the associated specialties.
- *Physical therapy utilization:* Crosswalk the utilization associated with all physical therapy services to the specialty of physical therapy.
- *Identify professional and technical services not identified under the usual TC and 26 modifiers:* Flag the services that are PC and TC services but do not use TC and 26 modifiers (for example, electrocardiograms). This flag associates the PC and TC with the associated global code for use in creating the indirect PE RVUs. For example, the professional service, CPT code 93010 (Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only), is associated with the global service, CPT code 93000 (Electrocardiogram, routine ECG with at least 12 leads; with interpretation and report).
- *Payment modifiers:* Payment modifiers are accounted for in creating the file consistent with the current payment policy as implemented in claims processing. For example, services billed with the assistant at surgery modifier are paid 16 percent of the PFS amount for that service; therefore, the utilization file is modified to only account for 16 percent of any service that contains the assistant at surgery modifier. Similarly, for those services to which volume adjustments are made to account for the payment modifiers, time

adjustments are applied as well. For time adjustments to surgical services, the intraoperative portion in the work time file is used; where it is not present, the intraoperative percentage from the payment files used by contractors to process Medicare claims is used instead. Where neither is available, we use the payment adjustment ratio to adjust the time accordingly. Table 2 provides details in which the modifiers are applied.

TABLE 2: Application of Payment Modifiers to Utilization Files

Modifier	Description	Volume Adjustment	Time Adjustment
80,81,82	Assistant at Surgery	16%	Intraoperative portion
AS	Assistant at Surgery – Physician Assistant	14% (85% * 16%)	Intraoperative portion
50 or LT and RT	Bilateral Surgery	150%	150% of work time
51	Multiple Procedure	50%	Intraoperative portion
52	Reduced Services	50%	50%
53	Discontinued Procedure	50%	50%
54	Intraoperative Care only	Preoperative + Intraoperative Percentages on the payment files used by Medicare contractors to process Medicare claims	Preoperative + Intraoperative portion
55	Postoperative Care only	Postoperative Percentage on the payment files used by Medicare contractors to process Medicare claims	Postoperative portion
62	Co-surgeons	62.5%	50%
66	Team Surgeons	33%	33%
CO, CQ	Physical and Occupational Therapy Assistant Services	88%	88%

We also adjust volume and time that correspond to other payment rules, including special multiple procedure endoscopy rules and multiple procedure payment reductions (MPPRs). We note that section 1848(c)(2)(B)(v) of the Act exempts certain reduced payments for multiple imaging procedures and multiple therapy services from the BN calculation under section 1848(c)(2)(B)(ii)(II) of the Act. These MPPRs are not included in the development of the RVUs.

Beginning in CY 2022, section 1834(v)(1) of the Act required that we apply a 15 percent payment reduction for outpatient occupational therapy services and outpatient physical therapy services that are provided, in whole or in part, by a physical therapist assistant (PTA) or occupational therapy assistant (OTA). Section 1834(v)(2)(A) of the Act required CMS to establish modifiers to identify these services, which we did in the CY 2019 PFS final rule (83 FR 59654 through 59661), creating the CQ and CO payment modifiers for services provided in whole or in part by PTAs and OTAs, respectively. These payment modifiers are required to be used on claims for services with dates of service beginning January 1, 2020, as specified in the CY 2020 PFS final rule (84 FR 62702 through 62708). We applied the 15 percent payment reduction to therapy services provided by PTAs (using the CQ modifier) or OTAs (using the CO modifier), as required by statute. Under sections 1834(k) and 1848 of the Act, payment is made for outpatient therapy services at 80 percent of the lesser of the actual charge or applicable fee schedule amount (the allowed charge). The remaining 20 percent is the beneficiary copayment. For therapy services to which the new discount applies, payment will be made at 85 percent of the 80 percent of allowed charges. Therefore, the volume discount factor for therapy services to which the CQ and CO modifiers apply is: (0.20 + (0.80 * 0.85), which equals 88 percent.

For anesthesia services, we do not apply adjustments to volume since we use the average allowed charge when simulating RVUs; therefore, the RVUs as calculated already reflect the payments as adjusted by modifiers, and no volume adjustments are necessary. However, a time adjustment of 33 percent is made only for medical direction of two to four cases since that is the only situation where a single practitioner is involved with multiple beneficiaries concurrently, so that counting each service without regard to the overlap with other services would overstate the amount of time spent by the practitioner furnishing these services.

- *Work RVUs:* The setup file contains the work RVUs from this proposed rule.

(6) Equipment Cost per Minute

The equipment cost per minute is calculated as:

(1/(minutes per year * usage)) * price * ((interest rate/(1 (1/((1 + interest rate)^ life of equipment)))) + maintenance)

Where:

minutes per year = maximum minutes per year if usage were continuous (that is, usage=1); generally, 150,000 minutes.
usage = variable, see discussion below in this proposed rule.
price = price of the particular piece of equipment.
life of equipment = useful life of the particular piece of equipment.
maintenance = factor for maintenance; 0.05.
interest rate = variable, see discussion below in this proposed rule.

Usage: We currently use an equipment utilization rate assumption of 50 percent for most equipment, with the exception of expensive diagnostic imaging equipment, for which we use a 90 percent assumption as required by section 1848(b)(4)(C) of the Act.

Useful Life: In the CY 2005 PFS final rule we stated that we updated the useful life for equipment items primarily based on the AHA's ''Estimated Useful Lives of Depreciable Hospital Assets'' guidelines (69 FR 66246). The most recent edition of these guidelines was published in 2018. This reference material provides an estimated useful life for hundreds of different types of equipment, the vast majority of which fall in the range of 5 to 10 years, and none of which are lower than two years in duration. We believe that the updated editions of this reference material remain the most accurate source for estimating the useful life of depreciable medical equipment.

In the CY 2021 PFS final rule, we finalized a proposal to treat equipment life durations of less than 1 year as having a duration of 1 year for the purpose of our equipment price per minute formula. In the rare cases where items are replaced every few months, we noted that we believe it is more accurate to treat these items as disposable supplies with a fractional supply quantity as opposed to equipment items with very short equipment life durations. For a more detailed discussion of the methodology associated with very short equipment life durations, we refer readers to the CY 2021 PFS final rule (85 FR 84482 through 84483).

- *Maintenance:* We finalized the 5 percent factor for annual maintenance in the CY 1998 PFS final rule with comment period (62 FR 33164). As we previously stated in the CY 2016 PFS final rule with comment period (80 FR 70897), we do not believe the annual maintenance factor for all equipment is precisely 5 percent, and we concur that the current rate likely understates the true cost of maintaining some equipment. We also noted that we believe it likely overstates the maintenance costs for other equipment. When we solicited comments regarding data sources containing equipment maintenance rates, commenters could not identify an auditable, robust data source that CMS could use on a wide scale. We noted that we did not believe voluntary submissions regarding the maintenance costs of individual equipment items would be an appropriate methodology for determining costs. As a result, in the absence of publicly available datasets regarding equipment maintenance costs or another systematic data collection methodology for determining a different maintenance factor, we did not propose a variable maintenance factor for equipment cost per minute pricing as we did not believe that we have sufficient information at present. We noted that we would continue to investigate potential avenues for determining equipment maintenance costs across a broad range of equipment items.
- *Interest Rate:* In the CY 2013 PFS final rule with comment period (77 FR 68902), we updated the interest rates used in developing an equipment cost per minute calculation (see 77 FR 68902 for a thorough discussion of this issue). The interest rate was based on the Small Business Administration (SBA) maximum interest rates for different categories of loan size (equipment cost) and maturity (useful life). The interest rates are listed in Table 3.

TABLE 3: SBA MAXIMUM INTEREST RATES

Price	Useful Life	Interest Rate
<$25K	<7 Years	7.50%
$25K to $50K	<7 Years	6.50%
>$50K	<7 Years	5.50%
<$25K	7+ Years	8.00%
$25K to $50K	7+ Years	7.00%
>$50K	7+ Years	6.00%

We are not proposing any changes to the equipment interest rates for CY 2026.

3. Adjusting RVUs To Match the PE Share of the Medicare Economic Index (MEI)

In the past, we have stated that we believe that the MEI is the best measure available of the relative weights of the three components in payments under the PFS—work, practice expense (PE), and malpractice (MP). Accordingly, we believe that to ensure that the PFS payments reflect the relative resources in each of these PFS components as required by section 1848(c)(3) of the Act, the RVUs used in developing rates should reflect the same weights in each component as the cost share weights in the Medicare Economic Index (MEI). In the past, we have proposed (and subsequently finalized) to accomplish this by holding the work RVUs constant and adjusting the PE RVUs, MP RVUs, and CF to produce the appropriate balance in RVUs among the three PFS components and payment rates for individual services, that is, that the total RVUs on the PFS are proportioned to approximately 51 percent work RVUs, 45 percent PE RVUs, and 4 percent MP RVUs. As the MEI cost shares are updated, we would typically propose to modify steps 3 and 10 to adjust the aggregate pools of PE costs (direct PE in step 3 and indirect PE in step 10) in proportion to the change in the PE share in the 2017-based MEI cost share weights, and to recalibrate the relativity adjustment that we apply in step 18 as described in the CY 2023 PFS final rule (87 FR 69414 and 69415) and CY 2014 PFS final rule (78 FR 74236 and 74237). The most recent recalibration was done for the CY 2014 RVUs.

In the CY 2014 PFS proposed rule (78 FR 43287 through 43288) and final rule (78 FR 74236 through 74237), we detailed the steps necessary to accomplish this result (see steps 3, 10, and 18). The CY 2014 proposed and final adjustments were consistent with our longstanding practice to make adjustments to match the RVUs for the PFS components with the MEI cost share weights for the components, including the adjustments described in the CY 1999 PFS final rule (63 FR 58829), CY 2004 PFS final rule (68 FR 63246 and 63247), and CY 2011 PFS final rule (75 FR 73275).

In the CY 2023 PFS final rule (87 FR 69688 through 69711), we finalized to rebase and revise the MEI to reflect more current market conditions faced by physicians in furnishing physicians' services (referred to as the ''2017-based MEI''). We also finalized a delay of the adjustments to the PE pools in steps 3 and 10 and the recalibration of the relativity adjustment in step 18 until the

public had an opportunity to comment on the rebased and revised 2017-based MEI (87 FR 69414 through 69416). Because we finalized significant methodological and data source changes to the MEI in the CY 2023 PFS final rule and significant time had elapsed since the last rebasing and revision of the MEI in CY 2014, we believed that delaying the implementation of the finalized 2017-based MEI was consistent with our efforts to balance payment stability and predictability with incorporating new data through more routine updates. We refer readers to the discussion of our comment solicitation in the CY 2023 PFS final rule (87 FR 69429 through 69432), where we reviewed our ongoing efforts to update data inputs for PE to aid stability, transparency, efficiency, and data adequacy. We also solicited comments in the CY 2023 PFS proposed rule on when and how to best incorporate the 2017-based MEI into PFS ratesetting, and whether it would be appropriate to consider a transition to full implementation for potential future rulemaking. We presented the impacts of implementing the 2017-based MEI in PFS ratesetting through a 4-year transition and through full immediate implementation, that is, with no transition period in the CY 2023 PFS proposed rule. We also solicited comments on other implementation strategies for potential future rulemaking in the CY 2023 PFS proposed rule. In the CY 2023 PFS final rule, we discussed that many commenters supported our proposed delayed implementation, and many commenters expressed concerns with the redistributive impacts of the implementation of the 2017-based MEI in PFS ratesetting. Many commenters also noted the AMA's intent to collect practice cost data from physician practices, which could be used to derive cost share weights for the MEI and RVU shares.

In CY 2025 PFS rulemaking (89 FR 97722), we stated that in light of the AMA's current data collection efforts and because the methodological and data source changes to the 2017-based MEI finalized in the CY 2023 PFS final rule would have significant impacts on PFS payments, similar to our discussion of this topic in the CY 2024 PFS rulemaking cycle (88 FR 78829 through 78831), we continued to believe that delaying the implementation of the finalized 2017-based MEI cost share weights for the RVUs was consistent with our efforts to balance payment stability and predictability with incorporating new data through more routine updates. For these reasons, we did not propose to incorporate the 2017-based MEI in PFS ratesetting for CY 2024 and CY 2025. As we noted in the CY 2024 PFS final rule, many commenters on the CY 2024 PFS proposed rule supported our continued delayed implementation of the 2017-based MEI in PFS ratesetting (88 FR 78830). Most of these commenters recommended to us to pause consideration of other sources for the MEI until the AMA's efforts to collect practice cost data from physician practices concluded, although a few commenters recommended that we implement the MEI for PFS ratesetting as soon as possible. We stated that we agree with the commenters that it would be prudent, and avoid potential duplication of effort, to wait to consider other data sources for the MEI while the AMA's data collection activities were ongoing. We stated that as we discussed in the CY 2024 PFS final rule, we continue to monitor the data available related to physician services' input expenses, but we were not proposing to update the data underlying the MEI cost weights at that time.

At the time of publication of this proposed rule, the AMA has concluded their data collection efforts and, in early 2025, submitted data from its Physician Practice Information (PPI) and Clinician Practice Information (CPI) Surveys to CMS for us to consider implementing the PE/HR data and cost shares in PFS ratesetting for CY 2026. We appreciate the AMA's data collection efforts, and recognize the significant efforts required to develop the survey and collect the data. We have prioritized review of the submitted information during the first part of this year based on our longstanding interest in the value of updated practice expense information. At this time, however, we have substantive concerns about the accuracy and suitability of the PPI and CPI Survey data as an immediate replacement for the current PE/HR data and cost shares for use in CY 2026 PFS ratesetting. Due to overarching concerns with the data as described below and our previously described policy goal to balance PFS payment stability and predictability with incorporating new data through routine updates to the MEI, we are not proposing to implement the PE/HR or cost shares from the AMA's survey data at this time. Instead, we propose to maintain the current PE/HR and 2006-based MEI cost shares for CY 2026 PFS ratesetting.

4. Changes to Direct PE Inputs for Specific Services

This section focuses on specific PE inputs. The direct PE inputs are included in the CY 2026 direct PE input public use files, which are available on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-fafor-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

a. Standardization of Clinical Labor Tasks

As we noted in the CY 2015 PFS final rule with comment period (79 FR 67640 through 67641), we continue to make improvements to the direct PE input database to provide the number of clinical labor minutes assigned for each task for every code in the database instead of only including the number of clinical labor minutes for the preservice, service, and post service periods for each code. In addition to increasing the transparency of the information used to set PE RVUs, this level of detail would allow us to compare clinical labor times for activities associated with services across the PFS, which we believe is important to maintaining the relativity of the direct PE inputs. This information would facilitate the identification of the usual numbers of minutes for clinical labor tasks and the identification of exceptions to the usual values. It would also allow for greater transparency and consistency in the assignment of equipment minutes based on clinical labor times. Finally, we believe that the detailed information can be useful in maintaining standard times for particular clinical labor tasks that can be applied consistently to many codes as they are valued over several years, similar in principle to physician preservice time packages. We believe that setting and maintaining such standards would provide greater consistency among codes that share the same clinical labor tasks and could improve the relativity of values among codes. For example, as medical practice and technologies change over time, standards could be updated simultaneously for all codes with the applicable clinical labor tasks instead of waiting for individual codes to be reviewed.

In the CY 2016 PFS final rule with comment period (80 FR 70901), we solicited comments on the appropriate standard minutes for the clinical labor tasks associated with services that use digital technology. After consideration of comments received, we finalized standard times for clinical labor tasks associated with digital imaging at 2 minutes for ''Availability of prior images confirmed'', 2 minutes for ''Patient clinical information and questionnaire reviewed by technologist,

order from physician confirmed and exam protocoled by radiologist'', 2 minutes for ''Review examination with interpreting MD'', and 1 minute for ''Exam documents scanned into PACS'' and ''Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue.'' In the CY 2017 PFS final rule (81 FR 80184 through 80186), we finalized a policy to establish a range of appropriate standard minutes for the clinical labor activity, ''Technologist QCs images in PACS, checking for all images, reformats, and dose page.'' These standard minutes will be applied to new and revised codes that make use of this clinical labor activity when they are reviewed by us for valuation. We finalized a policy to establish 2 minutes as the standard for the simple case, 3 minutes as the standard for the intermediate case, 4 minutes as the standard for the complex case, and 5 minutes as the standard for the highly complex case. These values were based upon a review of the existing minutes assigned for this clinical labor activity; we determined that 2 minutes is the duration for most services and a small number of codes with more complex forms of digital imaging have higher values. We also finalized standard times for a series of clinical labor tasks associated with pathology services in the CY 2016 PFS final rule with comment period (80 FR 70902). We do not believe these activities would be dependent on number of blocks or batch size, and we believe that the finalized standard values accurately reflect the typical time it takes to perform these clinical labor tasks.

In reviewing the RUC-recommended direct PE inputs for CY 2019, we noticed that the 3 minutes of clinical labor time traditionally assigned to the ''Prepare room, equipment and supplies'' (CA013) clinical labor activity were split into 2 minutes for the ''Prepare room, equipment and supplies'' activity and 1 minute for the ''Confirm order, protocol exam'' (CA014) activity. We proposed to maintain the 3 minutes of clinical labor time for the ''Prepare room, equipment and supplies'' activity and remove the clinical labor time for the ''Confirm order, protocol exam'' activity wherever we observed this pattern in the RUC-recommended direct PE inputs. Commenters explained in response that when the new version of the PE worksheet introduced the activity codes for clinical labor, there was a need to translate old clinical labor tasks into the new activity codes, and that a prior clinical labor task was split into two of the new clinical labor activity codes: CA007 (*Review patient clinical extant information and questionnaire*) in the preservice period, and CA014 (*Confirm order, protocol exam*) in the service period. Commenters stated that the same clinical labor from the old PE worksheet was now divided into the CA007 and CA014 activity codes, with a standard of 1 minute for each activity. We agreed with commenters that we would finalize the RUC-recommended 2 minutes of clinical labor time for the CA007 activity code and 1 minute for the CA014 activity code in situations where this was the case. However, when reviewing the clinical labor for the reviewed codes affected by this issue, we found that several of the codes did not include this old clinical labor task, and we also noted that several of the reviewed codes that contained the CA014 clinical labor activity code did not contain any clinical labor for the CA007 activity. In these situations, we believe that the three total minutes of clinical staff time would be more accurately described by the CA013 ''Prepare room, equipment and supplies'' activity code, and we finalized these clinical labor refinements. We direct readers to the discussion in the CY 2019 PFS final rule (83 FR 59463 through 59464) for additional details.

Following the publication of the CY 2020 PFS proposed rule, one commenter expressed concern with the published list of common refinements to equipment time. The commenter stated that these refinements were the formulaic result of applying refinements to the clinical labor time and did not constitute separate refinements; the commenter requested that CMS no longer include these refinements in the table published each year. In the CY 2020 PFS final rule, we agreed with the commenter that these equipment time refinements did not reflect errors in the equipment recommendations or policy discrepancies with the RUC's equipment time recommendations. However, we believed it was important to publish the specific equipment times that we were proposing (or finalizing in the case of the final rule) when they differed from the recommended values due to the effect these changes can have on the direct costs associated with equipment time. Therefore, we finalized the separation of the equipment time refinements associated with changes in clinical labor into a separate table of refinements. We direct readers to the discussion in the CY 2020 PFS final rule (84 FR 62584) for additional details.

Historically, the RUC has submitted a ''PE worksheet'' that details the recommended direct PE inputs for our use in developing PE RVUs. The format of the PE worksheet has varied over time, and among the medical specialties developing the recommendations. These variations have made it difficult for the RUC's development and our review of code values for individual codes. Beginning with its recommendations for CY 2019, the RUC mandated the use of a new PE worksheet for its recommendation development process that standardizes the clinical labor tasks and assigns them a clinical labor activity code. We believe the RUC's use of the new PE worksheet in developing and submitting recommendations helps us simplify and standardize the hundreds of clinical labor tasks currently listed in our direct PE database. As in previous calendar years, to facilitate rulemaking for CY 2026, we are continuing to display two versions of the Labor Task Detail public use file: one version with the old listing of clinical labor tasks and one with the same tasks crosswalked to the new listing of clinical labor activity codes. These lists are available on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

b. Updates to Prices for Existing Direct PE Inputs

In the CY 2011 PFS final rule with comment period (75 FR 73205), we finalized a process to act on public requests to update equipment and supply price and equipment useful life inputs through annual rulemaking, beginning with the CY 2012 PFS proposed rule. Beginning in CY 2019 and continuing through CY 2022, we conducted a market-based supply and equipment pricing update using information developed by our contractor, StrategyGen, which updated pricing recommendations for approximately 1,300 supplies and 750 equipment items currently used as direct PE inputs. Given the potentially significant changes in payment that would occur, in the CY 2019 PFS final rule, we finalized a policy to phase in our use of the new direct PE input pricing over a 4-year period using a 25/75 percent (CY 2019), 50/50 percent (CY 2020), 75/25 percent (CY 2021), and 100/0 percent (CY 2022) split between new and old pricing. We believed that implementing the proposed updated prices with a 4-year phase-in would improve payment accuracy while maintaining stability and allowing interested parties to address potential

concerns about changes in payment for particular items. This 4-year transition period to update supply and equipment pricing concluded in CY 2022; for a more detailed discussion, we refer readers to the CY 2019 PFS final rule with comment period (83 FR 59473 through 59480).

For CY 2026, we are proposing to update the price of 35 supplies and seven equipment items in response to the public submission of invoices following the publication of the CY 2025 PFS final rule. The 42 supply and equipment items with proposed updated prices are listed in the valuation of specific codes section of the preamble under Table 6, CY 2026 Invoices Received for Existing Direct PE Inputs.

We received a series of invoices associated with the SD339 supply prior to our February 10th submission deadline and are proposing to update its pricing accordingly for CY 2026, as detailed in Table 6, CY 2026 Invoices Received for Existing Direct PE Inputs. We later received additional invoices associated with this supply several months following our February 10th deadline which arrived too late to be included in the proposed updated pricing for this supply as shown in Table 6. Consistent with our previously finalized policy associated with the February 10th deadline (79 FR 67608), we will review these invoices during the comment period following the publication of this CY 2026 PFS proposed rule for potential inclusion in the final rule.

We are not proposing to update the price of another eight supplies and one equipment item, which were the subject of public submission of invoices. Our reasons for not proposing updates to these prices are detailed below, and we are soliciting additional information from interested parties for assistance in pricing these supplies:

- *Radiation treatment vault (ER056):* We received pricing information associated with the radiation treatment vault from an interested party. However, this pricing information contained numerous costs associated with building construction which would not be included on a traditional invoice, such as surveying, plumbing and HVAC expenses, drywall packaging, and the installation of electrical equipment. As we previously stated in the CY 2021 PFS final rule about similar costs associated with proton beam treatment delivery services, the expenses associated with constructing new office facilities fall outside of our direct PE methodology and would be more accurately classified as a form of building maintenance or office rent under indirect PE (85 FR 84626). We do not agree that construction costs should be included as a form of direct PE because they are not individually allocable to a particular patient for a particular service. Therefore, we do not believe that it would serve the interests of relativity to include these building construction costs for the radiation treatment vault as a type of direct PE expense. In the absence of other pricing information associated with the radiation treatment vault, or pricing of the vault absent these building construction costs, we are proposing to maintain its current price of $773,104.
- *Congo red kits (SA110) and UltraView Universal DAB Detection Kit (SL488):* We received three invoices from interested parties requesting an increase in the price of the SA110 supply from $6.80 to $20.12 and another three invoices from interested parties requesting an increase in the price of the SL488 equipment from $12.28 to $41.26. In both cases, we do not understand how the typical price of these supplies could be increasing by such a large amount, tripling the current price in both cases, given that the price of both supplies was recently updated. Both the SA110 supply and the SL488 supply had their prices updated in the CY 2024 PFS final rule, with the SA110 supply increasing from $6.16 to $6.80 and the SL488 supply increasing from $9.70 to $12.28 (88 FR 78966 through 78967). We do not believe that the typical price for these supplies would increase to such a great degree given that their pricing was already recently updated for CY 2024; therefore, we are not proposing to update.
- *Catheter, balloon, rectal pressure (SD017); catheter, pressure, urodynamic (SD027); and transducer dome (pressure) (SD125):* We received one invoice from interested parties for each of these three supplies. Interested parties requested an increase in the price of the SD017 supply from $35.89 to $74.00, an increase in the price of the SD027 supply from $19.35 to $86.80, and an increase in the price of the SD125 supply from $3.58 to 17.32. However, in each of these three cases, it was unclear if the item on the invoice matched the supply item in question. The invoice for the SD017 supply listed a ''Abdominal Sensor Catheter'', the invoice for the SD027 supply listed a ''Single Sensor Catheter'', and the invoice for the SD125 supply listed a ''transducer cartridge with luer lock''. Given the differences between the names of the items in question, and the significant increases in requested pricing, we are not proposing to update the pricing of these three supplies as we cannot verify that the invoices refer to the same supply items.
- *Electrode, surface (SD062):* We received one invoice from interested parties requesting a decrease in the price of the SD062 supply from $1.58 to $0.34. The invoice appeared to state that there are 10 copies of 10 packs of 3 electrodes which, when dividing the total price of $103 by 300 electrodes, results in a price of $0.34 per electrode. We do not believe that the interested parties intended to submit an invoice resulting in a 78 percent decrease in pricing for the SD062 supply, and we are not convinced that we have correctly understood the unit quantity for this item. As a result, we are not proposing to change the pricing of the SD062 supply at this time.
- *Biohazard specimen transport bag (SM008):* We received one invoice from interested parties requesting an increase in the price of the SM008 supply from $0.087 to $0.750, an increase of more than 750 percent. However, when we reviewed the invoice, we determined that it referred to a different type of disposal bag than the biohazard specimen transport bag described by the SM008 supply, which explained the disparity in the pricing. We are therefore not proposing to update the pricing of the SM008 supply.
- *Wipes, lens cleaning (per wipe) (Kimwipe) (SM027):* We received one invoice from interested parties requesting an increase in the price of the SM027 supply from $0.04 to $0.33, an increase of approximately 700 percent. However, when we reviewed the supply in question, we found that lens cleaning wipes were readily available for purchase at the current price of $0.04 per wipe. We are therefore not proposing to update the pricing of the SM027 supply.

(1) Invoice Submission

We remind readers that we routinely accept public submissions of invoices as part of our process for developing payment rates for new, revised, and potentially misvalued codes. Often, these invoices are submitted in conjunction with the RUC-recommended values for the codes. To be included in a given year's proposed rule, we generally need to receive invoices by the same February 10th deadline we noted for consideration of RUC recommendations. However, we will consider invoices submitted as public comments during the comment period following the publication of the PFS proposed rule and will consider any invoices received after February 10th or outside of the public comment

process as part of our established annual process for requests to update supply and equipment prices. Interested parties are encouraged to submit invoices with their public comments or, if outside the notice and comment rulemaking process, via email at *PE_Price_Input_Update@cms.hhs.gov.*

(2) Supply Pack Pricing Update

Interested parties previously notified CMS that they identified numerous discrepancies between the aggregated cost of some supply packs and the individual item components contained within. The interested parties indicated that CMS should rectify these mathematical errors as soon as possible to ensure that the sum correctly matches the totals from the individual items, and they recommended that we resolve these pricing discrepancies in the supply packs during CY 2024 rulemaking. The AMA RUC convened a workgroup on this subject and submitted recommendations to update pricing for a series of supply packs along with the RUC's comment letter for the CY 2024 rule cycle.

We appreciated the additional information and RUC workgroup recommendations regarding discrepancies in the aggregated cost of some supply packs. However, due to the projected significant cost revisions in the pricing of supply packs and because we did not propose to address supply pack pricing in the CY 2024 proposed rule, we stated in the CY 2024 final rule that this issue would be better addressed in future rulemaking. For example, the cleaning and disinfecting endoscope pack (SA042) is included as a supply input in more than 300 HCPCS codes, which could have a sizable impact on the overall valuation of these services, and which was not incorporated into the proposed RVUs published for the CY 2024 proposed rule. We stated that interested parties would be better served if we comprehensively addressed this topic during future rulemaking in which commenters could provide feedback in response to proposed pricing updates (88 FR 78833 through 78834).

For CY 2025, we proposed to implement the supply pack pricing update and associated revisions as recommended by the RUC's workgroup (89 FR 97726 through 97727). We proposed to update the pricing of the ''pack, cleaning and disinfecting, endoscope'' (SA042) supply from $19.43 to $31.29, to update the pricing of the ''pack, drapes, cystoscopy'' (SA045) supply from $17.33 to $14.99, to update the pricing of the ''pack, ocular photodynamic therapy'' (SA049) supply from $16.35 to $26.35, to update the pricing of the ''pack, urology cystoscopy visit'' (SA058) supply from $113.70 to $37.63, and to update the pricing of the ''pack, ophthalmology visit (w-dilation)'' (SA082) supply from $3.91 to $2.33. As recommended by the RUC workgroup, we also proposed to delete the ''pack, drapes, laparotomy (chest-abdomen)'' (SA046) supply entirely. The updated prices for these supply packs were listed in the valuation of specific codes section of the preamble under Table 6, CY 2025 Invoices Received for Existing Direct PE Inputs (89 FR 97852).

In accordance with the RUC workgroup's recommendations, we also proposed to create 8 new supply codes, including components contained within previously existing supply packs. Aside from the SB056 supply, which is a replacement in several HCPCS codes for the deleted SA046 supply pack, all of these new supplies are not included as standalone direct PE inputs in any current HCPCS codes, as they are, again, components contained within previously existing supply packs. We proposed to add:

- The kit, ocular photodynamic therapy (PDT) (SA137) supply at a price of $26.00 as a component of the SA049 supply pack;
- The Abdominal Drape Laparotomy Drape Sterile (100 in x 72 in x 124 in) (SB056) supply at a price of $8.049 as a replacement for the SA046 supply pack;
- The drape, surgical, legging (SB057) supply at a price of $3.284 as a component of the SA045 supply pack;
- The drape, surgical, split, impervious, absorbent (SB058) supply at a price of $8.424 as a component of the SA045 supply pack;
- The post-mydriatic spectacles (SB059) supply at a price of $0.328 as a component of the SA082 supply pack;
- The y-adapter cap (SD367) supply at a price of $0.352 as a component of the SA049 supply pack;
- The ortho-phthalaldehyde 0.55 percent (for example, Cidex OPA) (SM030) supply at a price of $0.554 as a component of the SA042 supply pack; and
- The ortho-phthalaldehyde test strips (SM031) supply at a price of $1.556 as a component of the SA042 supply pack.

The new supply pack component items were listed in the valuation of specific codes section of the preamble under Table 8, CY 2025 New Invoices (89 FR 97853).

We also proposed the following additional supply substitutions based on the recommendations of the RUC workgroup. We proposed to remove the deleted SA046 supply pack and replace it with the drape, sterile, fenestrated 16in x 29in (SB011) supply for CPT codes 19020, 19101, 19110, 19112, 20101, and 20102. We proposed to remove the deleted SA046 supply pack and replace it with two supplies—the drape, sterile, three-quarter sheet (SB014) and the drape, towel, sterile 18in x 26in (SB019)—for CPT codes 19000 and 60300. We proposed to remove the deleted SA046 supply pack and replace it with 2 supplies—the drape, towel, sterile 18in x 26in (SB019) and the newly created Abdominal Drape Laparotomy Drape Sterile (100 in x 72 in x 124 in) (SB056) supply—for CPT codes 22510, 22511, 22513, and 22514. We proposed to remove the deleted SA046 supply pack without replacing it with anything for CPT code 22526; the RUC workgroup did not make a recommendation on what to do with CPT code 27278, which also previously contained the SA046 supply pack. Therefore, we also proposed not to replace the SA046 supply pack with any supplies for this code. The RUC workgroup also recommended removing the SA046 supply pack from CPT code 64595 with no replacement; however, this code was recently reviewed at the April 2022 RUC meeting and it no longer includes the SA046 supply.

In the comments on the CY 2025 PFS proposed rule (89 FR 97727 through 97729), several commenters supported the proposed supply pack pricing update as recommended by the RUC workgroup, however they indicated concern over the proposed decrease in the price of the urology cystoscopy visit pack (SA058) from $113.70 to $37.63. Commenters stated that the proposed pricing reduction in the SA058 supply could result in drastic payment rate cuts for physicians performing cystoscopy services in the office setting. Commenters requested that CMS either delay the pricing update or phase-in the supply pack changes over a four-year period like it has done for other PE changes with significant redistributive effects, allowing independent urology practices to better prepare for the negative financial impact this change will have.

After considering these comments, we agreed that the use of a phased-in transition period would be appropriate to allow practitioners to adjust to the updated pricing of these supplies. During our previous supply and equipment pricing update in the CY 2019 PFS final rule, we finalized a policy to phase in any updated pricing that we established during the 4-year transition period for very commonly used supplies and equipment, such as sterile gloves (SB024) or exam tables (EF023), even if invoices were provided as part of the formal review of a code family (83 FR 59475). Based on this previously established policy, we finalized the use of a pricing transition for three supply packs in Table 4:

TABLE 4: CY 2025 SUPPLY PACK PRICING TRANSITION

CMS_ CODE	HCPCS Codes	CMS_2024 Price	Recommended Price	Year 1 (CY 2025) Price	Year 2 (CY 2026) Price	Year 3 (CY 2027) Price	Final (CY 2028) Price
SA042	306	$19.43	$31.29	$22.40	$25.36	$28.33	$31.29
SA058	38	$113.70	$37.63	$94.68	$75.67	$56.65	$37.63
SA082	145	$3.91	$2.33	$3.52	$3.12	$2.73	$2.33

Following the same pattern as our previous supply/equipment and clinical labor pricing updates, we finalized the implementation of this pricing transition over 4 years such that one-quarter of the difference between the current price and the fully phased-in price is implemented for CY 2025, one-third of the difference between the CY 2025 price and the final price is implemented for CY 2026, and one-half of the difference between the CY 2026 price and the final price is implemented for CY 2027, with the new direct PE prices fully implemented for CY 2028. For the other proposed supply packs, the cystoscopy drapes pack (SA045) is only included in 7 HCPCS codes and the ocular photodynamic therapy pack (SA049) is only included in a single HCPCS code which do not meet these criteria established in previous rulemaking and described above. We therefore finalized each of them at their updated pricing for CY 2025 as proposed in the proposed rule. We believe that the use of this pricing transition will minimize any potential disruptive effects during the 4-year transition period that could be caused by other sudden shifts in RVUs due to the high number of services that make use of these very common supply packs.

Several commenters also stated that although five incomplete packs would have their pricing updated in the proposed rule, mathematical errors still remained for a number of additional supply packs. Commenters stated that only 3 of the 18 affirmed packs were priced correctly to match their components and provided tables showing the pricing of an additional 15 packs that needed mathematical correction by deconstructing the packs to determine the correct price through summing their individual components. Commenters requested that CMS initiate a correction of the packs pricing such that the sum of the individual components match the price of the corresponding pack as detailed in Table 5:

TABLE 5: SUPPLY PACK PRICING REQUESTED BY CY 2025 COMMENTERS

HCPCS Codes	Item Name	CMS Code	Current Price	New Price	% Change
111 codes	pack, basic injection	SA041	$10.45	$17.28	65%
560 codes	pack, cleaning, surgical instruments	SA043	$12.61	$11.09	-12%
3 codes	pack, moderate sedation	SA044	$18.55	$19.20	4%
4568 codes	pack, minimum multi-specialty visit	SA048	$5.02	$1.98	-61%
168 codes	pack, ophthalmology visit (no dilation)	SA050	$2.72	$1.35	-50%
239 codes	pack, pelvic exam	SA051	$20.16	$2.81	-86%
1079 codes	pack, post-op incision care (staple)	SA052	$4.80	$9.90	106%
469 codes	pack, post-op incision care (suture & staple)	SA053	$5.47	$11.54	111%
1708 codes	pack, post-op incision care (suture)	SA054	$4.62	$10.34	124%
12 codes	pack, post-op incision care, craniotomy	SA055	$7.30	$18.18	149%
24 codes	pack, post-op incision care, neurosurgical	SA056	$6.20	$16.05	159%
120 codes	pack, drapes, ortho, large	SA080	$37.30	$25.38	-32%
29 codes	pack, drapes, ortho, small	SA081	$2.25	$1.88	-16%
119 codes	pack, protective, ortho, large	SA083	$10.86	$14.75	36%
27 codes	pack, protective, ortho, small	SA084	$5.99	$8.15	36%

While we shared the concerns of the commenters regarding the need for accuracy in the pricing of these supply packs, we had reservations about their potential for pricing disruptions. Ten of these supply packs are included in the direct PE inputs for at least 100 HCPCS codes, and three of the packs are included in more than 1000 HCPCS codes. Many of these pricing updates would lead to drastic changes in pricing for these supply packs which are

included in hundreds of HCPCS codes, such as the SA051 pelvic exam pack decreasing in price from $20.16 to $2.81 (−86 percent) and the SA048 minimum multi-specialty visit pack decreasing in price from $5.02 to $1.98 (−61 percent). We were particularly concerned that these changes in supply pack pricing could lead to significant shifts in the overall PE RVU for affected HCPCS codes, without these proposed rates appearing in the proposed rule or allowing any opportunity for public comment.

Therefore, we did not finalize pricing updates for these additional 15 supply packs as requested by commenters. We anticipated returning to this subject in future rulemaking to allow any changes in associated pricing for HCPCS codes to appear in the proposed rule and provide an opportunity for the public to comment. Should these supply pack pricing updates be proposed in future rulemaking, we anticipated that we might propose the same pricing transition described above due to the number of potentially affected HCPCS codes. We finalized all of the other supply pack pricing changes as proposed, with the exception of the 4-year pricing transition for three supply packs as described above.

For CY 2026, we are proposing to continue implementing the supply pack pricing update and associated revisions as previously recommended by the RUC's workgroup. We are proposing to update the price of the 15 supply packs detailed in Table 5 which were received too late in CY 2025 to allow for proposed pricing or public comment. In the case of the surgical instruments cleaning pack (SA043), the moderate sedation pack (SA044) and the small ortho drapes pack (SA081), the proposed pricing update is modest enough that we are proposing these supplies move immediately to their final prices for CY 2026.

For the 12 other supply packs, we are proposing that they be incorporated into the muti-year supply pack pricing transition finalized in CY 2025 rulemaking. Rather than having two separate 4-year pricing transitions associated with supply packs, we are proposing that these 12 additional supply packs fold into the previous pricing transition using the same methodology, such that one-third of the difference between the CY 2025 price and the final price is implemented for CY 2026, and one-half of the difference between the CY 2026 price and the final price is implemented for CY 2027, with the new direct PE prices fully implemented for CY 2028 (89 FR 97728). With the inclusion of the SA042, SA058, and SA082 supply packs which began their pricing transition last year for CY 2025, we are proposing the total supply pack pricing update detailed in Table 6:

TABLE 6: CY 2026 SUPPLY PACK PRICING TRANSITION

CMS_ CODE	HCPCS Codes	CMS_2024 Price	Recommended Price	Year 1 (CY 2025) Price	Year 2 (CY 2026) Price	Year 3 (CY 2027) Price	Final (CY 2028) Price
SA042	306	$19.43	$31.29	$22.40	$25.36	$28.33	$31.29
SA058	38	$113.70	$37.63	$94.68	$75.67	$56.65	$37.63
SA082	145	$3.91	$2.33	$3.52	$3.12	$2.73	$2.33
SA041	111	$10.45	$17.28	-	$12.73	$15.00	$17.28
SA048	4568	$5.02	$1.98	-	$4.01	$2.99	$1.98
SA050	168	$2.72	$1.35	-	$2.26	$1.81	$1.35
SA051	239	$20.16	$2.81	-	$14.38	$8.59	$2.81
SA052	1079	$4.80	$9.90	-	$6.50	$8.20	$9.90
SA053	469	$5.47	$11.54	-	$7.49	$9.52	$11.54
SA054	1708	$4.62	$10.34	-	$6.53	$8.43	$10.34
SA055	12	$7.30	$18.18	-	$10.93	$14.55	$18.18
SA056	24	$6.20	$16.05	-	$9.48	$12.77	$16.05
SA080	120	$37.30	$25.38	-	$33.33	$29.35	$25.38
SA083	119	$10.86	$14.75	-	$12.16	$13.45	$14.75
SA084	27	$5.99	$8.15	-	$6.71	$7.43	$8.15
SD089	100	$20.56	$41.15	-	$27.42	$34.29	$41.15

This table also includes the hydrophilic guidewire (SD089) supply which we are proposing to transition in pricing over three years given its inclusion in approximately 100 HCPCS codes. We continue to believe that the use of this pricing transition will minimize any potential disruptive effects during the transition period that could be caused by other sudden shifts in RVUs due to the high number of services that make use of these very common supply items.

c. Technical Corrections To Direct PE Input Database and Supporting Files

Following the publication of the CY 2025 PFS final rule, we received a request from the RUC to remove all equipment items priced below $500 from the CMS ratesetting database. The RUC stated that since CMS has defined that medical equipment must be at least $500 and all equipment inputs under $500 are considered indirect expense, the 11 current equipment items under this threshold should no longer be listed as equipment. The RUC requested that CMS remove these items from its equipment list and from the specific HCPCS codes to conform to the definition of direct medical equipment and to ensure that the rule remains consistently applied.

We appreciate the RUC bringing this topic to our attention. However, we are not proposing to remove these 11 equipment items that fall under the $500 threshold from the CMS ratesetting database. These equipment items have historically been included as direct PE inputs in their respective HCPCS codes for the last two decades and, given the very small valuation associated with their use (such as the ED004 digital

camera priced at approximately 0.06 cents per minute of use), we do not believe that it is necessary to remove them from the database. We believe that it better serves relativity by continuing to maintain these equipment items due to their historical inclusion in their associated HCPCS codes, as opposed to the removal of long-standing direct PE inputs which may cause unnecessary confusion and lead to concern that the valuation of these services would be negatively impacted. We are soliciting comments on whether to maintain or remove these equipment items.

We also received a request from the RUC to update the names of several supplies and equipment items in the CMS ratesetting database. The RUC stated that these naming changes would remove specific product or brand names and more accurately describe the items in question. We agree with the RUC and we are proposing naming changes for the following supplies and equipment items:

- EQ392: We are proposing to rename the ''heart failure patient physiologic monitoring equipment package'' to ''patient physiologic monitoring equipment package''.
- ER089: We are proposing to rename the ''IMRT Accelerator'' to ''Radiation Treatment Delivery Linear Accelerator''.
- SD253: We are proposing to rename the ''atherectomy device (Spectronetics laser or Fox Hollow)'' supply to ''atherectomy device''.
- SD254: We are proposing to rename the ''covered stent (VIABAHN, Gore)'' to ''covered stent (VIABAHN)''.

We received a separate request from the RUC for a technical correction involving CPT code 65780 (*Ocular surface reconstruction; amniotic membrane transplantation, multiple layers*). The RUC stated that there was a potential issue with the intraservice work time for CPT code 65780, which was recommended by the RUC with 35 minutes of work time and finalized by CMS with no work time refinements. However, CPT code 65780 was listed with 25 minutes of intraservice work time in the work time public use file issued with the CY 2025 PFS final rule; the RUC questioned whether this was a potential technical error. We have reviewed CPT code 65780 and concluded that the intraservice work time was unintentionally listed with the incorrect work time of 25 minutes; we are proposing to correct this to the intended work time of 35 minutes. We note that the total work time of 192 minutes was listed correctly for CPT code 65780 and does not require a technical correction.

We also received a request from the RUC for a technical correction involving CPT code 15851 (*Removal of sutures or staples requiring anesthesia (that is, general anesthesia, moderate sedation*)). The RUC stated that CPT code 15851 continued to receive PE RVUs in the nonfacility setting despite no longer having any direct PE inputs following its review at the January 2022 RUC meeting. Since CMS finalized the RUC's recommended lack of direct PE inputs for CPT code 15851 in the CY 2023 PFS final rule, the RUC questioned whether this was a potential technical error. We have reviewed CPT code 15851 and concluded that the continued assignment of PE RVUs in the nonfacility setting is an unintended technical error; we are proposing to correct this code by removing the nonfacility PE RVUs for CY 2026.

5. Development of Strategies for Updates to Practice Expense Data Collection and Methodology

a. Background

The AMA PPIS was first introduced in 2007 as a means to collect comprehensive and reliable data on the direct and indirect PEs incurred by physicians (72 FR 66222). In considering the use of PPIS data, the goal was to improve the accuracy and consistency of PE RVUs used in the PFS. The data collection process included a stratified random sample of physicians across various specialties, and the survey was administered between August 2007 and March 2008. Data points from that period of time are integrated into PFS calculations today. In the CY 2009 PFS proposed rule (73 FR 38507 through 3850), we discussed the indirect PE methodology that used data from the AMA's survey that predated the PPIS. In CY 2010 PFS rulemaking, we announced our intent to incorporate the AMA PPIS data into the PFS ratesetting process, which would first affect the PE RVU. In the CY 2010 PFS proposed rule, we outlined a 4-year transition period, during which we would phase in the AMA PPIS data, replacing the existing PE data sources (74 FR 33554). We also explained that our proposals intended to update survey data only (74 FR 33530 through 33531). In our CY 2010 final rule, we finalized our proposal, with minor adjustments based on public comments (74 FR 61749 through 61750). We responded to the comments we received about the transition to using the PPIS to inform indirect PE allocations (74 FR 61750). In the responses, we acknowledged concerns about potential gaps in the data, which could impact the allocation of indirect PE for certain physician specialties and suppliers, which are issues that remain important today. The CY 2010 PFS final rule explains that section 212 of the Balanced Budget Refinement Act of 1999 (Pub. L. 106–113, November 29, 1999) (BBRA) directed the Secretary to establish a process under which we accept and use, to the maximum extent practicable and consistent with sound data practices, data collected or developed by entities and organizations to supplement the data we normally collect in determining the PE component. BBRA required us to establish criteria for accepting supplemental survey data. Since the supplemental surveys were specific to individual specialties and not part of a comprehensive multispecialty survey, we had required that certain precision levels be met in order to ensure that the supplemental data was sufficiently valid, and acceptable for use in the development of the PE RVUs. At the time, our rationale included the assumption that because the PPIS is a contemporaneous, consistently collected, and comprehensive multispecialty survey, we do not believe similar precision requirements are necessary, and we did not propose to establish them for the use of the PPIS data (74 FR 61742). We noted potential gaps in the data, which could impact the allocation of indirect PE for certain physician and suppliers. The CY 2010 final rule adopted the proposal, with minor adjustments based on public comments, and explained that these minor adjustments were in part due to non-response bias that results when the characteristics of survey respondents differ in meaningful ways, such as in the mix of practices sizes, from the general population (74 FR 61749 through 61750).

Throughout the 4-year transition period, from CY 2010 to CY 2013, we gradually incorporated the AMA PPIS data into the PFS rates, replacing the previous data sources. The process involved addressing concerns and making adjustments as necessary, such as refining the PFS ratesetting methodology in consideration of interested party feedback. For background on the refinements that we considered after the transition began, we refer readers to discussions in the CY 2011 through 2014 final rules (75 FR 73178 through 73179; 76 FR 73033 through 73034; 77 FR 98892; 78 FR 74272 through 74276).

In the CY 2011 PFS proposed rule, we requested comments on the methodology for calculating indirect PE RVUs, explicitly seeking input on using survey data, allocation methods, and

potential improvements (75 FR 40050). In our CY 2011 PFS final rule, we addressed comments regarding the methodology for indirect PE calculations, focusing on using survey data, allocation methods, and potential improvements (75 FR 73178 through 73179). We recognized some limitations of the current PFS ratesetting methodology but maintained that the approach was the most appropriate at the time. In the CY 2012 PFS final rule, we responded to comments related to indirect PE methodology, including concerns about allocating indirect PE to specific services and using the AMA PPIS data for certain specialties (76 FR 73033 through 73034). We indicated that CMS would continue to review and refine the methodology and work with interested parties to address their concerns. In the CY PFS 2014 final rule, we responded to comments about fully implementing the AMA PPIS data. By 2014, the AMA PPIS data had been fully integrated into the PFS, serving as the primary source for determining indirect PE inputs (78 FR 74235). We continued to review data and the PE methodology annually, considering interested party feedback and evaluating the need for updates or refinements to ensure the accuracy and relevance of PE RVUs (79 FR 67548). In the years following the full implementation of the AMA PPIS data, we further engaged with interested parties, thought leaders and subject matter experts to improve our PE inputs' accuracy and reliability. For further background, we refer readers to our discussions in final rules for CY 2016 through 2022 (80 FR 70892; 81 FR 80175; 82 FR 52980 through 52981; 83 FR 59455 through 59456; 84 FR 62572; 85 FR 84476 through 84478; 86 FR 62572).

In our CY 2023 PFS final rule, we issued an RFI to solicit public comment on strategies to update PE data collection and methodology (87 FR 69429 through 69432). We solicited comments on current and evolving trends in health care business arrangements, the use of technology, or similar topics that may affect or factor into PE calculations. As described in previous rulemaking, we have continued interest in developing a roadmap for updates to our PE methodology that account for changes in the health care landscape. Of various considerations necessary to form a roadmap for updates, we reiterate that allocations of indirect PE continue to present a wide range of challenges and opportunities. As discussed in multiple cycles of previous rulemaking, our PE methodology currently relies on AMA PPIS data, which we have maintained represented the best aggregated available source of information at the time of its implementation. We noted in our CY 2023 and CY 2024 rules that there are several competing concerns that CMS must take into account when considering updated data sources, which also should support and enable ongoing refinements to our PE methodology.

b. Refreshed Data and Request for Information on Timing To Effectuate Routine Updates

In the CY 2024 PFS proposed rule, we continued to encourage interested parties to provide feedback and suggestions to CMS that give an evidentiary basis to shape optimal PE data collection and methodological adjustments over time. Considering our ratesetting methodology and prior experiences implementing new data, we issued a follow-up from the CY 2023 comment solicitation for general information. We solicited comments from interested parties on strategies to incorporate information that could address known challenges we experienced in implementing the initial AMA PPIS data. Our current methodology relies on the AMA PPIS data, legislatively mandated supplemental data sources (for, example, we use supplemental survey data collected in 2003, as required by section 1848(c)(2)(H)(i) of the Act to set rates for oncology and hematology specialties), and in some cases crosswalks to allocate indirect PE as necessary for certain specialties and practitioner types. We also sought to understand whether, upon completion of the updated PPIS data collection effort by the AMA, contingencies or alternatives may be necessary and available to address the lack of data availability or response rates for a given specialty, set of specialties, or specific service suppliers who are paid under the PFS.

In response to the CY 2024 RFI, most commenters stated that CMS should defer significant changes until the AMA PPIS results become available. For further background, refer to 88 FR 78841 through 78843. In responding to our RFI, the AMA RUC provided a set of responses, which many other commenters echoed in separate comments. In summary, the AMA RUC letter submission from CY 2024 suggested that CMS should not consider further changes until PPIS data collection and analysis is complete. Overall, the AMA comments generally do not support any change to the methodology and stated that CMS should wait to consider any further changes until PPIS updates become available. Further, we noted that through its contractor, Mathematica, the AMA secured an endorsement for the PPIS updates from each State society, national medical specialty society, and others prior to fielding the survey (88 FR 78843). Refer to the AMA's summary of the PPIS, available at *https://www.ama-assn.org/system/files/physician-practice-information-survey-summary.pdf.* The AMA stated that it expects analysis, reporting, and documentation to be completed by the end of CY 2024 and would share data with CMS when results become available.

Some commenters did not recommend that CMS defer significant changes until the AMA PPIS results become available. These commenters stated that reliance on the PPIS updates may not improve the accuracy and stability of the PE methodology because of the survey design, possible implementation challenges, and a possible lack of transparency or granularity in resulting datasets. Other commenters stated that dependence on the PPIS or survey data in general, due to timing and frequency constraints, may continue to jeopardize independent practice and discourage fair competition among suppliers and providers of services paid under the PFS. These commenters assert that if current trends continue, it will result in far fewer independent practices and more consolidation before the availability of updated survey data, undermining the sampling methodology of any survey and the general goals of our PE methodology updates.

As we stated in the CY 2025 proposed rule (89 FR 61614), we believe the AMA's approach may possibly mitigate nonresponse bias, which created challenges using previous PPIS data. However, we remain uncertain about whether endorsements prior to fielding the survey may inject other types of bias in the validity and reliability of the information collected. We believe it remains important to reflect on the challenges with our current methodology, and to continue to consider alternatives that improve the stability and accuracy of our overall PE methodology. We reiterate our discussion summarizing the responses to previous years' RFIs in each of the CY 2023 and CY 2024 final rules (refer to 87 FR 69429 through 69432 and 88 FR 78841 to 78843). We also requested general information from the public on ways that CMS may continue work to improve the stability and predictability of any future updates. Specifically, we

requested feedback from interested parties regarding scheduled, recurring updates to PE inputs for supply and equipment costs. We stated that we believe that establishing a cycle of timing to update supply and equipment cost inputs every 4 years may be one means of advancing shared goals of stability and predictability. CMS would collect available data, including, but not limited to, submissions and independent third-party data sources, and propose a phase-in period over the following 4 years. The phase-in approach maps to our experience with previous updates. Additionally, we stated that more frequent updates may have the unintended consequence of disproportionate effects of various supplies and equipment that have newly updated costs.

Further, we solicited feedback in the CY 2025 proposed rule RFI (89 FR 61614) on possible mechanisms to establish a balance whereby our methodology would account for inflation and deflation in supply and equipment costs. We stated that we remain uncertain how economies of scale (meaning a general principle that cost per unit of production decreases as the scale of production increases) should or should not factor into future adjustments to our methodology. We stated that there remains a diversity of perspectives among interested parties about such effects. We sought information about specific mechanisms that may be appropriate, and in particular, approaches that would leverage verifiable and independent third-party data that is not managed or controlled by active market participants.

In response to our CY 2025 proposed rule RFI (89 FR 97737), numerous commenters expressed concerns regarding CMS's current PE methodology, particularly highlighting its perceived inadequacies in accommodating modern medical technologies and services, such as Software as a Service (SaaS) and artificial intelligence (AI). These commenters stated that there is a need for CMS to revise its PE methodology to better reflect the actual costs of running medical practices today, which includes more frequent updates and the incorporation of direct costs for software and innovative technologies. Many also supported the AMA's PPIS efforts to ensure updated and accurate data informs PE calculations. Commenters urged CMS to collaborate closely with medical associations and incorporate broad stakeholder feedback without increasing reporting burdens, particularly for smaller practices.

We note that we have an ongoing contract with the RAND Corporation to analyze and develop alternative methods for measuring PE and related inputs for implementation of updates to payment under the PFS. We will continue to study possible alternatives and have included analysis of the updated PPI and CPI Survey data in this proposed rule, as part of our ongoing work.

As previously stated above and discussed in sections II.N. and VI. of this proposed rule, we acknowledge that, at the time of publication of this proposed rule, the AMA concluded their data collection efforts and has submitted the data to CMS for us to consider implementing the PE/HR data and cost shares in PFS ratesetting for CY 2026. In the current system, accurate measurement of the indirect to direct PE ratio and the PE/HR for each specialty is critical to ensure that allocated indirect PE RVUs (and therefore total PE RVUs) accurately estimate service-level PE as defined by PFS ratesetting steps described above. Because the PE methodology is budget neutral, inaccuracies in the PE/HR data for some specialties can significantly impact the overall pool of PE available to distribute across all services, and therefore overall valuation and payment.

We appreciate the AMA's PPI and CPI Survey data collection efforts, and recognize the significant costs incurred to collect the data. However, our initial review of the new data raises substantive concerns about their accuracy, utility, and suitability as an immediate replacement for the current PE/HR data and cost shares for use in allocating nearly $91 billion in payments across PFS services. These concerns relate to issues including:

- *Low Response Rates and Representativeness:* A primary concern is the low response rate of the surveys. The 2024 PPI Survey had a response rate of 3 to 7 percent, depending on whether practices that did not click through the invitation email link were counted as non-respondents. The CPI Survey had a slightly higher response rate between 7 to 9 percent. In comparison, the 2008 PPIS had a response rate of 12 percent. Low response rates raise concerns as to whether responding practices are systematically different from sampled practices that did not or could not respond. Additionally, in response to lower-than-expected response rates, the AMA allowed 102 practices to volunteer to participate in the survey. Although most of these volunteer practices did not complete the survey, allowing practices to volunteer data adds to concerns about the representativeness of the data.

Additionally, the 2008 PE/HR estimates were based on the observations (about half of responses) that had no missing expense data, whereas the 2024 PE/HR estimates and the shares are based on observations that had at least some non-missing data where the missing data was imputed as described in the Survey Methods Report (Step 6).[1] It should be noted that some expense categories were reported more consistently by survey respondents. For example, 97 percent of the respondents reported compensation (physician work) compared to only 69 percent that were able to report non-billable drugs (direct expense under supplies) and information technology (indirect expense). Similarly, many survey respondents were not able to separately report expenses for qualified health providers (QHPs). Nearly 40 percent of the responses used in the calculation of the PE/HR estimates reported that they had nurse practitioners or physician assistants in their practice, but only 27 percent were able to separately report non-physician compensation expenses.

- *Small Sample Sizes and Sampling Variation:* Due in part to the low response rates, the number of respondents was small for many specialties included in the 2024 PPI and CPI data. For example, the PE/HR measures for Vascular Surgery are based upon responses from only 20 practices. Moreover, the PPI and CPI survey estimates give more weight to responses from practice types that would otherwise be under-represented in the sample, relative to the population of all eligible practices in a given specialty. For example, such an adjustment would be applied if the sample contained a higher proportion of facility-based practices than there are in the full population of practices in a given specialty. Applying such weights generally results in estimates that are less precise than an unweighted sample of a given size. One way to quantify this is via the effective sample size, which estimates the sample size from an unweighted sample that would be required to produce survey estimates that are as precise as those from the weighted sample. The effective sample size can be estimated as the ratio of the sample size to the design effect, which is reported in the PPI/CPI Methods Reports.[2] [3] For Vascular Surgery, the

[1] *https://www.ama-assn.org/system/files/ppi-survey-methods-report.pdf.*

[2] *https://www.ama-assn.org/system/files/ppi-survey-methods-report.pdf.*

Continued

reported design effect is 1.82, meaning that the 20 observations correspond to an effective sample size of only 11 (calculated as 11.0=20/1.82). For 12 of 18 broad specialty groupings reported in the 2024 PPI Survey, the effective sample size is less than 18.0 and for four of these specialties the effective sample size is less than 10.0. Similarly, in the CPI Survey data, the effective sample sizes are also small, with all but one below 20.0, and as low as 6.2 for Oral Surgery. Not including practices that volunteered, only 327 sampled practices completed the 2024 PPI Survey compared to 3,088 anticipated completions.

The low sample sizes contribute to substantial statistical uncertainty regarding the true specialty-level PE/HR measures. Figure A–B1 illustrates the 95 percent confidence intervals for direct and indirect PE/HR as reported in the 2024 PPI/CPI Surveys. The large points represent the new PE/HR estimates, the bars indicate the confidence intervals, and the smaller points show the current PE/HR estimates used in PFS ratesetting from the 2008 PPIS. The 2024 CPI and PPI Survey confidence intervals are so broad that they cover most of the original 2008 PPI PE/HR values in nominal dollars (that is, not adjusted for inflation). Therefore, in most cases, the new data are unable to establish statistically significant changes from the status quo, especially since the old PE/HR measures were themselves estimated with substantial levels of statistical uncertainty. Even so, the new PE/HR estimates differ enough from the old ones that many specialty-level impacts of adopting the new data are quite large. When translated into RVUs, the PE/HR standard errors for specialties such as Cardiology, Pathology, Ophthalmology, and Vascular Surgery correspond to a wide range of payments for services provided by those specialties meaning that the new data are compatible with a wide range of specialty impacts for many specialties.

- *Lack of Comparability to Previous Survey Data:* The 2024 PPI and CPI Survey data groups specialties in a considerably different way from the current structure, with 29 specialty groupings compared to 51 in the 2008 data. We found that using the 2008 PE/HR data averaged within the 2024 PPI Survey specialty groupings would lead to large specialty-level impacts in some cases, further complicating comparisons between the old and new data and indicating that the new 2024 specialty groupings is impactful on redistribution among the PFS alone. We refer readers to section VI. of this proposed rule for discussion of the impacts of the 2024 PPI Survey specialty groupings on PFS ratesetting. It is also unclear why some specialties were collapsed into relatively broad groups for the purposes of data collection and reporting while others were not.
- *Potential Measurement Error:* We are concerned that sampled practices were not able to accurately report the data necessary to respond to the PPI and CPI Surveys. For example, the survey contractor found that practices frequently had challenges reporting the number of physicians working in the practice. One may expect that the number of physicians in a practice is relatively easier for practices to measure than some of the specific costs integral to reporting PE/HR. However, the contractor noted that—prior to an adjustment—their estimate of the total number of physicians was nearly three times as large as the number of physicians in their sampling frame which ''indicated a large potential for measurement error in this estimate.'' [4] Also, because information on the number of physicians in each practice was available from external data which were obtained before survey data were collected, to inform the survey design, we believe it is likely that the number of physicians was highlighted as having high potential measurement error because it was possible to compare this measure against external data. Moreover, some responding practices reported that it took more than 40 hours to complete the survey, which suggests that the required data are not readily captured by their accounting systems and therefore may not be fully reliable.

Thus, we are left with doubts about not just the amount of data collected, but its quality as well.

- *Missing and Incomplete Data Submission:* The PPI Survey summary data was submitted to CMS in January 2025 and the CPI Survey summary data in February 2025. These initial submissions were missing from many of the elements required to analyze the data and determine their usability in our PE methodology. We inquired about these elements and have since received some additional information, but some of the information was not available due to the survey contract concluding, such as estimates based solely on the survey responses that had no missing expense data or the impact of the trims and edits of the data described in the PPI Survey Methods Report. Additionally, some data is completely missing from the submission, therefore we had to utilize old PE/HR data in analyses for specialties such as Independent Diagnostic Testing Facilities (IDTFs) when developing models to incorporate the data. Additionally, the American Occupational Therapists Association (AOTA) requested the continued crosswalk of PE/HR data from Physical Therapy to Occupational Therapy because the CPI respondents may have indirectly reported the salaries of occupational therapy assistants with provider compensation rather than including their salaries in clinical staff compensation.

Additionally, there is summary data provided from the PPI Survey [5] that are not provided for the CPI Survey.[6] For example, the PPI Survey summary data include two lines—''MEI shares'' and ''All [specialties]''—that could presumably be used to establish the share of total RVUs that should be attributed to work, practice expense, and malpractice, but we do not believe that they reflect the specialties' data from the CPI Survey, even though those specialties are included in PFS ratesetting, account for a significant portion of the PFS PE RVU pool, and draw from the same pool of RVUs as the PPI Survey specialties. Similarly, we do not have the corresponding CPI Survey specialty weighting information provided to CMS for the PPI Survey specialties, therefore, we have limited information to develop an approach for calculating shares for all CMS specialties accounted for in both the PPI and CPI Surveys.

In an effort to incorporate PPI and CPI Survey specialties' data despite the lack of analogous summary data, we developed possible methods to weight the data for all CMS specialties in a cohesive manner for use in the PFS PE methodology such as estimates of total RVUs and total service time by specialty used for CY 2026 PFS ratesetting. We refer readers to section VI. of this proposed rule for discussion of the different weighting methodologies and their resulting shares of work, PE, and MP.

Overall, the small sample sizes and the apparent presence of high levels of measurement error in data elements that could be compared to external estimates suggest that specialty-level PE/HR measures may be challenging to measure reliably through voluntary surveys alone. We note that the

[3] *https://www.ama-assn.org/system/files/cpi-survey-methods-report-main-report.pdf.*

[6] *https://www.ama-assn.org/system/files/table-1-results-from-cpi-final.pdf.*

interested parties may concur with this assertion based on the Methods Report, which states considerations for future data collection efforts that may forego the survey structure and rely on other practice expense sources such as tax returns. We believe that a more efficient and transparent system that could be updated on a regular basis may be possible using available administrative data (such as Medicare claims; hospital cost reports; publicly-reported tax information such as from IRS Form 990; and data collected by other agencies, such as the Census Bureau's Service Annual Survey (SAS)) to the fullest extent possible and relying on survey data only to fill gaps only where available data do not exist. An alternative to collecting any survey data would be to modify the PE allocation system so that it only relies only on data that can be measured accurately and on an on-going basis. For example, if there are components of indirect PE that are not captured in administrative data, those expense categories could potentially be re-classified as direct costs and accounted for in a manner similar to how direct costs are currently considered.

Beyond the use of the data in our PE methodology, we need information on the total share of PFS payments that should be allocated for work, PE, and MP. Data collected in the 2024 PPI and CPI Surveys could be used for this purpose, as well as potentially be considered in a construction of the MEI in the future; however, there still remain underlying concerns with the sample representativeness for these purposes. The AMA has asserted that shares derived from data collected from the Service Annual Survey (SAS) for the 2017-based MEI miss many physicians who work in facility settings and thereby understate the percent of total PFS payments that should be allocated to physician work. The data needed to derive the three component shares (work, PE, and MP) are more aggregated than the specialty-level PE/HR data required for the PE methodology, so we have fewer concerns with the small sample sizes for this application. However, we continue to have similar concerns with the data related to measurement error and sample representativeness for purposes of the shares.

BILLING CODE 4120–01–P

Figure 1: Comparison of PE/HR Data from 2008 PPIS and 2024 PPI and CPI Survey with 95% Confidence Intervals for the 2024 Data

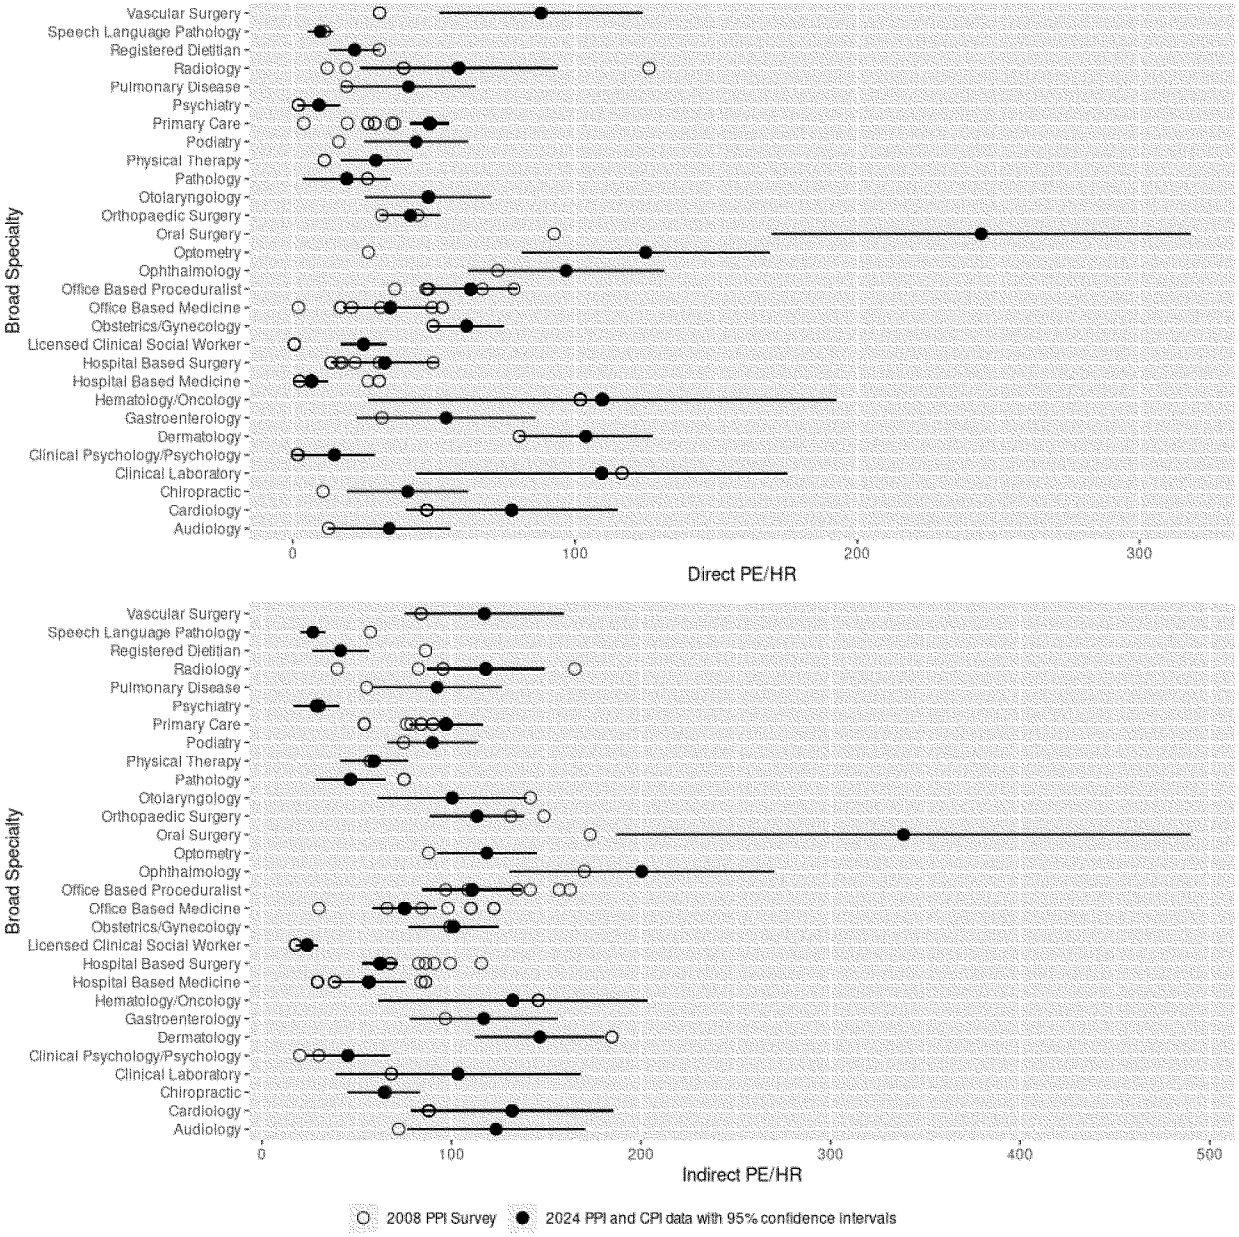

Figure 1: Comparison of PE/HR data from 2008 PPI Survey (small, hollow dots) and data from the 2024 PPI and CPI Survey (large, filled dots) with 95 percent confidence intervals for the 2024 data. Data are grouped by the 2024 specialty groupings.

BILLING CODE 4120–01–C

At the time of the publication of this proposed rule, we continue to conduct ongoing analyses on the potential impact of the AMA's PPI and CPI Survey data on PFS ratesetting. Due to overarching concerns with the data described above and our previously described policy goal to balance PFS payment stability and predictability with incorporating new data through routine updates to the MEI, we reiterate that we are not proposing to implement the PE/HR data or cost shares from the AMA's survey data at this time, and are proposing instead to maintain the current PE/HR data and cost shares for CY 2026 PFS ratesetting. At the same time, we remain focused on proposals that reflect evolutions in practice, including the site of service payment differential discussed below, while we continue to hold strong interest in specialty-level practice expense updates. Consequently, we intend to work with interested parties, including the AMA, to understand whether and how such data should be used in PFS ratesetting in future rulemaking.

c. Updates to Practice Expense (PE) Methodology—Site of Service Payment Differential

While we are not proposing to incorporate the PPI and CPI Survey data into PFS ratesetting for CY 2026, we are proposing a significant refinement to our PE methodology to better reflect trends in physician practice settings. As detailed in the description of the

practice expense methodology above, many services have a site of service payment differential between the facility (F) and nonfacility (NF) settings under the PFS. Services furnished in the nonfacility setting, such as a physician's office, include the physician work RVUs, direct costs for supplies, clinical staff, and equipment, and indirect costs allocated based on the direct costs and the greater of either the clinical labor costs or the physician work RVUs. In the facility setting, the payment rate includes physician work RVUs and the indirect practice expense allocated based on the physician work RV*U*. The direct costs in the facility setting are paid under a different payment system than the PFS, such as the OPPS. Indirect costs allocated to services furnished in the facility setting are meant to reflect the typical costs associated with practice expenses in that setting of care.

In the decades since implementing the PE methodology, there have been significant transformations to the landscape of the healthcare delivery system in the United States, particularly regarding physician practice patterns. Historically, private practice was the dominant model for physicians, offering them autonomy, flexibility, and the opportunity to build independent practices. Specifically, in 1988, approximately 72 percent of physicians were full or part owners in their practice.[7] This percentage had dropped to 35.4 percent by 2024, representing a 52 percent decrease, with a corresponding rise in physicians in hospital-owned practices and physicians employed directly by a hospital. The percentage of physicians in hospital-owned practices has increased by over 47 percent, from 23.4 percent in 2012 to 34.5 percent in 2024. Similarly, 12.2 percent of physicians were employed directly by a hospital (or contracted directly with a hospital) in 2024, up from 5.6 percent in 2012.[8] In their June 2025 Report to Congress,[9] MedPAC notes that there are 9 specialties where 60 percent of the clinicians who billed Medicare furnished 90 percent or more of their services in the facility setting. These trends indicate a steady decline in the percentage of physicians working in private practice, with a corresponding rise in physician employment by hospitals; and growth in the percentage of physicians who practice exclusively, or almost exclusively, in the facility setting. When the PFS was established, the methodology for allocating indirect practice expense was based in part on an assumption that the physician maintained an office-based practice even when also practicing in a facility setting. In that context, the PE methodology has allocated the same amount of indirect costs per work RVU, without regard to setting of care.

We note that, in the AMA's comment letter on the CY 2023 PFS proposed rule,[10] they stated that physician practices maintain some indirect practice expense costs for physicians who are solely facility-based such as coding, billing, and scheduling. We acknowledge that these indirect costs should be accounted for in PFS payment through PE RVUs, but we believe that allocating the same amount of indirect practice expense based on work RVUs in both settings may overstate the range of indirect costs incurred by facility-based physicians if it is now less likely that they would maintain an office-based practice separate from their facility practice. In a 2018 report developed under contract with CMS, RAND noted that ''operating from the perspective of paying for the 'typical' instance of a procedure, these analyses suggest that the current system could be improved by shifting more of the allocation of PE RVUs to the physician office setting''.[11] As MedPAC notes in their June 2025 report, ''In cases when clinicians practice exclusively or almost exclusively in a facility, or where a facility is financing indirect PE for clinicians, payment to both entities for indirect PE costs may be duplicative and unnecessary''. While the relative relationship between the PE allocated to services furnished in a facility and nonfacility setting may have been more reflective of the actual expenses incurred by physicians when the PE methodology was originally established, maintenance of that element of the methodology in the face of changing practice patterns likely represents an imbalance of the practice expense allocated to the facility relative to the nonfacility. Within the PFS relative value system, any overstatement of practice expenses in the facility setting would affect the allocation of indirect costs in the nonfacility setting. This dynamic, in which relative resources involved in furnishing PFS services may not be adequately reflected in facility and nonfacility settings, has the potential to contribute to broader undesirable financial incentives toward higher-priced settings of care, like hospitals, and away from more efficient settings, like physician offices.[12] [13] [14] This could result in unnecessary costs for payers and beneficiaries, and obstacles to physicians and other professionals operating independent practices.

We share MedPAC's concerns regarding the potential for duplicative payment under the current PE methodology for allocating indirect costs for physicians practicing in the facility setting. Allocating the same amount of indirect PE per work RVU for services furnished in the facility setting as the nonfacility setting may no longer reflect contemporary physician practice trends. As we noted above, data suggests that fewer than half of physicians currently own their practices, but the underlying assumption embedded in the PFS payment methodology presumed that physicians generally maintained office practices (and incurred associated indirect costs) even when they furnished care in facility settings. For these reasons, for each service valued in the facility setting under the PFS, we are proposing to reduce the portion of the facility PE RVUs allocated based on work RVUs to half the amount allocated to nonfacility PE RVUs beginning in CY 2026. This proposed change would occur in step 8 of the PE RVU Methodology described earlier in this section, in which indirect allocators (direct costs, clinical labor, and work RVUs) are assigned. For example, the work RVU for CPT code 33533 (*Coronary artery bypass, using arterial graft(s); single arterial graft*) is 33.75. For CY 2025, using the full work RVU as an indirect allocator, CPT code 33533 had approximately 12 indirect PE RVUs. Under this proposed change to the

methodology, where we would reduce the portion of the facility PE RVUs allocated based on work RVUs to half the amount allocated to nonfacility PE RVUs, CPT code 33533 would have approximately 7.2 indirect PE RVUs.

We note that this proposed change to the indirect cost allocation methodology is intended to better recognize the relative resources involved in furnishing services paid under the PFS in facility and nonfacility settings. We compare this proposed change to our current methodology, which functionally presumes approximately equal indirect costs incurred by physicians across sites of service. This presumption was initially made in the context of most practitioners maintaining office practices independent of the facilities in which they provided care, and as we discussed above, appears to be inconsistent with contemporary trends in physician practice. We understand from the AMA's comment letter on the CY 2023 PFS proposed rule noted above that physician practices may incur some indirect PE costs (such as coding, billing, and scheduling) for physicians who are facility-based. To better inform our consideration of how to account for any such costs in the PE RVU methodology, we are seeking comment on the specific types and magnitude of indirect PE costs incurred that are attributable to physicians who practice in part or exclusively in a facility setting, and any variables that affect whether and to what extent a practice would incur them. We are also seeking comments on whether our proposal to reduce the portion of the facility PE RVUs allocated based on work RVUs to half the amount allocated to nonfacility PE RVUs is an appropriate reduction or whether we should consider a different percentage reduction for CY 2026 or in future years. While our proposed change to the methodology represents a starting point to correcting potential historic distortions in the allocation of indirect PE costs across settings of care, we intend to further examine our methodology and consider additional refinements based upon public comments received and any studies or data sources identified. We are seeking comments on whether there are additional data sources that might help identify a more precise site of service difference in the allocation of indirect PE RVUs. We believe the implementation of this proposal would more accurately account for the resource costs involved in physicians furnishing care across all settings and correct potential distortions in the allocation of indirect PE under our current methodology. We refer readers to section VI. of this proposed rule for discussion of the impacts of this proposal on CY 2026 PFS ratesetting.

We are specifically soliciting comments on whether and how this proposed policy should apply to codes with MMM global periods (maternity services) and how it could specifically impact access to maternity services, given our understanding that many of the patient encounters across those services occur in the office setting. As we noted in the CY 2024 PFS final rule (88 FR 78949), maternity services are unique within the PFS in that they are the only global codes that provide a single payment for almost 12 months of services, which include a relatively large number of E/M visits performed along with delivery services and imaging; and were valued using a building-block methodology as opposed to the magnitude estimation method. Given that the work RVUs for maternity services encompass significant care during this lengthy period that may be furnished in the nonfacility setting, we are soliciting comment on whether we should include these services in our proposed policy to reduce the allocation of PE based on work in the facility setting.

We welcome comments on all aspects of this proposal, including ways to improve the allocation of facility and nonfacility PE RVUs in the future. We also seek comments on alternative approaches to improving the allocation of indirect PE as outlined in Chapter 1 of MedPAC's June 2025 Report to the Congress (pages 27 through 33).

d. Use of OPPS Data for PFS Ratesetting

For several kinds of PFS services, we are proposing to deviate from the use of the AMA survey data, and instead utilize data from auditable, routinely updated hospital data to either set relative or absolute rates, especially for technical services paid under the PFS. This approach promotes price transparency across settings, offers more predictable ratesetting outcomes, and limits the influence of anecdotal/survey data. We refer readers to sections II.E.24 and II.E.30 of this proposed rule for specific proposals related to radiation treatment delivery and superficial radiation therapy services and remote patient monitoring and remote therapeutic monitoring services respectively and section II.K of this proposed rule for specific proposals related to skin substitutes. Although we are proposing different methodologies for use of OPPS data based on service type, we are seeking comment on whether it would be preferable to adopt a single methodology, such as a scaler and how such a methodology would account for differences in practice expenses between services, such as services with extensive clinical staff time versus services where the valuation is primarily driven by the equipment costs.

6. Payment for Services in Urgent Care Centers

In the CY 2025 PFS proposed rule (89 FR 61746 through 61747), we sought comment on urgent care centers, noting that interested parties describe that hospital emergency departments are often used by beneficiaries to address non-emergent urgent care needs that could be appropriately served in less acute settings, but where other settings, such as physician offices, urgent care centers or other clinics, are not available or readily accessible. Patients enter EDs to treat common conditions like allergic reactions, lacerations, sprains and fractures, common respiratory illnesses (for example, flu or RSV), and bacterial infections (for example, strep throat, urinary tract infections or foodborne illness). Conditions like these often can be treated in less acute settings. We stated that we were interested in system capacity and workforce issues broadly and are interested in hearing more on those issues, including how entities such as urgent care centers can play a role in addressing some of the capacity issues in emergency departments.

In response to our CY 2025 PFS proposed rule (89 FR 61746 through 61747) question about whether the current ''Urgent Care Facility'' Place of Service code (POS 20) adequately identify and define the scope of services furnished in such settings other than the existing place of service codes,, commenters stated that the current place of service (POS) definitions are inadequately differentiated, especially if CMS wishes to encourage proliferation of the type of urgent care centers that can provide suitable alternatives to EDs, noting that POS 11 generally refers to physician offices that provide diagnostic and therapeutic care in an office setting, by appointment, typically during regular business hours; POS 17 generally refers to clinics that are attached to retail operations, such as pharmacies, grocery stores or big box stores, and provide low-acuity primary and preventive health care, such as vaccinations; and POS 20 refers to Urgent Care Facilities but does not adequately differentiate between those that offer services more akin to the typical general practitioner's office and those that offer enhanced diagnostic and therapeutic services and extended

hours. They recommended that the creation of a new POS code describing ''enhanced''' urgent care centers that offer specific diagnostic and therapeutic services and that operate outside typical business hours could fill this need. In response to our CY 2025 PFS proposed rule (89 FR 61746 through 61747) question about whether the current ''Urgent Care Facility'' Place of Service code (POS 20) adequately identify and define the scope of services furnished in such settings other than the existing code set and valuation, they stated that Medicare's fee-for-service payment systems do not recognize and adequately value services furnished in Urgent Care Clinics (UCCs) and stated that while there is some overlap in the types of professional services furnished in UCCs and physician offices, UCCs that operate for extended hours and that have enhanced diagnostic and therapeutic capabilities incur additional costs to provide these services.

In recent months, an interested party has requested that for CY 2026, we consider adopting a new Place of Service code for ''enhanced'' urgent care centers as well as create a new add-on G-code to describe the resource costs involved when practitioners furnish certain services in enhanced urgent care centers that offer extended hours and certain diagnostic and therapeutic services. The interested party suggested the following descriptor: ''*Visit complexity inherent to evaluation and management associated with medical care services that serve as the immediate focal point for all needed urgent, non-emergent health care services and/or with urgent, non-emergent medical care services that are related to diagnosis and treatment of an unscheduled, ambulatory patient's urgent, non-emergent conditions. (Add-on code, list separately in addition to office/outpatient evaluation and management visits, new or established)*'' and recommended that it be valued based on a crosswalk to HCPCS code G2211 *(Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (add-on code, list separately in addition to office/outpatient evaluation and management visit, new or established)* and made billable with all levels of office/outpatient E/M visits for both new and established patients when services are furnished in an enhanced urgent care center.

We are seeking comments from the public regarding whether separate coding and payment is needed for evaluation and management visits furnished at urgent care centers, including whether or not an add-on code would be appropriate or if a new set of visit codes would be more practical We note that the process for requesting new place of service codes or modification of existing place of service codes is described on the CMS website at *https://www.cms.gov/medicare/coding-billing/place-of-service-codes/process-requesting-new-codes-modification-existing-codes.* Additionally, as discussed in Section II.B of this proposed rule, many PFS services have a site of service payment differential between the facility and nonfacility settings under the PFS. Services furnished in the nonfacility setting, such as a physician's office, include direct costs for supplies, clinical staff, and equipment, the physician work RVU and indirect practice expense allocated based on the direct costs and the physician work RVU. In the facility setting, the payment rate includes physician work and the indirect practice expense allocated based on physician work. The direct costs in the facility setting are paid under a different payment system other than the PFS, such as the OPPS. PE allocated to services furnished in the facility setting is meant to reflect typical costs associated with practice expenses in that setting of care. We note that we are proposing a change in our PE RVU methodology to better recognize variations in indirect costs between facility and nonfacility settings of care in section II.B of this rule. We note here that we are likewise interested in understanding how practice costs, including but not limited to indirect costs, may vary among different nonfacility settings of care. We are also interested in receiving feedback regarding how either the code set, or the PE methodology might be improved to better recognize the relative resources involved in furnishing services across these kinds of settings.

C. Potentially Misvalued Services Under the PFS

1. Background

Section 1848(c)(2)(B) of the Act directs the Secretary to conduct a periodic review, not less often than every 5 years, of the relative value units (RVUs) established under the PFS. Section 1848(c)(2)(K) of the Act requires the Secretary to periodically identify potentially misvalued services using certain criteria and to review and make appropriate adjustments to the relative values for those services. Section 1848(c)(2)(L) of the Act also requires the Secretary to develop a process to validate the RVUs of certain potentially misvalued codes (PMVC) under the PFS, using the same criteria used to identify PMVC, and to make appropriate adjustments.

As outlined in section II.E. of this proposed rule, under Valuation of Specific Codes, each year we develop appropriate adjustments to the RVUs taking into account recommendations provided by the American Medical Association (AMA)/Specialty Society Relative Value Scale (RVS) Update Committee (referred to as the RUC), MedPAC, and other interested parties. For many years, the RUC has provided us with recommendations on the appropriate relative values for new, revised, and potentially misvalued PFS services. We review these recommendations on a code-by-code basis and consider these recommendations in conjunction with analyses of other data, such as claims data, to inform the decision-making process as authorized by statute. We may also consider analyses of work time, work RVUs, or direct practice expense (PE) inputs using other data sources, such as the Veterans Health Administration (VHA), National Surgical Quality Improvement Program (NSQIP), the Society for Thoracic Surgeons (STS), and the Merit-based Incentive Payment System (MIPS) data. In addition to considering the most recently available data, we assess the results of physician surveys and specialty recommendations submitted to us by the RUC for our review. We also consider information provided by other interested parties such as from the general medical-related community and the public. We conduct a review to assess the appropriate RVUs in the context of contemporary medical practice. We note that section 1848(c)(2)(A)(ii) of the Act authorizes the use of extrapolation and other techniques to determine the RVUs for physicians' services for which specific data are not available and requires us to take into account the results of consultations with organizations representing physicians who provide the services. In accordance with section 1848(c) of the Act, we determine and make appropriate adjustments to the RVUs.

In its March 2006 Report to the Congress (*https://www.medpac.gov/document/report-to-the-congress-2006-medicare-payment-policy/*), MedPAC discussed the importance of appropriately valuing physicians'

services, stating that misvalued services can distort the market for physicians' services, as well as for other health care services that physicians order, such as hospital services. In that same report, MedPAC postulated that physicians' services under the PFS can become misvalued over time. MedPAC stated, ''When a new service is added to the physician fee schedule, it may be assigned a relatively high value because of the time, technical skill, and psychological stress that are often required to furnish that service. Over time, the work required for certain services would be expected to decline as physicians become more familiar with the service and more efficient in furnishing it.'' We believe services can also become overvalued when PE costs decline. This can happen when the costs of equipment and supplies fall, or when equipment is used more frequently than is estimated in the PE methodology, reducing its cost per use. Likewise, services can become undervalued when physician work increases, or PE costs rise.

As MedPAC noted in its March 2009 Report to Congress (*https://www.medpac.gov/docs/default-source/reports/march-2009-report-to-congress-medicare-payment-policy.pdf*), in the intervening years since MedPAC made the initial recommendations, CMS and the RUC have taken several steps to improve the review process. Also, section 1848(c)(2)(K)(ii) of the Act augments our efforts by directing the Secretary to specifically examine, as determined appropriate, potentially misvalued services in the following categories:

- Codes that have experienced the fastest growth.
- Codes that have experienced substantial changes in PE.
- Codes that describe new technologies or services within an appropriate time-period (such as 3 years) after the relative values are initially established for such codes.
- Codes which are multiple codes that are frequently billed in conjunction with furnishing a single service.
- Codes with low relative values, particularly those that are often billed multiple times for a single treatment.
- Codes that have not been subject to review since implementation of the fee schedule.
- Codes that account for the majority of spending under the PFS.
- Codes for services that have experienced a substantial change in the hospital length of stay or procedure time.
- Codes for which there may be a change in the typical site of service since the code was last valued.
- Codes for which there is a significant difference in payment for the same service between different sites of service.
- Codes for which there may be anomalies in relative values within a family of codes.
- Codes for services where there may be efficiencies when a service is furnished at the same time as other services.
- Codes with high intraservice work per unit of time.
- Codes with high PE RVUs.
- Codes with high cost supplies.
- Codes as determined appropriate by the Secretary.

Section 1848(c)(2)(K)(iii) of the Act also specifies that the Secretary may use existing processes to receive recommendations on the review and appropriate adjustment of potentially misvalued services. In addition, the Secretary may conduct surveys, other data collection activities, studies, or other analyses, as the Secretary determines to be appropriate, to facilitate the review and appropriate adjustment of potentially misvalued services. This section also authorizes the use of analytic contractors to identify and analyze potentially misvalued codes, conduct surveys or collect data, and make recommendations on the review and appropriate adjustment of potentially misvalued services. Additionally, this section provides that the Secretary may coordinate the review and adjustment of any RVU with the periodic review described in section 1848(c)(2)(B) of the Act. Section 1848(c)(2)(K)(iii)(V) of the Act specifies that the Secretary may make appropriate coding revisions (including using current processes for consideration of coding changes), which may involve consolidating individual services into bundled codes for payment under the PFS.

2. Progress in Identifying and Reviewing Potentially Misvalued Codes

To fulfill our statutory mandate, we have identified and reviewed numerous PMVC as specified in section 1848(c)(2)(K)(ii) of the Act, and we intend to continue our work examining PMVC in these areas over the upcoming years. As part of our current process, we identify PMVC for review, and request recommendations from the RUC and other public commenters on revised work RVUs and direct PE inputs for those codes. The RUC, through its own processes, also identifies PMVC for review. Through our public nomination process for PMVC established in the CY 2012 PFS final rule with comment period (76 FR 73026, 73058 through 73059), other individuals and groups submit nominations for review of PMVC as well. Individuals and groups may submit codes for review under the PMVC initiative to CMS in one of two ways. Nominations may be submitted to CMS via email or through postal mail. Email submissions should be sent to the CMS e-mailbox at *MedicarePhysicianFeeSchedule@cms.hhs.gov,* with the phrase ''Potentially Misvalued Codes'' and the referencing CPT code number(s) and/or the CPT descriptor(s) in the subject line. Physical letters for nominations should be sent via the U.S. Postal Service to the Centers for Medicare & Medicaid Services, Mail Stop: C4–01–26, 7500 Security Blvd, Baltimore, Maryland 21244. Envelopes containing the nomination letters must be labeled ''Attention: Division of Practitioner Services, Potentially Misvalued Codes.'' Nominations for consideration in our next annual rule cycle should be received by our February 10th deadline. Since CY 2009, as a part of the annual PMVC review and Five-Year Review process, we have reviewed over 1,700 PMVC to refine work RVUs and direct PE inputs. We have assigned appropriate work RVUs and direct PE inputs for these services as a result of these reviews. A more detailed discussion of the extensive prior reviews of PMVC is included in the CY 2012 PFS final rule with comment period (76 FR 73052 through 73055). In the same CY 2012 PFS final rule with comment period, we finalized our policy to consolidate the review of physician work and PE at the same time and established a process for the annual public nomination of potentially misvalued services.

In the CY 2013 PFS final rule with comment period (77 FR 68892, 68896 through 68897), we built upon the work we began in CY 2009 to review PMVC that have not been reviewed since the implementation of the PFS (so-called ''Harvard-valued codes'' [15]). In the CY 2009 PFS proposed rule (73 FR 38589), we requested recommendations from the RUC to aid in our review of Harvard-valued codes that had not yet been reviewed, focusing first on high-volume,

[15] The research team and panels of experts at the Harvard School of Public Health developed the original work RVUs for most CPT codes, in a cooperative agreement with the Department of Health and Human Services (HHS). Experts from both inside and outside the Federal Government obtained input from numerous physician specialty groups. This input was incorporated into the initial PFS, which was implemented on January 1, 1992.

low intensity codes. In the fourth Five-Year Review of Work RVUs published in a separate notice (76 FR 32410, 32419), we requested recommendations from the RUC to aid in our review of Harvard-valued codes with annual utilization of greater than 30,000 services. In the CY 2013 PFS final rule with comment period, we identified specific Harvard-valued services with annual allowed charges that total at least $10,000,000 as potentially misvalued. In addition to the Harvard-valued codes, in the CY 2013 PFS final rule with comment period we finalized for review a list of PMVC that have stand-alone PE (codes with physician work and no listed work time and codes with no physician work that have listed work time). We continue each year to consider and finalize a list of PMVC that have or will be reviewed and revised as appropriate in future rulemaking.

3. CY 2026 Identification and Review of Potentially Misvalued Services

In the CY 2012 PFS final rule with comment period (76 FR 73058 through 73059), we finalized a process for the public to nominate PMVC. In the CY 2015 PFS final rule with comment period (79 FR 67548, 67606 through 67608), we modified this process whereby the public and interested parties may nominate PMVC for review by submitting the code with supporting documentation by February 10th of each year. Supporting documentation for codes nominated for the annual review of PMVC may include the following:

- Documentation in peer reviewed medical literature or other reliable data that demonstrate changes in physician work due to one or more of the following: technique, knowledge and technology, patient population, site-of-service, length of hospital stay, and work time.
- An anomalous relationship between the code being proposed for review and other codes.
- Evidence that technology has changed physician work.
- Analysis of other data on time and effort measures, such as operating room logs or national and other representative databases.
- Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey, or flawed crosswalk assumptions in a previous evaluation.
- Prices for certain high cost supplies or other direct PE inputs that are used to determine PE RVUs are inaccurate and do not reflect current information.
- Analyses of work time, work RVU, or direct PE inputs using other data sources (for example, VA, NSQIP, the STS National Database, and the MIPS data).
- National surveys of work time and intensity from professional and management societies and organizations, such as hospital associations.

