Office of the Secretary

45 CFR Part 170

[CMS–1833–F and CMS–1808–F] RINs 0938–AV45, 0938–AV34, and 0955–AA06

Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals (IPPS) and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year (FY) 2026 Rates; Changes to the FY 2025 IPPS Rates Due to Court Decision; Requirements for Quality Programs; and Other Policy Changes; Health Data, Technology, and Interoperability: Electronic Prescribing, Real-Time Prescription Benefit and Electronic Prior Authorization

AGENCY: Centers for Medicare & Medicaid Services (CMS) and Assistant Secretary for Technology Policy (ASTP)/Office of the National Coordinator for Health Information Technology (ONC) (collectively, ASTP/ONC), Department of Health and Human Services (HHS).

ACTION: Final rules.

SUMMARY: This final rule revises the Medicare hospital inpatient prospective payment systems (IPPS) for operating and capital-related costs of acute care hospitals; makes changes relating to Medicare graduate medical education (GME) for teaching hospitals; updates the payment policies and the annual payment rates for the Medicare prospective payment system (PPS) for inpatient hospital services provided by long-term care hospitals (LTCHs); updates and makes changes to requirements for certain quality programs; and makes other policy-related changes. We are also finalizing the provisions of the interim final action with comment period regarding the changes to the FY 2025 IPPS rates due to the court decision in *Bridgeport Hosp.* v. *Becerra.* Lastly, it finalizes certain updates to the ONC Health Information Technology (IT) Certification Program.

DATES: These final rules are effective on October 1, 2025. The incorporation by reference of certain material listed in this document is approved by the Director of the Federal Register as of October 1, 2025.

Tables Available on the CMS Website

The IPPS tables for this fiscal year (FY) 2026 final rule are available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled ''FY 2026 IPPS Final Rule Home Page'' or ''Acute Inpatient—Files for Download.'' The LTCH PPS tables for this FY 2026 final rule are available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/LongTermCareHospitalPPS/index.html* under the list item for Regulation Number CMS–1833–F. For further details on the contents of the tables referenced in this final rule, we refer readers to section VI. of the Addendum to this FY 2026 IPPS/LTCH PPS final rule.

Readers who experience any problems accessing any of the tables that are posted on the CMS websites, as previously identified, should contact Michael Treitel, *DAC@cms.hhs.gov*.

I. Executive Summary and Background

A. Executive Summary

1. Purpose and Legal Authority

This FY 2026 IPPS/LTCH PPS final rule will make payment and policy changes under the Medicare inpatient

prospective payment system (IPPS) for operating and capital-related costs of acute care hospitals as well as for certain hospitals and hospital units excluded from the IPPS. In addition, it makes payment and policy changes for inpatient hospital services provided by long-term care hospitals (LTCHs) under the long-term care hospital prospective payment system (LTCH PPS). This final rule also makes policy changes to programs associated with Medicare IPPS hospitals, IPPS-excluded hospitals, and LTCHs. We are also making changes relating to Medicare graduate medical education (GME) for teaching hospitals.

In the Hospital Value-Based Purchasing (VBP) Program, we are finalizing modifications to the Hospital-Level Total Hip Arthroplasty/Total Knee Arthroplasty (THA/TKA) Complications measure beginning with the FY 2033 program year. We also provide notice of the technical update to the five National Healthcare Safety Network (NHSN) Healthcare Associated Infection (HAI) measures beginning with the FY 2029 program year, and the technical update to the six measures in the Clinical Outcomes domain beginning with the FY 2027 program year. We are finalizing removal of the Health Equity Adjustment (HEA) from the program's scoring calculations in the FY 2026 program year. We provide previously and newly established performance standards for FY 2027 through FY 2031 program years for the Hospital VBP Program.

In the Hospital-Acquired Condition (HAC) Reduction Program, we are also providing notice of the technical update to the five Centers for Disease Control and Prevention's (CDC) NHSN healthcare-associated infection (HAI) measures.

In the Hospital Readmissions Reduction Program, we are finalizing our proposal to add Medicare Advantage (MA) beneficiaries to the six Hospital Readmissions Reduction Program (HRRP) measures beginning with the FY 2027 program year; however, we are not finalizing our proposal to include payment data for MA beneficiaries in the calculation of aggregate payments for excess readmissions. We also are finalizing our proposal to reduce the applicable period from 3-years to 2-years beginning with the FY 2027 program year. We also provide notice of the technical update to remove the COVID–19 exclusion from all six readmission measures.

In the PPS-Exempt Cancer Hospital Quality Reporting Program (PCHQR), we are finalizing our proposals to modify the public reporting requirements and remove three existing measures.

In the Hospital Inpatient Quality Reporting (IQR) Program, we are finalizing our proposals to modify four existing quality measures and to remove four existing measures. We also are finalizing our proposal, with modification, to update and codify the Extraordinary Circumstances Exception (ECE) policy to clarify that CMS has the discretion to grant an extension in response to an ECE request from a hospital in the Hospital IQR, Hospital Readmissions Reduction, PCHQR, HAC Reduction, and Hospital VBP Programs with a modification.

In the Medicare Promoting Interoperability Program, we are finalizing our proposal to define the electronic health record (EHR) reporting period in CY 2026 and subsequent years as a minimum of any continuous 180-day period within that calendar year for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program and to make corresponding revisions at 42 CFR 495.4. We are finalizing our proposal, with modifications, to revise the Security Risk Analysis measure beginning with the EHR reporting period in CY 2026. We are finalizing our proposal to modify the Safety Assurance Factors for EHR Resilience (SAFER) Guides measure beginning with the EHR reporting period in CY 2026. We are finalizing our proposal to add an optional bonus measure under the Public Health and Clinical Data Exchange objective for reporting data to a public health agency (PHA) using the Trusted Exchange Framework and Common Agreement (TEFCA) beginning with the EHR reporting period in CY 2026.

For the LTCH Quality Reporting Program (QRP), we are finalizing our proposal to remove one item from the LTCH Continuity Assessment Record and Evaluation (CARE) Data Set (LCDS) with respect to patients who have expired in the LTCH. We also are finalizing our proposal to remove four Social Determinant of Health (SDOH) standardized patient assessment data elements from the LCDS. Next, we are finalizing our proposal to amend the reconsideration request process in the LTCH QRP. Finally, we include summaries of comments received in response to Requests for Information (RFIs) on: (1) future measure concepts for the LTCH QRP; (2) revisions to the data submission deadlines for assessment data collected for the LTCH QRP; and (3) advancing digital quality measurement (dQM) in the LTCH QRP.

The Transforming Episode Accountability Model (TEAM), a mandatory alternative payment model that was finalized in the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986), aims to improve beneficiary care through financial accountability for episodes categories that begin with one of the following procedures: coronary artery bypass graft (CABG), lower extremity joint replacement (LEJR), major bowel procedure, surgical hip/femur fracture treatment (SHFFT), and spinal fusion. TEAM will test whether financial accountability for these episode categories reduces Medicare expenditures while preserving or enhancing the quality of care for Medicare beneficiaries. In this final rule, we finalizing updates to TEAM that would modify policies affecting participation of new hospitals, quality measure and assessment, the construction of target prices, the removal of certain health reporting elements, the broadening of the Skilled Nursing Facility (SNF) 3-Day Rule, and the removal of the Decarbonization and Resilience Initiative (DRI). Additionally, the policies in this final rule reflect our commitment to ensuring TEAM's incentives help to drive beneficiary quality of care improvements and reductions in Medicare spending.

The Secretary of Health and Human Services has delegated responsibilities to the Assistant Secretary for Technology Policy (ASTP)/Office of the National Coordinator for Health Information Technology (ONC) (collectively, ASTP/ONC [1]) for the implementation of certain provisions in Title IV of the 21st Century Cures Act (Public Law (Pub. L.)) 114–255, December 13, 2016) (Cures Act) that are designed to: advance interoperability; support the access, exchange, and use of electronic health information (EHI); and identify reasonable and necessary activities that do not constitute information blocking.[2] ASTP/ONC is also responsible for implementation of certain provisions of the Health Information Technology for Economic and Clinical Health Act (Pub. L. 111–5, Feb. 17. 2009) (HITECH Act) including: requirements that the National Coordinator perform duties consistent with the development of a nationwide

[1] On July 29, 2024, notice was posted in the **Federal Register** that ONC would be dually titled to the Assistant Secretary for Technology Policy and Office of the National Coordinator for Health Information Technology (89 FR 60903).

[2] Reasonable and necessary activities that do not constitute information blocking, also known as information blocking exceptions, are identified in 45 CFR part 171 subparts B, C and D. ONC's official website, *HealthIT.gov*, offers a variety of resources on the topic of Information Blocking, including fact sheets, recorded webinars, and frequently asked questions. To learn more, please visit: *https://www.healthit.gov/topic/information-blocking/*.

health information technology infrastructure that allows for the electronic use and exchange of information and that promotes a more effective marketplace, greater competition, and increased consumer choice, among other goals; and requirements to keep or recognize a program or programs for the voluntary certification of health information technology.

Under various statutory authorities, we either discuss continued program implementation or make changes to the Medicare IPPS, the LTCH PPS, other related payment methodologies and programs for FY 2026 and subsequent fiscal years, and other policies and provisions included in this final rule. These statutory authorities include, but are not limited to, the following:

- Section 1886(d) of the Social Security Act (the Act), which sets forth a system of payment for the operating costs of acute care hospital inpatient stays under Medicare Part A (Hospital Insurance) based on prospectively set rates. Section 1886(g) of the Act requires that, instead of paying for capital-related costs of inpatient hospital services on a reasonable cost basis, the Secretary use a prospective payment system (PPS).
- Section 1886(d)(1)(B) of the Act, which specifies that certain hospitals and hospital units are excluded from the IPPS. These hospitals and units are: rehabilitation hospitals and units; LTCHs; psychiatric hospitals and units; children's hospitals; cancer hospitals; extended neoplastic disease care hospitals; and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). Religious nonmedical health care institutions (RNHCIs) are also excluded from the IPPS.
- Sections 123(a) and (c) of the Balanced Budget Refinement Act of 1999 (BBRA) (Public Law (Pub. L.) 106–113) and section 307(b)(1) of the Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106–554) (as codified under section 1886(m)(1) of the Act), which provide for the development and implementation of a prospective payment system for payment for inpatient hospital services of LTCHs described in section 1886(d)(1)(B)(iv) of the Act.

Section 1814(l)(4) of the Act requires, beginning with FY 2017, that CAHs that do not successfully demonstrate meaningful use of certified electronic health record technology (CEHRT) for an EHR reporting period for a cost reporting period shall be paid 100 percent of reasonable costs rather than 101 percent of reasonable costs.

- Section 1886(a)(4) of the Act, which specifies that costs of approved educational activities are excluded from the operating costs of inpatient hospital services. Hospitals with approved graduate medical education (GME) programs are paid for the direct costs of GME in accordance with section 1886(h) of the Act. Hospitals paid under the IPPS with approved GME programs are paid for the indirect costs of training residents in accordance with section 1886(d)(5)(B) of the Act.
- Section 1886(d)(5)(F) of the Act provides for additional Medicare IPPS payments to subsection (d) hospitals that serve a significantly disproportionate number of low-income patients. These payments are known as the Medicare disproportionate share hospital (DSH) adjustment. Section 1886(d)(5)(F) of the Act specifies the methods under which a hospital may qualify for the DSH payment adjustment.
- Section 1886(b)(3)(B)(viii) of the Act, which requires the Secretary to reduce the applicable percentage increase that would otherwise apply to the standardized amount applicable to a subsection (d) hospital for discharges occurring in a fiscal year if the hospital does not submit data on measures in a form and manner, and at a time, specified by the Secretary.
- Section 1886(b)(3)(B)(ix) of the Act, which requires downward adjustments to the applicable percentage increase, beginning with FY 2015 (and beginning with FY 2022 for subsection (d) Puerto Rico hospitals), for eligible hospitals that do not successfully demonstrate meaningful use of CEHRT for an EHR reporting period for a payment adjustment year.
- Section 1866(k) of the Act, which provides for the establishment of a quality reporting program for hospitals described in section 1886(d)(1)(B)(v) of the Act, referred to as ''PPS-exempt cancer hospitals.''
- Section 1886(n) of the Act, which establishes the requirements for an eligible hospital to be treated as a meaningful EHR user for an EHR reporting period for a payment year or, for purposes of subsection (b)(3)(B)(ix) of the Act, for a fiscal year.
- Section 1886(o) of the Act, which requires the Secretary to establish a Hospital Value-Based Purchasing (VBP) Program, under which value-based incentive payments are made in a fiscal year to hospitals based on their performance on measures established for a performance period for such fiscal year.
- Section 1886(p) of the Act, which establishes a Hospital-Acquired Condition (HAC) Reduction Program, under which payments to applicable hospitals are adjusted to provide an incentive to reduce hospital-acquired conditions.
- Section 1886(q) of the Act, as amended by section 15002 of the 21st Century Cures Act, which establishes the Hospital Readmissions Reduction Program. Under the program, payments for discharges from an applicable hospital as defined under section 1886(d) of the Act will be reduced to account for certain excess readmissions. Section 15002 of the 21st Century Cures Act directs the Secretary to assess a hospital's performance relative to other hospitals with a similar proportion of beneficiaries who are dually eligible for both Medicare and full Medicaid benefits.
- Section 1886(r) of the Act, as added by section 3133 of the Affordable Care Act, which provides for a reduction to disproportionate share hospital (DSH) payments under section 1886(d)(5)(F) of the Act and for an additional uncompensated care payment to eligible hospitals. Specifically, section 1886(r) of the Act requires that, for fiscal year 2014 and each subsequent fiscal year, subsection (d) hospitals that would otherwise receive a DSH payment made under section 1886(d)(5)(F) of the Act will receive two separate payments: (1) 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments in section 1886(d)(5)(F) of the Act if subsection (r) did not apply (''the empirically justified amount''), and (2) an additional payment for the DSH hospital's proportion of uncompensated care, determined as the product of three factors. These three factors are: (1) 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act, in the absence of section 1886(r) of the Act; (2) 1 minus the percent change in the percent of individuals who are uninsured; and (3) the hospital's uncompensated care amount relative to the uncompensated care amount of all DSH hospitals expressed as a percentage.
- Section 1886(m)(5) of the Act, which requires the Secretary to reduce by 2 percentage points the annual update to the standard Federal rate for discharges for a long-term care hospital (LTCH) during the rate year for LTCHs that do not submit data on quality measures in the form, manner, and at a time, specified by the Secretary.
- Section 1886(m)(6) of the Act, as added by section 1206(a)(1) of the Pathway for Sustainable Growth Rate

(SGR) Reform Act of 2013 (Pub. L. 113–67) and amended by section 51005(a) of the Bipartisan Budget Act of 2018 (Pub. L. 115–123), which provided for the establishment of site neutral payment rate criteria under the LTCH PPS, with implementation beginning in FY 2016. Section 51005(b) of the Bipartisan Budget Act of 2018 amended section 1886(m)(6)(B) by adding new clause (iv), which specifies that the IPPS comparable amount defined in clause (ii)(I) shall be reduced by 4.6 percent for FYs 2018 through 2026.

- Section 1899B of the Act, which provides for the establishment of standardized data reporting for certain post-acute care providers, including LTCHs.
- Section 1115A of the Act authorizes the testing of innovative payment and service delivery models that preserve or enhance the quality of care furnished to Medicare, Medicaid, and Children's Health Insurance Program (CHIP) beneficiaries while reducing program expenditures.

2. Summary of the Major Provisions

The following is a summary of the major provisions in this final rule. In general, these major provisions are being finalized as part of the annual update to the payment policies and payment rates, consistent with the applicable statutory provisions. A general summary of the changes in this final rule is presented in section I.D. of the preamble of this final rule.

a. Transition for the Discontinuation of the Low Wage Index Hospital Policy

To help mitigate growing wage index disparities between high wage and low wage hospitals, in the FY 2020 IPPS/LTCH PPS rule (84 FR 42326 through 42332), we adopted a policy to increase the wage index values for certain hospitals with low wage index values (the low wage index hospital policy). This policy was adopted in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals. We indicated our intention that this policy would be effective for at least 4 years, beginning in FY 2020, in order to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. We also stated we intended to revisit the issue of the duration of this policy in future rulemaking as we gained experience under the policy. In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69301 through 69308), we adopted an extension of the low wage index hospital policy and the related budget neutrality adjustment effective for at least three more years, beginning in FY 2025, in order for sufficient wage data from after the end of the COVID–19 Public Health Emergency to become available.

As discussed in section III.F.5. of the preamble of this final rule, on July 23, 2024, the Court of Appeals for the D.C. Circuit held that the Secretary lacked authority under section 1886(d)(3)(E) of the Act or under the ''adjustments'' language of section 1886(d)(5)(I)(i) of the Act to adopt the low wage index hospital policy for FY 2020, and that the policy and related budget neutrality adjustment must be vacated. *Bridgeport Hosp.* v. *Becerra,* 108 F.4th 882, 887–91 & n.6 (D.C. Cir. 2024). After considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* in the FY 2025 IFC (89 FR 80405 through 80421), we recalculated the FY 2025 IPPS hospital wage index to remove the low wage index hospital policy for FY 2025. We also removed the low wage index budget neutrality factor from the FY 2025 standardized amounts. In addition, we established an interim transition policy for hospitals significantly impacted by the removal of the FY 2025 low wage index hospital policy using our authority under section 1886(d)(5)(I) of the Act. We note, as discussed elsewhere, in this final rule we are finalizing the provisions of the interim final action with comment period (IFC) (89 FR 80405) (hereinafter referred to as the FY 2025 IFC), that implemented revised Medicare wage index values for FY 2025, established a transitional payment exception for low wage hospitals significantly impacted by those revisions, and made conforming changes to the hospital IPPS and LTCH PPS payment rates for FY 2025 to reflect the removal of the low wage index hospital policy following the appellate court decision in *Bridgeport Hosp.* v. *Becerra*.

For FY 2026 and subsequent fiscal years, after considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* we are discontinuing the low wage index hospital policy and will no longer apply a low wage index budget neutrality factor to the standardized amounts. As discussed in section III.F.7. of the preamble of this final rule, we are using our authority under section 1886(d)(5)(I)(i) of the Act to adopt a narrow transitional exception to the calculation of FY 2026 IPPS payments for low wage index hospitals significantly impacted by the discontinuation of the low wage index hospital policy, that will be implemented in a budget neutral manner. This transitional exception policy will apply to hospitals that benefitted from the FY 2024 low wage index hospital policy and compares the hospital's FY 2026 wage index to the hospital's FY 2024 wage index. If the hospital's FY 2026 wage index is decreasing by more than 9.75 percent from the hospital's FY 2024 wage index, then the transitional payment exception for FY 2026 for that hospital is equal to the additional FY 2026 amount the hospital would be paid under the IPPS if its FY 2026 wage index were equal to 90.25 percent of its FY 2024 wage index. We are making this policy budget neutral through an adjustment applied to the standardized amounts for all hospitals.

b. Update to the IPPS Labor-Related Share

As discussed in section IV. of the preamble of this final rule, we are finalizing our proposal to rebase and revise the 2018-based IPPS market basket to reflect a 2023 base year. In addition, using the cost category weights from the 2023-based IPPS market basket, we calculated a labor-related share of 66.0 percent, which we will use for discharges occurring on or after October 1, 2025. The labor-related share of 66.0 percent is 1.6 percentage points lower than the current labor-related share of 67.6 percent. As discussed in section IV.B.3. of the preamble of this final rule, this downward revision to the labor-related share is primarily the result of incorporating the more recent 2023 Medicare cost report data for Wages and Salaries, Employee Benefits, and Contract Labor costs. This is partially offset by an increase in the Professional Fees: Labor-Related cost weight.

c. Hospital Readmissions Reduction Program

The Hospital Readmissions Reduction Program was established under section 1886(q) of the Act, as amended by section 15002 of the Cures Act. The Hospital Readmissions Reduction Program requires a reduction to a hospital's base operating DRG payment to account for excess readmissions of selected applicable conditions or procedures. In this final rule, we are finalizing the following proposals, beginning with the FY 2027 program year: (1) Refine all six readmission measures to add Medicare Advantage patient cohort data; (2) reduce the applicable period from 3-years to 2-years and update codified regulation language; and (4) update and codify the ECE policy to clarify that CMS has the discretion to grant an extension in response to an ECE request from a hospital with a modification. We also

provide notice of the technical update to remove the COVID–19 exclusion from all six readmission measures. We are not finalizing the proposal to include payment data for MA beneficiaries in the calculation of aggregate payments for excess readmissions..

d. Hospital Acquired Condition (HAC) Reduction Program

Section 1886(p) of the Act establishes the HAC Reduction Program under which payments to applicable hospitals are adjusted to provide an incentive to reduce hospital-acquired conditions. In this final rule, we are making a technical update to the NHSN Healthcare Associated Infection (HAI) measures baseline. We are also finalizing our proposal to update and codify the ECE policy to clarify that CMS has the discretion to grant an extension in response to an ECE request from a hospital with a modification.

e. Hospital Value-Based Purchasing (VBP) Program

Section 1886(o) of the Act requires the Secretary to establish a Hospital VBP Program under which value-based incentive payments are made in a fiscal year to hospitals based on their performance on measures established for a performance period for such fiscal year. In this final rule, we are finalizing modifications to the THA/TKA Complications measure beginning with the FY 2033 program year. We also provide notice of the technical update to remove the COVID–19 exclusion from the six measures in the Clinical Outcomes domain beginning with the FY 2027 program year and the technical update to the five NHSN Healthcare Associated Infection (HAI) measures beginning with the FY 2029 program year. We also are finalizing our proposal to update and codify the ECE policy to clarify that CMS has the discretion to grant an extension in response to an ECE request from a hospital with a modification. We are also finalizing our proposal to remove the Program's HEA adjustment in the FY 2026 program year. Lastly, we provide previously and newly established performance standards for FY 2027 through FY 2031 program years for the Hospital VBP Program.

f. Hospital Inpatient Quality Reporting (IQR) Program

Under section 1886(b)(3)(B)(viii) of the Act, subsection (d) hospitals are required to report data on measures selected by the Secretary for a fiscal year in order to receive the full annual percentage increase. In this FY 2026 IPPS/LTCH PPS final rule, we are finalizing several changes to the Hospital IQR Program. We are finalizing modifications to four measures currently in the Hospital IQR Program measure set: (1) Hospital-Level, Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) beginning with the April 1, 2023–March 30, 2025 reporting period/2027 payment determination; (2) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Ischemic Stroke Hospitalization with Claims-Based Risk Adjustment for Stroke Severity beginning with the July 1, 2023–June 30, 2025 reporting period/2027 payment determination; (3) the Hybrid Hospital-Wide Readmission (HWR) measure beginning with the July 1, 2025, through June 30, 2026 Reporting Period/FY 2028 payment determination; and (4) the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality (HWM) measure beginning with the July 1, 2025, through June 30, 2026 reporting period/FY 2028 payment determination. We are also finalizing the removal of four measures: (1) the Hospital Commitment to Health Equity measure beginning with the CY 2024 reporting period/FY 2026 payment determination; (2) the COVID–19 Vaccination Coverage among HCP measure beginning with the CY 2024 reporting period/FY 2026 payment determination; (3) the Screening for Social Drivers of Health measure beginning with the CY 2024 reporting period/FY 2026 payment determination; and (4) the Screen Positive Rate for Social Drivers of Health measure beginning with the CY 2024 reporting period/FY 2026 payment determination. We are finalizing our proposal to update and codify the ECE policy to clarify that CMS has the discretion to grant an extension in response to an ECE request from a hospital with a modification. Additionally, we sought comments regarding measure concepts related to well-being and nutrition for future consideration. We also sought comments on the path forward for digital quality measurement and use of Fast Healthcare Interoperability Resources (FHIR).

g. PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

Section 1866(k)(1) of the Act requires, for purposes of FY 2014 and each subsequent fiscal year, that a hospital described in section 1886(d)(1)(B)(v) of the Act (a PPS-exempt cancer hospital, or a PCH) submit data in accordance with section 1866(k)(2) of the Act with respect to such fiscal year. In this final rule, we are finalizing our proposal to publicly report PCH data on both the Provider Data Catalog and on Care Compare and to make corresponding changes to regulatory text to replace references to ''Provider Data Catalog'' with ''CMS website''. We are also finalizing our proposals to remove the (1) Hospital Commitment to Health Equity, (2) the Screening for Social Drivers of Health measure; and (3) the Screen Positive Rate for Social Drivers of Health measure beginning with the CY 2024 reporting period/FY 2026 program year. Lastly, we are finalizing our proposal to update and codify the ECE policy to clarify that CMS has the discretion to grant an extension in response to an ECE request from a hospital with a modification.

h. Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

For the LTCH QRP, we are finalizing our proposal to remove one item from the LCDS with respect to patients who have expired in the LTCH. We also are finalizing our proposal to removal of four SDOH standardized patient assessment data elements from the LCDS. We are finalizing our proposal to amend the reconsideration request process in the LTCH QRP. Finally, we include a summary of comments received in response to Requests for Information (RFIs) on: (1) future measure concepts for the LTCH QRP; (2) revisions to the data submission deadlines for assessment data collected for the LTCH QRP; and (3) advancing digital quality measurement (dQM) in the LTCH QRP.

i. Medicare Promoting Interoperability Program

Under sections 1886(b)(3)(B)(ix) and 1814(l)(4) of the Act, respectively, eligible hospitals and CAHs are required to submit data in accordance with section 1886(n) to successfully demonstrate meaningful use of CEHRT for an EHR reporting period to avoid a downward payment adjustment under Medicare for the associated fiscal year. In this final rule, we are finalizing several changes to the Medicare Promoting Interoperability Program. Specifically, we are finalizing our proposals: (1) to amend the definition of ''EHR reporting period for a payment adjustment year'' at 42 CFR 495.4 for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program to define the EHR reporting period in CY 2026 and subsequent years as a minimum of any continuous 180-day period within that calendar year; (2) to modify the Security Risk Analysis measure to require eligible hospitals and CAHs to attest

''yes'' to having conducted security risk management in addition to the existing measure requirement to attest ''yes'' to having conducted security risk analysis, beginning with the EHR reporting period in CY 2026; (3) to modify the SAFER Guides measure by requiring eligible hospitals and CAHs to attest ''yes'' to completing an annual self-assessment using the eight SAFER Guides published in January 2025, beginning with the EHR reporting period in CY 2026; and (4) to add an optional bonus measure to the Public Health and Clinical Data Exchange objective for eligible hospitals and CAHs that submit health information to a public health agency (PHA) using the Trusted Exchange Framework and Common Agreement ™ (TEFCA), and consistent with other measure requirements, beginning with the EHR reporting period in CY 2026.

j. Transforming Episode Accountability Model (TEAM)

In section XI.A. of the preamble of this final rule, we discuss the changes we finalized and considered for the Transforming Episode Accountability Model (TEAM). TEAM is a 5-year mandatory model that will be tested under the authority of section 1115A of the Act, beginning on January 1, 2026, and ending on December 31, 2030. We finalized changes to multiple areas of the model, including: (1) a limited deferment period for certain hospitals; (2) addressing the expiration of the Medicare Dependent Hospital program; (3) excluding Indian Health Service (IHS) hospitals from TEAM participation; (4) adding the Information Transfer Patient Reported Outcome-based Performance Measure (Information Transfer PRO–PM); (5) applying a neutral quality measure score for TEAM participants with insufficient quality data; (6) a methodology to construct target prices when there are coding changes; (7) reconstructing the normalization factor and prospective trend factor; (8) replacing the Area Deprivation Index (ADI) with the Community Deprivation Index (CDI); (9) using a 180-day lookback period and Hierarchical Condition Categories (HCC) version 28 for beneficiary risk adjustment; (10) eliminating downside financial risk for low volume hospitals; (11) aligning the date range used for episode attribution; (12) removing health equity plans and health related social needs data reporting; (13) broadening the Skilled Nursing Facility (SNF) 3-day rule waiver; (14) modifying the referral to primary care services requirement; and (15) removing the Decarbonization and Resilience Initiative (DRI).

k. ONC Health IT Certification Program Updates

In the Health Data, Technology, and Interoperability: Patient Engagement, Information Sharing, and Public Health Interoperability proposed rule (HTI–2 Proposed Rule) (89 FR 63498), which appeared in the **Federal Register** on August 5, 2024, ASTP/ONC proposed a wide-ranging set of updates to the ONC Health IT Certification Program. In the Health Data, Technology, and Interoperability: Electronic Prescribing, Real-Time Prescription Benefit and Electronic Prior Authorization (HTI–4 final rule), which is being published as part of the FY 2026 IPPS/LTCH final rule, ASTP/ONC is finalizing a limited subset of the proposals in the HTI–2 proposed rule. In this section, ASTP/ONC describes the HTI–2 proposals it is finalizing in this rule.

(1) New and Revised Standards and Certification Criteria

(a) Minimum Standards Code Sets Updates

In section III.B.5 of the preamble of the HTI–2 Proposed Rule, ASTP/ONC proposed to adopt an updated baseline version of RxNorm, identified as a minimum standard code set, in 45 CFR 170.207(d) (Medications), and to reorganize the text of the regulation in 45 CFR 170.207(d). RxNorm is referenced in the ''electronic prescribing'' and ''real-time prescription benefit'' health IT certification criteria ASTP/ONC is also finalizing in this final rule. ASTP/ONC is finalizing these proposals in section XI.*B*.4.b.(2) of the preamble of this final rule, with modifications. Consistent with 45 CFR 170.555, health IT developers may use newer versions of the adopted baseline version of a standard identified as a minimum standard on a voluntary basis.

(b) Revised Electronic Prescribing Certification Criterion

As discussed in section XI.*B*.4.b.(3) of the preamble of this final rule, ASTP/ONC is finalizing proposed updates in the HTI–2 Proposed Rule to the ''electronic prescribing'' criterion in 45 CFR 170.315(b)(3), with modifications. ASTP/ONC is finalizing that, for technology certified to the criterion in 45 CFR 170.315(b)(3) subsequent to June 30, 2020, health IT developers must update the Health IT Module to use the National Council for Prescription Drug Programs (NCPDP) SCRIPT standard version 2023011 and provide that update to their customers in order to maintain certification of the Health IT Module, by January 1, 2028. For the time period up to and including December 31, 2027, ASTP/ONC is finalizing that developers certifying a Health IT Module to 45 CFR 170.315(b)(3) may use either the updated NCPDP SCRIPT standard version 2023011 or the NCPDP SCRIPT standard version 2017071. ASTP/ONC is also finalizing that any Health IT Modules for which a health IT developer seeks certification to the updated criterion using NCPDP SCRIPT standard version 2023011 would need to support electronic prior authorization transactions in accordance with the standard. Finally, ASTP/ONC is finalizing a series of additional updates to 45 CFR 170.315(b)(3)(ii), including removing transactions currently identified as optional for the certification criterion.

(c) New Real-Time Prescription Benefit Criterion

As discussed in section XI.*B*.4.b.(4) of the preamble of this final rule, ASTP/ONC is finalizing the proposal in the HTI–2 Proposed Rule to adopt a ''real-time prescription benefit'' certification criterion in 45 CFR 170.315(b)(4), with modifications. Real-time prescription benefit tools empower providers and their patients to compare the patient-specific cost of a drug to the cost of a suitable alternative, compare prescription costs at different pharmacies, view information about out-of-pocket costs, and learn whether prior authorization for a specific drug is required. The certification criterion ASTP/ONC is finalizing is based on the NCPDP Real-Time Prescription Benefit (RTPB) standard version 13. ASTP/ONC is also finalizing a proposal to include this certification criterion in the Base EHR definition in 45 CFR 170.102 after January 1, 2028. ASTP/ONC is finalizing these policies in order to implement section 119(b)(3) of Title I of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260).

(d) New Certification Criteria for Modular API Capabilities

As discussed in section XI.*B*.4.b.(5) of the preamble of this final rule, ASTP/ONC is finalizing two health IT certification criteria for ''modular API capabilities'' proposed in the HTI–2 Proposed Rule. Specifically, ASTP/ONC is finalizing certification criteria in 45 CFR 170.315(j)(20), ''Workflow triggers for decision support interventions,'' and 45 CFR 170.315(j)(21), ''Subscriptions—client,'' both of which are cross-referenced by other certification criteria ASTP/ONC is finalizing to support electronic prior authorization.

(e) New Certification Criteria for Electronic Prior Authorization

In section III.B.20 of the preamble of the HTI–2 Proposed Rule, ASTP/ONC proposed to adopt a ''prior authorization API—provider'' criterion in 45 CFR 170.315(g)(34). ASTP/ONC also proposed to adopt a set of HL7® FHIR® implementation guides (IGs) in 45 CFR 170.215 for HHS use, including IGs referenced as part of the proposed criterion for electronic prior authorization and other IGs that support interoperable exchange of information between payers, providers, and patients.

In section XI.*B*.4.b.(5) of the preamble of this final rule, ASTP/ONC is finalizing three certification criteria in 45 CFR 170.315(g)(31), (32), and (33) for electronic prior authorization that are based on the requirements originally proposed in 45 CFR 170.315(g)(34), with modifications. ASTP/ONC is also finalizing adoption of the IGs proposed in section III.B.20 and incorporating these specifications by reference in 45 CFR 170.299.

ASTP/ONC is finalizing these criteria to make available Health IT Modules that can enable health care providers to conduct prior authorization transactions using payer APIs established by CMS in the Interoperability and Prior Authorization rule (89 FR 8758). Use of these Health IT Modules will also support providers and clinicians participating in the Promoting Interoperability programs and MIPS Promoting Interoperability performance category required to report on Electronic Prior Authorization measures.

3. Summary of Costs and Benefits

The following table provides a summary of the costs, savings, and benefits associated with the major provisions described in section I.A.2. of the preamble of this final rule.

BILLING CODE 4120–01–P

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Transition for the Discontinuation of the Low Wage Index Hospital Policy	As discussed in section III.F.7. of the preamble of this final rule, we are using our authority under section 1886(d)(5)(I)(i) of the Act to adopt a narrow transitional exception to the calculation of FY 2026 IPPS payments for low wage index hospitals significantly impacted by the discontinuation of the low wage index hospital policy, that would be implemented in a budget neutral manner. We are making this policy budget neutral through an adjustment applied to the standardized amounts for all hospitals.
Update to the IPPS Labor-Related Share	As discussed in section IV. of the preamble of this final rule, we are rebasing and revising the 2018-based IPPS market basket to reflect a 2023 base year. In addition, using the cost category weights from the 2023-based IPPS market basket, we calculated a labor-related share of 66.0 percent, which we will use for discharges occurring on or after October 1, 2025. The labor-related share of 66.0 percent is 1.6 percentage points lower than the current labor-related share of 67.6 percent. This change is budget neutral.
Update to the IPPS Payment Rates and Other Payment Policies	As discussed in Appendix A of this final rule, acute care hospitals are estimated to experience an increase of approximately $5.0 billion in FY 2026, primarily driven by the changes in FY 2026 operating payments, uncompensated care payments, and capital payments and the expiration of the temporary changes in the low-volume hospital program and the expiration of the MDH program on October 1, 2025.
Update to the LTCH PPS Payment Rates and Other Payment Policies	As discussed in Appendix A of this final rule, based on the best available data for the 329 LTCHs in our database, we estimate that the changes to the payment rates and factors that we present in the preamble of and Addendum of this final rule, which reflect the update to the LTCH PPS standard Federal payment rate for FY 2026, would result in an estimated increase in payments in FY 2026 of approximately $83 million.
Changes to the Hospital Readmissions Reduction Program	We estimated that our changes for the Hospital Readmissions Reduction Program will result in no financial impact for the FY 2026 payment determination or subsequent years.
Changes to the Value-Based Incentive Payments under the Hospital VBP Program	We estimated that there will be no net financial impact to the Hospital VBP Program for the FY 2026 program year in the aggregate because, by law, the amount available for value-based incentive payments under the program in a given year must be equal to the total amount of base operating MS-DRG payment amount reductions for that year, as estimated by the Secretary. The estimated amount of base operating MS-DRG payment amount reductions for the FY 2026 program year and, therefore, the estimated amount available for value-based incentive payments for FY 2026 discharges is approximately $1.7 billion.
Changes to the HAC Reduction Program	We estimated that our changes for the HAC Reduction Program will result in no financial impact for the FY 2026 payment determination or subsequent years.
Changes to the Hospital IQR Program	Across 3,050 IPPS hospitals, we estimated that our changes for the Hospital IQR Program will result in a maximum decrease of 654,477 hours and $17,724,699 to the information collection burden for the FY 2026 payment determination or subsequent years.
Changes to the PCHQR Program	Across 11 PCHs, we estimated that our changes for the PCHQR Program will result in a decrease of 107 hours and $2,921 to the information collection burden for the FY 2026 program year or subsequent years.
Changes to the LTCH QRP	Across 330 LTCHs, we estimated that our proposed changes for the FY 2026 LTCH QRP would result in a total information collection burden increase of 4 hours and $187.60 associated with updates to our reconsideration policy. We estimated that our proposed changes for the FY 2028 LTCH QRP would result in a decrease of 2,633.51 hours associated with our policies and updated burden estimates and a total cost decrease of approximately $180,016.80.
Changes to the Medicare Promoting Interoperability Program	Across 4,550 eligible hospitals and CAHs, we estimated that our changes for the Medicare Promoting Interoperability Program will not result in a change to the information collection burden for the EHR reporting period in CY 2026 and subsequent years.

Provision Description	Description of Costs, Transfers, Savings, and Benefits
Transforming Episode Accountability Model (TEAM)	We estimate for the TEAM proposals included in this final rule that there would be no significant change from the savings estimate in the FY 2025 IPPS/LTCH PPS final rule. Therefore, we estimate testing TEAM would result in saving the Medicare program $368 million across the 5 performance years.
HTI-2 (ASTP/ONC)	ASTP/ONC estimate that the total annual cost to developers of certified health IT and health IT purchasers for this final rule for the first year after it is finalized (including one-time costs), based on the cost estimates outlined above and throughout this RIA, would result in $50.3 million. The total undiscounted cost over a 10-year period for this final rule (starting in year two), based on the cost estimates outlined above, would result in $177.6 million. ASTP/ONC estimate the total costs to developers of certified health IT and health IT purchasers to be $228 million. ASTP/ONC estimate the total annual benefit across all entities for progress toward interoperability (progress initiated by adoption of the criteria and standards set forth in this final rule, then implemented with intermediate activities that connect such adoption with the generation of benefits) beginning in 2027, when the associated policies are required to be implemented and expected benefits to be realized, would be on average $1.0 billion. ASTP/ONC estimate the total benefits across all entities to be $19.2 billion. This benefits estimate is not comparable with the quantification of costs (totaling $228 million over ten years) because the cost of some intermediate activities has not been estimated and the cost of other intermediate activities has been attributed to other regulatory provisions, such as the ones finalized by CMS at 89 FR 8758.
FY 2025 IFC	In section XI.C. of the preamble of this final rule, we finalize the provisions of the FY 2025 IFC, which implemented revised Medicare wage index values for FY 2025, established a transitional payment exception for low wage hospitals significantly impacted by those revisions, and made conforming changes to the hospital IPPS payment rates for FY 2025. These changes reflect the removal of the low wage index hospital policy following the appellate court decision in *Bridgeport Hosp. v. Becerra.* That IFC also made conforming changes to IPPS rates and factors used to determine certain payments under the LTCH PPS for FY 2025. We estimate that acute care hospitals will experience an increase of approximately $41 million in FY 2025 due to the provisions of the FY 2025 IFC. This change is primarily due to the application of the non-budget neutral transitional payment exception policy

BILLING CODE 4120–01–C

B. Background Summary

1. Acute Care Hospital Inpatient Prospective Payment System (IPPS)

Section 1886(d) of the Act sets forth a system of payment for the operating costs of acute care hospital inpatient stays under Medicare Part A (Hospital Insurance) based on prospectively set rates. Section 1886(g) of the Act requires the Secretary to use a prospective payment system (PPS) to pay for the capital-related costs of inpatient hospital services for these ''subsection (d) hospitals.'' Under these PPSs, Medicare payment for hospital inpatient operating and capital-related costs is made at predetermined, specific rates for each hospital discharge. Discharges are classified according to a list of diagnosis-related groups (DRGs).

The base payment rate is comprised of a standardized amount that is divided into a labor-related share and a nonlabor-related share. The labor-related share is adjusted by the wage index applicable to the area where the hospital is located. If the hospital is located in Alaska or Hawaii, the nonlabor-related share is adjusted by a cost-of-living adjustment (COLA) factor. This base payment rate is multiplied by the DRG relative weight.

If the hospital treats a high percentage of certain low-income patients, it receives a percentage add-on payment applied to the DRG-adjusted base payment rate. This add-on payment, known as the disproportionate share hospital (DSH) adjustment, provides for a percentage increase in Medicare payments to hospitals that qualify under either of two statutory formulas designed to identify hospitals that serve a disproportionate share of low-income patients. For qualifying hospitals, the amount of this adjustment varies based on the outcome of the statutory calculations. The Affordable Care Act revised the Medicare DSH payment methodology and provides for an additional Medicare payment beginning on October 1, 2013, that considers the amount of uncompensated care furnished by the hospital relative to all other qualifying hospitals.

If the hospital is training residents in an approved residency program(s), it receives a percentage add-on payment for each case paid under the IPPS, known as the indirect medical education (IME) adjustment. This percentage varies, depending on the ratio of residents to beds.

Additional payments may be made for cases that involve new technologies or medical services that have been approved for special add-on payments. In general, to qualify, a new technology or medical service must demonstrate that it is a substantial clinical improvement over technologies or services otherwise available, and that, absent an add-on payment, it would be inadequately paid under the regular DRG payment. In addition, certain transformative new devices and certain antimicrobial products may qualify under an alternative inpatient new technology add-on payment pathway by demonstrating that, absent an add-on payment, they would be inadequately paid under the regular DRG payment.

The costs incurred by the hospital for a case are evaluated to determine whether the hospital is eligible for an additional payment as an outlier case. This additional payment is designed to protect the hospital from large financial losses due to unusually expensive cases. Any eligible outlier payment is added to the DRG-adjusted base payment rate, plus any DSH, IME, and new technology or medical service add-on adjustments and, beginning in FY 2023 for IHS and Tribal hospitals and hospitals located in Puerto Rico, the new supplemental payment.

Although payments to most hospitals under the IPPS are made on the basis of the standardized amounts, some categories of hospitals are paid in whole or in part based on their hospital-specific rate, which is determined from their costs in a base year. For example, sole community hospitals (SCHs) receive the higher of a hospital-specific rate based on their costs in a base year (the highest of FY 1982, FY 1987, FY 1996, or FY 2006) or the IPPS Federal rate based on the standardized amount. SCHs are the sole source of care in their areas. Specifically, section 1886(d)(5)(D)(iii) of the Act defines an SCH as a hospital that is located more than 35 road miles from another hospital or that, by reason of factors such as an isolated location, weather conditions, travel conditions, or absence of other like hospitals (as determined by the Secretary), is the sole source of hospital inpatient services reasonably available to Medicare beneficiaries. In addition, certain rural hospitals previously designated by the Secretary as essential access community hospitals are considered SCHs.

With the recent enactment of section 2202 of the Full-Year Continuing Appropriations and Extensions Act, 2025, under current law, the Medicare-dependent, small rural hospital (MDH) program is effective through September 30, 2025. For discharges occurring on or after October 1, 2007, but before October 1, 2025, an MDH receives the higher of the Federal rate or the Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the highest of its FY 1982, FY 1987, or FY 2002 hospital-specific rate. MDHs are a major source of care for Medicare beneficiaries in their areas. Section 1886(d)(5)(G)(iv) of the Act defines an MDH as a hospital that is located in a rural area (or, as amended by the Bipartisan Budget Act of 2018, a hospital located in a State with no rural area that meets certain statutory criteria), has not more than 100 beds, is not an SCH, and has a high percentage of Medicare discharges (not less than 60 percent of its inpatient days or discharges in its cost reporting year beginning in FY 1987 or in two of its three most recently settled Medicare cost reporting years). As section 2202 of the Full-Year Continuing Appropriations and Extensions Act, 2025 extended the MDH program through FY 2025 only, beginning on October 1, 2025, the MDH program will no longer be in effect absent a change in law. Because the MDH program is not authorized by statute beyond September 30, 2025, beginning October 1, 2025, all hospitals that previously qualified for MDH status under section 1886(d)(5)(G) of the Act will no longer have MDH status and will be paid based on the IPPS Federal rate.

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient hospital services in accordance with a prospective payment system established by the Secretary. The basic methodology for determining capital prospective payments is set forth in our regulations at 42 CFR 412.308 and 412.312. Under the capital IPPS, payments are adjusted by the same DRG for the case as they are under the operating IPPS. Capital IPPS payments are also adjusted for IME and DSH, similar to the adjustments made under the operating IPPS. In addition, hospitals may receive outlier payments for those cases that have unusually high costs.

The existing regulations governing payments to hospitals under the IPPS are located in 42 CFR part 412, subparts A through M.

2. Hospitals and Hospital Units Excluded From the IPPS

Under section 1886(d)(1)(B) of the Act, as amended, certain hospitals and hospital units are excluded from the IPPS. These hospitals and units are: Inpatient rehabilitation facility (IRF) hospitals and units; long-term care hospitals (LTCHs); Inpatient psychiatric hospitals (IPF) and units; children's hospitals; cancer hospitals; extended neoplastic disease care hospitals, and hospitals located outside the 50 States,

the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa). Religious nonmedical health care institutions (RNHCIs) are also excluded from the IPPS. Various sections of the Balanced Budget Act of 1997 (BBA) (Pub. L. 105–33), the Medicare, Medicaid and SCHIP [State Children's Health Insurance Program] Balanced Budget Refinement Act of 1999 (BBRA, Pub. L. 106–113), and the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA, Pub. L. 106–554) provide for the implementation of PPSs for IRF hospitals and units, LTCHs, and psychiatric hospitals and units (referred to as inpatient psychiatric facilities (IPFs)). (We note that the annual updates to the LTCH PPS are included along with the IPPS annual update in this document. Updates to the IRF PPS and IPF PPS are issued as separate documents.) Children's hospitals, cancer hospitals, hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa), and RNHCIs continue to be paid solely under a reasonable cost-based system, subject to a rate-of-increase ceiling on inpatient operating costs. Similarly, extended neoplastic disease care hospitals are paid on a reasonable cost basis, subject to a rate-of-increase ceiling on inpatient operating costs.

The existing regulations governing payments to excluded hospitals and hospital units are located in 42 CFR parts 412 and 413.

3. Long-Term Care Hospital Prospective Payment System (LTCH PPS)

The Medicare prospective payment system (PPS) for LTCHs applies to hospitals described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002. The LTCH PPS was established under the authority of sections 123 of the BBRA and section 307(b) of the BIPA (as codified under section 1886(m)(1) of the Act). Section 1206(a) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) established the site neutral payment rate under the LTCH PPS, which made the LTCH PPS a dual rate payment system beginning in FY 2016. Under this statute, effective for LTCH's cost reporting periods beginning in FY 2016 cost reporting period, LTCHs are generally paid for discharges at the site neutral payment rate unless the discharge meets the patient criteria for payment at the LTCH PPS standard Federal payment rate. The existing regulations governing payment under the LTCH PPS are located in 42 CFR part 412, subpart O. Beginning October 1, 2009, we issue the annual updates to the LTCH PPS in the same documents that update the IPPS.

4. Critical Access Hospitals (CAHs)

Under sections 1814(l), 1820, and 1834(g) of the Act, payments made to critical access hospitals (CAHs) (that is, rural hospitals or facilities that meet certain statutory requirements) for inpatient and outpatient services are generally based on 101 percent of reasonable cost. Reasonable cost is determined under the provisions of section 1861(v) of the Act and existing regulations under 42 CFR part 413.

5. Payments for Graduate Medical Education (GME)

Under section 1886(a)(4) of the Act, costs of approved educational activities are excluded from the operating costs of inpatient hospital services. Hospitals with approved graduate medical education (GME) programs are paid for the direct costs of GME in accordance with section 1886(h) of the Act. The amount of payment for direct GME costs for a cost reporting period is based on the hospital's number of residents in that period and the hospital's costs per resident in a base year. The existing regulations governing payments to the various types of hospitals are located in 42 CFR part 413. Section 1886(d)(5)(B) of the Act provides that prospective payment hospitals that have residents in an approved GME program receive an additional payment for each Medicare discharge to reflect the higher patient care costs of teaching hospitals relative to non-teaching hospitals. The additional payment is based on the indirect medical education (IME) adjustment factor, which is calculated using a hospital's ratio of residents to beds and a multiplier, which is set by Congress. Section 1886(d)(5)(B)(ii)(XII) of the Act provides that, for discharges occurring during FY 2008 and fiscal years thereafter, the IME formula multiplier is 1.35. The regulations regarding the indirect medical education (IME) adjustment are located at 42 CFR 412.105.

C. Summary of Provisions of Recent Legislation That Are Implemented in This Final Rule

1. The Full-Year Continuing Appropriations and Extensions Act, 2025 (Pub. L. 119–4)

Section 2201 of the Full-Year Continuing Appropriations and Extensions Act, 2025 extended through FY 2025 the modified definition of a low-volume hospital and the methodology for calculating the payment adjustment for low-volume hospitals that had been in effect for FYs 2019 through 2024. Specifically, under section 1886(d)(12)(C)(i) of the Act, as amended, for FYs 2019 through 2025, a subsection (d) hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 3,800 total discharges during the fiscal year. Under section 1886(d)(12)(D) of the Act, as amended, for discharges occurring in FYs 2019 through September 30, 2025, the Secretary determines the applicable percentage increase using a continuous, linear sliding scale ranging from an additional 25 percent payment adjustment for low-volume hospitals with 500 or fewer discharges to a zero percent additional payment for low-volume hospitals with more than 3,800 discharges in the fiscal year.

Section 2202 of the Full-Year Continuing Appropriations and Extensions Act, 2025 amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act to provide for an extension of the MDH program through FY 2025 (that is, through September 30, 2025).

D. Issuance of a Notice of Proposed Rulemaking and Summary of the Proposed Provisions

The FY 2026 IPPS/LTCH PPS proposed rule appeared in the April 30, 2025, **Federal Register** (90 FR 18002). In the proposed rule, we set forth proposed payment and policy changes to the Medicare IPPS for FY 2026 operating costs and capital-related costs of acute care hospitals and certain hospitals and hospital units that are excluded from IPPS. In addition, we set forth proposed changes to the payment rates, factors, and other payment and policy-related changes to programs associated with payment rate policies under the LTCH PPS for FY 2026.

The following is a general summary of the changes that we proposed to make.

1. Proposed Changes to MS–DRG Classifications and Recalibrations of Relative Weights

In section II. of the preamble of the proposed rule, we included the following:

- Proposed changes to MS–DRG classifications based on our yearly review for FY 2026.
- Proposed recalibration of the MS–DRG relative weights.
- A discussion of the proposed FY 2026 status of new technologies approved for add-on payments for FY

2025, a presentation of our evaluation and analysis of the FY 2026 applicants for add-on payments for high-cost new medical services and technologies (including public input, as directed by the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) Public Law 108–173, obtained in a town hall meeting for applications not submitted under an alternative pathway), and a discussion of the proposed status of FY 2026 new technology applicants under the alternative pathways for certain medical devices and certain antimicrobial products.

2. Proposed Changes to the Hospital Wage Index for Acute Care Hospitals

In section III. of the preamble of the proposed rule, we proposed revisions to the wage index for acute care hospitals and the annual update of the wage data. Specific issues addressed include, but are not limited to, the following:

- The proposed FY 2026 wage index update using wage data from cost reporting periods beginning in FY 2022.
- Calculation, analysis, and implementation of the proposed occupational mix adjustment to the wage index for acute care hospitals for FY 2026 based on the 2022 Occupational Mix Survey.
- Proposed application of the rural, imputed and frontier State floors, and proposed transition for the discontinuation of the low wage index hospital policy.
- Proposed revisions to the wage index for acute care hospitals, based on hospital redesignations and reclassifications under sections 1886(d)(8)(B), (d)(8)(E), and (d)(10) of the Act.
- Proposed adjustment to the wage index for acute care hospitals for FY 2026 based on commuting patterns of hospital employees who reside in a county and work in a different area with a higher wage index.
- Proposed labor-related share for applying the FY 2026 wage index.

3. Proposed Rebasing and Revising of the IPPS Market Baskets

In section IV. of the preamble of the proposed rule, we proposed to rebase and revise the IPPS market baskets to reflect a 2023 base year. In section IV.B.3. of the preamble of the proposed rule, using the cost category weights from the proposed 2023-based IPPS market basket, we proposed to use a labor-related share of 66.0 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000.

4. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs) for FY 2026

In section V. of the preamble of the proposed rule, we discussed the following:

- Proposed calculation of Factor 1 and Factor 2 of the uncompensated care payment methodology.
- Proposed methodological approach for determining Factor 3 of the uncompensated care payment for FY 2026, which is the same methodology that was used for FY 2025.
- Proposed methodological approach for determining the amount of interim uncompensated care payments, using the average of the most recent 3 years of discharge data.

5. Other Decisions and Proposed Changes to the IPPS for Operating Costs

In section VI. of the preamble of the proposed rule, we discussed proposed changes or clarifications of a number of the provisions of the regulations in 42 CFR parts 412 and 413, including the following:

- Proposed inpatient hospital market basket update for FY 2026.
- Proposed updated national and regional case-mix values and discharges for purposes of determining RRC status.
- Proposed conforming amendments to reflect the statutory extension of the temporary changes to the low-volume hospital payment adjustment through September 30, 2025.
- Proposed conforming amendments to reflect the statutory extension of the MDH program through September 30, 2025.
- A direct graduate medical education (GME) and indirect medical education (IME) policy proposal for calculating full-time equivalent counts and caps for cost reporting periods other than 12 months; and a notice of closure of two teaching hospitals and opportunities to apply for available slots.
- Proposed nursing and allied health education (NAHE) program Medicare Advantage (MA) add-on rates and direct GME MA percent reductions for CY 2024; and proposed regulatory changes regarding the calculation of net cost of NAHE.
- Proposed update to and revision to the payment adjustment for certain immunotherapy cases.
- Proposed changes to the requirements of the Hospital Readmissions Reduction Program—Updating the proposed estimate of the financial impacts for the FY 2026 Hospital Readmissions Reduction Program.
- Proposed changes to the requirements of the Hospital Value-Based Purchasing Program—Updating the proposed estimate of the financial impacts for the FY 2026 Hospital Value-Based Purchasing Program.
- Proposed changes to the requirements of the Hospital-Acquired Conditions Reduction Program—Updating the proposed estimate of the financial impacts for the FY 2026 Hospital-Acquired Conditions Reduction Program.
- Discussion of and proposed changes relating to the implementation of the Rural Community Hospital Demonstration Program in FY 2025.

6. Proposed FY 2026 Policy Governing the IPPS for Capital-Related Costs

In section VII. of the preamble of the proposed rule, we discussed the proposed payment policy requirements for capital-related costs and capital payments to hospitals for FY 2026.

7. Proposed Changes to the Payment Rates for Certain Excluded Hospitals: Rate-of-Increase Percentages

In section VIII. of the preamble of the proposed rule, we discussed the following:

- Proposed changes to payments to certain excluded hospitals for FY 2026.
- Proposed continued implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration.

8. Proposed Changes to the LTCH PPS

In section IX. of the preamble of the proposed rule, we set forth proposed changes to the LTCH PPS Federal payment rates, factors, and other payment rate policies under the LTCH PPS for FY 2026.

9. Proposed Changes Relating to Quality Data Reporting for Specific Providers and Suppliers

In section X. of the preamble of the proposed rule, we addressed the following:

- Solicitation of comment on adopting measures across the hospital quality reporting and value-based purchasing programs which capture more forms of unplanned post-acute care and encourage hospitals to improve discharge processes.
- Proposed changes to the requirements for the Hospital IQR Program.
- Proposed changes to the requirements for the PCHQR Program.
- Proposed changes to the requirements for the LTCH QRP, and requests for information on future measure concepts, revisions to the data

submission deadlines for assessment data collection, and advancing digital quality measurement (dQM) in the LTCH QRP.

- Proposed changes to requirements pertaining to eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program.

10. Other Proposals and Comment Solicitations Included in the Proposed Rule

Section XI. of the preamble of the proposed rule included proposed changes to TEAM that would affect participation, quality measure and assessment, pricing methodology, health data reporting, waivers of Medicare Program requirements, and the Decarbonization and Resilience Initiative.

11. Other Provisions of the Proposed Rule

Section XII.A. of the preamble of the proposed rule includes our discussion of the MedPAC Recommendations.

Section XII.B. of the preamble of the proposed rule includes a descriptive listing of the public use files associated with the proposed rule.

Section XIII. of the preamble of the proposed rule includes the collection of information requirements for entities based on our proposals.

Section XIV. of the preamble of the proposed rule includes information regarding our responses to public comments.

12. Determining Prospective Payment Operating and Capital Rates and Rate-of-Increase Limits for Acute Care Hospitals

In sections II. and III. of the Addendum of the proposed rule, we set forth proposed changes to the amounts and factors for determining the proposed FY 2026 prospective payment rates for operating costs and capital-related costs for acute care hospitals, including cost-of-living adjustment (COLA) factors for IPPS hospitals located in Alaska and Hawaii. We proposed to establish the threshold amounts for outlier cases. In addition, in section IV. of the Addendum of the proposed rule, we addressed the proposed update factors for determining the rate-of-increase limits for cost reporting periods beginning in FY 2026 for certain hospitals excluded from the IPPS.

13. Determining Prospective Payment Rates for LTCHs

In section V. of the Addendum of the proposed rule, we set forth proposed changes to the amounts and factors for determining the proposed FY 2026 LTCH PPS standard Federal payment rate and other factors used to determine LTCH PPS payments under both the LTCH PPS standard Federal payment rate and the site neutral payment rate in FY 2026. We proposed to establish the adjustments for the wage index, labor-related share, the cost-of-living adjustment, and high-cost outliers, including the applicable fixed-loss amounts and the LTCH cost-to-charge ratios (CCRs) for both payment rates.

14. Impact Analysis

In Appendix A of the proposed rule, we set forth an analysis of the impact the proposed changes would have on affected acute care hospitals, LTCHs, and other entities.

15. Recommendation of Update Factors for Operating Cost Rates of Payment for Hospital Inpatient Services

In Appendix B of the proposed rule, as required by sections 1886(e)(4) and (e)(5) of the Act, we provided our recommendations of the appropriate percentage changes for FY 2026 for the following:

- A single average standardized amount for all areas for hospital inpatient services paid under the IPPS for operating costs of acute care hospitals (and hospital-specific rates applicable to SCHs and MDHs).
- Target rate-of-increase limits to the allowable operating costs of hospital inpatient services furnished by certain hospitals excluded from the IPPS.
- The LTCH PPS standard Federal payment rate and the site neutral payment rate for hospital inpatient services provided for LTCH PPS discharges.

16. Discussion of Medicare Payment Advisory Commission Recommendations

Under section 1805(b) of the Act, MedPAC is required to submit a report to Congress, no later than March 15 of each year, in which MedPAC reviews and makes recommendations on Medicare payment policies. MedPAC's March 2025 recommendations concerning hospital inpatient payment policies address the update factor for hospital inpatient operating costs and capital-related costs for hospitals under the IPPS. We addressed these recommendations in Appendix B of the proposed rule. For further information relating specifically to the MedPAC March 2025 report or to obtain a copy of the report, contact MedPAC at (202) 220–3700 or visit MedPAC's website at *https://www.medpac.gov*.

E. Public Comments Received in Response to the FY 2026 IPPS/LTCH PPS Proposed Rule

We received approximately 5,409 timely pieces of correspondence containing multiple comments on the proposed rule that appeared in the April 30, 2025 **Federal Register** (89 FR 18002) titled ''Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year 2026 Rates; Requirements for Quality Programs; and Other Policy Changes'' (hereinafter referred to as the FY 2026 IPPS/LTCH PPS proposed rule). We note that some of these public comments were outside of the scope of the proposed rule. These out-of-scope public comments are not addressed with policy responses in this final rule. Summaries of the public comments that are within the scope of the proposed rule and our responses to those public comments are set forth in the various sections of this final rule under the appropriate heading.

II. Changes to Medicare Severity Diagnosis-Related Group (MS–DRG) Classifications and Relative Weights

A. Background

Section 1886(d) of the Act specifies that the Secretary shall establish a classification system (referred to as diagnosis-related groups (DRGs)) for inpatient discharges and adjust payments under the IPPS based on appropriate weighting factors assigned to each DRG. Therefore, under the IPPS, Medicare pays for inpatient hospital services on a rate per discharge basis that varies according to the DRG to which a beneficiary's stay is assigned. The formula used to calculate payment for a specific case multiplies an individual hospital's payment rate per case by the weight of the DRG to which the case is assigned. Each DRG weight represents the average resources required to care for cases in that particular DRG, relative to the average resources used to treat cases in all DRGs.

Section 1886(d)(4)(C) of the Act requires that the Secretary adjust the DRG classifications and relative weights at least annually to account for changes in resource consumption. These adjustments are made to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources.

B. Adoption of the MS–DRGs and MS–DRG Reclassifications

For information on the adoption of the MS–DRGs in FY 2008, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47140 through 47189).

For general information about the MS–DRG system, including yearly reviews and changes to the MS–DRGs, we refer readers to the previous discussions in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43764 through 43766) and the FYs 2011 through 2025 IPPS/LTCH PPS final rules (75 FR 50053 through 50055; 76 FR 51485 through 51487; 77 FR 53273; 78 FR 50512; 79 FR 49871; 80 FR 49342; 81 FR 56787 through 56872; 82 FR 38010 through 38085; 83 FR 41158 through 41258; 84 FR 42058 through 42165; 85 FR 58445 through 58596; 86 FR 44795 through 44961; 87 FR 48800 through 48891; 88 FR 58654 through 58787; and 89 FR 69000 through 69109, respectively). For discussion regarding our previously finalized policies (including our historical adjustments to the payment rates) relating to the effect of changes in documentation and coding that do not reflect real changes in case mix, we refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 48799 through 48800).

Comment: A commenter summarized the statutory and regulatory history regarding the documentation and coding recoupment adjustments required under section (7)(b) of the TMA, Abstinence Education, and QI Programs Extension Act of 2007 (Pub. L. 110–90), as amended. The commenter reiterated its position that the total level of adjustments made by CMS under this section took back more than was authorized by Congress and stated that section 7(b)(2) of Public Law 110–90 requires CMS to increase the standardized amount by 0.9412% to avoid carrying over into FY 2026 the -3.9% reduction to the standardized amount that law required between FY 2013 and FY 2017.

Response: As of FY 2023, CMS completed the statutory requirements of section 7(b)(1)(B) of Public Law 110–90 as amended by section 631 of the American Taxpayer Relief Act of 2012 (ATRA, Pub. L. 112–240), section 404 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10), and section 15005 of the 21st Century Cures Act (Pub. L. 114–255). As we discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44794 through 44795), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58444 through 58445) and in prior rules, we believe section 414 of the MACRA and section 15005 of the 21st Century Cures Act set forth the levels of positive adjustments for FYs 2018 through 2023. Those adjustments added up to +2.9488 percentage points, not +3.9 percentage points, and we see no evidence that Congress enacted that smaller adjustment schedule with the silent intent that CMS would later make a permanent 0.9412% payment adjustment to reach a total +3.9 percentage point adjustment. To the contrary, section 414 of MACRA instructs the agency to ''not make the adjustment (estimated to be an increase of 3.2 percent) that would otherwise apply for discharges occurring during fiscal year 2018 by reason of the completion of the adjustments required under clause (ii).'' Because the adjustment ''that would otherwise apply'' in fiscal year 2018 but for clause (1)(B)(iii) was +3.9%, the commenter's suggestion to complete making that adjustment now is inconsistent with the statute's text.

Subparagraph (b)(2) of Public Law 110–90 does not compel a contrary result. As the U.S. Court of Appeals for the D.C. Circuit has explained, that provision simply requires CMS ''to ignore recoupment adjustments'' when ''calculat[ing] and apply[ing] the annual 'percentage increase' '' to base rates provided for in the Medicare statute to account for inflation. *Fresno Community Hospital & Medical Center* v. *Cochran,* 987 F.3d 158, 163 (D.C. Cir. 2021). The Secretary has complied with that instruction. Similarly, the commenter's citations to statements the agency made in the **Federal Register** about its intent to unwind the reductions to the standardized amount the agency made between FY 2013 and FY 2017 were made before Congress passed clause (1)(B)(iii) and have been countermanded by that provision. We therefore decline the commenter's suggestion to read into section 7(b) of Public Law 110–90 implied authority to increase the standardized payment amount by 0.9412%.

C. Changes to Specific MS–DRG Classifications

1. Discussion of Changes to Coding System and Basis for FY 2026 MS–DRG Updates

a. International Classification of Diseases, 10th Revision (ICD–10)

Providers use the International Classification of Diseases, 10th Revision (ICD–10) coding system to report diagnoses and procedures for Medicare hospital inpatient services under the MS–DRG system. The ICD–10 coding system includes the International Classification of Diseases, 10th Revision, Clinical Modification (ICD–10–CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) for inpatient hospital procedure coding, as well as the ICD–10–CM and ICD–10–PCS Official Guidelines for Coding and Reporting.

b. Basis for FY 2026 MS–DRG Updates

The deadline for interested parties to submit MS–DRG classification change requests for FY 2026 was October 20, 2024. All requests are submitted to CMS via Medicare Electronic Application Request Information System™ (MEARIS™), accessed at *https://mearis.cms.gov*. Specifically, as indicated on the MEARIS™ site, the MS–DRG classification change request process may be used for requests to create, modify, or delete MS–DRGs, change ICD–10–CM diagnosis code(s) severity level designations, change ICD–10–PCS procedure code(s) Operating Room (O.R.) designations, or to review the CC Exclusions List or the surgical hierarchy.

Within MEARIS™, we have built in several resources to support users, including a ''Resources'' section available at *https://mearis.cms.gov/public/resources* with technical support available under ''Useful Links'' at the bottom of the MEARIS™ site. Questions regarding the MEARIS™ system can be submitted to CMS using the form available under ''Contact'', also at the bottom of the MEARIS™ site.

We note that the burden associated with this information collection requirement is the time and effort required to collect and submit the data in the request for MS–DRG classification changes to CMS. The aforementioned burden is subject to the Paperwork Reduction Act (PRA) of 1995 and approved under OMB control number 0938–1431 and has an expiration date of 09/30/2025.

Interested parties should submit any MS–DRG classification change requests, including any comments and suggestions for FY 2027 consideration by October 20, 2025 via MEARIS™ at: *https://mearis.cms.gov/public/home*. As we have discussed in prior rulemaking, we may not be able to fully consider all of the requests that we receive for the upcoming fiscal year. We have found that, with the implementation of ICD 10, some types of requested changes to the MS–DRG classifications require more extensive research to identify and analyze all of the data that are relevant to evaluating the potential change.

Beginning with the MS–DRG classification change requests that are submitted for FY 2027 consideration, we plan to inform requestors via MEARIS™ if the MS–DRG classification change request is not able to be considered with the upcoming fiscal year rulemaking cycle. As in prior years, requests that may require more extensive analysis may include those involving multiple MS–DRGs, overlapping logic across multiple Major Diagnostic Categories (MDCs), special logic such as diagnosis codes combined with procedure codes, and/or complex logic including code clusters or multiple logic lists. Beginning with FY 2027 rulemaking, we will no longer summarize in the proposed and final rules those requests that are not able to be considered for the upcoming FY.

As noted previously, interested parties had to submit MS–DRG classification change requests for FY 2026 by October 20, 2024. As we have discussed in prior rulemaking and as previously noted, we may not be able to fully consider all of the requests that we receive for the upcoming fiscal year. In the proposed rule, we noted those topics for which further research and analysis are required, and which we will continue to consider in connection with future rulemaking as summarized in the discussion that follows. We further noted that we also received recommendations and feedback that did not involve requests to create, modify, or delete MS–DRGs, change code designations, or to review the CC Exclusions List or the surgical hierarchy, which therefore were not summarized or addressed in the discussion of the MS–DRG classification change requests received for FY 2026.

As discussed in the proposed rule, we received requests to modify the GROUPER logic in several MS–DRGs under MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) and a request to modify the GROUPER logic for MS–DRG 794 (Neonate with Other Significant Problems) under MDC 15 (Newborns and Other Neonates with Conditions Originating in Perinatal Period). Specifically, we received requests to do the following:

- Modify the GROUPER logic of new MS–DRG 426 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with MCC or Custom-Made Anatomically Designed Interbody Fusion Device), new MS–DRG 427 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical with CC), and new MS–DRG 428 (Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical without CC/MCC); new MS–DRG 447 (Multiple Level Spinal Fusion Except Cervical with MCC or Custom-Made Anatomically Designed Interbody Fusion Device) and new MS–DRG 448 (Multiple Level Spinal Fusion Except Cervical without MCC); and MS–DRGs 456, 457, and 458 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with MCC, with CC, and without CC/MCC, respectively) by reassigning cases with an ICD–10–PCS code that describes fusion of a sacroiliac joint using an internal fixation device with tulip connector or insertion of an internal fixation device with tulip connector into a pelvic bone with another spinal fusion procedure code that currently map to the lower severity level MS–DRG to the highest severity level (with MCC) MS–DRG.
- Modify the GROUPER logic of MS–DRGs 463, 464, and 465 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 466, 467, and 468 (Revision of Hip or Knee Replacement with MCC, with CC, and without CC/MCC, respectively); and MS–DRGs 492, 493, and 494 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with MCC, with CC, and without CC/MCC, respectively) by reassigning cases with ICD–10–PCS code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) that currently map to the lower severity level MS–DRG to the highest severity level (with MCC) MS–DRG.
- Modify the GROUPER logic of MS–DRG 794. The requestor recommended that ICD–10–CM diagnosis codes P09.6 (Abnormal findings on neonatal screening for neonatal hearing loss), Z13.0 (Encounter for screening for diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism), Z82.5 (Family history of asthma and other chronic lower respiratory diseases) and Z82.79 (Family history of other congenital malformations, deformations and chromosomal abnormalities), be added to the MS–DRG 795 (Normal Newborn) ''only secondary diagnosis'' list so that they would result in assignment to MS–DRG 795 when coded with a principal diagnosis code from ICD–10–CM category Z38 (Liveborn infants according to place of birth and type of delivery) instead of MS–DRG 794.

In the proposed rule, we stated that we appreciated the submissions and related analyses provided by the requestors for our consideration as we review MS–DRG classification change requests for FY 2026; however, we also noted the complexity of the GROUPER logic for these MS–DRGs in connection with these requests requires more extensive analyses to identify and evaluate all the data relevant to assessing these potential modifications. Specifically, we noted that MS–DRGs 426, 427, 428, 447, and 448 recently became effective October 1, 2024 (FY 2025) and as discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 35982 through 35983) and final rule (89 FR 69049 through 69053) in consideration of any future modifications to the current structure of the logic for case assignment to MS–DRGs 456, 457, and 458 we noted that additional analysis would be needed because the logic is also defined by diagnosis code logic as well as extensive fusions. We also noted that, as discussed further in section II.C.5.c. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule, we identified additional inconsistencies related to the diagnosis code logic for MS–DRGs 456, 457, and 458 for which we proposed modifications. In addition, we stated that analyzing the impact of restructuring the logic in these MS–DRGs with respect to procedure codes describing fusion of a sacroiliac joint using an internal fixation device with tulip connector necessitates evaluating the impact across numerous other MS–DRGs in MDC 08, as well as MS–DRG 028 (Spinal Procedures with MCC), MS–DRG 029 (Spinal Procedures with CC or Spinal Neurostimulators), and MS–DRG 030 (Spinal Procedures without CC/MCC) under MDC 01 (Diseases and Disorders of the Nervous System) since the procedure codes describing fusion of a sacroiliac joint using an internal fixation device with tulip connector also map to these MS–DRGs.

With respect to the request to reassign cases reporting procedure code XW0V0P7 from the lower severity level to the highest (with MCC) severity level in the previously listed MS–DRGs, we noted in the proposed rule that the procedure to insert a bone void filler is designated as a non-operating room (Non-O.R.) procedure and believe that the key factor that would contribute to resource utilization in these cases is the fact that the patients have an infection(s) which require additional resources. As discussed in section II.C.5.a. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule, we also noted that we received an MS–DRG request related to cases reporting a hip or knee procedure with a diagnosis of

periprosthetic joint infection (PJI) in MS–DRGs 463, 464, and 465. We stated that in our review of the claims data to address that request we noted that a subset of the cases also reported procedure code XW0V0P7. As discussed in the proposed rule, consistent with our established process, we must also consider if there are additional factors, such as the severity of illness with other secondary CC/MCC conditions reported and any other O.R. procedures or services provided, such as mechanical ventilation, that may be contributing to the consumption of resources for these cases. We stated that, for these reasons and those previously described, we believed additional time was needed to review and evaluate potential extensive modifications to the structure of these MS–DRGs.

In the proposed rule, we noted that with respect to the request to modify the GROUPER logic of MS–DRG 794, as discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69061 through 69065), we acknowledged that MS–DRG 794 utilizes ''fall-through'' logic, meaning if a diagnosis code is not assigned to any of the other MS–DRGs, then assignment ''falls-through'' to MS–DRG 794. As discussed in the FY 2025 IPPS/LTCH PPS rule, we stated we have started to examine the GROUPER logic that would determine the assignment of cases to the MS–DRGs in MDC 15, including MS–DRGs 794 and 795, to determine where further refinements could potentially be made to better account for differences in clinical complexity and resource utilization. However, as we have noted in prior rulemaking (72 FR 47152), we stated we cannot adopt the same approach to refine the newborn MS–DRGs because of the extremely low volume of Medicare patients there are in these MS–DRGs. We stated we believe it is appropriate to consider the request to add ICD–10–CM diagnosis codes P09.6 (Abnormal findings on neonatal screening for neonatal hearing loss), Z13.0 (Encounter for screening for diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism), Z82.5 (Family history of asthma and other chronic lower respiratory diseases) and Z82.79 (Family history of other congenital malformations, deformations and chromosomal abnormalities) to the MS–DRG 795 (Normal Newborn) ''only secondary diagnosis'' list in connection with our continued examination of the GROUPER logic that would determine the assignment of cases to the MS–DRGs in MDC 15 in future rulemaking, rather than proposing to change the MS–DRG assignment of individual ICD–10–CM diagnosis codes at this time. We stated that additional time is needed to fully and accurately evaluate cases currently grouping to the MS–DRGs in MDC 15 to consider if restructuring the current MS–DRGs would better recognize the clinical distinctions of these patient populations.

Comment: A commenter (the manufacturer) thanked CMS for consideration of its request to reassign cases with an ICD–10–PCS code that describes fusion of a sacroiliac joint using an internal fixation device with tulip connector or insertion of an internal fixation device with tulip connector into a pelvic bone with another spinal fusion procedure code that currently map to the lower severity level MS–DRG to the highest severity level (with MCC) MS–DRG and expressed their understanding that resources are limited such that not every request may be considered each cycle. However, the commenter stated they were hopeful that CMS would move forward with their recommendations, so that hospitals supporting these case types in FY 2026 would be compensated appropriately. The commenter provided additional information and analyses for CMS' consideration, including analyses with the proposed diagnosis code logic changes for MS–DRGs 456, 457, and 458, and stated its findings reinforce that the reassignment request for FY 2026 involving MS–DRGs 426, 427, and 428; MS–DRGs 456, 457, and 458; and MS–DRGs 447 and 448 to maintain payment accuracy and protect access to care for Medicare beneficiaries requiring advanced sacropelvic fixation is warranted, given the significant cost differences reported for these cases compared to all other cases in related MS–DRGs.

Several commenters (members of an international society for spine surgery) suggested that CMS finalize the requested reassignment of cases reporting a sacroiliac joint fusion or pelvic fixation procedure with another spinal fusion procedure code from the lower severity level to the higher severity level spinal fusion MS–DRG in FY 2026 IPPS rulemaking. The commenters stated that in comparison to standard spinal fusion cases, procedures that include sacroiliac joint fusion and pelvic fixation represent a substantial increase in surgical complexity, operative time, and instrumentation cost. According to the commenters, the addition of both sacroiliac joint fusion and pelvic fixation adjunctive to spinal fusion introduces a level of surgical intensity that is not currently accounted for in the existing MS–DRG assignments. The commenters encouraged CMS to recognize the added clinical burden and cost associated with these cases and assign them to MS–DRGs that appropriately reflect their complexity.

A commenter stated that CMS should reconsider its rejection of the request to reassign cases reporting procedures describing sacroiliac joint and pelvic internal fixation devices using a tulip connector. Another commenter stated that while there is an increased cost in performing pelvic fixation, its use dramatically lowers the risk of failure and reoperation, both of which lead to extraordinary cost escalation for care of these patients. The commenter also stated that long-term sustainability of the health care landscape depends on CMS incentivizing and supporting better care for these spinal patients through reassigning these higher cost cases to the higher paying MCC MS–DRG in the relevant MS–DRG grouping.

In response to the discussion regarding the request to reassign cases reporting procedure code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) from the lower severity level to the highest (with MCC) severity level MS–DRG among MS–DRGs 463, 464, and 465; MS–DRGs 466, 467, and 468; and MS–DRGs 492, 493, and 494, a commenter (the manufacturer) expressed concern that CMS did not act on its request and deferred the requested changes. The commenter stated its belief that without action on its request, the payment outlook for cases reporting procedure code XW0V0P7 for bone infection will result in underpayment and suppress hospital adoption and patient access to improved clinical outcomes. Additionally, the commenter stated that CMS' reasoning to defer decision making on claims reporting procedure code XW0V0P7 was based on the procedures non-O.R. designation and it was confusing to them as most treatments of bone infection with the antibiotic-eluting bone void filler (code XW0V0P7) are performed in the O.R. The commenter further stated that CMS should reconsider its FY 2026 decision to postpone action on the MS–DRG modification request to reassign cases reporting procedure code XW0V0P7 and clarify the criteria for how procedures are assigned O.R. versus non-O.R. status, as well as whether having O.R. status for a procedure code is essential for the code to potentially influence the MS–DRG assignment in the GROUPER. The commenter provided additional information and analyses for CMS' consideration and stated that cases

reporting procedure code XW0V0P7 show a compelling discrepancy in resource use that should not be ignored.

With respect to our discussion regarding the request to modify the GROUPER logic of MS–DRG 794, a commenter specifically stated they appreciate CMS' ongoing examination of the GROUPER logic for the MS–DRGs in MDC 15 (Newborns and Other Neonates with Conditions Originating in Perinatal Period) to determine if restructuring the current MS–DRGs would better recognize the clinical distinctions of these patient populations.

Response: We thank the commenters for sharing their feedback on these requests. As discussed in the proposed rule, we have found that with the implementation of ICD–10, some types of requested changes to the MS–DRG classifications require more extensive research to identify and analyze the relevant data for evaluating a potential change.

With respect to the comments received in response to our proposed rule discussion of the request to modify the GROUPER logic of MS–DRGs 426, 427, and 428, MS–DRGs 456, 457, and 458, and MS–DRGs 447 and 448, while many commenters stated their belief that a modification to the logic of these MS–DRGs is warranted for FY 2026, we note that we did not propose a change to the logic for FY 2026, nor did we state the request was specifically rejected. Rather, we noted in the proposed rule that we will continue to consider this request in connection with future rulemaking. We appreciate the analysis that the commenter (the manufacturer) performed and the findings it shared, including with the proposed changes to the diagnosis code logic for MS–DRGs 456, 457, and 458; however, as discussed in the proposed rule, the proposed changes for MS–DRGs 456, 457, and 458 involving diagnosis code logic were only one of several considerations as to why additional time is needed to evaluate the reassignment request (90 FR 18012). We note that the logic for case assignment to MS–DRGs 456, 457, and 458 is also defined by extensive fusions. In addition, MS–DRGs 426, 427, 428, 447, and 448 (that is, multiple level spinal fusions) recently became effective October 1, 2024 which we are continuing to monitor. The data analysis necessary to examine the intricate logic within the spinal fusion MS–DRGs outlined in the request is complex and requires additional time for careful consideration of case redistribution and potential relative weight impacts, in connection with other related spinal fusion procedure requests that may be discussed in future rulemaking.

With respect to the comment we received in response to our proposed rule discussion of the request to reassign cases with ICD–10–PCS code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) among MS–DRGs 463, 464, and 465; MS–DRGs 466, 467, and 468; and MS–DRGs 492, 493, and 494, while the commenter stated that CMS should reconsider the decision to postpone action on the request to modify the MS–DRG logic for the aforementioned MS–DRGs for FY 2026, we note that we did not propose a change to the logic for FY 2026. Rather, we noted in the proposed rule that we will continue to consider this request in connection with future rulemaking. We appreciate the analysis that the commenter (the manufacturer) performed and the findings it shared; however, we note that in addition to assessing impacts in association with other MS–DRG requests being considered, there are various types of bone void fillers and additional data analysis would also need to be performed to assess cases reporting the procedure codes describing those alternative products for comparison. While we did not propose a change to the assignment of these cases for FY 2026, we noted in our proposed rule discussion that we will continue to consider this request in connection with future rulemaking.

As previously discussed, we will continue to consider these issues in connection with future rulemaking. As we develop and refine our analysis of the claims data with respect to MS–DRGs in MDC 01, MDC 08, and MDC 15, we welcome feedback on other factors that should be considered in the potential restructuring of these MS–DRGs. Feedback and other suggestions may be directed to MEARIS™ at: *https://mearis.cms.gov/public/home.* As noted, interested parties should submit any MS–DRG classification change requests, including any comments and suggestions for FY 2027 consideration by October 20, 2025 via MEARIS™ at: *https://mearis.cms.gov/public/home.*

As we did for the FY 2025 IPPS/LTCH PPS proposed rule, for the FY 2026 IPPS/LTCH PPS proposed rule we provided a test version of the ICD–10 MS–DRG GROUPER Software, Version 43, so that the public can better analyze and understand the impact of the proposals included in the proposed rule. We noted that this test software reflected the proposed GROUPER logic for FY 2026. Therefore, it included the new diagnosis and procedure codes that are effective for FY 2026 as reflected in Table 6A.—New Diagnosis Codes—FY 2026 and Table 6B.—New Procedure Codes—FY 2026 associated with the proposed rule and does not include the diagnosis codes that are invalid beginning in FY 2026 as reflected in Table 6C.—Invalid Diagnosis Codes—FY 2026 and Table 6D.—Invalid Procedure Codes—FY 2026 associated with the proposed rule. Those tables were not published in the Addendum to the FY 2026 IPPS/LTCH PPS proposed rule, but are available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* as described in section VI. of the Addendum to the FY 2026 IPPS/LTCH PPS proposed rule. Because the diagnosis and procedure codes no longer valid for FY 2026 are not reflected in the test software, we made available a supplemental file in Table 6P.1a that includes the mapped Version 43 FY 2026 ICD–10–CM codes and the deleted Version 42 FY 2025 ICD–10–CM codes and Table 6P.1b that includes the mapped Version 43 FY 2026 ICD–10–PCS codes and the deleted Version 42.1 FY 2025 ICD–10–PCS codes that should be used for testing purposes with users' available claims data. Therefore, users had access to the test software allowing them to build case examples that reflect the proposals that were included in the proposed rule. In addition, users were able to view the draft version of the ICD–10 MS–DRG Definitions Manual, Version 43 that contains the documentation for proposed FY 2026 ICD–10 MS–DRG GROUPER Version 43 logic changes and were also able to view a draft version of the Definitions of Medicare Code Edits (MCE) Manual to review any changes that will become effective October 1 for FY 2026. In the proposed rule we also noted that, as a result of new and modified code updates approved after the annual spring ICD–10 Coordination and Maintenance Committee meeting, any further changes to the MCE will be reflected in the finalized Definitions of Medicare Code Edits (MCE) Manual, made available in association with the annual IPPS/LTCH PPS final rule. As such, we made available the draft FY 2026 ICD–10 MCE Version 43 Manual file on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software.*

We noted in the proposed rule that the MCE manual is comprised of two chapters: *Chapter 1: Edit code lists* provides a listing of each edit, an

explanation of each edit, and as applicable, the diagnosis and/or procedure codes for each edit, and *Chapter 2: Code list changes* summarizes the changes in the edit code lists (for example, additions and deletions) from the prior release of the MCE software. We also stated that the public may submit any questions, comments, concerns, or recommendations regarding the MCE to the CMS mailbox at *MSDRGClassificationChange@cms.hhs.gov* for our review and consideration.

In association with the proposed rule, we made available the test version of the ICD–10 MS–DRG GROUPER Software, Version 43, the draft version of the ICD–10 MS–DRG Definitions Manual, Version 43, the draft version of the Definitions of Medicare Code Edits Manual, Version 43, and the supplemental mapping files in Tables 6P.1a and 6P.1b of the FY 2025 and FY 2026 ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes which are available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*.

Comment: Commenters expressed appreciation that we provided a test version of the ICD–10 MS–DRG GROUPER Software, Version 43, along with mapping files to assist with analysis, however, the commenters stated that this version essentially only allows for a case-by-case analysis and a minimal batch analysis. The commenters stated that it would be more beneficial to have a Batch z/OS version of the test GROUPER so that it could be better utilized for broader and more meaningful analysis purposes. The commenters requested that availability of a Batch z/OS version of the test GROUPER be made publicly available for all future rulemaking.

Response: We appreciate the commenters' feedback and will take the suggestion into consideration.

Following are the changes that we proposed to the MS–DRGs for FY 2026. We invited public comments on each of the MS–DRG classification proposed changes, as well as our proposals to maintain certain existing MS–DRG classifications discussed in the FY 2026 IPPS/LTCH PPS proposed rule. In some cases, we proposed changes to the MS–DRG classifications based on our analysis of claims data and clinical appropriateness. In other cases, we proposed to maintain the existing MS–DRG classifications based on our analysis of claims data and clinical appropriateness. As discussed in the FY 2026 IPPS/LTCH PPS proposed rule, our MS–DRG analysis was based on ICD–10 claims data from the September 2024 update of the FY 2024 MedPAR file, which contains hospital bills received from October 1, 2023 through September 30, 2024. In our discussion of the proposed MS–DRG reclassification changes, we referred to these claims data as the ''September 2024 update of the FY 2024 MedPAR file.''

As explained in previous rulemaking (76 FR 51487), in deciding whether to propose to make further modifications to the MS–DRGs for particular circumstances brought to our attention, we consider whether the resource consumption and clinical characteristics of the patients with a given set of conditions are significantly different than the remaining patients represented in the MS–DRG. We evaluate patient care costs using average costs and lengths of stay and rely on clinical factors to determine whether patients are clinically distinct or similar to other patients represented in the MS–DRG. In evaluating resource costs, we consider both the absolute and percentage differences in average costs between the cases we select for review and the remainder of cases in the MS–DRG. We also consider variation in costs within these groups; that is, whether observed average differences are consistent across patients or attributable to cases that are extreme in terms of costs or length of stay, or both. Further, we consider the number of patients who will have a given set of characteristics and generally prefer not to create a new MS–DRG unless it would include a substantial number of cases.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58448), we finalized our proposal to expand our existing criteria to create a new complication or comorbidity (CC) or major complication or comorbidity (MCC) subgroup within a base MS–DRG. Specifically, we finalized the expansion of the criteria to include the NonCC subgroup for a three-way severity level split. We stated we believed that applying these criteria to the NonCC subgroup would better reflect resource stratification as well as promote stability in the relative weights by avoiding low volume counts for the NonCC level MS–DRGs. We noted that in our analysis of MS–DRG classification requests for FY 2021 that were received by November 1, 2019, as well as any additional analyses that were conducted in connection with those requests, we applied these criteria to each of the MCC, CC, and NonCC subgroups.

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58661), we continue to apply the criteria to create subgroups, including application of the NonCC subgroup criteria, in our annual analysis of MS–DRG classification requests, consistent with our approach since FY 2021 when we finalized the expansion of the criteria to include the NonCC subgroup for a three-way severity level split. Accordingly, in our analysis of the MS–DRG classification requests for FY 2026 that we received by October 20, 2024, as well as any additional analyses that were conducted in connection with those requests, we applied these criteria to each of the MCC, CC, and NonCC subgroups, as described in the following table.

Criteria Number	Three-Way Split 123 (MCC vs CC vs NonCC)	Two-Way Split 1_23 MCC vs (CC+NonCC)	Two-Way Split 12_3 (MCC+CC) vs NonCC
1. At least 500 cases in the MCC/CC/NonCC group	500+ cases for MCC group; and 500+ cases for CC group; and 500+ cases for NonCC group	500+ cases for MCC group; and 500+ cases for (CC+NonCC) group	500+ cases for (MCC+CC) group; and 500+ cases for NonCC group
2. At least 5% of the patients are in the MCC/CC/NonCC group	5%+ cases for MCC group; and 5%+ cases for CC group; and 5%+ cases for NonCC group	5%+ cases for MCC group; and 5%+ cases for (CC+NonCC) group	5%+ cases for (MCC+CC) group; and 5%+ cases for NonCC group
3. There is at least a 20% difference in average cost between subgroups	20%+ difference in average cost between MCC group and CC group; and 20%+ difference in average cost between CC group and NonCC group	20%+ difference in average cost between MCC group and (CC+NonCC) group	20%+ difference in average cost between (MCC+ CC) group and NonCC group
4. There is at least a $2,000 difference in average cost between subgroups	$2,000+ difference in average cost between MCC group and CC group; and $2,000+ difference in average cost between CC group and NonCC group	$2,000+ difference in average cost between MCC group and (CC+ NonCC) group	$2,000+ difference in average cost between (MCC+ CC) group and NonCC group
5. The R2 of the split groups is greater than or equal to 3	R2 ≥ 3.0 for the three-way split within the base MS-DRG	R2 ≥3.0 for the two-way 1_23 split within the base MS-DRG	R2 ≥ 3.0 for the two-way 12_3 split within the base MS-DRG

In general, once the decision has been made to propose to make further modifications to the MS–DRGs as described previously, such as creating a new base MS–DRG, or in our evaluation of a specific MS–DRG classification request to split (or subdivide) an existing base MS–DRG into severity levels, all five criteria must be met for the base MS–DRG to be split (or subdivided) by a CC subgroup. We note that in our analysis of requests to create a new MS–DRG, we typically evaluate the most recent year of MedPAR claims data available. For example, we stated earlier that for the FY 2026 IPPS/LTCH PPS proposed rule, our MS–DRG analysis was based on ICD–10 claims data from the September 2024 update of the FY 2024 MedPAR file. However, in our evaluation of requests to split an existing base MS–DRG into severity levels, as noted in prior rulemaking (80 FR 49368), we typically analyze the most recent 2 years of data. This analysis includes 2 years of MedPAR claims data to compare the data results from one year to the next to avoid making determinations about whether additional severity levels are warranted based on an isolated year's data fluctuation and also, to validate that the established severity levels within a base MS–DRG are supported. The first step in our process of evaluating if the creation of a new CC subgroup within a base MS–DRG is warranted is to determine if all the criteria is satisfied for a three-way split. In applying the criteria for a three-way split, a base MS–DRG is initially subdivided into the three subgroups: MCC, CC, and NonCC. Each subgroup is then analyzed in relation to the other two subgroups using the volume (Criteria 1 and 2), average cost (Criteria 3 and 4), and reduction in variance (Criteria 5). If the criteria fail, the next step is to determine if the criteria are satisfied for a two-way split. In applying the criteria for a two-way split, a base MS–DRG is initially subdivided into two subgroups: ''with MCC'' and ''without MCC'' (1_23) or ''with CC/MCC'' and ''without CC/MCC'' (12_3). Each subgroup is then analyzed in relation to the other using the volume (Criteria 1 and 2), average cost (Criteria 3 and 4), and reduction in variance (Criteria 5). If the criteria for both of the two-way splits fail, then a split (or CC subgroup) would generally not be warranted for that base MS–DRG. If the three-way split fails on any one of the five criteria and all five criteria for both two-way splits (1_23 and 12_3) are met, we would apply the two-way split with the highest R2 value. We note that if the request to split (or subdivide) an existing base MS–DRG into severity levels specifies the request is for either one of the two-way splits (1_23 or 12_3), in response to the specific request, we will evaluate the criteria for both of the two-way splits; however, we do not also evaluate the criteria for a three-way split.

We are making the FY 2026 ICD–10 MS–DRG GROUPER and Medicare Code Editor (MCE) Software Version 43, the ICD–10 MS–DRG Definitions Manual files Version 43 and the Definitions of Medicare Code Edits Manual Version 43 available to the public on our CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*.

2. Pre-MDC MS–DRG 018 Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18015 through 18017), we discussed a request we received to review the recent MS–DRG assignments to Pre-MDC MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies) and to clarify how decisions for the assignment of cell and gene therapies will be made moving forward. According to the requestor, for FY 2025, CMS did not assign prademagene zamikeracel (PZ), an autologous genetically engineered cell-based gene therapy, to MS–DRGs that would create clinical homogeneity and therefore, the mapping of these cases to MS–DRG 018 instead implied that estimated post-approval product pricing takes precedent for cell and gene therapies over clinical homogeneity principles. The requestor acknowledged that CMS has previously clarified that therapies mapped to Pre-MDC MS–DRG 018 do not need to be CAR T-cell products or utilized in the treatment of cancer and stated it concurs with that approach. However, the requestor indicated that the mapping of PZ to Pre-MDC MS–DRG 018 for FY 2025 also raised the following questions:

- Why was PZ mapped to Pre-MDC MS–DRG 018 when a different product (eladocagene exuparvovec) that is also delivered via operating room administration methods was mapped to other non-pre-MDC MS–DRGs?
- Why did CMS indicate that Lantidra, a recently approved cellular therapy, would map to the same MS–DRGs as existing insulin delivery therapies and technologies used to treat the subset of patients with hard-to-control Type 1 diabetes complicated by severe hypoglycemia who cannot receive a whole pancreas transplant instead of to Pre-MDC MS–DRG 018?
- Does CMS intend a future split of Pre-MDC MS–DRG 018 between medical and surgical cell and gene therapies to recognize the clinical resource

differential between the two modalities, even if the 500 case volume threshold is not reached?

- Why was a product delivered via allogeneic stem cell transplant procedure (Orca-T) mapped to Pre-MDC MS–DRG 018 instead of Pre-MDC MS–DRG 014 (Allogeneic Bone Marrow Transplant)?
- If products delivered via stem cell transplant should be mapped to Pre-MDC MS–DRG 018 based on resource use, per the Orca-T example, why are multiple gene therapy products delivered via stem cell transplant instead mapped to Pre-MDC MS–DRGs 016 and 017 (Autologous Bone Marrow Transplant with CC/MCC and without CC/MCC, respectively)?

The requestor stated the previously listed questions illustrate examples of inconsistencies with the MS–DRG mappings of cell and gene therapy products in recent years. The requestor recommended that CMS review recent MS–DRG assignments for these products and consider refinements to the approach. The requestor also urged CMS to clarify how decisions for cell and gene therapies will be made in the future. The requestor stated that if the intent of CMS is for Pre-MDC MS–DRG 018 to be a broad cell and gene therapy MS–DRG then a modification to the title of Pre-MDC MS–DRG 018 should be proposed and therapies currently assigned to other MS–DRGs should be re-mapped.

The requestor also suggested that CMS clarify the process by which interested parties can submit comments on potential or proposed procedure code mappings to the MS–DRGs for code proposals discussed at the Spring ICD–10 Coordination and Maintenance (C&M) Committee meeting since, given the timing, proposed code assignments are not published in association with the annual IPPS/LTCH PPS proposed rule. Specifically, the requestor stated there is no opportunity for interested parties to provide feedback to CMS about the assignment of new codes to Pre-MDC MS–DRG 018. The requestor stated that because MS–DRG 018 is a Pre-MDC MS–DRG with a limited number of procedure codes mapping to it, it is important for interested parties to have the ability to preview potential assignments to this MS–DRG and provide feedback to CMS prior to any final mapping decisions being made. The requestor acknowledged that CMS previously responded to prior comments regarding the process of commenting on the assignment of newly created codes; however, the requestor suggested that CMS provide additional clarification. Specifically, the requestor stated that the primary comment period with respect to the Spring procedure code requests is the timeframe following the ICD–10 C&M Committee meeting and that the materials provided in association with the meeting do not contain mapping requests submitted by the code requestor. The requestor indicated that if it is to assume any new procedure code request could potentially be mapped to Pre-MDC MS–DRG 018 and submits comments accordingly, that would create an undue burden. The requestor submitted the following questions regarding the process by which interested parties may submit comments on potential procedure code mappings to MS–DRGs:

- Can mapping requests be submitted as part of the request for a new ICD–10–PCS procedure code or do mapping requests need to go through the MS–DRG modification process with an annual October deadline?
- Can CMS provide information on mapping requests as part of the ICD–10 C&M Committee meeting materials?
- Will comments submitted to the ICD–10 C&M Committee about potential mappings be shared with the CMS teams associated with MS–DRG mapping decisions?
- Should interested parties include the same comments that are submitted to the ICD–10 C&M Committee in their proposed rule comments?
- Will comments submitted as part of the proposed rule be considered within scope for proposed codes presented during the spring meeting that are subsequently finalized but not listed in Table 6A.—New Diagnosis codes and Table 6B.—New Procedure Codes with proposed mappings?
- Do CMS' prior responses indicate that interested parties who submit comments on procedure code mappings should request code proposals presented at the spring meeting be delayed until the fall meeting?

The requestor recommended that CMS address the previously listed questions and seek input on the process by which interested parties may submit comments on potential procedure code mappings.

We stated in the proposed rule that we appreciated the requestor's feedback and suggestions regarding the classification of therapies to Pre-MDC MS–DRG 018 and the broader topic of MS–DRG mappings of cell and gene therapy products for the future. As discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69008 through 69010), we summarized and responded to comments regarding the mapping of procedure codes describing the application of PZ and other newly established procedure codes to Pre-MDC MS–DRG 018. We noted that we previously addressed similar comments in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48806 through 48807), and we also noted that we provided detailed summaries and responses to these same or similar comments in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44798 through 44806). We also referred the reader to the discussion in section II.D. of the FY 2026 IPPS/LTCH PPS proposed rule, regarding the proposed relative weight methodology for cases mapping to Pre-MDC MS–DRG 018 effective October 1, 2025, for FY 2026.

As discussed in the proposed rule, with respect to the requestor's suggestion that a modification to the title of Pre-MDC MS–DRG 018 be proposed, we noted that the requestor did not provide a specific recommendation for FY 2026 consideration; however, we acknowledged that there has been discussion related to requests to revise the title to Pre-MDC MS–DRG 018 in prior rulemaking, most recently in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69008 through 69010), and we stated that we continue to be interested in obtaining input from members of the public on options to consider, recognizing there are additional types of cell and gene therapies now mapping to Pre-MDC MS–DRG 018. We stated we will continue to review additional feedback and suggestions in connection with future rulemaking.

In response to the requestor's assertion that there is no opportunity for interested parties to submit feedback about MS–DRG assignments, as we have discussed in prior rulemaking (87 FR 48807 through 48808) and as noted in the proposed rule discussion, interested parties may use current coding information as shown in the ICD–10 C&M Committee meeting materials to consider the potential MS–DRG assignments for any procedure codes that may be finalized after the Spring meeting and submit public comments for consideration. As we have noted in prior rulemaking, because the diagnosis and procedure code proposals that are presented at the Spring ICD–10–CM C&M Committee meeting for an October 1 implementation (upcoming FY) are not finalized in time to include in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes in association with the proposed rule, we use our established process to examine the MS–DRG assignment for the predecessor codes to determine the most appropriate MS–DRG assignment. Specifically, we review the predecessor code and MS–DRG assignment most

closely associated with the new procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We have noted in prior rulemaking that this process does not automatically result in the new procedure code being assigned to the same MS–DRG or to have the same designation (O.R. versus Non-O.R.) as the predecessor code. In response to the question regarding the inclusion of information on mapping requests as part of the ICD–10 C&M Committee meeting materials, we noted in the proposed rule that, as announced at each ICD–10 C&M Committee meeting, there is no discussion of MS–DRGs, payment, coverage, or billing at the ICD–10 C&M Committee meetings; therefore, we do not include such information in the meeting materials made publicly available in association with the meeting. Rather, we state that any issues related to MS–DRGs or payment are addressed through IPPS rulemaking. We noted that the purpose of the ICD–10 C&M Committee meeting is to present code proposals based on requests received regarding coding updates (that is, additions, deletions, or revisions). Therefore, while mapping requests may be included in the submission of an ICD–10–PCS procedure code request, that information is not included in the meeting materials, nor is there any discussion about any mapping request(s) during the meeting.

In response to the requestor's question regarding whether comments submitted to the ICD–10 C&M Committee about potential mappings are shared with the CMS staff associated with MS–DRG mapping decisions, we noted in the proposed rule that the comments are shared. With respect to whether interested parties should include the same comments submitted to the ICD–10 C&M Committee in the comments submitted in response to the proposed rule, we noted in the proposed rule that what comments to include and submit for each process is up to the commenter. In response to the question of whether comments submitted in response to the proposed rule would be considered within scope for proposed codes presented during the Spring meeting that are subsequently finalized but not listed in Table 6A.—New Diagnosis codes and Table 6B.—New Procedure Codes with proposed mappings, we noted in the proposed rule that the procedure code update files reflecting the newly finalized codes are made publicly available following the receipt and review of public comments received by the established deadline for the Spring coding topics, and that interested parties may choose to submit public comments on MS–DRG assignment for the agency's consideration. Lastly, in response to the question of whether interested parties considering submitting comments on procedure code mappings should request code proposals associated with the Spring meeting be delayed until the Fall meeting, we similarly noted in the proposed rule that the decision on what comments a commenter decides to include and submit in response to a code proposal is up to the commenter. We referred the reader to section II.C.11. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule for additional information regarding the ICD–10 C&M Committee meeting process.

As discussed in the proposed rule, in connection with the comments and questions about how products are grouped under the IPPS MS–DRGs, specifically with respect to cell and gene therapies under Pre-MDC MS–DRG 018, for FY 2026, we also received a request to create a new neurosurgical gene therapy MS–DRG to more accurately reflect the clinical characteristics and resource intensity required for the administration of neurosurgical gene therapies, including eladocagene exuparvovec, for patients diagnosed with Aromatic L-amino acid decarboxylase (AADC) deficiency. We referred the reader to the FY 2022 IPPS/LTCH PPS final rule (86 FR 44895) and the FY 2023 IPPS/LTCH PPS final rule (87 FR 48853 through 48854) for discussion regarding eladocagene exuparvovec.

We stated that the requestor (the manufacturer), expressed its appreciation for CMS' efforts to reassign cases reporting procedure code XW0Q316 (Introduction of eladocagene exuparvovec into cranial cavity and brain, percutaneous approach, new technology group 6) to a surgical MS–DRG as discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44895). According to the requestor, the decision appropriately reclassified cases involving eladocagene exuparvovec from a Non-O.R. procedure to an operating room (O.R.) procedure due to the requirement for intraputaminal administration via a burr hole in the skull. However, the requestor did not agree with the current assignment to MS–DRGs 628, 629, and 630 (Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 10, or MS–DRGs 987, 988, and 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without MCC/CC, respectively). According to the requestor, the clinical characteristics and average costs of the cases currently assigned to MS–DRGs 628, 629, and 630 are significantly different from those associated with eladocagene exuparvovec neurosurgical gene therapy for rare disease.

The requestor stated that CMS denied the request to create a new MS–DRG for FY 2023, stating that it would continue to explore appropriate mechanisms to address low volume MS–DRGs indicated for rare diseases; however, after receiving responses to the Request for Information (RFI), the requestor stated that there have not been any changes proposed to the IPPS. The requestor stated its belief that assigning cases for this gene therapy and the rare disease indicated to a new MS–DRG is both appropriate and warranted. According to the requestor, the current MS–DRGs that eladocagene exuparvovec cases group to do not adequately reflect the clinical characteristics or resource needs associated with treatment which may deter hospitals from providing this therapy.

The requestor also stated there are approximately 68 gene therapy trials in the U.S. for central nervous system disorders for which over 30 of the 68 trials involve the gene therapy being administered directly into the brain parenchyma. According to the requestor, gene therapies administered surgically, including with neurosurgery, are extremely complicated, resource-intensive procedures for hospitals to undertake. These procedures require highly specialized surgeons, surgical equipment, and staff. Patients undergoing these procedures may also require continuous monitoring and longer hospital stays. The requestor stated the more intensive needs of these patients are not adequately captured in existing MS–DRGs and the creation of a new MS–DRG for neurosurgical gene therapy would help CMS proactively shape payment policy for this evolving class of therapies, thus allowing appropriate payment to support patient access to these treatments.

We stated that our analysis of the September 2024 update of the FY 2024 MedPAR file yielded zero cases reporting the administration of eladocagene exuparvovec; therefore, we believed it would be premature to consider the creation of a new neurosurgical gene therapy MS–DRG at this time. We also stated we appreciated

the detailed clinical information that the requestor provided and acknowledged that cases involving neurosurgery are technically complex and that patients undergoing these procedures tend to be critically ill, many with rare diseases.

We noted that we did receive a new procedure code request to identify and describe the Smartflow® Neuro Cannula as the delivery mechanism to administer eladocagene exuparvovec that was included as a topic in the Spring 2025 ICD–10 Coordination and Maintenance Committee Update materials. We refer the reader to the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials* for additional detailed information regarding the request, and the related materials. We note that procedure code 00H033J (Insertion of infusion device into brain, temporary, percutaneous approach) that describes the procedure that uses the Smartflow® Neuro Cannula was approved and finalized as reflected in the FY 2026 ICD–10–PCS code update files that were made publicly available on the CMS website on June 6, 2025 at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes*.

We also noted, as discussed in prior rulemaking, that this category of therapies continues to evolve, and we are in the process of carefully considering the feedback we have previously received about ways in which we can continue to appropriately reflect resource utilization while maintaining clinical coherence and stability in the relative weights under the IPPS MS–DRGs. We appreciate the recommendations and suggestions for consideration we have received and will continue to examine these complex issues in connection with future rulemaking. We acknowledge that there may be distinctions to account for as we continue to gain more experience in the use of these therapies and have additional claims data to analyze.

Comment: A commenter (the requestor) expressed appreciation for the clarification CMS provided regarding the submission of comments related to coding requests presented during the Spring ICD–10 Coordination and Maintenance Committee Meeting and that comments submitted after the Spring meeting will be shared with the groups responsible for considering MS–DRG mappings. The commenter stated that while some stakeholders may have the resources and expertise to review meeting materials, infer potential requested mappings for all therapies requesting new codes and submit mapping comments accordingly, many stakeholders will not. The commenter stated that if an applicant is requesting an MS–DRG mapping as part of the ICD–10–PCS process, this should be made explicitly public in the meeting materials, even if it is not discussed in the meeting itself. The commenter also stated that CMS should not ask or expect all stakeholders to know enough about clinical care and CMS' mapping processes to be able to suggest an alternative mapping for a code, if required. The commenter reiterated its request for CMS to introduce a process by which stakeholders can review requested MS–DRG mappings as part of, or in parallel to, the ICD–10–PCS code request process. The commenter also requested that CMS utilize its established process to review and reconsider MS–DRG assignment when stakeholders raise concerns about CMS' assignment instead of expecting stakeholders to propose alternative mappings.

Response: We thank the commenter for the feedback. In response to the commenter's assertion that not all stakeholders may have the resources and expertise to review meeting materials, infer potential requested mappings for all therapies requesting new codes and submit mapping comments accordingly, we note that we have made all of the information and materials necessary to conduct those actions publicly available via the CMS website. Specifically, the ICD–10 Coordination and Maintenance Committee Meeting materials are available at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-10-coordination-maintenance-committee-materials*, and the meeting process is summarized in the annual rulemakings available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*. In addition, the ICD–10 MS–DRG Definitions Manual is made publicly available via the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*.

In response to the commenter's statement that if an applicant is requesting an MS–DRG mapping as part of the ICD–10–PCS process it should be made public in the meeting materials even if it is not discussed in the meeting itself, we note that, as discussed in the preamble of the proposed rule (90 FR 18016) and this final rule, the purpose of the ICD–10 Coordination and Maintenance Committee meeting is to present code proposals based on requests received regarding coding updates (that is, additions, deletions, or revisions). Therefore, while mapping requests may be included in the submission of an ICD–10–PCS procedure code request, we disagree that the information should be included in the meeting materials. We underscore that the focus of the ICD–10 Coordination and Maintenance Committee meetings is on updates and maintenance to the ICD–10 code sets and not about how a potential new code may be designated or assigned under the IPPS, which is addressed through rulemaking. These are two separate and distinct processes, each with their own objectives and timelines.

In response to the commenter's statement that CMS should not ask or expect all stakeholders to know enough about clinical care and CMS' mapping processes to be able to suggest an alternative mapping for a code, if required, we note that under our established process, we consider requests for MS–DRG classification changes on an annual basis that are submitted via MEARIS™ at: *https://mearis.cms.gov/public/home* by the designated October 20 deadline for the upcoming fiscal year. If a proposal is subsequently put forth in rulemaking and members of the public submit comments expressing disagreement with that proposal (for example, proposed new MS–DRG(s), proposed reassignment of diagnosis and/or procedure codes, or their designation), the public comments routinely provide the rationale behind the disagreement as well as alternative suggestions) for our consideration, which we may be able to further evaluate. With respect to the mapping process, as discussed in the preamble of the proposed rule (90 FR 18016) and this final rule, under our established process, when a new procedure code is finalized, we review the predecessor code and MS–DRG assignment most closely associated with the new procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We have noted in prior rulemaking that this process does not automatically result in the new procedure code being assigned to the same MS–DRG or to have the same designation (O.R. versus Non-O.R.) as the predecessor code.

Comment: A commenter (the requestor) expressed appreciation that CMS shared the types of concerns and questions raised by stakeholders about the rationale for mapping new ICD–10–PCS codes for novel therapies into Pre-MDC MS–DRG 018; however, the commenter requested that CMS discuss

the rationale for mapping Orca-T allogeneic T-cell immunotherapy to Pre-MDC MS–DRG 018.

Response: We thank the commenter for the feedback. The procedure code proposal for Orca-T allogeneic T-cell immunotherapy was discussed at the March 19–20, 2024 ICD–10 Coordination and Maintenance Committee meeting. We refer the reader to the meeting materials on the CMS website at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-10-coordination-maintenance-committee-materials* for additional information regarding the request. ICD–10–PCS codes XW033BA (Introduction of Orca-T allogeneic T-cell immunotherapy into peripheral vein, percutaneous approach, new technology group 10) and XW043BA (Introduction of Orca-T allogeneic T-cell immunotherapy into central vein, percutaneous approach, new technology group 10) became effective October 1, 2024, for FY 2025. Under our established process, we reviewed the predecessor code assignments. The predecessor codes for Orca-T allogeneic T-cell immunotherapy (hereafter referred to as Orca-T) are procedure codes 3E033GC (Introduction of other therapeutic substance into peripheral vein, percutaneous approach) and 3E043GC (Introduction of other therapeutic substance into central vein, percutaneous approach) that are designated as non-O.R. and do not affect MS–DRG assignment. We then reviewed other factors associated with Orca-T. Notably, Orca-T is a precision-engineered allogeneic stem cell and T-cell immunotherapy biologic (that is, a combination therapy comprised of immune cells, including regulatory T-cells (Tregs) and conventional T-cells (Tcons), and stem cells) that is in clinical trials and regulated under FDA section 351 of the Public Health Service Act (PHSA) as a biologic.

Allogeneic hematopoietic stem cell transplant (alloHSCT) can provide a curative therapy for many patients with advanced hematologic malignancies. Unfortunately, despite advancements in identifying matching donors and medical care, patients can experience a variety of post-transplant complications including Graft Versus Host Disease (GvHD), infection and organ failure. GvHD is a condition in which the donated cells attack the recipient's tissues which can lead to end organ damage.

Orca-T is derived from an HLA matched donor and combines progenitor stem cells along with highly purified T-cells in the form of regulatory T-cells (Tregs, a specialized CD4+ T cell subset) and conventional T-cells (Tcons). Because of its purified nature, the Tregs can proliferate and exist in a patient's tissues in a fashion not normally possible. While the stem cells serve to build a long term immune system in the recipient, the Tregs act to protect the patient's tissues and organs from GvHD and other toxicities. The Tcons component is designed to accelerate the reconstitution of a patient's immune system, mediating the graft-versus-leukemic effect, graft-versus-infection and the inflammatory responses, providing protection against infection.

Establishment of a successful allograft requires an approach that balances an enhancement of the graft-vs-tumor and graft-vs-infection effects while avoiding or limiting GvHD. While some immunotherapeutic agents treat an active disease process, the specialized cells in Orca-T are intended to immunologically mitigate significant post allograft complications such as GvHD and infection.

We note that both CAR T-cell therapy and Orca T-cell therapy are forms of immunotherapies that are indicated for patients diagnosed with acute lymphoblastic leukemia (ALL), among other types of cancer. One of the challenges experienced to date with the treatment of ALL is GvHD, which is what Orca-T is formulated to address. We also note that there are other procedure codes describing both allogeneic CAR T-cell and non-CAR T-cell immunotherapy currently assigned to MS–DRG 018. Therefore, we believe the assignment of Orca T-cell immunotherapy to Pre-MDC MS–DRG 018 is appropriate.

Comment: A commenter stated that the procedure code describing valoctocogene roxaparvovec is listed in Table 6B in association with the proposed rule and a proposed mapping to Pre-MDC MS–DRG 018, but CMS did not discuss any rationale for this proposal in the rule text. The commenter stated that the title of Pre-MDC MS–DRG 018 is Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies, and valoctocogene roxaparvovec is an off-the-shelf in vivo gene therapy that is neither a CAR–T nor an immunotherapy. Additionally, according to the commenter, it does not require the same types of complex and specialized clinical resources to administer as the other therapies assigned to Pre-MDC MS–DRG 018. The commenter further stated that, as a result, and without any discussion or explanation from CMS about why its medical advisors have proposed this, they assume that this proposed assignment is simply based on the manufacturer's request to assign its product to Pre-MDC MS–DRG 018 as part of the ICD–10–PCS code request application. The commenter stated that CMS' acceptance of this requested mapping is concerning as it seems that resource homogeneity is the only factor being relied upon. The commenter stated its understanding is that CMS has always discussed the importance of balancing both clinical and resource homogeneity when considering MS–DRG assignments for new therapies. The commenter provided an example stating that CMS assigned several hematopoietic stem cell gene therapies to autologous transplant MS–DRGs 016 and 017 (Autologous Bone Marrow Transplant with CC/MCC and without CC/MCC, respectively) based on the clinical similarity of the services being provided to the patient, rather than basing assignment on price point. According to the commenter, if the latter had been deemed more critical at the time of those assignments, then CMS would have assigned the therapies to Pre-MDC MS–DRG 018 as well. The commenter also stated that CMS did not propose to map eladocagene exuparvovec to MS–DRG 018 after denying its request for a new MS–DRG (as discussed later in this section), though eladocagene exuparvovec has a similar price point. The commenter stated it cannot determine any consistent logic guiding the variation in recent mapping proposals and decisions.

The commenter requested that CMS not finalize the proposed mapping of valoctocogene roxaparvovec to Pre-MDC MS–DRG 018 due to differences in clinical complexity and resource use. The commenter stated that CMS should use its established mapping process and input from its clinical advisors to assign valoctocogene roxaparvovec to a more clinically appropriate MS–DRG.

Response: In response to the commenter's request that CMS not finalize the proposed mapping of valoctocogene roxaparvovec to Pre-MDC MS–DRG 018 because it is neither a CAR–T nor an immunotherapy and does not require the same types of complex and specialized clinical resources to administer as the other therapies assigned to Pre-MDC MS–DRG 018, we note that, as discussed in prior rulemaking, consideration is given to the similarities and differences in resource utilization among patients in each MS–DRG and we strive to ensure that resource utilization is relatively consistent across patients in each MS–DRG. However, some variation in resource intensity will remain among the patients in each MS–DRG because

the definition of the MS–DRG is not so specific that every patient is identical, rather the average pattern of resource intensity of a group of patients in an MS–DRG can be predicted. We note that historically, in the development of the DRGs, the initial step in the determination of the DRG had been the assignment of the appropriate MDC based on the principal diagnosis, however, beginning with the eighth version of the GROUPER (CMS 8.0), the initial step in DRG assignment was based on the procedure being performed, thus the creation of the Pre-MDC DRGs, where the patient is assigned to these DRGs independent of the MDC of the principal diagnosis. Therefore, the logic for case assignment to Pre-MDC MS–DRG 018 does not preclude the assignment of other therapies indicated in the treatment of patients with different diagnoses. In our review of the MS–DRG assignment of valoctocogene roxaparvovec, we recognized that this technology is defined as a gene therapy. We also note that similar to the discussions in prior rulemaking with respect to the difficulty in predicting what the associated costs will be in the future for CAR T-cell and other immunotherapies that remain under development (87 FR 48806), it is also difficult to predict what the associated costs will be in the future for cell and gene therapies that remain under development or in clinical trials.

In response to the commenter's assertion that CMS did not use its established mapping process and input from its clinical advisors to assign valoctocogene roxaparvovec to a more clinically appropriate MS–DRG, as discussed in the preamble of the proposed rule (90 FR 18016) and this final rule, and as noted in prior rulemaking, we use our established process to examine the MS–DRG assignment for the predecessor codes to determine the most appropriate MS–DRG assignment. Specifically, we review the predecessor code and MS–DRG assignment most closely associated with the new procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. As noted previously and in prior rulemaking, this process does not automatically result in the new procedure code being assigned to the same MS–DRG or to have the same designation (O.R. versus Non-O.R.). We note that the proposal to create new procedure codes that describe the administration of valoctocogene roxaparvovec was discussed at the September 10, 2024 ICD–10 Coordination and Maintenance Committee meeting. The predecessor codes to describe the administration of valoctocogene roxaparvovec are ICD–10–PCS codes 3E033GC (Introduction of other therapeutic substance into peripheral vein, percutaneous approach) and 3E043GC (Introduction of other therapeutic substance into central vein, percutaneous approach) which are designated as non-O.R. and do not impact MS–DRG assignment. We refer the reader to the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials* for additional detailed information regarding the code request, including a recording of the discussion and the related meeting materials. We also note that the procedure codes to describe the administration of valoctocogene roxaparvovec were approved and finalized as reflected in Table 6B.—New Procedure Codes associated with the proposed rule and this final rule (and available via the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*) as well as reflected in the FY 2026 ICD–10–PCS code update files that were made publicly available on the CMS website on June 6, 2025 at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes.* As discussed in section II.C.11. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, the code titles are adopted as part of the ICD–10 Coordination and Maintenance Committee meeting process that have been finalized after the review of public comments. As also discussed in the preamble of the proposed rule (90 FR 18067) and this final rule, we proposed the MDC and MS–DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes associated with the proposed rule. Therefore, the public has the opportunity to comment and provide feedback on the proposed assignments for CMS' consideration, which is subsequently included in the final rule with a summary of the comments and feedback and CMS' response, as is reflected in the discussion in this section of this final rule.

In response to the commenter's statement that valoctocogene roxaparvovec does not require the same types of complex and specialized clinical resources to administer as other therapies assigned to Pre-MDC MS–DRG 018, we note that valoctocogene roxaparvovec is indicated in the treatment of Hemophilia A, an X-linked genetic disorder that results in a dysfunction in the gene encoding for Factor VIII which is essential for proper coagulation. Patients may have varying degrees of functional activity of Factor VIII with severe activity (< 1IU per deciliter) resulting in spontaneous hemorrhage. This can result in life threatening hemorrhages into the brain or lead to debilitating hemorrhages in the soft tissues or joints leading to chronic pain or arthropathy. While prophylactic regimens may improve outcomes, they do not address the underlying dysfunctional gene encoding for Factor VIII. Valoctocogene roxaparvovec is a one-time therapy that uses an adeno-associated virus (AAV5) to deliver a functional copy of the F8 gene which is responsible for the production of Factor VIII.

Valoctocogene roxaparvovec is similar to other gene based therapies currently assigned to Pre-MDC MS–DRG 18 such as prademagene zamikeracel (Zevaskyn™) and CAR T-cell therapy in that these treatments involve introduction of genetic material into a patient's cells to treat a disease process. CAR T-cell therapy uses a patient's genetically modified T-cells to treat cancer while prademagene zamikeracel and valoctocogene roxaparvovec introduce functional deoxyribonucleic acid (DNA) copies into a patient's skin and liver, respectively, to correct an inherited genetic dysfunction. While they are similar in character to the hematopoietic stem cell gene therapies assigned to autologous transplant MS–DRGs 016 and 017 (Autologous Bone Marrow Transplant with CC/MCC and without CC/MCC, respectively), resource utilization differs. Prademagene zamikeracel and valoctocogene roxaparvovec involve introduction of genetic material into mature cells while hematopoietic gene therapy involves introduction of genetic material into stem cells which require a level of resource utilization more akin to other therapies in MS–DRGs 016 and 017.

In response to the commenter's assumption that the manufacturer requested assignment to Pre-MDC MS–DRG 018 in association with its procedure code request, we note that it did not. We also take this opportunity to emphasize that, as has been discussed in prior rulemaking with respect to gene therapies, this category of therapies continues to evolve, and we are in the process of carefully considering the feedback we have previously received about ways in which we can continue

to appropriately reflect resource utilization while maintaining clinical coherence and stability in the relative weights under the IPPS MS–DRGs. We also note that valoctogene roxaparvovec is primarily administered in the outpatient setting (for example, hemophilia treatment centers). However, in rare instances when the therapy is administered in the inpatient setting or the patient must be transferred to the inpatient setting, providers are equipped with a specific procedure code to report its use in connection with a predictable payment mechanism under the IPPS.

Comment: A commenter stated they support appropriate and ongoing refinement of the MS–DRG system and greater clarity with respect to how CMS renders decisions regarding ICD–10–PCS codes mapped to Pre-MDC MS–DRG 018. Another commenter recommended that CMS dedicate space in each IPPS proposed rule to identify relevant ICD–10–PCS codes that might be assigned to Pre-MS–DRG 018, along with preliminary rationales for these potential assignments.

Response: We appreciate the commenters' feedback. We note that while the establishment of Pre-MDC MS–DRG 018 has presented unique operational considerations under the IPPS, there are also over 700 other MS–DRGs that warrant continued review for ongoing refinements. In response to how CMS renders decisions regarding the mapping of procedure codes to a Pre-MDC MS–DRG, as discussed in the preamble of the proposed rule (90 FR 18068) and in this final rule, we review the predecessor code and MS–DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis or treatment of the condition. As previously noted, this process does not automatically result in the new diagnosis or procedure code being proposed for assignment to the same MS–DRG or to have the same designation as the predecessor code.

Comment: A commenter stated it is unclear why discussion of the request to create a new MS–DRG to describe neurosurgical gene therapies was included under the Pre-MDC MS–DRG 018 section of the proposed rule instead of under MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders) where prior discussions of eladocagene exuparvovec have been included. The commenter indicated that if CMS placed this discussion in the Pre-MDC MS–DRG 018 section in an effort to seek comments about whether Pre-MDC MS–DRG 018 should be broadened to include eladocagene exuparvovec and other gene therapies that it be made explicit what information the agency is seeking from stakeholders in advance of the FY 2027 IPPS/LTCH PPS rulemaking cycle. The commenter also stated that if CMS intends for Pre-MDC MS–DRG 018 to be the primary Pre-MDC MS–DRG for all cell and gene therapies until further modifications can be made, the agency should propose to rename the MS–DRG and be consistent with mapping practices and rationale. The commenter further remarked that CMS' proposed rule analysis stated no cases reporting eladocagene exuparvovec were found, however, according to the commenter, because the product was not approved until November 2024, cases would not be expected to appear in the data.

Response: As stated in the preamble of the proposed rule (90 FR 18016), in connection with the comments and questions about how products are grouped under the IPPS MS–DRGs, specifically with respect to cell and gene therapies under Pre-MDC MS–DRG 018, for FY 2026, we also received a request to create a new neurosurgical gene therapy MS–DRG, which we believe was appropriately placed and discussed in that section of the preamble of the proposed rule. As also explicitly stated in the preamble of the proposed rule (90 FR 18017), we continue to welcome additional feedback and comments on other options to consider on how to appropriately address low volume, high-cost treatments for rare diseases, therefore, we believe that our intentions were clearly stated. In response to the commenter's suggestion that a proposal to revise the title for Pre-MDC MS–DRG 018 should be put forth if CMS aims to temporarily designate Pre-MDC MS–DRG 018 as the primary Pre-MDC MS–DRG for all cell and gene therapies, we note that, as also stated in the preamble of the proposed rule, (90 FR 18016), there has been discussion related to requests to revise the title to Pre-MDC MS–DRG 018 in prior rulemaking, most recently in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69008 through 69010), and we continue to be interested in obtaining input from members of the public on options to consider, recognizing there are additional types of cell and gene therapies now mapping to Pre-MDC MS–DRG 018. We stated we will continue to review additional feedback and suggestions in connection with future rulemaking. In response to the commenter's remarks that CMS' proposed rule analysis stated no cases were found to report the administration of eladocagene exuparvovec and because the product was not approved until November 2024, cases would not be expected to appear in the data, we note that procedure code XW0Q316 (Introduction of eladocagene exuparvovec into cranial cavity and brain, percutaneous approach, new technology group 6) that describes the administration of eladocagene exuparvovec became effective October 1, 2020 (FY 2021) and a single case was previously identified in the data in MS–DRG 829 (Myeloproliferative Disorders or Poorly Differentiated Neoplasms with Other Procedures with CC/MCC) with an average length of stay of 2 days and average costs of $1,544, as discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48854). We further note that, as also discussed in prior rulemaking, the creation of a code to describe a technology that is utilized in the performance of a procedure or service does not require FDA approval of the technology nor is the proposed and final assignment of a procedure code to an MS–DRG dependent upon a product's FDA approval (86 FR 44806).

Several commenters provided general feedback on the subject of cell and gene therapies for CMS' consideration in association with the Pre-MDC MS–DRG 018 proposed rule discussion. Notably, commenters suggested that CMS: (1) issue a Request for Information (RFI) to obtain additional insight on provider experiences, including information on the therapies under development and expected to become available in the near future, as well as features of their administration and the affected patient populations, (2) develop a payment model or long-term solution for appropriate payment that also accounts for products whose new technology add-on payment is expiring, and (3) ensure transparency in the refinement process by collaborating with stakeholders.

We appreciate the commenters' recommendations and feedback as we continue to examine the complexities involved with these therapies under the IPPS. We intend to address any potential modifications to the MS–DRGs through future notice and comment rulemaking.

3. MDC 01 (Diseases and Disorders of the Nervous System)

a. Logic for MS–DRGs 023 Through 027

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18017

through 18025), we received three separate but related requests to review the MS–DRG assignments for a subset of procedures assigned to MS–DRGs 023 through 027. In this section of the preamble of this FY 2026 IPPS/LTCH PPS final rule, we discuss each of these separate, but related requests.

The first request was to create a new MS–DRG for cases involving ''chemotherapy implants'' and cases involving ''epilepsy with neurostimulator.'' The requestor noted chemotherapy implants are used to treat patients with brain tumors. They are implanted into the brain during the craniotomy procedure at the time of tumor resection. Upon implantation, these devices immediately release radiation or chemotherapeutic agents. This approach enables treatment to be initiated at the time of tumor resection without undue delay. ''Epilepsy with neurostimulator'' cases involve devices used in the treatment of medically intractable epilepsy. The neurostimulator is implanted in the skull via a craniotomy and is connected to electrodes that are implanted on the surface of the brain or in the brain through either a craniotomy or a burr hole(s). According to the requestor, like the procedure to insert a chemotherapy implant, the craniotomy procedure to insert the neurostimulator lead is performed under general anesthesia and the procedure typically takes four hours.

We noted in the proposed rule that the requestor performed their own analysis of Medicare claims data and stated they found that the average costs of cases involving chemotherapy implants and cases involving epilepsy with neurostimulators are significantly higher than the average costs of other procedures currently grouped within MS–DRG 023 (Craniotomy with Acute Complex CNS Principal Diagnosis with MCC or Antineoplastic Implant). The requestor asserted that as a result, these cases are not being adequately paid under the current MS–DRG. Therefore, given the limited options within the existing MS–DRG structure, the requestor recommended that CMS extract cases reporting the insertion of a chemotherapy implant and cases reporting a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain, and a principal diagnosis of epilepsy from MS–DRG 023 and create a new MS–DRG for these cases with a payment rate that better aligns with the resource utilization associated with these procedures. The requestor stated that this recommendation appeared to be reasonable, given that CMS has already determined that these two subsets of cases are clinically coherent by virtue of them being currently assigned to the same MS–DRG.

To begin our analysis, as discussed in the proposed rule, we reviewed the GROUPER logic for MS–DRGs 023 and 024 (Craniotomy with Acute Complex CNS Principal Diagnosis without MCC). We noted in the proposed rule that the requestor is correct that currently, cases involving ''chemotherapy implants'' and cases involving ''epilepsy with neurostimulator'' are assigned to the higher severity level MS–DRG 023. MS–DRGs 023 and 024 contain a logic list referred to as ''Chemotherapy Implant.'' This logic list includes the following four ICD–10–PCS codes:

ICD-10-PCS Code	Description
00H004Z	Insertion of radioactive element, cesium-131 collagen implant into brain, open approach
3E0Q005	Introduction of other antineoplastic into cranial cavity and brain, open approach
3E0Q305	Introduction of other antineoplastic into cranial cavity and brain, percutaneous approach
3E0Q705	Introduction of other antineoplastic into cranial cavity and brain, via natural or artificial opening

We stated that the ''Chemotherapy Implant'' logic list was created for cases reporting the implantation of a chemotherapeutic agent and devices implanted in the brain, such as implantable chemotherapeutic wafers. Additionally, we noted MS–DRGs 023 and 024 contain a logic list referred to as ''Epilepsy Principal Diagnosis'' that includes 58 ICD–10–CM diagnosis codes that describe epilepsy, and a logic list referred to as ''Neurostimulator'' that includes the following three ICD–10–PCS procedure code combinations:

- 0NH00NZ (Insertion of neurostimulator generator into skull, open approach), in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach);
- 0NH00NZ (Insertion of neurostimulator generator into skull, open approach), in combination with 00H03MZ (Insertion of neurostimulator lead into brain, percutaneous approach); and
- 0NH00NZ (Insertion of neurostimulator generator into skull, open approach), in combination with 00H04MZ (Insertion of neurostimulator lead into brain, percutaneous endoscopic approach).

These two logic lists were created to capture cases involving the use of the Responsive Neurostimulation (RNS)® neurostimulator, a treatment option for persons diagnosed with medically intractable epilepsy. The RNS® neurostimulator includes a cranially implanted programmable neurostimulator connected to one or two depth and/or subdural cortical strip leads that are surgically placed in or on the brain at the seizure focus. The implanted neurostimulator continuously monitors brain electrical activity and is programmed by a physician to detect abnormal patterns of electrical activity that the physician believes may lead to seizures (epileptiform activity).

We refer the reader to the ICD–10 MS–DRG Definitions Manual, Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for complete documentation of the GROUPER logic for MS–DRGs 023 and 024.

As discussed in the preamble of the proposed rule, we then examined claims data from the September 2024 update of the FY 2024 MedPAR file for all cases in MS–DRG 023 and compared the results to cases reporting one of the four procedure codes that appear under the logic list referred to as ''Chemotherapy Implant'' in MS–DRG 023 and for all cases reporting a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator), and a principal diagnosis of epilepsy. The following table shows our findings:

MS-DRG 023 – ALL CASES COMPARED TO CASES REPORTING THE INSERTION OF A CHEMOTHERAPY IMPLANT AND CASES REPORTING A NEUROSTIMULATOR GENERATOR INSERTED INTO THE SKULL WITH THE INSERTION OF A NEUROSTIMULATOR LEAD INTO THE BRAIN AND A PRINCIPAL DIAGNOSIS OF EPILEPSY			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 023 - All cases	12,136	10	$51,132
Cases reporting the insertion of a chemotherapy implant	176	6.4	$49,743
Cases with principal diagnosis of epilepsy with neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain	68	2.4	$66,303

As shown in the table, for MS–DRG 023, we identified a total of 12,136 cases, with an average length of stay of 10 days and average costs of $51,132. Of the 12,136 cases in MS–DRG 023, there were 176 cases reporting the insertion of a chemotherapy implant with an average length of stay of 6.4 days and average costs of $49,743. Additionally, there were 68 cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) that had a principal diagnosis of epilepsy with an average length of stay of 2.4 days and average costs of $66,303.

As the data show, the 68 cases in MS–DRG 023 describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy have average costs that are higher than the average costs of all cases in MS–DRG 023 ($66,303 compared to $51,132), and they have an average length of stay that is shorter (2.4 days compared to 10 days). The 176 cases in MS–DRG 023 reporting the insertion of a chemotherapy implant have average costs that are lower than the average costs of all cases in MS–DRG 023 ($49,743 compared to $51,132), and they have an average length of stay that is shorter (6.4 days compared to 10 days).

We stated we reviewed the claims data, and did not believe the data support creating a new MS–DRG for cases reporting the insertion of a chemotherapy implant and cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy. We stated that the results of the claims analysis as previously summarized indicate the cases reporting the insertion of a chemotherapy implant demonstrate comparable resource utilization with other cases in their currently assigned MS–DRG. Further, the claims data analysis indicates that these two subsets of cases, that is cases reporting the insertion of a chemotherapy implant and cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy, do not demonstrate comparable resource utilization. The cases in MS–DRG 023 reporting the insertion of a chemotherapy implant have average costs that are lower than the average costs of cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain and a principal diagnosis of epilepsy ($49,743 compared to $66,303), and they have an average length of stay that is longer (6.4 days compared to 2.4 days).

Therefore, based on review of the claims data, we did not propose to create a new MS–DRG for cases reporting the insertion of a chemotherapy implant and cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy for FY 2026. However, while our analysis of the claims data did not support creating a new MS–DRG for cases reporting the insertion of a chemotherapy implant and cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy, as discussed in the proposed rule, cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy have average costs that are higher than the average costs of all cases in MS–DRG 023, with a shorter average length of stay. Accordingly, in the proposed rule we stated we determined that further analysis of cases reporting a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator), and a principal diagnosis of epilepsy was needed in conjunction with the separate but related requests we received to review the MS–DRG assignments for a subset of procedures also assigned to MS–DRGs 023 through 027 for the FY 2026 IPPS/LTCH PPS proposed rule to ensure clinical coherence between these cases and the other cases with which they would potentially be grouped, as discussed later in this section.

As noted previously, MS–DRGs 023 and 024 contain a logic list referred to as ''Chemotherapy Implant'' that includes the following four ICD–10–PCS codes:

ICD-10-PCS Code	Description
00H004Z	Insertion of radioactive element, cesium-131 collagen implant into brain, open approach
3E0Q005	Introduction of other antineoplastic into cranial cavity and brain, open approach
3E0Q305	Introduction of other antineoplastic into cranial cavity and brain, percutaneous approach
3E0Q705	Introduction of other antineoplastic into cranial cavity and brain, via natural or artificial opening

In the proposed rule we stated that during our review of the GROUPER logic for MS–DRGs 023 and 024, we identified that the following four ICD–10–PCS procedure codes describing the insertion of a radioactive element were inadvertently excluded from the ''Chemotherapy Implant'' logic list:

ICD-10-PCS Code	Description
00H001Z	Insertion of radioactive element into brain, open approach
00H005Z	Insertion of radioactive element, palladium-103 collagen implant into brain, open approach
00H031Z	Insertion of radioactive element into brain, percutaneous approach
00H041Z	Insertion of radioactive element into brain, percutaneous endoscopic approach

In review of this finding, we stated we analyzed claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 023, 024, 025, 026, and 027 for all cases and for cases reporting procedure codes 00H001Z, 00H005Z, 00H031Z, or 00H041Z. The findings from our analysis are shown in the following table.

MS-DRG		Number of cases	Average Length of Stay	Average Costs
023	All cases	12,136	10	$51,132
	Cases reporting 00H001Z, 00H005Z, 00H031Z, or 00H041Z	0	0	$0
024	All cases	4,624	5	$35,516
	Cases reporting 00H001Z, 00H005Z, 00H031Z, or 00H041Z	0		$0
025	All cases	21,059	8.6	$40,215
	Cases reporting 00H001Z, 00H005Z, 00H031Z, or 00H041Z	4	3.8	$40,199
026	All cases	5,833	4.1	$28,404
	Cases reporting 00H001Z, 00H005Z, 00H031Z, or 00H041Z	0	0	$0
027	All cases	7,049	1.9	$23,059
	Cases reporting 00H001Z, 00H005Z, 00H031Z, or 00H041Z	0	0	$0

As the data show, we found four cases reporting procedure code 00H001Z, 00H005Z, 00H031Z, or 00H041Z in MS–DRG 025, with average costs of $40,199 and an average length of stay of 3.8 days. We reviewed this issue and noted in the proposed rule radioactive elements are inserted into the brain to deliver a targeted concentrated dose of radiation directly to a brain tumor or tumor bed. They are primarily used to treat recurrent brain metastases or other aggressive brain cancers, as it allows for high-dose radiation delivery specifically to the tumor site while minimizing damage to surrounding healthy brain tissue. Although we did not identify many cases, we stated we believe the four procedure codes describing the insertion of a radioactive element into the brain are clinically aligned with the procedure codes currently included in the ''Chemotherapy Implant'' logic list in MS–DRGs 023 and 024.

Therefore, for clinical consistency we proposed to add procedure codes 00H001Z, 00H005Z, 00H031Z, and 00H041Z to the ''Chemotherapy Implant'' logic list in MS–DRGs 023 and 024, effective October 1, 2025, for FY 2026. We also proposed to change the description of the logic list in MS–DRGs 023 and 024 from ''Chemotherapy Implant'' to ''Antineoplastic Implant'' to better reflect the GROUPER logic that includes ICD–10–PCS procedure codes describing antineoplastic agents implanted in the brain.

Comment: Commenters supported the proposals to add procedure codes 00H001Z, 00H005Z, 00H031Z, and 00H041Z to the ''Chemotherapy Implant'' logic list in MS–DRGs 023 and 024 and to change the description of the logic list in MS–DRGs 023 and 024 from ''Chemotherapy Implant'' to ''Antineoplastic Implant'', effective October 1, 2025, for FY 2026.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to add procedure codes 00H001Z, 00H005Z, 00H031Z, and 00H041Z to the ''Chemotherapy Implant'' logic list in MS–DRGs 023 and 024, without modification, effective October 1, 2025, for FY 2026. We are also finalizing the change of the description of the logic list in MS–DRGs 023 and 024 from ''Chemotherapy Implant'' to ''Antineoplastic Implant''.

As mentioned previously, and as discussed in the FY 2026 IPPS/LTCH PPS proposed rule, we received three separate but related requests to review and reconsider the MS–DRG assignments for a subset of procedures assigned to MS–DRGs 023 through 027. The second and third request involve the MS–DRG assignment of cases reporting procedure codes describing the insertion of deep brain stimulators (DBS). Deep brain stimulation is a surgical treatment that involves the implantation of a neurostimulator, used in the treatment of essential tremor, Parkinson's disease, dystonia, epilepsy, obsessive-compulsive disorder and chronic pain. A DBS system consists of one or two leads that are placed stereotactically at defined targets deep within the brain via one or two burr holes created in the skull. The lead is then connected to an extension that is tunneled under the skin, down the neck, and connected to a programmable neurostimulator generator that is placed under the skin.

The second request we received was to reassign cases reporting the implantation of a DBS system from the lower (without MCC) severity level MS–DRG 024 to the higher (MCC) severity level MS–DRG 023, even if there is no MCC reported. The requestor suggested that if finalized, the title for MS–DRG 023 should be revised to reflect ''Craniotomy with Acute Complex Central Nervous System Principal Diagnosis with MCC or Chemotherapy Implant or Major Device Implant or Epilepsy with Neurostimulator.''

We stated in the proposed rule that the requestor performed their own analysis and stated they found that the majority of cases reporting the implantation of a DBS system are assigned to the lower severity level MS–DRG 024. The requestor also stated that in their analysis, the cases reporting the implantation of a DBS system assigned to MS–DRG 024 have average costs that are 20 percent greater than all cases in MS–DRG 024. The requestor asserted that reassigning cases reporting the implantation of a DBS system from the lower (without MCC) severity level MS–DRG 024 to the higher (with MCC) severity level MS–DRG 023, even if there is no MCC reported, would better recognize hospital resource utilization when the DBS systems are inserted.

We stated in the proposed rule that the requestor identified cases reporting the implantation of a DBS system by the presence of the following procedure code combinations:

- 0JH60DZ (Insertion of multiple array stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach);
- 0JH60DZ (Insertion of multiple array stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H03MZ (Insertion of neurostimulator lead into brain, percutaneous approach);
- 0JH60EZ (Insertion of multiple array rechargeable stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach); and
- 0JH60EZ (Insertion of multiple array rechargeable stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H03MZ (Insertion of neurostimulator lead into brain, percutaneous approach).

To begin our analysis, as discussed in the proposed rule, we again reviewed the GROUPER logic for MS–DRGs 023 and 024. The GROUPER logic for MS–DRGs 023 and 024 also contains 78 procedure code combinations representing the insertion of neurostimulator generator and a neurostimulator lead that are captured under a list referred to as ''Major Device Implant.'' The procedure codes describing the insertion of a neurostimulator generator on this list describe insertion of the neurostimulator generator into the subcutaneous areas of the chest, back, or abdomen, as well as into the skull. The procedure codes describing the insertion of a neurostimulator lead describe the insertion of the lead into the brain or the cerebral ventricle. We refer the reader to the ICD–10 MS–DRG Definitions Manual, Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for complete documentation of the GROUPER logic for MS–DRGs 023 and 024.

In our analysis of this issue, we stated that we agree that the four procedure code combinations discussed previously that were identified by this requestor are included in the ''Major Device Implant'' logic list of MS–DRGs 023 and 024, but we noted in the proposed rule that 32 additional procedure code combinations exist on the ''Major Device Implant'' logic list that also describe the implantation of a DBS system by describing the insertion of a neurostimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain. We refer the reader to Table 6P.2a associated with the FY 2026 IPPS/LTCH PPS proposed rule (and available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*) for the list of the 36 ICD–10–PCS procedure code combinations in the logic of MS–DRGs 023 and 024 in the ''Major Device Implant'' logic list that we identified that describe the implantation of a DBS system and therefore were included in our analysis.

We stated we then examined claims data from the September 2024 update of the FY 2024 MedPAR file for all cases in MS–DRGs 023 and 024 and compared the results to cases reporting the implantation of a DBS system by reporting a procedure code combination that describes the insertion of a neurostimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain. The following table shows our findings:

MS-DRGs 023 AND 024 – ALL CASES COMPARED TO CASES REPORTING THE INSERTION OF A DEEP BRAIN STIMULATION SYSTEM

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 023 - All cases	12,136	10	$51,132
Cases reporting the implantation of a DBS system	26	8.3	$81,947
MS-DRG 024 - All cases	4,624	5	$35,516
Cases reporting the implantation of a DBS system	432	1.7	$43,032

As shown in the table, for MS–DRG 023, we identified a total of 12,136 cases, with an average length of stay of 10 days and average costs of $51,132. Of the 12,136 cases in MS–DRG 023, there were 26 cases reporting the implantation of a DBS system with an average length of stay of 8.3 days and average costs of $81,947. For MS–DRG 024, we identified a total of 4,624 cases, with an average length of stay of 5 days and average costs of $35,516. Of the 4,624 cases in MS–DRG 024, there were 432 cases reporting the implantation of a DBS system with an average length of stay of 1.7 days and average costs of $43,032.

In the proposed rule, we stated we reviewed the claims data, and the data did not support reassignment of the cases reporting the implantation of a DBS system from MS–DRG 024 to MS–DRG 023 even if there is no MCC

reported. We stated the results of the claims analysis as previously summarized indicate the cases reporting the implantation of a DBS system, without reporting a secondary diagnosis designated as an MCC, that are currently assigned to MS–DRG 024, have average costs that are lower than the average costs of all cases in MS–DRG 023 ($43,032 compared to $51,132), and they have an average length of stay that is shorter (1.7 days compared to 10 days). While the average costs of these cases are higher than the average costs of all cases in MS–DRG 024 ($43,032 compared to $35,516), we stated we believe it would not be appropriate to reassign these cases into the higher severity level MS–DRG 023, even if there is no MCC reported, because the cases would not be coherent with regard to resource utilization. The cases reporting the implantation of a DBS system, without reporting a secondary diagnosis designated as an MCC, that are currently assigned to MS–DRG 024 have average costs that are $8,100 lower than the average costs of all cases in MS–DRG 023. Therefore, we did not propose to reassign cases reporting the implantation of a DBS system from the lower (without MCC) severity level MS–DRG 024 to the higher (with MCC) severity level MS–DRG 023, even if there is no MCC reported. However, while the analysis of the claims data did not support reassigning the cases reporting the implantation of a DBS system from the lower (without MCC) severity level MS–DRG 024 to the higher (MCC) severity level MS–DRG 023 even if there is no MCC reported, as discussed, we stated our analysis of the claims data found the average costs of the cases reporting the implantation of a DBS system are higher than all cases in their respective MS–DRGs, while the average lengths of stay are shorter. Accordingly, and as discussed later in this section, we stated we determined that further analysis of cases reporting the implantation of a DBS system is needed in conjunction with the separate but related requests we received to review the MS–DRG assignments for a subset of procedures also assigned to MS–DRGs 023 through 027 for the FY 2026 IPPS/LTCH PPS proposed rule to ensure clinical coherence between these cases and the other cases with which they may potentially be grouped.

The third request we received, as discussed in the proposed rule, was to have all cases reporting the concomitant insertion of a DBS generator and lead assigned to MS–DRGs 023 and 024. This requestor performed their own analysis and stated they found 76 claims reporting procedure codes describing the insertion of a DBS generator and a lead assigned to MS–DRGs 026 and 027 (Craniotomy and Endovascular Intracranial Procedures with CC, and without CC/MCC, respectively) and found that the average costs of these cases were 54% and 63% higher than the average of all cases in MS–DRGs 026 and 027, respectively. The requestor stated that placement of a complete DBS system, which requires placement of both the generator and the lead, during a single procedure, appears to be an efficacious and well-tolerated procedure. The requestor asserted that the relatively low reimbursement in MS–DRGs 026 and 027 can limit patient access to a single stage procedure.

This requestor identified cases reporting the implantation of a DBS system by the presence of the following procedure code combinations:

- 0JH60DZ (Insertion of multiple array stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach);
- 0JH60DZ (Insertion of multiple array stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H03MZ (Insertion of neurostimulator lead into brain, percutaneous approach);
- 0JH60EZ (Insertion of multiple array rechargeable stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach); and
- 0JH60EZ (Insertion of multiple array rechargeable stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H03MZ (Insertion of neurostimulator lead into brain, percutaneous approach);
- 0JH60BZ (Insertion of single array stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach); and
- 0JH60BZ (Insertion of single array stimulator generator into chest subcutaneous tissue and fascia, open approach), in combination with 00H03MZ (Insertion of neurostimulator lead into brain, percutaneous approach).

In the proposed rule, we stated to begin our analysis, we again reviewed the GROUPER logic for MS–DRG 023 and 024. As mentioned previously, the GROUPER logic for MS–DRGs 023 and 024 contains 78 procedure code combinations representing the insertion of neurostimulator generator and a neurostimulator lead that are captured under a list referred to as ''Major Device Implant.'' The procedure codes describing the insertion of a neurostimulator generator on this list describe insertion of the neurostimulator generator into the subcutaneous areas of the chest, back, or abdomen, as well as into the skull.

In reviewing this request, we noted in the proposed rule that the procedure code combinations in MS–DRG 023 and 024 captured under the ''Major Device Implant'' logic list that describe the insertion of a neurostimulator generator into the subcutaneous areas of the chest, back, or abdomen, all describe the insertion of a multiple array stimulator generator or a rechargeable multiple array stimulator generator. We further noted that procedure code combinations describing the insertion of a single array stimulator generator or a rechargeable single array stimulator generator into the subcutaneous areas of the chest, back, or abdomen and a neurostimulator lead are not captured under the ''Major Device Implant'' logic list, therefore MS–DRGs 025, 026, and 027 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively) are assigned based on the reporting of the ICD–10–PCS procedure code describing the insertion of the neurostimulator into the brain. We refer the reader to the ICD–10 MS–DRG Definitions Manual, Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for complete documentation of the GROUPER logic for MS–DRGs 023, 024, 025, 026, and 027.

In the proposed rule, we stated we identified 36 ICD–10–PCS procedure code combinations that would describe the implantation of a DBS system with a single array stimulator generator or a rechargeable single array stimulator generator and the insertion of a neurostimulator lead into the brain. We refer the reader to Table 6P.2b associated with the FY 2026 IPPS/LTCH PPS proposed rule and this final rule (available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*) for the list of the 36 ICD–10–PCS procedure code combinations we identified that describe the implantation of a DBS system with a single array stimulator generator or a rechargeable single array stimulator generator and the insertion of a neurostimulator lead into the brain.

As discussed in the proposed rule, we then examined claims data from the September 2024 update of the FY 2024 MedPAR file for all cases in MS–DRGs 025, 026, and 027 and compared the results to cases reporting a procedure code combination that describes the insertion of a single array stimulator generator or a rechargeable single array stimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain. The following table shows our findings:

MS-DRGs 025, 026, AND 027 – ALL CASES COMPARED TO CASES REPORTING THE INSERTION OF A SINGLE ARRAY GENERATOR AND INSERTION OF NEUROSTIMULATOR LEAD INTO BRAIN			
MS-DRG	**Number of Cases**	**Average Length of Stay**	**Average Costs**
MS-DRG 025 - All cases	21,059	8.6	$40,215
Cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain	5	5	$73,168
MS-DRG 026 - All cases	5,833	4.1	$28,404
Cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain	25	2.3	$42,002
MS-DRG 027 - All cases	7,049	1.9	$23,059
Cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain	78	1.4	$39,381

As shown in the table, for MS–DRG 025, we identified a total of 21,059 cases, with an average length of stay of 8.6 days and average costs of $40,215. Of those 21,059 cases, there were 5 cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain with average costs higher than the average costs in the FY 2024 MedPAR file for MS–DRG 025 ($73,168 compared to $40,215) and a shorter average length of stay (5 days compared to 8.6 days). In MS–DRG 026, we identified a total of 5,833 cases, with an average length of stay of 4.1 days and average costs of $28,404. Of the 5,833 cases in MS–DRG 026, there were 25 cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain with average costs higher than the average costs in the FY 2024 MedPAR file for MS–DRG 026 ($42,002 compared to $28,404) and a shorter average length of stay (2.3 days compared to 4.1 days). In MS–DRG 027, we identified a total of 7,049 cases, with an average length of stay of 1.9 days and average costs of $23,059. Of the 7,049 cases in MS–DRG 027, there were 78 cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain with average costs higher than the average costs in the FY 2024 MedPAR file for MS–DRG 027 ($39,381 compared to $23,059) and a shorter average length of stay (1.4 days compared to 1.9 days). As the data show, the cases in MS–DRGs 025, 026, and 027 reporting the insertion of a single array generator and insertion of neurostimulator lead into brain have average costs that are higher than the average costs of all cases in their respective MS–DRGs.

We reviewed the clinical issues and noted in the proposed rule a deep brain stimulator typically has one or two leads implanted in the brain, depending on whether one or both sides of the brain need treatment. A single array stimulator generator has one port where one lead can be connected. A multiple array stimulator generator has two or more ports where two or more leads can be connected. We stated we believe the procedure code combinations that describe the insertion of a single array stimulator generator or a rechargeable single array stimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain are clinically coherent with the procedure code combinations in MS–DRG 023 and 024 captured under the ''Major Device Implant'' logic list that describe the insertion of a multiple array stimulator generator or a rechargeable multiple array stimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain.

As discussed in the proposed rule, to determine how the resources for this subset of cases compared to cases in MS–DRGs 023 and 024 as a whole, we examined the average costs and length of stay for cases in MS–DRGs 023 and 024. Our findings are shown in this table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 023--All cases	12,136	10	$51,132
MS-DRG 024--All cases	4,624	5	$35,516

We reviewed the data and noted in the proposed rule the cases in MS–DRGs 025, 026, and 027 reporting the insertion of a single array generator and insertion of neurostimulator lead into brain have average costs that are higher and the average length of stay is shorter than all cases in MS–DRGs 023 and 024. We stated we agree with the requestor that cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain are more resource intensive and are clinically distinct from other cases currently assigned to MS–DRGs 025, 026, and 027. However, we stated we did not believe proposing to reassign all cases reporting the procedure code combination describing a single array generator and insertion of neurostimulator lead into brain to MS–DRGs 023 and 024 would fully address the difference in resource utilization in these cases.

To explore other mechanisms to address this request, we stated we then reexamined the separate but related requests discussed previously to review the MS–DRG assignments for a subset of procedures assigned to MS–DRGs 023

through 027. In examining these requests, we noted in the proposed rule that the first request was to reassign cases involving ''chemotherapy implants'' and cases involving ''epilepsy with neurostimulator'' from MS–DRG 023 and to create a new MS–DRG for these cases. While analysis of the claims data did not support creating a new MS–DRG for cases reporting the insertion of a chemotherapy implant and cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy, we stated in the proposed rule that our analysis of that request found cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy have average costs that are higher than the average costs of all cases in MS–DRG 023, with a shorter average length of stay.

The second request we received was to reassign cases reporting the implantation of a DBS system from the lower (without MCC) severity level MS–DRG 024 to the higher (MCC) severity level MS–DRG 023 even if there is no MCC reported. While analysis of the claims data did not support reassigning the cases reporting the implantation of a DBS system from the lower (without MCC) severity level MS–DRG 024 to the higher (MCC) severity level MS–DRG 023 even if there is no MCC reported, we stated our analysis of that request found the average costs of the cases reporting the implantation of a DBS system are higher than all cases in their respective MS–DRGs, while the average lengths of stay are shorter. Lastly, our analysis of the third request demonstrates the cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain have average costs that are higher than the average costs of all cases in their respective MS–DRGs, while the average lengths of stay are shorter.

As discussed in the proposed rule, we reviewed these issues and noted intracranial neurostimulator implants, such as deep brain stimulators and RNS® neurostimulators, are similar in that these intracranial neurostimulators are implanted surgically and include placement of a neurostimulator generator and insertion of leads into specific brain regions to deliver electrical stimulation. Additionally, we stated that based on our data analysis, cases reporting the insertion of intracranial neurostimulator implants are clinically coherent in that they are similar in terms of technical complexity and hospital resource use as reflected by the similarity in average costs and average lengths of stay.

We stated we explored creating a new base MS–DRG for cases reporting the insertion of an intracranial neurostimulator implant and compared the analysis discussed previously using the claims data from the September 2024 update of the FY 2024 MedPAR file. The following table illustrates our findings for all 654 cases reporting procedure codes describing the insertion of an intracranial neurostimulator implant.

CASES REPORTING THE INSERTION OF AN INTRACRANIAL NEUROSTIMULATOR IMPLANT			
	Number of Cases	**Average Length of Stay**	**Average Costs**
Cases with principal diagnosis of epilepsy with neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain	68	2.4	$66,303
Cases reporting the implantation of a DBS system (insertion of a multiple array generator and insertion of neurostimulator lead into brain) – with MCC	26	8.3	$81,947
Cases reporting the insertion of a multiple array generator and insertion of neurostimulator lead into cerebral ventricle – with MCC	1	9	$44,475
Cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain – with MCC	5	5	$73,168
Cases reporting the insertion of a multiple array generator and insertion of neurostimulator lead into cerebral ventricle – with CC	5	2.2	$81,517
Cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain – with CC	25	2.3	$42,002
Cases reporting the implantation of a DBS system (insertion of a multiple array generator and insertion of neurostimulator lead into brain) – without MCC	432	1.7	$43,032
Cases reporting the insertion of a multiple array generator and insertion of neurostimulator lead into cerebral ventricle – without CC/MCC	14	1.7	$48,258
Cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain – without CC/MCC	78	1.4	$39,381
Total	**654**	**2.1**	**$47,163**

In the proposed rule we stated we reviewed these data and did not believe proposing a new base MS–DRG for these cases would better reflect hospital resource use. Because there were only 654 cases identified, the analysis demonstrates both a three-way and a two-way split of a new base MS–DRG would fail the criterion that there be at least 500 cases for each subgroup. The analysis also demonstrates the cases reporting a principal diagnosis of epilepsy with neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain, and cases reporting the insertion of a single or multiple array generator with a secondary diagnosis designated as an

MCC, would continue to have average costs that are higher when compared to all other cases reporting the insertion of an intracranial neurostimulator implant in a new MS–DRG. We therefore explored an alternative mechanism to address these requests.

We noted in the proposed rule that in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38015 through 38019), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58459 through 58462) and the FY 2024 IPPS/LTCH PPS final rule (88 FR 58661 through 58667), we discussed requests we received to reassign cases describing the insertion of a neurostimulator generator into the skull in combination with the insertion of a neurostimulator lead into the brain from MS–DRG 023 to MS–DRG 021 (Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with CC). While acknowledging the cases in MS–DRG 023 describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulators) and a principal diagnosis of epilepsy have average costs that are similar to the average costs of cases in MS–DRG 021, we have stated we did not support reassigning the cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulators) and a principal diagnosis of epilepsy from MS–DRG 023 to MS–DRGs 020, 021, and 022 (Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage, with MCC, with CC, without CC/MCC, respectively), as the cases in MS–DRGs 020, 021, and 022 are defined by a principal diagnosis of a hemorrhage. We stated that RNS® neurostimulators are not used to treat patients with diagnosis of hemorrhage and that we believe that it is inappropriate to reassign cases representing a principal diagnosis of epilepsy to a MS–DRG that contains cases that represent the treatment of intracranial hemorrhage.

However, after further consideration, to explore other mechanisms to address this request, we stated in the proposed rule we examined MS–DRGs 020, 021, and 022 to reconsider the possibility of reassigning the cases reporting the insertion of an intracranial neurostimulator implant as we have been unable to identify another MS–DRG in MDC 01 that would be a more appropriate MS–DRG assignment for these cases based on the indication for and complexity of the procedures.

As discussed in the proposed rule, the GROUPER logic for MS–DRGs 020, 021, and 022 contains a list of procedure codes describing intracranial vascular procedures that are captured under a logic list referred to as ''Intracranial Vascular Procedures'' and a list of diagnosis codes describing a diagnosis of a hemorrhage that are captured under a logic list referred to as ''Hemorrhage Principal Diagnosis.'' We noted in the proposed rule that during our review of MS–DRGs 020, 021, and 022, we identified 57 ICD–10–PCS procedure codes describing the intracranial vascular procedures and 66 diagnosis codes describing a diagnosis of intracranial hemorrhage that were inadvertently excluded from these logic lists. We refer the reader to Table 6P.2c and Table 6P.2d associated with the FY 2026 IPPS/LTCH PPS proposed rule (and available at: *https://www.cms.gov/medicare/medicare-fee-for-service-payment/acuteinpatientpps*) for the lists of the 57 ICD–10–PCS procedure codes and 66 ICD–10–CM diagnosis codes that we identified.

As these 57 procedure codes describe intracranial vascular procedures and the 66 diagnosis codes describe a diagnosis of intracranial hemorrhage, in the proposed rule we stated we believe these codes are clinically aligned with the codes currently included in the ''Intracranial Vascular Procedures'' and the ''Hemorrhage Principal Diagnosis'' logic lists, respectively in MS–DRGs 020, 021, and 022. Therefore, for clinical consistency we proposed to add the 57 procedure codes to the ''Intracranial Vascular Procedures'' logic list, and the 66 diagnosis codes to the ''Hemorrhage Principal Diagnosis'' logic list of MS–DRGs 020, 021, and 022, effective October 1, 2025, for FY 2026.

As discussed in the proposed rule, in reviewing the claims data from the September 2024 update of the FY 2024 MedPAR file and examining the clinical considerations, we stated we believe that the cases reporting the insertion of an intracranial neurostimulator implant could more suitably group to MS–DRGs 020, 021, and 022 and would lead to a grouping that is more coherent and better reflects the clinical severity and resource use involved in these cases. While we previously have stated that we believe it would be inappropriate to reassign cases representing a principal diagnosis of epilepsy to a MS–DRG that contains cases that represent the treatment of intracranial hemorrhage, after further consideration, we stated we no longer believe maintaining a difference in assignment based on the indication is warranted in this subset of cases based on the fact that both treatments involve intracranial procedures and demonstrate comparable resource utilization.

In the proposed rule, we stated we also believe that cases reporting the insertion of an intracranial neurostimulator implant, regardless of principal diagnosis, share similar resource utilization such that it is no longer necessary to subdivide these cases based on the diagnosis codes reported. Accordingly, we stated that we believe it is appropriate to remove the special logic defined as ''Epilepsy Principal Diagnosis'' from the definition for assignment to the proposed modified MS–DRGs, as the cases can be appropriately grouped along with cases reporting any MDC 01 diagnosis when reported with qualifying procedures, as part of the proposed restructured MS–DRGs.

Therefore, we proposed to add 114 procedure code combinations to a new ''Intracranial Neurostimulator Implant'' logic list in MS–DRGs 020, 021, and 022 that describe (1) the insertion of multiple or single array neurostimulator generators with the insertion of a neurostimulator lead into the brain or the cerebral ventricle and (2) the insertion of neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain. We also proposed to delete the ''Major Device Implant,'' ''Epilepsy Principal Diagnosis,'' ''Neurostimulator'' logic lists from MS–DRGs 023 and 024. We refer the reader to Table 6P.2e associated with the FY 2026 IPPS/LTCH PPS proposed rule (and available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*) for the list of the 114 ICD–10–PCS procedure code combinations we proposed to add to a new ''Intracranial Neurostimulator Implant'' logic list in MS–DRGs 020, 021, and 022.

To compare and analyze the impact of these potential modifications, as discussed in the proposed rule, we ran a simulation using the claims data from the September 2024 update of the FY 2024 MedPAR file. The following table reflects the simulation of our proposed changes in MS–DRGs 020, 021, and 022.

MS-DRG		Number of Cases	Average Length of Stay	Average Cost
020	All Cases	2,322	12.5	$71,916
	-- add cases reporting procedure codes describing the insertion of an intracranial neurostimulator implant	100	4.1	$70,495
	-- add cases reporting one of the 57 procedure codes describing an intracranial vascular procedure with one of the 66 diagnosis codes describing hemorrhage as principal diagnosis	140	13.6	$73,810
	Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant with MCC	**2,562**	**12.2**	**$71,964**
021	All Cases	642	7.8	$48,421
	-- add cases reporting procedure codes describing the insertion of an intracranial neurostimulator implant	134	2.2	$47,421
	-- add cases reporting one of the 57 procedure codes describing an intracranial vascular procedure with one of the 66 diagnosis codes describing hemorrhage as principal diagnosis	45	9.3	$54,617
	Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant with CC	**821**	**7**	**$48,597**
022	All Cases	385	2.4	$28,243
	-- add cases reporting procedure codes describing the insertion of an intracranial neurostimulator implant	420	1.5	$41,525
	-- add cases reporting one of the 57 procedure codes describing an intracranial vascular procedure with one of the 66 diagnosis codes describing hemorrhage as principal diagnosis	1	1	$24,744
	Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant without CC/MCC	**806**	**1.9**	**$35,160**

In the proposed rule, we stated we believe that this simulation supports that the resulting MS–DRG assignments would be more clinically homogeneous, coherent, and better reflect hospital resource use. As the table shows, for MS–DRG 020, there were a total of 2,322 cases with an average length of stay of 12.5 days and average costs of $71,916. For MS–DRG 021, there were a total of 642 cases with an average length of stay of 7.8 days and average costs of $48,421. For MS–DRG 022, there were a total of 385 cases with an average length of stay of 2.4 days and average costs of $28,243. We stated that a review of this simulation shows that adding a new ''Intracranial Neurostimulator Implant'' logic list, while also adding 57 procedure codes to the ''Intracranial Vascular Procedures'' logic list, and 66 diagnosis codes to the ''Hemorrhage Principal Diagnosis'' logic list in MS–DRGs 020, 021 and 022 has a limited effect on the average costs of these MS–DRGs, while leading to a grouping that is more coherent and better reflects the clinical severity and resource use involved in these cases.

In summary, for FY 2026, to more appropriately reflect utilization of resources for these procedures, we proposed to add 114 procedure code combinations to a new ''Intracranial Neurostimulator Implant'' logic list in MS–DRGs 020, 021, and 022 that describe (1) the insertion of multiple or single array neurostimulator generators with the insertion of a neurostimulator lead into the brain or the cerebral ventricle and (2) the insertion of neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain. We also proposed to add 57 procedure codes to the ''Intracranial Vascular Procedures'' logic list, and 66 diagnosis codes to the ''Hemorrhage Principal Diagnosis'' logic list of MS–DRGs 020, 021, and 022.

Additionally, we also proposed to delete the ''Major Device Implant,'' ''Epilepsy Principal Diagnosis,'' ''Neurostimulator'' logic lists from MS–DRGs 023 and 024. Lastly, for consistency, we proposed to change the titles of MS–DRGs 020, 021, and 022 from ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with MCC, with CC, and without CC/MCC, respectively'' to ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant with MCC, with CC, and without CC/MCC, respectively,'' proposed to change the title of MS–DRG 023 from ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator'' to ''Craniotomy with Acute Complex Central Nervous System Principal Diagnosis with MCC or Antineoplastic Implant,'' and proposed to change the title of MS–DRG 024 from ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis without MCC'' to ''Craniotomy with Acute Complex Central Nervous System Principal Diagnosis without MCC'' to better reflect the assigned procedures effective October 1, 2025, for FY 2026.

Comment: Commenters supported the proposal to add the 57 procedure codes to the ''Intracranial Vascular Procedures'' logic list, and the 66 diagnosis codes to the ''Hemorrhage Principal Diagnosis'' logic list of MS–DRGs 020, 021, and 022, effective October 1, 2025, for FY 2026.

Response: We appreciate the commenters' support.

Comment: Several commenters supported our proposal to add 114 procedure code combinations to a new ''Intracranial Neurostimulator Implant'' logic list in MS–DRGs 020, 021, and 022 that describe (1) the insertion of multiple or single array neurostimulator generators with the insertion of a neurostimulator lead into the brain or the cerebral ventricle and (2) the insertion of neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain. A few commenters expressed gratitude to CMS for its thorough analysis and fully supported the proposal, urging CMS to finalize it in its current form. A

commenter specifically stated that this proposal supports their longstanding goal of providing more appropriate payment levels for hospitals furnishing intracranial vascular procedures that are assigned to MS–DRGs 020, 021, and 022 after multiple years of payment declines. Another commenter stated that the proposal recognizes the similarities in clinical characteristics associated with deep brain stimulators for Parkinson's disease, essential tremor, epilepsy, and dystonia and stated that the proposed reassignments better represent the resource utilization associated with inserting a full deep brain stimulator system.

Many other commenters expressed their concerns with the proposals. Some commenters noted that procedure code 00H004Z (Insertion of radioactive element, cesium-131 collagen implant into brain, open approach) is included in the Chemotherapy Implant logic list of MS–DRG 023 and suggested that this assignment does not accurately reflect the increased resources required to perform procedures involving the insertion of radioactive implants. Several commenters stated that with CMS' proposed reassignment of neurostimulator cases out of MS–DRG 023, these procedures involving the insertion of radioactive implants will be grouped with acute complex central nervous system (CNS) procedures, and this grouping is clinically inconsistent, as the majority of acute CNS cases describe conditions treated without implanted devices. Other commenters stated that while procedures involving the insertion of radioactive implants and procedures involving the introduction of chemotherapy both involve the delivery of either radiation or chemotherapy directly after tumor resection, the overall care pathway and resources associated with the episodes of care are dramatically different. These commenters stated that procedures involving the insertion of radioactive implants are more aligned with major device implant procedures than with the acute complex CNS cases that will remain in MS–DRG 023. Another commenter stated they performed their own analysis and stated that they found that procedures involving the insertion of radioactive implants have consistently demonstrated higher resource use than antineoplastic chemotherapy implant cases across two consecutive years of MedPAR data and are more closely aligned with cases assigned to MS–DRGs 020, 021 and 022. These commenters recommended that cases reporting procedure code 00H004Z, such as cases involving GammaTile®, which is a surgically implanted brachytherapy device used to treat patients with malignant brain tumors, be assigned to MS–DRGs 020, 021, and 022.

Other commenters expressed concerns with the proposal to reassign cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) with a principal diagnosis of epilepsy from MS–DRG 023 to MS–DRGs 020, 021, and 022. These commenters stated that this proposal would have devastating impacts on hospital payment, which in turn would impact the ability of hospitals to continue to offer the RNS® neurostimulator to Medicare beneficiaries. While thanking CMS for continuing to explore solutions to better align the resource utilization of epilepsy with neurostimulator cases, some commenters stated the proposed reassignment would result in a greater misalignment of hospital costs, resulting in a significant reduction in hospital payment for the vast majority of epilepsy with neurostimulator cases. A commenter specifically stated that they performed their own analysis and found that most epilepsy with neurostimulator cases do not report a secondary diagnosis designated as an MCC, therefore reassigning these cases to MS–DRGs 020, 021, and 022 without maintaining the ''Epilepsy Principal Diagnosis,'' ''Neurostimulator'' logic lists in these MS–DRGs will have the opposite effect and will decrease hospital payments even further. Many commenters requested that CMS modify its current proposal and assign all cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) with a principal diagnosis of epilepsy to MS–DRG 020 even if there is no MCC reported.

Response: We appreciate the commenters' feedback and thank the commenters for sharing their concerns.

In response to the commenters' concerns that finalizing our proposal could adversely affect cases reporting procedure code 00H004Z and cases reporting a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy, we performed additional analysis of these cases. As discussed in the preamble of the proposed rule, MS–DRGs 023 and 024 contain a logic list referred to as ''Chemotherapy Implant.'' This logic list includes four ICD–10–PCS codes: 00H004Z (Insertion of radioactive element, cesium-131 collagen implant into brain, open approach), 3E0Q005 (Introduction of other antineoplastic into cranial cavity and brain, open approach), 3E0Q305 (Introduction of other antineoplastic into cranial cavity and brain, percutaneous approach), and 3E0Q705 (Introduction of other antineoplastic into cranial cavity and brain, via natural or artificial opening). In our analysis discussed in the proposed rule, we examined claims data from the September 2024 update of the FY 2024 MedPAR file for all cases in MS–DRG 023 and compared the results to cases reporting one of the four procedure codes that appear under the ''Chemotherapy Implant'' logic list in MS–DRG 023.

To evaluate the commenters' concerns regarding cases involving the insertion of radioactive implants, we further examined claims data from the September 2024 update of the FY 2024 MedPAR file for all cases in MS–DRG 023 and compared the results to cases reporting procedure code 00H004Z specifically. The following table shows our findings:

MS-DRG 023	Number of Cases	Average Length of Stay	Average Costs
All cases	12,136	10	$51,132
Cases reporting procedure code 00H004Z	111	5.5	$53,666

As shown in the table, for MS–DRG 023, we identified a total of 12,136 cases, with an average length of stay of 10 days and average costs of $51,132. Of the 12,136 cases in MS DRG 023, there were 111 cases reporting procedure

code 00H004Z with an average length of stay of 5.5 days and average costs of $53,666.

Because all cases reporting a procedure code included in the logic list referred to as ''Chemotherapy Implant'' are assigned to the higher severity level (with MCC) MS–DRG 023 and there is a three-way split within MS–DRGs 020, 021, and 022, we next analyzed the 111 cases reporting a procedure code 00H004Z in MS–DRG 023 for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC).

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
023	Cases reporting procedure code 00H004Z with a secondary diagnosis code designated as an MCC	77	6.5	$57,820
	Cases reporting procedure code 00H004Z with a secondary diagnosis code designated as a CC	23	3.5	$46,741
	Cases reporting procedure code 00H004Z without a secondary diagnosis code designated as a CC or an MCC	11	2.1	$39,075

We then examined claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 020, 021, and 022. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
020	2,322	12.5	$71,916
021	642	7.8	$48,421
022	385	2.4	$28,243

As shown in the table, the data analysis performed indicates that the 77 cases in MS–DRG 023 reporting procedure code 00H004Z with a secondary diagnosis code designated as an MCC have a shorter average length of stay (6.5 days versus 12.5 days) and lower average costs ($57,820 versus $71,916) when compared to all the cases in MS–DRG 020. The 23 cases in MS–DRG 023 reporting procedure code 00H004Z with a secondary diagnosis code designated as an CC have a shorter average length of stay (3.5 days versus 7.8 days) and lower average costs ($46,741 versus $48,421) when compared to all the cases in MS–DRG 021. The 11 cases in MS–DRG 023 reporting procedure code 00H004Z without a secondary diagnosis code designated as an CC or an MCC have a shorter average length of stay (2.1 days versus 2.4 days) and higher average costs ($39,075 versus $28,243) when compared to all the cases in MS–DRG 022. These data reflect when distributed based on the presence or absence of a secondary diagnosis designated as a CC or an MCC, the 111 cases in MS–DRG 023 reporting procedure code 00H004Z have lower average costs and shorter lengths of stay than the cases in the FY 2024 MedPAR file for MS–DRGs 020 and 021 while having higher average costs and shorter lengths of stay than the cases in MS–DRG 022.

While the 111 cases reporting procedure code 00H004Z have average costs that are higher than the average costs of all cases in their currently assigned MS–DRG 023 ($53,666 versus $51,132), we do not believe it would be appropriate to reassign the cases reporting procedure code 00H004Z to MS–DRG 020, 021, and 022 as the cases are not clinically coherent with regard to resource utilization as reflected in the difference in average costs when distributed based on the presence or absence of a secondary diagnosis designated as a CC or an MCC.

We then performed a similar analysis for the cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy. As discussed in the proposed rule, for MS–DRG 023, there were 68 cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy with an average length of stay of 2.4 days and average costs of $66,303. Because all cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy are assigned to the higher severity level (with MCC) MS–DRG 023 and there is a three-way split within MS–DRGs 020, 021, and 022, next we analyzed the 68 cases describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy in MS–DRG 023 for the presence or absence of a secondary diagnosis designated as a complication or comorbidity (CC) or a major complication or comorbidity (MCC).

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
023	Cases with a principal diagnosis of epilepsy and a secondary diagnosis code designated as an MCC with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain	9	4.6	$66,945
	Cases with a principal diagnosis of epilepsy and a secondary diagnosis code designated as a CC with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain	23	2.6	$76,648
	Cases with a principal diagnosis of epilepsy without a secondary diagnosis code designated as a CC or an MCC with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain	36	1.8	$59,534

The data analysis performed indicates that the 9 cases in MS–DRG 023 reporting a principal diagnosis of epilepsy and a secondary diagnosis code designated as an MCC with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain have a shorter average length of stay (4.6 days versus 12.5 days) and lower average costs ($66,945 versus $71,916) when compared to all the cases in MS–DRG 020. The 23 cases in MS–DRG 023 reporting a principal diagnosis of epilepsy and a secondary diagnosis code designated as a CC with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain have a shorter average length of stay (2.6 days versus 7.8 days) and higher average costs ($76,648 versus $48,421) when compared to all the cases in MS–DRG 021. The 36 cases in MS–DRG 023 reporting a principal diagnosis of epilepsy without a secondary diagnosis code designated as a CC or an MCC with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain have a shorter average length of stay (1.8 days versus 2.4 days) and higher average costs ($59,534 versus $28,243) when compared to all the cases in MS–DRG 022.

As shown in the table, when distributed based on the presence or absence of a secondary diagnosis designated as a CC or an MCC, the 68 cases in MS–DRG 023 reporting a principal diagnosis of epilepsy with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain have higher average costs and shorter lengths of stay than the cases in the FY 2024 MedPAR file for MS–DRGs 021 and 022 while having lower average costs and shorter lengths of stay than the cases in MS–DRG 020. We note, similar to the commenters' analysis, our analysis using the September 2024 update of the FY 2024 MedPAR file reflects that the majority of the cases (36) describing a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy do not also report secondary diagnoses designated as CCs or MCCs.

While the 68 cases reporting a principal diagnosis of epilepsy with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into brain have average costs that are higher than the average costs of all cases in their currently assigned MS–DRG 023 ($66,303 versus $51,132), the data indicate that the difference in average costs is $12,382 ($71,916 − $59,534 = $12,382) for the majority of the cases which describe a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy without reporting a secondary diagnosis code designated as a CC or an MCC in MS–DRG 023 when compared to all the cases in MS–DRG 020. We do not believe it would be appropriate to reassign all cases reporting a principal diagnosis of epilepsy with a neurostimulator generator inserted into the skull and insertion of a neurostimulator lead into the brain to the highest severity level (with MCC) MS DRG 020 as the majority of the cases are not clinically coherent with regard to resource utilization as reflected in the difference in average costs.

After consideration of the public comments we received, and for the reasons discussed, we believe that further analysis of cases reporting the insertion of a radioactive element into the brain and cases reporting a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy is needed prior to generally finalizing further reassignment of these cases to ensure clinical and resource coherence between these cases and the other cases with which they may potentially be grouped. Accordingly, we believe it would be appropriate to take additional time to examine the relevant clinical factors and similarities in resource consumption in order to best represent these subsets of patients within the MS–DRG classification and improve the overall accuracy of the IPPS payments.

CMS appreciates the comments submitted in response to our proposal as discussed in the FY 2026 IPPS/LTCH PPS proposed rule. We continue to be attuned to the requestors' and the commenters' concerns about payment for cases reporting procedure codes describing the insertion of the RNS® neurostimulator, the implantation of a DBS system, or the insertion of antineoplastic implants and note that our work in this area is ongoing. As stated in prior rulemaking, we recognize the logic for MS–DRGs 020 through 027 has grown more complex over the years and continue to believe there is an opportunity for further refinement. As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58661 through 58667), we have begun to analyze the ICD–10 coded claims data to determine if the patients' diagnoses, the objective of the procedure performed, the specific anatomical site where the procedure is performed or the surgical approach used (for example, open, percutaneous, percutaneous endoscopic, among others) demonstrates a greater severity of illness and/or increased treatment difficulty as we consider where further refinements could potentially be made to better account for differences in the technical complexity and resource utilization among the procedures that are currently assigned to MS–DRGs 020 through 027, including how to better

align the clinical indications with the performance of specific intracranial procedures. CMS will continue to monitor and analyze the claims data with respect to MS–DRGs 020 through 027 as we further examine the logic for case assignment to the craniotomy MS–DRGs and we will continue to consider these issues as we develop potential future rulemaking proposals. Feedback and other suggestions on what other factors should be considered in a potential restructuring of these MS–DRGs may continue to be directed to MEARIS™, discussed in section II.C.1.b. of the preamble of this final rule at: *https://mearis.cms.gov/public/home*.

In summary, for FY 2026, after consideration of the public comments we received and for the reasons discussed, we are generally not finalizing our proposed changes to the assignment of the cases reporting the insertion of an intracranial neurostimulator implant, other than the changes described in more detail in the discussion that follows.

For FY 2026, cases reporting a neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain (including cases involving the use of the RNS® neurostimulator) and a principal diagnosis of epilepsy will be maintained in MS–DRG 023. We are not finalizing our proposal to add 114 procedure code combinations to a ''Intracranial Neurostimulator Implant'' logic list in MS–DRGs 020, 021, and 022 that describe (1) the insertion of multiple or single array neurostimulator generators with the insertion of a neurostimulator lead into the brain or the cerebral ventricle and (2) the insertion of neurostimulator generator inserted into the skull with the insertion of a neurostimulator lead into the brain. Accordingly, the ''Major Device Implant,'' ''Epilepsy Principal Diagnosis,'' ''Neurostimulator'' logic lists will be maintained in MS–DRGs 023 and 024 for FY 2026.

We are also not finalizing our proposals to change the titles of MS–DRGs 020, 021, and 022 from ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with MCC, with CC, and without CC/MCC, respectively'' to ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant with MCC, with CC, and without CC/MCC, respectively,'' to change the title of MS–DRG 023 from ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator'' to ''Craniotomy with Acute Complex Central Nervous System Principal Diagnosis with MCC or Antineoplastic Implant,'' or to change the title of MS–DRG 024 from ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis without MCC'' to ''Craniotomy with Acute Complex Central Nervous System Principal Diagnosis without MCC.''

As discussed earlier in this section, we noted that 36 procedure code combinations describing the insertion of a single array stimulator generator or a rechargeable single array stimulator generator into the subcutaneous areas of the chest, back, or abdomen and a neurostimulator lead are not captured under the ''Major Device Implant'' logic list, in MS–DRG 023 and 024, therefore MS–DRGs 025, 026, and 027 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively) are assigned based on the reporting of the ICD–10–PCS procedure code describing the insertion of the neurostimulator into the brain. As discussed in the proposed rule, our analysis indicated the cases in MS–DRGs 025, 026, and 027 reporting the insertion of a single array generator and insertion of neurostimulator lead into brain have average costs that are higher than the average costs of all cases in their respective MS–DRGs. We then examined the data to determine how the resources for the subset of cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain compared to cases in MS–DRGs 023 and 024, and similarly found that the cases reporting the insertion of a single array generator and insertion of neurostimulator lead into brain have average costs that are higher and an average length of stay that is shorter than all cases in MS–DRGs 023 and 024. In the FY 2026 proposed rule we stated we believe the procedure code combinations that describe the insertion of a single array stimulator generator or a rechargeable single array stimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain are clinically coherent with the procedure code combinations in MS–DRG 023 and 024 captured under the ''Major Device Implant'' logic list that describe the insertion of a multiple array stimulator generator or a rechargeable multiple array stimulator generator into the subcutaneous areas of the chest, back, or abdomen in combination with a code describing the insertion of a neurostimulator lead into the brain. While we continue to believe that reassigning all cases reporting the procedure code combination describing a single array generator and insertion of neurostimulator lead into brain to MS–DRGs 023 and 024 would not fully address the difference in resource utilization in these cases, we believe that adding the 36 procedure code combinations describing the insertion of a single array stimulator generator or a rechargeable single array stimulator generator into the subcutaneous areas of the chest, back, or abdomen and a neurostimulator lead to the ''Major Device Implant'' logic list under MS–DRGs 023 and 024 for FY 2026 would better reflect hospital resource utilization and appropriately group these cases describing single array stimulator generator combinations with those cases describing multiple array generator combinations consistent with our proposal. Therefore, for the reasons discussed, we are finalizing the addition of the 36 ICD–10–PCS procedure code combinations that describe the implantation of a DBS system with a single array stimulator generator or a rechargeable single array stimulator generator and the insertion of a neurostimulator lead into the brain to the ''Major Device Implant'' logic list in MS–DRGs 023 and 024. We refer the reader to Table 6P.2b associated with this FY 2026 IPPS/LTCH PPS final rule (available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*) for the list of the 36 ICD–10–PCS procedure code combinations that describe the implantation of a DBS system with a single array stimulator generator or a rechargeable single array stimulator generator and the insertion of a neurostimulator lead into the brain that are being added to the ''Major Device Implant'' logic list in MS–DRGs 023 and 024.

We also note that as discussed earlier in this section, after consideration of the public comments we received, we are finalizing our proposal to add procedure codes 00H001Z, 00H005Z, 00H031Z, and 00H041Z to the ''Chemotherapy Implant'' logic list in MS–DRGs 023 and 024, without modification, effective October 1, 2025, for FY 2026. We are also finalizing the change of the description of the logic list in MS–DRGs 023 and 024 from ''Chemotherapy Implant'' to ''Antineoplastic Implant''. Therefore, for consistency with our finalized changes to the logic list, we are finalizing a change to the title of MS–DRG 023 from ''Craniotomy with Major

Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator'' to ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Antineoplastic Implant or Epilepsy with Neurostimulator.''

Comment: Several commenters noted that in Table 6P.2c associated with the FY 2026 IPPS/LTCH PPS proposed rule, which contains the list of the 57 ICD–10–PCS procedure codes that were inadvertently excluded from the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022, ICD–10–PCS codes 057L3DZ (Dilation of intracranial vein with intraluminal device, percutaneous approach) and 057L4DZ (Dilation of intracranial vein with intraluminal device, percutaneous endoscopic approach) were included. These commenters noted that ICD–10–PCS code 057L0DZ (Dilation of intracranial vein with intraluminal device, open approach) was not also included in the list and recommended CMS consider also adding procedure code 057L0DZ to the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022, as this code also describes dilation of an intracranial vein with an intraluminal device, differing only in approach. Several commenters specifically stated that they were unclear on the rationale for not including ICD–10–PCS code 057L0DZ (Dilation of Intracranial Vein with Intraluminal Device, Open Approach) to the logic list of MS–DRGs 020, 021, and 022.

Response: We appreciate the commenters' feedback. In the ICD–10 MS–DRGs Version 42.1, ICD–10–PCS procedure codes 057L3DZ and 057L4DZ are currently assigned to MS–DRGs 023, 024, 025, 026, and 027. As we noted in the proposed rule, during our review of MS–DRGs 020, 021, and 022, we identified 57 ICD–10–PCS procedure codes describing intracranial vascular procedures that were inadvertently excluded from the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022. We note that we identified the 57 procedure codes by comparing the logic lists in MS–DRGs 023, 024, 025, 026, and 027 to the logic list of MS–DRGs 020, 021, and 022.

ICD–10–PCS procedure code 057L0DZ (Dilation of intracranial vein with intraluminal device, open approach) is currently assigned to MDC 05 (Diseases and Disorders of the Circulatory System) MS–DRGs 252, 253 and 254 (Other Vascular Procedures with MCC, with CC, without MCC respectively) and therefore was not identified in our initial review. We agree with the commenters that ICD–10–PCS code 057L0DZ describes an intracranial vascular procedure and should be added to the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022, consistent with our proposal to add the ICD–10–PCS procedure codes describing intracranial vascular procedures that were inadvertently excluded from the ''Intracranial Vascular Procedures'' logic list.

During our review of this issue identified by the commenters, we further examined the GROUPER logic that would determine the assignment of a case to MS–DRGs 020, 021, and 022. Specifically, we reviewed the ICD–10–PCS classification to determine if there were other ICD–10–PCS codes describing dilation of an intracranial vein that were not listed in the logic for MS–DRGs 020, 021, and 022. We identified the following three procedure codes.

ICD-10-PCS Code	Description
057L0ZZ	Dilation of intracranial vein, open approach
057L3ZZ	Dilation of intracranial vein, percutaneous approach
057L4ZZ	Dilation of intracranial vein, percutaneous endoscopic approach

ICD–10–PCS codes 057L0ZZ, 057L3ZZ, and 057L4ZZ are also currently assigned to MS–DRGs 252, 253 and 254 in the ICD–10 MS–DRGs Version 42.1. In response to the commenters that stated they were unclear on the rationale for not including ICD–10–PCS code 057L0DZ in the list of procedure codes proposed to be added to the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022, we have identified that the disparate MS–DRG assignments of the six ICD–10–PCS procedure codes that describe the dilation of an intracranial vein are a result of a replication error in transitioning to ICD–10. We determined it may be helpful to provide the comparable translations under ICD–9–CM for commenters to better understand how these six procedures were initially grouped to the ICD–10 MS–DRGs as a result of replication during the conversion from ICD–9 to ICD–10 based MS–DRGs. We refer the reader to Table 6P.2f associated with this FY 2026 IPPS/LTCH PPS final rule (which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) for the findings from our analysis of the six procedure codes, which indicates how these procedures were classified under ICD–10–PCS based on the comparable translations under ICD–9–CM resulting in the current MS–DRG assignments.

We reviewed ICD–10–PCS codes 057L0DZ, 057L0ZZ, 057L3ZZ, and 057L4ZZ and note these codes describe intracranial vascular procedures that are consistent with the existing procedure codes included in the logic for case assignment to MS–DRGs 020, 021, 022, 023, 024, 025, 026, and 027. Accordingly, because procedure codes 057L0DZ, 057L0ZZ, 057L3ZZ, and 057L4ZZ that describe dilation of an intracranial vein were not assigned to MS–DRGs 020, 021, 022, 023, 024, 025, 026, and 027 as a result of replication in the transition from ICD–9 to ICD–10 based MS–DRGs, and are consistent with the existing procedure codes that also describe dilation of an intracranial vein currently included in the logic for these MS–DRGs, we believe that consistent with our proposal to add the other ICD–10–PCS procedure codes describing intracranial vascular procedures that were inadvertently excluded from the ''Intracranial Vascular Procedures'' logic list, procedure codes 057L0DZ, 057L0ZZ, 057L3ZZ, and 057L4ZZ should be assigned to MS–DRGs 020, 021, 022, 023, 024, 025, 026, and 027 in MDC 01, effective FY 2026.