We evaluate the supporting documentation submitted with the nominated codes and assess whether the nominated codes appear to be PMVC appropriate for review under the annual process. In the following year's PFS proposed rule, we publish the list of nominated codes and indicate for each nominated code whether we agree with its inclusion as a PMVC. The public has the opportunity to comment on these and all other proposed PMVC. In each year's final rule, we finalize our list of PMVC.

a. Public Nominations

In each proposed rule, we seek nominations from the public and from interested parties of codes that they believe we should consider as potentially misvalued. We receive public nominations for PMVC by February 10th and we display these nominations on our public website (*https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices?DLSort=2&DLEntries=10&DLPage=1&DLSortDir=descending*), where we include the submitter's name, their associated organization and the submitted studies for full transparency. We sometimes receive submissions for specific, PE-related inputs for codes, and discuss these PE-related submissions, as necessary under the Determination of PE RVUs section of the rule. We summarize below this year's submissions under the PMVC initiative. For CY 2026, we received 11 requests concerning various codes as PMVC. The nominations are as follows:

(1) Maxillofacial Prosthetic Services (CPT codes 21076, 21077, 21079, 21080, 21081, 21082, 21083, 21084, 21085, 21086, 21087)

An interested party nominated CPT codes 21076 (*Impression and custom preparation; surgical obturator prosthesis*), 21077 (*Impression and custom preparation; orbital prosthesis*), 21079 (*Impression and custom preparation; interim obturator prosthesis*), 21080 (*Impression and custom preparation; definitive obturator prosthesis*), 21081 (*Impression and custom preparation; mandibular resection prosthesis*), 21082 (*Impression and custom preparation; palatal augmentation prosthesis*), 21083 (*Impression and custom preparation; palatal lift prosthesis*), 21084 (*Impression and custom preparation; speech aid prosthesis*), 21085 (*Impression and custom preparation; oral surgical splint*), 21086 (*Impression and custom preparation; auricular prosthesis*), and 21087 (Impression and custom preparation; nasal prosthesis) as potentially misvalued based on what they believe to be missing, outdated, and undervalued practice expense inputs. The nominator stated that these misvalued PE inputs (equipment, supplies, and clinical staff time) result in inadequate payment rates to clinicians who furnish these services, which limits patient access to necessary care. The nominator indicated that the physician work values remain accurate for all of the nominated codes.

According to the nominator, maxillofacial prosthodontists provide specialized rehabilitation care for patients with compromised oral and facial anatomy due to conditions such as cancer, trauma, or congenital defects, addressing both physical and psychological challenges experienced by such patients. Custom prosthetic obturators are medical devices that restore vital oral functions in cancer patients with palatal defects. These implant-retained devices are prescribed based on the location of the defect: maxillary obturators for hard palate issues, pharyngeal obturators for soft palate problems, or a combination for both. The primary purpose of the intraoral prostheses is to enable patients to speak, eat, and swallow more naturally. The nominator stated that these implants can improve patients' quality of life and may eliminate the need for feeding tubes.

The nominator is concerned that CMS payment rates for maxillofacial prosthetic services, which were last reviewed in 1995, are outdated. In particular, the nominator stated that CPT codes 21080 and 21081 have undergone significant changes since the development of their PE values in the mid-1990s. At that time, mandibular reconstruction was rare, and removable prostheses were used to align the jaw. Microvascular reconstruction and virtual surgical planning have since transformed the procedures described by CPT codes 21080 and 21081, allowing precise prosthetic rehabilitation during surgery and improving oral function, speech, and quality of life. The nominator asserted that the PE inputs for CPT codes 21080 and 21081 did not account for these advancements, which did not exist in 1995 when the codes were valued. Furthermore, they stated that when these maxillofacial prosthetic services

were valued in 1995, CMS used inaccurate inputs, which they believe did not account for the appropriate clinical staff time and materials required for prostheses. They stated that changes in clinical staff time, supplies, and equipment require the direct PE inputs to be updated.

The nominator stated that significant technological advancements have also occurred for extraoral prostheses, such as orbital (CPT code 21077), auricular (CPT code 21086), and nasal prostheses (CPT code 21087). For orbital prostheses, hand sculpting and painting remain time-intensive tasks, with limited use of 3D technology. In auricular prostheses, 3D technology has significantly improved the waxing process. For nasal prostheses, preoperative scanning now helps to shape the prosthesis, leading to better cosmetic outcomes. All extraoral prostheses (for example, orbital, auricular, and nasal) now commonly use 3D technology, craniofacial implants, and color-matching devices, which were not standard in the 1990s. The nominator asserted that the practice expense inputs for these codes fail to account for these advancements.

Additionally, the nominator asserts that there are other instances where the nominated codes fail to reflect the significant technological advancements in treatment delivery since 1995. The nominator requested an update to the PE inputs for all of the nominated codes, stating that the dental x-ray (ER071), valued at $128,020.91, has been replaced by various pieces of capital equipment. For example, they listed a ''CMS Planmeca CBCT Imaging'' system, which costs $163,767.66, and stated that this takes the place of the x-ray unit, highlighting a notable price difference between the x-ray machine and the CT. Furthermore, they provided a lengthy list of additional equipment (*e.g.,* 3D printer) that is not accounted for in the PE inputs for all of the nominated codes, underscoring the extensive modernization in service delivery since 1995.

To support their nomination, the nominator included information on what they believe to be more accurate PE inputs, including invoices for supplies and equipment. For items where invoices paid were unavailable, price quotes from a supplier were included. In addition, their appendices included recommendations for deleting and adding supplies, equipment, and clinical staff time. For more information, we refer readers to the submitted nomination, which is posted in the public use files for this proposed rule available on our public website under PFS Federal Regulation Notices at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.*

Although the nomination stated that the work RVUs are accurate as currently valued, because these codes have not been reviewed in the last 30 years, we believe it is appropriate to examine both PE and work inputs. Given the technological advancements the nominator described, there may also be resulting changes in the physician work involved in performing these services, and therefore, a comprehensive review of both practice expense and work values would be appropriate. While we are not proposing to nominate these codes as potentially misvalued, we welcome public comments and recommendations, including those from the RUC, to better understand these codes, particularly regarding typical direct PE inputs and work values.

(2) Supervision of Preparation and Provision of Antigens for Allergen Immunotherapy (CPT codes 95145, 95146, 95147, 95148, 95149).

An interested party nominated the professional supervision of preparation and provision of stinging insect venom for allergen immunotherapy described by CPT codes 95145 (*Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy (specify number of doses); single stinging insect venom*), 95146 (*Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy (specify number of doses); 2 single stinging insect venoms*), 95147 (*Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy (specify number of doses); 3 single stinging insect venoms*), 95148 (*Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy (specify number of doses); 4 single stinging insect venoms*), and 95149 (*Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy (specify number of doses); 5 single stinging insect venoms*) as potentially misvalued, stating that the current payment rates for these CPT codes do not accurately reflect the practice expenses required for these procedures. The nominator indicated that the cost to manufacture venom therapy has drastically increased since the last time these codes were reviewed by the RUC in 2001, citing higher labor and raw material costs.

Venom immunotherapy, used for treating insect stings, involves extracting venom from various stinging insects like honeybees and wasps. According to the nominator, the manufacturing process is labor-intensive, requiring 520 staff hours to manually extract venom from 130,000 insects per batch, along with substantial equipment investment. The final product is packaged in single, five, or twelve-dose vials for medical use. For more information, we refer readers to the submitted nomination, which is posted in the public use files for this proposed rule available on our public website under PFS Federal Regulation Notices at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.*

The nominator stated that before 1995, venom products were paid under product-specific HCPCS J-codes, but due to infrequent use and limited budget impact on the Medicare trust funds, CMS retired the J-codes and instead bundled venom products within CPT codes 95145, 95146, 95147, 95148, and 95149. According to the nominator, current payment rates for these codes are based on the Harvard valuation and have not been surveyed by the RUC since February 2001. The nominator stated that when surveyed in 2001, the PE inputs for these codes only accounted for swab-pad, antigen, syringe, and gloves. In contrast, the nominator indicated that CPT code 95165 (*Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy; single or multiple antigens (specify number of doses),* which was more recently reviewed in 2016 and shares similar PE inputs as the nominated codes, includes additional items such as a surgical cap, gown, mask, alcohol, paper towel, and vial transport envelope. The nominator stated that, according to the 2019 standards for allergen extract compounding under USP Chapter 797,[16] the procedures described by CPT codes 95145, 95146, 95147, 95148, and 95149 require additional supplies and practice expenses, such as sterile powder-free gloves, face mask, hair net/beard net, gown/sterile garb, isopropyl alcohol, paper towel, sterile empty vials, and albumin saline, in addition to the allergenic extract. The nominator stated that these standards also mandate significantly more annual training for providers, including competency observation, media fill test, gloved fingertip test, and corrective actions. Furthermore, the nominator asserted

[16] *https://college.acaai.org/wp-content/uploads/2021/01/Section-21-USP-Compounding-Allergenic-Extracts.pdf.*

that the overall cost of venom therapy has increased substantially and submitted invoices to support this statement.

At this time, we are not proposing the CPT codes submitted by the nominator as potentially misvalued. CPT codes 95145–95149 are typically billed in conjunction with CPT codes 95115 and 95117. We note that the nominator has listed PE inputs that are also included in the inputs for CPT codes 95115 and 95117 and these same inputs may overlap with inputs included in CPT codes 95145–95149. While the PE inputs that overlap between CPT codes 95145–95149 and 95115 and 95117 may contain the necessary elements, we are seeking feedback regarding these overlapping PE inputs in relation to billing frequencies and the possibility of duplicative payment. Specifically, we request comments on whether these inputs overlap and what potential adjustments should be made to avoid duplicative payment. We request comments regarding the standard minutes for clinical activity code CA008 (Perform regulatory mandated quality assurance activity (pre-service)) and the standard unit measurement for supply code SH004 (albumin saline). Additionally, we seek input regarding the establishment of clinical activity codes for two specific procedures requested by the nominator: cleaning and disinfecting the compounding area, and sterile preparation of compounds.

Furthermore, anomalies were identified related to the clinical activities described by CA021 (Perform procedure/service—NOT directly related to physician work time). Specifically, the typical times associated with these activities in the RUC database are as follows: 2.3 minutes for CPT code 95145, 3.3 minutes for CPT code 95146, 2.3 minutes for CPT code 95147, 3.3 minutes for CPT code 95148, and 4.3 minutes for CPT code 95149. The nominator has requested 10 minutes for all of the nominated CPT codes without providing any justification for this time. Regarding the clinical labor direct inputs (L037D), we seek comments on several aspects of dosage preparation, including but not limited to: the typical number of dosages, the time required for preparation, the number of vials or dosages that can be prepared from each vial, and the total time needed for preparation of these vials and dosages. Additionally, we seek information about the derivation of the 2.3-minute time. This information would help inform the appropriate time for both clinical labor activities.

We received several invoices for mixed and single venom prices from the nominator; however, we are unable to determine the number of individual venoms in the mixed venom preparations. Specifically, supply codes SH009 (antigen, venom) and SH010 (antigen, venom, tri-vespid) are currently priced at $35.58 and $69.21 respectively, with prices last updated in the CY 2024 PFS final rule (88 FR 78967). The nominator stated that the venom cost has increased to $481.50 for a 5-dose wasp venom as of April 1, 2024, and submitted invoices to support this claim to update the current price. Since we are unsure whether these invoices are for mixed or single venom prices, we welcome additional invoices and comments regarding the methodology for calculating venom prices using mixture invoices. We welcome feedback to gain a broader understanding of these codes, including how standards of practice have evolved over time, as this information can help identify related coding issues.

(3) Electronic analysis of implanted neurostimulator pulse generator/transmitter (CPT codes 95970, 95976, 95977).

CPT codes 95970 (*Electronic analysis of implanted neurostimulator pulse generator/transmitter (eg, contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with brain, cranial nerve, spinal cord, peripheral nerve, or sacral nerve, neurostimulator pulse generator/transmitter, without programming*), 95976 (*Electronic analysis of implanted neurostimulator pulse generator/transmitter (eg, contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with simple cranial nerve neurostimulator pulse generator/transmitter programming by physician or other qualified health care professional*), and 95977 (*Electronic analysis of implanted neurostimulator pulse generator/transmitter (eg, contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with complex cranial nerve neurostimulator pulse generator/transmitter programming by physician or other qualified health care professional)* were nominated as potentially misvalued for two reasons identified by the nominator: there has been a significant shift in the clinical specialties utilizing these codes, and the PE inputs currently assigned to these codes may not accurately reflect the costs associated with analyzing and programming the hypoglossal nerve stimulation (HGNS) system.

The nominator stated that, from 2017 to 2023, there has been a significant change in the clinical specialties that utilize these codes in the non-facility setting. According to the nominator, while CPT codes 95970, 95976, and 95977 were primarily billed by neurologists when last surveyed by the RUC in 2017, the usage of these codes has shifted away from neurologists toward sleep specialists. The nominator asserted that this shift necessitates changes to the work RVUs and PE inputs for these codes. In addition, the nominator stated that many sleep specialists believe CPT codes 95970, 95976, and 95977 do not appropriately reflect the practice expenses involved in furnishing these services. According to the nominator, a survey conducted among several high-volume sleep specialists (the details of which the nominator did not share with CMS) showed unanimous agreement that these codes do not accurately reflect the practice expense inputs. These three codes currently have 0 minutes of clinical staff time included in the direct PE inputs. However, the nominator stated that based on the survey results the typical clinical staff time spent for patient care was 35 minutes for CPT code 95970, 37 minutes for CPT code 95976, and 46 minutes for CPT code 95977. The nominator stated that CPT codes 95970, 95976, and 95977 should reflect the same clinical staff time as similar analysis and programming procedures, such as CPT codes 93150 (*Therapy activation of implanted phrenic nerve stimulator system, including all interrogation and programming*), 93151 (*Interrogation and programming (minimum one parameter) of implanted phrenic nerve stimulator system*), and 93153 (*Interrogation without programming of implanted phrenic nerve stimulator system*). The nominator stated that these codes more accurately account for the clinical staff time.

We appreciate the nominator sharing their survey results from high-volume

sleep specialists, which may indicate potential inaccuracies in the direct PE inputs for CPT codes 95970, 95976, and 95977. Our review of the submitted information, however, reveals a lack of survey details (for example, sampling methods, data collection procedures), so it is difficult to understand the context of the information provided by the nominator and identify potential biases of this survey. While we acknowledge potential changes in the specialties utilizing these codes, and sleep medicine's Medicare specialty percentage has grown over time, neurology remains the dominant billing practitioner type. For these reasons, we are not proposing to consider these codes as potentially misvalued. We are, however, seeking comments and additional information on the information provided by the nominator. This includes any analysis or studies demonstrating that one or more of these codes meet the criteria listed in section II.C.3 of this proposed rule, under ''Identification and Review of Potential Misvalued Services,'' particularly regarding changes in practice expense inputs for service delivery.

(4) Excimer laser treatment for psoriasis (CPT codes 96920, 96921, 96922).

An interested party nominated CPT codes 96920 (*Excimer laser treatment for psoriasis; total area less than 250 sq cm*), 96921 (*Excimer laser treatment for psoriasis; 250 sq cm to 500 sq cm*), and 96922 (*Excimer laser treatment for psoriasis; over 500 sq cm*) as potentially misvalued, due to the CPT Editorial Panel's recent modifications to the code descriptor and allegedly inaccurate data used by CMS in valuing these services.

According to the nominator, the misvaluation of these codes creates a significant healthcare access barrier by reducing payment for excimer laser therapy, which disproportionately impacts vulnerable populations while potentially increasing overall healthcare costs. The nominator stated that the low payment rates for these codes make it financially unfeasible for dermatologists to offer this FDA-approved treatment, effectively making it unavailable to Medicare beneficiaries despite its proven effectiveness and potential cost savings.

We discussed our review of these codes and our rationale for finalizing the current work RVUs and direct PE extensively in the CY 2025 PFS final rule (89 FR 97797 through 97801). We stated that we disagreed with the RUC recommended work RVUs for CPT codes 96920, 96921, and 96922 of 1.00, 1.07, and 1.32. The RUC noted that there have been multiple reviews of these CPT codes, and the valuation of the codes is currently based on the original valuation over two decades ago in 2002 where the physician time values were lower than the current times. A subsequent review in 2012 adopted new survey times while maintaining the work RVUs from 2002 for CPT codes 96920 and 96922. The RUC noted that for both CPT code 96921 and 96922, with the largest treatment area, the total times had not changed since first implemented more than 20 years ago. At the time we also believed that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure had increased, significant decreases in time should be reflected in decreases to work RVUs. We noted that our proposed work RVU of 0.83 maintained the intensity associated with the 2002 review of CPT code 96920, which we believed to be more appropriate than the significant increase in intensity that results from the RUC-recommended work RVU of 1.00 which nearly doubled the current intensity of the code (89 FR 97797). We had no evidence to indicate that the intensity of CPT code 96920 had increased to this degree given how the surveyed work time had substantially decreased.

For CY 2026, the nominator raised two issues related to these codes. First, according to the nominator, a coding change by the CPT Editorial Panel that was released in 2024 and effective January 1, 2025, modified the code descriptor from ''Laser treatment for inflammatory skin disease(psoriasis)'' to ''Excimer laser treatment for psoriasis.'' We remind readers that, in April 2022, the RUC referred CPT codes 96920, 96921, and 96922 to the CPT Editorial Panel to capture expanded indications beyond what was currently noted in the codes' descriptions to include laser treatment for other inflammatory skin disorders such as vitiligo, atopic dermatitis, and alopecia areata, and those expanded indications could reflect changes in physician work as compared to the codes' current descriptors. The coding change application was subsequently withdrawn from the September 2022 CPT Editorial Panel meeting when it was determined that existing literature was insufficient and did not support expanded indications at that time. Therefore, these CPT codes were re-surveyed and reviewed at the April 2023 RUC meeting without any revisions to their code descriptors. We note that, according to the CPT Editorial Panel and the RUC's publicly available meeting notes, since the descriptors for CPT codes 96920, 96921, and 96922 were established in 2002, psoriasis is the only approved indication and use for this treatment modality.[17]

While the nominator is working with the CPT Editorial Panel again to expand the indications for excimer laser treatment beyond psoriasis to include other inflammatory skin conditions, they stated that they believe establishing a temporary G-code for interim coverage is necessary and therefore requested that CMS create coding to more accurately reflect the clinically appropriate use of the excimer laser. The nominator states that this would ensure patients with skin conditions other than psoriasis can access excimer laser treatments without delay.

To provide more evidence as to the accuracy of including non-psoriasis inflammatory skin diseases in the code definition, the nominator provided a data compendium supporting the excimer laser's versatility and key studies demonstrating positive outcomes for conditions like vitiligo, atopic dermatitis, leukoderma, and alopecia areata. Reviewing these submitted studies, the nominator stated that sufficient clinical evidence exists to support expanding coverage for excimer laser treatment beyond just psoriasis. The nominator requested that CMS create additional coding to describe the expanded indications for the excimer laser treatment, because the nominator believes that the standard CPT process is time-consuming and could leave many patients without adequate care in the interim; thus, implementing a temporary G-code would ensure continued access to this essential therapy for these patients.

Second, the nominator provided additional invoices and data detailing PE costs related to the excimer laser devices. The nominator claimed that their own analysis relies on real-world data (which was not shared with CMS) and shows that CMS has overestimated the utilization rate of excimer lasers. Using their own survey, they found that on average, dermatologists perform 244 excimer laser treatments per device annually, with each treatment requiring approximately 38 to 46 minutes of excimer laser use. This amounts to nearly 15,000 minutes of total utilization per year, resulting in an effective utilization rate of 10 percent, rather than the 50 percent rate currently used by CMS. As stated in section II.B. of this proposed rule, we currently use an equipment utilization rate

[17] *https://www.ama-assn.org/system/files/ap-2023-ruc-meeting-minutes.pdf.*

assumption of 50 percent for most equipment, with the exception of expensive diagnostic imaging equipment, for which we use a 90 percent assumption as required by section 1848(b)(4)(C) of the Act.

Based on their real-world device utilization data, the nominator calculated the direct PE cost using CMS' standard equipment formula. The calculated equipment costs are $99.88 for CPT code 96920, $105.14 for CPT code 96921, and $120.91 for CPT code 96922. The nominator also stated that CMS currently assumes a maintenance cost of $7,560 for excimer lasers, based on a 5% maintenance rate applied to a purchase price of $151,200. However, the nominator stated that excimer lasers are technical devices with substantially higher maintenance costs. According to the nominator, the annual service cost for the excimer laser is $30,000, and they claimed that a laser chamber replacement service costs $44,000; however, as discussed in section II.B. of this proposed rule, we finalized a 5 percent factor for annual maintenance in the CY 1998 PFS final rule with comment period (62 FR 33164). As we previously stated in the CY 2016 PFS final rule with comment period (80 FR 70897), we do not believe the annual maintenance factor for all equipment is precisely 5 percent, and we stated that this estimate likely understates the true cost of maintaining some equipment. We also noted that we believe it likely overstates the maintenance costs for other equipment. When we solicited comments regarding data sources containing equipment maintenance rates, commenters could not identify an auditable, robust data source that CMS could use on a wide scale. As a result, in the absence of publicly available datasets regarding equipment maintenance costs or another systematic data collection methodology for determining a different maintenance factor, we did not propose a variable maintenance factor for equipment cost per minute pricing as we did not believe that we have sufficient information at present. Therefore, we remind readers that we do not believe voluntary submissions regarding the maintenance costs of individual equipment items would be an appropriate methodology for determining costs.

Moreover, the nominator asserted that CMS currently does not include the costs of consumable gas (code EQ154) and the optical delivery system (code EQ155) in the direct practice expense cost for these services. Based on our review of the January 2012 RUC recommendations submitted to CMS, it appears that these equipment items were removed by RUC PE Subcommittee for CY 2013. The requestor stated that the gas cylinder (EQ154) costs $6,300 (excluding labor and shipping costs), and the optical delivery system (EQ155) costs $7,429; however, no supporting invoices or evidence of the typicality of the equipment items' usage for these services were provided to support the equipment items' reintegration into the codes' direct practice expense.

Based on this information, the nominator recommended creating a G-code for excimer laser treatment of inflammatory skin diseases. Furthermore, they requested to include their own real-world data on excimer laser utilization rates in the practice expense calculation, adjust the maintenance cost in the practice expense calculation to reflect the actual cost of maintaining excimer laser devices, and reinstate the costs of consumable gas (code EQ154) and the optical delivery system (code EQ155) in the practice expense calculation.

We appreciate the detailed information submitted by the nominator. However, we continue to disagree that CPT codes 96920, 96921, and 96922 are potentially misvalued. We note that the CPT code change request was withdrawn from the AMA in September 2022 due to insufficient supporting literature for expanded indications. Additionally, according to RUC's publicly available meeting notes, psoriasis is the only approved indication and use for this treatment modality since the descriptors for CPT codes 96920, 96921, and 96922 were established in 2002. When the codes were resurveyed in April 2023, no descriptor revisions were made, as the available 2021 Medicare claims data indicated that the typical patient was being treated for psoriasis (96920, psoriasis = 79.3 percent).[18] Additionally, there have been numerous CPT Editorial Panel applications and actions since the withdrawn application at the September 2022 meeting,[19] including a February 2025 action.[20] However, at the time of drafting this proposed rule, the request for expanded indications does not appear to have been re-submitted or revisited by the specialty societies. We are seeking comments on whether creating a new HCPCS G-code that is not condition-specific would improve payment accuracy for this technology when used to treat conditions other than psoriasis. We are also seeking information regarding possible barriers to coding changes undertaken through the CPT Editorial Panel process. We are seeking information regarding the nominator's assertion that equipment items EQ154 and EQ155 are necessary and typical for these services, and invoices to support the nominator's asserted purchase prices, so as to provide a comprehensive understanding of the overall costs associated with these services. We note that, effective for January 1, 2027, based on the publicly available Summary of CPT Editorial Panel Actions from the February 2025 meeting,[21] the codes' descriptors will change from ''Excimer laser treatment for psoriasis'' to ''Laser treatment for psoriasis,'' absent subsequent CPT Editorial Panel actions. Therefore, we believe it is important for comments to support the typicality of these equipment items regardless of the type of laser used for these services.

(5) Optical coherence tomography (OCT) of retina (CPT code 0605T).

CPT code 0605T (*Optical coherence tomography (OCT) of retina, remote, patient-initiated image capture and transmission to a remote surveillance center, unilateral or bilateral; remote surveillance center technical support, data analyses and reports, with a minimum of 8 daily recordings, each 30 days*) was submitted as potentially misvalued. This code is a temporary CPT category III code and is assigned procedure status ''C'' (contractor priced) under the PFS. The nominator generally expressed concern that the initial pricing by the contractor was inaccurate and did not appropriately consider the cost of the OCT device when provided by the independent diagnostic testing facility (IDTF). The nominator requested that CMS revise the valuation of this code to properly account for the cost of the OCT imaging device used to provide this remote diagnostic retinal monitoring service.

The nominator stated that remote OCT allows for better management of patients with neovascular age-related macular degeneration (NV–AMD) and improved management has been shown to result in reduction in treatments.[22] [23] According to the nominator, one of the Medicare Administrative Contractors who priced the service did not

[18] *https://www.ama-assn.org/system/files/ap-2023-ruc-meeting-minutes.pdf.*

[20] *https://www.ama-assn.org/system/files/feb-2025-summary-of-panel-actions.pdf.*

[21] *https://www.ama-assn.org/system/files/feb-2025-summary-of-panel-actions.pdf.*

[22] Holekamp, Nancy M., et al. ''Prospective trial of Home OCT guided management of treatment experienced nAMD patients.'' *RETINA* (2022): 10–1097.

[23] Heier, Jeffrey S., et al. ''Clinical Use of Home OCT Data to Manage Neovascular Age-Related Macular Degeneration.'' *Journal of VitreoRetinal Diseases* (2024): 24741264241302858.

appropriately consider the cost of the OCT device provided by the IDTF, resulting in an inadequate payment rate that did not cover the direct operating costs. The nominator asserted that this code is misvalued because the contractor established its value by crosswalking to the valuation for remote physiological monitoring (RPM) CPT code 99454 (*Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days*). The nominator stated that CPT code 99454 represents a distinct type of service and falls under a different benefit category than remote OCT. The nominator asserted that while remote OCT is a diagnostic service that is provided by an IDTF, CPT code 99454 is an E/M service that is not permitted to be furnished by IDTFs. In addition, the device used to furnish remote OCT performs retinal imaging comparable to that performed in the physician office, has a useful life of 5 years, and costs $40,000. The nominator provided an invoice to support this claim. In contrast, the nominator indicated that the device used in the service described by CPT code 99454 captures simple physiologic data and costs $1,000. The nominator provided a device equipment cost per month of $666.67 for the device used to furnish remote OCT. Using the device cost calculation, the nominator estimated an unadjusted rate of $632.22 by following CMS' valuation methodology.

Overall, the nominator stated that CPT code 99454 is not an accurate crosswalk for remote OCT and recommended that CMS revise the valuation of CPT code 0605T to properly account for the higher cost of the OCT imaging device used to provide this remote diagnostic retinal monitoring service. The nominator stated that due to the current undervaluation, the prescribing physicians and their patients in need of remote monitoring of a treatable sight-threatening retinal disease do not have access to this service.

We are not proposing CPT code 0605T as potentially misvalued at this time. We note that the nominator submitted a single invoice in support of its assertions, which may not be reflective of typical costs, and we encourage interested parties to provide additional information. including invoices for the OCT devices. Also, we welcome comments on whether this code should be nationally priced and what inputs should be used if we were to set a national rate for this service.

(6) Mechanical separation of plasma from blood (CPT code 36514).

An interested party nominated CPT code 36514 (*Therapeutic apheresis; for plasma pheresis*) as potentially misvalued for two PE-related reasons. The first concern involves the assigned clinical labor code, L056A (RN/OCN), which the nominator states undervalues the therapeutic apheresis nurse's operating wage cost. The second concern relates to the equipment code, EQ084 (cell separator system), specifically its price and equipment utilization rate.

The nominator presented differences in therapeutic plasmapheresis or plasma exchange (TPE) procedure payments between settings, with 50 percent to 75 percent of the 100,000 annual TPE procedures occurring in hospital outpatient settings. The nominator stated that the payment differential is substantial: under the Hospital OPPS, the average CY 2025 Medicare payment rate for TPE performed in a hospital outpatient department is $1,639.28, excluding compensation for the supervising physician. In contrast, under the PFS, the average CY 2025 Medicare payment rate for the same procedure performed in a non-facility setting is $663.43. According to the nominator, the differences in payment rates have forced patients to receive treatment in more expensive hospital outpatient settings, as physicians cannot financially sustain the costs of performing TPE services in non-facility settings under the current payment rates. The nominator asserted that this payment structure not only limits patient access to care but also results in higher overall costs to the Medicare program, as procedures are channeled to the more expensive hospital outpatient setting where payment rates are nearly 2.5 times higher than non-facility rates.

The nominator stated that TPE is a complex extracorporeal blood therapy procedure used to treat patients with serious hematological, oncologic, neurological, rheumatologic, cardiac and autoimmune disorders. Therapeutic apheresis nurses performing this procedure require extensive specialized training to independently handle patients with a wide spectrum of serious illnesses and comorbidities. They must be trained and highly skilled in evaluating patients and managing clinical issues and adverse events that commonly arise during the procedure, particularly in patients with comorbid anemia, renal failure, cardiovascular disease, serum protein abnormalities or other risk factors.[24] Their key responsibilities include advanced vascular access, continuous management of the extracorporeal circuit, troubleshooting, patient assessment to manage adverse events, and medication administration. The nominator emphasized that therapeutic apheresis nurses' training and skill level are distinct from nurses collecting blood products from healthy donors.

The nominator summarized the wide range of median annual and hourly base salaries ($92,525 to nearly $125,000) for ''Apheresis Nurse'' or ''Apheresis RN'' positions identified across four leading online employment recruiting firms. According to the nominator, this variability likely stems from the differing mixes of higher-paid therapeutic apheresis nurse job postings versus lower-paid postings for nurses collecting blood products from healthy donors at community blood centers across these firms. Based on the listed position openings, the nominator found that the rate per minute for a therapeutic apheresis nurse, inclusive of benefits, likely ranges between $1.30 and $1.50 per minute, well over 60 percent higher than the $0.81 per minute valuation currently assigned to CPT code 36514 with the L056A labor code. Also, the nominator claimed that in order to accurately assess therapeutic apheresis nurse wages, other surveys could be employed focusing on nurses performing therapeutic procedures while excluding those working in blood/plasma collection centers from healthy volunteer donors, as the latter typically receive lower compensation despite using similar equipment.

The nominator proposes that CMS collaborate with the Department of Labor (DOL) to accurately assess therapeutic apheresis nurse salaries and establish a new clinical labor code with appropriate per-minute rates. This would replace the current L056A labor code used for CPT code 36514, which the nominator asserts undervalues these specialized nurses' wages and benefits. The new code would specifically exclude non-patient-facing nurses who perform blood product collection, ensuring more accurate compensation for this specialized role.

According to the nominator, the current Medicare payment rate for CPT code 36514 in the non-facility setting fails to adequately account for direct PE costs. First, based on fourth quarter 2024 U.S. sales data, the nominator

[24] Chhibber V and King KE. Management of the therapeutic apheresis patient (Chapter 12). In: *Apheresis: Principles and Practice, 3rd Edition.* Bethesda, MD: AABB Press, 2010.

requested updating the CMS Equipment File price for the cell separator system equipment code (EQ084) from $81,656.40 to $93,321.35, reflecting current market conditions. According to the nominator, the current rate of 0.5 for equipment code EQ084 implies that facilities perform 426 procedures per year per device; however, data from major hospitals, including the three largest-volume hospitals in the U.S., demonstrates that facilities average only 181 procedures per year per device, suggesting a more accurate utilization rate of 0.21. This discrepancy can significantly impact on the calculated costs and subsequent payment rates for equipment code EQ084.

After reviewing the nominator's submission, we do not believe that we have enough information to evaluate whether CPT code 36514 is potentially misvalued, and thus we are not proposing the code as potentially misvalued at this time. To assist us in further considering whether CPT code 36514 is potentially misvalued, we are seeking information on the direct practice expense inputs, particularly regarding the clinical labor code L056A and equipment code EQ084. Specifically, we seek comments on whether to establish a new therapeutic apheresis nurse clinical labor code in the non-facility setting. Also, we seek invoices and other associated information that could be used to update to the cell separator system equipment code EQ084 to reflect current market costs. We do not believe an update to the equipment utilization rate is necessary. We disagree with the nominator that an equipment utilization rate of 21 percent would be typical for the cell separator system. As we stated previously, we currently use an equipment utilization rate assumption of 50 percent for most equipment, with the exception of expensive diagnostic imaging equipment, for which we use a 90 percent assumption as required by section 1848(b)(4)(C) of the Act. As we discussed in the CY 2021 PFS final rule, it would distort relativity to assign a utilization rate of 21 percent for the cell separator system equipment, as this would have the same effect as doubling the overall price of the equipment (85 FR 84629).

(7) Remote interrogation device evaluation (CPT code 93296).

An interested party nominated CPT code 93296 (*Interrogation device evaluation(s) (remote), up to 90 days; single, dual, or multiple lead pacemaker system, leadless pacemaker system, or implantable defibrillator system, remote data acquisition(s), receipt of transmissions and technician review, technical support and distribution of results*) as potentially misvalued, because the service has experienced substantial changes in PE. The nominator emphasized that the current direct practice expense inputs do not accurately represent either the current standard of care or the actual resources required to provide the service, necessitating an urgent review of the code's resource input valuations.

CPT code 93296 is a technical component-only code describing remote monitoring of cardiac devices over 90 days. The nominator stated that this service enables healthcare providers to remotely evaluate implanted cardiac defibrillators and pacemakers, review device data, communicate with patients, and share findings with physicians. The monitoring helps prevent emergencies and reduces hospitalizations through early intervention and timely device adjustments. According to the nominator, the code's direct costs, last reviewed by RUC in 2016 and implemented in 2018, no longer reflect current service delivery requirements because technological advancements and expanded monitoring protocols have significantly increased service complexity and resource requirements.

According to the nominator, the service delivery for CPT code 93296 has evolved significantly, requiring enhanced organizational infrastructure and specialized clinical expertise. Modern service delivery involves complex data management, with each transmission requiring 32 distinct tasks [25] for complete patient care. The increased service complexity stems from advanced technology requirements, expanded patient monitoring needs, and more frequent device interrogation, shifting from quarterly to more regular intervals. These changes have created a notable disparity between current resource costs and existing valuations, necessitating updated mechanisms for data management and prioritization.

According to the nominator, the direct cost inputs for clinical labor and equipment do not reflect the current direct costs required to furnish the services. The nominator stated that the total direct cost of $25.84 (including clinical labor and equipment) exceeds the CY 2025 national non-facility PFS payment rate of $19.41. They stated that the current valuations do not reflect modern clinical staffing needs and equipment requirements for this pacemaker interrogation system service, despite similar updates being approved for comparable diagnostic services. To assess resource requirements, the nominator conducted an independent study among IDTFs, using standardized data collection and a volume-weighted analysis of 2023 service data. The nominator claimed that their findings demonstrate a significant disparity between current valuations and actual service delivery costs, supporting the need for comprehensive input review.

The study of IDTFs conducted by the nominator revealed that CPT code 93296 requires 83.66 minutes of non-physician clinical labor time, significantly more than CMS' current value of 28 minutes. This time encompasses eleven distinct tasks, from patient enrollment to quality assurance, with the most time-intensive activities being data review and analysis (25.25 minutes) and unscheduled alert management (21.84 minutes).

[25] Aileen M. Ferrick et al,. 2023 HRS/EHRA/APHRS/LAHRS Expert Consensus Statement on Practical Management of the Remote Device Clinic (2023), *http://www.hrsonline.org/guideance/clinical-resources/2023-hrsehraaphrslahrs-expert-consensus-statement-practical-management-remote-device-clinic?gad_source=1&gclid=Cj0KCQiAkoe9BhDYARIsAH85cDOusU-vRRcEnwoXzUmN2COkX0_DiRVHuOM8cYMf8riBNXW-KrFagnAaAs5NEALw_wcB.*

TABLE 7: LIST OF NON-PHYSICIAN CLINICAL LABOR TIME FROM THE NOMINATOR'S SURVEY

Description	Time (minutes)
Patient enrollment and verification	0.08
Patient education and consent	0.90
Device preparation and setup	3.20
Data review and analysis	25.25
Unscheduled event and episode evaluation	8.70
Unscheduled alert management and reporting	21.84
Unscheduled transmission data archival and documentation	1.46
Scheduled summary report preparation and delivery	6.17
Patient support and inquiry response	2.96
Manual transmission and connectivity management	3.47
Quality assurance of alert and routine reports	9.63

Furthermore, the nominator stated that while the valuation for CPT code 93296 is currently based on electrodiagnostic technologists (L037A) at $0.44 per minute, the service is typically performed by cardiovascular technicians (L038B), who receive $0.60 per minute. Thus, the nominator believes that updating both the time and clinical staff classification is needed for accurate service valuation and consistency with other implantable device monitoring services.

Finally, the nominator requested two updates to the equipment costs for CPT code 93296. First, they recommended adjusting the equipment usage time to align with the updated clinical labor time for remote interrogation device evaluation. Second, they recommended changing the assigned equipment code from ''pacemaker interrogation, system'' (EQ320) priced at $123,250 to ''pacemaker follow-up system'' (EQ198) priced at $279,453. We note that no invoices were submitted to support these prices. The nominator believes that these changes would align the equipment valuation with actual costs and match similar CMS-approved device monitoring services.

Overall, the nominator stated that a review of CPT code 93296 current inputs reveals significant undervaluation in several key areas. According to the nominator, the existing resource costs for clinical labor times, labor types, and equipment costs do not adequately reflect the current service requirements. Based on the submitted information, however, we are not currently proposing to nominate this code as potentially misvalued. We request that the nominator submit a complete report detailing associated direct practice expense input assessment data to enable us to more fully consider whether the code is potentially misvalued. Additionally, we welcome comments, including any analysis or studies from the broader medical community, including the RUC, regarding whether this service has experienced substantial changes in practice expenses since its last review.

(8) Fine Needle Aspiration (FNA) (CPT codes 10021, 10004, 10005, 10006)

An interested party requested that CMS reconsider CPT codes 10021 (*Fine needle aspiration biopsy, without imaging guidance; first lesion*), 10004 (*Fine needle aspiration biopsy, without imaging guidance; each additional lesion*), 10005 (*Fine needle aspiration biopsy, including ultrasound guidance; first lesion*) and 10006 (*Fine needle aspiration biopsy, including ultrasound guidance; each additional lesion*) for nomination as potentially misvalued, citing significant undervaluation since 2019. The nominator submitted a request to CMS for the reevaluation of these codes, stating that the payment changes have created a concerning cascade of negative consequences impacting the care of patients with thyroid nodules and cancer. Specifically, the nominator questions the fundamental basis of CMS' 2019 work RVU reductions for FNA procedures. While the RUC recommended work RVUs of 1.20 for CPT code 10021 and 1.63 for CPT code 10005, CMS instead implemented lower values of 1.03 and 1.46, respectively. The nominator strongly disagreed with CMS' methodology, particularly its comparison to CPT code 36440 (neonatal blood transfusion). The nominator argued that this crosswalk comparison is inappropriate because the neonatal procedure represents a fundamentally different type of service with distinct work intensity levels, requires different expertise, is rarely billed to Medicare, and serves an entirely different patient population than FNA procedures.

The nominator further emphasized that when the work RVU for CPT code 10005 was reduced by 10.5 percent

(from 1.94 to 1.46), it triggered a much larger 35.7 percent drop in payment. This substantial decrease has forced a significant shift in where these procedures are performed, moving from office-based settings to hospital facilities. Using claims data, the nominator stated that there has been a shift in the site of service for FNA procedures between 2018 and 2023; the percentage of procedures performed in facility settings increased from 52.06 percent in 2018 to 57.05 percent in 2023. Conversely, services performed in office settings declined from 47.05 percent in 2018 to 42.40 percent in 2023. The nominator claimed that this shift in performance of FNA from the office setting to hospital outpatient departments resulted in Medicare paying 524 percent more for the same procedure. With an additional cost of $584.92 per procedure at facility locations, the nominator claimed that this shift has resulted in increased Medicare expenses of $4.17 million.

Beyond the financial implications, the nominator stated that the low valuation of this code family has resulted in a shift to facility settings raising Medicare costs, reducing access, and reducing quality of care. According to the nominator, most concerning is the long-term impact on medical education, as new endocrinologists and surgeons are now avoiding learning FNA procedures altogether. Furthermore, the nominator referenced a study,[26] which discusses the potentially negative consequences of code devaluation on patient care and healthcare spending. Overall, to address these issues, the nominator specifically requested that CMS restore the work RVU values to those originally recommended by the RUC in 2019, stating that CMS' previous crosswalk to neonatal transfusion described by CPT code 36440 (*Push transfusion, blood, 2 years or younger*) was inappropriate given the significant differences in work intensity levels and required expertise between the procedures.

We appreciate the comprehensive information provided by the nominator, including their reference to recent research and detailed trend analysis. However, we note that these codes have undergone multiple recent reviews. Our review of these codes and our rationale for finalizing the current values are extensively discussed in the CY 2019 PFS final rule (83 FR 59517) and CY 2021 PFS final rule (85 FR 84599). Furthermore, this code family was previously nominated two times as potentially misvalued and discussed in the CY 2020 PFS final rule (84 FR 62625) and CY 2025 PFS final rule (89 FR 97743). For more information, we encourage the nominator to reference the discussions in previous rulemaking. We maintain our position and are not proposing this code family as potentially misvalued. We acknowledge the shift in site of service for FNA procedures between 2018 and 2023. While we do not currently consider these changes substantial enough to warrant immediate revaluation, we will continue to monitor the site-of-service trends closely. Should these patterns persist or accelerate, a new survey in the future may be necessary to accurately reflect these changes in practice patterns. We welcome public comments and recommendations, including those from the RUC, regarding whether these codes should be re-reviewed in light of the information submitted by the nominator.

(9) Nasal Sinus Irrigation (CPT Codes 31000 and 31002)

An interested party nominated CPT codes 31000 (*Lavage by cannulation; maxillary sinus (antrum puncture or natural ostium)*), and 31002 (*Lavage by cannulation; sphenoid sinus*) as potentially misvalued. The interested party expressed concern that these codes are undervalued due to missing pricing data for essential lavage supplies and stated that they are not currently priced in the non-facility setting.

Regarding both codes, the interested party identified two issues. They stated that this procedure uses the Cyclone® sinonasal suction and irrigation system, and requires additional tools, staff time and supplies. For CPT code 31000, the interested party stated that while the current PE supplies are valued at $33.68, this amount should be $333.68, reflecting a $300 increase to include the Cyclone device cost. Similarly, for CPT code 31002, the interested party proposed increasing the supply price from $26.74 to $326.74 to incorporate the Cyclone device cost. To support this claim, the interested party has provided seven paid invoices demonstrating the actual cost of the system.

The interested party also claimed that both codes do not have non-facility RVUs, but are primarily performed in non-facility settings. According to the AMA's RUC database's procedure volume data, CPT code 31002 is performed in the non-facility setting 81.4 percent of the time and CPT code 31000 is reported 77.2 percent of the time in the non-facility setting.[27]

The interested party emphasized that these misvaluations have real-world implications for patient care. The current valuations may limit physicians' ability to provide these services in both facility and non-facility settings, potentially affecting patient access to care, particularly for those who can only receive treatment in physician offices. Thus, the interested party requested a revaluation of the PE components for both codes and the establishment of non-facility PE inputs for these services.

Although we are not currently proposing to designate these codes as potentially misvalued, we acknowledge the interested party's concerns about their current valuation. Specifically, these concerns could stem from missing pricing data and observed changes in the typical site of service and dominant specialty since the last valuation. We note that CPT code 31000 is typically performed in the non-facility setting but question whether the Cyclone device is either typically used or necessary for the performance of this procedure. We note that CPT code 31002 does not have non-facility PE inputs, however it seems to typically be performed in the office setting with the dominant specialty listed as Allergy/Immunology and not Otolaryngology. We also question whether the Cyclone device is either typically used or necessary for the performance of this procedure. We believe that both codes would require a comprehensive review to address these potential changes in typical site of service and dominant specialty, as well as PE valuation. We welcome public comments regarding these issues concerning CPT codes 31000 and 31002. Interested parties are encouraged to submit relevant documentation, such as invoices or other evidence that demonstrates the typical resource costs for providing these services.

(10) Portable X-Ray Services (HCPCS Codes R0070, R0075)

In the CY 2025 PFS final rule, we acknowledged that several portable x-ray (PXR) suppliers and trade organizations continue to express longstanding concerns with how payment is established for transportation services related to PXR as described by HCPCS codes R0070 and R0075 (89 FR 97809). We also noted interested parties' request for greater consistency in the pricing of these services (89 FR 97809 through 97810).

[26] THYROID Volume 34 Number 11, 2024 *https://doi.org/10.1089/thy.2024.0442 Eldeiry, et al.* ''Impact of Changes in Fine Needle Aspiration Biopsy Reimbursement on Clinical Care of Patients with Thyroid Nodules in the United States''.

[27] *AMA RBRVS DataManager.* American Medical Association. (2025, January 15). *https://www.ama-assn.org/.*

We suggested that interested parties may best engage with the MACs on these issues by appropriately reporting cost data in the MAC requested format. We also recognized that we should maintain consistency in pricing these services that are more indicative of changes in costs that occur yearly. In this proposed rule, we are seeking comments on whether we should assign national pricing under the PFS for PXR transportation services; specifically, for HCPCS code R0070 (Transportation of portable x-ray equipment and personnel to home or nursing home, per trip to facility or location, one patient seen) and HCPCS code R0075 (Transportation of portable x-ray equipment and personnel to home or nursing home, per trip to facility or location, more than one patient seen). We believe that national pricing would be conducive to ensuring consistency in payment rates across localities and also create payment stability for these services.

To nationally price HCPCS codes R0070 and R0075, we could use reference codes that have only PE values and no work RVUs because these codes describe only the transportation services associated with PXR. Since these codes are currently paid using contractor pricing, we could also analyze the average MAC payment for them to inform national pricing. For example, we observed that HCPCS code R0070 was priced between $215 to 230 per service while HCPCS code R0075 was priced between $80 to 90 per service. Using these valuations could help to inform us of potential crosswalk codes in order to maintain consistency with the rates currently being paid. By converting the dollar payment for HCPCS codes R0070 and R0075 from Medicare Part B claims data into RVUs through the usage of our current conversion factor under the PFS, we identified potential crosswalk codes. For HCPCS code R0070, we could use a crosswalk to CPT code 93243 (External electrocardiographic recording for more than 48 hours up to 7 days by continuous rhythm recording and storage; scanning analysis with report), which has a total national non-facility payment rate of $226.43 for CY 2025, and for HCPCS code R0075, we could use a crosswalk to CPT code 92582 (Conditioning play audiometry), which has a total national non-facility payment rate of $86.69 for CY 2025.

We welcome comments from the public on whether we should consider national pricing for HCPCS codes R0070 and R0075, as well as whether these potential crosswalk codes would appropriately value these services, and any other factors we should consider.

(11) Cryoablation Therapy To Treat Postoperative Pain

An interested party requested we establish a code to describe the additional intraoperative time required by the surgeon to perform adjunctive cryoablation therapy for postoperative pain management. According to the interested party, intraoperative cryoablation therapy is performed as a supplemental procedure alongside primary surgical procedures to provide postoperative pain relief for up to 60 days. The therapy works by freezing nerves near the surgical site without causing permanent damage, temporarily blocking pain signals during the patient's recovery period. The interested party stated that this procedure requires an additional 20–30 minutes of intraoperative time for the surgeon beyond the primary surgical procedure. The interested party referenced clinical evidence highlighting the use of intraoperative cryoablation to reduce the need for opioids in postsurgical patients, as well as recent guideline recommendations.[28] [29]

Currently, there is no specific code to account for the additional physician work associated with intraoperative cryoablation therapy. According to the nomination letter, we included the Cryo Nerve Block Therapy (CryoNB) on the list of devices eligible for temporary additional payments under the Non-Opioids Prevent Addiction in the Nation (NOPAIN) Act [30] in the CY 2025 OPPS final rule (89 FR 94353 through 94354). However, the interested party stated barriers still exist for physician adoption mainly because there is currently no code to account for the 20–30 additional minutes of physician work associated with the intraoperative administration and delivery of cryoablation therapy.

Also, the interested party stated that many practitioners incorrectly interpret Medicare's anesthesia rules as prohibiting payment for extra professional services when the same surgeon provides ancillary cryoablation therapy.[31] According to the nominator, while CMS typically do not allow separate payments for anesthesia services when the same physician performs both the surgical procedure and anesthesia, this limitation does not apply to cryoablation therapy for postoperative pain management.[32] However, according to the interested party, ongoing confusion regarding this policy's application creates an unnecessary barrier to cryoablation procedures that could reduce or replace opioid use for Medicare beneficiaries.

The interested party stated that establishment of a G-code for physician work associated with intraoperative cryoablation therapy for postoperative pain would facilitate greater access for patients who require or prefer non-opioid alternatives for pain relief. The interested party further stated that such a G-code would help promote patient access to this alternative to opioids by clarifying that Medicare anesthesia rules do not apply to cryoablation for postoperative pain when furnished by the same surgeon. We are seeking public comments on whether a new G-code is needed to account for the additional intraoperative time required to perform cryoablation therapy, including service elements and valuation of work and practice expense, including potential crosswalk codes.

D. Payment for Medicare Telehealth Services Under Section 1834(m) of the Act

As discussed in prior rulemaking, several conditions must be met for Medicare to make payment for telehealth services under the PFS. See further details and full discussion of the scope of Medicare telehealth services in the CY 2018 PFS final rule (82 FR 53006), the CY 2021 PFS final rule (85 FR 84502), and the CY 2024 PFS final rule (88 FR 78861 through 78866) and in 42 CFR 410.78 and 414.65.

1. Payment for Medicare Telehealth Services Under Section 1834(m) of the Act

a. Changes to the Medicare Telehealth Services List

In the CY 2003 PFS final rule with comment period (67 FR 79988), we established a regulatory process for adding services to or deleting services

[28] *Miller DL, Hutchins J, Ferguson MA, Barhoush Y, Achter E, Kuckelman JP. Intercostal Nerve Cryoablation During Lobectomy for Postsurgical Pain: A Safe and Cost-Effective Intervention. Pain Ther. 2025 Feb;14(1):317–328. doi: 10.1007/s40122–024–00694–3.*

Eur J Cardiothorac Surg. 2024 66(1):ezae166.*

[30] *CY 2025 OPPS Final Rule, 89 Fed. Reg. 93912, 94354 (Nov. 27, 2024) (CMS specifically affirmed that ''the CryoNB System meets the statutory requirements and should be paid separately under this provision.'')*

[31] *See Medicare NCCI 2024 Coding Policy Manual, Chapter 13, pgs. 6–7 (revised Jan. 1, 2025), available at: https://www.cms.gov/files/document/13-chapter13-ncci-medicare-policy-manual-2025finalcleanpdf.pdf.*

[32] *AHA Coding Clinic®, Q3 2024 vol. 11, no. 3 (effective with discharges Aug. 1, 2024).*

from the Medicare Telehealth Services List in accordance with section 1834(m)(4)(F)(ii) of the Act (42 CFR 410.78(f)). This process provides the public with an ongoing opportunity to submit requests for adding services, which are then reviewed and assigned to categories established through notice and comment rulemaking. Under the process we established beginning in CY 2003, we evaluated whether a service should be assigned to the Medicare Telehealth Services List and designated as *Category 1:* Services similar to professional consultations, office visits, and office psychiatry services currently on the Medicare Telehealth Services List or *Category 2:* Services that were not similar to those on the current Medicare Telehealth Services List.

In the CY 2021 PFS final rule (85 FR 84507), we created a third category of criteria for adding services to the Medicare Telehealth Services List on a temporary basis following the end of the PHE for the COVID–19 pandemic. This new category described services that were added to the Medicare Telehealth Services List during the PHE, for which there was likely to be clinical benefit when furnished via telehealth, but there was not yet sufficient evidence available to consider the services for permanent addition under the Category 1 or Category 2 criteria. Services added on a temporary, Category 3 basis ultimately needed to meet the criteria under Category 1 or 2 to be permanently added to the *Medicare Telehealth* Services List. To add specific services on a Category 3 basis, we would conduct a clinical assessment to identify those services for which we could foresee a reasonable potential likelihood of clinical benefit when furnished via telehealth.

In the CY 2024 PFS final rule (88 FR 78861 through 78866), we consolidated these three categories and implemented a revised 5-step process for making additions, deletions, and changes to the Medicare Telehealth Services List (5-step process), beginning for the CY 2025 Medicare Telehealth Services List. The 5-step process review criteria are set forth in the CY 2024 PFS final rule (88 FR 78861 through 78866), includes the following steps: (1) Determine whether the service is separately payable under the PFS; (2) Determine whether the service is subject to the provisions of section 1834(m) of the Act; (3) Review the elements of the service as described by the HCPCS code and determine whether each of them is capable of being furnished using an interactive telecommunications system as defined in § 410.78(a)(3); (4) Consider whether the service elements of the requested service map to the service elements of a service on the list that has a permanent status described in previous final rulemaking; and (5) Consider whether there is evidence of clinical benefit analogous to the clinical benefit of the in-person service when the patient, who is located at a telehealth originating site, receives a service furnished by a physician or practitioner located at a distant site using an interactive telecommunications system. Rather than categorizing a service as ''Category 1'', ''Category 2,'' or ''Category 3,'' each service is now assigned a ''permanent'' or ''provisional'' status. A service is assigned a ''provisional'' status if it meets steps 1, 2, and 3 of our review process, and, if while there is not enough evidence to demonstrate that the service is of clinical benefit, there is enough evidence to suggest that further study may demonstrate such benefit.

b. Proposal To Modify the Medicare Telehealth Services List and Review Process

Section 1834(m)(4)(F)(ii) of the Act requires that the Secretary establish a process that provides, on an annual basis, for the addition or deletion of services to the definition of telehealth services for which payment can be made when furnished via telehealth under the conditions specified in section 1834(m) of the Act. As specified at § 410.78(f), except for a temporary policy that was limited to the PHE for COVID–19, we make changes to the list of Medicare telehealth services through the annual PFS rulemaking process. Our current 5-step review process reflects the stepwise method by which we consider requests to add services to, remove services from, or change the status of, services on the Medicare Telehealth Services List, beginning with the CY 2025 Medicare Telehealth Services List (88 FR 78861 through 78871).

We are proposing, beginning for the CY 2026 Medicare Telehealth Services List, to revise the 5-step review process for reviewing requests to the Medicare Telehealth Services List. Based on feedback from interested parties, we believe that we need to simplify our telehealth list review process by focusing our review on whether the service can be furnished using an interactive telecommunications system. The current 5-step review process has proven to be unclear for requestors. Interested parties, including requestors, have emphasized that it is difficult to ascertain the level of clinical evidence needed for a service with a provisional designation to be redesignated permanent. Additionally, for new services or services with low utilization, interested parties have had a difficult time providing peer-reviewed evidence applicable to the service and/or the Medicare beneficiary patient population. Lastly, based on feedback from interested parties and our own internal review, the 5-step process insufficiently accounts for the vital role of professional judgment exercised by physicians and other practitioners. We continue to believe that physicians and other practitioners, given their in-depth knowledge of their beneficiaries' clinical needs, are best positioned to exercise their professional judgment in determining whether a service can be safely furnished via telehealth and whether furnishing a service via telehealth will provide clinical benefit justifying its use.

We therefore are proposing to remove Step 4 (Consider whether the service elements of the requested service map to the service elements of services on the list that has a permanent status described in previous final rulemaking) and Step 5 (Consider whether there is evidence of clinical benefit analogous to the clinical benefit of the in-person service when the patient, who is located at a telehealth originating site, receives a service furnished by a physician or practitioner located at a distant site using an interactive telecommunications system) from our review criteria and retain Steps 1 through 3 (detailed below). Under this proposal, services on the Medicare Telehealth Services List would no longer be designated ''permanent'' or ''provisional''. All services listed or added on the Medicare Telehealth Services List would be considered included on a permanent basis. Note, CMS would still reserve the right to remove services included on the Medicare Telehealth Services List based on internal review or feedback received from interested parties in accordance with section 1834(m)(4)(F)(ii) of the Act (42 CFR 410.78(f)). If finalized, all codes currently on the list (provisional or permanent) will remain on the Medicare Telehealth Services List. Because CMS has already determined that services with a ''provisional'' designation satisfy the standards represented in Steps 1 through 3 in prior rulemaking cycles, we do not believe further review would be required to justify their inclusion on the Medicare Telehealth Services List under the revised process. We continue to request information from interested parties about service(s) that may be appropriate for addition to or deletion from the list of Medicare telehealth services and their effects on beneficiary access, safety, and quality of care.

We are proposing to retain Steps 1 through 3 and eliminate Steps 4 through 5 because we believe that the standards represented in Steps 1 through 3 alone are sufficient guardrails to ensure that only services separately payable under the PFS, subject to the provisions of section 1834(m) of the Act, and capable of being furnished using an interactive telecommunications system are considered Medicare telehealth services. For additional information, these steps are further discussed in the CY 2024 PFS final rule (88 FR 78861 through 78866). We do not believe Steps 4 through 5 are necessary, because as discussed above, we believe the complex professional judgment of the physician or practitioner is sufficient to ensure a service can be safely furnished via telehealth and that the service will be clinically beneficial to the beneficiary. We believe that the determination to utilize the complex professional judgment of the physician or practitioner will better allow practitioners to determine if telehealth is appropriate for that specific Medicare beneficiary and that specific clinical scenario.

We expect that physicians and other practitioners would consider the entirety of the circumstances, including the clinical profile and needs of the beneficiary, to determine the appropriate modality for furnishing the service. This specification is similar to the requirements set forth for the process by which CMS updates the list of covered surgical procedures in Medicare when furnished within an ambulatory surgical center (ASC) (also called the ASC covered procedures list (CPL)), which were established in the 2021 OPPS Final Rule (85 FR 86148 through 86149). In addition, this specification is similar to our policy regarding the in-person visit requirements for telehealth behavioral health services (''. . . the practitioner is not precluded from scheduling in-person visits at a more frequent interval, should such visit be determined to be clinically appropriate or preferred by the patient'' (86 FR 65057)) and for audio-only telehealth services (''practitioners should always use their clinical judgment in deciding to furnish services via telehealth, including in the patient's home, to ensure that appropriate care is being delivered; including scheduling in-person care as needed'' (89 FR 97761)). We strive to balance the goals of increasing practitioner and patient choice of service modality with the consideration of patient safety for all Medicare beneficiaries. Notably, the addition of a service to the Medicare Telehealth Services List does not mean that it is appropriate to be furnished via telehealth to every Medicare beneficiary in every clinical scenario—as always, the physician or practitioner should use his or her complex professional judgment to determine the appropriate service modality on a case-by-case basis. As technology advances and more services may be safely furnished via telehealth and paid under the PFS, it is increasingly important for physicians or practitioners to exercise their professional judgment in determining the generally appropriate service modality for their patients to receive a service.

We believe our proposal to remove steps 4 through 5 of the 5-step review process would expand and build upon our intent to simplify and reduce the administrative burden of submission and review of services to the Medicare Telehealth Services List. We believe our proposed policy would allow patients and physicians or practitioners to determine the most appropriate service modality for an individual patient while continuing to ensure patient safety. As discussed above, physicians and other practitioners are best positioned to make patient-specific service modality determinations. Physicians and other practitioners have the greatest familiarity with and understanding of the needs of their individual patients and will use their complex professional judgment to determine whether a service can be safely furnished via telehealth, given their patients' clinical profiles and needs, among other essential considerations.

We believe physicians and other practitioners would consider important safety factors when determining the appropriate service modality for their specific beneficiaries. We continue to encourage the review and use of clinical practice guidelines, peer-reviewed literature, and similar materials that illustrate the typical setting of care, population of beneficiaries, and clinical scenarios that practitioners would encounter when furnishing the Medicare Telehealth service using only interactive, two-way audio-video communications technology or two-way, real-time audio-only communication technology for services furnished to a patient in their home, as permitted in accordance with 42 CFR 410.78(a)(3). We are proposing to refine the regulatory process for adding services to or deleting services from the Medicare Telehealth Services List by removing Steps 4 and 5 and maintaining the current Steps 1 through 3. The steps are listed in detail below:

Step 1. Determine whether the service is separately payable under the PFS.

When considering whether to add, remove, or change the status of a service on the Medicare Telehealth Services List, we first determine whether the service, as described by the individual HCPCS code, is separately payable under the PFS because, as further discussed in CY 2024 PFS final rule (88 FR 78861 through 78866), Medicare telehealth services are limited to those services for which separate Medicare payments can be made under the PFS. Before gathering evidence and preparing to submit a request to add a service to the Medicare Telehealth Services List, the submitter should therefore first check the payment status for a given service and ensure that the service (as identified by a HCPCS code), is a covered and separately payable service under the PFS (as identified by payment status indicators A, C, T, or R on our public use files).

Step 2. Determine whether the service is subject to the provisions of section 1834(m) of the Act. If we determine at Step 1 that a service is separately payable under the PFS, we apply Step 2 under which we determine whether the service at issue is subject to the provisions of section 1834(m) of the Act. Section 1834(m) of the Act provides for payment to a physician or other practitioner for a service furnished via an interactive telecommunications system, notwithstanding that the furnishing physician or practitioner and patient are not in the same location, at the same amount that would have been paid if the service was furnished without the telecommunications system. We have historically interpreted this to mean that only services that are ordinarily furnished with the furnishing physician or practitioner and patient in the same location can be classified as a ''telehealth service'' for which payment can be made under section 1834(m) of the Act. Given that there may be a range of services delivered using certain telecommunications technology that, though they are separately payable under the PFS, do not fall within the definition of telehealth service set forth in section 1834(m) of the Act, the aim of Step 2 is therefore to determine whether the service at issue is, in whole or in part, inherently a face-to-face service. Services that fall outside the definition of telehealth services generally include services that do not require the presence of, or involve interaction with, the patient (for example, remote interpretation of diagnostic imaging tests, and certain care management services). Other examples include virtual check-ins, e-

visits, and remote patient monitoring services which involve the use of telecommunications technology to facilitate interactions between the patient and practitioner, but do not serve as a substitute for an in-person encounter.

In determining whether a service is subject to the provisions of section 1834(m) of the Act, we therefore review during this Step 2 whether one or more of the elements of the service, as described by the particular HCPCS code at issue, ordinarily involve direct, face-to-face interaction between the patient and physician or practitioner such that the use of an interactive telecommunications system to deliver the service would be a substitute for an in-person visit.

Step 3. Review the elements of the service as described by the HCPCS code and determine whether each of them is capable of being furnished using an interactive telecommunications system as defined in § 410.78(a)(3).

Step 3 is corollary to Step 2 and is used to determine whether one or more elements of a service are capable of being delivered via an interactive telecommunication system as defined in § 410.78(a)(3). In Step 3, we consider whether one or more face-to-face component(s) of the service, if furnished via audio-video communications technology, would be equivalent to the service being furnished in-person, and we seek information from requesters to demonstrate evidence of substantial clinical improvement in different beneficiary populations that may benefit from the requested service when furnished via telehealth, including, for example, in rural populations. The services are not equivalent when the clinical actions, or patient interaction, would not be of similar content as an in-person visit, or could not be completed.

Additionally, we are proposing to simplify our Medicare Telehealth Services List review process by removing the distinction between provisional and permanent services and focusing our review on whether the service can be furnished using an interactive, two-way audio-video telecommunications system. We are seeking comments on our proposal to refine the Medicare Telehealth Services List review process. We also invite comments regarding safety and/or quality concerns. We would like to re-emphasize that a service's presence on the Medicare telehealth list does not indicate that CMS believes that telehealth may be appropriate in all circumstances; instead, we rely on physicians and other practitioners to use their professional judgment to make appropriate determinations based on the needs of the individual patient.

c. Requests To Add Services to the Medicare Telehealth Services List for CY 2026

We received several requests to add various services to the Medicare Telehealth Services List, effective for CY 2026, some of which we believe would meet the proposed revised criteria for being added to the Medicare Telehealth Services List. That is, we reviewed these services and found that they would meet the criteria of the 3-step process proposed in section D(1)(b). The requested services are listed in Table 8.

Consistent with the deadline for our receipt of code valuation recommendations from the American Medical Association's Relative Value Scale Update Committee (AMA RUC) and other interested parties (83 FR 59491) and with the process set forth in prior calendar years, for CY 2026, requests to add services to the Medicare Telehealth Services List must have been submitted to and received by CMS by February 10, 2025. Consistent with the deadline for our receipt of code valuation recommendations from the AMA RUC and other interested parties (83 FR 59491) and with the process set forth in prior calendar years, for CY 2027, requests to add services to the Medicare Telehealth Services List must be submitted to and received by CMS by February 10, 2026. The deadline for each request to add a service to the Medicare Telehealth Services List must include any supporting documentation the requester wishes us to consider as we review the request. Because we use the annual PFS rulemaking process to make changes to the Medicare Telehealth Services List, requesters are advised that any information submitted as part of a request is subject to public disclosure for this purpose. For more information on submitting a request to add services to the Medicare Telehealth Services List, including where to send these requests, and to view the current Medicare Telehealth Service List, see our website at *https://www.cms.gov/Medicare/Medicare-General-Information/Telehealth/index.html.*

TABLE 8: CY 2026 REQUESTS FOR ADDITION TO THE MEDICARE TELEHEALTH SERVICES LIST

Category	HCPCS	Short Descriptor

Home INR Monitoring	G0248	Demonstrate use home INR mon

The following is a discussion of the requests received for the addition of services to the Medicare Telehealth Services List:

(1) Multiple-Family Group Psychotherapy

We received a request to add CPT code 90849 (*Multiple-Family Group Psychotherapy*) to the Medicare Telehealth Services List. This code describes the provision of psychotherapy to multiple adult or adolescent patients and their family members simultaneously. This code was requested to be added in the CY 2022 PFS Final Rule, but we did not add it to the Medicare Telehealth Services List at the time because these services were not separately payable and had a restricted payment status, indicating that claims must be adjudicated on a case-by-case basis when furnished in-person 86 FR 65052. In the CY 2023 PFS Final Rule, we finalized a change in the procedure status indicator for CPT code 90849, which is now assigned an A for active status meaning that the service is now separately payable under the PFS. Based on our review, we believe this service now meets step 1 of our review process because it is currently assigned status indicator A, meets step 2 of our review process because it is a service ordinarily furnished with the furnishing practitioner and patient in the same location and therefore is subject to the provisions of section 1834(m) of the Act, and meets step 3 because that all elements of this service may be furnished using an interactive telecommunications system as defined in § 410.78(a)(3). Therefore, we are proposing to add this service to the Medicare Telehealth Services List. We welcome public comments on this proposal.

(2) Group Behavioral Counseling for Obesity

We received a request to add CPT code G0473 (*Face-to-face behavioral counseling for obesity, group (2–10), 30 minutes*) to the Medicare Telehealth Services List. This code includes a 30-minute group session that consists of a dietary assessment, counseling, and behavioral therapy, as well as one face-to-face visit per week for each week for the first month, one face-to-face visit every other week for months two through six, and one face-to-face visit per month for months seven through twelve (if an individual loses 3kg in the first six months). Based on our review, we believe this service meets step 1 of our review process because it is currently assigned status indicator A, meets step 2 of our review process because it is a service ordinarily furnished with the furnishing practitioner and patient in the same location and therefore is subject to the provisions of section 1834(m) of the Act, and meets step 3 because that all elements of this service may be furnished using an interactive telecommunications system as defined in 410.78(a)(3). Therefore, we propose to add this service to the Medicare Telehealth Services List. We welcome public comments on this proposal.

(3) Infectious Disease Add-On

We received a request to add CPT code G0545 (*Visit complexity inherent to hospital inpatient or observation care*

associated with a confirmed or suspected infectious disease by an infectious diseases consultant, including disease transmission risk assessment and mitigation, public health investigation, analysis, and testing, and complex antimicrobial therapy counseling and treatment. (add-on code, list separately in addition to hospital inpatient or observation evaluation and management visit, initial, same day discharge, or subsequent) to the Medicare Telehealth Services List. This code can include service elements such as disease transmission risk assessment and mitigation, public health investigation and analysis, and complex antimicrobial therapy counseling. Based on our review, we believe this service meets step 1 of our review process because it is currently assigned status indicator A (meaning that the service is separately payable under the PFS), meets step 2 of our review process because it is a service ordinarily furnished with the furnishing practitioner and patient in the same location and therefore is subject to the provisions of section 1834(m) of the Act, and meets step 3 because that all elements of this service may be furnished using an interactive telecommunications system as defined in 410.78(a)(3). Therefore, we propose to add this service to the Medicare Telehealth Services List. We welcome public comments on this proposal.

(4) Auditory Osseointegrated Sound Processor

We received a request to add CPT codes 92622 (*Diagnostic analysis, programming, and verification of an auditory osseointegrated sound processor, any type; first 60 minutes*) and 92623 (*Diagnostic analysis, programming, and verification of an auditory osseointegrated sound processor, any type; each additional 15 minutes (List separately in addition to code for primary procedure*)) to the Medicare Telehealth Services List. Based on our review, we believe these services meet step 1 of our review process because they are currently assigned status indicator A (meaning that the service is separately payable under the PFS), meet step 2 of our review process because they are services ordinarily furnished with the furnishing practitioner and patient in the same location and therefore subject to the provisions of section 1834(m) of the Act, and meet step 3 because that all elements of these services may be furnished using an interactive telecommunications system as defined in 410.78(a)(3). Therefore, we propose to add these services to the Medicare Telehealth Services List. We welcome public comments on this proposal.

(5) Dialysis

We received a request to add dialysis procedures described by CPT codes 90935 (*Hemodialysis procedure with single evaluation by a physician or other qualified health care professional*), 90937 (*Hemodialysis procedure requiring repeated evaluation(s) with or without substantial revision of dialysis prescription*), 90945 (*Dialysis procedure other than hemodialysis (for example, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies), with single evaluation by a physician or other qualified health care professional*), and 90947 (*Dialysis procedure other than hemodialysis (for example, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies) requiring repeated evaluations by a physician or other qualified health care professional, with or without substantial revision of dialysis prescription*) to the Medicare Telehealth Services List. These codes describe reviewing medical records, obtaining an interval history, performing an expanded problem focused or detailed physical examination, formulating and/or revising diagnosis and treatment plan(s) (moderate or high complexity medical decision-making), and discussing diagnosis and treatment. On either a single or two or more visits, the practitioner assesses the patient and response so far to dialysis, writes and/or reviews orders, and supervises dialysis.

We are not proposing to add these services to the Medicare Telehealth Services List at this time, as we do not believe that we have enough information to determine if these services meet step 3 of the Medicare Telehealth review process. It is not clear under what clinical circumstances this service could be furnished via telehealth and how all service elements would be performed when furnished via telehealth. We seek comments on whether the elements of the service are capable of being delivered via an interactive telecommunication system as required for Medicare telehealth services under § 410.78(a)(3). We also seek comments regarding the service elements clinical staff at the originating site are performing and how these patient interactions compare to service elements that the professional may be furnishing via telehealth. When adding ESRD-related services (CPT codes 90963–90966, 90967–90970) to the Medicare Telehealth Service list in the CY 2015 (80 FR 41783) and CY 2017 (81 FR 80194) final rules with comment period, we noted the clinical examination of the access site must still be furnished face-to-face ''hands-on'' (without the use of an interactive telecommunications system) by a physician, CNS, NP, or PA. We seek comment to see if this requirement would also be appropriate for CPT codes 90935, 90937, 90945, and 90947 or if any other service elements need to be furnished ''hands-on.'' At this time, we require more information to determine whether this requirement of a ''hands-on'' clinical examination by a physician, CNS, NP, or PA would inhibit furnishing these services via telehealth, or if a practitioner at the originating site could perform this requirement.

(6) Home INR Monitoring

We received a request to add Home INR Monitoring (HCPCS code G0248) to the Medicare Telehealth Services List for CY 2026. This service, as described by HCPCS code G0248, encompasses a face-to-face demonstration of the use and care of the INR monitor, obtaining at least one blood sample, providing instructions for reporting home INR test results, and documenting the patient's ability to perform testing and report results. In response to this request for the CY 2025 PFS proposed rule, commenters explained in detail that the interaction with the patient described by this service is generally delivered by individuals considered to be clinical staff and not a physician or practitioner as defined under section 1834(m)(4) of the Act. ''Clinical staff'' means someone who is supervised by a physician or other qualified health care professional and is allowed by law, regulation, and facility policy to perform or assist in a specialized professional service but does not individually report that professional service. After reviewing these comments and receiving additional information from interested parties, especially those that reminded us that the patient interactions for this service typically occur with clinical staff, it is clear that this is not a service that is generally furnished via a telecommunications system by a physician or a practitioner, as defined under section 1834(m)(4) of the Act, but rather is a technical part of a service delivered by clinical staff employed or otherwise providing services for a supplier. Indeed, the patient interaction portion of the service is valued under the PFS as typically involving the clinical staff of a supplier rather than the professional work of a physician or practitioner. Furthermore, there is no restriction on billing for this service and a physician/practitioner visit code on

the same day, which suggests that the interaction between the clinical staff and the patient described by this service is severable from the kind of professional service that falls under the scope of section 1834(m) of the Act. We understand that before the broad adoption of telecommunications technology for patient interactions nearly 6 years ago, these interactions may have typically taken place in person, and we considered the request to add this service to the telehealth list in that context. However, the interaction described explicitly by the code does not indicate an interaction between the patient and a physician or other practitioner. Because such an interaction falls outside the scope of the definition of Medicare telehealth service, it does not meet step 2 of our review process. Therefore, we are not proposing adding HCPCS code G0248 to the Medicare list of telehealth services. We welcome public comments on this proposal.

(7) Telemedicine E/M Services

We received a request to add the telemedicine E/M services (CPT codes 98000–98015) to the Medicare Telehealth Services List. These services do not satisfy the criteria under Step 1 of our process. Specifically, they are not separately payable under the Medicare PFS, as they are currently assigned status indicator I (Not valid for Medicare purposes). Given that these services are not separately payable when furnished in person, they likewise will not be separately payable when furnished via telehealth. Therefore, this service does not meet Step 1 of our review process. We are not proposing to add them to the Medicare list of telehealth services. We welcome public comments on this proposal.

(8) Clarification on DMHT/RPM/RTM

We have received a number of questions regarding Digital Mental Health Treatment (DMHT), Remote Physiologic Monitoring (RPM), and Remote Therapeutic Monitoring (RTM) services and the applicability of the telehealth rules. We would like to clarify that these services, which are inherently non-face-to-face, do not meet the definitions of 1834(m) of the Act, fall outside the scope of the definition of Medicare telehealth service, and do not meet step 2 of our review process. These services are not subject to section 1834(m) of the Act.

(9) Services Requested To Be Transitioned From Provisional to Permanent

We received a number of submissions requesting for services on the Medicare Telehealth Services List designated as ''provisional'' to be designated as ''permanent.'' If our proposal to eliminate these designations is finalized, these codes will remain on the Medicare Telehealth Services List. If not, rather than selectively adjudicating only those services for which we received requests for potential permanent status, we believe it would be appropriate to complete a comprehensive analysis of all provisional codes currently on the Medicare Telehealth Services List before determining which codes should be made permanent. We are therefore proposing to not making determinations to recategorize provisional codes as permanent at this time. For CY 2026, we propose to revise the Medicare Telehealth Services criteria. We propose to remove steps 4 and 5 from the review process. Using these revised criteria, we propose to add 5 new codes to the Medicare Telehealth Services list that are not on the CY 2025 Medicare Telehealth Services list. After consideration of the priorities discussed above, we believe that these proposed policies will increase the flexibility for physicians or other practitioners to exercise their complex professional judgment, factoring in patient safety considerations, and for flexibility for patients to choose the modality of care in which to receive services. The services we propose adding to the Medicare Telehealth Services List are listed in Table A–D2.

(10) Deleted Services

In section II.I. of this proposed rule, we proposed to delete HCPCS code G0136. This code is currently on the Medicare Telehealth Services List, so it will also be deleted from the list if finalized.

TABLE 9: SERVICES PROPOSED FOR ADDITION TO THE MEDICARE TELEHEALTH SERVICES LIST FOR CY 2026

Category	HCPCS	Short Descriptor
Multiple-Family Group Psychotherapy	90849	Multiple family group psytx

	92623	Dx aly aud oi snd prcsr each

d. Frequency Limitations on Medicare Telehealth Subsequent Care Services in Inpatient and Nursing Facility Settings, and Critical Care Consultations

When adding some services to the Medicare Telehealth Services List in the past, we have included certain frequency restrictions on how often physicians and other practitioners may furnish the service via telehealth. These include a limitation of one subsequent hospital care service furnished through telehealth every three days, added in the CY 2011 PFS final rule (75 FR 73317 through 73318), one subsequent nursing facility visit furnished through telehealth every 14 days, added in the CY 2011 PFS final rule (75 FR 73318), and one critical care consultation service furnished through telehealth per day, added in the CY 2017 final rule (81 FR 80198). In establishing these limits, we cited concerns regarding these patients' potential acuity and complexity.

We temporarily removed these frequency restrictions during the PHE for COVID–19. In the March 31, 2020 COVID–19 interim final rule with comment period (IFC) (85 FR 19241), we stated that we did not believe the frequency limitations for certain subsequent inpatient visits, subsequent NF visits, and critical care consultations furnished via Medicare telehealth were appropriate or necessary for the duration of the PHE because this would have been a patient population who would have otherwise not had access to clinically appropriate in-person treatment. Although the frequency limitations resumed effect on May 12,

2023 (upon expiration of the PHE), through enforcement discretion during the remainder of CY 2023 and notice-and-comment rulemaking for CY 2024 and CY 2025, Medicare telehealth frequency limitations were suspended for CY 2025 (89 FR 97758 through 97760) for certain subsequent inpatient visits, subsequent NF visits, and critical care consultations.

In the CY 2024 (88 FR 78877) and CY 2025 PFS final rules (89 FR 97758 through 97760), we solicited comments from interested parties on how physicians and other practitioners have been ensuring that Medicare beneficiaries receive subsequent inpatient and nursing facility visits, as well as critical care consultation services since the expiration of the PHE. As discussed in those final rules, many commenters supported permanently removing these frequency limitations, stating that they are arbitrary and re-imposing the limitations would result in decreased access to care; that physicians and other practitioners should be allowed to use their professional judgment to determine the type of visit, how many visits, and the type of treatment that is the best fit for the patient so long as the standard of care is met; and that lifting these limitations during the PHE has been instructive and demonstrates the value of continuing such flexibilities. Some commenters did not support removing these frequency limitations, citing patient acuity and safety. However, our analysis of claims data from 2020 to 2023 indicates that the volume of services that would be affected by implementing these limitations is relatively low; in other words, these services are not being furnished via telehealth with such frequency that, if the frequency limits were in place, they would be met or exceeded very often or for many beneficiaries. Claims data from 2020 to 2023 suggest that less than five percent of beneficiaries who received one or more of these services (subsequent care services in inpatient and nursing facility settings, and critical care consultations) received them as telehealth services. In addition, we have solicited comments on this policy for two years and have received overwhelming support for continuing this flexibility, with minimal commenters not supporting the removal of frequency limitations.

We believe that physicians and other practitioners, who have the greatest familiarity and insight into the needs of individual beneficiaries, can use their complex professional judgment to determine whether they can safely furnish a service via telehealth, given the entirety of the circumstances, including the clinical profile and needs of the beneficiary, to determine the appropriate service modality. We strive to balance the goals of increasing physician or practitioner and patient choice of service modality with consideration of patient safety for all Medicare beneficiaries. As technology advances and more services may be safely furnished via telehealth and paid under the PFS, it is increasingly important for physicians and other practitioners to exercise their professional judgment in determining the generally appropriate service modality for their patients to receive a service. Notably, the removal of these frequency limitations does not mean that these services are appropriate to be furnished via telehealth to every Medicare beneficiary in every clinical scenario—as always, the physician or practitioner should use his or her complex professional judgment to determine the appropriate service modality on a case-by-case basis.

We are proposing to permanently remove frequency limitations on furnishing these services via telehealth for the following codes relating to Subsequent Inpatient Visits, Subsequent Nursing Facility Visits, and Critical Care Consultation Services:

1. Subsequent Inpatient Visit CPT Codes:

- 99231 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.*);
- 99232 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. when using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.*); *and*
- 99233 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. when using total time on the date of the encounter for code selection, 50 minutes must be met or exceeded.*)

2. Subsequent Nursing Facility Visit CPT Codes:

- 99307 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. when using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.*);
- 99308 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 15 minutes must be met or exceeded.*);
- 99309 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. when using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.*); and
- 99310 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. when using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.*)

3. Critical Care Consultation Services: HCPCS Codes

- G0508 (*Telehealth consultation, critical care, initial, physicians typically spend 60 minutes communicating with the patient and providers via telehealth.*); and
- G0509 (*Telehealth consultation, critical care, subsequent, physicians typically spend 50 minutes communicating with the patient and providers via telehealth.*)

We are seeking comments on these proposals, specifically additional information regarding potential concerns about patient safety and quality of care.

2. Other Non-Face-to-Face Services Involving Communications Technology Under the PFS

a. Direct Supervision via Use of Two-Way Audio/Video Communications Technology

Under Medicare Part B, certain types of services, including diagnostic tests described under § 410.32 and services incident to a physician's (or other practitioner's) professional service described under § 410.26 (incident-to services), are required to be furnished under specific minimum levels of supervision by a physician or other practitioner. We define three levels of supervision in our regulation at

§ 410.32(b)(3): General Supervision, Direct Supervision, and Personal Supervision. Notwithstanding the temporary measures implemented in response to the PHE for COVID–19 and extended thereafter, direct supervision has historically required the physician (or other supervising practitioner) to be present in the office suite and immediately available to furnish assistance and direction throughout the performance of the service. It has not historically been interpreted as mean that the physician (or other supervising practitioner) must be present in the room when the service is performed. Again, notwithstanding the temporary measures implemented in response to the PHE for COVID–19 and extended thereafter, we have historically established this ''immediate availability'' requirement to mean in-person, physical, not virtual, availability (see the April 6, 2020 IFC (85 FR 19245) and the CY 2022 PFS final rule (86 FR 65062)).

Direct supervision is required for various types of services, including most incident-to-services under § 410.26, many diagnostic tests under § 410.32, pulmonary rehabilitation services under § 410.47, cardiac rehabilitation and intensive cardiac rehabilitation services under § 410.49, and certain hospital outpatient services as provided under § 410.27(a)(1)(iv). In the March 31, 2020 COVID–19 IFC, we amended the definition of ''direct supervision'' for the duration of the PHE for COVID–19 (85 FR 19245 through 19246) at § 410.32(b)(3)(ii) to state that the necessary presence of the physician (or other practitioner) for direct supervision includes virtual presence through audio/video real-time communications technology. Instead of requiring the supervising physician's (or other practitioner's) physical presence, the amendment permitted a supervising physician (or other practitioner) to be considered ''immediately available'' through virtual presence using two-way, real-time audio/visual technology for diagnostic tests, incident-to services, pulmonary rehabilitation services, and cardiac and intensive cardiac rehabilitation services. We made similar amendments at § 410.27(a)(1)(iv) to specify that direct supervision for certain hospital outpatient services may include virtual presence through audio/video real-time communications. The CY 2021 PFS final rule (85 FR 84538 through 84540), CY 2024 PFS final rule (88 FR 78878), and CY 2025 PFS Final rule (89 FR 97764) subsequently extended these policies through December 31, 2025.

In the CY 2024 PFS proposed rule, we solicited comments on whether we should consider extending the definition of direct supervision to permit virtual presence beyond December 31, 2024. Specifically, we stated we were interested in input from interested parties on potential patient safety or quality concerns when direct supervision occurs virtually; for instance, if virtual direct supervision of certain types of services is more or less likely to present patient safety concerns, or if this flexibility would be more appropriate for certain types of services, or when certain types of auxiliary personnel are performing the supervised service. We stated we were also interested in potential program integrity concerns such as overutilization or fraud and abuse that interested parties may have in regard to this policy (88 FR 52302). As discussed in the CY 2024 PFS final rule (88 FR 78878), in the absence of evidence that patient safety is compromised by virtual direct supervision, we were concerned about an abrupt transition to our pre-PHE policy that defines direct supervision to require the physical presence of the supervising practitioner. We noted that an immediate reversion to the pre-PHE definition of direct supervision would prohibit virtual direct supervision, which may present a barrier to access to many services, such as incident-to-services, and that physicians and/or other supervising practitioners, in certain instances, would need time to reorganize their practice patterns established during the PHE to reimplement the pre-PHE approach to direct supervision without the use of audio/video technology. We acknowledged the utilization of this flexibility and recognize that many practitioners have stressed the importance of maintaining it. This flexibility has been available and widely utilized since the beginning of the PHE, and we recognized that it may enhance patient access.

In the CY 2025 PFS final rule (89 FR 97763), we acknowledged the utilization of this flexibility and stated we recognized that many practitioners have stressed the importance of maintaining it but were seeking additional information regarding potential patient safety and quality of care concerns. Given the importance of certain services being furnished under direct supervision in ensuring quality of care and patient safety, and in particular the ability of the supervising practitioner to intervene if complications arise, we stated that we believed an incremental approach is warranted, particularly in instances where unexpected or adverse events may arise for procedures which may be riskier or more intense. In light of these potential safety and quality of care implications, and exercising an abundance of caution, we finalized the revision of the regulation at § 410.26(a)(2) to state that for the following services furnished after December 31, 2025, the presence of the physician (or other practitioner) required for direct supervision shall continue to include virtual presence through audio/video real-time communications technology (excluding audio-only): services furnished incident to a physician's service when they are provided by auxiliary personnel employed by the physician and working under his or her direct supervision and for which the underlying HCPCS code has been assigned a PC/TC indicator of '5'; and services described by CPT code 99211 (office and other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional).

In response to overwhelming support and requests to extend this policy permanently for a wider set of services than the ones that were finalized in the CY 2025 PFS Final Rule, we are proposing to continue to build on this incremental approach to allow certain services to be furnished under direct supervision that allows ''immediate availability'' of the supervising practitioner using audio/video real-time communications technology (excluding audio-only). We are proposing to permanently adopt a definition of direct supervision that allows ''immediate availability'' of the supervising practitioner using audio/video real-time communications technology (excluding audio-only), for all services described under § 410.26, except for services that have a global surgery indicator of 010 or 090. This information can be found in the PFS PPRVU public use file (*https://www.cms.gov/medicare/payment/fee-schedules/physician/pfs-relative-value-files*). These global surgery indicators are defined in IOM Pub. 100–04, chapter 23, section 50.6 as 010 ''Minor procedure with preoperative relative values on the day of the procedure and postoperative relative values during a 10-day postoperative period included in the fee schedule amount; evaluation and management services on the day of the procedure and during this 10-day postoperative period generally not payable'' and 090 ''Major surgery with a 1-day preoperative period and 90-day postoperative period included in the fee schedule payment amount.'' The

purpose of excluding these services is to ensure the quality of care and patient safety, and in particular, the ability of the supervising practitioner to intervene if complications arise, particularly in complex, high-risk instances where unexpected or adverse events may occur or for procedures that may be riskier or more intense where a patient's clinical status can quickly change. For such services, in-person supervision would be necessary to allow for rapid on-site decision-making in the event of an adverse clinical situation.

We would like to note that, similar to our guidance above regarding Medicare Telehealth services, our proposed definition of direct supervision (allowing ''immediate availability'' of the supervising practitioner using audio/video real-time communications technology (excluding audio-only) for all services described under § 410.26, except for services that have a global surgery indicator of 010 or 090), does not mean that it is appropriate to allow virtual presence for every service for every Medicare beneficiary in every clinical scenario. As always, the physician or practitioner should use his or her complex professional judgment to determine the appropriate supervision modality on a case-by-case basis.

We are proposing to revise the regulation at § 410.26(a)(2) to state that the presence of the physician (or other practitioner) required for direct supervision may include virtual presence through audio/video real-time communications technology (excluding audio-only) for services without a 010 or 090 global surgery indicator.

We are proposing to revise the regulations at § 410.32(b)(3)(ii) to state that the presence of the physician (or other practitioner) may include virtual presence through audio/video real-time communications technology (excluding audio-only) for services without a 010 or 090 global surgery indicator.

We note that because to the definition of direct supervision applicable to cardiac, pulmonary, and intensive cardiac rehabilitation services relies on the definition of direct supervision set forth at § 410.32(b)(3)(ii), the definition of direct supervision for these services would similarly be modified to include virtual presence through audio/video real-time communications technology (excluding audio-only) for services without a 010 or 090 global surgery indicator. We are seeking comment on applying this definition to the applicable services under § 410.32 and the applicable cardiac, pulmonary, and intensive cardiac rehabilitation services.

We are seeking comment on whether to adopt a definition of direct supervision that allows ''immediate availability'' of the supervising practitioner using audio/video real-time communications technology (excluding audio-only), for all services described under § 410.26, except for services that have a 000, 010, or 090 global surgery indicator. For each of these proposals, we are also seeking additional information regarding potential concerns about patient safety and quality of care for services that have a 000 global surgery indicator and if it is necessary to exclude these services from allowing the presence of the physician (or other practitioner) to include virtual presence through audio/video real-time communications technology (excluding audio-only). Global surgery indicator 000 is defined in IOM Pub. 100–04, chapter 23, section 50.6 as ''Endoscopic or minor procedure with related preoperative and postoperative relative values on the day of the procedure only included in the fee schedule payment amount; evaluation and management services on the day of the procedure generally not payable''. We believe that these services, which have no minimum postoperative period, do not have the same potential patient safety risk that services with a 010 or 090 global surgery indicator may have. We are seeking comments on these proposals.

b. Proposed Changes to Teaching Physicians' Billing for Services Involving Residents With Virtual Presence

As discussed in the CY 2025 PFS final rule (89 FR 97764 through 97765), in the CY 2021 PFS final rule (85 FR 84577 through 84585), we established a policy that after the end of the PHE for COVID–19, teaching physicians may meet the requirements set forth at § 1842(b)(7)(A)(i)(I) to be present for the key or critical portions of services when furnished involving residents through audio/video real-time communications technology (virtual presence), but only for services furnished in residency training sites located outside of OMB-defined metropolitan statistical areas (MSAs). We made this location distinction consistent with our longstanding interest in increasing beneficiary access to Medicare-covered services in rural areas. We noted that this policy provides the ability to expand training opportunities for residents in rural settings. For all other locations, we expressed concerns that continuing to permit teaching physicians to bill for services furnished involving residents when they are virtually present, outside the conditions of the PHE for COVID–19, may not allow the teaching physician to have personal oversight and involvement over the management of the portion of the case for which the payment is sought, under section 1842(b)(7)(A)(i)(I) of the Act. In addition, we stated concerns about patient populations that may require a teaching physician's experience and skill to recognize specialized needs or testing and whether it is possible for the teaching physician to meet these clinical needs while having a virtual presence for the key portion of the service. We refer readers to the CY 2021 PFS final rule (85 FR 84577 through 84584) for a more detailed description of our specific concerns. At the end of the PHE for COVID–19, and as finalized in the CY 2021 PFS final rule, we intended for the teaching physician to have a physical presence during the key portion of the service personally provided by residents to be paid for the service under the PFS, in locations that were within an MSA. This policy applied to all services, regardless of whether the patient was co-located with the resident or for services provided virtually (for example, the service was furnished as a 3-way telehealth visit, with the teaching physician, resident, and patient in different locations). However, interested parties expressed concerns regarding the requirement that the teaching physician be physically present with the resident when a service is furnished virtually (as a Medicare telehealth service) within an MSA. Some interested parties stated that during the PHE for COVID–19, when residents provided telehealth services, and the teaching physician was virtually present, the same safe and high-quality oversight was provided as when the teaching physician and resident were physically co-located. In addition, these interested parties stated that during telehealth visits, the teaching physician was virtually present during the key and critical portions of the telehealth service, available immediately in real-time, and had access to the electronic health record. After reviewing the public comments, we finalized a temporary policy that allowed the teaching physician to have a virtual presence in all teaching settings, but only in clinical instances when the service was furnished virtually (for example, a 3-way telehealth visit, with all parties in separate locations). This permitted teaching physicians to have a virtual presence during the key portion of the Medicare telehealth service for which payment was sought, through audio/video real-time communications technology, in all residency training locations through December 31, 2024.

As stated in the CY 2025 PFS final rule (89 FR 97765), we were concerned that an abrupt transition to our pre-PHE policy may present a barrier to access to many services. We also understood that teaching physicians gained clinical experience providing services involving residents with virtual presence during the PHE for COVID–19 and could help us to identify circumstances where the teaching physician can routinely provide sufficient personal and identifiable services to the patient through their virtual presence during the key portion of the Medicare telehealth service. We sought comments and information to help us consider other clinical treatment situations where it may be appropriate to continue to permit the virtual presence of the teaching physician, while continuing to support patient safety, meeting the clinical needs for all patients and ensuring burden reduction without creating risks to patient care or increasing opportunities for fraud.

As summarized in the CY 2025 PFS final rule (89 FR 97764 through 97765), commenters encouraged us to establish this policy permanently and include in -person services to promote access to care, stated that teaching physicians should be allowed to determine when their virtual presence would be clinically appropriate, based on their assessment of the patient's needs and the competency level of the resident. While we continue to consider clinical scenarios where it may be appropriate to permit the virtual presence of the teaching physician, we are proposing to transition back to our pre-PHE policy, which would maintain the rural exception established in the CY 2021 PFS final rule recognizing the unique challenges and importance of expanding medical education opportunities in rural settings. We are not proposing to extend our current policy to allow teaching physicians to have a virtual presence for purposes of billing for services furnished involving residents in all teaching settings through December 31, 2025, but only when the service is furnished virtually (for example, a 3-way telehealth visit, with the patient, resident, and teaching physician in separate locations). As always, documentation in the medical record must continue to demonstrate whether the teaching physician was physically present or present through audio/video real-time communications technology at the time of the Medicare telehealth service, which includes documenting the specific portion of the service for which the teaching physician was present through audio/video real-time communications technology.

As discussed in earlier in this proposed rule, we are concerned that continuing to permit teaching physicians to bill for services furnished involving residents when they are virtually present, outside the conditions of the PHE for COVID–19, may not allow the teaching physician to have personal oversight and involvement over the management of the portion of the case for which the payment is sought in accordance with section 1842(b)(7)(A)(i)(I) of the Act. Therefore, we now believe that permitting Medicare payment to continue for this PHE flexibility is no longer necessary. This proposal to not extend our current policy to allow teaching physicians to have a virtual presence for services furnished virtually aligns with our statutory obligations under section 1842(b)(7)(A)(i)(I) of the Act, which requires teaching physicians to provide appropriate oversight and personal involvement in resident-furnished services for which Medicare payment is sought.

Under this proposal, for services provided within MSAs, physicians must maintain physical presence during critical portions of all resident-furnished services to qualify for Medicare payment, not just in-person services, ensuring consistent oversight standards. Documentation requirements remain rigorous, with medical records needing to clearly demonstrate the teaching physician's physical presence during key service portions. However, as we discussed earlier in this proposed rule, recognizing the unique challenges faced by rural healthcare providers, we maintain flexibility for services provided outside MSAs. In these rural settings, teaching physicians may continue utilizing audio/video real-time communications technology to fulfill the presence requirement, provided they maintain active, real-time observation and participation in the service. This geographical distinction aligns with our longstanding commitment to enhancing Medicare beneficiary access to covered services in rural areas.

The proposed to not extend flexibilities for virtual services would not impact teaching physicians' ability to provide virtual supervision of residents for educational purposes. Teaching physicians retain the discretion to provide greater involvement in resident-furnished services and may determine when virtual presence is appropriate based on the specific services and the experience level of the residents involved.

3. Telehealth Originating Site Facility Fee Payment Amount Update

Section 1834(m)(2)(B) of the Act established the Medicare telehealth originating site facility fee for telehealth services furnished from October 1, 2001 through December 31, 2002 at $20.00, and specifies that, for telehealth services furnished on or after January 1 of each subsequent calendar year, the telehealth originating site facility fee is increased by the percentage increase in the Medicare Economic Index (MEI) as defined in section 1842(i)(3) of the Act. The proposed percentage increase in the MEI for CY 2026 is 2.7 percent and is based on the expected historical percentage increase of the 2017-based MEI. For the final rule, we propose to update the MEI increase for CY 2026 based on historical data through the second quarter of 2025. Therefore, for CY 2026, the proposed payment amount for HCPCS code Q3014 (*Telehealth originating site facility fee*) is $31.85. Table 10 shows the Medicare telehealth originating site facility fee and the corresponding MEI percentage increase for each applicable time period.

TABLE 10: THE MEDICARE TELEHEALTH ORIGINATING SITE FACILITY FEE

Time Period	MEI (%)	Facility Fee for Q3014
Oct. 1, 2001 to Dec. 31, 2002	NA	$20.00
2003	3.0	$20.60
2004	2.9	$21.20
2005	3.1	$21.86
2006	2.8	$22.47
2007	2.1	$22.94
2008	1.8	$23.35
2009	1.6	$23.72
2010	1.2	$24.00
2011	0.4	$24.10
2012	0.6	$24.24
2013	0.8	$24.43
2014	0.8	$24.63
2015	0.8	$24.83
2016	1.1	$25.10
2017	1.2	$25.40
2018	1.4	$25.76
2019	1.5	$26.15
2020	1.9	$26.65
2021	1.4	$27.02
2022	2.1	$27.59
2023	3.8	$28.64
2024	4.6	$29.96
2025	3.56	$31.01
2026*	2.7	$31.85

*Reflects the most recent estimate of the CY 2026 MEI percentage increase and will be updated in the final rule based on historical data through the second quarter of 2025.

E. Valuation of Specific Codes

1. Background: Process for Valuing New, Revised, and Potentially Misvalued Codes

Establishing valuations for newly created and revised CPT codes is a routine part of maintaining the PFS. Since the inception of the PFS, it has also been a priority to revalue services regularly to make sure that the payment rates reflect the changing trends in the practice of medicine and current prices for inputs used in the PE calculations. Initially, this was accomplished primarily through the 5-year review process, which resulted in revised work RVUs for CY 1997, CY 2002, CY 2007, and CY 2012, and revised PE RVUs in CY 2001, CY 2006, and CY 2011, and revised MP RVUs in CY 2010, CY 2015, and CY 2020. Under the 5-year review process, revisions in RVUs were proposed and finalized via rulemaking. In addition to the 5-year reviews, beginning with CY 2009, CMS and the RUC identified a number of potentially misvalued codes each year using various identification screens, as outlined in section II.C. of this proposed rule, Potentially Misvalued Services under the PFS. Historically, when we received RUC recommendations, our process had been to establish interim final RVUs for the potentially misvalued codes, new codes, and any other codes for which there were coding changes in the final rule with comment period for a year. Then, during the 60-day period following the publication of the final rule with comment period, we accepted public comments about those valuations. For services furnished during the calendar year following the publication of interim final rates, we paid for services based upon the interim final values established in the final rule. In the final rule with comment period for the subsequent year, we considered and responded to public comments received on the interim final values and typically made any appropriate adjustments and finalized those values.

In the CY 2015 PFS final rule with comment period (79 FR 67547), we finalized a new process for establishing values for new, revised and potentially misvalued codes. Under the new process, we include proposed values for these services in the proposed rule, rather than establishing them as interim final in the final rule with comment period. Beginning with the CY 2017 PFS proposed rule (81 FR 46162), the new process was applicable to all codes, except for new codes that describe truly new services. For CY 2017, we proposed new values in the CY 2017 PFS proposed rule for the vast majority of new, revised, and potentially misvalued codes for which we received complete RUC recommendations by February 10, 2016. To complete the transition to this new process, for codes for which we established interim final values in the CY 2016 PFS final rule with comment period (81 FR 80170), we reviewed the comments received during the 60-day public comment period following release of the CY 2016 PFS final rule with comment period (80 FR 70886), and re-proposed values for those codes in the CY 2017 PFS proposed rule. We considered public comments received during the 60-day public comment period for the proposed rule before establishing final values in the CY 2017 PFS final rule. As part of our established process, we will adopt interim final values only in the case of wholly new

services for which there are no predecessor codes or values and for which we do not receive recommendations in time to propose values.

As part of our obligation to establish RVUs for the PFS, we thoroughly review and consider available information including recommendations and supporting information from the RUC, the Health Care Professionals Advisory Committee (HCPAC), public commenters, medical literature, Medicare claims data, comparative databases, comparison with other codes within the PFS, as well as consultation with other physicians and healthcare professionals within CMS and the Federal Government as part of our process for establishing valuations. Where we concur that the RUC's recommendations, or recommendations from other commenters, are reasonable and appropriate and are consistent with the time and intensity paradigm of physician work, we proposed those values as recommended. Additionally, we continually engage with interested parties, including the RUC, regarding our approach for accurately valuing codes, and as we prioritize our obligation to value new, revised, and potentially misvalued codes. We continue to welcome feedback from all interested parties regarding valuation of services for consideration through our rulemaking process.

2. Methodology for Establishing Work RVUs

a. Background

For each code identified in this section, we conduct a review that includes the current work RVU (if any), RUC-recommended work RVU, intensity, time to furnish the preservice, intraservice, and postservice activities, as well as other components of the service that contribute to the value. Our reviews of recommended work RVUs and time inputs generally include, but have not been limited to, a review of information provided by the RUC, the HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, consultation with other physicians and health care professionals within CMS and the Federal Government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). When referring to a survey, unless otherwise noted, we mean the surveys conducted by specialty societies as part of the formal RUC process.

Components that we use in the building block approach may include preservice, intraservice, or postservice time and post-procedure visits. When referring to a bundled CPT code, the building block components could include the CPT codes that make up the bundled code and the inputs associated with those codes. We use the building block methodology to construct, or deconstruct, the work RVU for a CPT code based on component pieces of the code. Magnitude estimation refers to a methodology for valuing work that determines the appropriate work RVU for a service by gauging the total amount of work for that service relative to the work for a similar service across the PFS without explicitly valuing the components of that work. In addition to these methodologies, we frequently utilize an incremental methodology in which we value a code based upon its incremental difference between another code and another family of codes. Section 1848(c)(1)(A) of the Act specifically defines the work component as the resources that reflect time and intensity in furnishing the service. Also, the published literature on valuing work has recognized the key role of time in overall work. For particular codes, we refine the work RVUs in direct proportion to the changes in the best information regarding the time resources involved in furnishing particular services, either considering the total time or the intraservice time.

Several years ago, to aid in the development of preservice time recommendations for new and revised CPT codes, the RUC created standardized preservice time packages. The packages include preservice evaluation time, preservice positioning time, and preservice scrub, dress and wait time. Currently, there are preservice time packages for services typically furnished in the facility setting (for example, preservice time packages reflecting the different combinations of straightforward or difficult procedure, and straightforward or difficult patient). Currently, there are three preservice time packages for services typically furnished in the nonfacility setting.

We developed several standard building block methodologies to value services appropriately when they have common billing patterns. In cases where a service is typically furnished to a beneficiary on the same day as an E/M service, we believe that there is overlap between the two services in some of the activities furnished during the preservice evaluation and postservice time. Our longstanding adjustments have reflected a broad assumption that at least one-third of the work time in both the preservice evaluation and postservice period is duplicative of work furnished during the E/M visit.

Accordingly, in cases where we believe that the RUC has not adequately accounted for the overlapping activities in the recommended work RVU and/or times, we adjust the work RVU and/or times to account for the overlap. The work RVU for a service is the product of the time involved in furnishing the service multiplied by the intensity of the work. Preservice evaluation time and postservice time both have a long-established intensity of work per unit of time (IWPUT) of 0.0224, which means that 1 minute of preservice evaluation or postservice time equates to 0.0224 of a work RVU.

Therefore, in many cases when we remove 2 minutes of preservice time and 2 minutes of postservice time from a procedure to account for the overlap with the same day E/M service, we also remove a work RVU of 0.09 (4 minutes $\times$ 0.0224 IWPUT) if we do not believe the overlap in time had already been accounted for in the work RVU. The RUC has recognized this valuation policy and, in many cases, now addresses the overlap in time and work when a service is typically furnished on the same day as an E/M service.

The following paragraphs discuss our approach to reviewing RUC recommendations and developing proposed values for specific codes. When they exist, we also include a summary of interested party reactions to our approach. We noted that many commenters and interested parties have expressed concerns over the years with our ongoing adjustment of work RVUs based on changes in the best information we had regarding the time resources involved in furnishing individual services. We have been particularly concerned with the RUC's and various specialty societies' objections to our approach given the significance of their recommendations to our process for valuing services and since much of the information we used to make the adjustments is derived from their survey process. We note that we are obligated under the statute to

consider both time and intensity in establishing work RVUs for PFS services. As explained in the CY 2016 PFS final rule with comment period (80 FR 70933), we recognize that adjusting work RVUs for changes in time is not always a straightforward process, so we have applied various methodologies to identify several potential work values for individual codes.

We observed that for many codes reviewed by the RUC, recommended work RVUs have appeared to be incongruous with recommended assumptions regarding the resource costs in time. This has been the case for a significant portion of codes for which we recently established or proposed work RVUs that are based on refinements to the RUC-recommended values. When we adjusted work RVUs to account for significant changes in time, we started by looking at the change in the time in the context of the RUC-recommended work RVU. When the recommended work RVUs do not appear to account for significant changes in time, we employed the different approaches to identify potential values that reconcile the recommended work RVUs with the recommended time values. Many of these methodologies, such as survey data, building block, crosswalks to key reference or similar codes, and magnitude estimation have long been used in developing work RVUs under the PFS. In addition to these, we sometimes use the relationship between the old-time values and the new time values for particular services to identify alternative work RVUs based on changes in time components.

In so doing, rather than ignoring the RUC-recommended value, we used the recommended values as a starting reference and then applied one of these several methodologies to account for the reductions in time that we believe were not otherwise reflected in the RUC-recommended value. If we believe that such changes in time are already accounted for in the RUC's recommendation, then we do not make such adjustments. Likewise, we do not arbitrarily apply time ratios to current work RVUs to calculate proposed work RVUs. We use the ratios to identify potential work RVUs and consider these work RVUs as potential options relative to the values developed through other options.

We do not imply that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs. Instead, we believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs. If the RUC's recommendation has appeared to disregard or dismiss the changes in time, without a persuasive explanation of why such a change should not be accounted for in the overall work of the service, then we generally used one of the aforementioned methodologies to identify potential work RVUs, including the methodologies intended to account for the changes in the resources involved in furnishing the procedure.

Several interested parties, including the RUC, have expressed general objections to our use of these methodologies and suggested that our actions in adjusting the recommended work RVUs are inappropriate; other interested parties have also expressed general concerns with CMS refinements to RUC-recommended values in general. In the CY 2017 PFS final rule (81 FR 80272 through 80277), we responded in detail to several comments that we received regarding this issue. In the CY 2017 PFS proposed rule (81 FR 46162), we requested comments regarding potential alternatives to making adjustments that would recognize overall estimates of work in the context of changes in the resource of time for particular services; however, we did not receive any specific potential alternatives. As described earlier in this section, crosswalks to key reference or similar codes are one of the many methodological approaches we employed to identify potential values that reconcile the RUC-recommended work RVUs with the recommended time values when the RUC-recommended work RVUs did not appear to account for significant changes in time.

In response to comments, in the CY 2019 PFS final rule (83 FR 59515), we clarified that terms ''reference services'', ''key reference services'', and ''crosswalks'' as described by the commenters are part of the RUC's process for code valuation. These are not terms that we created, and we do not agree that we necessarily must employ them in the identical fashion for the purposes of discussing our valuation of individual services that come up for review. However, in the interest of minimizing confusion and providing clear language to facilitate feedback from interested parties, we stated that we would seek to limit the use of the term, ''crosswalk,'' to those cases where we are making a comparison to a CPT code with the identical work RVU. (83 FR 59515) We note that we also occasionally make use of a ''bracket'' for code valuation. A ''bracket'' refers to when a work RVU falls between the values of two CPT codes, one at a higher work RVU and one at a lower work RVU.

We look forward to continuing to engage with interested parties and commenters, including the RUC, as we prioritize our obligation to value new, revised, and potentially misvalued codes; and we will continue to welcome feedback from all interested parties regarding valuation of services for consideration through our rulemaking process. We refer readers to the detailed discussion in this section of the valuation considered for specific codes. Table 19 contains a list of codes and descriptors for which we are proposing work RVUs for CY 2026; this includes all codes for which we received RUC recommendations by February 10, 2025. The proposed work RVUs, work time and other payment information for all CY 2026 payable codes are available on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-ServicePayment/PhysicianFeeSched/index.html*).

b. Proposed Efficiency Adjustment

(1) Background

CMS has historically relied on survey data provided by the American Medical Association (AMA)/Specialty Society Relative Value Scale (RVS) Update Committee (referred to as the RUC) to estimate practitioner time, work intensity, and practice expense for the purpose of establishing RVUs for the codes used for payment under the PFS. As described in section II.C. of this proposed rule, CMS regularly revalues codes as part of its potentially misvalued codes initiative, as required by section 1848(c)(2)(K) of the Act, using RUC survey data that shows clinicians' estimates of how long a particular service takes to complete. In the CY 2025 PFS final rule, we summarized public comments that we had received expressing concerns with using RUC data as a source of valuation and identifying a need for empirical data in the context of valuing advanced primary care management services (89 FR 97898). In response to these comments, we indicated that we were open to alternative recommendations for how to price these and other services, and that we would consider all options presented to us with a preference for information with empirical evidence behind it. We also reminded commenters that we do not exclusively rely on RUC recommendations and can

receive data and recommendations from other outside sources as well.

The limits of survey data are in part based on the nature of the surveys. There have been longstanding concerns about the use of surveys that have low response rates, low total number of responses, and a large range in responses, all of which may undermine the accuracy of recommendations relying on survey data.[33] For example, a Government Accountability Office (GAO) Report found that the median number of responses to surveys administered by the RUC for payment year 2015 was 52, the median response rate was only 2.2 percent, and 23 of the 231 surveys had under 30 respondents. Another study conducted compared operative times in the National Surgical Quality Improvement Project to RUC survey times, adjusted for patient variables, and found a wide variation in the median RVU per hour ratio for 11 surgical specialties, with the highest specialties overreporting (via RUC values) by 27 and 23 minutes per case. All surgical specialties showed overreporting in RUC survey times compared to operative times. This resulted in high RVU per hour payments for surgeons in those specialties.[34]

With such low response rates, we are concerned that those practitioners who respond to the RUC surveys may be fundamentally different than those clinicians who do not respond to the surveys. Widely read journals, such as the Journal for the American Medical Association, specify that for submitting authors, ''survey studies should have sufficient response rates (generally greater than or equal to 60%), and appropriate characterization of nonresponders to ensure that nonresponse bias does not threaten the validity of the findings.'' [35] The GAO report noted that the RUC has undertaken steps to mitigate the effects of possible biases; however, the report goes on to describe the potential conflicts of interest survey respondents may have, as those that serve Medicare beneficiaries would benefit from an increase in the relative values for the services they perform.[36] Another component of these surveys is the selection of another service code that is similar to the service in question. Since there are so many procedure, radiology, and diagnostic test codes, the selection of a high-valued service for potential comparisons, either by the specialty society administering the survey, or by respondents, could further bias results. Additionally, RUC surveys contain clinical vignettes, and expert reviewers have raised concerns that these clinical vignettes are not typical and thus may lead to biased recommendations that usually overinflate time spent on the service.[37] And as detailed in section II.B. of this proposed rule, we further articulate the particular challenges of using the recently completed PPI survey data, including the quality of the data, sampling variation, and lack of comparability to previous survey data—similar challenges that we have experienced over time with surveys estimating the time and work intensity of individual services, used to establish the work RVUs. CMS has historically had to rely on survey data due to a lack of other more reliable sources of information, but in recent years many new methods to identify empiric inputs used in valuation have been developed.[38]

In the CY 2024 PFS proposed rule (88 FR 78975 through 78982), we requested comments on how we may evaluate E/M services more regularly and comprehensively. We raised specific questions for commenters to consider, including whether the methods used by the RUC and CMS were appropriate to accurately value E/M and other HCPCS codes, and we requested that commenters provide specific recommendations on improving data collection and making better evidence-based and more accurate payments for E/M and other services. In response, as we summarized in the CY 2024 PFS final rule (88 FR 78977), commenters stated that the methods used do not lead to accurate valuation and that the problems lie with the nature of E/M services and the PFS's budget neutrality adjustment. They stated that the resources used in furnishing the work portion of E/M services are primarily a function of the time the clinician spends with the patient and, therefore, are not amenable to efficiency gains and that the valuation process is not responsive to efficiency gains, leading to passive devaluation of E/M services under the constraints of budget neutrality. At the time, we responded that we recognized that there are opportunities to improve how all services are valued and better account for resource variation for different types of care under the PFS.

For several years, we have been concerned about not accounting for the efficiencies gained in work RVUs for non-time-based services. As we discuss below, non-time-based codes, such as codes describing procedures, radiology services, and diagnostic tests, should become more efficient as they become more common, professionals gain more experience, technology is improved, and other operational improvements (including but not limited to enhancements in procedural workflows) are implemented. We would highlight, however, that there are often many years between a code's introduction and revaluation within the RUC process, with only a few hundred out of the more than 9,000 codes paid under the PFS considered for revaluation annually by the RUC. While there is significant variability in how often codes are reviewed by the RUC, on average, CMS estimates that there are 25.49 years since a code valuation has been reviewed by the RUC (this includes 5382 out of 9970 codes which were never reviewed). When we exclude from the average those codes that have never been reviewed, the average is 17.69 years since the last review of a code by the RUC. We note that these numbers weight each code equally and the PFS itself is heavily weighted by utilization towards a much smaller number of often utilized codes.

Furthermore, even when a code is reviewed by the RUC, 2 to 3 years usually pass between when the survey data was collected and its use by CMS in setting rates becomes effective. In the intervening years without revaluation, we are most likely overvaluing codes by not accounting for these efficiencies gained in the valuation of work RVUs for non-time-based services. And even when recommendations have been submitted by the RUC to CMS as potentially misvalued codes from 2009 to 2025, the RUC only recommended a decrease in the physician time and resources for the codes 39 percent of the time.[39]

[39] American Medical Association. ''AMA/Specialty Society RVS Update Committee: An Overview of the RUC Process.'' Available from:

Studies have demonstrated that CMS continues to overvalue non-time-based services. In a pilot project for CMS conducted by the Urban Institute in 2016,[40] which compared data obtained from electronic health records and direct observation, the ratios of fee schedule time to empirical time were often inflated, with the largest discrepancies in imaging and other test interpretations. In the study, the median ratio of PFS time to empiric intraservice physician time for CT and MRI scans was 2.13, for noninvasive cardiac testing was 4.00, and for mammography was 1.67. Another study compared estimated procedure time from anesthesia claims and the PFS time, and found that the mean estimated procedure time was 27 percent lower than the time used for PFS valuation.[41] Expert reviewers have attributed some of the discrepancies to automation and personnel substitution that has become prevalent in the time between when CMS adopted many codes and when those codes are revalued.[42] MedPAC, in their 2018 recommendations to Congress, recommended three options to offset these historic distortions, including passive devaluation: (1) an automatic reduction to the prices of new services and services with high growth rates; (2) an extension of the annual numeric target for CMS to reduce the prices of overpriced services; and (3) an across-the-board reduction to all fee schedule services other than ambulatory E&M services.[43] For reasons we will further describe below in this section, we are proposing a modified version of this third option for procedures, radiology, and diagnostic tests.

Section 1848(c)(2)(B)(ii)(I) of the Act provides that the Secretary shall, to the extent he determines to be necessary, adjust the number of RVUs to take into account changes in medical practice. We believe that many of the efficiency gains that historically may not have been fully reflected in the valuation of work RVUs for non-time-based services represent or have been caused by changes in medical practice, as described in further detail below. To take into account changes in medical practice and better reflect the resources involved in furnishing services paid under the PFS, we are proposing to establish an efficiency adjustment to the work RVUs, as well as corresponding updates to the intraservice portion of physician time inputs for non-time-based services. Our initial proposed approach is designed to be conservative in nature, as we are concerned about making too many changes at once to the current methodology. In the future, we may consider making additional corresponding updates to the direct PE inputs for clinical labor and equipment costs. Our proposal is based on our assumption that both the intraservice portion of physician time and the work intensity (including mental effort, technical effort, physical effort, and risk of patient complications) would decrease as the practitioner develops expertise in performing the specific service. As expertise develops, learning leads to enhanced familiarity with the various aspects of a service, variations in the anatomy of each patient, and confidence in the practitioner's own ability to handle unexpected challenges that arise.

For example, one cross-specialty observational study found that increased surgical experience was associated with significant reductions in operative time for coronary artery bypass grafting, total knee replacement, and bilateral reduction mammoplasty.[44] While this expertise in part develops as a practitioner accumulates years of experience following the culmination of training, it also accumulates across the entire health system with the creation of a new procedure or service that practitioners must grow accustomed to. Furthermore, changes in medical practice such as enhancements in operational workflows and technology advancements after the introduction of a new procedure or service can further reduce the risk associated with the service and increase efficiencies. When a new surgical technique is introduced, operational workflows and procedures are based on previous experience with a similar service, which may not directly translate to the new procedure. These workflows generally evolve over time as experience grows, and tend to result in improvements, which make the service more efficient. This is consistent with systematic reviews demonstrating that with increased case volume and years of expertise, surgeons demonstrate decreased risk of poor outcomes.[45] Other studies have found that with increased experience performing new procedures, clinicians demonstrate increased operational efficiency and decreased time. For example, one systematic review found that for clinicians newly introduced to robotic thoracic surgery, a reduction in operating time based on the increasing number of cases performed.[46] Another study concluded that for robotic thoracic procedures, the hourly productivity increase for experienced and proficient surgeons ranged from 11.4 work relative value units/hour (+26%) for lobectomy to 17.0 work relative value units/hour (+50%) for segmentectomy.[47] These changes in practitioner experience, operational workflows, and new technologies in totality represent large-scale, system-wide changes in medical practice as described in section 1848(c)(2)(B)(ii)(I) of the Act that may not have been previously accounted for in the valuation of non-time based codes. Given the relative infrequency of service revaluation under the PFS and the limitations of reliance on survey data, we are concerned that the RVUs we have established for codes paid under the PFS may not reflect these efficiencies accrued as practitioners gain experience, operational workflows improve, and new technology is adopted.

(2) Proposed Methodology for the Efficiency Adjustment

To calculate the efficiency adjustment, we propose using the Medicare Economic Index (MEI) productivity adjustment. The MEI is a measure of inflation faced by physicians with respect to their practice costs and general wage levels, and includes inputs used in furnishing physicians' services such as physician's own time, non-physician employees' compensation, rents, medical equipment, and more. Every year, the CMS Office of the

Actuary (OACT) subtracts the MEI productivity adjustment from the MEI percent change moving average to calculate the final MEI update. The MEI productivity adjustment used for the final MEI update reflects the most recent historical estimate of the 10-year moving average growth of private nonfarm business total factor productivity, as calculated by the Bureau of Labor Statistics.[48] Every year, the productivity adjustment for the final MEI update is calculated by OACT based on historical data. For example, in 2026 the productivity adjustment for the final MEI update will reflect historical data through 2024. OACT incorporates a 10-year moving average to minimize yearly fluctuations in productivity associated with normal business cycles. The productivity adjustment to be applied to the proposed MEI percent change moving average for CY 2026 is listed in Table 11 (0.8 percent), and it will be updated for the final rule based on the most up to date data. The MEI productivity adjustment is substantively similar to the productivity adjustment required for the hospital inpatient prospective payment system (IPPS) and outpatient prospective payment system (OPPS) at sections 1886(b)(3)(B)(xi)(II) and 1833(t)(3)(F)(i) of the Act, respectively. The main difference is that the MEI productivity adjustment reflects historical data at the time of the CY update and the OPPS and IPPS productivity adjustments reflect a forecast to correspond to the FY update.

For CY 2026, we are proposing to apply the efficiency adjustment using a look-back period of 5 years. We considered a couple initial look-back periods. As previously described, despite the efforts to update valuation, many codes have never been revalued, and even for codes that have been revalued, there is, on average, more than 17 years since revaluation recommendations submitted by the RUC. Thus, using a look-back period of 17 years would help to account for the average amount of time that has elapsed since the last revaluation. However, using a look-back period of 17 years may be imprecise because, even when a code has been reviewed by the RUC, historic reliance on survey data may have skewed results and not properly accounted for efficiencies in the physician time and work RVU. We are also proposing to apply the efficiency adjustment to the codes that the RUC and CMS have reviewed within the look-back period of 5 years, including codes being proposed for revaluation this year, as many of the challenges discussed previously in this section, namely reliance on survey data, still apply. We realize that adjusting for the efficiencies gained would be a change in our payment methodology, and so as an initial conservative approach, we are proposing a look-back of 5 years. This represents our intended cadence for updating the efficiency adjustment (3 years), plus an additional 2 years, since it has historically taken about 2 years to make changes to PFS valuation after we receive new recommendations from the RUC.

We recognize that over time, there may be variation in the efficiencies accrued service-by-service (for example, the previously cited research has identified that efficiencies have been gained more in minor procedures and radiology services than in major inpatient procedures). But because PFS intraservice time is higher than empirical intraservice time on average for studied non-time based services,[49] [50] we believe that applying the efficiency adjustment to non-time-based services more broadly, instead of applying it only to certain services that may be more likely to accrue efficiency gains, may help to improve the overall accuracy of our valuation of these services under the PFS. Furthermore, a look-back period of 5 years is not intended to account for the full magnitude of previously unaccounted for efficiency gains in services paid under the PFS, and we may consider making refinements to the efficiency adjustment in future rulemaking to better account for these gains. To implement this efficiency adjustment, we propose to decrease the work RVUs and make corresponding changes to the intraservice physician time for codes describing non-time-based services by a factor equal to the MEI productivity adjustment, equivalent to if this factor had been applied every year over the past 5 years.

This methodology would yield a proposed efficiency adjustment of 2.5 percent, a downward (negative) adjustment for certain codes, for CY 2026. Given the 5-year look back period, the formula sums all productivity adjustments included in the final MEI updates from CY 2022–CY 2026. The CY 2026 productivity adjustment will be updated for the CY 2026 final rule to reflect more recent historical data from the Bureau of Labor Statistics.

TABLE 11 PROPOSED EFFICIENCY ADJUSTMENT FOR CY 2026

CY	MEI Productivity Adjustment (%)
2022	0.2
2023	0.5
2024	0.4
2025	0.6
2026*	0.8*
Efficiency Adjustment	**2.5%**

** Proposed, will be updated for CY 2026 final rule*

Using the methodology described above, we have included Table A–E2, which outlines examples of two different CPT codes that would be subject to the proposed efficiency adjustment. Table 12 is intended only as an illustrative example. For more information on the impacts of this proposed policy, see the Regulatory Impact Analysis in section VII.C.2.c. of this proposed rule.

63047	Lam facetectomy & foramotomy 1 vrt sgm lumbar	90	15.37	87.75	14.99

We solicit comments on the initial look-back period and the use of the MEI productivity adjustment percentage values for calculation of the efficiency adjustment for 2026. We seek comments on whether adjustments should be made in future rulemaking to also adjust the direct PE inputs for clinical labor and equipment time that correspond with the physician time inputs.

If finalized for CY 2026, we propose to apply the efficiency adjustment to the intraservice portion of physician time and work RVUs every 3 years. This timing would imply that the next efficiency adjustment after CY 2026 would be calculated and applied in CY 2029 PFS rulemaking, reflecting efficiency gains measured from 2027 through 2029. We are proposing to update and apply the proposed efficiency adjustment with a cadence of every 3 years to align with the other updates under the PFS, including updates to the Geographic Practice Cost Index (GPCI) and Malpractice (MP) RVUs, to allow for streamlining so that interested parties can expect updates on a similar timeframe. We also seek comments as to whether or not efficiencies stop accruing for services after a predefined number of years.

We are proposing to apply this efficiency adjustment to non-time-based services that we expect to accrue efficiencies over time. We are proposing to apply the adjustment to all codes except time-based codes, including but not limited to, E/M visits, care management services, behavioral health services, services on the CMS telehealth list, and maternity codes with a global period of MMM. This adjustment would apply to all codes that are assigned a procedure status of A (active), B (bundled), C (contractor/carrier priced code), I (not valid for Medicare purposes), N (noncovered service by Medicare), R (restricted coverage), and T (injections), and are not otherwise excluded. Included code families represent the procedures, diagnostic tests, and radiology services that CMS expects to accrue efficiencies over time as changes in medical practice occur, including changes in clinician expertise, workflows, and technology. We seek comments on the codes expected to accrue efficiencies over time. The full descriptions of these indicators can be found in the Medicare Claims Processing Manual, Chapter 23 at *https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/clm104c23.pdf.* Additionally, a list of the codes we are proposing to apply this adjustment to can be found under the Downloads section posted with this proposed rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.*

Finally, we understand that accruing efficiencies does not apply equally to all services, and that efficiencies gained over time may often apply more to services that take less time to perform. Efficiencies gained in services that could be performed many times per day such as cataract extractions, skin biopsies, and CT scans, allow the practitioner to perform more of those services in a given day. We seek comments on whether and how we should consider additional efficiencies for services that require less time to perform. Additionally, we seek comments on whether the introduction of new artificial intelligence has or will lead to otherwise unaccounted for efficiencies gained in specific services.

Going forward, we also propose that the public may submit nominations via the ''Potentially Misvalued Codes'' process, as described in section II.C. of this proposed rule, if they believe the efficiency adjustment will lead to inaccurate physician time and work RVUs for a particular code. Nominations submitted should include supporting information. For the reasons discussed previously in this section, we propose that CMS will place greater emphasis on ''empiric'' supporting information for the codes nominated, to avoid the limitations of using survey data. Proposed examples of empiric data may include electronic health record logs, operating room logs, and time-motion data and should be robust enough to achieve a high degree of assuredness as to accuracy and be inclusive of multiple types of practices (for example, inclusive of academic, health centers, and private practices wherever possible). We solicit comments on what kinds of data CMS should consider as valid, reliable, empiric information for this purpose.

3. Methodology for the Direct PE Inputs To Develop PE RVUs

a. Background

On an annual basis, the RUC provides us with recommendations regarding PE inputs for new, revised, and potentially misvalued codes. We review the RUC-recommended direct PE inputs on a code-by-code basis. Like our review of recommended work RVUs, our review of recommended direct PE inputs generally includes, but is not limited to, a review of information provided by the RUC, HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, and consultation with physicians and health care professionals within CMS and the Federal Government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. When we determine that the RUC's recommendations appropriately estimate the direct PE inputs (clinical labor, disposable supplies, and medical equipment) required for the typical service, are consistent with the principles of relativity, and reflect our payment policies, we use those direct PE inputs to value a service. If not, we refine the recommended PE inputs to better reflect our estimate of the PE resources required for the service. We also confirm whether CPT codes should have facility and/or nonfacility direct PE inputs and refine the inputs accordingly.

Our review and refinement of the RUC-recommended direct PE inputs includes many refinements that are common across codes, as well as refinements that are specific to particular services. Table 20 details our refinements of the RUC's direct PE recommendations at the code-specific level. In section II.B. of this proposed rule, Determination of Practice Expense Relative Value Units (PE RVUs), we address certain refinements that will be common across codes. Refinements to particular codes are addressed in the

portions of that section that are dedicated to particular codes. We note that for each refinement, we indicate the impact on direct costs for that service. We note that, on average, in any case where the impact on the direct cost for a particular refinement is $0.35 or less, the refinement has no impact on the PE RVUs. This calculation considers both the impact on the direct portion of the PE RVU, as well as the impact on the indirect allocator for the average service. In this proposed rule, we also note that many of the refinements listed in Table 20 result in changes under the $0.35 threshold and would be unlikely to result in a change to the RVUs.

We note that the direct PE inputs for CY 2026 are displayed in the CY 2026 direct PE input files, available on the CMS website under the downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.* The inputs displayed there have been used in developing the CY 2026 PE RVUs as displayed in Addendum B (see *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/addendum-a-b-updates*).

b. Common Refinements

(1) Changes in Work Time

Some direct PE inputs are directly affected by revisions in work time. Specifically, changes in the intraservice portions of the work time and changes in the number or level of postoperative visits associated with the global periods result in corresponding changes to direct PE inputs. The direct PE input recommendations generally correspond to the work time values associated with services. We believe that inadvertent discrepancies between work time values and direct PE inputs should be refined or adjusted in the establishment of proposed direct PE inputs to resolve the discrepancies.

(2) Equipment Time

Prior to CY 2010, the RUC did not generally provide CMS with recommendations regarding equipment time inputs. In CY 2010, in the interest of ensuring the greatest possible degree of accuracy in allocating equipment minutes, we requested that the RUC provide equipment times along with the other direct PE recommendations, and we provided the RUC with general guidelines regarding appropriate equipment time inputs. We appreciate the RUC's willingness to provide us with these additional inputs as part of its PE recommendations.

In general, the equipment time inputs correspond to the service period portion of the clinical labor times. We clarified this principle over several years of rulemaking, indicating that we consider equipment time as the time within the intraservice period when a clinician is using the piece of equipment plus any additional time that the piece of equipment is not available for use for another patient due to its use during the designated procedure. For those services for which we allocate cleaning time to portable equipment items, because the portable equipment does not need to be cleaned in the room where the service is furnished, we do not include that cleaning time for the remaining equipment items, as those items and the room are both available for use for other patients during that time. In addition, when a piece of equipment is typically used during follow-up postoperative visits included in the global period for a service, the equipment time will also reflect that use.

We believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure (the clinical labor service period) and are typically available for other patients even when one member of the clinical staff may be occupied with a preservice or postservice task related to the procedure. We also noted that we believe these same assumptions will apply to inexpensive equipment items that are used in conjunction with and located in a room with non-portable highly technical equipment items since any items in the room in question will be available if the room is not being occupied by a particular patient. For additional information, in that rule we referred readers to our discussion of these issues in the CY 2012 PFS final rule with comment period (76 FR 73182) and the CY 2015 PFS final rule with comment period (79 FR 67639).

(3) Standard Tasks and Minutes for Clinical Labor Tasks

In general, the preservice, intraservice, and postservice clinical labor minutes associated with clinical labor inputs in the direct PE input database reflect the sum of particular tasks described in the information that accompanies the RUC-recommended direct PE inputs, commonly called the ''PE worksheets.'' For most of these described tasks, there is a standardized number of minutes, depending on the type of procedure, its typical setting, its global period, and the other procedures with which it is typically reported. The RUC sometimes recommends a number of minutes either greater than or less than the time typically allotted for certain tasks. In those cases, we review the deviations from the standards and any rationale provided for the deviations. When we do not accept the RUC-recommended exceptions, we refine the proposed direct PE inputs to conform to the standard times for those tasks. In addition, in cases when a service is typically billed with an E/M service, we remove the preservice clinical labor tasks to avoid duplicative inputs and to reflect the resource costs of furnishing the typical service.

We refer readers to section II.B. of this proposed rule, Determination of Practice Expense Relative Value Units (PE RVUs), for more information regarding the collaborative work of CMS and the RUC in improvements in standardizing clinical labor tasks.

(4) Recommended Items That Are Not Direct PE Inputs

In some cases, the PE worksheets included with the RUC's recommendations include items that are not clinical labor, disposable supplies, or medical equipment or that cannot be allocated to individual services or patients. We addressed these kinds of recommendations in previous rulemaking (78 FR 74242), and we do not use items included in these recommendations as direct PE inputs in the calculation of PE RVUs.

(5) New Supply and Equipment Items

The RUC generally recommends the use of supply and equipment items that already exist in the direct PE input database for new, revised, and potentially misvalued codes. However, some recommendations include supply or equipment items that are not currently in the direct PE input database. In these cases, the RUC has historically recommended that a new item be created and has facilitated our pricing of that item by working with the specialty societies to provide us copies of sales invoices. For CY 2026 we received invoices for several new supply and equipment items. Tables 20 and 21 detail the invoices received for new and existing items in the direct PE database. As discussed in section II.B. of this proposed rule, Determination of Practice Expense Relative Value Units, we encourage interested parties to review the prices associated with these new and existing items to determine whether these prices appear to be accurate. Where prices appear inaccurate, we encourage interested parties to submit invoices or other information to improve the accuracy of

pricing for these items in the direct PE database by February 10th of the following year for consideration in future rulemaking, similar to our process for consideration of RUC recommendations.

We remind interested parties that due to the relativity inherent in the development of RVUs, reductions in existing prices for any items in the direct PE database increase the pool of direct PE RVUs available to all other PFS services. Tables 20 and 21 also include the number of invoices received and the number of nonfacility allowed services for procedures that use these equipment items. We provide the nonfacility allowed services so that interested parties will note the impact the particular price may have on PE relativity, as well as to identify items that are used frequently, since we believe that interested parties are more likely to have better pricing information for items used more frequently. A single invoice may not be reflective of typical costs, and we encourage interested parties to provide additional invoices so that we might identify and use accurate prices in the development of PE RVUs.

In some cases, we do not use the price listed on the invoice that accompanies the recommendation because we identify publicly available alternative prices or information that suggests a different price is more accurate. In these cases, we include this in the discussion of these codes. In other cases, we cannot adequately price a newly recommended item due to inadequate information. Sometimes, no supporting information regarding the price of the item has been included in the recommendation. In other cases, the supporting information does not demonstrate that the item has been purchased at the listed price (for example, vendor price quotes instead of paid invoices). In cases where the information provided on the item allows us to identify clinically appropriate proxy items, we might use existing items as proxies for the newly recommended items. In other cases, we include the item in the direct PE input database without any associated price. Although including the item without an associated price means that the item does not contribute to the calculation of the final PE RVU for particular services, it facilitates our ability to incorporate a price once we obtain information and are able to do so.

(6) Service Period Clinical Labor Time in the Facility Setting

Generally speaking, our direct PE inputs do not include clinical labor minutes assigned to the service period because the cost of clinical labor during the service period for a procedure in the facility setting is not considered a resource cost to the practitioner since Medicare makes separate payment to the facility for these costs. We address code-specific refinements to clinical labor in the individual code sections.

(7) Procedures Subject to the Multiple Procedure Payment Reduction (MPPR) and the OPPS Cap

We note that the list of services for the upcoming calendar year that are subject to the MPPR on diagnostic cardiovascular services, diagnostic imaging services, diagnostic ophthalmology services, and therapy services; and the list of procedures that meet the definition of imaging under section 1848(b)(4)(B) of the Act, and therefore, are subject to the OPPS cap; are displayed in the public use files for the PFS proposed and final rules for each year. The public use files for CY 2026 are available on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.* For more information regarding the history of the MPPR policy, we referred readers to the CY 2014 PFS final rule with comment period (78 FR 74261 through 74263).

Effective January 1, 2007, section 5102(b)(1) of the Deficit Reduction Act of 2005 (DRA) (Pub. L. 109–171, enacted on February 8, 2006) amended section 1848(b)(4) of the Act to require that, for imaging services, if—(i) The TC (including the TC portion of a global fee) of the service established for a year under the fee schedule without application of the geographic adjustment factor, exceeds (ii) The Medicare OPD fee schedule amount established under the prospective payment system (PPS) for HOPD services under section 1833(t)(3)(D) of the Act for such service for such year, determined without regard to geographic adjustment under section 1833(t)(2)(D) of the Act, the Secretary shall substitute the amount described in clause (ii), adjusted by the geographic adjustment factor under the PFS, for the fee schedule amount for such TC for such year. As required by section 1848(b)(4)(A) of the Act, for imaging services furnished on or after January 1, 2007, we cap the TC of the PFS payment amount for the year (prior to geographic adjustment) by the Outpatient Prospective Payment System (OPPS) payment amount for the service (prior to geographic adjustment). We then apply the PFS geographic adjustment to the capped payment amount. Section 1848(b)(4)(B) of the Act defines imaging services as ''imaging and computer-assisted imaging services, including X-ray, ultrasound (including echocardiography), nuclear medicine (including PET), magnetic resonance imaging (MRI), computed tomography (CT), and fluoroscopy, but excluding diagnostic and screening mammography.'' For more information regarding the history of the cap on the TC of the PFS payment amount under the DRA (the ''OPPS cap''), we referred readers to the CY 2007 PFS final rule with comment period (71 FR 69659 through 69662).

For CY 2026, we identified new and revised codes to determine which services meet the definition of ''imaging services'' as defined at section 1848(b)(4)(B) of the Act for purposes of this cap. Beginning for CY 2026, we are proposing to include the following services on the list of codes to which the OPPS cap applies: CPT codes 0598T (*Real-time fluorescence wound imaging with clinical darkness, to identify location of bacterial wound pathogens and measure wound size, per session; first anatomic site (e.g., lower extremity, right leg*), 0599T (*Real-time fluorescence wound imaging with clinical darkness, to identify location of bacterial wound pathogens and measure wound size, per session; each additional anatomic site (e.g., upper extremity, left leg) (List separately in addition to code for primary procedure)*), 0944T (*3D contour simulation of target liver lesion(s) and margin(s) for image-guided percutaneous microwave ablation*), 0946T (*Orthopedic implant movement analysis using paired computed tomography (CT) examination of the target structure, including data acquisition, data preparation and transmission, interpretation and report (including CT scan of the joint or extremity performed with paired views)*), 0961T (*Shortwave infrared radiation imaging, surgical pathology specimen, to assist gross examination for lymph node localization in fibroadipose tissue, per specimen (List separately in addition to code for primary procedure)*), 0972T (*Assistive algorithmic classification of burn healing (i.e., healing or nonhealing) by noninvasive multispectral imaging, including system set-up and acquisition, selection, and transmission of images, with automated generation of report*), 0984T (*Intravascular imaging of extracranial cerebral vessels using optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention, including all associated radiological supervision,*

interpretation, and report; initial vessel (List separately in addition to code for primary procedure)), 0985T (*Intravascular imaging of extracranial cerebral vessels using optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention, including all associated radiological supervision, interpretation, and report; each additional vessel (List separately in addition to code for primary procedure)*), 0986T (*Intravascular imaging of intracranial cerebral vessels using optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention, including all associated radiological supervision, interpretation, and report; initial vessel (List separately in addition to code for primary procedure)*), 0987T (*Intravascular imaging of intracranial cerebral vessels using optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention, including all associated radiological supervision, interpretation, and report; each additional vessel (List separately in addition to code for primary procedure)*), 70XX1 (Computed tomographic *angiography (CTA), head and neck, with contrast material(s), including noncontrast images, when performed, and image postprocessing*), 70XX2 (*Computed tomographic (CT) cerebral perfusion analysis with contrast material(s),* including image postprocessing *performed with concurrent CT or CT angiography of the same anatomy (List separately in addition to code for primary procedure)*), 70XX3 (*Computed tomographic (CT) cerebral perfusion analysis with contrast material(s), including image postprocessing performed without concurrent CT or CT angiography of the same anatomy*), and 77X09 (*Surface radiation therapy; superficial or orthovoltage, image guidance, ultrasound for placement of radiation therapy fields for treatment of cutaneous tumors, per course of treatment (List separately in addition to the code for primary procedure)*). We believe that these codes meet the definition of imaging services under section 1848(b)(4)(B) of the Act, and thus, should be subject to the OPPS cap.

4. Valuation of Specific Codes for CY 2026

(1) Tympanostomy (CPT Code 0583T)

In the CY 2025 PFS final rule (89 FR 97745 through 97746), we reviewed Category III CPT code 0583T (*Tympanostomy (requiring insertion of ventilating tube), using an automated tube delivery system, iontophoresis local anesthesia)* as potentially misvalued. We considered whether to establish national payment for CPT code 0583T, which is used to report tympanostomy using the TULA system, or whether to create a device-agnostic G-code which could be used to report tympanostomies using the TULA or other devices. We stated that CPT code 69433 (*Tympanostomy (requiring insertion of ventilating tube), local or topical anesthesia*) might serve as a sufficient base code, adequately describing most of the surgeon's work and facility resources. In response to comments supporting the latter approach, we established separate payment for HCPCS code G0561 (*Tympanostomy with local or topical anesthesia and insertion of a ventilating tube when performed with tympanostomy tube delivery device, unilateral (List separately in addition to 69433) (Do not use in conjunction with 0583T)*) to be billed with CPT code 69433 in order to describe the additional resource costs associated with using the innovative tympanostomy tube delivery devices and/or systems falling under emerging technology and services categories and finalized contractor pricing for CY 2025.

We have received input from interested parties expressing gratitude for the creation of HCPCS code G0561 but also continuing to request that CMS establish national pricing for CPT code 0583T. In response, we are seeking comments on whether to nationally price both codes, and what inputs for physician work, time, and direct practice expense would most accurately capture the resource costs associated with performing both procedures. For example, in response to a similar request for comment in CY 2025 PFS rulemaking, commenters recommended a direct crosswalk to the values associated with CPT code 31295 (*Nasal/sinus endoscopy, surgical, with dilation (e.g., balloon dilation); maxillary sinus ostium, transnasal or via canine fossa*) which they stated was similar to CPT code 0583T with respect to the intensity and invasiveness of the procedure, preparation time for the procedure, and total time to complete the surgery. We are seeking comments on whether interested parties continue to believe CPT code 31295 would be an accurate comparison or whether there are other services that CMS should consider.

(2) Temporary Female Intraurethral Valve-Pump (CPT Codes 0596T and 0597T)

For the CY 2025 PFS final rule (89 FR 97710), we reviewed CPT codes 0596T (*Temporary female intraurethral valve-pump (i.e., voiding prosthesis); initial insertion, including urethral measurement*) and 0597T (*Temporary female intraurethral valve-pump (that is, voiding prosthesis); initial insertion, replacement*) as potentially misvalued. We added pricing for 3 new supplies related to these services: (1) inFlow Measuring Device, (2) inflow Valve Pump Device, and (3) inFlow Activator Kit. The RUC reviewed and surveyed these codes as potentially misvalued for the January 2025 meeting and stated that they would flag for the RAW in 3 years.

We are proposing the RUC-recommended work RVU of 2.43 for CPT code 0596T and the RUC-recommended work RVU of 1.05 for CPT code 0597T.

We are proposing the RUC-recommended direct PE inputs for both CPT codes without refinement.

(3) Limb Lengthening-Shortening—Femur (CPT Codes 27465, 27466, 27468, and 27XX0)

The CPT Editorial Panel created a new Category I code, CPT code 27XX0 *(Osteotomy(ies), femur, unilateral, with insertion of an externally controlled intramedullary lengthening device, including iliotibial band release when performed, imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device)* in May 2024. This code describes femur lengthening using the insertion of an externally controlled intramedullary lengthening device, including imaging. CPT code 27XX0 and the other codes within this code family, including CPT codes 27465 *(Osteoplasty, femur; shortening (excluding 64876),* 27466 *(Osteoplasty, femur; lengthening),* and 27468 *(Osteoplasty, femur; combined, lengthening and shortening with femoral segment transfer),* were surveyed during the September 2024 RUC Meeting.

We are proposing the RUC-recommended work RVUs of 26.65, 21.13, and 22.65 for CPT codes 27XX0, 27465, and 27466, respectively. We are also proposing the direct PE inputs for CPT codes 27XX0, 27465, and 27466 without refinement.

However, for CPT code 27468, we disagree with the RUC's recommendation to contractor price this code. We believe CPT code 27468 is valued appropriately and should not be paid under contractor pricing based on the results of ten surveys. We are instead proposing to maintain the current work RVU and direct PE inputs for CPT code 27468 for CY 2026.

(4) Limb Lengthening-Shortening—Tibia (CPT Codes 27715 and 27XX1)

The CPT Editorial Panel created a new Category I code, CPT code 27XX1, *(Osteotomy(ies), tibia, including fibula when performed, unilateral, with insertion of an externally controlled intramedullary lengthening device, including imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device)* in May 2024. This code describes tibia lengthening using the insertion of an externally controlled intramedullary lengthening device, including imaging. CPT codes 27XX1 and 27715 (*Osteoplasty, tibia and fibula, lengthening or shortening)* were surveyed for the September 2024 RUC Meeting.

We are proposing the RUC-recommended work RVU of 28.00 for CPT code 27XX1 and the work RVU of 22.50 for CPT 27715. We are also proposing the direct PE inputs for CPT codes 27XX1 and 27715 without refinement.

(5) Arthrodesis Great Toe (CPT Codes 28750 and 28755)

At the April 2024 Relativity Assessment Workgroup (RAW), the RAW identified CPT code 28750 (*Arthrodesis, great toe; metatarsophalangeal joint*) on the ''different performing specialty from survey screen,'' where the top specialty performing over 50 percent of the Medicare claims did not survey the service or the top two specialties did not survey the service. The RAW noted that when this service was last valued in 1995, podiatry, which now performs over half of the volume for this service, was not involved in the survey. CPT code 28755 (*Arthrodesis, great toe; interphalangeal joint*) which was valued by the Harvard Studies and never surveyed by the RUC, was added as part of the code family. CPT codes 28750 and 28755, were surveyed at the January 2025 AMA RUC meeting.

We are proposing the RUC-recommended work RVU of 8.75 for CPT code 28750.

We disagree with the RUC-recommended work RVU of 7.50 for CPT code 28755 and we are instead proposing a work RVU of 6.76. The RUC-recommended valuation would place it above the median range when compared to other 90-day global codes with similar work times and the current time and work values. We are proposing a work RVU of 6.76 for CPT code 28755 based on a direct crosswalk to CPT code 28122 (*Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (for example, osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus*). CPT code 28122 shares the same intraservice work time of 45 minutes as compared with CPT code 28755, it has a very similar total time (230 minutes as compared with 234 minutes), and both of these codes also contain four postoperative office visits in their global periods. We are supporting this proposed work RVU of 6.76 with the total time ratio for CPT code 28755, which calculates at a work RVU of 6.64 (the total time is increasing from 172 minutes to 234 minutes for an increase of 36 percent, which results in a work RVU of 6.64 when multiplied with the current work RVU of 4.88 for CPT code 28755). Our proposed work RVU of 6.76 is further supported by a pair of other 90-day global codes with similar work time values, with a lower bracket of CPT code 26785 (*Open treatment of interphalangeal joint dislocation, includes internal fixation, when performed, single*) at a work RVU of 6.60 and an upper bracket of CPT code 56620 (*Vulvectomy simple; partial*) at an RVU of 7.53.

We are proposing the RUC-recommended direct PE inputs for all of the codes in this family.

(6) Closure Left Atrial Appendage With Endocardial Implant (CPT Code 33340)

The Relativity Assessment Workgroup (RAW) reviewed CPT code 33340 (*Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation*) in 2023 as part of the new technology/service screen. Around that same time, specialty societies asserted that this service was undergoing rapid change. Therefore, the RAW recommended specialty societies conduct a survey for the April 2024 RUC meeting.

We are proposing the RUC-recommended work RVU of 10.25 for CPT code 33340. We are also proposing the RUC-recommended direct PE inputs for CPT code 33340 without refinement.

(7) Thoracic Branch Endograft Services (CPT Codes 33880, 33881, 33883, 33886, 33XX2, and 35XX1)

At the September 2024 CPT Editorial Panel meeting, CPT approved endovascular repair of thoracic aortic aneurysms (TEVAR) coding changes. CPT deleted three codes describing the procedure and replaced them with two new codes and four revised codes in the TEVAR family. These revisions update the TEVAR code family to more accurately describe the current practice and current coding standards. The new codes are CPT code 33XX2 (*Endovascular repair of the thoracic aorta by deployment of a branched endograft multipiece system involving an aorto-aortic tube device with a fenestration for the left subclavian artery stentgraft(s) and all aortic tube endograft extension(s) placed from the level of the left common carotid artery to the celiac artery, including preprocedure sizing and device selection, all target zone angioplasty, all nonselective catheterization(s) and left subclavian artery selective catheterization(s), all associated radiological supervision and interpretation*), CPT code 35XX1 (*Bypass graft, with other than vein; carotid-contralateral carotid*), CPT code 33880 (*Endovascular repair of descending thoracic aorta (e.g., aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin, radiological supervision and interpretation*), CPT code 33881 (*by deployment of an aorto-aortic tube endograft not involving coverage of the left subclavian artery origin and all endograft extension(s) placed from the level of the left subclavian carotid artery to the celiac artery*), CPT code 33883 (*Proximal extension prosthesis(s) not involving coverage of the left subclavian artery origin, delayed placement after endovascular repair of the thoracic aorta, including preprocedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed*), and CPT code 33886 (*Distal extension prosthesis(s) from the level of the left subclavian artery to the celiac artery, delayed placement after endovascular repair of descending thoracic aorta, including preprocedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation*). The new codes in this code family were surveyed at the January 2025 AMA RUC meeting.

The RUC surveyed this code family and there were overall decreases in the work times. The RUC-recommended work RVUs do not appear to fully

account for these decreases. Although we do not believe that changes in work time as reflected in survey values must equate to a one-to-one or linear change in the valuation of work RVUs, we believe that since the two components of work are time and intensity, decreases in the surveyed work time should typically be reflected in decreases to the work RVU.

We reviewed the RUC recommendations and found them to be high, relative to other codes with the same or similar times. Based on a search of similarly timed codes in the RUC database, the RUC-recommended values exceed the work RVUs for five of the six codes.

We disagree with the RUC recommended work RVU of 30.00 for CPT code 33880 and we are instead proposing a work RVU of 27.00. This valuation was higher than nearly all of the other 90-day global codes with similar time values. We found that the RUC-recommended work RVU does not maintain relativity with other 90-day global period codes with an intraservice time of 120 minutes and similar total time around 546 minutes. We are instead proposing a direct crosswalk to CPT code 32672 (*Thoracoscopy, surgical; with resection-plication for emphysematous lung (bullous or non-bullous) for lung volume reduction (LVRS), unilateral includes any pleural procedure, when performed*) at the previously mentioned work RVU of 27.00. CPT code 32672 shares the same intraservice work time of 120 minutes as compared with CPT code 33880, it has a similar total time (567 minutes as compared with 546 minutes), and both of these codes each have two postoperative office visits in their global periods. We are supporting this proposed work RVU of 27.00 with a pair of other 90-day global codes with similar work time values, with a lower bracket of CPT code 43820 (*Gastrojejunostomy; without vagotomy*) at a work RVU of 22.53 and an upper bracket of CPT code 34702 (*Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for rupture including temporary aortic and/or iliac balloon occlusion, when performed (for example, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*) with a work RVU of 36.00.

We disagree with the RUC recommended work RVU of 26.75 for CPT code 33881 and we are instead proposing a work RVU of 22.53. The RUC's recommended work RVUs do not match the surveyed drops in work time (from 200 minutes to 110 minutes for CPT code 33881) and we are therefore selecting a crosswalk code that more accurately captures this decrease in the surveyed times. CPT code 43820 has a slightly higher intraservice work time of 120 minutes as compared with CPT code 33881 which has 110 minutes, it has a very similar total time (545 minutes as compared with 506 minutes), and three postoperative office visits as compared to CPT code 33881 which has two postoperative office visits in the global period. We are supporting this proposed work RVU of 22.53 with a pair of other 90-day global codes with similar work time values, with a lower bracket of CPT code 34707 at a work RVU of 22.28 and an upper bracket of CPT code 43880 at an RVU of 27.18.

We disagree with the RUC recommended work RVU of 39.00 for CPT code 33XX2 and we are instead proposing a work RVU of 35.00. We found that the RUC-recommended work RVU does not maintain relativity with other 90-day global period codes with the same intraservice time of 180 minutes and similar total time around 621 minutes. We are proposing a work RVU of 35.00 for CPT code 33XX2 based on a direct crosswalk to CPT code 33390 (*Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; simple (i.e., valvotomy, debridement, debulking, and/or simple commissural resuspension)*). There were several recently reviewed codes in the RUC database search that have the exact same intraservice time with higher total times and a lower work RVU. CPT code 33390 shares the same intraservice work time of 180 minutes as compared with CPT code 33880, it has a very similar total time (621 minutes as compared with 622 minutes), and both of these codes also contain two postoperative office visits in their global periods. We are supporting this proposed work RVU with a pair of other 90-day global codes with similar work time values, with a lower bracket of CPT code 33647 (*Repair of atrial septal defect and ventricular septal defect, with direct or patch closure*) at a work RVU of 33.00 and an upper bracket of CPT code 35216 (*Repair blood vessel, direct; intrathoracic, without bypass*) at an RVU of 35.00.

We disagree with the RUC recommended work RVU of 24.25 for CPT code 33883 and we are instead proposing a work RVU of 19.91. We found that the RUC-recommended work RVU does not maintain relativity with other 90-day global period codes with the same intraservice time of 90 minutes and similar total time around 486 minutes. We are proposing a work RVU of 19.91 for CPT code 33883 based on a direct crosswalk to CPT code 44320 (*Colostomy or skin level cecostomy*).

The RUC-recommended work RVUs do not match the surveyed drops in work time (from 120 minutes to 90 minutes) for CPT code 33883 and we are therefore selecting a crosswalk code that more accurately captures this decrease in the surveyed times. CPT code 44320 shares the same intraservice work time of 90 minutes as compared with CPT code 33883, it has a slightly higher total time (507 minutes as compared with 486 minutes), and three postoperative office visits as compared to two post operative office visits for CPT code 33883 in the global period. We are supporting this proposed work RVU of 19.91 with a pair of other 90-day global codes with similar work time values, with a lower bracket of CPT code 33267 (*Exclusion of left atrial appendage, open, any method (for example, excision, isolation via stapling, oversewing, ligation, plication, clip)*) at a work RVU of 18.50 and an upper bracket of CPT code 43611 (*Excision, local; malignant tumor of stomach*) at an RVU of 20.38.

We disagreed with the RUC recommended work RVU of 23.50 for CPT code 33886 and we are instead proposing a work RVU of 19.91. We found that the RUC-recommended work RVU does not maintain relativity with other 90-day global period codes with the same intraservice time of 90 minutes and similar total time around 486 minutes. We are proposing a work RVU of 19.91 for CPT code 33886 based on a direct crosswalk to CPT code 44320. The RUC-recommended work RVUs do not match the surveyed drops in work time (from 100 minutes to 90 minutes) for CPT code 33886 and we are therefore selecting a crosswalk code that more accurately captures this decrease in the surveyed times. CPT code 44320 shares the same intraservice work time of 90 minutes as compared with CPT codes 33886, it has a slightly higher total time (507 minutes as compared with 486 minutes), and three postoperative office visits as compared to two post operative office visits for CPT code 33886 in the global period. We are supporting this proposed work RVU of 19.91 with a pair of other 90-day global codes with

similar work time values, with a lower bracket of CPT code 33267 at a work RVU of 18.50 and an upper bracket of CPT code 43611 at an RVU of 20.38.

We disagree with the RUC recommended work RVU of 27.40 for CPT code 35XX1 and we are instead proposing a work RVU of 23.53. We found that the RUC-recommended work RVU does not maintain relativity with other 90-day global period codes with the same intraservice time of 150 minutes and similar total time around 486 minutes. Furthermore, we note that there was a decrease in the intraservice time by 23 minutes and the intraservice time ratio for this code suggests that the RUC-recommendation is too high. We are proposing a work RVU of 23.53 for CPT code 35XX1 based on a direct crosswalk to CPT code 32669 (*Thoracoscopy, surgical; with removal of a single lung segment (segmentectomy)*). We note that CPT code 35XX1 was also valued by the RUC using a crosswalk code to maintain relativity within the family.

The RUC's recommended work RVUs do not reflect surveyed drops in work time (from 173 minutes to 150 minutes) for CPT code 35XX1and we are therefore selecting a crosswalk code that more accurately captures this decrease in the surveyed times. CPT code 32669 shares the same intraservice work time of 150 minutes as compared with CPT code 35XX1, it has a slightly higher total time (502 minutes as compared with 486 minutes), and both of these codes also contain two postoperative office visits in their global periods. We are supporting this proposed work RVU of 23.53 with a pair of other 090-day global codes with similar work time values, with a lower bracket of CPT code 22612 (*Arthrodesis, posterior or posterolateral technique, single interspace; lumbar (with lateral transverse technique, when performed)*) at a work RVU of 23.53 and an upper bracket of CPT code 35666 (*Bypass graft, with other than vein; femoral-anterior tibial, posterior tibial, or peroneal artery*) at an RVU of 23.66.

We are proposing the RUC-recommended direct PE inputs for all the codes in this family.

(8) Lower Extremity Revascularization (CPT Codes 37XX1, 37X02, 37X03, 37X04, 37X05, 37X06, 37X07, 37X08, 37X09, 37X10, 37X11, 37X12, 37X13, 37X14, 37X15, 37X16, 37X17, 37X18, 37X19, 37X20, 37X21, 37X22, 37X23, 37X24, 37X25, 37X26, 37X27, 37X28, 37X29, 37X30, 37X31, 37X32, 37X33, 37X34, 37X35, 37X36, 37X37, 37X38, 37X39, 37X40, 37X41, 37X42, 37X43, 37X44, 37X45, and 37X46)

In October 2018, three CPT codes (37225, 37227, and 37229) were flagged by the Relativity Assessment Workgroup for high-cost supplies review, leading to a series of significant changes in the lower extremity revascularization (LER) code family. After multiple reviews and discussions between 2018 and 2024, the CPT Editorial Panel ultimately created four new subsections and 46 new codes to replace the existing 16 codes (CPT codes 37220–37235) for LER services. According to the RUC, this comprehensive update was driven by technological advances, changes in practice settings, and the need to better differentiate between a stenosis (i.e. a straightforward lesion) and an occlusion (that is, a complex lesion) procedures. These codes were surveyed for the September 2024 RUC meeting and recommendations submitted to CMS for consideration in the CY 2026 PFS proposed rule. See table 13 for a summary of the codes, and their long descriptors.

According to the RUC, not all codes received a full survey from participants. Eleven selected core codes had complete survey responses from all respondents, while the remaining 35 codes underwent an abbreviated survey process. The 35 abbreviated survey codes were split into two groups and survey respondents only received one of those two groups along with the 11 core codes. There were two notable changes made to the abbreviated survey. First, survey respondents were provided with one of the anchor codes as a comparator instead of using a reference service list; second, survey respondents were only asked one question per abbreviated code in the intensity/complexity section. Therefore, respondents did not complete all elements of the abbreviated survey, as some elements were pre-populated. We note that this method could potentially introduce inaccuracies and bias in the survey outcomes.

For CY 2026, we are proposing the RUC-recommended work RVUs for all 46 CPT codes. However, we have concerns about the survey data, specifically regarding the small sample size and large variations in responses. We encourage commenters to submit additional data for our consideration in determining the valuation of work and direct PE inputs for these CPT codes. Table 13 also shows the proposed work RVUs for the 46 CPT codes:

TABLE 13: CPT LONG DESCRIPTORS AND PROPOSED WORK RVUS FOR LOWER EXTREMITY REVASCULARIZATION PROCEDURES

CPT Code	Long Descriptors	Proposed Work RVUs
37XX1	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel*	7.30
+37X02	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	3.00
37X03	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel*	10.75
+37X04	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	3.89
37X05	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel*	8.75
+37X06	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	4.00
37X07	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all*	12.69

CPT Code	Long Descriptors	Proposed Work RVUs
	imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
+37X08	*Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel*	4.25
+37X09	*Intravascular lithotripsy(ies), iliac vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)*	3.00
37X10	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel*	7.75
+37X11	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	3.00
37X12	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel*	10.50
+37X13	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	4.00
37X14	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel*	8.75
+37X15	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary*	3.73

CPT Code	Long Descriptors	Proposed Work RVUs
	to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	
37X16	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel*	14.75
+37X17	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	5.00
37X18	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel*	9.00
+37X19	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel*	4.00
37X20	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel*	12.63
+37X21	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	5.50
37X22	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological*	11.00

CPT Code	Long Descriptors	Proposed Work RVUs
	supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	
+37X23	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	4.25
37X24	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel*	15.00
+37X25	*Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	6.00
+37X26	*Intravascular lithotripsy(ies), femoral and popliteal vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)*	4.00
37X27	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel*	9.80
+37X28	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	3.00
37X29	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel*	12.31

CPT Code	Long Descriptors	Proposed Work RVUs
+37X30	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	4.26
37X31	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel*	10.00
+37X32	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	3.34
37X33	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel*	13.46
+37X34	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	5.00
37X35	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel*	13.50
+37X36	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	4.75

CPT Code	Long Descriptors	Proposed Work RVUs
37X37	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel*	17.00
+37X38	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)*	6.50
37X39	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel*	15.00
+37X40	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	6.50
37X41	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel*	18.00
+37X42	*Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure*	8.16
37X43	*Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing*	11.00

CPT Code	Long Descriptors	Proposed Work RVUs
	the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	
+37X44	*Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)*	4.00
37X45	*Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel*	13.70
+37X46	*Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure*	5.00

We are proposing the RUC-recommended PE inputs for all 46 CPT codes, with several revisions to address discrepancies found in the documentation. Regarding the drug-coated balloon (SD382), which is priced at $2,343.33, the RUC recommendations show inconsistent quantity allocations across different code sets. The RUC documentation specifies two units for the initial vessel and one unit for additional vessels in CPT codes 37X10—37X13 and 37X18—37X21. However, for CPT codes 37X14—37X15 and 37X22—37X23, only one unit is listed for the initial vessel. Furthermore, CPT codes 37X16—37X17 and 37X24—37X26 have no quantity values specified at all. To address these inconsistencies, we propose updating the initial vessel quantities to one unit of the SD382 drug-coated balloon for CPT codes 37X10, 37X12, 37X18, and 37X20, while maintaining one unit for additional vessels.

The RUC recommends a quantity of two for supply code SD379 (drug eluting stent, tibial) for four CPT codes in the tibial and peroneal vascular territory, CPT codes 37X33, 37X34, 37X41, and 37X42. The RUC-recommended quantity exceeds the number of units of supply code SD266 (stent, self-expanding 2–5 mm XPERT (Abbott)) currently used in CPT code 37230, 37234, 37231, and 37235, respectively. We are proposing to reduce the quantity from two to one for supply code SD379 (drug eluting stent, tibial) in each of the four CPT codes 37X33, 37X34, 37X41, and 37X42.

For this code family, the RUC recommended 34 minutes of equipment time for the Professional PACS Workstation (ED053). We believe this recommendation contains an unintended technical error regarding the equipment time. Therefore, we propose using the standard equipment formula for the professional PACS workstation, which calculates equipment minutes as the sum of intraservice work time plus half of the preservice work time.

While we are proposing the listed refinements above, we are seeking comments on whether we should create G-codes to describe the use of high-cost supplies. Alternatively, we are seeking comments on whether we could use the Hospital Outpatient Prospective Payment System (OPPS) mean unit cost data (MUC) to accurately price these services and their supplies based on how these supplies are paid for in the hospital setting. We seek comments on whether there is additional information we should consider in establishing proposed payments for these services.

(9) Irreversible Electroporation of Tumors (CPT Codes 4001X and 5XX11)

At the September 2024 CPT Editorial Panel Meeting, two new CPT codes were created for reporting percutaneous irreversible electroporation ablation of one or more tumors: CPT codes 4001X (*Ablation, irreversible electroporation, liver, 1 or more tumors, including imaging guidance, percutaneous*) and 5XX11 (*Ablation, irreversible electroporation, prostate, 1 or more tumors, including imaging guidance, percutaneous*). These new CPT codes were surveyed at the January 2025 AMA RUC meeting. For CY 2026, we are proposing the RUC-recommended work RVUs of 9.41 for CPT code 4001X and 13.50 for CPT code 5XX11.

We are proposing the following refinements to the direct PE inputs for CPT code 4001X. We disagree with the RUC recommendation to use the standard 90-day global pre-service clinical labor times in the Facility setting for CPT code 4001X since this is a 0-day global procedure. We do not agree that it would serve the interests of relativity to use the 90-day global clinical labor standard times for a 0-day global service. Therefore, we are proposing the standard 000/010 global day extensive pre-service clinical labor times in the Facility setting, resulting in

the following changes: the minutes associated with CA002 (*Coordinate pre-surgery services (including test results)*) are reduced from 20 minutes to 10 minutes; the minutes associated with CA003 (*Schedule space and equipment in facility*) are reduced from 8 minutes to 5 minutes; the minutes associated with CA004 (*Provide pre-service education/obtain consent*) are reduced from 20 minutes to 7 minutes; and the minutes associated with CA005 (*Complete pre-procedure phone calls and prescription*) are reduced from 7 minutes to 3 minutes.

We are proposing the RUC-recommended direct PE inputs for CPT code 5XX11 without refinement.

(10) Endoscopic Sleeve Gastroplasty (CPT Code 4XX04)

In September 2024, CPT approved the addition of a new code to report transoral gastric restrictive procedures using an endosurgical approach. CPT code 4XX04 (*Gastric restrictive procedure, transoral, endoscopic sleeve gastroplasty (ESG), including argon plasma coagulation, when performed)* was surveyed for the January 2025 RUC meeting.

The RUC-recommended a direct crosswalk to CPT 36832 (*Revision, open, arteriovenous fistula; without thrombectomy, autogenous or nonautogenous dialysis graft (separate procedure))* with a work RVU of 13.50. During the RUC prefacilitation meeting, 1 unit of CPT code 99232 (*Subsequent hospital inpatient or observation care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and a moderate level of medical decision making)* was removed from the postoperative period, and 20 minutes of work time was added into the immediate post-service time. The RUC also revised the global period of CPT code 4XX04 to reduce the work and time value of CPT code 99238 (*Hospital inpatient or observation discharge day management; 30 minutes or less on the date of the encounter)* to half of the original value. We believe the RUC partially applied the 23-hr policy when it applied the policy to the immediate postservice time but not to the work RVU. The 23-hour policy established in the CY 2011 PFS final rule (75 FR 73226) applies to services that are typically performed in the outpatient setting and require a hospital stay of less than 24 hours. We discussed in the CY 2011 PFS final rule that we believe the value of these codes should not reflect work that is typically associated with an inpatient service. We believe the 23-hour policy in its entirety should be applied to CPT code 4XX04, which includes the work RVUs along with the immediate post service time. Following the valuation methodology we established for the 23 hour policy in the CY 2011 PFS final rule (75 FR 73226), we are proposing a work RVU of 12.56 for CPT code 4XX04. The steps are as follows:

Step (1): The RUC appropriately reduced the hospital discharge day management service included in the global period from 1 to 0.5; therefore, we will skip this step.

Step (2): 13.50 − 1.39 ** = 12.11

Step (3): 12.11 + (20 minutes × 0.0224) *** = 12.56 RVUs

* Value associated with ½ hospital day discharge management service.

** Value associated with an inpatient hospital visit, CPT Code 99232.

*** Value associated with the reallocated intraservice time multiplied by the postservice intensity of the 23-hour stay code.

We are proposing the RUC-recommended direct PE inputs for CPT code 4XX04 without refinement.

(11) Transurethral Robotic-Assisted Resection of Prostate (CPT Codes 52500, 52601, 52630, 52648, 52649, and 52XX1)

In May 2024, the CPT Editorial Panel created a new CPT code to report transurethral robotic-assisted waterjet resection of the prostate, including ultrasound guidance: CPT code 52XX1 (*Transurethral robotic-assisted waterjet resection of prostate, including intraoperative planning, ultrasound guidance, control of postoperative bleeding, complete, including vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy, when performed*). CPT code 52XX1 was surveyed for the September 2024 RUC meeting along with the existing codes in this code family: CPT code 52500 (*Transurethral resection of bladder neck (separate procedure)*), CPT code 52601 (*Transurethral electrosurgical resection of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)*), CPT code 52630 (*Transurethral resection; residual or regrowth of obstructive prostate tissue including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)*), CPT code 52648 (*Laser vaporization of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)*), and CPT code 52649 (*Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)*). For CY 2026, the RUC-recommended a work RVU of 6.00 for CPT code 52500, a work RVU of 10.25 for CPT code 52XX1, a work RVU of 10.00 for CPT code 52601, a work RVU of 6.55 for CPT code 52630, a work RVU of 10.05 for CPT code 52648, and a work RVU of 14.56 for CPT code 52649.

We are proposing the RUC-recommended work RVU of 6.00 for CPT code 52500, the work RVU of 10.25 for CPT code 52XX1, the work RVU of 10.00 for CPT code 52601, the work RVU of 6.55 for CPT code 52630, and the work RVU of 10.05 for CPT code 52648.

We note that the RUC will be placing CPT code 52XX1 on the New Technology/New Services list and CPT code 52XX1 will be re-reviewed by the RUC in 3 years to ensure correct valuation, patient population, and utilization assumptions. Also, we received external input suggesting the RVU for CPT code 52XX1 should be higher than the RUC recommendation of 10.25 and that an RVU of 14.56 (same as the RUC recommendation for CPT code 52649) would be more appropriate. However, given the survey times and comparisons to similarly timed codes with similar intensity, an RVU of 14.56 for CPT code 52XX1 would not be accurate. The RUC's valuation for CPT code 52XX1 is typical for a procedure code with the same work time values (that is, 60 minutes intra-service time and 234 minutes of total time). With all of these considerations, we believe that proposing a work RVU of 10.25 for CPT code 52XX1 maintains relativity with the other CPT codes in this family.

For CPT code 52649, we disagree with the RUC-recommended work RVU of 14.56 and we are proposing an RVU of 13.00 instead, based on a crosswalk to CPT code 53500 (*Urethrolysis, transvaginal, secondary, open, including cystourethroscopy (for example, postsurgical obstruction, scarring)*). We believe the RUC-recommended work RVU of 14.56 is too high and should be lowered due to the decrease in intraservice time of 30 minutes (from 120 minutes to 90 minutes), and the decrease in total time by 16 minutes (from 279 minutes to 263

minutes). An RVU of 13.00 for CPT code 52649 is supported by the range of CPT code 64912 (*Nerve repair; with nerve allograft, each nerve, first strand (cable)*) with an RVU of 12.00, the same intraservice time and 272 minutes of total time, and by CPT code 15730 (*Midface flap (that is, zygomaticofacial flap) with preservation of vascular pedicle(s)*) with an RVU of 13.50, the same intraservice time and 255.5 minutes of total time.

We are proposing the RUC-recommended direct PE inputs for CPT codes 52500, 52XX1, 52601, 52630, and 52649 without refinement. For CPT code 52648, we are proposing to remove the 6 minutes of clinical labor time for CA021 (Perform procedures/services—NOT directly related to physician work time). Therefore, the equipment time reported under EF031 (table, power) has also been reduced by 6 minutes (from 95 minutes to 89 minutes) to reflect the removal of clinical labor activity CA021 from CPT code 52648. We note that CPT code 52648 is performed in the facility setting only and the standard is 0 minutes for CA021 in the facility. Also, supply item SL036 (cup, biopsy-specimen sterile 4oz) was reported as a non-facility PE input for CPT code 52648. Since CPT code 52648 is only performed in the facility setting, we believe inclusion of supply item SD036 as a non-facility PE input was unintentional and therefore proposing to remove.

(12) Cystourethroscopy (CPT Code 52XX2)

At the September 2024 CPT Editorial Panel Meeting, CPT code 0619T (*Cystourethroscopy with transurethral anterior prostate commissurotomy and drug delivery, including transrectal ultrasound and fluoroscopy, when performed*) was deleted and replaced with CPT code 52XX2, which describes an endoscopic procedure for the management of benign prostatic enlargement that entails using both a non-medication-coated and a medication-coated balloon to open the prostatic urethra. CPT code 52XX2 (*Cystourethroscopy with initial transurethral anterior prostate commissurotomy with a non-drug-coated balloon catheter followed by therapeutic drug delivery into the prostate by a drug-coated balloon catheter, including transrectal ultrasound and fluoroscopy, when performed*) was surveyed at the January 2025 AMA RUC meeting.

We are proposing the RUC-recommended work RVU of 3.62 for CPT code 52XX2. For direct PE, we are proposing to refine the clinical labor associated with clinical activity CA023 (Monitor patient following procedure/service, no multitasking) to 0 minutes for CPT code 52XX2. We note that the RUC-recommended a direct crosswalk of most clinical labor times for CPT code 52XX2 based on reference CPT code 52441 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant*), however, the PE Summary of Recommendations for CPT code 52XX2 only describes patient monitoring activities done while multi-tasking and does not describe any no-multitasking (1:1) patient monitoring time (clinical activity code CA023) like it was described in the PE SOR for CPT code 52441, reviewed for CY 2020 PFS rulemaking. We are therefore proposing to remove this clinical labor time.

We also disagree with the RUC-recommended 40 minutes for the clinical labor associated with clinical activity CA025 (Clean scope) and are proposing to refine CA025 to the standard 30 minutes for a flexible scope. We would like to note that, while the PE SOR for CPT code 52XX2 did not justify non-standard times for clinical activities CA016 (Prepare, set-up and start IV, initial positioning and monitoring of patient) and CA017 (Sedate/apply anesthesia) of 2 minutes, we are not proposing to refine these clinical activity times because there was a robust explanation of these non-standard times in the PE SOR for CPT code 52441, which is a clinically similar endoscopy code requiring positioning and anesthetic activities that warrant the non-standard times for CPT codes 52441 and 52XX2.

For medical supplies, we are proposing to remove the SM022 (sanitizing cloth-wipe (patient)) supply because there are five of these cloth wipes included in the SA058 supply (pack, urology cystoscopy visit).

For equipment times, we are proposing to refine the time for the ES031 (scope video system (monitor, processor, digital capture, cart, printer, LED light)) and ES018 (fiberscope, flexible, cystoscopy) equipment items to account for the clinical labor times that should be included in the standard scope systems and scope equipment formulas. We disagree with the RUC-recommended 64 minutes for ES031 and ES018, and we are proposing to refine ES031 to 52 minutes and ES018 to 79 minutes in accordance with our standard equipment time formulas for scopes and scope video systems. We are proposing all other direct PE inputs for CPT code 52XX2.

(13) Prostate Biopsy Services (CPT Codes 55705, 55706, 5XX00, 5XX01, 5XX02, 5XX03, 5XX04, 5XX07, 5XX08, 5XX09, 5XX10, and 76872)

At the April 2022 Relativity Assessment Workgroup (RAW), prostate biopsy services were reviewed and identified as services performed by the same physician on the same date of service 75 percent of the time or more. As a result of that review, the RAW requested action plans for September 2022 to determine if specific code bundling solutions should occur for CPT codes 55700 (*Biopsy, prostate; needle or punch, single or multiple, any approach*) and CPT code 76872 (*Ultrasound, transrectal;*). The RAW referred that issue to the CPT Editorial Panel for revision of descriptors and for clarity in reporting CPT code 55700 with CPT code 76872. At the May 2024 CPT Editorial Panel meeting, CPT deleted existing CPT code 55700, revised CPT codes 55705 (*Biopsy, prostate; any approach, non-imaging-guided*) and 76872 and added 9 new codes that clarify reporting for prostate biopsies and the imaging procedures that accompany them.

CPT codes 55705, 55706 (*Biopsies, prostate, needle, transperineal, stereotactic template guided saturation sampling, including imaging guidance*), 5XX00 (*Biopsy, prostate, transrectal, ultrasound-guided (i.e., sextant), ultrasound-localized*), 5XX01 (*Biopsy, prostate, transrectal, ultrasound-guided (i.e., sextant) with MRI-fusion guidance*), 5XX02 (*Biopsy, prostate, transperineal, ultrasound-guided (i.e., sextant), ultrasound-localized*), 5XX03 (*Biopsy, prostate, transperineal, ultrasound-guided (i.e., sextant) with MRI-fusion guidance*), 5XX04 (*Biopsy, prostate, transrectal, MRI-ultrasound-fusion guided, targeted lesion(s) only*), 5XX07 (*Biopsy, prostate, transperineal, MRI-ultrasound-fusion guided, targeted lesion(s) only, first targeted lesion*), 5XX08 (*Biopsy, prostate, in-bore CT- or MRI-guided (i.e., sextant), with biopsy of additional targeted lesion(s), first targeted lesion*), 5XX09 (*Biopsy, prostate, in-bore CT- or MRI-guided targeted lesion(s) only, first targeted lesion*), and 5XX10 (*Biopsy, prostate, each additional, MRI-ultrasound fusion or in-bore CT- or MRI-guided targeted lesion (List separately in addition to code for primary procedure)*), and 76872 were surveyed at the September 2024 RUC meeting.

We are proposing the RUC-recommended work RVUs for all twelve CPT codes in this family. We are proposing a work RVU of 1.93 for CPT code 55705, a work RVU of 4.27 for CPT

code 55706, a work RVU of 2.63 for CPT code 5XX00, a work RVU of 3.39 for CPT code 5XX01, a work RVU of 3.23 for CPT code 5XX02, a work RVU of 3.81 for CPT code 5XX03, a work RVU of 2.61 for CPT code 5XX04, a work RVU of 3.10 for CPT code 5XX07, a work RVU of 4.00 for CPT code 5XX08, a work RVU of 3.62 for CPT code 5XX09, a work RVU of 1.05 for CPT code 5XX10, and a work RVU of 0.67 for CPT code 76872.

We are proposing the RUC-recommended direct PE inputs for all of the codes in this family.

(14) Laparoscopic Prostatectomy (CPT Codes 55840, 55842, 55845, 55866, 55867, 558X1, and 558X2)

In April 2023, the RUC's Relativity Assessment Workgroup identified CPT codes 38571 (*Laparoscopy, surgical; with bilateral total pelvic lymphadenectomy*) and 55866 (*Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed*) as typically reported together 75 percent or more based on 2021 Medicare claims data and referred them to the CPT Editorial Panel to possibly develop a code bundling solution. In May 2024, the CPT Editorial Panel created two new codes to report laparoscopic prostatectomy with lymph node biopsy(ies) (limited pelvic lymphadenectomy) and with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes, respectively: CPT code 558X1 *(Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed; with lymph node biopsy(ies) (limited pelvic lymphadenectomy)* and 558X2 ((*Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes*). These new codes were surveyed along with the rest of the family, CPT code 55840 (*Prostatectomy, retropubic radical, with or without nerve sparing*), 55842 (*Prostatectomy, retropubic radical, with or without nerve sparing; with lymph :node biopsy(s) (limited pelvic lymphadenectomy)*), 55845 (*Prostatectomy, retropubic radical, with or without nerve sparing; with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes*), 55866 (*Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed*), and 55867 (*Laparoscopy, surgical prostatectomy, simple subtotal (including control of postoperative bleeding, vasectomy, meatotomy, urethral calibration and/or dilation, and internal urethrotomy), includes robotic assistance, when performed*) at the September 2024 RUC meeting.

We are proposing the RUC's recommended work RVU for five of the six codes in the Laparoscopic Prostatectomy family. We are proposing a work RVU of 21.36 for CPT code 55840, a work RVU of 21.36 for CPT code 55842, a work RVU of 25.18 for CPT code 55845, a work RVU of 22.46 for CPT code 55866, a work RVU of 22.46 for CPT code 558X1, and a work RVU of 19.53 for CPT code 55867.

We disagree with the RUC's recommended work RVU of 29.35 for CPT code 558X2 and we are instead proposing a work RVU of 27.41 based on a crosswalk to CPT code 50543 (*Laparoscopy, surgical; partial nephrectomy*). The RUC's recommended work RVU of 29.35 is based on a crosswalk to CPT code 27059 (*Radical resection of tumor (for example, sarcoma), soft tissue of pelvis and hip area; 5 cm or greater*). However, CPT code 27059 is a procedure typically performed on an inpatient basis, with nearly 200 minutes of additional total time higher than the surveyed work time for CPT code 558X2 (608 minutes as compared with 434 minutes), due to the inclusion of five inpatient office visits in its global period. CPT code 558X2 will typically be performed on an outpatient basis and does not contain any inpatient office visits in its global period, which leads us to believe that CPT code 27059 is not the most accurate choice of CPT code for a valuation crosswalk.

Instead, we believe that it is more accurate to propose a work RVU of 27.41 for CPT code 558X2 based on the crosswalk to CPT code 50543. This crosswalk code is another type of surgical laparoscopy which more closely matches the intraservice work time (240 minutes against 230 minutes) and total work time (557 minutes against 434 minutes) of CPT code 558X2. We also note that the intensity of CPT code 558X2 is anomalously high in relation to the rest of this code family at the RUC's recommended work RVU of 29.35, roughly 30–40 percent higher than any of its peer codes. While we agree that CPT code 558X2 should have the highest intensity amongst this group of codes, we believe that our proposed work RVU of 27.41 reflects a more accurate intensity relative to the rest of the family.

For the direct PE inputs, we are proposing to correct what appears to be an error in the recommendations for CPT code 55867. The RUC-recommended 106 minutes of clinical labor time for the CA039 (Post-operative visits (total time)) activity based on two Level 4 office visits included in the global period for CPT code 55867. However, this CPT code instead contains one Level 3 and one Level 4 office visit which sum to 89 minutes of clinical labor time, not 106 minutes. We are proposing to make this correction to the CA039 clinical labor time for CPT code 55867, which also carries over to the equipment time for the power table (EF031) and the surgical light (EF014). We are proposing the direct PE inputs as recommended by the RUC in all other cases for this code family.

(15) Endovascular Therapy With Imaging (CPT Codes 61624, 61626, 75894, and 75898)

In April 2022, the Relativity Assessment Workgroup (RAW) requested action plans to evaluate potential code bundling solutions for the following code pairs: CPT code 61624 (*Transcatheter permanent occlusion or embolization [for example, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation], percutaneous, any method; central nervous system [intracranial, spinal cord]*) and CPT code 75894 (*Transcatheter therapy, embolization, any method, radiological supervision and interpretation*), CPT code 61624 and CPT code 75898 (*Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis*), CPT code 61626 (*Transcatheter permanent occlusion or embolization [e.g., for tumor destruction, to achieve hemostasis, to occlude a vascular malformation], percutaneous, any method; non-central nervous system, head or neck [extracranial, brachiocephalic branch]*) and CPT code 75894, and CPT code 61626 and CPT code 75898. The RUC reviewed these codes during the April 2024 RUC meeting. For CY 2026, the RUC-recommended a work RVU of 20.00 for CPT code 61624, an RVU of 15.31 for CPT code 61626, an RVU of 2.25 for CPT code 75894, and an RVU of 1.85 for CPT code 75898.

We are proposing the RUC-recommended work RVU of 2.25 for CPT code 75894 and work RVU of 1.85 for CPT code 75898. However, we have concerns about the survey data due to the significant variations in both work values and intraservice times reported by respondents. These variations can suggest that the proposed RVU values at the 25th percentile may not accurately

reflect the actual work involved in performing these services. As a result, we are seeking public comments regarding the proposed work RVUs for CPT codes 75894 and 75898.

We disagree with the RUC-recommended work RVUs for CPT codes 61624 and 61626. For CPT code 61624, we are proposing a work RVU of 17.06 instead of the RUC-recommended 20.00. This proposal is based on a crosswalk to CPT code 49622 (*Repair of parastomal hernia, any approach (that is, open, laparoscopic, robotic), initial or recurrent, including implantation of mesh or other prosthesis, when performed; incarcerated or strangulated*). This crosswalk is supported by a range of CPT code 33224 (*Insertion of pacing electrode, cardiac venous system, for left ventricular pacing, with attachment to previously placed pacemaker or implantable defibrillator pulse generator (including revision of pocket, removal, insertion, and/or replacement of existing generator)*) with a work RVU of 9.04, 135 minutes intra-service time and 204 minutes total time, and CPT code 93590 (*Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve*.) with a work RVU of 21.70, 135 minutes intraservice time and 223 minutes total time. The intraservice time for CPT code 61624 decreased from 232 to 150 minutes, reducing by 82 minutes, and the total time decreased from 362 to 246 minutes, reducing by 116 minutes, which supports a lower RVU. The lower work RVU proposal of 17.06 reflects the significant decreases in both intraservice time and total time for CPT code 61624.

For CPT code 61626, we are proposing a work RVU of 13.46 instead of the RUC-recommended work RVU of 15.31. This proposal is based on a crosswalk to CPT code 49594 (*Repair of anterior abdominal hernia[s] [that is, epigastric, incisional, ventral, umbilical, spigelian], any approach [that is, open, laparoscopic, robotic], initial, including implantation of mesh or other prosthesis when performed, total length of defect[s]; 3 cm to 10 cm, incarcerated or strangulated*). This crosswalk is supported by a range of CPT code 55881 (*Ablation of prostate tissue, transurethral, using thermal ultrasound, including magnetic resonance imaging guidance for, and monitoring of, tissue ablation*) with a work RVU of 9.80, 120 minutes intra-service time and 202 minutes total time, and CPT code 93580 (*Percutaneous transcatheter closure of congenital interatrial communication (that is, Fontan fenestration, atrial septal defect) with implant*) with a work RVU of 17.97, 120 minutes intraservice time and 210 minutes total time. The intraservice time for CPT code 61626 decreased by 53 minutes, and the total time decreased by 90 minutes, which supports a lower RVU. The lower work RVU proposal of 13.46 reflects the significant decreases in both intraservice time and total time for CPT code 61626.

We are also proposing the RUC-recommended direct PE inputs for CPT codes 61624, 75894, and 75898 without refinement. However, we disagree with a few RUC-recommended direct PE inputs for CPT code 61626. We are proposing to refine the clinical staff time for the CA011 activity 'Provide education/obtain consent' to the standard of 2 minutes for CPT code 61626. Since no rationale was provided in the PE Summary of Recommendations for extending clinical staff time beyond the standard 2 minutes for the CA011 activity, we believe 2 minutes is more appropriate than the RUC-recommended 5 minutes. We are also proposing to change the medical supply quantity of the SD172 (guidewire, cerebral (Bentson)) supply from 1 to 0 because CPT code 61626 describes non-central nervous system procedures, while SD172 is a cerebral guidewire; thus, we believe this supply is not typically used in this service.

Additionally, regarding the clinical labor associated with CA024 (Clean room/equipment by clinical staff), we believe that the RUC's recommendation of 3 minutes for CA024 was not properly accounted for in one of the equipment time formula inputs. Therefore, we are proposing an increase of 3 minutes to the equipment time for the angiography room (EL011), which increases from 124 to 127 minutes for this code to incorporate this missing time associated with the CA024 activity. Lastly, for CPT code 61626, the equipment time for the professional PACS workstation (ED053) should be half of the physician preservice time plus the full physician intraservice time. We believe this was an unintended error, and we are proposing 152 minutes after rounding up from 151.5 minutes.

Although we are proposing the direct PE inputs for CPT codes 75894 and 75898 without refinement, we have concerns over one of the RUC-recommended direct PE inputs, CA021 (Perform procedure/service—NOT directly related to physician work time) as the involvement of additional vascular interventional technologists remains unclear. According to the RUC recommendation, CPT codes 61624 and 61626 should not be reported in conjunction with CPT codes 75894 and 75898. And the RUC's recommendation of 60 minutes of clinical labor time for CPT code 75894 and 45 minutes for CPT code 75898 associated with the CA021 activity did not include an adequate explanation for these activities when CPT codes 75894 and 75898 are performed in the absence of CPT codes 61624 and 61626. Thus, we are proposing the direct PE inputs as recommended by the RUC; however, due to the concerns mentioned above, we are seeking public comments regarding the recommended CA021 clinical labor time of 60 minutes for CPT code 75894 and 45 minutes for CPT code 75898, specifically what intraservice clinical labor time would be typical for these procedures.