Therefore, after consideration of the public comments we received, and for the reasons discussed, we are finalizing our proposal to add the 57 procedure codes to the ''Intracranial Vascular Procedures'' logic list, and the 66 diagnosis codes to the ''Hemorrhage

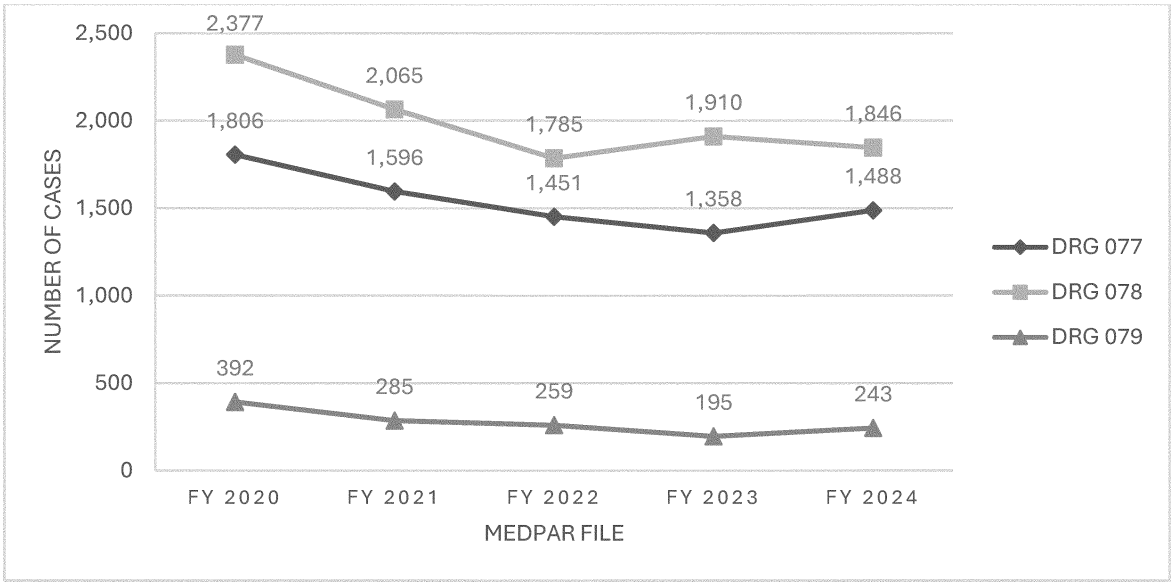
Principal Diagnosis'' logic list of MS–DRGs 020, 021, and 022, with modification, effective October 1, 2025, for FY 2026. Specifically, we are also adding ICD–10–PCS codes 057L0DZ, 057L0ZZ, 057L3ZZ, and 057L4ZZ that also describe dilation of an intracranial vein to the list of procedure codes in the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022. The list of ICD–10–PCS procedure codes describing intracranial vascular procedures that we are finalizing to add to the ''Intracranial Vascular Procedures'' logic list of MS–DRGs 020, 021, and 022 are shown in Table 6P.2c associated with this final rule and available on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*. In addition, we are also finalizing the assignment of ICD–10–PCS codes 057L0DZ, 057L0ZZ, 057L3ZZ, and 057L4ZZ to MS–DRGs 023, 024, 025, 026, and 027 in MDC 01 effective FY 2026.

These finalizations as discussed are reflected in the final version of ICD–10 MS–DRG Definitions Manual, Version 43 that contains the complete documentation of the GROUPER logic for MS–DRGs 020 through 027 for FY 2026 and is available via the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*.

b. Hypertensive Encephalopathy

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18026 through 18028, we received a request to delete MS–DRGs 077, 078, and 079 (Hypertensive Encephalopathy with MCC, with CC, and without CC/MCC, respectively). Hypertensive encephalopathy refers to brain dysfunction that occurs when the brain's blood vessels can no longer regulate blood flow due to severe or sudden rises in blood pressure, causing brain swelling and damage. It is characterized by the insidious onset of headache, nausea, and vomiting, followed by non-localizing neurologic symptoms such as restlessness, confusion, and, if the hypertension is not treated, seizures and coma. The diagnosis is based on clinical presentation, elevated blood pressure, and neurological examination, often supported by brain imaging like CT or MRI. The treatment involves immediate and rapid lowering of blood pressure with appropriate medications administered in a controlled setting. ICD–10–CM diagnosis code I67.4 (Hypertensive encephalopathy) is used to report this diagnosis.

The requestor noted that effective FY 2025, a ''use additional code'' instructional note was added under diagnosis code I16.1 (Hypertensive emergency) in the ICD–10–CM Tabular List of Diseases and Injuries. Specifically, the instructional note states, ''use additional code, if applicable, to identify specific organ dysfunction, such as:'' and lists I67.4 as well as eight other ICD–10–CM diagnosis codes. The requestor stated that the addition of this ''use additional code'' instructional note has sequencing implications and requires I67.4 to be sequenced as a secondary diagnosis when hypertensive emergency and hypertensive encephalopathy are documented. As the GROUPER logic for MS–DRGs 077, 078, and 079 is defined by only diagnosis code I67.4, the requestor stated there will no longer be cases grouping to medical MS–DRGs 077, 078, and 079 because I67.4 will only be sequenced as a secondary diagnosis and I16.1 will have to be sequenced as the principal diagnosis. Instead, these cases will group to MDC 05 (Diseases and Disorders of the Circulatory System) medical MS–DRGs 304 and 305 (Hypertension with MCC and without MCC, respectively) since I16.1 is assigned to those MS–DRGs.



To begin our analysis, as discussed in the proposed rule, we reviewed the ICD–10–CM Tabular List of Diseases and Injuries. We stated that the requestor is correct a ''use additional code'' instructional note was added under diagnosis code I16.1 (Hypertensive emergency) in the ICD–10–CM Tabular List of Diseases and Injuries, effective FY 2025. According to the ICD–10–CM Official Guidelines for Coding and Reporting, ''certain conditions have both an underlying etiology and multiple body system manifestations due to the underlying etiology. For such conditions the ICD–10–CM has a coding convention that requires the underlying condition to be sequenced first followed by the manifestation. Wherever such a combination exists there is an 'use additional code' note at the etiology code, and a 'code first' note at the manifestation code. These instructional notes indicate the proper sequencing order of the codes, etiology followed by manifestation.'' We noted in the proposed rule that no such ''code first'' note appears at ICD–10–CM diagnosis code I67.4 (Hypertensive encephalopathy) in the ICD–10–CM Tabular List of Diseases and Injuries meaning the sequencing depends on the circumstances of the encounter when hypertensive emergency and hypertensive encephalopathy are documented. If providers have cases involving hypertensive emergency and hypertensive encephalopathy for which they need ICD–10 coding assistance, we encourage them to submit their questions to the American Hospital Association's Central Office on ICD–10 at *https://www.codingclinicadvisor.com/*.

We then reviewed the GROUPER logic. We stated the requestor is correct that diagnosis code I67.4 is the only diagnosis code listed under the heading of ''Principal Diagnosis'' in the ICD–10 MS–DRG Definitions Manual for MS–DRGs 077, 078, and 079. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 42.1, which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software,* for complete documentation of the GROUPER logic for MS–DRGs 077, 078, and 079. We noted in the proposed rule that a DRG for a principal diagnosis of hypertensive encephalopathy (48 FR 39876) has existed since 1983 when Congress amended the Social Security Act to include a national DRG-based hospital prospective payment system for all Medicare patients.

We then examined claims data from the September 2024 update of the FY 2024 MedPAR file for all cases in MS–DRGs 077, 078, and 079 to consider the resources involved in the cases reporting a principal diagnosis of hypertensive encephalopathy. Our findings are shown in this table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 077--All cases	1,488	5.0	$13,176
MS-DRG 078--All cases	1,846	3.3	$8,591
MS-DRG 079--All cases	243	2.4	$6,729

We stated in the proposed rule the data reflect a moderately low volume of cases in MS–DRGs 077, 078, and 079, relatively. We then evaluated the reporting of hypertensive encephalopathy in the inpatient setting over the past few years in medical MS–DRGs 077, 078, and 079. We analyzed claims data for MS–DRGs 077, 078, and 079 from the FY 2020 through the FY 2024 MedPAR files, which were used in our analysis of claims data for MS–DRG reclassification requests effective for FY 2022 through FY 2026 to trend the number of cases assigned to these MS–DRGs over time. Our findings are shown in the following graph:

The data show a general decline in the number of cases reporting hypertensive encephalopathy as a principal diagnosis in medical MS–DRGs 077, 078, and 079 for the past 5 years. We noted in the proposed rule that as discussed in prior rulemaking, the MS–DRGs are a classification system intended to group together diagnoses and procedures with similar clinical characteristics and utilization of resources. We generally seek to identify sufficient sets of claims data with demonstrated clinical similarity in developing diagnosis related groups rather than subsets based on single diagnoses. After review of the findings indicating a general decline in the number of cases reporting hypertensive encephalopathy as a principal diagnosis, and consideration of the intent of the MS–DRGs, we stated we believe that there is no longer a clinical reason to maintain the MS–DRGs for hypertensive encephalopathy (MS–DRGs 077, 078, and 079) as they are defined by the reporting of one principal diagnosis code.

As discussed in the proposed rule, to explore mechanisms to ensure clinical coherence between cases reporting hypertensive encephalopathy as a principal diagnosis and the other cases with which they may potentially be grouped, we then conducted an examination of all the MS–DRGs where I67.4 was also reported as principal diagnosis to determine if the diagnosis was included in any other MS–DRGs outside of MDC 01, to assess the current MS–DRG assignment of this diagnosis code. Our findings are shown in the following table.

OTHER MS-DRGs REPORTING HYPERTENSIVE ENCEPHALOPATHY AS PRINCIPAL DIAGNOSIS					
MDC	MS-DRG	Description	Number of Cases	Average Length of Stay	Average Costs
PRE	004	Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck without Major O.R. Procedures	1	52	$128,406
01	025	Craniotomy and Endovascular Intracranial Procedures with MCC	1	16	$114,582
01	026	Craniotomy and Endovascular Intracranial Procedures with CC	1	6	$79,934
01	028	Spinal Procedures with MCC	1	26	$58,049
01	037	Extracranial Procedures with MCC	4	5.5	$27,923
01	038	Extracranial Procedures with CC	1	4	$12,509
01	040	Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC	5	8.2	$29,325
01	041	Peripheral, Cranial Nerve and Other Nervous System Procedures with CC or Peripheral Neurostimulator	8	4.9	$14,909
	981	Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC	10	10.3	$31,543
	982	Extensive O.R. Procedures Unrelated to Principal Diagnosis with CC	1	1	$10,926
	987	Non-Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC	2	8.5	$28,020
		Total	**35**	**9.3**	**$32,956**

As shown in the table, we found 35 cases reporting hypertensive encephalopathy as the principal diagnosis in MS–DRGs other than MS–DRGs 077, 078, and 079. We noted in the proposed rule that the majority of the listed MS–DRGs are assigned to MDC 01 with one exception: Pre-MDC MS–DRG 004 (Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck without Major O.R. Procedures). Additionally, there were 11 cases that grouped to MS–DRGs 981, and 982 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, and with CC, respectively) and two cases that grouped to MS–DRG 987 (Non-Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC). After review of these data, we stated we believe it would not be appropriate to reassign diagnosis code I67.4 to another MDC because it could inadvertently cause cases reporting a principal diagnosis of hypertensive encephalopathy with a nervous system procedure to be assigned to an unrelated MS–DRG. Further, we stated we believe it is clinically appropriate to maintain the assignment of I67.4 in MDC 01 as the condition is consistent with other conditions reported by diagnosis codes assigned to MDC 01.

We then examined the MS–DRGs within MDC 01 to consider the possibility of reassigning the cases with a principal diagnosis of hypertensive encephalopathy to other MS–DRGs within MDC 01. In reviewing the claims data from the September 2024 update of the FY 2024 MedPAR file, and examining the clinical considerations, we stated we believe that the cases reporting a principal diagnosis of hypertensive encephalopathy could suitably group to MS–DRGs 070, 071, and 072 (Nonspecific Cerebrovascular Disorders with MCC, with CC and, without CC/MCC, respectively), which contain other cerebrovascular diagnoses under the heading of ''Principal Diagnosis'' in the GROUPER logic list, noting in the proposed rule that hypertensive encephalopathy is considered a cerebrovascular disorder, as it is a neurological condition directly caused by a sudden, severe elevation in blood pressure. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 42.1, which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*, for complete documentation of the GROUPER logic for MS–DRGs 070, 071, and 072.

To determine how the resources for the cases in MS–DRGs 077, 078, and 079 compared to cases in MS–DRGs 070, 071, and 072, we examined the average costs and length of stay for cases in MS–DRGs 070, 071, and 072. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 070--All cases	16,979	6.4	$14,771
MS-DRG 071--All cases	16,596	4.5	$9,381
MS-DRG 072--All cases	2,687	2.9	$7,047

As reflected and discussed in the proposed rule, the average costs of the 1,488 cases reporting a principal diagnosis of I67.4 with a secondary diagnosis designated as a MCC in MS–DRG 077 are slightly lower ($13,176 compared to $14,771) and the average length of stay is shorter (5 days compared to 6.4 days) than for all cases in MS–DRGs 070. The average costs of the 1,846 cases reporting a principal diagnosis of I67.4 with a secondary diagnosis designated as a CC in MS–DRG 078 are slightly lower ($8,591 compared to $9,381) and the average length of stay is shorter (3.3 days compared to 4.5 days) than for all cases in MS–DRGs 071. The average costs of the 243 cases reporting a principal diagnosis of I67.4 without reporting a secondary diagnosis designated as a CC or a MCC in MS–DRG 079 are slightly lower ($6,729 compared to $7,047) and the average length of stay is shorter (2.4

days compared to 2.9 days) than for all cases in MS–DRGs 072.

We stated in the proposed rule our analysis demonstrates that the cases reporting a principal diagnosis of I67.4 currently grouping to medical MS–DRGs 077, 078, and 079 are generally aligned with the average costs for the cases currently grouping to MS–DRGs 070, 071, and 072. While the cases reporting a principal diagnosis code describing hypertensive encephalopathy have slightly lower costs and a shorter average length of stay than for cases in MS–DRGs 070, 071, and 072, we stated we believe reassigning diagnosis code I67.4 to MS–DRGs 070, 071, and 072 will account for the subset of patients reporting this principal diagnosis and will appropriately reflect the resources involved in evaluating and treating these patients.

As discussed in the proposed rule, during our review of this issue and the examination of the MS–DRGs within MDC 01, we noted that the title of MS–DRGs 067, 068, and 069 is ''Nonspecific CVA and Precerebral Occlusion without Infarction with MCC, with CC, and without CC/MCC, respectively'' and the title of MS–DRGs 070, 071, and 072 is ''Nonspecific Cerebrovascular Disorders, with MCC, with CC, and without CC/MCC, respectively.'' In examining the GROUPER logic for these MS–DRGs and reviewing the diagnoses listed under the heading of ''Principal Diagnosis'' in the ICD–10 MS–DRG Definitions Manual, we stated we believe the titles for these MS–DRGs no longer accurately reflects the assigned diagnoses. Like MS–DRGs 077, 078, and 079, the titles of MS–DRGs 067, 068, 069, 070, 071, and 072 were established prior to the transition to ICD–10–CM. The terminology ''nonspecific'' in the titles for these MS–DRGs was appropriate to describe the ICD–9–CM diagnosis codes that were previously assigned to these DRGs, but as discussed in the HIPAA Administrative Simplification: Modification to Medical Data Code Set Standards To Adopt ICD–10–CM and ICD–10–PCS proposed rule (73 FR 49796 through 49803), in comparison to ICD–9–CM, ICD–10–CM diagnosis codes are very specific and that this specificity improves the richness of data for analysis and improves the accuracy of data used for medical research. Therefore, we stated we believe it is appropriate to propose to revise the titles of these MS–DRGs for consistency.

In this final rule, we are amending our previous statement as the titles of MS–DRGs 067 and 068 are ''Nonspecific CVA and Precerebral Occlusion without Infarction with MCC and without MCC'', respectively, in the ICD–10 MS–DRG Definitions Manual Version 42.1. The title of MS–DRG 069 is ''Transient Ischemia without Thrombolytic'' and was inadvertently referenced in our proposed rule discussion in connection with MS–DRGs 067 and 068.

In summary, for FY 2026, we proposed to delete MS–DRGs 077, 078, and 079. Additionally, we proposed to reassign ICD–10–CM diagnosis code I67.4 (Hypertensive encephalopathy) from MDC 01 MS–DRGs 077, 078, and 079 to MS–DRGs 070, 071, and 072. Lastly, for consistency, we also proposed to change the titles of MS–DRGs 067, 068, and 069 from ''Nonspecific CVA and Precerebral Occlusion without Infarction with MCC, with CC, and without CC/MCC, respectively'' to ''Precerebral Occlusion without Infarction with MCC, with CC, and without CC/MCC, respectively'' and to change the titles of MS–DRGs 070, 071, and 072 from ''Nonspecific Cerebrovascular Disorders, with MCC, with CC, and without CC/MCC, respectively'' to ''Other Cerebrovascular Disorders with MCC, with CC, and without CC/MCC, respectively'' to better reflect the assigned diagnoses.

Comment: Commenters supported the proposals to delete MS–DRGs 077, 078, and 079, to reassign ICD–10–CM diagnosis code I67.4 (Hypertensive encephalopathy) from MDC 01 MS–DRGs 077, 078, and 079 to MS–DRGs 070, 071, and 072, to change the titles of MS–DRGs 067, 068, and 069 to ''Precerebral Occlusion without Infarction with MCC, with CC, and without CC/MCC, respectively'' and to change the titles of MS–DRGs 070, 071, and 072 to ''Other Cerebrovascular Disorders with MCC, with CC, and without CC/MCC, respectively''. Some commenters stated that they supported the proposal based on CMS' data analysis, which indicates a general decline in the number of cases reporting hypertensive encephalopathy as a principal diagnosis in these MS–DRGs over the past 5 years.

Several commenters, while supporting the proposals, stated that they disagree with CMS' statement that since no ''code first'' note appears at ICD–10–CM diagnosis code I67.4 (Hypertensive encephalopathy) in the ICD–10–CM Tabular List of Diseases and Injuries, the sequencing of the diagnosis codes depends on the circumstances of the encounter when hypertensive emergency and hypertensive encephalopathy are documented. These commenters stated that they do not believe this is a correct interpretation of the ICD–10–CM instructional notes. In their interpretation, when both an etiology and manifestation are documented, and a ''use additional code'' note appears at the ICD–10–CM code for the etiology, the manifestations listed in that note must be sequenced as secondary diagnosis codes, regardless of whether a corresponding ''code first'' note appears at the codes listed in the ''use additional code'' note. A commenter stated that since they question the interpretation of the instructional notes as discussed in the proposed rule, additional data analysis should be performed based on the ICD–10–CM Tabular List instructions.

Response: We appreciate the commenters' support and thank them for sharing their interpretation of the ICD–10–CM instructional notes. As noted in section II.C.11. of the preamble of this final rule, the Centers for Disease Control and Prevention's (CDC's) National Center for Health Statistics (NCHS) has lead responsibility for the diagnosis codes and CMS has lead responsibility for the ICD–10–PCS procedure codes. We note that after review of the commenters' interpretation of the ICD–10–CM Tabular List instructions, we consulted with the staff at the CDC/NCHS and NCHS confirmed that they would consider further review of the classification, including review of the Tabular List instructions for hypertensive emergency and hypertensive encephalopathy and other instances in the classification where a ''code first'' note does not appear at the manifestation code. Additionally, as we noted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38012), coding advice is issued independently from payment policy. While we collaborate with the American Hospital Association (AHA) through the Coding Clinic for ICD–10–CM and ICD–10–PCS to promote proper coding as one of the Cooperating Parties for ICD–10, the AHA is the official U.S. clearinghouse on medical coding. We recommend that an entity seeking coding guidance on reporting hypertensive emergency and hypertensive encephalopathy submit any questions to the AHA's Central Office on ICD–10 at *https://www.codingclinicadvisor.com/*.

In response to the suggestion that CMS perform additional analysis based on the commenters' interpretation of the ICD–10–CM Tabular List instructions, we note that as discussed in the proposed rule, the GROUPER logic for MS–DRGs 077, 078, and 079 is defined by only diagnosis code I67.4 listed under the heading of ''Principal Diagnosis'' in the ICD–10 MS–DRG Definitions Manual. As the GROUPER logic for MS–DRGs 077, 078, and 079 is

defined by only one diagnosis code, it is unclear how the interpretation of the ICD–10–CM Tabular List instructions would factor into our data analysis, as cases reporting a different principal diagnosis code would not be assigned to MS–DRGs 077, 078, and 079. We further note our proposal to delete MS–DRGs 077, 078, and 079 was based on our review of the findings indicating a general decline in the number of cases reporting hypertensive encephalopathy as a principal diagnosis in the inpatient setting over the past few years and in consideration of the intent of the MS–DRGs.

Therefore, after consideration of the public comments we received, we are finalizing our proposal to delete MS–DRGs 077, 078, and 079. Additionally, we are finalizing our proposal to reassign ICD–10–CM diagnosis code I67.4 (Hypertensive encephalopathy) from MDC 01 MS–DRGs 077, 078, and 079 to MS–DRGs 070, 071, and 072. We are also finalizing our proposal to change the titles of MS–DRGs 070, 071, and 072 from ''Nonspecific Cerebrovascular Disorders, with MCC, with CC, and without CC/MCC, respectively'' to ''Other Cerebrovascular Disorders with MCC, with CC, and without CC/MCC, respectively'', without modification, effective October 1, 2025, for FY 2026.

Lastly, as discussed previously, in the ICD–10 MS–DRG Definitions Manual Version 42.1, the titles of MS–DRGs 067 and 068 are ''Nonspecific CVA and Precerebral Occlusion without Infarction with MCC and without MCC'', respectively, and MS–DRG 069 was inadvertently referenced in our discussion in the proposed rule. Therefore, after consideration of the public comments we received, for the reasons discussed, we are finalizing our proposal with modification. Specifically, we are finalizing our proposal to change the titles of MS–DRGs 067 and 068 from ''Nonspecific CVA and Precerebral Occlusion without Infarction with MCC and without MCC'', respectively, to ''Precerebral Occlusion without Infarction with MCC and without MCC'', respectively, effective October 1, 2025. Under this finalization, the title of MS–DRG 069 will be maintained as ''Transient Ischemia without Thrombolytic'' for FY 2026.

c. Encounter for Adjustment and Management of Implanted Devices of the Special Senses

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18028 through 18029), we identified a replication issue from the ICD–9 based MS–DRGs to the ICD–10 based MS–DRGs regarding the assignment of four ICD–10–CM diagnosis codes that describe encounters for adjustment and management of implanted devices of the special senses. Under the Version 32 ICD–9–CM based MS–DRGs, ICD–9–CM diagnosis code V53.09 (Fitting and adjustment of other devices related to nervous system and special senses), as shown in the following table, was assigned medical MS–DRGs 091, 092, and 093 (Other Disorders of Nervous System with MCC, with CC, and without CC/MCC, respectively) in MDC 01 (Diseases and Disorders of the Nervous System). The four ICD–10–CM code translations also shown in the following table, that provide more detailed and specific information, also currently group to MS–DRGs 091, 092, and 093 in the ICD–10 MS–DRGs Version 42.1. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for complete documentation of the GROUPER logic for MS–DRGs 091, 092, and 093.

ICD-9-CM Diagnosis Code	Description	ICD-10-CM Diagnosis Code	Description
V53.09	Fitting and adjustment of other devices related to nervous system and special senses	Z45.31	Encounter for adjustment and management of implanted visual substitution device
		Z45.320	Encounter for adjustment and management of bone conduction device
		Z45.321	Encounter for adjustment and management of cochlear device
		Z45.328	Encounter for adjustment and management of other implanted hearing device

As discussed in the proposed rule, during our review of this issue, we noted that under ICD–9–CM, diagnosis code V53.09 (Fitting and adjustment of other devices related to nervous system and special senses) did not further describe the type of device related to nervous system and special senses. This is in contrast to its four comparable ICD–10–CM code translations listed in the previous table that provide more detailed and specific information than the ICD–9–CM diagnosis code and do specify the type of device.

In reviewing the four ICD–10–CM diagnosis codes listed in the previous table and the devices they describe, we stated we believe that code Z45.31 is more appropriately assigned to MDC 02 (Diseases and Disorders of the Eye) and codes Z45.320, Z45.321, and Z45.328 are more appropriately assigned to MDC 03 (Diseases and Disorders of the Ear, Nose, Mouth and Throat). We noted in the proposed rule that an ''implanted visual substitution device,'' also known as a ''visual prosthesis,'' is a medical implant designed to partially restore vision to a patient who is blind by directly stimulating the visual pathway in the retina or brain, essentially bypassing damaged photoreceptor cells in the eye and providing a basic visual perception through electrical stimulation. Bone conduction devices, also known as bone conduction hearing aids, amplify sound via bone conduction, or vibrations through the bones of the skull which directly stimulate a functioning cochlea. Cochlear devices and other implanted hearing devices are small electronic devices designed for patients with moderate to severe hearing loss caused by damage to the inner ear to help perceive sounds.

We analyzed claims data from the September 2024 update of the FY 2024 MedPAR file to determine if there were any cases reported with diagnosis codes Z45.31, Z45.320, Z45.321, or Z45.328. One case was found in MS–DRG 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis without CC/MCC) reporting principal diagnosis Z45.321 and procedure code 09PE0SZ (Removal of hearing device from left inner ear, open approach) with costs of $5,530 and a length of stay of one day.

In the proposed rule we stated we recognize that the volume of inpatient cases for patients with a principal diagnosis of Z45.31, Z45.320, Z45.321,

or Z45.328 is low, however we believe that for clinical consistency, it is more appropriate for these cases to be assigned to MDCs that better describe the indication of the implanted devices of the special senses the codes describe. Accordingly, because the cases reporting principal diagnoses describing encounters for adjustment and management of implanted devices of the special senses are more clinically consistent in MDC 02 or MDC 03 depending on the type of device, and the diagnosis codes were initially assigned to MDC 01 MS–DRGs 091, 092, and 093 as a result of replication in the transition from ICD–9 to ICD–10 based MS–DRGs, we proposed to reassign ICD–10–CM diagnosis code Z45.31 from MS–DRGs 091, 092, and 093 to MDC 02 MS–DRG 123 (Neurological Eye Disorders). We also proposed to reassign ICD–10–CM diagnosis codes Z45.320, Z45.321, and Z45.328 from MS–DRGs 091, 092, and 093 to MDC 03 MS–DRGs 154, 155, and 156 (Other Ear, Nose, Mouth and Throat Diagnoses with MCC, with CC, and without CC/MCC, respectively).

Comment: Commenters supported the proposal to assign ICD–10–CM codes Z45.31, Z45.320, Z45.321, and Z45.328 to MDCs that better describe the indication of the implanted devices of the special senses the diagnosis codes describe.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to reassign ICD–10–CM diagnosis code Z45.31 from MDC 01 MS–DRGs 091, 092, and 093 to MDC 02 MS–DRG 123 (Neurological Eye Disorders). We are also finalizing our proposal to reassign ICD–10–CM diagnosis codes Z45.320, Z45.321, and Z45.328 from MS–DRGs 091, 092, and 093 to MDC 03 MS–DRGs 154, 155, and 156 (Other Ear, Nose, Mouth and Throat Diagnoses with MCC, with CC, and without CC/MCC, respectively).

4. MDC 05 (Diseases and Disorders of the Circulatory System)

a. Endovascular Aneurysm Repair (EVAR) With Iliac Branch Procedures

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18029 through 18032), we discussed a request we received to create a new MS–DRG for cases reporting endovascular repair of abdominal aortic aneurysms that extend into at least one iliac artery to preserve blood flow to the external or internal iliac arteries. According to the requestor, aortic aneurysms extend into at least one of the iliac arteries in approximately 25% of patients with abdominal aortic aneurysms. The requestor (the manufacturer), stated that the GORE® EXCLUDER® Iliac Branch Endoprosthesis was approved by the Food and Drug Administration (FDA) in March of 2016 to be used exclusively with the GORE® EXCLUDER® Abdominal Aortic Aneurysm Endoprosthesis to isolate the common iliac artery from systemic blood flow and preserve blood flow in the external iliac and internal iliac arteries in patients with a common iliac or aortoiliac aneurysm, who have appropriate anatomy.[3] According to the requestor, maintaining flow to the internal iliac artery and pelvic circulation using iliac branch devices or alternative techniques aims to decrease complications associated with artery occlusion.[4] [5] [6] The requestor also stated that occluding the internal iliac artery can result in significant hip and/or buttock claudication, erectile dysfunction, and colonic and spinal cord ischemia.

According to the requestor, endovascular aneurysm repair (EVAR) procedures that preserve blood flow to the iliac arteries are technically more challenging than conventional EVAR of the abdominal aorta, and they require increased procedure time, fluoroscopy time, and anesthesia time. The requestor stated that tortuosity and/or stenosis in the iliac territory may increase the complexity or even prevent the deployment of devices, leading to treatment failure or causing early occlusion of the branches. In such cases, some patients may develop symptoms of pelvic ischaemia.[7] [8] The requestor stated that current guidelines advocate the preservation of at least one internal iliac artery in patients with common iliac artery aneurysms, and iliac branched devices were developed to preserve the perfusion in the internal iliac artery.[9]

The requestor also expressed concern that hospitals who treat Medicare patients with aortoiliac and common iliac aneurysms using endovascular procedures with endoprostheses are not classified appropriately based on the current MS–DRG assignment and the resources required. The requestor performed its own data analysis and indicated it found differences in resource utilization when comparing cases reporting standard EVAR of the abdominal aorta to cases reporting EVAR of the abdominal aorta combined with procedures to preserve flow to an iliac branch. According to the requestor, the disparity in resource coherency under the current MS–DRG assignment may reduce access to Medicare beneficiaries who could benefit from these procedures. The requestor stated a new MS–DRG would enable more precise payments and better resource coherency under the MS–DRGs.

The procedure codes that describe EVAR using an abdominal aortic aneurysm (AAA) endoprosthesis and the procedure codes that describe EVAR using an iliac branch endoprosthesis (IBE) that are used to treat aortoiliac and iliac artery aneurysms, respectively, are listed in the following tables.

PROCEDURE CODES DESCRIBING EVAR USING AN ABDOMINAL AORTIC ANEURYSM (AAA) ENDOPROSTHESIS	
ICD-10-PCS Code	**Description**
04V03DZ	Restriction of abdominal aorta with intraluminal device, percutaneous approach
04V03EZ	Restriction of abdominal aorta with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach
04V03FZ	Restriction of abdominal aorta with branched or fenestrated intraluminal device, three or more arteries, percutaneous approach

PROCEDURE CODES DESCRIBING EVAR USING AN ILIAC BRANCH ENDOPROSTHESIS (IBE)	
ICD-10-PCS Code	**Description**
04VC3DZ	Restriction of right common iliac artery with intraluminal device, percutaneous approach
04VC3EZ	Restriction of right common iliac artery with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach
04VD3DZ	Restriction of left common iliac artery with intraluminal device, percutaneous approach
04VD3EZ	Restriction of left common iliac artery with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach
04VE3DZ	Restriction of right internal iliac artery with intraluminal device, percutaneous approach
04VF3DZ	Restriction of left internal iliac artery with intraluminal device, percutaneous approach
04VH3DZ	Restriction of right external iliac artery with intraluminal device, percutaneous approach
04VJ3DZ	Restriction of left external iliac artery with intraluminal device, percutaneous approach

Cases reporting a combination of these procedure codes (that is, any one procedure code from each list) for the endovascular treatment of aortoiliac and iliac artery aneurysms are currently assigned to MS–DRGs 268 and 269 (Aortic and Heart Assist Procedures Except Pulsation Balloon with MCC and without MCC, respectively). Based on its analysis of Medicare claims data using the previously listed codes in MS–DRGs 268 and 269, and to facilitate more precise payments for these procedures, the requestor recommended that CMS assign cases reporting a procedure code describing EVAR using an AAA endoprosthesis with a procedure code describing EVAR using an IBE to a proposed new MS–DRG titled, ''Concomitant Endovascular Abdominal Aorta and Iliac Branch Procedures''.

In review of this request, as discussed in the proposed rule, we analyzed claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 268 and 269 and for cases reporting standard EVAR using an AAA endoprosthesis compared to cases reporting EVAR using an AAA endoprosthesis with an IBE that are used to treat aortoiliac and iliac artery aneurysms with the previously listed procedure codes. The findings from our analysis are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 268 – All cases	2,519	9.1	$62,984
MS-DRG 268 – Cases reporting standard EVAR using an AAA endoprosthesis	1,500	7.4	$63,877
MS-DRG 268 – Cases reporting EVAR using an AAA endoprosthesis with an IBE	193	8.2	$68,145
MS-DRG 269 – All cases	10,108	2.0	$39,165
MS-DRG 269 – Cases reporting standard EVAR using an AAA endoprosthesis	8,655	1.8	$38,562
MS-DRG 269 – Cases reporting EVAR using an AAA endoprosthesis with an IBE	871	1.8	$48,159

As shown in the table, we identified a total of 2,519 cases within MS–DRG 268 with an average length of stay of 9.1 days and average costs of $62,984. Of the 2,519 cases, we found 1,500 cases reporting standard EVAR using an AAA endoprosthesis with an average length of stay of 7.4 days and average costs of $63,877 and 193 cases reporting EVAR using an AAA endoprosthesis with an IBE with an average length of stay of 8.2 days and average costs of $68,145. The data show that the cases reporting standard EVAR using an AAA endoprosthesis have a shorter average length of stay (7.4 days versus 8.2 days) and lower average costs ($63,877 versus $68,145) compared to the average costs of the cases reporting EVAR using an AAA endoprosthesis with an IBE. The data further show that the 193 cases reporting EVAR using an AAA endoprosthesis with an IBE have a shorter average length of stay (8.2 days versus 9.1 days) and higher average costs ($68,145 versus $62,984) compared to the average length of stay and average costs of all the cases in MS–DRG 268.

For MS–DRG 269, we identified a total of 10,108 cases with an average length of stay of 2.0 days and average costs of $39,165. Of the 10,108 cases, we found 8,655 cases reporting standard EVAR using an AAA endoprosthesis with an average length of stay of 1.8 days and average costs of $38,562 and 871 cases reporting EVAR using an AAA endoprosthesis with an IBE with an average length of stay of 1.8 days and average costs of $48,159. The data show that the cases reporting standard EVAR using an AAA endoprosthesis have a comparable average length of stay (1.8 days versus 1.8 days) and lower average costs ($38,562 versus $48,159) compared to the cases reporting EVAR using an AAA endoprosthesis with an IBE. The data further show that the 871 cases reporting EVAR using an AAA endoprosthesis with an IBE have a

shorter average length of stay (1.8 days versus 2.0 days) and higher average costs ($48,159 versus $39,165) compared to the average length of stay and average costs of all the cases in MS–DRG 269.

We stated in the proposed rule that the findings suggest that the cases reporting EVAR using an AAA endoprosthesis with an IBE utilize greater resources compared to the cases reporting standard EVAR using an AAA endoprosthesis. We agreed that patients who have aortoiliac and iliac aneurysms are a more complex population to treat, contributing to increased resource utilization.

Additionally, in the proposed rule we stated that, based on our review and analysis of the cases reporting standard EVAR using an AAA endoprosthesis compared to the cases reporting EVAR using an AAA endoprosthesis with an IBE to treat aortoiliac and iliac artery aneurysms in MS–DRGs 268 and 269, we believe new MS–DRGs are warranted to differentiate the utilization of resources between standard EVAR to treat AAA and EVAR to treat AAA extending into the iliac artery.

We stated we applied the criteria to create subgroups in a base MS–DRG as discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule. We noted that, as shown in the table that follows, a three-way split of the proposed new base MS–DRG failed to meet the criterion that at least 500 or more cases are in each subgroup. It also failed to meet the criterion that there be at least a 20 percent difference in average costs between the CC and NonCC (without CC/MCC) subgroup and at least a $2,000 difference in average costs between the CC and NonCC (without CC/MCC) subgroup. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	193	8.2	$68,145
With CC	419	2.3	$48,415
Without CC/MCC	452	1.3	$47,921

As discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. In the proposed rule we stated we applied the criteria for a two-way split for the ''with MCC'' and ''without MCC'' subgroups. We noted that, as shown in the table that follows, a two-way split of this base MS–DRG failed to meet the criterion that there be at least 500 cases in the ''with MCC'' subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	193	8.2	$68,145
Without MCC	871	1.8	$48,159

We then applied the criteria for a two-way split for the ''with CC/MCC'' and ''without CC/MCC'' subgroups. As shown in the table that follows, a two-way split of this base MS–DRG failed to meet the criterion that there be at least 500 or more cases in the ''without CC/MCC'' subgroup and at least a 20 percent difference in average costs between the ''with CC/MCC'' and ''without CC/MCC'' subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With CC/MCC	612	4.2	$54,637
Without CC/MCC	452	1.3	$47,921

We noted that because the criteria for both of the two-way splits failed, a split (or CC subgroup) is not warranted for the proposed new base MS–DRG. As a result, for FY 2026, we proposed to create new base MS–DRG 213 (Endovascular Abdominal Aorta and Iliac Branch Procedures). The following table reflects a simulation of the proposed new base MS–DRG.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed MS-DRG 213	1,064	3.0	$51,784

Comment: Commenters supported the proposal to create proposed new MS–DRG 213 to differentiate resource use between standard EVAR to treat AAA and EVAR to treat AAA extending into the iliac artery. The commenters stated that they appreciated CMS' thorough analysis of the request in exploring mechanisms to address resource use of these procedures. The commenters agreed with CMS' findings that the cases reporting EVAR using an abdominal aortic aneurysm (AAA) endoprosthesis with an IBE utilize greater resources compared to the cases reporting standard EVAR using an AAA endoprosthesis and that patients who have aortoiliac and iliac aneurysms are a more complex population to treat, contributing to increased resource utilization. The commenters also acknowledged that the criteria were not met to subdivide the proposed new MS–DRG 213 further. However, the commenters stated that given that CMS' data support that patients who have EVAR procedures using an AAA endoprosthesis with an IBE are a more complex population to treat and contribute to increased resource utilization, they requested CMS reconsider the proposed relative weight of proposed new MS–DRG 213. The

commenters stated that, as reflected in Table 5.—List of Medicare Severity Diagnosis-Related Groups (MS–DRGs), Relative Weighting Factors, and Geometric and Arithmetic Mean Length of Stay—FY 2026 Proposed Rule, the proposed new MS–DRG 213 relative weight of 5.7834 is lower than the FY 2026 proposed relative weight of MS–DRG 268 (6.9027) and that MS–DRG 268 is the ''with MCC'' MS–DRG. A commenter who supported the proposal also encouraged CMS to continue to track the costs of these cases in future years to assess if CC subgroups would be supported.

Response: We thank the commenters for their support and feedback. The commenters are correct that in Table 5., made publicly available in association with the proposed rule at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*, the proposed relative weight for MS–DRG 213 is shown as 5.7834 and the proposed relative weight for MS–DRG 268 is shown as 6.9027. As summarized in the analysis provided in the preamble of the proposed rule (90 FR 18031) and this final rule, a total of 2,519 cases were identified in MS–DRG 268 and a total of 10,108 cases were identified in MS–DRG 269. Among the 2,519 cases in MS–DRG 268, we found 193 cases that reported EVAR using an AAA endoprosthesis with an IBE, with an average length of stay of 8.2 days and average costs of $68,145. Of the 10,108 cases in MS–DRG 269, we found 871 cases that reported EVAR using an AAA endoprosthesis with an IBE, with an average length of stay of 1.8 days and average costs of $48,159. Because most of the cases reporting EVAR using an AAA endoprosthesis with an IBE are derived from MS–DRG 269 compared to MS–DRG 268 (871 versus 193), and the cases from MS–DRG 269 have lower average costs compared to MS–DRG 268 ($48,159 versus $68,145), the data from MS–DRG 269 have a greater influence on the structure and composition of the proposed new MS–DRG 213. Alternatively, among the 2,519 cases found in MS–DRG 268, 1,500 cases reported standard EVAR using an AAA endoprosthesis with average costs of $63,877, and among the 10,108 cases in MS–DRG 269, we found 8,655 cases that reported standard EVAR using an AAA endoprosthesis with average costs of $38,562. Since the higher volume of cases in MS–DRG 268 is reflected by the cases reporting standard EVAR using an AAA endoprosthesis compared to the cases reporting EVAR using an AAA endoprosthesis with an IBE (1,500 compared to 193), the cases reporting standard EVAR using an AAA endoprosthesis have a greater influence on the revised structure and composition of MS–DRG 268, thus, the higher proposed relative weight for MS–DRG 268 compared to the proposed relative weight for the proposed new MS–DRG 213.

After consideration of the public comments we received, we are finalizing our proposal, without modification, to create new base MS–DRG 213 (Endovascular Abdominal Aorta and Iliac Branch Procedures) for FY 2026. We will continue to monitor the data for this new MS–DRG to determine if future revisions are warranted.

b. Concomitant Single Valve Procedure With Open Surgical Ablation

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 44836 through 44848), we discussed a two-part request we received to review the MS–DRG assignments for cases involving the surgical ablation procedure for atrial fibrillation. The first part of the request was to create a new classification of surgical ablation MS–DRGs to better accommodate the costs of open concomitant surgical ablations. The second part of the request was to reassign cases describing standalone percutaneous endoscopic surgical ablation. In the part of the request relating to the costs of open concomitant surgical ablations, the requestor identified the following potential procedure combinations that would comprise an ''open concomitant surgical ablation'' procedure.

- Open coronary artery bypass graft (CABG) + open surgical ablation.
- Open mitral valve repair or mitral valve replacement (MVR) + open surgical ablation.
- Open aortic valve repair or mitral valve replacement (AVR) + open surgical ablation.
- Open MVR + open AVR + open surgical ablation.
- Open MVR + open CABG + open surgical ablation.
- Open MVR + open AVR + open CABG + open surgical ablation.
- Open AVR + open CABG + open surgical ablation.

As discussed in the FY 2022 IPPS/LTCH PPS final rule, we examined claims data from the March 2020 update of the FY 2019 MedPAR file and the September 2020 update of the FY 2020 MedPAR file for cases reporting procedure code combinations describing open concomitant surgical ablations and stated our analysis showed while the average lengths of stay and average costs of cases reporting procedure code combinations describing open concomitant surgical ablations are higher than all cases in their respective MS–DRG, we found variation in the volume, length of stay, and average costs of the cases.

In the FY 2022 IPPS/LTCH PPS final rule, for the reasons discussed, we finalized our proposal to revise the surgical hierarchy for the MS–DRGs in MDC 05 (Diseases and Disorders of the Circulatory System) to sequence MS–DRGs 231–236 (Coronary Bypass, with or without PTCA, with or without Cardiac Catheterization or Open Ablation, with and without MCC, respectively) above MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively), effective October 1, 2021. In addition, we also finalized the assignment of cases with a procedure code describing coronary bypass and a procedure code describing open ablation to MS–DRGs 233 and 234 and changed the titles of these MS–DRGs to ''Coronary Bypass with Cardiac Catheterization or Open Ablation with and without MCC, respectively'' to reflect this reassignment for FY 2022.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 48845 through 48849), we discussed a request we received to again review the MS–DRG assignment of cases involving open concomitant surgical ablation procedures. The requestor stated they continue to believe that the average hospital costs for surgical ablation for atrial fibrillation demonstrates a cost disparity compared to all procedures within their respective MS–DRGs. The requestor suggested that when open surgical ablation is performed with MVR, or AVR or MVR/AVR + CABG that these procedures are either (1) assigned to a different family of MS–DRGs or (2) assigned to MS–DRGs 216 and 217 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC and with CC, respectively) similar to what CMS did with CABG and open ablation procedures in the FY 2022 rulemaking to better accommodate the added cost of open concomitant surgical ablation.

We stated our analysis using the September 2021 update of the FY 2021 MedPAR file reflected that the cases reporting an open concomitant surgical ablation code combination are predominately found in the higher (CC or MCC) severity level MS–DRGs of their current base MS–DRG assignment, suggesting that the patient's co-morbid conditions may also be contributing to the higher costs of these cases. Secondly, for the numerous procedure combinations that would comprise an

''open concomitant surgical ablation'' procedure, the increase in average costs appeared to directly correlate with the number of procedures performed. For example, cases that describe ''Open MVR + Open surgical ablation'' generally demonstrated costs that were lower than cases that describe ''Open MVR + Open AVR + Open CABG + Open surgical ablation.''

Therefore, we stated we believe that additional time was needed to allow for further analysis of the claims data to determine to what extent the patient's co-morbid conditions are also contributing to higher costs and to identify other contributing factors that might exist with respect to the increased length of stay and costs of these cases in these MS–DRGs. For the reasons summarized, and after consideration of the public comments we received, we did not make any MS–DRG changes for cases involving the open concomitant surgical ablation procedures for FY 2023.

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58681 through 58690), we again received a request to review the MS–DRG assignment of cases involving open concomitant surgical ablation procedures. The requestor recommended that CMS reassign open concomitant surgical ablation procedures for atrial fibrillation (AF) from MS–DRGs 219, 220, and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 216, 217, and 218. The requestor further recommended that if CMS does not reassign cases involving open concomitant surgical ablation procedures to MS–DRGs 216, 217, and 218, in the alternative, CMS should create new MS–DRGs for all open mitral or aortic valve repair or replacement procedures with concomitant surgical ablation for AF to improve clinical coherence when three to four open heart procedures are performed in one setting.

The requestor stated that cases reporting open surgical ablation procedures for AF performed during open valve repair/replacement procedures are typically assigned to MS–DRGs 216, 217, 218, 219, 220, and 221, with the majority of the cases being assigned to MS–DRGs 219, 220, and 221 because of the surgical hierarchy in MDC 05 and because there is less of a need for cardiac catheterization in these cases. We stated in the final rule that the requestor performed its own data analysis, and stated their analysis showed that the data continue to demonstrate that claims with open surgical ablation procedures for AF are not clinically similar to the remaining cases in MS–DRGs 219, 220, and 221, and there are significant differences in resource utilization that reflect those clinical differences.

We noted in FY 2024 IPPS/LTCH PPS final rule that our analysis of the claims data suggested that it is the performance of an aortic valve repair or replacement procedure, a mitral valve repair or replacement procedure plus another concomitant procedure that is associated with increased hospital resource utilization, not solely the performance of open surgical ablation as suggested by the requestor, when compared to other cases in their respective MS–DRGs. Therefore, for the reasons discussed, we finalized our proposal to create MS–DRG 212 (Concomitant Aortic and Mitral Valve Procedures) in MDC 05 for cases reporting an aortic valve repair or replacement procedure, a mitral valve repair or replacement procedure, and another concomitant procedure.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18032 through 18035), we again received a request to review the MS–DRG assignment of cases involving a single open surgical valve procedure with an open surgical ablation. The requestor recommended that CMS reassign cases involving a single open surgical valve procedure with an open surgical ablation from MS–DRGs 219, 220, and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 216, 217, and 218 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively). The requestor also suggested that if finalized, the title for MS–DRGs 216, 217, and 218 should be revised to ''Cardiac valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization or Open Ablation, with MCC, with CC or without CC/MCC, respectively.''

As discussed in the proposed rule, the requestor stated MS–DRGs primarily focus on the most resource intensive procedure, without fully accounting for the overall resource intensity and complexity of all procedures performed and stated treating AF as a secondary condition is one such example. The requestor stated that AF, if not treated early after diagnosis, continues to worsen and is associated with stroke and mortality risk, and significantly higher healthcare spending. According to the requestor, a majority of AF patients undergoing surgical ablation procedures are older and frailer than non-surgical ablation valvular patients, and these patients frequently require two or even three procedures during one hospital visit to treat multiple conditions (AF, valve disease, heart failure, blocked coronaries). The requestor further stated patients undergoing multiple cardiac procedures, including surgical ablation, typically require between two and four hours of additional time in the operating room, a longer length of stay, and are at an increased risk for adverse event in recovery and noted that much like cardiac catheterization procedures, in many instances adding surgical ablation to open valvular procedures also requires an atriotomy to better visualize the mitral valve and complete the surgical ablation, making these concomitant procedures significantly more complex than single valve procedures performed on their own. The requestor stated that the current MS–DRG assignments do not adequately pay hospitals for the resources associated with furnishing surgical ablation procedures and that therefore, it is increasingly becoming financially unviable for hospitals to perform these procedures to Medicare beneficiaries in a single admission.

The requestor asserted that reassigning cases involving a single open surgical valve procedure with an open surgical ablation, which are currently assigned in MS–DRGs 219, 220, and 221, to MS–DRGs 216, 217, and 218 would accommodate the clinical complexity of performing two or more open heart procedures, would enhance clinical coherence for patients undergoing multiple procedures within MDC 05, would more accurately reflect associated costs and resource utilization, and would help minimize the need for multiple patient admissions. The requestor performed its own data analysis of the Standard Analytical File (SAF) FY 2022 Q1–Q3 report and stated they identified 1,938 cases involving a single open surgical valve procedure with an open surgical ablation that were assigned to MS–DRGs 219, 220, and 221. The requestor stated their analysis showed that the impact of reassigning the 1,938 cases would result in better resource alignment with minimal relative weight changes. Specifically, the requestor stated that their analysis showed that if the cases involving a single open surgical valve procedure with an open surgical ablation that are currently assigned to MS–DRGs 219, 220, and 221 were reassigned to MS–DRGs 216, 217, and 218, the relative weights of MS–DRGs

216, 217, 218, 219, 220, and 221 would change by −5.35%, −4.48%, −2.59%, +0.47%, −0.93% and −0.12% respectively.

As previously noted, the requestor recommended that we consider cases involving a single open surgical valve procedure with an open surgical ablation; however, the requestor did not provide a specific list of procedure codes for our consideration. Therefore, as discussed in the proposed rule, we reviewed the ICD–10–PCS classification and identified 81 procedure codes describing open surgical valve procedures and eight procedure codes describing open surgical ablation procedures. We refer readers to Table 6P.3a associated with the FY 2026 IPPS/LTCH PPS proposed rule (which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*) which sets forth the list of ICD–10–PCS procedure codes describing open surgical valve procedures and open surgical ablation procedures that we examined.

To address this request and to understand the resource use for the subset of cases reporting procedure codes describing a single open surgical valve procedure with an open surgical ablation, without reporting a procedure code describing the performance of a cardiac catheterization, that are currently grouping to MS–DRGs 219, 220, and 221, we examined claims data from the September 2024 update of the FY 2024 MedPAR file for the average length of stay and average costs for these cases. Our findings are shown in the following table:

MS-DRGs 219-221: CASES REPORTING AN OPEN VALVE PROCEDURE AND AN OPEN SURGICAL ABLATION PROCEDURE WITHOUT REPORTING CARDIAC CATHETERIZATION

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
219	All cases	13,222	10	$69,728
	Cases reporting an open valve procedure and an open surgical ablation procedure without reporting cardiac catheterization	1,657	10.1	$67,532
220	All cases	9,636	6.2	$49,514
	Cases reporting an open valve procedure and an open surgical ablation procedure without reporting cardiac catheterization	999	6.9	$53,603
221	All cases	1,146	3.6	$46,900
	Cases reporting an open valve procedure and an open surgical ablation procedure without reporting cardiac catheterization	41	5.6	$48,353

As shown in the table, the data analysis performed indicates that the 1,657 cases in MS–DRG 219 reporting an open valve procedure and an open surgical ablation procedure, without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an MCC have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 219 (10.1 days versus 10 days) and lower average costs when compared to all the cases in MS–DRG 219 ($67,532 versus $69,728). The difference in average costs is $2,196 ($69,728 − $67,532 = $2,196) for the cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a MCC in MS–DRG 219 when compared to all the cases in MS–DRG 219.

In MS–DRG 220, the 999 cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a CC have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 220 (6.9 days versus 6.2 days) and higher average costs when compared to all the cases in MS–DRG 220 ($53,603 versus $49,514). The difference in average costs is $4,089 ($53,603 − $49,514=$4,089) for the cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a CC in MS–DRG 220 when compared to all the cases in MS–DRG 220.

In MS–DRG 221, the 41 cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and without a secondary diagnosis code designated as a CC or MCC have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 221 (5.6 days versus 3.6 days) and higher average costs when compared to all the cases in MS–DRG 221 ($48,353 versus $46,900). The difference in average costs is $1,453 ($48,353 − $46,900=$1,453) for the cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and without a secondary diagnosis code designated as a CC or MCC in MS–DRG 221 when compared to all the cases in MS–DRG 221.

As discussed in the proposed rule, we then examined the data for cases in MS–DRGs 216, 217, and 218, and our findings are shown in the following table:

MS-DRG	Description	Number of Cases	Average Length of Stay	Average Costs
216	Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC	5,137	13.6	$88,193
217	Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with CC	1,571	6.8	$59,943
218	Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization without CC/MCC	251	2.9	$61,733

The data analysis performed indicates that the cases in MS–DRGs 219, 220, and 221 reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization have a generally longer average length of stay and lower average costs when compared to all cases in MS–DRGs 216, 217, and 218. As shown in the table, the data analysis performed indicates that the 1,657 cases in MS–DRG 219 reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as an MCC have a shorter average length of stay (10.1 days versus 13.6 days) and lower average costs ($67,532 versus $88,193) when compared to all the cases in MS–DRG 216. The difference in average costs is $20,661 ($88,193 − $67,532=$20,661) for the cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a MCC in MS–DRG 219 when compared to all the cases in MS–DRG 216.

The 999 cases in MS–DRG 220 reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a CC have a longer average length of stay (6.9 days versus 6.8 days) and lower average costs ($53,603 versus $59,943) when compared to all the cases in MS–DRG 217. The difference in average costs is $6,340 ($59,943 − $53,603=$6,340) for the cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and with a secondary diagnosis code designated as a CC in MS–DRG 220 when compared to all the cases in MS–DRG 217.

The 41 cases in MS–DRG 221 reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and without a secondary diagnosis code designated as a CC or MCC have a longer average length of stay (5.6 days versus 2.9 days) and lower average costs ($48,353 versus $61,733) when compared to all the cases in MS–DRG 218. The difference in average costs is $13,380 ($61,733 − $48,353=$13,380) for the cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization, and without a secondary diagnosis code designated as a CC or MCC in MS–DRG 221 when compared to all the cases in MS–DRG 218.

While the data analysis reflects that cases that report an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization generally demonstrate slightly higher average costs in their respective MS–DRGs, we stated we believe these cases are more suitably grouped to MS–DRGs 219, 220, and 221 where they are currently assigned, based on the closer similarities in resource utilization compared to all the cases in their respective MS–DRG. As discussed in prior rulemaking (86 FR 44878), the MS–DRG system is a system of averages and it is expected that within the diagnostic related groups, some cases may demonstrate higher than average costs, while other cases may demonstrate lower than average costs. We also provide outlier payments to mitigate extreme loss on individual cases. Moreover, we stated that the data do not indicate cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization utilize similar resources when compared to the cases assigned to MS–DRGs 216, 217, and 218. We stated that the cases are not clinically coherent with regard to resource utilization as reflected in the greater differences in average costs.

Further, in examining this request, we noted in the proposed rule that the requestor suggested that CMS reassign cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization from MS–DRGs 219, 220, and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 216, 217, and 218 for FY 2026, however, as discussed in prior rulemaking (86 FR 44830, 87 FR 48847, and 88 FR 58683), MS–DRGs 216, 217, and 218 are defined by the performance of cardiac catheterization. We stated we continue to be concerned about the effect on clinical coherence of assigning cases reporting an open valve procedure and an open surgical ablation procedure that do not also have a cardiac catheterization procedure reported to MS–DRGs that are defined by the performance of that procedure. We stated our claims analysis for the FY 2026 IPPS/LTCH PPS proposed rule continues to reflect the difference in average costs demonstrated by the two cohorts, as cases reporting the performance of a cardiac catheterization in MS–DRGs 216, 217, and 218 continue to demonstrate higher average costs.

We stated that our analysis of the claims data continues to reflect that cases reporting an open valve procedure and an open surgical ablation procedure without a procedure code describing the performance of a cardiac catheterization are clinically coherent in their currently assigned MS–DRGs. Therefore, we proposed to maintain the structure of MS–DRGs 216, 217, and 218 for FY 2026. We also proposed to maintain the title of MS–DRGs 216, 217, and 218 as ''Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively'' for FY 2026.

Comment: Commenters expressed support for the proposal to maintain the structure of MS–DRGs 216, 217, and 218 in MDC 05 for FY 2026. A commenter specifically stated that they support CMS' decision and rationale for maintaining the current structure of MS–DRGs 216, 217, and 218. Another commenter stated they acknowledge CMS' assessment that current data do not support moving these cases for the upcoming fiscal year and stated they believe that updated data will continue to reflect the greater resource utilization

of cases reporting cardiac valve procedures with surgical ablation compared to other cases in the respective MS–DRGs, and respectfully requested that CMS continue to monitor the relevant data and reassess the impact of concomitant surgical ablation in future rulemaking cycles.

Some commenters stated while they appreciate CMS' continued review of this issue and understand CMS' reasoning for proposing to maintain the current structure of MS–DRGs 216, 217, and 218 for FY 2026, the measures taken by CMS, such as revisions to the surgical hierarchy in FY 2022 and the creation of MS–DRG 212 (Concomitant Aortic and Mitral Valve Procedures) in FY 2024, have not effectively addressed the increased resource demands of cases involving a single open surgical valve procedure combined with open surgical ablation despite repeated analyses over the years recognizing the higher costs associated with these procedures. A few commenters suggested that CMS should consider alternative methods of addressing the increased costs associated with cases where a single open surgical valve procedure is performed with any of the other concomitant procedures, such as the creation of new MS–DRGs, to ensure clinical coherence and more accurately reflect resource utilization. A commenter suggested that CMS amend the definition of MS–DRG 212 to address cases where a single open surgical valve procedure is performed with any of the other concomitant procedures from MDC 05 that are included in the GROUPER logic of MS–DRG 212, while another commenter suggested that CMS carefully review all concomitant procedures with higher hospital resource utilization, given the important patient care benefits and efficiencies associated with performing certain procedures concomitantly in a single encounter rather than staging separate procedures.

Response: We thank the commenters for their support, and we appreciate the commenters sharing their concerns and feedback on this proposal. While the data do not support creating a new MS–DRG for cases reporting an open valve procedure and an open surgical ablation procedure and instead suggest that cases are suitably grouped to MS–DRGs 216, 217, 218, 219, 220, and 221 where they are currently assigned based on the similarities in resource utilization compared to all the cases in their respective MS–DRG, we will continue to monitor the claims data for cases reporting an open valve procedure and an open surgical ablation procedure to determine if additional refinements may be warranted in the future. We note that we would address any proposed modifications to the existing logic in future rulemaking.

Comment: Another commenter suggested that if CMS finalizes its proposal to maintain the structure of MS–DRGs 216, 217, and 218 for FY 2026, CMS should consider partially mitigating the impact of this finalization on advanced AF patients by designating ICD–10–CM diagnosis codes I48.11 (Longstanding persistent atrial fibrillation) and I48.21 (Permanent atrial fibrillation) as MCCs on its own initiative for FY 2026 to better align appropriate resources to treat the most complex subset of patients with atrial fibrillation. This commenter stated they performed their own analysis and found that data indicate that the presence of longstanding persistent atrial fibrillation and permanent atrial fibrillation results in significant costs differences compared to other admissions.

Response: We appreciate the commenters' feedback. While we consider this comment to be outside the scope of the proposal included in the FY 2026 IPPS/LTCH PPS proposed rule as we did not examine a potential change to the severity level designations for the diagnosis codes that describe longstanding persistent atrial fibrillation and permanent atrial fibrillation, we encourage individuals with comments about the severity level designations of ICD–10–CM diagnosis codes to submit these comments no later than October 20th of each year, via MEARIS™ at: *https://mearis.cms.gov/public/home*, so that they can be considered for possible inclusion in the annual proposed rule. We refer the commenter to section II.C.8. of the preamble of this FY 2026 IPPS/LTCH PPS final rule for discussion related to our plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data and the application of nine guiding principles and plan to present the findings and proposals in future rulemaking.

Therefore, after consideration of the public comments we received, we are finalizing our proposal to maintain the structure of MS–DRGs 216, 217, and 218 for FY 2026, without modification. We are also finalizing our proposal to maintain the title of MS–DRGs 216, 217, and 218 as ''Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively'' for FY 2026.

c. Transcatheter Aortic Valve Replacement Procedures for Aortic Regurgitation

Transcatheter aortic valve replacement (TAVR) is a minimally invasive procedure that involves a catheter being inserted into an artery, without an incision for most cases, and then guided to the heart. The catheter delivers the new valve without the need for the chest or heart to be surgically opened. As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18035 through 18038), we received a request to reassign cases reporting TAVR procedures for aortic regurgitation (AR) from MS–DRGs 266 and 267 (Endovascular Cardiac Valve Replacement with or without MCC, respectively) to what the requester described as a more clinically and cost cohesive MS–DRG such as MS–DRG 215 (Other Heart Assist System Implant) and to revise the title of MS–DRG 215 to ''Other Heart Assist System Implant or Endovascular Cardiac Regurgitant Valve Replacement Procedures.''

According to the requestor, Medicare patients with severe, symptomatic AR often present with chronic, congestive heart failure, which equates to significantly greater diastolic heart failure, atrial fibrillation, and concomitant kidney, liver, and biventricular failure. As a result, managing this systemic damage requires a multidisciplinary care team, comprised of implanting physicians, cardiac surgeons, imaging cardiologists, and heart failure specialists, similar to the management required for cases currently assigned to MS–DRG 215. Further, the requestor stated TAVR procedures for AR prevent patients from devolving into heart failure and are clinically more comparable to short term heart assist device support. The requestor stated regurgitant valve disease, such as AR, is a whole-heart cardiac disease that has systemic manifestations that leads to biventricular heart failure and non-cardiac morbidity, while stenotic valve disease, such as aortic stenosis (AS), is less often associated with non-cardiac dysfunction. According to the requestor, managing a diagnosis of AR leads to inpatient lengths of stay that are double the duration of the length of stay of patients with AS, as management of AS only requires the involvement of the implanting physician and the cardiac surgeon.

As discussed in the proposed rule, the requestor identified TAVR for AR with ICD–10–CM diagnosis code I35.1 (Nonrheumatic aortic (valve) insufficiency) and ICD–10–PCS

procedure code 02RF38Z (Replacement of aortic valve with zooplastic tissue, percutaneous approach) and performed their own analysis of the FY 2023 Final MedPAR data. The requestor stated they found the cases reporting a diagnosis of aortic regurgitation in MS–DRG 266 and 267 have 20 percent higher average costs (AR = $54,425 versus AS = $45,323), two times the length of stay (AR = 5 days versus AS = 2.5 days) and trigger outlier payments two times more often (AR = 11.43 percent versus AS = 5.82 percent) compared to the cases reporting a diagnosis of aortic stenosis in MS–DRGs 266 and 267. The requestor noted in order to perform their analysis, they excluded cases reporting procedure codes describing the insertion of a percutaneous short-term external heart assist device by removing cases that reported ICD–10–PCS procedure codes 02HA3RZ (Insertion of short-term external heart assist system into heart, percutaneous approach) and 5A0221D (Assistance with cardiac output using impeller pump, continuous) from their analyses, as the requestor asserted those procedure codes were reassigned to MS–DRGs 001 and 002 (Heart Transplant or Implant of Heart Assist System with MCC and without MCC, respectively) in FY 2024.

As stated previously, the requestor identified TAVR procedures for AR with ICD–10–CM diagnosis code I35.1 (Nonrheumatic aortic (valve) insufficiency) and ICD–10–PCS procedure code 02RF38Z (Replacement of aortic valve with zooplastic tissue, percutaneous approach). As we discussed in the proposed rule, in reviewing this request, we identified five additional ICD–10–CM diagnosis codes that also describe aortic regurgitation and included these codes in our analysis. The five ICD–10–CM diagnosis codes we identified are listed in the following table.

ICD-10-CM Code	Description
I06.1	Rheumatic aortic insufficiency
I08.0	Rheumatic disorders of both mitral and aortic valves
I08.2	Rheumatic disorders of both aortic and tricuspid valves
I08.3	Combined rheumatic disorders of mitral, aortic and tricuspid valves
I35.2	Nonrheumatic aortic (valve) stenosis with insufficiency

Also, we noted in the proposed rule we identified eight additional ICD–10–PCS procedure codes that describe TAVR procedures as well, and similarly included these codes in our analysis. The eight ICD–10–PCS procedure codes we identified are listed in the following table.

ICD-10-PCS Code	Description
02RF37H	Replacement of aortic valve with autologous tissue substitute, transapical, percutaneous approach
02RF37Z	Replacement of aortic valve with autologous tissue substitute, percutaneous approach
02RF38H	Replacement of aortic valve with zooplastic tissue, transapical, percutaneous approach
02RF38N	Replacement of aortic valve with zooplastic tissue, using rapid deployment technique, percutaneous approach
02RF3JH	Replacement of aortic valve with synthetic substitute, transapical, percutaneous approach
02RF3JZ	Replacement of aortic valve with synthetic substitute, percutaneous approach
02RF3KH	Replacement of aortic valve with nonautologous tissue substitute, transapical, percutaneous approach
02RF3KZ	Replacement of aortic valve with nonautologous tissue substitute, percutaneous approach

To begin our analysis, we reviewed the GROUPER logic. We stated the requestor is correct that nine ICD–10–PCS codes that describe TAVR procedures mentioned previously are currently assigned to MS–DRGs 266 and 267. The requestor is also correct that in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58690 through 58696), we discussed a request we received to reassign certain cases reporting procedure codes describing the insertion of a short-term external heart assist device from MS–DRG 215 to MS–DRGs 001 and 002. We stated temporary heart assist devices are intended to support blood pressure and provide increased blood flow to critical organs in patients with cardiogenic shock, by drawing blood out of the heart and pumping it into the aorta, partially or fully bypassing the left ventricle to provide adequate circulation of blood (replace or supplement left ventricle pumping) while also allowing damaged heart muscle the opportunity to rest and recover in patients who need short-term support.

In the FY 2024 IPPS/LTCH PPS final rule, we stated that we examined the claims data and the data suggested that overall, cases reporting a procedure code describing the open insertion of a short-term external heart assist device may be more appropriately aligned with the average costs of the cases in MS–DRGs 001 and 002 in comparison to MS–DRG 215, even though the average length of stay is shorter. We also stated that we reviewed the clinical considerations along with this data analysis and agreed that cases reporting a procedure code that describes the open insertion of a short-term external heart assist device are generally more resource intensive and are clinically distinct from other cases reporting procedure codes describing the insertion of short-term external heart devices by other approaches currently assigned to MS–DRG 215. Therefore, for the reasons discussed and after consideration of the public comments we received, we finalized our proposal to reassign ICD–10–PCS code 02HA0RZ (Insertion of short-term external heart assist system into heart, open approach) from MS–DRG 215 in MDC 05 to Pre-MDC MS–DRGs 001 and 002 when reported as a standalone procedure for FY 2024. Under this finalization, procedure code 02HA0RZ no longer needs to be reported as part of a procedure code combination or procedure code ''cluster'' to satisfy the logic for assignment to MS–DRGs 001 and 002. We refer the reader to the ICD–10 MS–DRG Definitions Manual, Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software)* for complete documentation of the

GROUPER logic for MS–DRGs 001, 002, 215, 266 and 267.

While the requestor stated that procedure code 02HA3RZ (Insertion of short-term external heart assist system into heart, percutaneous approach) and procedure code 5A0221D (Assistance with cardiac output using impeller pump, continuous) were reassigned to MS–DRGs 001 and 002 (Heart Transplant or Implant of Heart Assist System with MCC and without MCC, respectively) in FY 2024, we noted in the proposed rule that our finalization in the FY 2024 IPPS/LTCH PPS final rule did not involve modifying the MS–DRG assignment of procedure code 02HA3RZ or procedure code 5A0221D. In Version 42.1, cases reporting procedure codes 02HA3RZ and 5A0221D, continue to be assigned to MS–DRG 215. We refer the reader to Appendix E of the ICD–10 MS–DRG Definitions Manual, Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software)* for the MS–DRG assignments of procedure codes 02HA0RZ, 02HA3RZ, and 5A0221D.

Next, we examined claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRG 266 and 267 to identify cases reporting one of the six ICD–10–CM codes listed previously that describe aortic regurgitation as a principal or a secondary diagnosis with one of the nine procedure codes that describe a TAVR procedure. Our findings are shown in the following table:

MS-DRGs 266 – 267: ALL CASES AND CASES REPORTING A PROCEDURE CODE DESCRIBING TAVR WITH A PRINCIPAL OR SECONDARY DIAGNOSIS OF AORTIC REGURGITATION

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
266	All cases	22,083	4.5	$55,402
	Cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation	3,616	5.7	$56,010
267	All Cases	36,405	1.5	$43,282
	Cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation	4,521	1.6	$41,189

As shown in the table, in MS–DRG 266, we identified a total of 22,083 cases with an average length of stay of 4.5 days and average costs of $55,402. Of those 22,083 cases, there were 3,616 cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation, with average costs higher than the average costs in the FY 2024 MedPAR file for MS–DRG 266 ($56,010 compared to $55,402) and a longer average length of stay (5.7 days compared to 4.5 days). In MS–DRG 267, we identified a total of 36,405 cases with an average length of stay of 1.5 days and average costs of $43,282. Of those 36,405 cases, there were 3,616 cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation, with average costs lower than the average costs in the FY 2024 MedPAR file for MS–DRG 267 ($41,189 compared to $43,282) and a longer average length of stay (1.6 days compared to 1.5 days).

As discussed in the proposed rule, we then examined claims data from the September 2024 update of the FY 2024 MedPAR for MS–DRG 215. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
215	3,257	8.2	$87,701

Our analysis indicates that the cases assigned to MS–DRG 215 have much higher average costs ($87,701 versus $56,010 or $41,189) and a much longer length of stay (8.2 days versus 5.7 days or 1.6 days) than the cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation currently assigned to MS–DRGs 266 or 267, respectively. Instead, we stated the average costs and average length of stay for cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation appear to be generally more aligned with the average costs and average length of stay for all cases in MS–DRGs 266 and 267, where they are currently assigned.

In addition, based on our review of the clinical considerations, in the proposed rule we stated we do not believe the procedure codes describing a TAVR are clinically coherent with the procedure codes currently assigned to MS–DRG 215. Heart assist devices, such as ventricular assist devices and artificial heart systems, provide circulatory support by taking over most of the workload of the left ventricle. Blood enters the pump through an inflow conduit connected to the left ventricle and is ejected through an outflow conduit into the body's arterial system. Heart assist devices can provide temporary left, right, or biventricular support for patients whose hearts have failed and can also be used as a bridge for patients who are awaiting a heart transplant. We stated while we agree that TAVR can be a treatment option for patients with severe AR who are at high risk for mortality or complications due to advanced age and multiple comorbidities, we do not believe the procedure codes describing TAVR should be assigned to MS–DRG 215. AR is a condition where the aortic valve doesn't close properly causing blood to leak back into the heart. While we acknowledged that if not treated AR can gradually worsen and lead to left ventricular enlargement and eventually heart failure, we stated we believe that patients with indications for heart assist devices tend to be more severely ill and these inpatient admissions are associated with greater resource utilization as evidenced by the higher average costs and longer lengths of stay. Therefore, for the reasons stated previously, we proposed to maintain the GROUPER logic for MS–DRGs 266 and 267 for FY 2026. We also proposed to maintain the title of MS–DRGs 215 as ''Other Heart Assist System Implant'' for FY 2026.

Comment: Commenters supported the proposal to maintain the GROUPER

logic for MS–DRGs 266 and 267 for FY 2026. A commenter stated they believe the request to reassign cases reporting TAVR procedures for aortic regurgitation from MS–DRGs 266 and 267 was premature, as valve treatments and the data associated with these procedures are limited. This commenter further stated that as more data are available, CMS will be better able to evaluate appropriate assignment of endovascular cardiac valve therapies in the future. Another commenter stated that patients requiring heart assist devices tend to present with more severe illnesses and require greater resource utilization and longer lengths of stay than those patients undergoing TAVR for aortic regurgitation, therefore reassigning cases reporting TAVR procedures for aortic regurgitation to MS–DRG 215 would not be clinically coherent. Other commenters stated that upon review of the data analysis that CMS described in the proposed rule, it appears the reassignment may not be appropriate at this time and encouraged CMS to continue to monitor the data for these cases and consider if any MS–DRG modifications may be warranted in the future.

Response: We appreciate the commenters' support.

Comment: Other commenters stated CMS should reconsider its proposal to maintain the GROUPER logic for MS–DRGs 266 and 267 for FY 2026 and should reassign cases reporting TAVR procedures for aortic regurgitation from MS–DRGs 266 and 267 to a more clinically and cost cohesive MS–DRG. Several commenters noted that CMS' analysis of cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation included ICD–10–CM diagnosis code I35.2 (Nonrheumatic aortic (valve) stenosis with insufficiency). These commenters stated that code I35.2 inadvertently identifies patients with mixed valvular heart disease and predominant aortic stenosis and including this code in the analysis does not allow an understanding of the resource utilization required to treat patients with predominant aortic regurgitation. These commenters encouraged CMS to refine our analysis to exclude cases with aortic stenosis by analyzing the cases reporting a principal or secondary diagnosis of aortic regurgitation, without including ICD–10–CM code I35.2 and, if the data supports, assign these cases to a more clinically and cost cohesive MS–DRG. Another commenter (the requestor) stated the inclusion of ICD–10–CM code I35.2 inadvertently analyzed a very different patient population from the population they identified in their initial request, which they asserted truly identified patients who were treated with TAVR for aortic regurgitation. This commenter stated that it was impossible for more than 8,000 TAVR procedures to have been performed for patients with aortic regurgitation since there is no FDA-approved valve for this indication and noted that the ALIGN–AR trial (a single-arm, prospective, multicenter study designed to evaluate the efficacy and safety of the JenaValve Trilogy transcatheter heart valve in patients with symptomatic, greater-than-moderate native aortic regurgitation who were deemed high risk for surgery) only treated 180 patients in 2023. The commenter requested that CMS analyze the MedPAR data again using ICD–10–CM diagnosis codes I06.1 (Rheumatic aortic insufficiency) or I35.1 (Nonrheumatic aortic (valve) insufficiency) as principal or secondary diagnosis only, to accurately identify the costs and lengths of stay for patients treated for aortic regurgitation.

Response: We appreciate the commenters sharing their concerns and feedback. We agree with commenters that diagnosis code I35.2 describes nonrheumatic mixed aortic valve disease (MAVD), a condition where the aortic valve is affected by both aortic stenosis and aortic regurgitation. As discussed in the proposed rule and earlier in this section, the requestor identified TAVR for aortic regurgitation with ICD–10–CM diagnosis code I35.1 (Nonrheumatic aortic (valve) insufficiency) only. In reviewing this request, we identified five additional diagnosis codes in the ICD–10–CM classification that also describe aortic regurgitation, including code I35.2, and therefore included these codes in our analysis to avoid unintended consequences or missed opportunities in most appropriately capturing the resource utilization and clinical coherence for cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation.

To examine the recommendations that CMS (1) analyze cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation, while excluding cases reporting a principal or secondary diagnosis of ICD–10–CM code I35.2 (Nonrheumatic aortic (valve) stenosis with insufficiency), and (2) analyze cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of ICD–10–CM codes I06.1 (Rheumatic aortic insufficiency) or I35.1 (Nonrheumatic aortic (valve) insufficiency) only, we further examined claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRG 266 and 267. Our findings are shown in the following table:

MS-DRGs 266 – 267: ALL CASES AND CASES REPORTING A PROCEDURE CODE DESCRIBING TAVR WITH A PRINCIPAL OR SECONDARY DIAGNOSIS OF AORTIC REGURGITATION				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
266	All cases	22,083	4.5	$55,402
	Cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation excluding cases reporting ICD-10-CM diagnosis code I35.2	2,019	6.5	$57,724
	Cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation by reporting ICD-10-CM diagnosis codes I06.1 or I31.1 only	264	7.0	$61,433
267	All Cases	36,405	1.5	$43,282
	Cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation excluding cases reporting ICD-10-CM code I35.2	2,038	1.7	$40,153
	Cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation by reporting ICD-10-CM diagnosis codes I06.1 or I31.1 only	262	1.6	$40,937

As shown in the table, in MS–DRG 266, we identified a total of 22,083 cases with an average length of stay of 4.5 days and average costs of $55,402. Of those 22,083 cases, there were 2,019 cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation, excluding cases reporting ICD–10–CM diagnosis code I35.2, with average costs higher than the average costs in the FY 2024 MedPAR file for MS–DRG 266 ($57,724 compared to $55,402) and a longer average length of stay (6.5 days compared to 4.5 days). Additionally, there were 264 cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation by reporting ICD–10–CM diagnosis codes I06.1 or I31.1 only, with average costs higher than the average costs in the FY 2024 MedPAR file for MS–DRG 266 ($61,433 compared to $55,402) and a longer average length of stay (7.0 days compared to 4.5 days).

In MS–DRG 267, we identified a total of 36,405 cases with an average length of stay of 1.5 days and average costs of $43,282. Of those 36,405 cases, there were 2,038 cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation, excluding cases reporting ICD–10–CM diagnosis code I35.2, with average costs lower than the average costs in the FY 2024 MedPAR file for MS–DRG 267 ($40,153 compared to $43,282) and a longer average length of stay (1.7 days compared to 1.5 days). Additionally, there were 262 cases reporting a procedure code describing TAVR with a principal or secondary diagnosis of aortic regurgitation by reporting ICD–10–CM diagnosis codes I06.1 or I31.1 only, with average costs lower than the average costs in the FY 2024 MedPAR file for MS–DRG 267 ($40,937 compared to $43,282) and a longer average length of stay (1.6 days compared to 1.5 days).

We reviewed these data and note that the original request was to reassign cases reporting TAVR procedures for aortic regurgitation from MS–DRGs 266 and 267 to what the requester described as a more clinically and cost cohesive MS–DRG such as MS–DRG 215 (Other Heart Assist System Implant). We continue to believe that patients with indications for heart assist devices tend to be more severely ill and these inpatient admissions are associated with greater resource utilization as evidenced by the higher average costs and longer lengths of stay compared to cases reporting codes describing TAVR for aortic regurgitation, even when excluding cases with a principal or secondary diagnosis of ICD–10–CM code I35.2 or when considering cases reporting a principal or secondary diagnosis of ICD–10–CM codes I06.1 or I35.1 only. We also note that the claims data reflect variance with regard to average length of stay and average costs for these cases when considering which principal or secondary ICD–10–CM diagnosis codes are reported to describe aortic regurgitation. The claims data also clearly show that the cases reporting secondary diagnoses designated as MCCs are more resource intensive compared to other cases reporting codes describing TAVR for aortic regurgitation. As such, we believe it is premature to propose changes to the MS–DRG assignment of cases reporting TAVR procedures for aortic regurgitation. Further analysis is needed, particularly focusing on the diagnosis codes reported, and also giving consideration as to whether other factors, such as the reporting of secondary MCC and CC diagnoses, may be contributing to the average costs prior to proposing any reassignment of these cases to ensure clinical coherence between these cases and the other cases with which they may potentially be grouped. Furthermore, it is also difficult to predict what the associated costs and resource utilization will be in the future for TAVR devices that remain under development or in clinical trials as research continues to refine TAVR techniques, evaluate long-term outcomes, develop new devices, and expand clinical indications. We expect in future years we will have additional data that can be used to evaluate the potential reassignment of cases reporting TAVR procedures. We will continue to monitor the claims data in consideration of any future modifications to the MS–DRGs for which TAVR procedures may be reported.

Therefore, after consideration of the public comments we received, we are finalizing our proposal to maintain the GROUPER logic for MS–DRGs 266 and 267 for FY 2026, without modification. We are also finalizing our proposal to maintain the title of MS–DRGs 215 as ''Other Heart Assist System Implant'' for FY 2026.

d. Percutaneous Coronary Atherectomy

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58704 through 58712), we discussed a request we received to

review the MS–DRG assignment of cases describing percutaneous coronary intravascular lithotripsy (IVL). Coronary IVL is utilized in a subset of percutaneous coronary intervention (PCI) procedures when the artery is severely calcified. According to the requestor, PCIs involving coronary IVL are clinically more complex because coronary IVL is a therapy deployed exclusively in severely calcified coronary lesions, and these lesion types are associated with longer procedure times and increased utilization of hospital resources. In analyzing this request, we stated in the FY 2024 IPPS/LTCH PPS final rule that the data analysis showed that the average costs of cases reporting percutaneous coronary IVL, with or without involving the insertion of an intraluminal device, were higher than for all cases in their respective MS–DRG. Therefore, for FY 2024, taking into consideration that it clinically requires greater resources to perform coronary IVL, and after consideration of the public comments we received, we finalized our proposal to create MS–DRG 323 (Coronary Intravascular Lithotripsy with Intraluminal Device with MCC), MS–DRG 324 (Coronary Intravascular Lithotripsy with Intraluminal Device without MCC) and MS–DRG 325 (Coronary Intravascular Lithotripsy without Intraluminal Device) in MDC 05.

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69000 through 69002), we discussed requests to modify the GROUPER logic in a number of cardiac MS–DRGs under MDC 05 (Diseases and Disorders of the Circulatory System) for which we stated further research and analysis were required, and which we would continue to consider in connection with future rulemaking. Specifically, we discussed requests we received to modify the GROUPER logic of MS–DRGs 323, 324, and 325. In two separate but related requests, the requestors suggested that we add procedure codes that describe additional PCI procedures, such as percutaneous coronary rotational, laser, and orbital atherectomy, to the GROUPER logic of new MS–DRGs 323, 324, and 325.

In the FY 2025 IPPS/LTCH PPS final rule, we noted that as stated in prior rulemaking (88 FR 58708), atherectomy is distinct from coronary lithotripsy in that each of these procedures are defined by clinically distinct definitions and objectives. We stated additional analysis to assess for unintended consequences across the classification was needed as we have made a distinction between the root operations used to describe atherectomy (Extirpation) and the root operation used to describe lithotripsy (Fragmentation) in evaluating other requests in rulemaking. We stated we would need to consider the application of these two root operations in other scenarios where we have also specifically stated that Extirpation is not the same as Fragmentation and do not warrant similar MS–DRG assignment (85 FR 58572 through 58573). Furthermore, as MS–DRGs 323, 324, and 325 had recently become effective on October 1, 2023 (FY 2024), we stated additional time was needed to review and evaluate extensive modifications to the structure of these MS–DRGs.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18038 through 18042), we received a request to reassign percutaneous coronary atherectomy procedures from MS–DRGs 250 and 251 (Percutaneous Cardiovascular Procedures without Intraluminal Device with MCC and without MCC, respectively) and MS–DRGs 321 and 322 (Percutaneous Cardiovascular Procedures with Intraluminal Device with MCC or 4+ Arteries/Intraluminal Devices and without MCC, respectively) to MS–DRGs 323, 324, and 325 where cases reporting percutaneous coronary IVL are assigned. Atherectomy is a procedure used to remove plaque buildup from the inside of arteries. The requestor stated that coronary atherectomy and coronary IVL target the same step of the PCI treatment process (that is, reducing the burden of calcium by preparing the vessel prior to stent delivery). The requestor further stated that coronary atherectomy is more clinically similar to coronary IVL than other routine vessel preparation techniques (such as angioplasty) in that both coronary atherectomy and coronary IVL are used to modify severe coronary calcium, treat the same patient population, and have the same intended clinical use for complex vessel preparation. Complex vessel preparation is required to increase the diameter of an artery's lumen in severely calcified lesions and improves revascularization by debulking calcification which enables better intraluminal device deployment and improved drug uptake into the vessel wall. Similar to lithotripsy, after percutaneous atherectomy is performed, the provider can implant an intraluminal device, also called a stent, to keep the vessel open.

According to the requestor, removing percutaneous coronary atherectomy procedures from their current MS–DRG assignments and assigning them to MS–DRGs 323, 324, and 325 would reduce cost variance and improve clinical coherence across all PCI MS–DRGs. The requestor also stated that as atherectomy procedures involve more complex calcified lesions and require greater resources, it is not clinically or cost coherent to maintain their current MS–DRG assignments, therefore creating a new MS–DRG for all cases involving percutaneous coronary atherectomy procedures was a reasonable alternative option if CMS did not agree with the reassignment of these cases to MS–DRGs 323, 324, and 325.

As discussed in the proposed rule, the requestor identified eight ICD–10–PCS codes that they state describe percutaneous coronary atherectomy. The eight codes the requestor identified are listed in the following table.

ICD-10-PCS Code	Description
02C03Z7	Extirpation of matter from coronary artery, one artery, orbital atherectomy technique, percutaneous approach
02C03ZZ	Extirpation of matter from coronary artery, one artery, percutaneous approach
02C13Z7	Extirpation of matter from coronary artery, two arteries, orbital atherectomy technique, percutaneous approach
02C13ZZ	Extirpation of matter from coronary artery, two arteries, percutaneous approach
02C23Z7	Extirpation of matter from coronary artery, three arteries, orbital atherectomy technique, percutaneous approach
02C23ZZ	Extirpation of matter from coronary artery, three arteries, percutaneous approach
02C33Z7	Extirpation of matter from coronary artery, four or more arteries, orbital atherectomy technique, percutaneous approach
02C33ZZ	Extirpation of matter from coronary artery, four or more arteries, percutaneous approach

While we agree with the requestor that the eight procedure codes listed in the previous table describe percutaneous coronary atherectomy, we noted in the proposed rule there are additional ICD–10–PCS codes that

describe percutaneous coronary atherectomy in the GROUPER logic for MS–DRGs 250, 251, 321, and 322. Therefore, in reviewing this request, we stated we identified 12 additional ICD–10–PCS procedure codes that also describe percutaneous or percutaneous endoscopic coronary atherectomy procedures and included these codes in our analysis. The 12 codes we identified are listed in the following table.

ICD-10-PCS Code	Description
02C03Z6	Extirpation of matter from coronary artery, one artery, bifurcation, percutaneous approach
02C04Z6	Extirpation of matter from coronary artery, one artery, bifurcation, percutaneous endoscopic approach
02C04ZZ	Extirpation of matter from coronary artery, one artery, percutaneous endoscopic approach
02C13Z6	Extirpation of matter from coronary artery, two arteries, bifurcation, percutaneous approach
02C14Z6	Extirpation of matter from coronary artery, two arteries, bifurcation, percutaneous endoscopic approach
02C14ZZ	Extirpation of matter from coronary artery, two arteries, percutaneous endoscopic approach
02C23Z6	Extirpation of matter from coronary artery, three arteries, bifurcation, percutaneous approach
02C24Z6	Extirpation of matter from coronary artery, three arteries, bifurcation, percutaneous endoscopic approach
02C24ZZ	Extirpation of matter from coronary artery, three arteries, percutaneous endoscopic approach
02C33Z6	Extirpation of matter from coronary artery, four or more arteries, bifurcation, percutaneous approach
02C34Z6	Extirpation of matter from coronary artery, four or more arteries, bifurcation, percutaneous endoscopic approach
02C34ZZ	Extirpation of matter from coronary artery, four or more arteries, percutaneous endoscopic approach

We refer the reader to the ICD–10 MS–DRG Definitions Manual, Version 42.1 (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for complete documentation of the GROUPER logic for MS–DRGs 250, 251, 321, and 322.

To begin our analysis, we examined claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 250, 251, 321, and 322 to identify cases reporting a procedure code describing percutaneous or percutaneous endoscopic coronary atherectomy and compared the results to all cases in their respective MS–DRG. Our findings are shown in the following table.

MS-DRG		Number of Cases	Average Length of Stay	Average Costs
250	All cases	3,047	4.4	$21,383
	Cases reporting percutaneous or percutaneous endoscopic coronary atherectomy	493	4.6	$25,139
251	All cases	2,515	2.4	$14,521
	Cases reporting percutaneous or percutaneous endoscopic coronary atherectomy	340	2.5	$18,121
321	All cases	32,517	5.0	$26,309
	Cases reporting percutaneous or percutaneous endoscopic coronary atherectomy	3,307	5.1	$31,886
322	All cases	46,600	2.4	$16,792
	Cases reporting percutaneous or percutaneous endoscopic coronary atherectomy	3,134	2.5	$20,889

As shown by the table, in MS–DRG 250, we identified a total of 3,047 cases, with an average length of stay of 4.4 days and average costs of $21,383. Of those 3,047 cases, there were 493 cases reporting percutaneous or percutaneous endoscopic coronary atherectomy without reporting the insertion of an intraluminal device, with higher average costs as compared to all cases in MS–DRG 250 ($25,139 compared to $21,383), and a longer average length of stay (4.6 days compared to 4.4 days). In MS–DRG 251, we identified a total of 2,515 cases with an average length of stay of 2.4 days and average costs of $14,521. Of those 2,515 cases, there were 340 cases reporting percutaneous or percutaneous endoscopic coronary atherectomy without reporting the insertion of an intraluminal device, with higher average costs as compared to all cases in MS–DRG 251 ($18,121 compared to $14,521), and a longer average length of stay (2.5 days compared to 2.4 days).

In MS–DRG 321, we identified a total of 32,517 cases with an average length of stay of 5.0 days and average costs of $26,309. Of those 32,517 cases, there were 3,307 cases reporting percutaneous or percutaneous endoscopic coronary atherectomy with the insertion of an intraluminal device, with higher average costs as compared to all cases in MS–DRG 321 ($31,886 compared to $26,309), and a longer average length of stay (5.1 days compared to 5.0 days). In MS–DRG 322, we identified a total of 46,600 cases with an average length of stay of 2.4 days and average costs of $16,792. Of those 46,600 cases, there were 3,134 cases reporting percutaneous or percutaneous endoscopic coronary atherectomy with the insertion of an intraluminal device, with higher average costs as compared to all cases in MS–DRG 322 ($20,889 compared to $16,792), and a longer average length of stay (2.5 days compared to 2.4 days). The data analysis shows that the average costs of cases reporting percutaneous or percutaneous endoscopic coronary atherectomy, with or without involving the insertion of an intraluminal device, are higher than for all cases in their respective MS–DRG.

As discussed in the proposed rule, we then examined claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 323, 324, and 325. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
323	4,429	6.0	$39,047
324	4,877	2.9	$28,809
325	646	3.9	$29,362

In MS–DRG 323, we found a total of 4,429 cases with an average length of stay of 6.0 days and average costs of $39,047. In MS–DRG 324, we found a total of 4,877 cases with an average length of stay of 2.9 days and average costs of $28,809. In MS–DRG 325, we found a total of 646 cases with an average length of stay of 3.9 days and average costs of $29,362.

The average costs of the 3,307 cases reporting percutaneous or percutaneous endoscopic coronary atherectomy with the insertion of an intraluminal device in MS–DRG 321 are $7,161 less than the average costs of all cases in MS–DRG 323 ($39,047 − $31,886 = $7,161) and have an average length of stay that is less than the average length of stay of all cases in MS–DRG 323 (5.1 days versus 6.0 days). The average costs of the 3,134 cases reporting percutaneous or percutaneous endoscopic coronary atherectomy with the insertion of an intraluminal device in MS–DRG 322 are $7,920 less than the average costs of all cases in MS–DRG 324 ($28,809 − $20,899 = $7,920) and have an average length of stay that is less than the average length of stay of all cases in MS–DRG 324 (2.5 days versus 2.9 days). The average costs of the 493 cases in MS–DRG 250 and the 340 cases in MS–DRG 251 reporting percutaneous or percutaneous endoscopic coronary atherectomy without reporting a procedure code describing the insertion of an intraluminal device are $4,223 and $11,241 less than the average costs of all cases in MS–DRG 325 ($29,362 − $25,139 = $7,920; $29,362 − $18,121 = $11,241), respectively. These 493 cases in MS–DRG 250 have an average length of stay that is more than the average length of stay of all cases in MS–DRG 325 (4.6 days versus 3.9 days) while the 340 cases in MS–DRG 251 have an average length of stay that is less than the average length of stay of all cases in MS–DRG 325 (2.5 days versus 3.9 days).

Upon analysis of the claims data and our review of the request, we stated in the proposed rule we do not agree with reassigning cases reporting percutaneous or percutaneous endoscopic coronary atherectomy from MS–DRGs 250, 251, 321, and 322 to MS–DRGs 323, 324, and 325. We stated that while we agree that the performance of percutaneous or percutaneous endoscopic coronary atherectomy contributes to increased resource consumption for these PCI procedures, as previously noted, the data do not support that cases reporting percutaneous or percutaneous endoscopic coronary atherectomy, with or without involving the insertion of an intraluminal device, utilize similar resources when compared to coronary IVL procedures currently assigned to MS–DRGs 323, 324, and 325. Additionally, as stated previously and in prior rulemaking (88 FR 58708), coronary atherectomy is distinct from coronary lithotripsy in that each of these procedures are defined by clinically distinct definitions and objectives. We stated we continue to believe that the root operation Extirpation is not the same as the root operation Fragmentation and do not warrant similar MS–DRG assignment (85 FR 58572 through 58573).

As discussed in the proposed rule, we then explored alternative options, as was requested. As discussed in prior rulemaking (88 FR 58706), we continue to agree that clinically, the presence of severe calcification can increase the treatment difficulty and complexity of service. We stated the data analysis clearly shows that cases reporting percutaneous or percutaneous endoscopic coronary atherectomy, with or without involving the insertion of an intraluminal device, have higher average costs and longer lengths of stay compared to all the cases in their assigned MS–DRG. For these reasons, we proposed to create new MS–DRGs for cases reporting procedure codes describing percutaneous or percutaneous endoscopic coronary atherectomy involving the insertion of an intraluminal device, as well as a new MS–DRG for cases reporting procedure codes describing percutaneous or percutaneous endoscopic coronary atherectomy without the insertion of an intraluminal device to address the differential in resource consumption.

To compare and analyze the impact of our suggested modifications, as discussed in the proposed rule, we ran a simulation using the most recent claims data from the September 2024 update of the FY 2024 MedPAR file. The following table illustrates our findings for all 6,441 cases reporting procedure codes describing percutaneous or percutaneous endoscopic atherectomy involving the insertion of an intraluminal device.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX Percutaneous Coronary Atherectomy with Intraluminal Device	6,441	3.8	$26,535

We applied the criteria to create subgroups in a base MS–DRG as discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule. As shown, a three-way split of the proposed new MS–DRG failed to meet the criterion that there be at least a 20 percent difference in average costs between the CC and NonCC subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	3,307	5.1	$31,886
With CC	1,861	2.8	$21,961
Without CC/MCC	1,273	2	$19,322

As discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. We therefore applied the criteria for a two-way split for the ''with MCC'' and ''without MCC'' subgroups and found that all five criteria were met. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	3,307	5.1	$31,886
Without MCC	3,134	2.5	$20,889

As discussed in the proposed rule, for the proposed new MS–DRGs for cases reporting procedure codes describing percutaneous or percutaneous endoscopic atherectomy involving the insertion of an intraluminal device, there is at least (1) 500 cases in the MCC subgroup and 500 cases in the without MCC subgroup; (2) 5 percent of the cases in the MCC group and 5 percent in the without MCC subgroup; (3) a 20 percent difference in average costs between the MCC group and the without MCC group; (4) a $2,000 difference in average costs between the MCC group and the without MCC group; and (5) a 3-percent reduction in cost variance, indicating that the proposed severity level splits increase the explanatory power of the base MS–DRG in capturing differences in expected cost between the proposed MS–DRG severity level splits by at least 3 percent and thus improve the overall accuracy of the IPPS payment system.