(16) Guided High Intensity Focused Ultrasound (CPT Code 61715)

In September 2023, the CPT Editorial Panel created a new Category I code to describe magnetic resonance image guided high intensity focused ultrasound (MRgFUS) intracranial ablation for treatment of a severe central tremor that is recalcitrant to other medical treatments for CY 2025 to replace the existing Category III code.

For CY 2025, we finalized the implementation of CPT code 61715 (*Magnetic resonance image guided high intensity focused ultrasound (MRgFUS), stereotactic ablation of target, intracranial, including stereotactic navigation and frame placement, when performed*) as a global-only code with direct PE inputs in the facility setting only, as recommended by the RUC. After implementation, an interested party raised concerns about the lack of non-facility pricing for the new CPT code 61715, which would result in an untenable non-facility payment equal to the established facility payment. The interested party expressed concerns about access to the service in the non-facility setting given the facility payment rate and provided information about the appropriateness of the service in the non-facility setting and the payments set by the MACs for the predecessor code. The interested party stated that the predecessor code, CPT code 0398T, was paid $9,750 in the non-facility setting by one MAC, and for CY 2025, CPT code 61715 is paid at $1,180 in the non-facility setting due to being set equal to the facility payment, absent established non-facility PE RVUs. In an effort to temporarily resolve this issue for CY 2025, we implemented PC/TC splits for CPT code 61715, with contractor-pricing for the global and technical components, which would restore MAC discretion in pricing this

service, including in the non-facility setting.

For CY 2026, we are seeking comments on non-facility pricing of this service to address the issue permanently. When considering potential crosswalk or reference codes for proposed direct PE inputs in the non-facility setting, we found all codes in the CPT code 615XX, 616XX, 617XX, and 618XX series are only valued in the facility setting and therefore were not tenable crosswalk codes for the non-facility direct PE. Additionally, there are MRI-guidance ultrasound ablation Category III codes that could be commensurate for non-facility direct PE, such as CPT code 0071T (*Focused ultrasound ablation of uterine leiomyomata, including MR guidance; total leiomyomata volume less than 200 cc of tissue*), and the previous predecessor code of CPT code 61715, CPT code 0398T, but they are/were contractor-priced under the PFS and do not have direct PE inputs for consideration.

We considered the prostate tissue MRI-guided ultrasound ablation codes, CPT codes 55881 (*Ablation of prostate tissue, transurethral, using thermal ultrasound, including magnetic resonance imaging guidance for, and monitoring of, tissue ablation*) and 55882 (*Ablation of prostate tissue, transurethral, using thermal ultrasound, including magnetic resonance imaging guidance for, and monitoring of, tissue ablation; with insertion of transurethral ultrasound transducer for delivery of thermal ultrasound, including suprapubic tube placement and placement of an endorectal cooling device, when performed*) as possible references because they are valued in the non-facility setting, but they include very high-cost disposable supplies and equipment that are specific to the CPT codes including SA136 (TULSA–PRO Disposable Kit) and EQ410 (TULSA–PRO TDC Cart), as well as some other direct PE inputs that may not be typical for CPT code 61715.

We also considered partial crosswalks of CPT codes for portions of CPT code 61715, such as CPT codes 77372 (*Radiation* treatment *delivery, stereotactic radiosurgery (SRS), complete course of treatment of cranial lesion(s) consisting of 1 session; linear accelerator based*), 61800 (*Application of stereotactic headframe for stereotactic radiosurgery (List separately in addition to code for primary procedure)*), 61736 (*Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion*), and 61796 (*Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); 1 simple cranial lesion*), but these codes have similar challenges related to the facility-only pricing and/or direct PE inputs that would not be applicable to or typical for CPT code 61715.

Given these challenges, we are seeking comments on appropriate non-facility direct PE inputs (clinical labor, disposable supplies, and medical equipment), and/or appropriate crosswalk codes for non-facility direct PE inputs for CPT code 61715. We would also consider a non-facility direct PE RVU crosswalk (in lieu of establishing specific non-facility direct PE inputs) for CPT code 61715 if that PE RVU could be substantiated by commenters. We note that we would not consider the MACs' established payment for the predecessor CPT code 0398T, particularly outlier payment rates, as substantiation for a PE RVU crosswalk for CPT code 61715 because there was significant variation among the MACs' payment for CPT code 0398T, some of which did not establish payment in the non-facility. Additionally, the established MAC payments do not differentiate between work, PE, and malpractice, making it difficult to establish a reasonable PE RVU for CPT code 61715 based on MAC payment alone. We received a second letter from an interested party stating that the previous non-facility payment rate for CPT code 0398T was $9,750, but we note that this payment rate is a significant outlier payment based on the reported range of payments from the MACs in April 2022. The range of reported payments in the facility setting reported by the MACs in April 2022 for CPT code 0398T was $440.50 to $20,842.19, and $1,554.58 to $2,036.75 when the highest and lowest outliers were removed. Of note, when the outliers were removed from the range, the established payment by the MACs for CPT code 0398T are commensurate with the established national facility pricing of $1,180 for CPT code 61715. In April 2022, only one MAC reported an established non-facility payment of $2,036.75, therefore, we are unable to substantiate the interested parties' statement about a non-facility payment of $9,750 and are seeking comments on any additional information about the established MAC payments for CPT code 0398T that we could use to consider non-facility pricing for CPT code 61715.The second interested party requested contractor-pricing for CPT code 61715 for CY 2026. We note that, in an effort to temporarily resolve this issue for CY 2025, we implemented the PC/TC splits for CPT code 61715, with contractor-pricing for the global and technical components, to restore MAC discretion when it came to pricing this service. Therefore, for CY 2026, we are seeking comments on national pricing options in the non-facility setting to address it permanently. We are also seeking comments in the form of clinical evidence to support the appropriateness of this service in the non-facility setting and the appropriateness of the established PC/TC split for CPT code 61715.

(17) Percutaneous Interlaminar Lumbar Decompression (CPT Codes 62XX0 and 62XX1)

In September 2024, CPT created two new Category I codes to replace existing Category III code 0275T. CPT codes 62XX0 (*Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (ie, CT or fluoroscopy), bilateral; one insterspace, lumbar*) and 61XX1 (*Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (that is, CT or fluoroscopy), bilateral; additional interspace(s), lumbar (List separately in addition to code for primary procedure*) were surveyed for the January 2025 RUC meeting. CPT code 62287 (*Decompression percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar*) was not surveyed as part of the code family due to low utilization (approximately 100 claims in 2023 per the RUC). Specialty societies stated that a code change application requesting the deletion of CPT code 62287 will take place for the 2026 CPT cycle.

We are proposing the RUC-recommended work RVUs for both CPT code 62XX0 (8.00) and CPT code 62XX1 (4.25) without refinement. We are also proposing the RUC-recommended direct PE inputs without refinement for both CPT code 62XX0 and 62XX1.

(18) Percutaneous Decompression of Median Nerve (CPT Code 647XX)

In September 2024, the CPT Editorial Panel created a new CPT code to report percutaneous decompression of the median nerve at the carpal tunnel using ultrasound guidance and a balloon

dilation device while transecting the transcarpal ligament: CPT code 647XX (*Decompression; median nerve at the carpal tunnel, percutaneous, with intracarpal tunnel balloon dilation, including ultrasound guidance*). For CY 2026, the RUC-recommended a work RVU of 2.70 for CPT code 647XX.

We are proposing the RUC-recommended work RVU of 2.70 for CPT code 647XX. We would like to note that CPT code 647XX is a new technology procedure, previously reported with an unlisted code, and we received external input suggesting the RVU should be 6.00, which is much higher than the RUC recommendation. However, a review of similarly timed procedures does not support an RVU greater than the RUC recommendation of 2.70. The RUC's valuation for CPT code 647XX is very typical for a procedure code with the same work time values (that is, 20 minutes intra-service time and 57 minutes of total time) and has a typical intensity for this kind of procedure.

We are proposing the RUC-recommended direct PE inputs for CPT code 647XX without refinement.

(19) Baroreflex Activation Therapy (CPT Codes 64XX5, 64XX6, 64XX7, 64XX8, 64XX9, 64X10, 93XX4, and 93XX5)

Baroreflex activation therapy (BAT) treats heart failure symptoms and resistant hypertension by electrically stimulating carotid baroreceptors within the carotid artery. The BAT modulation system received FDA approval in August 2019, and the CPT Editorial Panel approved conversion from a Category III code set to a Category I code set at the September 2024 CPT Panel meeting through the creation of the following CPT codes: 64XX5 (*Initial open implantation of baroreflex activation therapy (BAT) modulation system, including lead placement onto the carotid sinus, lead tunnelling, connection to a pulse generator placed in a distant subcutaneous pocket (that is, total system), and intraoperative interrogation and programming*), 64XX6 (*Revision or replacement of baroreflex activation therapy (BAT) modulation system, with intraoperative interrogation and programming; lead only*), 64XX7 (*Revision or replacement of baroreflex activation therapy (BAT) modulation system, with intraoperative interrogation and programming; pulse generator only*), 64XX8 (*Removal of baroreflex activation therapy (BAT) modulation system; total system, including lead and pulse generator*), 64XX9 (*Removal of baroreflex activation therapy (BAT) modulation system; total system, including lead and pulse generator; lead only*), 64X10 (*Removal of baroreflex activation therapy (BAT) modulation system; total system, including lead and pulse generator; pulse generator only*), 93XX5 (*Interrogation device evaluation (in person), carotid sinus baroreflex activation therapy (BAT) modulation system including telemetric iterative communication with the implantable device to monitor device diagnostics and programmed therapy values, with interpretation and report (for example, battery status, lead impedance, pulse amplitude, pulse width, therapy frequency, pathway mode, burst mode, therapy start/stop times each day); with programming, including optimization of tolerated therapeutic level setting*), and 93XX4 (*Interrogation device evaluation (in person), carotid sinus baroreflex activation therapy (BAT) modulation system including telemetric iterative communication with the implantable device to monitor device diagnostics and programmed therapy values, with interpretation and report (for example, battery status, lead impedance, pulse amplitude, pulse width, therapy frequency, pathway mode, burst mode, therapy start/stop times each day); without programming*). This code family describes the implantation, replacement, revision, removal and interrogation/programming of a BAT modulation system and was surveyed for the January 2025 RUC meeting.

We are proposing the RUC's recommended work RVU for seven of the eight codes in the Baroreflex Activation Therapy family. We are proposing a work RVU of 11.00 for CPT code 64XX5, a work RVU of 11.30 for CPT code 64XX6, a work RVU of 8.01 for CPT code 64XX7, a work RVU of 12.13 for CPT code 64XX8, a work RVU of 8.95 for CPT code 64XX9, a work RVU of 8.23 for CPT code 64X10, and a work RVU of 0.90 for CPT code 93XX5.

We disagree with the RUC's recommended work RVU of 0.79 for CPT code 93XX4 and we are instead proposing a work RVU of 0.65 based on a crosswalk to CPT code 93279 (*Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; single lead pacemaker system or leadless pacemaker system in one cardiac chamber*), which was the top reference code from the survey. We believe that it is more accurate to base the work valuation for CPT code 93XX4 on this crosswalk to CPT code 93279 due to the close clinical similarity between the two procedures (both of them cardiac device evaluations) which share the same intraservice work time of 10 minutes and the same total work time of 22 minutes.

The RUC recommended the survey 25th percentile work RVU of 0.79 for CPT code 93XX4, stating that CPT code 93XX4 has a higher estimated intensity and complexity than the two key reference services (including CPT code 93279). However, we do not agree that CPT code 93XX4 should be valued at a higher work RVU based on the intensity for a clinically similar device evaluation code like CPT code 93279. The RUC's recommended work RVU of 0.79 results in an intensity for CPT code 93XX4 which is close to 40 percent higher than the intensity for peer CPT code 93XX5. We do not believe that this results in an accurate valuation for the two new codes given that CPT code 93XX4 describes cases where the BAT device is working properly and does not require adjustment, whereas CPT code 93XX5 describes cases where the BAT device is working properly but requires additional device programming. We believe that CPT code 93XX5 should have the higher intensity given the additional device programming required in this code to achieve optimal therapeutic levels for the BAT device. Therefore, we are proposing a work RVU of 0.65 for CPT code 93XX4, which we believe reflects more accurate relativity between CPT code 93XX4 and CPT code 93XX5.

We are proposing the direct PE inputs as recommended by the RUC for CPT codes 64XX5–64X10. For CPT codes 93XX4 and 93XX5, we disagree with the RUC- recommended use of the RN (L051A) clinical labor type. These kinds of device evaluation procedures typically do not make use of RN clinical labor; for example, reference codes 93279 and 93281, which were used as a model for the direct PE inputs of these two new codes, both use a combination of the RN/LPN/MTA blend (L037D) and Medical/Technical Assistant (L026A) clinical labor types. Therefore, we are proposing to refine the clinical labor for CPT codes 93XX4 and 93XX5 from RN (L051A) to the RN/LPN/MTA blend (L037D); we are proposing that the numerical values for each clinical labor input will remain the same, with only the staff type changing from L051A to L037D. We are proposing the rest of the RUC-recommended PE inputs without refinement.

(20) Percutaneous Electrical Nerve Field Stimulation (CPT Code 64X11)

In September 2024, the CPT Editorial Panel created a new CPT code to report percutaneous electrical nerve field stimulation of cranial nerves: CPT code 64X11 (*Percutaneous electrical nerve field stimulation, cranial nerves, without implantation*). For CY 2026, the RUC-recommended a work RVU of 1.50 for CPT code 64X11.

We are proposing the RUC-recommended work RVU of 1.50 for CPT code 64X11, and the RUC-recommended direct PE inputs without refinement.

(21) Laminotomy—Repair of Disc Defect (CPT Code 6XX13)

In September 2024, the CPT Editorial Panel created a new add-on code to report the repair of an annular defect by implantation of a bone anchored annular closure device after a laminotomy (hemilaminectomy): CPT code 6XX13 (*Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; with repair of annular defect by implantation of bone anchored annular closure device, including all imaging guidance, 1 interspace, lumbar (List separately in addition to code for primary procedure)*). CPT codes 63030 (*Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar*) and 63035 (*Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)*) were identified as codes in the same family as CPT code 6XX13, but were recently surveyed in 2022 and discussed in the CY 2023 PFS final rule (87 FR 69495 through 64999). The specialty societies stated that the work for these procedures is unchanged and distinct from the work of the new code, and therefore only surveyed CPT code 6XX13.

For CY 2026, we are proposing the RUC-recommended work RVU of 2.50 for CPT code 6XX13. There are no direct PE inputs for CPT code 6XX13.

(22) Cerebral Perfusion & CT Angiography-Head & Neck (CPT Codes 70496, 70498, 70XX1, 70XX2, and 70XX3).

In May 2024, the CPT Editorial Panel created three new codes for cerebral perfusion and CT angiography of the head and neck: CPT code 70XX1 (*Computed tomographic angiography (CTA), head and neck, with contrast material(s), including noncontrast images, when performed, and image postprocessing*), CPT code 70XX2 (*Computed tomographic (CT) cerebral perfusion analysis with contrast material(s), including image postprocessing performed with concurrent CT or CT angiography of the same anatomy (List separately in addition to code for primary procedure)*), and 70XX3 (*Computed tomographic (CT) cerebral perfusion analysis with contrast material(s), including image postprocessing performed without concurrent CT or CT angiography of the same anatomy*). Codes 70XX1, 70XX2, and 70XX3 were surveyed for the September 2024 RUC meeting, along with the existing standalone codes for CTA head and CTA neck in this code family: CPT code 70496 (*Computed tomographic angiography, head, with contrast material(s), including noncontrast images, if performed, and image postprocessing*) and CPT code 70498 (*Computed tomographic angiography, neck, with contrast material(s), including noncontrast images, if performed, and image postprocessing*).

We are proposing the RUC-recommended work RVU of 2.50 for CPT code 70XX1, the work RVU of 0.77 for CPT code 70XX2, the work RVU of 1.00 for CPT code 70XX3, and the work RVU of 1.75 for both CPT codes 70496 and 70498.

We are proposing the RUC-recommended direct PE inputs for CPT codes 70XX1, 70XX2, 70XX3, 70496, and 70498 without refinement.

(23) Coronary Atherosclerotic Plaque Assessment (CPT Code 75XX6)

In September 2024, the CPT Editorial Panel created new Category I CPT code 75XX6 (*Quantification and characterization of coronary atherosclerotic plaque to assess severity of coronary disease, derived from augmentative software analysis of the data set from a coronary computed tomographic angiography, with interpretation and report by a physician or other qualified health care professional*) and deleted the four existing Category III CPT codes associated with coronary atherosclerotic plaque assessment.

We are proposing the RUC-recommended work RVU of 0.85 for CPT code 75XX6. For the direct PE inputs, these recommendations also include a new supply item, Plaque Characterization Analysis Software, that lists a per-patient fee of $1500 for the plaque data analysis summary generated by the vendor. This RUC-recommended supply item accounts for the overwhelming majority of this CPT code's PE valuation. We continue to have concerns that software analysis fees are not well accounted for in our direct PE methodology, as discussed for CPT code 75580 (*Noninvasive estimate of coronary fractional flow reserve (FFR) derived from augmentative software analysis of the data set from a coronary computed tomography angiography, with interpretation and report by a physician or other qualified health care professional*) in our CY 2024 final rule (88 FR 78901); however, we recognize that the analysis represents a significant part of the resource costs associated with this procedure.

Similar to our previously finalized policy for CPT code 75580, we are therefore proposing to identify a crosswalk code for CPT code 75XX6 based on the OPPS assignment for the current coding under which this service is paid, Category III CPT code 0625T (*Automated quantification and characterization of coronary atherosclerotic plaque to assess severity of coronary disease, using data from coronary computed tomographic angiography; computerized analysis of data from coronary computed tomographic angiography*). We are proposing to crosswalk the PE RVU for CPT code 75XX6 to the PE RVU for CPT code 77373 (*Stereotactic body radiation therapy, treatment delivery, per fraction to 1 or more lesions, including image guidance, entire course not to exceed 5 fractions*), which is a PE-only code with no work RVU and which closely approximates the OPPS assignment previously employed by Category III CPT code 0625T. As we have previously stated in rulemaking, we believe that crosswalking the PE RVU for CPT code 75XX6 to a code with similar resource costs (CPT code 77373) allows CMS to recognize that practitioners are incurring resource costs for the purchase and ongoing use of the software employed in CPT code 75XX6, which would not typically be considered direct PE under our current methodology (86 FR 65038 and 65039).

(24) Use of the Relationship Between OPPS APC Relative Weights To Establish PE RVUs for Radiation Oncology Treatment Delivery (CPT Codes 77387, 77402, 77407, 77412, and 77417), Superficial Radiation Treatment (CPT Codes 77X05, 77X07, 77X08, and 77X09), and Proton Beam Treatment Delivery (CPT Codes 77520, 77522, 77523, and 77525)

A. Background

We typically establish two separate PE RVUs for services that can be furnished in either a nonfacility setting, such as a physician's office, or a facility setting, such as a hospital. The nonfacility PE RVUs reflect all the direct and indirect practice expenses involved in furnishing a particular service when the entire service is furnished in a nonfacility setting. The facility PE RVUs reflects the direct and indirect practice expenses associated with furnishing a particular service in a setting such as a hospital, where those facilities incur a portion of the costs and receive a separate Medicare payment for the service. The types of costs covered by the facility fee are comparable to the PE costs incurred by physicians in non-facility settings, namely direct and indirect costs. For certain services, such as radiation treatment delivery services, the coding itself reflects differing types of resources associated with furnishing the service—from coding describing the technical aspects of the treatment delivery only, which do not include any physician work, to codes that describe both the physician work and the technical resources associated with that work. The former services are valued through information on the direct practice expenses, whereas the latter are valued through the resource costs associated with the physician work and any applicable direct practice expenses.

When services are furnished in the facility setting, such as a Hospital Outpatient Department (HOPD) or an Ambulatory Surgical Center (ASC), the total combined Medicare payment (made to the facility and the professional) typically exceeds the Medicare payment made for the same service when furnished in the physician office or other nonfacility setting. This payment difference is largely based on differences in statutory provisions that specify how payment amounts are determined under the PFS and under facility payment systems, like the Hospital Outpatient Prospective Payment System (OPPS). CMS has received feedback from interested parties that the difference reflects the greater costs that facilities incur than those incurred by practitioners furnishing services in offices and other nonfacility settings. For example, interested parties have indicated that hospitals incur higher overhead costs because they maintain the capability to furnish services 24 hours a day and 7 days per week, generally furnish services to higher acuity patients than those who receive services in physicians' offices, and have additional legal obligations such as complying with the Emergency Medical Treatment and Labor Act (EMTALA). Additionally, hospitals incur expenses to meet conditions of participation and ASCs incur expenses to meet conditions for coverage in order to participate in Medicare; many of these conditions are not applicable in nonfacility settings.

While we receive recommendations from the RUC that include information on resource costs, this information relies heavily on the voluntary submission of information by individuals furnishing the service. Furthermore, in the case of certain direct costs, such as the price of high-cost disposable supplies and expensive capital equipment, even voluntary information has been very difficult to obtain or validate. Such incomplete, small sample, potentially biased or inaccurate resource input costs may distort our valuation of the nonfacility PE RVUs used in calculating PFS payment rates for individual services. As MedPAC noted in their comment to the CY 2011 PFS proposed rule, ''using price information voluntarily submitted by specialty societies, individual practitioners, suppliers, and product developers might not result in objective and accurate prices because each group has a financial stake in the process''. We have repeatedly stated, such as in the CY 2018 final rule, that ''we do not believe that very small numbers of voluntarily submitted invoices are likely to reflect typical resource costs and create the potential for overestimation of supply and equipment costs'' (82 FR 52998).In addition to the difficulty we face in obtaining accurate information about some of the direct PE inputs, the data used in the PFS PE methodology can often be outdated. Although we received updated PPI survey information from the AMA, we are not proposing to utilize this new data in our practice expense methodology due to concerns we identified in section II.B. of this proposed rule. We refer readers there for further discussion.

Under the PFS, we strive to maintain relativity in a variety of ways. For example, we typically review the work RVUs, physician time, and direct PE inputs for all codes within families of codes. We also routinely compare work RVUs across services with similar clinical characteristics, global periods, etc. For direct PE inputs, we routinely make standardized assumptions regarding the typical involvement of clinical staff or use of medical equipment based on the kind of service being furnished.

However, we also recognize that the utility of using the exact same methodologies to establish and maintain appropriate relativity under the PFS can be especially limited for services that are difficult to compare to other PFS services. Radiation treatment delivery services are a clear example of this dynamic. Generally, the PFS practice expense methodology serves the purpose of using direct cost and professional work data to assign relative value units to services. In establishing nonfacility PE RVUs, these settings include physician offices for a range of kinds of care and specialties as well as independent clinics/suppliers. However, the costs for furnishing radiation treatment delivery services in nonfacility settings (that is, freestanding radiation therapy centers) include capital-intensive and specialized resources that are difficult to compare to the kinds of resources involved in furnishing most other kinds of services in other nonfacility settings. For example, the sum of the current prices for the equipment inputs used in the PE calculations for radiation treatment delivery services (*i.e.,* $3,000,966 for ER089 (IMRT accelerator) and $773,104 for ER056 (radiation treatment vault)) is well over twice the price of the next most expensive piece of equipment ($1,559,013 for EL008 (room, MR) used in furnishing other types of services in other nonfacility settings. Furthermore, other inputs for capital equipment over $1 million are utilized in a wide array of services for multiple specialties, while the equipment inputs for radiation treatment delivery services are more specialized in that they are used in a small number of services and predominantly in radiation oncology. We have long had difficulty understanding how best to characterize the costs associated with architectural infrastructure needs prompted by use of linear accelerators. In the CY 2016 PFS final rule (80 FR 70953), we stated that we believe at least some portions of the costs associated with the radiation treatment vault construction are indirect PE under the established methodology. We most recently noted this difficulty in CY 2021 PFS rulemaking when addressing our inability to use the recommended direct PE inputs for proton beam therapy services (85 FR

84625). We described difficulty using invoices provided, given that they did not separately identify the direct PE inputs (that is, cost of the equipment) from that of the infrastructure needs surrounding the equipment. For the CY 2016 PFS final rule (80 FR 70954), technical PFS rate setting concerns related to how costs were allocated to different codes based on presumptions about costs of image guidance, prompted CMS to maintain the HCPCS G-codes under the PFS in use for reporting radiation treatment delivery services instead of newly introduced CPT codes. (These HCPCS G codes, which mirrored the coding structure prior to the newly introduced CPT codes, were developed for CY 2015 PFS rulemaking in order to allow CMS to include the changes to radiation treatment delivery services in the CY 2016 PFS proposed rule). At that time, CMS adopted the new CPT codes for use under the OPPS, where payment calculations did not suffer from the same problems. Since that time, outpatient radiation therapy services have been reported to Medicare using two different sets of HCPCS codes, depending on whether the services are provided in a HOPD or in a nonfacility setting paid under the PFS.

For CY 2026, the CPT Editorial Panel has again revised the codes describing radiation treatment delivery services. This presents an opportunity both to consider adopting CPT codes under the PFS and to re-examine how to best assign relative value units to radiation treatment delivery and superficial radiation treatment delivery services under the PFS. If we were to utilize the RUC-recommended direct PE inputs and new RUC PE survey data to value the new, newly payable, and revised codes in these code families, valuation, and ultimately payment, for these services would be subject to the additional volatility associated with small sample surveys, the unique dynamic of capital-intensive costs, and voluntarily submitted invoice data.

We considered the RUC recommended PE inputs for the new, and revised codes listed above in the context of the concerns we outlined above. Specifically, we considered how PE is allocated for under the standard methodologies and noted that radiation treatment delivery and superficial radiation treatment services require long-term capital and infrastructure investments more like facility costs than most other services paid under the PFS. Therefore, we have determined that identifying an alternative data source that is more routinely updated and standardized would improve the accuracy of valuation for these services.

One alternative data source that we have examined is the use of OPPS cost data to develop PE RVUs. Under section 1848(c)(2)(N) of the Act, we have authority to establish or adjust PE RVUs using cost, charge, or other data from suppliers or providers of services. Under contract with CMS, RAND Corporation (''RAND'') examined the feasibility of using OPPS cost data in developing PE RVUs.[51] [52] RAND noted that ''if OPPS-based costs were used to construct total PE RVUs, the valuation process would also be streamlined by using a single data source, thereby eliminating the valuation complexities posed by having separate direct and indirect cost RVU pools.'' RAND identified a number of methodological issues that would need to be resolved to utilize OPPS cost data for all PFS services but found that the potential benefits justified investments to further develop this option. RAND noted that using OPPS data ''might not be appropriate for the entirety of services in the MPFS and the advisability of using OPPS data should be evaluated by categories of costs and/or services.'' Considering that the resources involved in furnishing radiation treatment delivery and superficial radiation treatment delivery services seem to be primarily driven by capital costs that aren't as likely to vary greatly between facilities like hospitals and free standing centers, and because the billing codes for the services (both old and new) are already stratified into professional and technical services, these services have obvious characteristics that make use of OPPS data particularly appropriate. Additionally, use of routinely updated, auditable, and standardized cost data from hospital cost reports that is currently used in setting rates under the OPPS offers the possibility of long-term stable rates that many interested parties have long sought and that may be helpful in maintaining access to care for capital-intensive services. Consequently, we believe that using OPPS data in setting the relative rates for these kinds of services represents the best source for improved valuation of practice expense in free-standing radiation centers.

We have long noted that data obtained from hospital cost reports is regularly updated, auditable, and required to adhere to national standards for reporting. For example, in the CY 2015 PFS final rule (79 FR 67569), we noted that ''routinely updated, auditable resource cost information submitted contemporaneously by a wide array of providers across the country is a valid reflection of ''relative'' resources and could be useful to supplement the resource cost information developed under our usual methodology based upon a typical case that are developed with information from a small number of representative practitioners for a small percentage of codes in any particular year''.

Under OPPS, services are grouped based on clinical characteristics and resource costs into Ambulatory Payment Classifications (APCs). The OPPS methodology utilizes charges from claims data and cost-to-charge ratios developed from cost report data to establish the geometric mean costs for each APC. APC payments are in turn based on the geometric mean costs associated with the services within the APC.

While the costs involved in furnishing technical services in the facility setting could generally be expected to be greater than or equal to those of providing the same service in the nonfacility setting, we believe that the *relationship* of the costs of services within a code family under the PFS would likely mirror the relationship of those costs of services under the OPPS. (The Ambulatory Surgical Center (ASC) fee schedule, which relies on OPPS relative weights multiplied by an ASC conversion factor, is an example of using the same underlying data to establish relative values in two payment systems while continuing to recognize differences in cost structure between settings). For example, if ''service A'' is twice as costly under the OPPS as ''service B'', it is reasonable to assume that the resource costs of ''service A'' are twice as costly as ''service B'' under the PFS. We would expect that the relationship between the resources involved in furnishing services within the same code family under the OPPS would be similar under the PFS. Given that the APC is the payment unit under the OPPS, we believe that applying the relationship of the APC relative weights to the codes within the Radiation Oncology Treatment Delivery and Superficial Radiation Treatment code families is the most accurate and transparent mechanism to translate the

[51] Burgette, Lane F., Jodi L. Liu, Benjamin M. Miller, Barbara O. Wynn, Stephanie Dellva, Rosalie Malsberger, Katie Merrell, et al. ''Practice Expense Methodology and Data Collection Research and Analysis.'' RAND Corporation, April 11, 2018. *https://www.rand.org/pubs/research_reports/RR2166.html.*

[52] Burgette, Lane F., Joachim O. Hero, Jodi L. Liu, Catherine C. Cohen, Barbara O. Wynn, Katie Merrell, et al. Practice Expense Data Collection and Methodology.'' RAND Corporation, November 1, 2021. *https://www.rand.org/pubs/research_reports/RRA1181-1.html.*

relationship of the cost data under the OPPS to the PFS. This approach would help to mitigate volatility in relativity among services that would be attributable to small sample surveys, voluntarily submitted invoice data, or PE allocation methodologies that are not designed primarily for capital-intensive costs in architecture and medical equipment as costly as linear accelerators. Therefore, we are proposing to use this relationship between the relative weights of the OPPS APCs to which the codes in these families are assigned to value the PE portion of the Radiation Oncology Treatment Delivery and Superficial Radiation Treatment code families. We are proposing to use the CY 2026 proposed OPPS APC relative weights and to update these in the final rule based on the updated OPPS APC relative weights. The OPPS APC relative weights can be found in ''Addendum B'' under ''OPPS Addenda'' under the most recent proposed or final rule listed at *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/regulations-notices.* We are also proposing to value the MP RVUs for the Radiation Oncology Treatment Delivery and Superficial Radiation Treatment code families with our usual methodology for PE-only services.

While we believe that the relationship between services within the Radiation Oncology Treatment Delivery and Superficial Radiation Treatment code families are well approximated by the relationship between those services under the OPPS, we recognize that the RVUs for these groups of services must reflect the resources involved in furnishing services relative to other services paid under the PFS. As such, the proposed PE RVUs for the Radiation Oncology Treatment Delivery and Superficial Radiation Treatment code families, which are based on the relationship of the relative weights of the OPPS APCs to which these codes are assigned, were calculated using the portion of total PE and MP RVUs accounted for by the volume and PE RVUs of these families as they existed in CY 2025. In other words, we calculated the RVUs for these codes so that the overall PE and MP RVUs for these services represent the same share of total PE and MP RVUs in CY 2025 and CY 2026.

Under the PE methodology, the allocation of indirect PE for a given family of services impacts the allocation of indirect PE for other services furnished by the specialties that furnish that family of services (''relevant specialties''). This results from specialty-specific calculations that occur in steps 12 through 15, described in section II.B. of this proposed rule, that are impacted by the size of the pool of indirect allocators (that is, work RVUs and direct costs) for each specialty. Since the codes in these families have historically contained direct PE inputs, and have historically been allocated indirect PE RVUs using the usual methodology, the proposed PE RVUs for CY 2026 have been calculated in a manner that maintains the same effect on the indirect allocation for other services had the PE RVUs been calculated under the usual methodology. In other words, in calculating the proposed PE RVUs for CY 2026, we approximated the direct costs for these services and allocated indirect PE RVUs per the standard methodology in order to both arrive at PE RVUs based on the proposal described above and also maintain relativity with the PE RVUs across the fee schedule. We have included those approximated direct costs in the downloads section of our website to facilitate transparency. We note that the direct PE input public use file does not include these proxy inputs since they only serve the purpose of stabilizing the PE allocated to other services. We seek comments on this aspect of the methodology in particular, especially given our interest in transparency in rate setting.

We are seeking comments on our proposal to use the relative relationship between the proposed OPPS APC relative weights to establish the PE RVUs for these code families.

We believe that this proposal will improve the accuracy of the relative values established for these services and prevent reliance on irregularly updated information for establishing and maintaining payment for these services under the PFS. Additionally, we believe that the alignment of coding, underlying cost data and billing units between settings paid under the PFS and OPPS will have additional salutary effects, especially in price transparency for patients and payers.

B. Radiation Oncology Treatment Delivery (CPT Codes 77387, 77402, 77407, 77412, and 77417)

At the September 2024 CPT Editorial Panel meeting, the Panel approved the revision of CPT codes 77402, 77407 and 77412 to establish a technique-agnostic family of codes and bundle imaging into the three CPT codes, and the deletion of CPT codes 77385, 77386 and 77014. The related guidelines and tables were all updated to reflect the consolidated services for radiation oncology treatment delivery. These services were subsequently reviewed by the RUC and a valuation recommendation was submitted to CMS for inclusion in CY 2026 rulemaking. Please see Table 14 for the current and CY 2026 code descriptors (where applicable) for the CPT codes in this family.

TABLE 14: COMPARISON BETWEEN CURRENT AND CY 2026 LONG DESCRIPTORS

HCPCS	Current Long Descriptor	CY 2026 Long Descriptor
77401	Radiation treatment delivery, superficial and/or ortho voltage, per day	Deleted
77402	Radiation treatment delivery, >=1 MeV; simple	Radiation treatment delivery; Level 1 (for example, single electron field, multiple electron fields, or 2D photons), including imaging guidance, when performed
77407	Radiation treatment delivery, >=1 MeV; intermediate	Radiation treatment delivery; Level 2, single isocenter (eg, 3D or IMRT), photons, including imaging guidance, when performed
77412	Radiation treatment delivery, >=1 MeV; complex	Radiation treatment delivery; Level 3, multiple isocenters with photon therapy (for example, 2D, 3D, or IMRT) OR a single isocenter photon therapy (eg, 3D or IMRT) with active motion management, OR total skin electrons, OR mixed electron/photon field(s), including imaging guidance, when performed
77385	Intensity modulated radiation treatment delivery (IMRT), includes guidance and tracking, when performed; simple	Deleted
77386	Intensity modulated radiation treatment delivery (IMRT), includes guidance and tracking, when performed; complex	Deleted
77387	Guidance for localization of target volume for delivery of radiation treatment, includes intrafraction tracking, when performed	
77014	Computed tomography guidance for placement of radiation therapy fields	Deleted
77417	Therapeutic radiology port image(s)	

Although these CPT codes were established for CY 2015, CMS has not used them for payment under the PFS. In October 2013, the CPT Editorial Panel created CPT codes 77402, 77407, 77412, 77385, 77386 and 77387, which were reviewed at the January 2014 RUC meeting for CY 2015. Previously, radiation treatment delivery had been reported with 17 CPT codes. CMS identified concerns with the packaging of Image-guided Radiation Therapy (IGRT) into some of the delivery codes in the family and not others. As a result, CMS created 17 HCPCS G-codes, to mirror the existing codes (at the time), maintained CPT code 77014, and established values that linked directly to the existing values/inputs for the PFS. Table 15 includes the HCPCS G-codes and their long descriptors.

TABLE 15: HCPCS G-CODES FOR RADIATION TREATMENT DELIVERY

HCPCS	Long Descriptor
G6001	Ultrasonic guidance for placement of radiation therapy fields
G6002	Stereoscopic x-ray guidance for localization of target volume for the delivery of radiation therapy
G6003	Radiation treatment delivery, single treatment area, single port or parallel opposed ports, simple blocks or no blocks: up to 5 mev
G6004	Radiation treatment delivery, single treatment area, single port or parallel opposed ports, simple blocks or no blocks: 6-10 mev
G6005	Radiation treatment delivery, single treatment area, single port or parallel opposed ports, simple blocks or no blocks: 11-19 mev
G6006	Radiation treatment delivery, single treatment area, single port or parallel opposed ports, simple blocks or no blocks: 20 mev or greater
G6007	Radiation treatment delivery, 2 separate treatment areas, 3 or more ports on a single treatment area, use of multiple blocks: up to 5 mev
G6008	Radiation treatment delivery, 2 separate treatment areas, 3 or more ports on a single treatment area, use of multiple blocks: 6-10 mev
G6009	Radiation treatment delivery, 2 separate treatment areas, 3 or more ports on a single treatment area, use of multiple blocks: 11-19 mev
G6010	Radiation treatment delivery, 2 separate treatment areas, 3 or more ports on a single treatment area, use of multiple blocks: 20 mev or greater
G6011	Radiation treatment delivery, 3 or more separate treatment areas, custom blocking, tangential ports, wedges, rotational beam, compensators, electron beam; up to 5 mev
G6012	Radiation treatment delivery, 3 or more separate treatment areas, custom blocking, tangential ports, wedges, rotational beam, compensators, electron beam; 6-10 mev
G6013	Radiation treatment delivery, 3 or more separate treatment areas, custom blocking, tangential ports, wedges, rotational beam, compensators, electron beam; 11-19 mev
G6014	Radiation treatment delivery, 3 or more separate treatment areas, custom blocking, tangential ports, wedges, rotational beam, compensators, electron beam; 20 mev or greater
G6015	Intensity modulated treatment delivery, single or multiple fields/arcs,via narrow spatially and temporally modulated beams, binary, dynamic mlc, per treatment session
G6016	Compensator-based beam modulation treatment delivery of inverse planned treatment using 3 or more high resolution (milled or cast) compensator, convergent beam modulated fields, per treatment session
G6017	Intra-fraction localization and tracking of target or patient motion during delivery of radiation therapy (eg,3d positional tracking, gating, 3d surface tracking), each fraction of treatment

Over the past several years, the Radiation Oncology community met with CMS and CMMI to address the concerns identified by CMS in the 2015 code set as well as the possibility of creating an episode-based alternative payment approach for radiation therapy services. The G-codes were identified in a Relativity Assessment Workgroup (RAW) screen (CMS/Other source with 2019 estimated Medicare utilization over 20,000). The RAW did not agree with the specialty societies' request to maintain the current valuation. As a result, the CPT Editorial Panel reviewed the radiation oncology delivery treatment family at the September 2024 CPT meeting and established a technique-agnostic family of codes and bundled imaging into all three services. The Panel approved the revision of CPT codes 77402, 77407 and 77412 and the deletion of 77385, 77386 and 77014. The specialty societies have also requested that CMS delete the related G-codes, G6001 through G6017. As stated previously, we have not recognized the radiation treatment delivery CPT codes for payment under PFS and have instead used the G-codes to describe these services, based primarily on concerns related to how the conventional practice expense methodology applies to these services. For CY 2026, we are proposing to delete the 17 G-codes and recognize the newly revised CPT codes for payment under the PFS, in conjunction with our proposal to utilize OPPS cost data to establish PE RVUs, as previously described.

We are proposing the RUC-recommended work RVU of 0.70 for the single code in the family that has a physician work component, CPT code 77387.

We are proposing to utilize the relationship between the proposed OPPS APC relative weights for APCs 5621, 5622, and 5623 to inform the valuation of PE-only CPT codes 77402, 77407, and 77412 when paid under the PFS. As described above, we believe that the relationship between the OPPS APC relative weights more accurately reflects the relative resource costs associated with furnishing these services.

To facilitate the use of the relationship of the OPPS APC relative weights to establish PE RVUs for radiation treatment delivery services, we believe it is important to standardize the billing units and bundling rules between the settings. That is, services in this code family that describe technical costs and are not separately payable under the OPPS will not be separately payable under the PFS, because the associated costs are incorporated into the costs for separately paid codes. As a result, the proposed PE RVUs for the

services in this code family, which are developed based on the relationship of the APC relative weights to which services in this family are assigned, include a redistribution of the PE RVUs from the newly bundled services to the other services in that family, as described below.

In an effort to align the relationship between the PFS payment for this code family with the OPPS payment, we are proposing to assign Procedure Status ''B'' to the technical component of CPT code 77387 to maintain consistency with OPPS payment for this code, which is packaged into payment for the treatment delivery codes, CPT codes 77402, 77407, and 77412, and therefore is not separately payable under the OPPS. As described in section II.B. of this proposed rule, typically, when services have separately billable PC and TC components, the payment for the global service equals the sum of the payment for the TC and PC. In the case of CPT code 77387, we are proposing that the PE and total RVU for the global service will equal the PE and total RVU for the professional component only because the technical component is not separately payable under the PFS since the relative resources are included in the valuation of another code (treatment delivery). We are proposing to display CPT code 77387 in Addendum B with the professional and technical components, where the technical component has non-payable Procedure Status ''B,'' as well as the global service equal to the payable professional component, We are also seeking comment on strategies to mitigate billing confusion that could result from this relatively novel circumstance where the technical component of a service is bundled but the professional component is separately reported. Specifically, we are seeking comments on whether displaying the global service equal to the professional component is problematic, and if it would be preferable to eliminate the global code and display only the professional and technical components in Addendum B.

Similarly, for PE-only CPT code 77417 (*Therapeutic radiology port image(s)*), we are proposing to assign Procedure Status ''B'' to align with OPPS payment for this code, which is packaged into payment for the treatment delivery codes, CPT codes 77402, 77407, and 77412 and therefore would not be separately reportable under the PFS. Similarly, of course, it is packaged under the OPPS.

C. Superficial Radiation Therapy (CPT Codes 77X05, 77X07, 77X08, and 77X09)

Superficial radiation therapy is currently provided using CPT code 77401 (*Radiation treatment delivery, superficial and/or ortho voltage, per day*) in conjunction with CPT code 77280 (*Therapeutic radiology simulation-aided field setting; simple*) and HCPCS code G6001 (*Ultrasonic guidance for placement of radiation therapy fields*).

In October 2020, HCPCS code G6001 was identified by the RAW via the CMS/Other Medicare utilization over 20,000 screen. In January 2021, the RUC recommended referring G6001 to CPT to develop new code(s) that reflect the different process of care between the two specialties (dermatology and radiation oncology). After a 2-year delay to allow time for re-review, the CPT Editorial Panel created four codes and a new subsection to report surface radiation therapy in September 2024. These codes will replace CPT code 77401 and HCPCS code G6001 which were scheduled for deletion by the CPT Editorial Panel and recommended for deletion by CMS, respectively. This code family was surveyed for the January 2025 RUC meeting.

The new codes are as follows:

- 77X05: *Surface radiation therapy; superficial or orthovoltage, treatment planning and simulation-aided field setting.*
- 77X07: *Surface radiation therapy, superficial, delivery, <150 kV, per fraction (e.g., electronic brachytherapy).*
- 77X08: *Surface radiation therapy, orthovoltage, delivery, >150–500 kV, per fraction.*
- 77X09: *Surface radiation therapy, superficial or orthovoltage, image guidance, ultrasound for placement of radiation therapy fields for treatment of cutaneous tumors, per course of treatment (List separately in addition to the code for primary procedure).*

We are proposing the RUC-recommended work RVU for the two codes in the family that have a work RVU. We are proposing a work RVU of 0.77 for CPT code 77X05 and a work RVU of 0.30 for CPT code 77X09.

Similar to our approach for the radiation oncology treatment delivery codes discussed above, we believe that using the relationship between the relative weights of the OPPS APCs to which codes in this family are assigned likely more accurately reflect the actual costs of these services compared to use of direct PE input and PE allocation methodologies. Therefore, similar to our proposal for radiation treatment delivery services, we are proposing to use this relationship to establish the RVUs for the PE portion of these services.

We are proposing to utilize the relationship between the proposed OPPS APC assignments for APCs 5621 and 5732 to inform the valuation of PE-only CPT codes 77X07 ((*Surface radiation therapy, superficial, delivery, <150 kV, per fraction (eg, electronic brachytherapy)*)) and 77X08 (*Surface radiation therapy, orthovoltage, delivery, >150–500 kV, per fraction*), and for the technical component of CPT code 77X05 (*Surface radiation therapy; superficial or orthovoltage, treatment planning and simulation-aided field setting*) when paid under the PFS.

In an effort to align the relationship between the PFS payment for this code family with the relationship of the OPPS information used to develop the RVUs, we are proposing to assign Procedure Status ''B'' to the technical component of CPT code 77X09 to align with OPPS of this code whose costs are packaged into payment for the treatment delivery CPT codes 77X07 and 77X08. We are proposing to display CPT code 77X09 in Addendum B with the professional and technical components, where the technical component is non-payable Procedure Status ''B,'' as well as the global service equal to the payable professional component, but are seeking comment on strategies to mitigate possible billing confusion that could result from this relatively novel circumstance where the technical component of a service is bundled but the professional component is separately reported. Specifically, we are seeking comments on whether displaying the global service equal to the professional component is problematic, and if it would be preferable to eliminate the global service and display the professional and technical components only in Addendum B.

TABLE 16: SUMMARY OF CODING PROPOSALS FOR RADIATION ONCOLOGY TREATMENT DELIVERY AND SUPERFICIAL RADIATION THERAPY CODES

CPT Code-Modifier	Long Descriptor	OPPS Payment Status	OPPS Proposed APC	PFS Procedure Code Status	PE Only Code?
77402	Radiation treatment delivery; Level 1 (eg, single electron field, multiple electron fields, or 2D photons), including imaging guidance, when performed	S	5621	A	✓
77407	Radiation treatment delivery; Level 2, single isocenter (eg, 3D or IMRT), photons, including imaging guidance, when performed	S	5622	A	✓
77412	Radiation treatment delivery; Level 3, multiple isocenters with photon therapy (eg, 2D, 3D, or IMRT) OR a single isocenter photon therapy (eg, 3D or IMRT) with active motion management, OR total skin electrons, OR mixed electron/photon field(s), including imaging guidance, when performed	S	5623	A	✓
77417	Therapeutic radiology port image(s)	N	N/A	B	
77387	Guidance for localization of target volume for delivery of radiation treatment, includes intrafraction tracking, when performed	N	N/A	A	
77387-26 Professional component				A	
77387-TC Technical component				B	
77X05	Surface radiation therapy; superficial or orthovoltage, treatment planning and simulation-aided field setting	S?	5732	A	
77X05-26 Professional component				A	
77X05-TC Technical component				A	
77X07	Surface radiation therapy, superficial, delivery, <150 kV, per fraction (eg, electronic brachytherapy)	S?	5621	A	✓
77X08	Surface radiation therapy, orthovoltage, delivery, >150-500 kV, per fraction	S?	5621	A	✓
77X09	Surface radiation therapy, superficial or orthovoltage, image guidance, ultrasound for placement of radiation therapy fields for treatment of cutaneous tumors, per course of treatment (List separately in addition to the code for primary procedure)	N	N/A	A	
77X09-26 Professional component				A	
77X09-TC Technical component				B	

D. Proton Beam Treatment Delivery (CPT Codes 77520, 77522, 77523, and 77525)

PFS payment amounts for proton beam treatment delivery services are currently determined by local Medicare Administrative Contractors (MACs). As discussed in CY 2021 rulemaking (85 FR 84625 through 84626), we have not previously established RVUs for these services due to the unique nature of the equipment costs associated with these services compared to other capital costs addressed by our usual PE methodology. Given the proposals described above to establish RVUs for the new and revised CPT codes for Radiation Oncology and Superficial Radiation Treatment Delivery Services, we are seeking comments on whether we should adopt a similar approach to establish RVUs for

proton beam treatment delivery services. We note that these services are assigned to APCs 5623 and 5625 under the OPPS with established Medicare payment rates (unlike the contractor pricing in place for these services under the PFS). We are specifically seeking comments on how we might establish national pricing and total RVUs for these services to maintain relativity within the PFS. For example, would using the overall ratio between OPPS and PFS payment for radiation oncology treatment services to establish initial year RVUs for proton beam treatment delivery services accurately reflect the relative resources involved in furnishing the services? Alternatively, would it be more appropriate to consider the overall difference between the OPPS and Medicare payment as currently determined by the MACs for these services, or are there other alternative methods we should consider? We welcome comments on this topic.

(25) Combination COVID–19 Vaccine Administration (CPT Codes 90480 and 9X16X)

In September 2024, the CPT Editorial Panel created a new add-on code, 9X16X (*each additional component administered (List separately in addition to code for primary procedure)*), to report when each additional non-COVID vaccine component is administered with the COVID–19 vaccine. CPT code 90480 (*Immunization administration by intramuscular injection of severe acute respiratory syndrome coronavirus 2 (SAR CoV2) (coronavirus disease [COVID19]) vaccine; first or only component of each vaccine administered*) was revised as part of this family of services.

We received RUC recommendations for CPT code 90480 that affirmed the September 2023 work and PE RUC recommendations. We previously established CPT code 90480 with a procedure status of ''X'' on the PFS and the code is therefore not payable under the PFS. Payment for this CPT code is also addressed under previously finalized policies associated with the emergency use authorization declaration. We refer readers back to the CY 2025 PFS final rule (89 FR 97710) for more information on this previously finalized policy.

We also received RUC recommendations for add-on CPT code 9X16X. The RUC recommendations for this CPT code do not include work or PE inputs as the recommendations suggest that the work and PE is already included in the administration base code and this add-on code is intended for tracking purposes of the second vaccine.

We are proposing to maintain procedure status ''X'' for CPT code 90480 and assign procedure status ''X'' to CPT code 9X16X.

(26) Immunization Counseling (CPT Codes 90XX1, 90XX2, and 90XX3)

In May 2024, the CPT Editorial Panel created three new time-based CPT codes 90XX1, 90XX2, and 90XX3 to report vaccine counseling performed where a vaccine is not administered. CPT code 90XX1 (*Immunization counseling by physician or other qualified health care professional when immunization(s) is not administered by provider on the same date of service; 3 minutes up to 10 minutes*), CPT code 90XX2 (*Immunization counseling by physician or other qualified health care professional when immunization(s) is not administered by provider on the same date of service; greater than 10 minutes up to 20 minutes*) and CPT code 90XX3 (*Immunization counseling by physician or other qualified health care professional when immunization(s) is not administered by provider on the same date of service; greater than 20 minutes*). These services were surveyed and reviewed at the September 2024 RUC meeting.

In 2022, CMS created six new HCPCS codes so that Medicaid providers could bill for stand-alone vaccine counseling, ''State Health Official Letter #22–002 ''Medicaid and CHIP Coverage of Standalone Vaccine Counseling''.[53] The six HCPCS codes are:

G0310 (*Immunization counseling by a physician or other qualified health care professional when the vaccine(s) is not administered on the same date of service, 5 to 15 mins time. (This code is used for Medicaid billing purposes.)*)

G0311 (*Immunization counseling by a physician or other qualified health care professional when the vaccine(s) is not administered on the same date of service, 16–30 mins time. (This code is used for Medicaid billing purposes.)*)

G0312 (*Immunization counseling by a physician or other qualified health care professional when the vaccine(s) is not administered on the same date of service for ages under 21, 5 to 15 mins time. (This code is used for Medicaid billing purposes.)*)

G0313 *Immunization counseling by a physician or other qualified health care professional when the vaccine(s) is not administered on the same date of service for ages under 21, 16–30 mins time. (This code is used for Medicaid billing purposes.)*

G0314 *Immunization counseling by a physician or other qualified health care professional for COVID–19, ages under 21, 16–30 mins time. (This code is used for the Medicaid Early and Periodic Screening, Diagnostic, and Treatment Benefit (EPSDT.)*

G0315 *Immunization counseling by a physician or other qualified health care professional for COVID–19, ages under 21, 5–15 mins time. (This code is used for the Medicaid Early and Periodic Screening, Diagnostic, and Treatment Benefit (EPSDT.)*

The RUC requested that CMS delete HCPCS codes G0310–G0313, and replace them with the new CPT codes 90XX1, 90XX2, and 90XX3. However, we are proposing to assign status indicator (''I'') to each of these three services, as not valid for Medicare purposes. Medicare uses other coding for reporting of, and payment for immunization counseling. We are not proposing any work RVUs or PE RVUs for any of the three new CPT codes.

(27) Colon Motility Services (CPT Codes 91XX1 and 91XX2)

In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT codes 91120 and 91122 as reported together 75 percent of the time or more based on 2021 Medicare claims data. The RUC noted that these services are reported together 95 percent of the time and recommended that the specialty societies work with the CPT Editorial Panel to develop a code bunding solution. In May 2024, the CPT Editorial Panel created two new codes, CPT code 91XX1 (*Rectal sensation, tone, and compliance study (for example, barostat)*) and CPT code 91XX2 (*Anorectal manometry, with rectal sensation and rectal balloon expulsion test, when performed*) to describe these services to replace CPT codes 91120 and 91122. The two new codes were surveyed for the September 2024 RUC meeting.

For CY 2026, the RUC-recommended a work RVU of 3.05 for CPT code 91XX1 and 2.70 for CPT code 91XX2. We are proposing these RUC recommendations without refinement.

For the direct PE inputs, we disagree with the RUC-recommended 17 minutes of clinical labor associated with CA013 (Prepare room, equipment and supplies) for CPT code 91XX2.We are proposing a time of 2 minutes for CA013, which is the standard time for this PE input. We are proposing the RUC recommendation of 17 minutes of clinical labor time for CA013 for CPT code 91XX1 to account for a previous

[53] *https://www.medicaid.gov/state-resource-center/downloads/stnd-vacc-cou-spec-hcpcs-codes.pdf.*

input of 15 minutes to calibrate equipment in similar codes. We recognize it is not typical to have different values for the same clinical labor activity across a code family, and we welcome comments as to the appropriateness of these refinements.

We disagree with the RUC-recommended 30 minutes of clinical labor associated with CA024 (Clean room/equipment by clinical staff) for CPT 91XX1 as we believe this is unnecessarily long, and does not match similar services. We are proposing a CA024 time of 10 minutes for both codes (CPT 91XX1 and 91XX2) based off reference CPT code 45300 (*Proctosigmoidoscopy, rigid; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*).

We are also proposing to refine the SM015 supply (Enzymatic detergent) to a quantity of 4 ounces for both codes, to match similar inputs for similar services. We seek comment on the appropriateness of this refinement, as we do not believe that 120 ounces of the SM015 supply would be typical or necessary given that no HCPCS code on the entire PFS uses more than 8 ounces of this supply.

We are proposing all of the other RUC recommendations for direct PE for CPT codes 91XX1 and 91XX2 without refinement.

(28) Dark Adaptation Diagnostic and Screening Services (CPT Codes 92284 and 922X1)

In 2023, the specialty societies prepared and submitted a Category I Code Change Application to create CPT code 922X1 *(Screening dark adaptation measurement (for example, rod recovery intercept time), with interpretation and report),* which describes the screening test for retinal and optic nerve disease. This code was created to differentiate between diagnostic dark adaptation testing and screening testing that has possibly been reported under CPT code 92284 *(Diagnostic dark adaptation examination (for example, rod and cone sensitivities, rod-cone breakpoint), with interpretation and report).* CPT also added a parenthetical to CPT code 92284, to describe how the diagnostic dark adaptation test is conducted in order to identify patients with macular degeneration or inherited retinal diseases when they have symptomatic visual loss without any identifiable cause or clinical examination.

CPT code 92XX1 describes a screening service that has not been determined to be a preventive service under Section 1861 of the Social Security Act and as such is not covered under Medicare. We are proposing to assign status indicator (''N'') to this service, as a non-covered service. We will list the RUC-recommended RVUs for display purposes only.

In the CY 2023 PFS final rule we finalized a work RVU of 0.00 for CPT code 92284 as proposed (87 FR 69513). The RUC had surveyed this procedure in 2021, reviewed the survey results for the procedure and recommended 1 minute of pre-service time, 3 minutes of intra-service time, 1 minute of immediate post-service time, totaling 5 minutes, all of which reduced the surveyed times. The RUC also recommended a work RVU of 0.14. We disagreed with the RUC-recommended work RVU of 0.14 for CPT code 92284. We found that the recommended work RVU did not adequately reflect reductions in physician time, since the diagnostic screening is usually completed during an E/M visit and largely consists of interpreting machine generated results.

For this latest review of CPT code 92284 in CY 2026, we disagree with the RUC-recommended work RVU of 0.32 and are proposing a work RVU of 0.29 for CPT code 92284 based on reference to code CPT 92132 (*Computerized ophthalmic diagnostic imaging (e.g., optical coherence tomography [OCT]), anterior segment, with interpretation and report, unilateral or bilateral*), for which we finalized 0.29 work RVU in the CY 2025 PFS. Our proposed work RVU is also supported by reference to CPT code 71110 (*Radiologic examination, ribs, bilateral; 3 views*), with a work RVU of 0.29. Both reference codes have intra-service work times of 6 minutes and total times of 8 minutes. While the intra-service work time of both reference codes is 1 minute less than the RUC-recommended median survey time for CPT code 92284, they each have 1 minute for pre-service and post-service times. We believe it is more appropriate to use these reference codes than the RUC-recommended cross walk to CPT 92282 *(Imaging of retina for detection or monitoring of disease; with remote physician or other qualified health care professional interpretation and report, unilateral or bilateral)* with a work value of 0.32 RVU because we believe the RUC-recommended intra-service work time and work RVU are overstated relative to the current instar-service work time and work RVU for CPT code 92284. Additionally, we also searched for crosswalks to CPT codes the same intra-service time and a range of similar pre-and post-service times and found that the recommended work RVU of 0.32 fell near the top of this range, which would not maintain relativity of the work values among the identified CPT codes.

We are proposing the RUC-recommended direct PE inputs for CPT code 92284 without refinement.

(29) Coronary Therapeutic Services and Procedures (CPT Codes 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92973, 92X01, 92X02, 93571, and 93572)

In the CY 2013 PFS final rule (77 FR 69063 through 69064), we reviewed 13 new codes to describe percutaneous coronary intervention (PCI) services and assigned bundled status to all the add-on codes for the additional branches off the major coronary arteries because we believed that separately paying for branch-level stents may encourage increased placement of stents. To bundle the work of each new add-on code into its respective base code, we used the RUC-recommended utilization crosswalk to determine what percentage of the base code utilization would be billed with the add-on code, and added that percentage of the RUC-recommended work RVU and physician time for the add-on code to the RUC-recommended work RVU and physician time of the base code.

In September 2022, the CPT Editorial Panel created one new Category I CPT code for percutaneous coronary lithotripsy. The new add-on CPT code 92972 (*Percutaneous transluminal coronary lithotripsy*) was reviewed by the RUC on an interim basis for CY 2024 while the entire PCI code family was referred to the CPT Editorial Panel for restructuring. Subsequently, the code family was revised at the February 2024 CPT Editorial Panel meeting, including the deletion of the bundled add-on codes, and surveyed for the April 2024 RUC meeting.

The following is a list of the CPT codes and their long descriptors: CPT codes 92920 (*Percutaneous transluminal coronary angioplasty, single major coronary artery and/or its branch(es)*), 92924 (*Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)*), 92928 (*Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); one lesion involving one or more coronary segments*), 92933 (*Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)*), 92937 (*Percutaneous transluminal*

revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed, single vessel major coronary artery and/its branches), 92941 (*Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single major coronary artery and/or its branches or single bypass graft and/or its subtended branches*), 92943 (*Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach*), 92973 (*Percutaneous transluminal coronary thrombectomy aspiration mechanical (List separately in addition to code for primary procedure)*), 92X01 (*Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); two or more distinct coronary lesions with two or more coronary stents deployed in two or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch*), 92X02 (*Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches*), 93571 (*Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; initial vessel (List separately in addition to code for primary procedure)*), and 93572 (*Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; each additional vessel (List separately in addition to code for primary procedure)*).We are proposing the RUC-recommended work RVU for all twelve codes in the family. We are proposing a work RVU of 8.35 for CPT code 92920, a work RVU of 10.13 for CPT code 92924, a work RVU of 10.00 for CPT code 92928, a work RVU of 11.94 for CPT code 92933, a work RVU of 11.30 for CPT code 92937, a work RVU of 12.72 for CPT code 92941, a work RVU of 13.69 for CPT code 92943, a work RVU of 1.75 for CPT code 92973, a work RVU of 12.00 for CPT code 92X01, a work RVU of 15.00 for CPT code 92X02, a work RVU of 1.80 for CPT code 93571, and a work RVU of 1.44 for CPT code 93572.

However, we note these work RVUs as recommended by the RUC set new upper ranges for multiple codes in the RUC Database. For example, the proposed work RVU of 12.00 for CPT code 92X01 sets a new upper range on RUC Database searches for 000-day global codes with an intraservice time of 75 minutes, with a previous maximum value of 10.25 work RVUs for CPT code 49614 (*Repair of anterior abdominal hernia(s) (that is, epigastric, incisional, ventral, umbilical, spigelian), any approach (that is, open, laparoscopic, robotic), recurrent, including implantation of mesh or other prosthesis when performed, total length of defect(s); less than 3 cm, incarcerated or strangulated*), with the same intraservice time and 165 minutes of total time. Similarly, we shared in the RUC's difficulties finding major surgical procedures with the 000-day global period with similar times to use as potential reference or bracket codes.

The RUC did not recommend, and we are not proposing any direct PE inputs for these facility-based services.

(30) RSV Monoclonal Antibody Administration (CPT Codes 96380 and 96381)

In September 2023, CPT created two Category I codes, 96380 (*Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional*) and 96381 ((*Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection*) to report administration of respiratory syncytial virus (RSV), monoclonal antibody and seasonal dose, with and without counseling. These codes were effective October 6, 2023 for immediate use. At the time, the RUC did an immediate review of these codes and issued interim recommendations to CMS. The RUC reviewed these codes again at the April 2024 RUC meeting.

We are proposing the RUC-recommended work RVU of 0.28 for CPT code 96380 and 0.17 for CPT code 96381.

We are proposing the RUC-recommended direct PE inputs without refinement. (30) Remote Monitoring (CPT codes 98975, 98976, 98977, 98978, 98980, 98981, 98XX4, 98XX5, 98XX6, 98XX7, 99091, 99453, 99454, 99457, 99458, 99473, 99474, 99XX4, and 99XX5)

In September 2024, the Current Procedural Terminology (CPT) Editorial Panel added one code and made code revisions to report remote physiologic monitoring (RPM) device supply for 2 to 15 days and 16–30 days within a 30-day period to report RPM parameters; created one new code and code revisions to report RPM treatment management services for the first 10 minutes, first 20 minutes, and each additional 20 minutes thereafter; added three remote therapeutic monitoring (RTM) device supply codes to report respiratory, musculoskeletal and cognitive behavioral therapy for 2 to 15 days and 16 to 30 days within a 30-day period; created one new code and made code revisions to report RTM treatment management services for the first 10 minutes, first 20 minutes, and each additional 20 minutes thereafter; and revised remote monitoring guidelines.

Remote physiologic monitoring (RPM) represents the remote monitoring of parameters such as weight, blood pressure, and pulse oximetry to monitor a patient's condition and inform their management. The remote physiologic monitoring code set currently includes CPT codes 99453, 99454, 99091, 99457, 99458, 99473, and 99474 (code descriptors can be found in Table 17). For CY 2026, the CPT Editorial Panel created two new RPM codes to describe RPM services that describe less than 16 days of data transmission per 30-day period and less than 20 minutes of interactive communication per month: CPT codes 99XX4 and 99XX5. The CPT Editorial Panel also made edits to specify the minimum days of data transmission per 30-day period for CPT code 99454 (new code descriptors and revised code descriptors can be found in Table 18). None of the RPM codes (CPT codes 99091, 99474, 99XX5, 99457, and 99458) met the minimum survey requirements established by the RUC for the January 2025 RUC meeting. As a result, the RUC-recommended that CPT codes 99091, 99474, 99XX5, 99457, and 99458 be resurveyed after 1 year of utilization data is available for this CPT 2026 code structure. All RPM codes are expected to be reviewed at the January 2028 RUC meeting.

Remote therapeutic monitoring (RTM) represents the monitoring of adherence

to at-home therapeutic interventions. RTM can be provided for a variety of conditions, and there are distinct device supply codes that have been created for three types of therapeutic monitoring: respiratory system, cognitive behavioral therapy, and musculoskeletal system monitoring. The remote therapeutic monitoring code set currently includes CPT codes 98975, 98976, 98977, 98978, 98980, and 98981 (code descriptors can be found in Table 17). For CY 2026, the CPT Editorial Panel created four new RTM codes to describe RTM services that describe less than 16 days of data transmission per 30-day period and less than 20 minutes of interactive communication per month: CPT codes 98XX4, 98XX5, and 98XX7. The CPT Editorial Panel also made edits to specify the minimum days of data transmission per 30-day period for CPT codes 98976, 98977, and 98978 (new code descriptors and revised code descriptors can be found in Table 18). All of the codes in the RTM family are considered new technology (CPT codes 98975, 98XX4, 98976, 98XX5, 98977, 98XX7, 98XX7, 98980, and 98981) and will be placed on the New Technology list to be reviewed after 3 years of data are available (April 2030).

TABLE 17: CY 2025 REMOTE MONITORING CODES

Code	Long Descriptor
99453	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on use of equipment
99454	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days
99091	Collection and interpretation of physiologic data (eg, ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days
99457	Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes
99458	Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; each additional 20 minutes (List separately in addition to code for primary procedure)
99473	Self-measured blood pressure using a device validated for clinical accuracy; patient education/training and device calibration
99474	Self-measured blood pressure using a device validated for clinical accuracy; separate self-measurements of two readings one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average systolic and diastolic pressures and subsequent communication of a treatment plan to the patient
98975	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); initial set-up and patient education on use of equipment

Code	Long Descriptor
98976	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of respiratory system, each 30 days
98977	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of musculoskeletal system, each 30 days
98978	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of cognitive behavioral therapy, each 30 days
98980	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient or caregiver during the calendar month; first 20 minutes
98981	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient or caregiver during the calendar month; each additional 20 minutes (List separately in addition to code for primary procedure)

TABLE 18: PROPOSED CY 2026 REMOTE MONITORING CODES

Code	Long Descriptor
99453	No changes for CY 2026
99XX4	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial: device(s) supply with daily recording(s) or programmed alert(s) transmission, 2-15 days in a 30-day period
99454	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; device(s) supply with daily recording(s) or programmed alert(s) transmission, 16-30 days in a 30-day period
99091	No changes for CY 2026
99XX5	Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring 1 real-time interactive communication with the patient/caregiver during the calendar month; first 10 minutes
99457	No changes for CY 2026
99473	No changes for CY 2026
99474	No changes for CY 2026
99458	No changes for CY 2026
98975	No changes for CY 2026
98XX4	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of respiratory system, 2-15 days in a 30-day period
98976	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of respiratory system, 16-30 days in a 30-day period
98XX5	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of musculoskeletal system, 2-15 days in a 30-day period
98977	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of musculoskeletal system, 16-30 days in a 30-day period

98XX6	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of cognitive behavioral therapy, 2-15 days in a 30-day period
98978	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of cognitive behavioral therapy, 16-30 days in a 30-day period
98XX7	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least 1 real-time interactive communication with the patient or caregiver during the calendar month; first 10 minutes
98980	No changes for CY 2026
98981	No changes for CY 2026

A. Valuation for Remote Physiologic Monitoring (RPM)

For CPT code 99091, we disagree with the RUC's recommendation of 0.70 work RVUs and are proposing to maintain the current work RVU of 1.10 and the corresponding physician time inputs. This code, as well as the other RPM codes, did not meet the minimum survey requirements established by the RUC for the January 2025 RUC meeting. The RPM coding will be resurveyed after 1 year of utilization data is available for this 2026 CPT code structure, and we look forward to reviewing the additional data at that time to refine the valuation for this code more accurately. The RUC did not recommend, and we are not proposing any direct PE inputs for CPT code 99091.

For CPT code 99XX5, we disagree with the RUC's recommendation of 0.39 work RVUs and are proposing a work RVU of 0.31, with 10 minutes or intra-service/total time. We disagree with the recommended value and propose a work RVU of 0.31 for CPT code 99XX5 based on the total time ratio between the 20 minutes of total time assigned to CPT code 99457 and the 10 minutes of total time assigned to CPT code 99XX5. This ratio equals 50 percent, and 50 percent of the current work RVU of 0.61 rounds to a work RVU of 0.31. Although we do not believe that the decrease in time described in the code descriptor must equate to a one-to-one or linear decrease in the valuation of work RVUs, since the two components of work are time and intensity, significant reductions in time for codes with equivalent intensity should generally be reflected in decreases to work RVUs. In the case of CPT code 99XX5, we believe it would be more accurate to propose the total time ratio at a work RVU of 0.31 to account for these decreases in work time compared to CPT code 99457. We also propose using this time ratio with the current PE inputs for CPT code 99457 for clinical staff time. We are proposing 5 minutes of CA021 intra-service clinical labor time and 15 minutes of CA037 post-service clinical labor time for CPT code 99XX5.

For CPT code 99457, we disagree with the RUC's recommendation of 0.45 work RVUs and are proposing to maintain the current work RVU of 0.61, the current work time of 20 minutes, and the current direct PE inputs. This code, as well as the other RPM codes, did not meet the minimum survey requirements established by the RUC for the January 2025 RUC meeting. RPM coding will be resurveyed after 1 year of utilization data is available for this 2026 CPT code structure, and we look forward to reviewing the additional data at that time to refine the valuation for this code more accurately. For CPT code 99458, we disagree with the RUC's recommended direct PE inputs and are proposing to maintain the current inputs. We are proposing the RUC-recommended work RVU of 0.61 for CPT code 99458, as this work RVU was reviewed by the RUC and resulted in no recommended changes for CY 2026. Our proposal to maintain current work RVUs and PE inputs is due to the lack of survey data supporting changes to these codes' valuation, as none of the RPM codes met the minimum survey requirements established by the RUC for the January 2025 RUC meeting. We also believe it is important to maintain relativity between RPM and RTM codes describing equivalent amounts of treatment management time and effort.

For CPT code 99474, we are proposing the RUC-recommended work RVU of 0.18 and direct PE inputs without refinement, as this code was reviewed by the RUC and resulted in no recommended changes for CY 2026.

For CPT code 99473, which is a PE-only code, we are proposing the RUC-recommended direct PE inputs without refinement, as this code was reviewed by the RUC and resulted in no recommended changes for CY 2026.

For CPT code 99453, which is a PE-only code, we are proposing the RUC-recommended PE inputs without refinement.

For the PE-only CPT codes 99XX4 and 99454, the RUC's recommendations include a ''digital remote physiologic monitoring device app,'' which is a per-click vendor fee that has not traditionally been included as a form of direct PE. We understand that as these technologies evolve, the issues involving the use of software and other forms of digital tools become more difficult to account for accurately in our standard PE methodology. We acknowledge that for CPT codes 99XX4 and 99454, the overall payment rate is driven by practice expense supply and equipment inputs rather than physician work or clinical staff time We have concerns with the RUC-recommended PE inputs for device supply and equipment, as these inputs are difficult to accurately account for due to lack of substantive invoices and other types of supportive data. As MedPAC noted in their comment to the CY 2011 PFS proposed rule, ''using price information voluntarily submitted by specialty societies, individual practitioners, suppliers, and product developers might not result in objective and accurate prices because each group has a financial stake in the process''. We have repeatedly stated, such as in the CY 2018 final rule, that ''we do not believe that very small numbers of voluntarily submitted invoices are likely to reflect typical resource costs and create the potential for overestimation of supply and equipment costs'' (82 FR 52998). Given our concerns with the RUC-recommended PE inputs and our inability to verify the pricing for these inputs, we believe that using Hospital Outpatient Prospective Payment System (OPPS) cost data to value CPT codes 99XX4 and 99454 may more accurately reflect the actual costs of these technologies. We assume the costs incurred in furnishing these PE-only

codes would be the same across settings of care (physician office and hospital outpatient), since these codes do not have any physician work and only account for PE associated with device supply and data transmission. Under section 1848(c)(2)(N) of the Act, we have authority to establish or adjust PE RVUs using cost, charge, or other data from suppliers or providers of services. We propose to use OPPS cost data to establish the valuation for the practice expense portion of Remote Physiologic Monitoring CPT codes 99XX4 and 99454. We believe that the OPPS cost data is more accurate than the PE inputs recommended by the RUC. OPPS practice expense data obtained from cost reports is regularly updated, auditable, and required to adhere to national standards for reporting. For example, in the CY 2015 PFS final rule (79 FR 67569), we noted that ''routinely updated, auditable resource cost information submitted contemporaneously by a wide array of providers across the country is a valid reflection of ''relative'' resources and could be useful to supplement the resource cost information developed under our current methodology based upon a typical case that are developed with information from a small number of representative practitioners for a small percentage of codes in any particular year''. We are proposing to utilize the OPPS total geometric mean cost for CPT code 99454 to inform the valuation of CPT codes 99XX4 and 99454 when paid under the PFS. We are proposing to calculate this value by dividing the OPPS Geometric Mean Cost (GMC) for CPT code 99454, which is represented in a dollar amount, by the estimated CY 2026 PFS conversion factor (CF), which represents the dollar value of an RVU, in order to convert the GMC dollar amount into RVUs. The resulting value will be our proposed PE RVU for CPT codes 99XX4 and 99454. We are proposing the same valuation for both CPT codes 99XX4 and 99454 since the device is supplied to the beneficiary for the full 30-day period, regardless of the number of days that data is transmitted.

We are seeking comments on these proposals.

B. Valuation for Remote Therapeutic Monitoring (RTM)

For CPT code 98XX7, we disagree with the RUC's recommendation of 0.66 work RVUs and are proposing a work RVU of 0.31, with 10 minutes or intra-service/total time. We are proposing this work RVU for CPT code 98XX7 based on the total time ratio between CPT code 98980's time of 20 minutes and CPT code 98XX7's time of 10 minutes. This ratio equals 50 percent, and 50 percent of the current work RVU of 0.62 for CPT code 98980 equals a work RVU of 0.31 for CPT code 98XX7. Although we do not believe that the decrease in time described in the code descriptor must equate to a one-to-one or linear decrease in the valuation of work RVUs, we believe that since the two components of work are time and intensity, significant reductions in time for codes with equivalent intensity should generally be reflected in decreases to work RVUs. In the case of CPT code 98XX7, we believe it would be more accurate to propose the total time ratio at a work RVU of 0.31 to account for these decreases in work time compared to CPT code 98980. We are also proposing using this time ratio with the current direct PE inputs for CPT code 98980. We are proposing 5 minutes of CA021 intra-service clinical labor time and 15 minutes of CA037 post-service clinical labor time for CPT code 98XX7. We are proposing this clinical labor using the RN/LPN/MTA (L037D) blend as this has historically been the typical clinical labor type for remote therapeutic monitoring services.

For CPT code 98980, we disagree with the RUC's recommendation of 0.78 work RVUs and are proposing to maintain the current work RVU of 0.62, the current 20 minutes of intra-service/total work time, and the current direct PE inputs. For CPT code 98981, we disagree with the RUC's recommendation of 0.70 work RVUs and are proposing to maintain the current work RVU of 0.61 and the current direct PE inputs; the RUC recommended, and we are proposing to maintain the current 20 minutes of intra-service/total work time. These proposals are due to wanting to maintain relativity between RPM and RTM codes describing equivalent amounts of treatment management time and effort. RTM coding will be placed on the New Technology list to be reviewed after 3 years of data are available for this CPT 2026 code structure, and we look forward to reviewing the additional data at that time to refine the valuation for this code more accurately.

For the PE-only CPT code 98975, the RUC's recommendations include a ''Remote musculoskeletal therapy monitoring program enrollment fee.'' We are not proposing a price for this input at this time as we believe this type of fee has not traditionally been included as a form of direct PE and would constitute forms of indirect PE under our methodology. We understand that as the PE data age, these issues involving the use of software and other forms of digital tools become more complex. However, in general we believe that this type of cost is most similar to indirect PE costs rather than direct costs, which must be individually allocable to a particular patient for a particular service. Additionally, we believe that indirect technology costs associated with RTM are better accounted for in the data transmission RTM codes (CPT codes 98XX5 and 98977, discussed below) that will also be reported during the beneficiary's course of treatment. We look forward to continuing to seek out new data sources to help in updating the PE methodology. The RTM coding will be placed on the New Technology list to be reviewed after 3 years of data are available for this 2026 CPT code structure, and we look forward to reviewing the additional data at that time to refine the valuation for this code more accurately. We are proposing to maintain the current direct PE inputs for CPT code 98975.

For the PE-only CPT codes 98XX5 and 98977, the RUC's recommendations include a ''Remote musculoskeletal therapy monitoring monthly supply fee,'' which is a per-click vendor fee that has not traditionally been included as a form of direct PE. We understand that as these technologies evolve, the issues involving the use of software and other forms of digital tools become more difficult to account for accurately in our standard PE methodology. We acknowledge that for CPT codes 98XX5 and 98977, the overall payment rate is driven by practice expense supply and equipment inputs rather than physician work or clinical staff time. We have concerns with the RUC-recommended PE inputs for device supply and equipment, as these inputs are difficult to accurately account for due to lack of substantive invoices and other types of supportive data. As MedPAC noted in their comment to the CY 2011 PFS proposed rule, ''using price information voluntarily submitted by specialty societies, individual practitioners, suppliers, and product developers might not result in objective and accurate prices because each group has a financial stake in the process''. We have repeatedly stated, such as in the CY 2018 final rule, that ''we do not believe that very small numbers of voluntarily submitted invoices are likely to reflect typical resource costs and create the potential for overestimation of supply and equipment costs'' (82 FR 52998). Given our concerns with the RUC-recommended PE inputs and our inability to verify the pricing for these inputs, we believe that using Hospital Outpatient Prospective Payment System

(OPPS) cost data to value CPT codes 98XX5 and 98977 may more accurately reflect the actual costs of these technologies as opposed to the PE inputs as recommended by the AMA RUC. We assume the costs incurred in furnishing these PE-only codes would be the same across settings of care (physician office and hospital outpatient), since these codes do not have any physician work and only account for PE associated with device supply and data transmission. Under section 1848(c)(2)(N) of the Act, we have authority to establish or adjust PE RVUs using cost, charge, or other data from suppliers or providers of services. We propose to use OPPS cost data to establish the valuation for the practice expense portion of Remote Therapeutic Monitoring CPT codes 98XX5 and 98977. We believe that the OPPS cost data is more accurate than the PE inputs recommended by the RUC. OPPS practice expense data obtained from cost reports is regularly updated, auditable, and required to adhere to national standards for reporting. For example, in the CY 2015 PFS final rule (79 FR 67569), we noted that ''routinely updated, auditable resource cost information submitted contemporaneously by a wide array of providers across the country is a valid reflection of ''relative'' resources and could be useful to supplement the resource cost information developed under our current methodology based upon a typical case that are developed with information from a small number of representative practitioners for a small percentage of codes in any particular year''. We are proposing to utilize the OPPS total geometric mean cost for CPT code 98977 to inform the valuation of CPT codes 98XX5 and 98977 when paid under the PFS. We are proposing to calculate this value by dividing the OPPS Geometric Mean Cost (GMC) for CPT code 98977, which is represented in a dollar amount, by the estimated CY 2025 PFS conversion factor (CF), which represents the dollar value of an RVU, in order to convert the GMC dollar amount into RVUs. The resulting value will be our proposed PE RVU for CPT codes 98XX5 and 98977. We are proposing the same valuation for both CPT codes 98XX5 and 98977 since the device is supplied to the beneficiary for the full 30-day period, regardless of the number of days that data is transmitted.

We are also proposing to maintain the current clinical staff type for the RTM codes (RN/LPN/MTA), as opposed to the RUC recommendation of physical therapy assistant, since the dominant specialty type that bills this code, family medicine, did not participate in the survey.

We are also soliciting comments specifically on data to support the recommended PE inputs for this code, including invoices, additional data, or evidence to support the position.

The RUC-recommended and we are proposing to contractor price the PE-only CPT codes 98XX4 and 98976.

CPT codes 98XX6 and 98978 are PE-only codes. We are proposing to contractor price CPT code 98XX6 and proposing to maintain contractor pricing for CPT code 98978.

We are seeking comments on these proposals.

C. Comment Solicitation

We are seeking comments on whether there are differences in the valuation of remote physiologic and remote therapeutic monitoring, specifically whether the services have similar costs and/or practice expense inputs. We are currently proposing similar valuations for what we have historically viewed as similar remote monitoring services (for example, RTM and RPM treatment management, RTM and RPM device supply, RTM and RPM data transmission), but are interested in gaining more information regarding any differences in work (in the case of timed codes, if there are varying levels of intensity between remote therapeutic vs. physiologic monitoring), clinical staff time, supplies, equipment, etc. We are particularly interested in comments that include data or evidence to support the position.

(31) Hearing Device Services (CPT Codes 9X01X, 9X02X, 9X03X, 9X04X, 9X07X, 9X08X, 9X09X, 9X10X, 9X11X, 9X12X, 9X13X, and 9X14X)

At the February 2024 CPT Editorial Panel meeting, 12 new Category I codes were created to report hearing devices services (for example, air-conduction hearing aids) including hearing aid candidacy determination, hearing aid selection, hearing aid fitting, follow-up after fitting, hearing aid verification, and assistive-device services. The current CPT codes, 92590–92595, were recommended for deletion. CPT codes 9X01X–9X14X were reviewed at the April 2024 RUC HCPAC meeting for CY 2026.

The following is a list of the new CPT codes and their long descriptors: CPT code 9X01X (*Evaluation for hearing aid candidacy, unilateral or bilateral, including review and integration of audiologic function tests, assessment, and interpretation of hearing needs (for example, speech-in-noise, suprathreshold hearing measures) discussion of candidacy results, counseling on treatment options with report, and, when performed, assessment of cognitive and communication status; first 30 minutes*), CPT code 9X02X (*Evaluation for hearing aid candidacy, unilateral or bilateral, including review and integration of audiologic function tests, assessment, and interpretation of hearing needs (for example, speech-in-noise, suprathreshold hearing measures) discussion of candidacy results, counseling on treatment options with report, and, when performed, assessment of cognitive and communication status; each additional 15 minutes*), CPT code 9X03X (*Hearing aid selection services, unilateral or bilateral, including review of audiologic function tests and hearing aid candidacy evaluation, assessment of visual and dexterity limitations, and psychosocial factors, establishment of device type, output requirements, signal processing strategies and additional features, discussion of device recommendations with report; first 30 minutes*), CPT code 9X04X (*Hearing aid selection services, unilateral or bilateral, including review of audiologic function tests and hearing aid candidacy evaluation, assessment of visual and dexterity limitations, and psychosocial factors, establishment of device type, output requirements, signal processing strategies and additional features, discussion of device recommendations with report; each additional 15 minutes*), CPT code 9X07X (*Hearing aid fitting services, unilateral or bilateral, including device analysis, programming, verification, counseling, orientation, and training, and, when performed, hearing assistive device, supplemental technology fitting services; first 60 minutes*), CPT code 9X08X (*Hearing aid fitting services, unilateral or bilateral, including device analysis, programming, verification, counseling, orientation, and training, and, when performed, hearing assistive device, supplemental technology fitting services; each additional 15 minutes*), CPT code 9X09X (*Hearing aid post-fitting follow-up services, unilateral or bilateral, including confirmation of physical fit, validation of patient benefit and performance, sound quality of device, adjustment(s) (for example, verification, programming adjustment(s), device connection(s), and device training), as indicated, and, when performed, hearing assistive device, supplemental technology fitting services; first 30 minutes*), CPT code 9X10X (*Hearing aid post-fitting follow-*

up services, unilateral or bilateral, including confirmation of physical fit, validation of patient benefit and performance, sound quality of device, adjustment(s) (for example, verification, programming adjustment(s), device connection(s), and device training), as indicated, and, when performed, hearing assistive device, supplemental technology fitting services; each additional 15 minutes), CPT code 9X11X (*Behavioral verification of amplification including aided thresholds, functional gain, speech in noise, when performed*), CPT code 9X12X (*Hearing-aid measurement, verification with probe-microphone*), CPT code 9X13X (*Hearing device verification, electroacoustic analysis*), and CPT code 9X14X (*Hearing assistive device, supplemental technology fitting services (for example, personal frequency modulation (FM)/digital modulation (DM) system, remote microphone, alerting devices)*).

The RUC is recommending contractor pricing for all twelve codes in the family. However, section 1862(a)(7) of the Act prohibits Medicare payment under Part A or Part B for any expenses incurred for hearing aids or examinations therefore, it has been our established policy not to pay for these hearing device services on the PFS, as their predecessor CPT codes 92590–92595 all have non-payable status codes. Therefore, we are proposing to maintain the same policy of assigning non-payable status codes to each of the twelve new CPT codes in this family.

(32) Scalp Cooling Services (CPT Codes 9XX01, 9XX02, and 9XX03)

At the September 2024 CPT Editorial Panel meeting, CPT deleted two Category II CPT codes and created three new Category I CPT codes, CPT code 9XX01(*Mechanical Scalp cooling, including individual cap supply with head measurement, fitting, and patient education),* 9XX02(*mechanical scalp cooling; including hair preparation, individual cap placement, therapy initiation, and pre-cooling period*), and 9XX03(*mechanical scalp cooling; each 30 minutes*)) to report scalp cooling services to address chemotherapy induced alopecia. The new codes were surveyed for the January 2025 RUC meeting and the RUC determined that the code family requires no physician work and are practice expense (PE) only services. As such, the RUC did not recommend, and we are not proposing work RVUs for these codes.

We disagree with the RUC-recommended 5 minutes of service period clinical staff time in direct PE input CA021 (Perform procedure/service—not directly related to physician work time) for CPT code 9XX01. We are proposing 27 minutes of clinical labor time for CA021 based off reference CPT code 99453 (*Remote monitoring of physiologic parameter(s) (for example, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on use of equipment*). We have received feedback from interested parties that 5 minutes does not adequately account for the full duration of time required to educate, measure, fit, and calibrate the cap. We agree with interested parties and believe that the 27 minutes of clinical staff time in CA021 for CPT code 99453 better accounts for the full duration of time required for this service. We are proposing all other direct PE inputs, supplies, and equipment as recommended by the RUC for CPT code 9XX01. We are also proposing all direct PE inputs, supplies, and equipment as recommended by the RUC for CPT codes 9XX02 and 9XX03 without refinement.

TABLE 19: CY 2026 WORK RVUs FOR NEW, REVISED, AND POTENTIALLY MISVALUED CODES

HCPCS	Descriptor	CY 2025 Work RVU	Proposed CY 2026 Work RVU	Final CY 2026 Work RVU	CMS Work Time Refinement
0596T	Temporary female intraurethral valve-pump (ie, voiding prosthesis); initial insertion, including urethral measurement	C	2.43	2.43	No
0597T	Temporary female intraurethral valve-pump (ie, voiding prosthesis); replacement	C	1.05	1.05	No
27465	Osteoplasty, femur; shortening	18.60	21.13	21.13	No
27466	Osteoplasty, femur; lengthening	17.28	22.65	22.65	No
27468	Osteoplasty, femur; combined, lengthening and shortening with femoral segment transfer	19.97	C	19.97	Yes
27715	Osteoplasty, tibia and fibula, lengthening or shortening	15.50	22.50	22.50	No
27XX0	Osteotomy(ies), femur, unilateral, with insertion of an externally controlled intramedullary lengthening device, including iliotibial band release when performed, imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device	NEW	26.65	26.65	No
27XX1	Osteotomy(ies), tibia, including fibula when performed, unilateral, with insertion of an externally controlled intramedullary lengthening device, including imaging, alignment assessments, computations of adjustment schedules, and management of the intramedullary lengthening device	NEW	28.00	28.00	No
28750	Arthrodesis, great toe; metatarsophalangeal joint	8.57	8.75	8.75	No
28755	Arthrodesis, great toe; interphalangeal joint	4.88	7.50	6.76	No

HCPCS	Descriptor	CY 2025 Work RVU	Proposed CY 2026 Work RVU	Final CY 2026 Work RVU	CMS Work Time Refinement
33340	Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation	14.00	10.25	10.25	No
33880	Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft covering the left subclavian artery and all aortic tube endograft extension(s) proximally in the aortic arch and ascending aorta and distally to the celiac artery, when performed	34.58	30.00	27.00	No
33881	Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft not involving coverage of the left subclavian artery origin and all endograft extension(s) placed from the level of the left subclavian carotid artery to the celiac artery	29.58	26.75	22.53	No
33883	Delayed placement of proximal extension prosthesis(es) not involving coverage of the left subclavian artery origin, after endovascular repair of the thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed	21.09	24.25	19.91	No
33886	Delayed placement of distal extension prosthesis(es) from the level of the left subclavian artery to the celiac artery, after endovascular repair of descending thoracic aorta, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation	18.09	23.50	19.91	No
33XX2	Endovascular repair of the thoracic aorta by deployment of a branched endograft multipiece system involving an aorto-aortic tube device with a fenestration for the left subclavian artery stentgraft(s) and all aortic tube endograft extension(s) placed from the level of the left common carotid artery to the celiac artery, including pre-procedure sizing and device selection, all target zone angioplasty, all nonselective catheterization(s) and left subclavian artery selective catheterization(s), and all associated radiological supervision and interpretation	NEW	39.00	35.00	No
35XX1	Bypass graft, with other than vein; carotid-contralateral carotid	NEW	27.40	23.53	No

HCPCS	Descriptor	CY 2025 Work RVU	Proposed CY 2026 Work RVU	Final CY 2026 Work RVU	CMS Work Time Refinement
37X02	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	NEW	3.00	3.00	No
37X03	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	NEW	10.75	10.75	No
37X04	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	NEW	3.89	3.89	No
37X05	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	NEW	8.75	8.75	No
37X06	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	NEW	4.00	4.00	No

F. Evaluation and Management (E/M) Visits

1. Evaluation and Management (E/M) Visit Complexity Add-On

In the CY 2024 PFS final rule (88 FR 78970 through 78982), we finalized separate payment for the office/outpatient evaluation and management (O/O E/M) visit complexity add-on code, HCPCS code G2211 (*Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (Add-on code, list separately in addition to office/outpatient evaluation and management visit, new or established).*

In the CY 2024 PFS final rule, we noted that the O/O E/M visit complexity add-on code ''reflects the time, intensity, and PE resources involved when practitioners furnish the kinds of O/O E/M visit services that enable them to build longitudinal relationships with all patients (that is, not only those patients who have a chronic condition or single high-risk disease) and to address the majority of a patient's health care needs with consistency and continuity over longer periods of time.'' (88 FR 78970 through 78971). We explained in the CY 2024 PFS final rule that it is the relationship between the patient and the practitioner that is the determining factor for when the add-on code should be billed. The add-on code captures the inherent complexity of the visit that is derived from the longitudinal nature of the practitioner and patient relationship. The first part of the code descriptor, the ''continuing focal point for all needed health care services,'' describes a relationship between the patient and the practitioner when the practitioner is the continuing focal point for all health care services that the patient needs. The second part of the add-on code also describes a relationship involving medical services that are part of ongoing care related to a patient's single, serious condition or a complex condition. There is previously unrecognized but important cognitive effort of utilizing the longitudinal relationship in making a diagnosis, developing a treatment plan, and weighing the factors that affect a longitudinal doctor-patient relationship. The practitioner must decide what course of action and choice of words in the visit itself would lead to the best health outcome in the single visit while simultaneously building up an effective, trusting longitudinal relationship with the patient. Weighing these various factors, even for a seemingly simple condition, makes the entire visit inherently complex, which is what this add-on code is intended to capture (88 FR 78973 through 78974).

Interested parties have recommended that CMS either establish separate payment for an evaluation and management inherent complexity add-on code specific to home-based visits or expand use of the O/O E/M visit complexity add-on code HCPCS code G2211 to be reported alongside home and residence E/M visits furnished to beneficiaries in nursing facilities, assisted living facilities, and the beneficiary's home. Interested parties have explained that home-based primary care practices provide access to primary care services for patients who otherwise would not be able to leave the house to see a primary care practitioner, and include the development of longitudinal, ''high-touch'' relationships with their patients.

In the CY 2024 PFS final rule (88 FR 78818, 78971), we stated that the values we established for the revised O/O E/M CPT codes in the CY 2021 PFS final rule were finalized in concert with separate payment for HCPCS code G2211 (85 FR 84569, 87 FR 69588), and that we finalized work RVUs for the nursing facility E/M visit codes (87 FR 69604 through 69606) and the home or residence services code family (87 FR 69608 and 69609) subsequently in the CY 2023 PFS final rule. We stated that we may nevertheless consider in future rulemaking whether home or residence evaluation and management services bear unrecognized resource costs and whether HCPCS code G2211 should be applicable to home or residence E/M visits. We have noted that the application of the add-on code is not based on the characteristics of particular patients (even though the rationale for valuing the code is based on recognizing the typical complexity of patient needs), but rather the relationship between the patient and the practitioner (88 FR 78973). In part, HCPCS code G2211 recognizes the resource costs involved in building trust in a long-term practitioner-patient relationship that are

not reflected in the valuation of the O/O E/M code set. The same appears to be true about the home and residence evaluation and management code set. Building trust as part of a longitudinal practitioner-patient relationship may be particularly significant in the context of home and residence E/M visits. Typically, home visits occur at least monthly and people with serious illness may receive weekly visits. These visits involve developing and following through on a longitudinal care plan with proactive contacts regarding all of a person's health care needs. The follow-through based on a trusting practitioner/patient relationship is critical to keeping patients stable and preventing exacerbations. For this reason, we believe it is appropriate to extend the application of HCPCS code G2211 to home and residence E/M visits at this time. Therefore, we are proposing to allow HCPCS code G2211 to be billed as an add-on code with the home or residence evaluation and management visits code family (CPT codes 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350). The HCPCS code G2211 descriptor would read as follows, ''*(Visit complexity inherent to evaluation and management* associated with *medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (Add-*on code, *list separately in addition to home or residence or* office/outpatient *evaluation and management* service*, new* or *established))*''.

G. Enhanced Care Management

1. Integrating Behavioral Health Into Advanced Primary Care Management (APCM)

In the CY 2025 PFS final rule (89 FR 97859 through 97902), we finalized separate coding and payment for Advanced Primary Care Management (APCM) services (HCPCS codes G0556, G0557, and G0558).