We then ran a simulation using the most recent claims data from the September 2024 update of the FY 2024 MedPAR file for all 833 cases reporting procedure codes describing percutaneous or percutaneous endoscopic atherectomy without the insertion of an intraluminal device. The following table illustrates our findings.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX Percutaneous Coronary Atherectomy without Intraluminal Device	833	3.7	$22,275

We applied the criteria to create subgroups in a base MS–DRG as discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule. As shown, a three-way split of the proposed new MS–DRG failed to meet the criterion that there be at least 500 cases in the MCC subgroup, CC subgroup, and NonCC subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	493	4.6	$25,139
With CC	257	2.7	$19,080
Without CC/MCC	83	2	$15,151

As discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. We therefore applied the criteria for a two-way split for the ''with MCC'' and ''without MCC'' subgroups. We note that, as shown in the table that follows, a two-way split of this base MS–DRG failed to meet the criterion that there be at least 500 cases in the with MCC and the without MCC subgroups.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	493	4.6	$25,139
Without MCC	340	2.5	$18,121

We then applied the criteria for a two-way split for the ''with CC/MCC'' and ''without CC/MCC'' subgroups. As shown in the table that follows, a two-way split of this base MS–DRG also failed to meet the criterion that there be at least 500 cases in the without CC/MCC subgroup.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With CC/MCC	750	3.9	$23,063
Without CC/MCC	83	2	$15,151

We noted in the proposed rule that because the criteria for both of the two-way splits failed, a split (or CC subgroup) is not warranted for the proposed new base MS–DRG. As a result, for FY 2026, we proposed to

create a base MS–DRG for cases reporting procedure codes describing percutaneous or percutaneous endoscopic atherectomy without the insertion of an intraluminal device.

In summary, for FY 2026, taking into consideration that it clinically requires greater resources to perform percutaneous or percutaneous endoscopic coronary atherectomy, we proposed to create two new MS–DRGs with a two-way severity level split for cases describing percutaneous or percutaneous endoscopic coronary atherectomy involving the insertion of an intraluminal device in MDC 05. We also proposed to create a new base MS–DRG for cases describing percutaneous or percutaneous endoscopic coronary atherectomy without an intraluminal device. The proposed new MS–DRGs are proposed new MS–DRG 359 (Percutaneous Coronary Atherectomy with Intraluminal Device with MCC), proposed new MS–DRG 360 (Percutaneous Coronary Atherectomy with Intraluminal Device without MCC) and proposed new MS–DRG 318 (Percutaneous Coronary Atherectomy without Intraluminal Device). We refer the reader to Table 6P.4a and Table 6P.4b associated with the FY 2026 IPPS/LTCH PPS proposed rule (which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) for the list of procedure codes we proposed to define in the logic for each of the proposed new MS–DRGs. We noted that discussion of the surgical hierarchy for the proposed modification is discussed in section II.C.10. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule.

Comment: Many commenters expressed support for CMS' proposal to create new MS–DRGs for cases describing percutaneous or percutaneous endoscopic coronary atherectomy. Commenters stated they appreciate CMS' recognition of the greater resources required to perform percutaneous or percutaneous endoscopic coronary atherectomy. These commenters stated that they agree that the new MS–DRGs will appropriately reflect the higher resource use and longer hospital stays associated with these complex procedures and applauded CMS for recognizing the increased resources required and for undertaking the detailed analysis.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to create new MS–DRG 359 (Percutaneous Coronary Atherectomy with Intraluminal Device with MCC), new MS–DRG 360 (Percutaneous Coronary Atherectomy with Intraluminal Device without MCC) and new MS–DRG 318 (Percutaneous Coronary Atherectomy without Intraluminal Device) for cases reporting percutaneous or percutaneous endoscopic coronary atherectomy, without modification, for FY 2026.

We refer the reader to Table 6P.4a and Table 6P.4b associated with this FY 2026 IPPS/LTCH PPS final rule (which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) for the list of procedure codes we are finalizing to define in the logic for each of the new MS–DRGs. We note that discussion of the surgical hierarchy for the finalized modification is discussed in section II.C.10. of the preamble of this FY 2026 IPPS/LTCH PPS final rule.

e. Complex Aortic Arch Procedures

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18042 through 18047), we received two separate but related requests to review and reconsider the MS–DRG assignments for a subset of codes describing aortic arch procedures assigned to MS DRGs 216, 217, 218, 219, 220, and 221 (Cardiac Valve & Other Major Cardiothoracic Procedure with and without Cardiac Catheterization, with MCC, with CC, without CC/MCC, respectively). In this section of the preamble of this FY 2026 IPPS/LTCH PPS final rule, we discuss each of these separate, but related requests.

The first request was to reassign cases reporting a procedure code describing endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device from MS–DRGs 219, 220, and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively) to MS–DRG 216 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC). Alternatively, the requestor stated CMS could consider reassigning other similar complex aortic arch branch procedures to MS–DRG 216. The requestor suggested that if finalized, the title for MS–DRG 216 should be revised to reflect ''Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC or with Aortic Arch Branch Intraluminal Device.''

According to the requestor, the manufacturer of the GORE® TAG® Thoracic Branch Endoprosthesis (TBE), reassignment of the procedure code describing endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device to MS–DRG 216 would result in higher payment and better account for the differences in resource use of the cases reporting this procedure than other cases in their respective MS–DRGs where they are currently assigned. The GORE® TAG® TBE provides endovascular repair of pathologies of the descending thoracic aorta requiring a proximal landing zone including the left subclavian artery. It is a modular device that consists of three implantable fabric tubes supported by a nitinol framework. The GORE® TAG® TBE is indicated for endovascular repair of lesions such as aortic aneurysms, traumatic transections, and dissections of the descending thoracic aorta with treatment extending to the aortic arch, while maintaining flow into the left subclavian artery (Zone 2 of the aortic arch), in patients who are at high risk for debranching subclavian procedures and who have appropriate anatomy. According to the requestor, patients with lesions in the aortic arch are often more clinically complex and more difficult to treat than patients with lesions in lower parts of the aorta due to vascular tortuosity, proximity to the heart, involvement of arch vessels that feed into the head and brain, and risk of stroke and paraplegia or paraparesis from emboli released into arteries that provide blood flow to the left arm and head. The requestor stated that for lesions involving the left subclavian artery, the only other treatment options available today include open surgical repair with a synthetic graft or a hybrid procedure which includes a non-branched endovascular device and an open surgical bypass procedure of the head vessels. Per the requestor, for arch lesions involving the brachiocephalic and left common carotid arteries, a TBE device enables hybrid treatment with one fewer bypass procedure.

The requestor identified cases reporting endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device by the presence of ICD–10–PCS codes 02VX3EZ (Restriction of thoracic aorta, ascending/arch with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach) and 02VW3DZ (Restriction of thoracic aorta, descending with intraluminal device, percutaneous approach) on the same claim and performed its own analysis of the claims data. The requestor stated they found 90 cases reporting endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device, and

these cases are 49% (+$32,326), 60% (+$27,727), and 38% (+$15,432) more costly compared to all cases in MS–DRGs 219, 220, and 221, respectively. While acknowledging that cases reporting endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device typically do not require a cardiac catheterization procedure, the requestor asserted that this claims analysis demonstrates cases reporting endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device require resources similar to cases in MS–DRG 216.

As mentioned previously, the requestor stated we could also consider reassigning cases reporting procedure codes describing other complex aortic arch branch procedures to MS–DRG 216. The requestor stated to be considered a similar ''complex aortic arch procedure'' the case should report an ICD–10–PCS code describing the endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device with an ICD–10–PCS code describing a Zone 0 or a Zone 1 Bypass procedure. Zone 0 is in the ascending aorta, proximal to the brachiocephalic artery and Zone 1 covers the portion of the aortic arch between the brachiocephalic artery and the left common carotid artery. The requestor identified cases reporting these ''other complex aortic arch procedures'' as cases reporting ICD–10–PCS codes as reflected in the following table.

ICD-10-PCS Code	Description
02VX3EZ	Restriction of thoracic aorta, ascending/arch with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach
with one of the following:	
031409J	Bypass left subclavian artery to right extracranial artery with autologous venous tissue, open approach
031409K	Bypass left subclavian artery to left extracranial artery with autologous venous tissue, open approach
03140AJ	Bypass left subclavian artery to right extracranial artery with autologous arterial tissue, open approach
03140AK	Bypass left subclavian artery to left extracranial artery with autologous arterial tissue, open approach
03140JJ	Bypass left subclavian artery to right extracranial artery with synthetic substitute, open approach
03140JK	Bypass left subclavian artery to left extracranial artery with synthetic substitute, open approach
03140KJ	Bypass left subclavian artery to right extracranial artery with nonautologous tissue substitute, open approach
03140KK	Bypass left subclavian artery to left extracranial artery with nonautologous tissue substitute, open approach
03140ZJ	Bypass left subclavian artery to right extracranial artery, open approach
03140ZK	Bypass left subclavian artery to left extracranial artery, open approach
03LJ0CZ	Occlusion of left common carotid artery with extraluminal device, open approach
03LJ0ZZ	Occlusion of left common carotid artery, open approach
03LJ3BZ	Occlusion of left common carotid artery with bioactive intraluminal device, percutaneous approach
03LJ3DZ	Occlusion of left common carotid artery with intraluminal device, percutaneous approach
03LJ4CZ	Occlusion of left common carotid artery with extraluminal device, percutaneous endoscopic approach
03LJ4ZZ	Occlusion of left common carotid artery, percutaneous endoscopic approach
031J09J	Bypass left common carotid artery to right extracranial artery with autologous venous tissue, open approach
031J09K	Bypass left common carotid artery to left extracranial artery with autologous venous tissue, open approach
031J09Y	Bypass left common carotid artery to upper artery with autologous venous tissue, open approach
031J0AJ	Bypass left common carotid artery to right extracranial artery with autologous arterial tissue, open approach
031J0AK	Bypass left common carotid artery to left extracranial artery with autologous arterial tissue, open approach
031J0AY	Bypass left common carotid artery to upper artery with autologous arterial tissue, open approach
031J0JJ	Bypass left common carotid artery to right extracranial artery with synthetic substitute, open approach
031J0JK	Bypass left common carotid artery to left extracranial artery with synthetic substitute, open approach
031J0JY	Bypass left common carotid artery to upper artery with synthetic substitute, open approach
031J0KJ	Bypass left common carotid artery to right extracranial artery with nonautologous tissue substitute, open approach
031J0KK	Bypass left common carotid artery to left extracranial artery with nonautologous tissue substitute, open approach
031J0KY	Bypass left common carotid artery to upper artery with nonautologous tissue substitute, open approach
031J0ZJ	Bypass left common carotid artery to right extracranial artery, open approach
031J0ZK	Bypass left common carotid artery to left extracranial artery, open approach
031J0ZY	Bypass left common carotid artery to upper artery, open approach

In analyzing this request, we noted in the proposed rule the requestor is correct that the following ICD–10–PCS codes specifically describe procedures involving the GORE® TAG® TBE: 02VX3EZ (Restriction of thoracic aorta, ascending/arch with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach), in combination with 02VW3DZ (Restriction of thoracic aorta, descending with intraluminal device, percutaneous approach). The requestor is also correct that procedure codes 02VX3EZ and 02VW3DZ are assigned to MS–DRGs 216, 217, 218, 219, 220, and 221. Additionally, we stated we agree that the ICD–10–PCS codes as reflected in the previous table can describe other complex aortic arch procedures, and when reported, MS–DRGs 216, 217, 218, 219, 220, and 221 would be assigned. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 42.1, which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*, for complete documentation of the GROUPER logic for MS–DRGs 216, 217, 218, 219, 220, and 221. We noted in the proposed rule that the GORE® TAG® TBE was approved for new technology add-on payments for FY 2023 (87 FR 48966 through 48969), FY 2024 (88 FR 58800), and FY 2025 (89 FR 69124). We refer readers to section II.E.5 of the preamble of this FY 2026 IPPS/LTCH PPS final rule for a discussion regarding the FY 2026 status of technologies approved for FY 2025 new technology add-on payments, including the GORE® TAG® TBE.

To explore mechanisms to address this request and to understand the resource use for the subset of cases reporting procedure codes 02VX3EZ and 02VW3DZ, and cases reporting ''other complex aortic arch procedures'', in the proposed rule we stated we began our analysis by examining claims data from the September 2024 update of the FY 2024 MedPAR file for cases assigned to MS–DRGs 216, 217, 218, 219, 220, and 221. Our findings are shown in the following table:

MS-DRGs 216-221: CASES REPORTING ENDOVASCULAR RESTRICTION OF THE THORACIC AORTA WITH A BRANCHED OR FENESTRATED INTRALUMINAL DEVICE AND CASES REPORTING OTHER COMPLEX AORTIC ARCH PROCEDURES				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
216	All cases	5,137	13.6	$88,193
	Cases reporting 02VX3EZ and 02VW3DZ	4	25.3	$156,361
	Cases reporting other complex aortic arch procedures	0	0	$0
217	All cases	1,571	6.8	$59,943
	Cases with 02VX3EZ and 02VW3DZ	1	2	$46,235
	Cases reporting other complex aortic arch procedures	0	0	$0
218	All cases	251	2.9	$61,733
	Cases with 02VX3EZ and 02VW3DZ	0	0	$0
	Cases reporting other complex aortic arch procedures	0	0	$0
219	All cases	13,222	10	$69,728
	Cases with 02VX3EZ and 02VW3DZ	81	11.4	$97,336
	Cases reporting other complex aortic arch procedures	10	20.7	$112,213
220	All cases	9,636	6.2	$49,514
	Cases with 02VX3EZ and 02VW3DZ	64	5.2	$76,700
	Cases reporting other complex aortic arch procedures	10	6.9	$87,003
221	All cases	1,146	3.6	$46,900
	Cases with 02VX3EZ and 02VW3DZ	32	1.9	$56,765
	Cases reporting other complex aortic arch procedures	0	0	$0

As shown in the table, the data analysis performed indicates that the 4 cases in MS–DRG 216 reporting procedure codes 02VX3EZ and 02VW3DZ have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 216 (25.3 days versus 13.6 days) and higher average costs when compared to all the cases in MS–DRG 216 ($156,361 versus $88,193). The difference in average costs is $68,168 ($156,361 − $88,193 = $68,168) for the cases reporting procedure codes 02VX3EZ and 02VW3DZ in MS–DRG 216 when compared to all the cases in MS–DRG 216. There were zero cases reporting other complex aortic arch procedures in MS–DRG 216. In MS–DRG 217, the one case reporting procedure codes 02VX3EZ and 02VW3DZ has a length of stay that is shorter than the average length of stay for all the cases in MS–DRG 217 (2 days versus 6.8 days) and lower costs when compared to all the cases in MS–DRG 217 ($46,235 versus $59,943). The difference in average costs is $13,708 ($59,943 − $46,235 = $13,708) for the cases reporting procedure codes 02VX3EZ and 02VW3DZ in MS–DRG 217 when compared to all the cases in MS–DRG 217. There were zero cases reporting other complex aortic arch procedures in MS–DRG 217. In MS–DRG 218, there were zero cases reporting procedure codes 02VX3EZ and 02VW3DZ or other complex aortic arch procedures.

The 81 cases in MS–DRG 219 reporting procedure codes 02VX3EZ and 02VW3DZ have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 219 (11.4 days versus 10 days) and higher average costs when compared to all the cases in MS–DRG 219 ($97,336 versus $69,728). The difference in average costs is $27,608 ($97,336 − $69,728 = $27,608) for the cases reporting procedure codes 02VX3EZ and 02VW3DZ in MS–DRG 219 when compared to all the cases in MS–DRG 219. The 10 cases in MS–DRG 219 reporting procedure codes describing other complex arch procedures have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 219 (20.7 days versus 10 days) and higher average costs when compared to all the cases in MS–DRG 219 ($112,213 versus $69,728). The difference in average costs is $42,485 ($112,213 − $69,728 = $42,485) for the cases reporting procedure codes describing other complex arch procedures in MS–DRG 219 when compared to all the cases in MS–DRG 219.

In MS–DRG 220, the 64 cases reporting procedure codes 02VX3EZ and 02VW3DZ have an average length of stay that is shorter than the average length of stay for all the cases in MS–DRG 220 (5.2 days versus 6.2 days) and higher average costs when compared to all the cases in MS–DRG 220 ($76,700 versus $49,514). The difference in average costs is $27,186 ($76,700 − $49,514 = $27,186) for the cases reporting procedure codes 02VX3EZ and 02VW3DZ in MS–DRG 220 when compared to all the cases in MS–DRG 220. The 10 cases reporting procedure codes describing other complex arch procedures have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 220 (6.9 days versus 6.2 days) and higher average costs when compared to all the cases in MS–DRG 220 ($87,003 versus $49,514). The difference in average costs is $37,489 ($87,003 − $49,514 = $37,489) for the cases reporting procedure codes describing other complex arch procedures in MS–DRG 220 when compared to all the cases in MS–DRG 220.

In MS–DRG 221, the 32 cases reporting procedure codes 02VX3EZ and 02VW3DZ have an average length of stay that is shorter than the average length of stay for all the cases in MS–DRG 221 (1.9 days versus 3.6 days) and higher average costs when compared to all the cases in MS–DRG 221 ($56,765 versus $46,900). The difference in average costs is $9,865 ($56,765 − $46,900 = $9,865) for the cases reporting procedure codes 02VX3EZ and 02VW3DZ in MS–DRG 221 when compared to all the cases in MS–DRG 221. There were zero cases reporting other complex aortic arch procedures in MS–DRG 221.

As discussed in the proposed rule, our analysis of the claims data for cases reporting procedure codes 02VX3EZ and 02VW3DZ and cases reporting procedure codes describing other complex arch procedures demonstrated a relatively low volume of cases in comparison to all the cases in their respective MS–DRGs (that is, in 216, 217, 218, 219, 220, and 221). Analysis of the claims data also demonstrates that the cases had an average length of stay

generally longer than all the cases in their respective MS–DRGs. The data analysis indicates that the average costs of the 182 cases reporting procedure codes 02VX3EZ and 02VW3DZ and the 20 cases reporting procedure codes describing other complex arch procedures are generally higher when compared to the average costs of all cases in MS–DRGs 216, 217, 218, 219, 220, and 221. Specifically, most of these cases have average costs that are considerably higher than the average costs of all cases in MS–DRG 216. We stated we reviewed these data and do not believe that proposing to reassign the cases reporting procedure codes 02VX3EZ and 02VW3DZ and the cases reporting procedure codes describing other complex arch procedures to MS–DRG 216, even if there is no cardiac catheterization procedure reported and no secondary diagnosis designated as an MCC reported, would fully address the difference in resource utilization in these cases. Accordingly, we stated we do not believe the data adequately support a potential reassignment of these cases to MS–DRG 216. Therefore, we decided to further explore alternative options to ensure clinical coherence between these cases and the other cases with which they may potentially be grouped in conjunction with the separate but related request we received to review and reconsider the MS–DRG assignments for another subset of codes describing aortic arch procedures, as discussed later in this section.

The second request we received, and discussed in the proposed rule, was to reassign cases reporting thoracic aortic arch replacement combined with restriction of the descending thoracic aorta from MS–DRGs 219, 220, and 221 (Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 216, 217, and 218 (Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively).

The requestor, the manufacturer of the Thoraflex™ Hybrid device (also known as the Terumo Aortic Hybrid device), stated that hospital resource utilization for cases involving the Thoraflex™ Hybrid device is significantly higher compared to all cases in MS–DRGs 216, 217, 218, 219, 220, and 221, creating substantial financial loss for the hospitals that offer this technology. The Thoraflex™ Hybrid device is a dual-purpose medical device that replaces the ascending aorta and aortic arch while also stabilizing and repairing the descending thoracic aorta in a single procedure. It is indicated for the open surgical repair or replacement of damaged or diseased vessels of the aortic arch and descending aorta with or without involvement of the ascending aorta in cases of aneurysm and/or dissection. According to the requestor, when the Thoraflex™ Hybrid device is implanted within the aorta, it creates a channel for the blood to bypass the damaged or diseased part of the vessel and keep flowing as the graft and stented sections of the implant replace the parts of the aorta that are not working properly.

The requestor stated that aortic pathologies such as aneurysms and dissections that involve the aortic arch and descending thoracic aorta continue to present surgical challenges and carry risks such as stroke, cerebral malperfusion, paralysis, and renal malperfusion. These risks must be mitigated by intense and patient specific goal-oriented care. According to the requestor, hospitals treating aortic arch pathologies must be able to deploy rapid neurology, neurosurgery, and nephrology all within hours to ensure a good patient outcome. According to the requestor, all these attributes attest to the difficulty and complexity of thoracic aortic arch replacement combined with restriction of the descending thoracic aorta and care of the patient.

The requestor identified cases reporting thoracic aortic arch replacement combined with restriction of the descending thoracic aorta by the presence of ICD–10–PCS code X2RX0N7 (Replacement of thoracic aorta, arch using branched synthetic substitute with intraluminal device, open approach, new technology group 7) in combination with X2VW0N7 (Restriction of thoracic aorta, descending using branched synthetic substitute with intraluminal device, open approach, new technology group 7) on the same claim and performed its own analysis of the claims data. The requestor stated they found that while the volume of cases reporting thoracic aortic arch replacement combined with restriction of the descending thoracic aorta is <1% of total volume in MS–DRGs 216, 217, 218, 219, 220, and 221, the average costs and average lengths of stay of these cases are significantly greater than all other cases in MS–DRG 216.

As discussed in the proposed rule, in analyzing this request, we noted the requestor is correct that the following ICD–10–PCS codes specifically describe procedures involving the Thoraflex™ Hybrid device: X2RX0N7 (Replacement of thoracic aorta arch with branched synthetic substitute with intraluminal device, new technology group 7) in combination with X2VW0N7 (Restriction of thoracic descending aorta with branched synthetic substitute with intraluminal device, new technology group 7). We stated the requestor is also correct that procedure codes X2RX0N7 and X2VW0N7 are assigned to MS–DRGs 216, 217, 218, 219, 220, and 221. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 42.1, which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*, for complete documentation of the GROUPER logic for MS–DRGs 216, 217, 218, 219, 220, and 221. The Thoraflex™ Hybrid device was approved for new technology add-on payments for FY 2023 (87 FR 48974 through 48976), FY 2024 (88 FR 58800), and FY 2025 (89 FR 69124). We refer readers to section II.E.5 of the preamble of this FY 2026 IPPS/LTCH PPS final rule for a discussion regarding the FY 2026 status of technologies approved for FY 2025 new technology add-on payments, including the Thoraflex™ Hybrid device.

To explore mechanisms to address this request and to understand the resource use for the subset of cases reporting procedure codes X2RX0N7 and X2VW0N7, we stated in the proposed rule that we began our analysis by examining claims data from the September 2024 update of the FY 2024 MedPAR file for cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta assigned to MS–DRGs 216, 217, 218, 219, 220, and 221. Our findings are shown in the following table:

MS-DRGs 216-221: CASES REPORTING THORACIC AORTIC ARCH REPLACEMENT COMBINED WITH RESTRICTION OF THE DESCENDING THORACIC AORTA				
MS-DRG		Number of Cases	Average Length of Stay	Average Costs
216	All cases	5,137	13.6	$88,193
	Cases reporting X2RX0N7 and X2VW0N7	20	23	$158,920
217	All cases	1,571	6.8	$59,943
	Cases reporting X2RX0N7 and X2VW0N7	2	21.5	$160,014
218	All cases	251	2.9	$61,733
	Cases reporting X2RX0N7 and X2VW0N7	0	0	$0
219	All cases	13,222	10	$69,728
	Cases reporting X2RX0N7 and X2VW0N7	61	16.9	$154,134
220	All cases	9,636	6.2	$49,514
	Cases reporting X2RX0N7 and X2VW0N7	14	8.9	$84,004
221	All cases	1,146	3.6	$46,900
	Cases reporting X2RX0N7 and X2VW0N7	1	3	$97,825

As shown in the table, the data analysis performed indicates that the 20 cases in MS–DRG 216 reporting procedure codes X2RX0N7 and X2VW0N7 have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 216 (23 days versus 13.6 days) and higher average costs when compared to all the cases in MS–DRG 216 ($158,920 versus $88,193). The difference in average costs is $70,727 ($158,920 − $88,193 = $70,727) for the cases reporting procedure codes X2RX0N7 and X2VW0N7 in MS–DRG 216 when compared to all the cases in MS–DRG 216. In MS–DRG 217, the 2 cases reporting procedure codes X2RX0N7 and X2VW0N7 have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 217 (21.5 days versus 6.8 days) and higher average costs when compared to all the cases in MS–DRG 217 ($160,014 versus $59,943). The difference in average costs is $100,071 ($160,014 − $59,943 = $100,071) for the cases reporting procedure codes X2RX0N7 and X2VW0N7 in MS–DRG 217 when compared to all the cases in MS–DRG 217. In MS–DRG 218, there were zero cases reporting procedure codes X2RX0N7 and X2VW0N7.

The 61 cases in MS–DRG 219 reporting procedure codes X2RX0N7 and X2VW0N7 have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 219 (16.9 days versus 10 days) and higher average costs when compared to all the cases in MS–DRG 219 ($154,134 versus $69,728). The difference in average costs is $84,406 ($154,134 − $69,728 = $84,406) for the cases reporting procedure codes X2RX0N7 and X2VW0N7 in MS–DRG 219 when compared to all the cases in MS–DRG 219. In MS–DRG 220, the 14 cases reporting procedure codes X2RX0N7 and X2VW0N7 have an average length of stay that is longer than the average length of stay for all the cases in MS–DRG 220 (8.9 days versus 6.2 days) and higher average costs when compared to all the cases in MS–DRG 220 ($84,004 versus $49,514). The difference in average costs is $34,490 ($84,004 − $49,514 = $34,490) for the cases reporting procedure codes X2RX0N7 and X2VW0N7 in MS–DRG 220 when compared to all the cases in MS–DRG 220. In MS–DRG 221, the one case reporting procedure codes X2RX0N7 and X2VW0N7 has a length of stay that is shorter than the average length of stay for all the cases in MS–DRG 221 (3 days versus 3.6 days) and higher average costs when compared to all the cases in MS–DRG 221 ($97,825 versus $46,900). The difference in average costs is $50,925 ($97,825 − $46,900 = $50,925) for the cases reporting procedure codes X2RX0N7 and X2VW0N7 in MS–DRG 221 when compared to all the cases in MS–DRG 221.

In the proposed rule, we stated we reviewed these data and noted the average costs of the 98 cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta are higher when compared to the average costs of all cases in MS–DRGs 216, 217, 218, 219, 220, and 221. The difference in average costs of the 98 cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta is $56,445 ($144,638 − $88,193 = $56,445) for the cases reporting procedure codes X2RX0N7 and X2VW0N7 when compared to all the cases in MS–DRG 216, which is the highest severity level ''with MCC'' MS–DRG. We reviewed these data and stated we do not believe that proposing to reassign all cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta to MS–DRGs 216, 217, and 218, even if there is no cardiac catheterization procedure reported and no secondary diagnosis designated as an MCC reported, would fully address the difference in resource utilization in these cases as the average costs of the cases reporting procedure codes X2RX0N7 and X2VW0N7 are much higher when compared to all the cases in MS–DRG 216. Accordingly, we stated we do not believe the data adequately supports a potential reassignment of these cases to MS–DRGs 216, 217, and 218, respectively.

We also stated we do not believe that the small subset cases that report the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta warrants the creation of a new MS–DRG at this time. As stated in prior rulemaking, the MS–DRGs are a classification system intended to group together diagnoses and procedures with similar clinical characteristics and utilization of resources. We generally seek to identify sufficiently large sets of claims data with a resource/cost similarity and clinical similarity in developing diagnosis related groups rather than smaller subsets. Moreover, as stated in prior rulemaking (85 FR 58472), we have concerns regarding making proposed MS–DRG changes based on a specific, single technology (the Thoraflex™ Hybrid device) identified by only one unique procedure code combination versus considering proposed changes based on a group of related procedure codes that can be reported to describe the same type or class of technology, which is more consistent with the intent of the MS–DRGs.

To explore other mechanisms to address this request, we then reexamined the separate but related request discussed previously to reassign cases reporting procedure codes describing endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device and cases reporting other complex aortic arch procedures. In examining these requests, we noted in the proposed rule that the first requestor suggested that CMS reassign cases reporting procedure codes describing endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device from MS–DRGs 219, 220, and 221 to MS–DRG 216 and the second requestor suggested that CMS reassign cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta without a procedure code describing the performance of a cardiac catheterization from MS–DRGs 219, 220, and 221 to MS–DRGs 216, 217, and 218 for FY 2026. As discussed in prior rulemaking (86 FR 44830, 87 FR 48847, and 88 FR 58683), MS–DRGs 216, 217, and 218 are defined by the performance of cardiac catheterization. We stated we are concerned about the effect on clinical coherence of assigning cases that do not also have a cardiac catheterization procedure reported to MS–DRGs that are defined by the performance of that procedure.

However, we stated that in our examination of both requests, the data analysis indicates that the average costs of these complex aortic arch procedures, such as the cases reporting procedure codes describing endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device, the cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta, and the cases reporting other complex aortic arch procedures, are higher when compared to the average costs of all cases in MS–DRGs 216, 217, 218, 219, 220, and 221. Analysis of the claims data also suggests that these cases reporting complex aortic arch procedures are associated with increased hospital resource utilization.

We reviewed these data and noted in the proposed rule that, clinically, aortic arch pathologies are serious clinical conditions associated with an increased likelihood of death but also the potential for significant functional limitations. The aortic arch is the segment of the aorta that helps distribute blood to the head and upper extremities via the brachiocephalic trunk, the left common carotid, and the left subclavian artery. The aortic arch also plays a role in blood pressure homeostasis via baroreceptors found within the walls of the aortic arch that help prevent quick, drastic changes in blood pressure. Aortic aneurysms and aortic dissection that involve the aortic arch are associated with extremely high mortality and morbidity and the data analysis clearly shows that cases reporting complex aortic arch procedures have higher average costs and generally longer lengths of stay compared to all the cases in their assigned MS–DRG.

Therefore, based on our review of the clinical issues and the claims data, we proposed to create a new MS–DRG to better differentiate these complex aortic arch procedures from other cases in their respective MS–DRGs, based on treatment difficulty, clinical similarity, and resource use. To compare and analyze the impact of our suggested modifications, we ran a simulation using the claims data from the September 2024 update of the FY 2024 MedPAR file.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed new MS-DRG XXX Complex Aortic Arch Procedures	300	11.2	$104,826

For the cases reporting complex aortic arch procedures, we identified a total of 300 cases using the claims data from the September 2024 update of the FY 2024 MedPAR file, so the criterion that there are at least 500 or more cases in each subgroup could not be met. Therefore, we did not propose to subdivide the proposed new MS–DRG for complex aortic arch procedures into severity levels.

In summary, for FY 2026, taking into consideration that it clinically requires greater resources to perform complex aortic arch procedures, we proposed to create a new base MS–DRG for cases reporting complex aortic arch procedures in MDC 05. The proposed new MS–DRG is proposed new MS–DRG 209 (Complex Aortic Arch Procedures). We refer the reader to Table 6P.5a associated with the FY 2026 IPPS/LTCH PPS proposed rule (which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for the list of procedure codes we proposed to define in the logic for the proposed new MS–DRG. We note that the surgical hierarchy for the proposed modification is discussed in section II.C.10. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule.

Comment: Many commenters expressed support for the proposal to create new base MS–DRG 209 for cases reporting complex aortic arch procedures in MDC 05. Commenters stated that the creation of MS–DRG 209 would ensure better alignment with resource use and clinical needs, allowing appropriate payment and improved access to care for patients undergoing these complex surgeries. Several commenters agreed patients undergoing complex aortic arch procedures reflect a complex patient population that require increased resource utilization associated with their care. A commenter stated that the new MS–DRG would account for new technologies, resulting in a more tailored and appropriate payment to providers, which will inevitably result in better patient care and wider access to these complex aortic arch procedures. Another commenter specifically stated they appreciate the creation of the new MS–DRG and stated the proposed placement of MS–DRG 209 in the surgical hierarchy of MDC 05 will ensure that this group of complex patients will be clinically coherent and will appropriately account for the increased resource use and complexity required to care for them.

Response: We appreciate the commenters' support.

Comment: Another commenter disagreed with the proposal to create new MS–DRG 209 for cases reporting complex aortic arch procedures in MDC 05 and suggested that CMS delay the creation of the new MS–DRG to allow more time to analyze cost and length of stay data. This commenter stated that the current volume of cases is too small to justify a new MS–DRG and stated that more data is needed to assess the impact of concomitant comorbidities on resource use. While acknowledging that aortic arch repair procedures can be resource-intensive, the commenter

asserted that the impact of other concomitant comorbidities in exacerbating resource use has not adequately been assessed, and these cases should be more thoroughly evaluated before establishing a new MS–DRG. This commenter performed their own analysis and stated that they found that cases reporting a diagnosis of atrial fibrillation with procedure codes describing complex aortic arch procedures have higher average costs and longer average lengths of stay. The commenter stated that the disparity of resource use for complex aortic procedures may partially be due to the presence of comorbid diagnoses, such as atrial fibrillation, and should be evaluated in further detail. Lastly, the commenter expressed concern that the new MS–DRG could negatively affect the surgical hierarchy in MDC 05, particularly with regard to MS–DRG 212 (Concomitant Aortic and Mitral Valve Procedures). Specifically, the commenter noted that for FY 2026, CMS proposed to place new MS–DRG 209 in the highest position in the proposed Version 43 surgical hierarchy for MDC 05, ahead of MS–DRG 212. The commenter stated that MS–DRG 212 is defined by the performance of three cardiac procedures and asserted the complexity of performing three cardiac procedures is significant and should be reflected in the surgical hierarchy.

Response: We thank the commenter for their feedback and for sharing their concerns. In response to the suggestion that CMS delay implementation of proposed new MS–DRG 209 for complex aortic arch procedures, we reviewed the commenters' concern and do not agree that a delay is necessary or appropriate. As stated earlier, the data analysis clearly shows that when performed, complex aortic arch procedures are clinically different when compared to all cases in MS–DRGs 216, 217, 218, 219, 220, and 221 in terms of technical complexity and hospital resource use. For these reasons, we proposed to create a new MS–DRG for cases reporting complex aortic arch procedures. We continue to believe that a new base MS–DRG in MDC 05 will better differentiate these cases reporting complex aortic arch procedures from other cases in their currently assigned MS–DRGs.

In response to the commenters' concern that the disparity of resource use for complex aortic procedures may partially be due to the presence of comorbid diagnoses and therefore should be evaluated in further detail, as discussed in the proposed rule and earlier in this section, our data analysis indicated that the average costs of the cases reporting procedure codes describing endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device, the cases reporting the procedure code combination describing thoracic aortic arch replacement combined with restriction of the descending thoracic aorta, and the cases reporting other complex aortic arch procedures are generally higher when compared to the average costs of all cases in MS–DRGs 216, 217, 218, 219, 220, and 221. Specifically, most of these cases have average costs that are higher than the average costs of all cases in MS–DRG 216, which is the highest severity level ''with MCC'' MS–DRG. For the cases reporting these complex aortic arch procedures, we identified a total of 300 cases using the claims data from the September 2024 update of the FY 2024 MedPAR file, so the criterion that there are at least 500 or more cases in each subgroup could not be met. Therefore, we did not propose to subdivide the proposed new MS DRG for complex aortic arch procedures into severity levels for FY 2026. We believe that over time the volume of cases reporting complex aortic arch procedures in MS–DRG 209 may increase and we could consider subdividing the proposed new MS DRG for complex aortic arch procedures into severity levels in the future.

In response to the concern regarding the surgical hierarchy for MDC 05, we continue to believe our proposed revisions to the surgical hierarchy account for the resources expended to address these complex procedures and do not believe any modifications are warranted at this time. We believe the sequencing as discussed in the proposed rule appropriately reflects resource utilization when the assigned cardiac procedures are performed and will result in the most suitable MS–DRG assignments. We will continue to review the surgical hierarchy, consistent with our annual rulemaking, to determine if other modifications are warranted in the future.

Comment: A commenter (the manufacturer of the GORE® TAG® TBE) stated they reviewed the ICD–10–PCS classification for other procedure code combinations that would describe a ''complex aortic arch procedure'' by reporting a procedure code reporting the endovascular restriction of the thoracic aorta with a branched or fenestrated intraluminal device with an ICD–10–PCS code describing a Zone 0 (innominate artery), Zone 1 (left common carotid), or Zone 2 (left subclavian artery) aortic arch procedure to ensure continued access to care for Medicare beneficiaries undergoing this treatment and better alignment of resource use, costs, and clinical complexity of these aortic arch procedures. This commenter identified the following nine ICD–10–PCS codes and requested that these codes be added to definition (logic) of new MS–DRG 209 when reported with code 02VX3EZ (Restriction of thoracic aorta, ascending/arch with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach).

ICD-10-PCS Code	Description
031209K	Bypass innominate artery to left extracranial artery with autologous venous tissue, open approach
03120AK	Bypass innominate artery to left extracranial artery with autologous arterial tissue, open approach
03120JK	Bypass innominate artery to left extracranial artery with synthetic substitute, open approach
03120KK	Bypass innominate artery to left extracranial artery with nonautologous tissue substitute, open approach
03L40CZ	Occlusion of left subclavian artery with extraluminal device, open approach
03L40ZZ	Occlusion of left subclavian artery, open approach
03L43DZ	Occlusion of left subclavian artery with intraluminal device, percutaneous approach
03L44CZ	Occlusion of left subclavian artery with extraluminal device, percutaneous endoscopic approach
03L44ZZ	Occlusion of left subclavian artery, percutaneous endoscopic approach

Response: We appreciate the commenters' feedback. As discussed previously and in the proposed rule, Zone 0 of the aortic arch is in the ascending aorta, proximal to the brachiocephalic artery and Zone 1 covers the portion of the aortic arch between the brachiocephalic artery and the left common carotid artery. We note

that Zone 2 of the aortic arch refers to the segment of the aortic arch located between the left common carotid artery and the left subclavian artery. This zone is a common location for aortic tears, aneurysms, and dissections and is a critical area for surgical and endovascular interventions. We agree with the commenter that the nine ICD–10–PCS codes as reflected in the previous table describe Zone 0, Zone 1, or Zone 2 aortic arch procedures, and when reported with code 02VX3EZ (Restriction of thoracic aorta, ascending/arch with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach), would describe complex aortic arch procedures and should be added to the list of ICD–10–PCS procedure codes in the logic for assignment of cases for the proposed new MS–DRG that describe complex aortic arch procedures when reported with code 02VX3EZ.

During our review of this issue, we further examined the GROUPER logic that would determine assignment of a case to proposed new MS–DRG 209. Specifically, we reviewed the ICD–10–PCS classification to determine if there were other ICD–10–PCS codes describing Zone 0, Zone 1 or Zone 2 aortic arch procedures that could describe complex aortic arch procedures when reported with code 02VX3EZ that were inadvertently not listed in the proposed GROUPER logic for MS–DRG 209. We identified the following 11 procedure codes.

ICD-10-PCS Code	Description
03120ZK	Bypass innominate artery to left extracranial artery, open approach
03L40DZ	Occlusion of left subclavian artery with intraluminal device, open approach
03L43CZ	Occlusion of left subclavian artery with extraluminal device, percutaneous approach
03L43ZZ	Occlusion of left subclavian artery, percutaneous approach
03L44DZ	Occlusion of left subclavian artery with intraluminal device, percutaneous endoscopic approach
03LJ0BZ	Occlusion of left common carotid artery with bioactive intraluminal device, open approach
03LJ0DZ	Occlusion of left common carotid artery with intraluminal device, open approach
03LJ3CZ	Occlusion of left common carotid artery with extraluminal device, percutaneous approach
03LJ3ZZ	Occlusion of left common carotid artery, percutaneous approach
03LJ4BZ	Occlusion of left common carotid artery with bioactive intraluminal device, percutaneous endoscopic approach
03LJ4DZ	Occlusion of left common carotid artery with intraluminal device, percutaneous endoscopic approach

We reviewed the 11 ICD–10–PCS codes as reflected in the previous table and note that when reported with code 02VX3EZ (Restriction of thoracic aorta, ascending/arch with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach), these procedure code combinations also describe complex aortic arch procedures. As these procedure code combinations also describe complex aortic arch procedures, we believe these 11 ICD–10–PCS procedure codes should also be added to the list of ICD–10–PCS procedure codes that describe complex aortic arch procedures when reported with code 02VX3EZ in the logic for assignment of cases for proposed new MS–DRG 209.

Therefore, after consideration of the public comments received, and for the reasons discussed, we are finalizing our proposal to create new MS–DRG 209 (Complex Aortic Arch Procedures), with modification, effective October 1, 2025, for FY 2026. Specifically, we are adding the 20 ICD–10–PCS codes listed previously to the list of procedure codes that describe other complex aortic arch procedures when reported with ICD–10–PCS code 02VX3EZ in the logic for the new MS–DRG 209. Conforming changes to the GROUPER logic are also are shown in Table 6P.5a associated with this final rule and available on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* and also as reflected in the final version of ICD–10 MS–DRG Definitions Manual, version 43, available in association with this final rule and available via the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*. We note that discussion of the surgical hierarchy for the finalized modification is discussed in section II.C.10. of the preamble of this FY 2026 IPPS/LTCH PPS final rule.

Comment: A commenter noted that a code proposal requesting new procedure codes to identify bypass procedures from the innominate artery to a subclavian artery or an axillary artery was displayed in association with the Spring 2025 ICD–10 Coordination and Maintenance Committee Update. The commenter suggested that any new procedure codes finalized in association with the Spring 2025 ICD–10 Coordination and Maintenance Committee Update that identify bypass procedures from the innominate artery to a subclavian artery or an axillary artery should be assigned to the GROUPER logic of MS–DRG 209 when coded with procedure code 02VX3EZ, as these procedure code combinations would describe ''complex aortic arch procedures'' as well.

Response: We thank the commenter for their feedback. We note that the proposal requesting new procedure codes to identify bypass procedures from the innominate artery to a subclavian artery or an axillary artery that was displayed in association with the Spring 2025 ICD–10 Coordination and Maintenance Committee Update was approved and five new procedure codes to identify bypass procedures from the innominate artery to a subclavian artery or an axillary artery were finalized as reflected in the FY 2026 ICD–10–PCS Code Update files that were made publicly available on the CMS website at *https://www.cms.gov/Medicare/Coding/ICD10* on June 6, 2025. We note that the new procedure codes are also reflected in Table 6B.—New Procedure Codes, in association with this final rule and available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*, including the MS–DRG assignments for these new codes for FY 2026.

We agree that when coded with procedure code 02VX3EZ, these procedure code combinations would also describe complex aortic arch procedures and therefore should be assigned to new MS–DRG 209 along with other procedure codes describing complex aortic arch procedures. As reflected in Table 6B.—New Procedure Codes in association with this final rule, we note that the five procedure codes describing bypass procedures from the innominate artery to a subclavian artery or an axillary artery are assigned to new MDC 05 MS–DRG 209 and MS–DRGs

252, 253, and 254 (Other Vascular Procedures with MCC, with CC, and without CC/MCC, respectively) for FY 2026. This assignment is reflected in the final V43 GROUPER logic. We refer the reader to section II.C.13. of the preamble of this final rule for further information regarding the table.

f. Deep Vein Thrombophlebitis

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18047), we stated that consistent with our annual review of the MS–DRGs, we consider changes in resource consumption, treatment patterns, technology, and any other factors that may change the relative use of hospital resources. We noted that in our review of the claims data from the September 2024 update of the FY 2024 MedPAR file, we identified a low volume of cases for MS–DRGs 294 and 295 (Deep Vein Thrombophlebitis with CC/MCC and without CC/MCC, respectively). Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
294	146	4.1	$10,808
295	0	0	0

A deep vein thrombophlebitis (DVT) is a blood clot that forms in one of the deep veins of the body, most commonly occurring in the veins of the pelvis, calf, or thigh. The 35 ICD–10–CM diagnosis codes describing deep vein thrombophlebitis currently assigned to MS–DRGs 294 and 295 are shown in the following table.

BILLING CODE 4120–01–P

DIAGNOSIS CODES DESCRIBING DEEP VENOUS THROMBOPHLEBITIS (DVT) IN MS-DRGS 294-295	
ICD-10-CM Code	Description
I80.10	Phlebitis and thrombophlebitis of unspecified femoral vein
I80.11	Phlebitis and thrombophlebitis of right femoral vein
I80.12	Phlebitis and thrombophlebitis of left femoral vein
I80.13	Phlebitis and thrombophlebitis of femoral vein, bilateral
I80.201	Phlebitis and thrombophlebitis of unspecified deep vessels of right lower extremity
I80.202	Phlebitis and thrombophlebitis of unspecified deep vessels of left lower extremity
I80.203	Phlebitis and thrombophlebitis of unspecified deep vessels of lower extremities, bilateral
I80.209	Phlebitis and thrombophlebitis of unspecified deep vessels of unspecified lower extremity
I80.211	Phlebitis and thrombophlebitis of right iliac vein
I80.212	Phlebitis and thrombophlebitis of left iliac vein
I80.213	Phlebitis and thrombophlebitis of iliac vein, bilateral
I80.219	Phlebitis and thrombophlebitis of unspecified iliac vein
I80.221	Phlebitis and thrombophlebitis of right popliteal vein
I80.222	Phlebitis and thrombophlebitis of left popliteal vein
I80.223	Phlebitis and thrombophlebitis of popliteal vein, bilateral
I80.229	Phlebitis and thrombophlebitis of unspecified popliteal vein
I80.231	Phlebitis and thrombophlebitis of right tibial vein
I80.232	Phlebitis and thrombophlebitis of left tibial vein
I80.233	Phlebitis and thrombophlebitis of tibial vein, bilateral
I80.239	Phlebitis and thrombophlebitis of unspecified tibial vein
I80.241	Phlebitis and thrombophlebitis of right peroneal vein
I80.242	Phlebitis and thrombophlebitis of left peroneal vein
I80.243	Phlebitis and thrombophlebitis of peroneal vein, bilateral
I80.249	Phlebitis and thrombophlebitis of unspecified peroneal vein
I80.251	Phlebitis and thrombophlebitis of right calf muscular vein
I80.252	Phlebitis and thrombophlebitis of left calf muscular vein
I80.253	Phlebitis and thrombophlebitis of calf muscular vein, bilateral
I80.259	Phlebitis and thrombophlebitis of unspecified calf muscular vein
I80.291	Phlebitis and thrombophlebitis of other deep vessels of right lower extremity
I80.292	Phlebitis and thrombophlebitis of other deep vessels of left lower extremity
I80.293	Phlebitis and thrombophlebitis of other deep vessels of lower extremity, bilateral
I80.299	Phlebitis and thrombophlebitis of other deep vessels of unspecified lower extremity
I80.3	Phlebitis and thrombophlebitis of lower extremities, unspecified
I82.220	Acute embolism and thrombosis of inferior vena cava
I82.221	Chronic embolism and thrombosis of inferior vena cava

BILLING CODE 4120–01–C

In light of the initial findings of only 146 cases for MS–DRG 294 and zero cases in MS–DRG 295, we further reviewed the MedPAR claims data for cases assigned to MS–DRGs 294 and 295 for the past 5 fiscal years. As reflected in the following tables, the data indicate that the number of cases grouping to MS–DRGs 294 and 295 has declined.

FY and MedPAR Data Reviewed for MS-DRG 294	Number of Cases	Average Length of Stay	Average Costs
FY 2022 (FY 2020 MedPAR)	222	4.3	$8,962
FY 2023 (FY 2021 MedPAR)	227	4.2	$9,325
FY 2024 (FY 2022 MedPAR)	177	4.8	$9,665
FY 2025 (FY 2023 MedPAR)	178	4.6	$10,404
FY 2026 (FY 2024 MedPAR)	146	4.1	$10,808

FY and MedPAR Data Reviewed for MS-DRG 295	Number of Cases	Average Length of Stay	Average Costs
FY 2022 (FY 2020 MedPAR)	20	3.4	$7,323
FY 2023 (FY 2021 MedPAR)	11	2.5	$4,988
FY 2024 (FY 2022 MedPAR)	0	0	0
FY 2025 (FY 2023 MedPAR)	0	0	0
FY 2026 (FY 2024 MedPAR)	0	0	0

We noted in the proposed rule that, if, during our annual MS–DRG analysis we identify that there are only a few patients in a respective MS–DRG, consistent with our established process in deciding whether to propose to make further modifications, we consider if there have been potential changes in the clinical characteristics of the patients, treatment patterns, or resource utilization. A principle of the MS–DRGs and the characteristics of a meaningful DRG classification scheme is the ability to detect such changes and accordingly, propose clinically appropriate modifications that are also consistent with resource utilization. We have noted in prior rulemaking that we prefer to have a substantial number of cases in an MS–DRG because having larger clinical cohesive groups within an MS–DRG provides greater stability for annual updates to the relative payment weights. In light of these considerations, and the low volume of cases in MS–DRGs 294 and 295, we believed it was appropriate to further analyze how to potentially reclassify these cases.

Accordingly, using the September 2024 update of the FY 2024 MedPAR file, we examined whether there were other MS–DRGs to which these cases could appropriately be reassigned. As part of this analysis, we also reviewed the base DRG by severity claims data for MS–DRG 294 because the MS–DRG includes cases reporting an MCC as well as cases reporting a CC. As previously noted, there were zero cases identified in MS–DRG 295, which would only consist of NonCC cases. Therefore, we analyzed the claims data to determine the number of cases, the average length of stay, and average costs for the 146 cases in MS–DRG 294 by severity level (1=MCC and 2=CC). Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
294-1	45	5.4	$14,085
294-2	101	3.5	$9,348
294 base DRG total	**146**	**4.1**	**$10,808**

We note that medical MS–DRGs 299, 300, and 301 (Peripheral Vascular Disorders with MCC, with CC, and without CC/MCC, respectively) also include diagnoses describing other types of phlebitis and thrombophlebitis in the logic for case assignment, consistent with the diagnosis codes in the logic for case assignment to MS–DRGs 294 and 295. As such, we reviewed the claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 299, 300, and 301 to examine the resource utilization associated with cases assigned to these MS–DRGs. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
299	14,129	5.5	$14,742
300	18,038	3.9	$9,757
301	3,807	2.5	$6,723

As shown in the data, the 45 cases reporting an MCC in MS–DRG 294 have an average length of stay of 5.4 days with average costs of $14,085, which is comparable to the cases in MS–DRG 299 reporting an MCC that have an average length of stay of 5.5 days with average costs of $14,742. The 101 cases reporting a CC in MS–DRG 294 have an average length of stay of 3.5 days with average costs of $9,348, which is comparable to the cases in MS–DRG 300 reporting an CC that have an average length of stay of 3.9 days with average costs of $9,757.

We stated in the proposed rule that based on our analysis and review of the cases grouping to MS–DRGs 294 and 295, we believed it is appropriate to delete these MS–DRGs and reassign the cases currently assigned to MS–DRGs 294 and 295 to MS–DRGs 299, 300, and 301, which are clinically consistent and also align with the resource utilization for these cases. Accordingly, for FY 2026, we proposed to delete MS–DRGs 294 and 295 and reassign the previously listed 35 diagnosis codes describing deep vein thrombophlebitis to MS–DRGs 299, 300, and 301. We refer the reader to the ICD–10 MS–DRG Version 42.1 Definitions Manual (which is available via the internet on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS–DRG-Classifications-and-Software* for complete documentation of the

GROUPER logic for MS–DRGs 299, 300, and 301.

Comment: Several commenters supported the proposal to delete MS–DRGs 294 and 295 and reassign the previously listed 35 diagnosis codes describing deep vein thrombophlebitis to MS–DRGs 299, 300, and 301.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to delete MS–DRGs 294 and 295 and reassign the 35 diagnosis codes describing deep vein thrombophlebitis listed previously that are currently assigned to MS–DRGs 294 and 295 to MS–DRGs 299, 300, and 301 for FY 2026.

5. MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)

a. Hip or Knee Procedures With Periprosthetic Joint Infection

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18049 through 18052), we discussed a request we received to reassign cases reporting a hip or knee procedure with a principal diagnosis of periprosthetic joint infection (PJI) from the lower severity level ''without CC/MCC'' MS–DRG to the higher severity level ''with CC'' MS–DRG when there is no major complication or comorbidity (MCC) or complication or comorbidity (CC) reported. According to the requestor, PJI is a devastating healthcare condition that occurs in one percent to two percent (1% to 2%) of primary joint replacements.[10] PJI is also the primary cause for revision arthroplasty in most developed markets. The requestor stated that patients undergoing revision for PJI experience higher mortality rates ranging from 0.8 to 4 percent at 1 year and 12.9 to 25.9 percent at 5 years following revision surgery.

According to the requestor, management of PJI requires complex treatment strategies including multiple surgical revisions and long-term antimicrobial treatment, leading to substantially higher costs versus aseptic revision arthroplasty. The requestor asserted that when missed or undertreated, PJI leads to persistence of infection and multiple surgical revisions causing poor function or disability, considerably impairing quality of life.

The requestor stated that current treatment options for PJI include chronic suppressive antibiotics; debridement, antibiotics, and implant retention (DAIR); one-stage revision; two-stage revision; and amputation. According to the requestor, regardless of the treatment option selected for the knee or hip, the presence of PJI as the principal diagnosis appears to significantly increase the length of stay and the resource utilization of these cases in comparison to all other cases assigned to the respective MS–DRGs.

Using the FY 2023 MedPAR file that informed FY 2025 rulemaking, the requestor stated it performed its own analysis of cases reporting PJI as the principal diagnosis. The requestor provided the following list of ICD–10–CM diagnosis codes it used to identify the presence of a PJI in the hip or knee joint.

ICD-10-CM Code	Description
T84.51XA	Infection and inflammatory reaction due to internal right hip prosthesis, initial encounter
T84.51XD	Infection and inflammatory reaction due to internal right hip prosthesis, subsequent encounter
T84.51XS	Infection and inflammatory reaction due to internal right hip prosthesis, sequela
T84.52XA	Infection and inflammatory reaction due to internal left hip prosthesis, initial encounter
T84.52XD	Infection and inflammatory reaction due to internal left hip prosthesis, subsequent encounter
T84.52XS	Infection and inflammatory reaction due to internal left hip prosthesis, sequela
T84.53XA	Infection and inflammatory reaction due to internal right knee prosthesis, initial encounter
T84.53XD	Infection and inflammatory reaction due to internal right knee prosthesis, subsequent encounter
T84.53XS	Infection and inflammatory reaction due to internal right knee prosthesis, sequela
T84.54XA	Infection and inflammatory reaction due to internal left knee prosthesis, initial encounter
T84.54XD	Infection and inflammatory reaction due to internal left knee prosthesis, subsequent encounter
T84.54XS	Infection and inflammatory reaction due to internal left knee prosthesis, sequela

The requestor stated that cases involving the DAIR procedure are commonly assigned to MS–DRGs 463, 464, and 465 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders with MCC, with CC, and without CC/MCC, respectively), MS–DRGs 480, 481, and 482 (Hip and Femur Procedures Except Major Joint with MCC, with CC, and without CC/MCC, respectively) or MS–DRG 485, 486, and 487 (Knee Procedures with Principal Diagnosis of Infection with MCC, with CC, and without CC/MCC, respectively). According to the requestor, in each of the scenarios reviewed, the average cost and average length of stay for cases with a principal diagnosis of PJI that grouped to the ''with CC'' or ''without CC/MCC'' MS–DRG are similar or higher and longer than the other cases assigned to the same MS–DRGs.

The requestor also stated that one-stage hip or knee revision procedures are typically assigned to MS–DRGs 466, 467, and 468 and the findings from their analysis showed the presence of a PJI as the principal diagnosis with a hip or knee revision procedure show a longer length of stay and a similar or higher average cost than for the other aseptic revision arthroplasties.

In addition, the requestor stated that its analysis of cases reporting PJI with the last treatment option, amputation, assigned to MS–DRGs 474, 475, and 476 (Amputation for Musculoskeletal System and Connective Tissue Disorders with MCC, with CC, and without CC/MCC, respectively) also showed a longer average length of stay and higher average costs compared to all other non-PJI cases in MS–DRGs 474, 475, and 476, further supporting the request to reassign cases to the ''with CC'' severity level MS–DRG.

In summary, the requestor specifically recommended the following modifications to the listed MS–DRGs for cases reporting a hip or knee procedure with a principal diagnosis of PJI:

[10] Corvec S, Portillo ME, Pasticci BM, Borens O, Trampuz A. Epidemiology and new developments in the diagnosis of prosthetic joint infection. Int J Artif Organs 2012;35:923–934.

Current MS-DRG Assignment	Requested MS-DRG Assignment
465 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders without CC/MCC)	MS-DRG 464 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders with CC)
MS-DRG 468 (Revision of Hip or Knee Replacement without CC/MCC)	MS-DRG 467 (Revision of Hip or Knee Replacement with CC)
MS-DRG 476 (Amputation for Musculoskeletal System and Connective Tissue Disorders without CC/MCC)	MS-DRG 475 (Amputation for Musculoskeletal System and Connective Tissue Disorders with CC)
MS-DRG 482 (Hip and Femur Procedures Except Major Joint without CC/MCC)	MS-DRG 481 (Hip and Femur Procedures Except Major Joint with CC)
MS-DRG 487 (Knee Procedures with Principal Diagnosis of Infection without CC/MCC)	MS-DRG 486 (Knee Procedures with Principal Diagnosis of Infection with CC)

We reviewed claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 463, 464, 465, 466, 467, 468, 474, 475, 476, 480, 481, 482, 485, 486, and 487 and for cases reporting a principal diagnosis of PJI with a hip or knee procedure. We refer the reader to Table 6P. 6a that was made publicly available in association with the proposed rule and is available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* for the list of diagnosis codes we analyzed to identify a PJI and for the list of procedure codes we analyzed from the previously listed MS–DRGs to identify a hip or knee procedure. Findings from our analysis are shown in the following table.

MS-DRG	Description	Number of Cases	Average Length of Stay	Average Costs
463	All cases	3,909	14.2	$45,233
	Cases with principal diagnosis of PJI with hip or knee procedure	804	13.9	$50,127
464	All cases	5,775	7.3	$26,757
	Cases with principal diagnosis of PJI with hip or knee procedure	1,358	7.7	$32,474
465	All cases	1,496	3.0	$16,794
	Cases with principal diagnosis of PJI with hip or knee procedure	237	4.3	$22,689
466	All cases	4,282	9.0	$43,314
	Cases with principal diagnosis of PJI with hip or knee procedure	460	11.2	$40,433
467	All cases	17,682	4.1	$30,612
	Cases with principal diagnosis of PJI with hip or knee procedure	947	6.5	$28,505
468	All cases	12,986	1.8	$24,921
	Cases with principal diagnosis of PJI with hip or knee procedure	160	4	$23,978
474	All cases	2,417	12.2	$35,707
	Cases with principal diagnosis of PJI with hip or knee procedure	112	13.6	$47,240
475	All cases	2,634	7.3	$19,577
	Cases with principal diagnosis of PJI with hip or knee procedure	166	7	$20,739
476	All cases	322	3.5	$10,454
	Cases with principal diagnosis of PJI with hip or knee procedure	27	4.1	$14,101
480	All cases	26,238	7.3	$26,430
	Cases with principal diagnosis of PJI with hip or knee procedure	136	11.7	$38,407
481	All cases	62,141	4.9	$19,153
	Cases with principal diagnosis of PJI with hip or knee procedure	234	7.4	$24,138
482	All cases	13,842	3.5	$14,886
	Cases with principal diagnosis of PJI with hip or knee procedure	30	4.6	$19,122
485	All cases	1,297	9.5	$29,761
	Cases with principal diagnosis of PJI with hip or knee procedure	521	9.6	$31,779
486	All cases	2,574	6.0	$19,679
	Cases with principal diagnosis of PJI with hip or knee procedure	985	5.8	$21,376
487	All cases	632	4.1	$14,615
	Cases with principal diagnosis of PJI with hip or knee procedure	194	4	$16,616

The findings show that the cases reporting a PJI with a hip or knee procedure in MS–DRGs 466, 467, and 468 have a slightly longer average length of stay and lower average costs compared to the average length of stay and average costs of all the cases in their respective MS–DRGs. Therefore, because the resource utilization of these cases is generally comparable to all the cases in their respective MS–DRGs, we believe the cases reporting a PJI in MS–DRGs 466, 467, and 468 appear to be grouping appropriately in their current MS–DRG assignment.

The findings show that for the cases reporting a PJI with a hip or knee procedure in MS–DRGs 463, 464, 465, 474, 475, 476, 485, 486, and 487, the average length of stay is comparable to the average length of stay of all the cases in their respective MS–DRGs, however, the average length of stay for the cases reporting a PJI with a hip or knee procedure in MS–DRGs 480, 481, and 482 are notably longer compared to the average length of stay of all the cases in their respective MS–DRGs. Findings from our analysis also show that the average costs of the cases reporting a PJI with a hip or knee procedure in MS–DRGs 463, 464, 465, 474, 475, 476, 480, 481, and 482 are higher compared to the average costs of all the cases in their respective MS–DRGs with a difference in average costs of approximately $5,459 for cases reporting a PJI with a hip or knee procedure across MS–DRGs 463, 464, and 465, a difference in average costs of approximately $5,190 for cases reporting a PJI with a hip or knee procedure across MS–DRGs 474, 475, and 476, and a difference in average costs of approximately $7,306 for cases reporting a PJI with a hip or knee procedure across MS–DRGs 480, 481 and 482. However, because MS–DRGs

485, 486, and 487 currently include a principal diagnosis of infection in the logic for case assignment to these MS–DRGs, the difference in average costs for the cases reporting a PJI with a hip or knee procedure compared to the average costs of all the cases in their respective MS–DRG is minimal ($2,018, $1,697, and $2,001, respectively).

We stated in the proposed rule that, based on our review and analysis of the data, we disagreed with the request to reassign PJI cases from the lower severity ''without CC/MCC'' level MS–DRG to the higher severity ''with CC'' level MS–DRG suggested by the requestor as the average costs of the PJI cases in the ''without CC/MCC'' level are not comparable and do not align with the average costs of all the cases at the ''with CC'' level. In addition, our findings show that other than for MS–DRGs 466, 467, and 468, the cases reporting a PJI with a hip or knee procedure at the higher ''with CC'' level and the highest ''with MCC'' level have higher average costs compared to all the cases in their respective MS–DRG. For example, as reflected in the findings of our analysis for MS–DRGs 463, 464, and 465, if we were to reassign the 237 cases reporting a PJI with a hip or knee procedure with an average length of stay of 4.3 days and average costs of $22,689 from MS–DRG 465 to MS–DRG 464 where we found a total of 5,775 cases with an average length of stay of 7.3 days and average costs of $26,757, the 1,358 cases reporting a PJI with a hip or knee procedure with an average length of stay of 7.7 days and average costs of $32,474 in MS–DRG 464 and the 804 cases reporting a PJI with a hip or knee procedure with an average length of stay of 13.9 days and average costs of $50,127 in MS–DRG 463 would continue to not be comparable from a resource perspective as compared to all the cases in their assigned MS–DRGs. We stated we believe the data support proposing a new base MS–DRG for the cases reporting a PJI with a hip or knee procedure in MS–DRGs 463, 464, 465, 474, 475, 476, 480, 481, and 482 to better reflect the complexity of services, resource utilization, and severity of illness of these patients.

We stated we applied the criteria to create subgroups in a base MS–DRG as discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule. We noted that, as shown in the table that follows, a three-way split of this proposed new base MS–DRG failed to meet the criterion that at least 500 or more cases are in the ''without CC/MCC'' subgroup. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	1,052	13.6	$48,305
With CC	1,758	7.6	$30,256
Without CC/MCC	293	4.3	$21,505

As discussed in section II.C.1.b. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, if the criteria for a three-way split fail, the next step is to determine if the criteria are satisfied for a two-way split. Therefore, we applied the criteria for a two-way split for the ''with MCC and without MCC'' subgroups and found that all five criteria were met. The following table illustrates our findings.

Proposed New MS-DRGs	Number of Cases	Average Length of Stay	Average Costs
With MCC	1,052	13.6	$48,305
Without MCC	2,051	7.1	$29,006

For the proposed new MS–DRGs for cases reporting a PJI with a hip or knee procedure, there is at least: (1) 500 cases in the MCC subgroup and 500 cases in the without MCC subgroup; (2) 5 percent of the cases in the MCC group and 5 percent in the without MCC subgroup; (3) a 20 percent difference in average costs between the MCC group and the without MCC group; (4) a $2,000 difference in average costs between the MCC group and the without MCC group; and (5) a 3-percent reduction in cost variance, indicating that the proposed severity level splits increase the explanatory power of the base MS–DRG in capturing differences in expected cost between the proposed MS–DRG severity level splits by at least 3 percent and thus improve the overall accuracy of the IPPS payment system.

As a result, for FY 2026, we proposed to create new MS–DRGs 403 and 404 (Hip or Knee Procedures with Principal Diagnosis of Periprosthetic Joint Infection with MCC and without MCC, respectively). The following table reflects a simulation of the proposed new MS–DRGs.

Proposed New MS-DRG	Number of Cases	Average Length of Stay	Average Costs
Proposed MS-DRG 403	1,052	13.6	$48,305
Proposed MS-DRG 404	2,051	7.1	$29,006

Comment: Several commenters supported the proposal to create proposed new MS–DRGs 403 and 404. A commenter stated it was pleased that CMS is taking note of the resource intensiveness required to thoroughly treat periprosthetic joint infections (PJI). According to the commenter, PJIs have become more prevalent in recent years and are now the leading cause of revision surgery in both Total Knee Arthroplasty (TKA) and Total Hip Arthroplasty (THA) procedures. The commenter stated that according to the American Joint Replacement Registry, PJIs account for over 20 percent of hip revisions and 28 percent of knee revisions annually. The commenter expressed agreement with CMS' statement in the proposed rule that there are multiple MS–DRGs to which these cases are assigned dependent on treatment type. The commenter stated that given the wide variability of cost among the cases in the MS–DRGs analyzed, they appreciate that CMS proposed to assign these cases to

proposed new MS–DRGs based on a principal diagnosis of PJI. The commenter stated its belief that these proposed new MS–DRGs will provide more accurate and appropriate payment for the treatment of PJI commensurate with the complexity of these cases. The commenter also stated that as this epidemic of PJI is growing, they want to ensure that individuals facing challenges with treatment of PJI have access to a quality health care system which is primarily based on a set of organizational structures to ensure rapid diagnosis and appropriate treatment, and this proposed change is a significant positive step in that direction. Another commenter who expressed support for the proposal recommended that CMS and other stakeholders take caution and closely monitor these proposed new MS–DRGs if finalized, to observe how the proposed new structure may alter referral patterns, utilization, or site of service for unanticipated effects. This commenter also suggested that CMS identify the party requesting reassignment and stated that in the interest of transparency in public programs, when CMS addresses a reclassification request in the annual proposed rulemakings, it should be clear to the public which parties are requesting the changes so that stakeholders can take that into account when commenting to CMS.

Response: We appreciate the commenters' support. In response to the commenter's recommendation that any finalized policy should continue to be closely monitored, we thank the commenter for the feedback and note that we review the MS–DRGs for changes in treatment patterns and resource utilization on an annual basis. With respect to the request that CMS identify the party requesting reassignment for transparency, we will consider this suggestion for future rulemaking.

Comment: A commenter who expressed support for the creation of proposed new MS–DRGs 403 and 404 stated it encountered inconsistencies with case volumes when grouping cases using the Version 43 test GROUPER that was made publicly available in association with the FY 2026 IPPS/LTCH PPS proposed rule on the CMS website: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software.* The commenter stated it reviewed CMS' analysis findings summarized in the proposed rule and the accompanying After Outliers Removed and Before Outliers Removed (AOR/BOR) file that shows the case volume and MS–DRG shifts between the Version 42.1 GROUPER and Version 43 test GROUPER and identified differences in case volume shifts among the MS–DRGs that were analyzed for proposed new MS–DRGs 403 and 404. The commenter indicated that it was challenging to understand the rationale for some of the shifts in case volume among the MS–DRGs when comparing the AOR/BOR file to the proposed rule findings. The commenter stated it validated that the data appropriately reflected declining volume in MS–DRGs 463, 464, 465, 474, 475, 476, 480, 481, and 482 as CMS outlined in the analysis as the cases shifted to proposed new MS–DRGs 403 and 404. The commenter also validated that CMS' analysis excluded MS–DRGs 485, 486, and 487 and these MS–DRGs reflected zero cases shifting as CMS outlined in the preamble of the proposed rule (90 FR 18051) and in the AOR/BOR file that was made publicly available in association with the proposed rule at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps.* However, the commenter stated that the AOR/BOR file shows a decline (that is, shift) in case volume for MS–DRG 466 (243 cases), MS–DRG 467 (406 cases), and MS–DRG 468 (48 cases), resulting in a total decline of 699 cases while the proposed rule analysis identified a total of 1,567 cases reporting a principal diagnosis of PJI with a hip or knee procedure among those MS–DRGs (MS–DRG 466 (460 cases); MS–DRG 467 (947 cases); and MS–DRG 468 (160 cases)). The commenter also stated that in the proposed rule analysis, CMS noted that it excluded MS–DRGs 466, 467, and 468 from further consideration because it believed those cases were grouping appropriately in their current MS–DRG assignment.

The commenter stated that they reviewed the list of procedure codes analyzed by CMS, which was made publicly available in Table 6P.6a in connection with the proposed rule, as well as the list of procedure codes in the logic for MS–DRGs 466, 467, and 468 included in the Draft Version 43 ICD–10 MS–DRG Definitions Manual and noted an overlap of approximately 52 procedure codes. The commenter provided the example of procedure code 0SRB0EZ (Replacement of left hip joint with articulating spacer, open approach) and stated this procedure code is included in both lists. The commenter stated it recognized that logically the surgical hierarchy would result in the assignment of MS–DRG 403 or 404 versus MS–DRGs 466, 467, or 468, however, the commenter expressed concern regarding the case shift for 699 of the 1,567 cases from MS–DRGs 466, 467, and 468 into the proposed new MS–DRGs 403 and 404 and that the shift was not acknowledged nor explained in the proposed rule. The commenter stated their belief that the shifts should have been included within the proposed rule and explained for data transparency. According to the commenter, the lack of detail in the proposed rule made it unclear if the cases shifted because of the procedure code overlap or because of programming within the Version 43 test GROUPER. The commenter requested CMS provide an explanation for the decline in case volume among MS–DRGs 466, 467, and 468.

The commenter stated that during its review of the shift in case volume among MS–DRGs 466, 467, and 468, it identified inconsistencies in the assignment of cases to proposed new MS–DRGs 403 and 404 utilizing the Version 43 test GROUPER. The commenter provided examples of eight different test cases that included procedure codes from the list in Table 6P.6a that was made available in association with the proposed rule. According to the commenter's review, all eight cases should have resulted in assignment to the proposed new MS–DRGs 403 and 404; however, using the Version 43 test GROUPER, only four of the test cases grouped to proposed new MS–DRGs 403 and 404 while the remaining four test cases grouped to current MS–DRGs 463 or 464. The commenter stated that proposed new MS–DRGs 403 and 404 are proposed to be sequenced higher in the surgical hierarchy than existing MS–DRGs 463 and 464, therefore, the commenter requested an explanation regarding the accuracy of the Version 43 test GROUPER and the impact on the AOR/BOR file. The commenter requested additional transparency with regard to the MS–DRG groupings, the Version 43 test GROUPER, and the AOR/BOR file. Additionally, the commenter stated that if the findings demonstrate inaccuracies, corrected versions should be made available. The commenter suggested that for future rulemaking CMS consider including further insight, rationale and transparency regarding any shifts in volume that may result from proposed changes to MS–DRG logic.

Response: We appreciate the commenter's support and feedback. The commenter is correct that there is a redistribution (or shift) in cases among the MS–DRGs that were analyzed and discussed in the proposed rule (466, 467, and 468). We note that under the

GROUPER software program some collections of ICD–10–PCS procedure codes have a different set of attributes, independent of those of the codes that make them up (that is, their ''components''). These collections of ICD–10–PCS procedure codes are called clusters. A routine program in the GROUPER, upstream of the MS–DRG assignment logic, searches the claim for clusters. When a cluster is found, it is added to the list of procedures found on the claim. Clusters may be ''restricted'' by Major Diagnostic Category (MDC) and a restricted cluster inhibits the use of its procedure code component attributes for the MDC's MS–DRG assignment logic. For example, procedure code cluster 0SPC0JZ (Removal of synthetic substitute from right knee joint, open approach) and 0SRT0JZ (Replacement of right knee joint, femoral surface with synthetic substitute, open approach) may be recognized on a claim if both codes appear (in any order). The reporting of these codes creates a new procedure code cluster ''@0045''. The cluster @ 0045 has a different set of attributes than either code 0SPC0JZ or 0SRT0JZ by itself and is further ''restricted'' for MDC 08. When the GROUPER logic determines that the MDC is 08, it ignores the attributes of procedure codes 0SPC0JZ and 0SRT0JZ individually, only using those of @0045. This logic results in assignment of the claim to MS–DRGs 466, 467, and 468 (Revision of Hip or Knee Replacement with MCC, with CC, and without CC/MCC, respectively) rather than MS–DRGs 463, 464, and 465 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders with MCC, with CC, and without CC/MCC, respectively). If the principal diagnosis reported is not assigned under MDC 08, the cluster would not restrict the interpretation of the component codes and their individual attributes could be relevant as well as those of @0045.

Following publication of the proposed rule, we identified that the intended grouping of cases to the proposed new MS–DRGs was impacted because of these cluster restrictions under MDC 08, therefore we removed the restrictions and performed additional analysis. As a result of removing the restrictions, and due to the existing overlapping procedure code logic among a subset of the MDC 08 MS–DRGs, our analysis showed that further redistribution of the cases under MDC 08 occurs, impacting the remaining number of cases in MS–DRGs 466, 467, and 468 and MS–DRGs 485, 486, and 487, such that, those MS–DRGs no longer satisfy the criteria for a 3-way split. Under our established process for applying the criteria to create subgroups within a base MS–DRG, existing MS–DRGs 466, 467, and 468 would be deleted and a new base MS–DRG for Revision of Hip or Knee Replacement would be established. Additionally, under this established process, existing MS–DRGs 485, 486, and 487 would be deleted and new MS–DRGs (2-way split) for Knee Procedures with Principal Diagnosis of Infection with and without MCC, respectively, would be established. Because these findings were not identified until after publication of the proposed rule, we believe it is appropriate to further consider the creation of proposed new MS–DRGs 403 and 404, along with the removal of the MDC 08 restrictions on the procedure code clusters and the potential implications for existing MS–DRGs 466, 467, and 468 and MS–DRGs 485, 486, and 487, as well as the creation of new MS–DRGs, in addition to having an updated test Grouper that reflects these potential changes. We also note that any future proposed MS–DRG changes may also impact the surgical hierarchy.

After consideration of the public comments we received, and for the reasons described, we are not finalizing our proposal to create new MS–DRGs 403 and 404 (Hip or Knee Procedures with Principal Diagnosis of Periprosthetic Joint Infection with MCC and without MCC, respectively) for FY 2026. As noted, we may further consider these potential MS–DRG changes for future rulemaking.

b. Arthroscopy

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18052 through 18054), we stated that consistent with our annual review of the MS–DRGs, we consider changes in resource consumption, treatment patterns, technology, and any other factors that may change the relative use of hospital resources. We noted that in our review of the claims data from the September 2024 update of the FY 2024 MedPAR file, we identified an extremely low volume of cases for MS–DRG 509 (Arthroscopy). Specifically, we found 16 cases with an average length of stay of 5.2 days and average costs of $18,239.

An arthroscopy is a surgical procedure that allows orthopedic surgeons to see the inside of a joint through a small incision and with specialized instruments (for example, arthroscope). The ICD–10–PCS codes describing arthroscopy and currently assigned to MS–DRG 509 are shown in the following table.

BILLING CODE 4120–01–P

PROCEDURE CODES DESCRIBING ARTHROSCOPY IN MS-DRG 509	
ICD-10-PCS Code	**Description**
0RJ04ZZ	Inspection of occipital-cervical joint, percutaneous endoscopic approach
0RJ14ZZ	Inspection of cervical vertebral joint, percutaneous endoscopic approach
0RJ34ZZ	Inspection of cervical vertebral disc, percutaneous endoscopic approach
0RJ44ZZ	Inspection of cervicothoracic vertebral joint, percutaneous endoscopic approach
0RJ54ZZ	Inspection of cervicothoracic vertebral disc, percutaneous endoscopic approach
0RJ64ZZ	Inspection of thoracic vertebral joint, percutaneous endoscopic approach
0RJ94ZZ	Inspection of thoracic vertebral disc, percutaneous endoscopic approach
0RJA4ZZ	Inspection of thoracolumbar vertebral joint, percutaneous endoscopic approach
0RJB4ZZ	Inspection of thoracolumbar vertebral disc, percutaneous endoscopic approach
0RJE4ZZ	Inspection of right sternoclavicular joint, percutaneous endoscopic approach
0RJF4ZZ	Inspection of left sternoclavicular joint, percutaneous endoscopic approach
0RJG4ZZ	Inspection of right acromioclavicular joint, percutaneous endoscopic approach
0RJH4ZZ	Inspection of left acromioclavicular joint, percutaneous endoscopic approach
0RJJ4ZZ	Inspection of right shoulder joint, percutaneous endoscopic approach
0RJK4ZZ	Inspection of left shoulder joint, percutaneous endoscopic approach
0RJL4ZZ	Inspection of right elbow joint, percutaneous endoscopic approach
0RJM4ZZ	Inspection of left elbow joint, percutaneous endoscopic approach
0RJN4ZZ	Inspection of right wrist joint, percutaneous endoscopic approach
0RJP4ZZ	Inspection of left wrist joint, percutaneous endoscopic approach
0RJQ4ZZ	Inspection of right carpal joint, percutaneous endoscopic approach
0RJR4ZZ	Inspection of left carpal joint, percutaneous endoscopic approach
0RJS4ZZ	Inspection of right carpometacarpal joint, percutaneous endoscopic approach
0RJT4ZZ	Inspection of left carpometacarpal joint, percutaneous endoscopic approach
0RJU4ZZ	Inspection of right metacarpophalangeal joint, percutaneous endoscopic approach
0RJV4ZZ	Inspection of left metacarpophalangeal joint, percutaneous endoscopic approach
0RJW4ZZ	Inspection of right finger phalangeal joint, percutaneous endoscopic approach
0RJX4ZZ	Inspection of left finger phalangeal joint, percutaneous endoscopic approach
0SJ04ZZ	Inspection of lumbar vertebral joint, percutaneous endoscopic approach
0SJ34ZZ	Inspection of lumbosacral joint, percutaneous endoscopic approach
0SJ54ZZ	Inspection of sacrococcygeal joint, percutaneous endoscopic approach
0SJ64ZZ	Inspection of coccygeal joint, percutaneous endoscopic approach
0SJ74ZZ	Inspection of right sacroiliac joint, percutaneous endoscopic approach
0SJ84ZZ	Inspection of left sacroiliac joint, percutaneous endoscopic approach
0SJ94ZZ	Inspection of right hip joint, percutaneous endoscopic approach
0SJB4ZZ	Inspection of left hip joint, percutaneous endoscopic approach
0SJC4ZZ	Inspection of right knee joint, percutaneous endoscopic approach
0SJD4ZZ	Inspection of left knee joint, percutaneous endoscopic approach
0SJF4ZZ	Inspection of right ankle joint, percutaneous endoscopic approach
0SJG4ZZ	Inspection of left ankle joint, percutaneous endoscopic approach
0SJH4ZZ	Inspection of right tarsal joint, percutaneous endoscopic approach
0SJJ4ZZ	Inspection of left tarsal joint, percutaneous endoscopic approach
0SJK4ZZ	Inspection of right tarsometatarsal joint, percutaneous endoscopic approach
0SJL4ZZ	Inspection of left tarsometatarsal joint, percutaneous endoscopic approach
0SJM4ZZ	Inspection of right metatarsal-phalangeal joint, percutaneous endoscopic approach
0SJN4ZZ	Inspection of left metatarsal-phalangeal joint, percutaneous endoscopic approach
0SJP4ZZ	Inspection of right toe phalangeal joint, percutaneous endoscopic approach
0SJQ4ZZ	Inspection of left toe phalangeal joint, percutaneous endoscopic approach

BILLING CODE 4120–01–C

In light of our initial findings of 16 cases for MS–DRG 509, we further reviewed the MedPAR claims data for cases assigned to MS–DRG 509 for the past 5 fiscal years. As reflected in the following table, the data indicate that the number of cases grouping to MS–DRG 509 has steadily declined.

FY and MedPAR Data Reviewed	Number of Cases	Average Lenth of Stay	Average Costs
FY 2022 (FY 2020 MedPAR)	25	3.9	$10,372
FY 2023 (FY 2021 MedPAR)	31	4.2	$10,882
FY 2024 (FY 2022 MedPAR)	34	4.3	$11,380
FY 2025 (FY 2023 MedPAR)	21	5.4	$13,683
FY 2026 (FY 2024 MedPAR)	16	5.2	$18,239

We noted that, if, during our annual MS–DRG analysis we identify that there are only a few patients in a respective MS–DRG, consistent with our established process, we consider if there have been potential changes in the clinical characteristics of the patients, treatment patterns, or resource utilization. A principle of the MS–DRGs and the characteristics of a meaningful DRG classification scheme is the ability to detect such changes and accordingly, propose clinically appropriate modifications that are also consistent with resource utilization.

We stated we believe that the volume of cases reporting the arthroscopy procedures in the inpatient setting has shifted to the outpatient setting over the years; it is usually performed as an outpatient procedure. Of the 16 cases found to report an arthroscopy procedure in the FY 2024 MedPAR data, 13 cases also reported another procedure. For example, one case that reported procedure code 0RJK4ZZ (Inspection of left shoulder joint, percutaneous endoscopic approach) also reported procedure code 0RBK4ZZ (Excision of left shoulder joint, percutaneous endoscopic approach). Procedure code 0RBK4ZZ is assigned to MS–DRGs 510, 511, and 512 (Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures with MCC, with CC, and without CC/MCC, respectively). However, because of the surgical hierarchy, the resulting assignment is MS–DRG 509.

Using the September 2024 update of the FY 2024 MedPAR file, we also reviewed the base DRG by severity claims data for MS–DRG 509 to determine the number of cases, average length of stay and average costs for the 16 cases by severity level (1=MCC, 2=CC and 3=NonCC). Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
509-1	4	5.5	$15,196
509-2	7	6.1	$27,880
509-3	5	3.6	$7,177
509 base DRG total	**16**	**5.2**	**$18,239**

Next, we reviewed the claims data from the September 2024 update of the FY 2024 MedPAR file for MS–DRGs 510, 511, and 512 (Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 513 and 514 (Hand or Wrist Procedures, Except Major Thumb or Joint Procedures with CC/MCC and without CC/MCC, respectively); and MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) because these MS–DRGs are considered to be clinically appropriate and consistent with the arthroscopy procedure code descriptions in MS–DRG 509 previously listed that specify the anatomic site. Our findings are shown in the following tables.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
510	916	6.4	$25,000
511	2,538	4.3	$18,701
512	1,303	2.6	$14,582

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
513	1,335	5.0	$14,219
514	317	2.6	$9,556

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
515	4,095	8.4	$28,466
516	10,522	5.0	$18,832
517	5,951	2.9	$14,067

Based on our analysis and review of the cases grouping to MS–DRG 509, we stated that we believe it is appropriate to delete MS–DRG 509 and reassign the 47 procedure codes describing arthroscopy of various anatomic sites to clinically appropriate MS–DRGs that also align with the resource utilization for these cases. For example, of the 16 cases found to group to MS–DRG 509, in addition to identifying 13 cases reporting additional procedures as previously discussed, we also identified 11 cases reporting diagnosis codes designated as a CC or MCC where the average length of stay and average costs of those cases are comparable with the average length of stay and average costs of the cases in the MS–DRGs considered clinically appropriate for their reassignment. Therefore, for FY 2026, of the 47 procedure codes previously listed describing arthroscopy of various anatomic sites, we proposed to do the following:

- Reassign the 8 procedure codes describing arthroscopy of the shoulder or elbow joint to MS–DRGs 510, 511, and 512 (Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures with MCC, with CC, and without CC/MCC, respectively).
- Reassign the 10 procedure codes describing arthroscopy of the hand or wrist joint to MS–DRGs 513 and 514 (Hand or Wrist Procedures, Except Major Thumb or Joint Procedures with CC/MCC and without CC/MCC, respectively).
- Reassign the 29 procedure codes describing arthroscopy of various vertebral joints and other

musculoskeletal joints to MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively).

We refer the reader to Table 6P.7a made publicly available in association with the proposed rule and available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* for the detailed list of procedure codes with the proposed MS–DRG reassignments.

Comment: Commenters supported our proposal to delete MS–DRG 509 and to reassign the 47 procedure codes describing arthroscopy of various anatomic sites to the proposed clinically appropriate MS–DRGs.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to delete MS–DRG 509 and to reassign the 47 procedure codes describing arthroscopy of various anatomic sites to clinically appropriate MS–DRGs, as reflected in Table 6P.7a in association with this final rule and available at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*.

c. MS–DRG Logic for MS–DRGs 456, 457, and 458

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18054 through 18056), we identified an inconsistency in the GROUPER logic for MS–DRGs 456, 457, and 458 (Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions with MCC, with CC, and without CC/MCC, respectively) related to the ICD–10–CM diagnosis codes describing a principal diagnosis of infection. The logic for case assignment to MS–DRGs 456, 457, and 458 as displayed in the ICD–10 MS–DRG Definitions Manual Version 42.1 (which is available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*) is comprised of four logic lists. The first logic list is titled ''Spinal Fusion Except Cervical'' and is defined by a list of procedure codes designated as O.R. procedures that describe spinal fusion procedures of the thoracic, thoracolumbar, lumbar, lumbosacral, sacrococcygeal, and sacroiliac joint. (We note that 12 procedure codes describing Fusion of coccygeal joint were deleted effective with discharges beginning April 1, 2025 in version 42.1). The second logic list is titled ''Spinal Curvature/Malignancy/Infection'' and is defined by a list of diagnosis codes describing spinal curvature, spinal malignancy, and spinal infection that are used to define the logic for case assignment when any one of the listed diagnosis codes is reported as the principal diagnosis. The third logic list is titled ''OR Secondary Diagnosis'' and is defined by a list of diagnosis codes describing curvature of the spine that are used to define the logic for case assignment when any one of the listed codes is reported as a secondary diagnosis. The fourth logic list is titled ''Extensive Fusions'' and is defined by a list of procedure codes designated as O.R. procedures that describe extensive spinal fusion procedures. We refer the reader to the ICD–10 MS–DRG Definitions Manual Version 42.1, (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) for complete documentation of the GROUPER logic for MS–DRGs 456, 457, and 458.

In the second logic list titled ''Spinal Curvature/Malignancy/Infection'' there are a subset of diagnosis codes describing spinal infections. We stated in the proposed rule that in our review and analysis of MS–DRGs 456, 457, and 458, we identified additional diagnosis codes within the ICD–10–CM classification describing spinal infections that are not currently listed in the logic for case assignment to MS–DRGs 456, 457, and 458. Specifically, we identified the following 47 diagnoses that we believe are clinically appropriate to add to the existing diagnosis codes describing spinal infections in MS–DRGs 456, 457, and 458.

BILLING CODE 4120–01–P

ICD-10-CM Code	Description
A02.24	Salmonella osteomyelitis
A54.40	Gonococcal infection of musculoskeletal system, unspecified
A54.41	Gonococcal spondylopathy
A54.43	Gonococcal osteomyelitis
A54.49	Gonococcal infection of other musculoskeletal tissue
M46.21	Osteomyelitis of vertebra, occipito-atlanto-axial region
M46.22	Osteomyelitis of vertebra, cervical region
M46.23	Osteomyelitis of vertebra, cervicothoracic region
M46.30	Infection of intervertebral disc (pyogenic), site unspecified
M46.31	Infection of intervertebral disc (pyogenic), occipito-atlanto-axial region
M46.32	Infection of intervertebral disc (pyogenic), cervical region
M46.33	Infection of intervertebral disc (pyogenic), cervicothoracic region
M46.34	Infection of intervertebral disc (pyogenic), thoracic region
M46.35	Infection of intervertebral disc (pyogenic), thoracolumbar region
M46.36	Infection of intervertebral disc (pyogenic), lumbar region
M46.37	Infection of intervertebral disc (pyogenic), lumbosacral region
M46.38	Infection of intervertebral disc (pyogenic), sacral and sacrococcygeal region
M46.39	Infection of intervertebral disc (pyogenic), multiple sites in spine
M46.50	Other infective spondylopathies, site unspecified
M46.51	Other infective spondylopathies, occipito-atlanto-axial region
M46.52	Other infective spondylopathies, cervical region
M46.53	Other infective spondylopathies, cervicothoracic region
M46.54	Other infective spondylopathies, thoracic region
M46.55	Other infective spondylopathies, thoracolumbar region
M46.56	Other infective spondylopathies, lumbar region
M46.57	Other infective spondylopathies, lumbosacral region
M46.58	Other infective spondylopathies, sacral and sacrococcygeal region
M46.59	Other infective spondylopathies, multiple sites in spine
M86.00	Acute hematogenous osteomyelitis, unspecified site
M86.09	Acute hematogenous osteomyelitis, multiple sites
M86.10	Other acute osteomyelitis, unspecified site
M86.19	Other acute osteomyelitis, multiple sites
M86.20	Subacute osteomyelitis, unspecified site
M86.29	Subacute osteomyelitis, multiple sites
M86.30	Chronic multifocal osteomyelitis, unspecified site
M86.39	Chronic multifocal osteomyelitis, multiple sites
M86.40	Chronic osteomyelitis with draining sinus, unspecified site
M86.49	Chronic osteomyelitis with draining sinus, multiple sites
M86.50	Other chronic hematogenous osteomyelitis, unspecified site
M86.59	Other chronic hematogenous osteomyelitis, multiple sites
M86.60	Other chronic osteomyelitis, unspecified site
M86.69	Other chronic osteomyelitis, multiple sites
M86.8X0	Other osteomyelitis, multiple sites
M86.8X9	Other osteomyelitis, unspecified sites
M86.9	Osteomyelitis, unspecified
T84.63XA	Infection and inflammatory reaction due to internal fixation device of spine, initial encounter
T84.69XA	Infection and inflammatory reaction due to internal fixation device of other site, initial encounter

BILLING CODE 4120–01–C

Therefore, for clinical consistency and because these codes describe spinal infections that could reasonably require a spinal fusion procedure, we proposed to add the previously listed diagnosis codes to the logic list titled ''Spinal Curvature/Malignancy/Infection'' in MS–DRGs 456, 457, and 458, effective October 1, 2025 for FY 2026.

We also identified eight diagnosis codes currently listed in the second logic list titled ''Spinal Curvature/Malignancy/Infection'' for case assignment to MS–DRGs 456, 457, and 458 that we believe are not clinically appropriate to maintain in the list. Specifically, we identified the following diagnoses.

ICD-10-CM Code	Description
M4850XA	Collapsed vertebra, not elsewhere classified, site unspecified, initial encounter for fracture
M4854XA	Collapsed vertebra, not elsewhere classified, thoracic region, initial encounter for fracture
M4855XA	Collapsed vertebra, not elsewhere classified, thoracolumbar region, initial encounter for fracture
M4856XA	Collapsed vertebra, not elsewhere classified, lumbar region, initial encounter for fracture
M4857XA	Collapsed vertebra, not elsewhere classified, lumbosacral region, initial encounter for fracture
M4858XA	Collapsed vertebra, not elsewhere classified, sacral and sacrococcygeal region, initial encounter for fracture
M8008XA	Age-related osteoporosis with current pathological fracture, vertebra(e), initial encounter for fracture
M8088XA	Other osteoporosis with current pathological fracture, vertebra(e), initial encounter for fracture

The previously listed diagnosis codes do not describe a spinal curvature, malignancy or infection, rather they describe compression fractures of various anatomic sites (for example, collapsed vertebra) and osteoporosis is a condition where the bones become weakened leading to an increased risk of bone fracture. Therefore, for clinical consistency and to ensure accuracy in the logic for case assignment, we proposed to remove the eight previously listed diagnosis codes from the logic list titled ''Spinal Curvature/Malignancy/Infection'' in MS–DRGs 456, 457, and 458, effective October 1, 2025 for FY 2026.

Comment: Commenters supported our proposal to add the previously listed 47 diagnosis codes to the logic list titled ''Spinal Curvature/Malignancy/Infection'' in MS–DRGs 456, 457, and 458, and our proposal to delete the eight previously listed diagnosis codes from the logic list titled ''Spinal Curvature/Malignancy/Infection'' in MS–DRGs 456, 457, and 458.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to add the previously listed 47 diagnosis codes to the logic list titled ''Spinal Curvature/Malignancy/Infection'' in MS–DRGs 456, 457, and 458, effective October 1, 2025 for FY 2026. We are also finalizing, without modification, our proposal to remove the eight previously listed diagnosis codes from the logic list titled ''Spinal Curvature/Malignancy/Infection'' in MS–DRGs 456, 457, and 458, effective October 1, 2025 for FY 2026.

6. Review of Procedure Codes in MS–DRGs 981 Through 983 and 987 Through 989

We annually conduct a review of procedures producing assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS–DRGs 987 through 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) on the basis of volume, by procedure, to see if it would be appropriate to move cases reporting these procedure codes out of these MS–DRGs into one of the surgical MS–DRGs for the MDC into which the principal diagnosis falls. The data are arrayed in two ways for comparison purposes. We look at a frequency count of each major operative procedure code. We also compare procedures across MDCs by volume of procedure codes within each MDC. We use this information to determine which procedure codes and diagnosis codes to examine.

We identify those procedures occurring in conjunction with certain principal diagnoses with sufficient frequency to justify adding them to one of the surgical MS–DRGs for the MDC in which the diagnosis falls. We also consider whether it would be more appropriate to move the principal diagnosis codes into the MDC to which the procedure is currently assigned.