TABLE: 25 APCM CODES

Code	G0556	G0557	G0558
Population	For beneficiaries with one chronic condition or fewer	For beneficiaries with multiple (two more more) chronic conditions	For beneficiaries who are a Qualified Medicare Beneficiaries with multiple (two or more) chronic conditions
Long Descriptor	*Advanced primary care management services for a patient with one chronic condition [expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline], or fewer, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:* ● *Consent;* ++ *Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.* ++ *Document in patient's medical record that consent was obtained.* ● *Initiation during a qualifying visit for new patients or patients not seen within 3 years;*	*Advanced primary care management services for a patient with multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:* ● *Consent;* ++ *Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.* ++ *Document in patient's medical record that consent was obtained.* ● *Initiation during a qualifying visit for new*	*Advanced primary care management services for a patient that is a Qualified Medicare Beneficiary with multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, which place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, provided by clinical staff and directed by a physician or other qualified health care professional who is responsible for all primary care and serves as the continuing focal point for all needed health care services, per calendar month, with the following elements, as appropriate:* ● *Consent;* ++ *Inform the patient of the availability of the service; that only one practitioner can furnish and be paid for the service during a calendar month; of the right to stop the services at any time (effective at the end of the calendar month); and that cost sharing may apply.* ++ *Document in patient's medical record that consent was obtained.* ● *Initiation during a qualifying visit for new*

	online assessment and management and E/M visits (or e-visits). • *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;* • *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;* • *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology*).	*communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).* • *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;* • *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;* • *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology.*).	*communications that require a clinical decision, such as virtual check-ins and digital online assessment and management and E/M visits (or e-visits).* • *Analyze patient population data to identify gaps in care and offer additional interventions, as appropriate;* • *Risk stratify the practice population based on defined diagnoses, claims, or other electronic data to identify and target services to patients;* • *Be assessed through performance measurement of primary care quality, total cost of care, and meaningful use of Certified EHR Technology*)

In the CY 2017 PFS final rule (81 FR 80230), we began making separate payment to practitioners who provide behavioral health integration (BHI) services to patients using the Psychiatric Collaborative Care Model (CoCM) (a specific model of care provided by a primary care team consisting of a primary care provider and a health care manager who works in collaboration with a psychiatric consultant) using HCPCS codes G0502, G0503, and G0504.

In the CY 2018 PFS final rule (82 FR 53077 through 53078), these codes were replaced by CPT codes 99492 (Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional, initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan, review by the psychiatric consultant with modifications of the plan if recommended, entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant, and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies), 99493 (Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: tracking patient follow-up and progress using the registry, with appropriate documentation, participation in weekly caseload consultation with the psychiatric consultant, ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers, additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant, provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies, monitoring of patient outcomes using validated rating scales, and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment), and 99494 (Initial or subsequent psychiatric collaborative care management, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (List separately in addition to code for primary procedure)), respectively.

In the CY 2017 PFS final rule (81 FR 80230), we also began making separate payment to practitioners who provide general BHI services to patients, using HCPCS code G0507. BHI is a term that refers broadly to collaborative care that integrates behavioral health services with primary care. BHI is a team-based approach to care that focuses on integrative treatment of patients with medical and mental or behavioral health conditions. In the CY 2018 PFS final rule (82 FR 53077 through 53078), HCPCS code G0507 was replaced by CPT code 99484.

CPT code 99484 is for care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional, per calendar month, with the following required elements: initial assessment or follow-up monitoring, including the use of applicable validated rating scales, behavioral health care planning in relation to behavioral/psychiatric health problems, including revision for patients who are not progressing or whose status changes,

facilitating and coordinating treatment such as psychotherapy, pharmacotherapy, counseling and/or psychiatric consultation, and continuity of care with a designated member of the care team.

Patients with chronic health conditions are ''more likely to have related behavioral health concerns and find it easier to improve chronic conditions when these concerns are also addressed.'' [54] Integrating behavioral health with primary care has been shown to improve outcomes like reduced depression severity, and enhancing patient's experience of care.[55] In the CY 2025 PFS final rule (89 FR 97897), we summarized comments that we had received on our APCM services proposals discussing the importance of behavioral health on overall health and urging us to consider including behavioral health in future rulemaking as it relates to advanced primary care, citing the growing need for fully integrated physical and behavioral health. In our response, we agreed with commenters that behavioral health integration services are complementary to APCM services and that behavioral health is important in the context of overall health. We stated that we will take comments recommending strategies for further integration into consideration for future rulemaking. We further stated that we continue to be interested in the use of behavioral health integration services as they relate to advanced primary care and welcome input from interested parties, including how evolving changes in practice may warrant reconsideration of payment and coding policies.

We believe that the physicians and practitioners who furnish APCM services should be able to provide BHI services and CoCM without needing to document their time spent performing the service because this would help facilitate a more holistic, team-based approach to care coordination and reduce burden. Otherwise, the practice would need to develop a time documentation system for BHI and CoCM, but not APCM. Functionally, we also believe that many practices that develop the interdisciplinary teams to provide advanced primary care are also the ones most likely ready to furnish BHI and CoCM services, so alignment in billing requirements would streamline processes. Therefore, for CY 2026, we are proposing to create optional add-on codes for APCM services that would facilitate providing complementary BHI services by removing the time-based requirements of the existing BHI and CoCM codes. We believe that removing the time-based requirements will reduce burden on practitioners by reducing the documentation requirements for billing. By reducing the documentation requirements, we also believe primary care practitioners may be more likely to offer and furnish BHI and CoCM services, which would improve access to BHI and CoCM for primary care patients. These proposed optional add-on codes for APCM services would be considered a ''designated care management service'' under § 410.26(b)(5) and, as such, could be provided by auxiliary personnel under the general supervision of the billing practitioner. In the CY 2024 PFS final rule (88 FR 78939), we summarized comments received for Principal Illness Navigation services that discussed that patients with severe mental illness and substance use disorders may only see behavioral health practitioners regularly, which we believe makes the integration of behavioral health and primary care important for this population to improve access. We are opting to not create an add-on code for CPT code 99494 as this code is for an additional 30 minutes of initial or subsequent psychiatric collaborative care management in a calendar month, and the APCM codes, and proposed add-on codes do not require the counting of minutes in order to bill.

2. Behavioral Health Integration Add-On Codes for APCM (HCPCS Codes GPCM1, GPCM2, GPCM3)

We are proposing the establishment of three new G-codes to be billed as add-on services when the APCM base code (HCPCS codes G0556, G0557, and G0558) is reported by the same practitioner in the same month. HCPCS code GPCM1, an add-on code based on CPT code 99492, HCPCS code GPCM2, an add-on code based on CPT code 99493 for CoCM services delivered to patients also receiving APCM services, and HCPCS code GPCM3, an add-on code for general behavioral health integration services based on CPT code 99484. We are not proposing to create an add-on code for CPT code 99494, as that code describes additional time, and these codes do not require the counting of minutes.

Our proposed code descriptors are listed below.

HCPCS code GPCM1: Initial psychiatric collaborative care management, in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional, initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan, review by the psychiatric consultant with modifications of the plan if recommended, entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant, and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies (list separately and in addition to the Advanced Primary Care Management code).

HCPCS code GPCM2: Subsequent psychiatric collaborative care management, in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: tracking patient follow-up and progress using the registry, with appropriate documentation, participation in weekly caseload consultation with the psychiatric consultant, ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers, additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant, provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies, monitoring of patient outcomes using validated rating scales, and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are

''Outcomes of Integrated Behavioral Health with Primary Care.'' J Am Board Fam Med. 2017 Mar–Apr;30(2):130–139.doi: 10.3122/jabfm.2017.02.160234.

prepared for discharge from active treatment (list separately and in addition to Advanced Primary Care Management code).

HCPCS code GPCM3: Care management services for behavioral health conditions, directed by a physician or other qualified health care professional, per calendar month, with the following required elements: initial assessment or follow-up monitoring, including the use of applicable validated rating scales, behavioral health care planning in relation to behavioral/psychiatric health problems, including revision for patients who are not progressing or whose status changes, facilitating and coordinating treatment such as psychotherapy, pharmacotherapy, counseling and/or psychiatric consultation, and continuity of care with a designated member of the care team (list separately and in addition to Advanced Primary Care Management code).

3. Valuation of Behavioral Health Integration Add-on Codes for APCM Services

In consideration that the services described by the proposed add-on codes are meant to be directly comparable to the existing CoCM and BHI codes, we propose a direct crosswalk to the current work RVU values of CPT code 99492 for HCPCS code GPCM1 (work RVU 1.88), CPT code 99493 for HCPCS code GPCM2 (work RVU 2.05), and CPT code 99484 for HCPCS code GPCM3 (work RVU 0.93). We also propose a direct crosswalk to the current direct PE inputs for CPT codes 99492 (non-facility RVU 2.48, facility RVU 0.80), 99493 (non-facility RVU 1.93, facility RVU 0.86), and 99484 (non-facility RVU 0.66, facility RVU 0.30), to HCPCS codes GPCM1, GPCM2, and GPCM3, respectively. We welcome comments on this approach.

4. Request for Information Related to APCM and Prevention

Having a usual source of primary care can be positively associated with better receipt of recommended prevention services [56] and effective management of chronic disease,[57] which per the Trump Administration's Executive Order, ''Establishing the President's Make America Healthy Again Commission,'' [58] is a top priority for CMS. APCM coding and payment has represented CMS' recent efforts to promote team-based primary care. In the CY 2025 PFS final rule (89 FR 97863), commenters recommended that cost sharing be eliminated for APCM services, indicating that any amount of cost sharing could be prohibitive and may limit the uptake of APCM services. A few commenters suggested that APCM services are preventive services that should be exempt from beneficiary cost sharing.

At the time, we responded to comments stating that CMS did not see how APCM fit within the benefit categories for preventive services. After further consideration and analysis, there are some service elements of APCM that are substantively similar to certain aspects of the ''personalized prevention plan services'' described under section 1861(hhh)(1) of the Act. For example, the personalized prevention plan includes a health risk assessment, which includes identification of chronic diseases, injury risks, modifiable risk factors, and urgent health needs. This is substantively similar to the service element of APCM that requires an overall systematic needs assessment (which includes both medical and psychosocial needs). The personalized prevention plan includes ''improving self-management, or community-based lifestyle interventions to reduce health risks and promote self-management,'' which is substantively similar to the APCM service element of ''oversight of self-management.'' However, as APCM is a bundle of different care management and communication technology-based services, there are other service elements of the APCM codes that may be covered under Medicare Part B and carry cost sharing obligations.

The blending of prevention and treatment services makes intuitive sense for those familiar with advanced primary care practices— which must simultaneously balance ensuring patients receive their needed preventive services and treatment services. Indeed, effective care management often means balancing prevention and treatment in the life an individual patient. For example, for a patient with a recent history of a Deep Venous Thrombosis (DVT) on anticoagulation medication, a primary care team must often balance whether or not to hold the patient's anticoagulation in order for the patient to receive a colonoscopy (where removal of a polyp while the patient is on anticoagulation can lead to excessive bleeding).[59] The primary care team must balance the relative risks of holding the anticoagulation medication, with the relative risks of delaying cancer screening, for the optimal health and wellbeing of the patient.

Given these factors, we are seeking comments on how CMS should consider application of cost sharing for APCM services, particularly, if we were to include preventive services within the APCM bundles. How should we account for cost sharing if APCM includes both preventive services and other Part B services? Should CMS consider including the Annual Wellness Visit, depression screening, or other preventative services in the APCM bundle, and if so, which services and why?

Should CMS consider other changes to APCM or additional coding to further recognize the work of advanced primary care practices in preventing and managing chronic disease?

Additionally, we have often described how primary care teams are central to the relative success of Medicare Shared Savings ACOs. In 2023, as in previous years, ACOs comprised of larger proportions of primary care clinicians had significantly higher net per capita savings than ACOs comprised of smaller proportions of primary care clinicians.

Should CMS consider new payments to Shared Savings Program ACOs for prospective monthly APCM payments to be delivered to primary care practices that satisfy the APCM billing requirements, with the payments reconciled under the ACO benchmark?

If so, how should CMS consider consent and other features of APCM in these contexts?

Should CMS consider other updates to APCM payments or Shared Savings Program policies that would drive increased participation of primary care practitioners in ACOs?

I. Policies To Improve Care for Chronic Illness and Behavioral Health Needs

1. Updates to Payment for Digital Mental Health Treatment (DMHT) and Comment Solicitation on Payment Policy for Software as a Service (SaaS)

a. Updates to Payment for DMHT

In the CY 2025 PFS final rule (89 FR 97923 through 97928), we established Medicare payment to billing practitioners for digital mental health treatment (DMHT) devices furnished incident to professional behavioral health services used in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care. We use the term ''DMHT device'' to include the term digital cognitive behavioral therapy we used in prior rulemaking (88 FR 79012 through 79013) and in general to refer to software devices cleared, approved, or granted De Novo authorization by the Food and Drug Administration (FDA) that are intended to treat or alleviate a mental health condition, in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care, by generating and delivering a mental health treatment intervention that has a demonstrable positive therapeutic impact on a patient's health. We use the terms ''behavioral health conditions'' and ''mental disorders'' interchangeably and to mean psychiatric disorders as referenced in FDA regulation, 21 CFR 882.5801. This includes substance use disorders. The FDA definition of devices encompasses certain software intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease, in man or other animals, or intended to affect the structure or any function of the body of man or other animals.[60] As the field of innovative products including digital therapeutics and computerized behavioral therapy devices for behavioral health treatment develops and expands the FDA continues to apply a risk-based framework to review and classify computerized behavioral therapy devices.

Effective January 1, 2025, we finalized three HCPCS G-codes for DMHT devices, to be billed by physicians and practitioners who are authorized to furnish services for the diagnosis and treatment of mental illness: G0552 *(Supply of digital mental health treatment device and initial education and onboarding, per course of treatment that augments a behavioral therapy plan);* HCPCS code G0553 *(First 20 minutes of monthly treatment management services directly related to the patient's therapeutic use of the digital mental health treatment (DMHT) device that augments a behavioral therapy plan, physician/other qualified health care professional time reviewing data generated from the DMHT device from patient observations and patient specific inputs in a calendar month and requiring at least one interactive communication with the patient/caregiver during the calendar month);* and HCPCS code G0554 *(Each additional 20 minutes of monthly treatment management services directly related to the patient's therapeutic use of the digital mental health treatment (DMHT) device that augments a behavioral therapy plan, physician/other qualified health care professional time reviewing data generated from the DMHT device from patient observations and patient specific inputs in a calendar month and requiring at least one interactive communication with the patient/caregiver during the calendar month).*

Additionally, we finalized the conditions of payment for these codes. To be payable under the PFS, the DMHT device must have been cleared under section 510(k) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) or granted De Novo authorization by FDA and in each instance classified at § 882.5801. In addition, the billing practitioner must incur the cost of the DMHT device furnished to the beneficiary, and the furnishing of the DMHT device must be incident to the billing practitioner's professional services in association with ongoing behavioral health treatment under a plan of care by the billing practitioner. Furthermore, we finalized that the billing practitioner must diagnose the patient with a mental health condition and prescribe or order the DMHT device. We are clarifying here that the patient must have a mental health condition diagnosis, but the billing practitioner does not need to be the practitioner who made the diagnosis. The patient could then use the DMHT device in settings according to how the device has been classified by FDA for use at § 882.5801, which could include the home or an office or other outpatient setting if consistent with the FDA classification for use. Also, payment may only be made for DHMT devices for mental health treatment in accordance with the use indicated in their FDA classification at § 882.5801. We continue to be vigilant about waste, fraud and abuse as we develop payment policy for devices that may function like DMHT devices but whose technology platforms may differ from those of DMHT devices classified at § 882.5801. We seek to ensure that DMHT devices are not only safe for patients but also beneficial for patients. Our objective in requiring that DMHT devices be classified at § 882.5801 as a condition of payment was to set guardrails within our payment policy for patient safety and benefit. While partly in recognition of our inability to evaluate every DMHT device, in this way we limited payment to devices which are required to comply with the special controls requiring clinical data to validate the model of behavioral therapy as implemented by the device. While presently use cases for insomnia, substance use disorder, depression and anxiety have been classified by the FDA at 21 CFR 882.5801, future use cases are not necessarily limited to these.

It is possible that additional DMHT devices for other use cases with similar characteristics may be classified under this code section.

We anticipate that updating our payment policies will be an iterative process relating first to behavioral health treatment and by extension to chronic conditions. Behavioral health conditions are some of the most prevalent chronic diseases in the country. Among adults aged 18 or older in 2023, 22.8 percent (or 58.7 million people) had any mental illness and 48.5 million people aged 12 or older (or 17.1 percent) had a substance use disorder (SUD) in the past year. These behavioral health conditions are often chronic in nature. Individuals with Major Depressive Disorder, for example, often have recurrent episodes throughout their lives.[61]

The technologies and platforms for digital therapeutics are evolving rapidly. We are at an early stage of Medicare payment for DMHT devices as supplies furnished incident to professional behavioral health services used in conjunction with ongoing behavioral health care treatment under a behavioral health treatment plan of care. In considering the next stage in the development of our payment policy, we have been reviewing interested parties' recommendations to make payment for FDA authorized devices under other classifications, including Computerized behavioral therapy device for treating symptoms of gastrointestinal conditions under 21 CFR 876.5960; Biofeedback device under 21 CFR 882.5050; Digital

[60] Sec. 201(h)(1) of the Federal Food, Drug, and Cosmetic Act.

therapy device to reduce sleep disturbance for psychiatric conditions under 21 CFR 882.5705; Digital therapy device for Attention Deficit Hyperactivity Disorder under 21 CFR 882.5803; and Computerized behavioral therapy device for the treatment of fibromyalgia symptoms to be codified at 21 CFR 882.5804. We note that Medicare coverage of biofeedback is limited by a long-standing national coverage determination. See, Medicare National Coverage Determinations Manual Chapter 1, Part 1 (Sections 10–80.12) Coverage Determinations, Section 30.1, Biofeedback, *https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/ncd103c1_part1.pdf.*

We are proposing to expand our payment policies for HCPCS codes G0552, G0553, and G0554 to also make payment for DMHT devices cleared under section 510(k) of the FD&C Act or granted De Novo authorization by FDA and in each instance classified at § 882.5803 Digital therapy device for Attention Deficit Hyperactivity Disorder (ADHD). The § 882.5803 classification is for software intended to provide therapy for ADHD or any of its individual symptoms as an adjunct to clinician supervised treatment. Comparable to the special controls for device classification § 882.5801 Computerized behavioral therapy device for psychiatric disorders, the § 882.5803 device classification's special controls require the use of a validated measure to evaluate effectiveness of the device to provide therapy for ADHD or any of its individual symptoms. The special controls for device classification § 882.5801 require that clinical data must be provided to describe a validated model of behavioral therapy for the psychiatric disorder; and to validate the model of behavioral therapy as implemented by the device. Comparable to the § 882.5801 device classification, the § 882.5803 device classification is intended to provide therapy as an adjunct to clinician supervised treatment. We believe that it is important to expand our coding and payment policies to include such devices classified at § 882.5803 to more fully reflect the range of behavioral health disorders treated by FDA-authorized products. We also propose that all the conditions of payment for HCPCS codes G0552, G0553, and G0554 finalized in the CY 2025 PFS final rule would apply to DMHT devices classified at § 882.5803. Additionally, we welcome comments on whether we should establish coding and payment policies for devices classified under the following FDA regulation sections that were recommended to us by interested parties: Computerized behavioral therapy devices for treating symptoms of gastrointestinal conditions at § 876.5960; Digital therapy devices to reduce sleep disturbance for psychiatric conditions at § 882.5705; and Computerized behavioral therapy device for the treatment of fibromyalgia symptoms to be codified at § 882.5804.

Medicare FFS claims data for HCPCS codes G0552, G0553, and G0554 have remained low in volume since we established these codes in the CY 2025 PFS final rule. We understand there may be several reasons for this. We are aware per interested parties and commenters that a condition of payment that we established for these codes, that the billing practitioner is incurring the cost of furnishing the DMHT device to the patient, may not align with direct to consumer delivery and payment models that existed before the final rule was issued.

At this time, we do not believe we can appropriately price all the DMHT devices for which we would make payment under our current policies and proposals, and therefore, we are not proposing any changes to the existing contractor-priced status for HCPCS code G0552. As we have noted, the technologies and DMHT therapies are evolving rapidly. We recognize our payment policy, too, will evolve. Given the dynamic nature of the development of these devices and the variation in methods of action for potential technology platforms, we do not have sufficient information needed to establish national pricing for devices described by HCPCS code G0552 at this time. We recognize that the ongoing nationwide behavioral health workforce shortage combined with increasing demand for behavioral health care services may limit access to behavioral health services for some Medicare beneficiaries.[62] We recognize that digital therapeutic devices may offer innovative means to access certain behavioral health care services. We acknowledge that the field of digital therapeutics is evolving and continue to solicit comments from the public on this topic, including the CPT Editorial Panel. We continue to aim to both provide access to vital behavioral health services and gather further information about the delivery of digital behavioral health therapies, their effectiveness, their adoption by practitioners as complements to the behavioral health care they furnish, and their use by patients for the treatment of behavioral health conditions. We continue to welcome information and may consider national pricing through future rulemaking.

We are seeking comments on the possibility of establishing for CY 2026 additional separate coding and payment for a broader based set of services describing digital tools used by practitioners intended for maintaining or encouraging a healthy lifestyle, as part of a mental health treatment plan of care. Specifically, we are seeking information about clinical practice involving use of such tools. On what reliable evidence do practitioners inform their clinical judgment that use of such digital tools is warranted or beneficial to their treatment of the patient? What role do these digital tools typically have within plans of behavioral health treatment? What appropriate crosswalks would we consider for the purposes of nationally pricing a code to describe digital tools that do not require FDA clearance, approval or authorization and therefore do not entail the development costs of FDA clearance, approval or authorization or meet other conditions of payment for HCPCS code G0552, primarily that the practitioner must bear the cost of the DMHT device as a supply incident to their services. For example, we could consider the inputs assigned to CPT code 98016 (Brief communication technology-based service (for example, virtual check-in) by a physician or other qualified health care professional who can report evaluation and management services, provided to an established patient, not originating from a related evaluation and management service provided within the previous 7 days nor leading to an evaluation and management service or procedure within the next 24 hours or soonest available appointment, 5 to 10 minutes of medical discussion) or CPT code 99421 (Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 5 to 10 minutes). Since the resource costs reflected in the practice expense should be lower for services involving digital tools that do not require FDA clearance, approval, or authorization or meet the condition of payment that the billing practitioner bears the cost of supplying the DMHT device for HCPCS code G0552, we anticipate that the corresponding valuation for any additional coding would be appropriately lower than G0552. We welcome comments on these potential crosswalks or any other services that

[62] *https://bhw.hrsa.gov/data-research/projecting-health-workforce-supply-demand.*

may best approximate the resource costs involved in cases where practitioners furnish a digital tool as part of a mental health treatment plan of care and furnish initial education and onboarding, per course of treatment that augments a behavioral therapy plan, and monthly treatment management services directly related to the patient's use of these digital tools. We also welcome comments on these potential crosswalks or any other services that may best approximate the resource costs involved in cases where practitioners do not furnish the digital tool and do not furnish initial education and onboarding for the tool, but nonetheless incorporate use of the tool as part of a mental health treatment plan of care.

Additionally, we are requesting comments on other related digital device policies for our consideration in future rulemaking. Specifically, we received a request from an interested party to create a new add-on G code to existing CPT codes 96112, 96113, 96116, 96121, 96130, 96131, 96132, and 96133 (code descriptors can be found in Table 26), for physicians' or non-physician practitioners' psychological/neuropsychological evaluations so they may report administration of an FDA authorized eye-tracking technology to aid in the diagnosis of Autism Spectrum Disorder (ASD) in pediatric patients, including staff time with the patient, data submission and output.

The interested party stated that the device collects data based on the clinical presentation of a patient, then an analysis algorithm is applied to the collected data to generate output. The interested party raised concerns that currently there are delays and waitlists to obtain diagnostic evaluations for children at risk for ASD. Their solution is to use this ASD diagnosis tool at the point of care after a parent or physician identifies a risk of ASD in a child. According to the interested party, this digital device can help reduce ASD diagnosis delays to be seen by a diagnostic specialist. The interested party is requesting the following code descriptor, *Algorithm-driven neurological assessment for likelihood of Autism Spectrum Disorder (ASD) diagnosis, and of ASD-measures' severity (for example, social disability, verbal and non-verbal ability), derived from validated quantitative analysis of looking behavior,* and recommends for CMS to either establish a national rate for the add-on code using a crosswalk to CPT code 93243 (*External electrocardiographic recording for more than 48 hours up to 7 days by continuous rhythm recording and storage; scanning analysis with report*), CPT code 93247 (External electrocardiographic recording for more than 7 days up to 15 days by continuous rhythm recording and storage; scanning analysis with report), or to allow contractor pricing.

We are seeking comments from the public regarding whether creating an add-on G code and contractor pricing is needed for the administration of an FDA authorized eye-tracking technology and other technology to aid in the diagnosis of ASD in pediatric patients; or whether it would be more appropriate to go through the CPT Editorial Panel process to obtain a Category III CPT code for this treatment.

TABLE 26: PSYCHOLOGICAL/NEUROPSYCHOLOGICAL EVALUATION CODES

CPT Code	Long Descriptor
96112	Developmental test administration (including assessment of fine and/or gross motor, language, cognitive level, social, memory and/or executive functions by standardized developmental instruments when performed), by physician or other qualified health care professional, with interpretation and report; first hour
96113	Developmental test administration (including assessment of fine and/or gross motor, language, cognitive level, social, memory and/or executive functions by standardized developmental instruments when performed), by physician or other qualified health care professional, with interpretation and report; each additional 30 minutes (List separately in addition to code for primary procedure)
96116	Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, [eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities]), by physician or other qualified health care professional, both face-to-face time with the patient and time interpreting test results and preparing the report; first hour
96121	Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, [eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities]), by physician or other qualified health care professional, both face-to-face time with the patient and time interpreting test results and preparing the report; each additional hour (List separately in addition to code for primary procedure)
96130	Psychological testing evaluation services by physician or other qualified health care professional, including integration of patient data, interpretation of standardized test results and clinical data, clinical decision making, treatment planning and report, and interactive feedback to the patient, family member(s) or caregiver(s), when performed; first hour
96131	Psychological testing evaluation services by physician or other qualified health care professional, including integration of patient data, interpretation of standardized test results and clinical data, clinical decision making, treatment planning and report, and interactive feedback to the patient, family member(s) or caregiver(s), when performed; each additional hour (List separately in addition to code for primary procedure)
96132	Neuropsychological testing evaluation services by physician or other qualified health care professional, including integration of patient data, interpretation of standardized test results and clinical data, clinical decision making, treatment planning and report, and interactive feedback to the patient, family member(s) or caregiver(s), when performed; first hour
96133	Neuropsychological testing evaluation services by physician or other qualified health care professional, including integration of patient data, interpretation of standardized test results and clinical data, clinical decision making, treatment planning and report, and interactive feedback to the patient, family member(s) or caregiver(s), when performed; each additional hour (List separately in addition to code for primary procedure)

b. Comment Solicitation on Payment Policy for Software as a Service (SaaS)

In recent years, there have been rapid developments in the use of software-based technologies to support clinical decision-making in the outpatient and physician office settings, some of which may be devices requiring FDA, clearance, approval, or authorization. We refer to these software-based technologies as software as a service (SaaS). As the data used in our PE methodology has aged, and more services have begun to include innovative technology such as software algorithms and AI, these innovative applications are not well accounted for in our PE methodology. As described in section II.B of this proposed rule, PE resources typically involved in furnishing services are characterized as either direct or indirect costs. Direct costs involved in furnishing a service are estimated for each code and include clinical labor, medical supplies, and medical equipment. Indirect costs include administrative labor, office expenses, and all other expenses. Indirect PE is allocated to each service based on physician work, direct costs, and a specialty-specific indirect percentage. The source of the specialty specific indirect percentage was the Physician Practice Information (PPI) Survey, last administered in 2007 and 2008, when emerging technologies that rely primarily on software, licensing, and analysis fees, with minimal costs in equipment and hardware may not have been typical. Thus, these costs are not well accounted for in the PE methodology. While we have received updated PPI survey data from the AMA that did incorporate information on the practice costs associated with SaaS and AI services, this information would only reflect the impact of SaaS and AI on the PE/hr associated with a given medical specialty, rather than providing insight into the direct costs associated with use of this technology.

Furthermore, as described in section II.B.5 of this proposed rule, due to several limitations with the data, we are

not proposing to implement the PE/HR data or cost shares from the AMA's PPI Survey data for CY 2026 ratesetting. Consistent with our PE methodology and as we have stated in past PFS rulemaking (83 FR 59557), we have considered most computer software and associated analysis and licensing fees to be indirect costs tied to costs for associated hardware that is considered to be medical equipment. However, beginning with payment for Fractional Flow Reserve Computed Tomography (Heartflow) in the CY 2022 PFS final rule (86 FR 65041) CMS has made intermediate, service-specific policies to allow for PFS payment of SaaS and AI applications in certain circumstances.

We consider several distinct issues when evaluating SaaS technologies. First, we have observed wide variations in the purported costs of clinically similar SaaS technologies. The various costs that manufacturers consider when pricing their technologies, including research and development and software maintenance, are often not publicly verifiable. Additionally, due to the novel and evolving nature of these technologies, there are rarely existing medical items or services that can be utilized for comparison purposes to determine clinical and resource similarity. Finally, while there has been a rapid increase in the development and coding of services incorporating these technologies in recent years, there is a very limited amount of Medicare claims data for these services.

As this technology has continued to evolve and diversify, interested parties have stated that the lack of a consistent payment policy for SaaS and AI devices is an impediment to patient access when these devices are otherwise cleared, approved, or authorized by the FDA. Interested parties have requested that CMS consider the development of a payment policy for these devices that is stable and consistent across settings of care, payment systems, and types of services incorporating SaaS and AI devices. Additionally, as we are interested in paying accurately for the management of chronic disease and primary care services, we are seeking to understand how the use of SaaS and AI technology affects those services and how to incorporate these costs into our current strategy for paying for evolving models of care delivery, such as Advanced Primary Care Management and risk-based payment arrangements generally. Therefore, we are requesting public comments on how we should consider paying for SaaS under the PFS, including:

- What factors should we consider when paying for SaaS?
- What has the experience been of risk-based payment arrangement participants with incorporating SaaS under their payment arrangements?
- Have risk-based payment arrangements reflected the underlying value of SaaS to the practice of medicine?
- Given the limitations of the PE methodology to account for this kind of technology, what alternative pricing strategies should CMS use to accurately pay for SaaS and AI devices under the PFS? For example, should CMS continue its current practice, as referenced in section II.E.23. of this proposed rule, of crosswalking values from the OPPS established payment amounts for the technical components of services incorporating SaaS and AI? Or should we integrate OPPS geometric mean costs for these devices into our ratesetting methodology as we are proposing to do in this proposed rule for RPM and RTM services, or set payment rates relative to OPPS rates as we are proposing to do for radiation oncology services? See sections II.E.24. and 30. this proposed rule.
- How should CMS value the physician work associated with utilizing and interpreting the clinical outputs associated with SaaS and AI devices?
- Is there an alternative data source outside of the limited Medicare claims data currently available and hospital invoices provided by manufacturers, which may not fully depict total hospital acquisition costs, that can accurately reflect the costs of the SaaS?
- How are these technologies used in the treatment of chronic disease?
- How may CMS best evaluate the quality and efficacy of SaaS and AI technologies?

We welcome input from interested parties on these questions as well as any additional suggestions that would enhance our ability to provide accurate and consistent payment for procedures incorporating SaaS. We note that there is a comment solicitation in the CY 2026 OPPS proposed rule regarding SaaS devices furnished in hospital outpatient departments and ASCs.

2. Prevention and Management of Chronic Disease—Request for Information

Six in ten Americans have at least one chronic disease, and four in ten have two or more chronic diseases. Many preventable chronic diseases are caused by a short list of risk behaviors, including smoking, poor nutrition, physical inactivity, and excessive alcohol use.[63] In 2023, among adults aged 18 or older, 22.8 percent (or 58.7 million people) had any mental illness (AMI) in the past year.[64] Although Medicare Part B covers many preventive services,[65] as defined in section 1861(ddd)(3) of the Act, Medicare preventive services have some restrictions.[66]

Per the Trump Administration Executive Order, ''Establishing the President's Make America Healthy Again Commission,'' [67] the Administration is directing our focus towards understanding and drastically lowering chronic disease rates, including thinking on nutrition, physical activity, healthy lifestyles, over-reliance on medication and treatments, the effects of new technological habits, environmental impacts, and food and drug quality and safety. Furthermore, the Executive Order directs that agencies must ensure the availability of expanded treatment options and the flexibility for health insurance coverage to provide benefits to support beneficial lifestyle changes and disease prevention. As such, focusing on the prevention and management of chronic disease is a top priority for us.

We are broadly soliciting feedback to help us better understand how we could enhance our support management for prevention and management of chronic disease. Specifically, we are requesting commenters consider the following information:

- How could we better support prevention and management, including self-management, of chronic disease?
- Are there certain services that address the root causes of disease, chronic disease management, or prevention, where the time and resources to perform the services are not adequately captured by the current physician fee schedule code set? If so, please provide specific examples.
- Are there current services being performed to address social isolation and loneliness of persons with

[63] Centers for Disease Control. ''Chronic diseases in America.'' Available from: *https://www.cdc.gov/chronic-disease/about/index.html#:~:text=Six%20in%2010%20Americans%20have,inactivity%2C%20and%20excessive%20alcohol%20use.*

Medicare, where the time and resources to perform the services are not adequately captured by the current physician fee schedule code set? If so, what evidence has supported these services, and what do these services entail? What services have been delivered by Medicare providers or community-based organizations, including area agencies on aging and other local aging and disability organizations? What has been the impact?

- Are there current services being performed that improve physical activity, where the time and resources to perform the services are not adequately captured by the current physician fee schedule code set? How should CMS consider provider assessment of physical activity, exercise prescription, supervised exercise programs, and referral, given the accelerating use of wearable devices and advances in remote monitoring technology?
- Should CMS consider creating separate coding and payment for intensive lifestyle interventions, where the time and resources to perform the services are not adequately captured by the current physician fee schedule code set, and how should these interventions be prioritized? If so, what evidence has supported these services, and what do the services entail? How would additional coding and payment be substantively different from coding and payment for Intensive Behavioral Therapy?
- Should CMS consider creating separate coding and payment for medically-tailored meals, as an incident-to service performed under general supervision of a billing practitioner? If so, what would be the appropriate description of such a service, and under what patient circumstances (that is, after discharge from a hospital)? Do community-based organizations providing medically tailored meals currently employ a physician, nurse practitioner, physician assistant, or other practitioner who could both bill Medicare and supervise a medically-tailored meal service? Should CMS consider allowing billing providers to refer to community-based organizations to deliver and ensure quality of medically-tailored meals while under general supervision (please see § 410.26(a)(3) for further information about general supervision) of the referring billing provider? If CMS were to create separate coding and payment for medically-tailored meals, how should CMS ensure integrity of the service being delivered?
- Please provide information on whether we should consider creating separate coding and payment for FDA-cleared digital therapeutics that treat or manage the symptoms of chronic diseases an incident-to service performed under the general supervision of a billing practitioner. Please see the CY 2025 PFS final rule (89 FR 97923 through 97928) for reference as to how we created new coding and payment for FDA-cleared digital mental health treatments (DMHTs).
- Are there technical solutions that would enhance the uptake of the annual wellness visit (AWV), or the improving accessibility, impact, and usefulness of the AWV? How can CMS better support practitioners and beneficiaries related to the AWV? Should CMS consider moving some of the required components of the AWV to optional add-on codes of the AWV instead, with the intent of decreasing burden, improving uptake, and allowing practitioners to select additional AWV elements that may be more relevant to particular patients?
- The Administration for Community Living (ACL) has defined evidence-based programs,[68] which have demonstrated impact in effectively treating chronic disease, preventing disease, and helping older adults and people with disabilities to adopt healthy behaviors, improve their health status, reduce disability and injury, and reduce their use of hospital services and emergency room visits. In addition to programs impacting chronic disease management and prevention, there are evidence-based health programs that address older adult falls, mental health, physical activity, and more. Fifty-six State units on aging that work with over 600 area agencies on aging (AAAs) and their networks of service providers receive formula grants from ACL to administer programs, but the need exceeds available federal funding. Are there certain existing or new Physician Fee Schedule codes and payment, or Innovation Center Models, that could better support practitioner provision of successful interventions through partnerships between health care entities, AAAs, community care hubs, and other local aging and disability organizations? If so, please provide specific examples.
- In consideration that there are significantly more types of coding and payment that describe procedures in the physician fee schedule, please provide feedback regarding whether this detracts from the codes describing services that address underlying health behaviors, chronic disease management, and prevention.

Aligning with this initiative to focus on the prevention and management of chronic disease, we are considering whether to create additional coding and payment for motivational interviewing. Motivational interviewing is a collaborative, goal-oriented style of communication with particular attention to the language of change. It is designed to strengthen personal motivation for and commitment to a specific health goal and exploring the person's own reasons for change within an atmosphere of acceptance and compassion.[69] Compared to traditional advice-giving, motivational interviewing is more successful at improving a patient's underlying health behaviors that contribute to chronic disease, including but not limited to smoking, substance use, physical activity, nutrition, and adherence to medication and other treatments. Multiple meta-analyses have demonstrated that motivational interviewing has demonstrated statistically significant improvements in reduction of alcohol consumption, reduction in substance use in people with dependency or addiction, increased physical activity participation,[70] increased weight loss, and reduction in blood pressure.[71] Motivational interviewing has been adapted and integrated into many settings, including primary care facilities, emergency departments, behavioral health centers, and criminal justice and social service agencies.[72] We are considering whether to develop separate coding and payment for motivational interviewing, which could also be performed under general supervision of the billing practitioner, in order to better account for the time and resources involved in furnishing this care. Furthermore, we understand that in many practices, health coaches can help support the provision of motivational interviewing services. We note that the Category III CPT codes

[72] SAMHSA, Treatment Improvement Protocol 35: Enhancing Motivation for Change in Substance Abuse Treatment Updated 2019, *https://library.samhsa.gov/sites/default/files/tip-35-pep19-02-01-003.pdf.*

(0591T, 0592T, and 0593T) for health coaching are currently contractor-priced, and have a January 2030 sunset date. However, health coaches do not have a Medicare benefit category and therefore cannot bill Medicare directly (a new benefit category requires statutory change) but could potentially operate as clinical staff under general supervision incident-to a physician service if new coding and payment were constructed in this way.

We are soliciting feedback from the public regarding motivational interviewing and health coaches. Specifically, we are requesting commenters consider the following information:

- Please provide information on whether we should create separate coding and payment for motivational interviewing, or whether the resources involved in furnishing these services are appropriately recognized in current coding and payment.
- What is the best definition and description of motivational interviewing?
- What types of clinical staff should be able to perform motivational interviewing under the general supervision of a billing practitioner?
- How long does a session of motivational interviewing typically last? If we were to create coding and payment for motivational interviewing, what should the time-based requirements of the code be?
- We heard from interested parties that in many clinics, health coaches perform services under general supervision, and that there may be substantive overlap with motivational interviewing. To what extent are the services performed by health coaches encompassed by motivational interviewing?
- What training is required to effectively perform motivational interviewing? Are there agreed upon national training or certification standards for health coaches? If so, what are they? Do states have separate training or certification standards for health coaches?
- To what extent would health coaches be able to perform motivational interviewing incident-to billing practitioners under general supervision? Please see § 410.26(a)(3) for further information about general supervision.
- In what clinical situations are motivational interviewing and health coaching most commonly performed? What are the clinical characteristics of a patient where motivational interviewing and health coaching would be medically reasonable and necessary?
- Can motivational interviewing and health coaching appropriately be performed via audiovisual or audio-only synchronous telecommunication?
- What has been the experience of providers and payers utilizing the codes 0591T (Health and well-being coaching: face-to-face, individual initial assessment), 0592T (Individual follow-up session, at least 30 minutes), and 0593T (Group session, two or more individuals, at least 30 minutes)? If the CPT committee were to create permanent codes with staff able to operate under the general supervision of a billing practitioner, would this capture the time and resources to perform health coaching?
- To what extent would new coding for motivational interviewing or health coaching better support some of the evidence-based programs funded and overseen by ACL that effectively manage or prevent chronic disease?

We welcome feedback from stakeholders and the public on how we could better support management of chronic disease and prevention, including whether we should create separate coding and payment for motivational interviewing, along with overlap between motivational interviewing and health coaches for consideration for future rulemaking.

3. Community Health Integration and Principal Illness Navigation for Behavioral Health

a. Practitioner Types

In the CY 2024 PFS final rule (88 FR 78920), we finalized G-codes to reflect new coding and payment for services describing Community Health Integration (CHI) services (HCPCS codes G0019 (*Community health integration services performed by certified or trained auxiliary personnel, including a community health worker, under the direction of a physician or other practitioner; 60 minutes per calendar month*) and G0022 (*Community health integration services, each additional 30 minutes per calendar month*)), provided by certified or trained auxiliary personnel, including a community health worker, under the direction of a physician or other practitioner. We also finalized Principal Illness Navigation (PIN) services (HCPCS codes G0023 (*Principal Illness Navigation services by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a patient navigator or certified peer specialist; 60 minutes per calendar month*) and G0024 (*Principal Illness Navigation services, additional 30 minutes per calendar month*); G0140 (*Principal Illness Navigation—Peer Support by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a certified peer specialist; 60 minutes per calendar month*) and G0146 (*Principal Illness Navigation—Peer Support, additional 30 minutes per calendar month*)), provided by certified or trained auxiliary personnel under the direction of a physician or other practitioner, including a patient navigator or certified peer specialist. In the CY 2025 PFS final rule (89 FR 97822), we clarified that when we refer to ''certified or trained auxiliary personnel'' in the following codes: G0019, G0022, G0023, G0024, G0140, G0146, this also includes clinical social workers (CSWs).

Marriage and family therapists (MFTs) and mental health counselors (MHCs) have a similar statutory benefit category as CSWs and may also connect individuals with community-based resources to address unmet social needs that affect the diagnosis and treatment of medical problems. Like CSWs, MFTs and MHCs can bill Medicare directly for services they personally perform for the diagnosis or treatment of mental illness and substance use disorders, but are not authorized by statute to bill under the PFS for services that are provided by auxiliary personnel incident to their professional services. CHI and PIN services are typically provided by auxiliary personnel supervised by the billing practitioner, and MFTs and MHCs could serve as auxiliary personnel, as the codes do not limit the types of auxiliary personnel that can perform CHI and PIN services incident to the billing practitioner's professional services, so long as they meet the requirements to provide all elements of the service included in the code, consistent with the definition of auxiliary personnel at § 410.26(a)(1). MFTs and MHCs could not directly bill Medicare under the PFS for CHI and PIN services if they were provided by auxiliary personnel, as they are not authorized to supervise, bill, and be paid directly by Medicare for services that are provided by auxiliary personnel incident to their professional services. As we stated previously in the CY 2024 PFS final rule (88 FR 78926), ''the codes do not limit the types of other health care professionals, such as registered nurses and social workers, that can perform CHI services (and PIN services, as we discuss in the next section) incident to the billing practitioner's professional services, so long as they meet the requirements to provide all elements of the service included in the code, consistent with the definition of

auxiliary personnel at § 410.26(a)(1).'' We are clarifying that when we refer to ''certified or trained auxiliary personnel'' in the following HCPCS codes: G0019, G0022, G0023, G0024, G0140, G0146, this also includes MFT and MHCs. We are clarifying that, like CSWs, MFTs and MHCs can bill Medicare directly for CHI and PIN services they personally perform for the diagnosis or treatment of mental illness. Additionally, CMS required for auxiliary personnel performing CHI and PIN under general supervision, that in the absence of state level certification or training requirements, CMS required training to perform the services. We are further clarifying that if CSWs, MFTs, and MHCs are performing the services as auxiliary personnel under the general supervision of a billing practitioner, in the absence of state-level requirements, that they meet the certification or training requirements to perform all CHI and PIN service elements. This is relevant in the cases where a CSW, MFT, or MHC are performing CHI and PIN under the general supervision of a billing practitioner for a medical problem that is not considered a mental illness. For CHI and PIN services, as with all incidents to services, it is the billing practitioner's responsibility to ensure that all payment rules and applicable State requirements are met including licensure, certification, and/or training. This does not mean that the billing practitioners are required to provide the licensure, certification, and/or training themselves, but rather that they must ensure that the Medicare criteria for billing and payment of CHI and PIN services are met.

Individuals who personally furnish or serve as auxiliary personnel for CHI and PIN services must meet all other service requirements associated with these codes. We welcome comments on this clarification.

b. Initiating Visits

In the CY 2024 PFS final rule (88 FR 78923), we finalized allowing E/M services (other than a low-level E/M visit done by clinical staff), including an E/M service that is part of a transitional care management (TCM) service and an annual wellness visit (AWV) service to serve as the initiating visit for CHI services. We received comments requesting for CPT codes 90791 (Psychiatric diagnostic evaluation) and 96156 (Health behavior assessment, or re-assessment (that is, health-focused clinical interview, behavioral observations, clinical decision making)) to be allowed to serve as initiating visits, but we determined at the time that these services would be better captured and better serve the needs being addressed with the PIN service elements. We have continued to analyze the uptake of CHI services and believe that these services may fit the need for additional initiating CHI visits, as utilization data is showing that CHI services are being used to address SDOH need(s) that significantly limit the practitioner's ability to diagnose or treat mental illness.

For CSWs, MFTs, and MHCs to bill Medicare directly for CHI services personally performed for the diagnosis or treatment of mental illness, we are proposing to allow for CPT code 90791 (Psychiatric diagnostic evaluation) or the Health Behavior Assessment and Intervention (HBAI) services that CPT codes 96156, 96158, 96159, 96164, 96165, 96167, and 96168 (and any subsequent HBAI codes) to serve as initiating visits for CHI, as we believe these codes are the most analogous codes to the E/M codes that are currently used as initiating visits for CHI that are utilized by practitioners in a specialty whose covered services are limited by statute to services for the diagnosis and treatment of mental illness. All other policies for CHI initiating visits also apply to CHI services furnished by CSWs, MFTs, and MHCs. Please see the 2024 PFS final rule (88 FR 78921 through 78932) and 2025 PFS final rule (89 FR 97821 through 97824) for additional information regarding CHI services and CHI initiating visits. We welcome comments on this proposal.

4. Technical Refinements To Revise Terminology for Services Related to Upstream Drivers of Health

a. Policies To Improve Care for Chronic Illness and Behavioral Health Needs

(1) Social Determinants of Health Risk Assessment (HCPCS Code G0136)

In the CY 2024 PFS final rule (88 FR 78932 through 78937), we finalized coding and payment for HCPCS code G0136 (*Administration of a standardized, evidence-based social determinants of health risk assessment tool, 5 to 15 minutes*). After further review of utilization information, we have come to believe that the resource costs described by HCPCS code G0136 are already accounted for in existing codes, including but not limited to E/M visits. Therefore, we are proposing to delete this code for CY 2026. Accordingly, we are proposing to remove this code from the Medicare Telehealth Services list.

Additionally, we are proposing conforming regulation text updates at 42 CFR 410.15. We are proposing to revise § 410.15(a) as follows: in paragraph (a), by revising the definition of First annual wellness visit providing personalized prevention plan services by removing subparagraph (xiii) and redesignating subparagraph (xiv) as (xiii); and, in revising the definition of Subsequent annual wellness visit providing personalized prevention plan services by removing subparagraph (xi) and redesignating subparagraph (xii) as (xi).

(2) Community Health Integration Services (HCPCS Codes G0019)

In response to the CY 2024 PFS proposed rule, we received several comments requesting that CMS revise some of the language used in the Community Health Integration (CHI) (HCPCS codes G0019) code descriptor to better fit the purpose of CHI services. Some of the examples that commenters provided as an alternative to ''social determinants of health'' included: ''social drivers of health, drivers of health, or health-related social needs.'' Many of these commenters noted that other CMS programs use the term social drivers of health and requested that CMS use consistent naming conventions (88 FR 78933). After further consideration of the code descriptors, we are proposing to replace the term ''social determinants of health (SDOH)'' with the term ''upstream driver(s)''. We have determined that the term ''upstream driver(s)'' is more comprehensive and includes a variety of factors that can impact the health of Medicare beneficiaries. The term ''upstream driver(s)'' encompasses a wider range of root causes of the problems that practitioners are addressing through CHI services. This type of whole-person care can better address the upstream drivers that affect patient behaviors (such as smoking, poor nutrition, low physical activity, substance misuse, etc.) or potential dietary, behavioral, medical, and environmental drivers to lessen the impacts of the problem(s) addressed in the initiating visit.

We are proposing the following changes to HCPCS codes G0019, and we will make conforming revisions to codes describing similar services to reflect the updated terminology, including services furnished by RHCs, FQHCs, and OTPs.

G0019—Community health integration services performed by certified or trained auxiliary personnel, including a community health worker, under the direction of a physician or other practitioner; 60 minutes per calendar month, in the following activities to address upstream driver(s) that are significantly limiting ability to

diagnose or treat problem(s) addressed in an initiating E/M visit:

- *Person-centered assessment, performed to better understand the individualized context of the intersection between the upstream driver(s) and the problem(s) addressed in the initiating E/M visit.*

++ Conducting a person-centered assessment to understand patient's life story, strengths, needs, goals, preferences and desired outcomes, including understanding cultural and linguistic factors.

++ Facilitating patient-driven goal-setting and establishing an action plan.

++ Providing tailored support to the patient as needed to accomplish the practitioner's treatment plan.

- *Practitioner, Home-, and Community-Based Care Coordination.*

++ Coordinating receipt of needed services from healthcare practitioners, providers, and facilities; and from home- and community-based service providers, social service providers, and caregiver (if applicable).

++ Communication with practitioners, home- and community-based service providers, hospitals, and skilled nursing facilities (or other health care facilities) regarding the patient's psychosocial strengths and needs, functional deficits, goals, preferences, and desired outcomes, including cultural and linguistic factors.

++ Coordination of care transitions between and among health care practitioners and settings, including transitions involving referral to other clinicians; follow-up after an emergency department visit; or follow-up after discharges from hospitals, skilled nursing facilities or other health care facilities.

++ Facilitating access to community-based social services to address upstream driver(s).

Health education—Helping the patient contextualize health education provided by the patient's treatment team with the patient's individual needs, goals, and preferences, in the context of the upstream driver(s), and educating the patient on how to best participate in medical decision-making.

- *Building patient self-advocacy skills, so that the patient can interact with members of the health care team and related community-based services addressing the upstream driver(s), in ways that are more likely to promote personalized and effective diagnosis or treatment.*
- *Health care access/health system navigation.*

++ Helping the patient access healthcare, including identifying appropriate practitioners or providers for clinical care and helping secure appointments with them.

- *Facilitating behavioral change as necessary for meeting diagnosis and treatment goals, including promoting patient motivation to participate in care and reach person-centered diagnosis or treatment goals.*
- *Facilitating and providing social and emotional support to help the patient cope with the problem(s) addressed in the initiating visit, the upstream driver(s), and adjust daily routines to better meet* diagnosis *and treatment goals.*
- *Leveraging lived experience when applicable to provide support, mentorship, or inspiration to meet treatment goals.*

J. Provisions on Medicare Parts A and B Payment for Dental Services Inextricably Linked to Other Covered Services

1. Medicare Payment for Dental Services

a. Overview

Section 1862(a)(12) of the Act generally precludes payment under Medicare Parts A or B for any expenses incurred for services in connection with the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth. (Collectively here, we will refer to ''the care, treatment, filling, removal, or replacement of teeth or structures directly supporting teeth'' as ''dental services.'') That section of the statute also includes an exception to allow payment to be made for inpatient hospital services in connection with the provision of such dental services if the individual, because of their underlying medical condition and clinical status or because of the severity of the dental procedure, requires hospitalization in connection with the provision of such services. Our regulation at § 411.15(i) similarly excludes payment for dental services except for inpatient hospital services in connection with dental services when hospitalization is required because of: (1) the individual's underlying medical condition and clinical status; or (2) the severity of the dental procedure.

Fee for service (FFS) Medicare Parts A and B also make payment for certain dental services in circumstances where the services are not considered to be in connection with dental services within the meaning of section 1862(a)(12) of the Act. In the CY 2023 PFS final rule (87 FR 69663 through 69688), we clarified and codified at § 411.15(i)(3) that Medicare payment under Parts A and B could be made when dental services are furnished in either the inpatient or outpatient setting when the dental services are inextricably linked to, and substantially related and integral to the clinical success of, other covered services. We also added several examples of clinical scenarios that are considered to meet that standard under §411.15(i)(3) and amended that regulation to add more examples in the CY 2024 PFS final rule (88 FR 79022 through 79029) and in the CY 2025 PFS final rule (89 FR 97936 through 97945).

b. Submissions Received Through Public Submission Process

In the CY 2023 PFS final rule, we established a process whereby we accept and consider submissions from the public (the ''public submission process'') to assist us to identify additional dental services that are inextricably linked to, and substantially related and integral to the clinical success of, other covered services (87 FR 69663 through 69688). We thank all those who submitted recommendations through this process. We received seven submissions from various organizations and individuals on or before February 10, 2025.

Most of the submissions recommended that we consider clinical scenarios involving beneficiaries with diabetes mellitus when contemplating payment under Medicare for dental services that are inextricably linked to other covered services. Four submitters had similar themes in their submissions that expressed the concern that the absence of treatment of chronic dental infections could complicate covered medical treatment for the management of diabetes-associated retinopathy and nephropathy. Two submitters were focused on their view of how important it is to improve oral health through treatment of oral infections like periodontitis and preventive dental care, as they asserted these dental services are related to the successful prevention and treatment of diabetic retinopathy. These two submitters were specifically concerned about beneficiaries who are at risk for diabetes-related retinopathy and vision loss or who have diabetes-related retinopathy and vision loss.

One submitter explained that their submission's purpose was not to nominate a new clinical scenario for consideration for CY 2026 rulemaking, but instead was to provide an update on their ongoing research efforts in response to CMS' previous questions about the connection between autoimmune disease and oral health. The submitter referred to their nomination for CY 2025 rulemaking and CMS' respective request for comment

which is discussed in the CY 2025 PFS proposed rule (89 FR 61760 through 61762). The letter emphasized that patients with autoimmune diseases often experience oral and dental complications, which can be exacerbated by immunosuppressive therapies. The submitter stated that they are currently analyzing Medicare claims data and commercial insurance data to demonstrate the positive impact of dental care on patients undergoing immunosuppressive treatment. They explained that they are particularly focused on investigating the relationship between regular preventive dental visits and systemic infection rates for those with Sjogren's disease.

Since CY 2023, we have discussed our commitment to review submissions we receive through the public submissions process. We have also expressed our intention to continue to engage in discussions with the public on a wide spectrum of issues relating to Medicare payment for dental services that may be inextricably linked to other covered services. For CY 2026, we are not making any proposals in response to the submissions that we received and will take the information and recommendations submitted into consideration for the future.

K. Payment for Skin Substitutes

A. Background

The CY 2014 Hospital Outpatient Prospective Payment System (OPPS)/Ambulatory Surgical Center (ASC) final rule with comment period describes skin substitutes as ''. . . a category of products that are most commonly used in outpatient settings for the treatment of diabetic foot ulcers and venous leg ulcers . . .'' (78 FR 74930 through 74931). When a procedure utilizing a skin substitute product is performed, providers bill one or more Healthcare Common Procedure Coding System (HCPCS) codes to describe the preparation of the wound, the use of at least one skin substitute product, and application of the skin substitute product through suturing or various other techniques. Specifically, CPT codes 15271 through 15278 describe the application of skin substitutes to various size wounds and anatomical locations.

Recently, several novel industry practices have come to our attention, likely driving substantial and unusual increases in the number of available skin substitute products, the sales and distribution structure for these products, and the rapidity of products changing manufacturer ownership. These industry changes are causing a significant increase in spending under Medicare Part B for skin substitute products in the non-facility setting. According to Medicare claims data, Part B spending for these products rose from approximately $250 million in 2019 to over $10 billion in 2024, a nearly 40-fold increase, while the number of patients receiving these products only doubled. Increases in payment rates and launch prices for skin substitutes, especially newer products, account for the majority of observed Medicare spending increases on these products. Of note, as part of its workplan, the U.S. Department of Health and Human Services' Office of the Inspector General announced in November 2024 plans to review Medicare Part B claims for skin substitutes to identify payments that were at risk for noncompliance with Medicare requirements with an expected issue date of fiscal year 2026.[73]

We outlined our HCPCS Level II coding and payment policy objectives for skin substitutes in the CY 2023 PFS proposed rule (87 FR 46249) because we concluded it would be beneficial for interested parties to understand our priorities as we work to create a consistent approach for the suite of products we have referred to as skin substitutes. As discussed in the CY 2023 PFS proposed rule, we have a number of objectives related to refining our Medicare policies in this area, including: (1) ensuring a consistent payment approach for skin substitute products across the physician office and hospital outpatient department settings; (2) ensuring that appropriate HCPCS codes describe skin substitute products; (3) employing a uniform benefit category across products within the physician office setting, regardless of whether the product is synthetic or comprised of human- or animal-based material, so we can incorporate payment methodologies that are more consistent; and (4) promoting clarity for interested parties on CMS skin substitutes policies and procedures. Interested parties have requested that CMS address what they have described as inconsistencies in our payment and coding policies, indicating that treating clinically similar products (for example, animal-based and synthetic skin products) differently for purposes of payment is confusing and problematic for healthcare providers and patients. These concerns exist specifically within the non-facility setting; however, interested parties have also indicated that further alignment of our policies across the non-facility and hospital outpatient department settings would reduce confusion.

[73] *https://oig.hhs.gov/reports-and-publications/workplan/summary/wp-summary-0000894.asp.*

On April 25, 2024, the Medicare Administrative Contractors (MACs) released a proposed Local Coverage Determination (LCD) to provide appropriate coverage for skin substitute grafts used for chronic non-healing diabetic foot and venous leg ulcers. The MACs issued the collaborative proposed Skin Substitute Grafts/Cellular and Tissue-Based Products for the Treatment of Diabetic Foot Ulcers and Venous Leg Ulcers LCD to make sure that Medicare covers, and people with Medicare have access to, skin substitute products that are supported by evidence that shows that they are reasonable and necessary for the treatment of diabetic foot and venous leg ulcers in the Medicare population and that coverage aligns with professional guidelines for appropriately managing these wounds. All of the MACs have delayed the effective date of the final local coverage determinations for cellular and tissue-based products for wounds (CTPs, or skin substitutes) in diabetic foot ulcers and venous leg ulcers, moving the implementation date across all MAC jurisdictions to January 1, 2026. For details, please see the final LCD, L36377, titled: Skin Substitute Grafts/Cellular and Tissue-Based Products for the Treatment of Diabetic Foot Ulcers and Venous Leg Ulcers at: *https://www.cms.gov/medicare-coverage-database/view/lcd.aspx?lcdId=36377&ver=19.* We note that additional coverage determinations may apply to skin substitute products.

The Medicare statute, regulations, and manual provisions empower the Medicare program to determine if a product is reasonable and necessary for the treatment of a beneficiary's condition and safe and effective, not experimental or investigational, and appropriate and therefore eligible for coverage under Part B. (*See,* for example, 42 U.S.C. 1395l(e), 1395y(a)(1)(A), 42 CFR 411.15(k)(1), 424.5(a)(6), Medicare Program Integrity Manual § 3.6.2.2, Medicare Benefit Policy Manual ch. 15, §§ 50.4.1–50.4.3, and Medicare Program Integrity Manual, ch. 13 §§ 13.5.3, 13.5.4.) The inclusion of a product in this payment rule does not necessarily imply that a determination has been made by CMS or its contractors that it is reasonable and necessary and meets the other preconditions to Medicare coverage. Similarly, the use of short descriptors and associated FDA regulatory categories[74] may reflect current FDA

[74] The term ''FDA regulatory categories'' is used in this Proposed Rule when referring to the basis for CMS's proposed payment policies but is not intended to reflect or imply that the products

regulation but are not intended to imply that FDA has determined that a product meets any specific FDA statutory or regulatory requirements. FDA's statutory and regulatory framework, including, for example, FDA's findings that a product is ''safe and effective,'' is not controlling of Medicare's determination under its own authorities of whether a product is ''reasonable and necessary'' for an individual patient and meets all preconditions for Medicare coverage and payment. FDA does not make Medicare coverage or payment determinations, nor do FDA statutes and regulations govern Medicare coverage or payment determinations. However, CMS has determined that, when it is setting payment rates on a prospective basis, a different inquiry and set of considerations apply and that it makes sense to consider how FDA regulates products that CMS considers to be skin substitutes.

We continue to believe that our existing payment policies are unsatisfactory, unsustainable over the long term, and rooted in historical practice established two decades ago prior to significant evolutions in medical technology and practice. After hosting a town hall [75] to provide an opportunity for public input, including discussion of potential approaches to the methodology for payment of skin substitute products, as well as reviewing several years of comments in response to CY rulemaking in 2023, 2024, and 2025 on this subject, we have developed a proposal that addresses our stated objectives as well as many of the comments we have received.

B. Medicare Part B Payment for Skin Substitutes

1. Payment for Skin Substitutes When Used During a Covered Application Procedure Under the PFS in the Non-Facility Setting

CMS has historically considered skin substitutes to be biologicals for payment purposes under Medicare Part B. The Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (Pub. L. 108–173) (MMA) established payment methodology for drugs and biologicals under section 1847A of the Act. Under this methodology, a vast majority of drugs and biologicals separately paid under Medicare Part B are paid at the Average Sales Price (ASP) plus six percent. Section 303(c) of the MMA, titled ''Payment reform for covered outpatient drugs and biologicals,'' amended Title XVIII of the Act by adding new section 1847A of the Act. In part, this section established the use of the ASP to determine the payment limit for drugs and biologicals described in section 1842(o)(1)(C) of the Act (that is, drugs or biologicals billed by a physician, supplier, or any other person and not paid on a cost or prospective payment basis) furnished on or after January 1, 2005. Because Medicare is currently paying for most skin substitutes as biologicals using the methodology under section 1847A of the Act, each skin substitute product receives a unique billing code (typically, a Level II HCPCS code) and payment limit.

Section 401 of Division CC, Title IV of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260) (CAA, 2021) amended section 1847A of the Act to add new section 1847A(f)(2) of the Act, which requires certain manufacturers without a Medicaid drug rebate agreement, such as certain manufacturers of skin substitutes, to report ASP data to CMS for calendar quarters beginning on January 1, 2022, for drugs or biologicals payable under Medicare Part B and described in sections 1842(o)(1)(C), (E), or (G) or 1881(b)(14)(B) of the Act, including items, services, supplies, and products that are payable under Part B as a drug or biological. Because most skin substitutes are currently paid as biologicals using the methodology described in section 1847A of the Act, manufacturers of these products are currently required to report their ASP data to CMS every quarter. Prior to this, section 1927(b)(3)(A)(iii)(I) of the Act only required manufacturers with a Medicaid drug rebate agreement to report ASP data to CMS for drugs or biologicals described in section 1842(o)(1)(C) of the Act.

Section 1847A of the Act also includes several relevant definitions. While the definition of ''single-source drug or biological'' provided at section 1847A(c)(6)(D) includes ''a biological,'' sections 1847A(c)(6)(H) and (I) of the Act offer more insight into the meaning of the term for purposes of this section. Subparagraph (I) defines the term ''reference biological product'' as a biological product licensed under section 351 of the PHS Act. Subparagraph (H) defines the term ''biosimilar biological product'' as ''a biological product approved under an abbreviated application for a license of a biological product that relies in part on data or information in an application for another biological product licensed under section 351 of the Public Health Service Act.''

Section 1927 of the Act, which is referred to multiple times in section 1847A of the Act, also references section 351 of the PHS Act when referencing biologicals. The title of section 303 of the MMA, which added section 1847A to the Act, refers to ''covered outpatient drugs,'' defined in section 1927(k)(2) of the Act. Subparagraph (B) adds biological products to this definition when those products are licensed under section 351 of the PHS Act, among other requirements.

In the CY 2022 PFS final rule, to address the need to establish a payment mechanism for synthetic skin substitutes in the physician office setting and to be responsive to feedback received from commenters, we finalized an approach for payment of each synthetic skin substitute for which we had received a HCPCS Level II coding application. We finalized that those products would be payable in the physician office setting and billed separately from the procedure to apply them using HCPCS A-codes (86 FR 65120).

2. Payment for Skin Substitutes Under the Outpatient Prospective Payment System (OPPS)

Prior to CY 2014, all products considered to be skin substitutes were separately paid under the OPPS as if they were biologicals according to the ASP methodology (78 FR 74930 through 74931). In the CY 2014 OPPS/ASC final rule with comment period (78 FR 74938), we unconditionally packaged skin substitute products furnished in the hospital outpatient setting into their associated application procedures as part of a broader policy to package all drugs and biologicals that function as supplies when used in a surgical procedure. As part of the policy to package skin substitutes, we also finalized a methodology that divides the skin substitutes into a high-cost group and a low-cost group, to ensure adequate resource homogeneity among APC assignments for the skin substitute application procedures (78 FR 74933). In the CY 2015 OPPS/ASC final rule with comment period (79 FR 66886), we stated that skin substitutes are best characterized as either surgical supplies or devices because of their required surgical application and because they share significant clinical similarity with other surgical devices and supplies.

discussed within this Proposed Rule are characterized as such or grouped together by FDA.

[75] CMS Skin Substitutes Town Hall, which was held virtually on January 18, 2023. More information regarding the CMS Skin Substitutes Town Hall such as links to recording and transcripts is available at *https://www.cms.gov/medicare/payment/fee-schedules/physician/skin-substitutes#:~:text=The%20CMS%20Skin%20Substitutes%20Town,Physician%20Fee%20Schedule%20(PFS).*

Skin substitutes assigned to the high-cost group are described by CPT codes 15271 through 15278. Skin substitutes assigned to the low-cost group are described by HCPCS codes C5271 through C5278. Claims billed with primary CPT codes 15271, 15273, 15275, or 15277 are used to calculate the geometric mean costs for procedures assigned to the high-cost group, and claims billed with primary HCPCS codes C5271, C5273, C5275, or C5277 are used to calculate the geometric mean costs for procedures assigned to the low-cost group (78 FR 74935). The graft skin substitute administration add-on codes, which include ''each additional 25 sq cm'' in the description (that is, CPT codes 15272, 15274, 15276, and 15278; HCPCS codes C5272, C5274, C5276, and C5278), are packaged into the payment rates for the primary administration codes.

For CY 2025, each of the HCPCS codes described earlier are assigned to one of the following three skin procedure APCs according to the geometric mean cost for the code: APC 5053 (Level 3 Skin Procedures): HCPCS codes C5271, C5275, and C5277; APC 5054 (Level 4 Skin Procedures): HCPCS codes C5273, 15271, 15275, and 15277; or APC 5055 (Level 5 Skin Procedures): HCPCS code 15273. In CY 2025, the payment rate for APC 5053 (Level 3 Skin Procedures) is $612.13, the payment rate for APC 5054 (Level 4 Skin Procedures) is $1,829.23, and the payment rate for APC 5055 (Level 5 Skin Procedures) is $3,660.97. Table 27 lists the APC assignments and CY 2025 payment rates for the HCPCS codes describing the skin substitute application procedures. This information is also available in Addenda A and B of the CY 2025 final OPPS/ASC rule with comment period (the Addenda A and B are available on the CMS website *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/regulations-notices*).

TABLE 27: CY 2025 APC ASSIGNMENTS FOR SKIN SUBSTITUTE APPLICATION HCPCS CODES

APC	APC Title	HCPCS Codes	Final CY 2025 OPPS Payment Rate
APC 5053	Level 3 Skin Procedures	C5271, C5275, C5277	$612.13
APC 5054	Level 4 Skin Procedures	C5273, CPT codes 15271, 15275, 15277	$1,829.23
APC 5055	Level 5 Skin Procedures	CPT code 15273	$3,660.97

Beginning in CY 2016, we adopted a policy where we determine the high-cost/low-cost status for each skin substitute product based on either a product's geometric mean unit cost (MUC) exceeding the geometric MUC threshold or the product's per day cost (PDC), which is calculated as the total units of a skin substitute multiplied by the mean unit cost and divided by the total number of days, exceeding the PDC threshold. We assign each skin substitute that exceeds either the MUC threshold or the PDC threshold to the high-cost group. We assign any skin substitute with a MUC or a PDC that does not exceed either the MUC threshold or the PDC threshold to the low-cost group (87 FR 71976). We also assign skin substitutes with pass-through payment status to the high-cost category.

We assign skin substitutes with some pricing information but without claims data for which to calculate a geometric MUC or PDC to either the high-cost or low-cost category based on the product's ASP plus 6 percent payment rate as compared to the MUC threshold. If ASP is not available, we use the wholesale acquisition cost (WAC) plus 3 percent to assign a product to either the high-cost or low-cost category. Finally, if neither ASP nor WAC is available, we use 95 percent of the average wholesale price (AWP) to assign a skin substitute to either the high-cost or low-cost category.

In the CY 2021 OPPS/ASC final rule with comment period, after the first entirely synthetic skin substitute products were introduced into the market, we revised our description of skin substitutes to include both biological and synthetic products (85 FR 86064 through 86067). Any skin substitute product that is assigned to a code in the HCPCS A2XXX series is assigned to the high-cost skin substitute group, including new products without pricing information. New skin substitutes without pricing information that are not assigned a code in the HCPCS A2XXX series are assigned to the low-cost category until pricing information is available to compare to the MUC and PDC thresholds (89 FR 94247).

In the CY 2014 OPPS/ASC final rule, we also noted that several skin substitute products are applied as either liquids or powders per milliliter or per milligram and are employed in procedures outside of CPT codes 15271 through 15278. We stated that these products ''. . . will be packaged into the surgical procedure in which they are used.'' (78 FR 74930 through 74931).

We also clarified that our definition of skin substitutes does not include bandages or standard dressings, and that, under the OPPS, these items cannot be assigned to either the high-cost or low-cost skin substitute groups or be reported with either CPT codes 15271 through 15278 or HCPCS codes C5271 through C5278 (85 FR 86066).

C. Current FDA Regulation of Products CMS Considers To Be Skin Substitutes

The FDA regulates products that CMS considers to be skin substitutes based on a variety of factors, including product composition, mode of action, and intended use. Relevant categories of FDA regulation for skin substitute products include the following:

1. Self-determination Under Section 361 of the PHS Act and the Regulations in 21 CFR 1271 (361 HCT/Ps)

Human Cells, Tissues, and Cellular and Tissue-Based Products (HCT/Ps) are defined in 21 CFR 1271.3(d) as articles containing or consisting of human cells or tissues that are intended for implantation, transplantation, infusion, or transfer into a human recipient. Examples include bone, ligament, skin, dura mater, heart valve, cornea, hematopoietic stem/progenitor cells derived from peripheral and cord blood, manipulated autologous chondrocytes, epithelial cells on a synthetic matrix, and semen or other reproductive tissue. Pursuant to section 361 of the Public Health Service (PHS) Act, FDA promulgated regulations at 21 CFR

1271, *et seq* that create an electronic registration and listing system for establishments that manufacture HCT/Ps, regulate donor eligibility, and establish current good tissue practice and other procedures to prevent the introduction, transmission, and spread of communicable diseases by HCT/Ps.

A subset of HCT/Ps are those that are regulated solely under section 361 of the PHS Act and the regulations in 21 CFR 1271 (361 HCT/Ps). The FDA has taken a risk-based, tiered approach in regulating HCT/Ps; as the potential risk posed by a product increases, so too does the level of oversight (63 FR 26745). Although FDA is authorized to apply the requirements in the Federal Food, Drug, and Cosmetic Act (FD&C Act) and/or the PHS Act to those products that meet the definition of drug, biological product, or device, under a tiered, risk-based approach, HCT/Ps that meet specific criteria or fall within detailed exceptions do not require premarket review and approval. HCT/Ps that do not meet all the criteria in 21 CFR 1271.10(a) are not regulated solely under section 361 of the PHS Act and the regulations in 21 CFR part 1271. Unless an exception in 21 CFR 1271.15 applies, such products are regulated as drugs, devices, and/or biological products under the FD&C Act and/or the PHS Act and are subject to additional regulation, including applicable premarket review. An HCT/P is regulated solely under section 361 of the PHS Act and 21 CFR part 1271 if it meets all of the following criteria (21 CFR 1271.10(a)):

- The HCT/P is minimally manipulated.
- The HCT/P is intended for homologous use only, as reflected by the labeling, advertising, or other indications of the manufacturer's objective intent.
- The manufacture of the HCT/P does not involve the combination of the cells or tissues with another article, except for water, crystalloids, or a sterilizing, preserving, or storage agent, provided that the addition of water, crystalloids, or the sterilizing, preserving, or storage agent does not raise new clinical safety concerns with respect to the HCT/P.
- Either:

++ The HCT/P does not have a systemic effect and is not dependent upon the metabolic activity of living cells for its primary function; or

++ The HCT/P has a systemic effect or is dependent upon the metabolic activity of living cells for its primary function; and

--- Is for autologous use;

--- Is for allogeneic use in a first-degree or second-degree blood relative; or

--- Is for reproductive use.

Establishments that manufacture 361 HCT/Ps, as defined by 21 CFR 1271.3(e), must register and list their 361 HCT/Ps in the FDA's electronic Human Cell and Tissue Establishment Registration System (eHCTERS), but premarket review and approval by FDA is not needed. However, FDA acceptance of an establishment registration and 361 HCT/P listing form does not constitute a determination that an establishment is compliant with applicable FDA rules and regulations, that the FDA has agreed with the manufacturer's self-determination as a 361 HCT/P, or that the HCT/P is licensed or approved by FDA (21 CFR 1271.27(b)). When this proposed rule refers to 361 HCT/Ps, it generally refers to products where an establishment has self-determined that their product is a 361 HCT/P.[76] If an HCT/P does not meet the criteria set out in 21 CFR 1271.10(a), and the establishment that manufactures the HCT/P does not qualify for any of the exceptions in 21 CFR 1271.15, the HCT/P will be regulated as a drug, device, and/or biological product under the FD&C Act, and/or section 351 of the PHS Act (42 U.S.C. 262), and applicable regulations, including 21 CFR part 1271, and premarket review generally is required.

2. 510(k) Premarket Notification Submissions, Premarket Approval Applications, and De Novo Requests

''Devices,'' as defined under 21 U.S.C. 321(h)(1), do not achieve their primary intended purposes through chemical action and are not dependent upon being metabolized for the achievement of their primary intended purposes. Devices may be subject to premarket review through: (1) a 510(k) premarket notification submission (510(k)) in accordance with section 510(k) of the FD&C Act and implementing regulations in subpart E of 21 CFR part 807; (2) a premarket approval application (PMA) under section 515 of the FD&C Act and regulations in 21 CFR part 814; or, potentially, (3) a De Novo classification request (De Novo request) under section 513(f)(2) of the FD&C Act and regulations in subpart D of 21 CFR part 860. A 510(k) is a premarket submission made to the FDA to demonstrate that the device to be marketed is substantially equivalent to a legally marketed device that is not subject to premarket approval (sections 510(k) and 513(i) of the FD&C Act). Premarket approval is the most rigorous type of review and generally is required for class III medical devices. Class III devices are those devices for which insufficient information exists to determine that general controls and special controls would provide a reasonable assurance of safety and effectiveness and are purported or represented to be for a use in supporting or sustaining human life or for a use which is of substantial importance in preventing impairment of human health, or present potential unreasonable risk of illness or injury (section 513(a)(1)(C) of the FD&C Act). De Novo classification is a marketing pathway for novel medical devices for which general controls alone (class I), or general and special controls (class II), provide reasonable assurance of safety and effectiveness, but for which there is no legally marketed predicate device. Devices that are classified into class I or class II through a De Novo request may be marketed and used as predicates for future premarket notification (that is, 510(k)) submissions, when applicable.

3. Biologics License Application

To lawfully introduce or deliver for introduction into interstate commerce a drug that is a biological product, a valid biologics license application (BLA) must be in effect under section 351(a)(1) of the PHS Act, 42 U.S.C. 262(a)(1), unless exempted under 42 U.S.C. 262(a)(3). Such licenses are issued only after showing that the product is safe, pure, and potent. Approval of a biologics license application or issuance of a biologics license shall constitute a determination that the establishment(s) and the product meet applicable requirements to ensure the continued safety, purity, and potency of such products (21 CFR 601.2(d)). Potency has long been interpreted to include effectiveness (21 CFR 600.3(s)).

The definition of the term ''biological product'' in section 351(i) of the PHS Act is: ''a virus, therapeutic serum, toxin, antitoxin, vaccine, blood, blood component or derivative, allergenic product, protein, or analogous product . . . applicable to the prevention, treatment, or cure of a disease or condition of human beings.'' (42 U.S.C. 262(i)). In contrast to the registration and listing requirements for a 361 HCT/P or the substantial equivalence requirements for 510(k)s, products licensed under section 351 of the PHS Act are required to meet stringent pre- and post-market requirements to ensure the products' safety and efficacy when

[76] We note that establishments may seek feedback from FDA regarding their self-determination analysis and conclusion that a particular product is a 361 HCT/P. See, For example., *https://www.fda.gov/vaccines-blood-biologics/tissue-tissue-products/tissue-reference-group*.

marketed. Table 2 lists several other notable differences between the relevant FDA regulatory categories for products CMS considers to be skin substitutes.

TABLE 28: COMPARISON OF FDA CLASSIFICATIONS

Classification	Review Goal Within	FY2025 Standard Application Fee
361 HCT/P	N/A[77] (registration required)	N/A
510(k)[78]	90 Days	$24,335
PMA	180 or 320 days[79]	$540,783
BLA (original application for products requiring clinical data)	10 months[80]	$4,310,002[81]

D. Proposed Payment of Skin Substitute Products Under the PFS and OPPS

1. Separate Payment for Skin Substitute Products as Incident-To Supplies

We have carefully considered our policy objectives, which include: (1) ensuring a consistent payment approach for skin substitute products across the physician office and hospital outpatient department settings; (2) ensuring that appropriate HCPCS codes describe skin substitute products; (3) employing a uniform approach across products within the physician office setting, regardless of whether the product is synthetic or comprised of human- or animal-based material; and (4) providing clarity for interested parties on CMS skin substitutes policies and procedures. We propose, starting January 1, 2026, to separately pay for the provision of certain groups of skin substitute products as incident-to supplies when, for those products that are coverable under Medicare's rules, they are used during a covered application procedure paid under the PFS in the non-facility setting or under the OPPS. This proposal does not apply to biological products licensed under section 351 of the PHS Act, which will continue to be paid as biologicals under the ASP methodology in section 1847A of the Act. While we considered proposing to pay separately for skin substitutes initially under just the PFS in non-facility settings consistent with current practice, one of our primary policy objectives is to ensure a consistent payment approach for skin substitute products across the physician office and hospital outpatient department settings; and so, we ultimately determined that the suite of products referred to as skin substitutes should be treated in a uniform manner across different outpatient care settings, to the extent permitted by applicable law. The physician, in consultation with his or her patient, decides the site of service for treatment. While many factors are considered as a part of that decision, substantial differences in payment for the application of the same skin substitute product in one site of service versus another, or between similar skin substitute products, should not be one of them. Establishing a consistent framework for how these products are treated within the non-facility and hospital outpatient settings would empower providers to make the best treatment decisions for their patients, ensure equitable access to needed services, and pay appropriately for these services. We also considered bundling payment for skin substitute products in both the PFS and OPPS as part of this proposal. While supplies are generally bundled into the payment of the service in both the physician office and hospital outpatient departments, for many years skin substitute products have been paid separately in the physician office setting, where the majority of these products are currently applied. So, we have determined that bundling payment for skin substitute products with their administration procedures across both settings under this new proposal, before efforts are made to address improper utilization patterns, would be premature. Depending on whether our proposal is finalized, and the outcomes of a final policy, we may consider packaging skin substitute products with the related application procedures in both the hospital outpatient setting and non-facility setting in future rulemaking. We seek comments on our proposal to separately pay for the provision of certain groups of skin substitute products as well as on our proposal to implement this policy in both the non-facility and hospital outpatient settings. For additional details on the OPPS proposal for skin substitutes, please see the CY 2026 OPPS/ASC proposed rule with comment period; the remainder of this policy proposal will focus on implementation under the PFS.

We propose, under the PFS, to pay separately for the use of specific skin substitute products (that is, skin substitute products that are not regulated as biological products under section 351 of the PHS Act) that are eligible for Medicare coverage during a covered application procedure in the non-facility setting as incident-to supplies in accordance with section 1861(s)(2)(A) of the Act. Supplies are a large category of items that typically are either for single use or have a shorter use life span than equipment. Supplies can be anything that is not equipment and include not only minor, inexpensive, or commodity-type items but also include a wide range of products used in outpatient settings, including certain implantable medical devices. ''Incident-to supplies'' refers to supplies that are furnished as an integral, although incidental, part of the physician's professional services in the course of diagnosis or treatment of an injury or illness (42 CFR 410.26). Because a skin substitute must be used to perform any of the procedures described by a CPT code in the range 15271 through 15278, and the procedure of treating the wound and applying a covering to the wound is the independent service, skin substitute products serve as a necessary supply for these surgical repair procedures. We seek comments on our proposal to separately pay for provision of skin substitutes as incident-to supplies under the PFS in the non-facility setting.

Skin substitutes have historically been paid separately in the non-facility setting as biologicals instead of supplies when used during a covered application procedure. Products CMS considers to be skin substitutes may also meet FDA's

[77] No premarket authorization is required for 361 HCT/Ps.

[78] *https://www.fda.gov/industry/fda-user-fee-programs/medical-device-user-fee-amendments-mdufa.*

[79] These numbers include either a review within 180 days for decisions without advisory committee input or a review within 320 days for decisions with advisory committee input, respectively.

[80] PDUFA performance goals call for FDA to review and act on 90 percent of original BLA submissions within 10 months of the 60-day filing date. Other regulatory pathways may have different timelines. See *https://www.fda.gov/patients/learn-about-drug-and-device-approvals/fast-track-breakthrough-therapy-accelerated-approval-priority-review; https://www.fda.gov/drugs/development-approval-process-drugs.*

[81] *https://www.fda.gov/industry/fda-user-fee-programs/prescription-drug-user-fee-amendments.*

definition of a biological product, either directly or as an analogous product. However, section 1847A of the Act, which includes the controlling provisions for setting Medicare payment for drugs and biologicals billed by a physician, generally refers to biologicals in ways that do not encompass most skin substitutes. While most skin substitutes are either medical devices regulated under the FD&C Act or products regulated solely under section 361 of the PHS Act, subparagraphs (H) and (I) of section 1847A(c)(6) of the Act only refer to biologicals licensed under section 351 of the PHS Act. Section 1847A of the Act also references section 1927 of the Act, which again refers to section 351 of the PHS Act when referencing biologicals. In addition, to operationalize the payment system, section 1847A of the Act includes extensive references to National Drug Codes, a type of drug identifier published by the FDA and generally not assigned to skin substitutes, which further supports our proposal to stop utilizing 1847A payment methodologies for skin substitutes that are not licensed under section 351 of the PHS Act. For example, section 1847A(b)(4)(A) of the Act directs use of the lesser of the average sales price or wholesale acquisition cost when determining the payment amount for a single-source drug or biological for all National Drug Codes assigned to the drug or biological. The methodology for calculating both the average sales price and the wholesale acquisition cost is described in paragraph (6) of section 1847A(b) of the Act, which describes a process that again specifies the use of National Drug Codes. Because skin substitutes generally do not have National Drug Codes, CMS has operationalized this process for skin substitutes by allowing manufacturers of skin substitutes to self-select an Alternate ID to distinguish between different skin substitute products.[82] However, the use of an alternative identification method is not required by the statute, and the calculation of a payment rate for these products is otherwise not possible.

We note that section 351 and section 361 of the PHS Act are two distinct regulatory frameworks. Section 351 biological products must seek FDA pre-marketing approval (using clinical studies that are required by the applicable section 351 regulations) and are applicable to the prevention, treatment, or cure of a disease or condition. In contrast to the prerequisites for marketing products that fall under section 351 of the PHS Act , no FDA approval or clearance is required for marketing the self-determined 361 HCT/Ps. Section 361 products also do not receive an FDA license of approval for a specific prevention, treatment, or cure of a disease or condition and do not require controlled clinical trials to demonstrate effectiveness. Rather the self-determined 361 HCT/Ps are limited to intended uses that reflect homologous use for that particular product.

In light of our careful review of the applicable statutory provisions governing skin substitute products paid under the ASP methodology under 1847A of the Act, the different FDA regulatory frameworks used for these products, and the skyrocketing increase in Medicare spending for such products, we are proposing to pay separately for specific skin substitute products (other than products licensed under section 351 of the PHS Act, which will continue to be paid as biologicals under the ASP methodology in section 1847A of the Act) that are eligible for Medicare coverage during a covered application procedure in the non-facility setting as incident-to supplies in accordance with section 1861(s)(2)(A) of the Act.

One purpose of the new proposed policy is to limit some of the current profiteering practices occurring in this industry. For example, as reflected in CMS's ASP pricing files, we have observed a dramatic increase in launch prices. It is unclear how these prices could be attached to realistic changes in resource costs as many of these new products are minimally manipulated tissues. Our proposed policy is likely to disincentivize this practice, as well as several other novel industry practices that have come to our attention by preventing exploitation of skin substitute pricing under section 1847A of the Act, overuse of expensive skin substitute products, and waste resulting from use of more-expensive skin substitute products over clinically-appropriate, less-expensive alternatives. Notably, there has not been significant growth in payments for skin substitutes in the OPPS, which unconditionally packages the payment for skin substitute products with their associated application procedures. We note that the relevant statutory provisions, when considered together, do not require all of these kinds of products to be paid as biologicals under section 1847A of the Act. Therefore, under this proposed policy, unless a skin substitute is approved as a drug or as a biological product under section 351 of the PHS Act, in which case we would continue to pay for it consistent with section 1847A of the Act, we would consider it an incident-to supply for payment purposes under the PFS with the definitions and rates described below. For Medicare purposes, we propose to codify the definition of ''biological'' as ''a product licensed under section 351 of the Public Health Service Act'' at §§ 414.802 and 414.902. We seek comments on our proposal to limit application of section 1847A of the Act to skin substitutes that are approved as a drug or as a biological product under section 351 of the PHS Act and our proposed edits to the regulations.

2. Payment Categories Based on FDA Regulatory Category

Paying separately for skin substitutes in the non-facility setting has led to dramatic price increases for these products, as noted above. Grouping similar products or services into a single billing code and using a single payment amount for them, as we do with many services under the OPPS, some services under the PFS, and all multiple-source drugs under section 1847A of the Act, incentivizes hospitals and prescribers to make the most cost-efficient, clinically effective treatment decision. However, we recognize that grouping dissimilar products and/or services to set payment rates can limit beneficiaries' access to appropriate care, especially when some groups encompass products and services with significant clinical and resource variability. In the case of skin substitutes, no single product among the wide range of products stands out as typical; so we have reviewed several methods to group or classify skin substitutes to determine which best reflects clinical and resource similarities between these products.

To reflect relevant product characteristics, we propose to group skin substitutes that are not drugs or biologicals (that is, biological products licensed under section 351 of the PHS Act) using three CMS payment categories based on FDA regulatory categories (PMAs, 510(k)s, and 361 HCT/Ps) to set payment rates. We have previously noted in rulemaking that CMS has no obligation to categorize products based on the FDA's current regulatory framework (74 FR 60476); but, in this case, we have determined that the FDA regulatory categories provide an appropriate level of distinction for a heterogeneous category of products that exhibit clinical and resource variability that can ultimately improve the accuracy of the relative value units under the PFS. Proposing a payment policy that aligns with FDA's current regulatory framework also

[82] *https://www.cms.gov/files/document/frequently-asked-questions-faqs-asp-data-collection.pdf.*

provides for predictability and efficiency for purposes of Medicare payment. Payment for new products, as discussed below, could be achieved quickly and consistently by CMS's capacity to immediately recognize the FDA regulatory categories.

a. 361 HCT/Ps

As described previously, 361 HCT/Ps are a subset of HCT/Ps that are regulated solely under section 361 of the PHS Act and the regulations in 21 CFR 1271 and listed in the FDA's eHCTERS. Currently, registered 361 HCT/Ps generally are dressings intended only to cover and protect a wound. They are not intended to act on the wound to mediate, facilitate, or accelerate wound healing. Their activity is typically limited to that of a physical covering or wrap. A structural tissue intended for wound care is generally limited to the homologous use of cover and protect in order to be a 361 HCT/P.[83] Intended uses such as wound treatment, promotion or acceleration of wound healing, or serving as a skin substitute would generally be non-homologous uses of structural tissues. Instead, products for such intended uses (for example, the treatment of wounds) generally are subject to PMA or BLA requirements.

b. Devices Requiring 510(k) Clearance

A 510(k) is a premarket submission made to the FDA generally by the manufacturer of a device to demonstrate that the device to be marketed is substantially equivalent to a legally marketed device that is not subject to premarket approval. (FD&C Act sections 510(k), 513(i)). Currently, 510(k)-cleared devices that we are considering for purposes of this proposal generally are dressings intended only to cover and protect a wound, to absorb exudate, and to maintain appropriate moisture balance within the wound. They are not intended to act on the wound to mediate, facilitate, or accelerate wound healing. Their activity is typically limited to that of a physical covering or wrap. When intended only to cover and protect a wound, to absorb exudate, and to maintain appropriate moisture balance within the wound and otherwise meeting the device definition, generally the FDA's Center for Devices and Radiological Health (CDRH) regulates wound dressings composed of natural biomaterials, including animal and human derived tissue as devices, and they are currently subject to 510(k) requirements. At this time, wound dressings have not been 510(k) cleared by FDA for indications such as wound treatment, promotion or acceleration of wound healing, or serving as a skin substitute.[84] Instead, products for such intended uses generally are subject to PMA or BLA requirements.

For the purposes of this policy, we propose to group any skin substitutes authorized through the De Novo pathway with those cleared under 510(k)s. De Novo classification is a marketing pathway for medical devices for which general controls alone (class I), or general and special controls (class II), provide reasonable assurance of safety and effectiveness. While products authorized through the De Novo pathway have no legally marketed predicate device, devices that are classified into class I or class II through a De Novo authorization may be marketed and used as predicates for future premarket notification (that is, 510(k)) submissions, when applicable. Because of this, we would expect skin substitutes authorized through the De Novo pathway and those cleared under 510(k)s to be similar for purposes of this proposal.

c. Products Subject to PMAs

Premarket approval is the most rigorous type of review and generally is required for class III medical devices. Similar to BLA-approved wound care products, PMA-approved wound care products generally are intended to go beyond a simple wound cover to provide some type of direct treatment effect. The FDA has not defined the term ''skin substitute.'' However, the term has been used as a descriptor for certain wound care constructs that are currently approved under a BLA or PMA for treatment of burns or skin ulcers, including ulcers that appear to have failed to heal after standard of care. The intended uses of these products may include scaffold claims, reference to matrix attributes that promote endogenous cell binding, migration, differentiation, or proliferation, and/or activities mediated by matrix-associated regulatory factors that facilitate wound healing. Currently, wound care products intended to interact with the wound to facilitate, promote, or accelerate wound healing generally require approval of a BLA or, in some instances, a PMA. Approval of these products requires demonstration of safety and efficacy for the intended use, which generally requires the performance of clinical studies. So PMA-approved devices can be readily distinguished from 510(k)-cleared devices and 361 HCT/P products, which are intended mainly to cover and protect the wound. They are clinically different, provide different benefits, and would theoretically be used for patients presenting with different clinical scenarios. As discussed, PMA-approved devices also go through a much more rigorous review process before marketing as compared to the substantial equivalence requirements for 510(k)s and lack of premarket review for registered 361 HCT/Ps. This more rigorous review for PMAs, as well as differences in clinical utility, and the associated costs to manufacturers, suggests that the resources involved in furnishing these products could be distinct from 361 HCT/Ps and 510(k)s. We seek comment on our proposal to group skin substitutes into three FDA categories, PMA, 510(k), and 361 HCT/P, to set payment rates.

d. Innovative Products

We note that recognizing innovation for supplies through payment policy is complex. It may be difficult to differentiate a truly innovative product from another that offers no true clinical advance. We seek comments on how to properly recognize innovative products through payment policy under the PFS as we continue to assess how best to identify and value innovative products under the PFS. For example, we seek comments on whether skin substitutes with active pass-through payment status under the OPPS and/or those receiving new technology add-on payments (NTAP) under the IPPS should be paid separately from their FDA category under the PFS. We seek comments on whether these products should meet a substantial clinical improvement standard or whether, consistent with current pass-through policy, a device that has received marketing authorization for an indication covered by FDA's Breakthrough Devices Program would generally represent clinically-relevant innovation sufficient to qualify for a product-specific payment rate. Finally, we seek comments on using either a product's ASP or invoice pricing, similar to how devices with pass-through status are paid in ambulatory surgical centers, or adding a set percentage, similar to the NTAP add-on, to the applicable FDA category's base rate to set payment limits during the period of time that the product is covered by the pass-through and/or NTAP programs.

[83] See *Regulatory Considerations for HCT/Ps: Minimal Manipulation and Homologous Use, July 2020 (pg. 19).*

[84] FDA Executive Summary Prepared for the October 26 & 27, 2022 Meeting of the General and Plastic Surgery Devices Panel of the Medical Devices Advisory Panel Classification of Wound Dressings with Animal-derived Materials (Section 3). Available at download

3. Alternative Payment Categories

As a conceptually possible alternative to our proposal to group skin substitutes based on FDA regulatory categories for purposes of payment, we considered aligning these products based on their composition, for example, whether they are non-synthetic or synthetic. Two examples provided by interested parties include grouping the products as allografts (for example, amniotic products, cellular products), xenografts (for example, collagen products derived from animals), synthetics (for example, artificial products made from various biomaterials) and grouping the products as human living/cryopreserved tissue, dehydrated human/amniotic tissue, animal xenografts, and synthetics/polymers. However, as noted previously, skin substitutes are a heterogenous group with an increasing intersection between tissue, bioengineered, and synthetic components. With many products now including both non-synthetic and synthetic components, clear categorization of skin substitutes by composition is no longer feasible. This makes this alternative extremely complex to implement because it would be necessary to determine which category would be most appropriate for each individual product based on the components of its composition and an assessment of the importance of each. In addition, it is unclear if grouping products based solely on their composition would provide accurate differentiation with respect to resource or clinical similarity for the purposes of setting an appropriate payment rate.

Other alternatives we considered include grouping all products together to set a single payment rate or creating two or more categories reflecting product cost, similar to the grouping used currently to set payment rates for skin substitutes in hospital outpatient departments. While these options may offer certain operational advantages for their simplicity, neither recognizes the clinical differences among skin substitutes as reflected by their different intended uses. Paying for similar items and services at a comparable rate is a foundational aspect of our payment systems, but hospital outpatient departments and physicians and other practitioners paid under the PFS would instead have a financial incentive to use the least expensive skin substitute or the product offering the greatest discount, which could negatively affect patient outcomes and disincentivize innovation in this space if clinical differences are not recognized and differential payments rates are not set. In addition, dividing products by cost relies on pricing set by manufacturers. Especially in light of the dramatic growth of skin substitutes' ASP-based payment limits, this method is unlikely to accurately reflect skin substitute resource costs or clinical similarity.

We seek comments on whether adding certain subcategories to the three proposed FDA categories would improve clinical or resource similarity. One potential example is creating certain subcategories for payment based on one or more FDA device product codes, which is a categorization process that FDA uses to group similar products together. Other examples that have come to our attention include setting unique payment rates for 361 HCT/Ps based on the number of tissue layers (for example, one layer, two layers, and three or more tissue layers) or entirely synthetic products versus non-synthetic products for 510(k)s. If significant clinical or resource differences were identified between products in one or more of these categories, CMS could create a separate payment grouping for these products for payment purposes.

We also seek comments on whether products that are not in sheet form are appropriately considered skin substitutes for the purposes of providing separate payment under this policy. Examples include gel, powder, ointment, foam, liquid, or injected products listed in the nontraditional units of cc, mL, mg, and cm^3. We request feedback on whether these products could be appropriately used as part of the CPT administration codes in the range 15271 through 15278, despite existing CPT coding guidelines limiting their use, and how these units could be paid using the FDA regulatory category groups. For example, assuming these products were appropriate to administer using the noted CPT administration codes or other administration codes, CMS could include products listed in units of cc, mL, or cm^3 in the applicable FDA categories and equate a single cm^2 unit to each cc, mL, or cm^3 for payment purposes. We seek comments on whether other administration codes could be used to appropriately describe services performed using products with units other than cm^2.

4. Establishing RVUs and Initial Payment Rates

Section 1848(c)(2)(N) of the Act provides authority to establish or adjust practice expense RVUs using cost, charge, or other data from suppliers or providers of services, including information collected or obtained under section 1848(c)(2)(M) of the Act. Section 1848(c)(2)(M) of the Act authorizes the Secretary to collect or obtain information on the resources directly or indirectly related to furnishing services for which payment is made under the PFS fee schedule, and such information may be collected or obtained from any eligible professional or any other source. In addition, it allows the Secretary, as he determines appropriate, to use such information in the determination of RVUs. We are relying on these authorities to propose to establish practice expense RVUs and initial payment rates for skin substitute products in each of the three FDA regulatory categories discussed above based on the volume-weighted average ASP, with no additional markup, as submitted by manufacturers, when available. We have developed initial payment rates for each group based on the weighted, per-unit average of ASPs for the fourth quarter of calendar year 2024. These initial payment rates are listed in the file titled ''Skin Substitute Products by FDA Regulatory Category'' on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.* When ASP was not available, we used the MUC, which we currently use to determine the high-cost/low-cost status for each skin substitute product in the hospital outpatient setting, to calculate the proposed initial rates. While use of hospital cost data departs from the hierarchy of data sources contained in section 1847A of the Act to calculate prices for drugs and biologicals, we note that section 1848(c)(2)(N) of the Act provides authority for us to use this data to establish or adjust practice expense RVUs. In addition, as proposed, skin substitutes in the three FDA regulatory categories would no longer be considered biologicals for the purposes of payment under section 1847A of the Act. We considered using only the MUC data to calculate payment rates for these products. However, when ASP is reported, it may serve as a better estimate of cost across both settings as the ASP reflects sales to physicians as well as hospitals. We seek comments on our proposal to establish PE RVUs and initial payment rates for skin substitute products in each of the three FDA regulatory categories using ASP, or MUC when ASP is not available, using per-unit averaged pricing data from the fourth quarter of 2024. We also seek comments on whether these calculations, if finalized, should be updated with the most recently

available data at the time the final rule is drafted.

As we are proposing to implement this policy for CY 2026 in a site-neutral manner across both the non-facility setting under the PFS and hospital outpatient setting under the OPPS, we are including all products used in either setting to calculate the rates. However, when product-specific utilization across both settings is used to calculate volume-weighted average payments, the result is an apparent rank order anomaly; despite having a more rigorous regulatory review process and receiving indications to treat and heal wounds, the PMA category has the lowest average payment. We are concerned that use of the novel pricing practices noted above has resulted in a decoupling of actual resource costs from the ASP. To address this, as a short-term measure, we propose to weight the product-specific utilization in calculating the proposed rates using the proportions from only the hospital OPPS data and establish for CY 2026 a single payment rate that would apply to all skin substitute products in the three FDA regulatory categories. We believe the OPPS utilization data may better predict utilization patterns under our proposed policies for non-facility settings because, similar to our proposals, these products are already grouped together for payment purposes under the OPPS. By grouping skin substitutes into high- and low-cost groups in the OPPS, hospitals are incentivized to choose either the lowest-cost, clinically appropriate product in the low-cost group or the lowest-cost, clinically appropriate product in the high-cost group. No similar incentive currently exists in the non-facility setting for physicians and other suppliers billing under the PFS. As the proposed policies are intended to mitigate the problematic incentives associated with current patterns of use in the non-facility setting by establishing payment rates for the products in groups instead of individually, we do not believe it would reflect the expected resource costs involved in providing care if we were to base the initial rates on utilization data from the non-facility setting that may be skewed by incentives that would no longer exist under our proposals. For these reasons, we are proposing to initially use hospital outpatient utilization to weight how much each product's price contributes to the proposed payment rates for skin substitutes cleared through the 510(k) pathway, self-determined to be 361 HCT/Ps, or approved under a PMA. We seek comments on the use of the hospital outpatient product utilization patterns to set payment rates for these products under the PFS. We are also proposing for CY 2026 to establish the same initial rate for each group of skin substitutes, including 510(k)-cleared products, registered 361 HCT/Ps, and approved PMAs. To ensure we are not underestimating the resources involved in using these products in furnishing care, we are proposing to use the highest of the calculated volume-weighted average payment amounts for 510(k)s, 361 HCT/Ps, and PMAs to set initial payment valuations. As the 361 HCT/Ps have the highest volume-weighted average payment amount, this average payment rate is reflected in the proposed initial payment rate below. However, we note that, in future notice and comment rulemaking, we intend to propose using claims data to set payment rates for products in these three categories, which would likely result in payment valuations that diverge based on the updated data. Another alternative is to set the payment rate for products in these categories at the volume-weighted average for all three categories, resulting in a lower initial payment rate for all three groups of products. We seek comment on our proposal to use the 361 HCT/P volume-weighted average payment amount to set the initial payment rates for products in all three categories as well as the alternative of using a pooled average of the three categories to set the initial payment rates.

Alternatively, while the ASP pricing files show that skin substitutes across all three of the FDA regulatory categories have increased in cost substantially since 2019, unlike the self-determined 361 HCT/Ps and 510(k)-cleared devices, there has not been a substantial increase in the number of skin substitutes with approved PMAs. Consequently, it is possible that the non-facility utilization of the skin substitutes with approved PMAs is not as distorted as the utilization of the other kinds of skin substitutes. Setting a separate payment rate for this category using combined product utilization patterns (from both OPPS and non-facility settings), would result in a higher initial payment rate for the PMA category. This would rationally order the FDA regulatory categories, based on clinical considerations and some indicators of resource cost, until pricing data removed from these aberrant financial incentives can be incorporated. We seek comments on this alternative policy option.

Under the PFS, payment rates are determined based on work RVUs, PE RVUs, and MP RVUs multiplied by their respective GPCI adjusters and then converted into dollars through multiplication by the conversion factor. For skin substitutes that would be valued and paid as incident-to supplies under our proposal, the practitioner work associated with the application of the skin substitute is already accounted for in the valuation of the application codes themselves (CPT codes 15271–15278), so we are not proposing work RVUs for the codes that describe the products involved in furnishing the application service. Rather than using the established PE methodology to derive PE RVUs from work, direct PE inputs, and the PE/HR data (as described in section II.E of this proposed rule), we are instead proposing to use our authority under sections 1848(c)(2)(M) and (N) of the Act to establish PE RVUs for these supplies using rates calculated from a combination of OPPS cost data and ASP data weighted by OPPS volume. For the specific PE RVUs, please see Addendum B of this proposed rule available on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.* For malpractice RVUs, we generally believe that the malpractice resources are already reflected in the MP RVUs associated with the application codes, but because the standard PFS methodologies assign a minimum of .01 MP RVUs to all codes except add-on codes (75 FR 73276.), we are proposing an MP RVU of 0.01 for these supplies consistent with the rounding convention We also seek comments on whether we should consider treating the codes describing skin substitute products as add-on codes to the current CPT application codes. This would more clearly indicate that the only skin substitute products to be paid for and treated as supplies by Medicare are those used in conjunction with the already existing CPT administration codes. If we were to treat these codes as add-on codes to the application codes, we would effectuate this by assigning a global indicator of ZZZ to the skin substitute codes under the PFS. If we were to finalize these codes as add-on codes, we would assign 0 MP RVUs to them, consistent with existing policy regarding add-on codes.

The proposed PE and MP RVUs would result in an initial payment rate of approximately $125.38/cm^2 for skin substitute products in all three FDA regulatory categories (including PMA-

approved devices, 361 HCT/Ps, and 510(k) cleared devices) prior to the application of the geographic adjustments. Again, the proposed PE and MP RVUs are available in Addendum B of this proposed rule. We seek comments on these proposed initial values.

We determined these proposed values using product pricing and volume for skin substitutes from paid claims with dates of service in the fourth quarter of 2024 because it is the most recent, substantially complete quarter of data. For professional claims, we excluded claims without a positive line-level allowed amount, so that we did not inadvertently include volume without presumed costs in the calculation. In addition, in reviewing the ASP pricing files from the first quarter of 2017 through the first quarter of 2025, the most complete ASP reporting is in the fourth quarter of each year. To determine the payment rates, we first used a product's ASP if it was available. If the ASP rate was missing, we used the 2024 MUC for the HCPCS code. We then calculated a single rate for each FDA category by taking the volume-weighted average of the rates for the applicable codes using the hospital outpatient utilization to weight each category. We note that if rather than using the final quarter of CY 2024, we alternatively, were to use pricing and volume from all four quarters of 2024 to determine proposed rates, the rate for all categories would be approximately $114.87/cm^2. Using a pooled payment rate across all three categories would result in a rate of approximately $65.85/cm^2, while splitting the categories to pay the PMA category using the combined product utilization patterns and the 510(k) and 361 HCT/P categories using the OPPS utilization patterns would result in rates of approximately $259.47/cm^2 and $125.38/cm^2 respectively. We seek comments on our proposed process to calculate initial payment rates as well as these alternatives.

We propose to maintain the current structure of HCPCS codes for skin substitutes, including a process to introduce new product-specific codes and propose initial valuation based on the typical resource costs (that is, those reflected in ASP and MUC data) of the groups associated with each skin substitute's HCPCS code. For a complete list of codes and FDA categories, please see file titled ''Skin Substitute Products by FDA Regulatory Category'' available on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.* Individual HCPCS coding remains necessary to provide identification on claims and track each product's cost. This will also allow effectuation of any applicable coverage policies and improve our ability to determine if any refinements in payment categories would be appropriate in future rulemaking. For the most part, the resources for incident-to supplies are included in the total RVUs of a procedural code or are packaged under the OPPS. However, this proposed approach is not entirely novel, since Medicare pays for various components of services through the use of separate HCPCS codes and/or payment modifiers. The most obvious examples of these kinds of payment and coding splits occur in diagnostic tests and radiation treatment services, but there are also many examples in the PFS of add-on codes with RVUs primarily driven by the costs of particular items, including disposable supplies. In this case, the full range of resource costs for the services would not be included in the RVUs or payment amount for a single code but rather spread across several codes, namely a base code and one or more add-on codes. In this case, the application base codes would be reported with an add-on or multiple add-on HCPCS codes associated with skin substitutes. For example, CPT code 15271 (application of skin substitute graft, leg or ankle) would be reported with a PE-only add-on code that includes the resources involved in using the skin substitute product. (Such PE-only codes are designated with a PC/TC indicator of 3 and are only paid under the PFS in the non-facility setting. The same HCPCS code would be separately reportable in the hospital outpatient setting but not paid under the PFS.)

We propose that new HCPCS codes describing skin substitutes would be categorized based on whether they are PMA-approved, 510(k)-cleared, or self-determined 361 HCT/Ps and the RVUs that apply to that category would be applied to the new code at the next quarterly update. Any change to the RVUs associated with each group would be subject to annual notice and comment rulemaking. Currently, HCPCS Level II coding applications are submitted and reviewed during the quarterly and biannual coding cycles. We post our coding determinations for drugs and biologicals on a quarterly basis, and do not routinely review those applications at a HCPCS public meeting. For non-drugs and non-biologicals, we post our coding decisions on a biannual basis. For our biannual cycles for non-drugs and non-biologicals, we post preliminary coding determinations then invite feedback on those preliminary coding determinations at a biannual HCPCS public meeting; final coding determinations are posted following the HCPCS public meeting. CMS has been reviewing skin substitutes marketed as 361 HCT/Ps in the quarterly drugs and biologicals coding cycle and 510(k)-cleared skin substitutes in the biannual, non-drugs and non-biologicals coding cycle. Beginning January 1, 2026, we propose to review HCPCS Level II coding applications for all skin substitutes marketed as 361 HCT/Ps through our biannual coding cycle for non-drugs and non-biological products, rather than on a quarterly basis. Skin substitutes that received a 510(k) clearance, PMA approval, or a granted De Novo request would continue to be evaluated in the biannual HCPCS Level II coding cycles. Therefore, under this proposal, CMS would evaluate all complete HCPCS Level II applications for skin substitutes in our biannual cycles. Should any products come to market under the BLA, NDA, or ANDA pathways that could potentially be considered skin substitutes, CMS would instead review them in a quarterly HCPCS Level II drugs and biologicals coding cycle. Before a code is assigned, not otherwise classified (NOC) codes would be used and the CMS MACs would assign the appropriate payment based on the product's FDA regulatory category.

If skin substitutes that are not licensed under section 351 of the PHS Act are no longer paid as biologicals using the methodology under section 1847A of the Act, as proposed, then the manufacturers of these products would no longer be required to report ASP data to CMS under section 1847A(f)(2) of the Act. However, as noted above, when ASP data is reported, it may serve as a better estimate of resources across the hospital outpatient and non-facility settings than hospital outpatient MUC data. We propose to update the rates for the skin substitute categories annually through rulemaking using the most recently available calendar quarter of ASP data, when available, to set the rates. However, we have concerns that using a single, scheduled quarter of ASP data to set payment rates could encourage gaming. We seek comments on the use of a longer timeframe, such as the most recently available four calendar quarters, to set payment rates in future years. In the event ASP is not available for a particular product, we propose to use the MUC data. If MUC is not available, we propose to use the product's WAC or 89.6 percent of AWP

if WAC is also unavailable, similar to other products for which ASP is used to calculate a payment rate.[85] Once updated use patterns reflecting this policy are available to calculate rates, we propose using all relevant products and the combined product utilization patterns (OPPS and non-facility) to determine a weighted average per-unit cost by category to set separate payment rates for each of the three categories. We seek comments on our proposed methodology to set and update the payment rates for skin substitutes as well as the rates themselves.

5. Summary

To implement this policy, we propose, starting January 1, 2026, to separately pay for skin substitute products as incident-to supplies in both the non-facility and hospital outpatient settings. We propose to create three groups to pay for skin substitutes based on their FDA regulatory categories: PMA, 510(k), and 361 HCT/P, and would include each skin substitute in the applicable category based on its FDA approval, clearance, or self-determination, unless a skin substitute is licensed under section 351 of the PHS Act, as described earlier in this section, in which case the payment methodology under section 1847A would continue to apply. We propose calculate initial payment rates for skin substitute products in each of the three FDA regulatory categories using the volume-weighted average ASP for skin substitute products in each group as submitted by manufacturers, when available, and the MUC when ASP is not available. We propose to use the hospital outpatient utilization patterns to set the payment rates for all three categories of skin substitutes, which we propose to pay at a single rate for CY 2026. For CY 2026, the proposed PE and MP RVUs would result in an initial payment rate of approximately $125.38/cm^2 (prior to the application of the geographic adjustments) for PMA approvals, 510(k)s, and self-determined 361 HCT/Ps. We propose to accomplish this by maintaining the current HCPCS codes for skin substitutes and then applying this rate to each code. We propose to update the rates for the skin substitute categories annually through rulemaking using the most recently available calendar quarter of ASP data, when available, to set the rates, though we are seeking comments on whether a single quarter is most advisable. In the event ASP is not available for a particular product, we propose to use the hospital outpatient MUC data. If MUC is not available, we propose to use the product's WAC or 89.6 percent of AWP if WAC is also unavailable. We propose to include all skin substitute products used across both settings as well as the combined product utilization patterns, as soon as data is available that reflects the results of this policy, to determine a weighted average per-unit cost by group to set the payment rates for each of the three categories. We are also seeking comments on how to best integrate this data into updated PE RVUs for years subsequent to CY 2026. Specifically, we are seeking comment on whether we should apply PE scaling factors to the data (that is, volume-weighted ASP or MUC) in order to optimize relativity with other PFS services and supplies once these products are incorporated into PFS data used for rate setting. We propose to evaluate all complete HCPCS Level II applications for skin substitutes in our biannual cycles. Finally, we propose to codify the definition of ''biological'' as ''a product licensed under section 351 of the Public Health Service Act'' at §§414.802 and 414.902.

L. Strategies for Improving Global Surgery Payment Accuracy

1. Background

CMS establishes valuation and payment for approximately several thousand physician services as ''global surgical packages'' (herein 'globals') under the PFS. Each package includes a surgical procedure defined by the HCPCS code as well as related services, for example, pre and immediate post-operative care on the day of the procedure, care related to complications, and discharge services, and post-operative evaluation and management (E/M) services typically provided during postoperative periods of specified lengths called ''global periods.'' Currently, CMS pays for approximately 5,500 globals covering 0-, 10- and 90-day postoperative periods. Of the 5,500 total global surgical procedures, approximately 4,200 have either a 10- or 90-day global periods and nearly all of these 4,200 globals have at least one post-operative E/M visit included as part of their respective global surgical packages. Global surgical packages apply to the practitioner performing the procedure and, in the case of group practices, to the entire practice. Practitioners outside of those performing the procedure (or in the same group practice) can separately bill for post-operative and other care related to a global surgical procedure.

Taking into consideration findings from OIG reports that practitioners were performing fewer post-operative visits than Medicare assumed when valuing globals as well as our internal analysis, we finalized a policy in the CY 2015 PFS final rule to transition all globals with 10-day and 90-day global periods to have 0-day global periods. This change would allow practitioners to bill separately for any post-operative visits (or other care related to the procedure, for example, care for complications) furnished after the day of the procedure to be billed as standalone services. However, the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10), prohibited CMS from implementing this finalized policy and required that we collect data on the number and level of post-operative visits provided to enrollees as part of global periods and use this information to improve the valuation of globals.

In response to the MACRA requirements, CMS developed a claims-based reporting system and required practitioners in nine states and in practices of 10 or more National Provider Identifiers (NPIs) to report post-operative visits falling with global periods using no-pay HCPCS code 99024. We also initiated a research contract with RAND to analyze the collected data, to conduct a survey-based study on the level of post-operative visits, and to model different approaches to use the collected data and other information to improve the accuracy of valuation for global surgical services (see 81 FR 80212 through 80222 for more detailed discussion).

We recognize that, in some cases, a practitioner may only furnish the procedure component of a global surgical package, while in others, a practitioner may only provide post-operative care. In these cases, we rely on a set of transfer of care modifiers to split the fixed overall valuation of global surgical packages between providers. CMS broadened the scope for required reporting of transfer of care modifier -54 (*Surgical care only*) in the CY 2025 PFS Final Rule as part of an iterative process to improve global package valuation and therefore payment. Previously, this modifier could only be attached to global procedures with a 10 or 90-day global period when a patient's transfer of care was formally documented by both the surgeon and one or more post-operative care practitioners. In internal analyses, CMS found modifier -54 was used only rarely in aggregate and was concentrated in a small number of

[85] 89.6 percent of AWP was calculated by first reducing the usual 95 percent of AWP price by 6 percent to generate a value that is similar to WAC with no percentage markup.

ophthalmologic and cardiology procedures. Beginning January 1, 2025, and onward, modifier -54 must be reported in all cases where the surgeon does not intend to provide post-operative care, including but not limited to cases where both the surgeon and another practitioner both formally document the transfer of care as under the previous policy (see 89 FR 97961 through 97967 for that discussion).

For CY 2025, we also finalized a new add-on code, HCPCS code G0559, for post-operative care services furnished by a practitioner other than the one who performed the surgical procedure (or another practitioner in the same group practice). This add-on code will more appropriately reflect the time and resources involved in these post-operative follow-up visits by practitioners who were not involved in furnishing the surgical procedure however may see the patient for postoperative care (see 89 FR 97968 through 97971 for that discussion).

2. Strategies To Address Global Package Valuation

We noted in the CY 2025 PFS final rule that our proposal to broaden the required use of the transfer of care modifiers was a first step in an iterative process towards improving the accuracy of global surgical service valuation and payment. We are considering next steps to improve the valuation and payment for these services. We are continuing to consider approaches to establishing the payment allocations for portions of the global package when the transfer of care modifiers are used. Furthermore, we are considering approaches to specifically use information reported to CMS on the number and level of post operative visits to improve global surgical service valuation as required by Section 1848(c)(8)(C) of the Act.

We requested comments in the CY 2025 proposed rule on how best to determine the appropriate shares used to split total global surgical package valuations into discrete portions for the purposes of determining valuation (and therefore payment) in transfer of care scenarios. We sought comment on potential approaches to revise these shares and how they could better reflect current medical practice and conventions for post-operative follow-up care. We sought to identify a procedure-specific, data-driven method for assigning shares to portions of the global package valuation to more appropriately align the resources involved in each portion to payment rates. We stated in the CY 2025 PFS proposed rule that we would appreciate and carefully consider recommendations from interested parties, including the AMA RUC, on what those shares should be and other relevant information. We also stated in the proposed rule that CMS could use data collected over nearly a decade on the observed number of post-operative visits furnished to patients as part of global surgical packages as the basis for calculating new data-driven shares. We note that we received few comments in response to our comment solicitation.

Currently, Medicare pays surgeons a fixed share of a global procedure's valuation when billed with specified modifiers, specifically, modifier -54. These ''procedure shares'' are based on long-standing assumption and are clustered at certain values, for example, 79 percent, 80 percent, or 81 percent for roughly half of procedures with 90-day global periods and 90 percent for most procedures with 10-day global periods (the remaining approximately 20 percent and 10 percent for 90-day and 10-day procedures, respectively, account for post-operative care). We believe that the use of these distinct portions of the global package will help us to best align valuation—and therefore payment—to the practitioner who is performing a specific portion of the global surgical service.

We heard from commenters that the current component percentages published in the PFS were developed using magnitude estimation and cross-specialty scaling and that there is not any reverse engineering of work and time that can be performed to develop a better percentage of pre-, intra- and post-operative work than what is currently published in the PFS. Given the fact that both PFS global surgical procedures and relative valuations have changed since the inception of the PFS, we believe there may be better ways to provide the correct apportionments to the global surgical packages. Furthermore, clinical practice including post-operative care has changed dramatically over the decades since the inception of the current shares. We did not update procedure shares in the CY 2025 PFS final rule.

We are again soliciting public comments on strategies to improve the accuracy of payment for global surgical packages, specifically related to the procedure shares. We are seeking public comments on what the procedure shares should be based on for the 90-day global packages. We are also seeking comments and stakeholder input as to current practice standards and division of work between surgeons and providers of post-operative care. Currently, there is no clear basis for the current procedure shares, and this will allow for stakeholder input as to what those procedure shares should be.

In accordance with MACRA, we have been collecting data on post-operative visits furnished as part of global surgical packages and the extent to which these furnished post-operative visits align with the number of post-operative visits assumed by CMS when valuing global surgical services. For procedures with 90-day global periods and 2023 dates of service, our internal analysis shows that only 28 percent of post-operative visits considered by CMS during global surgical service valuation were actually provided to enrollees as part of global surgical packages. Our internal findings and RAND's published analyses have consistently shown that only a fraction of ''expected'' post-operative visits are provided. Absent evidence to the contrary, which CMS has not identified despite several solicitations for comments from the public (89 FR 97961 through 97962), our interpretation is that many post-operative visits considered during the valuation of global surgical packages are not provided as part of these packages. This presents an opportunity to use information from claims-based reporting of post-operative visits to develop procedure shares that better reflect current practice patterns. Using this data, as established through notice and comment rulemaking (81 FR 80212 through 80222), we considered several options regarding how the procedure shares could be updated, based on the data that was analyzed. These options are available in the file titled ''Estimated Procedure Shares Under Procedure-Only Modifier -54, Surgical Services with 90-day Global Period'' on the CMS website under downloads for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

As we continue to contemplate how to pay more accurately for global surgical packages, and specifically in consideration of how the procedure shares could be updated, we identified three alternatives to the status quo assumed procedure shares (that is, the share of a global surgical package valuation assigned to the surgeon when modifier -54 is reported) for global surgical packages. Each alternative uses information available in claims data to calculate new HCPCS code-specific procedure shares. Each alternative also calculates procedure shares as the ratio of procedure work RVUs (defined as the sum of intraservice work and other work on the day of the procedure (that is, pre-service work) as indicated on the

Physician Time File to total global surgical package work RVUs. The Physician Time File and Addendum B are both located under the Download files for this proposed rule at: *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.* The approaches differ in the way we would calculate procedure work RVUs, and more specifically, intraservice work as a component of procedure work RVUs.

Under the first approach, we would calculate procedure work RVUs by subtracting work RVUs assigned to each post-operative visit listed in the Physician Time File for a global procedure HCPCS code from the total valuation of the global surgical package. Under the second approach, we would calculate procedures' work RVUs by subtracting the work RVUs for post-operative visits provided as part of global surgical packages. To do so, we would multiply the number of post-operative visits typically provided for the global procedure HCPCS code (defined as the median count of post-operative visits reported to CMS using no-pay code 99024 among procedures without overlapping global periods with other global surgical services) by the average valuation per post-operative visit calculated for the mix (that is, number and level) of post-operative visits for the global procedure HCPCS code as listed in the Physician Time File. Under the third approach, would calculate procedure RVUs as the product of total physician time (in minutes) for each global procedure HCPCS code from the Physician Time File and the ratio of physician time (in minutes) assigned to post-operative visits for the code in the Physician Time File to total physician time.

In the CY 2025 PFS final rule, we expanded the scope for modifier -54 (surgical care only) to include all scenarios where the surgeon does not expect to provide post-operative care. The scope for modifier -55 (post-operative care only) was not changed. As a result, the post-operative share of total global surgical package valuation can only be billed with modifier -55 when transfers of care are formally documented by the surgeon and another practitioner.

Looking at 2023 claims data, RAND's analyses suggest the current procedure shares do not reflect the real-world division of work between surgeons and providers of post-operative care. Across all CY 2023 90-day global procedures and weighted by procedure volume, the procedure share under our current assumed procedure shares would have been 82 percent, on average, assuming all procedures were billed with modifier -54. Under the procedure shares calculated based on the actual number of visits furnished in global surgical periods (determined using information from claims-based reporting of post-operative visits), the average procedure share would have been 91 percent, with 85 percent of procedures having higher procedure shares under this approach compared to CMS' current assumptions.

We are seeking comments on the best approach to utilize going forward, specifically on the CPT code 99024-based approach. Of these approaches, the first (in terms of work RVUs) and third (in terms of physician time minutes) rely on Physician Time File counts of the number and level of post-operative visits assumed to occur as part of global surgical packages. Based on prior analyses (see 89 FR 97961), these counts are substantially inflated. Of all Physician Time File assumed visits and for 2023 global surgical procedure volumes, only 2 percent of visits following procedures with 10-day global periods and 28 percent of visits following procedures with 90-day global periods were provided to patients as part of global surgical packages. For this reason, we believe the resulting procedure shares under these approaches are too low and would lead to payments to surgeons that do not reflect the time and resources involved in furnishing the procedure component of global surgical services. In contrast, the second approach (using post-operative visit counts from claims-based reporting) reflects real-world, observed patterns of post-operative care. Furthermore, the second approach allows for routine, transparent updating of procedure shares over time. In contrast, shares could be updated under the first and third approaches only when global surgical services are revalued, and even then, with the limitation noted previously that the resulting visit counts by E/M service level are often substantially too high.

We are seeking comments on replacing the current procedure shares using the second approach described above (that is, with procedure work RVUs calculated using counts of post-operative visits reported using no-pay CPT code 99024).

Additionally, in our internal review of the percentages assigned for the pre-operative, surgical care, and post-operative portions of the global packages, we found that there are a small number of codes that do not have any assigned percentages in our files even though these codes are identified as global packages. We are again seeking comments on whether we should consider, first, whether these codes are appropriately categorized as 90-day global package codes, and if so, we are seeking comments on what the assigned percentages should be for each portion of the service.

M. Determination of Malpractice Relative Value Units (RVUs)

1. Overview

Section 1848(c) of the Act requires that each service paid under the PFS be composed of three components: work, practice expense (PE), and malpractice (MP) expense. As required by section 1848(c)(2)(C)(iii) of the Act, beginning in CY 2000, MP RVUs are resource-based. Section 1848(c)(2)(B)(i) of the Act also requires that we review, and if necessary, adjust RVUs no less often than every 5 years. As explained in the CY 2011 PFS final rule with comment period (75 FR 73208), MP RVUs for new and revised codes effective before the next 5-year review of MP RVUs were determined either by a direct crosswalk from a similar source code or by a modified crosswalk to account for differences in work RVUs between the new/revised code and the source code. For the modified crosswalk approach, we adjusted (or scaled) the MP RVU for the new/revised code to reflect the difference in work RVU between the source code and the new/revised work RVU (or, if greater, the difference in the clinical labor portion of the fully implemented PE RVU) for the new code. For example, if the proposed work RVU for a revised code was 10 percent higher than the work RVU for its source code, the MP RVU for the revised code would be increased by 10 percent over the source code MP RVU. Under this approach, the same risk factor (RF) was applied for the new/revised code and source code, but the work RVU for the new/revised code was used to adjust the MP RVUs for risk.

We consider the following factors when we determine MP RVUs for individual PFS services: (1) specialty-level risk values derived from data on specialty-specific MP premiums incurred by practitioners; (2) service-level risk values derived from Medicare claims data of the weighted average risk values of the specialties that furnish each service; and (3) an intensity/complexity of service adjustment to the service-level risk value based on either the higher of the work RVU or clinical labor portion of the direct PE RVU. In the CY 2016 PFS final rule with comment period (80 FR 70906 through 70910), we discussed this methodology and finalized a policy to begin conducting annual MP RVU updates to

reflect changes in the mix of practitioners providing services (using Medicare claims data), and to adjust MP RVUs for risk for intensity and complexity (using the work RVU or clinical labor RVU). We also finalized a policy to modify the specialty mix assignment methodology (for both MP and PE RVU calculations) to use an average of the three most recent years of data instead of a single year of data. Under this approach, for new and revised codes, we generally assign a specialty-level risk factor to individual codes based on the same utilization assumptions we make regarding specialty mix we use for calculating PE RVUs and for PFS budget neutrality. We continue to use the work RVU or clinical labor RVU to adjust the MP RVU for each code for intensity and complexity. In finalizing this policy, we stated that the specialty-level risk factors would continue to be updated through notice and comment rulemaking every 5 years using updated premium data but would remain unchanged between the 5-year reviews.

In the CY 2018 PFS proposed rule (82 FR 33965 through 33970), we proposed to update the specialty-level risk factors used in the calculation of MP RVUs prior to the next required 5-year update (CY 2020) using the updated MP premium data that were used in the eighth Geographic Practice Cost Index (GPCI) update for CY 2017; however, the proposal was ultimately not finalized for CY 2018.

Section 1848(e)(1)(C) of the Act requires us to review, and if necessary, adjust the GPCIs at least every 3 years. In the CY 2020 PFS final rule (84 FR 62606 through 62615), we implemented the fourth review and update of MP RVUs, and we also conducted the statutorily required 3-year review of the GPCIs. The MP premium data used to update the MP GPCIs are the same data used to determine the specialty-level risk factors, which are used in the calculation of MP RVUs. Therefore, to increase efficiency, we finalized a policy to align the update of MP premium data and specialty-level risk factors with the update to the MP GPCIs. We finalized a policy to review, and if necessary, update the MP RVUs at least every 3 years, similar to our review and update of the GPCIs.

In the CY 2023 PFS final rule, we conducted the statutorily required review of the MP RVUs and GPCIs (87 FR 69634 through 69641). We refer to this review and update of the MP RVUs as the ''CY 2023 update.'' As part of this review, we finalized a methodological improvement to move from MP risk factors to a MP risk index. The risk index is calculated as a ratio of the specialty's national average premium to the volume-weighted national average premium across all specialties. We finalized this methodological improvement to increase consistency with the calculation of MP RVUs, so that changes in the MP risk index reflect changes in payment, as opposed to changes relative only to the specialty with the lowest national average premium.

2. Methodology for the Proposed Revision of Resource-Based Malpractice (MP) RVUs

a. General Discussion

We calculated the MP RVUs that we are proposing for CY 2026 using updated MP premium data obtained from state insurance rate filings. The methodology used to calculate the CY 2026 resource-based MP RVUs largely parallels the process used in the CY 2023 update with continued improvements to our data collection process. To calculate the MP RVUs, we obtain information on specialty-specific MP premiums that are linked to specific services, and using this information, we derive relative risk values for the various specialties that furnish a particular service. Because MP premiums vary by state and specialty, we weigh the MP premium data geographically and by specialty. We calculated the MP RVUs we are proposing using four data sources: data on MP insurance premium rates presumed to be in effect as of December 31, 2023; CY 2023 Medicare payment and utilization data; higher of the CY 2025 final work RVUs or the clinical labor portion of the direct PE RVUs; and CY 2025 GPCIs. We used the higher of the CY 2025 final work RVUs or clinical labor portion of the direct PE RVUs in our calculation to develop the CY 2026 proposed MP RVUs while maintaining overall PFS budget neutrality.

Similar to the CY 2023 update, we calculated the proposed MP RVUs using specialty-specific MP premium data because they represent the expense incurred by practitioners to obtain MP insurance as reported by insurers. For CY 2026, we obtained the most current MP insurance premium data available, reflecting rates with a presumed effective date of no later than December 31, 2023, from insurers with the largest market share in each state. We identified insurers with the largest market share using the National Association of Insurance Commissioners (NAIC) 2023 market share report. This annual report provides state-level market share for entities that provide premium liability insurance (PLI) in a state. Premium data was downloaded from the System for Electronic Rates & Forms Filing Access Interface (SERFF) (accessed from the NAIC website) for participating states. For non-SERFF states, data was downloaded from the state-specific website (if available online) or obtained directly from the state's alternate access to filings. For SERFF states and non-SERFF states with online access to filings, we used the 2023 market share report to select insurance companies. These market share filings were the most current data available during the data collection and acquisition process.

MP insurance premium data was collected from all 50 States and the District of Columbia. We made efforts to collect filings from Puerto Rico; however, no recent filings were submitted at the time of data collection, and therefore, we used filings from the previous update. Consistent with the CY 2023 MP RVU update, we did not collect filings for the other U.S. territories: American Samoa, Guam, Virgin Islands, or Northern Mariana Islands. We collected MP insurance premium data for coverage limits of $1 million/$3 million, mature, claims-made policies (policies covering claims made, rather than those covering losses occurring, during the policy term). A $1 million/$3 million liability limit policy means that the most that would be paid on any claim is $1 million and the most that the policy would pay for claims over the timeframe of the policy is $3 million. We made adjustments to the premium data to reflect mandatory surcharges for patient compensation funds (PCF, funds used to pay for any claim beyond the state's statutory amount, thereby limiting an individual physician's liability in cases of a large suit) in states where participation in such funds is mandatory.

In the CY 2020 PFS final rule (84 FR 62607 through 62610), we finalized methodological improvements that expanded the specialties and amount of filings data used to develop the proposed risk factors, which are used to develop the proposed MP RVUs. Premium data were included for all physician and nonphysician practitioner (NPP) specialties, and all risk classifications available in the collected rate filings. Although premium data were collected from all States, the District of Columbia, and previous filings for Puerto Rico were utilized, not all specialties had distinct premium data in the rate filings from all States.

b. Proposed Methodological Refinements

For the CY 2026 update, we are not proposing any major methodological refinements to the development of MP premium data. However, we have continued to refine the universe of specialties subject to imputation and sources of imputation for each specialty. For the CY 2023 update, premium data for the specialties of Geriatric Medicine, Hospitalist, Internal Medicine, Medical Oncology, Pain Management, and Preventive Medicine were augmented with some imputed data, but sufficient data was collected for these specialties during this CY 2026 update such that imputation was unnecessary. Additionally, Allergy/Immunology was previously used as the imputation source for both Osteopathic Manipulative Medicine and Addiction Medicine. For this CY 2026 update, more clinically similar specialties were used as the imputation source for these specialties.

c. Steps for Calculating Proposed Malpractice RVUs

Calculation of the proposed MP RVUs conceptually follows the specialty-weighted approach used in the CY 2015 PFS final rule with comment period (79 FR 67591), along with the methodological improvements established in the CY 2023 PFS final rule (87 FR 69634 through 69641). The specialty-weighted approach bases the MP RVUs for a given service on a weighted average of the risk index of all specialties furnishing the service. This approach ensures that all specialties furnishing a given service are reflected in the calculation of the MP RVUs. The steps for calculating the proposed MP RVUs are described below.

Step (1): Compute a preliminary national average premium for each specialty.

Insurance rating area MP premiums for each specialty are mapped to the county level. The specialty premium for each county is then multiplied by its share of the total U.S. population (from the U.S. Census Bureau's 2018 to 2022 American Community Survey (ACS) 5-year estimates). This contrasts with the method used for creating national average premiums for each specialty in the 2015 update; in that update, specialty premiums were weighted by the total RVU per county, rather than by the county share of the total U.S. population. We refer readers to the CY 2016 PFS final rule with comment period (80 FR 70909) for a discussion of why we have adopted a weighting method based on share of total U.S. population. This calculation is then divided by the average MP GPCI across all counties for each specialty to yield a normalized national average premium for each specialty. The specialty premiums are normalized for geographic variation so that the locality cost differences (as reflected by the 2025 GPCIs) would not be counted twice. Without the geographic variation adjustment, the cost differences among fee schedule areas would be reflected once under the methodology used to calculate the MP RVUs and again when computing the service specific payment amount for a given fee schedule area.

Step (2): Determine which premium service risk groups to use within each specialty.

Some specialties had premium rates that differed for surgery, surgery with obstetrics, and non-surgery. These premium classes are designed to reflect differences in risk of professional liability and the cost of MP claims if they occur. To account for the presence of different classes in the MP premium data and the task of mapping these premiums to procedures, we calculated a distinct risk index for surgical, surgical with obstetrics, and nonsurgical procedures where applicable. However, the availability of data by surgery and non-surgery varied across specialties. Historically, no single approach accurately addressed the variability in premium class among specialties, and we previously employed several methods for calculating average premiums by specialty.

Developing Distinct Service Risk Groups: We determined that there was sufficient data for surgery and non-surgery premiums, as well as sufficient differences in rates between classes for 17 specialties. These specialties are listed in Table 29. The CY 2026 update uses the same structure of specialty/service risk group as the CY 2023 update. For all other specialties (those that are not listed in Table 29) that typically do not distinguish premiums as described above, a single risk index value was calculated, and that specialty risk index value was applied to all services performed by those specialties.

TABLE 29: SPECIALTIES SUBDIVIDED INTO SERVICE RISK GROUPS

Service Risk Groups	Specialties
Surgery/No Surgery	Otolaryngology (04), Cardiology (06), Dermatology (07), Gastroenterology (10), Neurology (13), Ophthalmology (18), Cardiac Electrophysiology (21), Urology (34), Geriatric Medicine (38), Nephrology (39), Endocrinology (46), Podiatry (48), Emergency Medicine (93) Unknown Physician Specialty (99)
Surgery/No Surgery/OB	General Practice (01), Family Practice (08), OB/GYN (16)

Step (3): Calculate a risk index for each specialty.

The relative differences in national average premiums between specialties are expressed in our methodology as a specialty-level risk index. These risk index values are calculated by dividing the national average premium for each specialty by the volume-weighted national average premium across all specialties. Risk index values less than one correspond to specialties with relatively lower malpractice risk than average, and values greater than one correspond to specialties with relatively higher malpractice risk. The volume-weighted national average premium was calculated as the sum of the product of the national average premium and total CY 2023 PE and work RVUs for each specialty/service risk group, then dividing by total CY 2023 PE and work RVUs across all specialties.

(a) Technical Component (TC) Only Services

For the CY 2020 update of the MP RVUs (84 FR 62606 through 62615), we finalized that we would assign a risk factor of 1.00, which was the lowest physician specialty risk factor (allergy/immunology), to TC-only services due to a lack of sufficient professional liability premium data. For the proposed CY 2023 update of the MP RVUs (87 FR 46016), our expanded data

collection efforts resulted in sufficient premium data such that we could directly assign a risk value for TC- only services without the need for mapping. However, due to a technical error, we continued to assign a 1.0 risk factor for all TC-only services which resulted in an incorrect calculation of the proposed MP RVUs for TC-only services. In the CY 2023 PFS final rule (87 FR 69641), we finalized a correction to this ratesetting error for the 2023 update of the MP RVUs that again mapped TC-only services to allergy/immunology, which had a risk index value of 0.430. We stated that using this risk value will correct the identified error, while also maintaining as much stability as possible for TC-only services so that there is not a major shift in value from current MP RVUs for the technical and professional components.

For this CY 2026 update of the MP RVUs, we are proposing to map TC-only services to the specialty allergy/immunology, which now has a risk index value of 0.427. Mapping the TC-only services to the specialty allergy/immunology would be consistent with the CY 2020 and 2023 updates of the MP RVUs and maintain stability in our ratesetting process. We request comments regarding the risk index value for TC-only services. Table 30 shows the risk index values by specialty type and service risk group.

*Note: CMS specialty codes denoted with an asterisk (*) were established for billing purposes effective January 1, 2024. This is the first update for which risk index values have been calculated for these specialties.

BILLING CODE 4120–01–C

Step (4): Calculate MP RVUs for each CPT/HCPCS code.

Resource-based MP RVUs were calculated for each CPT/HCPCS code that has work or PE RVUs. The first step was to identify the percentage of services furnished by each specialty for each respective CPT/HCPCS code. This percentage was then multiplied by each respective specialty's risk index value as calculated in Step 3. The products for all specialties for the CPT/HCPCS code were then added together, yielding a specialty-weighted service specific risk index reflecting the weighted MP costs across all specialties furnishing that procedure. The service specific risk index was multiplied by the greater of the work RVU or clinical labor portion of the direct PE RVU for that service, to reflect differences in the complexity and risk-of-service between services.

For low volume services codes, we finalized in the CY 2018 PFS final rule (82 FR 53000 through 53006) a proposal to apply the list of expected specialties instead of the claims-based specialty mix for low volume services to address stakeholder concerns about the year to year variability in PE and MP RVUs for low volume services (which also includes no volume services); these are defined as codes that have 100 allowed services or fewer. These service-level overrides are used to determine the specialty for low volume procedures for both PE and MP.

In the CY 2018 PFS final rule (82 FR 53000 through 53006), we also finalized our proposal to eliminate general use of an MP-specific specialty-mix crosswalk for new and revised codes. However, we indicated that we would continue to consider, in conjunction with annual recommendations, specific recommendations regarding specialty mix assignments for new and revised codes, particularly in cases where coding changes are expected to result in differential reporting of services by specialty, or where the new or revised code is expected to be low-volume. Absent such information, the specialty mix assumption for a new or revised code would derive from the analytic crosswalk in the first year, followed by the introduction of actual claims data, which is consistent with our approach for developing PE RVUs.

For CY 2026, we are soliciting public comment on the list of expected specialties. The proposed list of codes and expected specialties is available on our website under downloads for the CY 2026 PFS proposed rule at *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html.*

Step (5): Rescale for budget neutrality.

The statute requires that changes to fee schedule RVUs must be budget neutral. Thus, the last step is to adjust for relativity by rescaling the proposed MP RVUs so that the total proposed resource-based MP RVUs are equal to the total current resource-based MP RVUs scaled by the ratio of the pools of the proposed and current MP and work RVUs. This scaling is necessary to maintain the work RVUs for individual services from year to year while also maintaining the overall relationship among work, PE, and MP RVUs.

Specialties Excluded from Ratesetting Calculation: In section II.B. of this proposed rule, Determination of Practice Expense Relative Value Units, we discuss specialties that are excluded from ratesetting for the purposes of calculating PE RVUs. We are proposing to treat those excluded specialties in a consistent manner for the purposes of calculating MP RVUs. We note that all specialties are included for purposes of calculating the final BN adjustment. The list of specialties excluded from the ratesetting calculation for the purpose of calculating the PE RVUs that we propose to also exclude for the purpose of calculating MP RVUs is available in section II.B. of this final rule, Determination of Practice Expense Relative Value Units. The resource-based MP RVUs are shown in Addendum B, which is available on the CMS website under the downloads section of the CY 2026 PFS rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.*

Because a different share of the resources involved in furnishing PFS services is reflected in each of the three fee schedule components, implementation of the resource-based MP RVU update will have much smaller payment effects than implementing updates of resource-based work RVUs and resource-based PE RVUs. On average, work currently represents about 50.9 percent of payment for a service under the fee schedule, PE about 44.8 percent, and MP about 4.3 percent. Therefore, a 25 percent change in PE RVUs or work RVUs for a service would result in a change in payment of about 11 to 13 percent. In contrast, a corresponding 25 percent change in MP values for a service would yield a change in payment of only about 1 percent. Estimates of the effects on payment by specialty type is detailed in section VII. of this proposed rule, the Regulatory Impact Analysis.

Additional information on our methodology for updating the MP RVUs is available in the ''Interim Report for the CY 2026 Update of GPCIs and MP RVUs for the Medicare Physician Fee Schedule,'' which is available on the CMS website under the downloads section of the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.*

N. Geographic Practice Cost Indices (GPCIs)

1. Background

Section 1848(e)(1)(A) of the Act requires us to develop separate

Geographic Practice Cost Indices (GPCIs) to measure relative cost differences among localities compared to the national average for each of the three fee schedule components (that is, work, practice expense (PE), and malpractice (MP)). We discuss the localities established under the PFS below in this section. Although the statute requires that the PE and MP GPCIs reflect full relative cost differences, section 1848(e)(1)(A)(iii) of the Act requires that the work GPCIs reflect only one-quarter of the relative cost differences compared to the national average. In addition, section 1848(e)(1)(G) of the Act sets a permanent 1.5 work GPCI floor for services furnished in Alaska beginning January 1, 2009, and section 1848(e)(1)(I) of the Act sets a permanent 1.0 PE GPCI floor for services furnished in Frontier States (as defined in section 1848(e)(1)(I) of the Act) beginning January 1, 2011. Additionally, section 1848(e)(1)(E) of the Act provides for a 1.0 floor for the work GPCIs, which has been extended by many successive amendments to the statute. The 1.0 floor for the work GPCI under section 1848(e)(1)(E) of the Act was most recently extended by section 2206 of the Full-Year Continuing Appropriations and Extensions Act, 2025 (Pub. L. 119–4, enacted March 15, 2025) through September 30, 2025 (that is, for services furnished no later than September 30, 2025). Therefore, as proposed, the CY 2026 work GPCIs and summarized GAFs do not reflect the 1.0 work floor. Additionally, as required by sections 1848(e)(1)(G) and (I) of the Act, the 1.5 work GPCI floor for Alaska and the 1.0 PE GPCI floor for Frontier States are permanent, and therefore, are reflected in the CY 2026 proposed GPCIs.

Section 1848(e)(1)(C) of the Act requires us to review and, if necessary, adjust the GPCIs at least every 3 years. Section 1848(e)(1)(C) of the Act requires that, if more than 1 year has elapsed since the date of the last previous GPCI adjustment, the adjustment to be applied in the first year of the next adjustment shall be ½ of the adjustment that otherwise would be made. Therefore, since more than 1 year has passed since the previous GPCI update was implemented in CY 2023 and 2024, we are proposing to phase in ½ of the proposed GPCI adjustment in CY 2026 and the remaining ½ of the adjustment for CY 2027.

We have completed our review of the GPCIs and are proposing new GPCIs beginning for CY 2026 in this proposed rule. We also calculate a geographic adjustment factor (GAF) for each PFS locality. The GAFs are a weighted composite of each PFS locality's proposed work, PE, and MP GPCIs using the share of total RVUs that each component accounts for in the actual Medicare utilization from CY 2023. While we do not actually use GAFs in computing the PFS payment for a specific service, they are a useful metric for purposes of comparing overall costs and payments across fee schedule areas. The actual effect of GPCIs on payment for any actual service would deviate from the GAF to the extent that the proportions of work, PE and MP RVUs for the service differ from those reflected in the GAF.

See Addenda D and E to this proposed rule for the CY 2026 proposed GPCIs and summarized GAFs. These Addenda are available on the CMS website under the supporting documents section of the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html*.

2. Payment Locality Background

Prior to 1992, Medicare payments for physicians' services were made under the reasonable charge system. Payments under this system largely reflected the charging patterns of physicians, which resulted in large differences in payment for physicians' services among types of services, physician specialties and geographic payment areas.

Local Medicare carriers initially established 210 payment localities, to reflect local physician charging patterns and economic conditions. These localities changed little between the inception of Medicare in 1967 and the beginning of the PFS in 1992. In 1994, we undertook a study that culminated in a comprehensive locality revision (based on locality resource cost differences as reflected by the GPCIs) that we implemented in 1997. The development of the current locality structure is described in detail in the CY 1997 PFS final rule (61 FR 34615) and the subsequent final rule with comment period (61 FR 59494). The revised locality structure reduced the number of localities from 210 to 89 and increased the number of Statewide localities from 22 to 34.

Section 220(h) of the Protecting Access to Medicare Act (PAMA) (Pub. L. 113–93, enacted April 1, 2014) required modifications to the payment localities in California for payment purposes beginning with 2017. As a result, in the CY 2017 PFS final rule (81 FR 80265 through 80268) we established 23 additional localities, increasing the total number of PFS localities from 89 to 112. Subsequently, we operationalized a technical refinement to retire several California localities that were no longer operationally necessary, resulting in a reduction of unique California localities from 32 to 29 from CY 2024 on. We refer readers to the discussion of this technical refinement in the CY 2023 (87 FR 69621 through 69625) and 2024 (88 FR 78985 through 78987) PFS final rules, and the section below. As a result, the current 109 payment localities include 34 Statewide areas (that is, only one locality for the entire State) and 72 localities in the other 16 States, with 10 States having two localities, two States having three localities, one State having four localities, and three States having five or more localities. The remainder of the 109 PFS payment localities are comprised as follows: the combined District of Columbia, Maryland, and Virginia suburbs; Puerto Rico; and the Virgin Islands. We note that the localities generally represent a grouping of one or more constituent counties.

The current 109 fee schedule areas, also referred to as payment localities, are defined alternatively by State boundaries (Statewide areas for example, Wisconsin), metropolitan areas (for example, Metropolitan St. Louis, MO), portions of a metropolitan area (for example, Manhattan), or rest-of-state areas that exclude metropolitan areas (for example, Rest of Missouri). This locality configuration is used to calculate the GPCIs that are in turn used to calculate geographically adjusted payments for physicians' services under the PFS.

As stated in the CY 2011 PFS final rule with comment period (75 FR 73261), changes to the PFS locality structure would generally result in changes that are budget neutral within a State. For many years, before making any locality changes, we have sought consensus from among the professionals whose payments would be affected. We refer readers to the CY 2014 PFS final rule with comment period (78 FR 74384 through 74386) for further discussion regarding additional information about locality configuration considerations.

3. GPCI Update

As required by the statute, we developed GPCIs to measure relative cost differences among payment localities compared to the national average for each of the three fee schedule components (that is, work, PE, and MP). The changes to the proposed CY 2026 GPCIs for each locality reflect the updated resource cost data in each area to better adjust PFS payments for geographic cost differences compared to national average costs. We note that the changes in the proposed GPCIs reflect

the statutory floors and limitations on variation discussed above that may advantage some rural localities. We describe the data sources and methodologies we use to calculate each of the three GPCIs below in this section. Additional information on the CY 2026 GPCI update is available in an interim report, ''Interim Report for the CY 2026 Update of GPCIs and MP RVUs for the Medicare PFS,'' on our website located under the supporting documents section for the CY 2026 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html*.

a. Work GPCIs

The work GPCIs are designed to reflect the relative cost of physician labor by Medicare PFS locality. As required by statute, the work GPCI reflects one quarter of the relative wage differences for each locality compared to the national average.

To calculate the work GPCIs, we use wage data for nine professional specialty occupation categories, adjusted to reflect one-quarter of the relative cost differences for each locality compared to the national average, as a proxy for physicians' wages. Physicians' wages are not included in the occupation categories used in calculating the work GPCI because Medicare payments are a key determinant of physicians' earnings. Including physician wage data in calculating the work GPCIs would potentially introduce some circularity to the adjustment since Medicare payments typically contribute to or influence physician wages. That is, including physicians' wages in the physician work GPCIs would, in effect, make the indices, to some extent, dependent upon Medicare payments.

The work GPCI updates in CYs 2001, 2003, 2005, and 2008 were based on professional earnings data from the 2000 Census. However, for the CY 2011 GPCI update (75 FR 73252), the 2000 data were outdated and wage and earnings data were not available from the more recent Census because the ''long form'' was discontinued. Therefore, we used the median hourly earnings from the 2006 through 2008 Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics (OEWS), formerly known as Occupational Employee Statistics (OES), wage data as a replacement for the 2000 Census data. The BLS OEWS data meet several criteria that we consider to be important for selecting a data source for purposes of calculating the GPCIs. For example, the BLS OEWS wage and employment data are derived from a large sample size of approximately 200,000 establishments of varying sizes nationwide from every metropolitan area and can be easily accessible to the public at no cost. Additionally, the BLS OEWS is updated regularly, and includes a comprehensive set of occupations and industries (for example, 800 occupations in 450 industries). For the CY 2014 GPCI update, we used updated BLS OEWS data (2009 through 2011) as a replacement for the 2006 through 2008 data to compute the work GPCIs; for the CY 2017 GPCI update, we used updated BLS OEWS data (2011 through 2014) as a replacement for the 2009 through 2011 data to compute the work GPCIs; for the CY 2020 GPCI update, we used updated BLS OEWS data (2014 through 2017) as a replacement for the 2011 through 2014 data to compute the work GPCIs; and for the CY 2023 GPCI update, we used updated BLS OEWS data (2017 through 2020) as a replacement for the 2014 through 2017 data to compute the work GPCIs.

Because of its reliability, public availability, level of detail, and national scope, we believe the BLS OEWS data continue to be the most appropriate source of wage and employment data for use in calculating the work GPCIs (and as discussed below, the employee wage component and purchased services component of the PE GPCI). Therefore, for the CY 2026 GPCI update, we used updated BLS OEWS data (2020 through 2023) as a replacement for the 2017 through 2020 data to compute the proposed work GPCIs.

b. Practice Expense (PE) GPCIs

The PE GPCIs are designed to measure the relative cost difference in the mix of goods and services comprising PEs (not including MP expenses) among the PFS localities as compared to the national average of these costs. Whereas the physician work GPCIs (and as discussed later in this section, the MP GPCIs) are comprised of a single index, the PE GPCIs are comprised of four component indices (employee wages; purchased services; office rent; and equipment, supplies and other miscellaneous expenses). The employee wage index component measures geographic variation in the cost of the kinds of skilled and unskilled labor that would be directly employed by a physician practice. Although the employee wage index adjusts for geographic variation in the cost of labor employed directly by physician practices, it does not account for geographic variation in the cost of services that typically would be purchased from other entities, such as law firms, accounting firms, information technology consultants, building service managers, or any other third-party vendor. The purchased services index component of the PE GPCI (which is a separate index from employee wages) measures geographic variation in the cost of contracted services that physician practices would typically buy. For more information on the development of the purchased service index, we refer readers to the CY 2012 PFS final rule with comment period (76 FR 73084 through 73085). The office rent index component of the PE GPCI measures relative geographic variation in the cost of typical physician office rents. For the medical equipment, supplies, and miscellaneous expenses component, we believe there is a national market for these items such that there is not significant geographic variation in costs. Therefore, the equipment, supplies and other miscellaneous expense cost index component of the PE GPCI is given a value of 1.000 for each PFS locality.

For the previous update to the GPCIs (implemented in CY 2023), we used 2017 through 2020 BLS OEWS data to calculate the employee wage and purchased services indices for the PE GPCI. As discussed previously in this section, because of its reliability, public availability, level of detail, and national scope, we continue to believe the BLS OEWS is the most appropriate data source for collecting wage and employment data. Therefore, in calculating the CY 2026 GPCI update, we used updated BLS OEWS data (2020 through 2023) as a replacement for the 2017 through 2020 data for purposes of calculating the employee wage component and purchased service index component of the PE GPCI. In calculating the CY 2026 GPCI update for the office rent index component of the PE GPCI, we used the 2018 through 2022 American Community Survey (ACS) 5-year estimates as a replacement for the 2015 through 2019 ACS data.

c. Malpractice Expense (MP) GPCIs

The MP GPCIs measure the relative cost differences among PFS localities for the purchase of professional liability insurance (PLI). To ensure that premium data are homogenous and comparable across geographic areas, data were collected for policies with uniform coverage limits of $1 million per occurrence and $3 million aggregate ($1 million/$3 million). The MP GPCIs are calculated based on insurer rate filings of premium data for $1 million/$3 million mature claims-made policies (policies for claims made rather than losses occurring during the policy term). For the CY 2023 GPCI update, we used

premium data presumed in effect as of December 31, 2020. The CY 2026 MP GPCI update reflects premium data presumed in effect no later than December 31, 2023. We note that we finalized a few technical refinements to the MP GPCI methodology in CY 2017 and refer readers to the CY 2017 (81 FR 80270) PFS final rule for additional discussion of those.

d. GPCI Cost Share Weights

For the CY 2026 GPCIs, we are proposing to continue to use the current 2006-based MEI cost share weights for determining the proposed PE GPCI values. Specifically, we use the cost share weights to weight the four components of the PE GPCI: employee compensation, office rent, purchased services, and medical equipment, supplies, and other miscellaneous expenses, as shown in Table 31. We refer readers to the CY 2014 PFS final rule with comment period (78 FR 74382 through 74383), for further discussion regarding the 2006-based MEI cost share weights revised in CY 2014 that we also finalized for use in the CY 2017, CY 2020, and CY 2023 GPCI updates.

We note that we proposed and finalized to rebase and revise the MEI cost share weights for CY 2023, and we refer readers to the detailed discussion in section II.M. of the CY 2023 PFS final rule (87 FR 69688 through 69710). Due to the concurrent rebasing and revision of the MEI cost share weights during the CY 2023 GPCI update, we proposed and finalized to maintain the use of the 2006-based MEI cost share weights for the CY 2023 GPCIs, thus delaying the implementation of the rebased and revised 2017-based MEI cost share weights for this purpose. We refer readers to our discussion about using the rebased and revised MEI cost share weights for purposes of proportioning the work, PE, and MP RVU pools in PFS ratesetting and for the purposes of updating the GPCIs in the CY 2023 PFS final rule (87 FR 69414 through 69415, 69619 through 69620, and 70212 through 70218). In those sections, we discussed our considerations for updating the MEI cost share weights for the RVUs and the GPCIs and the potential redistributive impact that making such a change would have had on PFS payments. We have historically updated the GPCI cost share weights to make them consistent with the most recent update to the MEI, which was most recently done for CY 2023; however, in light of the overall impacts of making this change and in the interest of maintaining stability in payments, we proposed and finalized to maintain the use of the currently used 2006-based MEI cost share weights for the CY 2023 final PE GPCIs. For the CY 2026 GPCI update, we have the same concerns about the potential redistributive effects that implementing the 2017-based MEI would have on PFS payments. Additionally, we have received data from the American Medical Association's (AMA) Physician Practice Information [86] (PPI) and Clinician Practice Information [87] (CPI) Surveys, however, these data lack the specific breakdown of practice expense that we would need to consider its use to weight the four components of the PE GPCI for CY 2026, including Office Rent and Purchased Services, which are reported in an aggregate buckets of general overhead costs and other expenses in the survey data. We refer readers to section VII. of this proposed rule for more discussion regarding a possible derivation of cost share weights for use in the PE GPCI from the PPI and CPI Survey.

We also note that maintaining the 2006-based MEI cost share weights for the CY 2026 GPCI update preserves consistency in the data used to update both the GPCI and PFS ratesetting inputs for CY 2026. We refer readers to section VII. of this proposed rule for additional discussion on this issue and the estimated impacts as it relates to PFS ratesetting and the GPCI update for CY 2026. We also refer readers to the discussion regarding the PPI and CPI survey data in section II.B. of this proposed rule. In addition, we direct readers to the CY 2011 PFS final rule (75 FR 73256) where we similarly delayed implementation of updated MEI cost share weights in response to commenters' concerns about our separate, ongoing analysis that would inform future GPCI changes and the reallocation of labor-related costs from the medical equipment and supplies and miscellaneous component to the employee compensation component of the PE GPCI.

In the CY 2011 PFS final rule (75 FR 73256), we acknowledged that we typically update the GPCI cost share weights concurrently with the most recent MEI rebasing and revision, but in consideration of the commenters' concerns in response to the proposed rule, we did not use the revised cost share weights for the CY 2011 GPCIs and instead finalized the implementation of the rebased and revised MEI cost share weights through subsequent rulemaking. We invite comments on the 2017-based MEI cost share weights and the weights based on PPI and CPI Survey data for purposes of alternatives considered for the CY 2026 GPCIs and PFS ratesetting, given the estimated impacts discussed in section VII. of this proposed rule. We are also soliciting comments on how best to proceed with implementation of the 2017-based MEI cost share weights or PPI and CPI Survey weights in the future. More specifically, we are seeking comment on how best to incorporate updated cost share weights into the PE GPCI if we were to implement them outside the statutorily required triennial update in which we phase in all aspects of the GPCI update through the previously discussed 2-year (½ in each year) phase-in required by section 1848(e)(1)(C) of the Act. Section 1848(e)(1)(C) of the Act requires that, if more than one year has elapsed since the date of the last GPCI adjustment, the adjustment to be applied in the first year of the next adjustment shall be ½ of the adjustment that otherwise would be made. Therefore, specifically, we are seeking comment on potentially incorporating the updated cost share weights into the CY 2027 GPCIs. We note that we would not be required by statute to phase in the adjustment over 2 years as specified in section 1848(e)(1)(C) of the Act because, in CY 2027, no more than one year would have elapsed since this CY 2026 GPCI adjustment. Therefore, we are also seeking comment on whether it would be appropriate to use a multi-year transition to incorporate updated cost share weights for purposes of the PE GPCI and PFS ratesetting as we have done in the past when incorporating other new data into the PFS payment methodology (for example, the clinical labor update), or if, because updated cost share weights only impact the composition of the PE GPCI, such a transition would not be warranted. If we were to instead apply updated cost share weights for purposes of the PE GPCI and PFS ratesetting for CY 2028 or later, we would be required under section 1848(e)(1)(C) of the Act to phase in the GPCI adjustments over 2 years. We are seeking comments on whether, in that case, it would be appropriate to similarly apply a transition to implement updated cost share weights for purposes of PFS ratesetting as well, and refer readers to section II.B and VII. of this proposed rule for more discussion regarding the alternatives considered and impacts of a phase-in of updated cost share weights in PFS ratesetting. The proposed CY 2026 GPCI cost share weights are displayed in

[86] *https://www.ama-assn.org/system/files/table-1-results-from-ppi.pdf.*

[87] *https://www.ama-assn.org/system/files/table-1-results-from-cpi-final.pdf.*

Table 31. We note that the 2017-based MEI cost share weights as finalized in section II.M. of the CY 2023 PFS (87 FR 69688 through 69708) final rule are also displayed in Table 31 for awareness regarding potential future rulemaking and GPCI updates. As previously discussed, the PPI and CPI Survey data lack the specific breakdown of practice expense that we would need to consider its use to weight the four components of the PE GPCI for CY 2026, therefore, we refer readers to section VII. of this proposed rule for more discussion regarding a possible derivation of cost share weights for use in the PE GPCI from the PPI and CPI Survey for awareness regarding potential future rulemaking and GPCI updates.

TABLE 31: PROPOSED GPCI COST SHARE WEIGHTS FOR CY 2026

Expense Category	Current and CY 2026 Proposed GPCI Cost Share Weights (2006-based MEI)	2017-based MEI Cost Share Weights*
Work	50.866%	47.522%
Practice Expense	44.839%	51.129%
- Employee Compensation	16.553%	25.450%
- Office Rent	10.223%	5.683%
- Purchased Services	8.095%	13.419%
- Equipment, Supplies, Other	9.968%	6.576%
Malpractice Insurance	4.295%	1.349%
Total	**100.000%**	**100.000%**

*As finalized in the CY 2023 PFS final rule (87 FR 69688 - 69708)

e. PE GPCI Floor for Frontier States

Section 10324(c) of the Affordable Care Act added a new subparagraph (I) under section 1848(e)(1) of the Act to establish a 1.0 PE GPCI floor for physicians' services furnished in Frontier States effective January 1, 2011. In accordance with section 1848(e)(1)(I) of the Act, beginning in CY 2011, we applied a 1.0 PE GPCI floor for physicians' services furnished in States determined to be Frontier States. In general, a Frontier State is one in which at least 50 percent of the counties are ''frontier counties,'' which are those that have a population per square mile of less than 6. For more information on the criteria used to define a Frontier State, we refer readers to the FY 2011 Inpatient Prospective Payment System (IPPS) final rule (75 FR 50160 through 50161). There are no changes in the states identified as Frontier States for the CY 2026 PFS proposed rule. The qualifying states are: Montana; Wyoming; North Dakota; South Dakota; and Nevada. In accordance with statute, we will apply a 1.0 PE GPCI floor for these states in CY 2026.

f. Methodology for Calculating GPCIs in the U.S. Territories

Prior to CY 2017, for all the island territories other than Puerto Rico, the lack of comprehensive data about unique costs for island territories had minimal impact on GPCIs because we used either the Hawaii GPCIs (for the Pacific territories: Guam; American Samoa; and Northern Mariana Islands) or used the unadjusted national averages (for the Virgin Islands). In an effort to provide greater consistency in the calculation of GPCIs given the lack of comprehensive data regarding the validity of applying the proxy data used in the States in accurately accounting for variability of costs for these island territories, in the CY 2017 PFS final rule (81 FR 80268 through 80270), we finalized a policy to treat the Caribbean Island territories (the Virgin Islands and Puerto Rico) in a consistent manner. We do so by assigning the national average of 1.0 to each GPCI index for both Puerto Rico and the Virgin Islands. We refer readers to the CY 2017 PFS final rule for a comprehensive discussion of this policy.

g. California Update to the Fee Schedule Areas Used for Payment Under Section 220(h) of the Protecting Access to Medicare Act

Section 220(h) of the PAMA added a new section 1848(e)(6) to the Act that modified the fee schedule areas used for payment purposes in California beginning in CY 2017. Prior to CY 2017, the fee schedule areas used for payment in California were based on the revised locality structure that was implemented in 1997 as previously discussed. Beginning in CY 2017, section 1848(e)(6)(A)(i) of the Act required that the fee schedule areas used for payment in California must be Metropolitan Statistical Areas (MSAs) as defined by the Office of Management and Budget (OMB) as of December 31 of the previous year; and section 1848(e)(6)(A)(ii) of the Act required that all areas not located in an MSA must be treated as a single rest-of-state fee schedule area. The resulting modifications to California's locality structure increased its number of fee schedule areas from 9 under the current locality structure to 27 under the MSA-based locality structure; although for the purposes of payment, the actual number of fee schedule areas under the MSA-based locality structure is 32. We refer readers to the CY 2017 PFS final rule (81 FR 80267) for a detailed discussion of this operational decision.

Section 1848(e)(6)(D) of the Act defined transition areas as the counties in fee schedule areas for 2013 that were in the rest-of-state locality, and locality 3, which was comprised of Marin County, Napa County, and Solano County. Section 1848(e)(6)(B) of the Act specified that the GPCI values used for payment in a transition area are to be phased in over 6 years, from 2017 through 2022, using a weighted sum of the GPCIs calculated under the new MSA-based locality structure and the GPCIs calculated under the PFS locality structure that was in place prior to CY 2017. That is, the GPCI values applicable for these areas during this transition period were a blend of what the GPCI values would have been for California under the locality structure that was in place prior to CY 2017, and what the GPCI values would be for California under the MSA-based locality structure. For example, in CY 2020, which represented the fourth year of the transition period, the applicable GPCI values for counties that were previously

in the rest-of-state locality or locality 3 and are now in MSAs were a blend of ⅔ of the GPCI value calculated for the year under the MSA-based locality structure, and ⅓ of the GPCI value calculated for the year under the locality structure that was in place prior to CY 2017. The proportions continued to shift by ⅙ in each subsequent year so that, by CY 2021, the applicable GPCI values for counties within transition areas were a blend of ⅚ of the GPCI value for the year under the MSA-based locality structure, and ⅙ of the GPCI value for the year under the locality structure that was in place prior to CY 2017. Beginning in CY 2022, the applicable GPCI values for counties in transition areas were the values calculated solely under the new MSA-based locality structure; therefore, the phase-in for transition areas is complete. Additionally, section 1848(e)(6)(C) of the Act establishes a hold harmless requirement for transition areas beginning with CY 2017; whereby, the applicable GPCI values for a year under the new MSA-based locality structure may not be less than what they would have been for the year under the locality structure that was in place prior to CY 2017. There are 58 counties in California, 50 of which were in transition areas as defined in section 1848(e)(6)(D) of the Act. The eight counties that were not within transition areas are: Orange; Los Angeles; Alameda; Contra Costa; San Francisco; San Mateo; Santa Clara; and Ventura counties. We note that while the phase-in for transition areas is no longer applicable, the hold harmless requirement is not time-limited, and therefore, is still in effect.

For the purposes of calculating budget neutrality and consistent with the PFS budget neutrality requirements as specified under section 1848(c)(2)(B)(ii)(II) of the Act, we finalized the policy to start by calculating the national GPCIs as if the fee schedule areas that were in place prior to CY 2017 are still applicable nationwide; then, for the purposes of payment in California, we override the GPCI values with the values that are applicable for California consistent with the requirements of section 1848(e)(6) of the Act. This approach to applying the hold harmless requirement is consistent with the implementation of the GPCI floor provisions that have previously been implemented—that is, as an after-the-fact adjustment that is made for purposes of payment after both the GPCIs and PFS budget neutrality have already been calculated.

Additionally, section 1848(e)(1)(C) of the Act requires that, if more than 1 year has elapsed since the date of the last GPCI adjustment, the adjustment to be applied in the first year of the next adjustment shall be ½ of the adjustment that otherwise would be made. For a comprehensive discussion of this provision, transition areas, and operational considerations, we refer readers to the CY 2017 PFS final rule (81 FR 80265 through 80268).

In the CY 2020 final rule (84 FR 62622), a commenter indicated that some of the distinct fee schedule areas that were used during the period between CY 2017 and CY 2018 are no longer necessary. Specifically, with regard to the Los Angeles-Long Beach-Anaheim MSA, which contains 2 counties (across two former unique locality numbers, 18 and 26) that are not transition areas, we acknowledge that we only needed more than one unique locality number for that MSA for payment purposes in CY 2017, which was the first year of the implementation of the MSA-based payment locality structure. Neither of the counties in the Los Angeles-Long Beach-Anaheim MSA (Orange County and Los Angeles County) are transition areas under section 1848(e)(6)(D) of the Act. Therefore, the counties were not subject to the aforementioned GPCI value incremental phase-in (which is no longer applicable) or the hold-harmless provision at section 1848(e)(6)(C) of the Act. Similarly, the San Francisco-Oakland-Berkeley MSA contains four counties—San Francisco, San Mateo, Alameda, and Contra Costa counties—across three former unique locality numbers, 05, 06, and 07. These counties are not transition areas and will receive the same GPCI values, for payment purposes, going forward. In response to the comment, we acknowledged that we did not propose any changes to the number of fee schedule areas in California, but would consider the feasibility of a technical refinement to consolidate into fewer unique locality numbers; and if we determined that consolidation was operationally feasible, we would propose the technical refinement in future rulemaking. In light of the foregoing, for CY 2023, we proposed and finalized to identify the Los Angeles-Long Beach-Anaheim MSA, containing Orange County and Los Angeles County, by one unique locality number, 18, as opposed to two, thus retiring locality number 26, as it is no longer needed. Similarly, we proposed and finalized to identify the San Francisco-Oakland-Berkeley MSA containing San Francisco, San Mateo, Alameda, and Contra Costa counties by one unique locality number, 05, as opposed to four, thus retiring locality numbers 06 and 07, as they are no longer needed. Additionally, we noted that we would modify the MSA names as follows: the San Francisco-Oakland-Berkeley (San Francisco Cnty) locality (locality 05) would become San Francisco-Oakland-Berkeley (San Francisco/San Mateo/Alameda/Contra Costa Cnty), and Los Angeles-Long Beach-Anaheim (Los Angeles Cnty) locality (locality 18) would become Los Angeles-Long Beach-Anaheim (Los Angeles/Orange Cnty). The refinement finalized in the CY 2024 PFS final rule (88 FR 78985 through 78987) ultimately changed the number of distinct fee schedule areas for payment purposes in California from 32 to 29. We noted that because Marin County is in a transition area and subject to the hold harmless provision at section 1848(e)(6)(C) of the Act, we needed to retain a unique locality number for San Francisco-Oakland-Berkeley (Marin Cnty), locality 52. We note that these changes do not have any payment implications under the PFS.

h. Alternatives Considered Related to List of Occupation Codes Used in the Work GPCI Calculation

As explained in the Work GPCIs section above, we utilize a refined list of occupation groups and codes from the Bureau of Labor Statistics (BLS) Occupational Employment and Wage Statistics (OEWS) data to calculate the work GPCI. Because of its reliability, public availability, level of detail, and national scope, we believe the BLS OEWS data continue to be the most appropriate source of wage and employment data for use in calculating the work GPCIs. For the CY 2023 GPCI update, we reviewed the occupation codes and groups used to capture geographic variation in professional wages to assess other potential codes and groups that could be used in addition to the current selections to calculate the work GPCI, with significant consideration given to the extent to which the data exist in the file (data existence) and how well the occupation codes are represented in the data (data sufficiency). Based on our review and commenters' response to the proposals, we finalized the addition of two new occupation groups (and their corresponding occupation codes), Management Occupations and Business and Financial Operation Occupations, to the preexisting seven occupation groups, and four new occupation codes to the pre-existing Computer, Mathematical, Life, and Physical Science group, and three occupation codes to the pre-existing Social Science,

Community and Social Service, and Legal group in the CY 2023 PFS final rule (87 FR 69621 through 69625). The practical effect of the addition of these occupation groups and codes on the work GPCI was minimal because the statute at section 1848(e)(1)(A)(iii) of the Act requires that the work GPCI reflect only one quarter of cost differences, but their inclusion added meaningful data regarding the geographic variation in professional wages for CY 2023.

In the CY 2023 PFS final rule (87 FR 69631), some commenters stated that our methodologic changes to the work GPCI occupation groups and codes create unnecessary complexity and limited transparency. The commenters stated that CMS did not provide an impact analysis or criteria for inclusion (that is, how well it correlated as a proxy) other than significant consideration to the extent to which the data exist in the file (data existence) and how well the occupation codes are represented in the data (data sufficiency). The commenters stated that, without further explanation, two additional occupation groups were added to the previous seven occupation groups, which increased the greater than 100 current occupation codes by 60. One commenter believed that it is unlikely that the cumulation of so many professions will accurately reflect the relative difference in work of a single profession such as a physician; the commenter stated that, if one were to compare the BLS OEWS data file used for the work GPCI with that of the healthcare provider dataset, there is a discordance. The commenters agreed that the healthcare provider dataset should not be used for developing the work GPCI due to circularity, but believe it could be used to validate the proposed work GPCIs and to identify a much smaller subset of professions that would act as more reliable proxies than what was proposed. The commenters urged CMS to apply a smaller number of professions to the work GPCI, as they thought that doing so would result in a more reliable and accurate proxy for physician work, and provide more information about the correlation between physician work and the proxy professions to allow the public to verify its accuracy.

In response to commenters, we noted that we do not claim the proxy professions themselves, or the absolute wages of the proxy professionals are correlated to physician wages, but rather, that the geographic variation in proxy professional wages is similar to the geographic variation in physician wages.

We believed that there would be similar geographic variation if one were to compare the BLS OEWS data used for the work GPCI with data from a healthcare provider dataset. We continue to believe in the majority of instances, the earnings of physicians will vary among areas to the same degree that the earnings of other professionals across an array of industries vary. Further, we welcomed opportunities to discuss data sources that can be used to validate the work GPCI, similar to the analysis that we performed for residential and commercial rent data used for the office rent index for CY 2023.

For CY 2026, we analyzed the potential effect of using a consolidated set of occupation codes on the work GPCI and compared that effect to changes in work GPCI values that would occur utilizing the standard set of occupation codes, as finalized for CY 2023. We acknowledge that the use of a more parsimonious set of occupations could be an improvement if it results in essentially the same work GPCI values with increased simplicity and clarity for interested parties. We explored approaches to condense the list of occupation codes used in a more systematic manner, with the establishment of inclusion criteria for an occupation code such as level of education attainment and data completeness. For our analysis, we identified 274, 157 and 90 occupation codes with at least 50 percent, 75 percent, and 90 percent having a Bachelor's Degree or higher, excluding occupation codes in Group 29 that are paid on the Fee Schedule, respectively from the May 2023 OEWS data. We then applied various data completeness criteria thresholds to these occupation codes with wage data for at least 50 percent, 75 percent, and 90 percent of U.S. counties, resulting in the number of occupation codes displayed below in Table 32.

TABLE 32: DATA EXISTENCE FOR CODES THAT MEET VARIOUS EDUCATION ATTAINMENT THRESHOLDS: AT LEAST 50%, 75% OR 90% WITH A BACHELOR'S DEGREE OR HIGHER, EXCLUDING GROUP 29 OCCUPATION CODES THAT ARE PAID ON THE FEE SCHEDULE

	Bachelor's Degree or higher ≥ 50%		Bachelor's Degree or higher ≥ 75%		Bachelor's Degree or higher ≥ 90%	
# of Codes	274		157		90	
	Number	Percent	Number	Percent	Number	Percent
Codes with wage data for at least 50% of U.S. counties	112	41%	57	36%	23	26%
Codes with wage data for at least 75% of U.S. counties	69	25%	31	20%	8	9%
Codes with wage data for at least 90% of U.S. counties	45	16%	19	12%	4	4%

* Note: Prosthodontists (1) 29-1024 is not in the MSA-level data file that is used for analyzing data completeness. Wage data is only available at the national level in file "all_data_M_2023.xlsx". Therefore, the starting # of codes is 273, 156 and 89.

Of these scenarios with various thresholds of the education attainment and data completeness inclusion criterion, we investigated two scenarios compared to the standard CY 2026 GPCI: (1) occupation codes with at least 75 percent of Bachelor's Degree or Higher excluding Group 29 and wage data for at least 50 percent of U.S. counties, resulting in a list of 57 occupation codes and (2) occupation codes with at least 75 percent of Bachelor's Degree or Higher excluding Group 29 and wage data for at least 75 percent of U.S. counties, resulting in a

list of 31 occupation codes from the May 2023 OWES data. Under these two scenarios, the work GPCIs result in changes relative to current CY 2025 work GPCI values that are nearly identical to those under the standard CY 2026 GPCI update, as shown below in Table 33.

TABLE 33 Distribution of Work GPCI Change Under Consolidated Occupation Code Lists, Transition Values for CY 2026 Compared to CY 2025 Values

SIZE OF CHANGE IN MEASURE	Standard CY 2026 GPCI Update # of Payment Areas	BACH 75 DATA 50 # of Payment Areas	BACH 75 DATA 75 # of Payment Areas
< -10%	0	0	0
-10% to < - 4%	0	0	0
-4% to < -1.5%	13	12	13
-1.5% to < -0.5%	36	37	37
-0.5% to < 0.5%	53	54	53
0.5% to < 1.5%	7	6	6
1.5% to < 4%	0	0	0
4% to < 10%	0	0	0
10% or more	0	0	0

Standard CY 2026 GPCI Update: reflects changes to occupation codes as described in Interim Report, using the same approach as in previous updates

BACH 75 DATA 50: includes occupation codes with ≥75% Bachelors' degrees (or higher) and data available for ≥50% of U.S. counties

BACH 75 DATA 75: includes occupation codes with ≥75% Bachelors' degrees (or higher) and data available for ≥75% of U.S. counties

Based on the two scenarios' changes relative to current CY 2025 work GPCI values that are nearly identical to those under the standard CY 2026 GPCI update, we are seeking comment on the potential to establish clear inclusion criteria for occupation codes for the calculation of the work GPCI in future GPCI updates. We note that a smaller, standardized list of occupation codes that meet rigorous and clearly established thresholds for education attainment and data completeness would aid transparency in the work GPCI and be responsive to the commenters' requests.

Similar to the finalized addition of occupation groups and codes for the CY 2023 GPCI update, the practical effect of limiting the occupation groups and codes on the work GPCI would be minimal because the statute at section 1848(e)(1)(A)(iii) of the Act requires that the work GPCI reflect only one quarter of cost differences, but the limitation could aid transparency and allow for a greater degree of precision when tracking changes in geographic variation in professional wages across GPCI update years.

i. Proposed GPCI Update Summary

As explained in the Background section above, section 1848(e)(1)(C) of the Act mandates the periodic review and adjustment of GPCIs. For each periodic review and adjustment, we publish the proposed GPCIs in the PFS proposed rule to provide an opportunity for public notice and comment and allow us to consider whether any revisions in response to comments are warranted prior to implementation. The proposed CY 2026 updated GPCIs that we propose for the first and second year of the 2-year phase-in, along with the GAFs, are displayed in Addenda D and E to this proposed rule available on our website under the supporting documents section of the CY 2026 PFS proposed rule web page at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.*

We note that in recent GPCI updates, commenters have stated that there is a lack of transparency into the GPCI data and methodology used to derive the GPCIs. In response to the CY 2023 PFS proposed rule, one commenter stated that they cannot accurately validate CMS' GPCI calculations because there is little transparency and access to the data and methods used. The commenter stated that they submitted a comment on the CY 2022 PFS proposed rule urging CMS to provide more transparency into the GPCI calculations in general, including a more detailed description of the step-by-step methodology and the specific data files used to derive the GPCIs. In addition to making the RVUs by county available, the commenters also suggested CMS to make available the source data for the work GPCI by county, the source data for each component of the practice expense GPCI, and all budget neutrality adjustments and calculations.

The commenters stated that CMS provided these data prior to 2020 and that they used it to reproduce and validate the CMS methodology for calculating the GPCIs each year. In the CY 2023 PFS final rule, in response to these comments, we referred readers to the step-by-step instructions provided in the final report, ''Final Report for the CY 2023 Update of GPCIs and MP RVUs for the Medicare PFS,'' on our website located under the supporting documents section for the CY 2023 PFS final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.* We also referred readers to Table 4.A.1: Summary of Elements Required for GPCI Calculation in the final report, and the previous discussion, for the data sources used for the work GPCI and each component of the practice expense GPCI. As noted in the proposed and final rules for each GPCI update, we discuss the years and timeframes of data used from each source. We note that we provide web links to the publicly-available data sources used in the GPCI updates, the methodological parameters, as well as an overview of how we develop each GPCI component in the interim and final reports published with

each proposed and final rule containing a GPCI update. This practice is consistent with previous updates. We also note that the budget neutrality adjustment and statutory floors applied after the budget neutrality adjustment are detailed in the note, ''CY 2023 GPCI Update Note_County_Data,'' on our website located under the supporting documents section for the CY 2023 PFS proposed and final rules at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/index.html.* We also reminded commenters that, in response to the commenters' concerns expressed in rulemaking for the CY 2020 GPCI update, we included more detailed steps in the final report, ''Final Report for the CY 2020 Update of GPCIs and MP RVUs for the Medicare Phys Fee Sched_v19Feb2020'', which is available on the CMS website under the downloads section of the CY 2020 PFS final rule to assist interested parties in navigating these data. Additionally, as part of our ongoing commitment to transparency, we post the county-level data that we use to develop the proposed GPCIs, which allows interested parties to further examine and replicate our GPCI methodology. This file is also available on the CMS website on our website under the Downloads section, titled ''CY 2023 Proposed Rule GPCI County-Level Data File.'' We believe that we sufficiently addressed previous commenters' concerns for the CY 2023 GPCI update in the proposed and final rules and aforementioned CY 2020 and CY 2023 interim and final reports, but we are seeking comment related to any additional information specific to what data was provided prior to 2020 that is no longer provided. Based on a comparison of data and information in the interim and final reports, as well as the data file downloads, we have not identified any information or data that we have discontinued since 2020, as commenters have claimed. We are open to any feedback related to specific information and data that would aid transparency in a GPCI update.

III. Other Provisions of the Proposed Rule

A. Drugs and Biological Products Paid Under Medicare Part B

1. Requiring Manufacturers of Certain Single-Dose Container or Single-Use Package Drugs To Provide Refunds With Respect To Discarded Amounts (§§ 414.902 and 414.940)

a. Background

Section 90004 of the Infrastructure Investment and Jobs Act (Pub. L. 117–58, November 15, 2021) (hereinafter referred to as ''the Infrastructure Act'') amended section 1847A of the Act to add a provision requiring manufacturers to provide a refund to CMS for certain discarded amounts from a refundable single-dose container or single-use package drug (hereinafter referred to as ''refundable drug'') for calendar quarters beginning January 1, 2023.

The calculation of the refund is codified at § 414.940(c). For a new refund quarter (as defined at § 414.902) beginning on or after January 1, 2023, an amount equal to the estimated amount (if any) by which:

- The product of the total number of units of the billing and payment code for such drug that were discarded during such new refund quarter; and the amount of payment determined for such drug or biological under section 1847A(b)(1)(B) or (C) of the Act, as applicable, for such new refund quarter;
- Exceeds an amount equal to the applicable percentage of the estimated total allowed charges for such drug for the new refund quarter.

Section 1847A(h)(3)(B)(ii) of the Act provides that, in the case of a refundable drug that has unique circumstances involving similar loss of product as that described in section 1847A(h)(8)(B)(ii) of the Act, the Secretary may increase the applicable percentage otherwise applicable as determined appropriate by the Secretary. In the CY 2023 PFS final rule, we adopted an increased applicable percentage of 35 percent for drugs reconstituted with a hydrogel and with variable dosing based on patient-specific characteristics (87 FR 69731). In the CY 2024 PFS final rule (88 FR 79047 through 79064), we finalized an increased applicable percentage for two categories of drugs with unique circumstances, codified at § 414.940(d). These categories include: certain drugs with a low-volume dose (that is, where the volume removed from the vial or container containing the labeled dose does not exceed 0.1 mL or falls between 0.11 mL and 0.4 mL); and orphan drugs furnished to fewer than 100 unique beneficiaries. Drugs with an increased applicable percentage are listed on the CMS website.[88]

b. Application for Increased Applicable Percentage

Section 1847A(h)(3)(B)(ii) of the Act permits the Secretary to increase the applicable percentage for a refundable drug that has unique circumstances through notice and comment rulemaking. In the CY 2024 PFS final rule (88 FR 79057 through 79060), we finalized an application process (CMS–10835, OMB 0938–1435) by which manufacturers could apply for an increased applicable percentage for a drug and may request that we consider an individual drug to have unique circumstances for which an increased applicable percentage is appropriate. We explained that manufacturers could benefit from a formal process through which they can provide information, including that which may not be publicly available, in order to request an increase in their refundable drug's applicable percentage and provide justification for why the drug has unique circumstances for which such an increase is appropriate, including in the case of a drug with an applicable percentage that has already been increased by virtue of its unique circumstances.[89] [90] We finalized the application deadline of February 1 of each year, adopted a deadline of August 1 for the FDA-approval of the drug and the deadline for notifying and submitting the FDA-approved label to CMS of September 1 of the year before the year in which the increased applicable percentages would apply. We codified this process in regulation at § 414.940(e). The application process requires the applicant to provide a written request comprising FDA-approved labeling for the drug; justification for the consideration of an increased applicable percentage based on such unique circumstances; and justification for the requested increase in the applicable percentage. Following a review of timely applications, CMS will summarize its analyses of applications and propose appropriate increases in rulemaking. If adopted, the increased applicable percentage will be the applicable percentage beginning as of the following January 1. The collection of information requests associated with the application process (CMS–10835, OMB 0938–1435) would remain unchanged under this proposed rule.

We received two applications for increased applicable percentage for consideration in the CY 2026 PFS proposed rule. Both applicants submitted the information required under § 414.940(e)(1), including, as applicable, the FDA-approved labeling for the drug, justification for consideration for increased applicable

[88] *https://www.cms.gov/medicare/payment/part-b-drugs/discarded-drugs.*

[89] *https://www.cms.gov/files/document/drugs-increased-applicable-percentage.pdf.*

[90] *https://cms.gov/files/document/orphan-drugs-increased-applicable-percentage-calendar-quarters-2023.pdf.*

percentage, and justification for the requested applicable percentage.

The first application for increased applicable percentage for CY 2026 is from the manufacturer of Leukine® (sargramostim),[91] who has resubmitted a request for a 72 percent applicable percentage after applying in the previous year. Leukine® is a leukocyte growth factor with five FDA-approved indications in hematological malignancies and one indication for post-radiation exposure to increase white blood cell counts. The applicant's submitted FDA-approved labeling for the drug did not include the adjuvant uses described in the application (further described below in this paragraph) due to ongoing cancer vaccine adjuvant trials. The applicant reemphasizes that multiple sponsors are in late-stage development, with a total of 22 Phase II and Phase III clinical trials, an increase from 16 reported in the previous year, investigating Leukine® as a vaccine adjuvant for oncology indications, specifically to stimulate the immune response of dendritic cells when used alongside these vaccines. Cancer treatment vaccines differ from the vaccines that protect against viruses, such as the influenza virus. Instead of preventing disease, cancer treatment vaccines aim to stimulate the immune system to attack existing cancer cells in the body.[92] The applicant states that it has no ownership stake in the development of these cancer treatment vaccines and does not possess control or influence over the design and execution of the clinical trials. The estimated completion dates for Phase III clinical trials vary, with the earliest expected in late 2025 [93] and the latest in March 2029.[94] The adjuvant use of Leukine® in predetermined dosage is distinct from its six FDA-approved indications, all of which have dosages that are based on body weight or body surface area (BSA). The adjuvant use dosages of Leukine® in clinical trials are generally much smaller than dosages for indications in the FDA-approved labeling. The smallest dose of Leukine® used for vaccine adjuvant purposes of which the applicant is aware (that is, 70 mcg) would lead to as much as 72 percent of the drug being discarded from a single-dose 250 mcg lyophilized vial, which is the only size available commercially. The applicant suggests that if use of these small doses were to become more common for an approved indication, the percentage of discarded units could increase the discarded drug refund amount that could be owed by the applicant, even though the applicant lacks control or knowledge of the potential variability of the discarded amounts that may occur if Leukine® were used for such purposes. If another manufacturer were to seek FDA approval for adjuvant use of sargramostim but was not involved in its production, the available single-dose 250-mcg vial presentation of Leukine® would likely not be optimized for the small doses being studied in these trials.

As part of CMS's review of the application, we analyzed existing claims data from the first quarter of 2018 through the last quarter of 2024 and found the percentage of units discarded for the HCPCS code for Leukine® (J2820) ranged from 1.2 percent to 3.8 percent, which is below the applicable percentage of 10 percent. In addition to the low overall discard rate, the percentage of units discarded showed a standard deviation of less than 1 percent across quarters. This is notably lower than the 6.21 percent average standard deviation observed for rarely utilized orphan drugs, as reported in the CY 2024 PFS final rule (88 FR 52393). The low standard deviation indicates minimal quarter-to-quarter variation, with the percentage of units discarded tightly clustered around a 2.2 percent mean. For context, approximately two-thirds of the quarterly percentage values for units discarded fall within one percentage point above or below the mean, highlighting the consistency and stability of the trend over the 7-year period. Therefore, although the applicant suggests otherwise, this data does not follow a statistical distribution similar to that considered for rarely-utilized orphan drugs meeting the criteria in § 414.940(d)(5), which may not have a normal statistical distribution from quarter to quarter, potentially resulting in highly variable refund amounts as compared with the variability of drugs administered to a higher number of beneficiaries. Since we did not yet know the impact of a new adjuvant indication with a type of immunotherapy commonly referred to as cancer vaccines [95] on the current percentage of units discarded, we did not propose an increased applicable percentage in the CY 2025 PFS proposed rule. Additionally, because it was not yet known whether sargramostim would be approved for additional indications and dosages, as indicated in the information provided by the applicant, and the available data did not provide enough information for CMS to determine whether Leukine® had unique circumstances that would prompt an increase in the applicable percentage, we did not propose an increase in the applicable percentage for the drug in the CY 2025 PFS proposed rule. The applicant agreed with CMS' rationale for this decision.