Based on the results of our review of the claims data from the September 2024 update of the FY 2024 MedPAR file of cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989, we proposed to move the cases reporting the procedures and/or principal diagnosis codes described in this section of this rule from MS–DRGs 981 through 983 or MS–DRGs 987 through 989 into one of the surgical MS–DRGs for the MDC into which the principal diagnosis or procedure is assigned.

a. Control of Bleeding in the Genitourinary Tract

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18056 through 18057), during the review of the cases that group to MS–DRGs 981 through 983, we noted that when ICD–10–PCS procedure codes describing the control of bleeding in the genitourinary tract are reported in conjunction with ICD–10–CM diagnosis codes in MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs, and Immunologic Disorders), the cases group to MS–DRGs 981 through 983. The five ICD–10–CM procedure codes reviewed, as well as their current MDC assignments, are found in the table:

ICD-10-PCS Code	Description	MDC
0W3R0ZZ	Control bleeding in genitourinary tract, open approach	05; 11; 12; 13; 17; 21; 24
0W3R3ZZ	Control bleeding in genitourinary tract, percutaneous approach	05; 11; 12; 13; 17; 21; 24
0W3R4ZZ	Control bleeding in genitourinary tract, percutaneous endoscopic approach	05; 11; 12; 13; 17; 21; 24
0W3R7ZZ	Control bleeding in genitourinary tract, via natural or artificial opening	05; 11; 12; 13; 17; 21; 24
0W3R8ZZ	Control bleeding in genitourinary tract, via natural or artificial opening endoscopic	05; 11; 12; 13; 17; 21; 24

We refer the reader to Appendix E of the ICD–10 MS–DRG Version 42.1 Definitions Manual, which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps.html*, for the MS–DRG assignment for each procedure code listed and further discussion of how each procedure code may be assigned to multiple MDCs and MS–DRGs under the IPPS.

The principal diagnosis most frequently reported with the five ICD–10–PCS procedure codes describing the control of bleeding in the genitourinary tract in MDC 16 is ICD–10–CM code D68.32 (Hemorrhagic disorder due to extrinsic circulating anticoagulants). Hemorrhagic disorder due to extrinsic circulating anticoagulants is a condition

that occurs when bleeding is caused by anticoagulants or antithrombotics, which are medicines commonly used to treat or prevent blood clots by decreasing the amount of clotting proteins in the blood.

As noted in the proposed rule, we examined claims data from the September 2024 update of the FY 2024 MedPAR file to identify the average length of stay and average costs for cases reporting a procedure code describing the control of bleeding in the genitourinary tract with a principal diagnosis in MDC 16, which are currently grouping to MS–DRGs 981 through 983, as well as all cases in MS–DRGs 981 through 983. Our findings are shown in the following table.

MS-DRGs 981-983: ALL CASES AND CASES REPORTING A PROCEDURE CODE DESCRIBING THE CONTROL OF BLEEDING IN THE GENITOURINARY TRACT AND A PRINCIPAL DIAGNOSIS IN MDC 16

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 981--All cases	19,155	11.7	$40,259
MS-DRG 981--Cases reporting procedure code describing the control of bleeding in the genitourinary tract and a principal diagnosis in MDC 16	23	9	$27,900
MS-DRG 982--All cases	9,392	5.7	$21,951
MS-DRG 982-- Cases reporting procedure code describing the control of bleeding in the genitourinary tract and a principal diagnosis in MDC 16	64	4.3	$13,462
MS-DRG 983--All cases	1,831	2.6	$15,837
MS-DRG 983-- Cases reporting procedure code describing the control of bleeding in the genitourinary tract and a principal diagnosis in MDC 16	5	2.8	$9,416

We then examined the MS–DRGs within MDC 16 and determined that the cases reporting procedure codes describing the control of bleeding in the genitourinary tract with a principal diagnosis in MDC 16 would most suitably group to MS–DRGs 802, 803, and 804 (Other O.R. Procedures of the Blood and Blood Forming Organs with MCC, with CC, and without CC/MCC, respectively), which contains a group of procedures that are only infrequently related to the diagnoses in the MDC, but are still occasionally performed on patients with cases assigned to the MDC with these diagnoses.

To determine how the resources for this subset of cases compared to cases in MS–DRGs 802, 803, and 804 as a whole, we stated in the proposed rule we examined the average costs and length of stay for cases in MS–DRGs 802, 803, and 804. Our findings are shown in this table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 802--All cases	417	11.6	$37,595
MS-DRG 803--All cases	452	5.3	$16,762
MS-DRG 804--All cases	209	2.2	$12,605

We reviewed the data and noted in the proposed rule that for this subset of cases, the average costs are lower and the average length of stays are generally shorter than for cases in MS–DRGs 802, 803, and 804. However, we stated we believe that when an ICD–10–PCS procedure code describing the control of bleeding in the genitourinary tract is reported with a principal diagnosis in MDC 16 (typically hemorrhagic disorder due to extrinsic circulating anticoagulants), the procedure is related to the principal diagnosis. Because a procedure code describing the control of bleeding in the genitourinary tract would be expected to be related to a principal diagnosis describing a hemorrhagic disorder due to extrinsic circulating anticoagulants, it is clinically appropriate for the procedures to group to the same MS–DRGs as the principal diagnoses. Therefore, we proposed to add the five procedure codes listed previously to MDC 16. Under this proposal, cases reporting a procedure code describing the control of bleeding in the genitourinary tract with a principal diagnosis of a hemorrhagic disorder due to extrinsic circulating anticoagulants (diagnosis code D68.32) in MDC 16 would group to MS–DRGs 802, 803, and 804.

Comment: Commenters supported the proposal to add ICD–10–PCS procedure codes 0W3R0ZZ, 0W3R3ZZ, 0W3R4ZZ, 0W3R7ZZ, and 0W3R8ZZ to MDC 16 (Diseases and Disorders of Blood, Blood Forming Organs and Immunologic Disorders).

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS procedure codes 0W3R0ZZ, 0W3R3ZZ, 0W3R4ZZ, 0W3R7ZZ, and 0W3R8ZZ to MDC 16, without modification, for FY 2026. Under this finalization, cases reporting a procedure code describing the control of bleeding in the genitourinary tract with a principal diagnosis of a hemorrhagic disorder due to extrinsic circulating anticoagulants (diagnosis code D68.32) in MDC 16 would group to MS–DRGs 802, 803, and 804.

b. Removal of Infusion Device From Peritoneal Cavity

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18057 through 18058), during the review of the

cases that group to MS–DRGs 981 through 983, we noted that when ICD–10–PCS procedure codes describing the removal of an infusion device from the peritoneal cavity are reported in conjunction with ICD–10–CM diagnosis codes in MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs), the cases group to MS–DRGs 981 through 983. In the proposed rule, we included the following table, listing the three ICD–10–PCS procedure codes reviewed, and indicating current assignment to MDCs 06 and 21:

ICD-10-PCS Code	Description	MDC
0WPG03Z	Removal of infusion device from peritoneal cavity, open approach	06; 21
0WPG33Z	Removal of infusion device from peritoneal cavity, percutaneous approach	06; 21
0WPG43Z	Removal of infusion device from peritoneal cavity, percutaneous endoscopic approach	06; 21

In this final rule, we are correcting this display to reflect that ICD–10–PCS code 0WPG33Z is not currently assigned to MDC 21. We note that, in ICD–10 MS–DRGs Definitions Manual Version 42.1, ICD–10–PCS codes 0WPG03Z and 0WPG43Z are assigned to MDC 21 MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively). ICD–10–PCS code 0WPG33Z is assigned to MDC 06 MS–DRGs 356, 357 and 358 (Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). We list in the following table the ICD–10–PCS procedure codes describing the removal of an infusion device from the peritoneal cavity and their corresponding MS–DRG assignments in the ICD–10 MS–DRGs Definitions Manual Version 42.1.

ICD-10-PCS Code	Description	MDC	MS-DRG	Description
0WPG03Z	Removal of infusion device from peritoneal cavity, open approach	06	356-358	Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively
		21	907-909	Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively
0WPG33Z	Removal of infusion device from peritoneal cavity, percutaneous approach	06	356-358	Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively
0WPG43Z	Removal of infusion device from peritoneal cavity, percutaneous endoscopic approach	06	356-358	Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively
		21	907-909	Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively

We refer the reader to Appendix E of the ICD–10 MS–DRG Version 42.1 Definitions Manual (which is available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps.html*) for the MS–DRG assignment for each procedure code listed and further discussion of how each procedure code may be assigned to multiple MDCs and MS–DRGs under the IPPS.

As discussed in the proposed rule, the principal diagnosis most frequently reported with the three ICD–10–PCS procedure codes describing the removal of an infusion device from the peritoneal cavity in MDC 21 is ICD–10–CM code T85.71XA (Infection and inflammatory reaction due to peritoneal dialysis catheter, initial encounter).

We stated we examined claims data from the September 2024 update of the FY 2024 MedPAR file to identify the average length of stay and average costs for cases reporting a procedure code describing the removal of an infusion device from the peritoneal cavity with a principal diagnosis in MDC 21, which are currently grouping to MS–DRGs 981 through 983, as well as all cases in MS–DRGs 981 through 983. Our findings are shown in the following table.

MS-DRGs 981-983: ALL CASES AND CASES REPORTING A PROCEDURE CODE DESCRIBING THE REMOVAL OF AN INFUSION DEVICE FROM THE PERITONEAL CAVITY AND A PRINCIPAL DIAGNOSIS IN MDC 21			
MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 981--All cases	19,155	11.7	$40,259
MS-DRG 981--Cases reporting procedure code describing the removal of an infusion device from the peritoneal cavity and a principal diagnosis in MDC 21	85	8.8	$25,556
MS-DRG 982--All cases	9,392	5.7	$21,951
MS-DRG 982--Cases reporting procedure code describing the removal of an infusion device from the peritoneal cavity and a principal diagnosis in MDC 21	1	4	$11,845
MS-DRG 983--All cases	1,831	2.6	$15,837
MS-DRG 983--Cases reporting procedure code describing the removal of an infusion device from the peritoneal cavity and a principal diagnosis in MDC 21	0	0	$0

We then examined the MS–DRGs within MDC 21 and determined that the cases reporting procedure codes describing the removal of an infusion device from the peritoneal cavity with a principal diagnosis in MDC 21 would most suitably group to MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively), which contains other operating room procedures performed for injuries as further detailed later in this section.

To determine how the resources for this subset of cases compared to cases in MS–DRGs 907, 908, and 909 as a whole, we examined the average costs and length of stay for cases in MS–DRGs 907, 908, and 909. Our findings are shown in the following table.

MS-DRG	Number of Cases	Average Length of Stay	Average Costs
MS-DRG 907--All cases	7,754	9.4	$34,049
MS-DRG 908--All cases	6,625	4.8	$17,938
MS-DRG 909--All cases	1,721	2.7	$12,154

As discussed in the proposed rule, we reviewed the data and noted for the subset of cases reporting procedure codes describing the removal of an infusion device from the peritoneal cavity with a principal diagnosis in MDC 21, the average costs are lower and the average lengths of stay are shorter than for cases in MS–DRGs 907, 908, and 909. However, we stated we believe that when an ICD–10–PCS procedure code describing the removal of an infusion device from the peritoneal cavity is reported with a principal diagnosis in MDC 21 (typically infection and inflammatory reaction due to peritoneal dialysis catheter), the procedure is related to the principal diagnosis. Because a procedure code describing the removal of an infusion device from the peritoneal cavity would be expected to be related to a principal diagnosis describing an infected catheter used for peritoneal dialysis causing inflammation in the surrounding tissue, we stated it is clinically appropriate for the procedures to group to the same MS–DRGs as the principal diagnoses. Therefore, we proposed to add the three procedure codes listed previously to MDC 21. We stated that under this proposal, cases reporting a procedure code describing the removal of an infusion device from the peritoneal cavity with a principal diagnosis of an infection and inflammatory reaction due to peritoneal dialysis catheter, initial encounter (diagnosis code T85.71XA) in MDC 21 would group to MS–DRGs 907, 908, and 909.

Comment: Commenters supported the proposal to add procedure codes describing the removal of an infusion device from the peritoneal cavity to MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs).

Response: We appreciate the commenters' support.

As discussed previously, in ICD–10 MS–DRGs Definitions Manual Version 42.1, ICD–10–PCS codes 0WPG03Z and 0WPG43Z are already assigned to MDC 21 MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively). Therefore, after consideration of the public comments we received, for the reasons discussed, we are finalizing our proposal with modification. Specifically, we are finalizing our proposal to add ICD–10–PCS code 0WPG33Z to MDC 21 for FY 2026. Under this finalization, cases reporting procedure code 0WPG33Z (Removal of infusion device from peritoneal cavity, percutaneous approach) with a principal diagnosis of an infection and inflammatory reaction due to peritoneal dialysis catheter, initial encounter (diagnosis code T85.71XA) in MDC 21 would group to MS–DRGs 907, 908, and 909.

In addition to the internal review of procedures producing assignment to MS–DRGs 981 through 983 or MS–DRGs 987 through 989, as discussed in the proposed rule, we also consider requests that we receive to examine cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989 to determine if it would be appropriate to add procedure codes to one of the surgical MS–DRGs for the MDC into which the principal diagnosis falls or to move the principal diagnosis to the surgical MS–DRGs to which the procedure codes are assigned. We stated we did not receive any requests suggesting reassignment.

We also review the list of ICD–10–PCS procedures that, when in combination with their principal diagnosis code, result in assignment to MS DRGs 981 through 983, or 987 through 989, to ascertain whether any of those procedures should be reassigned from one of those two groups of MS–DRGs to the other group of MS–DRGs

based on average costs and the average length of stay. We look at the data for trends such as shifts in treatment practice or reporting practice that would make the resulting MS–DRG assignment illogical. If we find these shifts, we will propose to move cases to keep the MS–DRGs clinically similar or to propose MS–DRG assignments for the cases in a similar manner. Generally, we propose to move only those procedures for which we have an adequate number of discharges to analyze the data.

Additionally, we also consider requests that we receive to examine cases found to group to MS–DRGs 981 through 983 or MS–DRGs 987 through 989 to determine if it would be appropriate for the cases to be reassigned from one of the MS–DRG groups to the other. We stated we did not receive any requests suggesting reassignment. Further, based on the results of our review of the claims data from the September 2024 update of the FY 2024 MedPAR file we stated we did not identify any cases for reassignment. Therefore, for FY 2026 we did not propose to move any cases reporting procedure codes from MS–DRGs 981 through 983 to MS–DRGs 987 through 989 or vice versa.

Comment: Commenters expressed support for CMS' proposal to not move any cases reporting procedure codes from MS–DRGs 981 through 983 to MS–DRGs 987 through 989 or vice versa.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing, without modification, our proposal to not move any cases reporting procedure codes from MS–DRGs 981 through 983 to MS–DRGs 987 through 989 or vice versa.

7. Operating Room (O.R.) and Non-O.R. Procedures

a. Background

Under the IPPS MS–DRGs (and former CMS MS–DRGs), we have a list of procedure codes that are considered operating room (O.R.) procedures. Historically, we developed this list using physician panels that classified each procedure code based on the procedure and its effect on consumption of hospital resources. For example, generally the presence of a surgical procedure which required the use of the operating room would be expected to have a significant effect on the type of hospital resources (for example, operating room, recovery room, and anesthesia) used by a patient, and therefore, these patients were considered surgical. Because the claims data generally available do not precisely indicate whether a patient was taken to the operating room, surgical patients were identified based on the procedures that were performed.

Generally, if the procedure was not expected to require the use of the operating room, the patient would be considered medical (non-O.R.). Currently, each ICD–10–PCS procedure code has designations that determine whether and in what way the presence of that procedure on a claim impacts the MS–DRG assignment. First, each ICD–10–PCS procedure code is either designated as an O.R. procedure for purposes of MS–DRG assignment (''O.R. procedures'') or is not designated as an O.R. procedure for purposes of MS–DRG assignment (''non-O.R. procedures''). Second, for each procedure that is designated as an O.R. procedure, that O.R. procedure is further classified as either extensive or non-extensive. Third, for each procedure that is designated as a non-O.R. procedure, that non-O.R. procedure is further classified as either affecting the MS–DRG assignment or not affecting the MS–DRG assignment. We refer to these designations that do affect MS–DRG assignment as ''non O.R. affecting the MS–DRG.'' For new procedure codes that have been finalized through the ICD–10 Coordination and Maintenance Committee meeting process and are proposed to be classified as O.R. procedures or non-O.R. procedures affecting the MS–DRG, we recommend the MS–DRG assignment which is then made available in association with the proposed rule (Table 6B.—New Procedure Codes) and subject to public comment. These proposed assignments are generally based on the assignment of predecessor codes or the assignment of similar codes. For example, we generally examine the MS–DRG assignment for similar procedures, such as the other approaches for that procedure, to determine the most appropriate MS–DRG assignment for procedures proposed to be newly designated as O.R. procedures. As discussed in section II.C.13 of the preamble of this FY 2026 IPPS/LTCH PPS final rule, we are making Table 6B.—New Procedure Codes—FY 2026 available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps.html.* We also refer readers to the ICD–10 MS–DRG Version 42.1 Definitions Manual at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software.html* for detailed information regarding the designation of procedures as O.R. or non-O.R. (affecting the M–DRG) in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index.

In the FY 2020 IPPS/LTCH PPS proposed rule, we stated that, given the long period of time that has elapsed since the original O.R. (extensive and non-extensive) and non-O.R. designations were established, the incremental changes that have occurred to these O.R. and non-O.R. procedure code lists, and changes in the way inpatient care is delivered, we plan to conduct a comprehensive, systematic review of the ICD–10–PCS procedure codes. This will be a multiyear project during which we will also review the process for determining when a procedure is considered an operating room procedure. For example, we may restructure the current O.R. and non-O.R. designations for procedures by leveraging the detail that is now available in the ICD–10 claims data. We refer readers to the discussion regarding the designation of procedure codes in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38066) where we stated that the determination of when a procedure code should be designated as an O.R. procedure has become a much more complex task. This is, in part, due to the number of various approaches available in the ICD–10–PCS classification, as well as changes in medical practice. While we have typically evaluated procedures on the basis of whether or not they would be performed in an operating room, we believe that there may be other factors to consider with regard to resource utilization, particularly with the implementation of ICD–10.

We discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19230) that, as a result of this planned review and potential restructuring, procedures that are currently designated as O.R. procedures may no longer warrant that designation, and conversely, procedures that are currently designated as non-O.R. procedures may warrant an O.R. designation. We intend to consider the resources used and how a procedure should affect the MS–DRG assignment. We may also consider the effect of certain surgical approaches to evaluate whether to subdivide a subset of MS–DRGs based on a specific surgical approach. We stated we plan to utilize our available MedPAR claims data as a basis for this review and the input of our clinical advisors. As part of this comprehensive review of the procedure codes, we also intend to evaluate the MS–DRG assignment of the procedures and the current surgical hierarchy

because both of these factor into the process of refining the ICD–10 MS–DRGs to better recognize complexity of service and resource utilization.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58540 through 58541), we provided a summary of the comments we had received in response to our request for feedback on what factors or criteria to consider in determining whether a procedure is designated as an O.R. procedure in the ICD–10–PCS classification system for future consideration. We also stated that in consideration of the PHE, we believed it may be appropriate to allow additional time for the claims data to stabilize prior to selecting the timeframe to analyze for this review.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18059 through 18060), we stated we continue to believe additional time is necessary as we continue to develop our process and methodology. As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58749), we have signaled in prior rulemaking that the designation of an O.R. procedure encompasses more than the physical location of the hospital room in which the procedure may be performed; in other words, the performance of a procedure in an operating room is not the sole determining factor we will consider as we examine the designation of a procedure in the ICD–10–PCS classification system. We stated we are exploring alternatives on how we may restructure the current O.R. and non-O.R. designations for procedures by leveraging the detail that is available in the ICD–10 claims data. We are considering the feedback received on what factors and/or criteria to consider in determining whether a procedure is designated as an O.R. procedure in the ICD–10–PCS classification system as we continue to develop our process and methodology and will provide more detail on this analysis and the methodology for conducting this comprehensive review in future rulemaking. We encourage the public to continue to submit feedback and comments on any other factors in consideration of our refinement efforts to recognize and differentiate consumption of resources under the ICD–10 MS–DRGs.

Comment: Commenters supported CMS' plan to continue to conduct the comprehensive, systematic review of the ICD–10–PCS codes and to evaluate their current O.R. and non-O.R. designations. These commenters expressed that they were supportive of CMS' decision to continue to develop our process and methodology. A commenter stated they agreed that the revolution in medical procedures in recent years may render the performance of a procedure in an O.R. a less critical distinction in driving payment policy and stated that because of technological advances, sophisticated, resource-intensive procedures are no longer confined to the O.R. setting and noted that in their observation, bi-plane radiology interventional suites and cardiac catheterization labs used for procedures such as mechanical thrombectomy or endovascular coiling for aneurysms can utilize more advanced equipment and supplies than a basic operating room with minimal installed equipment. This commenter recommended that CMS provide detailed impact files prior to the adoption of changes to the designation of procedure codes in the ICD–10–PCS classification and stated that they look forward to commenting on CMS' data analysis and methodology in the future.

As part of the broader and continuing conversation about the designations of procedures in the ICD–10–PCS classification system, a commenter recommended that CMS work closely with physician specialty societies and industry stakeholders to identify the most important drivers of complexity and resource use in the hospital setting. Another commenter specifically recommended that CMS include nurse representatives when reviewing methodologies for determining the designation of procedure codes in the ICD–10–PCS classification system and noted that nurses are an integral part of the healthcare team, work closely with physicians in the operating room and have firsthand knowledge and experience to know what hospital resources are needed for procedures. This commenter further stated that omitting nurses only serves to discount their perspectives and could result in decision making that does not fully capture the hospital resources needed.

Response: We thank the commenters for their support. We also thank commenters for sharing their views and their willingness to provide feedback and recommendations as to what factors to consider in evaluating O.R. versus non-O.R. designations. We agree with commenters and believe that there may be other factors to consider with regard to resource utilization, particularly with the implementation of ICD–10. While CMS has already convened an internal team comprised of clinicians, consultants, coding specialists and other policy analysts, as well as provided the opportunity for interested parties to provide feedback as to what factors to consider in evaluating O.R. versus non-O.R. designations, we look forward to further input and feedback from interested parties, including nurses. As discussed in the proposed rule, we are considering the feedback received to date on what factors and/or criteria to consider in determining whether a procedure is designated as an O.R. procedure in the ICD–10–PCS classification system as we continue to develop our process and methodology and will provide more detail on this analysis and the methodology for conducting this comprehensive review in future rulemaking. As part of this comprehensive review of the procedure codes, we are also considering renaming the designations that determine whether and in what way the presence of that procedure on a claim impacts the MS–DRG assignment (that is, ''O.R. procedures'', ''non-O.R. procedures'', or ''non O.R. affecting the MS–DRG'') for consistency. As discussed in prior rulemaking and earlier in this section of the preamble of this final rule, we have signaled that the performance of a procedure in an operating room is not the sole determining factor we will consider as we examine the designation of a procedure in the ICD–10–PCS classification system. We encourage the public to continue to submit comments and feedback on any other factors to consider in our refinement efforts to recognize and differentiate consumption of resources for procedures within the ICD–10 MS–DRGs under the IPPS.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule, we received requests regarding changing the designation of specific ICD–10–PCS procedure codes from non-O.R. to O.R. procedures. In this section of the preamble of this FY 2026 IPPS/LTCH PPS final rule, as we did in the proposed rule, we summarize and respond to those requests. In this section of the preamble of this final rule, we also discuss the proposal we made based on our internal review and analysis and the process that was utilized for evaluating each procedure code. For each procedure, we considered—

- Whether the procedure would typically require the resources of an operating room;
- Whether it is an extensive or a non-extensive procedure; and
- To which MS–DRGs the procedure should be assigned.

We note that many MS–DRGs require the presence of any O.R. procedure. As a result, cases with a principal diagnosis associated with a particular MS–DRG would, by default, be grouped to that MS–DRG. Therefore, we do not list these MS–DRGs in our discussion in this section of the preamble of this FY

2026 IPPS/LTCH PPS final rule. Instead, we only discuss MS–DRGs that require explicitly adding the relevant procedure codes to the GROUPER logic in order for those procedure codes to affect the MS–DRG assignment as intended.

For procedures that would not typically require the resources of an operating room, we determined if the procedure should affect the MS–DRG assignment. In cases where we proposed to change the designation of procedure codes from non-O.R. procedures to O.R. procedures, we also proposed one or more MS–DRGs with which these procedures are clinically aligned and to which the procedure code would be assigned.

In addition, cases that contain O.R. procedures will map to MS–DRGs 981, 982, or 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS–DRGs 987, 988, or 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) when they do not contain a principal diagnosis that corresponds to one of the MDCs to which that procedure is assigned. These procedures need not be assigned to MS–DRGs 981 through 989 in order for this to occur. Therefore, we did not specifically address that aspect in summarizing the request and our response to that request or the proposal we made based on our internal review and analysis in the proposed rule and in this section of the preamble of this FY 2026 IPPS/LTCH PPS final rule.

b. Non-O.R. Procedures to O.R. Procedures

(1) Open Drainage of the Mandible

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 44895 through 44896), we discussed a request we received to change the designation of procedure codes 0N9R0ZZ (Drainage of maxilla, open approach), 0N9T0ZZ (Drainage of right mandible, open approach), and 0N9V0ZZ (Drainage of left mandible, open approach), from non-O.R. to O.R. procedures. In the FY 2022 final rule, we stated that we disagreed that the procedures describing the open drainage of the maxilla or mandible typically require the resources of an operating room. We stated that if admission is required for the treatment of a jaw infection, the admission is quite likely due to the need for IV antibiotics as opposed to the need for operating room resources in an inpatient setting. After consideration of the public comments we received, we finalized our proposal to maintain the non-O.R. designation of ICD–10–PCS procedure codes 0N9R0ZZ, 0N9T0ZZ, and 0N9V0ZZ, without modification, for FY 2022.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18060 through 18061), we again received a request to change the designation of ICD–10–PCS codes 0N9T0ZZ (Drainage of right mandible, open approach), and 0N9V0ZZ (Drainage of left mandible, open approach), from non-O.R. to O.R. The requestor identified procedure code 0W950ZZ (Drainage of lower jaw, open approach) that is currently designated as an O.R. procedure and stated that the body part value of mandible is more specific than the body part value of lower jaw. The requestor also stated that in the ICD–10–PCS classification, other procedure codes that describe drainage procedures performed on body parts deeper than subcutaneous tissue, such as muscles, tendons, and bone, are designated as O.R. procedures. Therefore, the requestor stated that procedure codes 0N9T0ZZ and 0N9V0ZZ should also be recognized as O.R. procedures for purposes of MS–DRG assignment. The requestor did not provide a specific list of the procedure codes that describe drainage procedures performed on body parts deeper than subcutaneous tissue, such as muscles, tendons, and bone, that are currently designated as O.R. procedures for CMS to review.

In the ICD–10 MS–DRGs Definitions Manual Version 42.1, procedure codes 0N9T0ZZ and 0N9V0ZZ are currently designated as non-O.R. procedures for purposes of MS–DRG assignment. We reviewed this issue and in the proposed rule, we stated we continue to disagree that the procedures describing the open drainage of the mandible are typically performed in the operating room under general anesthesia. As discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44896), these procedures can be done in an oral surgeon's office, or an outpatient setting and are rarely performed in the inpatient setting. Therefore, we proposed to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0N9T0ZZ and 0N9V0ZZ.

Comment: A commenter opposed CMS' proposal to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0N9T0ZZ (Drainage of right mandible, open approach), and 0N9V0ZZ (Drainage of left mandible, open approach) and stated when performed in the inpatient setting, these procedures often involve complex infectious disease cases requiring significant resources. This commenter stated that their analysis and clinical experience suggest that these procedures, when performed on hospitalized patients, are substantially different and more complex when compared to routine outpatient drainage procedures and more closely align with other O.R.-designated procedures in terms of resource utilization. The commenter further stated that the infectious nature of these cases specifically requires additional resources beyond the procedure itself, including extended antimicrobial therapy, infectious diseases consultation and potential management of sepsis or other systemic complications.

Response: We thank the commenter for their feedback.

We reviewed the commenter's concerns and continue to support maintaining the current non-O.R. designation of the procedure codes describing open drainage of the mandible and disagree that the procedures describing the open drainage of the mandible typically require the resources of an operating room. We continue to believe if admission is required for the treatment of a jaw infection, the admission is quite likely due to the need for IV antibiotics as opposed to the need for operating room resources in an inpatient setting.

In response to the issues raised by this commenter, we examined claims data from the September 2024 update of the FY 2024 MedPAR file for cases reporting 0N9T0ZZ or 0N9V0ZZ. Our findings are shown in the following table.

BILLING CODE 4120–01–P

MS-DRGs Reporting Procedure Codes 0N9T0ZZ or 0N9V0ZZ					
MS-DRG	**Description**		**Number of Cases**	**Average Length of Stay**	**Average Costs**
012	Tracheostomy for Face, Mouth and Neck Diagnoses or Laryngectomy with CC	All cases	1,294	9.8	$38,637
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	11	$69,077
157	Dental and Oral Diseases with MCC	All cases	1,598	6.1	$15,737
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	2	4	$6,798
158	Dental and Oral Diseases with CC	All cases	2,725	3.5	$8,424
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	13	3.6	$10,745
159	Dental and Oral Diseases without CC/MCC	All cases	503	2.5	$6,686
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	6	$19,745
356	Other Digestive System O.R. Procedures with MCC	All cases	6,122	10.2	$38,574
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	3	$37,175
516	Other Musculoskeletal System and Connective Tissue O.R. Procedures with CC	All cases	10,522	5.0	$18,832
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	4	$10,908
554	Bone Diseases and Arthropathies without MCC	All cases	8,807	3.5	$7,800
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	3	$4,352
603	Cellulitis without MCC	All cases	55,341	3.8	$8,045
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	2	$2,437
853	Infectious and Parasitic Diseases with O.R. Procedures with MCC	All cases	75,711	12.3	$42,737
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	17	$39,483
856	Postoperative or Post-Traumatic Infections with O.R. Procedures with MCC	All cases	6,497	12.1	$38,696
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	4	$11,471
871	Septicemia or Severe Sepsis without MV >96 Hours with MCC	All cases	540,907	6.4	$17,468
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	2	10	$17,971
872	Septicemia or Severe Sepsis without MV >96 Hours without MCC	All cases	98,684	4.2	$9,413
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	4	$15,260
908	Other O.R. Procedures for Injuries with CC	All cases	6,625	4.8	$17,938
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	9	$11,475
920	Complications of Treatment with CC	All cases	10,257	3.7	$9,330
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	4	$13,263
983	Extensive O.R. Procedures Unrelated to Principal Diagnosis without CC/MCC	All cases	1,831	2.6	$15,837
		Cases reporting 0N9T0ZZ or 0N9V0ZZ	1	1	$4,117
		All cases reporting 0N9T0ZZ or 0N9V0ZZ	**29**	**4.9**	**$14,758**

BILLING CODE 4120–01–C

As shown in the table, we found a total of 29 cases reporting procedure codes 0N9T0ZZ or 0N9V0ZZ across the MS–DRGs, demonstrating that procedures that describe open drainage of the mandible are infrequently performed in the inpatient setting. Our data findings also demonstrate, generally, the cases reporting procedures describing the open drainage of the mandible have average costs that are lower than the average costs of all cases in their respective MS–DRGs, while the average lengths of stay are shorter.

Therefore, after consideration of the public comments we received, for the reasons stated, we are finalizing our proposal to maintain the current non-O.R. designation of ICD–10–PCS procedure codes 0N9T0ZZ and 0N9V0ZZ, without modification, for FY 2026.

In our review of this issue, in the proposed rule, we stated we agree with the requestor that in the ICD–10 MS–DRGs Definitions Manual Version 42.1, procedure code 0W950ZZ (Drainage of lower jaw, open approach) is currently designated as an O.R. procedure for purposes of MS–DRG assignment. While we have stated in prior rulemaking that a correlation cannot be made between procedures performed in general anatomic regions and procedures performed in specific body parts because these procedures coded with the general anatomic regions body part represent a broader range of procedures that cannot be coded to a specific body part, we stated we continue to believe if admission is required for the treatment of a jaw infection, the admission is quite likely due to the need for IV antibiotics as opposed to the need for operating room resources in an inpatient setting. Like procedures that describe open drainage of the mandible, procedures to drain the lower jaw can also be done in an oral surgeon's office or an outpatient setting and are rarely performed in the inpatient setting. In the proposed rule we stated we agree that procedures that describe open drainage of the mandible consume resources comparable to the related ICD–10–PCS procedure code that describes the open drainage of the jaw. These procedures do not typically require the resources of an operating room and are not surgical in nature. Therefore, for clinical consistency, we proposed to remove procedure code 0W950ZZ (Drainage of lower jaw, open approach) from the FY 2026 ICD–10 MS–DRGs Version 43 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as an O.R. procedure. Under this proposal, this procedure

would no longer impact MS–DRG assignment.

Comment: Commenters supported CMS' proposal to remove procedure code 0W950ZZ from the FY 2026 ICD–10 MS–DRGs Version 43 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as an O.R. procedure.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of procedure code 0W950ZZ (Drainage of lower jaw, open approach) from O.R. procedure to non-O.R. procedure, without modification, effective October 1, 2025. Under this finalization, this procedure code would no longer impact MS–DRG assignment.

(2) Introduction of Paclitaxel-Coated Balloon Catheter Technology

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69094 through 69096), we summarized and responded to comments we received regarding the O.R. designation and MS–DRG assignment of 16 procedure codes that describe introduction of the AGENT™ Paclitaxel-Coated Balloon Catheter technology that is indicated to treat coronary in-stent restenosis (ISR) in patients with coronary artery disease. The following procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology were finalized following the March 19, 2024, ICD–10 Coordination and Maintenance Committee meeting and made available via the CMS website on June 5, 2024, at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*. We refer the reader to the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials* for additional detailed information regarding the request, including a recording of the discussion and the related meeting materials.

ICD-10-PCS Code	Description
XW0J3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0K3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0L3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0K3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0L3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0M3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, four or more arteries, percutaneous approach, new technology group 10

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18061 through 18062), we again received a request to reconsider the designation and MS–DRG assignment of the previously listed 16 procedure codes. Specifically, the requestor (the manufacturer) requested that the procedure codes be designated as O.R. procedures and assigned to the following surgical MS–DRGs:

- MS–DRG 250 Percutaneous Cardiovascular Procedures without Intraluminal Device with MCC
- MS–DRG 251 Percutaneous Cardiovascular Procedures without Intraluminal Device without MCC
- MS–DRG 321 Percutaneous Cardiovascular Procedures with Intraluminal Device with MCC or 4+ Arteries/Intraluminal Devices
- MS–DRG 322 Percutaneous Cardiovascular Procedures with Intraluminal Device without MCC
- MS–DRG 323 Coronary Intravascular Lithotripsy with Intraluminal Device with MCC
- MS–DRG 324 Coronary Intravascular Lithotripsy with Intraluminal Device without MCC
- MS–DRG 325 Coronary Intravascular Lithotripsy without Intraluminal Device

According to the requestor, the root operation CMS identified as the most appropriate (that is, Introduction in the Administration section), and the predecessor code selected, (procedure code 3E073GC (Introduction of other therapeutic substance into coronary artery, percutaneous approach)), only involves a therapeutic substance being delivered via infusion or injection. The requestor stated that the procedure to administer the paclitaxel via the drug coated balloon (DCB) catheter is a surgical procedure as described in the instructions for use, with the drug delivery occurring using controlled prolonged balloon inflation during which the patient is monitored for signs of ischemia or arrythmia. The requestor stated that the procedure to deliver the paclitaxel is more appropriate as an O.R. procedure than a non-O.R. procedure. The requestor acknowledged that while the MS–DRG assignment for existing percutaneous coronary intervention (PCI) procedures is driven by vessel preparation or the use of an intraluminal device, it should not preclude the designation of the procedure codes identifying use of an AGENT™ Paclitaxel-Coated Balloon Catheter technology that describes the delivery of the paclitaxel to the coronary vessel(s) as O.R. procedures.

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69095 through 69096), we stated that under our established process, we reviewed the predecessor code and MS–DRG assignment most closely associated with the new procedure codes. We noted that because the procedure codes describing the use of an AGENT™ Paclitaxel-Coated Balloon Catheter are describing delivery of the paclitaxel to the coronary vessel(s), the predecessor code is 3E073GC, which is designated as a non-O.R. procedure and does not affect MS–DRG assignment. We also stated that, as discussed at the March 19, 2024, ICD–10 Coordination and Maintenance Committee meeting and in the commenters' feedback, a preparatory step (that is, vessel preparation by either angioplasty, atherectomy, or lithotripsy) is required to be performed first, before the AGENT™ Paclitaxel-Coated Balloon Catheter is deployed. We noted that each type of vessel preparation procedure is designated as an O.R. procedure and maps to one of the previously listed surgical MS–DRGs. We also noted that based on the surgical hierarchy, the reporting of one of the vessel preparation steps (that is, angioplasty, atherectomy, or lithotripsy), or placement of a new stent in connection with the use of the AGENT™ Paclitaxel-Coated Balloon Catheter would result in assignment to one of the previously listed surgical MS–DRGs. We noted that use of the AGENT™ Paclitaxel-Coated Balloon Catheter to deliver the paclitaxel to the coronary vessel(s) cannot occur in the absence of a surgical vessel preparation and therefore, it is the vessel preparation procedure that will determine the surgical MS–DRG assignment to one of the previously listed surgical MS–DRGs.

In the proposed rule, we noted that we reviewed the instructions for use submitted by the requestor regarding the procedure to insert the drug-coated balloon catheter. The instructions for use state:

''Note: For optimal DCB results, adequate lesion preparation is essential. This should include predilatation with a non-coated coronary balloon. Intravascular imaging to guide lesion preparation and to assess the adequacy of the final result is strongly recommended.

Caution: Lesion preparation is necessary to prevent delamination of the balloon's drug coating while traversing patient anatomy. The TransPax coating is designed to facilitate drug transfer into the vessel wall upon contact. Do not use the AGENT Drug-Coated Balloon Catheter for lesion preparation.''

We also noted that the FDA-approved indication states, ''The AGENT™ Paclitaxel-Coated Balloon Catheter is intended to be used after appropriate vessel preparation in adult patients undergoing percutaneous coronary intervention (PCI) in coronary arteries 2.0 mm to 4.0 mm in diameter and lesions up to 26 mm in length for the purpose of improving myocardial perfusion when treating in-stent restenosis (ISR).'' We further noted that, as reflected in the March 19, 2024 ICD–10 Coordination and Maintenance Committee meeting materials, ''The AGENT™ Drug-Coated Balloon (DCB) has been designated by the FDA as an implant for PMA purposes. Per FDA guidance, the drug component is considered a permanent implant because it remains in the body for greater than 30 days.''

As such, we stated in the proposed rule that we continue to disagree with designating the procedure to deliver paclitaxel to a coronary vessel as identified by any one of the previously listed 16 procedure codes as O.R. procedures. As stated earlier in this section, the MS–DRG assignment is dependent on the surgical vessel preparation procedure that would be reported when the AGENT™ Paclitaxel-Coated Balloon Catheter technology is used to deliver the paclitaxel to the coronary vessel(s) and result in assignment to one of the previously listed surgical MS–DRGs. We referred the reader to the ICD–10 MS–DRG Definitions Manual, Version 42.1 available in association with the FY 2026 IPPS/LTCH PPS proposed rule on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* for complete documentation of the GROUPER logic for the previously listed surgical MS–DRGs under MDC 05. For the reasons discussed, we proposed to maintain the designation of the 16 procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology as non-O.R. for FY 2026.

Comment: Some commenters agreed with the proposal to maintain the designation of the 16 procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology as non-O.R. for FY 2026.

Response: We thank the commenters for their support.

Comment: A commenter (the manufacturer) urged CMS to change the designation of the procedure codes that describe the AGENT™ Paclitaxel-Coated Balloon Catheter technology from non-O.R. to O.R. for FY 2026. The commenter stated that patients scheduled for a procedure that uses the AGENT™ Paclitaxel-Coated Balloon Catheter technology have a principal diagnosis of ISR, and introduction of the AGENT™ implant is the principal procedure to address the ISR. The commenter stated that the AGENT™ implant represents the therapeutic intent of the intervention, drives associated resource requirements, and is not performed incident to vessel preparation. The commenter stated that other services provided during the same operative session as the AGENT™ implant are for the purpose of vessel dilation or plaque modification in preparation for effective therapeutic drug delivery. According to the commenter, the specific approach and rigor to vessel preparation technique(s) are dictated by the physician's decision to treat the lesion with the AGENT™ implant and are therefore secondary to the AGENT™ implant. The commenter stated the secondary procedures may include balloon angioplasty for vessel dilation, and atherectomy, lithotripsy, and/or cutting balloon for plaque modification. In addition, the commenter stated that intravascular ultrasound (IVUS) and/or optical coherence tomography (OCT) may be used for enhanced vessel visualization.

The commenter provided a table comparing clinical functions associated with percutaneous coronary interventions as follows:

Clinical Function	Procedure	Technologies
Vessel Dilation	Angioplasty	Compliant Low-Pressure Dilation Balloon Semi-Compliant Low- Pressure Dilation Balloon Non-Compliant High- Pressure Dilation Balloon
Lesion Modification *(fragmentation, extirpation)*	Atherectomy Intravascular Lithotripsy	Cutting and Scoring Balloons Rotational and Orbital Atherectomy Laser Fiber Catheter Sonic Wave Balloon Catheter
Lesion Treatment *(insertion, supplement)*	Stent Placement Localized Drug Implant	Bare Metal Stent (BMS) Drug Eluting Stent (DES) Drug Coated Balloon (DCB)

The commenter also stated that the primary role of the AGENT™ implant is supported by ICD–10–PCS Guidelines which instruct to sequence the procedure performed for definitive treatment most related to the principal diagnosis as principal procedure. The commenter included the FDA labeling language that was referenced in the preamble of the proposed rule (90 FR 18062) and stated that because patients who are admitted for a procedure to deliver the AGENT™ implant have a principal diagnosis of ISR, the AGENT™ implant is the principal procedure from a coding perspective and is the primary procedure that represents the therapeutic intent of the intervention.

The commenter asserted that the AGENT™ DCB therapy is consistent with drug-eluting stent (DES) therapy in terms of diagnostic methods, intra-operative procedure steps, complexity and risk, therefore, consistent with DES and other procedure codes for percutaneous coronary interventions (PCI), the codes for the AGENT™ DCB should be designated as O.R. codes. The commenter stated that the procedure involving the AGENT™ implant is most clinically similar to a DES procedure because both are PCI procedures, performed only by physicians experienced in PCI, involve a surgical implant within the coronary artery, involve the transfer of therapeutic substances to a lesion and are targeted localized therapies as opposed to systemic treatments. The commenter added that the procedural steps to prepare a vessel for the AGENT™ implant is consistent with that required for a DES including obtaining percutaneous arterial access, positioning a guide catheter in the heart, advancing a guide wire across the coronary artery stenosis, preparing the vessel for the AGENT™ implant using specialized catheters and devices as needed (for example, angioplasty balloon, cutting balloon, lithotripsy, atherectomy), and using angiographic imaging to visualize the heart and IVUS or OCT to guide the procedure.

The commenter stated that in addition to the clinical similarities between the AGENT™ DCB and a DES, the procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology in ICD–10–PCS Table XW0 (Introduction, Anatomical Regions) closely mirror the procedure codes describing use of a DES, in ICD–10–PCS Table 027, Dilation of Heart and Great Vessels because both sets of codes account for treatment of multiple coronary arteries and the use of multiple devices. The commenter asserted that since the procedure codes describing a DES and all other PCI procedure codes are classified as surgical, the AGENT™ Paclitaxel-Coated Balloon Catheter technology should be similarly classified as surgical. The commenter stated that the 16 procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology should be designated as O.R. procedures regardless of whether there is immediate impact to the MS–DRG assignment.

Other commenters expressed appreciation that CMS reviewed the request to reconsider the MS–DRG assignment of the sixteen procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology from non-O.R. to O.R. however, the commenters disagreed with the proposal to maintain the DCB placement as a non-O.R. procedure. According to the commenters, because the vessel preparation techniques discussed to allow placement of the AGENT™ Paclitaxel-Coated Balloon Catheter are O.R. services, it would only be consistent for the AGENT™ Paclitaxel-Coated Balloon Catheter service itself to also be designated as an O.R. service. The commenters stated that, from a similar perspective, just as drug-eluting intraluminal device procedures (drug-eluting stents) are considered alongside non-drug-eluting intraluminal devices (stents); the AGENT™ Paclitaxel-Coated Balloon Catheter service should be categorized in the same manner as other dilation of coronary artery procedures (that is, angioplasty).

Response: We appreciate the commenters' feedback. We disagree with the commenter's (the manufacturer) statement that the vessel preparation technique(s) are secondary to delivery of the AGENT™ implant (that is, paclitaxel). While the delivery of paclitaxel via the AGENT™ Paclitaxel-Coated Balloon Catheter is the intended therapeutic intervention to treat ISR, it cannot occur in the absence of the initial vessel preparation procedure (for example, angioplasty for vessel dilation, and atherectomy, lithotripsy, and/or cutting balloon for plaque modification). In response to the commenter's statement that the primary role of the AGENT™ implant is supported by ICD–10–PCS sequencing guidelines for the principal procedure, we note that the ICD–10–PCS Guidelines regarding sequencing of the principal procedure have no direct correlation on MS–DRG assignment or whether a procedure code is designated as O.R. or non-O.R. We also note that the sequencing of the procedure on the claim does not have an effect on MS–DRG assignment. Rather, the MS–DRG assignment is based on the O.R. or non-O.R. designation of the procedure code.

While we agree that there are some procedural similarities between delivery of the AGENT™ implant and the insertion of a DES, we note that a major distinction is that the objective of the AGENT™ Paclitaxel-Coated Balloon Catheter is to deliver a targeted anti-proliferative drug dose, without introducing an extra layer of metal that is intended to remain permanently. We disagree with the commenter that the procedure involving the AGENT™ implant should be designated as an O.R. procedure. Although the FDA

designated the AGENT™ Paclitaxel-Coated Balloon as an implant for Pre-Market Approval (PMA) purposes, (that is, per FDA guidance, the drug component is considered a permanent implant because it remains in the body for greater than 30 days), delivery of a drug (or therapeutic agent) is not equivalent to the insertion of an intraluminal device (that is, stent) under the ICD–10–PCS classification. Notably, unlike a device, a drug cannot become dislodged from its location nor can it be removed.

Designating a procedure code that is identified as one component of a multi-component procedure, service, or therapy as O.R. when that component would not be performed independently and is not FDA approved to be performed independently in the absence of another component (that is, two components are necessary for reporting to accurately reflect the entire procedure) would not be appropriate and is also not necessary when the other component has an existing O.R. designation. Specifically, it would not be appropriate to only report a procedure code describing the introduction of the AGENT™ Paclitaxel-Coated Balloon Catheter technology and arrive at one of the requested MS–DRG assignments in the absence of a procedure code describing an angioplasty, lithotripsy, or atherectomy procedure being reported. To encourage proper coding and reporting, as well as to ensure appropriate MS–DRG assignment, both the AGENT™ Paclitaxel-Coated Balloon Catheter technology and one of the procedure codes describing an angioplasty, lithotripsy, or atherectomy must be reported. We also note that under ICD–10–PCS, PCI procedures such as angioplasty performed for the treatment of blocked arteries with one or more intraluminal devices (that is, stents) that remain in the patient are coded to ''Dilation with intraluminal device''. The AGENT™ Paclitaxel-Coated Balloon Catheter technology does not involve a stent; rather, the drug (paclitaxel) is deployed and the balloon catheter is removed. The procedure codes describe the administration or transfer of the drug via the delivery mechanism of the balloon catheter. The intended outcomes or benefits of altering the designation of the procedure codes for the AGENT™ Paclitaxel-Coated Balloon Catheter technology from non-O.R. to O.R. remain unclear, as the MS–DRG assignment is determined by the vessel preparation procedure, which is classified as an O.R. procedure. As discussed in section II.C.7 of the preamble of the proposed rule (90 FR 18059) and this final rule, each ICD–10–PCS procedure code has a designation that determines whether and in what way the presence of that procedure on a claim impacts the MS–DRG assignment.

After consideration of the public comments received and for the reasons previously described, we are finalizing our proposal to maintain the designation of the 16 procedure codes describing use of the AGENT™ Paclitaxel-Coated Balloon Catheter technology as non-O.R. for FY 2026.

(3) Endoscopic Drainage of the Ureter With Drainage Device

As discussed in the proposed rule (90 FR 18062 through 18063), during our internal review, we noted that procedure codes that describe drainage of the ureter with a drainage device, via a natural or artificial opening endoscopic approach, are not recognized as O.R. procedures for purposes of MS–DRG assignment. We identified the following three related codes:

ICD-10-PCS Code	Description
0T9680Z	Drainage of right ureter with drainage device, via natural or artificial opening endoscopic
0T9780Z	Drainage of left ureter with drainage device, via natural or artificial opening endoscopic
0T9880Z	Drainage of bilateral ureters with drainage device, via natural or artificial opening endoscopic

Upon further review and consideration, we stated we believe that procedure codes 0T9680Z, 0T9780Z, and 0T9880Z that describe the drainage of the ureter with a drainage device via a natural or artificial opening endoscopic approach warrant designation as O.R. procedures. These procedures involve the use of a cystoscope and include the insertion of a small tube (called a ureteral stent or drainage tube) into one or both of the ureters (the tubes that carry urine from the kidneys to the bladder) to drain urine from a blocked or partially blocked ureter and must be performed by a urologist who specializes in diagnosing and treating conditions of the urinary tract, genitals, and adrenal glands through surgery. These procedures are typically performed in an operating room under anesthesia, can take about 30 minutes or more, including preparation time, and require that a patient's vital signs be monitored by the health care team for the duration of the procedure.

Therefore, we proposed to add procedure codes 0T9680Z, 0T9780Z, and 0T9880Z to the FY 2026 ICD–10 MS–DRG Version 43 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS-DRG Index as O.R. procedures assigned to MS–DRG 264 (Other Circulatory System O.R. Procedures) in MDC 05 (Diseases and Disorders of the Circulatory System); MS–DRGs 656, 657, and 658 (Kidney and Ureter Procedures for Neoplasm, with MCC, with CC, and without CC/MCC, respectively) and MS–DRGs 659, 660, and 661 (Kidney and Ureter Procedures for Non-Neoplasm, with MCC, with CC, and without CC/MCC, respectively) in MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract); MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively) in MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs); and MS–DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively) in MDC 24 (Multiple Significant Trauma).

Comment: Commenters supported the proposal to change the designation of procedure codes 0T9680Z, 0T9780Z, and 0T9880Z from non-O.R. procedures to O.R. procedures.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of procedure codes 0T9680Z, 0T9780Z, and 0T9880Z from non-O.R. procedures to O.R. procedures, without modification, effective October 1, 2025.

8. Changes to the MS–DRG Diagnosis Codes for FY 2026

a. Background of the CC List and the CC Exclusions List

Under the IPPS MS–DRG classification system, we have developed a standard list of diagnoses that are considered CCs. Historically, we

developed this list using physician panels that classified each diagnosis code based on whether the diagnosis, when present as a secondary condition, would be considered a substantial complication or comorbidity. A substantial complication or comorbidity was defined as a condition that, because of its presence with a specific principal diagnosis, would cause an increase in the length-of-stay by at least 1 day in at least 75 percent of the patients. However, depending on the principal diagnosis of the patient, some diagnoses on the basic list of complications and comorbidities may be excluded if they are closely related to the principal diagnosis. In FY 2008, we evaluated each diagnosis code to determine its impact on resource use and to determine the most appropriate CC subclassification (NonCC, CC, or MCC) assignment. We refer readers to sections II.D.2. and 3. of the preamble of the FY 2008 IPPS final rule with comment period for a discussion of the refinement of CCs in relation to the MS DRGs we adopted for FY 2008 (72 FR 47152 through 47171).

b. Overview of Comprehensive CC/MCC Analysis

In the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159), we described our process for establishing three different levels of CC severity into which we would subdivide the diagnosis codes. The categorization of diagnoses as an MCC, a CC, or a NonCC was accomplished using an iterative approach in which each diagnosis was evaluated to determine the extent to which its presence as a secondary diagnosis resulted in increased hospital resource use. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our approach. Since the comprehensive analysis was completed for FY 2008, we have evaluated diagnosis codes individually when assigning severity levels to new codes and when receiving requests to change the severity level of specific diagnosis codes.

We noted in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235 through 19246) that with the transition to ICD–10–CM and the significant changes that have occurred to diagnosis codes since the FY 2008 review, we believed it was necessary to conduct a comprehensive analysis once again. Based on this analysis, we proposed changes to the severity level designations for 1,492 ICD–10–CM diagnosis codes and invited public comments on those proposals. As summarized in the FY 2020 IPPS/LTCH PPS final rule, many commenters expressed concern with the proposed severity level designation changes overall and recommended that CMS conduct further analysis prior to finalizing any proposals. After careful consideration of the public comments we received, as discussed further in the FY 2020 IPPS/LTCH PPS final rule, we generally did not finalize our proposed changes to the severity designations for the ICD–10–CM diagnosis codes, other than the changes to the severity level designations for the diagnosis codes in category Z16 (Resistance to antimicrobial drugs) from a NonCC to a CC. We stated that postponing adoption of the proposed comprehensive changes in the severity level designations would allow further opportunity to provide additional background to the public on the methodology utilized and clinical rationale applied across diagnostic categories to assist the public in its review. We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42150 through 42152) for a complete discussion of our response to public comments regarding the proposed severity level designation changes for FY 2020.

As discussed in the FY 2021 IPPS/LTCH PPS proposed rule (85 FR 32550); to provide the public with more information on the CC/MCC comprehensive analysis discussed in the FY 2020 IPPS/LTCH PPS proposed and final rules, CMS hosted a listening session on October 8, 2019. The listening session included a review of this methodology utilized to mathematically measure the impact on resource use. We refer readers to *https://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/Downloads/10082019ListingSessionTrasncriptandQandAsandAudioFile.zip* for the transcript and audio file of the listening session. We also refer readers to *https://www.cms.gov/Medicare/MedicareFee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software.html* for the supplementary file containing the mathematical data generated using claims from the FY 2018 MedPAR file describing the impact on resource use of specific ICD–10–CM diagnosis codes when reported as a secondary diagnosis that was made available for the listening session.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58550 through 58554), we discussed our plan to continue a comprehensive CC/MCC analysis, using a combination of mathematical analysis of claims data as discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235) and the application of nine guiding principles and plan to present the findings and proposals in future rulemaking. The nine guiding principles are as follows:

- Represents end of life/near death or has reached an advanced stage associated with systemic physiologic decompensation and debility.
- Denotes organ system instability or failure.
- Involves a chronic illness with susceptibility to exacerbations or abrupt decline.
- Serves as a marker for advanced disease states across multiple different comorbid conditions.
- Reflects systemic impact.
- Post-operative/post-procedure condition/complication impacting recovery.
- Typically requires higher level of care (that is, intensive monitoring, greater number of caregivers, additional testing, intensive care unit care, extended length of stay).
- Impedes patient cooperation or management of care or both.
- Recent (last 10 years) change in best practice, or in practice guidelines and review of the extent to which these changes have led to concomitant changes in expected resource use.

We refer readers to the FY 2021 IPPS/LTCH PPS final rule for a complete summation of the comments we received for each of the nine guiding principles and our responses to those comments.

In the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25175 through 25180), as another interval step in our comprehensive review of the severity designations of ICD–10–CM diagnosis codes, we requested public comments on a potential change to the severity level designations for ''unspecified'' ICD–10–CM diagnosis codes that we were considering adopting for FY 2022. Specifically, we noted we were considering changing the severity level designation of ''unspecified'' diagnosis codes to a NonCC where there are other codes available in that code subcategory that further specify the anatomic site. As summarized in the FY 2022 IPPS/LTCH PPS final rule, many commenters expressed concern with the potential severity level designation changes overall and recommended that CMS delay any possible change to the designation of these codes to give hospitals and their physicians time to prepare. After careful consideration of the public comments we received, we maintained the severity level designation of the ''unspecified'' diagnosis codes currently designated as a CC or MCC where there are other codes available in that code subcategory that further specify the anatomic site for

FY 2022. We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 44916 through 44926) for a complete discussion of our response to public comments regarding the potential severity level designation changes. Instead, for FY 2022, we finalized a new Medicare Code Editor (MCE) code edit for ''unspecified'' codes, effective with discharges on and after April 1, 2022. We stated we believed finalizing this new edit would provide additional time for providers to be educated while not affecting the payment the provider is eligible to receive. We refer the reader to section II.D.14.e. of the preamble of the FY 2022 IPPS/LTCH PPS final rule (86 FR 44940 through 44943) for the complete discussion.

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48866), we stated that as the new unspecified edit became effective beginning with discharges on and after April 1, 2022, we believed it was appropriate to not propose to change the designation of any ICD–10–CM diagnosis codes, including the unspecified codes that are subject to the ''Unspecified Code'' edit, as we continue our comprehensive CC/MCC analysis to allow interested parties the time needed to become acclimated to the new edit.

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28177 through 28181), we also requested public comments on how the reporting of diagnosis codes in categories Z55–Z65 might improve our ability to recognize severity of illness, complexity of illness, and/or utilization of resources under the MS–DRGs. We stated we were also interested in receiving feedback on how we might otherwise foster the documentation and reporting of the diagnosis codes describing social and economic circumstances to more accurately reflect each health care encounter and improve the reliability and validity of the coded data.

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58755 through 58759), based on our analysis of the impact on resource use for the ICD–10–CM Z codes that describe homelessness and after consideration of public comments, we finalized changes to the severity levels for diagnosis codes Z59.00 (Homelessness, unspecified), Z59.01 (Sheltered homelessness), and Z59.02 (Unsheltered homelessness), from NonCC to CC.

In the FY 2025 proposed rule (89 FR 35995), we noted that since the FY 2021 IPPS/LTCH PPS final rule we have continued to solicit feedback regarding the nine guiding principles, as well as other possible ways we can incorporate meaningful indicators of clinical severity. We stated we had encouraged the public to provide a detailed explanation of how applying a suggested concept or principle would ensure that the severity designation appropriately reflects resource use for any diagnosis code when providing feedback or comments. We also noted in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26748 through 26750) we illustrated how the nine guiding principles might be applied in evaluating changes to the severity designations of diagnosis codes in our discussion of our proposed changes to the severity level designation for certain diagnosis codes that describe homelessness. After consideration of the ongoing feedback and comments we had received, we proposed to finalize the nine guiding principles. After consideration of the public comments received, and for the reasons discussed, we finalized the nine guiding principles as listed previously in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69076 through 69078). Accordingly, we stated that our evaluations to determine the extent to which the presence of a diagnosis code as a secondary diagnosis results in increased hospital resource use will include a combination of mathematical analysis of claims data as discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19235) and the application of the nine guiding principles.

Comment: A commenter stated that they applaud the inclusion of the guiding principles that recognize organ system instability or failure, chronic illness with susceptibility to exacerbations, conditions requiring higher levels of care, and systemic impact. This commenter stated that these principles appropriately capture the resource intensity associated with managing complex infectious diseases. This commenter also urged CMS to expedite the comprehensive CC/MCC analysis, paying particular attention to diagnoses that describe infectious conditions, and recommended that CMS consider additional factors specific to infectious disease management such as antimicrobial resistances, factors related to immunocompromised hosts and the role of antimicrobial stewardship when reviewing these conditions.

Response: We thank the commenter for their support and appreciate their feedback. We continue to welcome feedback regarding the guiding principles, as well as other possible ways we can incorporate meaningful indicators of clinical severity. We will examine these suggestions as we continue the comprehensive CC/MCC analysis and will provide more detail in future rulemaking.

Additionally, in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69079 through 69084), based on our analysis of the impact on resource use for the ICD–10–CM diagnosis codes that describe inadequate housing and housing instability, and after consideration of public comments, we finalized changes to the severity levels for seven diagnosis codes for FY 2025.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18064), we did not receive any requests to change the severity level designations of specific ICD–10–CM diagnosis codes. We stated at this time, we believe it is appropriate to continue to formulate future next steps in our comprehensive review of the severity designations of ICD–10–CM diagnosis codes, rather than proposing to change the designation of individual ICD–10–CM diagnosis codes. Therefore, we did not propose any severity designation changes for FY 2026.

Comment: Commenters supported the decision to not propose any severity designation changes for FY 2026. A commenter stated that they appreciate CMS' commitment to refining the MS–DRG system to better reflect hospital resource use.

Response: We appreciate the commenters' support.

Comment: Several commenters stated that they appreciate that CMS finalized changes to the severity level designations for the diagnosis codes in category Z16 (Resistance to antimicrobial drugs) from a NonCC to a CC in the FY 2020 IPPS/LTCH PPS final rule. These commenters stated that they continue to support these designations and encouraged CMS to clarify that all current and future ICD–10–CM diagnosis codes describing antimicrobial resistance will be appropriately designated as CCs.

Other commenters encouraged CMS to examine the ICD–10–CM diagnosis codes that describe longstanding persistent and permanent atrial fibrillation to determine the hospital resource utilization related to addressing these diagnoses and to analyze whether these codes should be considered for severity designation changes. These commenters stated that from a resource perspective, patients with longstanding persistent atrial fibrillation or permanent atrial fibrillation require markedly more intensive management and typically face longer operative times, higher complication rates, prolonged hospital stays, and increased readmission risk.

Response: We appreciate the feedback.

In response to the request that CMS clarify that all future ICD–10–CM diagnosis codes describing antimicrobial resistance will be designated as CCs, as discussed in prior rulemaking and in section II.C.9 of this final rule, consistent with our established process for assigning new diagnosis or new procedure codes to MDCs, MS–DRGs, and the associated attributes (severity level and O.R. status), we examine the MDCs, MS–DRG assignment and severity level designation of the predecessor diagnosis codes to inform our assignments and designations. We review the predecessor code and MS–DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we consider other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. As we have previously noted, this process does not automatically result in the new diagnosis or procedure code being assigned to the same MS–DRG or to have the same designation as the predecessor code.

As we continue our comprehensive CC/MCC analysis, we may consider proposing changes for other diagnosis codes in the future based on our analysis of the impact on resource use, per our methodology, as previously described, and consideration of the guiding principles consistent with our annual process and will provide more detail in future rulemaking. We have updated the Impact on Resource Use Files on the CMS website so that the public can review the mathematical data for the impact on resource use generated using claims from the FY 2019 through the FY 2024 MedPAR files. These files are posted on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*.

We encourage individuals with comments about the severity level designations of ICD–10–CM diagnosis codes to submit these comments no later than October 20th of each year, via the Medicare Electronic Application Request Information System™ (MEARIS™) at: *https://mearis.cms.gov/public/home*, so that they can be considered for possible inclusion in the annual proposed rule. When submitting requests to change the severity level designation of an ICD–10–CM diagnosis code when reported as a secondary diagnosis, we encourage the public to review the mathematical data for the impact on resource use generated using claims from the FY 2019 through the FY 2024 MedPAR files as well as to provide a detailed explanation of how applying a suggested guiding principle would ensure that the severity designation appropriately reflects resource use for any diagnosis code.

For new diagnosis codes approved for FY 2026, consistent with our annual process for designating a severity level (MCC, CC, or NonCC) for new diagnosis codes, we first review the predecessor code designation, followed by review and consideration of other factors that may be relevant to the severity level designation, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis or treatment of the condition. We note that this process does not automatically result in the new diagnosis code having the same designation as the predecessor code. We refer the reader to section II.C.9 of the preamble of this FY 2026 IPPS/LTCH PPS final rule for the discussion of the finalized changes to the ICD–10–CM and ICD–10–PCS coding systems for FY 2026.

c. Additions and Deletions to the Diagnosis Code Severity Levels for FY 2026

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18065), we stated that the following tables identify the proposed additions and deletions to the diagnosis code MCC and CC severity levels list for FY 2026 and are available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*

Table 6I.1—Proposed Additions to the MCC List—FY 2026;

Table 6I.2—Proposed Deletions to the MCC List—FY 2026;

Table 6J.1—Proposed Additions to the CC List—FY 2026; and

Table 6J.2—Proposed Deletions to the CC List—FY 2026.

We note that there was an inadvertent error in the listing of Table 6I.2 in the preamble of the proposed rule as there were no proposed deletions to the MCC list for FY 2026 and Table 6I.2 was not developed in association with the proposed rule.

Comment: Commenters agreed with the proposed additions and deletions to the MCC and CC lists as shown in tables 6I.1, 6J.1, and 6J.2 associated with the proposed rule.

Response: We appreciate the commenters' support.

The following tables associated with this final rule reflect the finalized severity levels under Version 43 of the ICD–10 MS–DRGs for FY 2026 and are available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*; Table 6I.—Complete MCC List—FY 2026; Table 6I.1—Additions to the MCC List—FY 2026; Table 6J.—Complete CC List—FY 2026; Table 6J.1—Additions to the CC List—FY 2026; and Table 6J.2—Deletions to the CC List—FY 2026.

d. CC Exclusions List for FY 2026

In the September 1, 1987 final notice (52 FR 33143) concerning changes to the DRG classification system, we modified the GROUPER logic so that certain diagnoses included on the standard list of CCs would not be considered valid CCs in combination with a particular principal diagnosis. We created the CC Exclusions List for the following reasons: (1) to preclude coding of CCs for closely related conditions; (2) to preclude duplicative or inconsistent coding from being treated as CCs; and (3) to ensure that cases are appropriately classified between the complicated and uncomplicated DRGs in a pair.

In the May 19, 1987 proposed notice (52 FR 18886) and the September 1, 1987 final notice (52 FR 33154), we explained that the excluded secondary diagnoses were established using the following five principles:

- Chronic and acute manifestations of the same condition should not be considered CCs for one another;
- Specific and nonspecific (that is, not otherwise specified (NOS)) diagnosis codes for the same condition should not be considered CCs for one another;
- Codes for the same condition that cannot coexist, such as partial/total, unilateral/bilateral, obstructed/unobstructed, and benign/malignant, should not be considered CCs for one another;
- Codes for the same condition in anatomically proximal sites should not be considered CCs for one another; and
- Closely related conditions should not be considered CCs for one another.

The creation of the CC Exclusions List was a major project involving hundreds of codes. We have continued to review the remaining CCs to identify additional exclusions and to remove diagnoses from the master list that have been shown not to meet the definition of a CC. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50541 through 50544) for detailed information regarding revisions that were made to

the CC and CC Exclusion Lists under the ICD–9–CM MS–DRGs.

The ICD–10 MS–DRGs Version 42.1 CC Exclusion List is included as Appendix C in the ICD–10 MS–DRG Definitions Manual (available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*) and includes three lists identified as Part 1, Part 2 and Part 3. Part 1 is the list of all diagnosis codes that are defined as a CC or MCC when reported as a secondary diagnosis. For all diagnosis codes on the list, a link is provided to a collection of diagnosis codes which, when reported as the principal diagnosis, would cause the CC or MCC diagnosis to be considered as a NonCC. Part 2 is the list of diagnosis codes designated as an MCC only for patients discharged alive; otherwise, they are assigned as a NonCC. Part 3 is the list of diagnosis codes that are designated as a CC or MCC and included in the definition of the logic for the listed MS–DRGs. When reported as a secondary diagnosis and grouped to one of the listed MS–DRGs, the diagnosis is excluded from acting as a CC/MCC for severity in DRG assignment (that is, suppression logic).

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69093), we stated that, because commenters had raised concerns regarding the principal diagnoses listed under Part 1 of Appendix C–CC Exclusions List in Principal Diagnosis Collection Lists 1379 and 1380 that exclude diagnosis codes N18.5 (Chronic kidney disease, stage 5) and N18.6 (End stage renal disease) from acting as a CC or MCC under the CC exclusion logic in accordance with the list of five principles established in 1987, we intended to perform a broad review of the conditions in these lists to determine if any modifications are warranted and to ensure they continue to be clinically appropriate. In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18065), we noted that the Principal Diagnosis Collection List numbers may change because of updates that are made to the list annually through rulemaking. Therefore, while under Version 41.1 the principal diagnoses listed in Principal Diagnosis Collection List numbers 1379 and 1380 exclude diagnosis codes N18.5 and N18.6 from acting as a CC or MCC, under Version 42.1, the principal diagnoses listed in Principal Diagnosis Collection List numbers 1330 and 1331 exclude diagnosis codes N18.5 and N18.6 from acting as a CC or MCC. Accordingly, we reviewed the list of principal diagnosis codes listed in Principal Diagnosis Collection List numbers 1330 and 1331 that exclude diagnosis codes N18.5 and N18.6 from acting as a CC or MCC to assess clinical appropriateness.

As discussed in the preamble of the FY 2026 IPPS/LTCH PPS proposed rule, the findings from our review indicated several of the listed conditions, when reported as a principal diagnosis, are not applicable to exclude the designated N18.5 or N18.6 secondary CC/MCC diagnosis code under application of our five established principles finalized in the September 1, 1987 final notice (52 FR 33154) previously discussed. For example, diagnosis codes describing diabetes with other specified complications such as arthropathy, periodontal disease, or a foot ulcer, and diagnosis codes describing endometriosis, are not chronic and acute manifestations of, or closely related conditions to, chronic kidney disease, stage 5 (code N18.5) or end stage renal disease (code N18.6), nor are they describing codes for the same condition that cannot coexist.

As previously described, the Principal Diagnosis Collection List numbers may change because of updates that are made to the list annually through rulemaking. We noted that, under proposed Version 43, the proposed Principal Diagnosis Collection List number to exclude diagnosis codes N18.5 and N18.6 from acting as a CC or MCC is 1335. We therefore proposed to remove the diagnosis codes listed in Table 6P.8a associated with the FY 2026 IPPS/LTCH PPS proposed rule and available via the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* from Principal Diagnosis Collection List number 1335 under proposed Version 43. In the proposed rule (90 FR 18065), we stated that findings from our internal review also indicated that diagnosis code I12.9 (Hypertensive chronic kidney disease with stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease) is currently listed in Principal Diagnosis Collection List number 1331 and excludes diagnosis code N18.6 from acting as an MCC; however, diagnosis code I12.9 is not currently listed in the Principal Diagnosis Collection List number 1330 to exclude diagnosis code N18.5. We stated we believe it is clinically appropriate to add diagnosis code I12.9 to Principal Diagnosis Collection List number 1335 under Version 43 because it would not be expected that a secondary diagnosis of N18.5 would be reported with a principal diagnosis of I12.9. As also discussed in the proposed rule, during our internal review we identified diagnosis code I13.0 (Hypertensive heart and chronic kidney disease with heart failure and stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease) and diagnosis code I13.10 (Hypertensive heart and chronic kidney disease without heart failure, with stage 1 through stage 4 chronic kidney disease, or unspecified chronic kidney disease) that we believe are appropriate to add to Principal Diagnosis Collection List number 1335 to exclude diagnosis codes N18.5 and N18.6 from acting as a CC/MCC when reported because the conditions describe chronic kidney disease, stage 5 and end stage renal disease (ESRD) and it would not be clinically appropriate to have a principal diagnosis describing stage 1 through stage 4 chronic kidney disease reported with chronic kidney disease, stage 5 or ESRD.

In summary, we proposed to add diagnosis code I12.9 to Principal Diagnosis Collection List number 1335 to exclude diagnosis code N18.5 from acting as a CC, proposed to remove the diagnosis codes listed in Table 6P.8a associated with the FY 2026 IPPS/LTCH PPS proposed rule and available via the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* from Principal Diagnosis Collection List number 1335, and proposed to add diagnosis codes I13.0 and I13.10 to Principal Diagnosis Collection List number 1335 to exclude diagnosis codes N18.5 and N18.6 from acting as a CC/MCC.

Comment: Several commenters agreed with our proposals to add diagnosis code I12.9 to Principal Diagnosis Collection List number 1335 to exclude diagnosis code N18.5 from acting as a CC, remove the diagnosis codes listed in Table 6P.8a associated with the FY 2026 IPPS/LTCH PPS proposed rule and available via the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* from Principal Diagnosis Collection List number 1335, and to add diagnosis codes I13.0 and I13.10 to Principal Diagnosis Collection List number 1335 to exclude diagnosis codes N18.5 and N18.6 from acting as a CC/MCC. However, a commenter disagreed with the proposed addition of diagnosis codes I13.0 and I13.10 to principal diagnosis collection list number 1335 to exclude diagnosis codes N18.5 and N18.6 from acting as a CC/MCC. According to the commenter, diagnosis codes I13.0 and I13.10 are combination codes and do not differentiate between a patient that is being admitted for congestive heart failure (CHF) or

chronic kidney disease (CKD). The commenter stated that the exclusion of codes N18.5 and N18.6 eliminates the complexity of these patients and the additional resources in management of their renal function when admitted for cardiogenic related conditions.

Response: We appreciate the commenters' support and feedback. In response to the commenter who disagreed with the proposal to exclude diagnosis codes N18.5 and N18.6 from acting as a CC/MCC when diagnosis code I13.0 or I13.10 is assigned as the principal diagnosis, we note that, as discussed in the FY 2026 IPPS/LTCH PPS proposed rule, the conditions described by diagnosis codes N18.5 and N18.6 describe chronic kidney disease, stage 5 and end stage renal disease (ESRD), respectively, and it would not be clinically appropriate to have a principal diagnosis describing stage 1 through stage 4 chronic kidney disease reported with chronic kidney disease, stage 5 or ESRD. We also note that in the ICD–10–CM Tabular List of Diseases, there are instructional notes at diagnosis codes I13.0 and I13.10 that specifically direct the user to ''Use additional code to identify the stage of chronic kidney disease (N18.1–N18.4, N18.9)''. The instructional note does not list diagnosis codes N18.5 or N18.6 because they are not clinically applicable, as previously described. There is also another instructional note in the ICD–10–CM Tabular List of Diseases at diagnosis code I13.0 that specifically directs the user to ''Use additional code to identify the type of heart failure (I50.-)'' because diagnosis code I13.0 describes ''with heart failure'' (while diagnosis code I13.10 describes ''without heart failure''). With respect to the commenter's statement that the combination codes (I13.0 and I13.10) do not differentiate between a patient that is being admitted for CHF or CKD, we note that because these codes are classified as combination codes, they include both a CHF and CKD component. Therefore, the appropriate combination code (I13.0 or I13.10) is assigned on a claim to accurately reflect the conditions documented, and any additional codes would be assigned based on the Tabular instructions.

After consideration of the public comments we received, we are finalizing our proposals to add diagnosis code I12.9 to Principal Diagnosis Collection List number 1335 to exclude diagnosis code N18.5 from acting as a CC, remove the diagnosis codes listed in Table 6P.8a associated with this FY 2026 IPPS/LTCH PPS final rule and available via the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* from Principal Diagnosis Collection List number 1335, and to add diagnosis codes I13.0 and I13.10 to Principal Diagnosis Collection List number 1335 to exclude diagnosis codes N18.5 and N18.6 from acting as a CC/MCC, effective October 1, 2025 for FY 2026.

We intend to continue this type of internal review to ensure all the other Principal Diagnosis Collection lists reflect the appropriate codes in connection with the CC/MCC secondary diagnosis code that is excluded from acting as a CC/MCC. Any proposed changes to the lists will be discussed in future rulemaking. To inform future rulemaking, feedback and other suggestions may be submitted by October 20, 2025, and directed to MEARIS™ at: *https://mearis.cms.gov/public/home*.

As discussed in the proposed rule (90 FR 18066 through 18067), we also performed an internal review of the diagnoses listed in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive. The diagnoses listed in Part 2 of Appendix C are assigned as an MCC only for patients discharged alive, otherwise the codes are assigned as a NonCC. The diagnoses listed in Part 2 in Version 42.1 are shown in the following table.

ICD-10-CM Code	Description
I46.2	Cardiac arrest due to underlying cardiac condition
I46.8	Cardiac arrest due to other underlying condition
I46.9	Cardiac arrest, cause unspecified
I49.01	Ventricular fibrillation
R09.2	Respiratory arrest
R57.0	Cardiogenic shock
R57.1	Hypovolemic shock
R57.8	Other shock

In developing Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive (72 FR 47161 through 47168), the claims data were evaluated to determine if there was a difference in resource use between cases in which the patient was discharged alive or died during the hospital stay. For most secondary diagnoses, the charges were similar for the two groups. However, there were a few diagnoses where the difference in charges and clinical considerations supported a different CC designation for patients who died before discharge. For these diagnoses, the patients who were discharged alive required significantly more hospital resources than the patients who died. Therefore, when reported as a secondary diagnosis, each of the diagnoses is designated as an MCC in cases where the patient is discharged alive and as a NonCC in cases where the patient died.

As discussed in the preamble of the FY 2026 IPPS/LTCH PPS proposed rule, we analyzed claims data from the September 2024 update of the FY 2024 MedPAR file for the diagnoses currently listed in Appendix C—Part 2. Our findings are reflected in the following table:

ICD-10-CM Code	Description	Patient Discharged Alive (Without Discharge Status 20)			Patient Expired (With Discharge Status 20)		
		Number of Cases	Average LOS	Average Cost	Number of Cases	Average LOS	Average Cost
I46.2	Cardiac arrest due to underlying cardiac condition	8,241	11.6	$61,108	5,766	5.3	$33,173
I46.8	Cardiac arrest due to other underlying condition	3,884	15.6	$62,505	6,133	5.8	$25,979
I46.9	Cardiac arrest, cause unspecified	13,121	13.3	$59,732	28,437	5.2	$24,933
I49.01	Ventricular fibrillation	10,705	9.9	$52,118	6,788	4.6	$28,949
R09.2	Respiratory arrest	367	8.7	$33,536	375	5.5	$17,280
R57.0	Cardiogenic shock	46,537	12.5	$58,432	23,335	6.8	$39,457
R57.1	Hypovolemic shock	32,614	10.8	$39,051	6,476	8.3	$38,697
R57.8	Other shock	37,728	12.4	$50,374	11,570	8.4	$43,215

As shown in the table, the data reflect that most of the conditions currently listed in Appendix C—Part 2, utilize hospital resources as expected, with the patients who were discharged alive (without discharge status 20) requiring significantly more hospital resources than the patients who expired (with discharge status 20), as demonstrated by the longer lengths of stay and higher average costs of these cases. However, we noted in the proposed rule that the resource utilization for cases reporting R57.1 (Hypovolemic shock) as a secondary diagnosis appear to be comparable whether the patient was discharged alive or the patient expired. As reflected in the table, the claims data from the September 2024 update of the FY 2024 MedPAR file reflect that code R57.1 was reported as a secondary diagnosis in 32,614 cases where the patient was discharged alive. These cases had average costs of $39,051 and an average length of stay of 10.8 days. In the 6,476 cases where R57.1 was reported as a secondary diagnosis and the patient expired, the average costs were slightly lower ($38,697 versus $39,051) and the average length of stay was slightly shorter (8.3 days versus 10.8 days). We reviewed this issue and noted clinically, the recommended treatment for hypovolemic shock is immediate intervention with fluid resuscitation with intravenous (IV) fluids, blood transfusions, and vasoactive drugs. Hypovolemic shock generally has a lower mortality rate and responds to timely treatment. As the claims data no longer reflect that patients reporting hypovolemic shock as secondary diagnosis that are discharged alive require significantly more hospital resources than the patients who expire, we proposed to remove code R57.1 from the list found in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive. We noted that under this proposal, when reported as a secondary diagnosis, R57.1 (Hypovolemic shock) will be assigned as an MCC when the patient is discharged alive or if the patient expires.

Comment: Commenters expressed support for our proposal to remove code R57.1 from the list found in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to remove code R57.1 (Hypovolemic shock) from the list found in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive, without modification, effective October 1, 2025. Under this finalization, when reported as a secondary diagnosis, R57.1 will be assigned as an MCC when the patient is discharged alive or if the patient expires.

Based on our review, we considered if it was appropriate to add other diagnosis codes describing shock to Appendix C—Part 2. Specifically, we considered code T79.4XXA (Traumatic shock, initial encounter). ICD–10–CM diagnosis code T79.4XXA is currently designated as an MCC when reported as secondary diagnoses. Traumatic shock represents a unique pathological condition that begins with multiple, usually blunt, trauma and may conclude with acute respiratory distress syndrome, coagulopathy, sepsis, multiple organ dysfunction syndrome and death.

As discussed in the proposed rule, we analyzed claims data from the September 2024 update of the FY 2024 MedPAR file for cases reporting T79.4XXA as a secondary diagnosis and our findings are reflected in the following table:

ICD-10-CM Code	Description	Patient Discharged Alive (Without Discharge Status 20)			Patient Expired (With Discharge Status 20)		
		Number of Cases	Average LOS	Average Cost	Number of Cases	Average LOS	Average Cost
T79.4XXA	Traumatic shock, initial encounter	1,187	16.1	$79,218	553	6.5	$48,880

As reflected in the table, the claims data from the September 2024 update of the FY 2024 MedPAR file indicate that T79.4XXA was reported as a secondary diagnosis in 1,187 cases where the patient was discharged alive. These cases had average costs of $79,218 and an average length of stay of 16.1 days. In the 553 cases where T79.4XXA was reported as a secondary diagnosis and the patient expired, the average costs were considerably lower ($48,880 versus $79,218) and the average length of stay was much shorter (6.5 days versus 16.1 days).

As the data reflect that cases reporting traumatic shock, initial encounter, as a secondary diagnosis for patients that are discharged alive require significantly more hospital resources than the patients who expire, we proposed to add code T79.4XXA to the list found in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive. We noted that under this proposal, when reported as a secondary diagnosis, T79.4XXA (Traumatic shock, initial encounter) would be assigned as an MCC only when the patient is discharged alive.

Comment: Commenters expressed support for our proposal to add code T79.4XXA to the list found in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to add code T79.4XXA (Traumatic shock, initial encounter) to the list found in Appendix C—Part 2: Codes That are Major CC Only if Patient Discharged Alive, without modification, effective October 1, 2025. Under this finalization, when reported as a secondary diagnosis, T79.4XXA would be assigned as an MCC only when the patient is discharged alive.

In summary, the proposals and related findings discussed in connection with Appendix C and finalized in this section of the preamble of this final rule are reflected in the Version 43 ICD–10 MS–DRG Definitions Manual, which is available in association with this final rule at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*.

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18067), we proposed additional changes to the ICD–10 MS–DRGs Version 43 CC Exclusion List based on the diagnosis code updates as discussed in section II.C.13. of the preamble of the proposed rule and set forth in Tables 6G.1, 6G.2, 6H.1, and 6H.2 associated with the proposed rule and available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*.

We did not receive any public comments opposing the proposed CC Exclusions List.

The finalized CC Exclusions List as displayed in Tables 6G.1, 6G.2, 6H.1, 6H.2, and 6K, associated with this final rule reflect the additions, deletions, and complete list of CC exclusions under Version 43 of the ICD–10 MS–DRGs. We have developed Table 6G.1.—Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2026; Table 6G.2.—Principal Diagnosis Order Additions to the CC Exclusions List—FY 2026; Table 6H.1.—Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2026; and Table 6H.2.—Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2026; and Table 6K. Complete List of CC Exclusions—FY 2026. Tables 6G.1., 6G.2., 6H.1., 6H.2., and 6K associated with this FY 2026 IPPS/LTCH PPS final rule are available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

For Table 6G.1, each secondary diagnosis code finalized for addition to the CC Exclusion List is shown with an asterisk and the principal diagnoses that exclude the secondary diagnosis code are provided in the indented column immediately following it. For Table 6G.2, each of the principal diagnosis codes for which there is a CC exclusion is shown with an asterisk and the conditions finalized for addition to the CC Exclusion List that will not count as a CC are provided in an indented column immediately following the affected principal diagnosis. For Table 6H.1, each secondary diagnosis code finalized for deletion from the CC Exclusion List is shown with an asterisk followed by the principal diagnosis codes that exclude it. For Table 6H.2, each of the principal diagnosis codes is shown with an asterisk and the finalized deletions to the CC Exclusions List are provided in an indented column immediately following the affected principal diagnosis. Table 6K contains a list of all of the codes that are defined as either a CC or MCC when assigned as a secondary diagnosis. Each CC or MCC secondary diagnosis code is assigned to a principal diagnosis number that reflects a collection of diagnosis codes which, when reported as the principal diagnosis, will cause the CC or MCC secondary diagnosis to be considered as only a non-CC secondary diagnosis.

9. Changes to the ICD–10–CM and ICD–10–PCS Coding Systems

To identify new, revised, and deleted diagnosis and procedure codes, for FY 2026, we have developed Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D.—Invalid Procedure Codes, Table 6E.—Revised Diagnosis Code Titles, and Table 6F.—Revised Procedure Code Titles for this FY 2026 IPPS/LTCH PPS final rule.

These tables are not published in the Addendum to the proposed rule or final rule, but are available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* as described in section VI. of the Addendum to this FY 2026 IPPS/LTCH PPS final rule. As discussed in section II.C.11. of the preamble of this FY 2026 IPPS/LTCH PPS final rule, the code titles are adopted as part of the ICD–10 Coordination and Maintenance Committee meeting process. Therefore, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18067 through 18068), we proposed the MDC and MS–DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes. We also stated that the proposed severity level designations for the new diagnosis codes are set forth in Table 6A. and the proposed O.R. status for the new procedure codes are set forth in Table 6B. Consistent with our established process, we examined the MS–DRG assignment and the attributes (severity level and O.R. status) of the predecessor diagnosis or procedure code, as applicable, to inform our proposed assignments and designations.

Specifically, we reviewed the predecessor code and MS–DRG assignment most closely associated with the new diagnosis or procedure code, and in the absence of claims data, we considered other factors that may be relevant to the MS–DRG assignment, including the severity of illness, treatment difficulty, complexity of service and the resources utilized in the diagnosis and/or treatment of the condition. We noted that this process does not automatically result in the new diagnosis or procedure code being proposed for assignment to the same MS–DRG or to have the same designation as the predecessor code.

In this FY 2026 IPPS/LTCH PPS final rule, we present a summation of the comments we received in response to the proposed assignments, our responses to those comments, and our finalized policies.

Comment: Several commenters supported the proposed MDC and MS–DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes. A commenter expressed appreciation for the new diagnosis codes finalized that describe ''Fontan physiology'' (I27.840, Fontan-associated liver disease [FALD]; I27.841, Fontan-associated lymphatic dysfunction; I27.848, Other Fontan-associated condition; and I27.849, Fontan related circulation, unspecified) and stated they are needed. The commenter also stated they were thankful for the work the Committee and the submitters do to keep the code set current and accurate. Another commenter expressed strong support for the new diagnosis codes finalized related to pyrophosphate metabolism (E83.82, ENPP1 deficiency causing generalized arterial calcification of infancy; E83.822, ENPP1 deficiency causing autosomal recessive hypophosphatemic rickets type 2; E83.823, ABCC6 deficiency causing generalized arterial calcification of infancy; and E83.824, ABCC6 deficiency causing pseudoxanthoma elasticum) and stated providers and medical coders

will now be better equipped to more specifically document and report, which will be very useful for tracking patients diagnosed with these rare conditions and help to improve patient outcomes.

Response: We appreciate the commenters' support and feedback.

Comment: A commenter (the manufacturer) requested that CMS assign procedure code X2H13XB (Insertion of temporary phrenic nerve/diaphragm stimulation electrodes into superior vena cava, percutaneous approach, new technology group 11) that can be reported to describe use of the AeroPace® System, to MS–DRG 003 (ECMO or Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck with Major O.R. Procedures), MS–DRG 004 (Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck without Major O.R. Procedures), MS–DRG 207 (Respiratory System Diagnosis with Ventilator Support >96 Hours), and MS–DRG 870 (Septicemia or Severe Sepsis with MV >96 Hours). The commenter stated that based on the predecessor code, CMS assigned this new procedure code to MS–DRG 264 (Other Circulatory System O.R. Procedures) under MDC 05 (Diseases and Disorders of the Circulatory System) and to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedures Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) as reflected in Table 6B.—New Procedure Codes. The commenter also stated that it understands these are preliminary MS–DRG assignments and do not limit the MS–DRGs to which a case may group.

According to the commenter, because the Food and Drug Administration (FDA) indication for use of the technology is in patients ages 18 years or older on mechanical ventilation > 96 hours and who have not weaned, procedure code X2H13XB will be reported on claims that also report procedure code 5A1955Z (Respiratory ventilation, greater than 96 consecutive hours). The commenter stated that the data described in the new technology add-on payment application demonstrate that over 60 percent of beneficiaries who have received greater than 96 hours of mechanical ventilation are assigned to MS–DRGs 003, 004, 207, and 870.

Response: We thank the commenter for their feedback. We note that procedure code X2H13XB may be reported to describe the use of the AeroPace® System and was finalized following the September 10–11, 2024 ICD–10 Coordination and Maintenance Committee meeting. The materials for the discussion related to this topic are located on the CMS website at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-10-coordination-maintenance-committee-materials*.

Under our established process, we reviewed the predecessor code and MS–DRG assignment most closely associated with the new procedure code. We note that because the procedure code that identifies use of the AeroPace® System is describing temporary transvenous diaphragm activation via stimulation of the phrenic nerve(s), the predecessor code is 02HV3YZ (Insertion of other device into superior vena cava, percutaneous approach), which is designated as an O.R. procedure and assigned to MS–DRG 264 under MDC 05.

The logic for case assignment to Pre-MDC MS–DRG 003 (ECMO or Tracheostomy with MV >96 Hours or Principal Diagnosis Except Face, Mouth and Neck with Major O.R. Procedures) requires that either a procedure code describing extracorporeal membrane oxygenation (ECMO) or a procedure code describing a tracheostomy procedure with procedure code 5A1955Z is reported with any principal diagnosis that is not assigned to MS–DRGs 011, 012, or 013 (Tracheostomy for Face, Mouth and Neck Diagnoses or Laryngectomy with MCC, with CC, and without CC/MCC, respectively) and with a procedure code that is designated as a major operating room (O.R.) procedure. Accordingly, the appropriate MS–DRG assignment to Pre-MDC MS–DRG 003 or to Pre-MDC MS–DRG 004 would be determined when procedure code X2H13XB is reported on a claim with procedure codes that satisfy the logic for case assignment to the respective Pre-MDC MS–DRG.

We note that when procedure code X2H13XB is reported on a claim with procedure code 5A1955Z and a principal diagnosis from MDC 04 (Diseases and Disorders of the Respiratory System), the MS–DRG assignment will result in MS–DRG 207 (Respiratory System Diagnosis with Ventilator Support >96 Hours). Specifically, the logic for case assignment to MS–DRG 207 requires any principal diagnosis from MDC 04 with procedure code 5A1955Z. When procedure code X2H13XB is reported on a claim with procedure code 5A1955Z and a principal diagnosis describing septicemia, the MS–DRG assignment will result in MS–DRG 870 (Septicemia or Severe Sepsis with MV >96 Hours). In those scenarios, it is the respiratory ventilation procedure code and the principal diagnosis that will determine the MS–DRG assignment. We refer the reader to the ICD–10 MS–DRG Definitions Manual, Version 43 available in association with this final rule on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software* for complete documentation of the GROUPER logic.

Comment: Commenters expressed support for the seven new diagnosis codes describing various types of hyperoxaluria and the proposed CC severity level designation for three of the new codes as reflected in Table 6A.—New Diagnosis Codes that was made publicly available in association with the proposed rule. However, the commenters stated that the remaining four new codes were not proposed to be designated as CCs and recommended that CMS reconsider the proposed designations. A commenter stated that each hyperoxaluria type involves the excessive excretion of oxalate in urine that can lead to kidney stones and therefore, all seven codes should be considered for a CC designation.

Response: We appreciate the commenters' feedback. The seven new diagnosis codes describing various types of hyperoxaluria and their proposed severity level designation are shown in the following table:

ICD-10-CM Diagnosis Code	Description	Proposed Severity Level
E72.530	Primary hyperoxaluria, type 1	CC
E72.538	Other specified primary hyperoxaluria	CC
E72.539	Primary hyperoxaluria, unspecified	CC
E72.540	Dietary hyperoxaluria	NonCC
E72.541	Enteric hyperoxaluria	NonCC
E72.548	Other secondary hyperoxaluria	NonCC
E72.549	Secondary hyperoxaluria, unspecified	NonCC

Consistent with our established process, we identified diagnosis code E72.53 (Primary hyperoxaluria) which is designated as a CC, as the predecessor code for the three diagnosis codes describing a specified type of primary hyperoxaluria (E72.530, E72.538, and E72.539). We identified diagnosis code R82.992 (Hyperoxaluria) which is designated as a NonCC, as the predecessor code for the four diagnosis codes proposed to be designated as NonCC (E72.540, E72.541, E72.548, and E72.549). We also reviewed the FY 2024 Impact on Resource Use file available via the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software* for the predecessor codes and the C1, C2, and C3 counts reflected in the following table. We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47159) for a complete discussion of our historical approach to mathematically evaluate the extent to which the presence of an ICD–10–CM code as a secondary diagnosis resulted in increased hospital resource use, and a more detailed explanation of the columns in the table.

ICD-10-CM Code[a]	Description[b]	Total Count[c]	Cnt 1[d]	C1[e]	Cnt 2[f]	C2[g]	Cnt 3[h]	C3[i]
E72.53	Primary hyperoxaluria	92	2	1.19	31	2.90	59	3.30
R82.992	Hyperoxaluria	57	2	1.06	30	2.10	25	1.85

[a] This column is the secondary diagnosis code (SDX).
[b] This column is the title of the SDX.
[c] The total count of discharge claims with the SDX.
[d] Count of discharge claims with the SDX but with no other SDX or with all other SDX a NonCC.
[e] "C1" impact on resource use of the SDX for discharge claims in "Cnt1".
[f] Count of discharge claims with the SDX and with at least one other SDX that is a CC but none that is an MCC.
[g] "C2" impact on resource use of the SDX for discharge claims in "Cnt2".
[h] Count of discharge claims with the SDX and with at least one other SDX that is an MCC
[i] "C3" impact on resource use of the SDX for discharge claims in "Cnt3".

The table shows that for diagnosis code E72.53 the C1 finding is 1.19 and the C2 finding is 2.90, and for diagnosis code R82.992, the C1 finding is 1.06 and the C2 finding is 2.10. A higher value in the C1 (or C2 and C3) field suggests more resource usage is associated with the diagnosis and an increased likelihood that it is more like a CC or MCC than a NonCC. Thus, a value close to 2.0 suggests the condition is more like a CC than a NonCC but not as significant in resource usage as an MCC. A value close to 3.0 suggests the condition is expected to consume resources more similar to an MCC than a CC or NonCC. The data suggest that when diagnosis code E72.53 is reported as a secondary diagnosis the resources involved in caring for a patient diagnosed with primary hyperoxaluria are aligned with a CC and may also consume resources more similar to an MCC. The data suggest that when diagnosis code R82.992 is reported as a secondary diagnosis that the resources involved in caring for a patient diagnosed with hyperoxaluria are more aligned with a NonCC.