Because we are maintaining our determination from the CY 2025 PFS proposed rule, we are not proposing an increase in the applicable percentage for Leukine® at this time. The applicant may reapply in a future application cycle when more information, such as FDA-approved labeling reflecting new indications or dosages, becomes available.

The second application is from the manufacturer of Jelmyto® (mitomycin for pyelocalyceal solution) [96] who is requesting an additional 10 percent increase to the 35 percent applicable percentage finalized in the CY 2023 PFS final rule (87 FR 69727 through 69731), bringing the total applicable percentage to 45 percent. Jelmyto® is indicated for the treatment of adult patients with low-grade Upper Tract Urothelial Cancer (LG–UTUC), a rare cancer with approximately 7,000 new annual cases [97] in the United States. According to the applicant, Jelmyto® dosing ranges from 20 mg to 60 mg per single treatment, with the specific dose determined by kidney volume measurements obtained through pyelography.[9] In the CY 2023 PFS final rule, we stated that Jelmyto®, a drug reconstituted with a hydrogel and administered via ureteral catheter or nephrostomy tube into the kidneys, may leave a substantial amount adhering to the vial wall due to its viscosity, and making it non-extractable. This viscosity results from proprietary reverse-thermal technology (RTGel®), which enables the drug to transition from a chilled liquid at instillation into a gel at body temperature. We determined that a 35 percent applicable percentage was appropriate—accounting for 25 percent lost to adhesion (that is, an 80 mg package with maximum extractable dose of 60 mg results in at least 25 percent being discarded) and an additional 10 percent to align with drugs without unique circumstances for patients requiring less than the maximum dose of 60 mg. We disagreed that an

[97] *https://www.urologyhealth.org/urology-a-z/u/upper-tract-urothelial-carcinoma-(utuc).*

applicable percentage greater than 35 percent should be applied to such hydrogel products, because we believe that 25 percent accounts for the hydrogel that adheres to the vial, and because we have allowed for an additional 10 percent of drug to be discarded before any refund would be owed. This 35 percent applicable percentage was codified at § 414.940(d)(2), with broad support from commenters, for drugs that are both reconstituted with a hydrogel and subject to variable dosing based on patient-specific characteristics.

The applicant contends that the current 35 percent applicable percentage does not account for drug loss due to kidney volume variations and different administration routes, both of which the applicant claims meet the patient-specific characteristics outlined in § 414.940(d)(2). Since kidney volume cannot be determined until the pharmacy has prepared the drug and the patient is ready for administration of the initial treatment, the applicant states that patients with smaller-than-average kidney volumes may lead to a higher amount of drug being discarded. Additionally, the amount of Jelmyto® discarded may increase when providers choose antegrade (via nephrostomy tube) administration over the more common retrograde (via ureteral catheter) administration, as the greater drug delivery efficiency of the antegrade route may result in a lower dose required, leading to more of the drug being discarded. The choice of administration route must be determined on an individual basis, considering multiple factors, including but not limited to the risks and benefits of each route, previous history of failed administration attempts, tolerance to anesthesia, anatomical variations in the urinary tract, patient preference, and the patient's clinical presentation at the time of drug administration.[98] [99] [100] These patient-specific characteristics, combined with the requirement for hydrogel reconstitution, were considered when establishing the current 35 percent applicable percentage.

In the CY 2024 PFS final rule (88 FR 79057), we stated that we do not consider the following to be unique circumstances warranting an increased applicable percentage at this time: weight-based doses, BSA-based doses, varying surface area of a wound, loading doses, escalation or titration doses, tapering doses, and dose adjustments for toxicity because we believe manufacturers can optimize the availability of products for these circumstances to limit the percentage of discarded units for a drug, unlike the circumstances of manufacturers of drugs that require filtration during the preparation process, as described in section 1847A(h)(8)(B)(ii) of the Act. Consistent with that statement, we generally do not consider dose variations due to patient- or condition-specific characteristics to be unique circumstances for the same reason. That is, manufacturers can optimize the availability of products for these circumstances to minimize discarded amounts. Therefore, we do not consider the drug loss due to patient-specific characteristics, such as variation in kidney volume and factors leading to antegrade administration, to be unique circumstances, and we are not proposing an increase in the applicable percentage of 45 percent for the drug. Consistent with the CY 2023 PFS final rule, we propose that the applicable percentage for Jelmyto® continue to be 35 percent.

We welcome comments on these applications for increased applicable percentage.

2. Average Sales Price: Price Concessions and Bona Fide Service Fees (§ 414.804 and 414.802)

a. Background

Drugs payable under Medicare Part B fall into three general categories: those furnished incident to a physician's service (hereinafter referred to as ''incident to'') (section 1861(s)(2) of the Act), those furnished via a covered item of durable medical equipment (DME) (section 1861(s)(6) of the Act), and other drugs for which coverage is specified by statute (for example, certain vaccines described in sections 1861(s)(10)(A) and (B) of the Act). Payment limits for most drugs separately payable under Medicare Part B are determined using the methodology in section 1847A of the Act, and in many cases, payment is based on the average sales price (ASP) plus a statutorily mandated 6 percent add-on. If CMS determines a payment limit for a drug, it is published in the ASP pricing file or Not Otherwise Classified (NOC) pricing file, which are both updated quarterly.

The calculation of payment limits for such drugs payable under Part B is done on a quarterly basis using the manufacturer's ASP (as defined in § 414.902), as applicable, using methodology in section 1847A of the Act. Manufacturers are required to report ASP data to CMS under sections 1847A(f)(2) and 1927(b)(3) of the Act and are instructed to calculate the manufacturer's ASP in accordance with section 1847A(c) of the Act and § 414.804(a).

As part of that calculation of the manufacturer's ASP, required under section 1847A(c)(3) of the Act and § 414.804(a)(2), manufacturers must deduct price concessions such as volume discounts, prompt pay discounts, cash discounts, free goods that are contingent on any purchase requirement, chargebacks, and rebates (other than rebates under the Medicaid Drug Rebate Program and the Medicare Prescription Drug Inflation Rebate Program). Section 1847A(c)(3) of the Act also provides that, ''[f]or years after 2004, the Secretary may include in such price other price concessions, which may be based on recommendations of the Inspector General, that would result in a reduction of the cost to the purchaser.'' The Secretary implemented an interim rule adopting those statutory categories of price concessions in 2004 (69 FR 47488). In 2006 the Secretary finalized policies for how the manufacturer's ASP is calculated, which required manufacturers to deduct all price concessions from ASP at § 414.804(a)(2). While price concessions are deducted from the manufacturer's ASP (that is, price concessions will lower the resulting manufacturer's ASP), bona fide service fees (BFSFs) are not considered price concessions and, therefore, are not deducted when calculating the manufacturer's ASP (see § 414.804(a)(2)(ii)). In other words, BFSFs do not lower the manufacturer's ASP because they are not part of the calculation.

In the Calendar Year (CY) 2007 Physician Fee Schedule (PFS) final rule (71 FR 69665 through 69678) Medicare finalized a definition of BFSF for the purposes of calculating the manufacturer's ASP at § 414.802. The definition finalized in that final rule states that the term ''BFSFs'' means fees paid by a manufacturer to an entity, that represent fair market value for a bona fide, itemized service actually performed on behalf of the manufacturer that the manufacturer would otherwise perform (or contract for) in the absence of the service arrangement, and that are not passed on in whole or in part to a client or customer of an entity, whether or not the entity takes title to the drug. In the CY 2007 PFS final rule, we stated that the BFSF definition provides an appropriate safeguard against the potential risk for inappropriately

[98] *https://bjui-journals.onlinelibrary.wiley.com/doi/full/10.1111/bju.15925.*

[99] *https://www.sciencedirect.com/science/article/pii/S2405456923001232.*

[100] *https://www.jelmyto.com/hcp/pdf/jelmyto-antegrade-instillation-overview.pdf.*

inflated ASPs. We stated that if a manufacturer has determined that a fee paid meets the other elements of the definition of ''bona fide service fee,'' then the manufacturer may presume, in the absence of any evidence or notice to the contrary, that the fee paid is not passed on to a client or customer of any entity. Further, we stated (71 FR 69669) that in the absence of specific guidance in the Act or Federal regulations, the manufacturer may make reasonable assumptions in its calculations of the manufacturer's ASP, consistent with the general requirements and intent of the Act, Federal regulations, and its customary business practices. We stated that these assumptions may be submitted along with the ASP data.

Accurate assessment and reporting of price concessions and BFSFs are essential to correctly calculating the manufacturer's ASP. Improperly classifying price concessions as BFSFs would artificially increase the manufacturer's ASP resulting in Medicare overpayments and higher coinsurance amounts paid by beneficiaries.

In December of 2022, the Office of Inspector General (OIG) published a report entitled ''Manufacturers May Need Additional Guidance to Ensure Consistent Calculations of Average Sales Prices'' (hereinafter referred to as the December 2022 OIG report).[101] That report recommended CMS actively review current guidance related to areas identified in the report and determine whether additional guidance would ensure more accurate and consistent ASP calculations. One area identified was how bundled sales price concessions should be incorporated into the manufacturer's ASP calculation. Manufacturers noted they would like additional guidance regarding whether unbundling a bundled arrangement should include just the discounts contingent on purchase or performance or all discounts that are part of the arrangement, how to treat bundled sales that include covered and noncovered products, and how manufacturers should identify and reallocate discounts with sales that may be considered bundled across time periods.

This report also recommended CMS give particular consideration to guidance regarding BFSFs. Manufacturers surveyed in the report expressed that there could be inconsistencies and differences in how manufacturers interpret the BFSF definition. For example, manufacturers noted that CMS has not defined the term fair market value (FMV) for the purposes of the BFSF. The report states that CMS should provide additional guidance on the methodology that manufacturers should use to assess FMV and clarify a timeframe after which manufacturers should reassess the FMV of BFSFs.

In addition to the recommendations from the December 2022 OIG report, we have concern that certain costs could be classified as BFSFs when they should instead be classified as a price concession in some instances. Further, we are concerned that certain costs that are classified as BFSFs may not represent the FMV for the service. Lastly, the current policy that manufacturers may presume none of the fees are passed on in whole or in part may allow for certain costs to be misclassified when reasonable inquiry would demonstrate that fees are indeed passed on. Such occurrences would likely impact the accuracy of ASP data that is reported to CMS each quarter.

For these reasons, in this proposed rule, we are proposing policies to provide additional guidance on two aspects of the calculation of manufacturer's ASP. First, we are proposing regulatory text to specify when certain fees are considered price concessions and on how manufacturers should allocate pricing for drugs sold under a bundled arrangement. Second, we are proposing to revise the definition of BFSFs by (1) specifying the methodology that should be used to determine FMV and the time period after which manufacturers should reassess the FMV; and (2) further explaining what CMS considers to be sufficient evidence of whether or not a fee is passed on in whole or in part to an affiliate,[102] client, or customer of an entity. We are also proposing that in the absence of specific guidance, manufacturers be required to submit any reasonable assumptions they utilize for manufacturer's ASP calculations (which is currently voluntary), including documentation of the methodology used to determine fair market value and periodic reviews of fair market value. We propose that manufacturers must also submit a warranty or certification from the recipient of the fee that it is not passed on in whole or in part to an affiliate, client, or customer of an entity. Finally, in this proposed rule, we will provide certain non-exhaustive examples of fees that CMS considers to be price concessions and not BFSFs.

The goal of these proposed policies is to avoid inaccurate calculation of the manufacturer's ASP that is used to determine Part B drug payment limits. These proposed policies also will clarify how certain costs should be considered under newer pharmaceutical business practices that may not have been considered when Medicare last finalized the definition of BFSFs in 2007.

b. Price Concessions

As discussed in the background section, the statute requires that the manufacturer's ASP include volume discounts, prompt pay discounts, cash discounts, free goods that are contingent on any purchase requirement, chargebacks, and rebates (other than rebates under the Medicaid Drug Rebate Program and the Medicare Prescription Drug Inflation Rebate Program).

Manufacturers can offer certain price concessions as part of bundled arrangements in which price concessions are treated as discounts that are tied to the purchase of the same drug or item or multiple drugs or items. They can also be discounts contingent on certain performance requirements, such as achievement of market share. In addition, price concessions as part of a bundled arrangement may include only Part B drugs or may include both Part B drugs and other products or services. These price concessions within bundled arrangements are accounted for in the calculation of the manufacturer's ASP.

We discussed bundled price concessions and considered how manufacturers could apportion such discounts to calculate the manufacturer's ASP in the CY 2007 PFS final rule (71 FR 69673 through 69676). We stated that given the potentially wide range of bundling arrangements that might exist, based on the information we had about such arrangements, we could not determine at that time whether there is a universal approach for treating bundled price concessions in the manufacturer's ASP calculation that would address all potential structures of bundling arrangements in a manner that would achieve our goal of ensuring the accuracy of the ASP payment methodology and preventing inappropriate financial incentives. Then, in the Medicare Payment Advisory Commission's (MedPAC) January 2007 Report to Congress, ''Impact of Changes in Medicare

[101] Manufacturers May Need Additional Guidance To Ensure Consistent Calculations of Average Sales Price, Office of Inspector General, U.S. Department of Health and Human Services. December 2022. *https://oig.hhs.gov/documents/evaluation/3215/OEI-BL-21-00330-Complete%20Report.pdf*.

[102] Affiliate meaning the affiliate of an entity that is receiving the fee that is providing the service.

Payments for Part B Drugs,'' [103] they discussed the issue of allocation of bundled price concessions for purposes of calculating the manufacturer's ASP, noting that ''some manufacturers offer provider discounts for one of their products contingent on purchases of one or more other products.'' In light of MedPAC's recommendation that CMS address the ASP reporting requirements for bundled products and our discussion of bundled price concessions in the CY 2007 PFS rulemaking, we stated in the CY 2008 PFS proposed rule (72 FR 38150 through 38151) that we believe specific guidance in the ASP context is warranted to ensure consistency in ASP reporting across manufacturers and to enhance the accuracy of the ASP payment system. We stated at that time that we found MedPAC's suggestion not to defer further guidance in this area compelling with respect to the potential that manufacturers may make differing assumptions in the absence of specific guidance on how to allocate bundled price concessions in the context of ASP. However, in the CY 2008 PFS final rule (72 FR 66256 through 66258), based on comments recommending a delay and to better understand the concerns stated by the commenters, we did not finalize the regulatory language changes we proposed in the CY 2008 PFS proposed rule at that time. However, we explained that in the absence of specific guidance, manufacturers may make reasonable assumptions in their calculation of ASP, consistent with the general requirements and the intent of the Act, Federal regulations, and their customary business practices.

In the 2007 Prescription Drugs final rule (72 FR 39144 through 39145), Medicaid finalized a definition of the term ''bundled sale'' for the purpose of calculating the average manufacturer price (AMP) and best price, which is codified at § 447.502. The definition was revised in the CY 2016 Covered Outpatient Drugs final rule (81 FR 5181 through 5183) and the 2020 Establishing Minimum Standards in Medicaid State Drug Utilization Review and Supporting Value-Based Purchasing for Drugs Covered in Medicaid, Revising Medicaid Drug Rebate and Third Party Liability Requirements final rule (85 FR 87022 through 87024). The current definition states that a bundled sale means any arrangement regardless of physical packaging under which the rebate, discount, or other price concession is conditioned upon the purchase of the same drug, drugs of different types (that is, at the nine-digit National Drug Code (NDC) level) or another product or some other performance requirement (for example, the achievement of market share, inclusion or tier placement on a formulary), or where the resulting discounts or other price concessions are greater than those which would have been available had the bundled drugs been purchased separately or outside the bundled arrangement. The definition further states: (1) The discounts in a bundled sale, including those discounts resulting from a contingent arrangement, are allocated proportionally to the total dollar value of the units of all drugs or products sold under the bundled arrangement; (2) For bundled sales where multiple drugs are discounted, the aggregate value of all the discounts in the bundled arrangement must be proportionally allocated across all the drugs or products in the bundle; and (3) Value-based purchasing (VBP) arrangements may qualify as a bundled sale.

We are aware that many manufacturers currently utilize portions of the Medicaid definition of bundled sales to identify any bundled arrangements for the purposes of their ASP calculations. In addition, we noted in the CY 2008 PFS final rule (72 FR 66257 through 66258), that most commenters supported an appropriately consistent approach for the treatment of bundled price concessions with both AMP and ASP calculations. We also stated our intention at that time to remain consistent, as appropriate, with the final policy adopted in the 2007 Prescription Drugs final rule (72 FR 39144 through 39145).

As discussed in the background section, the December 2022 OIG report recommended that CMS consider providing additional guidance with regard to how bundled sales price concessions should be incorporated into the manufacturer's ASP calculation. The report stated specifically that one manufacturer requested additional guidance pertaining to bundled sales discounts for the following:

- Whether unbundling a bundled arrangement should include just the discounts contingent on purchase or performance requirements or all discounts that may be part of the underlying arrangement.
- How to treat bundled sales that include both covered products and noncovered products (that is, products for which there is no government price reporting obligation).
- How manufacturers should identify and reallocate discounts associated with sales that may be considered bundled across time periods. The manufacturer stated that CMS guidance on these types of temporal bundling will be critical because they will play an important role in the implementation and evaluation of value- and outcomes-based arrangements, which may require assessing the efficacy of a drug over multiple reporting periods.

Therefore, in this proposed rule, we propose to add a definition of the term bundled arrangement to § 414.802, similar to that which was proposed in the CY 2008 PFS proposed rule. Specifically, we are proposing the definition to state ''Bundled Arrangement means an arrangement regardless of physical packaging under which the rebate, discount, or other price concession is conditioned upon the purchase of the same drug or biological or other drugs or biologicals or another product or some other performance requirement (for example, the achievement of market share, inclusion or tier placement on a formulary, purchasing patterns, prior purchases), or where the resulting discounts or other price concessions are greater than those which would have been available had the bundled drugs or biologicals been purchased separately or outside the bundled arrangement.'' We also propose adding subparagraphs (iii) and (iv) at § 414.804(a)(2) to provide manufacturers with additional guidance on how to allocate discounts under bundled arrangements, which aligns with Medicaid's definition of bundled sale further described later in this section. This proposal aligns with our previously stated intent to remain consistent, as appropriate, with Medicaid's policy for calculating AMP and aligns with supportive comments discussed in the CY 2007 and 2008 PFS final rule discussions on this topic.

Second, to address the suggestion that the agency determine whether additional guidance would be appropriate for the areas described in the December 2022 OIG report for how to account for unbundling a bundled arrangement, we note that Medicaid's definition of ''bundled sale'' at § 447.502 directs that discounts in a bundled sale, including those discounts resulting from a contingent arrangement, are allocated proportionally to the total dollar value of the units of all drugs or products sold under the bundled arrangement. In other words, as noted in 81 FR 5181 through 5183, the ''unbundling'' of both contingent and non-contingent discounts is appropriate because ''all

[103] Impact of Changes in Medicare Payments for Part B Drugs, Medicare Payment Advisory Commission. January 2007. *https://www.govinfo.gov/content/pkg/GOVPUB-Y3_M46_3-PURL-LPS78409/pdf/GOVPUB-Y3_M46_3-PURL-LPS78409.pdf.*

the discounts'' in the bundled arrangement should be proportionally allocated. We propose to adopt this approach for the calculation of the manufacturer's ASP because of our stated intent for consistency with policies for AMP. Consistent application of this policy by all manufacturers reduces the opportunity for improper manipulation of the ASP calculation, providing greater certainty to CMS of the integrity of the submitted ASP. We are, therefore, proposing the same regulatory language be added to § 414.804(a)(2) under paragraphs (iii) and (iv).

Third, to address the suggestion that the agency determine whether additional guidance would be appropriate for the areas described in the December 2022 OIG report for how to allocate discounts for bundled sales, we propose that for bundled sales containing both Medicare Part B-covered and non-covered products, manufacturers allocate discounts proportionally as described in the previous paragraph. However, we have heard from interested parties that this method may not be sufficient to cover all cases and could potentially result in inaccurate ASPs. Bundled arrangements may vary depending upon the number and type of products included in a bundling arrangement, whether the price concessions are contingent on the purchase of only one product, the purchase of multiple products, or the inclusion of one or more products on a formulary, and the timing of the price concessions. For example, a different allocation method may be needed to account for variable costs per product in the bundled arrangement. We solicit comment on if there are other methods of allocating discounts in these circumstances that would more accurately represent ASP.

Finally, to address the suggestion that the agency determine whether additional guidance would be appropriate for the areas described in the December 2022 OIG report as it relates to how to reallocate discounts associated with sales that may be considered bundled across time periods (for example, outcomes-based arrangements or value-based purchasing arrangements), we are *not* proposing to adopt the portion of the Medicaid definition of bundled sale stating that value-based purchasing arrangements may qualify as a bundled sale because we are continuing to evaluate how value-based purchasing arrangements should be considered for drugs payable under Medicare Part B. We solicit comments on how discounts associated with sales that may be considered bundled across time periods could be accounted for in the manufacturer's ASP calculation.

We solicit comments on this proposal.

c. Bona Fide Service Fees

As described in the background section above, currently, the term ''BFSFs'' means fees paid by a manufacturer to an entity, that (1) represent FMV (2) for a bona fide, itemized service actually performed on behalf of the manufacturer (3) that the manufacturer would otherwise perform (or contract for) in the absence of the service arrangement, and (4) that are not passed on in whole or in part to a client or customer of an entity, whether or not the entity takes title to the drug.[104] A fee must meet all four conditions of the definition to be considered a BFSF rather than a price concession to be deducted from ASP. We are proposing two changes to the BFSFs regarding (1) what is considered FMV and (2) proposing what evidence is required to be provided by a manufacturer to show that a fee is not passed on in whole or in part to an affiliate, client, or customer of an entity, whether or not the entity takes title to the drug. In addition, we are proposing an addition to the list of price concessions to include when certain fees paid by a manufacturer are presumed to be price concessions.

(1) Fair Market Value

One element of the definition of BFSFs specifies that the fees must represent FMV for the service. To date, we have not issued guidance on a specific method that manufacturers must use to determine whether a fee represents FMV. In the CY 2007 PFS final rule (71 FR 69666 through 69670), we stated that the appropriate method or methods for determining whether a fee represents FMV may depend upon the specifics of the contracting terms, such as the activities the entity will perform and the agreed-upon mechanism for establishing the payment (for example, percentage of goods purchased). We stated in that final rule that we believe manufacturers are well-equipped to determine the most appropriate, industry-accepted method for determining FMV of drug distribution services for which they contract. Therefore, we did not mandate the specific method manufacturers must use to determine whether a fee represents FMV for purposes of excluding BFSFs from the calculation of ASP.

As discussed in the background section above, the December 2022 OIG report identified BFSFs as an area where CMS could provide additional guidance to manufacturers and further stated that manufacturers expressed that competitors may be taking disparate approaches when applying CMS's four-part test to make these determinations. In some cases, BFSFs that are very high could mask price concessions that are passed on by the entity performing the bona fide service so that the product's ASP can remain high. Conversely, certain fees that are BFSFs could be incorrectly classified as a price concession to reduce the manufacturer's ASP and mask price increases that could be faster than the rate of inflation for purposes of the Medicare Prescription Drug Inflation Rebate Program. Consequently, we recommend additional guardrails to ensure that BFSFs are correctly identified, and that the manufacturer's ASP is not manipulated to be artificially increased or decreased.

Accordingly, in this proposed rule, we are (1) proposing revisions to the definition of BFSFs at § 414.802 that retains the existing four prong test (as described in the background section) and adds proposed requirements for the standards and the methodology that should be used to determine the FMV for such fees; (2) the time period after which manufacturers should reassess the FMV; and (3) any FMV analysis of fees that vary directly with the amount of drug sold or price of a manufacturer's drug must be conducted by an independent third party that does not have a conflict of interest.

Based on the structure or arrangement of certain fees that meet the definition of BFSF, we propose additional requirements for the standards and methodology that should be used to determine FMV. Specifically, we propose that for fees paid by a manufacturer to an entity that do not vary directly with the amount of drug sold or price of a manufacturer's drug, that the FME must be determined either based on comparable market transactions that generally reflect current market conditions or the cost of the service plus a reasonable markup to the total cost.

We propose that, for fees paid by a manufacturer to an entity that vary directly with the amount of drug sold or price of a manufacturer's drug, the FMV must be determined by using the cost of the service and adding a reasonable markup to the total cost. If any material portion of cost data is not available, manufacturers should follow a market-based approach based on verifiable market data until such time as sufficient cost data becomes available. In addition,

[104] 42 CFR 414.802.

we propose that under such circumstances that the FMV assessment must be conducted by an independent third-party valuator. This means that the valuator must not have any financial relationship (other than the arrangement to conduct FMV analyses) with either party to the arrangement and no stake in the outcome of the valuation. The FMV analysis must be documented with a clear explanation, including a description of the methodology used.

Regarding FMV assessments, we propose manufacturers conduct periodic updates of any FMV analyses for service arrangements that are ongoing, at a frequency no less than the renewal frequency of the agreement (that is, annually for annual renewals). Documentation of this update should be included in the reasonable assumption documentation that corresponds with the quarter when the update is conducted. Implementing standards and defining the methodology manufacturers must use to determine FMV will better establish uniform industry practices and provide the desired clarity requested by manufacturers in the December 2022 OIG report.

We solicit comments on this proposal.

(2) Fees Presumed To Be Price Concessions

We are proposing revisions to § 414.804(a)(2) to specify when certain fees should be presumed to be price concessions. Specifically, we propose that if fees paid by a manufacturer to an entity vary directly with the amount or price of a manufacturer's drugs (that is, the fees paid are (i) percentage-based fees or (ii) flat fees or fixed fees that are designed in such a way as to approximate percentage-based fees), such fees are presumed to be price concessions to be deducted from the calculation of the manufacturer's ASP unless such manufacturer determines such fees to be FMV using a cost-based approach which may be further validated with market-based data.

(3) Evidence

Another element of the BFSF definition specifies that the BFSF must not be passed on, in whole or in part, to a client or customer of an entity. When finalizing the CY 2007 PFS final rule (71 FR 69669 through 69670), we stated that there may be significant barriers that limit a manufacturer's ability to determine whether a fee that otherwise meets the definition of BFSF is passed on, in whole or in part, to a client or customer of any entity. We noted in the preamble section of that rule that we believe that it is essential to retain the ''not passed on'' element in the definition of BFSFs given that the ''not passed on'' element is a key factor in distinguishing a price concession from a BFSF because, if a fee that is passed on is excluded from the ASP calculation, then there is a greater risk of the ASP being inappropriately inflated. We stated that if a manufacturer has determined that a fee paid meets the other elements of the definition of ''bona fide service fees,'' then the manufacturer may presume, in the absence of any evidence or notice to the contrary, that the fee paid is not passed on to a client or customer of any entity.

There may be certain fees that a manufacturer classifies as BFSFs for the purposes of calculating the manufacturer's ASP that should actually be considered price concessions and, therefore, deducted from the manufacturer's ASP. In the December 2022 OIG report, manufacturers reported inconsistent practices in the treatment of BFSFs. As such, we propose that it is no longer appropriate that a manufacturer may presume, in absence of any evidence or notice to the contrary, that a fee paid is not passed on to an affiliate, client, or customer of any entity. This proposed revision to the definition specifies that, in addition to a client or customer of any entity, that the fee also shall not be passed on to an affiliate, which means an affiliate of an entity that is receiving the fee the tis providing the service. We propose the addition of the word affiliate to more comprehensively address the type of arrangements that may exist between certain entities.

In addition, we propose that the manufacturer be responsible for obtaining a certification or warranty from the entity receiving the fee stating that such fee will not be passed on to an affiliate, client, or customer of any entity. We are proposing to add new subparagraph § 414.804(a)(5)(iii) requiring manufacturers to provide certification letters from any recipient of a BFSF that the fee is not passed on in whole or in part to an affiliate, client or customer of an entity, whether or not the entity takes title to the drug.

We also propose to revise § 414.804(a)(5) to add additional data submission requirements. This paragraph currently states that the manufacturer's average sales price must be calculated by the manufacturer every calendar quarter and submitted to CMS within 30 days of the close of the quarter. The first quarter submission must be submitted by April 30, 2004. Subsequent reports are due not later than 30 days after the last day of each calendar quarter. We are proposing to add a header to this section titled ''Submission Requirements'' and remove ''The first quarter submission must be submitted by April 30, 2004. Subsequent reports are due not later than 30 days after the last day of each calendar quarter.'' We are also proposing to add three paragraphs (i, ii, and iii). The proposed text would be revised to state that manufacturers must submit the following to CMS within 30 days of the close of the quarter:

- The manufacturer's average sales price, which must be calculated by the manufacturer every calendar quarter. The first quarter submission must be submitted by April 30, 2004.
- Effective January 1, 2026, reasonable assumptions for calculation of the manufacturer's ASP including the fair market value analysis for bona fide service fees, consistent with the general requirements and intent of the Act, Federal regulations, and its customary business practices, including documentation of the methodology used to determine fair market value and periodic reviews of fair market value.
- Effective January 1, 2026, certification letter from the recipient of a bona fide service fee (as defined under § 414.802) as evidence that the fee is not passed on in whole or in part to an affiliate, client, or customer of an entity, whether or not the entity takes title to the drug.

These data submission requirements, if finalized, would be effective for sales occurring January 1, 2026, and after and that data would be due to CMS by April 30, 2026, and used in the July 2026 pricing file. The newly proposed certification letter should be submitted in the current portal and uploaded under reasonable assumptions. Lastly, manufacturers must maintain and submit to CMS a copy of the FMV analysis, confirming it was conducted in a timely manner, documentation (such as a certification letter from the recipient of the fee) that the fee is not passed on in whole or in part to an affiliate, client or customer of an entity, whether or not the entity takes title to the drug, and documentation (such as a mutual representation in the relevant services agreement) that both parties have agreed to represent the payment as a BFSF in a consistent manner to all third parties, including any affiliates, clients, and governmental agencies.

We solicit comment on this proposal.

(3) Further Guidance on the BFSF Definition

In the CY 2007 PFS final rule (71 FR 69667 through 69668), we discussed the option of providing a list of bona fide

services. However, many commenters at that time were opposed to establishing a list of bona fide services because it would require ongoing refinement for manufacturers to accurately calculate ASP. In that final rule, we did not establish a list of bona fide services because we wanted to avoid inadvertently limiting the scope of what could constitute a bona fide service. We continue to believe that constructing an exhaustive list could be prohibitive over time. However, in this proposed rule, we are proposing some specific, non-exhaustive examples of fees and how they should be considered in the calculation of manufacturer's ASP.

First, we note that certain payments by drug manufacturers to drug distributors, which lower the price that distributors and purchasing physicians pay, appear to be price concessions. In 2024, the Department of Justice filed a complaint against a manufacturer alleging the company engaged in fraudulent drug price reporting practices by classifying payments to distributors to cover credit card processing fees as BFSFs instead of price concessions.[105] The manufacturers' payment allegedly enabled the purchasers of the product to use credit cards to purchase drugs from the distributor without incurring an additional fee that would otherwise be charged, while also taking advantage of the benefits of using credit cards, such as ''cash back'' and other credit card rewards. This type of arrangement would lower the price of the drug to both the distributor and the distributors' customers and the manufacturers' payments should be classified as price concessions, which are deducted from ASP, not BFSFs.

Second, as discussed in our Autologous Cell-based Immunotherapy and Gene Therapy Payment proposal, we also propose that any payment by the manufacturer to an entity for tissue procurement is not considered a BFSF for the purposes of calculating the manufacturer's ASP since this is an integral part of the manufacturing process for autologous cell-based immunotherapy or gene therapy and should be included in the price of the product.

Third, certain fees for data sharing services about the product appear to exceed the FMV for the service or are not for bona fide services because the data is required for legal compliance and audit purposes under the services agreement (such as complete and timely data to validate that a rebate or discount has been earned or is not duplicative prior to its payment by the manufacturer). If a manufacturer pays an entity for providing data back to the manufacturer about the product being sold, that fee should be assessed for FMV as discussed previously in this section and we propose a certification or warranty from the entity providing the service that the fee is not passed on in whole or in part to an affiliate, client, or customer of an entity. As proposed previously in this section, we propose that such certification or warranty should be submitted by the manufacturer to CMS as part of the quarterly ASP data submission.

Lastly, certain fees paid for distribution services appear to exceed the FMV for the service. Similar to data sharing services, if a manufacturer pays an entity for distributing their product, the fee should be assessed for FMV, and we propose a certification or warranty should be provided by the entity providing the service that the fee is not passed on in whole or in part to an affiliate, client, or customer of an entity. As proposed previously in this section, we propose that such certification or warranty should be submitted by the manufacturer to CMS as part of the quarterly ASP data submission.

We solicit comment on these proposals.

d. Summary

In summary, we are proposing to add a definition of bundled arrangement at § 414.802 and to update § 414.804(a)(2) to provide guidance to manufacturers regarding pricing of bundled price concessions. We are also proposing new regulatory text at § 414.804(a)(2)(i) to specify when certain fees are considered price concessions. We propose revisions to the definition of BFSFs at § 414.802 to specify: (1) standards and the methodology that should be used to determine FMV for such fees; (2) the time period after which manufacturers should reassess the FMV; and (3) that any FMV analysis regarding BFSFs that vary directly with the amount of drug sold or price of a manufacturer's drug must be conducted by an independent third party that does not have a conflict of interest. Further, we propose revising § 414.804(a)(5) to update requirements for ASP data submissions as they relate to reasonable assumptions and evidence that BFSFs are not passed on. Finally, we are proposing a non-exhaustive list of certain fees that we either do not consider BFSFs or may not be in line with FMV.

3. Average Sales Price: Units Sold at Maximum Fair Price

The Act establishes the Medicare Drug Price Negotiation Program (the ''Negotiation Program'') to negotiate a maximum fair price (MFP)[106] for certain high expenditure, single source drugs payable under Medicare Part B and covered under Part D (each, a ''selected drug''). For the initial price applicability year 2026, CMS reached agreement on a negotiated price for all 10 selected drugs covered under Part D. Then, for initial price applicability year 2027, CMS selected an additional 15 drugs covered under Part D. For the third year of the Negotiation Program, initial price applicability year 2028, CMS will select for negotiation up to 15 high expenditure, single source drugs payable under Part B and/or covered under Part D.

Beginning in initial price applicability year 2028, for selected drugs payable under Part B, section 1847A(b)(1)(B) of the Act sets the Medicare Part B payment limit during the price applicability period as 106 percent of MFP. Payment limits are published on the ASP drug pricing file, which is updated quarterly. For selected drugs with a negotiated price for initial price applicability year 2026 and 2027 that have utilization under Medicare Part B, we clarify that the Part B payment limit will not be based on the MFP unless it is selected for renegotiation, pursuant to section 1194(f)(3) of the Act and as discussed in section 130.2 of the Medicare Drug Price Negotiation Program: Draft Guidance, Implementation of sections 1191 through 1198 of the Act for Initial Price Applicability Year 2028 and Manufacturer Effectuation of the Maximum Fair Price in 2026, 2027, and 2028; [107] and there is an agreed-upon renegotiated MFP.

Manufacturers of drugs payable under Part B are required to report the manufacturer's ASP to CMS each quarter as described in sections 1927(b)(3) and 1847A(f) of the Act, even when a drug is a selected drug with an MFP, including a renegotiated MFP. The statute directs that the manufacturer's ASP include sales to all purchasers in the United States (section 1847A(c)(1) of the Act) with two exempted categories of sales: (1) sales exempt from best price under section 1927(c)(1)(C)(i) of the Act; and (2) sales that are merely nominal in

[105] United States Files Complaint Against Regeneron Pharmaceuticals Alleging Fraudulent Drug Price Reporting, District of Massachusetts, United States Attorney's Office. April 2024. *https://www.justice.gov/usao-ma/pr/united-states-files-complaint-against-regeneron-pharmaceuticals-alleging-fraudulent-drug.*

[106] Defined at section 1191(c)(3) of the Act.

[107] See: *https://www.cms.gov/files/document/ipay-2028-draft-guidance.pdf.*

amount as applied for purposes of section 1927(c)(1)(C)(ii)(III) of the Act, as limited by section 1927(c)(1)(D) of the Act. Units of drugs sold at MFP do not fall in either of those categories. In addition, units sold at MFP are expressly included in the determination of best price, as stated in section 1927(c)(1)(C)(ii)(V) of the Act. Therefore, since the statutory language does not expressly or implicitly exempt units of Medicare Part B or Part D MFP sales from the calculation of the manufacturer's ASP, we clarify in this proposed rule that units of selected drugs sold at MFP are included in the calculation of the manufacturer's ASP described in section 1847A(c) of the Act effective January 1, 2026.

The file used for publishing payment limits for drugs covered under Part B is usually referred to as the ''ASP drug pricing file'' likely because most drugs listed on the file have a payment limit based on the ASP (usually 106 percent of ASP). However, the file also contains the payment limits based on other pricing metrics. For example, several provisions in section 1847A of the Act require that the payment limit be based on a pricing metric other than ASP under specific circumstances, including the following:

- When the Wholesale acquisition cost (WAC) is less than ASP for a single source drug or biological (section 1847A(b)(4) of the Act);
- When ASP exceeds the widely available market price (WAMP) or average manufacturer price (AMP) (section 1847A(d) of the Act); and
- For a selected drug, 106 percent of MFP (section 1847A(b)(1) of the Act).

In such circumstances, only the actual payment limit is published on the pricing file (and no ASP information is displayed).

4. Autologous Cell-Based Immunotherapy and Gene Therapy Payment

a. Background

Medicare Part B covers many cellular immunotherapies and gene therapies that are FDA-approved under a biologics license application (BLA) as incident to drugs and biologicals under section 1861(s)(2) of the Act, which are paid under section 1847A of the Act (typically, at ASP plus 6 percent). Cell-based autologous therapies are a particular subset, which require cells to be collected from the patient, altered to create the intended therapy, and then administered to the same patient for treatment of a condition. These steps generally include cell collection from the patient via apheresis (including leukapheresis), surgical removal, biopsies or other means, the cells are immediately transported at very low temperatures to a manufacturing site for genetic engineering and/or other steps (for example, activation, cell expansion, and/or quality testing). After the manufacturing steps are complete, the final product is transported back to the healthcare provider or treatment facility to be administered to the patient.

For example, for Chimeric Antigen Receptor (CAR) T-cell therapy, T-cells are collected from the patient via leukapheresis and genetically engineered to express a chimeric antigen receptor that will bind to a certain protein on a patient's cancerous cells. The CAR T-cells are then administered to the same patient to attack certain cancerous cells. For other autologous cell-based therapy, the preparatory and manufacturing steps follow a similar general process.

Many studies show that the manufacturing steps for these therapies have a very high cost of goods sold (COGS), including very high proportion of labor costs in manufacturing, which ultimately leads to a high final cost of the therapy.[108] [109] Some also note that the acquisition of raw materials, including tissue procurement, and quality-related activities are other top contributors to the COGS for autologous cell-based therapies. As technologies advance, there has been continued research to scale cell-based therapies, including a possible shift to allogeneic cell therapy, in which cell collection would be from healthy donors or stem cells. Manufacturing allogenic cell-based therapy would allow the therapy to be ready ahead of time instead of the multiple-week wait time between cell collection and administration of the treatment for allogeneic therapies.[110] [111] [112] Throughout research and discussions of cell-based therapies, tissue procurement is a key consideration in the discussion of the COGS. This further distinguishes all types of tissue procurement, whether it be for allogenic or autologous therapies, are part of the COGS and part of the manufacturing process for the products.

As technologies for autologous cell-based immunotherapies and gene therapies continue to advance, we aim for payment policies amongst these therapies to be consistent. Therefore, in this proposed rule, we are proposing policies for how Medicare pays for the manufacturing steps across all types of autologous cell-based immunotherapies and gene therapies and proposing how these steps should be considered by manufacturers when submitting ASP data to CMS.

b. Payment

Medicare payment for the manufacturing steps to CAR T-cell therapies have previously been discussed in rulemaking, specifically in the CY 2019, 2020, and 2021 Medicare hospital Outpatient Prospective Payment System (OPPS) and Ambulatory Surgical Center (ASC) payment system final rules and the CY 2025 Physician Fee Schedule (PFS) final rule. In the 2019 OPPS/ASC final rule (83 FR 58904 through 58908), we finalized policies for payment of four Level III CPT codes (0537T through 0540T). We finalized that CPT codes describing (1) harvesting of blood-derived T lymphocytes, (2) preparation of T lymphocytes for transportation, cryopreservation, and storage, and (3) preparation of the CAR T-cell therapy for administration are not payable under OPPS. We stated that these codes describe various steps required to collect and prepare the genetically modified T-cells, and Medicare does not generally pay separately for each step used to manufacture a drug or biological. We noted that the billing and payment codes for the CAR T-cell therapies include leukapheresis and dose preparation procedures because these services are included in the manufacturing of these biologicals. In that final rule, we also finalized to pay separately for the Level III CPT code describing the administration service for CAR T-cell therapy. This policy was reiterated in the CY 2020 and 2021 OPPS/ASC final rules (84 FR 61231 through 61234 and 85 FR 85949 through 85951, respectively).

[112] Pigeau GM, Csaszar E, Dulgar-Tulloch A. Commercial Scale Manufacturing of Allogeneic Cell Therapy. Front Med (Lausanne). 2018 Aug 22;5:233. doi: 10.3389/fmed.2018.00233. PMID: 30186836; PMCID: PMC6113399.

In September 2023, the CPT Editorial Panel deleted four Level III codes (0537T through 0540T) and created four new Level I codes (38225 through 38228) that describe only the steps of the complex CAR–T Therapy process performed and supervised by physicians: CPT code 38225 *(Chimeric antigen receptor T-cell (CAR–T) therapy; harvesting of blood-derived T lymphocytes for development of genetically modified autologous CAR–T cells, per day);* 38226 (*Chimeric antigen receptor T-cell (CAR–T) therapy; preparation of blood-derived T lymphocytes for transportation (e.g., cryopreservation, storage)*); 38227 (*Chimeric antigen receptor T-cell (CAR–T) therapy; receipt and preparation of CAR–T cells for administration*); 38228 (*Chimeric antigen receptor T-cell (CAR–T) therapy; CAR–T cell administration, autologous*). In the CY 2025 PFS final rule (89 FR 97779 through 97780), we finalized the policy to continue to bundle payment under the PFS for CAR–T services described under CPT codes 38225, 38226, and 38227. We stated that bundling payment is appropriate for these codes to align with OPPS policies to not pay separately for each step used to manufacture a drug or biological. In that final rule we also finalized to pay separately for CPT code 38228 (the service of CAR T-cell therapy administration), which aligns with OPPS policy.

To date, payment for procedures that are required for manufacturing other autologous cell-based immunotherapies and gene therapies (that are not CAR T-cell therapies) have not been explicitly addressed. As discussed in the background section above, the tissue procurement step for all autologous cell-based therapies is a pivotal part of the manufacturing process and a key component of the overall cost of the product, that is, COGS. In addition, if certain therapies could be scaled in a way that they could be allogenic in nature, we see that the tissue procurement step would even more clearly be considered a manufacturing step.

Therefore, in this proposed rule, we propose that preparatory procedures for tissue procurement required for manufacturing an autologous cell-based immunotherapy or gene therapy be included in the payment of the product itself. This proposal continues the current payment policies for CAR T-cell therapies as discussed earlier in this section and extends the same payment policy to other autologous cell-based therapies. In our evaluation of each therapy, there are similar sequences of steps as we described in the background section. Consistent with previous rulemaking, we propose that Medicare not pay separately for each step used to manufacture an autologous cell-based immunotherapy or gene therapy. In other words, Medicare does not pay separately for the collection of raw materials or labor associated with the collection of raw materials for a drug or biological that are essentially part of the COGS. Payment for the raw materials and any labor associated with collection of the raw materials is included in the payment of the drug or biological itself, using the billing and payment code for the product.

We solicit comments on the proposal to continue this policy for CAR T-cell therapies and extension of the policy to other autologous cell-based immunotherapy or gene therapies.

c. Average Sales Price

Payment limit calculations for drugs payable under Part B are done on a quarterly basis using the manufacturer's ASP (as defined in § 414.902) using methodology in section 1847A of the Act. Manufacturers are required to report ASP data to CMS under sections 1847A(f)(2) and 1927(b)(3) of the Act. Manufacturers are instructed to calculate the manufacturer's ASP in accordance with section 1847A(c) of the Act and § 414.804(a). To date, we have not addressed how manufacturers of autologous cell-based immunotherapy or gene therapy should account for the procedures for the collection of cells used to manufacture the product into the calculation of the manufacturer's ASP.

As discussed in section III.A.3.a. of this proposed rule, the COGS and manufacturing process for an autologous cell-based immunotherapy or gene therapy include tissue procurement (that is, the collection of cells from the patient). Consistent with the proposal in the previous section that preparatory procedures required for manufacturing an autologous cell-based immunotherapy or gene therapy be included in the payment of the product itself, we also propose that, beginning January 1, 2026 (that is, data reflecting sales beginning on that date), any preparatory procedures for tissue procurement required for manufacturing an autologous cell-based immunotherapy or gene therapy that are paid by the manufacturer be included in the calculation of the manufacturer's ASP. We also propose that any payment by the manufacturer to an entity for tissue procurement is not considered a bona fide service fee for the purposes of calculating the manufacturer's ASP since this is an integral part of the manufacturing process for autologous cell-based immunotherapy or gene therapy and should be included in the price of the product.

We solicit comment on this proposal.

d. Summary

In summary, we propose that preparatory procedures for tissue procurement required for manufacturing an autologous cell-based immunotherapy or gene therapy be included in the payment of the product itself and that, beginning January 1, 2026, any preparatory procedures for tissue procurement required for manufacturing an autologous cell-based immunotherapy or gene therapy that were paid for by the manufacturer be included in the calculation of the manufacturer's ASP.

B. Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

1. Background on RHC and FQHC Payment Methodologies

As provided in 42 CFR part 405 subpart X of our regulations, RHC and FQHC visits generally are defined as face-to-face encounters between a patient and one or more RHC or FQHC practitioners during which one or more RHC or FQHC qualifying services are furnished. RHC and FQHC practitioners are physicians, NPs, PAs, CNMs, clinical psychologists (CPs), licensed marriage and family therapists, mental health counselors, and clinical social workers, and under certain conditions, a registered nurse or licensed practical nurse that is furnishing care to a homebound RHC or FQHC patient in an area verified as having shortage of home health agencies. Transitional Care Management (TCM) services can also be paid by Medicare as an RHC or FQHC visit. In addition, Diabetes Self-Management Training (DSMT) or Medical Nutrition Therapy (MNT) sessions furnished by a certified DSMT or MNT program may also be considered FQHC visits for Medicare payment purposes. Only medically necessary medical, mental health, or qualified preventive health services that require the skill level of an RHC or FQHC practitioner are RHC or FQHC billable visits. Services furnished by auxiliary personnel (for example, nurses, medical assistants, or other clinical personnel acting under the supervision of the RHC or FQHC practitioner) are considered incident to the visit and are included in the per-visit payment.

RHCs generally are paid an all-inclusive rate (AIR) for all medically

necessary medical and mental health services and qualified preventive health services furnished on the same day (with some exceptions). The AIR is subject to a payment limit, meaning that an RHC will not receive any payment beyond the specified limit amount per visit. As of April 1, 2021, all RHCs are subject to statutory upper payment limits determined in accordance with section 1833(f) of the Act, as amended by section 130 of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260).

FQHCs were paid under the same AIR methodology until October 1, 2014. Beginning on that date, in accordance with section 1834(o) of the Act (as added by section 10501(i)(3) of the Patient Protection and Affordable Care Act (Pub. L. 111–148)), FQHCs began to transition to the FQHC PPS system, in which they are paid based on the lesser of the FQHC PPS rate or their actual charges. The FQHC PPS rate is adjusted for geographic differences in the cost of services by the FQHC PPS geographic adjustment factor (GAF). The rate is increased by 34 percent when an FQHC furnishes care to a patient that is new to the FQHC, or to a beneficiary receiving an initial preventive physical examination (IPPE) or has an annual wellness visit (AWV).

Both the RHC AIR and FQHC PPS payment rates were initially designed to reflect the cost of all services and supplies that an RHC or FQHC furnishes to a patient in a single day. These nearly all-inclusive rates are not adjusted at the individual level for the complexity of individual patient health care needs, the length of an individual visit, or the number or type of practitioners involved in the patient's care. Instead for RHCs, all costs for the facility over the course of the year are aggregated and an AIR is derived from these aggregate expenditures. The FQHC PPS base rate is updated annually by the percentage increase in the FQHC market basket reduced by a productivity adjustment. For CY 2025, we rebased and revised the 2017-based FQHC market basket to reflect a 2022 base year (89 FR 98023 through 98032).

2. Payment for Care Coordination Services

a. Background

In the last several years of rulemaking, we have expanded the scope of care coordination services (formerly referred to as care management services) that are billable using HCPCS code G0511. More recently, in the CY 2025 PFS final rule, we unbundled the individual HCPCS codes that make up G0511 (89 FR 97999 through 98000). We have also been engaged in a multi-year examination of coordinated and collaborative care services in professional settings, and as a result, established codes and separate payment to independently recognize and pay for these important services. As stated in the CY 2016 PFS Final Rule (80 FR 71080 through 71088), the care coordination included in services, such as office visits, does not always adequately describe the non-face-to-face care management work involved in primary care and similar care relationships. We noted that payment for office visits may not reflect all the services and resources required to furnish comprehensive, coordinated care management for certain categories of beneficiaries, such as those who are returning to a community setting following discharge from a hospital or skilled nursing facility (SNF) stay.

Over the last decade, we have updated RHC and FQHC payment policies as appropriate, and we remain committed to improving how Medicare payment recognizes the resources involved in furnishing covered services that encompass aspects of advanced primary care furnished by interprofessional care teams and typically concentrating on the delivery of appropriate preventive care to patients and the management of individuals' chronic conditions as they progress over time. As a result, we reaffirmed our support of primary care and recognized care management as one of the critical components of primary care by implementing significant changes aimed at better capturing the resources required for care management services, including chronic care management (CCM), principal care management (PCM), general behavior health integration (BHI), chronic pain management (CPM), transitional care management (TCM), remote physiologic monitoring (RPM), remote therapeutic monitoring (RTM), community health integration (CHI), principal illness navigation (PIN), PIN-peer support services and Advanced Primary Care Management (APCM). For RHCs and FQHCs, we established payment for these suites of care coordination services outside of the RHC AIR and FQHC PPS. That is, payment is made in addition to the otherwise billable visit.

In the CY 2025 PFS final rule (89 FR 97870 through 97874), we discussed how we established coding and payment under the PFS for a newly defined set of APCM services described and defined by three new HCPCS G-codes. This new coding reflects the recognized effectiveness and growing adoption of the advanced primary care approach to care. It also encompasses a broader range of services and simplifies the billing and documentation requirements, as compared to existing care management codes. The finalized coding for APCM incorporated elements of several existing care management services into a bundle that we have already considered to be care coordination services paid separately to RHCs and FQHCs using HCPCS code G0511 (for example, CCM and PCM). In addition, the coding for APCM incorporated elements of communication technology-based services (CTBS) into a bundle that we have already considered to be virtual communications paid separately to RHCs and FQHCs using HCPCS code G0071. Therefore, to allow RHCs and FQHCs the ability to simplify the billing and documentation requirements associated with furnishing APCM services we finalized in the CY 2025 PFS final rule to allow RHCs and FQHCs to bill for these services and receive separate payment.

Further, the APCM code sets vary by the degree of complexity of patient conditions (that is, non-complex and complex CCM for multiple chronic conditions or PCM for a single high-risk condition), and whether the number of minutes spent by clinical staff or the physician or non-physician practitioner (NPP) is used to meet time thresholds for billing. In the CY 2025 final rule, we finalized and adopted the three new APCM codes G0556, G0557, and G0558.

RHCs and FQHCs are required to use the more specific coding, that is, the three HCPCS G-codes listed above when furnishing APCM. These services are paid in addition to the otherwise billable visit under the RHC AIR methodology or FQHC PPS because we believe that they are similar to the other care coordination services, such as, CCM, PCM, and RPM. That is, APCM involves non-face to-face care coordination of which the costs associated with these services are not captured in the RHC AIR or FQHC PPS rate. Similarly to the care coordination services, payment for APCM is based on the PFS national non-facility rate. It is important to note that if RHCs and FQHCs furnish APCM services, the HCPCS codes for APCM are per calendar month bundles. Consequently, if the RHC/FQHC furnishes APCM then they would not bill for certain other individual care coordination services. For further discussion on duplicative services and concurrent billing restrictions regarding APCM policies, please refer to the CY 2025 PFS final rule (89 FR 97710).

b. Integrating Behavioral Health Into Advanced Primary Care Management (APCM)

In the CY 2018 PFS final rule, we established requirements and separate payment for general Behavioral Health Integration (BHI) and Psychiatric Collaborative Care Model (CoCM) services furnished in RHCs and FQHCs (82 FR 53169 through 53180). General BHI and Psychiatric CoCM services are based on a model of behavioral health integration that enhances usual primary care by adding two key services to the primary care team: care management support for patients receiving behavioral health treatment and regular psychiatric inter-specialty consultation. In the CY 2018 PFS final rule, we also initiated the use of HCPCS codes G0511 and G0512 to pay for general care coordination services and CoCM services, respectively.

As discussed in section II.G.1. of this proposed rule, we recognize that patients with chronic health conditions are ''more likely to have related behavioral health concerns and find it easier to improve chronic conditions when these concerns are also addressed.'' [113] Integrating behavioral health with primary care has been shown to improve outcomes like reduced depression severity, and enhancing patient's experience of care. [114] We explain that in response to comments received for CY 2025 rulemaking, for services paid under the PFS, we are proposing to create optional add-on codes for APCM services that would facilitate providing complementary BHI services.

As discussed previously in this section, we adopted the coding for the defined set of APCM services described and defined by HCPCS codes G0556, G0557, and G0558 to allow RHCs and FQHCs the ability to simplify the billing and documentation requirements associated with furnishing APCM services (89 FR 98010 through 98012). In addition, and similarly to the discussion in section II.G of this proposed rule, since RHCs and FQHCs that fulfill the requirements to bill for APCM services must comply with requirements that ensure the integrity of the services provided, we believe that these settings should also be able to provide BHI and CoCM with simpler billing and documentation requirements. Therefore, for CY 2026, in alignment with the PFS and goals associated with APCM services, we are proposing to adopt the add-on codes for APCM that would facilitate billing for BHI and CoCM services when RHCs and FQHCs are providing advanced primary care. We believe allowing for the use of these add-on codes would encourage RHCs and FQHCs to provide complementary BHI services, thereby improving access to BHI and CoCM for primary care patients in the RHC and FQHC settings. For further discussion regarding the optional add-on codes, please see section II.G.2 of this proposed rule.

In the CY 2025 PFS final rule (89 FR 98010), commenters suggested that we consider unbundling HCPCS code G0512, similarly to what we did with HCPCS code G0511. That is, unbundle the services that comprise HCPCS code G0512 and permit billing of HCPCS codes 99492, 99493, and 99494. Commenters explained that allowing RHCs and FQHCs to report the dedicated CPT codes would support and encourage the adoption of CoCM in these settings. In addition, since we are proposing use of add-on codes for APCM services to facilitate payment of BHI and CoCM services when they are furnished by RHCs and FQHCs providing advanced primary care services, we believe that we would also need to unbundle HCPCS code G0512 to effectuate that policy. RHCs and FQHCs that are furnishing BHI and CoCM as advanced primary care services would not be able to bill for certain other individual CPT codes, such as, 99492, 99493, and 99484.

Therefore, we are proposing to require RHCs and FQHCs to report the individual codes that make up the CoCM HCPCS code, G0512 beginning January 1, 2026. Similar to what was finalized in the CY 2025 PFS final rule (89 FR 98000 through 98010) for the general care management HCPCS code G0511, HCPCS code G0512 would no longer be payable when billed by RHCs and FQHCs; instead, RHCs and FQHCs will be required to bill the individual CPT and HCPCS codes that make up HCPCS G0512. The current list of base codes and add-on codes that make up G0512 are listed in Table 34, titled ''Psychiatric Collaborative Care Model HCPCS Codes and Descriptors.'' Payment for these services will be based on the national non-facility PFS payment rate when the individual code is on an RHC or FQHC claim, either alone or with other payable services and the payment rates are updated annually based on the PFS amounts for these codes. We are proposing to revise § 405.2464(c) to reflect our proposal on payment of CoCM services for RHCs and FQHCs.

TABLE 34: PSYCHIATRIC COLLABORATIVE CARE MODEL HCPCS CODES AND DESCRIPTORS

HCPCS Code	Short Descriptors	Long Descriptors
99492	1st psych collab care mgmt.; CoCM First Month, 70 minutes per calendar month	Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and that the treating physician or other qualified health care professional directs, with the following required elements: • Outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional. • Initial assessment of the patient, including administering validated rating scales, with the development of an individualized treatment plan • Review by the psychiatric consultant with modifications of the plan, if recommended. • Entering patient in a registry and tracking patient follow-up and progress using the registry, with proper documentation, and participation in weekly caseload consultation with the psychiatric consultant. • Provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.
99493	Sbsq psyc collab care management; CoCM Subsequent Months, 60 minutes per calendar month	Follow up psychiatric collaborative care management, first 60 minutes in a following month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: • Tracking patient follow-up and progress using the registry, with proper documentation • Participation in weekly caseload consultation with the psychiatric consultant. • Ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers. • Other review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations supplied by the psychiatric consultant. • Provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies. • Monitoring of patient outcomes using validated rating scales; and relapse prevention planning with patients as they achieve remission

HCPCS Code	Short Descriptors	Long Descriptors
		of symptoms, other treatment goals and prepare for discharge from active treatment.
99494	1st/subesq psyc collab care; Add-on CoCM (any month), each additional 30 minutes per calendar month.	Initial or subsequent psychiatric collaborative care management, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and that the treating physician or other qualified health care professional directs (list separately from the code for the primary procedure).
G2214	Init/sub psych care m 1st 30; Initial or subsequent psychiatric collaborative care management, 30 minutes of behavioral health care manager time per calendar month.	Initial or subsequent psychiatric collaborative care management, first 30 minutes in a month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional: • Tracking patient follow-up and progress using the registry, with proper documentation; participation in weekly caseload consultation with the psychiatric consultant. • Ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers. • Other review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations supplied by the psychiatric consultant. • Provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies. • Monitoring of patient outcomes using validated rating scales. • Relapse prevention planning with patients as they achieve remission of symptoms, or other treatment goals and prepare for discharge from active treatment.

BILLING CODE 4120–01–C

c. Payment for Communication Technology-Based Services (CTBS) and Remote Evaluation Services—HCPCS Code G0071

In the CY 2019 PFS final rule (83 FR 59683 through 59688), we established requirements and separate payment for certain CTBS and remote evaluation services in RHCs and FQHCs. Effective January 1, 2019, RHCs and FQHCs are paid for HCPCS code G0071 (Virtual Communication Services), when HCPCS code G0071 is on an RHC or FQHC claim, either alone or with other payable services, and at least 5 minutes of communication technology-based or remote evaluation services are furnished by an RHC or FQHC practitioner to a patient who has had an RHC or FQHC billable visit within the previous year, and the medical discussion or remote evaluation is for a condition not related to an RHC or FQHC service provided within the previous 7 days, and does not lead to an RHC or FQHC visit within the next 24 hours or at the soonest available appointment. At that time, HCPCS code G0071 comprised individual HCPCS codes G2012 (CTBS) and G2010 (remote evaluation services). For respective CTBS code descriptors, please refer to Table 35 in this section. The payment rate for HCPCS G0071 was set at the average of the PFS national non-facility payment rates for HCPCS code G2012 and HCPCS code G2010 for remote evaluation services.

(1) Updates to CTBS and Remote Evaluation Services Under the PFS

In the CY 2021 PFS final rule (85 FR 84532 through 84533), for practitioners billing under the PFS, we discuss additional policies as they relate to CTBS services. One of which was the establishment of HCPCS code G2250, which allows billing of CTBS by certain non-physician practitioners (NPPs), consistent with the scope of these practitioners' benefit categories, who cannot independently bill for evaluation and management (E/M) services. At the time of the CY 2021 PFS rulemaking we did not address the applicability of

G2250 for RHC and FQHC purposes. However, we acknowledge that the code descriptor for HCPCS code G2250 mirrors that of the existing HCPCS code G2010 in that both codes describe the remote assessment of recorded video and/or images submitted by an established patient (for example, store and forward), including interpretation with follow-up with the patient within 24 business hours, not originating from a related service provided within the previous 7 days nor leading to a service or procedure within the next 24 hours or soonest available appointment. Since HCPCS code G2250 describes remote evaluation services similarly to HCPCS code G2010 and certain non-physician practitioners are recognized as RHC and FQHC practitioners, we propose to consider HCPCS code G2250 as billable for separate payment when this service is furnished in an RHC or FQHC. Please see below for more detail on the proposals for CY 2026.

In CY 2025 PFS final rule (89 FR 97791 through 97794), for practitioners billing under the PFS, we discuss how the CPT Editorial Panel established new CPT code 98016 describing a brief virtual check-in encounter that is intended to evaluate the need for a more extensive visit (that is, a visit described by one of the office/outpatient E/M codes). We stated that the code descriptor for CPT code 98016 mirrored the existing HCPCS code G2012, which is described as a brief communication technology-based service, for example, virtual check-in, by a physician or other qualified health care professional who can report evaluation and management services, provided to an established patient, not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5 to 10 minutes of medical discussion). We further stated that given the similarity between CPT code 98016 and HCPCS code G2012, we finalized the replacement of HCPCS code G2012 with CPT 98016. That is, HCPCS code G2012 was terminated effective December 31, 2024. We inadvertently did not discuss the applicability of this code termination to RHCs and FQHCs; however, given our alignment with the PFS, beginning January 1, 2025 for HCPCS code G0071, CPT code 98016 was used for purposes of computing the payment rate.

(2) Proposal for CY 2026 for CTBS and Remote Evaluation Services

As we stated previously in section III.B.2.a. of this proposed rule, APCM includes elements of CTBS and remote evaluation services, however in the CY 2025 PFS final rule, we did not address how there are potential duplicative services with APCM and these services for RHCs and FQHCs (89 FR 98010 through 98012). Similarly with unbundling of G0512, we believe that we would also need to unbundle HCPCS code G0071 to better effectuate the payment policy for APCM. RHCs and FQHCs that are furnishing CTBS or remote evaluation services as advanced primary care services would not be able to bill for certain other individual CPT codes, such as, G2010, G2250, and 98016. Therefore, we are proposing to require RHCs and FQHCs to report the individual codes that make up HCPCS code G0071 beginning January 1, 2026. Payment for these services will be based on the national non-facility PFS payment rate when the individual code is on an RHC or FQHC claim, either alone or with other payable services and the payment rates are updated annually based on the PFS amounts for these codes. We are proposing to revise § 405.2464(e) to reflect our proposal for payment of CTBS and remote evaluation services for RHCs and FQHCs.

BILLING CODE 4120–01–P

TABLE 35: CODE DESCRIPTORS FOR COMMUNICATION TECHNOLOGY-BASED SERVICES AND REMOTE EVALUATION SERVICES

HCPCS Code	Short Descriptors	Long Descriptors
G0071	Communication Services by RHC/FQHC 5 minutes	Payment for communication technology-based services for 5 minutes or more of a virtual (non-face-to-face) communication between an rural health clinic (RHC) or Federally qualified health center (FQHC) practitioner and RHC or FQHC patient, or 5 minutes or more of remote evaluation of recorded video and/or images by an RHC or FQHC practitioner, occurring in lieu of an office visit; RHC or FQHC only.
G2010	Remote image submit by patient	Remote evaluation of recorded video and/or images submitted by an established patient (for example, store and forward), including interpretation with follow-up with the patient within 24 business hours, not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment).
G2012	Discontinued - Brief check in by MD/QHP	Brief communication technology-based service, for example, virtual check-in, by a physician or other qualified health care professional who can report evaluation and management services, provided to an established patient, not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5 to 10 minutes of medical discussion.

HCPCS Code	Short Descriptors	Long Descriptors
G2250	Remote image submitted by patient, non-E/M	Remote assessment of recorded video and/or images submitted by an established patient (for example, store and forward), including interpretation with follow-up with the patient within 24 business hours, not originating from a related service provided within the previous 7 days nor leading to a service or procedure within the next 24 hours or soonest available appointment.
98016	Brief communication technology-based service	Established patient brief communication technology-based service with 5 to 10 minutes of medical discussion.

BILLING CODE 4120–01–C

d. Aligning With the PFS for Care Coordination Services

(1) Background

Under the PFS, certain care management/coordination services are categorized as designated care management services and assigned general supervision for purposes of ''incident to'' billing. As we discuss in the CY 2017 PFS final rule (81 FR 80238), generally, we do not believe it is clinically necessary for the individuals on the team who provide these services other than the treating practitioner (namely, clinical staff) to have the treating practitioner immediately available to them at all times, as would be required under a higher level of supervision. We also discussed how the regulations under § 410.26(b), at that time, provided for an exception to assign general supervision to CCM services (and similarly, for the non-face-to-face portion of TCM services), because these are generally non-face-to-face care management/care coordination services that would commonly be provided by clinical staff when the billing practitioner (who is also the supervising practitioner) is not physically present; and the CPT codes comprise solely (or to a significant degree) non-face-to-face services provided by clinical staff (81 FR 80255).

For practitioners billing under the PFS, in an effort to better define general supervision and to assign general supervision not only to CCM services and the non-face-to-face portion of TCM services, but also to the then proposed codes., we amended §§ 410.26(a)(3) and 410.26(b). We amended § 410.26(a)(3) to better describe general supervision in the context of these services, and amended § 410.26(b) to assign general supervision to ''designated care management services'', stating that we will designate such services through notice and comment rulemaking (81 FR 80255 through 80256). We state at § 410.26(b)(5) that designated care management services can be furnished under general supervision of the physician (or other practitioner) when these services or supplies are provided incident to the services of a physician (or other practitioner). The physician (or other practitioner) supervising the auxiliary personnel need not be the same physician (or other practitioner) who is treating the patient more broadly. However, only the supervising physician (or other practitioner) may bill Medicare for incident to services.

Since CY 2017, when new care management/coordination services are proposed under the PFS, we also propose to add the new codes, when applicable, to the list of designated care management services for which we allow general supervision. Each year along with the proposed rule and the final rule we have published the codes for designated care management services assigned general supervision as supporting documentation. For example, for the CY 2025 PFS final rule, the file is titled ''CY 2025 Final Rule List of Designated Care Management Services.''

(2) RHC and FQHC Care Coordination Services

As we discuss in section III.B.2.a. of this proposed rule, over the last several years we have been increasing our focus on care coordination. These services have evolved to focus on preventing and managing chronic disease, improving a beneficiary's transition from the hospital to the community setting, or on integrative treatment of patients with behavioral health conditions. Care coordination services are typically non-face-to-face services that do not require the skill level of an RHC or FQHC practitioner. We have acknowledged that the care coordination included in services such as office visits does not always describe adequately the non-face-to-face care management work involved and may not reflect all the services and resources required to furnish comprehensive, coordinated care management for certain categories of beneficiaries.

We have noted previously that RHCs and FQHCs cannot bill under the PFS for RHC or FQHC services and individual practitioners working at RHCs and FQHCs cannot bill under the PFS for RHC or FQHC services while working at the RHC or FQHC (80 FR 71081). Therefore, we have proposed payment policies for RHCs and FQHCs that complement the new services for care coordination established under the PFS to align use of the RHC and FQHC resources for those services with a separate payment.

Over the last decade, the number of new care coordination services established under the PFS has increased. As these services are proposed, we review and evaluate the new care coordination codes each year as established under the PFS to determine their applicability to RHCs and FQHCs. Our general process is to review the descriptor and policies under the PFS for each new HCPCS code to determine if the services are provided face-to-face with a practitioner or auxiliary personnel with a patient, or have some face-to-face component with a practitioner or auxiliary personnel or are strictly non-face-to-face; that is, the care coordination services are being performed behind the scenes and not in

the presence of the patient. If the new care coordination service met the non-face-to-face criteria for RHCs and FQHCs, we would propose in the proposed rule adding it to the list of care coordination services that can be paid separately from a billable visit for RHCs and FQHCs. For a detailed history on the payment for care coordination services, please see section III.B.2. of the CY 2025 PFS final rule (89 FR 97998 through 98010).

The increase in frequency of this complementary rulemaking has prompted us consider operational efficiencies that we believe could result in more transparency and clarity in determining applicable care coordination services for RHCs and FQHCs. In the CY 2025 PFS final rule (89 FR 98012), we solicited comment on how we can improve the transparency regarding which HCPCS codes are considered care coordination services. Our goal is to classify care coordination services established under the PFS that extend to RHCs and FQHCs. We stated that we believe establishing a streamlined policy regarding which services are separately paid for RHCs and FQHCs versus which services are included as part of the visit creates transparency. In addition, we believe establishing a policy where codes are communicated and updated through subregulatory guidance such as manuals, website pages, and change requests may be more efficient.

Only a few commenters responded to our request for information on how we can improve transparency and predictability regarding which HCPCS codes are considered care coordination services. These commenters agreed with a streamlined approach and that communicating these updates through sub-regulatory guidance would be more transparent and efficient. Commenters stated that by distinguishing services that are separately payable from those services included in a visit, we would provide RHCs and FQHCs the clarity needed to accurately submit claims for Medicare reimbursement.

In response to the comment solicitation, we propose adopting services that are established and paid under the PFS and designated as care management services as care coordination services for purposes of separate payment for RHCs and FQHCs. We believe this proposal would improve transparency and efficiency for RHCs and FQHCs since these services and their designation as care management services go through notice and comment rulemaking. In addition, as discussed under §§ 405.2413 and 405.2415, service and supplies furnished incident to TCM and care coordination services can be furnished under general supervision.

As discussed previously in this section, under the PFS, when new care management/coordination services are proposed under the PFS, we also propose to add the new codes, when applicable, to the list of designated care management services for which we allow general supervision. Each year, along with the proposed rule and the final rule, we have published the codes for designated care management services assigned general supervision as supporting documentation. For example, for the CY 2025 PFS final rule, the file is titled ''CY 2025 Final Rule List of Designated Care Management Services.'' Under our proposal, services designated as care management services and added to the list of designated care management services could also be furnished in RHCs and FQHCs and paid separately as described in § 405.2464(c). Interested parties can look for opportunities to review and comment on new services in the respective sections of the PFS proposed and final rules. When services are finalized under the PFS, we propose to update RHC and FQHC sub-regulatory guidance to reflect the new care coordination services. We expect that this will occur, that is, we would adopt any new care management services that are proposed and finalized in the CY 2027 PFS rule and displayed on the list of the designated care management services to be care coordination services for RHCs and FQHCs.

Any new care coordination HCPCS codes will be paid separately from the RHC AIR methodology or FQHC PPS at the national non-facility PFS payment rate, either alone or with other payable visits. We note that some of the current RHC and FQHC care coordination services are not listed on the current list of designated care management service, however, we will continue to make separate payments for these RHC and FQHC care coordination services as they have been previously adopted through notice and comment rulemaking. These services include CCM, PCM, BHI, CPM, RPM, RTM, CHI, PIN and PIN-peer support services, and APCM.

We seek comment on whether the proposed process to align with the care coordination services paid under the PFS as care management services is sustainable moving forward or is there a more effective approach for adopting new care coordination codes established under the PFS as care management codes that would improve transparency and efficiency for RHCs and FQHCs.

3. Services Using Telecommunications Technology

a. Background

Section 3704 of the Coronavirus Aid, Relief, and Economic Security Act (the CARES Act) (Pub. L. 116–136, March 27, 2020) directed the Secretary to establish payment for RHC and FQHC services that are provided as Medicare telehealth services by RHCs and FQHCs serving as a distant site (that is, where the practitioner is located) during the PHE for COVID–19. Separately, section 3703 of the CARES Act expanded CMS' emergency waiver authority to allow for a waiver of any of the statutory telehealth payment requirements under section 1834(m) of the Act for telehealth services furnished during the PHE. Specifically, section 1834(m)(8)(B) of the Act, as added by section 3704 of the CARES Act, required that the Secretary develop and implement payment methods for FQHCs and RHCs that serve as a distant site during the PHE for the COVID–19 pandemic. The payment methodology outlined in the CARES Act requires that rates shall be based on rates that are similar to the national average payment rates for comparable telehealth services under the Medicare PFS. We established payment rates for these services furnished by RHCs and FQHCs based on the average PFS payment amount for all Medicare telehealth services, weighted by volume in a Special Edition Medicare Learning Network Article (SE20016). We subsequently finalized a policy to extend use of this payment methodology for these services through CY2025.

Section 303 of the Consolidated Appropriations Acs (CAA), 2022, section 4113(c) of CAA, 2023, section 3207(c) of the American Relief Act, 2025, and section 2207(c) of the Full-Year Continuing Appropriations and Extensions Act, 2025 each subsequently extended these flexibilities. Most recently, section 2207(c) of the Full-Year Continuing Appropriations and Extensions Act, 2025 amended section 1834(m)(8) of the Act to continue payment for RHC and FQHC services as Medicare telehealth services through September 30, 2025.

In addition to the statutory and associated rulemaking changes noted previously, we established various flexibilities related to use of telecommunications technology through rulemaking; for example, in the CY 2022 PFS final rule with comment period (86 FR 65211), we revised the regulatory requirement that an RHC or FQHC mental health visit must be a face-to-face (that is, in-person) encounter between an RHC or FQHC patient and

an RHC or FQHC practitioner, and we revised the regulations under § 405.2463 to state that an RHC or FQHC mental health visit can also include encounters furnished through interactive, real-time, audio/video telecommunications technology or audio-only interactions in cases where beneficiaries are not capable of, or do not consent to, the use of devices that permit a two-way, audio/video interaction for the purposes of diagnosis, evaluation or treatment of a mental health disorder.

We also revised § 405.2469, to add a supplemental wraparound payment to be made to the FQHC when a covered face-to-face (that is, in-person) encounter or an encounter where services are furnished using interactive, real-time, telecommunications technology or audio-only interactions in cases where beneficiaries do not wish to use or do not have access to devices that permit a two-way, audio/video interaction for the purposes of diagnosis, evaluation or treatment of a mental health disorder occurs between a MA enrollee and a practitioner as set forth in § 405.2463. We noted that these changes aligned with similar changes for Medicare telehealth services for behavioral health paid under the PFS. We also noted that this change would allow RHCs and FQHCs to report and be paid for mental health visits furnished via real-time, telecommunication technology in the same way they currently do when these services are furnished in-person.

In addition, in the CY 2022 PFS final rule (86 FR 65210 and 65211), we revised the regulations at §§ 405.2463 and 405.2469 to state that there must be an in-person mental health service furnished within 6 months prior to the furnishing of the telecommunications service and that an in-person mental health service (without the use of telecommunications technology) must be provided at least every 12 months while the beneficiary is receiving services furnished via telecommunications technology for diagnosis, evaluation, or treatment of mental health disorders, unless, for a particular 12-month period, the physician or practitioner and patient agree that the risks and burdens outweigh the benefits associated with furnishing the in-person item or service, and the practitioner documents the reasons for this decision in the patient's medical record. In the CY 2025 PFS final rule, we announced that we would continue to delay the in-person visit requirement for mental health services furnished via communication technology by RHCs and FQHCs to beneficiaries in their homes until January 1, 2026. However, subsequent to the publication of the CY 2025 PFS final rule, section 2207(d) of the Full-Year Continuing Appropriations and Extensions Act, 2025 (Pub. L. 119–4, March 15, 2025) legislated the in-person visit requirement for mental health visits following September 30, 2025; we are implementing conforming regulatory changes as discussed in section III.B.3.d. of this proposed rule.

As an additional regulatory flexibility, in the CY 2025 PFS final rule (89 FR 98013 through 98017), we extended our policy to deem the presence of the physician (or other practitioner) to include virtual presence for the purposes of direct supervision through audio/video real-time communications technology (excluding audio-only) through December 31, 2025.

b. Direct Supervision via Use of Two-Way Audio/Video Communications Technology

Under Medicare Part B, certain types of services are required to be furnished under specific minimum levels of supervision by a physician or practitioner. See section II.D.2 of this proposed rule for the discussion regarding direct supervision for services provided using telecommunications technologies under the PFS.

In the CY 2024 PFS final rule (88 FR 79067), we explained that extending this definition of direct supervision for RHCs and FQHCs under our regulations at §§ 405.2413, 405.2415, 405.2448, and 405.2452 through December 31, 2024, would align the timeframe of this policy with many of the previously discussed PHE-related telehealth policies that were extended under provisions of the CAA, 2023. In addition, we were concerned about an abrupt transition to the pre-PHE policy of requiring the physical presence of the supervising practitioner beginning after December 31, 2024, given that RHCs and FQHCs have established new patterns of practice during the PHE for COVID–19. We also believed that RHCs and FQHCs would need time to reorganize their practices established during the PHE to reimplement the pre-PHE approach to direct supervision without the use of audio/video technology. Similar to services furnished in physician office setting, RHC and FQHC services and supplies furnished incident to physician's services are limited to situations in which there is direct physician supervision of the person performing the service, except for certain care coordination services which may be furnished under general supervision. For CY 2024 we continued to define ''immediate availability'' as including real-time audio and visual interactive telecommunications through December 31, 2024, and solicited comment on whether we should consider extending the definition of ''direct supervision'' to permit virtual presence beyond December 31, 2024; specifically, we solicited comment on potential patient safety or quality concerns when direct supervision occurs virtually in RHCs and FQHCs; for instance, if certain types of services are more or less likely to present patient safety concerns, or if this flexibility would be more appropriate when certain types of auxiliary personnel are performing the supervised service. We were also interested in potential program integrity concerns such as overutilization or fraud and abuse that interested parties may have had in regard to this policy. In the CY 2025 final rule, (89 FR 98015) we finalized our policy to maintain the virtual presence flexibility on a temporary basis, that is, the presence of the physician (or other practitioner) would include virtual presence through audio/video real-time communications technology (excluding audio-only) through December 31, 2025 as such a policy continues to support access and preserve workforce capacity.

(1) Proposal for CY 2026 Regarding Direct Supervision in RHCs/FQHCs

We have considered information from interested parties, particularly in response to the CY 2024 PFS proposed rule where we solicited comment on potential patient safety or quality concerns when direct supervision occurs virtually in RHCs and FQHCs; for instance, if certain types of services are more or less likely to present patient safety concerns, or if this flexibility would be more appropriate when certain types of auxiliary personnel are performing the supervised service. We were also interested in potential program integrity concerns such as overutilization or fraud and abuse that interested parties may have regarding this policy.

As discussed in the CY 2025 final rule (89 FR 98014 through 98015), in response to our proposal to extend this definition through the end of 2025, commenters strongly supported the proposal to allow virtual direct supervision through real-time audio/video communications technology in RHCs and FQHCs, citing benefits such as reduced inefficiencies, improved accessibility, better alignment with other outpatient providers, and enhanced healthcare delivery without compromising patient safety or program integrity.

Given the information presented by interested parties on safety and effectiveness, we think direct supervision provided via two-way real time audio-video telecommunications technology meets the statutory requirements specific to RHCs and FQHCs at section 1861(aa)(2)(B) of the Act regarding necessary physician supervision and guidance. We note that in section II.D.2 of this proposed rule, we propose to permanently adopt a definition of direct supervision that allows ''immediate availability'' of the supervising practitioner using audio/video real-time communications technology (excluding audio-only), for all services described under § 410.26, except for services that have global surgery indicators of, 010, or 090. These indicators are defined in IOM Pub. 100–04, chapter 23, section 50.6 as 010 ''Minor procedure with preoperative relative values on the day of the procedure and postoperative relative values during a 10-day postoperative period included in the fee schedule amount; evaluation and management services on the day of the procedure and during this 10-day postoperative period generally not payable'' and 090 ''Major surgery with a 1-day preoperative period and 90-day postoperative period included in the fee schedule payment amount''. These are services that describe a surgical service as well as its post-operative period of either 10 days, or 90 days, respectively.

In the interests of aligning our approach toward direct supervision for RHCs and FQHCs with that discussed in section II.D.2. of this proposed rule, we believe that we should permanently adopt this flexibility in RHCs and FQHCs as it continues to support access and preserve workforce capacity. However, as we discuss in IOM Pub. 100–02, chapter 13, section 40.4, the Medicare global billing requirements do not apply to RHCs and FQHCs, and global billing codes are not accepted for RHC or FQHC billing or payment. Since services that have global surgery indicators are not applicable in the RHC and FQHC settings, we are proposing revisions at § 405.2401(b) to define ''Direct Supervision'' to mean that the physician (or other supervising practitioner) must be present in the RHC or FQHC and immediately available to furnish assistance and direction throughout the performance of the service. It does not mean that the physician (or other supervising practitioner) must be present in the room when the service is performed. The presence of the physician (or other practitioner) includes virtual presence through audio/video real-time communications technology (excluding audio-only).

c. Payment for Medical Visits Furnished via Telecommunications Technology

Widespread use of telecommunications technology to furnish services during the PHE has illustrated interest within the medical community and among Medicare beneficiaries in furnishing and receiving care through the use of technology beyond the PHE. During the PHE, RHCs and FQHCs, much like other health care providers, had to change how they furnish care to meet the needs of their patients. RHCs and FQHCs heavily utilized the temporary authority to be paid for their services when provided as Medicare telehealth services during the PHE. Eliminating flexibilities under which RHC and FQHC services have been furnished to beneficiaries via telecommunications technology for over 5 years and resuming payment solely for in-person, face-to-face medical visits, would cause disruptions in access to services from RHC and FQHC practitioners. This would be particularly problematic for the underserved populations that these settings furnish services to since it could fragment care. We believe that we need to preserve the flexibilities under which RHC and FQHC services have been furnished to beneficiaries via telecommunications technology temporarily and to do so through an approach that these settings are familiar with to mitigate burden while we consider how to incorporate services furnished through telecommunications technology on a more permanent basis.

For these reasons, in the event that Congress no longer authorizes payment to be made for telehealth services furnished via a telecommunications system by RHCs and FQHCs using a payment methodology based upon payment rates that are similar to the national average payment rates for comparable telehealth services under the PFS, we are proposing, on a temporary basis, to facilitate payment for non-behavioral health visits (hereafter referred to in this discussion as ''medical visit services'') furnished via telecommunications technology using an approach that closely aligns with this methodology. Like the methodology we used during and after the PHE, RHCs and FQHCs would continue to bill for RHC and FQHC medical visit services furnished using telecommunications technology, including services furnished using audio-only communications technology, by reporting HCPCS code G2025 on the claim. Since the costs associated with medical visit services furnished via telecommunications technology are not included in the calculations for the RHC AIR methodology and FQHC PPS, we believe, similar to the methodology described in section 1834(m)(8) of the Act, that we need to propose a proxy that would represent such resources used when furnishing these services. Therefore, we propose to continue to calculate the payment amount for these services billed using HCPCS code G2025 based on the average amount for all Medicare telehealth services paid under the PFS, weighted by volume for those services reported under the PFS. We believe that continuing to use this weighted average is appropriate during this interim period while we contemplate permanent policies for these services since there is a wide range of payment rates for the Medicare telehealth services paid under the PFS. As discussed in the CY 2025 final rule (89 FR 98015 through 98016), we believe that RHCs and FQHCs generally furnish services that are similar to and at a frequency the same as physicians and other practitioners paid under the PFS. While we do not have actual cost information, we believe that this weighted average is an appropriate proxy since it addresses certain resource costs experienced by professionals and would mitigate any potential over or under payments. Costs associated with these services would continue to not be used in determining payments under the RHC AIR methodology or the FQHC PPS.

We believe that the proposed approach would preserve the telecommunication technology flexibility under which RHC and FQHC services have been furnished for over 5 years and would not impact access to care for Medicare beneficiaries who currently benefit from these services while CMS contemplates next steps. We note that this is a stopgap approach to preserve access concerns temporarily. The same rationale that led us to propose and finalize this policy last year applies again now given that congress has again extended this flexibility following publication of last year's final rule; we beleive that our regulatory approach toward inclusion of these services furnished via telecommunications technology will continue to apply after the end of the statutory requirement that they be included. In addition, we believe that continuing this payment methodology on a temporary basis through December 31, 2026 would provide flexibility to respond to any future statutory changes.

(1) Alternative Proposal Considered for Payment of Medical Visits Furnished via Telecommunication Technology

We considered reevaluating the regulations regarding face-to-face visit requirements for encounters between a beneficiary and an RHC or FQHC practitioner in light of contemporary medical practices. That is, we considered proposing a revision to the regulatory requirement that an RHC or FQHC medical visit must be a face-to-face (that is, in-person) encounter between a beneficiary and an RHC or FQHC practitioner to also include encounters furnished through interactive, real-time, audio and video telecommunications technology. This would result in payment for services furnished via telecommunication technology to be made under the RHC AIR methodology and under the FQHC PPS, similar to how we revised the regulations for mental health visits. We believe interested parties may prefer the per visit payment that aligns with the RHC AIR or FQHC PPS. However, we did not propose this alternative because we determined that it would have unintended consequences, especially in cases where the RHC AIR or FQHC PPS per-visit rates would be significantly higher than the PFS rate that would apply if other entities furnished the same service to the same beneficiary in the same location.

We believe that continuing to pay temporarily for RHC and FQHC services furnished via telecommunication technologies in the same manner as we have done over the past several years preserves the flexibility for RHCs and FQHCs to continue access to care, mitigates administrative burden, and mitigates potential program integrity concerns. However, we are soliciting comment on the alternative proposal we considered. That is, revising the definition of a visit to include interactive, real-time, audio/video telecommunication technology which would result in a capitated payment under the RHC AIR methodology or FQHC PPS.

d. Proposal for Conforming Regulatory Text Changes

Subsequent to the publication of the CY 2025 PFS final rule, section 2207(d) of the Full-Year Continuing Appropriations and Extensions Act, 2025 amended sections 1834(y)(2) and 1834(o)(4)(B) of the Act by extending the delay of in-person requirements for mental health services furnished through telecommunication technology for RHCs and FQHCs, respectively, through September 30, 2025. We are therefore proposing to make conforming regulatory text changes based to the applicable RHC and FQHC regulations in 42 CFR part 405, subpart X, specifically, at § 405.2463, ''What constitutes a visit,'' we propose to amend paragraph (b)(3) and, at § 405.2469 ''FQHC supplemental payments,'' we propose to amend paragraph (d). Both of these provisions would require that, beginning October 1, 2025, there must be an in-person mental health service furnished within 6 months prior to the furnishing of the telecommunications service and that an in-person mental health service (without the use of telecommunications technology) must be provided at least every 12 months while the beneficiary is receiving services furnished via telecommunications technology for diagnosis, evaluation, or treatment of mental health disorders, unless, for a particular 12-month period, the physician or practitioner and patient agree that the risks and burdens outweigh the benefits associated with furnishing the in-person item or service, and the practitioner documents the reasons for this decision in the patient's medical record.

C. Ambulatory Specialty Model (ASM)

1. Overview of Proposed Ambulatory Specialty Model

a. Introduction

Under the authority of the Center for Medicare and Medicaid Innovation (Innovation Center) in section 1115A(b) of the Act, we are proposing the implementation and testing of the Ambulatory Specialty Model (ASM), a new mandatory alternative payment model with 5 performance years that would begin January 1, 2027 and end December 31, 2031. ASM would test whether adjusting payment for specialists based on their performance on targeted measures of quality, cost, care coordination, and meaningful use of certified electronic health record (EHR) technology (CEHRT) results in enhanced quality of care and reduced costs through more effective upstream chronic condition management.

To enhance quality of care and lower the costs of care, ASM would be established as a mandatory model focused on the care provided by select specialists to Medicare beneficiaries with the chronic conditions of heart failure and low back pain. Under the model, clinicians would be required to report a select set of measures and activities clinically relevant to their specialty type and the chronic condition of interest. These measures and activities would assess quality, cost, interoperability, and care coordination practices, all of which are necessary for effective upstream chronic condition management. To incentivize improvements in quality and care coordination, CMS would assess the clinician's performance on those measures and activities relative to their peers, who are also participants of the model and of a similar specialty type treating the same chronic condition.

ASM falls within a larger framework of activities initiated by the Innovation Center to focus on high-volume, high-cost chronic conditions and direct engagement of specialists in value-based payment. The Innovation Center recently announced its new strategy based on three strategic pillars for improving the health of Americans and protecting taxpayers: preventing disease through evidence-based practices, empowering people with information to make better decisions, and driving choice and competition.[115]

In line with the updated Innovation Center principles, this proposed rule proposes a new mandatory model that would improve beneficiary and provider engagement, incentivize preventive care, and increase financial accountability for certain specialists. The model would build upon lessons learned from previous Innovation Center models and the Merit-based Incentive Payment System (MIPS) under the Quality Payment Program. We believe the model would answer the call to create a more cohesive and efficient health system that enhances the quality of care and reduces costs over time. To promote preventive care, the model would incentivize specialists who are ASM participants to ensure that their patients have a regular source of primary care and are screened to help identify risks and early signs of chronic conditions. This model would also seek to prevent deterioration of and complications associated with established chronic conditions. To empower patients, the model would promote direct accountability for quality. By featuring patient-reported outcome measures in the proposed quality ASM performance category, this model encourages patients to report their improvement or decline in function, which directly impacts clinician payment and further incentivizes clinicians to incorporate patient voice and experience in clinical care decisions. We believe a focus on

[115] CMS Innovation Center, CMS Innovation Center 2025 Strategy to Make America Healthy Again, May 2025. *https://www.cms.gov/priorities/innovation/about/strategic-direction#:~:text=Three%2DPronged%20Approach,served%20by%20the%20Innovation%20Center.*

patient-reported measures elevates patient voice, leading clinicians to be more responsive to the patient's response to treatment, while also addressing the significant spending that results from functional impairment. These measures also provide a pathway for clinicians to have conversations about non-medical, lifestyle-based interventions with their patients. This proposed model is intent on removing the onus from patients to act as the go-between among clinicians they see for their care by incentivizing clinicians to coordinate care for their patients more seamlessly. Patients would be able to focus on solutions to their health, rather than resolving information and guidance they have received from multiple clinicians.

Finally, the model would require the participation of individual clinicians rather than organizations to encourage competition and create a level playing field for solo and small practices. By evaluating clinicians individually, ASM removes the unequal reporting and scoring benefits that have been previously afforded to consolidated health systems and group practices. This form of mandatory participation would bring transparency, accountability, and comparability at the clinician-level, helping to identify clinicians within large, consolidated health systems or provider networks providing low-value care.

Low-value care refers to services that: (1) may offer limited or no clinical benefit to a patient; or (2) may present risks of harm that outweigh the potential benefit. By requiring the participation of individual clinicians, we believe this model would reduce spending that represents low-value services and major cost-drivers for heart failure and low back pain (for example, unnecessary imaging, surgeries, hospital admissions). Ultimately, this model aims to drive competition among similar specialists with a targeted assessment of their performance relative to their peers in the treatment of a specific chronic condition and protect taxpayers by reducing low-value services by holding specialists accountable for the cost of services clinically related to their role in managing care.

We have designed ASM with a focus on clinicians who commonly treat patients in the ambulatory setting, develop longitudinal relationships with patients, and co-manage beneficiaries with primary care clinicians. In addition, we considered those who treat chronic conditions that are likely to benefit from improved integration between specialty and primary care to maximize opportunities for incentivizing high-value care and tertiary prevention. Specifically, we propose to focus the model on the chronic conditions of heart failure and low back pain, as they have previously established episode-based cost measures (EBCMs) specified for the MIPS cost performance category.

The EBCMs were developed with specialists and stakeholders through an extensive, collaborative process that, by design, focused on conditions with a large share of Medicare spending, a high number of responsible clinicians, and opportunities for care improvement. Based on recent estimates, heart failure and low back pain, in particular, account for 3.5 and 2.7 percent total Medicare Part A and B spending.[116] These are significantly higher than other chronic conditions with EBCMs, which account for less than one percent of Medicare Part A and B spending, except for diabetes, which accounts for 4.2 percent of spending.[117] In contrast, many Medicare beneficiaries with type 2 diabetes are capably managed by primary care physicians as the quarterback of their care with input from consulting specialists. Consequently, we do not believe it would be an appropriate chronic condition for this specialty care model.

ASM would be a mandatory model that begins on January 1, 2027 and ends December, 31, 2033. There would be 5 performance years, beginning January 1, 2027 and ending December 31, 2031. Final data submission of measures and activities would be in CY 2032, with final model payment adjustments in CY 2033.

To measure clinician performance in ASM, we would establish a mandatory set of measures and activities for physicians that meet the proposed ASM participant eligibility criteria described in section III.C.2.c.(3). of this proposed rule. ASM aims to assess the performance of ASM participants providing care for Medicare beneficiaries with the targeted chronic conditions at the individual clinician level. Specifically, ASM would test whether adjusting Medicare Part B payments for covered professional services based on measures of quality, cost, care coordination, and CEHRT results in enhanced quality of care and reduced costs through more effective upstream chronic condition management.