Comment: Several commenters indicated their support for the initiative to refine ICD–10 coding for immune complex membranoproliferative glomerulonephritis (IC–MPGN), though they also expressed concerns regarding the finalized new diagnosis codes. Specifically, a commenter stated that historically, IC–MPGN and C3 glomerulonephritis (C3G) (code N00.A, acute nephritic syndrome with C3 glomerulonephritis) were two distinct but related conditions, and based on that understanding, the proposed codes make sense. However, the commenter reported that new evidence has emerged suggesting that IC–MPGN and C3G may actually be a spectrum of the same condition and some patients can present with IC–MPGN initially and a repeat kidney biopsy might show C3G or the opposite (that is, some patients can present with C3G initially and a repeat kidney biopsy might show IC–MPGN). According to the commenter, the true distinction between these two diagnoses is currently uncertain. The commenter suggested that new codes be developed to address circumstances where the distinction between IC–MPGN and C3G cannot be determined. Other commenters stated similar concerns and suggested that reconsideration be given to the implementation of these new codes, including postponement, until treatment pathways for these conditions become more distinctly defined.

Response: We appreciate the commenters' feedback. We note that the Centers for Disease Control and Prevention's National Center for Health Statistics (CDC/NCHS) has lead responsibility for updates and maintenance to the ICD–10–CM diagnosis code set and the code proposal for Immune Complex-mediated Membranoproliferative Glomerulonephritis (IC–MPGN) was discussed at the September 10–11, 2024 ICD–10 Coordination and Maintenance Committee meeting. The materials for the discussion relating to this topic are located on the CDC website at: *https://www.cdc.gov/nchs/icd/icd-10-maintenance/meetings.html.*

The finalized diagnosis codes describing IC–MPGN are:

ICD-10-CM Code	Description
N00.B1	Acute nephritic syndrome with idiopathic immune membranoproliferative glomerulonephritis(IC-MPGN)
N00.B2	Acute nephritic syndrome with secondary immune complex membranoproliferative glomerulonephritis (IC-MPGN)
N04.B1	Nephrotic syndrome with idiopathic immune complex membranoproliferative glomerulonephritis(IC-MPGN)
N04.B2	Nephrotic syndrome with secondary immune complex membranoproliferative glomerulonephritis(IC-MPGN)

We communicated with the CDC/NCHS staff regarding the feedback and concerns expressed by the commenters with respect to the new codes and they indicated that the public comments received in response to the code proposal were all in support.

Comment: A commenter stated that CMS proposed to assign ICD–10–PCS code D228DZZ (Stereotactic other photon radiosurgery of conduction mechanism) to MS–DRG 317 (Concomitant Left Atrial Appendage Closure and Cardiac Ablation). The commenter indicated that the ICD–10 meeting materials describe the code proposal as enabling the capture of procedures such as cardiac stereotactic body radiotherapy (SBRT). Additionally, the commenter stated the meeting materials reflect that cardiac SBRT, also called cardiac radioablation, is a non-invasive procedure to treat ventricular tachycardia (VT) that allows for the precise delivery of high-dose radiation to target tissue to any desired area within the body, including areas that may be inaccessible in traditional catheter ablation while also minimizing radiation exposure to adjacent anatomic structures. Alternatively, the commenter reported that intracardiac catheter ablation procedures are either percutaneous or surgical procedures, often involving femoral access and transeptal puncture to access the left atrium and ablate electrical irregularities causing atrial fibrillation. According to the commenter, because of the non-invasive nature of the cardiac SBRT procedure, its application to the treatment of VT, and the lack of identifiable current clinical concomitant performance with left atrial appendage closure (LAAC) during the same operative session, they stated their belief that the new procedure code (D228DZZ) is inappropriately proposed for assignment to MS–DRG 317. The commenter requested that CMS reconsider the appropriateness of this proposed assignment as well as the potential need for a different assignment when cardiac SBRT is performed without percutaneous LAAC.

Response: We appreciate the commenter's feedback. The proposal for a new procedure code to describe SBRT was discussed at the September 10, 2024 ICD–10 Coordination and Maintenance Committee meeting. We refer the reader to the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials* for additional detailed information regarding the code request, including a recording of the discussion and the related meeting materials.

Procedure code D228DZZ was approved and finalized following the review and consideration of public comments effective with discharges on and after April 1, 2025, as reflected in Table 6B associated with the proposed rule (and available via the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps*).

Under our established process, we reviewed the predecessor code. The predecessor code for SBRT is 02583ZZ (Destruction of conduction mechanism, percutaneous approach) which is designated as an O.R. procedure and is assigned to MS–DRGs 273 and 274 (Percutaneous and Other Intracardiac Procedures with MCC and without MCC, respectively) in addition to MS–DRG 317. Because SBRT is not considered an intracardiac catheter ablation procedure we did not propose assignment to MS–DRGs 273 and 274.

We acknowledge that SBRT and LAAC procedures may be performed for separate and distinct cardiac conditions (that is, ventricular tachycardia and atrial fibrillation, respectively) as reflected in the September 10, 2024 ICD–10 Coordination and Maintenance Committee meeting materials, however, recent studies also suggest that SBRT or stereotactic arrhythmia radioablation (STAR) may be indicated as a non-invasive treatment option for atrial fibrillation. Although studies are ongoing, we believe the assignment of SBRT to MS–DRG 317 is appropriate at this time. We note that if there is a lack of concomitant LAAC and SBRT procedures performed, there is no significant impact since, as previously stated, the designation of the procedure code that describes SBRT is designated as non-O.R. Specifically, in response to the commenter's request that CMS consider the potential need for a different assignment when cardiac SBRT is performed without percutaneous LAAC, we note that because the designation of procedure code D228DZZ is non-O.R., the reporting of procedure code D228DZZ only impacts the MS–DRG assignment when reported with a LAAC procedure as listed in the logic for case assignment to MS–DRG 317. Accordingly, when procedure code D228DZZ is reported in the absence of an LAAC procedure, the MS–DRG assignment is dependent on the reported principal diagnosis, any secondary diagnoses defined as a CC or MCC, other procedures or services performed, age, sex, and discharge status.

Comment: A commenter stated that the proposed MS–DRG assignment for new diagnosis code E11.A (Type 2 diabetes mellitus without complications in remission) to MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders) in MS–DRGs 637, 638, and 639 (Diabetes with MCC, with CC, and without CC/MCC, respectively) as listed in Table 6A in association with the FY 2026 IPPS/LTCH PPS proposed rule is not entirely consistent with the MS–DRG assignments of the predecessor code, E11.9 (Type 2 diabetes mellitus without complications). According to the commenter, in addition to MDC 10, diagnosis code E11.9 is also currently mapped to Pre-MDC MS–DRG 008 (Simultaneous Pancreas and Kidney Transplant), Pre-MDC MS–DRG 010 (Pancreas Transplant), and Pre-MDC MS–DRG 019 (Simultaneous Pancreas and Kidney Transplant with Hemodialysis), as are diagnosis codes E08.9 (Diabetes mellitus due to underlying condition without complications), E09.9 (Drug or chemical induced diabetes mellitus without complications), E10.9 (Type 1 diabetes mellitus without complications), and E13.9 (Other specified diabetes mellitus without complications. The commenter stated that each of these five diagnoses describes a specific type of diabetes ''without complications''. However, the commenter also indicated that the five diagnosis codes do not appear to be clinically appropriate to be listed in the logic for Pre-MDC MS–DRGs 008, 010, and 019 because these MS–DRGs are defined by transplant procedures that are indicated for the treatment of diabetes ''with complications''. According to the commenter, a transplant procedure that is assigned to any one of the previously listed Pre-

MDC MS–DRGs would not be indicated for a patient diagnosed with diabetes that does not have any associated complications of the diabetes. The commenter suggested that CMS review the clinical appropriateness for assignment of these five diagnosis codes and consider removing them from the logic for Pre-MDC MS–DRGs 008, 010, and 019 and only maintaining assignment to MS–DRGs 637, 638, and 639 under MDC 10 for FY 2026.

Response: We thank the commenter for the feedback. The commenter is correct that the predecessor code E11.9 (as reflected in the FY 2026 ICD–10–CM Conversion Table available via the CMS website at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes*) for new diagnosis code E11.A currently maps to Pre-MDC MS–DRGs 008, 010, and 019, in addition to MDC 10 MS–DRGs 637, 638, and 639. The commenter is also correct that diagnosis codes E08.9, E09.9, E10.9, and E13.9 describe specific types of diabetes ''without complications''. We agree with the commenter that these codes are not clinically appropriate to be listed in the logic for case assignment to Pre-MDC MS–DRGs 008, 010, and 019 because as the commenter noted, these MS–DRGs are defined by transplant procedures that are indicated for the treatment of diabetes ''with complications''. In light of these findings, we examined claims data from the September 2024 update of the FY 2024 MedPAR file for Pre-MDC MS–DRGs 008, 010, and 019 and for cases reporting any one of the five listed diagnoses. Our analysis yielded zero cases reporting any one of the five diagnoses describing a type of diabetes ''without complications''. For clinical appropriateness and because the diagnoses are not indicated for a pancreatic or kidney transplant procedure, we are removing diagnosis codes E08.9, E09.9, E10.9, E11.9, and E13.9 from the logic lists in Pre-MDC MS–DRGs 008, 010, and 019. We are maintaining the assignment of the diagnosis codes to MDC 10 in MS–DRGs 637, 638, and 639 effective October 1, 2025, for FY 2026.

After consideration of the public comments received, we are finalizing the MDC and MS–DRG assignments for the new diagnosis codes and procedure codes as set forth in Table 6A.—New Diagnosis Codes and Table 6B.—New Procedure Codes associated with this final rule. In addition, the finalized severity level designations for the new diagnosis codes are set forth in Table 6A. and the finalized O.R. status for the new procedure codes are set forth in Table 6B associated with this final rule.

In association with this FY 2026 IPPS/LTCH PPS final rule, we are making the following tables available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*:

- Table 6A.—New Diagnosis Codes—FY 2026;
- Table 6B.—New Procedure Codes—FY 2026;
- Table 6C.—Invalid Diagnosis Codes—FY 2026;
- Table 6D.—Invalid Procedure Codes—FY 2026;
- Table 6E.—Revised Diagnosis Code Titles—FY 2026;
- Table 6F.—Revised Procedure Code Titles—FY 2026;

- Table 6J.2.—Deletions to the CC List—FY 2026; and
- Table 6K.—Complete List of CC Exclusions—FY 2026.

10. Changes to the Surgical Hierarchies

Some inpatient stays entail multiple surgical procedures, each one of which, occurring by itself, could result in assignment of the case to a different MS–DRG within the MDC to which the principal diagnosis is assigned. Therefore, it is necessary to have a decision rule within the GROUPER by which these cases are assigned to a single MS–DRG. The surgical hierarchy, an ordering of surgical classes from most resource-intensive to least resource-intensive, performs that function. Application of this hierarchy ensures that cases involving multiple surgical procedures are assigned to the MS–DRG associated with the most resource-intensive surgical class.

A surgical class can be composed of one or more MS–DRGs. For example, in MDC 11, the surgical class ''kidney transplant'' consists of a single MS–DRG (MS–DRG 652) and the class ''major bladder procedures'' consists of three MS–DRGs (MS–DRGs 653, 654, and 655).

Consequently, in many cases, the surgical hierarchy has an impact on more than one MS–DRG. The methodology for determining the most resource-intensive surgical class involves weighting the average resources for each MS–DRG by frequency to determine the weighted average resources for each surgical class. For example, assume surgical class A includes MS–DRGs 001 and 002 and surgical class B includes MS–DRGs 003, 004, and 005. Assume also that the average costs of MS–DRG 001 are higher than that of MS–DRG 003, but the average costs of MS–DRGs 004 and 005 are higher than the average costs of MS–DRG 002. To determine whether surgical class A should be higher or lower than surgical class B in the surgical hierarchy, we would weigh the average costs of each MS–DRG in the class by frequency (that is, by the number of cases in the MS–DRG) to determine average resource consumption for the surgical class. The surgical classes would then be ordered from the class with the highest average resource utilization to that with the lowest, with the exception of ''other O.R. procedures'' as discussed in this FY 2026 IPPS/LTCH PPS final rule.

This methodology may occasionally result in assignment of a case involving multiple procedures to the lower-weighted MS–DRG (in the highest, most resource-intensive surgical class) of the available alternatives. However, given that the logic underlying the surgical hierarchy provides that the GROUPER search for the procedure in the most resource-intensive surgical class, in cases involving multiple procedures, this result is sometimes unavoidable.

We note that, notwithstanding the foregoing discussion, there are a few instances when a surgical class with a lower average cost is ordered above a surgical class with a higher average cost. For example, the ''other O.R. procedures'' surgical class is uniformly ordered last in the surgical hierarchy of each MDC in which it occurs, regardless of the fact that the average costs for the MS–DRG or MS–DRGs in that surgical class may be higher than those for other surgical classes in the MDC. The ''other O.R. procedures'' class is a group of procedures that are only infrequently related to the diagnoses in the MDC but are still occasionally performed on patients with cases assigned to the MDC with these diagnoses. Therefore, assignment to these surgical classes should only occur if no other surgical class more closely related to the diagnoses in the MDC is appropriate.

A second example occurs when the difference between the average costs for two surgical classes is very small. We have found that small differences generally do not warrant reordering of the hierarchy because, as a result of reassigning cases on the basis of the hierarchy change, the average costs are likely to shift such that the higher-ordered surgical class has lower average costs than the class ordered below it.

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69100), we stated our intent to consider if the development of evaluation criteria would be useful for future proposed modifications to the surgical hierarchy for MS–DRGs that have meaningful changes to the clinical logic. We are continuing to examine what factors should be taken into account as we consider any future proposals. We welcome feedback and other suggestions to be submitted via MEARIS™ at *https://mearis.cms.gov/public/home* by October 20, 2025.

Based on the changes that we proposed to make for FY 2026, as discussed in section II.C. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, we proposed to modify the existing surgical hierarchy for FY 2026 as illustrated in the following tables. We noted in the proposed rule that because the current methodology involves weighing the average costs of each MS–DRG in the surgical class by frequency (that is, by the number of cases in the MS–DRG) to determine average resource consumption for the surgical class, that the surgical hierarchy of other MS–DRGs in the MDC may need to be adjusted based on the MS–DRG classification changes that are proposed to ensure that the average weighted cost for each base MS–DRG in each MDC are monotonically decreasing. We further noted that the proposed Version 43 surgical hierarchy as illustrated in the following tables may be subject to further modifications based on the finalized changes to the MS–DRG classifications for FY 2026.

BILLING CODE 4120–01–P

MDC 05 (Diseases and Disorders of the Circulatory System)			
		Current Version 42 Surgical Hierarchy	**Proposed Version 43 Surgical Hierarchy**
Proposed New MS-DRG 209	Complex Aortic Arch Procedures	N/A	1
MS-DRG 212	Concomitant Aortic and Mitral Valve Procedures	2	2
MS-DRG 215	Other Heart Assist System Implant	1	3
MS-DRGs 216 - 218	Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization	3	4
MS-DRGs 231 - 232	Coronary Bypass with PTCA	4	5
MS-DRG 275	Cardiac Defibrillator Implant with Cardiac Catheterization	6	6
MS-DRG 317	Concomitant Left Atrial Appendage Closure and Cardiac Ablation	5	7
MS-DRGs 219 - 221	Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization	3	8
MS-DRGs 233 - 234	Coronary Bypass with Cardiac Catheterization or Open Ablation	4	9
Proposed New MS-DRG 213	Endovascular Abdominal Aorta with Iliac Branch Procedures	N/A	10
MS-DRGs 266 - 267	Endovascular Cardiac Valve Replacement and Supplement Procedures	7	11
MS-DRGs 276 - 277	Cardiac Defibrillator Implant	6	12
MS-DRGs 268 - 269	Aortic and Heart Assist Procedures Except Pulsation Balloon	8	13
MS-DRGs 235 - 236	Coronary Bypass without Cardiac Catheterization	4	14
MS-DRG 245	AICD Generator Procedures	14	15
MS-DRGs 270 - 272	Other Major Cardiovascular Procedures	11	16
MS-DRGs 228 - 229	Other Cardiothoracic Procedures	9	17
MS-DRGs 319 - 320	Other Endovascular Cardiac Valve Procedures	10	18
MS-DRGs 278 - 279	Ultrasound Accelerated and Other Thrombolysis of Peripheral Vascular Structures	20	19
MS-DRGs 323 - 324	Coronary Intravascular Lithotripsy with Intraluminal Device	17	20
MS-DRGs 239 - 241	Amputation for Circulatory System Disorders Except Upper Limb and Toe	12	21
MS-DRG 265	AICD Lead Procedures	15	22
MS-DRGs 273 - 274	Percutaneous and Other Intracardiac Procedures	16	23
MS-DRG 325	Coronary Intravascular Lithotripsy without Intraluminal Device	17	24
MS-DRG 263	Vein Ligation and Stripping	25	25
MS-DRGs 252 - 254	Other Vascular Procedures	21	26
Proposed New MS-DRGs 359 - 360	Percutaneous Coronary Atherectomy with Intraluminal Device	N/A	27
MS-DRGs 242 - 244	Permanent Cardiac Pacemaker Implant	13	28
MS-DRGs 260 - 262	Cardiac Pacemaker Revision Except Device Replacement	24	29
Proposed New MS-DRG 318	Percutaneous Coronary Atherectomy without Intraluminal Device	N/A	30
MS-DRGs 321 - 322	Percutaneous Cardiovascular Procedures with Intraluminal Device	18	31
MS-DRGs 258 - 259	Cardiac Pacemaker Device Replacement	23	32
MS-DRGs 255 - 257	Upper Limb and Toe Amputation for Circulatory System Disorders	22	33
MS-DRGs 250 - 251	Percutaneous Cardiovascular Procedures without Intraluminal Device	19	34

MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)			
		Current Version 42 Surgical Hierarchy	Proposed Version 43 Surgical Hierarchy
MS-DRGs 426 - 428	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical	1	1
MS-DRG 402	Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical	2	5
MS-DRGs 429 - 430	Combined Anterior and Posterior Cervical Spinal Fusion	3	2
MS-DRGs 456 - 458	Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions	4	3
MS-DRGs 447 - 448	Multiple Level Spinal Fusion Except Cervical	5	4
Proposed New MS-DRGs 403 - 404	Hip or Knee Procedures with Principal Diagnosis of Periprosthetic Joint Infection	N/A	6
MS-DRGs 450 - 451	Single Level Spinal Fusion Except Cervical	6	7
MS-DRGs 461 - 462	Bilateral or Multiple Major Joint Procedures of Lower Extremity	7	10
MS-DRGs 463 - 465	Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders	8	8
MS-DRGs 466 - 468	Revision of Hip or Knee Replacement	9	9
MS-DRGs 521 - 522	Hip Replacement with Principal Diagnosis of Hip Fracture	10	18
MS-DRGs 469 - 470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity or Total Ankle Replacement	11	21
MS-DRGs 471 - 473	Cervical Spinal Fusion	12	11
MS-DRGs 474 - 476	Amputation for Musculoskeletal System and Connective Tissue Disorders	13	12
MS-DRGs 477 - 479	Biopsies of Musculoskeletal System and Connective Tissue	14	14
MS-DRGs 480 -482	Hip and Femur Procedures Except Major Joint	15	19
MS-DRG 483	Major Joint or Limb Reattachment Procedures of Upper Extremities	16	13
MS-DRGs 485 - 487	Knee Procedures with Principal Diagnosis of Infection	17	17
MS-DRGs 488 - 489	Knee Procedures without Principal Diagnosis of Infection	17	27
MS-DRGs 518 - 520	Back and Neck Procedures Except Spinal Fusion or Disc Device or Neurostimulator	18	20
MS-DRGs 492 - 494	Lower Extremity and Humerus Procedures Except Hip, Foot and Femur	19	15
MS-DRGs 495 - 497	Local Excision and Removal of Internal Fixation Devices Except Hip and Femur	20	25
MS-DRGs 498 - 499	Local Excision and Removal of Internal Fixation Devices of Hip and Femur	21	16
MS-DRGs 500 - 502	Soft Tissue Procedures	22	24
MS-DRGs 503 - 505	Foot Procedures	23	23
MS-DRG 506	Major Thumb or Joint Procedures	24	29
MS-DRGs 507 - 508	Major Shoulder or Elbow Joint Procedures	25	26
MS-DRGs 510 - 512	Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures	26	22
MS-DRGs 513 -514	Hand or Wrist Procedures, Except Major Thumb or Joint Procedures	27	28
MS-DRGs 515 - 517	Other Musculoskeletal System and Connective Tissue O.R. Procedures	28	30

Comment: Several commenters expressed support for the proposed changes to the surgical hierarchy for MDC 05 and MDC 08.

Response: We thank the commenters for their support.

Therefore, after consideration of the public comments we received, and based on the changes that we are finalizing for FY 2026, as discussed in section II.C. of the preamble of this final rule, we are finalizing our proposals to modify the existing surgical hierarchy under MDC 05 and MDC 08, effective with the ICD–10 MS–DRGs Version 43, with modification. As discussed in section II.C.4., we are creating MS–DRG 209, MS–DRG 213, MS–DRG 218, and MS–DRGs 359 and 360. As discussed in section II.C.5., we are not finalizing the creation of proposed new MS–DRGs 403 and 404 for FY 2026.

The finalized surgical hierarchy for MDC 05 and MDC 08 is shown in the following tables. These changes are also reflected in Appendix D MS–DRG Surgical Hierarchy by MDC and MS–DRG of the ICD–10 MS–DRG Definitions Manual, Version 43 available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/ms-drg-classifications-and-software*, effective October 1, 2025, for FY 2026.

MDC 05 (Diseases and Disorders of the Circulatory System)		
		Final Version 43 Surgical Hierarchy
MS-DRG 209	Complex Aortic Arch Procedures	1
MS-DRG 212	Concomitant Aortic and Mitral Valve Procedures	2
MS-DRG 215	Other Heart Assist System Implant	3
MS-DRGs 216 - 218	Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization	4
MS-DRGs 231 - 232	Coronary Bypass with PTCA	5
MS-DRG 275	Cardiac Defibrillator Implant with Cardiac Catheterization	6
MS-DRG 317	Concomitant Left Atrial Appendage Closure and Cardiac Ablation	7
MS-DRGs 219 - 221	Cardiac Valve and Other Major Cardiothoracic Procedures without Cardiac Catheterization	8
MS-DRGs 233 - 234	Coronary Bypass with Cardiac Catheterization or Open Ablation	9
MS-DRG 213	Endovascular Abdominal Aorta with Iliac Branch Procedures	10
MS-DRGs 266 - 267	Endovascular Cardiac Valve Replacement and Supplement Procedures	11
MS-DRGs 276 - 277	Cardiac Defibrillator Implant	12
MS-DRGs 268 - 269	Aortic and Heart Assist Procedures Except Pulsation Balloon	13
MS-DRGs 235 - 236	Coronary Bypass without Cardiac Catheterization	14
MS-DRG 245	AICD Generator Procedures	15
MS-DRGs 270 - 272	Other Major Cardiovascular Procedures	16
MS-DRGs 228 - 229	Other Cardiothoracic Procedures	17
MS-DRGs 319 - 320	Other Endovascular Cardiac Valve Procedures	18
MS-DRGs 278 - 279	Ultrasound Accelerated and Other Thrombolysis of Peripheral Vascular Structures	19
MS-DRGs 323 - 324	Coronary Intravascular Lithotripsy with Intraluminal Device	20
MS-DRGs 239 - 241	Amputation for Circulatory System Disorders Except Upper Limb and Toe	21
MS-DRG 265	AICD Lead Procedures	22
MS-DRGs 273 - 274	Percutaneous and Other Intracardiac Procedures	23
MS-DRG 325	Coronary Intravascular Lithotripsy without Intraluminal Device	24
MS-DRG 263	Vein Ligation and Stripping	25
MS-DRGs 252 - 254	Other Vascular Procedures	26
MS-DRGs 359 - 360	Percutaneous Coronary Atherectomy with Intraluminal Device	27
MS-DRGs 242 - 244	Permanent Cardiac Pacemaker Implant	28
MS-DRGs 260 - 262	Cardiac Pacemaker Revision Except Device Replacement	29
MS-DRG 318	Percutaneous Coronary Atherectomy without Intraluminal Device	30
MS-DRGs 321 - 322	Percutaneous Cardiovascular Procedures with Intraluminal Device	31
MS-DRGs 258 - 259	Cardiac Pacemaker Device Replacement	32
MS-DRGs 255 - 257	Upper Limb and Toe Amputation for Circulatory System Disorders	33
MS-DRGs 250 - 251	Percutaneous Cardiovascular Procedures without Intraluminal Device	34
MS-DRG 264	Other Circulatory System O.R. Procedures	35

MDC 08 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)		
		Final Version 43 Surgical Hierarchy
MS-DRGs 426 - 428	Multiple Level Combined Anterior and Posterior Spinal Fusion Except Cervical	1
MS-DRGs 429 - 430	Combined Anterior and Posterior Cervical Spinal Fusion	2
MS-DRGs 456 - 458	Spinal Fusion Except Cervical with Spinal Curvature, Malignancy, Infection or Extensive Fusions	3
MS-DRGs 447 - 448	Multiple Level Spinal Fusion Except Cervical	4
MS-DRG 402	Single Level Combined Anterior and Posterior Spinal Fusion Except Cervical	5
MS-DRGs 463 - 465	Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connective Tissue Disorders	6
MS-DRGs 450 - 451	Single Level Spinal Fusion Except Cervical	7
MS-DRGs 466 - 468	Revision of Hip or Knee Replacement	8
MS-DRGs 461 - 462	Bilateral or Multiple Major Joint Procedures of Lower Extremity	9
MS-DRGs 471 - 473	Cervical Spinal Fusion	10
MS-DRGs 474 - 476	Amputation for Musculoskeletal System and Connective Tissue Disorders	11
MS-DRG 483	Major Joint or Limb Reattachment Procedures of Upper Extremities	12
MS-DRGs 477 - 479	Biopsies of Musculoskeletal System and Connective Tissue	13
MS-DRGs 492 - 494	Lower Extremity and Humerus Procedures Except Hip, Foot and Femur	14
MS-DRGs 498 - 499	Local Excision and Removal of Internal Fixation Devices of Hip and Femur	15
MS-DRGs 485 - 487	Knee Procedures with Principal Diagnosis of Infection	16
MS-DRGs 521 - 522	Hip Replacement with Principal Diagnosis of Hip Fracture	17
MS-DRGs 480 -482	Hip and Femur Procedures Except Major Joint	18
MS-DRGs 518 - 520	Back and Neck Procedures Except Spinal Fusion or Disc Device or Neurostimulator	19
MS-DRGs 469 - 470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity or Total Ankle Replacement	20
MS-DRGs 510 - 512	Shoulder, Elbow or Forearm Procedures, Except Major Joint Procedures	21
MS-DRGs 503 - 505	Foot Procedures	22
MS-DRGs 500 - 502	Soft Tissue Procedures	23
MS-DRGs 495 - 497	Local Excision and Removal of Internal Fixation Devices Except Hip and Femur	24
MS-DRGs 507 - 508	Major Shoulder or Elbow Joint Procedures	25
MS-DRGs 488 - 489	Knee Procedures without Principal Diagnosis of Infection	26
MS-DRGs 513 -514	Hand or Wrist Procedures, Except Major Thumb or Joint Procedures	27
MS-DRG 506	Major Thumb or Joint Procedures	28
MS-DRGs 515 - 517	Other Musculoskeletal System and Connective Tissue O.R. Procedures	29

BILLING CODE 4120–01–C

For issues pertaining to the surgical hierarchy, as with other MS–DRG related requests, we encourage interested parties to submit comments no later than October 20, 2025, via MEARIS™ at *https://mearis.cms.gov/public/home*, so that they can be considered for possible inclusion in the annual proposed rule. We will consider these public comments for possible proposals in future rulemaking as part of our annual review process.

11. Maintenance of the ICD–10–CM and ICD–10–PCS Coding Systems

In September 1985, the ICD–9–CM Coordination and Maintenance Committee was formed. This is a Federal interdepartmental committee, co-chaired by the Centers for Disease Control and Prevention's (CDC) National Center for Health Statistics (NCHS) and CMS, charged with maintaining and updating the ICD–9–CM system. The final update to ICD–9–CM codes was made on October 1, 2013. Thereafter, the name of the Committee was changed to the ICD–10 Coordination and Maintenance Committee, effective with the March 19–20, 2014 meeting. The ICD–10 Coordination and Maintenance Committee addresses updates to the ICD–10–CM and ICD–10–PCS coding systems. The Committee is jointly responsible for approving coding changes, and developing errata, addenda, and other modifications to the coding systems to reflect newly developed procedures and technologies and newly identified diseases. The Committee is also responsible for promoting the use of Federal and non-Federal educational programs and other communication techniques with a view toward standardizing coding applications and upgrading the quality of the classification system.

The official list of ICD–9–CM diagnosis and procedure codes by fiscal year can be found on the CMS website at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-9-cm-diagnosis-procedure-codes-abbreviated-and-full-code-titles*.

The official list of ICD–10–CM and ICD–10–PCS codes can be found on the CMS website at: *http://www.cms.gov/Medicare/Coding/ICD10/index.html*.

The NCHS has lead responsibility for the ICD–10–CM and ICD–9–CM diagnosis codes included in the Tabular List and Alphabetic Index for Diseases, while CMS has lead responsibility for the ICD–10–PCS and ICD–9–CM procedure codes included in the Tabular List and Alphabetic Index for Procedures.

The Committee encourages participation in the previously mentioned process by health-related organizations. In this regard, the Committee holds public meetings for discussion of educational issues and proposed coding changes. These meetings provide an opportunity for representatives of recognized organizations in the coding field, such as the American Health Information Management Association (AHIMA), the American Hospital Association (AHA), and various physician specialty groups, as well as individual physicians, health information management professionals, and other members of the public, to contribute ideas on coding matters. Members of the public may submit comments on the proposed procedure code topics to CMS at: *ICDProcedureCodeRequest@cms.hhs.gov* and may submit comments on the proposed diagnosis code topics to the CDC/NCHS at: *nchsicd10cm@cdc.gov*. After considering the opinions expressed during the public meetings and in writing, the Committee formulates recommendations, which then must be approved by the agencies.

The Committee presented proposals for coding changes for implementation in FY 2026 at a public meeting held on September 10–11, 2024 and finalized

the coding changes after consideration of comments received at the meetings and in writing by November 15, 2024.

In lieu of holding its Spring 2025 meeting, the Committee solicited comments on the Spring 2025 ICD–10–PCS procedure code topics. The deadline for submitting comments on these code proposals was April 18, 2025. Any new diagnosis and procedure codes for which there was consensus of public support, and for which complete tabular and indexing changes would be made by June 2025 are included in the October 1, 2025 update to the ICD–10–CM diagnosis and ICD–10–PCS procedure code sets. As discussed in earlier sections of the preamble of this FY 2026 IPPS/LTCH PPS final rule, there are new, revised, and deleted ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes that are captured in Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D.—Invalid Procedure Codes, Table 6E.—Revised Diagnosis Code Titles, and Table 6F.—Revised Procedure Code Titles for this FY 2026 IPPS/LTCH PPS final rule, which are available on the CMS website at: *https://www.cms.gov/medicare/medicare-fee-for-service-payment/acuteinpatientpps.*

The code titles are adopted as part of the ICD–10 Coordination and Maintenance Committee process. Therefore, although we make the code titles available for the IPPS proposed and final rules, they are not subject to comment in the proposed or final rule. Because of the length of these tables, they are not published in the Addendum to the proposed or final rule. Rather, they are available on the CMS website as discussed in section VI. of the Addendum to the proposed rule and this final rule.

Recordings for the virtual meeting discussions of the procedure codes at the Committee's September 10–11, 2024 meeting and the materials for the Spring 2025 ICD–10–PCS procedure code topics can be obtained from the CMS website at: *https://www.cms.gov/Medicare/Coding/ICD10/C-and-M-Meeting-Materials*. The materials for the topics relating to diagnosis codes discussed at the September 10–11, 2024 meeting can be found at: *https://www.cdc.gov/nchs/icd/icd-10-maintenance/meetings.html*. These websites also provide detailed information about the Committee, including information on requesting a new code, participating in a Committee meeting, timeline requirements, submitting comments, and meeting dates.

Comment: A commenter stated that in March 2025, CMS decided to not present the Spring 2025 ICD–10–PCS procedure code topics during a public meeting. Instead, CMS posted the meeting materials on the CMS website and solicited public comments with a 30-day comment period. The commenter requested clarification from CMS regarding its plans for future ICD–10–PCS procedure code topics. Specifically, whether CMS intends to resume its previous practice of hosting a public meeting twice annually, in March and September, or if CMS plans to permanently discontinue these meetings. The commenter stated they do not oppose the current approach; however, appreciate any insight into CMS' intention for future code proposals.

Response: CMS will share any updates to our approach for upcoming ICD–10 Coordination and Maintenance Committee meetings through the CMS website and our Subscriber List. To sign up for ICD–10 Coordination and Maintenance Committee meeting and related updates, members of the public may join the ICD–10 Coordination and Maintenance Committee Meetings Subscriber List. Instructions are located in the Downloads section on the following CMS website: *https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-10-coordination-maintenance-committee-meetings*.

We encourage commenters to submit questions and comments on coding issues involving diagnosis codes via email to: *nchsicd10cm@cdc.gov*.

Questions and comments concerning the procedure codes should be submitted via email to: *ICDProcedureCodeRequest@cms.hhs.gov*.

As discussed in the proposed rule (90 FR 18071), CMS implemented 50 new procedure codes including cardiac stereotactic body radiotherapy (SBRT), transplantation of the larynx, repositioning of long bones using a ring external fixation device with automated strut adjustment, supplementing the right atrium with heterotopic bioprosthetic valve(s), the administration of emapalumab-Izsg anti-IFNy monoclonal antibody, and the administration of tarlatamab-dlle antineoplastic into the ICD–10–PCS classification effective with discharges on and after April 1, 2025. The procedure codes are as follows:

BILLING CODE 4120–01–P

Procedure Code	Description	O.R.	MDC	MS-DRG
D228DZZ**	Stereotactic other photon radiosurgery of conduction mechanism	N	05	317
0B118D6*	Bypass trachea to esophagus with intraluminal device, via natural or artificial opening endoscopic	N		
0CYS0Z0	Transplantation of larynx, allogeneic, open approach	Y	03 04 21 24	143-145 166-168 907-909 957-959
0CYS0Z1	Transplantation of larynx, syngeneic, open approach	Y	03 04 21 24	143-145 166-168 907-909 957-959
0DX80Z7	Transfer small intestine to vagina, open approach	Y	13 21 24	748 907-909 957-959
0DX84Z7	Transfer small intestine to vagina, percutaneous endoscopic approach	Y	13 21 24	748 907-909 957-959
0TT00Z0	Resection of right kidney, open approach, allogeneic	Y	11 21 24	656-661 907-909 957-959
0TT00Z1	Resection of right kidney, open approach, syngeneic	Y	11 21 24	656-661 907-909 957-959
0TT00Z2	Resection of right kidney, open approach, zooplastic	Y	11 21 24	656-661 907-909 957-959
0TT10Z0	Resection of left kidney, open approach, allogeneic	Y	11 21 24	656-661 907-909 957-959
0TT10Z1	Resection of left kidney, open approach, syngeneic	Y	11 21 24	656-661 907-909 957-959
0TT10Z2	Resection of left kidney, open approach, zooplastic	Y	11 21 24	656-661 907-909 957-959

Procedure Code	Description	O.R.	MDC	MS-DRG
0U7C7DJ*	Dilation of cervix with intraluminal device, temporary, via natural or artificial opening	N		
10D10ZZ	Extraction of products of conception, retained, open approach	Y	14	770 796-798
3E0U0GC*	Introduction of other therapeutic substance into joints, open approach	N		
X2KA30A	Bypass left atrium using conduit through coronary sinus to right atrium, percutaneous approach, new technology group 10	Y	05 21	270-272 907-909
X2U93YA	Supplement right atrium with intraluminal device, heterotopic bioprosthetic valve(s), percutaneous approach, new technology group 10	Y	05	266-267
XNS40GA	Reposition right humeral shaft with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNS43GA	Reposition right humeral shaft with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNS50GA	Reposition left humeral shaft with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNS53GA	Reposition left humeral shaft with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNS60GA	Reposition right radius with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS63GA	Reposition right radius with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS70GA	Reposition left radius with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS73GA	Reposition left radius with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS80GA	Reposition right ulna with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS83GA	Reposition right ulna with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS90GA	Reposition left ulna with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNS93GA	Reposition left ulna with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	510-512 907-909 957-959
XNSA0GA	Reposition right upper femur with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	480-482 907-909 956
XNSA3GA	Reposition right upper femur with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	480-482 907-909 956
XNSB0GA	Reposition left upper femur with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	480-482 907-909 956
XNSB3GA	Reposition left upper femur with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	480-482 907-909 956
XNSC0GA	Reposition right lower femur with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	480-482 907-909 956
XNSC3GA	Reposition right lower femur with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	480-482 907-909 956

Procedure Code	Description	O.R.	MDC	MS-DRG
XNSD0GA	Reposition left lower femur with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	480-482 907-909 956
XNSD3GA	Reposition left lower femur with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	480-482 907-909 956

XNSG0GA	Reposition right tibia with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNSG3GA	Reposition right tibia with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNSH0GA	Reposition left tibia with ring external fixation device with automated strut adjustment, open approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XNSH3GA	Reposition left tibia with ring external fixation device with automated strut adjustment, percutaneous approach, new technology group 10	Y	08 21 24	492-494 907-909 957-959
XW033MA*	Introduction of emapalumab-lzsg anti-IFNy monoclonal antibody into peripheral vein, percutaneous approach, new technology group 10	N		
XW033NA*	Introduction of tarlatamab-dlle antineoplastic into peripheral vein, percutaneous approach, new technology group 10	N		
XW043MA*	Introduction of emapalumab-lzsg anti-IFNy monoclonal antibody into central vein, percutaneous approach, new technology group 10	N		
XW043NA*	Introduction of tarlatamab-dlle antineoplastic into central vein, percutaneous approach, new technology group 10	N		
XXE5X5A*	Measurement of immune response, whole blood cellular assessment via microfluidic deformability, new technology group 10	N		

*As the procedure codes are designated as non-O.R. procedures, there is no assigned MDC or MS-DRG. The ICD-10 MS-DRG assignment is dependent on the reported principal diagnosis, any secondary diagnoses defined as a complication or comorbidity (CC) or major complication or comorbidity (MCC), procedures or services performed, age, sex, and discharge status.
**Non-O.R. procedure affecting the MS-DRG assignment.

BILLING CODE 4120–01–C

The 50 procedure codes are also reflected in Table 6B.—New Procedure Codes, in association with the proposed rule and available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*. As with the other new procedure codes and MS-DRG assignments included in Table 6B. in association with the FY 2026 IPPS/LTCH PPS proposed rule, we solicited public comments on the most appropriate MDC, MS–DRG, and operating room status assignments for these codes for FY 2026, as well as any other options for the GROUPER logic. We discuss the comments we received on these assignments in section II.C.9. of this final rule as well as our finalized assignments, as reflected in Table 6B.—New Procedure Codes in association with this final rule.

In the proposed rule, we also noted that Change Request (CR) 13917, Transmittal 12995, titled ''April 2025 Update to the Medicare Severity-Diagnosis Related Group (MS–DRG) Grouper and Medicare Code Editor (MCE) Version 42.1'' was issued on December 12, 2024 (available on the CMS website at: *https://www.cms.gov/medicare/regulations-guidance/transmittals/2024-transmittals/r12995cp*) regarding the release of an updated version of the ICD–10 MS–DRG GROUPER and Medicare Code Editor software, Version 42.1, effective with discharges on and after April 1, 2025, reflecting the new procedure codes. The updated software, along with the updated ICD–10 MS–DRG Version 42.1 Definitions Manual and the Definitions of Medicare Code Edits Version 42.1 manual is available at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*.

In the September 7, 2001 final rule implementing the IPPS new technology add-on payments (66 FR 46906), we indicated we would attempt to include proposals for procedure codes that

would describe new technology discussed and approved at the Spring meeting as part of the code revisions effective the following October.

Section 503(a) of the Medicare Modernization Act (Pub. L. 108–173) included a requirement for updating diagnosis and procedure codes twice a year instead of a single update on October 1 of each year. This requirement was included as part of the amendments to the Act relating to recognition of new technology under the IPPS. Section 503(a) of Public Law 108–173 amended section 1886(d)(5)(K) of the Act by adding a clause (vii) which states that the Secretary shall provide for the addition of new diagnosis and procedure codes on April 1 of each year, but the addition of such codes shall not require the Secretary to adjust the payment (or diagnosis-related group classification) until the fiscal year that begins after such date. This requirement improves the recognition of new technologies under the IPPS by providing information on these new technologies at an earlier date. Data will be available 6 months earlier than would be possible with updates occurring only once a year on October 1.

In the FY 2005 IPPS final rule, we implemented section 1886(d)(5)(K)(vii) of the Act, as added by section 503(a) of Public Law 108–173, by developing a mechanism for approving, in time for the April update, diagnosis and procedure code revisions needed to describe new technologies and medical services for purposes of the new technology add-on payment process. We also established the following process for making these determinations. Topics considered during the Fall ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee meeting were considered for an April 1 update if a strong and convincing case was made by the requestor during the Committee's public meeting. The request needed to identify the reason why a new code was needed in April for purposes of the new technology process. Meeting participants and those reviewing the Committee meeting materials were provided the opportunity to comment on the expedited request. We refer the reader to the FY 2022 IPPS/LTCH PPS final rule (86 FR 44950) for further discussion of the implementation of this prior April 1 update for purposes of the new technology add-on payment process.

However, as discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44950 through 44956), we adopted an April 1 implementation date, in addition to the annual October 1 update, beginning with April 1, 2022. We noted that the intent of this April 1 implementation date is to allow flexibility in the ICD–10 code update process. With this new April 1 update, CMS now uses the same process for consideration of all requests for an April 1 implementation date, including for purposes of the new technology add-on payment process (that is, the prior process for consideration of an April 1 implementation date only if a strong and convincing case was made by the requestor during the meeting no longer applies). We are continuing to use several aspects of our existing established process to implement new codes through the April 1 code update, which includes presenting proposals for April 1 consideration at the September ICD–10 Coordination and Maintenance Committee meeting, requesting public comments, reviewing the public comments, finalizing codes, and announcing the new codes with their assignments consistent with the new GROUPER release information. We note that under our established process, requestors indicate whether they are submitting their code request for consideration for an April 1 implementation date or an October 1 implementation date. The ICD–10 Coordination and Maintenance Committee makes efforts to accommodate the requested implementation date for each request submitted. However, the Committee determines which requests are to be presented for consideration for an April 1 implementation date or an October 1 implementation date. As discussed earlier in this section of the preamble of this FY 2026 IPPS/LTCH PPS final rule, there were code proposals presented for an April 1, 2025 implementation at the September 10–11, 2024 Committee meetings. Following the receipt of public comments, the code proposals were approved and finalized, therefore, there were new codes implemented April 1, 2025.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule, consistent with the process we outlined for the April 1 implementation date, we announced the new codes in November 2024 and provided the updated code files in December 2024. The NCHS provided the ICD–10–CM Official Guidelines for Coding and Reporting in January 2025. By February 27, 2025, we made available the updated Version 42.1 ICD–10 MS–DRG GROUPER software and related materials on the CMS web page at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/MS-DRG-Classifications-and-Software*.

ICD–9–CM addendum and code title information are published on the CMS website at *https://www.cms.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/addendum*. ICD–10–CM and ICD–10–PCS addendum and code title information are published on the CMS website at *https://www.cms.gov/Medicare/Coding/ICD10*. CMS also sends electronic files containing all ICD–10–CM and ICD–10–PCS coding changes to its Medicare contractors for use in updating their systems and providing education to providers. Information on ICD–10–CM diagnosis codes, along with the Official ICD–10–CM Coding Guidelines, can be found on the CDC website at *https://www.cdc.gov/nchs/icd/icd-10-cm/files.html*. Additionally, information on new, revised, and deleted ICD–10–CM diagnosis and ICD–10–PCS procedure codes is provided to the AHA for publication in the Coding Clinic for ICD–10. The AHA also distributes coding update information to publishers and software vendors.

In the proposed rule (90 FR 18074), we noted that for FY 2025, there are currently 74,044 diagnosis codes and 78,986 procedure codes. We also noted as displayed in Table 6A.—New Diagnosis Codes and in Table 6B.—New Procedure Codes associated with the FY 2026 IPPS/LTCH PPS proposed rule (and available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*), there are 487 new diagnosis codes and 14 new procedure codes that had been finalized for FY 2026 at the time of the development of the FY 2026 IPPS/LTCH PPS proposed rule and 50 new procedure codes that were effective with discharges on and after April 1, 2025. The code titles are adopted as part of the ICD–10 Coordination and Maintenance Committee process. Thus, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

As discussed in section II.C.13 of the preamble of this final rule, we are making Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, Table 6C.—Invalid Diagnosis Codes, Table 6D.—Invalid Procedure Codes, Table 6E.—Revised Diagnosis Code Titles and Table 6F.—Revised Procedure Code Titles available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* in association with this final rule. As shown in Table 6B.—New Procedure

Codes, there were procedure codes proposed for the Spring 2025 ICD–10 Coordination and Maintenance Committee Update that were not finalized in time to include in the proposed rule and are identified with an asterisk. We refer the reader to Table 6B.—New Procedure Codes associated with this final rule and available on the CMS website at: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps* for the detailed list of these 142 new procedure codes finalized for FY 2026.

We also note, as reflected in Table 6C.—Invalid Diagnosis Codes and in Table 6D.—Invalid Procedure Codes, there are a total of 28 diagnosis codes and 27 procedure codes that will become invalid effective October 1, 2025. Based on these code updates, effective October 1, 2025, there are a total of 74,719 ICD–10–CM diagnosis codes and 79,115 ICD–10–PCS procedure codes for FY 2026 as shown in the following table.

FY 2025 ICD-10-CM	74,260 total codes	FY 2025 ICD-10-PCS	78,986 total codes
FY 2026 ICD-10-CM	487 additions	FY 2026 ICD-10-PCS	156 additions
FY 2026 ICD-10-CM	28 deletions	FY 2026 ICD-10-PCS	27 deletions
FY 2026 ICD-10-CM	**74,719 total codes**	**FY 2026 ICD-10-PCS**	**79,115 total codes**

As stated previously, the public is provided the opportunity to comment on any requests for new diagnosis or procedure codes discussed during the ICD–10 Coordination and Maintenance Committee meeting. The code titles are adopted as part of the ICD–10 Coordination and Maintenance Committee process. Thus, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

12. Replaced Devices Offered Without Cost or With a Credit

a. Background

In the FY 2008 IPPS final rule with comment period (72 FR 47246 through 47251), we discussed the topic of Medicare payment for devices that are replaced without cost or where credit for a replaced device is furnished to the hospital. We implemented a policy to reduce a hospital's IPPS payment for certain MS–DRGs where the implantation of a device that subsequently failed or was recalled determined the base MS–DRG assignment. At that time, we specified that we will reduce a hospital's IPPS payment for those MS–DRGs where the hospital received a credit for a replaced device equal to 50 percent or more of the cost of the device.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51556 through 51557), we clarified this policy to state that the policy applies if the hospital received a credit equal to 50 percent or more of the cost of the replacement device and issued instructions to hospitals accordingly.

b. Changes for FY 2026

As discussed in section II.C.3a. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, for FY 2026, under MDC 01, we proposed to add procedure code combinations that describe the insertion of multiple or single array generators and the insertion of neurostimulator lead into the brain or cerebral ventricle and the procedure code combinations that describe the insertion of a neurostimulator generator into the skull and the insertion of a neurostimulator lead into the brain to a new ''intracranial neurostimulator implant'' logic list in MS–DRGs 020, 021, and 022. A subset of the procedures currently assigned to MS–DRGs 023 and 024 were proposed for reassignment to MS–DRGs 020, 021, and 022. We also proposed to revise the title of MS–DRG 020 from ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with MCC'' to ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant with MCC''; revise the title of MS–DRG 021 from ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage with CC'' to ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant with CC''; revise the title of MS–DRG 022 from ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage without CC/MCC'' to ''Intracranial Vascular Procedures with Principal Diagnosis Hemorrhage or Intracranial Neurostimulator Implant without CC/MCC''; revise the title of MS–DRG 023 from ''Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator'' to ''Craniotomy with Acute Complex CNS Principal Diagnosis with MCC or Antineoplastic Implant''; and revise the title of MS–DRG 024 from ''Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC'' to ''Craniotomy with Acute Complex CNS Principal Diagnosis without MCC''.

Additionally, as discussed in section II.C.4. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, for FY 2026, under MDC 05, we proposed new MS–DRG 209 (Complex Aortic Arch Procedures) and new MS–DRG 213 (Endovascular Abdominal Aorta with Iliac Branch Procedures). A subset of the procedures currently assigned to MS–DRGs 216, 217, 218, 219, 220, and 221 were proposed for assignment to proposed new MS–DRG 209 and a subset of the procedures currently assigned to MS–DRGs 268, 269, 270, 271, and 272 were proposed for assignment to proposed new MS–DRG 213.

As stated in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24409), we generally map new MS–DRGs onto the list when they are formed from procedures previously assigned to MS–DRGs that are already on the list. Currently, MS–DRGs 023, 024, 216, 217, 218, 219, 220, 221, 268, 269, 270, 271, and 272 are on the list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit as shown in the following table. Therefore, we proposed that if the applicable proposed MS–DRG changes are finalized, we also would add MS–DRGs 020, 021, and 022 and proposed new MS–DRGs 209 and 213 to the list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit and make conforming changes to the titles of MS–DRGs 023 and 024 in the list of MS–DRGs subject to the policy as reflected in the following table. We also proposed to continue to include the existing MS–DRGs currently subject to the policy.

As discussed in section II.C.3a of the preamble of this FY 2026 IPPS/LTCH PPS final rule, we are not finalizing our proposal to add procedure code combinations that describe the insertion of multiple or single array generators and the insertion of neurostimulator lead into the brain or cerebral ventricle and the procedure code combinations

that describe the insertion of a neurostimulator generator into the skull and the insertion of a neurostimulator lead into the brain to a new ''intracranial neurostimulator implant'' logic list in MS–DRGs 020, 021, and 022. Consequently, a subset of the procedures currently assigned to MS–DRGs 023 and 024 will not be reassigned to MS–DRGs 020, 021, and 022. Therefore, we are not finalizing our proposal to add MS–DRGs 020, 021, and 022 to the list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit for FY 2026. We are finalizing our proposal to make conforming changes to the titles of MS–DRGs 023 and 024 in the list of MS–DRGs subject to the policy, with modification. As discussed in section II.C.3a, we are finalizing the change of the description of the logic list in MS–DRG 023 from ''Chemotherapy Implant'' to ''Antineoplastic Implant''. Therefore, for consistency, we are finalizing a change to the title of MS–DRG 023 from ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Chemotherapy Implant or Epilepsy with Neurostimulator'' to ''Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Antineoplastic Implant or Epilepsy with Neurostimulator'' in the list of MS–DRGs subject to the policy. We are not finalizing a change to the title of MS–DRG 024 in the list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit for FY 2026.

As discussed in section II.C.4 of the preamble of this FY 2026 IPPS/LTCH PPS final rule, we are finalizing our proposals to create new MS–DRGs 209 and 213. We did not receive any public comments opposing our proposal to add proposed new MS–DRGs 209 and 213 to the list of MS–DRGs that will be subject to the replaced devices offered without cost or with a credit policy effective October 1, 2025. Therefore, we are finalizing our proposal to add new MS–DRGs 209 and 213 to the list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit for FY 2026.

We also note that under the current MS–DRGs version 42.1, MS–DRGs 466, 467, and 468 are on the list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit as shown in the table that was made available in association with the proposed rule (90 FR 18075 through 18076). As previously discussed in this section of this final rule, we generally map new MS–DRGs onto the list when they are formed from procedures previously assigned to MS–DRGs that are already on the list. As discussed in section II.C.5. of the preamble of the FY 2026 IPPS/LTCH PPS proposed rule and this final rule, for FY 2026, under MDC 08, we proposed to create new MS–DRGs 403 and 404 (Hip or Knee Procedures with Principal Diagnosis of Periprosthetic Joint Infection with MCC and without MCC, respectively). A subset of the procedures currently assigned to MS–DRGs 466, 467, and 468 were proposed for assignment to proposed new MS–DRGs 403 and 404, however, we inadvertently omitted listing MS–DRGs 403 and 404 in the proposed list of MS–DRGs subject to the policy for payment under the IPPS for replaced devices offered without cost or with a credit in the proposed rule. As discussed in section II.C.5. of the preamble of this final rule, we are not finalizing our proposal to create new MS–DRGs 403 and 404 for FY 2026. Therefore, MS–DRGs 403 and 404 are not reflected in the table of MS–DRGs that will be subject to the policy for FY 2026.

We did not receive any public comments opposing our proposal to continue to include the existing MS–DRGs currently subject to the policy. Therefore, for the reasons summarized, we are finalizing the list of MS–DRGs in the following table that will be subject to the replaced devices offered without cost or with a credit policy effective October 1, 2025.

BILLING CODE 4120–01–P

MDC	MS-DRG	MS-DRG TITLE
Pre-MDC	001	Heart Transplant or Implant of Heart Assist System with MCC
Pre-MDC	002	Heart Transplant or Implant of Heart Assist System without MCC
01	023	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis With MCC or Antineoplastic Implant or Epilepsy with Neurostimulator
01	024	Craniotomy with Major Device Implant or Acute Complex CNS Principal Diagnosis without MCC
01	025	Craniotomy and Endovascular Intracranial Procedures with MCC
01	026	Craniotomy and Endovascular Intracranial Procedures with CC
01	027	Craniotomy and Endovascular Intracranial Procedures without CC/MCC
01	040	Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC
01	041	Peripheral, Cranial Nerve and Other Nervous System Procedures with CC or Peripheral Neurostimulator
01	042	Peripheral, Cranial Nerve and Other Nervous System Procedures without CC/MCC
03	140	Major Head and Neck Procedures with MCC
03	141	Major Head and Neck Procedures with CC
03	142	Major Head and Neck Procedures without CC/MCC
05	209	Complex Aortic Arch Procedures
05	213	Endovascular Abdominal Aorta with Iliac Branch Procedures
05	215	Other Heart Assist System Implant
05	216	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization with MCC
05	217	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization with CC
05	218	Cardiac Valve and Other Major Cardiothoracic Procedure with Cardiac Catheterization without CC/MCC
05	219	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization with MCC
05	220	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization with CC
05	221	Cardiac Valve and Other Major Cardiothoracic Procedure without Cardiac Catheterization without CC/MCC
05	242	Permanent Cardiac Pacemaker Implant with MCC
05	243	Permanent Cardiac Pacemaker Implant with CC
05	244	Permanent Cardiac Pacemaker Implant without CC/MCC
05	245	AICD Generator Procedures
05	258	Cardiac Pacemaker Device Replacement with MCC
05	259	Cardiac Pacemaker Device Replacement without MCC
05	260	Cardiac Pacemaker Revision Except Device Replacement with MCC
05	261	Cardiac Pacemaker Revision Except Device Replacement with CC
05	262	Cardiac Pacemaker Revision Except Device Replacement without CC/MCC
05	265	AICD Lead Procedures
05	266	Endovascular Cardiac Valve Replacement and Supplement Procedures with MCC
05	267	Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC
05	268	Aortic and Heart Assist Procedures Except Pulsation Balloon with MCC
05	269	Aortic and Heart Assist Procedures Except Pulsation Balloon without MCC
05	270	Other Major Cardiovascular Procedures with MCC
05	271	Other Major Cardiovascular Procedures with CC
05	272	Other Major Cardiovascular Procedures without CC/MCC
05	275	Cardiac Defibrillator Implant with Cardiac Catheterization and MCC
05	276	Cardiac Defibrillator Implant with MCC or Carotid Sinus Neurostimulator
05	277	Cardiac Defibrillator Implant without MCC
05	319	Other Endovascular Cardiac Valve Procedures with MCC
05	320	Other Endovascular Cardiac Valve Procedures without MCC
08	461	Bilateral or Multiple Major Joint Procedures of Lower Extremity with MCC
08	462	Bilateral or Multiple Major Joint Procedures of Lower Extremity without MCC
08	466	Revision of Hip or Knee Replacement with MCC
08	467	Revision of Hip or Knee Replacement with CC
08	468	Revision of Hip or Knee Replacement without CC/MCC
08	469	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity with MCC or Total Ankle Replacement
08	470	Major Hip and Knee Joint Replacement or Reattachment of Lower Extremity without MCC
08	521	Hip Replacement with Principal Diagnosis of Hip Fracture with MCC
08	522	Hip Replacement with Principal Diagnosis of Hip Fracture without MCC

BILLING CODE 4120–01–C

The final list of MS–DRGs subject to the IPPS policy for replaced devices offered without cost or with a credit will be issued to providers in the form of a Change Request (CR).

13. Out of Scope Public Comments Received

We received public comments on MS–DRG related issues that were outside the scope of the proposals included in the FY 2026 IPPS/LTCH PPS proposed rule.

Because we consider these public comments to be outside the scope of the proposed rule, we are not addressing them in this final rule. As stated in section II.C.1.b. of the preamble of this final rule, we encourage individuals with comments about MS–DRG classifications to submit these comments no later than October 20, 2025, via MEARIS™ at: *https://mearis.cms.gov/public/home*, so that they can be considered for possible inclusion in the annual proposed rule. We will consider these public comments for possible proposals in future rulemaking as part of our annual review process.

D. Recalibration of the FY 2026 MS–DRG Relative Weights

1. Data Sources for Developing the Relative Weights

Consistent with our established policy, in developing the MS–DRG relative weights for FY 2026, we proposed to use two data sources: claims data and cost report data. The claims data source is the MedPAR file, which includes fully coded diagnostic and procedure data for all Medicare inpatient hospital bills. The FY 2024 MedPAR data used in this final rule includes discharges occurring on October 1, 2023, through September 30, 2024, based on bills received by CMS through March 31, 2025, from all hospitals subject to the IPPS and short-term, acute care hospitals in Maryland (which at that time were under a waiver from the IPPS).

The FY 2024 MedPAR file used in calculating the relative weights includes data for approximately 6,899,914 Medicare discharges from IPPS providers. Discharges for Medicare beneficiaries enrolled in a Medicare Advantage managed care plan are excluded from this analysis. These discharges are excluded when the MedPAR ''GHO Paid'' indicator field on the claim record is equal to ''1'' or when the MedPAR DRG payment field, which represents the total payment for the claim, is equal to the MedPAR ''Indirect Medical Education (IME)'' payment field, indicating that the claim was an ''IME only'' claim submitted by a teaching hospital on behalf of a beneficiary enrolled in a Medicare Advantage managed care plan. In addition, the March 2025 update of the FY 2024 MedPAR file complies with version 5010 of the X12 HIPAA Transaction and Code Set Standards, and includes a variable called ''claim type.'' Claim type ''60'' indicates that the claim was an inpatient claim paid as fee-for-service. Claim types ''61,'' ''62,'' ''63,'' and ''64'' relate to encounter claims, Medicare Advantage IME claims, and HMO no-pay claims. Therefore, the calculation of the relative weights for FY 2026 also excludes claims with claim type values not equal to ''60.'' The data exclude CAHs, including hospitals that subsequently became CAHs after the period from which the data were taken. In addition, the data exclude Rural Emergency Hospitals (REHs), including hospitals that subsequently became REHs after the period from which the data were taken. We note that the FY 2026 relative weights are based on the ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes from the FY 2024 MedPAR claims data, grouped through the ICD–10 version of the FY 2026 GROUPER (Version 43).

The second data source used in the cost-based relative weighting methodology is the Medicare cost report data files from the Healthcare Cost Report Information System (HCRIS). In general, we use the HCRIS dataset that is 3 years prior to the IPPS fiscal year. Specifically, for this final rule, we used the March 2025 update of the FY 2023 HCRIS for calculating the FY 2026 cost-based relative weights. Consistent with our historical practice, for this FY 2026 final rule, we are providing the version of the HCRIS from which we calculated these 19 cost-to charge-ratios (CCRs) on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*. Click on the link on the left side of the screen titled ''FY 2026 IPPS Final Rule Home Page'' or ''Acute Inpatient Files for Download.''

2. Methodology for Calculation of the Relative Weights

a. General

We calculated the FY 2026 relative weights based on 19 CCRs. The methodology we proposed to use to calculate the FY 2026 MS–DRG cost-based relative weights based on claims data in the FY 2024 MedPAR file and data from the FY 2023 Medicare cost reports is as follows:

- To the extent possible, all the claims were regrouped using the FY 2026 MS–DRG classifications discussed in sections II.B. and II.C. of the preamble of this final rule.
- The transplant cases that were used to establish the relative weights for heart and heart-lung, liver and/or intestinal, and lung transplants (MS–DRGs 001, 002, 005, 006, and 007, respectively) were limited to those Medicare-approved transplant centers that have cases in the FY 2024 MedPAR file. (Medicare coverage for heart, heart-lung, liver and/or intestinal, and lung transplants is limited to those facilities that have received approval from CMS as transplant centers.)
- Organ acquisition costs for kidney, heart, heart-lung, liver, lung, pancreas, and intestinal (or multivisceral organs) transplants continue to be paid on a reasonable cost basis.

Because these acquisition costs are paid separately from the prospective payment rate, it is necessary to subtract the acquisition charges from the total charges on each transplant bill that showed acquisition charges before computing the average cost for each MS–DRG and before eliminating statistical outliers.

Section 108 of the Further Consolidated Appropriations Act, 2020 provides that, for cost reporting periods beginning on or after October 1, 2020, costs related to hematopoietic stem cell acquisition for the purpose of an allogeneic hematopoietic stem cell transplant shall be paid on a reasonable cost basis. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule for further discussion of the reasonable cost basis payment for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835 through 58842). For FY 2022 and subsequent years, we subtract the hematopoietic stem cell acquisition charges from the total charges on each transplant bill that showed hematopoietic stem cell acquisition charges before computing the average cost for each MS–DRG and before eliminating statistical outliers.

- Claims with total charges or total lengths of stay less than or equal to zero were deleted. Claims that had an amount in the total charge field that differed by more than $30.00 from the sum of the routine day charges, intensive care charges, pharmacy charges, implantable devices charges, supplies and equipment charges, therapy services charges, operating room charges, cardiology charges, laboratory charges, radiology charges, other service charges, labor and delivery charges, inhalation therapy charges, emergency room charges, blood and blood products charges, anesthesia charges, cardiac catheterization charges, CT scan charges, and MRI charges were also deleted.
- At least 92.7 percent of the providers in the MedPAR file had charges for 14 of the 19 cost centers. All claims of providers that did not have charges greater than zero for at least 14 of the 19 cost centers were deleted. In other words, a provider must have no more than five blank cost centers. If a provider did not have charges greater than zero in more than five cost centers, the claims for the provider were deleted.
- Statistical outliers were eliminated by removing all cases that were beyond 3.0 standard deviations from the geometric mean of the log distribution of both the total charges per case and the total charges per day for each MS–DRG.
- Effective October 1, 2008, because hospital inpatient claims include a Present on Admission (POA) field for each diagnosis present on the claim, only for purposes of relative weight-setting, the POA indicator field was reset to ''Y'' for ''Yes'' for all claims that otherwise have an ''N'' (No) or a ''U'' (documentation insufficient to determine if the condition was present

at the time of inpatient admission) in the POA field.

Under current payment policy, the presence of specific HAC codes, as indicated by the POA field values, can generate a lower payment for the claim. Specifically, if the particular condition is present on admission (that is, a ''Y'' indicator is associated with the diagnosis on the claim), it is not a HAC, and the hospital is paid for the higher severity (and, therefore, the higher weighted MS–DRG). If the particular condition is not present on admission (that is, an ''N'' indicator is associated with the diagnosis on the claim) and there are no other complicating conditions, the DRG GROUPER assigns the claim to a lower severity (and, therefore, the lower weighted MS–DRG) as a penalty for allowing a Medicare inpatient to contract a HAC. While the POA reporting meets policy goals of encouraging quality care and generates program savings, it presents an issue for the relative weight-setting process. Because cases identified as HACs are likely to be more complex than similar cases that are not identified as HACs, the charges associated with HAC cases are likely to be higher as well. Therefore, if the higher charges of these HAC claims are grouped into lower severity MS–DRGs prior to the relative weight-setting process, the relative weights of these particular MS–DRGs would become artificially inflated, potentially skewing the relative weights. In addition, we want to protect the integrity of the budget neutrality process by ensuring that, in estimating payments, no increase to the standardized amount occurs as a result of lower overall payments in a previous year that stem from using weights and case-mix that are based on lower severity MS–DRG assignments. If this would occur, the anticipated cost savings from the HAC policy would be lost.

To avoid these problems, we reset the POA indicator field to ''Y'' only for relative weight-setting purposes for all claims that otherwise have an ''N'' or a ''U'' in the POA field. This resetting ''forced'' the more costly HAC claims into the higher severity MS–DRGs as appropriate, and the relative weights calculated for each MS–DRG more closely reflect the true costs of those cases.

In addition, in the FY 2013 IPPS/LTCH PPS final rule, for FY 2013 and subsequent fiscal years, we finalized a policy to treat hospitals that participate in the Bundled Payments for Care Improvement (BPCI) initiative the same as prior fiscal years for the IPPS payment modeling and ratesetting process without regard to hospitals' participation within these bundled payment models (77 FR 53341 through 53343). Specifically, because acute care hospitals participating in the BPCI Initiative still receive IPPS payments under section 1886(d) of the Act, we include all applicable data from these subsection (d) hospitals in our IPPS payment modeling and ratesetting calculations as if the hospitals were not participating in those models under the BPCI initiative. We refer readers to the FY 2013 IPPS/LTCH PPS final rule for a complete discussion on our final policy for the treatment of hospitals participating in the BPCI initiative in our ratesetting process. For additional information on the BPCI initiative, we refer readers to the CMS' Center for Medicare and Medicaid Innovation's website at *https://innovation.cms.gov/initiatives/Bundled-Payments/index.html* and to section IV.H.4. of the preamble of the FY 2013 IPPS/LTCH PPS final rule (77 FR 53341 through 53343).

The participation of hospitals in the BPCI initiative concluded on September 30, 2018. The participation of hospitals in the BPCI Advanced model started on October 1, 2018. The BPCI Advanced model, tested under the authority of section 1115A of the Act, is comprised of a single payment and risk track, which bundles payments for multiple services that beneficiaries receive during a Clinical Episode. Acute care hospitals may participate in BPCI Advanced in one of two capacities: as a model Participant or as a downstream Episode Initiator. Regardless of the capacity in which they participate in the BPCI Advanced model, participating acute care hospitals will continue to receive IPPS payments under section 1886(d) of the Act. Acute care hospitals that are Participants also assume financial and quality performance accountability for Clinical Episodes in the form of a reconciliation payment. For additional information on the BPCI Advanced model, we refer readers to the BPCI Advanced web page on the CMS Center for Medicare and Medicaid Innovation's website at *https://innovation.cms.gov/initiatives/bpci-advanced*. Consistent with our policy for FY 2025, and consistent with how we have treated hospitals that participated in the BPCI Initiative, for FY 2026, we continue to believe it is appropriate to include all applicable data from the subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations because, as noted previously, these hospitals are still receiving IPPS payments under section 1886(d) of the Act. Consistent with the FY 2025 IPPS/LTCH PPS final rule, we also proposed to include all applicable data from subsection (d) hospitals participating in the Comprehensive Care for Joint Replacement (CJR) Model in our IPPS payment modeling and ratesetting calculations.

The charges for each of the 19 cost groups for each claim were standardized to remove the effects of differences in area wage levels, IME and DSH payments, and for hospitals located in Alaska and Hawaii, the applicable cost-of-living adjustment. Because hospital charges include charges for both operating and capital costs, we standardized total charges to remove the effects of differences in geographic adjustment factors, cost-of-living adjustments, and DSH payments under the capital IPPS as well. Charges were then summed by MS–DRG for each of the 19 cost groups so that each MS–DRG had 19 standardized charge totals. Statistical outliers were then removed. These charges were then adjusted to cost by applying the national average CCRs developed from the FY 2023 cost report data.

The 19 cost centers that we used in the relative weight calculation are shown in a supplemental data file, Cost Center HCRIS Lines Supplemental Data File, posted via the internet on the CMS website for this final rule and available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS*. The supplemental data file shows the lines on the cost report and the corresponding revenue codes that we used to create the 19 national cost center CCRs. In the proposed rule, we stated that if we receive comments about the groupings in this supplemental data file, we may consider these comments as we finalize our policy. We did not receive any comments on the groupings in this table and are finalizing the groupings as proposed.

Consistent with historical practice, we account for rare situations of non-monotonicity in a base MS–DRG and its severity levels, where the mean cost in the higher severity level is less than the mean cost in the lower severity level, in determining the relative weights for the different severity levels. If there are initially non-monotonic relative weights in the same base DRG and its severity levels, then we combine the cases that group to the specific non-monotonic MS–DRGs for purposes of relative weight calculations. For example, if there are two non-monotonic MS–DRGs, combining the cases across those two

MS–DRGs results in the same relative weight for both MS–DRGs. The relative weight calculated using the combined cases for those severity levels is monotonic, effectively removing any non-monotonicity with the base DRG and its severity levels. In the FY 2026 proposed rule, we stated that this calculation was applied to address non-monotonicity for cases that grouped to the following: MS–DRG 016 and MS–DRG 017, MS–DRG 095 and MS–DRG 096, MS–DRG 504 and MS–DRG 505, MS–DRG 797 and MS–DRG 798. In the supplemental file titled AOR/BOR File, we include statistics for the affected MS–DRGs both separately and with cases combined.

We invited public comments on our proposals related to recalibration of the proposed FY 2026 relative weights and the changes in relative weights from FY 2025.

Comment: A commenter requested that CMS clarify whether MS–DRGs 016 and 017 were non-monotonic.

Response: The proposed rule inadvertently included an incorrect list of MS–DRGs where a calculation was applied to address non-monotonicity. This list should have been *MS–DRG 095 and MS–DRG 096, MS–DRG 217 and MS–DRG 218.*

After consideration of the comments received, we are finalizing our proposals without modifications related to the recalibration of the FY 2026 relative weights. We summarize and respond to comments relating to the methodology for calculating the relative weight for MS–DRG 018 in the next section of this final rule.

b. Relative Weight Calculation for MS–DRG 018

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58451 through 58453), we created MS–DRG 018 for cases that include procedures describing CAR T-cell therapies. We also finalized our proposal to modify our existing relative weight methodology to ensure that the relative weight for MS–DRG 018 appropriately reflects the relative resources required for providing CAR T-cell therapy outside of a clinical trial, while still accounting for the clinical trial cases in the overall average cost for all MS–DRGs (85 FR 58599 through 58600). Specifically, we stated that clinical trial claims that group to new MS–DRG 018 would not be included when calculating the average cost for MS–DRG 018 that is used to calculate the relative weight for this MS–DRG, so that the relative weight reflects the costs of the CAR T-cell therapy drug. We stated that we identified clinical trial claims as claims that contain ICD–10–CM diagnosis code Z00.6 or contain standardized drug charges of less than $373,000, which was the average sales price of KYMRIAH and YESCARTA, the two CAR T-cell biological products licensed to treat relapsed/refractory large B-cell lymphoma as of the time of the development of the FY 2021 final rule. In addition, we stated that (a) when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for new MS–DRG 018 to the extent such cases can be identified in the historical data, and (b) when there is expanded access use of immunotherapy, these cases will not be included when calculating the average cost for new MS–DRG 018 to the extent such cases can be identified in the historical data.

We also finalized our proposal to calculate an adjustment to account for the CAR T-cell therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS–DRGs and for purposes of budget neutrality and outlier simulations. We calculate this adjustor by dividing the average cost for cases that we identify as clinical trial cases by the average cost for cases that we identify as non-clinical trial cases, with the additional refinements that (a) when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the claim will be included when calculating the average cost for cases not determined to be clinical trial cases to the extent such cases can be identified in the historical data, and (b) when there is expanded access use of immunotherapy, these cases will be included when calculating the average cost for cases determined to be clinical trial cases to the extent such cases can be identified in the historical data. We stated that to the best of our knowledge, there were no claims in the historical data used in the calculation of this adjustment for cases involving a clinical trial of a different product, and to the extent the historical data contain claims for cases involving expanded access use of immunotherapy we believe those claims would have drug charges less than $373,000.

In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58842), we also finalized an adjustment to the payment amount for applicable clinical trial and expanded access use immunotherapy cases that group to MS–DRG 018, and indicated that we would provide instructions for identifying these claims in separate guidance. Following the issuance of the FY 2021 IPPS/LTCH PPS final rule, we issued guidance [11] stating that providers may enter a Billing Note NTE02 ''Expand Acc Use'' on the electronic claim 837I or a remark ''Expand Acc Use'' on a paper claim to notify the MAC of expanded access use of CAR T-cell therapy. In this case, the MAC would add payer-only condition code ''ZB'' so that Pricer will apply the payment adjustment in calculating payment for the case. In cases when the CAR T-cell therapy product is purchased in the usual manner, but the case involves a clinical trial of a different product, the provider may enter a Billing Note NTE02 ''Diff Prod Clin Trial'' on the electronic claim 837I or a remark ''Diff Prod Clin Trial'' on a paper claim. In this case, the MAC would add payer-only condition code ''ZC'' so that the Pricer will not apply the payment adjustment in calculating payment for the case.

In the FY 2022 IPPS/LTCH PPS final rule, we revised MS–DRG 018 to include cases that report the procedure codes for CAR T-cell and non-CAR T-cell therapies and other immunotherapies (86 FR 44798 through 44806). We also finalized our proposal to continue to use the proxy of standardized drug charges of less than $373,000 (86 FR 44965) to identify clinical trial claims. We also finalized use of this same proxy for the FY 2023 IPPS/LTCH PPS final rule (87 FR 48894).

Following the issuance of the FY 2023 IPPS/LTCH PPS final rule, we issued guidance [12] stating where there is expanded access use of immunotherapy, the provider may submit condition code ''90'' on the claim so that Pricer will apply the payment adjustment in calculating payment for the case. We stated that MACs would no longer append Condition Code 'ZB' to inpatient claims reporting Billing Note NTE02 ''Expand Acc Use'' on the electronic claim 837I or a remark ''Expand Acc Use'' on a paper claim, effective for claims for discharges that occur on or after October 1, 2022.

In the FY 2024 IPPS/LTCH PPS final rule, we explained that the MedPAR claims data now includes a field that identifies whether or not the claim includes expanded access use of immunotherapy. We stated that for the FY 2022 MedPAR claims data, this field identifies whether or not the claim includes condition code ZB, and for the FY 2023 MedPAR data and subsequent

[11] *https://www.cms.gov/files/document/r10571cp.pdf.*

[12] *https://www.cms.gov/files/document/r11727cp.pdf.*

years, this field will identify whether or not the claim includes condition code 90. We further noted that the MedPAR files now also include a variable that indicates whether the claim includes the payer-only condition code ''ZC'', which identifies a case involving the clinical trial of a different product where the CAR T-cell, non-CAR T-cell, or other immunotherapy product is purchased in the usual manner.

Accordingly, and as discussed further in the FY 2024 IPPS/LTCH PPS final rule, we finalized two modifications to our methodology for identifying clinical trial claims and expanded access use claims in MS–DRG 018 (88 FR 58791). First, we finalized to exclude claims with the presence of condition code ''90'' (or, for FY 2024 ratesetting, which was based on the FY 2022 MedPAR data, the presence of condition code ''ZB'') and claims that contain ICD–10–CM diagnosis code Z00.6 without payer-only code ''ZC'' to MS–DRG 018 when calculating the average cost for MS–DRG 018. Second, we finalized to no longer use the proxy of standardized drug charges of less than $373,000 to identify clinical trial claims and expanded access use cases when calculating the average cost for MS–DRG 018. Accordingly, we finalized that in calculating the relative weight for MS–DRG 018 for FY 2024, only those claims that group to MS–DRG 018 that (1) contain ICD–10–CM diagnosis code Z00.6 and do not include payer-only code ''ZC'' or (2) contain condition code ''ZB'' (or, for subsequent fiscal years, condition code ''90'') would be excluded from the calculation of the average cost for MS–DRG 018. Consistent with this, we also finalized modifications to our calculation of the adjustment to account for the CAR T-cell therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS–DRGs. We refer readers to the FY 2024 IPPS/LTCH PPS final rule for further discussion of these modifications (88 FR 58791).

Consistent with the FY 2025 IPPS/LTCH PPS final rule, in the proposed rule, for FY 2026 we proposed to continue to use our methodology as modified in the FY 2024 IPPS/LTCH PPS final rule for identifying clinical trial claims and expanded access use claims in MS–DRG 018, with an additional modification as discussed in this section. First, we exclude claims with the presence of condition code ''90'' and claims that contain ICD–10–CM diagnosis code Z00.6 without payer-only code ''ZC'' that group to MS–DRG 018 when calculating the average cost for MS–DRG 018. Second, we no longer use the proxy of standardized drug charges of less than $373,000 to identify clinical trial claims and expanded access use cases when calculating the average cost for MS–DRG 018.

In section VI.H. of this final rule, we discuss our proposal to apply the payment adjustment for clinical trial and expanded access use immunotherapy cases to other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost. To mirror this proposed change within our relative weight methodology, we proposed to also exclude claims with standardized drug charges below the median standardized drug charge of claims identified as clinical trials in MS–DRG 018 when we calculate the average cost for MS–DRG 018. For the proposed rule, based on the December 2024 update of the FY 2024 MedPAR file, we estimated that the median standardized drug charge of claims identified as clinical trials in MS–DRG 018 is $29,819. We proposed to apply this policy for 2 years (that is, in our relative weight methodology for MS–DRG 018 for FYs 2026 and 2027), until the claims data reflects the addition of the condition code indicating that the immunotherapy product is not purchased in the usual manner, such as obtained at no cost, which then would be able to be used to identify these cases such that they can be identified for exclusion from the calculation of the average cost of MS–DRG 018. We also proposed, for the purpose of performing this trim, to update the median standardized drug charge of claims identified as clinical trials in MS–DRG 018 based on more recent data for the final rule.

Accordingly, we proposed that in calculating the relative weight for MS–DRG 018 for FY 2026, in identifying clinical trial claims and expanded access use claims and other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost, only those claims that group to MS–DRG 018 that (1) contain ICD–10–CM diagnosis code Z00.6 and do not include payer-only code ''ZC'', (2) contain condition code ''90'', or (3) contain standardized drug charges below the median standardized drug charge of clinical trial cases in MS–DRG 018 would be excluded from the calculation of the average cost for MS–DRG 018.

With respect to claims that group to MS–DRG 018 and are identified as clinical trials or involve expanded access use of the CAR T-cell therapy or other immunotherapy, we noted in the proposed rule that there are some cases that appear to include drug charges similar to cases not identified as clinical trials or involving expanded access use. These charges are generally in revenue center 0891, Cell Therapy Drug Charges. We stated that we are seeking comments on potential reasons for why claims identified as clinical trials or involving expanded access use, in which the provider would typically receive the product at no cost, would have charges in revenue center 0891, Cell Therapy Drug Charges.

We also proposed to continue to use the methodology as modified in the FY 2024 IPPS/LTCH PPS final rule to calculate the adjustment to account for the CAR T-cell therapy cases identified as clinical trial cases in calculating the national average standardized cost per case that is used to calculate the relative weights for all MS–DRGs, with the same proposed modification as described previously to identify other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost:

- Calculate the average cost for cases assigned to MS–DRG 018 that (a) contain ICD–10–CM diagnosis code Z00.6 and do not contain condition code ''ZC'', (b) contain condition code ''90'', or (c) contain standardized drug charges below the median standardized drug charge of clinical trial cases in MS–DRG 018.
- Calculate the average cost for all other cases assigned to MS–DRG 018.
- Calculate an adjustor by dividing the average cost calculated in step 1 by the average cost calculated in step 2.
- Apply the adjustor calculated in step 3 to the cases identified in step 1 as applicable clinical trial or expanded access use cases, and other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost, then add this adjusted case count to the non-clinical trial case count prior to calculating the average cost across all MS–DRGs.

Under our proposal to continue to apply this methodology, with the proposed modification as described, based on the December 2024 update of the FY 2024 MedPAR file used for the proposed rule, we estimated that the average costs of cases assigned to MS–DRG 018 that are identified as clinical trial cases ($88,484) were 23 percent of the average costs of the cases assigned to MS–DRG 018 that are identified as non-clinical trial cases ($385,147). Accordingly, as we did for FY 2025, we proposed to adjust the transfer-adjusted case count for MS–DRG 018 by applying the proposed adjustor of 0.23 to the applicable clinical trial and expanded access use immunotherapy cases, and

other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost, and to use this adjusted case count for MS–DRG 018 in calculating the national average cost per case, which is used in the calculation of the relative weights. Therefore, in calculating the national average cost per case for purposes of the proposed rule, each case identified as an applicable clinical trial or expanded access use immunotherapy case, and other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost, was adjusted by 0.23. As we did for FY 2025, we applied the same adjustor for the applicable cases that group to MS–DRG 018 for purposes of budget neutrality and outlier simulations. We also proposed to update the value of the adjustor based on more recent data for the final rule.

Comment: Commenters supported our proposal to exclude claims in MS–DRG 018 with standardized drug charges below the median standardized drug charges of cases identified as clinical trials in MS–DRG 018. Commenters stated that this proposal ensures that clinical trial and no-cost cases do not distort payment rates across the IPPS. We note a commenter mistakenly referred to our existing policy as still excluding cases that have a standardized drug charge of less than $373,000.

Commenters requested clarification about whether the median standardized drug charges includes all drug revenue lines and all clinical trial claims, including expanded access claims. Some commenters expressed support for the identification of cases involving patient assistance programs, where no cost is incurred, but expressed confusion regarding the language ''product not purchased in the usual manner'', stating that is subjective, which can lead to confusion and undue administrative burden for providers and varying interpretations by the MACs. A commenter requested that CMS modify the language to reflect the request in the comment summarized in the FY 2025 IPPS/LTCH PPS final rule, which referred to cases where the immunotherapy is ''obtained at no cost''.

Response: We appreciate commenters support for our proposal. While we indicated in the proposed rule that we calculate the median standardized drug charges for cases identified as clinical trial claims including cases that contain ICD–10–CM diagnosis code Z00.6 and do not include payer only code ZC, we note that in calculating the median standardized drug charges for cases identified as clinical trial claims, we included claims that (a) contain ICD–10–CM diagnosis code Z00.6 and do not contain condition code ''ZC'' or (b) contain condition code ''90''. Just as we treat cases identified as clinical trial cases and expanded access use cases in the same manner for payment purposes and in the calculation of the relative weights, we are also including both claims identified as clinical trial cases and claims identified as expanded access use cases in calculating the median drug charges. Since the provider does not incur the cost of the drug in cases identified as clinical trial cases or expanded access use cases, but still incurs costs for other drugs during the inpatient stay, we believe that using the median standardized drug charge for clinical trial and expanded access use cases would appropriately identify other cases involving products not purchased in the usual manner. The drug revenue lines are the same as those used in the relative weight calculations, which are shown in the Cost Center HCRIS Lines Supplemental Data File referenced earlier in this section.

With respect to the commenters who expressed concerns about the language ''product not purchased in the usual manner'', we note that this phrasing is not new; we have used the language ''product is purchased in the usual manner'' in prior rules with respect to MS–DRG 018. Furthermore, we believe that this language is appropriately phrased to include the broad range of scenarios that may fall under it. For example, as described later in this section, commenters raised the possibility of immunotherapy products administered over multiple encounters. Given that we cannot predict all possible scenarios where the product is not purchased in the usual manner, use of a condition code that reflects a broad array of circumstances will facilitate more accurate payment and ratesetting. We further note that the ''usual manner'' in which a product is purchased may differ for products administered in one dose versus split doses.

Comment: Commenters noted that some immunotherapy products may be administered over multiple encounters (including in an outpatient setting). A commenter requested that CMS confirm that a reduced payment for MS–DRG 018 does not apply when a hospital purchases an immunotherapy product (that is, incurs a cost), irrespective of whether it is administered in multiple encounters. This commenter requested that if CMS has specific requirements for how providers should handle these situations, it should clarify them or state that it is up to the individual provider to determine how to develop charges for multiple administrations of a single product obtained from a manufacturer. A commenter stated that unless manufacturers change their processes for products administered over multiple encounters, hospitals will continue to receive a single invoice and require guidance about how to report the charges.

Response: CMS does not dictate a provider's charge structure or how they itemize their charges. As stated in Chapter 22, Section 2203 of the Provider Reimbursement Manual (*https://www.cms.gov/regulations-and-guidance/guidance/manuals/paper-based-manuals-items/cms021929*), providers ''should have an established charge structure which is applied uniformly to each patient as services are furnished to the patient and which is reasonably and consistently related to the cost of providing the services''. Providers should bill in the manner that they customarily bill for split-dose administration and the charges should be reasonably and consistently related to the cost of providing the service in a split-dose administration circumstance. A split-dose administration should not result in twice the amount of payment just by virtue of the fact it is a split-dose administration. For example, we remind hospitals that Chapter 3, Inpatient Hospital Billing, section 40.2.5 of the Medicare Claims Processing Manual (*https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/clm104c03.pdf*) states that hospitals may place a patient on a leave of absence when readmission is expected and the patient does not require a hospital level of care during the interim period. Placing a patient on a leave of absence will not generate two payments. Only one bill and one DRG payment are made.

Comment: A commenter stated that a potential reason why claims identified as clinical trials or involving expanded access use, in which the provider would typically receive the product at no cost, would have charges in revenue center 0891, is that the case involves a clinical trial of another product. The commenter stated that given the two-step and manual process in flagging these claims, (that is, the provider includes ''Diff Prod Clin Trial'' in the Remarks field and the MAC adds a payer-only condition code of ''ZC''), there is likely a percentage of cases where the condition code was not applied as it should be. The commenter noted that CMS' recent billing instructions that automate the application of ''ZC'' should reduce the number of claims with this profile.

Response: We appreciate the feedback on our comment solicitation and will continue to monitor CAR T-cell therapy claims for such potential anomalies.

Comment: Some commenters expressed concern that CMS no longer uses the $373,000 threshold to identify clinical trial cases and requested that CMS continue to refine its methodology to also consider standardized drug charges to correctly identify clinical trial cases. Commenters expressed concern that due to incorrect coding or incorrect application of condition codes, cases below the $373,000 threshold may be identified as clinical trials when the provider incurs the cost of the drug. The commenter stated that as a result, these cases would be included in ratesetting for MS–DRG 018 and these cases could be underpaid, particularly as more hospitals administer cell and gene therapies. The commenter requested that CMS publish information on future cases that are below the $373,000 threshold given the likely impact on the payment rate for MS–DRG 018.

Response: As we stated in the FY 2024 (88 FR 58791) and FY 2025 IPPS/LTCH PPS (89 FR 69112) final rules, while there continues to be a small percentage of claims that report standardized drug charges of less than $373,000 and do not report ICD–10–CM code Z00.6, we do not believe it is necessary to continue the use of the proxy until the number of cases reaches zero. In addition, our proposal to exclude claims with standardized drug charges below the median standardized drug charge of claims identified as clinical trials in MS–DRG 018 (that is, claims that (a) contain ICD–10–CM diagnosis code Z00.6 and do not include payer-only code ''ZC'' or (b) contain condition code ''90'') is expected to reduce the number of cases with low standardized drug charges that group to MS–DRG 018. We note that information on obtaining the MedPAR Limited Data Set is available on the CMS website, at *https://www.cms.gov/Research-Statistics-Data-and-Systems/Files-for-Order/LimitedDataSets/MEDPARLDSHospitalNational.*

Comment: A few commenters expressed confusion about CMS' differentiation between clinical trial and expanded access use cases. A commenter stated that it does not believe this differentiation is CMS' intent because expanded access use of CAR T-cell or other therapies that are grouped to MS–DRG 018 must occur as part of an Investigational New Device (IND) study, which would have a National Clinical Trial number and would meet criteria for routine costs of the clinical trial NCD 310.1. This commenter cited the FDA website [13] in support of these statements. Another commenter requested that CMS clarify that expanded access cases are a type of clinical trial.

A commenter requested that CMS clarify that expanded access use would also be excluded from ratesetting because facilities do not incur the cost of these products. A few commenters requested that CMS clarify that the agency would expect to see clinical trial billing indicators on expanded access claims (that is, diagnosis code Z00.6, condition code 30, value code D4, and the NCT number), in addition to condition code 90, which would help identify which clinical trial claims are expanded access claims.

Response. The FDA states, at the link provided by the commenter, ''Expanded access, sometimes called ''compassionate use,'' is the use of investigational new drug products *outside of clinical trials* to treat patients with serious or immediately life-threatening diseases or conditions when there are no comparable or satisfactory alternative treatment options''. While we utilize separate condition codes to identify clinical trial claims and expanded access use cases, we note that they are treated the same for payment purposes and in the calculation of the relative weights for MS–DRG 018.

Comment: A commenter stated that the MS–DRG payment for CAR T-cell therapy services has never been sufficient and provided various reasons for this, including problems with hospital chargemasters, CCRs, and charge compression. Commenters provided various suggestions to mitigate these concerns and increase the payment rate for MS–DRG 018. Commenters stated that the percentage of cases in MS–DRG 018 that are eligible for outlier payments has increased since FY 2021, which, the commenter stated, if left unaddressed, places a constraint on the outlier pool, which negatively impacts all hospitals.

A commenter stated that hospitals should not be targeted for having high outlier payments given that it is the ''new norm'' for cell and gene therapies, and that hospitals should not be questioned if they set their charges consistent with their CCRs. This commenter stated that CMS needs to provide more clarity so that stakeholders understand that hospitals have no choice but to mark up product charges, and that patients do not bear the cost of those charges. This commenter also requested that CMS consider other methodologies to pay for immunotherapies and expand CMMI's cell and gene therapy model.

Commenters requested that CMS explore the integration of Medicare Advantage claims into the ratesetting process for MS–DRG 018 to improve the sample size available for low volume products, which could improve the robustness and reliability of cost estimates. A commenter noted that as the percentage of enrollees in Medicare fee-for-service decreases, the number of claims used in the ratesetting process will decrease and become less representative for predicting resource utilization.

Response: Regarding the comments that the MS–DRG relative weight for MS–DRG 018 is inadequate and does not result in payment that fully covers the hospital resource costs, as well as comments regarding hospital charging practices, we refer readers to the FY 2022 IPPS/LTCH final rule (86 FR 44965) where we responded to similar comments. With respect to the commenter's statement about hospitals being ''targeted'' for having high outlier payments, we are unaware of the issue the commenter is raising. We note our proposal, as discussed in the CY 2026 OPPS proposed rule (90 FR 33476), to collect payer-specific negotiated charge data from MA organizations by MS–DRG for use in the MS–DRG relative weight setting, would, if finalized, obviate many of the concerns that commenters raised, including challenges with hospital charging practices and the potential role of MA claims in the ratesetting process.

Comment: Commenters requested that CMS revise its cost reporting instructions for cell and gene therapy products (revenue codes 0891 and 0892) to instruct providers to use cost center 78. A commenter requested that CMS also instruct providers to leave the services associated with these therapies in their original cost centers. This commenter stated that there is a precedent for CMS to define a cost center based on a revenue code, like it did for the implantable devices cost center. The commenter also requested that CMS clarify whether hospitals are allowed to use product charges and expenses as valid statistics to allocate administrative and general expenses to cost report line 78.

Response: We do not believe changes to billing guidance are needed at this time but will take these comments into consideration when developing policies and program requirements for future years for CAR T-cell therapy policy. We further note that under the proposal in

[13] *https://www.fda.gov/drugs/investigational-new-drug-ind-application/ind-applications-clinical-treatment-expanded-access-overview.*

the CY 2026 OPPS proposed rule to collect payer-specific negotiated charge data from MA organizations by MS–DRG for use in the MS–DRG relative weight setting, an additional cost center would not impact the relative weight for MS–DRG 018.

After consideration of the public comments we received, we are finalizing our proposals without modifications regarding the calculation of the relative weight for MS–DRG 018. We note that for this final rule, based on the March 2025 update of the FY 2024 MedPAR file, we estimated that the median standardized drug charge of claims identified as clinical trials in MS–DRG 018 (that is, claims that (a) contain ICD–10–CM diagnosis code Z00.6 and do not include payer-only code ''ZC'' or (b) contain condition code ''90'') is $27,466. Applying this finalized methodology, based on the March 2025 update of the FY 2024 MedPAR file used for this final rule, we estimated that the average costs of cases assigned to MS–DRG 018 that are identified as clinical trial cases ($61,643.46) were 16 percent of the average costs of the cases assigned to MS–DRG 018 that are identified as nonclinical trial cases ($384,471.59).

Accordingly, as we did for FY 2025, we are finalizing our proposal to adjust the transfer-adjusted case count for MS–DRG 018 by applying the adjustor of 0.16 to the applicable clinical trial and expanded access use immunotherapy cases, and other cases where the immunotherapy product is not purchased in the usual manner, such as obtained at no cost, and to use this adjusted case count for MS–DRG 018 in calculating the national average cost per case, which is used in the calculation of the relative weights. Therefore, in calculating the national average cost per case for purposes of this final rule, each case identified as an applicable clinical trial or expanded access use immunotherapy case, and other cases where immunotherapy product is not purchased in the usual manner, such as obtained at no cost, was adjusted by 0.16. As we did for FY 2025, we are applying this same adjustor for the applicable cases that group to MS–DRG 018 for purposes of budget neutrality and outlier simulations.

d. Cap for Relative Weight Reductions

In the FY 2023 IPPS/LTCH PPS final rule, we finalized a permanent 10-percent cap on the reduction in an MS–DRG's relative weight in a given fiscal year, beginning in FY 2023. We also finalized a budget neutrality adjustment to the standardized amount for all hospitals to ensure that application of the permanent 10-percent cap does not result in an increase or decrease of estimated aggregate payments. We refer the reader to the FY 2023 IPPS/LTCH PPS final rule for further discussion of this policy. In the Addendum to this IPPS/LTCH PPS final rule, we present the budget neutrality adjustment for reclassification and recalibration of the FY 2026 MS–DRG relative weights with application of this cap. We are also making available on the CMS website a supplemental file demonstrating the application of the permanent 10 percent cap for FY 2026. For a further discussion of the final budget neutrality adjustment for FY 2026, we refer readers to the Addendum of this final rule.

3. Development of National Average Cost-to-Charge Ratios (CCRs)

We developed the national average CCRs as follows:

Using the FY 2023 cost report data, we removed CAHs, REHs, Indian Health Service hospitals, all-inclusive rate hospitals, and cost reports that represented time periods of less than 1 year (365 days). We included hospitals located in Maryland because we include their charges in our claims database. Then we created CCRs for each provider for each cost center (see the supplemental data file for line items used in the calculations) and removed any CCRs that were greater than 10 or less than 0.01. We normalized the departmental CCRs by dividing the CCR for each department by the total CCR for the hospital for the purpose of trimming the data. Then we took the logs of the normalized cost center CCRs and removed any cost center CCRs where the log of the cost center CCR was greater or less than the mean log plus/minus 3 times the standard deviation for the log of that cost center CCR. Once the cost report data were trimmed, we calculated a Medicare-specific CCR. The Medicare-specific CCR was determined by taking the Medicare charges for each line item from Worksheet D–3 and deriving the Medicare-specific costs by applying the hospital-specific departmental CCRs to the Medicare-specific charges for each line item from Worksheet D–3. Once each hospital's Medicare-specific costs were established, we summed the total Medicare-specific costs and divided by the sum of the total Medicare-specific charges to produce national average, charge-weighted CCRs.

After we multiplied the total charges for each MS–DRG in each of the 19 cost centers by the corresponding national average CCR, we summed the 19 ''costs'' across each MS–DRG to produce a total standardized cost for the MS–DRG. The average standardized cost for each MS–DRG was then computed as the total standardized cost for the MS–DRG divided by the transfer-adjusted case count for the MS–DRG. The average cost for each MS–DRG was then divided by the national average standardized cost per case to determine the relative weight. The final FY 2026 cost-based relative weights were then normalized by an adjustment factor of 1.922881 so that the average case weight after recalibration was equal to the average case weight before recalibration. The normalization adjustment is intended to ensure that recalibration by itself neither increases nor decreases total payments under the IPPS, as required by section 1886(d)(4)(C)(iii) of the Act. We then applied the permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year; specifically for those MS–DRGs for which the relative weight otherwise would have declined by more than 10 percent from the FY 2025 relative weight, we set the FY 2026 relative weight equal to 90 percent of the FY 2025 relative weight. The final relative weights for FY 2026 as set forth in Table 5 associated with this final rule and available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS* reflect the application of this cap.

The 19 national average CCRs for FY 2026 are as follows:

NATIONAL AVERAGE CCRS	
Group	CCR
Routine Days	0.394
Intensive Days	0.335
Drugs and Cellular Therapies	0.177
Supplies & Equipment	0.297
Implantable Devices	0.255
Inhalation Therapy	0.148
Therapy Services	0.256
Anesthesia	0.071
Labor & Delivery	0.373
Operating Room	0.153
Cardiology	0.086
Cardiac Catheterization	0.098
Laboratory	0.098
Radiology	0.123
MRIs	0.065
CT Scans	0.032
Emergency Room	0.139
Blood and Blood Products	0.23
Other Services	0.327

Since FY 2009, the relative weights have been based on 100 percent cost weights based on our MS–DRG grouping system.

When we recalibrated the DRG weights for previous years, we set a threshold of 10 cases as the minimum number of cases required to compute a reasonable weight. We proposed to use that same case threshold in recalibrating the proposed MS–DRG relative weights for FY 2026. In this final rule, using data from the FY 2024 MedPAR file, there are 9 MS–DRGs that contain fewer than 10 cases. For FY 2026, because we do not have sufficient MedPAR data to set accurate and stable cost relative weights for these low-volume MS–DRGs, we proposed to compute relative weights for the low-volume MS–DRGs by adjusting their final FY 2025 relative weights by the percentage change in the average weight of the cases in other MS–DRGs from FY 2025 to FY 2026. The crosswalk table is as follows.

LOW-VOLUME MS-DRGS		
Low-Volume MS-DRG	MS-DRG Title	Crosswalk to MS-DRG
096	Bacterial and Tuberculous Infections of Nervous System without CC/MCC	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
218	Cardiac Valve and Other Major Cardiothoracic Procedures with Cardiac Catheterization without CC/MCC	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
789	Neonates, Died or Transferred to Another Acute Care Facility	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
790	Extreme Immaturity or Respiratory Distress Syndrome, Neonate	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
791	Prematurity with Major Problems	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
792	Prematurity without Major Problems	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
793	Full-Term Neonate with Major Problems	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
794	Neonate with Other Significant Problems	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)
795	Normal Newborn	Final FY 2025 relative weight (adjusted by percent change in average weight of the cases in other MS-DRGs)

We did not receive any public comments on this proposal and therefore are finalizing it for FY 2026 without modification.

E. Add-On Payments for New Services and Technologies for FY 2026

1. Background

Effective for discharges beginning on or after October 1, 2001, section 1886(d)(5)(K)(i) of the Act requires the Secretary to establish a mechanism to recognize the costs of new medical services and technologies (sometimes collectively referred to in this section as ''new technologies'') under the IPPS. Section 1886(d)(5)(K)(vi) of the Act specifies that a medical service or technology will be considered new if it meets criteria established by the Secretary after notice and opportunity for public comment. Section 1886(d)(5)(K)(ii)(I) of the Act specifies

that a new medical service or technology may be considered for new technology add-on payment if, based on the estimated costs incurred with respect to discharges involving such service or technology, the DRG prospective payment rate otherwise applicable to such discharges under this subsection is inadequate. The regulations at 42 CFR 412.87 implement these provisions and § 412.87(b) specifies three criteria for a new medical service or technology to receive the additional payment: (1) the medical service or technology must be new; (2) the medical service or technology must be costly such that the DRG rate otherwise applicable to discharges involving the medical service or technology is determined to be inadequate; and (3) the service or technology must demonstrate a substantial clinical improvement over existing services or technologies. In addition, certain transformative new devices and antimicrobial products may qualify under an alternative inpatient new technology add-on payment pathway, as set forth in the regulations at § 412.87(c) and (d).

We note that section 1886(d)(5)(K)(i) of the Act requires the Secretary to establish a mechanism to recognize the costs of new medical services and technologies under the payment system established under that subsection, which establishes the system for paying for the operating costs of inpatient hospital services. The system of payment for capital costs is established under section 1886(g) of the Act. Therefore, as discussed in prior rulemaking (72 FR 47307 through 47308), we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs.

In the proposed rule, we highlighted some of the major statutory and regulatory provisions relevant to the new technology add-on payment criteria, as well as other information. For further discussion on the new technology add-on payment criteria, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51572 through 51574), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42300), and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58736 through 58742).

a. New Technology Add-On Payment Criteria

(1) Newness Criterion

Under the first criterion, as reflected in § 412.87(b)(2), a specific medical service or technology will no longer be considered ''new'' for purposes of new medical service or technology add-on payments after CMS has recalibrated the MS–DRGs, based on available data, to reflect the cost of the technology. We note that we do not consider a service or technology to be new if it is substantially similar to one or more existing technologies. That is, even if a medical product receives a new FDA marketing authorization, it may not necessarily be considered ''new'' for purposes of new technology add-on payments if it is ''substantially similar'' to another medical product that was market authorized by FDA and has been on the market for more than 2 to 3 years. In the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43813 through 43814), we established criteria for evaluating whether a new technology is substantially similar to an existing technology, specifically whether: (1) a product uses the same or a similar mechanism of action to achieve a therapeutic outcome; (2) a product is assigned to the same or a different MS–DRG; and (3) the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population. If a technology meets all three of these criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments. For a detailed discussion of the criteria for substantial similarity, we refer readers to the FY 2006 IPPS final rule (70 FR 47351 through 47352) and the FY 2010 IPPS/LTCH PPS final rule (74 FR 43813 through 43814).

(2) Cost Criterion

Under the second criterion, § 412.87(b)(3) further provides that, to be eligible for the add-on payment for new medical services or technologies, the MS–DRG prospective payment rate otherwise applicable to discharges involving the new medical service or technology must be assessed for adequacy. Under the cost criterion, consistent with the formula specified in section 1886(d)(5)(K)(ii)(I) of the Act, to assess the adequacy of payment for a new technology paid under the applicable MS–DRG prospective payment rate, we evaluate whether the charges of the cases involving a new medical service or technology will exceed a threshold amount that is the lesser of 75 percent of the standardized amount (increased to reflect the difference between cost and charges) or 75 percent of one standard deviation beyond the geometric mean standardized charge for all cases in the MS–DRG to which the new medical service or technology is assigned (or the case-weighted average of all relevant MS–DRGs if the new medical service or technology occurs in many different MS–DRGs). The MS–DRG threshold amounts generally used in evaluating new technology add-on payment applications for FY 2026 are presented in a data file that is available, along with the other data files associated with the FY 2025 IPPS/LTCH PPS final rule, correction notice and interim final action with comment period, on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*.

We note that, under the policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58603 through 58605), beginning with FY 2022, we use the proposed threshold values associated with the proposed rule for that fiscal year to evaluate the cost criterion for all applications for new technology add-on payments and previously approved technologies that may continue to receive new technology add-on payments, if those technologies would be assigned to a proposed new MS–DRG for that same fiscal year.

As finalized in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41275), beginning with FY 2020, we include the thresholds applicable to the next fiscal year (previously included in Table 10 of the annual IPPS/LTCH PPS proposed and final rules) in the data files associated with the prior fiscal year. Accordingly, the final thresholds for applications for new technology add-on payments for FY 2027 are presented in a data file that is available on the CMS website, along with the other data files associated with this FY 2026 final rule, by clicking on the FY 2026 IPPS Final Rule Home Page at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*.

In the September 7, 2001, final rule that established the new technology add-on payment regulations (66 FR 46917), we discussed that applicants should submit a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. Specifically, applicants should submit a sample of sufficient size to enable us to undertake an initial validation and analysis of the data. We also discussed in the September 7, 2001, final rule (66 FR 46917) the issue of whether the Health Insurance Portability and Accountability Act of 1996 (HIPAA) Privacy Rule at 45 CFR part 160 and subparts A and E of 45 CFR part 164, applies to claims information that providers submit with applications

for new medical service or technology add-on payments. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51573) for further information on this issue.

(3) Substantial Clinical Improvement Criterion

Under the third criterion at § 412.87(b)(1), a medical service or technology must represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42292), we prospectively codified in our regulations at § 412.87(b) the following aspects of how we evaluate substantial clinical improvement for purposes of new technology add-on payments under the IPPS:

- The totality of the circumstances is considered when making a determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries.
- A determination that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries means—

++ The new medical service or technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments;

++ The new medical service or technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable, or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods, and there must also be evidence that use of the new medical service or technology to make a diagnosis affects the management of the patient;

++ The use of the new medical service or technology significantly improves clinical outcomes relative to services or technologies previously available as demonstrated by one or more of the following: a reduction in at least one clinically significant adverse event, including a reduction in mortality or a clinically significant complication; a decreased rate of at least one subsequent diagnostic or therapeutic intervention; a decreased number of future hospitalizations or physician visits; a more rapid beneficial resolution of the disease process treatment including, but not limited to, a reduced length of stay or recovery time; an improvement in one or more activities of daily living; an improved quality of life; or, a demonstrated greater medication adherence or compliance; or

++ The totality of the circumstances otherwise demonstrates that the new medical service or technology substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries.

- Evidence from the following published or unpublished information sources from within the United States or elsewhere may be sufficient to establish that a new medical service or technology represents an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of Medicare beneficiaries: clinical trials, peer reviewed journal articles; study results; meta-analyses; consensus statements; white papers; patient surveys; case studies; reports; systematic literature reviews; letters from major healthcare associations; editorials and letters to the editor; and public comments. Other appropriate information sources may be considered.
- The medical condition diagnosed or treated by the new medical service or technology may have a low prevalence among Medicare beneficiaries.
- The new medical service or technology may represent an advance that substantially improves, relative to services or technologies previously available, the diagnosis or treatment of a subpopulation of patients with the medical condition diagnosed or treated by the new medical service or technology.

We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42288 through 42292) for additional discussion of the evaluation of substantial clinical improvement for purposes of new technology add-on payments under the IPPS.

We note, consistent with the discussion in the FY 2003 IPPS final rule (67 FR 50015), that while FDA has regulatory responsibility for decisions related to marketing authorization (for example, approval, clearance, etc.), we do not rely upon FDA criteria in our evaluation of substantial clinical improvement for purposes of determining what services and technologies qualify for new technology add-on payments under Medicare. This criterion does not depend on the standard of safety and effectiveness on which FDA relies but on a demonstration of substantial clinical improvement in the Medicare population.

b. Alternative Inpatient New Technology Add-On Payment Pathway

Beginning with applications for FY 2021 new technology add-on payments, under the regulations at § 412.87(c), a medical device that is part of FDA's Breakthrough Devices Program may qualify for the new technology add-on payment under an alternative pathway. Additionally, under the regulations at § 412.87(d) for certain antimicrobial products, beginning with FY 2021, a drug that is designated by FDA as a Qualified Infectious Disease Product (QIDP), and, beginning with FY 2022, a drug that is approved by FDA under the Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD), may also qualify for the new technology add-on payment under an alternative pathway. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739) for further discussion on this policy. We note that CMS reviews the application based on the information provided by the applicant only under the alternative pathway specified by the applicant at the time of application submission. To receive approval for the new technology add-on payment under that alternative pathway, the technology must have the applicable FDA designation and meet all other requirements in the regulations in § 412.87(c) and (d), as applicable.

(1) Alternative Pathway for Certain Transformative New Devices

For applications received for new technology add-on payments for FY 2021 and subsequent fiscal years, a medical device designated under FDA's Breakthrough Devices Program[14] that has received FDA marketing authorization will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS, and will not need to meet the requirement under § 412.87(b)(1) that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. Under this alternative pathway, a medical device that has received a Breakthrough Device designation, and then received FDA marketing authorization (that is, has been

[14] Breakthrough Devices Program *https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program.*

approved or cleared by, or had a De Novo classification request granted by, FDA) for the indication covered by the Breakthrough Device designation, will need to meet the requirements of § 412.87(c). We note that in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58734 through 58736), we clarified our policy that a new medical device under this alternative pathway must receive marketing authorization for the indication covered by the Breakthrough Devices Program designation. We refer the reader to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58734 through 58736) for further discussion regarding this clarification.

(2) Alternative Pathway for Certain Antimicrobial Products

For applications received for new technology add-on payments for certain antimicrobial products, beginning with FY 2021, if a technology is designated by FDA as a QIDP and received FDA marketing authorization, and, beginning with FY 2022, if a drug is approved under FDA's LPAD pathway and used for the indication approved under the LPAD pathway, it will be considered not substantially similar to an existing technology for purposes of new technology add-on payments and will not need to meet the requirement that it represent an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. Under this alternative pathway for QIDPs and LPADs, a medical product that has received FDA marketing authorization and is designated by FDA as a QIDP or approved under the LPAD pathway will need to meet the requirements of § 412.87(d). We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739) for further discussion on this policy.

We note that, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58737 through 58739), we clarified that a new medical product seeking approval for the new technology add-on payment under the alternative pathway for QIDPs must receive FDA marketing authorization for the indication covered by the QIDP designation. We also finalized our policy to expand our alternative new technology add-on payment pathway for certain antimicrobial products to include products approved under the LPAD pathway and used for the indication approved under the LPAD pathway.

c. Additional Payment for New Medical Service or Technology

The new medical service or technology add-on payment policy under the IPPS provides additional payments for cases with relatively high costs involving eligible new medical services or technologies, while preserving some of the incentives inherent under an average-based prospective payment system. The payment mechanism is based on the cost to hospitals for the new medical service or technology. As noted previously, we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (72 FR 47307 through 47308).

For discharges occurring before October 1, 2019, under § 412.88, if the costs of the discharge (determined by applying operating cost-to-charge ratios (CCRs) as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), CMS made an add-on payment equal to the lesser of: (1) 50 percent of the costs of the new medical service or technology; or (2) 50 percent of the amount by which the costs of the case exceed the standard DRG payment.

Beginning with discharges on or after October 1, 2019, for the reasons discussed in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42297 through 42300), we finalized an increase in the new technology add-on payment percentage, as reflected at § 412.88(a)(2)(ii). Specifically, for a new technology other than a medical product designated by FDA as a QIDP, beginning with discharges on or after October 1, 2019, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 65 percent of the costs of the new medical service or technology; or (2) 65 percent of the amount by which the costs of the case exceed the standard DRG payment. For a new technology that is a medical product designated by FDA as a QIDP, beginning with discharges on or after October 1, 2019, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. For a new technology that is a medical product approved under FDA's LPAD pathway, beginning with discharges on or after October 1, 2020, if the costs of a discharge involving a new technology (determined by applying CCRs as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. As set forth in § 412.88(b)(2), unless the discharge qualifies for an outlier payment, the additional Medicare payment will be limited to the full MS–DRG payment plus 65 percent (or 75 percent for certain antimicrobial products (QIDPs and LPADs)) of the estimated costs of the new technology or medical service. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42297 through 42300) for further discussion on the increase in the new technology add-on payment beginning with discharges on or after October 1, 2019.

As discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69245 through 69252), we finalized an increase in the new technology add-on payment percentage, reflected at § 412.88(a)(2)(ii)(C) and (b)(2)(iv), that for certain gene therapies approved for new technology add-on payments in the FY 2025 IPPS/LTCH PPS final rule that are indicated and used specifically for the treatment of sickle cell disease (SCD), effective with discharges on or after October 1, 2024 and concluding at the end of the 2- to 3-year newness period for such therapy, if the costs of a discharge (determined by applying CCRs as described in § 412.84(h)) involving the use of such therapy for the treatment of SCD exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 75 percent of the costs of the new medical service or technology; or (2) 75 percent of the amount by which the costs of the case exceed the standard DRG payment. We noted that these payment amounts would only apply to Casgevy™ (exagamglogene autotemcel) and Lyfgenia™ (lovotibeglogene autotemcel), when indicated and used specifically for the treatment of SCD, which were approved for new

technology add-on payments in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69128 through 69135, and 89 FR 69188 through 69196).

We note that, consistent with the prospective nature of the IPPS, we finalize the new technology add on payment amount for technologies approved or conditionally approved for new technology add-on payments in the final rule for each fiscal year and do not make mid-year changes to new technology add-on payment amounts. Updated cost information may be submitted and included in rulemaking to be considered for the following fiscal year.

Section 503(d)(2) of the MMA (Pub. L. 108–173) provides that there shall be no reduction or adjustment in aggregate payments under the IPPS due to add-on payments for new medical services and technologies. Therefore, in accordance with section 503(d)(2) of the MMA, add-on payments for new medical services or technologies for FY 2005 and subsequent years have not been subjected to budget neutrality.

d. Evaluation of Eligibility Criteria for New Medical Service or Technology Applications

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we modified our regulation at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. That is, we first determine whether a medical service or technology meets the newness criterion, and only if so, do we then make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We specified that all applicants for new technology add-on payments must have FDA approval or clearance by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. In the FY 2021 IPPS/LTCH PPS final rule, to more precisely describe the various types of FDA approvals, clearances and classifications that we consider under our new technology add-on payment policy, we finalized a technical clarification to the regulation to indicate that new technologies must receive FDA marketing authorization [15] [16] (such as pre-market approval (PMA); 510(k) clearance; the granting of a De Novo classification request; or approval of a New Drug Application (NDA) or Biologics License Application (BLA)) by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered (85 FR 58742). Consistent with our longstanding policy, we consider FDA marketing authorization as representing that a product has received FDA approval or clearance, or has been granted a De Novo classification request when considering eligibility for the new technology add-on payment.

Additionally, in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58739 through 58742), we finalized our proposal to provide conditional approval for new technology add-on payment for a technology for which an application is submitted under the alternative pathway for certain antimicrobial products at § 412.87(d) that does not receive FDA marketing authorization by July 1 prior to the particular fiscal year for which the applicant applied for new technology add-on payments, provided that the technology otherwise meets the applicable add-on payment criteria. Under this policy, cases involving eligible antimicrobial products would begin receiving the new technology add-on payment sooner, effective for discharges the quarter after the date of FDA marketing authorization, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments.

As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958) and the FY 2025 IPPS/LTCH PPS final rule (89 FR 69242 through 69245), beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and must provide documentation of FDA acceptance (for a 510k application or De Novo Classification request) or filing (for a PMA, NDA, or BLA) to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958) and the FY 2025 IPPS/LTCH PPS final rule (89 FR 69242 through 69245). As we have discussed in prior rulemaking, we consider the application to be complete when the full application has been submitted to FDA and FDA has provided documentation to the applicant indicating that FDA has determined that the application is sufficiently complete to allow for substantive review by FDA. We recognize that FDA processes and documentation may change over time, and the acceptance or filing documentation may vary depending on the type of FDA marketing authorization application the applicant has submitted to FDA. For example, we understand that FDA considers submission of a 510(k) or De Novo Classification request to be accepted for substantive review after the completion of either a refuse to accept (RTA) review or a technical screening process. [17] [18] Submissions of 510(k) and De Novo Classification requests undergo a technical screening process when they are submitted to FDA using the electronic Submission Template And Resource (eSTAR) process; 510(k) and De Novo Classification requests that are not submitted via eSTAR undergo an RTA review. Accordingly, FDA provides applicants using eSTAR with a review assignment notification to indicate that FDA has completed its technical screening process and has determined that the application is sufficiently complete to allow for substantive review. Therefore, new technology add-on payment applicants that have submitted a 510(k) application or De Novo Classification request to FDA through eSTAR must submit a copy of the review assignment notification to CMS (at the time of new technology add-on payment application) to establish the application is sufficiently complete to allow for substantive review by FDA. We note that PMAs submitted using eSTAR that complete technical screening will still undergo a subsequent filing review by FDA, after which an application is determined to be sufficiently complete to allow for substantive review; therefore, we

continue to require documentation of FDA filing for these applications.

In addition, we recognize that FDA does not conduct a new filing review for NDA or BLA applications that were the subject of a Complete Response Letter (CRL) and were subsequently resubmitted to FDA, even though resubmissions are considered a new review cycle.[19] [20] Therefore, beginning with the new technology add-on applications submitted for FY 2027, these new technology add-on payment applicants must provide to CMS a copy of the resubmission acknowledgement letter from FDA that provides the new goal date for FDA review of the application. We further note that if there are other processes not described here, or if there are further changes to FDA's review processes, consistent with our policy, applicants must provide to CMS the most up-to-date documentation that indicates FDA has determined that the application is sufficiently complete to allow for substantive review by FDA.

Comment: A commenter expressed support for this clarification and, as FDA's review processes evolve or other challenges arise, encouraged CMS to be flexible and to consider additional opportunities to clarify documentation requirements to ensure technologies remain eligible for new technology add-on payment and reach patients who need them, without creating further delays in the availability of new technology add-on payment.

Response: We appreciate the commenter's support and note that an applicant may submit to us specific questions regarding their new technology add-on payment application using the resources described on the CMS website for the electronic application intake system: *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/new-medical-services-and-new-technologies.*

In the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958), we also finalized that, beginning with FY 2025 applications, in order to be eligible for consideration for the new technology add-on payment for the upcoming fiscal year, an applicant for new technology add-on payments must have received FDA marketing authorization by May 1 (rather than July 1) of the year prior to the beginning of the fiscal year for which the application is being considered (except for an application that is submitted under the alternative pathway for certain antimicrobial products), as reflected at § 412.87(f)(2) and (3), as amended and redesignated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958, 88 FR 59331).

e. Pharmaceutical & Technology Ombudsman (PTO)

Many interested parties (including device/biologic/drug developers or manufacturers, industry consultants, others) engage with CMS for coverage, coding, and payment questions or concerns. In order to streamline engagement by centralizing the different innovation pathways within CMS including new technology add-on payments, CMS utilizes the Pharmaceutical & Technology Ombudsman as an initial resource for interested parties. This Ombudsman is available to assist with all of the following:

- Help to point interested parties to or provide information and resources where possible regarding process, requirements, and timelines.
- As necessary, coordinate and facilitate opportunities for interested parties to engage with various CMS components.
- Serve as a primary point of contact for interested parties and provide updates on developments where possible or appropriate.

We receive many questions from parties interested in pursuing new technology add-on payments who may not be entirely familiar with working with CMS. While we encourage interested parties to first review our resources available at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech*, we know that there may be additional questions about the application process. Interested parties with further questions regarding Medicare's coverage, coding, and payment processes, and how they can navigate these processes, whether for new technology add-on payments or otherwise, should review the updated resource guide available at: *https://www.cms.gov/medicare/coding-billing/guide-medical-technology-companies-other-interested-parties.* Parties that would like to further discuss questions or concerns with CMS should contact the Pharmaceutical & Technology Ombudsman at *PharmTechOmbud@cms.hhs.gov*.

f. Application Information for New Medical Services or Technologies

Applicants for add-on payments for new medical services or technologies for FY 2027 must submit a formal request, including a full description of the clinical applications of the medical service or technology and the results of any clinical evaluations demonstrating that the new medical service or technology represents a substantial clinical improvement (unless the application is under one of the alternative pathways as previously described), along with a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. CMS will review the application based on the information provided by the applicant under the pathway specified by the applicant at the time of application submission. Complete application information, along with final deadlines for submitting a full application, will be posted as it becomes available on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech.html*.

To allow interested parties to identify the new medical services or technologies under review before the publication of the proposed rule for FY 2027, once the application deadline has closed, CMS will post on its website a list of the applications submitted, along with a brief description of each technology as provided by the applicant.

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48986 through 48990), we finalized our proposal to publicly post online new technology add-on payment applications, including the completed application forms, certain related materials, and any additional updated application information submitted subsequent to the initial application submission (except certain volume, cost and other information identified by the applicant as confidential), beginning with the application cycle for FY 2024, at the time the proposed rule is published. We also finalized that with the exception of information included in a confidential information section of the application, cost and volume information, and materials identified by the applicant as copyrighted or not otherwise releasable to the public, the contents of the application and related materials may be posted publicly, and that we will not post applications that are withdrawn prior to publication of the proposed rule. We refer the reader to the FY 2023 IPPS/LTCH PPS final

[19] SOPP 8405.1: Procedures for Resubmissions to an Application or Supplement. Version: 8 Effective Date: November 13, 2022. *https://www.fda.gov/media/84417/download.*

[20] 21 CFR 314.110, Complete response letter to the applicant *https://www.ecfr.gov/current/title-21/chapter-I/subchapter-D/part-314/subpart-D/section-314.110.*

rule (87 FR 48986 through 48990) for further information regarding this policy. In the proposed rule, we stated that beginning with the new technology add-on applications submitted for FY 2027, we intend to include certain cost criterion information in this public posting; however, consistent with our current policy, cost and volume information will not be publicly posted. Consistent with current practice, certain cost and volume information may still be summarized and discussed in the proposed rule, but we intend to provide more succinct information as part of the summaries in the proposed and final rules regarding the applicant's assertions as to how the medical service or technology meets the cost criterion. Specifically, beginning with the FY 2027 applications, the public posting will include the applicant's explanation of the cost analysis methodology, including the step-by-step explanation of the columns used in the cost analysis spreadsheet attachment, any optional comments provided by the applicant, and information about the case weighted threshold and final inflated case weighted standardized charge per case, as is currently subject to discussion in the cost criterion analysis for each eligible application in the proposed rule. The cost analysis spreadsheet attachment and other charge values provided in the applicant's responses would not be included in the public posting. We stated that we believe that including the described cost criterion information in the public posting will further improve and streamline our evaluation process, while also further supporting transparency and engagement with interested parties.

Comment: Multiple commenters asked CMS to reconsider finalizing or request additional input from interested parties through rulemaking before finalizing the inclusion of certain cost criterion information in the public posting beginning with FY 2027. Commenters stated that because CMS already summarizes the relevant cost analyses in the proposed rules to allow interested parties to comment on the analyses, there is no extra benefit to additional disclosures. Some commenters stated that disclosing applicants' cost analyses raises confidentiality concerns because information about expected inpatient volume and other data incorporated within cost analyses are based on confidential commercial and financial information, including proprietary market analyses. A commenter further explained that for therapies that target small patient populations, even high-level methodological detail may be commercially sensitive or permit back-calculation of pricing strategy. Commenters explained that such information should be kept confidential, consistent with long-standing statutes recognizing the need to protect confidential commercial and financial information against public disclosure. Multiple commenters also noted that because of the single annual application period, applicants generally submit their applications before their products are approved by FDA, creating special sensitivities in disclosing pricing information. Commenters stated that public release of this information could create disincentives for small or emerging companies that may be more risk-averse with respect to transparency of confidential methods.

Multiple commenters requested that CMS provide additional details on the guardrails and specific steps the Agency would employ to ensure proprietary and market sensitive cost and pricing data provided by new technology add-on payment applicants are not inadvertently publicized, either directly or indirectly, through this proposal. For example, a commenter noted that the application asks the applicant to provide the charges related to the new technology, as well as the cost-to-charge ratio used to convert the product's cost to charges, and if CMS were to publish these two data points, the public would be able to calculate the cost of the product. Another commenter further asked CMS to articulate the policy gaps this proposal would address and what stakeholder needs it would serve.

A commenter recommended that CMS modify the proposal to allow applicants to redact, generalize, or submit alternate public summaries of methodology where disclosure could reasonably reveal proprietary strategy. It also asked that CMS provide clear written guidance on what components of the cost methodology are considered ''public'' versus protected from disclosure.

Another commenter also stated its appreciation and support for CMS's commitment to only publishing an explanation of the applicant's cost analysis methodology without including cost or pricing data, and CMS's effort to bring additional information about new technology add-on payment applications to the public. The commenter further asked that CMS create a sub-section text box dedicated to capturing proprietary information in the cost analysis methodology section that would not be included in any publication. Finally, the commenter asked that CMS avoid use of artificial intelligence in drafting summaries of applications for public display, including in the proposed rule, or ensure human review of the summary before publication.

Response: We thank the commenters for their feedback and appreciate the commenters' raising their concerns regarding balancing the need to maintain the confidentiality of commercial and financial information with our intent to further improve and streamline our evaluation process and support transparency and engagement with interested parties.

As discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48986 through 48990), we finalized to publicly post online new technology add-on payment applications, including the completed application forms, certain related materials (for example, attachments, uploaded supportive materials), and any additional updated application information submitted subsequent to the initial application submission (except certain volume, cost and other information identified by the applicant as confidential). We also provided a mechanism for applicants to submit confidential information that would not be posted online, such as in a separate section of the application, or by identifying particular questions for which the information submitted would not be publicly posted. We also stated we would not publicly post cost and volume information; however, consistent with our current practice, we would continue to summarize and discuss certain cost and volume information for the proposed rule and will indicate as such in the application. With the exception of information included in a confidential information section of the application, cost and volume information, and materials identified by the applicant as copyrighted and/or not otherwise releasable to the public, the contents of the application and related materials may be posted publicly.

While we did not initially include the cost criterion analysis and related materials in the public posting as we gained experience with the public posting process, as noted by the commenters, in the meantime, we have continued to summarize the information under the cost criterion, including the applicant's assertions and supporting data on how the technology meets the criteria under § 412.87, in the annual rules. This includes information such as: the inclusion/exclusion criteria used for the cost analysis, including the data source and list of ICD–10–CM/PCS codes and MS–DRGs used by the applicant, the number of claims and

MS–DRGs identified by the applicant for the cost analysis, the indirect and direct charges removed for prior technology (including the methodology used to estimate these charges), how the applicant standardized charges, the inflation factor applied to the standardized charges, the indirect and direct charges added for the new technology (including the methodology used to convert the cost of the new technology to charges), the average case-weighted threshold amount, and the final inflated average case-weighted standardized charge per case.

Under this current proposal, the processes described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48986 through 48990) remain unchanged. The information described by commenters, including high-level methodological detail or information about data incorporated within cost analyses, is already included or subject to inclusion in the proposed and final rulemaking. Under our existing practice, we generally do not consider information that is marked as confidential, proprietary, or trade secret when determining whether a technology meets the criteria for new technology add-on payments. We would continue to indicate in the application where certain information will not be posted publicly (for example, contact information, cost and volume), otherwise, applicants should expect that everything else may be posted publicly. We would continue to provide a mechanism for applicants to submit confidential information that would not be posted online in a separate section of the application. Certain cost and volume information would continue to be included in the proposed or final rulemaking. For example, for an alternative pathway application, we continue to include, as applicable, the maximum add-on payment amount, where cost information is available. In the final rule, we would continue to provide, for approved technologies, the final add-on payment amounts and volume estimates.

When reviewing the public postings prior to publication, we would continue to use human review rather than review by artificial intelligence. Under this proposal, the case weighted threshold and final inflated case weighted standardized charge per case would be included in the public posting because they are currently subject to discussion in the cost criterion analysis for each eligible application in the proposed rule. The cost criterion analysis spreadsheet attachment would continue to be excluded from the public posting. Other cost or charge values, such as for charges related to the new technology, provided in the applicant's responses would not be included in the public posting. Human review would be used to identify and manually redact cost or charge values that may have been provided in the applicant's responses in the cost criterion section.

We continue to believe that providing additional information to the public by publicly posting the applications and certain related materials online helps further public engagement and fosters greater public input on the various new medical services and technologies presented annually for consideration for new technology add-on payments. We also continue to believe that posting the applications online reduces the risk that we may inadvertently omit or misrepresent relevant information submitted by applicants, or are perceived as misrepresenting such information, in our summaries in the rules. We do not believe that it would be appropriate for applicants to further redact, generalize, or provide alternate public summaries that would differ from the information provided in their new technology add-on payment applications for public review. As noted, we will continue to provide a mechanism for applicants to submit confidential information that would not be posted online in a separate section of the application.

Therefore, we are finalizing that, beginning with the new technology add-on payment applications submitted for FY 2027, the public posting will include the applicant's explanation of the cost analysis methodology, including the step-by-step explanation of the columns used in the cost analysis spreadsheet attachment, any optional comments provided by the applicant, and information about the case weighted threshold and final inflated case weighted standardized charge per case, as is currently subject to discussion in the cost criterion analysis for each eligible application in the proposed rule. The cost analysis spreadsheet attachment and other cost or charge values that may have been provided in the applicant's responses in the cost criterion section would not be included in the public posting. Consistent with current practice, certain cost and volume information may still be summarized and discussed in the proposed rule, but we intend to provide more succinct information as part of the summaries in the proposed and final rules regarding the applicant's assertions as to how the medical service or technology meets the cost criterion.

We note that the burden associated with this information collection requirement is the time and effort required to collect and submit the data in the formal request for add-on payments for new medical services and technologies to CMS. The aforementioned burden is subject to the PRA and approved under OMB control number 0938–1347 and has an expiration date of December 31, 2026.

2. Public Input Before Publication of a Notice of Rulemaking on Add-On Payments

Section 1886(d)(5)(K)(viii) of the Act, as amended by section 503(b)(2) of the MMA, provides for a mechanism for public input before publication of a notice of proposed rulemaking regarding whether a medical service or technology represents a substantial clinical improvement. The process for evaluating new medical service and technology applications requires the Secretary to do all of the following:

- Provide, before publication of a proposed rule, for public input regarding whether a new service or technology represents an advance in medical technology that substantially improves the diagnosis or treatment of Medicare beneficiaries.
- Make public and periodically update a list of the services and technologies for which applications for add-on payments are pending.
- Accept comments, recommendations, and data from the public regarding whether a service or technology represents a substantial clinical improvement.
- Provide, before publication of a proposed rule, for a meeting at which organizations representing hospitals, physicians, manufacturers, and any other interested party may present comments, recommendations, and data regarding whether a new medical service or technology represents a substantial clinical improvement to the clinical staff of CMS.

In order to provide an opportunity for public input regarding add-on payments for new medical services and technologies for FY 2026 prior to publication of the FY 2026 IPPS/LTCH PPS proposed rule, we published a notice in the September 13, 2024, **Federal Register** (89 FR 74962) and held a virtual town hall meeting on December 11, 2024. In the announcement notice for the meeting, we stated that the opinions and presentations provided during the meeting would assist us in our evaluations of applications by allowing public discussion of the substantial clinical improvement criterion for the FY 2026 new medical service and technology add-on payment

applications before the publication of the FY 2026 IPPS/LTCH PPS proposed rule.

Approximately 200 individuals attended the virtual town hall meeting. We posted the recordings of the virtual town hall on the CMS web page at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech.*

We considered each applicant's presentation made at the town hall meeting, as well as written comments received by the December 16, 2024, deadline, in our evaluation of the new technology add-on payment applications for FY 2026 in the development of the FY 2026 IPPS/LTCH PPS proposed rule. In response to the published notice and the December 11, 2024, New Technology Town Hall meeting, we received written comments regarding the applications for FY 2026 new technology add on payments. As explained earlier and in the **Federal Register** notice announcing the New Technology Town Hall meeting (89 FR 74962 through 74964), the purpose of the meeting was specifically to discuss the substantial clinical improvement criterion with regard to pending new technology add-on payment applications for FY 2026. Therefore, we did not summarize any written comments in the proposed rule that were unrelated to the substantial clinical improvement criterion. In section II.E.5. of the preamble of the proposed rule, we summarized comments regarding individual applications, or, if applicable, indicated that there were no comments received in response to the New Technology Town Hall meeting notice or New Technology Town Hall meeting, at the end of each discussion of the individual applications.

3. ICD–10–PCS Section ''X'' Codes for Certain New Medical Services and Technologies

As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49434), the ICD–10–PCS includes a new section containing the new Section ''X'' codes, which began being used with discharges occurring on or after October 1, 2015. Decisions regarding changes to ICD–10–PCS Section ''X'' codes will be handled in the same manner as the decisions for all of the other ICD–10–PCS code changes. That is, proposals to create, delete, or revise Section ''X'' codes under the ICD–10–PCS structure will be referred to the ICD–10 Coordination and Maintenance CommitteIn addition, several of the new medical services and technologies that have been, or may be, approved for new technology add-on payments may now, and in the future, be assigned a Section ''X'' code within the structure of the ICD–10–PCS. We posted ICD–10–PCS Guidelines on the CMS website at: *https://www.cms.gov/medicare/coding-billing/icd-10-codes*, including guidelines for ICD–10–PCS Section ''X'' codes. We encourage providers to view the material provided on ICD–10–PCS Section ''X'' codes.

4. FY 2026 Status of Technologies Receiving New Technology Add-On Payments for FY 2025

In this section of the final rule, we discuss the FY 2026 status of 42 technologies approved for 39 new technology add-on payments for FY 2025, as set forth in the tables that follow. In the proposed rule, we presented our proposals to continue the new technology add-on payments for FY 2026 for those technologies that were approved for the new technology add-on payment for FY 2025, and which would still be considered ''new'' for purposes of new technology add-on payments for FY 2026. We also presented our proposals to discontinue new technology add-on payments for FY 2026 for those technologies that were approved for the new technology add-on payment for FY 2025, and which would no longer be considered ''new'' for purposes of new technology add-on payments for FY 2026.

Our policy is that a medical service or technology may continue to be considered ''new'' for purposes of new technology add-on payments within 2 or 3 years after the point at which data begin to become available reflecting the inpatient hospital code assigned to the new service or technology. Our practice has been to begin and end new technology add-on payments on the basis of a fiscal year, and we have generally followed a guideline that uses a 6-month window before and after the start of the fiscal year to determine whether to extend the new technology add-on payment for an additional fiscal year, and, in general, we have extended new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry onto the U.S. market occurs in the latter half of the fiscal year (70 FR 47362).

As discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69238 through 69242), we finalized that, beginning with new technology add-on payments for FY 2026, in assessing whether to continue the new technology add-on payments for those technologies that are first approved for new technology add-on payments in FY 2025 or a subsequent year, we will extend new technology add-on payments for an additional fiscal year when the 3-year anniversary date of the product's entry onto the U.S. market occurs on or after October 1 of that fiscal year. This change is effective beginning with those technologies that are initially approved for new technology add-on payments in FY 2025 or a subsequent year. For technologies that were first approved for new technology add-on payments prior to FY 2025, including for technologies we determine to be substantially similar to those technologies, we continue to use the midpoint of the upcoming fiscal year (April 1) when determining whether a technology would still be considered ''new'' for purposes of new technology add-on payments.

In the proposed rule, we provided Table II.E–01.A listing the technologies that were first approved for new technology add-on payments prior to FY 2025, for which we proposed to continue making new technology add-on payments for FY 2026 because they were still considered ''new'' for purposes of new technology add-on payments because the 3-year anniversary date of the product's entry onto the U.S. market occurs on or after April 1, 2026. This table also presented the newness start date, new technology add-on payment start date, 3-year anniversary date of the product's entry onto the U.S. market, relevant final rule citations from prior fiscal years, proposed maximum add-on payment amount, and coding assignments for each technology. We referred readers to the cited final rules in the table for a complete discussion of the new technology add-on payment application, coding, and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

In the proposed rule, we also provided Table II.E–01.B listing the technologies that were first approved for new technology add-on payments in FY 2025, for which we proposed to continue making new technology add-on payments for FY 2026 because they were still considered ''new'' for purposes of new technology add-on payments because the 3-year anniversary date of the product's entry onto the U.S. market occurs on or after October 1, 2025. This table also presented the newness start date, new technology add-on payment start date, 3-year anniversary date of the product's entry onto the U.S. market, relevant final rule citations from prior fiscal years, proposed maximum add-on payment amount, and coding assignments for each technology. We referred readers to the cited final rules in the table for a complete discussion of

the new technology add-on payment application, coding, and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

We invited public comments on our proposals to continue new technology add-on payments for FY 2026 for the technologies listed in Tables II.E.–01.A and II.E.–01.B of the proposed rule.

Comment: Multiple commenters supported CMS's proposed continuation of new technology add-on payments for FY 2026 for those technologies that were approved for the new technology add-on payment for FY 2025, and which would still be considered ''new'' for purposes of new technology add-on payments for FY 2026.

Response: We appreciate the commenters' support.

Comment: Commenters, including the applicant for CYTALUX® for use in lung cancer, stated that they found that providers often do not bill for the full cost of the single-use vials when only a portion of the vial is administered during the surgical procedure. Commenters noted that this appears to be due confusion about whether Medicare Part B's discarded drug billing rules apply to inpatient billing under Medicare Part A, or uncertainty about whether the full vial cost should be reported in cases where only partial use occurs due to patient-specific dosing considerations.

The applicant noted that although the non-reporting of the full vial cost does not affect the triggering of the new technology add-on payment because payment is driven by the unique ICD–10–PCS code for CYTALUX®, this practice can decrease the likelihood that a hospital's reported cost for a case will exceed the payment threshold. Furthermore, commenters noted that underreporting of the full cost of CYTALUX® can distort the hospital's cost report data, which CMS relies upon for rate-setting purposes and for future MS–DRG assignments.

Commenters requested that CMS clarify that because hospitals are not required to report drug wastage, they should bill for the full package size used in administration, and that hospitals should report the full acquisition cost of inpatient-administered drugs in their cost reports, regardless of the quantity administered. A commenter further suggested that CMS could instead support the reporting of waste for products within the billing process for Medicare Part A inpatient billing, similar to what is required on Medicare Part B.

Response: We thank the applicant and other commenters for their comment. We note that they are correct that the drug wastage policy applies to Medicare Part B. We encourage commenters to consult the CMS Medicare discarded drug policy website at *https://www.cms.gov/medicare/payment/part-b-drugs/discarded-drugs* for further information.

Comment: The applicant for ZEVTERA® (ceftobiprole medocaril sodium for injection) submitted a comment providing updated information on its commercial availability and to update its Wholesale Acquisition Cost (WAC). The applicant noted that ZEVTERA® received marketing approval from FDA on April 3, 2024, for the treatment of adult patients with Staphylococcus aureus bloodstream infections (bacteremia) (SAB), including those with right-sided infective endocarditis, and adult patients with acute bacterial skin and skin structure infections (ABSSSI) and for adult and pediatric patients (3 months to less than 18 years old) with community-acquired bacterial pneumonia (CABP). The applicant also noted that ZEVTERA® received new technology add-on payment approval for FY 2025, with its newness period beginning on April 3, 2024.

Per the applicant, on December 14, 2024, it entered into a license and distribution agreement with Innoviva Specialty Therapeutics, LLC (ISTx) for the commercialization of ZEVTERA® in the United States. The applicant stated that transfer of ownership for the ceftobiprole Investigational New Drug (IND) Application (064407) and the ZEVTERA (ceftobiprole medocaril sodium for injection) NDA (218275) from Basilea to ISTx, LLC was submitted to FDA and was effective on March 18, 2025. ISTx, LLC announced on May 20th the commercial availability of ZEVTERA® for the US market. The applicant asserted that prior to this date, ZEVTERA® was not available to Medicare beneficiaries in the United States, and requested that CMS assign a newness date of May 20, 2025. The applicant asserted that CMS had delayed the newness dates for other products when market availability was significantly later than the FDA approval date, and provided examples from FY 2025: HEPZATO™ KIT, Annalise Enterprise CTB Triage—OH, and the LimFlow™ System.

The applicant also stated that ISTx, LLC made ZEVTERA® available for use on May 20, 2025, with a WAC of $235.00 per vial. The applicant explained that, with this updated pricing information, the average inpatient cost per case is $21,620 for the indication of SAB and $7,050 for the indication of ABSSSI and CABP. Therefore, because ZEVTERA® is a Qualified Infectious Disease Product (QIDP), the applicant requested that the maximum new technology add-on payment for a case involving the use of ZEVTERA® be updated to $16,215 for the indication of SAB and $5,288 for the indications of ABSSSI and CABP for FY 2026 (that is, 75 percent of the average cost of the technology).

Response: We thank the applicant for its comment and the updated cost information. We have updated the new technology add-on payment amount for ZEVTERA® accordingly.

ZEVTERA®'s current new technology add-on payment amount is $8,625.00 for the indication of SAB and $2,812.50 for the indications of ABSSSI and CABP, based on a WAC of $125 per vial. As we noted in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69237), for ABSSSI and CABP, the suggested daily dose is 3 vials per day for a duration of 5–14 days, resulting in an estimated average cost of $3,750 for a 10-day therapy. For SAB, the recommended dose is every 6 hours for the first 8 days, followed by every 8 hours for up to 42 days, and the applicant had made the assumption that patients would be inpatient for 28 days and then continue the therapy as an outpatient for up to 42 days. For FY 2026, the maximum new technology add-on payment amount is $16,215.00 for the indication of SAB and $5,287.50 for the indications of ABSSSI and CABP, as reflected in Table II.E.–01.B in this final rule.

With respect to the applicant's request that CMS should consider the beginning of the newness period to commence on May 20, 2025, which it states is the date on which ZEVTERA® became commercially available on the U.S. market, we note that that date occurred after new technology add-on payments for ZEVTERA® began, as it was approved for new technology add-on payment for FY 2025 (starting October 1, 2024). While we agree that per our policy, we may consider a documented delay in a technology's market availability in our determination of newness, we note that the new technology add-on payment for claims reporting ICD–10–PCS procedure codes for ZEVTERA® (XW0335A (Introduction of ceftobiprole medocaril anti-infective into peripheral vein, percutaneous approach) and XW0435A (Introduction of ceftobiprole medocaril anti-infective into central vein, percutaneous approach)) was available beginning October 1, 2024.

Furthermore, as discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69238 through 69242), we finalized that,

beginning with new technology add-on payments for FY 2026, in assessing whether to continue the new technology add-on payments for those technologies that are first approved for new technology add-on payments in FY 2025 or a subsequent year, we would extend new technology add-on payments for an additional fiscal year when the 3-year anniversary date of the product's entry onto the U.S. market occurs on or after October 1 of that fiscal year. If we were to consider the beginning of the newness period to commence on May 20, 2025, the date on which the applicant states ZEVTERA® became commercially available on the U.S. market, under our policy, the technology would potentially be eligible for new technology add-on payment for up to four years. Although the applicant stated that CMS had delayed the newness start dates for other technologies when market availability was significantly later than the FDA approval date, and that like these other products, ZEVTERA®'s newness period should commence on the date on which the technology became commercially available, we note that, unlike these other technologies, the applicant for ZEVTERA® is asserting a date of commercial availability that occurred after its new technology add-on payment began.

We also note that applicants may assert a delay in commercial availability due to business decisions made by the applicant. We are concerned that a delay in commercial availability extending beyond the implementation date for the new technology add-on payment would potentially allow applicants to postpone commercial availability for an indefinite period of time while the technology (and other technologies reported using the same codes) remain eligible for new technology add-on payment.

Therefore, we question whether, where the applicant asserts a date of commercial availability that occurred after the new technology add-on payment for the technology began, it would be appropriate to instead consider the beginning of the newness period to commence with the start of the technology's new technology add-on payment. We note that regardless of whether we consider the beginning of the newness period to commence for ZEVTERA® on May 20, 2025, April 3, 2024, or a date in between, the three-year anniversary date would occur after April 1, 2026, and, therefore, the technology would be considered new for FY 2026.

After consideration of the public comments we received, we are finalizing our proposals to continue new technology add-on payments for FY 2026 for the technologies that were approved for new technology add-on payment for FY 2025 and would still be considered ''new'' for purposes of new technology add-on payments for FY 2026, as listed in the proposed rule and in the following Tables II.E.–01.A and II–E.–01.B in this section of this final rule.

We note that the following Tables II.E.–01.A and II.E.–01.B are the same as Tables II.E.–01.A and II.E.–01.B that were presented in the proposed rule, but Table II.E.–01.A in this final rule includes the SAINT Neuromodulation System, as discussed later in this section, and Table II.E.–01.B in this final rule includes the updated cost information for ZEVTERA®, as discussed previously. Tables II.E.–01.A and II.E.–01.B in this final rule also present the newness start date, new technology add-on payment start date, 3-year anniversary date of the product's entry onto the U.S. market, relevant final rule citations from prior fiscal years, maximum add-on payment amount, and coding assignments for each technology. We refer readers to the final rules cited in the following tables for a complete discussion of the new technology add-on payment application, coding, and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

*We note that as discussed previously in this section, we are continuing to consider the applicable newness start date for this technology, but that it would continue to be eligible for new technology add-on payment in FY 2026.

BILLING CODE 4120–01–C

In the proposed rule, we provided a Table II.E.–02 listing the technologies that were first approved for new technology add-on payments prior to FY

2025, including technologies determined to be substantially similar to such technologies, for which we proposed to discontinue making new technology add-on payments for FY 2026 because they were no longer ''new'' for purposes of new technology add-on payments because the 3-year anniversary date of the product's entry onto the U.S. market occurs before April 1, 2026. This table also presented the newness start date, new technology add-on payment start date, the 3-year anniversary date of the product's entry onto the U.S. market, and relevant final rule citations from prior fiscal years. We referred readers to the cited final rules in the table for a complete discussion of each new technology add-on payment application and the coding and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

As we discussed in section II.E.6. of the preamble of the proposed rule, BONESUPPORT, Inc. is also seeking new technology add-on payments for CERAMENT® G for FY 2026 for use in defects in the extremities of skeletally mature patients as an adjunct to systemic antibiotic therapy and surgical debridement as part of the standard treatment approach to open fractures. Additionally, as discussed in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48961 through 48966), CERAMENT® G was approved for new technology add-on payments with an indication for use as a bone void filler in skeletally mature patients as an adjunct to systemic antibiotic therapy and surgical debridement (standard treatment approach to a bone infection) as part of the surgical treatment of osteomyelitis in defects in the extremities. For the proposed rule, we proposed to discontinue new technology add-on payments for FY 2026 for CERAMENT® G when used for bone infections, as the technology will no longer be considered new for this indication. We believed cases involving the use of CERAMENT® G related to bone infections, which would no longer be eligible for new technology add-on payment in FY 2026, would be identified by the ICD–10–PCS code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) in combination with the ICD–10–CM codes in category M86 (Osteomyelitis). We invited public comments on the use of these codes to exclude the indication for use of CERAMENT® G related to bone infections, which we stated would not be eligible for the new technology add-on payment for FY 2026, if approved.

Comment: Commenters expressed general support of the proposed ICD–10–CM codes for which CMS specifically sought input.

Response: We thank the commenters for their comments. As discussed in section II.E.6. of the preamble of this final rule, we are approving CERAMENT® G for new technology add-on payments for FY 2026 for use as a bone void filler intended for use in defects in the extremities of skeletally mature patients as an adjunct to systemic antibiotic therapy and surgical debridement as part of the standard treatment approach to open fractures. Therefore, cases involving the use of CERAMENT® G related to bone infections, which will no longer be eligible for new technology add-on payment in FY 2026, will be identified by the ICD–10–PCS code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) in combination with the ICD–10–CM codes in category M86 (Osteomyelitis).

We invited public comments on our proposals to discontinue new technology add-on payments for FY 2026 for the technologies listed in Table II.E.–02 of the proposed rule.

Comment: Multiple commenters, including the applicant for SAINT Neuromodulation System, requested that CMS recognize a delay in commercial availability of the technology to April 5, 2024, and subsequently extend new technology add-on payment for the SAINT Neuromodulation System for FY 2026.

Commenters presented the timelines for use of the device at their hospitals. A commenter stated that equipment was installed at the hospital on May 9 through 10, 2024; physicians and staff were trained by the manufacturer on May 15 through 17, 2024; and the first patient was treated on May 23, 2024. Another commenter stated that equipment was installed at its hospital on April 23, 2024; physicians and staff were trained between April 29 and May 1, 2024; and the first patients were treated on May 30, 2024. Commenters stated their hope that innovation for inpatient mental health patients would continue to be available to hospitals in 2026.

The applicant also asserted that the SAINT Neuromodulation System was commercially available in the United States on April 5, 2024, and provided a timeline of the device's availability. The applicant stated that although the device received FDA clearance on September 1, 2022, there were significant product development, manufacturing design, and compliance steps that it needed to complete before the device became commercially available. Per the applicant, initially, it had planned to develop and manufacture its own hardware; however, it was determined in the second half of 2023 that the best course was to work with third-party manufacturers for the stimulator and neuronavigation hardware. The applicant stated that for compliance purposes, it followed a development plan consistent with its quality system and the commercial product could not be sold until the manufacturing processes were designed, developed, and validated according to FDA quality guidelines. Per the applicant, this process was finished on April 5, 2024, which was the earliest possible date the device could be sold in compliance with FDA regulations.

The applicant further stated that in the FY2025 IPPS/LTCH PPS final rule, it was surprised to learn that there had been claims submitted with the ICD–10–PCS section X code that was created to administer the new technology add-on payment for the SAINT Neuromodulation System, before it was commercially available. The applicant stated it analyzed the claims using the Medicare Inpatient Standard Analytic Files (IPSAF) from October 2022 through March 2024 and confirmed that none of the billed cases were submitted by providers with access to the device or had discussed the device with the applicant.

The applicant further looked at the primary diagnoses, all diagnoses, and MS–DRG mapping for these claims. The applicant explained that the device is intended to treat patients with major depressive disorder with claims including ICD–10–CM diagnosis codes F33.2 or F32.2 and whose cases map to MS–DRG 885 (Psychoses), yet none of the claims contained either a psychiatric diagnosis or were assigned to MS–DRG 885. The applicant asserted that these claims used the ICD–10–PCS code inappropriately, and provided additional details in a summary table. Per the applicant, in the FY 2026 final rule, CMS stated that the applicant stated the specific ICD–10–PCS code X0Z0X18 is ''used to uniquely describe procedures involving the use of SAINT Neuromodulation System,'' which the applicant stated supports its contention that the procedure code was intended to be used specifically for the device or a procedure that is virtually the same when the technology was introduced into the clinical setting. Therefore, the applicant asserted that the 5 claims should not have been accepted as qualifying claims and should not be

included in the evaluation of continued eligibility.

The applicant asked that CMS establish the newness start date for the SAINT Neuromodulation System to be April 5, 2024, and noted that this would allow for the new technology add-on payment to continue in FY 2026. The applicant further asserted that this accurate newness date and continued new technology add-on payment would no longer result in premature termination of payment. The applicant stated that to fulfill the requirement for an adequate period of data collection of no less than 2 and no more than 3 years, terminating the new technology add-on payment at the end of FY 2025 would fall short of two years of active new technology add-on payment.

Response: We thank the applicant and the commenters for their comments and further details regarding the claims reporting the ICD–10–PCS code X0Z0X18 (Computer-assisted transcranial magnetic stimulation of prefrontal cortex, new technology group 8). As discussed in greater detail previously in this section, we question whether, where the applicant asserts a date of commercial availability that occurred after the new technology add-on payment for the technology began, it would be appropriate to instead consider the beginning of the newness period to commence with the start of the technology's new technology add-on payment. We note that regardless of whether we consider the beginning of the newness period to commence for SAINT Neuromodulation System on April 5, 2024; a date that reflects the start of the technology's new technology add-on payment in FY 2024; or a date in between, the three-year anniversary date would occur after April 1, 2026, and, therefore, the technology would be considered new for FY 2026.

Comment: Multiple commenters, including the applicant for EchoGo® Heart Failure 1.0 (referred to as EchoGo® Heart Failure), requested that CMS extend new technology add-on payment for EchoGo® Heart Failure for a third year. The commenters noted that EchoGo® Heart Failure, developed by Ultromics, is an FDA-cleared, AI-powered decision support platform designed to assist clinicians in detecting heart failure with preserved ejection fraction (HFpEF) using a single, routine echocardiogram view, and described the clinical need and clinical value of the device in identifying HFpEF from a standard echocardiogram.

The applicant stated that the request to extend new technology add-on payment is consistent with CMS's longstanding policy that the newness period begins with availability of the product on the market, which is when data become available. The applicant explained that the device was not available on the market until November 2023, when it entered its first contract with a customer and invoiced a customer for the service. As such, the applicant asserted that the three-year anniversary of entry into the U.S. market would be in November of 2026. The applicant noted that CMS has recognized a later date where an applicant could prove a delay in actual availability of a product after FDA approval or clearance. Therefore, the applicant stated that consistent with this policy, CMS should not use the identified date of November 23, 2022 (date of FDA marketing authorization) as the newness start date for EchoGo® Heart Failure because that does not reflect when the product was first available.

The applicant explained that the reason for the gap in time from FDA clearance to sales of EchoGo® Heart Failure was that upon FDA clearance, it had to perform considerable architectural and workflow changes to integrate the software into the product platform. Additionally, the applicant stated that it took considerable time to implement its product platform into a hospital's Picture Archiving and Communication System (PACS) and electronic health record (EHR) systems, all of which delayed it being able to have a viable and available product for which it could sign a commercial contract until 12 months after clearance. The applicant explained that it was not until late in 2023 that it could pursue contracts with customers, the first of which was signed in November of 2023, leading to a first invoice dated November 30, 2023. The applicant further stated that in light of this information, supplemented by its understanding that there are no claims for the ICD–10–PCS procedure code tied to the technology (XXE2X19) in the MedPAR database of FY 2023 claims, it asked CMS to apply its current policy and consider the starting point for the newness period for EchoGo® Heart Failure to begin in November of 2023, not November of 2022, such that EchoGo® Heart Failure would continue to receive new technology add-on payment for FY 2026.

Commenters stated that that while EchoGo® Heart Failure had been available with new technology add-on payment since October 2023, the technology is still in the early stages of adoption across U.S. hospitals. Commenters explained that new technology add-on payment has been instrumental in facilitating access to the device by offsetting the additional costs associated with its use. However, commenters asserted that broader clinical integration and real-world evidence generation of novel technologies require more than two years, particularly in the context of hospital operational cycles, education, and ongoing validation in diverse patient populations. Commenters explained that extending new technology add-on payment for a third year would: ensure continued access to EchoGo® Heart Failure for Medicare beneficiaries, particularly as hospitals complete the necessary training and workflow adjustments; support ongoing data collection and outcomes research, further establishing the clinical and economic value of the technology; and encourage adoption in a wider range of hospital settings, including those serving high-risk and underserved populations disproportionately affected by HFpEF.

The applicant stated that if CMS did not believe this extension is warranted under current policy, it should make changes to the new technology add-on payment policy to provide new technology add-on payment for three years for all technologies, similar to what was done under the hospital outpatient prospective payment system pass-through policy. The applicant explained that it can take a considerable period of time for a new technology to enter into the market, and that having a later year's data should provide more fulsome data set for rate setting. The applicant stated that CMS should not settle for data that would not be insufficient, but instead should strive to use as fulsome a data set as possible when making the important determination as to how to work a new technology into the MS–DRGs.

Response: We thank the applicant and commenters for their comments. We note that while CMS may consider a documented delay in the technology's market availability in our determination of newness, our policy for determining whether to extend new technology add-on payments for an additional year generally applies regardless of the volume of claims for the technology after the beginning of the newness period (83 FR 41280). We do not consider the date of first sale of a product, or first shipment of a product, as an indicator of the entry of a product onto the U.S. market; neither of these dates indicate when a technology in fact became available for sale. Similarly, our policy for determining whether to extend new technology add-on payments for a third year generally

applies regardless of the claims volume for the technology after the start of the newness period (88 FR 58801 through 58802).

The applicant stated the device was not available on the market until November 2023, which is when the applicant was able to enter its first contract with a customer and invoice a customer for the service; however, it is not clear to us when the technology first became *available* for sale. The applicant noted that it was not until late in 2023 that it had taken such steps that it could pursue contracts with customers, the first of which was signed in November of 2023, leading to a first invoice dated November 30, 2023. However, it seems that a viable product would have needed to be available for sale before the applicant would be able to pursue and enter its first contract. Furthermore, we note that according to the applicant's website, the device was available in the United States as of the press release on July 5, 2023,[21] if not earlier. This further conflicts with the applicant's assertion that the device was not available for sale until November 2023.

Therefore, we cannot determine a newness date based on a documented delay in the technology's availability on the U.S. market. Accordingly, we are finalizing that we consider November 23, 2022, the date on which the technology received FDA 510(k) clearance for the indication covered by its Breakthrough Device designation, to be the date the technology became available on the market and the beginning of its newness period.

We also disagree with the applicant's request that if CMS does not believe this extension is warranted under current policy, we should make changes to the new technology add-on payment policy to provide new technology add-on payment for three years for all technologies, similar to the hospital outpatient prospective payment system pass-through policy, to allow for as fulsome a data set as possible. When we had stated in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69241) that we did not believe that 2 years' worth of data would be insufficient to inform rate-setting for the inpatient setting, we also noted that, as described in the FY 2005 IPPS final rule (69 FR 49003), even if a technology does not receive new technology add-on payments, CMS continues to pay for new technologies through the regular payment mechanism established by the DRG payment methodology. In addition, the costs incurred by the hospital for a case are evaluated to determine whether the hospital is eligible for an additional payment as an outlier case. This additional payment is designed to protect the hospital from large financial losses due to unusually expensive cases. Any eligible outlier payment is added to the DRG-adjusted base payment rate (88 FR 58648). We further noted that whether a technology receives new technology add-on payments or not does not affect coverage of the technology or the ability for hospitals to provide a technology to patients where appropriate.

After consideration of the public comments we received, we are finalizing our proposal to discontinue new technology add-on payments for the technologies as listed in the proposed rule and in the following Table II.E.-02 of this final rule for FY 2025 because they are no longer ''new'' for purposes of new technology add-on payments. We note that Table II.E.-02 is the same as Table II.E.-02 that was presented in the proposed rule, but Table II.E.-02 in this final rule no longer lists the SAINT Neuromodulation System, as discussed previously. This Table II.E.-02 also presents the newness start date, new technology add-on payment start date, the 3-year anniversary date of the product's entry onto the U.S. market, and relevant final rule citations from prior fiscal years. We refer readers to the final rules cited in the following table for a complete discussion of each new technology add-on payment application and the coding and payment amount for these technologies, including the applicable indications and discussion of the newness start date.

BILLING CODE 4120–01–C

5. FY 2026 Applications for New Technology Add-On Payments (Traditional Pathway)

As discussed previously, in the FY 2023 IPPS/LTCH PPS final rule, we finalized our policy to publicly post online applications for new technology add-on payment beginning with FY 2024 applications (87 FR 48986 through 48990). As noted in the FY 2023 IPPS/LTCH PPS final rule, we are continuing to summarize each application in this final rule. However, while we are continuing to provide discussion of the concerns or issues we identified with respect to applications submitted under the traditional pathway, we are providing more succinct information as part of the summaries in the proposed and final rules regarding the applicant's assertions as to how the medical service or technology meets the newness, cost, and substantial clinical improvement criteria. We refer readers to *https://mearis.cms.gov/public/publications/ntap* for the publicly posted FY 2026 new technology add-on payment applications and supporting information (with the exception of certain cost and volume information, and information or materials identified by the applicant as confidential or copyrighted), including tables listing the ICD–10–CM codes, ICD–10–PCS codes, and/or MS–DRGs related to the analyses of the cost criterion for certain technologies for the FY 2026 new technology add-on payment applications.

We received 19 applications for new technology add-on payments for FY 2026 under the new technology add-on payment traditional pathway. In accordance with the regulations under § 412.87(f), applicants for FY 2026 new technology add-on payments must have received FDA marketing authorization by May 1 of the year prior to the beginning of the fiscal year for which the application is being considered. As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958) and the FY 2025 IPPS/LTCH PPS final rule (89 FR 69242 through 69245), we finalized that beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 and FY 2025 IPPS/LTCH PPS final rules (88 FR 58948 through 58958, 89 FR 69242 through 69245). Of the 19 applications received under the traditional pathway, 2 applicants were not eligible for consideration for new technology add-on payment because they did not meet these requirements, and 3 applicants withdrew their applications prior to the issuance of the proposed rule. Subsequently, prior to the issuance of this final rule, one additional application was withdrawn for DuraGraft® (Vascular Conduit Solution). We are not including in this final rule the description and discussion of applications that were withdrawn or that are ineligible for consideration for FY 2026. We are addressing the remaining 13 applications. We are not approving new technology add-on payments for 8 technologies: AUCATZYL® (obecabtagene autoleucel), COBENFY™ (xanomeline and trospium chloride), FIBRYGA® (fibrinogen (human)), IntelliSep® Test, Neuroguard IEP® 3-in-1 Carotid Stent and Post-Dilation Balloon System with Integrated Embolic Protection, RYSTIGGO® (rozanolixizumab-noli), SYMVESS™ (acellular tissue engineered vessel-tyod), and ZIIHERA® (zanidatamab-hrii) for the reasons discussed in the following sections. We are approving new technology add-on payments for FY 2026 for the remaining 5 technologies: AURLUMYN™ (iloprost injection), BREYANZI® (lisocabtagene maraleucel), GRAFAPEX™ (treosulfan), IMDELLTRA® (tarlatamab-dlle), and TECELRA® (afamitresgene autoleucel). A discussion of these applications is presented in the following sections.

a. AUCATZYL® (obecabtagene autoleucel)

Autolus Therapeutics, Inc. submitted an application for new technology add-on payments for AUCATZYL® for FY 2026. According to the applicant, AUCATZYL® is a fast off-rate cluster of differentiation 19 (CD19) autologous chimeric antigen receptor (CAR) T-cell therapy with tumor burden-guided dosing designed to improve persistence and reduce immune-mediated toxicity. Per the applicant, AUCATZYL® is indicated for the treatment of adults with relapsed or refractory (R/R) B-cell precursor acute lymphoblastic leukemia (B–ALL).

Please refer to the online application posting for AUCATZYL®, available at *https://mearis.cms.gov/public/publications/ntap/NTP241002GUJHV*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, AUCATZYL® was granted BLA approval from FDA on November 8, 2024, for the treatment of adults with R/R B–ALL. According to the applicant, AUCATZYL® was commercially available immediately after FDA approval. The applicant stated that a single treatment of AUCATZYL® consists of two intravenous infusions (given on Day 1 and Day 10 [±2]) administered via a syringe or gravity-assisted infusion through a central or peripheral venous line over a few minutes. Per the applicant, each infusion is packaged in three or more infusion bags containing a cell dispersion of the target tumor burden-guided dose of 410×10^6 CD19 CAR-positive viable T cells.[23]

The applicant stated that, effective October 1, 2024, the following ICD–10–PCS codes may be used to uniquely describe procedures involving the use of AUCATZYL®: XW0338A (Introduction of obecabtagene autoleucel into peripheral vein, percutaneous approach, new technology group 10) or XW0438A (Introduction of obecabtagene autoleucel into central vein, percutaneous approach, new technology group 10). The applicant stated that C91.00 (Acute lymphoblastic leukemia not having achieved remission), C91.01 (Acute lymphoblastic leukemia, in remission), or C91.02 (Acute lymphoblastic leukemia, in relapse) may

[22] As discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69149 through 69155), we determined that ELREXFIO™ (elranatamab-bcmm) and TALVEY™ (talquetamab-tgvs) were substantially similar to TECVAYLI® (teclistamab-cqyv), which was first approved for new technology add-on payment in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58885 through 58891). In accordance with our policy, because these technologies are substantially similar to each other, we use the earliest market availability date submitted as the beginning of the newness period for these technologies, November 9, 2022, the date TECVAYLI® became commercially available. As discussed previously in this section, for technologies that were first approved for new technology add-on payments prior to FY 2025, including for technologies we determine to be substantially similar to those technologies, we continue to use the midpoint of the upcoming fiscal year (April 1) when determining whether a technology would still be considered ''new'' for purposes of new technology add-on payments.

[23] The applicant stated that the first dose, infused on Day 1, is determined by the patient's bone marrow disease burden within 7 days prior to lymphodepletion, and the second dose, infused on Day 10 [±2], is tailored for a total dose of 410×10^6 CAR T cells to complete the single treatment of AUCATYZL®.

be used to currently identify the R/R B–ALL indication for AUCATZYL® under the ICD–10–CM coding system.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that AUCATZYL® is not substantially similar to other currently available technologies because it has a distinct immune-modulating mechanism of action and first-in-class tumor burden-guided dosing indicated for the treatment of adults with R/R B–ALL, and that therefore, the technology meets the newness criterion. More specifically, the applicant asserted that AUCATZYL® is the only CAR T-cell therapy constructed using the differentiated 4–1BB co-stimulatory domain with a novel, proprietary low affinity, fast off-rate CAT19 binding domain, and tumor burden-guided dosing. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for AUCATZYL® for the applicant's complete statements in support of its assertion that AUCATZYL® is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	AUCATZYL® is not substantially similar to currently available T-cell therapies indicated for the treatment of adult R/R B-ALL, specifically TECARTUS® (brexucabtagene autoleucel), the only currently available CD19 CAR T-cell therapy for this population. Specifically, AUCATZYL® is designed to model physiological T-cell activation, and its CAR is constructed using the differentiated 4-1BB co-stimulatory domain along with a proprietary and unique CAT19 binding domain, specifically designed to improve potency and persistence and to reduce immune-mediated toxicity. Shorter cell-cell contact resulting from the >40-fold lower affinity of CAT19 (off-rate of 3.7 minutes) compared with the FMC63 antigen-binding domain (off-rate of 2.8 hours) used in currently available CAR T-cell therapy, including TECARTUS®, serves to reduce cytokine release and toxicity, reduces CAR T-cell exhaustion and enhances CAR T-cell persistence. The 4-1BB co-stimulatory domain is also highly differentiated from the CD28 co-stimulatory domain used in TECARTUS®; the 4-1BB distinct signaling pathway results in lower T-cell activation, increased mitochondrial biogenesis, greater oxidative metabolism, and sustained CAR T-cell persistence. AUCATZYL® is also specifically designed to follow a manageable, personalized tumor burden-guided dosing schedule to proactively mitigate risk of cytokine release syndrome (CRS) and immune effector cell-associated neurotoxicity syndrome (ICANS), addressing the potential for toxicity in older patients and for consideration of patients with higher disease burden. The first-in-class tumor burden-guided dosing of AUCATZYL® tailors administration based on the individual patient's disease burden and corresponding immunotoxicity risk and supports maximal control for the treating physician, while minimizing immune-related toxicities and maximizing treatment effect.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	CMS has made the determination that ICD-10-PCS procedure codes identifying all CAR T-cell therapies will map to Pre-MDC MS-DRG 018 (Chimeric antigen receptor (CAR) T-cell and other immunotherapies), including previously approved TECARTUS® indicated for adult R/R B-ALL. Patient claims for adult R/R B-ALL patients where AUCATZYL® is administered will also be mapped to Pre-MDC MS-DRG 018 and will be identified by unique, AUCATZYL®-specific ICD-10-PCS codes which have been approved by CMS with an effective date of October 1, 2024.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	Inpatient cases involving adults with r/r B-ALL are identified by existing ICD-10-CM diagnosis codes C91.00 (Acute lymphoblastic leukemia not having achieved remission), C91.01 (Acute lymphoblastic leukemia, in remission), and C91.02 (Acute lymphoblastic leukemia, in relapse). These same ICD-10-CM diagnosis codes will identify adult R/R B-ALL patient types eligible for treatment with AUCATZYL®, where the inpatient claims will be identified by unique AUCATZYL® ICD-10-PCS codes, XW0338A or XW0438A, effective October 1, 2024. Importantly, the eligible patient population for treatment with AUCATZYL® is expected to be expanded because of the substantial clinical benefits of its highly differentiated immune-modulating mechanism of action and the first-in-class tumor burden-guided dosing, namely because of a significantly improved safety profile with very low rates of severe CRS and ICANS and high, sustained remissions following the single treatment of AUCATZYL®. The promise of these clinically meaningful results after treatment with AUCATZYL® are especially important for the older Medicare population, the Hispanic population that faces worse survival outcomes than patients of other ethnicities, and others with overall poor health and high disease burden; today, these populations are either considered ineligible for currently available therapies or are at elevated risk following treatment or consolidation with allogenic hemopoietic stem cell transplant (HSCT).

BILLING CODE 4120–01–C

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18092), we had the following concerns with regard to the newness criterion. We noted that the applicant asserted that AUCATZYL® does not use the same or

similar mechanism of action as existing technologies for R/R B–ALL in adults because AUCATZYL®'s co-stimulatory and binding domains differ from those of TECARTUS®, which the applicant stated is the only other currently available CD19-directed CAR T-cell immunotherapy for this population. However, we noted that in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41285 through 41291), with regard to the CAR T-cell therapies KYMRIAH® (tisagenlecleucel) and YESCARTA® (axicabtagene ciloleucel), we stated that although the two technologies were not completely the same in terms of manufacturing processes, co-stimulatory domains, and clinical profiles, these differences did not result in different mechanisms of action, and therefore, inferred that the technologies' mechanisms of action were the same. Similarly, we questioned whether differences in the co-stimulatory and binding domains for AUCATZYL® and TECARTUS® result in the use of a different mechanism of action. In addition, we noted that KYMRIAH® is also a CD19-directed CAR T-cell immunotherapy, and it is indicated for the treatment of patients up to 25 years of age with R/R B–ALL. We stated our belief that the mechanism of action for all three therapies is the binding to CD19 by a CAR construct, which results in T-cell activation and killing of malignant cells in the treatment of B–ALL. Furthermore, while the applicant also stated that AUCATZYL®'s personalized tumor burden-guided dosing schedule is first in class and differentiates it from other technologies' mechanisms of action, we stated we were unclear how a technology's dosing schedule is relevant to its mechanism of action. Accordingly, as it appeared that AUCATZYL®, TECARTUS®, and KYMRIAH® may use the same or similar mechanism of action to achieve a therapeutic outcome, are assigned to the same MS–DRG, and treat the same or similar patient population and disease, that is, adult patients with R/R B–ALL, we stated our belief that these technologies may be substantially similar to each other. We noted that, per our policy, if these technologies are substantially similar to each other, we use the earliest market availability date as the beginning of the newness period for the technologies. Therefore, if AUCATZYL® is substantially similar to TECARTUS® and KYMRIAH®, we stated our belief that the newness period for this technology would begin on November 22, 2017, the date KYMRIAH® became commercially available.[24] In addition, because the 3-year anniversary date of the KYMRIAH®'s entry onto the U.S. market (November 22, 2020) occurred in FY 2021, AUCATZYL® would no longer be considered new and would not be eligible for new technology add-on payments for FY 2026. We stated we were interested in information on how these technologies may differ from each other with respect to the substantial similarity criteria and newness criterion.

We invited public comments on whether AUCATZYL® meets the newness criterion, including whether AUCATZYL® is substantially similar to TECARTUS® and KYMRIAH® for purposes of new technology add-on payments.

Comment: Several commenters submitted comments in support of new technology add-on payments for AUCATZYL®. Some of the commenters disagreed with CMS's proposal to treat AUCATZYL® as substantially similar to other CD19-directed CAR T-cell therapies. A commenter argued that CMS's proposed approach does not take into consideration the specifics of the technological advancements that differentiate how mechanisms of action are achieved. Some commenters stated that when determining whether a CAR T-cell therapy sufficiently demonstrates substantial similarity compared to an existing technology, CMS should recognize innovations in the newer generation of therapies and how they differentiate these from previous CAR T-cell therapies. According to these commenters, those advancements should form the basis for differentiation as a distinct mechanism of action and without recognition of such advancements, continued innovation in the CAR T-cell therapy field may be discouraged and Medicare beneficiaries may be denied equitable access to such treatment advances. Some commenters argued that CMS should consider each CAR T-cell therapy application for new technology add-on payments on its own merits and not overly anchor to previous decisions to inform evaluation of the current fiscal year's applications. Per a commenter, it is especially important that CMS consider technological advancements when evaluating similarity of mechanisms of actions because they can translate directly into improved clinical outcomes.

Response: We thank the commenters for their comments. We note that we have stated in prior rulemaking (73 FR 48561 through 48563) that we first determine whether a new technology meets the newness criterion, and only if so, do we make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. Further, as we have discussed in prior final rules (69 FR 49018 through 49019, and 70 FR 47344), it is our past and present practice to analyze the new medical service or technology add-on payment criteria in the following sequence: Newness, cost threshold, and finally substantial clinical improvement.

Comment: The applicant and several commenters submitted public comments regarding the newness criterion for AUCATZYL®. The applicant reiterated that AUCATZYL® is a B-lymphocyte antigen CD19 CAR T-cell therapy designed to overcome the immune-related limitations in clinical activity and safety compared to current CD19 CAR T-cell therapies, with a fast target binding off-rate to minimize excessive activation of the programmed T cells, which reduces immune-mediated toxicity and is less prone to T-cell exhaustion, and that decreased T-cell exhaustion has been shown to enhance persistence. The applicant reiterated that based on the overall results from the pivotal phase 1b/2 FELIX study (N=127), the largest and most diverse patient population CAR T-cell study for adults with R/R B–ALL, a single treatment of AUCATZYL® reduces immune-mediated toxicity and results in reduced T cell exhaustion and improved persistence, leading to high levels of durable remissions.

The applicant stated that AUCATZYL® is not the same or substantially similar to TECARTUS®, the only other currently available CD19 CAR T-cell therapy approved for adult R/R B–ALL. The applicant reiterated that AUCATZYL® has a significantly distinct immune-modulating mechanism of action designed to model physiologic T-cell activation, and that it is constructed using the differentiated 4–1BB co-stimulatory domain with a novel, proprietary low affinity, fast off-rate anti-CD 19 (CAT) hybridoma-derived anti-CD19 scFv (CAT19 binding domain) designed to improve potency and persistence and to reduce immune-mediated toxicity, including CRS and ICANS. The applicant provided an illustration of various components of AUCATZYL®, which facilitate its immune-modulating mechanism of

[24] TECARTUS® received FDA approval on October 1, 2021, for treatment of adult patients with R/R B–ALL. *https://www.fda.gov/drugs/resources-information-approved-drugs/fda-approves-brexucabtagene-autoleucel-relapsed-or-refractory-b-cell-precursor-acute-lymphoblastic.*

action. These components included the CAT19 fast off-rate binder, the CD8-derived hinge region/transmembrane domain, the 4–1BB co-stimulatory domain, shown to enhance CAR T-cell expansion and reduce exhaustion compared with CD28 CARs in preclinical studies, and the CD3-zeta activation domain. The applicant reiterated that shorter cell-cell contact resulting from the greater than 40-fold lower affinity of CAT19 (off-rate of 3.7 minutes) compared with the FMC63 antigen-binding domain used in other currently available CAR T-cell therapy, including TECARTUS®, reduces cytokine release and toxicity and CAR T-cell exhaustion, and enhances CAR T-cell persistence. The applicant also reiterated that the 4–1BB co-stimulatory domain is also highly differentiated from the CD28 co-stimulatory domain used in TECARTUS®; the 4–1BB distinct signaling pathway results in lower T-Cell activation, increased mitochrondrial biogenesis, greater oxidative metabolism, and sustained CAR T-Cell persistence.

The applicant stated although it agreed that both AUCATZYL® and TECARTUS® target and kill CD19-expressing cancer cells, AUCATZYL® has a differentiated mechanism of action in how it binds CD19, with the key difference residing in the components of the respective CAR constructs. The applicant described differences in the CAR single chain variable fragments (scFv) for each technology and how they were derived, as well as the differing co-stimulatory domains, reiterating that the resulting shorter target interaction with targeT-Cells for AUCATZYL® due to its lower affinity for CD19 mimics physiologic T-cell activation, and the 4–1BB co-stimulatory domain is generally associated with longer persistence. The applicant stated that the use of these different features in AUCATZYL® leads to a unique mechanism of action characterized by differentiated binding kinetics, engraftment, persistence and immune-elicited responses. Regarding differentiated binding kinetics, the applicant stated that the CD19 (CAT) CAR binds CD19 with an above 40-fold lower affinity, resulting in faster disengagement, and >40 shorter half-life compared to the CD19 (FMC63) CAR used in currently marketed CAR–Ts, including TECARTUS® (CAT 3.73 min vs FMC63 2.8 hours). Per the applicant, both antibodies bind to an overlapping epitope of CD19 consisting of residues within loops 1 and 2 of the CD19 ectodomain and provided a chart that shows the results of the Ghorashian (2019) study. The applicant stated that, in particular, in *in vitro* studies, AUCATZYL® showed a higher equilibrium dissociation constant with CAT scFv (14 nM) as a result of a much faster off-rate (CAT: 3.1×10^{-3} s^{-1} vs FMC63: 6.8×10^{-5} s^{-1}), whereas the on-rate was equivalent compared to FMC63 scFv (CAT: 2.2×10^{5} $M^{-1}s^{-1}$ vs FMC63: 2.1×10^{5} $M^{-1}s^{-1}$). According to the applicant, the fast off-rate and subsequent shorter cell-cell contact is advantageous by reducing cytokine release and thereby reducing toxicity, as well as reducing T-cell exhaustion, which enhances CAR T-cell persistence. The applicant stated that these features are designed to address major limitations of CAR T-cell therapy in B–ALL, namely, toxicity and lack of durable responses.

Regarding engraftment and persistence, the applicant stated that owing to the differentiated binding kinetics of AUCATZYL®, differenT-Cell kinetics at initial expansion and persistence compared to TECARTUS® are observed. According to the applicant, the pharmacokinetics for each patient in the Infused Set of Cohort IIA (N=94) of the FELIX study were assessed between Day 1 and Day 28, and AUCATZYL® demonstrated a rapid and high level of expansion of the cells following infusion. The overall geometric mean of C_{max} was 114,982 copies/µg/deoxyribonucleic acid (DNA) (range 129–600,000 copies/µg DNA) with a median time to maximum (or peak) concentration (T_{max}) of 14 days (range 2–55 days) and a geometric mean AUC0–28d of 1,138,188 copies/µg DNA (range 179,000–7,230,000 copies/µg DNA * day). The applicant stated that expansion, measured by droplet digital PCR (ddPCR), was high regardless of whether patients achieved complete remission/complete remission with incomplete count recovery (CR/CRi) or not. Per the applicant, no biologically significant differences were seen in the geometric mean or median, interquartile range of C_{max}. Per the applicant, in CR/CRi patients, approximately 68.4 percent (54.6 percent–78.7 percent 95 percent confidence interval [CI]) demonstrated persistence at 6 months with a maximum duration of 21 months. The applicant added that 75 percent (27/36) of the patients who had ongoing remission as of the data cut-off date had ongoing CAR T persistence at the last laboratory assessment as of the data cut-off date. According to the applicant, in comparison to other FMC63-based CARs approved for ALL, such as TECARTUS®, the median C_{max} was 38.35 cells/uL (range: 1.31–1533.4) and median $AUC_{0–28}$ was 424.03 cells/uL × day (range: 14.12–19390.42) in responding patients treated with TECARTUS® (ZUMA–3 trial) compared to 0.49 cells/uL (range 0.0–183.50) and 4.12 cells/uL × day (range 0.0–642.25) for C_{max} and AUC0–28d respectively for non-responders. The applicant added that no CAR persistence was seen for TECARTUS® in the ZUMA–3 trial beyond 3 months by flow cytometry and 6 months by ddPCR.

Per the applicant, not only was CAR–T expansion generally lower for TECARTUS® than that seen for AUCATZYL®, an even lower expansion was observed in patients who did not respond compared to patients who responded, and CAR–T expansion of AUCATZYL® demonstrated a less than 3-fold increase in patients in CR/CRi vs patients not in CR/CRi. According to the applicant, this is strikingly different from TECARTUS® where ~80-fold increase in CAR–T expansion is seen in CR/CRi vs patients not in CR/CRi and where there is minimal CAR–T expansion in patients not in CR/CRi (0.49 cell/uL). The applicant referred to the chart that shows the comparative results of the Ghorashian (2019) study.

The applicant further stated that the immune-elicited responses for AUCATZYL® are not similar to TECARTUS®. Per the applicant, at an early stage of AUCATZYL® development, it was hypothesized that the scFv of obe-cel's CAT CAR with a greatly reduced affinity for CD19 would improve the post-infusion immune-mediated cytokine release kinetics and toxicity profile common to currently marketed CAR Ts using the FMC63 CAR construct. The applicant stated that the novel 2-step fractionated tumor burden-guided dosing regimen further enhances the ability to reduce immunotoxicity, which has been linked to both disease burden and expansion of CAR T-cells. The applicant stated that supportive data from a number of different CD19 CAR T-cell trials in acute lymphoblastic leukemia indicated that higher disease burden is predictive of more severe CRS. The applicant further stated this led some groups to mitigate this toxicity by either administering a lower dose of CAR T-cells to patients with higher disease burden or splitting the total dose. Furthermore, the applicant stated that tumor burden-guided dosing provides an opportunity to tailor AUCATZYL® doses based on the patient-specific tumor burden, which may reduce the extent and rate of expansion, and thereby affect the severity of CRS. The applicant stated that spacing between the dose fractions takes into consideration the duration of IL–15 surge following lymphodepletion

(LD), which is important for CAR T-cell expansion and function as well as timing of early signals of subsequent severe toxicity. The applicant also stated that tumor burden-guided dose is also unlikely to increase the risk of immune-mediated reactions to the murine sequence present in the CD19 antigen-binding domain of AUCATZYL®. The applicant stated thaT-Cellular immune response at the time of the second dose, on Day 10, will be significantly reduced by the LD chemotherapy administered before AUCATZYL® infusion. The applicant added that the humoral immune response, which takes approximately 14 days to be generated, will be impaired by the B cell aplasia and subsequent hypogammaglobulinaemia induced by the CD19 CAR T-cells administered on Day 1. The applicant also stated that a range of serum biomarkers were evaluated in the FELIX study, and per the applicant, in accordance with AUCATZYL®'s distinct immune-modulating mechanism of action, the profiles observed for induced inflammatory soluble serum biomarkers were overall consistently and considerably lower than those reported for TECARTUS® in the ZUMA–3 trial. The applicant illustrated this finding with a table that compares selected peak inflammatory soluble serum biomarkers between the FELIX and ZUMA–3 trials.

Per the applicant, the efficacy of CAR–T-cell therapy with impressive response rates in hematologic malignancies must be weighed with immune-mediated toxicities, notably CRS, a toxicity requiring urgent diagnostic and therapeutic interventions, and targeted modulation of key cytokine pathways represents the mainstay of CRS management. The applicant stated that the expected risk of developing CRS grade 3 after AUCATZYL® treatment was reduced relative to TECARTUS® (2.4 percent vs 25 percent). Per the applicant, the observed magnitude of difference in grade 3 CRS substantiates the distinct functional and biological properties of AUCATZYL®. The applicant acknowledged the limitations of unadjusted comparisons between single-arm trials and conducted a prospectively designed matching-adjusted indirect comparison (MAIC) of AUCATZYL® and TECARTUS® which, per the applicant, demonstrated that patients treated with TECARTUS® are significantly more likely to experience a grade 3 CRS event or immune-mediated neurotoxicity relative to patients treated with AUCATZYL®.

The applicant concluded that AUCATZYL®'s immune-modulating mechanism of action is not the same or substantially similar to TECARTUS® because the novel CD19 (CAT) CAR in AUCATZYL® exhibits distinct functional and biological characteristics, notably lower affinity binding kinetics, prolonged persistence, and a differentiated immune-modulating mechanism of action that leads to a marked decrease in the release of inflammatory cytokines and a decrease in the incidence of grade 3 CRS and immune-mediated neurotoxicity.

According to the applicant and several commenters, KYMRIAH® is not a relevant comparator for treatment of the Medicare population, as it is only approved for treatment of patients aged 25 or younger with R/R B–ALL. The applicant stated that in the pivotal AUCATZYL® Phase 2 Cohort IIA FELIX study population (n=94, infused), the median age was 50 years (range 20–81), with 88.3 percent over the age of 25. The applicant, as well as several commenters, also stated that while KYMRIAH® also uses the 4–1BB co-stimulatory domain, its scFv is FMC63-derived and therefore differences in binding kinetics described previously for TECARTUS® apply to KYMRIAH® as well. The applicant stated that therefore, AUCATZYL® is non-similar to KYMRIAH® in its mechanism of action and its intended population. In addition, the applicant stated that AUCATZYL® has a fundamentally different mechanism of action as a CAR T-cell therapy compared to immunotherapy, BLINCYTO® and BESPONSA®. The applicant stated that BLINCYTO® is a bispecific T-cell engager molecule derived from two distinct monoclonal antibodies that bind CD19 and CD3, while BESPONSA® is an antibody-drug conjugate (ADC) composed of a CD22-directed monoclonal IgG4 antibody linked to a cytotoxic agent. The applicant also explained that while immunotherapy is recommended as first-line treatment and considered superior to standard chemotherapy, CAR T-cell therapy is recommended following immunotherapy. The applicant stated that therefore, the focus of the substantial similarity test for AUCATZYL® should be TECARTUS®.

Response: We appreciate the additional information from the applicant and commenters with respect to whether AUCATZYL® is substantially similar to existing technologies. We agree that AUCATZYL® has a different mechanism of action as a CD19-directed CAR T-cell therapy compared to BLINCYTO® and BESPONSA®, which are bispecific T-cell engager molecule and antibody-drug conjugates. We also agree with the applicant that because KYMRIAH® is only approved for treatment of patients aged 25 or younger, representing a very small fraction of adults compared to AUCATZYL®, it therefore treats a different population and is not substantially similar. However, we disagree with the applicant and commenters that AUCATZYL® has a unique mechanism of action because we do not believe there is a clear differentiation between the mechanism of action of AUCATZYL® and that of TECARTUS®. While the applicant highlights differences such as the binding domain, costimulatory/activation domains, binding kinetics, and dosing regimen, we do not believe these meaningfully differentiate the mechanism of action of AUCATZYL® from other CD19-directed CAR T-cell therapies, which are all genetically modified autologous T-cell immunotherapies that bind to CD–19 expressing cancer cells. We refer the reader to the FY 2019 and FY 2022 IPPS/LTCH PPS final rules (83 FR 41287 through 41291, and 86 FR 44999 through 45000) for further discussion of this issue, where we determined that the mechanisms of action for CAR T-cell therapies were not new based on similar factors. While the applicant stated that AUCATZYL® uses a fast-on-fast-off mechanism, we disagree that a shorter length of binding time for AUCATZYL® represents a different mechanism of action than the other CAR T-cell therapies. We also disagree that any association between AUCATZYL®'s binding and the rates of CRS and ICANS would represent the technology's mechanism of action, nor would CAR T-cell persistence and how it affects durability of response, as any differences between AUCATZYL® and existing technologies in observed outcomes would relate to an assessment of substantial clinical improvement rather than the newness criterion.

Therefore, after consideration of the comments we received on AUCATZYL®'s newness, we believe that AUCATZYL® and TECARTUS® use the same mechanism of action to achieve a therapeutic outcome: the binding to CD19 by a CAR construct, which results in T-cell activation and killing of malignant cells in the treatment of B–ALL, and are assigned to the same MS–DRG. We also agree with the applicant that AUCATZYL® treats the same or similar patient population and disease as TECARTUS®, which is used in treatment for adult patients with R/R B–ALL.

Because AUCATZYL® meets all three of the substantial similarity criteria, we

believe AUCATZYL® is substantially similar to TECARTUS®. In accordance with our policy, because these technologies are substantially similar to each other, we use the earliest market availability date as the beginning of the newness period for AUCATZYL®. Therefore, we consider the newness period for AUCATZYL® to begin on October 1, 2021, the date TECARTUS® became commercially available. Since the 3-year anniversary date of TECARTUS®'s entry onto the market occurred prior to FY 2026, AUCATZYL® does not meet the newness criterion and is not eligible for new technology add-on payments for FY 2026. We note that we received public comments with regard to the cost and substantial clinical improvement criteria for this technology, but because we have determined that the technology does not meet the newness criterion and therefore is not eligible for approval for new technology add-on payments for FY 2026, we are not summarizing comments received or making a determination on those criteria in this final rule.

b. AURLUMYN™ (iloprost injection)

SERB Pharmaceuticals submitted an application for new technology add-on payments for AURLUMYN™ for FY 2026. According to the applicant, AURLUMYN™ is an intravenous form of iloprost associated with immediate generalized vasodilation, immunomodulation, and anti-inflammation indicated for the treatment of severe frostbite in adults to reduce the risk of digit amputations.

Please refer to the online application posting for AURLUMYN™, available at *https://mearis.cms.gov/public/publications/ntap/NTP241007QK29V*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, FDA granted NDA approval for AURLUMYN™ on February 13, 2024, for the treatment of severe frostbite in adults to reduce the risk of digit amputations. Per the applicant, the commercial launch of AURLUMYN™ was delayed until the NDA sponsor could secure a capable commercial partner. Per the applicant, it acquired AURLUMYN™ globally on October 18, 2024, and prepared for launch aligned with the beginning of the winter season. The applicant stated that the technology became available for sale on November 12, 2024. In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18096), we stated we were interested in additional information regarding the cause of any delay in the technology's commercial availability, including additional details about the preparation for launch that aligned with the beginning of the winter season.

According to the applicant, AURLUMYN™ is administered as a continuous intravenous (IV) infusion over 6 hours per day, increased in increments up to a maximum dose of 2 ng/kg/minute, for up to a maximum of 8 consecutive days. The applicant expected that AURLUMYN™ will be dosed in the inpatient setting for 8 consecutive days using a total of eight single-use vials (one per day).