ASM would leverage components of the existing MIPS Value Pathway (MVP) framework, as appropriate, to meaningfully engage specialists in improving the quality of care for high-volume, high-cost chronic conditions and better integrate specialists in primary care. MVPs are one MIPS reporting option that provides a smaller set of measures to choose from that are most relevant to a condition or specialty. Currently, for MIPS, CMS assesses the performance of each MIPS eligible clinician on measures and activities CMS has specified for a CY performance period/MIPS payment year for four performance categories: quality, cost, clinical practice improvement activities, and meaningful use of CEHRT (referred to as ''Promoting Interoperability''). In accordance with section 1848(q) of the Act, CMS calculates a composite performance score (a ''final score'' as defined at § 414.1305) from 0 to 100 points for each MIPS eligible clinician. Then, CMS compares each MIPS eligible clinician's final score to the performance threshold established in prior rulemaking for that CY performance period/MIPS payment year to calculate the MIPS payment adjustment factor as specified in section 1848(q)(6) of the Act. For the applicable MIPS payment year, CMS would calculate and apply to each MIPS eligible clinician: (1) a positive adjustment, if their final score exceeds the performance threshold; (2) a neutral adjustment, if their final score meets the performance threshold; or (3) a negative adjustment, if their final score is below the performance threshold. In calculating the MIPS payment adjustment factor for each MIPS eligible clinician, CMS accounts for scaling factor and budget neutrality requirements, as further specified in section 1848(q)(6) of the Act.

By applying these budget neutrality and scaling factor requirements, CMS's calculations of positive MIPS payment adjustment factors for each MIPS eligible clinician are limited by CMS's calculations of negative MIPS payment factors for each MIPS eligible clinician. In other words, CMS's estimated amounts of positive MIPS payment adjustment factors for MIPS eligible clinicians performing above the performance threshold must be offset by CMS's estimated amounts of negative MIPS payment adjustment factors for MIPS eligible clinicians performing below the performance threshold. In MVPs, however, clinicians still have flexibility to select which measures to report. Under MIPS, a clinician's performance is assessed against all MIPS clinicians, regardless of reporting

[116] Quality Payment Program, 2025 Summary of Cost Measures, December 2024. *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3129/2025-mips-summary-cost-measures.pdf.*

[117] Ibid.

option, specialty type, or the services they provide.

As CMS discussed in a 2024 Request for Information (RFI) (89 FR 61596),[118] we expect that a more targeted approach where clinicians are evaluated: (1) on required reporting of a set of relevant performance measures; and (2) among clinicians furnishing similar sets of services, would produce scores and subsequent payment adjustments that are more reflective of clinician performance. A more targeted approach to measurement would also offer more insight into how clinical decisions and processes, such as care coordination, affect patient outcomes. This targeted approach would include reporting or required collection of patient-reported outcome measures that assess the change in a beneficiary's functional status over the course of the episode, ensuring clinicians prioritize the same goals as their patients. Furthermore, equipped with more specialty-relevant performance information, we expect clinicians would be more likely to invest resources in pursuit of better outcomes and improved care coordination, ultimately resulting in better care for patients. To test this more targeted approach, this proposed mandatory model leverages the existing MVP policies, deviating from MVP policies in specific ways, as applicable.

First, unlike the voluntary measure and activity selection permitted under the MVP reporting option, ASM would require clinicians to report on a set of measures and activities clinically relevant to their specialty type and the chronic condition. of interest. This would ensure a more analogous comparison between clinicians. Second, while clinicians reporting under MVPs are scored against the entire pool of MIPS clinicians, ASM would assess performance against only those clinicians treating the same chronic condition. Each clinician would receive a performance score based on the measures and activities included in the four ASM performance categories (which are based on the MIPS performance categories)—quality, cost, improvement activities, and Promoting Interoperability. In section III.C.2.d. of this proposed rule, we describe the proposed requirements in the quality, cost, improvement activities, and Promoting Interoperability ASM performance categories.

Third, we would use a different approach, compared to MVPs, for aggregating the ASM performance categories to calculate a final score and determine the ASM payment adjustment. This approach would broaden the distribution of final scores and increase the magnitude of payment adjustments, which we believe would incentivize performance improvements that would lead to more effective upstream chronic condition management. We refer readers to the CY 2022 PFS final rule for additional details on the MVP performance category weighting § 414.1365(e). As described in section III.C.2.e. of this proposed rule, we would focus on value and variation in clinician performance by primarily measuring performance on quality and cost performance categories for calculating the ASM final score. We also understand the importance of the improvement activities and Promoting Interoperability performance categories and would apply potential negative scoring adjustments for non-reporting or poor performance. We are also considering additional positive scoring adjustments for clinicians in small practices participating in the model and for ASM participants treating a large proportion of medically complex patients. We refer readers to sections III.C.2.c., III.C.2.d., and III.C.2.e. of this proposed rule for additional details on the proposed policies related to ASM participant eligibility criteria, the quality, cost, improvement activities, and Promoting Interoperability ASM performance categories, and ASM final scoring calculations.

To ensure savings in the financial impacts for the model, ASM would also retain a percentage of the payments rather than distributing all funds as clinicians' payment adjustments. ASM participants would receive neutral, negative, or positive payment adjustments on future Medicare Part B payments for covered professional services based on their performance during an ASM performance year. As is done under MIPS, clinicians participating in ASM would continue to bill Medicare under the traditional FFS system for services furnished to Medicare FFS beneficiaries. MIPS eligibility criteria described under 42 CFR 414.1305 are not factored into the ASM participant eligibility criteria described in section III.C.2.c.(3). of this proposed rule. However, MIPS eligible clinicians participating in this model would be exempt from MIPS reporting requirements for any ASM performance year that they are included in ASM.

b. Background

Health care is becoming more fragmented as Medicare beneficiaries are increasingly seeing a greater number of specialists on a more regular basis. At the same time, the volume of primary care visits has remained relatively constant.[119] [120] Primary care teams must now coordinate with more specialists than ever before,[121] despite persistent barriers to specialist access for certain patients.[122] [123] We believe there are opportunities to improve coordination between specialists and primary care providers (PCPs) and increase beneficiary engagement in care decisions, particularly with respect to preventing the onset and progression of disease.

Although the Innovation Center has tested models that address the integration of primary and specialty care for chronic conditions that may benefit from greater collaboration and create opportunities for preventive care, these models have been largely focused on behaviors and practice patterns in primary care.[124] This proposed model test elects to focus on the behaviors and practice patterns in specialty care for those treating chronic conditions and would be the first Innovation Center

model to use the MVP framework as the foundation for a model test.

We believe the MVP framework has many benefits. First, the MVP framework advances value-based care by narrowing the available measure set based upon clinician specialty, medical condition, or patient population, which allows for meaningful comparisons to be made across providers and relevant feedback to be available to participants on their performance, strengthening the foundation for accountability in specialty care. The MVPs utilize a cohesive set of measures and activities focused on performance in rendering care for a particular specialty or clinical condition. Second, we believe that meaningful comparisons of performance combined with a payment methodology that includes more significant Medicare Part B payment adjustments, would encourage meaningful specialty care engagement with primary care clinicians to both prevent and manage the onset of chronic conditions. Third, we intend to test ASM's more targeted approach to performance assessment, as described in the introduction section of this proposed rule, so it may provide a foundation to potentially expand this approach to other specialist cohorts treating other chronic conditions. While there are 21 MVPs for the CY 2025 performance period/2027 MIPS payment year spanning numerous specialties, CMS has a goal of creating additional MVPs relevant to the practices of 80 percent of MIPS eligible clinicians. The MVP reporting option, with its focused set of measures and activities aligned around specific specialties or conditions, provides a framework for applying ASM's targeted approach to other specialist cohorts treating other chronic conditions. Using an existing framework that is agnostic to specialty type, as opposed to creating multiple unique models that are each narrowly defined by a condition or specialty, would allow the Innovation Center to take a more inclusive and unified approach to increasing specialist engagement in value-based payment.

Using MVPs as a framework to test a chronic condition model, ASM would increase the number of specialists in value-based care arrangements and hold them accountable for ensuring beneficiaries have a regular source of primary care. Through required improvement activities and measures, the model would also encourage specialty care providers to actively engage with both beneficiaries and PCPs to improve care transitions and make certain their patients are receiving preventive care, such as screening for obesity and depression. When primary and specialty care providers collaborate across care settings, together they can deliver accountable care that best meets patients' needs and preferences.

2. Provisions of Proposed Ambulatory Specialty Model

a. Definitions

We propose at 42 CFR 512.705 to define certain terms for ASM. We describe these proposed definitions in context throughout section III.C.2 of this proposed rule. We propose to codify the definitions and policies of ASM at 42 CFR part 512 subpart G (proposed § 512.705 through § 512.780). In addition, we propose that the definitions contained in the standard provisions for mandatory Innovation Center models at subpart A of part 512 would also apply to ASM, unless expressly stated otherwise in the proposed policies set forth at § 512.705 through § 512.780. We seek comments on these proposed definitions for ASM.

b. Proposed Length of Model Test

We propose at § 512.705 to define the ''ASM test period'' as the 7-year period from January 1, 2027, to December 31, 2033, that includes all ASM performance years and ASM payment years as described in Table 36. We propose at § 512.705 to define ''ASM performance year'' as a 12-month period beginning on January 1 and ending on December 31 of each year during the first 5 calendar years of ASM test period. We propose at § 512.705 to define an ''ASM payment year'' as a calendar year in which CMS applies the ASM payment multiplier to Medicare Part B payments based on the final score achieved by that ASM participant for the ASM performance year 2 years prior.

Like MIPS, we propose that an ASM payment year occurs 2 calendar years following the ASM performance year that determines the ASM participant's final score that then determines their payment adjustment factor applied in that ASM payment year. For instance, the CY 2027 ASM performance year would correspond to the CY 2029 ASM payment year to allow time for ASM participants to submit required data for each of the ASM performance categories as described in section III.C.2.d of this proposed rule and for CMS to score submitted data for the ASM performance categories, calculate final scores, and determine payment adjustments as discussed in sections III.C.2.d., III.C.2.e, and III.C.2.f of proposed rule. Final data submission of measures and activities would be in CY 2032, with final model payment adjustments in CY 2033. This timeline aligns with MIPS in that those who report traditional MIPS or MVPs receive an adjustment to their Medicare Part B fee-for-service payments 2 years after the corresponding MIPS performance period based on a total score calculated from reported measures and activities across the MIPS performance categories (see §§ 414.1305, 414.1320, 414.1365, and 414.1405(e)). We believe 5 ASM performance years followed by 5 ASM payment years would allow sufficient time for ASM participants to invest in care delivery transformation and for CMS to evaluate the impact of the model's payment adjustments.

TABLE 36: ASM PERFORMANCE YEARS AND ASM PAYMENT YEARS

Calendar Year	CY 2027	CY 2028	CY 2029	CY 2030	CY 2031	CY 2032	CY 2033
ASM Performance Year (PY)	X	X	X	X	X		
ASM Participant Data Submission		Report for PY 2027	Report for PY 2028	Report for PY 2029	Report for PY 2030	Report for PY 2031	
Final Score & ASM Payment Adjustment Factor Calculation		Released for PY 2027	Released for PY 2028	Released for PY 2029	Released for PY 2030	Released for PY 2031	
ASM Payment Years			Payment adjusted for PY 2027	Payment adjusted for PY 2028	Payment adjusted for PY 2029	Payment adjusted for PY 2030	Payment adjusted for PY 2031

We propose an ASM start date of January 1, 2027. We alternatively considered proposing an ASM start date as January 1, 2026, but given the rulemaking process, an earlier start date would not have given ASM participants enough time to prepare for participation in ASM.

We believe that the ASM test period of 7 years, as opposed to a shorter duration, is necessary to obtain sufficient data to compute a reliable impact estimate and to analyze the data from the Model to determine the next steps regarding potential expansion or extension of the Model. Further, we believe that a test period of 7 years is necessary to address and mitigate any potential implementation issues or unintended consequences. For a discussion of the proposed evaluation approach, please see section III.C.2.l of this proposed rule.

We invite public comments on the proposed ASM test period of 7 years. We also seek comment on the proposed ASM start date of January 1, 2027.

c. Proposed ASM Participants

(1) Proposed Mandatory Participation

We believe that requiring clinicians to participate in the model test is necessary to eliminate selection bias, yield generalizable results, and ensure an evaluable comparison group. Voluntary participation in Innovation Center models has demonstrated that those electing to voluntarily participate are more likely to have the infrastructure and experience to succeed under the model. Moreover, in a voluntary model, when the opportunity for financial gain is reduced or uncertain, participant attrition increases. We believe requiring participation in ASM would prevent this type of selection bias.

Mandatory participation in ASM would also ensure a sufficient volume of participants to produce a necessarily diverse, representative evaluation of clinicians providing specialty care to Medicare beneficiaries with heart failure or low back pain. We believe ASM could highlight inefficient care utilization patterns and potentially inform quality improvement and care coordination incentives for application in the Quality Payment Program, the MVP reporting option, and future Innovation Center models. Finally, mandatory participation would generate a statistically robust test of ASM with results that are reliable, generalizable, and able to support potential model expansion. Therefore, we propose at § 512.710(a)(1) that participation in ASM would be mandatory for all clinicians who meet the ASM participant eligibility criteria at § 512.710(b).

Specifically—

- 2027 ASM performance year: ASM participants would be measured for performance and exempted from MIPS participation, if applicable, during CY 2027; report and be scored during CY 2028; and receive payment adjustments for CY 2027 performance in CY 2029;
- 2028 performance year: ASM participants meeting ASM participant eligibility criteria for the 2028 performance year would be measured for performance and exempted from MIPS participation, if applicable, during CY 2028; report and be scored during CY 2029; and receive payment adjustments for CY 2028 performance in CY 2030;
- 2029 ASM performance year: ASM participants meeting ASM participant eligibility criteria for the 2029 performance year would be measured for performance and exempted from MIPS participation, if applicable, during CY 2029; report and be scored during CY 2030; and receive payment adjustments for CY 2029 performance in CY 2031;
- 2030 ASM performance year: ASM participants meeting ASM participant eligibility criteria for the 2030 performance year would be measured for performance and exempted from MIPS participation, if applicable, during CY 2030; report and be scored during CY 2031; and receive payment adjustments for CY 2030 performance in CY 2032; and
- 2031 ASM performance year: ASM participants meeting ASM participant eligibility criteria for the 2031 performance year would be measured for performance and exempted from MIPS participation, if applicable, during CY 2031; report and be scored during CY 2032; and receive payment adjustments for CY 2031 performance in CY 2033.

We propose at § 512.710(a)(1) that once a clinician meets the ASM participant eligibility criteria, they would be considered an ASM participant for the duration of the model. We propose at § 512.710(a)(2) that clinicians would be exempt from MIPS reporting for any ASM performance year that they meet ASM participant eligibility criteria and, therefore, must meet ASM model requirements. However, for any model year that a previously selected ASM participant does not continue to meet the ASM participant eligibility criteria for the upcoming ASM performance year/ASM payment year, the ASM participant would not be required to submit data in accordance with § 512.720, as proposed, would not be scored in accordance with § 512.745, as proposed, and would not receive an ASM payment adjustment in accordance with § 512.750. In addition, because the proposed Medicare waiver at § 512.775 only waives the requirements of section 1848(q) of the Act, and its implementing

regulations for an ASM performance year that ASM participants meets the ASM participant eligibility criteria, the ASM participant would be required to satisfy any MIPS reporting obligations and would receive a MIPS payment adjustment two years later, in accordance with current regulations, for any performance year that they do not meet the ASM participant eligibility criteria. Because ASM participants would potentially be subject to MIPS for any ASM performance year that they do not meet the ASM participant eligibility criteria, ASM payment adjustments may be applied during an ASM payment year during which an ASM participant is not actively participating in ASM and is instead participating in MIPS.

We invite public comments on our proposal at § 512.710(a) to require mandatory participation in ASM, exempt ASM participants from reporting under MIPS for only those years that they meet ASM participant eligibility criteria.

(2) Proposed ASM Participants

We propose that certain clinicians who treat heart failure and low back pain would be required to participate in ASM. We propose at § 512.705 to define the term ''ASM participant'' to mean an individual clinician who, for at least one ASM performance year, satisfies the ASM participant eligibility criteria described in section III.C.2.c.(3). of this proposed rule and has been selected for participation in the model as described in section III.C.2.c.(5). of this proposed rule. For ASM specifically, we propose at § 512.705 to define ''clinician'' as any ''eligible professional'' defined in section 1848(k)(3) of the Act, as identified by a unique TIN and NPI combination. We propose at § 512.705 to define ''ASM heart failure participant'' as an ASM participant who meets the ASM participant eligibility criteria related to heart failure and ''ASM low back pain participant'' as an ASM participant who meets the ASM participant eligibility criteria related to low back pain (discussed later in this section of this proposed rule). We note that the definition of ''model participant'' contained in § 512.110 should be interpreted to include each ASM participant.

We propose to define an ''ASM targeted chronic condition'' at § 512.705 as a medical condition that is a core focus of ASM; that is, heart failure or low back pain. We propose to define an ''ASM cohort'' as a group of ASM participants who treat the same ASM targeted chronic condition; specifically, we propose an ASM heart failure cohort and an ASM back pain cohort for this model. We propose to define the ''ASM heart failure cohort'' to be composed of all ASM heart failure participants and the ''ASM low back pain cohort'' to be composed of all ASM low back pain participants. We note that the proposed ASM cohorts would not include nonphysician practitioners (NPP) because NPPs would not meet the ASM participant eligibility criteria as proposed at § 512.710(b), which states that only clinicians assigned one of the specialty codes at § 512.710(d) may be ASM participants. Medicare does not currently assign specialty codes to NPPs; therefore, NPPs would not satisfy this criterion.

We also considered defining an ASM participant as a group of clinicians within a single practice, provided each clinician individually meets the proposed ASM participant eligibility criteria. However, the inclusion of a group of specialists would result in fewer ASM participants overall and would add complexity to comparing performance across the ASM performance categories and determining final scores. We also believe that a group-based approach to ASM participation may not reflect the variable arrangements of care teams, as clinicians may also work outside the group, across multiple service locations and teams. Under this alternative group-level scenario, we would need to provide the ASM participant with a list of clinicians who individually meet the ASM participant eligibility criteria for an applicable ASM performance year. In this case, each eligible clinician on an ASM participant's clinician list would be considered a downstream participant in ASM, and the ASM participant would be required to contractually bind all downstream participants to comply with all laws pertaining to any patient-identifiable data requested from CMS and the terms of any agreement with CMS, as a condition of receiving and maintaining data from the ASM participant.

We also considered whether the ASM participant under this alternative participant identification approach would be permitted to add or remove clinicians during an ASM performance year. We believe the addition of model policies and processes to account for individual clinician changes would increase operational complexity and the administrative burden of ASM participants if defined under this alternative group-based definition.

We seek comments on our proposed definitions at § 512.705. We also seek comments on adopting an alternative group participation policy and, if so, whether groups should be allowed to add or remove clinicians during a performance year.

(a) ASM Heart Failure Cohort

We propose at § 512.710(d)(1) for the ASM heart failure cohort to only select clinicians who have been assigned a specialty code of cardiology on the plurality of their Medicare Part B claims, provided they meet all applicable ASM participant eligibility criteria under § 512.710(b) for an ASM performance year. We understand that other clinicians may treat heart failure. However, only cardiologists would be required to participate in the model. Cardiologists commonly provide care to Medicare beneficiaries with heart failure and are well-positioned to improve outcomes by ensuring patients are optimized on guideline-directed medical therapy. We believe ASM would incentivize cardiologists to work with a primary care team to engage beneficiaries in addressing the root cause of their illness through lifestyle changes and preventing acute episodes.

In addition to the cardiology specialty code, we considered including clinicians identified by additional cardiac specialty codes, as Medicare uses distinct specialty codes for cardiac electrophysiology, intensive cardiac rehabilitation, cardiac surgery, interventional cardiology, and advanced heart failure and transplant cardiology. Depending on the etiology of heart failure, some beneficiaries may receive care from interventional cardiologists and cardiac electrophysiologists. However, as proceduralists, these specialists do not commonly participate in the longitudinal management of beneficiaries with heart failure and have limited ongoing interactions with primary care.[125] We also considered including cardiologists who specialize in adult congenital heart disease and advanced heart failure and transplant cardiology because these subspecialists often take over as primary managers of care. However, they do not generally co-manage patients or share responsibilities with primary care. Furthermore, they treat a particularly complex patient population, which makes comparing their performance to other cardiologists difficult. For these reasons, we do not propose to include clinicians with specialty codes other than cardiology as ASM participants.

We seek comment on our proposal at § 512.710(d)(1) to only include in the ASM heart failure cohort clinicians with

[125] Sokos G, Kido K, Panjrath G, et al. Multidisciplinary Care in Heart Failure Services. *J Card Fail.* 2023;29(6):943–958. doi:10.1016/j.cardfail.2023.02.011.

a cardiology specialty code on the plurality of their Medicare Part B claims. We also seek comments on including subspecialist cardiology codes in the ASM heart failure cohort.

(b) ASM Low Back Pain Cohort

We identified several nonsurgical and surgical specialties that commonly manage, treat, and maintain long-term relationships with patients with low back pain in the ambulatory setting. Both nonsurgical and surgical specialists offer meaningful, conservative (that is, less invasive) treatment options.[126] However, some low back pain treatments, including spinal fusion for the treatment of non-complex low back pain, contribute to low-value care.[127] For this reason, we believe including the specialists who most commonly perform these procedures is prudent for this model.

While surgical specialists are proceduralists, they are also commonly involved in the longitudinal management of Medicare beneficiaries with low back pain. Nevertheless, to ensure ASM would meet its goal of comparing like participants, we examined whether it would be appropriate to include nonsurgical and surgical specialists in the same ASM cohort.

We stratified 2023 EBCM data by beneficiaries who underwent surgery on their spine and who had complex low back pain and found that, across all specialty types, more than 80 percent of beneficiaries with episodes for low back pain did not undergo spine surgery (83.8 percent for neurosurgery; 90.8 percent for orthopedic surgery), as demonstrated in Table 37.

TABLE 37: Volume distribution of low back pain episodes by specialty types in CY2023

Surgical Status	Complex Low Back Pain	Anesthesiology	Interventional Pain Management	Neurosurgery	Pain Management	Physical Medicine & Rehabilitation	Orthopedic Surgery
No spine surgery	Yes	68.6%	67.4%	60.0%	67.1%	58.7%	46.9%
No spine surgery	No	27.8%	29.0%	23.8%	29.4%	38.1%	43.9%
Spine surgery	Yes	3.1%	3.1%	13.3%	2.9%	2.5%	6.5%
Spine surgery	No	0.5%	0.6%	3.0%	0.6%	0.8%	2.7%

Because orthopedic surgeons and neurosurgeons primarily treat low back pain non-surgically, we believe it is acceptable to include both surgical and nonsurgical specialists in the ASM low back pain cohort. Moreover, the EBCM episode volume eligibility criteria as described in section III.C.2.c.(3)(b) of this proposed rule would screen out specialists who are not treating low back pain longitudinally in the outpatient setting.

We propose at § 512.710(d)(2), for the ASM low back pain cohort, to select clinicians with a specialty type of anesthesiology, interventional pain management, neurosurgery, orthopedic surgery, pain management, and physical medicine and rehabilitation, provided they meet all applicable ASM participant eligibility criteria for an ASM performance year. We note that there may be some overlap between pain management, interventional pain management, and anesthesiology. However, we propose to include all three specialty designations to ensure we include anesthesiologists that have not yet updated their subspecialty with Medicare and those anesthesiologists treating low back pain without pursuing fellowship training.

Although other clinicians do treat low back pain, we propose that only those listed would be required to participate in ASM. We considered other specialties who could trigger higher volumes of low back pain episodes. For example, chiropractors and physical therapists work closely with both primary care and specialists to treat low back pain, often providing first-line therapy. However, we believe the selected specialties are better positioned to direct and be held accountable for the longitudinal management of low back pain that may employ a variety of modalities.

We seek public comments on our proposal at § 512.710(d)(2) to only include in the ASM low back pain cohort clinicians with a specialty code of anesthesiology, interventional pain management, neurosurgery, orthopedic surgery, pain management, or physical medicine and rehabilitation on the plurality of their Medicare Part B claims. We seek comments on alternative low back pain-related specialty types that we considered including the ASM low back pain cohort.

(3) ASM Participant Eligibility Criteria

In selecting participants for ASM, we seek to ensure (1) we include a sufficient volume of clinicians treating Medicare beneficiaries for the same clinical condition in the ambulatory setting; (2) there is a reasonable expectation that participants can be measured under the model and held accountable for the care provided to Medicare beneficiaries with heart failure and low back pain; (3) the selected clinicians have the operational capacity to meet the ASM performance requirements described in section III.C.2.d of this proposed rule; and (4) the model test results would be statistically valid, reliable, and generalizable to specialty types included in ASM nationwide should the model test be successful and considered for expansion under section 1115A(c) of the Act.

Therefore, we propose at § 512.705 to define ''ASM participant eligibility criteria'' as the set of criteria defined at § 512.710(b) that CMS uses to determine whether a clinician is selected to participate in ASM. We propose at § 512.710(b) that clinicians who meet all of the following ASM participant eligibility criteria would be required to participate in ASM:

- Is a clinician who bills claims under the Medicare Physician Fee Schedule.
- Is identified by TIN/NPI as a selected specialty type.
- Meets the EBCM episode volume threshold applicable to an ASM targeted chronic condition.
- Is located in one of the selected mandatory geographic areas.

[126] Steinmetz A. Back pain treatment: a new perspective. Ther Adv Musculoskelet Dis. 2022 Jul 4;14:1759720X221100293. doi: 10.1177/1759720X221100293. PMID: 35814351; PMCID: PMC9260567.

[127] Buchbinder R, Underwood M, Hartvigsen J, Maher CG. The Lancet Series call to action to reduce low value care for low back pain: an update. Pain. 2020 Sep;161 Suppl 1(1):S57–S64. doi: 10.1097/j.pain.0000000000001869. PMID: 33090740; PMCID: PMC7434211.

At § 512.705, we propose to define ''mandatory geographic area'' to mean a core-based statistical area (CBSA) or metropolitan division as defined by the Office of Management and Budget (OMB) and selected by CMS under the terms of § 512.710(f). We note that the proposed mandatory geographic areas may include rural areas as defined by MIPS at § 414.1305, which is a ZIP code designated as rural by the Health Resources and Services Administration's Federal Office of Rural Health Policy (FORHP), using the most recent FORHP Eligible ZIP Code file available.

We note that, as is the case in MIPS, clinicians practicing in Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs) who provide services that are billed exclusively under the RHC or FQHC payment methodologies would not be selected to participate in ASM. This is because FQHCs and RHCs receive All-Inclusive Rate (AIR) or Prospective Payment System (PPS) payments and do not submit claims under the Medicare Physician Fee Schedule. However, if these clinicians, separately, provide and bill for services under the Physician Fee Schedule, they would be required to participate in ASM provided they meet the ASM eligibility requirements. Clinicians who provide services at Critical Access Hospitals (CAHs) that are paid under Method I would be required to participate if they meet the ASM eligibility requirements, given that such services are paid under the Medicare PFS. Clinicians who provide services at CAHs that are paid under Method II, and meet all ASM eligibility requirements, would only be required to participate in ASM if they have not reassigned their billing rights to the Method II CAH; that is, if the clinician continues to submit professional claims through the PFS. This is because when a clinician reassigns their billing rights to a Method II CAH, the CAH bills those services through institutional claims. Under MIPS, we use both professional and institutional claims to trigger EBCMs and include clinicians who have reassigned their billing rights to a Method II CAH. However, in contrast to MIPS, ASM, as proposed, would only use professional claims to trigger EBCMs, and, therefore, would not include clinicians who have reassigned their billing rights to a Method II CAH.

We seek comments on the proposed ASM participant eligibility criteria at § 512.710(b).

(a) ASM Participant and Specialty Type Identification

As discussed in section III.C.2.c.(2) of this proposed rule, we propose at § 512.710(d) that only a certain subset of clinicians who treat heart failure and low back pain would be required to participate in this model. To identify ASM participants, we propose to adopt the Quality Payment Program policies for identifying clinicians and clinical specialty.

(i) ASM Participant Identification

Medicare claims are processed using TINs, which may represent an individual clinician or may represent a hospital or group practice. Because we propose that ASM would evaluate performance at an individual clinician level, TIN alone would not be useful for ASM. Individual providers are, however, identifiable by their unique NPI. When TIN and NPI are used together, CMS is able to identify and evaluate individual providers. NPI-level participation also aligns with the Innovation Center's goal of creating a level playing field for all clinicians and removing unequal benefits afforded to consolidated group practices and health systems.

The Quality Payment Program identifies MIPS eligible clinicians for the individual participation option, defined at § 414.1305, by a combination of TIN and NPI, (hereafter TIN/NPI). We believe this method is also the best method of identifying clinicians in ASM.

Using TIN/NPI for identifying ASM participants would offer several advantages. First, direct comparison of specialist performance between similar clinicians is a central feature of ASM. Participation at the TIN/NPI level puts the specialist as the unit of comparison, allowing for more meaningful assessment among peers. This level of participation would also produce more granular performance analysis and useful feedback for clinicians. Second, we also propose to use TIN/NPI to determine whether clinicians meet the other ASM participant eligibility criteria. Specifically, TIN/NPI would be used to ensure that each ASM participant has met the episode volume criteria for the EBCMs and for assigning clinicians to mandatory geographic areas described later in this section of this proposed rule. This approach would maintain consistency between participant identification and performance assessment within ASM and mirrors the methodology used in the Quality Payment Program. Finally, identifying ASM participants at the TIN/NPI level would enable us to identify claims for a single provider who works at more than one location or organization and, therefore, bills under multiple TINs.

We recognize that an individual clinician may assign their billing rights to multiple TINs (that is, practice across multiple TINs). Such an arrangement would have implications on how we identify ASM participants. For example, if a clinician's NPI is associated with two TINs and meets the ASM participant eligibility criteria for both TINs, then we would consider each TIN/NPI combination to be a separate ASM participant that must separately meet model requirements and report required data. Accordingly, we would separately assess performance and determine payment adjustments for each unique TIN/NPI combination, as described in sections III.C.2.d.(1).(b) and III.C.2.f. of this proposed rule. If an NPI is associated with two TINs but only meets the ASM participant eligibility criteria for one TIN/NPI combination, the clinician would only be considered an ASM participant under that one TIN/NPI combination.

We also considered selecting a single TIN/NPI combination to be the ASM participant in the case that a clinician meets ASM eligibility requirements under more than one TIN/NPI combination. Under that scenario, we would have selected the TIN/NPI combination with the majority of EBCM-triggered episodes for a given ASM cohort (see section III.C.2.c.(3).(b) for further discussion on EBCM as part of the ASM participant eligibility criteria). However, this alternative could adversely affect participant volume and exclude appropriate beneficiary episodes.

We believe that identifying ASM participants at the TIN/NPI level drives direct accountability so that outcomes are clearly attributed to ASM participants. Identifying ASM participants at the TIN/NPI level would allow for a like-to-like performance assessment of clinicians who meet ASM participant eligibility criteria. We believe this performance comparison approach would provide granular and actionable insights into best practices and specialty care delivery.

Therefore, we propose to identify clinicians for ASM by the same method used by the Quality Payment Program. Specifically, we propose to use TIN/NPI to identify clinicians as ASM participants.

We seek public comment on our proposal at § 512.710(b)(2) that ASM participants would be identified at the TIN/NPI level. We also seek comments

on the alternative method of using TIN-level specialty type for identifying ASM participants, as well as selecting a single TIN/NPI combination as an ASM participant in the case that a clinician meets ASM eligibility requirements under more than one TIN/NPI combination.

(ii) Participant Exclusion due to Change in TIN During an ASM Performance Year

We recognize that ASM participants may change practices (as reflected by a change in TIN) during an ASM performance year. In such circumstances, we would need to determine whether the ASM participant must continue to meet model requirements for the original TIN, for the new TIN, or would no longer be required to meet model requirements under either TIN for that ASM performance year. We propose at § 512.710(c)(1) that an ASM participant who, during an applicable ASM performance year, no longer assigns their billing rights to the TIN CMS used to identify them as an ASM participant must notify CMS of such change within 30 days of the change in a form and manner determined by CMS. We propose at § 512.710(c)(2) that an ASM participant who notifies CMS of a change in TIN during an ASM performance year would no longer be required to meet ASM requirements, including data submission requirements described at § 512.720, for the applicable ASM performance year and would instead be subject to MIPS reporting obligations, if applicable. We also propose that the waivers, including the MIPS waiver, established at § 512.775 would no longer apply beginning on the date we determine the clinician is no longer required to meet model requirements for the applicable ASM performance year. If the ASM participant fails to notify CMS within 30 days of no longer assigning billing rights to the original TIN in the form and manner determined by CMS, then the ASM participant would be required to meet the data submission requirements described at § 512.720 for the applicable ASM performance year.

Given our proposal to determine whether clinicians meet ASM participant eligibility criteria for each ASM performance year, we believe that we would naturally identify the movement of individual clinicians to a different TIN between ASM performance years. However, if an ASM participant reassigns their billing rights to a new TIN during an ASM performance year, CMS would not have sufficient data for the new TIN/NPI combination to determine if the ASM participant continues to meet all ASM participant eligibility criteria. For example, we would not have timely EBCM data available for the new TIN/NPI combination to determine if the ASM participant meets the 20 EBCM episode volume criterion (discussed in section III.C.2.c.(3).(b) of this proposed rule) under the new TIN. Without complete data to evaluate whether the ASM participant continues to meet the ASM participant eligibility criteria, we propose, for that ASM performance year, the ASM participant would not be required to submit data in accordance with § 512.720, as proposed, would not be scored in accordance with § 512.745, as proposed, and would not receive an ASM payment adjustment in accordance with § 512.750. Because the proposed Medicare waiver at § 512.775 only waives the requirements of section 1848(q) of the Act, and its implementing regulations for an ASM performance year that ASM participants meets the ASM participant eligibility criteria, the ASM participant would be required to satisfy any MIPS reporting obligations and would receive a MIPS payment adjustment two years later, in accordance with current regulations.

We intend to monitor TIN changes in each ASM cohort within each ASM performance year and across the ASM model test period. If CMS determines that changes to this policy are warranted for future ASM performance years, we would propose those changes through notice and comment rulemaking.

We considered requiring an ASM participant who reassigns their billing rights to a new TIN during an ASM performance year to continue to meet all model requirements for the applicable ASM performance year under the new TIN/NPI combination. As ASM focuses on specialty care related to specific chronic conditions, we considered that the ASM participant would likely continue to furnish services related to ASM targeted chronic conditions under the same specialty type and trigger applicable EBCM episodes during the remainder of the applicable ASM performance year. As discussed in sections III.C.2.d.(3) and III.C.2.e.(2).(b) of this proposed rule, in the case that an ASM participant under a new TIN/NPI combination does not trigger at least 20 episodes during the remainder of the applicable ASM performance year, the ASM participant would not receive a final score. Accordingly, they would receive no payment adjustments in the corresponding ASM payment year as described at § 512.750(d). However, if an ASM participant under a new TIN were to: (1) receive quality and cost ASM performance category scores discussed in sections III.C.2.d.(2).(i) and III.C.2.d.(3).(g) of this proposed rule, and (2) meet the requirements to receive a final score as discussed in section III.C.2.e.(2) of this proposed rule, then we believe it would be appropriate to determine an ASM payment adjustment factor and ASM payment multiplier for the ASM participant under the new TIN/NPI combination. We ultimately decided to not propose this policy because we believe that conforming to the policy set forth in section III.C.2.c.(1), which requires an ASM participant to satisfy any MIPS reporting obligations when they no longer meet ASM participant eligibility criteria, would avoid adding unnecessary complexity to the model.

We also considered not requiring an ASM participant to notify CMS if the change in TIN occurs during an ASM performance year and continuing to require the ASM participant to meet all model requirements under the original TIN/NPI combination for the applicable ASM performance year. However, we believe that it would be challenging for the ASM participant to access the necessary data to meet the data submission requirements if no longer affiliated with the original TIN. Therefore, we do not believe it would be appropriate to hold an ASM participant in this situation accountable for ASM requirements under the original TIN.

We seek comments on our proposal at § 512.710(c) to exclude ASM participants who change TIN during an applicable ASM performance year from ASM reporting requirements for that year of the model. We also seek comments on the alternatives of requiring the ASM participant to meet model requirements under their new TIN, as well as the alternative of requiring the ASM participant to meet model requirements and data submission requirements under the original TIN/NPI combination that identified them as an ASM participant.

(iii) ASM Specialty Identification

To ensure that all clinicians meeting the specialty requirements described at § 512.710(d) are included in the model, we propose to define ''specialty type'' based on the specialty code indicated on the plurality of a clinician's Medicare Part B claims during the period described in section III.C.2.c.(5) of this proposed rule. Specifically, we plan to use the same specialty codes used for the Quality Payment Program to identify

MIPS eligible clinicians as defined at § 414.1305.[128]

The specialty codes used on Medicare Part B claims are not reported by clinicians but are assigned to claims by the Medicare Administrative Contractors (MACs) and derived from the clinician-reported specialty designations that are entered in the Provider Enrollment, Chain, and Ownership System (PECOS) as part of the Medicare provider enrollment application. Because a clinician's specialty code could change during an ASM performance year, we propose to use the specialty code assigned to the majority of a clinician's Medicare Part B claims for determining specialty type for ASM.

We also considered using PECOS specialty designation alone for the purpose of determining specialty type for ASM. However, the PECOS specialty codes are self-reported, and a single clinician may list more than one primary specialty, which may make it unreliable as a single source for identifying a clinician's primary specialty. We stated in the CY 2023 PFS final rule that given the strong alignment between PECOS data and claims data and our historical use of claims data to identify a clinician's specialty, we believe that Medicare Part B claims data would be the best data source to use to identify a clinician's specialty (87 FR 70039).[129] Moreover, given that the Quality Payment Program uses Medicare claims data, we do not want to create inconsistencies between specialty types for ASM and MIPS. We also considered using the Health Care Provider Taxonomy Codes, which categorize the type, classification, and/or specialization of health care providers. These codes offer more specificity than PECOS (87 FR 70039) and are used when applying for an NPI from the National Plan and Provider Enumeration System (NPPES). However, they are not verified for accuracy.[130] We have previously elected not to use the Health Care Provider Taxonomy Codes for MIPS because of uncertainty regarding the reliability of NPPES as a data source for MIPS eligibility determinations (87 FR 70039). We analyzed the congruence between specialty designations made for the purposes of MIPS and those reported in NPPES for the proposed specialty types for each of ASM's targeted chronic conditions. Our analysis found a high degree of congruence between the two specialty type codes, likely because we provide a crosswalk of the Health Care Provider Taxonomy Codes and Medicare Specialty Codes that can be used by a clinician when they enroll in Medicare through PECOS.[131] Given the alignment between these coding systems, we believe that remaining consistent with the specialty type determination methodology used by the Quality Payment Program is important for potential scalability of ASM.

We seek comments on our proposal at § 512.710(d) to identify specialty type based on the specialty code indicated on the plurality of a clinician's Medicare Part B claims. We also seek comments on using PECOS specialty codes alone and Health Care Provider Taxonomy Codes for the purpose of determining specialty type for ASM.

(b) Episode-Based Cost Measure (EBCM) Episode Volume

We believe that ASM participant eligibility criteria must appropriately identify clinicians who furnish a sufficient volume of services related to ASM targeted chronic conditions and who can be appropriately evaluated on costs related to the ASM targeted chronic conditions. We propose to identify ASM participants using the volume of services related to heart failure and low back pain furnished by clinicians who have a specialty designation that corresponds with the proposed specialty types discussed in III.C.2.c.(2). of this proposed rule. Only clinicians with the proposed specialty types that furnish a volume of services above a specific threshold related to the applicable ASM targeted chronic condition would be identified as ASM participants. That is, not all clinicians with the proposed specialty types related to heart failure and low back pain would be required to participate in ASM.

We propose to use MIPS EBCMs to determine volume, rather than assessing volume based on claims for individual services. Specifically, the volume of attributed episodes from EBCMs related to the ASM targeted chronic conditions would serve as the data source by which we evaluate the volume of furnished episodes for ASM. We propose at § 512.710(e)(1) to identify ASM heart failure participants using the volume of episodes attributed to a TIN/NPI in accordance with the heart failure EBCM as specified under MIPS. We propose at § 512.710(e)(2) to identify ASM low back pain participants using the volume of episodes attributed to a TIN/NPI in accordance with the low back pain EBCM as specified under MIPS. We refer readers to section III.C.2.c.(5). of this proposed rule on the proposed processes and specific years of data that we would use to assess EBCM volume to identify ASM participants.

EBCMs assess Medicare resource use for a specific condition or procedure based on only those costs that occur as part of an attributed clinician's care management. CMS uses claims data from Medicare Parts A and B, and some Medicare Part D data, if applicable, to construct the EBCMs. An episode is initiated when a clinician submits a professional claim for at least two separate services, provided to a single beneficiary, that are clinically related to the chronic condition being assessed. Although the episode is initiated and attributed to a particular clinician, the episode includes all Medicare Part A and B services for the length of the episode, as defined by the measure specifications (88 FR 79339 through79347). Therefore, regardless of who provides the care, an episode includes all services related to a beneficiary's condition, routine care services, and consequences of care, and excludes services that are clinically unrelated to the targeted condition of the measure.[132]

To attribute episodes to practices and clinicians, CMS first attributes episodes to a TIN when it performs two services indicating care for a particular condition for a single beneficiary within a certain number of days (for example, 180 days); both professional claims must have diagnosis codes for the relevant chronic condition. CMS then attributes episodes to each clinician (NPI) within the group (TIN) that rendered at least 30 percent of the total number of qualifying services during the episode. For the heart failure EBCM, CMS also checks that the clinician prescribed at least two condition-related prescriptions on different days to two different patients during the calendar year used to construct the episode plus a 1-year lookback period to ensure that attributed clinicians are actually involved in providing ongoing chronic care management.[133] The low back pain EBCM does not use this additional check since the types of clinicians that manage low back pain may may not prescribe the relevant medication,

[128] *https://www.federalregister.gov/d/2022-23873/page-70039.*

[130] *https://data.cms.gov/resources/medicare-provider-and-supplier-taxonomy-crosswalk-methodology.*

[131] *https://data.cms.gov/provider-characteristics/medicare-provider-supplier-enrollment/medicare-provider-and-supplier-taxonomy-crosswalk/data.*

[132] *https://www.cms.gov/files/document/wave-4-measure-development-process-macra.pdf.*

[133] *https://www.cms.gov/files/zip/2024-cost-measure-information-forms-zip.zip-0.*

which could prevent certain clinician types from being attributed episodes.[134]

CMS began development and field testing of the heart failure and low back pain measures in 2022.[135] We finalized the inclusion of the heart failure and low back pain measures to the MIPS cost performance category beginning in the 2024 MIPS performance period/2026 MIPS payment year (88 FR 79319). We also finalized the inclusion of the heart failure EBCM in the Advancing Care for Heart Disease MVP (88 FR 80022 through 80025; 89 FR 99015 through 99019) and the low back pain EBCM in the in the Rehabilitative Support for Musculoskeletal Care MVP (88 FR 80002 through 80007; 89 FR 99050 through 990054).

We believe that the construction of the EBCMs and the existing use of these measures within MIPS and MVPs relevant to ASM targeted chronic conditions make the measures an appropriate data source by which to identify ASM participants that furnish enough services and provide longitudinal care management for Medicare beneficiaries diagnosed with ASM targeted chronic conditions.

We believe that an annual threshold of 20 or more attributed episodes from an EBCM is appropriate for identifying ASM participants that can be held accountable for quality and cost related to ASM targeted chronic conditions. We have defined a case minimum of 20 episodes for the purposes of scoring chronic condition EBCMs in MIPS, including MVP reporting, as specified in § 414.1350(c)(6) (88 FR 79346 through 79348). We believe using a similar 20-episode minimum from the calendar year used for determining ASM participant eligibility increases the likelihood that an ASM participant would trigger and be attributed at least 20 episodes within a given ASM performance year. Using a 20-episode threshold would increase the likelihood that they could be scored on the applicable EBCM during the relevant ASM performance year, as described in section III.C.2.d.(3).(g) of this proposed rule.

We also considered using an EBCM episode threshold greater than 20 episodes. For example, we considered the effects of using a 30-episode or 50-episode threshold. In our analysis of calendar year 2023 data, we found that a 30-episode threshold would decrease the number of potentially eligible ASM participants by 43 percent for heart failure and 35 percent for low back pain relative to the 20-episode threshold. We found that a 50-episode threshold would decrease the number of potentially eligible ASM participants by 76 percent for heart failure and by 65 percent for low back pain relative to the 20-episode threshold. We believe that the smaller number of potentially eligible ASM participants under a higher EBCM episode threshold would make for a less reliable model test.

We considered but are not proposing to add the MIPS low volume threshold of Medicare Part B allowed charges for covered professional services, Medicare patients that receive Medicare Part B covered professional services, and the number of Medicare Part B services provided for individual MIPS eligible clinicians as defined at § 414.1305 as part of the ASM participant eligibility criteria. Adding the MIPS low volume threshold would mean that clinicians would have to meet the MIPS eligibility determinations as defined at § 414.1305, as well as all other ASM participant eligibility criteria, to be identified as an ASM participant. We considered using the same low volume threshold for individual MIPS eligible clinicians given the use of the MVP framework for selecting measures for ASM and to identify ASM participants that furnish a sufficient volume of services related to ASM targeted chronic conditions. Given the importance of using EBCM episode volume to identify ASM participants, we found that inclusion of the MIPS low volume threshold in our ASM participant eligibility criteria would add a secondary service volume criterion. We estimate that the inclusion of the MIPS low volume threshold on top of the EBCM episode volume threshold could potentially decrease the number of ASM participants by more than 50 percent. We believe that the use of the EBCM 20-episode threshold would be a more appropriate criterion for identifying ASM.

We seek public comments on our proposals at § 512.710(e) to use the heart failure EBCM as specified under MIPS to identify potential ASM heart failure participants and the low back pain EBCM as specified under MIPS to identify potential ASM low back pain participants. We also seek comments on our proposal that clinicians who have 20 or more heart failure EBCM episodes attributed in accordance with the heart failure EBCM as specified under MIPS during the calendar year 2 years prior to the applicable ASM performance year would meet the ASM participation eligibility criterion at § 512.710(b)(3) and clinicians who have 20 or more low back pain EBCM episodes attributed in accordance with the low back pain EBCM under MIPS during the calendar year 2 years prior to the applicable ASM performance year would similarly meet the ASM participation eligibility criterion at § 512.710(b)(3). We also seek comment on specifying a higher episode volume threshold and using the MIPS low volume threshold of Medicare Part B allowed charges for covered professional services for identifying clinicians who provide a sufficient volume of services.

(4) Mandatory Geographic Areas

(a) Identification of Geographic Areas

We propose at § 512.710(f) that only clinicians in certain selected areas would be required to participate in the model. As proposed in § 512.710(f), the proposed unit of selection is CBSAs except in cases where OMB has divided large metropolitan statistical areas (MSAs) into metropolitan divisions. For these MSAs, we propose to use these metropolitan divisions in place of the CBSA. Using metropolitan divisions rather than large MSAs would enable more precise matching of intervention and control groups by using geographic units of more comparable size, which would improve the statistical validity of our evaluation approach.

OMB Bulletin 23–01, issued on July 21, 2023, states that there are 935 CBSAs in the United States and Puerto Rico. OMB delineates MSAs and micropolitan statistical areas, which are referred to collectively as CBSAs. The general concept of the MSA and micropolitan statistical area is that of a core area containing a substantial population nucleus, together with adjacent communities having a high degree of economic and social integration with that core. MSAs contain at least one urban area of 50,000 or more population; micropolitan statistical areas contain at least one urban area of at least 10,000 and less than 50,000 population.

If specified criteria are met, an MSA containing a single core with a population of 2.5 million or more may be subdivided into metropolitan divisions, which function as distinct areas within the larger metropolitan statistical area. CBSAs are composed of entire counties. There are 393 MSAs, of which 13 are subdivided into 37 metropolitan divisions, and 542 micropolitan statistical areas in the United States and Puerto Rico, as of July 2023.

We also considered using the following geographic areas as the geographic unit from which ASM

[134] *https://www.cms.gov/files/zip/mips-chrcondition-episode-based-cost-measures-attribution-methodology-2023-zip.zip.*

[135] *https://www.cms.gov/files/document/wave-4-measure-development-process-macra.pdf.*

participants are identified: (1) certain ZIP Codes based on their Hospital Referral Regions (HRR); or (2) certain states. We considered selecting based on HRRs for ASM. HRRs represent regional health care markets for tertiary medical care and are defined by determining where most patients were referred for major cardiovascular surgical procedures and for neurosurgery. There are 306 HRRs with at least one city where both major cardiovascular surgical procedures and neurosurgery are performed. While HRRs may sufficiently reflect referral patterns for heart failure episodes of care, they are less appropriate for low back pain episodes. Therefore, we decided that using CBSAs and metropolitan divisions as a geographic unit is preferable over HRRs for this model.

We also considered selecting states as the geographic unit of selection for ASM. However, we concluded that CBSAs and metropolitan divisions would provide a more granular unit of analysis, allowing for better matching of comparison areas. Additionally, selecting states would greatly reduce the number of independent geographic areas subject to selection under the model, and thus would decrease the statistical power of the model evaluation. Finally, CBSAs and metropolitan divisions straddle state lines where providers and Medicare beneficiaries can easily cross these boundaries for health care.

We propose that we would select the CBSAs and metropolitan divisions through the stratified random sampling methodology described later in this section of this proposed rule to participate in ASM. Although CBSAs are revised periodically, we propose to use the CBSA and metropolitan division designations in OMB Bulletin 23–01 issued on July 21, 2023 as the CBSA designations for purposes of selecting participants for this model, regardless of whether such CBSA designations have changed since July 21, 2023, or would change at some point during the ASM test period. We believe that this approach would best maintain the consistency of the ASM participants in the model, which is crucial for our ability to evaluate the effects of the model test on quality of care and changes in Medicare spending.

As discussed later in this in section III.C.2.c.(4).(e) of this proposed rule, we propose in § 512.710(f)(4) to use the ZIP Codes of the service locations of each clinician as discussed in section III.C.2.c.(4).(e) of this proposed rule to assign each clinician to a single CBSA or metropolitan division. Each clinician that CMS determines falls under the selected CBSA or metropolitan division, and that otherwise meets the other eligibility criteria set forth in § 512.710(b), would be required to participate in the model.

Based on our proposal to randomly select CBSAs and metropolitan divisions as ASM's mandatory geographic areas, III.CZIP Codes and other areas not located in a CBSA or metropolitan division would not be included in the ASM selection methodology as discussed in section III.C.2.c.(4).(b) of this proposed rule. We note that Transforming Episode Accountability Model (TEAM), a mandatory episode-based payment model, uses CBSAs as the geographic unit of selection (as defined in § 512.515). We note that the proposed mandatory geographic areas may include some areas considered as rural areas under MIPS, which defines rural areas at § 414.1305 as a ZIP Code designated as rural by the Health Resources and Services Administration's Federal Office of Rural Health Policy (FORHP), using the most recent FORHP Eligible ZIP Code file available.

We seek comments on our proposal to use CBSAs and metropolitan divisions as the geographic unit from which ASM participants are identified. We seek comments on our proposal to use the ZIP Codes of the service locations of each clinician as discussed in section III.C.2.c.(4).(e) of this proposed rule to assign each clinician to a single CBSA or metropolitan division, including ZIP Codes designated as rural by HRSA's FORHP using the most recent FORHP Eligible ZIP Code file available. We seek comment on our proposal to require all eligible clinicians within a CBSA or metropolitan division that the Innovation Center selects through the stratified random sampling methodology as part of the intervention group described in section III.C.2.c.(4).(d) in this proposed rule to participate in ASM. Finally, we seek comments on our proposal to use the CBSA and metropolitan division designations in OMB Bulletin 23–01 issued on July 21, 2023 as the CBSA designations for purposes of selecting participants for this model.

(b) Exclusion of Certain CBSAs and Metropolitan Divisions

We propose at § 512.710(f)(1) that we would not consider certain CBSAs or metropolitan divisions for selection. Specifically, we propose at § 512.710(f)(1)(ii) that we would exclude any CBSA or metropolitan division located entirely in U.S. territories due to challenges we would have in finding suitable geographic areas for comparison. We also propose at § 512.710(f)(1)(i) to exclude any CBSAs or metropolitan divisions that do not have any clinicians of the mandated specialty types with at least 20 eligible episodes between January 1, 2024 and December 31, 2024 in accordance with the EBCM episode threshold described in section III.C.3.c.(3).(b). We believe it is unlikely for these CBSAs or metropolitan divisions to have data available for evaluation after the model starts. After applying these criteria, we expect to have approximately 600 CBSA and metropolitan divisions remain available for selection into ASM.

We considered the alternative of excluding from ASM any CBSA or metropolitan divisions located within a state or portion of a state with a commitment to participate in the Advancing All-Payer Health Equity Approaches and Development (AHEAD) model. The AHEAD model is a state-wide CMS Innovation Center model implemented under section 1115A of the Act that aims to increase investment in primary care, provide financial stability for hospitals, and support beneficiary connections to community resources. We decided not to propose these exclusions because ASM would not interact with the payment methodology in AHEAD and may help align a broader set of clinicians towards the goals of AHEAD. We seek comments on our proposal to exclude from selection any CBSA or metropolitan division located entirely in a U.S. territory and any CBSAs or metropolitan divisions that do not have any clinicians of the mandated specialty types with at least 20 eligible episodes between January 1, 2024 and December 31, 2024. We seek comments on the alternative to exclude AHEAD geographies from ASM's mandatory CBSA or metropolitan divisions.

(c) Geographic Selection Methodology

To determine which CBSAs and metropolitan divisions would be included in the model, we propose to use a stratified random sampling method to select approximately 25 percent of CBSAs and metropolitan divisions into ASM following the process described in the following two sections of this proposed rule. We propose at § 512.710(f)(2) to stratify CBSAs and metropolitan divisions into mutually exclusive groups based on 3 CBSA/metropolitan division-level characteristics: average total Parts A and B episode spending, volume of eligible episodes, and metropolitan division status. We propose at § 512.710(f)(2)(i)

through (vi) stratifying eligible CBSAs into six mutually exclusive groups:

- Eligible CBSAs with ''Low'' average total episode spending (as defined below) and ''Low'' eligible episode volume (as defined below);
- Eligible CBSAs with ''Low'' average total episode spending and ''High'' eligible episode volume (as defined below);
- Eligible CBSAs with ''High'' average total episode spending (as defined below) and ''Low'' eligible episode volume;
- Eligible CBSAs with ''High'' average total episode spending and ''High'' eligible episode volume;
- Eligible CBSAs with ''Very High'' eligible episode volume (as defined below);
- Eligible metropolitan divisions.

(i) Average Total Parts A and B Episode Spending

We propose at § 512.710(f)(2) to measure average total Medicare Parts A and B episode spending using claims data from January 1, 2024 to December 31, 2024. One of the main objectives of ASM is to reduce spending, and therefore, it would be important to account for the significant variation in average episode spending across geographic areas. This stratification would help ensure that we can measure any variation in model effects between high and low spending areas. We propose to use a single, pooled measure including spending for both heart failure and low back pain episodes. This would help limit the number of overall strata and we believe would allow for adequate representation of both high spending low back pain areas and high spending heart failure areas, where the potential for savings may be greatest. We propose to categorize CBSAs into two categories based on average total parts A & B episode spending: below the median (''Low'') and at-or-above the median (''High'').

(ii) Volume of Eligible Episodes

We propose at § 512.710(f)(2) to measure eligible episode volume using claims data from January 1, 2024 to December 31, 2024. We expect significant variation in the volume of eligible episodes across areas. This variation may reflect differences in other characteristics that are related to ASM performance. For example, large, active markets with a larger number of specialists may have structural advantages in performing well in ASM compared to smaller, less active markets. The proposed stratification on volume of eligible episodes would help ensure we select an adequate sample of areas with varying levels of specialty activity so that we would be able to identify statistical differences in outcomes across levels of specialty activity. This stratification would also help ensure that selected CBSAs have sufficient episode volume to support a robust evaluation. We propose to use a single, pooled measure including both heart failure and low back pain episodes. This allows us to limit our number of stratification variables and analysis of 2023 episode-level data found that the episode volumes of the two conditions are highly correlated across CBSAs. We propose to categorize CBSAs into three categories based on total episode volume: below median (''Low''), at-or-above median up to the 95th percentile (''High''), and the 95th percentile and above (''Very High''). We propose to stratify out the top 5 percent of CBSAs by episode volume because of the right-skewed nature of the episode volume distribution.

(iii) Metropolitan Divisions

The largest 13 CBSAs are divided into 37 metropolitan divisions. Metropolitan divisions therefore represent a subdivision level compared to CBSAs. Additionally, these metropolitan divisions, all belonging to CBSAs with a core population of 2.5 million or more, may have important characteristics in common beyond episode volume and average total spending. To ensure adequate representation of metropolitan divisions in the sample, we propose to categorize metropolitan divisions into their own stratum.

We considered stratifying by other characteristics, including ACO penetration, supply of PCPs, region, rurality, and participation in the AHEAD model. We seek comments on our proposed selection strata as well as alternatives considered.

TABLE 38: NUMBER OF ELIGIBLE CBSAs AND METROPOLITAN DIVISIONS BY STRATUM (2023 EBCM DATA)

Stratum Number	Average Total Parts A&B Episode Spending	Volume of Eligible Episodes	CBSA or Metropolitan Division?	Selection Probability	Number of CBSAs or Metropolitan Divisions in Stratum
1	Low	Low	CBSA	40%	160
2	Low	High	CBSA	40%	120
3	High	Low	CBSA	40%	124
4	High	High	CBSA	40%	136
5	-	Very High	CBSA	40%	29
6	-	-	Metropolitan Division	40%	31

(d) Stratified Random Selection of Mandatory Geographic Areas

A representative sample of clinicians that meet eligibility requirements for the proposed ASM is necessary for a robust evaluation of the model. Testing the model in this manner would also allow us to learn more about utilization patterns of health care services and how to incentivize the improvement of quality and care coordination for chronic heart failure and low back pain. This learning could potentially inform the Quality Payment Program and the future of the MVP reporting option. Therefore, we are proposing a broad, representative sample of clinicians in multiple geographic areas. We determined that the best method for obtaining the necessarily diverse, representative group of clinicians would be through stratified, random selection. A stratified, randomly selected sample would allow us to ensure statistical

balance across characteristics of interest (for example, average spending and episode volume) and would provide results that applies generally to similar Medicare clinicians that submit FFS claims and treat heart failure or low back pain and would allow for a more robust evaluation of the model. We also believe that there could be broader learnings from ASM that could apply to other conditions and specialists.

At § 512.710(f)(3), we propose to randomly select CBSAs and metropolitan divisions for ASM from the six stratified groups described above at a 40 percent rate (that is, each CBSA and metropolitan division in each stratum has a 40 percent chance of being selected into the model). If 40 percent of a given stratum does not result in a whole number of CBSAs or metropolitan divisions, CMS would round up to the next whole number to ensure that at least 40 percent of areas from each stratum are selected. Table 38 provides an illustrative example of the six stratified groups based on CY 2023 data. We considered using other selection rates but based on preliminary analyses, we believe these selection rates would produce adequate sample size and participant mix for the model test. We refer readers to the regulatory impact analysis in section VII. of this proposed rule for further discussion on the scale of ASM and its estimated financial impact.

We conducted power analyses to identify detectable changes in total and episode spending between a potential group of CBSAs and metropolitan divisions selected for the model and a potential control group of CBSAs using a Type I error of 0.05 and Type 2 error of 0.2 (implying a power of 0.8). The analysis shows that, if 240 eligible CBSAs are selected for ASM, we would be able to detect about a 3.5 percent change in total episode spending if we look at heart failure and low back pain episodes separately. Allowing a higher Type I error of 0.25 and pooling heart failure and low back pain episodes would allow us to detect about a 1.7 percent change in total episode spending.

This model may be underpowered to detect statistically significant changes in total spending. However, the model may be more likely to generate statistically significant savings among certain low-value services or spending categories that are major cost drivers for heart failure and low back pain (for example, imaging, surgeries, hospital admissions). In a case where the model's impact on total spending is ambiguous, significant savings among these categories of spending may provide strong supporting evidence that Medicare saved money overall.

We seek public comments on our proposed approach to random selection of CBSAs and metropolitan divisions from our proposed selection strata as well as all alternatives considered.

(e) Assignment of Geographic Areas to Clinicians

We propose at § 512.710(f)(4) to assign a single CBSA or metropolitan division to each clinician based on the clinician's most common episode-level service location ZIP Code for each ASM performance year. We believe that it would be appropriate to use service location data from EBCM episodes to identify the CBSA or metropolitan division of clinicians' service locations given the use of the EBCMs as part of ASM participant eligibility criteria. As discussed in section III.C.2.c.(3).(b). of this proposed rule, EBCM episodes would help identify ASM participants who render a meaningful volume of services related to ASM's targeted chronic conditions. Using the service location from Medicare Part B claims of rendered services used to construct the episode as the basis for determining the service location of a clinician would keep a consistent and accurate source of data by which to make these geographic assignments. We also considered using the CBSA or metropolitan division related to the ZIP Code of the TIN to which a clinician has assigned billing rights for the purpose of determining whether a clinician furnishes ASM-related services in a mandatory geographic area. We believe that it would not be appropriate use a TIN's ZIP Code since a TIN's ZIP Code does not necessarily correlate to service location, particularly in the case of multi-site practices.

Using episode-level service location ZIP Code assignments, we propose at § 512.710(f)(4) the following process to identify clinician-level CBSA or metropolitan division assignments:

- Identify all EBCM episodes relevant to ASM targeted chronic conditions attributed to a clinician during the calendar year 2 years before the applicable ASM performance year (or during January 1, 2024 through December 31, 2024 for initial CBSA or metropolitan division assignment).
- For each episode, establish a service location ZIP Code. An episode may consist of several Medicare Part B Claims. Not all of the ZIP Codes set forth on the Medicare Part B claims form may be the same. To determine which ZIP Code the episode would be associated with, we propose to review all applicable Medicare Part B claims associated with the episode and identify the Medicare Part B claim line ZIP Code appearing most often. An episode could have an equal number of ZIP Codes on claims associated with the episode. We would break any ties between ZIP Codes by determining the episode's ZIP Code based on the ZIP Code on the claim with the highest total cost indicated by the total standardized allowed amount, or in instances a second tie break is needed, by using the ZIP Code on the claim with the most recent date.
- Match the ZIP Code assigned to each episode to a CBSA or metropolitan division. In other words, determine the CBSA or metropolitan division to which the episode is assigned. To do so, we propose to use ZIP Code and CBSA/metropolitan division crosswalks published quarterly by the U.S. Department of Housing and Urban Development.[136] Some CBSA and metropolitan division share ZIP Codes, meaning a ZIP Code could be assigned to multiple CBSAs and metropolitan divisions. In these instances, to ensure each ZIP Code is linked to a unique CBSA or metropolitan division, we would assign the ZIP Code to the CBSA or metropolitan division where the ZIP Code has the highest proportion of total addresses. For example, if ZIP–A spans CBSA–B and CBSA–C, and ZIP–A has more addresses in CBSA–B, then we would assign ZIP–A to CBSA–B. We would get the proportion of total addresses in each ZIP Code from the ZIP Code to CBSA/metropolitan division crosswalk published by the U.S. Department of Housing and Urban Development.[137] The crosswalk also subdivides the proportion of total addresses into the number of business addresses, residence addresses, and other addresses. If the proportion of total addresses within the ZIP Code is equal across CBSAs or metropolitan divisions (meaning that we cannot use the proportion of total addresses to assign a single CBSA or metropolitan division to the ZIP Code), then we would assign the ZIP Code to the CBSA and metropolitan division (if applicable) with the highest proportion of business addresses (regardless of the number of residence addresses or other addresses). We use business addresses as the tiebreaker since business addresses would represent where clinicians would practice, which aligns with our overall approach for using service location for participant identification.

[136] *https://www.huduser.gov/portal/datasets/usps_crosswalk.html.*

[137] *https://www.huduser.gov/portal/datasets/usps_crosswalk.html.*

• Determine the appropriate CBSA or metropolitan division for each clinician attributed applicable episodes. If the clinician is attributed multiple episodes in multiple CBSAs or metropolitan divisions, we would match the clinician with the CBSA or metropolitan division where the clinician has the most assigned episodes. If a clinician has an equal number of episodes assigned to multiple CBSAs or metropolitan divisions, we would break such a tie by matching the clinician to the CBSA or metropolitan division that has the highest total risk-adjusted spending across all episodes assigned to each CBSA or metropolitan division. If a second tie break is needed, we would match the clinician to the CBSA or metropolitan division that has episodes with the more recent dates. For example, if a clinician has an equal number of episodes in CBSA–B and CBSA–C, but the episodes in CBSA–B collectively have a higher total risk-adjusted spending compared to all episodes in CBSA–C, then the clinician would be matched to CBSA–B.

We seek comments on our proposed process at § 512.710(f)(4) for determining the CBSA or metropolitan division of a clinician for each ASM performance year using EBCM data for the purposes of determining whether a clinician is located within a mandatory geographic area for each ASM performance year.

(5) Proposed Selection and Notification Process for ASM Participants

We propose to identify ASM participants on an annual basis. At § 512.710(g) we propose to identify all clinicians furnishing covered services in accordance with the ASM participant eligibility criteria specified in section III.C.2.c.(3) of this proposed rule using applicable data from 2 calendar years prior to each ASM performance year. We also propose that a clinician selected for participation for any ASM performance year would be considered an ASM participant for the remainder of the model.

We propose at § 512.710(g)(1)(i), for the 2027 ASM performance year/2029 ASM payment year only, to identify preliminarily eligible ASM participants using the ASM participant eligibility criteria and applicable data from calendar year 2024. If ASM is finalized as proposed, we propose to make public the preliminarily eligible ASM participants in a form and manner determined by CMS. We expect to release this information by the end of CY 2025. Then, to finalize the ASM participants for the 2027 ASM performance year/2029 ASM payment year, we propose § 512.710(g)(1)(ii) to confirm that the preliminarily eligible ASM participants continue to meet the ASM participant eligibility criteria using more recent data from calendar year 2025. We propose to make public the selected ASM participants for the 2027 ASM performance year/2029 ASM payment year in a form and manner determined by CMS. We expect to release this information by the end of July 2026, preceding the start of the 2027 ASM performance year/2029 ASM payment year. We believe that notifying preliminarily eligible ASM participants well before the start of the first ASM performance year in 2027 would provide ample time to become familiar with ASM requirements, make practice adjustments, and prepare for reporting of the required measures and data.

We considered not releasing the preliminarily eligible ASM participants for the 2027 ASM performance year/2029 ASM payment year and, instead, only using applicable data from the 2025 calendar year to identify the final ASM participants for the 2027 ASM performance year/2029 ASM payment year. However, this alternative would provide less time for ASM participants to prepare for the first ASM performance year and potentially increase the operational burden for clinicians selected for the model.

If ASM is finalized, as proposed, for each ASM performance year, beginning with the 2028 ASM performance year/2030 ASM payment year, we propose at § 512.710(g)(2)(i) to confirm that ASM participants continue to meet ASM participant eligibility criteria for the upcoming ASM performance year/ASM payment year using applicable data from the calendar year 2 years prior to the applicable ASM performance year. If an ASM participant does not meet the ASM participant eligibility criteria for the upcoming ASM performance year, then they would not be required to participate in ASM for the applicable ASM performance year and would not need to meet applicable reporting requirements of ASM. Further, waivers, including the MIPS waiver, described at § 512.775 would no longer apply to the ASM participant, and the ASM participant must participate in MIPS if applicable.

Beginning with the 2028 ASM performance year/2030 ASM payment year, we propose at § 512.710(g)(2)(ii) to identify additional clinicians not previously identified as ASM participants but who meet the ASM participant eligibility criteria at § 512.710(b) for the upcoming ASM performance year/ASM payment year using data from the calendar year 2 years prior to the applicable ASM performance year.

We propose that CMS would make public the ASM participants for a given ASM performance year annually in a form and manner determined by CMS. We intend to release this information by the end of July in the year preceding the start of the applicable ASM performance year. We believe that the proposed approach of annually identifying clinicians who meet the ASM participant eligibility criteria would ensure we are accurately selecting ASM participants. That is, we would ensure that ASM participants continue to be of the required specialty type and meet the EBCM episode volume thresholds year-over-year. This proposed approach to selecting ASM participants also allows us to account for movement of ASM participants to different practices within mandatory geographic areas and allows new ASM participants into the model over the ASM test period. We also believe that this approach would allow ASM to maintain an appropriate number of ASM participants over the ASM test period to produce a reliable model test.

We considered an alternative approach of establishing a fixed list of ASM participants for all ASM performance years. Under this alternative, we would first identify ASM participants as clinicians that meet the ASM participant eligibility criteria using applicable data from the 2024 calendar year for the 2027 ASM performance year/2029 ASM payment year and release a list of preliminarily eligible ASM participants. We would then finalize the ASM participants for the 2027 ASM performance year/2029 ASM payment year using applicable data from the 2025 calendar year. Beginning in the 2028 ASM performance year/2030 ASM payment year, we would reconfirm that the final ASM participants identified for the 2027 ASM performance year/2029 ASM payment year continue to meet the ASM participant eligibility criteria for each ASM performance year thereafter using applicable data from 2 calendar years before the applicable ASM performance year. Under this alternative, we would not identify new ASM participants over the course of the ASM model test period. Repeatedly reconfirming that the initial ASM participants continue to meet ASM participant eligibility criteria for each ASM performance year would result in attrition of any ASM participant who changes their association with a practice (that is, assigns billing rights to a different TIN) after the first ASM performance year based on our proposed identification of

ASM participants at the TIN/NPI level. Accordingly, we believe that this alternative fixed-list approach would reduce the number of ASM participants over the ASM test period and the magnitude of this potential decrease could undermine the reliability of the model test.

We seek comments on our proposed approach for selecting and notifying ASM participants at § 512.710(g). We also seek comment on only identifying the final ASM participants for the 2027 ASM performance year/2029 ASM payment year using applicable data from the 2025 calendar year and the use of a fixed list of ASM participants for all ASM performance years.

d. Proposed ASM Performance Assessment Approach, Data Submission Requirements, and ASM Performance Category Requirements and Scoring

As discussed earlier in section III.C.1.b. of this proposed rule, we propose to use the MVP framework, including its performance categories, to assess ASM participant performance related to improving quality of care and reducing low-value care related ASM targeted chronic conditions. We believe this framework offers a tested performance assessment framework to use in creating value-based incentives for ASM participants. In this section of this proposed rule, we discuss the performance measures and activities that would be used to assess the performance of ASM participants in four ASM performance categories of (1) quality, (2) cost, (3) improvement activities, and (4) Promoting Interoperability. We propose to define at § 512.705 ''ASM performance category'' as a group of applicable measures or activities used to assess an ASM participant's performance on quality, cost, improvement activities, or Promoting Interoperability. Tying a clinician's performance to certain measures and activities (as discussed below) in these performance categories would support ASM goals, as discussed in section III.C.1 of this proposed rule, of decreasing the cost of care for beneficiaries with ASM's targeted chronic conditions as well as improving quality care as measured through a focused measure set relevant to ASM's clinical specialties and targeted chronic conditions.

- The quality ASM performance category would assess the quality of care ASM participants delivered by measuring health care processes, outcomes, and patient experiences of care with the goal of improving the quality of care for beneficiaries with ASM's targeted chronic conditions.
- The cost ASM performance category would assess the efficiency and cost-effectiveness of care provided to Medicare beneficiaries with ASM targeted chronic conditions with the goal of providing more cost-efficient care to generate cost savings.
- The improvement activities ASM performance category would assess ASM participants in their efforts to make practice improvements that improve population health, enhance patient experiences and outcomes, reduce cost of care, and improve clinician experience. To meet ASM's practice improvement goals, ASM's improvement activities would incentivize practice improvements that would strengthen care management and processes related to ASM's targeted chronic conditions, and incentivize stronger integration between specialist and primary care providers.
- The Promoting Interoperability ASM performance category would assess ASM participants in their efforts to promote patient engagement and electronic exchange of information using CEHRT to enhance quality of care and reduce costs through more effective upstream chronic condition management and care integration related to ASM's targeted chronic conditions. Under ASM, CEHRT should meet the requirements set forth in § 414.1305, except all instances of references to MIPS are to be replaced with references to ASM.

As further discussed below in section III.C.2.d.(2) of this proposed rule, we propose for the quality ASM performance category, cost ASM performance category, and promoting interoperability ASM performance category, to draw measures and activities from specific MVPs related to each of ASM's targeted chronic conditions to identify a cohesive set of vetted and clinically relevant measures and activities that would allow us to appropriately assess ASM participants on the care they deliver related to ASM's targeted chronic conditions. Using the same measures would mean the many ASM participants would already be familiar with required measures and activities proposed in each of the ASM performance categories. proposed in these ASM performance categories. However, as we discuss in sections III.C.2.d.(1) and III.C.2.f of this proposed rule, comparing performance on these measures and activities as measured by ASM performance category and final scores within each ASM cohort would result in payment adjustments based on direct peer-to-peer comparisons of similar specialists. For some ASM performance categories, we propose to include measures from outside of the relevant MVP, such as from the broader inventory of MIPS measures, when we believe there is a clinically justifiable rationale for including such a measure. We propose ASM-specific measures or activities in limited circumstances when we believe there is rationale for assessing performance or creating an incentive for practice improvement specific to ASM's targeted chronic conditions. For example, the improvement activities ASM performance category, as discussed in section III.C.2.d.(4). of this proposed rule, includes ASM-specific improvement activities.

We also discuss how we propose to score each ASM performance category within each of the ASM performance category sections within this section of this proposed rule. While many of the proposed scoring policies draw from MIPS, we are proposing scoring policies that simplify some existing policies. As a mandatory model, simplification of scoring compared to some MIPS and MVP policies would make it easier for the ASM participant to understand how their performance in each of the ASM performance categories contributes to their final score and resulting payment adjustment. As part of this simplification, our proposed scoring policies ensure that each ASM participant would at minimum be measured on quality and cost, with further scoring adjustments based on performance in the improvement activities and Promoting Interoperability ASM performance categories, to determine payment adjustments.

As discussed in section III.C.2.e of this proposed rule, we plan to calculate a final score based on the quality, cost, improvement activities, and Promoting Interoperability performance categories scores for each ASM participant for each ASM performance year. The scores in the quality and cost ASM performance categories would positively impact the ASM final score while performance in the improvement activities and Promoting Interoperability ASM performance categories could result in negative scoring adjustments to the ASM final score.

In the following section III.C.2.d.(1).(a) of this proposed rule, we first discuss the ASM performance assessment approach. We then propose data submission requirements applicable across the ASM performance categories in section III.C.2.d.(1).(b) of this proposed rule. Finally, we propose specific requirements and scoring policies for each of the four ASM performance categories in sections

III.C.2.d.(2) through III.C.2.d.(5). of this proposed rule.

(1) Proposed Performance Assessment and Data Submission Requirements

(a) ASM Performance Categories

We propose at § 512.715(a)(1) through (3) that CMS uses the performance measures and activities described under §§ 512.725(b) and (c), 512.730(b), 512.735(b), and 512.740(b) to assess ASM participants in the quality, cost, improvement activities, and Promoting Interoperability ASM performance categories. As discussed in section III.C.1 of this proposed rule, we believe that these ASM performance categories taken together would improve the quality of care and produce cost savings related to ASM's chronic conditions. Further, we believe that, taken together, the ASM performance categories provide a comprehensive understanding of an ASM participant's management of their beneficiaries' targeted chronic conditions.

We also believe that ASM participants, because of participation in other CMS programs including MIPS, would already be familiar with reporting (1) quality; (2) cost; (3) improvement activities; and (4) Promoting Interoperability performance categories to determine a final score. This proposed structure is similar to the performance assessment approach of other CMS programs like the MIPS reporting option of the Quality Payment Program. MIPS assesses the performance of MIPS eligible clinicians across four performance categories and then determines a MIPS payment adjustment factor that applies to the clinician's Medicare Part B payments for covered professional services finalized at §§ 414.1380(a) and 414.1405(a) and as defined at § 414.1305.

Under the proposed ASM performance categories, the value of care provided to chronic care patients would be assessed through performance in the quality and cost performance categories, supported by performance in the improvement activities and Promoting Interoperability performance categories. Measures and activities CMS selects to assess an ASM's performance across the quality ASM performance category and cost ASM performance category would assess the value of care directly furnished to chronic care patients. Measuring ASM participants' cost and quality performance ensures that Medicare beneficiaries are receiving clinically appropriate, comprehensive, high-value care. The measurement of cost and quality is essential to measuring the value of care provided to Medicare beneficiaries with chronic conditions. The improvement activities ASM performance category incentivizes care coordination and collaboration between specialty medicine and primary care, creating new opportunities for both groups playing vital roles in care management and coordination. And lastly, the Promoting Interoperability ASM performance category enables meaningful EHR use, the reporting of clinical quality measures, including electronic clinical quality measures (eCQMs) and continuous practice-based quality improvement and care transformation.

We believe that ASM's more targeted approach to performance assessment where we would evaluate ASM participants within each ASM cohort across the ASM performance categories—(1) on a set of relevant performance measures that they are required to report; and (2) among clinicians furnishing similar sets of services, would produce final scores and subsequent payment adjustments, as described in section III.C.2.f of this proposed rule, that are more reflective of clinician performance. A more targeted approach to measurement would also offer more insight into how clinical decisions and processes, such as care coordination, affect patient outcomes. We believe this insight is necessary to support and incentivize accountable care, increasing beneficiary access to coordinated specialty care. Furthermore, equipped with more specialty-relevant performance information through participation in ASM, we expect clinicians would be more likely to invest resources in pursuit of better outcomes, reducing the incidence of poor outcomes arising from care fragmentation, ultimately resulting in better care for patients.

We propose at § 512.715(a) that, as further described in §§ 512.725, 512.730, 512.735, and 512.740, ASM participants would receive a specific number of points for their performance on each measure or activity within an ASM performance category. CMS assigns the total number of points that a measure or activity may receive. The total score across all four performance categories that an ASM participant may receive is capped at 100 points. The number of points awarded for an ASM's performance on a measure or activity corresponds to the level of performance, the higher the points, the better the performance. We propose to define at § 512.705 ''ASM performance category score'' as the assessment of each ASM participant's performance on the applicable measures and activities for a performance category during an ASM performance year based on the policies proposed at §§ 512.715, 512.725, 512.730, 512.735, and 512.740. As further described below in this section of this proposed rule, CMS would, using an ASM participant's ASM performance category scores across all ASM performance categories, calculate an ASM participant's final score for an ASM performance year/ASM payment year in accordance with § 512.745.

We propose at § 512.715(b)(1) to use Medicare claims data and administrative data to calculate some measures included in the quality and cost ASM performance categories under §§ 512.725 and 512.730. We propose at § 512.715(b)(2) that we use other model-specific data reported by ASM participants to calculate measure or activity scores for the quality, improvement activities, and Promoting Interoperability ASM performance categories under §§ 512.725, 512.735, and 512.740.

We are soliciting feedback from the public on our proposal to assess ASM participant performance across four ASM performance categories: (1) quality; (2) cost; (3) improvement activities; and (4) promoting interoperability. We seek comments on our proposal at § 512.715(a) to set and assign specific points on measures or activities in each ASM performance category and to calculate a final score using point received across all four ASM performance categories as described at § 512.745. Finally, we seek comments on our proposal at § 512.715(b) to use Medicare claims, administrative data, and model-specific data reported by an ASM participant to calculate measure or activity scores used to calculate ASM performance category scores.

(b) Data Submission Requirements

We propose at § 512.720 that ASM participants would be required to submit data on the measures and activities for the quality, improvement activities, and Promoting Interoperability ASM performance categories in accordance with each ASM performance categories described in §§ 512.725, 512.735, and 512.740. As further discussed below, we are proposing to align some data submission requirements under this model with the data submission requirements under MIPS as defined at § 414.1325. We believe that the use of similar processes and ''submission types''—which we propose to define at § 512.705 as the mechanism by which the ASM submitter submits data to us in the form and manner specified by us, including, but not limited to: (1) direct;

(2) log in and upload; and (3) log in and attest—would limit confusion and burden for those ASM participants that have previously participated in MIPS. We also intend to provide further resources on the exact data submission procedures prior to the first data submission deadline for the 2027 ASM performance year.

We propose that ASM participants must submit data at the same level at which they are identified in the model. Since we propose identifying ASM participants at the TIN/NPI level (as outlined in section III.C.2.c.(3).(a).(i). of this proposed rule), we are likewise proposing that each ASM participant would be required to submit data for each ASM performance category at this same TIN/NPI level, unless specifically stated otherwise within the requirements for a particular performance category. Alignment between participant identification and data submission levels is necessary for a mandatory model and supports our goal of making accurate comparisons between similar participants. This approach differs from MIPS, which offers various reporting options (such as group, subgroup, or APM entity as defined in § 414.1305). We have determined that allowing multiple reporting configurations would undermine ASM's design objective of creating clear peer-to-peer performance comparisons for determining payment adjustments.

We recognize that some of the required measures and attestations in each ASM performance category may reflect practice-level activities. We, therefore, considered whether to allow submission of required measures and attestations for the improvement activities and Promoting Interoperability ASM performance categories at the TIN level. We believe that it is more appropriate to align the data submission level across all the ASM performance categories instead of having some ASM performance categories with data submitted at the TIN/NPI level and others at the TIN level. Alignment of submission level across all ASM performance categories supports our goal of making like-to-like performance comparisons to determine payment adjustments.

We are proposing the following data submission requirements at § 512.720(a)(1)(i) through (iii) (the order of the requirements aligns with the order in which similar data submission requirements for MIPS appear in § 414.1325):

- *Quality ASM performance category data submission requirements.* For the quality ASM performance category, we propose at § 512.720(a)(1)(i) that an ASM participant must report at least one required quality measure that is not an administrative claims-based collection type (discussed in sections III.C.2.d.(2).(b) and III.C.2.d.(2).(c) of this proposed rule) and meets the proposed data completeness requirement as discussed in section III.C.2.d.(2).(h).(i) of this proposed rule. The proposed requirements for the quality ASM performance category are similar to those required under MIPS as defined at § 414.1325(1)(i) but with the addition of meeting the data completeness requirement. We believe that the addition of the data completeness requirement ensures that we would have complete data by which to score at least one required quality measure. We also considered that an ASM participant must report complete data for at least two, at least three, or all required quality measures that are not administrative claims-based collection types as the data submission requirement for the quality ASM performance category. However, not reporting all required measures would negatively affect an ASM's participant quality ASM performance category score as discussed in section III.C.2.(d).(i) of this proposed rule. Further, not meeting the data submission requirement for the quality ASM performance category would mean that an ASM participant would receive the maximum negative payment adjustment for the applicable ASM payment year as discussed in section III.C.2.f.(4) of this proposed rule. Setting the minimum data submission requirement as reporting more than one complete quality measure could penalize ASM participants that are unable to report required measures because of extenuating circumstances. We believe that the proposed minimum data submission requirement combined with the proposed scoring policies would provide the appropriate incentive for reporting all required quality measures while ensuring that we can appropriately evaluate quality performance.
- *Improvement activities ASM performance category data submission requirements.* We propose § 512.720(a)(1)(ii) that the data submission requirement for the improvement activities ASM performance category would require that an ASM participant attest to completing or not completing the required ASM improvement activities defined in § 512.735. Unlike MIPS, we are not proposing to include a ''yes'' attestation to the minimum data submission requirements to receive a final score under ASM as defined in § 512.745(b) as it would conflict with how we propose to factor in the ASM improvement activities performance category score into the final score as proposed at § 512.745(a)(1)(iii).
- *Promoting Interoperability ASM performance category data submission requirements.* The proposed requirements for the Promoting Interoperability ASM performance category at § 512.720(a)(1)(iii) align with the MIPS requirements as defined at § 414.1325(1)(iii).
- *ASM performance categories without data submission requirements.* Like the cost performance category or administrative claims-based quality measures under MIPS, we propose at § 512.720(a)(2) that there would be no data submission requirements for the cost ASM performance category or for quality measures that have an administrative claims-based collection type. Like MIPS, performance in the ASM cost performance category and on some quality, measures would be calculated using administrative claims data, which includes claims submitted with dates of service during the applicable ASM performance year that are processed no later than 60 days following the close of the applicable ASM performance year.
- *Data submission types for ASM participants.* We propose at §§ 512.720(b)(1) and (2) that an ASM participant would, like an individual MIPS eligible clinician, be able to submit their ASM data using, for the quality ASM performance category, the direct, login and upload, submission types, and for improvement activities or Promoting Interoperability ASM performance categories, the direct, login and upload, or login and attest submission types as proposed at § 512.720(b). These are the same submission types available under MIPS.
- *Use of multiple data submission types.* Like the policy established under MIPS, we propose at § 512.720(c) that ASM participants would be permitted to submit their ASM data using multiple submission types for any performance category described at § 512.720(b) as applicable; provided, however, that the ASM participant uses the same identifier for all ASM performance categories and all data submissions.
- *Data submission deadlines.* We propose at § 512.720(d) that ASM participants would need to submit all required data and attestations as required for each ASM performance category by March 31 following the close of the applicable ASM performance year, or a later date as specified by CMS. This proposal aligns

with the deadline policy established under MIPS at § 414.325(e). We considered requiring a data submission deadline earlier than March 31 but believed that it would not provide ASM participants with sufficient time to prepare their data submission.

- *Treatment of multiple data submissions.* Like the policy established under MIPS, for multiple data submissions received in the quality and improvement activities ASM performance categories, for an ASM participant submitters in multiple organizations (for example, qualified registry, practice administrator, or EHR vendor), we propose at § 512.720(e) to calculate and score each submission received and assign the highest of the scores. We propose at § 512.720(e)(1) that for multiple data submissions received for an individual ASM participant from one or multiple submitters in the same organization, we propose to score the most recent submission. We propose at § 512.720(e)(2) that for multiple data submissions received for the Promoting Interoperability performance category, we propose to calculate a score for each data submission received and assign the highest of the scores. We also propose that data can be submitted on behalf of the ASM participant by an entity or individual designated to submit data to CMS, including a third-party intermediary as described in § 512.720(a), on behalf of the ASM participant. We propose at § 512.705 to use with the definition of third-party intermediary set forth in MIPS at § 414.1305 to align the data submission policies for third party intermediaries between MIPS and ASM.

We seek comments on the proposed data submission requirements and submission types for each ASM performance category, the data submission deadline, and the proposed treatment of multiple data submissions and scoring at § 512.720. We also seek comments on our proposal to require data submission at the level by which we determine ASM participation. We also seek comments on the alternative data submission requirements for the quality ASM performance category that we considered.

(2) Proposed Quality ASM Performance Category

The proposed quality ASM performance category supports the model goals of improving quality of care with a focus on measures that are relevant to ASM clinical specialties and targeted chronic conditions. It also seeks to decrease the cost of care for beneficiaries with ASM-targeted chronic conditions. Measuring quality of care helps identify areas for improvement and ensures that clinical interventions are effective and lead to improved patient outcomes. The importance of the quality ASM performance category is reflected in the weight of the performance category on the final score, discussed in section III.C.2.e.(1) of this proposed rule.

(a) Background

We propose at § 512.725(b) and (c) to use a quality measure set specific to each ASM cohort, one measure set for heart failure and one measure set for low back pain, which would contain condition-specific mandatory measures. Each ASM participant must report all measures specified in Table 39 for their applicable chronic condition, except for the proposed administrative claims-based measures, which would be calculated by CMS based on their submitted claims. These measures would likely stay consistent throughout the duration of the model to support reporting continuity, minimize burden, and ensure a reliable and valid model evaluation. The quality measurement approach in ASM is similar to the MVP reporting option under MIPS in that it limits reporting to a subset of clinically relevant measures. However, while the MVP reporting option allows a clinician to select an MVP and choose which MVP measures to report, the ASM participant would be required to report all quality measures in their respective ASM measure set.

Medicare's payment landscape is continuing to transform, moving away from traditional FFS payments that are not tied to quality and towards value-based models with increased provider accountability. ASM is a continuation of these efforts, strengthening the connection between quality and payment. We aim, in payment models such as ASM, to utilize quality measures that incentivize evidence-based care and prevention, improve patient outcomes, and reduce low-value health care spending.

We propose to avoid making significant changes to these measure sets over the period of model; however, we may propose to add or remove measures through rulemaking if we believe refinements to the measure set are necessary. We may propose to add or remove measures in response to relevant public comments, recommendations from participants and their collaborators, new CMS program activities, or significant changes to the included measures. We would use notice and comment rulemaking to propose any modifications, such as adding or removing measures for monitoring quality or calculating scores for quality performance. We seek comment on this proposal.

As proposed, ASM is designed to provide financial incentives for measurable improvements in clinical outcomes for beneficiaries. We expect our quality measurement strategy to increase adherence to clinical guidelines, focus attention on outcomes to reduce costs, and enhance the patient experience. Several of the measures also promote prevention, as detailed in Table 39, by mitigating the progression of the chronic diseases that ASM targets and reducing the risk for other comorbid diseases that may exacerbate health issues. Each quality measure proposed contains measures that aim to measure and incentivize improvement in the following three domains: (1) excess utilization, (2) evidence-based care and outcomes, and (3) patient-reported outcomes and experience. Each measure set would include a utilization-focused measure to assess appropriate use of select services in chronic disease management. This measurement area may also indicate where excess or inappropriate utilization is occurring, which aligns with CMS priorities to reduce spending related to unnecessary care, imaging, or procedures. Measures in the evidence-based care and outcomes domain are clinically relevant to the conditions of focus, can meaningfully discern differences in care furnished by ASM participants, and are associated with improved outcomes for patients. Finally, measures related to patient-reported outcomes capture what matters most to patients, and incentivizing ASM participants to be more attuned to the patient experience could drive improvements in functional status among beneficiaries receiving treatment for heart failure and low back pain. We believe that the measures in all three domains are clinically relevant to the conditions of focus and would align with other CMS programs and nationwide measurement efforts.

TABLE 39: Proposed ASM Measure Sets for the ASM Quality Performance Category

Domain	Prevention Category	Measure	Collection Type(s)
Heart Failure			
Excess Utilization	Adverse events and acute care utilization	Risk-Standardized Acute Unplanned Cardiovascular-Related Admission Rates for Patients with HF (MIPS Q492)	Claims
Evidence-based Care and Outcomes	Reduction of disease progression	HF: Beta-Blocker Therapy for LVSD (MIPS Q008)	eCQM MIPS CQM
Evidence-based Care and Outcomes	Reduction of disease progression	HF: ACE Inhibitor or ARB or ARNI Therapy for LVSD (MIPS Q005)	eCQM MIPS CQM
Evidence-based Care and Outcomes	Reduction of disease progression	Controlling High Blood Pressure (MIPS Q236)	eCQM MIPS CQM
Patient Reported Outcomes and Experience	Function/health status/wellbeing	Functional Status Assessments for Heart Failure (MIPS Q377)	eCQM
Low Back Pain			
Excess Utilization	Risk reduction/absence of disease	MRI Lumbar Spine for LBP (measure in development)	Claims
Evidence-based Care and Outcomes	Adverse events and acute utilization	Use of High-Risk Medications in Older Adults (MIPS Q238)	eCQM MIPS CQM
Evidence-based Care and Outcomes	Risk reduction/absence of disease	Preventive Care and Screening: Screening for Depression and Follow-Up Plan (MIPS Q134)	eCQM MIPS CQM
Evidence-based Care and Outcomes	Risk reduction/absence of disease	Preventive Care and Screening: BMI Screening and Follow-Up Plan (MIPS Q128)	eCQM MIPS CQM
Patient Reported Outcomes and Experience	Function/health status/wellbeing	Functional Status Change for Patients with Low Back Impairments (MIPS Q220)	MIPS CQM

(i) Performance Year for the Quality ASM Performance Category

We propose at § 512.725(a) that the ASM performance year for quality measures would be the full calendar year from January 1 to December 31, and the performance year would occur 2 years prior to an applicable ASM payment year. We believe that setting the ASM performance year for quality measures in this way aligns with MIPS as defined at § 414.1320 and would be easily adoptable for ASM participants.

We seek comments on our proposed approach setting the ASM performance year for quality measures.

(b) Quality Measure Set for the ASM Heart Failure Cohort

We propose at § 512.725(b)(1) through (5) to include the following measures in the heart failure measure set. Each ASM heart failure participant must report each measure using one of the collection types specified in Table 39.

(i) Risk-Standardized Acute Unplanned Cardiovascular-Related Admission Rates for Patients With Heart Failure (HF) (MIPS Q492)

We propose to include Risk-Standardized Acute Unplanned Cardiovascular-Related Admission Rates for Patients with Heart Failure (HF) (MIPS Q492) in the ASM heart failure measure set. By assessing potentially preventable cardiovascular-related hospital admissions, this measure incentivizes clinicians to adopt evidence-based practices in heart failure management, improve care coordination, and enhance the overall quality of care.

A hospital readmission, for any reason, is disruptive to patients and caregivers, costly to the health care system, and puts patients at additional risk of hospital-acquired infections and complications.[138] Readmissions are also a major source of patient and family stress and may contribute substantially to a decline in functional ability, particularly in older patients.[139] Some readmissions are unavoidable and result from inevitable progression of disease or worsening of chronic conditions. Patients with heart failure, particularly those at a more advanced stage, are vulnerable to a range of factors that may increase their risk for cardiovascular-related hospitalizations.[140] Risk of hospitalization may be related to an individual's clinical and social/community risk factors but may also be affected by the quality of care received. Activities that could improve quality of care include the adoption of guideline-directed medical therapy, early intervention for acute symptoms, optimal care coordination across providers, and support for self-management. Policy changes, such as the Medicare Hospital Readmissions Reduction Program, have led to a decrease in readmission rates for both principal and secondary heart failure hospitalizations; however, readmission rates in both groups remain high.[141] We propose to include this measure to continue the momentum on reducing avoidable hospital admissions and readmissions, as well as improve overall

quality of care for Medicare patients with heart failure.

In addition, this measure aligns with other quality programs, such as the Quality Payment Program, which includes the measure in the Advancing Care for Heart Disease MVP. Another benefit of the measure is that it is calculated using administrative claims, which reduces reporting burden for the ASM participant.