The applicant submitted a request for unique ICD–10–PCS procedure codes for AURLUMYN™ beginning in FY 2026 and was granted approval for the following procedure codes effective October 1, 2025: XW033QB (Introduction of iloprost into peripheral vein, percutaneous approach, new technology group 11) and XW043QB (Introduction of iloprost into central vein, percutaneous approach, new technology group 11). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for AURLUMYN™ under the ICD–10–CM coding system. Please refer to the online application posting for the complete list of ICD–10–CM codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that AURLUMYN™ is not substantially similar to other currently available technologies because it is the first-ever FDA-approved treatment for frostbite of any grade and is specifically indicated for the treatment of severe frostbite in adults to reduce the risk of finger or toe amputation, and therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for AURLUMYN™ for the applicant's complete statements in support of its assertion that AURLUMYN™ is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	AURLUMYN™ is the only IV form of iloprost available in the U.S. AURLUMYN™ is a stable synthetic analog of prostaglandin I2 (PGI2) and is a potent prostacyclin receptor agonist. Upon binding to the prostacyclin receptor, prostacyclin inhibits platelet activation and acts as a vasodilator. AURLUMYN™ is associated with immediate generalized vasodilation, immunodulation, and anti-inflammation. AURLUMYN™ has been associated with reductions in neutrophil adhesion and chemotaxis as well as downregulation of intracellular expression of IL-6 and TNF alpha in human monocytes. In addition, AURLUMYN™ has been shown to enhance fibrinolysis, increase red cell deformability, and reduce white cell adhesion to endothelial cells. AURLUMYN™ has also demonstrated activity with respect to increasing cAMP levels in human platelets via stimulation of adenylate cyclase, with resultant inhibition of platelet aggregation. AURLUMYN™ inhibits arachidonic acid-induced vasoconstriction, which may be explained by its ability to counteract thromboxane. As a result of these properties, AURLUMYN™ may mitigate vasoconstriction and microthrombosis to limit frostbite injury. Previously, access to medical frostbite treatment in the U.S. has been limited to agents not specifically studied or approved for frostbite. AURLUMYN™ is not substantially similar to those agents used in case study and anecdotal reports, including nonsteroidal anti-inflammatory drugs, heparin, antibiotics, dextran, tetanus toxoid, immune globulin, antiplatelet agents, and anticoagulant therapy. AURLUMYMN™ is also significantly differentiated from VENTAVIS® (iloprost) inhalation solution approved in 2004, and since discontinued, for the chronic treatment of pulmonary arterial hypertension and intended to be chronically administered.
Is the technology assigned to the same MS-DRG as existing technologies?	No	The 2023 MedPAR file contains no patient cases assigned to any MS-DRG representing frostbite cases treated with an FDA-approved therapy for severe frostbite. AURLUMYN™ is the first-ever FDA-approved treatment for frostbite of any grade. It is expected AURLUMYN™ administration cases will map to MS-DRGs based on the MS-DRG assignment logic for the case-specific diagnosis or procedural codes.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	AURLUMYN™ is the first-ever FDA-approved treatment for frostbite of any grade and is specifically approved for the treatment of severe frostbite in adults to reduce the risk of finger or toe amputation.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18097), we noted that the applicant asserted that AURLUMYN™ is not assigned to the same MS–DRG as existing technologies. However, as the applicant also stated that AURLUMYN™ will map to MS–DRGs based on diagnosis/procedure codes, we stated our belief that the use of AURLUMYN™ will not change the MS–DRG assignment and will, therefore, map to the same MS–DRGs as other treatments for severe frostbite. In addition, while the applicant asserted that AURLUMYN™ does not treat the same or similar type of disease and the same or similar patient population as existing treatments because it is the first-ever FDA-approved treatment for frostbite, we noted that there are other severe frostbite treatments that are commonly used including rapid rewarming, fasciotomy, thrombolysis, and sympathectomy.

We invited public comments on whether AURLUMYN™ is substantially similar to existing technologies and whether AURLUMYN™ meets the newness criterion.

Comment: A few commenters, including the applicant, stated that AURLUMYN™ meets the newness criterion because it is the only FDA-approved treatment for severe frostbite and the only available intravenous formulation of iloprost, which enhances blood flow and accelerates the healing

process through preserving tissue integrity and minimizing complications.

Response: We thank the applicant and other commenters for their input and have taken it into consideration in determining whether AURLUMYN™ meets the newness criterion, as discussed later in this section.

Comment: The applicant reiterated that AURLUMYN™ does not use the same or substantially similar mechanisms of action as any technology or drug therapy assigned to any MS–DRG in the 2023 MedPAR data, nor of any drug currently marketed in the U.S. The applicant further stated that AURLUMYN™ is a stable synthetic analog of PGI2 and is a potent prostacyclin receptor agonist as well as the only intravenous form of iloprost available in the U.S. In response to CMS's note that use of AURLUMYN™ will not change the MS–DRG assignment and will map to the same MS–DRGs as other treatments for severe frostbite, the applicant agreed that patient cases with severe frostbite where AURLUMYN™ is administered will map to the same MS–DRGs as other frostbite cases where AURLUMYN™ is not part of the frostbite treatment regimen, but noted that there are no claims for medical therapies or procedures in the 2023 MedPAR data with the same or similar mechanism of action as AURLUMYN™. Lastly, the applicant reiterated that patient cases where AURLUMYN™ is administered will be uniquely identified by two ICD–10–PCS codes specific to AURLUMYN™.

In response to CMS's note that there are other commonly used severe frostbite treatments, the applicant stated that prior to AURLUMYN™'s availability, frostbite treatment in the U.S. was limited to off-label use of tissue plasminogen activator (tPA) within 24 hours of injury. The applicant further stated that AURLUMYN™ extends the treatment window beyond the <24 hours recommended for off-label use of tPA, and AURLUMYN will be available to more patients with severe frostbite who, without access to AURLUMYN, would be contraindicated for the use of tPA with its associated significant bleeding risks and contraindications in trauma, recent surgery, recent stroke, and many other conditions that might pose a bleeding risk. Furthermore, the applicant stated that other non-pharmacologic post-thaw medical therapy options, such as hydrotherapy, hyperbaric oxygen therapy, sympathectomy, and fasciotomy, are part of multimodal frostbite treatment regimens; however, none of these non-pharmacologic treatments replace AURLUMYN™ or are used at the exclusion of AURLUMYN™.

In addition, a few commenters stated that AURLUMYN™ meets an unmet need for targeted, early intervention for patients with severe frostbite and represents a major advancement by uniquely promoting vasodilation and improving microcirculatory flow, thereby addressing the underlying pathophysiology of frostbite in a way that no other medication currently does.

In response to CMS's request for additional information about the delay in AURLUMYN™'s commercial availability, the applicant commented that, while AURLUMYN™ received FDA approval on February 13, 2024, the BLA sponsor, EICOS, delayed market availability because it lacked the necessary commercial infrastructure and needed to search for a capable commercial partner, and that the newness period should begin on November 1, 2024. The applicant stated that it acquired AURLUMYN™ on October 18, 2024, and immediately initiated production, resulting in AURLUMYN™ becoming available for order and shipment on November 1, 2024. The applicant stated that CMS should use November 1, 2024, as the market availability date for the newness period, and therefore, allow AURLUMYN™ to receive new technology add-on payments for a full 3 years instead of a 2-year period if the FDA approval date of February 13, 2024 is used.

Response: We thank the applicant and other commenters for their comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for AURLUMYN™, we agree with the applicant that AURLUMYN™ is the first synthetic analog of PGI2 that binds to prostacyclin receptors leading to vasodilation and inhibition of platelet activation approved by FDA to treat severe frostbite, and therefore uses a unique mechanism of action. Therefore, we agree with the applicant that AURLUMYN™ is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on November 1, 2024, the date on which AURLUMYN™ became commercially available.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that AURLUMYN™ meets the cost criterion. Each analysis followed the order of operations summarized in the following table.

AURLUMYN™ COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for AURLUMYN™.
Claims identified	Scenario 1: 103 claims mapping to nine MS-DRGs, with none of the MS-DRGs exceeding 13.59% of the total identified cases. Scenario 2: 159 claims mapping to 11 MS-DRGs, with 22.64% of claims mapping to MS-DRG 923 (Other Injury, Poisoning and Toxic Effect Diagnoses without CC).
Charges removed for prior technology	The applicant stated that no charges were removed for a prior technology as a result of using AURLUMYN™, and that there were no indirect charges related to a prior technology to be removed.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
Inflation factor	The applicant applied an inflation factor of 8.4% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	For both scenarios 1 and 2, the applicant added charges for the new technology by dividing the average cost of the new technology per inpatient stay by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Scenario 1: - Average case-weighted threshold amount: $87,166 - Final inflated average case-weighted standardized charge per case: $353,509 Scenario 2: - Average case-weighted threshold amount: $73,762 - Final inflated average case-weighted standardized charge per case: $328,186

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both scenarios, the applicant asserted that AURLUMYN™ meets the cost criterion.

We invited public comments on whether AURLUMYN™ meets the cost criterion.

Comment: Multiple commenters, inclusive of the applicant, stated that AURLUMYN™ meets the cost criterion. A few commenters also asserted that the current DRG payments for an inpatient hospitalization for severe frostbite are inadequate to account for the total cost of care and suggested that, without approval of new technology add-on payments, hospitals may not be able to use AURLUMYN™ for the treatment of frostbite in Medicare patients.

Response: We thank the applicant and other commenters for their comments. Based on the information submitted by the applicant as part of its FY 2026 new technology add-on payment application, as previously summarized, the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under both scenarios. Therefore, we agree that AURLUMYN™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that AURLUMYN™ represents a substantial clinical improvement over existing technologies because AURLUMYN™ substantially lowers the risk of digit amputation in severe frostbite cases. Additionally, the applicant claimed that, by reducing the risk of finger and toe amputations in adults with severe frostbite, AURLUMYN™ mitigates debilitating, lifelong health-related, functional, and work-related impacts associated with digit amputation. The applicant provided four documents, including two studies and clinical practice guidelines to support these claims, as well as two background articles about a classification system for frostbite severity and the prevention and clinical treatment of frostbite.[25] The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for AURLUMYN™ for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

[25] Background articles are not included in the following table but can be accessed via the online posting for the technology.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
AURLUMYN™ is the first-ever medical treatment for frostbite approved by the FDA and is specifically approved for treatment of severe frostbite to reduce the risk of digit amputations.	Cauchy E, et al. A controlled trial of a prostacyclin and rt-PA in the treatment of severe frostbite. N Engl J Med 2011;364, 189-190 Crooks S, et al. Effectiveness of intravenous prostaglandin to reduce digital amputations from frostbite: an observational study. Canadian Journal of Emergency Medicine 2022;24, 622-629. McIntosh SE, et al. Wilderness Medical Society Clinical Practice Guidelines for the Prevention and Treatment of Frostbite. 2019 Update. Wilderness & Environmental Medicine 2019;30, S19-S32. McIntosh SE, et al. Wilderness Medical Society Clinical Practice Guidelines for the Prevention and Treatment of Frostbite: 2024 Update. Wilderness & Environmental Medicine 2024;35(2) 183-197. The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
AURLUMYN™ reduces the risk of amputation of fingers and toes in adults with severe frostbite, mitigating debilitating, lifelong health-related, functional and work-related impacts of digit amputation.	Cauchy, 2011, *op. cit.* Crooks, 2022, *op. cit.* McIntosh, 2019, *op. cit.* McIntosh, 2024, *op. cit.*

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18098 through 18099), after review of the information provided by the applicant, we stated we had the following concerns regarding whether AURLUMYN™ meets the substantial clinical improvement criterion. With respect to the claim that AURLUMYN™ offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments, we noted that the applicant stated that AURLUMYN™ is the first-ever FDA-approved medical treatment for severe frostbite to reduce the risk of digit amputations, but did not identify a patient group that is unresponsive to, or ineligible for, the standard-of-care treatment, where AURLUMYN™ does offer a treatment option.

We stated that the applicant provided two published studies that used AURLUMYN™ to support this claim (Cauchy et al., 2011; Crooks et al., 2022). Cauchy et al. (2011), which was published as a letter to the editor, is a single site, open-label trial which randomized 47 healthy patients (aged 18 to 55 years) with severe frostbite after mountain rescue in France to receive either buflomedil, AURLUMYN™, or AURLUMYN™ plus recombinant tPA (rtPA), and assessed treatment efficacy based on bone scan scintigraphy to determine risk of amputation. The second study (Crooks et al., 2022) was a retrospective cohort study consisting of a medical records review in Calgary, Canada, a large city inclusive of an unhoused population. The study excluded patients due to superficial or grade 1 frostbite, resulting in 90 patients with an interquartile age range of 31 to 53 years old. For frostbite treatment, these patients received either AURLUMYN™ or the standard of care, which consisted of the local best practice without AURLUMYN™. We noted that while these two studies compared treatment of patients with severe frostbite using AURLUMYN™ to other treatments, neither study described a patient group that is unresponsive to, or ineligible for, existing treatment options where AURLUMYN™ offers treatment. We further noted that while the applicant also cited the Wilderness Medical Society Practice Guidelines (McIntosh et al., 2024) which included a strong recommendation for iloprost as the first-line treatment for severe (grades 3 and 4) frostbite less than 48 hours after thawing, and possibly for up to 72 hours post-thawing,[26] the full statement in the Guidelines is that intravenous iloprost should be considered first-line therapy for grade 3 and 4 frostbite <72 hours after injury, when tPA is contraindicated, and in austere environments where tPA infusion is considered risky or evacuation to a treatment facility will be delayed. Additionally, the guidelines include other recommendations for treatments such as sympathectomy, fasciotomy, and hydrotherapy. Therefore, we stated it appeared that there are other treatment options for frostbite other than AURLUMYN™. We stated that we would appreciate any additional information regarding which patient population AURLUMYN™ can treat for severe frostbite, for which other existing treatments could not be used.

With respect to the claim that AURLUMYN™ significantly improves clinical outcomes relative to services or technologies previously available, the

[26] McIntosh, S.E., Freer, L., Grissom, C.K., Rodway, G.W., Giesbrecht, G.G., McDevitt, M., Imray, C.H., Johnson, E.L., Pandey, P., Dow, J., & Hackett, P.H. (2024). Wilderness Medical Society Clinical Practice Guidelines for the Prevention and Treatment of Frostbite: 2024 Update. Wilderness & Environmental Medicine, 35(2). *https://doi.org/10.1177/10806032231222359.*

applicant stated that AURLUMYN™ reduces the risk of amputation of fingers and toes in adults with severe frostbite, mitigating debilitating, lifelong health-related, functional, and work-related impacts of digit amputation. To support this claim, the applicant provided the two published studies and Wilderness Medical Society Practice Guidelines previously discussed (Cauchy et al., 2011; Crooks et al., 2022; McIntosh et al., 2024). The Cauchy et al. (2011) study found that the 16 patients treated with AURLUMYN™ without rtPA resulted in no amputations, whereas the risk of amputation was greater in patients treated with buflomedil (60 percent, 9 of 15 patients) and patients treated with AURLUMYN™ plus rtPA (19 percent, 3 of 16 patients). The Crooks et al. (2022) study found that 18 percent of grade 3 frostbite injuries and 46 percent of grade 4 frostbite injuries treated with AURLUMYN™ resulted in digital amputation, compared to the standard of care groups where 44 percent of grade 3 frostbite injuries and 95 percent of grade 4 frostbite injuries resulted in amputations. However, we questioned whether the composition of the AURLUMYN™ and standard of care treatment groups in these two published studies were sufficiently comparable and, consequently, whether the outcomes demonstrated were clinically significant. Specifically, we questioned the accuracy of severity grading determinations and the resulting randomization process used to group patients in both studies due to the subjective nature of grading frostbite injuries that can evolve over time, and being that the grading of frostbite injuries in Crooks et al. (2022) was conducted using photographs and clinician health descriptions in the local electronic health record. We also noted that, in Crooks et al. (2022), no patients in the control group were treated with tPA, despite tPA and heparin being available for severe injuries during the period of treatment with standard frostbite care. The absence of tPA in the control group raised questions about the adequacy of the comparator, given that the Wilderness Medical Society Practice Guidelines recommend tPA for select severe frostbite cases where timely administration is feasible. We also questioned the extent to which the quality of frostbite care in the control group may have varied, prior to the implementation of the protocol that implemented 5-day iloprost infusion. In addition, while the utility of recommendations in establishing evidence of clinically improved outcomes is limited, we further noted that neither study provided direct comparison with therapies that are also strongly recommended by the Wilderness Medical Society, such as fasciotomy and hydrotherapy, or with other therapies that may have limited data availability, such as sympathectomy and hyperbaric oxygen therapy.

We also stated concerns about the generalizability of the Cauchy et al. (2011) and Crooks et al. (2022) studies to the Medicare population. We noted that Cauchy et al. (2011) studied AURLUMYN™ treatment in patients in France, whose mean age was 33.1 years and who had no notable medical or surgical history. As noted in the Crooks et al. (2022) study, which studied patients from a large Canadian city with a substantial unhoused population, the effects may not be as dramatic as results in other studies, owing to the differences in medical and social comorbidities in the study population. Similarly, the Medicare population may have significant differences from the Cauchy et al. (2011) study population, in physical and mental health and social complexities. We also questioned whether efficacy data from Cauchy et al. (2011) is generalizable to the Medicare population due to the study's location, small patient population, and patients' age. We noted that these two published studies assessing AURLUMYN™ were both conducted outside of the U.S and primarily included patients under the age of 55 years (range: 18 to 55 and 29 to 54 years, respectively). As noted in the AURLUMYN™ prescribing information, clinical studies included insufficient numbers of patients aged 65 years and older to determine whether they respond differently than younger subjects.[27]

We invited public comments on whether AURLUMYN™ meets the substantial clinical improvement criterion.

Comment: We received several comments in support of AURLUMYN™'s new technology add-on payment application. These commenters stated that denying AURLUMYN™'s application would leave a large gap in frostbite treatment and would be a grave disservice to the most vulnerable patients, as AURLUMYN™ offers a critical opportunity to change the trajectory of their lives. A few commenters specifically stated that AURLUMYN™ meets the substantial clinical improvement criterion because it has demonstrated a reduced risk of amputation, a clear improvement in patient quality of life, and a reduction in long-term costs associated with disability, rehabilitation, prosthetic use, and readmission. A commenter also stated that the inclusion of AURLUMYN™ into a multimodal treatment regimen has the potential to improve patient flow within healthcare systems, streamline the care of frostbite patients, decrease the burden on Q1 providers, facilitate more effective use of resources, and enhance continuity of care during critical treatment windows.

Several commenters, including the applicant, expressed general support for approval of AURLUMYN™'s new technology add-on payment application.

Response: We thank the commenters for their input and have taken it into consideration in determining whether AURLUMYN™ meets the substantial clinical improvement criterion as discussed later in this section.

Comment: The applicant submitted a comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. In response to our concern that the applicant did not identify a patient population that is unresponsive to, or ineligible for, the standard-of-care treatment where AURLUMYN™ does offer a treatment option, the applicant reiterated that AURLUMYN™ reduces significant risk of amputation and grade 3 and grade 4 frostbite's associated long-term complications, which impact a patient's ability to cope with normal everyday routines as well as health-related and functional quality of life. The applicant also reemphasized the 2024 Wilderness Medical Society Practice Guidelines for the Prevention and Treatment of Frostbite (WMS Guidelines) strong recommendation that AURLUMYN™ be used as a first-line therapy for grade 3 and 4 frostbite up to 48 hours after thawing, and possibly up to 72 hours. The applicant stated that the WMS Guidelines underline the need to consider the risk and benefits of using a thrombolytic, such as tPA, that is contraindicated in trauma, recent surgery, recent stroke, and many other conditions that might pose a bleeding risk; that has potential risks of systemic and catheter site bleeding, compartment syndrome, and failure to salvage tissue; and in which the long-term, functional consequences of digit salvage has not been evaluated. The applicant concluded that AURLUMYN extends the treatment window for patients beyond the <24 hours recommended for off-label use of tPA, and it provides an

[27] Eicos Sciences, Inc. Prescribing Information for *AURLUMYN*™ (iloprost) injection, for intravenous use (revised 5/2024), section 8.5 Geriatric Use. Available at: *https://www.accessdata.fda.gov/drugsatfda_docs/label/2024/217933s000lbl.pdf.*

important treatment option for patients with severe frostbite who are contraindicated for the off-label use of tPA.

In addition, a few commenters, including the applicant, asserted that AURLUMYN™ is an important component of a multimodal treatment regimen that includes pharmacologic and non-pharmacologic treatment for frostbite, such as rewarming, pain management, systemic hydration, and pharmacologic treatment. These commenters further stated that although non-pharmacologic post-thaw medical therapy, such as hydrotherapy, hyperbaric oxygen therapy (HBOT), sympathectomy, and fasciotomy, should be considered in a multimodal frostbite treatment regimen, these therapies do not replace AURLUMYN™ and instead are complementary. To demonstrate this, the applicant stated that they attached or enclosed two examples of clinical practice protocols for frostbite, which vary from institution to institution, but we note that there were no enclosures/attachments of that nature.

In response to CMS's concern as to whether the Cauchy et al. (2011) and Crooks et al. (2022) studies were sufficiently comparable and demonstrated clinically significant outcomes, the applicant reiterated the results from these two studies. The applicant also stated that Cauchy et al. (2011) reported results from the largest and only randomized, controlled, open-label study of severe frostbite treatment, which included 46 patients with grade 3 or grade 4 frostbite and 1 patient with grade 2 frostbite who were treated with buflomedil, AURLUMYN™, or recombinant tPA plus AURLUMYN™. The applicant also stated that the results from this study played a role in the WMS Guidelines recommending AURLUMYN™.

With regard to rapid rewarming, a commenter stated that a substantial proportion of the patients in Crooks et al. (2022) presented after the frostbitten tissue was already thawed and did not undergo rapid rewarming, which may have contributed to less favorable outcomes compared to the patients in Cauchy et al. (2011) who all underwent rapid rewarming. The commenter also stated that sympathectomy has not been shown to improve outcomes in frostbite and can be performed regardless of treatment with thrombolytics or AURLUMYN™, and fasciotomy is rarely necessary to treat frostbite but should be performed regardless of other treatments when required.

In addition, the applicant cited a retrospective chart review of 22 patients and a multicenter prospective single-arm study of 28 patients. The applicant stated that the retrospective chart review of 22 patients in Whitehorse, Yukon Territory, Canada, who presented to the hospital with grade 2, 3, or 4 frostbite, found that patients treated with AURLUMYN™, or AURLUMYN™ in addition to alteplase and heparin in the case of grade 4 frostbite, exhibited lower than expected amputation rates. Specifically, the applicant stated that no digits with grade 2 or 3 frostbite were amputated in patients treated with AURLUMYN™, and 50 percent of the digits with grade 4 frostbite treated with AURLUMYN™, alteplase, and heparin, required amputation. The applicant stated that overall, 29 of 142 (20.4 percent) digits were amputated, and the majority of digits amputated (N = 19) were from 1 patient who, according to direct correspondence with the author, was a very extreme case with frostbite extending beyond the carpal/tarsal region of the patient's limbs.[28] The applicant referenced expected rates of amputation of 1 percent for grade 2 digits, 31 to 67 percent for the grade 3 digits, and 98 to 100 percent for grade 4 digits, based on the Cauchy 2001 study.[29] The applicant also stated that a multicenter prospective single-arm study of 28 patients with grade 3 or 4 frostbite conducted in Switzerland and France compared early HBOT and AURLUMYN™ to treatment with AURLUMYN™ alone. The applicant stated that after 1 year of follow-up, 92 percent of injured digits/limbs treated with AURLUMYN™ did not require amputation, (85 percent in the AURLUMYN™ only control group and 98 percent in the AURLUMYN™ + HBOT group).[30] The applicant stated that this study's interpretability is limited, as the study does not report the amputation outcome rate in comparable patients who did not receive AURLUMYN™.

In response to CMS's concerns related to the Crooks et al. (2022) study's potentially inaccurate severity grading and the adequacy of the comparator in the absence of tPA in the control group, a commenter stated that the study authors listed both factors as limitations and that some or all of the 41 patients that presented within 24 hours had other contraindications to the use of tPA, including only grade 2 frostbite. The commenter further stated that Crooks et al. (2022) did not report which patients in the standard care group presented within 24 hours with grade 2 frostbite and noted that clinicians can sometimes have difficulty distinguishing between grade 2 and grade 3 frostbite initially, leading most clinicians to err on the side of caution and classifying the frostbite as grade 3.

In response to CMS's concern that the applicant did not present evidence that directly compared AURLUMYN™ with other therapies that are also strongly recommended by the WMS, the applicant stated that it is unaware of any published literature examining frostbite injury cases following treatment with AURLUMYN™ that are described specifically referencing results of other adjunctive post-thaw treatment options described in the WMS Guidelines (hydrotherapy, sympathectomy, and fasciotomy). The applicant reiterated that iloprost is a part of the multimodal treatment protocol hospitals follow and does not replace any of these non-pharmacologic treatment approaches; nor are these options employed at the exclusion of iloprost.

In response to CMS's concern about the Cauchy et al. (2011) and Crooks et al. (2022) studies' generalizability to the Medicare population, the applicant stated that, in its analysis of 2023 MedPAR data, Medicare paid 62 patient claims for severe frostbite, the majority of which (about 63 percent) were for Medicare beneficiaries under 65 years of age. The applicant stated that these findings mirror the age demographics in the cited AURLUMYN™ studies. The applicant also stated that evidence-based guidance for the prevention and treatment of frostbite does not vary by age groups nor by geographic region, which according to the applicant, aligns with the Cauchy et al. (2011) and Crooks et al. (2022) studies' results which demonstrate that regardless of age or geographic region, patients treated with AURLUMYN™ showed substantial clinical improvement. Another commenter stated that whether studies were conducted outside the U.S. is irrelevant as there is no evidence to suggest that the physiology of frostbite varies by location. The commenter also stated that it is prudent to treat older patients and patients with comorbidities using AURLUMYN™ when there are no contraindications because there is no evidence to suggest the effects of frostbite vary with age or that the response to treatment with

[28] Poole A, et al. Management of severe frostbite with iloprost, alteplase and heparin. A Yu-kon case series. CMAJ open 9 (2021), E585–E591.

[29] Cauchy E, et al. Retrospective study of 70 cases of severe frostbite lesions. A proposed new classification scheme. Wilderness & Environmental Medicine 2001;12, 248–255.

[30] Magnan MA, et al. Hyperbaric oxygen therapy with iloprost improves digit salvage in severe frostbite compared to iloprost alone. Medicina (Kaunas, Lathuania) 57 (2021).

AURLUMYN™ differs between older and younger patients but frostbite outcomes are likely to be worse in older patients or patients with comorbidities, such as diabetes. The commenter further stated that the proposed rule incorrectly reports the age range in the Crooks et al. (2022) study to be between 29 to 54 years and that these were instead interquartile ranges (90 FR 18099).

The applicant summarized adverse events reported in Cauchy et al. (2011) and Crooks et al. (2022), as well as a multicenter retrospective cohort study and the AURLUMYN™ prescribing information. The applicant also referenced the NDA sponsors clinical trial program for patients with systemic sclerosis who received either placebo or AURLUMYN™ to support the clinical safety of AURLUMYN™ in patients with severe frostbite. The applicant stated this clinical trial reported no deaths, study drug-related serious adverse events, or adverse events of special interest leading to study drug discontinuation, and all adverse events related to the study drug were expected and consistent with the established safety profile of AURLUMYN™.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we agree with the applicant and other commenters that AURLUMYN™ represents a substantial clinical improvement over existing technologies for the treatment of severe frostbite in adults because it reduces the risk of digit amputation compared to the standard of care, especially for patients who are contraindicated for tPA or are beyond the <24 hours treatment window recommended for off-label use of tPA.

After consideration of the public comments we received and the information included in the applicant's new technology add-on payment application, we have determined that AURLUMYN™ meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2026. Cases involving the use of AURLUMYN™ that are eligible for new technology add-on payments will be identified by ICD–10–PCS codes: XW033QB (Introduction of iloprost into peripheral vein, percutaneous approach, new technology group 11) or XW043QB (Introduction of iloprost into central vein, percutaneous approach, new technology group 11).

In its application, the applicant estimated that the cost of AURLUMYN™ is $44,000 per patient, based on eight single-use 100 mcg per mL vials (one per day over 8 days) at a cost of $5,500 per vial. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of AURLUMYN™ is $28,600 for FY 2026.

c. BREYANZI® (lisocabtagene maraleucel)

Bristol Myers Squibb submitted an application for new technology add-on payments for BREYANZI® for FY 2026. According to the applicant, BREYANZI® is a CD19-directed, autologous CAR T-cell immunotherapy comprised of individually formulated CD8 and CD4 CAR T-cells and is indicated for the treatment of adult patients with relapsed/refractory (R/R) chronic lymphocytic leukemia or small lymphocytic lymphoma (CLL/SLL) who have received two or more prior lines of therapy (LOTs), including a Bruton tyrosine kinase inhibitor (BTKi) and a B-cell lymphoma 2 protein inhibitor (BCL2i). We noted that BREYANZI® is also indicated for the treatment of adult patients with R/R large B-cell lymphoma, for which the applicant submitted an application for new technology add-on payments for FY 2021 and FY 2022, as discussed in the FY 2022 IPPS/LTCH PPS final rule (86 FR 44996 through 45008).

Please refer to the online application posting for BREYANZI®, available at *https://mearis.cms.gov/public/publications/ntap/NTP24100722KTJ*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, BREYANZI® was granted accelerated approval for its supplemental Biologics License Application (sBLA) by FDA on March 14, 2024 for the treatment of adult patients with R/R CLL or SLL who have received two or more prior LOTs, including a BTKi and a BCL2i.[31] According to the applicant, BREYANZI® was commercially available immediately after FDA marketing authorization for the CLL/SLL indication. Per the applicant, for this indication, patients receive a one-time intravenous infusion of BREYANZI®, which contains 90 to 110×10^6 CAR-positive viable T-cells consisting of 1:1 CAR-positive viable T-cells of the CD8 and CD4 components, with each component supplied separately in one or more single-dose vials.

The applicant stated that, effective October 1, 2021, the following ICD–10–PCS codes could be used to uniquely describe procedures involving the use of BREYANZI®: XW033N7 (Transfusion of lisocabtagene maraleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7) or XW043N7 (Transfusion of lisocabtagene maraleucel immunotherapy into central vein, percutaneous approach, new technology group 7). The applicant provided the following list of codes may be used to currently identify the R/R SLL/CLL indication for BREYANZI® under the ICD–10–CM coding system:

[31] Breyanzi. United States Prescribing Information (USPI), (revised 5/2024). According to the applicant, FDA has also approved BREYANZI® for several other indications, including for the treatment of adults with (1) R/R follicular lymphoma (FL) who have received two or more prior LOT (approved on 5/15/2024); (2) R/R mantle cell lymphoma (MCL) who have received at least two prior LOT, including a BTKi (approved on 5/30/2024); (3) R/R large B-cell lymphoma (LBCL) after two or more LOT, including diffuse large B-cell lymphoma (DLBCL) not otherwise specified (including DLBCL arising from indolent lymphoma), high-grade B-cell lymphoma, primary mediastinal LBCL, and FL grade 3B (approved on 2/5/2021); and (4) LBCL, including DLBCL, not otherwise specified (including DLBCL arising from indolent lymphoma), high-grade B-cell lymphoma, primary mediastinal LBCL, and FL grade 3B, who have either refractory disease to first-line chemoimmunotherapy or relapse within 12 months of first-line chemoimmunotherapy or refractory disease to first-line chemoimmunotherapy or relapse after first-line chemoimmunotherapy and are not eligible for hematopoietic stem cell transplant (HSCT) due to comorbidities or age (approved on 6/24/2022). (*https://www.fda.gov/vaccines-blood-biologics/cellular-gene-therapy-products/breyanzi-lisocabtagene-maraleucel*, accessed 3/27/2025).

ICD-10-CM Code	Description
C83.00	Small cell B-cell lymphoma, unspecified site
C83.01	Small cell B-cell lymphoma, lymph nodes of head, face, and neck
C83.02	Small cell B-cell lymphoma, intrathoracic lymph nodes
C83.03	Small cell B-cell lymphoma, intra-abdominal lymph nodes
C83.04	Small cell B-cell lymphoma, lymph nodes of axilla and upper limb
C83.05	Small cell B-cell lymphoma, lymph nodes of inguinal region and lower limb
C83.06	Small cell B-cell lymphoma, intrapelvic lymph nodes
C83.07	Small cell B-cell lymphoma, spleen
C83.08	Small cell B-cell lymphoma, lymph nodes of multiple sites
C83.09	Small cell B-cell lymphoma, extranodal and solid organ sites
C91.10	Chronic lymphocytic leukemia of B-cell type not having achieved remission
C91.12	Chronic lymphocytic leukemia of B-cell type in relapse

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18100), we invited public comments on the use of these ICD–10–CM diagnosis codes to identify the indication of R/R SLL or CLL for purposes of the new technology add-on payment, if approved.

Comment: We received comments expressing general support of the use of the listed ICD–10–CM codes for which CMS specifically sought input. A few commenters, including the applicant, agreed that these ICD–10–CM codes properly identify the R/R SLL/CLL indication for BREYANZI®. One of the commenters also suggested that CMS consider four additional diagnosis codes that also identify the indication of R/R SLL/CLL, including C91.Z0 (Other lymphoid leukemia not having achieved remission), C91.Z2 (Other lymphoid leukemia, in relapse), C91.90 (Lymphoid leukemia, unspecified not having achieved remission), and C91.92 (Lymphoid leukemia, unspecified, in relapse).

Response: We thank the applicant and commenters for their input. We note that the four additional ICD–10–CM codes describing ''other lymphoid leukemia'' and ''lymphoid leukemia, unspecified'' are not specific to SLL or CLL. Therefore, we do not believe those diagnosis codes are appropriate to identify the indication of R/R SLL/CLL. We agree with the applicant that the codes listed by the applicant accurately identify the indication for BREYANZI®.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that BREYANZI® is not substantially similar to other currently available technologies because BREYANZI® does not use the same or similar mechanism of action as other therapies approved for the treatment of R/R CLL/SLL, is not assigned to the same MS–DRG as other therapies currently approved for the treatment of R/R CLL/SLL, and does not involve treatment of the same or similar type of disease and patient population as other CAR T-cell therapies, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for BREYANZI® for the applicant's complete statements in support of its assertion that BREYANZI® is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	BREYANZI® is the first CAR T-cell therapy indicated for the treatment of R/R CLL/SLL. This mechanism of action is not similar to any existing technology indicated for the treatment of R/R CLL/SLL. Existing therapies include BTKis and BCL2is either alone or in combination with CD20 monoclonal antibodies. These classes of therapies are typically sequenced with BTKi as the first line of therapy, then BCL2i as the second line of therapy or vice versa depending on the preference of the patient and treating physician. Patients who experience intolerance to or disease progression after a BTKi and a BCL2i are limited to treatment via recycling of previous agents (unless refractory), chemoimmunotherapy, non-covalent BTKi, or phosphatidylinositol 3-kinase inhibitors (PI3Ki). BTKis, including ibrutinib, acalabrutinib, zanubrutinib, pirtobrutinib, work by inhibiting the B-cell receptor signaling pathway through the Bruton Tyrosine Kinase protein. BCL2is, including venetoclax, work by binding to the BCL2 protein in the mitochondria leading to apoptosis sensitization. Used in combination with CD20 monoclonal antibodies, such as rituximab, obinutuzumab, the two drugs synergize to induce direct induction of apoptosis, antibody-dependent cell-mediated cytotoxicity and complement-dependent lysis. Chemoimmunotherapy works through a variety of mechanisms that disrupt cellular replication
		leading to cell death. PI3Kis (idelalisb, duvelisib) work through the inhibition of the PI3K signaling pathway which regulates multiple downstream cellular pathways and is often associated with the development of malignancies. In contrast, BREYANZI® is a CAR T-cell therapy. A CAR is an artificial construct introduced into the DNA of a patient's T cells. The patient's T cells will then transcribe and translate this DNA into a protein, which resides at the surface of the T cell, with the extracellular/targeting domain on the outside of the cell and the costimulatory and signaling domains, required for T-cell activation, on the inside of the cell. When the targeting domain binds to its target. CD19 in the case of BREYANZI®, a signal is transmitted from the activation and costimulatory domain, that initiates proliferation of the T cell and secrete compounds that direct the immune system to kill the cell that is expressing the target. CAR binding to CD19 expressed in CLL/SLL cells induces activation and proliferation of CAR T cells, release of pro-inflammatory cytokines, and cytotoxic killing of target cells. No other therapy indicated for the treatment of R/R CLL/SLL has this mechanism of action.
Is the technology assigned to the same MS-DRG as existing technologies?	No	ICD-10-PCS codes XW033N7 (Transfusion of lisocabtagene maraleucel immunotherapy into peripheral vein) and XW043N7 (Transfusion of lisocabtagene maraleucel immunotherapy into central vein) are assigned to MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-cell and Other Immunotherapies). No other therapies indicated for the treatment of patients with R/R CLL/SLL are assigned to MS-DRG 018. Thus, BREYANZI® is anticipated to be the only technology indicated for R/R CLL/SLL assigned to MS-DRG 018.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	BREYANZI® is the first CAR T-cell therapy approved for the treatment of R/R CLL/SLL. Other approved CAR T-cell therapies treat other myelomas or lymphomas but are not sufficiently analogous to R/R CLL/SLL to be considered the same or a similar disease or patient population, as described later in this section. Because BREYANZI® is the first CAR T-cell therapy, regardless of target, indicated for the treatment of R/R CLL/SLL, it does not involve treatment of the same or similar type of disease and patient population when compared to existing CAR T-cell therapies.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18101), we noted that the applicant asserted that because BREYANZI® is the first CAR T-cell therapy, regardless of target, indicated for the treatment of R/R CLL/SLL, it does not involve treatment of the same or similar type of disease and patient population as existing technologies. However, we noted that there are other existing (non-CAR T-cell) treatments for patients with R/R CLL/SLL who have received two or more prior LOTs, including a BTKi and a BCL2i, such as noncovalent BTKis, PI3Kis, or allogeneic HSCT, and therefore, we questioned whether BREYANZI® treats

a different type of disease or patient population than existing technologies.

We invited public comments on whether BREYANZI® is substantially similar to existing technologies and whether BREYANZI® meets the newness criterion.

Comment: The applicant submitted a public comment that asserted BREYANZI® meets the newness criterion because it does not use a mechanism of action that is the same or similar to other therapies currently approved for the treatment of R/R CLL/SLL, and is not assigned to the same MS–DRG as those therapies. With respect to BREYANZI®'s mechanism of action, the applicant stated that BREYANZI® remains the only cell-based immunotherapy to be successfully manufactured for patients with CLL/SLL, which is characterized by profound T-cell dysfunction, and reiterated that BREYANZI® differs from other treatments as a CAR T-cell therapy that does not require repeated dosing until progression nor incur cumulative toxicity and drug resistance. With respect to BREYANZI®'s MS–DRG assignment, the applicant stated that no other therapies indicated for the treatment of patients with R/R CLL/SLL are assigned to MS–DRG 018.

Response: We thank the applicant for its comment. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for BREYANZI®, we agree with the applicant that BREYANZI® uses a unique mechanism of action because it is a CD19-directed, autologous CAR T-cell immunotherapy that initiates proliferation of CAR T cells that result in the cytotoxic killing of target cells for the treatment of adult patients with R/R CLL/SLL who have received two or more prior LOTs, including a BTKi and a BCL2i. We also agree with the applicant that BREYANZI® is not assigned to the same MS–DRG as other therapies currently approved for the treatment of these patients. Therefore, we agree with the applicant that BREYANZI® is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on March 14, 2024, the date on which BREYANZI® was granted accelerated approval of its sBLA from FDA.

With respect to the cost criterion, the applicant provided an analysis to demonstrate that BREYANZI® meets the cost criterion. The analysis followed the order of operations summarized in the following table.

BREYANZI® COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for BREYANZI®.
Claims identified	550 claims mapping to 11 MS-DRGs, with 30.00% of claims mapping to MS-DRG 840 (Lymphoma and Non-Acute Leukemia with MCC).
Charges removed for prior technology	Per the applicant, it is possible that BREYANZI® could replace other drug therapies during some patients' inpatient stays. The applicant removed 100% of drug charges from the identified cases, as it is difficult to identify the exact differences in drug regimens BREYANZI® patients would receive, both before and in conjunction with administration of BREYANZI®. The applicant stated this removal likely over-estimates charges for drugs that would be replaced by BREYANZI®, as patients may receive some ancillary drug treatments in conjunction with their BREYANZI® administration. The applicant did not remove indirect charges related to prior therapies.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Average case-weighted threshold amount: $1,554,026 Final inflated average case-weighted standardized charge per case: $2,759,094

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that BREYANZI® meets the cost criterion.

We invited public comments on whether BREYANZI® meets the cost criterion.

Comment: The applicant reiterated that the cost criterion analysis submitted with its application demonstrates that BREYANZI® meets the cost criterion.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in the applicant's cost analysis. Therefore, BREYANZI® meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that BREYANZI® demonstrates a substantial clinical improvement because R/R CLL/SLL patients who have received a prior BTKi and BCL2i have limited treatment options and outcomes are extremely poor. The applicant also asserted that BREYANZI® is the first and only CAR T-cell therapy indicated for this population, and in clinical studies, 20 percent of patients treated with BREYANZI® achieved complete response or remission (CR) and remained in CR through 22.4 months of follow-up. The applicant provided one article and two conference presentations regarding one clinical trial, and the BREYANZI® package insert to support these claims, as well as 11 background articles about CLL, SLL, and current treatment options.[32] The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for BREYANZI® for the applicant's complete statements regarding the substantial clinical

[32] Background articles are not included in the following table but can be accessed via the online posting for the technology.

improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
BREYANZI® is the first and only CAR T-cell therapy specifically approved for the treatment of R/R CLL and SLL patients who have received a prior covalent BTKi and BCL2i.	BREYANZI® (lisocabtagene maraleucel) Prescribing Information. 2024. Siddiqi, T., Maloney, D.G., Kenderian, S.S., Brander, D.M., Dorritie, K., Soumerai, J., Riedell, P.A., Shah, N.N., Nath, R., Fakhri, B., Stephens, D.M., Ma, S., Feldman, T., Solomon, S.R., Schuster, S.J., Perna, S.K., Tuazon, S.A., Ou, S.S., Papp, E., Peiser. L., Chen, Y., & Wierda, W.G. (2023a, August 19). Lisocabtagene maraleucel in chronic lymphocytic leukaemia and small lymphocytic lymphoma (TRANSCEND CLL 004): a multicentre, open-label, single-arm, phase 1-2 study. *The Lancet, 402*(10402), 641-654. https://doi.org/10.1016/S0140-6736(23)01052-8 The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
R/R CLL and SLL patients who received a prior BTKi and BCL2i have limited treatment options.	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
R/R CLL/SLL patients who have received a prior BTKi and BCL2i experience poor outcomes on existing therapy.	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.
BREYANZI® is anticipated to significantly improve clinical outcomes in R/R CLL/SLL patients who have received prior BTKi and BCL2i therapy. Abstract presented at: 2024 ASH Annual Meeting; December 7-10, 2024; San Diego, CA.

BILLING CODE 4120–01–C

We also received a public comment in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for BREYANZI®, which we summarized in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18103).

After review of the information provided by the applicant and the public comment received in response to the New Technology Town Hall meeting, we stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18103) that we had the following concerns regarding whether BREYANZI® meets the substantial clinical improvement criterion. First, we questioned whether there is a particular subpopulation for which BREYANZI® offers a treatment option that is unresponsive to or ineligible for other existing therapies. While the applicant asserted that BREYANZI® is the first and only CAR T-cell therapy for this indication, it also stated that there are other treatment options for this patient population, including non-covalent BTKis, such as Jaypirca®, and PI3Ks, such as COPIKTRA®.[33] We noted that being the first CAR T-cell therapy for a particular indication relates to mechanism of action and is not relevant to the demonstration of substantial clinical improvement.

Secondly, while the applicant stated that BREYANZI® is anticipated to significantly improve clinical outcomes in R/R CLL/SLL patients who have received prior BTKi and BCL2i therapy, we stated we had questions regarding the evidence provided in support of this claim. The applicant provided several

[33] National Comprehensive Cancer Network. (2024, October 1). *NCCN Clinical Practice Guidelines in Oncology (NCCN Guidelines®): Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma. https://www.nccn.org/professionals/physician_gls/pdf/cll.pdf.*

studies based on the results of the TRANSCEND CLL 004 trial, including one published article (Siddiqi et al., 2023a), two conference presentations (Siddiqi et al., 2023b; Siddiqi et al., 2024), and the BREYANZI® package insert (2024). We noted that the TRANSCEND CLL 004 trial was a single-arm study in which no historical controls were used to compare the effects of BREYANZI® on clinical outcomes. We also noted that the applicant acknowledged the caveats inherent with direct cross-study comparisons due to differences between patient populations, baseline comorbidities, and the number and type of prior treatment regimens that subjects have received. In addition, the applicant stated that no head-to-head studies exist comparing BREYANZI® in CLL to currently available treatments. At the same time, the applicant asserted that BREYANZI®'s median time to next therapy was considerably longer than that observed in a real-world study of patients with CLL/SLL after prior treatment with a BTKi and B-cell lymphoma 2 inhibitors (6.6 months [95 percent CI, 3.6–10.1].[34] Also, the applicant noted that patients with prior BTKi exposure who were venetoclax-naïve would have improved outcomes had they received BREYANZI® earlier, before other early-line treatments.[35] We stated our concern about the validity of comparing the clinical outcomes of BREYANZI® and existing therapies to the extent those clinical outcomes were results of trials with different designs, and the patients in those studies were selected based on different inclusion/exclusion criteria and may have different baseline clinical characteristics. We stated that these differences may have an impact on clinical outcomes that was independently of BREYANZI® or the comparator treatments. Moreover, we noted the differing results between BREYANZI® and other existing therapies in terms of the clinical outcomes cited by the applicant. For example, as previously described, BREYANZI® demonstrated a CR rate of 20 percent and ORR of 44 percent for patients in the PEAS cohort. According to the applicant, in a trial in which patients with R/R CLL/SLL received Jaypirca®, the CR rate and ORR was 0 percent and 70 percent respectively.[36] Furthermore, according to the applicant, BREYANZI® resulted in PFS of 11.9 months for patients in the PEAS cohort in the TRASNCEND CLL 004 trial. However, we noted that in the trial in which patients with R/R CLL/SLL received Jaypirca®, the PFS was 16.8 months.[37] We questioned how these mixed findings support the claim that BREYANZI® represents a substantial clinical improvement, given the higher values with respect to the existing therapies for particular outcome results.

In addition, with respect to the applicant's claims that R/R CLL/SLL patients who received prior BTKi and BCL2i therapies have limited treatment options, and that patients with R/R CLL/SLL have poor outcomes on existing therapy, we questioned whether these claims support that BREYANZI® improves clinical outcomes for this patient population.

We invited public comments on whether BREYANZI® meets the substantial clinical improvement criterion.

Comment: Several commenters expressed support for approval of BREYANZI® for new technology add-on payments. A few commenters stated that approval of BREYANZI®'s new technology add-on payment application will remove a potential barrier to accessing innovative treatments and tools advancing this approach to care for unmet medical needs. Another commenter stated that the new technology add-on payment program was created to eliminate the limitations on access to new therapies due to lack of reimbursement in the inpatient setting, and the use of BREYANZI® for the FDA-labeled indications would require hospitals to incur costs that, without a new technology add-on payment, would have to be fully absorbed by the treating hospital.

A few commenters also emphasized that CAR T-cell therapies are a critical and important advancement in the treatment of certain cancers and for patient populations with few existing treatment options. A commenter stated that BREYANZI® is a new CAR T-cell therapy for patients with CLL and a new option for patients who have exhausted all other treatment options. The commenter further urged CMS to consider adding BREYANZI® to the set of tools available to address the significant unmet need for additional lines of therapy for CLL, regardless of whether a patient receives BREYANZI® as their first treatment after progressing on two or more lines of therapy or after a noncovalent BTKi and/or a PI3Ki.

Response: We thank the commenters for their input and have taken it into consideration in determining whether BREYANZI® meets the substantial clinical improvement criterion as discussed later in this section.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant asserted that BREYANZI® provides a substantial clinical improvement relative to services or technologies previously available for the treatment of Medicare beneficiaries with R/R CLL/SLL who have limited therapy options, according to National Comprehensive Cancer Network (NCCN) Guidelines. The applicant further stated that BREYANZI® is the only NCCN Guidelines-preferred regimen that offers patients a treatment-free disease remission interval with improved quality of life and the potential to achieve a deep and durable response (20 percent CR) while other regimens, such as PI3Ki, have concerning benefit-risk profiles and are associated with poor outcomes characterized by high risks of fatal adverse events and the absence of complete disease remission.

In response to CMS's question about the applicant's assertion that BREYANZI® offers a treatment option for patients unresponsive to or ineligible for other existing therapies, the applicant stated that BREYANZI® is a novel, promising treatment option not only for patients with R/R CLL/SLL who have received at least two prior lines of therapy, including a BTKi and a BCL–2i (double class exposed), but is also the only treatment intentionally studied and proven efficacious in patients with highly refractory and aggressive CCL/SLL who experienced disease progression while on BTKi and failed to respond to Venclexta®. Per the applicant, these highly refractory patients represent a particularly difficult-to-treat population with no existing effective treatments. The applicant also stated that BREYANZI® substantially improves treatment of the double class exposed population, that is, patients with R/R CLL/SLL who had received at least 2 prior lines of therapy, achieving a 20 percent CR rate and improvements in health-related quality of life, whereas existing therapies, including Jaypirca® (pirtobrutinib), the recently approved non-covalent BTKi, rarely achieve CR in this population. The applicant asserted that BREYANZI® addresses the critical unmet need in this patient population by offering the possibility of a durable CR following a one-time treatment. The applicant stated that in this subpopulation, BREYANZI® demonstrated a consistent rate of 20 percent CR that was durable, with median PFS and DOR not reached at

[34] Siddiqi (2023b), *op.cit.*

[35] Siddiqi (2024), *op.cit.*

[36] Mato (2023b), *op.cit.*

[37] Mato (2023b), *op.cit.*

31.4 and 31.7 months of follow up respectively. The applicant further stated that PI3Kis, such as Copiktra® and Zydelig®, are not preferred treatment options for double class exposed patients due to their benefit-risk profile. The applicant noted that 31 percent of Copiktra®-treated patients and 48 percent of Zydelig®-treated patients experienced fatal/serious infections, while 18 percent and 20 percent of patients experienced fatal/serious diarrhea or colitis respectively. The applicant added that 15 percent of Copiktra®-treated patients demonstrated treatment-related mortality, and accordingly, an FDA expert panel voted on April 21, 2022 to recommend that future FDA approvals of PI3Kis be supported by randomized data, rather than single-arm data only, and further discontinuing the use of almost all PI3Kis in hematologic treatment. Another commenter stated that CMS's inquiry into whether there is a particular subpopulation that is unresponsive to or ineligible for alternatives to BREYANZI® did not recognize that a new treatment line in a chronic cancer can offer an incremental, additive survival benefit.

In response to CMS's concern about the lack of historical controls in the single-arm TRANSCEND CLL 004 trial to compare the effects of BREYANZI® on clinical outcomes, the applicant stated that it conducted an external control arm analysis to compare BREYANZI® to the standard of care treatments for double case exposed patients with R/R CLL/SLL using patients from the TRANSCEND CLL 004 monotherapy cohort matched to real-world patients from U.S. oncology practice and cancer centers. Per the applicant, to ensure fair and robust comparisons, it employed an advanced causal inference methodology, Inverse Probability of Treatment Weighting combined with regression modeling, to adjust for the differences in patient and disease characteristics between the clinical trial and the real-world cohorts. The applicant stated that this analysis demonstrated that BREYANZI® significantly improved response, including higher CR rates ([95% CI] of 17.9% [9–34] for BREYANZI® vs 2.2% [1–5]) for standard of care treatments, P<0.0001) and ORR rates ([95% CI] of 52.5% [35–79] for BREYANZI® vs 19.2% [14–26] for standard of care treatments, P=0.0007), and also delayed disease progression and prolonged OS compared with standard of care treatments. According to the applicant, the median PFS [95 percent CI] was 12.0 months (10.8–13.2) with BREYANZI® vs 4.4 months (3.2–5.5) for standard of care treatments (hazard ratio, 0.40; 95% CI, 0.24–0.68, P=0.0007). The probabilities of PFS at 24 and 36 months were 46.3 percent and 30.3 percent with BREYANZI®, compared to 11.5 percent and 5.1 percent for standard of care treatments, respectively. The applicant also stated that mOS [95 percent CI] was 33.6 months (31.7–35.5) for BREYANZI® vs 14.8 months (9.4–20.1) for standard of care treatments (hazard ratio, 0.47; 95% CI 0.28–0.79, P=0.0043). The probability of OS at 24 and 36 months were 73.4 percent and 42.6 percent with BREYANZI®, compared to 35.1 percent and 29.7 percent with standard of care treatments respectively. The applicant asserted that these statistically significant and clinically meaningful results confirm that treatment with BREYANZI® results in improved outcomes compared with historical controls for double class exposed patients with R/R CLL/SLL.

A commenter, in response to CMS's concern about the single-arm design of the BREYANZI® pivotal trial, cited a study [38] that asserted single-arm trials can provide substantial evidence of effectiveness and safety when randomized controlled trials are infeasible. The commenter also cited an article [39] that assessed the use of single-arm studies and found that almost all the single-arm studies (174 out of 176) identified were for locally, advanced, or metastatic disease and that most were for second-line or later treatment (49 percent), third-line or later treatment (20 percent), fourth-line or later treatment (4 percent), or fifth-line or later treatment (1 percent). This commenter asserted that FDA's acceptance of single-arm studies reflects both the challenges research sponsors face in designing randomized controlled trials in these patient populations and FDA's interest in getting promising treatments to patients who need them. Another commenter urged CMS to recognize the inherent ethical challenges to designing randomized studies in disease states, such as R/R CLL, in which patients have few treatment options and are unlikely to survive through a study duration if the investigational treatment is withheld. The commenter stated that for many rare diseases, the underlying biology and disease progression have not reached a level of broad scientific understanding. The commenter asserted that limited natural history data makes it difficult to choose appropriate endpoints, assess whether a drug is effective, or even determine the optimal timing or duration for the intervention and the trials. The commenter agreed with the applicant that the R/R patient population has limited treatment options. Per the commenter, while a poor prognosis does not establish a case for significant improvement, it explains the applicant's decision not to incorporate historic controls.

In response to CMS's concern about the mixed clinical outcomes of BREYANZI® compared to Jaypirca®, the applicant stated it is critical to note the key differences in the two studies' patient populations. The applicant stated that the TRANSCEND CLL 004 study's patients were more heavily pretreated (a median of 5 prior lines of therapy compared to 3 in the Jaypirca® BRUIN phase ½ pivotal trial cohort [40]), had significantly higher prior exposure to both BTKi and BCL–2i (80 percent versus 40.5 percent in the BRUIN trial), and experienced disease progression while on a BTKi and failed to respond to Venclexta®, making it a study population with highly refractory and aggressive disease that is not represented in the Jaypirca® BRUIN study. The applicant stated that BREYANZI® resulted in a 20 percent CR rate in this double-class exposed (DCE) population, while Jaypirca® failed to induce CR. The applicant also asserted that sustained durability of response in CLL has been shown to closely correlate with achieving a complete response, underscoring the risk of disease progression over time for patients treated with Jaypirca®. Per the applicant, this was reflected in the outcomes—although Jaypirca® demonstrated an overall response rate at 70 percent, the CR rate was 0 percent, and the durability of response (DoR) was inferior compared to BREYANZI®. In the DCE population, the median DoR with BREYANZI® was 35.3 months (95% CI, 12.4-not reached [NR])32 versus 12.2 months (95% CI, 9.3–14.7) among patients treated with Jaypirca®.

In addition, the applicant stated that the median PFS of 11.9 months associated with BREYANZI® that CMS referenced in the proposed rule pertains specifically to the primary efficacy analysis set in the TRANSCEND CLL

[38] Sundeep Agrawal, MD, Agrawal S, Arora S, Amiri-Kordestani L, et al. Use of single-arm trials for US Food and Drug Administration drug approval in oncology, 2002–2021. *JAMA Oncol.* 2023; 9(2): 266–272. doi:10.1001/jamaoncol.2022.5985.

[39] Nierengarten, M.B. (2023), Single-arm trials for US Food and Drug Administration cancer drug approvals. Cancer, 129: 1626–1626. *https://doi.org/10.1002/cncr.34830.*

[40] Mato AR, Woyach JA, Brown JR, et al (2023). Pirtobrutinib after a Covalent BTK Inhibitor in Chronic Lymphocytic Leukemia. *N Engl J Med* 2023;389:33–44. DOI: 10.1056/NEJMoa2300696.

004 study, which was the cohort of patients who experienced disease progression while on BTKi and failed to respond to Venclexta®. The applicant asserted that BREYANZI® uniquely demonstrates efficacy in an especially high-risk, refractory, and disease-aggressive population, which was not represented in the Jaypirca® study. The applicant further stated that it is inappropriate to compare the outcomes of BREYANZI®'s primary efficacy analysis set to those of the Jaypirca® study, who showed a median PFS of 16.8 months, because the patient population of the Jaypirca® study was previously treated with a BTKi and Venclexta® but not required to exhibit refractoriness to these treatments. The applicant further commented that the Jaypirca® study showed that the median PFS of double class exposed patients treated with Jaypirca® decreased to 15.9 months at a median follow-up of 27.5 months. The applicant contrasted these results to those of the TRANSCEND trial, in which 80 percent of the treated patients were double class exposed, and the median PFS for these patients remained at 18 months and among the patients who responded to BREYANZI®, the median PFS was 26.2 months at a median follow-up of 31.7 months. The applicant further stated that BREYANZI® results in treatment-free disease remission, which is manifested as health-related quality of life improvements in the R/R CLL/SLL population. Per the applicant, in the TRANSCEND–CLL–004 trial, clinically meaningful improvements were achieved in the key domains of global health status/quality of life, physical function, role functioning, symptom burdens, and fatigue after BREYANZI® infusion, and exceeded the pre-defined minimum important difference thresholds. The applicant also stated that BREYANZI®'s one-time infusion eliminates the compliance and adherence challenges commonly associated with existing continuous treatment technologies.

Another commenter stated that part of the clinical improvement BREYANZI® offers by virtue of being the only approved CAR T-cell therapy indicated for R/R CLL/SLL is the additional survival benefit from a new line of treatment for patients with few available options. The commenter further stated that BREYANZI® and its incremental benefit are best viewed as additions to that accrued by both prior and subsequent treatments, unlike second generation covalent BTKis, which are unlikely to be effective after progression on another treatment in its class. The commenter also stated that, during CMS's Medicare Drug Price Negotiation Program Town Hall for Initial Price Applicability Year 2027, CLL researchers and clinician experts emphasized that the treatment goal for CLL is to prolong survival without compromising quality of life. The commenter further stated that patients may remain in a ''wait and see'' period after diagnosis and may delay second and subsequent lines of treatment to delay or avoid progression through available treatments, and therefore, the ''time to next treatment'' endpoint is highly relevant to CLL. The commenter stated that median time to next therapy following treatment with BREYANZI® was considerably longer than that observed in a real-world study of patients with CLL/SLL after prior treatment with a BTKi and B-cell lymphoma 2 inhibitors (6.6 months, [95 percent CI, 3.6–10.1] [41]). The commenter stated that this improvement in time to next therapy is an important clinical improvement for patients with R/R CLL/SLL from both a patient and clinician perspective. In addition, the commenter stated that, according to clinicians and researchers, patients prefer treatment regimens of fixed duration and those that offer remission with shorter times on treatment. The commenter therefore stated it believes the option of receiving a course of therapy through a single infusion is an important benefit of BREYANZI®. In addition, the commenter stated that patients treated with BREYANZI® or Jaypirca® are not choosing between the median PFS of each therapy, but instead the decision is one of sequencing, and the incremental benefit in terms of PFS and/or overall survival is additive and significant. Moreover, the commenter argued that use of BREYANZI® for the FDA-labeled indications would require hospitals to incur costs that, without new technology add-on payments, would have to be fully absorbed by the treating hospital. The commenter asserted that the mechanism of new technology add-on payments was created to eliminate the limitations on access to new therapies due to lack of reimbursement in the inpatient setting.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we agree with the applicant and other commenters that BREYANZI® represents a substantial clinical improvement over existing technologies because BREYANZI® is a one-time treatment that significantly improves CR with lower risk of adverse events in R/R CLL/SLL patients who have received prior BTKi and BCL2i therapy.

After consideration of the public comments we received and the information included in the applicant's new technology add-on payment application, we have determined that BREYANZI® meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2026. Cases involving the use of BREYANZI® that are eligible for new technology add-on payments will be identified by ICD–10–PCS codes: XW033N7 (Transfusion of lisocabtagene maraleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 7) or XW043N7 (Transfusion of lisocabtagene maraleucel immunotherapy into central vein, percutaneous approach, new technology group 7) in combination with one of the following ICD–10–CM codes:

ICD-10-CM Code	Description
C83.00	Small cell B-cell lymphoma, unspecified site
C83.01	Small cell B-cell lymphoma, lymph nodes of head, face, and neck
C83.02	Small cell B-cell lymphoma, intrathoracic lymph nodes
C83.03	Small cell B-cell lymphoma, intra-abdominal lymph nodes
C83.04	Small cell B-cell lymphoma, lymph nodes of axilla and upper limb
C83.05	Small cell B-cell lymphoma, lymph nodes of inguinal region and lower limb

[41] Siddiqi et al. (2023), *op. cit.*

ICD-10-CM Code	Description
C83.06	Small cell B-cell lymphoma, intrapelvic lymph nodes
C83.07	Small cell B-cell lymphoma, spleen
C83.08	Small cell B-cell lymphoma, lymph nodes of multiple sites
C83.09	Small cell B-cell lymphoma, extranodal and solid organ sites
C91.10	Chronic lymphocytic leukemia of B-cell type not having achieved remission
C91.12	Chronic lymphocytic leukemia of B-cell type in relapse

In its application, the applicant estimated that the cost of a one-time intravenous infusion of BREYANZI® is $487,477 per patient. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of BREYANZI® is $316,860.05 for FY 2026.

d. COBENFY™ (xanomeline and trospium chloride)

Bristol Myers Squibb submitted an application for new technology add-on payments for COBENFY™ for FY 2026. According to the applicant, COBENFY™ is an oral combination drug consisting of xanomeline, a muscarinic agonist, and trospium chloride, a muscarinic antagonist, that is indicated for the treatment of schizophrenia in adults. Please refer to the online application posting for COBENFY™, available at *https://mearis.cms.gov/public/publications/ntap/NTP241007U99FM*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, COBENFY™ was granted NDA approval from FDA on September 26, 2024, for the treatment of schizophrenia in adults. The applicant stated that COBENFY™ became commercially available on October 9, 2024, and stated the delay in availability was due to a ramp-up period associated with distribution. We stated we were interested in additional information regarding the cause of any delay in the technology's commercial availability, such as additional information about the ramp-up period for distribution.

COBENFY™ has 3 approved dose strengths (50 mg/20 mg, 100 mg/20 mg, and 125 mg/30 mg) in capsule form. The recommended starting dosage is one 50 mg/20 mg capsule orally twice daily for at least 2 days. The dosage is increased to one 100 mg/20 mg capsule orally twice daily for at least 5 days and may be increased thereafter to one 125 mg/30 mg capsule orally twice daily based on patient tolerability and response. The applicant stated the per day treatment cost is the same across all dosages and the average length of stay for patients taking COBENFY™ is 7.5 days.

The applicant submitted a request for approval for a unique ICD–10–PCS procedure code for COBENFY™ and was granted approval to use the following procedure code effective October 1, 2025: XW0DXVB (Introduction of xanomeline and trospium chloride into mouth and pharynx, external approach, new technology group 11). The applicant provided the following list of diagnosis codes that may be used to currently identify the indication for COBENFY™ under the ICD–10–CM coding system: F20.0 (Paranoid schizophrenia), F20.1 (Disorganized schizophrenia), F20.3 (Undifferentiated schizophrenia), F20.89 (Other schizophrenia), F20.9 (Schizophrenia, unspecified), F25.0 (Schizoaffective disorder, bipolar type), F25.1 (Schizoaffective disorder, depressive type), F25.8 (Other schizoaffective disorders), and F25.9 (Schizoaffective disorder, unspecified).

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that COBENFY™ is not substantially similar to other currently available technologies because it is the first treatment for schizophrenia to target muscarinic receptors instead of dopamine. Per the applicant, COBENFY™ combines xanomeline, a muscarinic agonist, and trospium chloride, a muscarinic antagonist, which work together to stimulate muscarinic receptors in the brain while minimizing peripheral side effects; and its efficacy, safety, and tolerability have been established in acute and long-term trials providing a new option for patients; and therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for COBENFY™ for the applicant's complete statements in support of its assertion that COBENFY™ is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant Assertions Regarding this Criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	COBENFY™ targets muscarinic receptors as opposed to dopamine receptors, which has long been the standard of care. This novel mechanism marks a significant breakthrough in schizophrenia treatment. COBENFY™ is a combination of xanomeline, a muscarinic agonist, and trospium chloride, a muscarinic antagonist, indicated for the treatment of schizophrenia in adults. Per the FDA label, the efficacy of COBENFY™ is thought to be due to xanomeline's agonist activity at M1 and M4 muscarinic acetylcholine receptors in the central nervous system. Meanwhile, trospium chloride antagonizes the muscarinic receptors primarily in the peripheral tissues and does not measurably cross the blood brain barrier. In contrast, typical and atypical antipsychotics antagonize the dopamine receptors as pure antagonists or partial agonists and antagonists. With its unique mechanism of action, COBENFY™ represents the first treatment in a distinct class of drugs for schizophrenia.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	The use of COBENFY™ should not impact the MS-DRG assignment and COBENFY™ should be assigned to the same MS-DRG as existing products.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	While COBENFY™ treats the same condition, schizophrenia in adults, as other available technologies, COBENFY™ stands apart due to the distinct patient population that could benefit from it. While the current standard of care can be effective in managing symptoms of schizophrenia, studies have shown that approximately 40% of people with schizophrenia do not respond to therapy, and up to 60% experience a partial or inadequate improvement or intolerable side effects during therapy. Side effects from existing antipsychotics can include sedation, vision impairments, seizures, neuroleptic malignant syndrome, and motor disturbances, such as tremors and rigidity. Similarly, atypical antipsychotics are associated with significant weight gain, hyperlipidemia, insulin resistance/diabetes, heart-rate corrected QT interval (QTc) prolongation, extrapyramidal symptoms, tardive dyskinesia, and sexual dysfunction due to prolactin elevation. Breaking this cycle of trial and error is critical and highlights the urgent need for new treatment options. COBENFY™'s unique mechanism of action and clinical profile provide a new therapeutic option for patients, many of whom have not responded to prior treatments. Its efficacy, safety, and tolerability have been demonstrated across both acute and long-term studies. In all placebo-controlled clinical trials, COBENFY™ demonstrated statistically significant reductions in schizophrenia symptoms compared to placebo as measured by the Positive and Negative Syndrome Scale (PANSS) total score, the primary endpoint in the trial. While common adverse reactions of COBENFY™ included nausea and dyspepsia, more severe gastrointestinal issues were rare. Additionally, COBENFY™ does not have atypical antipsychotic class warnings and precautions and does not have a boxed warning. COBENFY™'s favorable side effect profile, coupled with its efficacy, positions it as a valuable alternative for patients, including those who are unable or unwilling to take typical or atypical antipsychotics due to adverse events.

BILLING CODE 4120–01–C

We invited public comments on whether COBENFY™ is substantially similar to existing technologies and whether COBENFY™ meets the newness criterion.

Comment: The applicant stated that COBENFY™ meets the newness criterion because it received FDA approval on September 26, 2024, which is within the eligibility window for FY 2026 new technology add-on payment consideration. Additionally, the applicant noted that as the first antipsychotic medication for schizophrenia that specifically targets muscarinic receptors instead of dopamine receptors, COBENFY™ represents the first novel pharmacological approach to schizophrenia treatment in decades. The applicant further explained that COBENFY™ selectively targets M1 and M4 receptors in the brain without blocking D2 receptors, making it fundamentally different from all existing antipsychotics that have relied on dopamine receptor modulation for over 70 years. The applicant also stated that FDA recognized this distinction, noting that COBENFY™ ''takes the first new approach to schizophrenia treatment in decades'' and ''offers a new alternative to the antipsychotic medications people with schizophrenia have previously been prescribed.'' The applicant concluded that COBENFY™ is not substantially similar to any other product currently available to treat schizophrenia because the therapy has a unique mechanism of action, distinctive safety profile, and a recent FDA-approval date. Additional commenters also noted the unique mechanism of action for COBENFY™ since it targets

cholinergic receptors and the muscarinic pathway rather than blocking dopamine receptors, which is the target for existing treatments.

The applicant asserted that the newness period for COBENFY™ should begin on October 9, 2024, to reflect the date that COBENFY™ was first commercially available for purchase. In response to CMS's request for additional information regarding the cause of any delay in commercial availability, the applicant explained that the delay between FDA approval on September 26, 2024, and market availability on October 9, 2024, was for multiple reasons. The applicant stated it allowed for complete standard launch preparation activities that typically follow regulatory approval, including finalizing the distribution network and ensuring support teams were fully prepared. The applicant stated that additional time was also needed to ensure sufficient inventory would be available across retail pharmacies nationwide to meet initial and anticipated patient demand without interruption. The applicant further stated that the delay was also needed following its acquisition of COBENFY™ from Karuna Therapeutics, since it needed additional time to properly scale up manufacturing and distribution capabilities to support a successful nationwide retail-pharmacy-based launch. The applicant urged CMS to use October 9, 2024 as the newness date, to align with new technology add-on payment statutes and to reflect the date of COBENFY™'s first commercial availability for inpatient hospital use.

Response: We thank the applicant for its comment. Based on our review of the comment received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for COBENFY™, we agree with the applicant that COBENFY™ uses a unique mechanism of action because it is the first schizophrenia treatment for adults to target muscarinic receptors in the brain by combining the muscarinic agonist, xanomeline, and the muscarinic antagonist, trospium chloride, unlike typical and atypical antipsychotics currently used to treat schizophrenia, which antagonize dopamine receptors. Therefore, we agree with the applicant that COBENFY™ is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on October 9, 2024, the date on which COBENFY™ became commercially available.

With respect to the cost criterion, the applicant provided an analysis to demonstrate that COBENFY™ meets the cost criterion. The analysis followed the order of operations summarized in the following table.

COBENFY™ COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for COBENFY™.
Claims identified	24,817 claims mapping to 9 MS-DRGs, with 93.45% of claims mapping to MS-DRG 885 (Psychoses).
Charges removed for prior technology	The applicant did not remove direct or indirect charges related to the prior technology. Per the applicant, patients admitted to the hospital for schizophrenia treatment need to be stabilized. The applicant anticipated that patients will continue to receive their traditional treatments to maintain consistent care and that COBENFY™ will be an additive treatment during a switching period where prescribers transition from traditional treatments to COBENFY™ as a monotherapy.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the average cost of the new technology per inpatient stay (treatment cost per day multiplied by an average 7.5 days per inpatient stay) by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Average case-weighted threshold amount: $43,788 Final inflated average case-weighted standardized charge per case: $44,511

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that COBENFY™ meets the cost criterion.

We invited public comments on whether COBENFY™ meets the cost criterion.

Comment: The applicant submitted a comment stating that its cost analysis was calculated to best represent the patients with schizophrenia who the applicant believes will be eligible for treatment with COBENFY™, specifically patients being treated for psychosis or other mental diseases or disorders in an inpatient or outpatient setting. The applicant also reiterated the methods it used in its cost criterion analysis and that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. Therefore, COBENFY™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that COBENFY™ represents a substantial clinical improvement over existing technologies because it is a first-in-class muscarinic agonist offering a new approach to treating schizophrenia by selectively targeting muscarinic receptors in the brain without targeting dopamine. The applicant further asserted that COBENFY™ has the potential to improve outcomes by addressing both positive and negative symptoms, which current drugs often inadequately manage, and that its unique mechanism reduces the risk of dopamine-related side effects, such as tardive dyskinesia (TD). The applicant stated that for these reasons, COBENFY™ offers a treatment

option for adult patients with schizophrenia who are unresponsive to, or ineligible for, currently available treatments and significantly improves clinical outcomes relative to existing treatments. The applicant provided six articles regarding five studies to support these claims. We also noted that two additional articles (Cornett et al., 2017 and Lieberman et al., 2005)[42] submitted as supporting evidence would more appropriately be characterized as background articles because they do not directly assess the use of COBENFY™.[43] [44] Instead, Cornett, et al. (2017) is a literature review of medication-induced TD, and Lieberman, et al. (2005) is a study reviewing the efficacy and side effect profile of other antipsychotic drugs in chronic schizophrenia. The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for COBENFY™ for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

Efficacy of KarXT on Negative Symptoms in Acute Schizophrenia: An Analysis of Pooled Data From 3 Trials. In Annual Meeting of the World Congress Collegium Internationale Neuro-Psychopharmacologicum (CINP)
COBENFY™ offers a side-effect profile that addresses a significant gap in antipsychotic treatment and has the potential to enhance outcomes by improving tolerability and expanding treatment options	Kaul, 2024a, *op. cit.* Kaul, 2024b, *op. cit.*
COBENFY™ has the potential to improve clinical outcomes due to its demonstrated efficacy in addressing both negative and positive symptoms of schizophrenia.	Brannan, 2021, *op. cit.* Kaul, 2024a, *op. cit.* Kaul, 2024b, *op. cit.* Weiden, 2022, *op. cit.*
COBENFY™ demonstrates statistically significant and clinically meaningful reductions in the severity of illness, as measured by the Clinical Global Impressions-Severity scale (CGI-S), compared to placebo.	Brannan, 2021, *op. cit.* Kaul, 2024b, *op. cit.*

BILLING CODE 4120–01–C

We also received a public comment in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for COBENFY™, which we summarized in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18107).

After review of the information provided by the applicant and the

public comment received in response to the New Technology Town Hall meeting, we stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18107 through 18108) that we had the following concerns regarding whether COBENFY™ meets the substantial clinical improvement criterion. We noted that the applicant did not identify a patient population for which COBENFY™ could be used that is unresponsive to or ineligible for other available treatments. The applicant asserted that COBENFY™'s efficacy and side effect profile make it a valuable option for patients who respond inadequately to current treatments and that COBENFY™ may be an effective treatment option for patients experiencing disruptive negative symptoms. To support these assertions, we noted that the applicant provided data on COBENFY™ from three 5-week, randomized, double-blind trials (EMERGENT–1, EMERGENT–2, and EMERGENT–3) that compared COBENFY™ to placebo and from two unpublished 52-week open-label trials (EMERGENT–4 and EMERGENT–5). While the exclusion criteria are unknown for EMERGENT–5, we noted that the other trials excluded patients with a history of treatment resistance to schizophrenia medications, and we therefore questioned how the trials demonstrated that COBENFY™ can treat patients unresponsive to other therapies. In addition, we did not receive data indicating that other antipsychotics cannot manage negative symptoms. We also noted that if a patient experiences a side effect on one antipsychotic, they may not experience the same side effect on another antipsychotic. Similarly, if one antipsychotic does not work for a patient, it does not necessarily mean another typical or atypical antipsychotic would not work for that patient. Therefore, we questioned if COBENFY™ is the only treatment option for patients with inadequate response to current treatments or for those experiencing negative symptoms.

The applicant also asserted that COBENFY™ significantly improves outcomes relative to previously available therapies. To support this assertion, the applicant provided data from three 5-week clinical trials (EMERGENT–1, EMERGENT–2, and EMERGENT–3) that compared COBENFY™ to placebo and a literature review on TD (Cornett et al., 2017). However, COBENFY™ was compared to placebo in these trials, and data was not provided comparing COBENFY™ to currently available therapies. We noted that, per the applicant, there are more than 20 FDA-approved therapies for schizophrenia, and we stated we were interested in additional information comparing clinical outcomes with COBENFY™ to these therapies, such as with regard to reduction in symptoms of schizophrenia and/or side effects, improved medication adherence, or other outcomes described under the regulations at § 412.87(b)(1)(ii)(C), to inform an assessment of whether COBENFY™ provides a substantial clinical improvement over existing treatment options.

In addition, with respect to the claim that COBENFY™ offers a side-effect profile that has the potential to enhance outcomes by improving tolerability and expanding treatment options, the applicant stated that the provided literature review on TD (Cornett et al., 2017) supports the theory that blockade of dopamine receptors by dopamine antagonists contributes to the development of TD, which COBENFY™ does not affect. We noted that the study stated that typical antipsychotics are the most likely to cause TD, while atypical antipsychotics may be associated with a decreased prevalence of TD, and we, therefore, stated we were unclear if the applicant is stating that COBENFY™ may reduce the prevalence of TD only compared to typical antipsychotics. We also noted that this literature review only discussed TD, which is one potential side effect of some schizophrenia treatments, and no other provided evidence related to rates of other potential side effects seen with existing schizophrenia treatment options, such as cardiac arrhythmias, metabolic syndrome, and tremor, were compared to the rates for COBENFY™. We stated that we would appreciate further information comparing the overall benefit-risk profile of COBENFY™ to previously available antipsychotics in order to assess if COBENFY™ provides a substantial clinical improvement over other available therapies. We also noted that the applicant stated that the EMERGENT trials demonstrated that COBENFY™ is well-tolerated and that measures of extrapyramidal symptoms, weight gain, and somnolence were similar between groups. However, given that the trials were only 5 weeks in duration and some side effects, such as tardive dyskinesia, can take longer to occur, we questioned whether these rates of adverse events may increase over time. For these reasons, we questioned the assertion that COBENFY™ improves tolerability and side-effects relative to previously available therapies.

The applicant claimed that COBENFY™ demonstrates statistically significant and clinically meaningful reductions in the severity of illness compared to placebo, as measured by the Clinical Global Impression-Severity (CGI–S) scale. According to the applicant, the CGI–S is a global assessment tool used to rate the overall severity of a patient's illness, and rather than being specific to positive, negative, or cognitive symptoms, it instead gives an overall sense of how severe schizophrenia is perceived to be at a given time. However, we questioned long-term efficacy, given that the only data submitted for this claim was from two 5-week trials (EMERGENT–1 and EMERGENT–3).

We invited public comments on whether COBENFY™ meets the substantial clinical improvement criterion.

Comment: A few commenters urged CMS to approve new technology add-on payments for COBENFY™. These commenters highlighted that COBENFY™ offers a critical new option for a patient population that has seen limited innovation despite urgent unmet need, has been effective in reducing positive and negative symptoms of schizophrenia demonstrated over 1 year of use, and provides an alternative option for patients to avoid the significant side effects associated with antipsychotic medications, such as TD, significant weight gain, metabolic disturbances, sedation and fluid retention, among others. A commenter stated that by offering a temporary payment adjustment, the new technology add-on payment ensures that hospitals don't face financial penalties for making clinically-driven decisions that benefit the schizophrenic community because hospitals are reimbursed through MS–DRG rates that struggle to reflect the value of innovative therapies. In addition, the commenter stated that without the new technology add-on payment, institutions may default to outdated inpatient care models that overlook recent advances in science and patient experience, simply to remain financially viable. This commenter also stated that delays in access to novel therapeutics increase the likelihood of patient relapse, readmission, or discontinuation of medication. The commenter further highlighted that inadequate treatment of schizophrenia contributes to severe consequences, including neurological damage, worsening symptoms, and an average lifespan that is 15 years shorter than that of the general population.

Another commenter stated that CMS should ensure coverage of new therapies, such as COBENFY™, to allow clinicians the ability to choose medications based on their expertise and patient needs, while also allowing patients to benefit from the full range of schizophrenia treatment options and to determine which therapy is an appropriate, advantageous option for them.

Response: We thank the commenters for their input and have taken it into consideration in determining whether COBENFY™ meets the substantial clinical improvement criterion as discussed later in this section. We note that whether a technology receives new technology add-on payments or not does not affect coverage of the technology or the ability for hospitals to provide a technology to patients where appropriate.

Comment: The applicant for COBENFY™ submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant asserted that COBENFY™ satisfies the substantial clinical improvement criterion by introducing the first novel pharmacological approach to schizophrenia treatment in decades. The applicant reiterated that COBENFY™ fundamentally differs from all existing antipsychotics as a first-in-class muscarinic agonist that selectively targets M1 and M4 receptors without blocking dopamine receptors. The applicant also stated that COBENFY™ has the potential to break the cycle of treatment resistance progression through its innovative mechanism and that the placebo-controlled trials submitted as part of its application were scientifically appropriate for evaluating this groundbreaking medication. The applicant also noted COBENFY™'s differentiated safety profile relative to existing antipsychotics across both 5-week and 52-week trials, as well as comprehensive long-term data that confirms sustained efficacy.

In response to CMS's concern that the applicant did not identify a patient population for which COBENFY™ could be used that is unresponsive to other available treatments, the applicant stated that by leveraging its novel mechanism of action, COBENFY™ offers a promising alternative that addresses multiple unmet needs in patients with schizophrenia by providing an effective and safe treatment option, particularly because all other approved antipsychotics work through varying degrees of dopamine receptor modulation.

In response to CMS's concern that the clinical trials excluded patients with a history of treatment resistance to schizophrenia medications, and questioned how the trials demonstrate that COBENFY™ treats patients unresponsive to other therapies, the applicant clarified that FDA recognizes treatment-resistant schizophrenia as a distinct indication from the general treatment of schizophrenia, as evidenced by FDA granting a separate indication to clozapine for treatment-resistant patients. The applicant also stated that treatment-resistant schizophrenia is estimated to affect only about 30 percent of individuals with the disease, meaning that roughly 70 percent of patients do not meet the criteria for treatment resistance and typically respond to standard therapies. The applicant asserted that while the COBENFY™ clinical trials focused on the primary indication of schizophrenia, the trials' exclusion of patients with documented treatment resistance does not preclude potential benefits across a broad segment of the schizophrenia population, namely the 70 percent of patients who do not meet the criteria for treatment resistance. The applicant further stated that because COBENFY™ does not rely on dopamine receptor antagonism, this therapy creates the potential for broader benefit. The applicant stated that medical literature suggests that the occurrence of treatment resistance in schizophrenia may develop through successive treatment failures, a cycle perpetuated by the limited mechanistic diversity of available therapies, such that patients experiencing insufficient response or intolerable side effects with one antipsychotic often encounter similar challenges when switching to another. The applicant explained that COBENFY™ presents an opportunity to interrupt patients' progression toward treatment resistance by offering a genuinely different pharmacological option. The applicant also stated that, although COBENFY™ does not carry a specific FDA-approved indication for treatment-resistant schizophrenia, it provides clinicians with an entirely different neurobiological approach that has the potential to benefit patients across the disease spectrum, including but not limited to, those who have experienced inadequate response or intolerable side effects with traditional antipsychotics that modulate dopamine receptors.

The applicant also stated that the side effects associated with conventional antipsychotics frequently lead to antipsychotic discontinuation and stem directly from dopamine receptor blockade and other associated receptor interactions, contributing to the cycle of treatment failures. The applicant asserted that COBENFY™'s fundamentally different mechanism of action significantly reduces the risk of these dopamine-related side effects, such as weight gain, diabetes, TD, extrapyramidal symptoms, sedation, and cognitive dulling, and may only result in manageable and transient effects, such as nausea and dyspepsia. The applicant also stated that there is a significant economic burden associated with managing antipsychotic-induced side effects due to the chronic nature of schizophrenia treatment and the potential need for long-term management of side effects, which can result in costs greater than $10,000 to $15,000 per patient annually. The applicant stated that COBENFY™ may reduce the need for such costly interventions, providing not only a clinically significant alternative but also a financially prudent option for healthcare systems and patients. The applicant asserted that this further highlights how COBENFY™ addresses the real unmet needs faced by patients with schizophrenia and underscores its importance in breaking the cycle of treatment failures that contribute to treatment resistance development.

In response to CMS's request for additional information comparing COBENFY™'s clinical outcomes to other FDA-approved therapies, the applicant stated that it made the scientifically sound and regulatory-compliant methodological decision to conduct placebo-controlled trials. The applicant explained that it believes placebo-controlled trials represent the most rigorous and appropriate methodology for establishing the safety, tolerability, and efficacy profile of COBENFY™. The applicant stated that placebo-controlled clinical trials are sufficient as well as the standard approach for obtaining initial FDA approval. The applicant further explained that placebo-controlled trials are particularly appropriate for psychiatric medications because FDA specifically prefers them to evaluate efficacy and safety due to the unique challenges inherent in psychiatric research and considers them essential to establish that a drug has an effect beyond nonspecific trial effects, such as expectation, rater bias, and regression to the mean—all of which are prominent in psychiatric trials. The applicant reiterated the findings from the three 5-week trials (EMERGENT–1, EMERGENT–2, and EMERGENT–3) and

2 52-week trials (EMERGENT–4 and EMERGENT–5) submitted in its new technology add-on payment application. Additionally, the applicant noted that despite being placebo-controlled, these trials demonstrate the comparative advantages of COBENFY™ with respect to its safety profile across both the 5-week trials and 52-week trials, indicating the sustained tolerability advantage of COBENFY™.

In response to CMS's concern whether COBENFY™ improves tolerability and side-effects relative to previously available therapies, the applicant stated that COBENFY™'s unique mechanism of action suggests potential benefits over both typical and atypical antipsychotics, although the Cornett et al. (2017) review it submitted only focused on typical antipsychotics. The applicant explained that, unlike any existing antipsychotics, COBENFY™ does not target dopamine receptors, which is the fundamental mechanism implicated in TD development. The applicant, therefore, asserted that this represents a categorical distinction rather than a marginal improvement, suggesting that COBENFY™ results in potential TD risk reduction compared to all current antipsychotics, both typical and atypical.

In response to CMS's concern that the clinical trials submitted in its application may be too brief in duration to observe some side effects, such as TD, the applicant summarized the safety data from the EMERGENT clinical trials. Specifically, the applicant stated there were no cases of TD reported in the three 5-week clinical trials, with the primary adverse effects being mild gastrointestinal symptoms. The applicant highlighted that the two 52-week EMERGENT trials did not show any new safety concerns compared with the 5-week trials. The applicant also stated that COBENFY™ demonstrated sustained symptom improvement through 52 weeks of treatment, and the trials only observed two cases of TD, which the primary investigator adjudicated as unrelated to treatment with COBENFY™, as the patients had pre-existing TD histories. The applicant asserted that the EMERGENT–4 and EMERGENT–5 52-week clinical trials directly address the potential emergence of delayed adverse effects and provide compelling evidence of COBENFY™'s long-term tolerability compared to the characteristic adverse effects associated with both typical and atypical antipsychotics that the applicant notes are commonly understood to be a result of prolonged dopamine receptor blockage, which COBENFY™ avoids. The applicant provided the side effect data from COBENFY™'s package insert: nausea (19 percent), dyspepsia (18 percent), vomiting (15 percent), hypertension (11 percent), abdominal pain (8 percent), diarrhea (6 percent), dizziness (5 percent), and tachycardia (5 percent). The applicant also indicated that motor disturbances, sedation, vision impairments, seizures, weight gain, hyperlipidemia, insulin resistance/diabetes, QTc prolongation, extrapyramidal symptoms, tardive dyskinesia, and sexual dysfunction are common antipsychotic side effects.

In response to CMS's concern whether the EMERGENT–1 and EMERGENT–3 clinical trials demonstrate COBENFY™'s long-term efficacy in reducing illness severity, the applicant provided additional evidence from the 52-week EMERGENT–4 trial, which showed COBENFY™ improves disease severity, as measured by the CGI–S scale, throughout a full 52-week trial period. The applicant explained that 47.4 percent of participants who remained on COBENFY™ by week 52 achieved CGI–S scores 3, compared to the mean baseline scores of 4, which reflected clinically meaningful improvement to mild disease severity or better. The applicant also stated that the EMERGENT–4 study demonstrates COBENFY™'s sustained efficacy across core schizophrenia symptoms as measured by the PANSS total score. Specifically, the applicant stated that nearly 70 percent of participants in the overall modified intent-to-treat population achieved at least a 30 percent reduction in PANSS total score from baseline to week 52, with 37.1 percent of participants achieving a 50 percent or greater reduction. The applicant asserted that the trial observed these PANSS total score improvements consistently across both positive and negative symptom domains, supporting the robust and durable therapeutic benefit of COBENFY™ beyond short-term clinical trials. Lastly, the applicant reiterated the EMERGENT–4 and EMERGENT–5 trials' pooled safety and tolerability data that it submitted in its application. The applicant asserted that these pooled data demonstrate durable effectiveness beyond dopamine receptor-based therapies, with a tolerability profile that can support improved medication adherence and reduce the risk of cumulative side effects that often complicate long-term antipsychotic use.

Response: We thank the applicant and commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received and all data received to date, we continue to have concerns as to whether COBENFY™ meets the substantial clinical improvement criterion to be approved for new technology add-on payments. Specifically, it remains unclear that COBENFY™ offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments for schizophrenia in adults and that the use of COBENFY™ significantly improves clinical outcomes over existing technologies.

While the applicant noted that COBENFY™ may be able to help patients who do not respond to or are intolerant of other therapies, the basis for this assertion was COBENFY™'s different mechanism of action rather than data supporting it. There was also no data provided indicating that other antipsychotics cannot manage negative symptoms. Therefore, we do not believe the evidence provided indicates COBENFY™ is a treatment option for patients who are unresponsive to or ineligible for other therapies.

With regard to the assertion that COBENFY™ improves clinical outcomes relative to previously available therapies, we note that there was no data provided comparing COBENFY™ to other therapies for schizophrenia in adults with regard to efficacy and safety. While the potential risk of certain side effects was noted for treatments for schizophrenia, there was no data provided comparing the relative risk of these side effects for COBENFY™ versus typical and atypical antipsychotics. In addition, while the applicant stated that COBENFY™'s different mechanism of action reduces the risk of the side effects that frequently lead to antipsychotic discontinuation, there was no comparative data provided indicating a lower risk of discontinuation for COBENFY™ compared to typical and atypical antipsychotics.

After consideration of all the information received from the applicant as well as the public comments we received, we are unable to determine that COBENFY™ represents a substantial clinical improvement over existing technologies for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not approving new technology add-on payments for COBENFY™ for FY 2026.

e. FIBRYGA® (Fibrinogen (Human))

Octapharma USA, Inc. submitted an application for new technology add-on payments for FIBRYGA® for FY 2026. According to the applicant, FIBRYGA® is a concentrated form of human fibrinogen, indicated for fibrinogen

supplementation in bleeding patients with acquired fibrinogen deficiency and the treatment of acute bleeding episodes in patients with congenital fibrinogen deficiency, including afibrinogenemia and hypofibrinogenemia. We note that the applicant is seeking new technology add-on payments for FIBRYGA® for FY 2026 specific to the 2024 supplemental Biologics License Application (sBLA) indicated for the fibrinogen supplementation in bleeding adult and pediatric patients with acquired fibrinogen deficiency.

Please refer to the online application posting for FIBRYGA®, available at *https://mearis.cms.gov/public/publications/ntap/NTP241007YU8UR*, for additional detail describing the technology and acquired fibrinogen deficiency.

With respect to the newness criterion, according to the applicant, FIBRYGA® was granted supplemental BLA approval from FDA on July 31, 2024, expanding its previous BLA indication to include the fibrinogen supplementation in bleeding adult and pediatric patients with acquired fibrinogen deficiency indication and to update the U.S. prescribing information to include this indication.[45] According to the applicant, FIBRYGA® became commercially available immediately after FDA approval for this expanded indicated use. The applicant stated that FIBRYGA® is administered intravenously with a recommended dose of 4g for adults per inpatient stay.

The applicant submitted a request for approval for unique ICD–10–PCS procedure codes for FIBRYGA® and was granted approval to use the following procedure codes effective October 1, 2025: XW133YB (Transfusion of nonautologous (human) fibrinogen concentrate, shelf-stable into peripheral vein, percutaneous approach, new technology group 11) and XW143YB (Transfusion of nonautologous (human) fibrinogen concentrate, shelf-stable into central vein, percutaneous approach, new technology group 11). The applicant stated that D68.4 (Acquired coagulation factor deficiency) and O72.3 (Postpartum coagulation defects) may be currently used to identify the indication for FIBRYGA® under the ICD–10–CM coding system. We stated the relevant ICD–10–CM code to identify the indication of fibrinogen supplementation in bleeding adult and pediatric patients with acquired fibrinogen deficiency that is relevant to this new technology add-on payment application would be D68.4 (Acquired coagulation factor deficiency). We invited public comments on the use of this ICD–10–CM diagnosis code to identify this indication for purposes of the new technology add-on payment, if approved.

Comment: Commenters expressinged general support for the use of the ICD–10–CM code for which CMS specifically sought input.

Response: We thank the commenters and agree that D68.4 (Acquired coagulation factor deficiency) accurately identifies the indication for FIBRYGA®.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that FIBRYGA® is not substantially similar to other currently available technologies because it is the only FDA-approved therapy available to treat acquired fibrinogen deficiency in bleeding patients. According to the applicant, in patients experiencing a major bleeding event, acquired fibrinogen deficiency often goes untreated because cryoprecipitate cannot be delivered fast enough. The applicant further explained that FIBRYGA®'s storage and preparation characteristics allow it to be readily available, giving patients reliable access to therapy that is potentially lifesaving, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for FIBRYGA® for the applicant's complete statements in support of its assertion that FIBRYGA® is not substantially similar to other currently available technologies.

[45] Previous FDA approvals for FIBRYGA®: In 2017, FDA granted FIBRYGA® approval under a BLA application for the treatment of acute bleeding episodes in adults and adolescents ≥ 12 years of age with congenital fibrinogen deficiency, including afibrinogenemia and hypofibrinogenemia. On December 23, 2020, FDA granted FIBRYGA® approval under a sBLA application for on-demand treatment of acute bleeding episodes to pediatric patients <12 years of age with congenital fibrinogen deficiency.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	Yes	FIBRYGA® works by providing a source of fibrinogen the body can use to form blood clots to stop bleeding. This is the same mechanism used by cryoprecipitate; however, FIBRYGA® provides a faster, safer, and more consistent dosage as compared to cryoprecipitate.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	It is not expected that the use of FIBRYGA® will affect the MS-DRG assignment.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	FIBRYGA® is currently the only FDA-approved therapy for treating acquired fibrinogen deficiency as a result of major bleeding. Fibrinogen is a key component in blood clot formation and levels in the body drop fast and early during an emergent major bleeding event. Low levels of fibrinogen can lead to impaired blood clot formation which is life threatening. Cryoprecipitate, the current standard of care, requires long processing times and transport to the point of care. Because of this, patients suffering from acquired fibrinogen deficiency during this early, critical period of a major bleed are often not treated as clinicians do not have a quickly available option to supplement declining fibrinogen levels. This potentially leads to adverse outcomes ranging from longer ICU stays to exsanguination. FIBRYGA® can be stored at room temperature and reconstituted quickly. These two properties allow it to be stored near the point of care and delivered quickly to bleeding patients who might otherwise not have received therapy. For the first time, FIBRYGA® offers an FDA-approved rapid treatment option for acquired hypofibrinogenemia in emergent bleeds.

As discussed in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18114), we noted the following concerns with regard to the newness criterion. While the applicant asserted that FIBRYGA® is currently the only FDA-approved therapy for treating acquired fibrinogen deficiency as a result of major bleeding, we noted that INTERCEPT® Fibrinogen Complex, which is the pathogen reduced cryoprecipitated fibrinogen complex (PRCFC) produced by the INTERCEPT® Blood System, is FDA-approved for the treatment and control of bleeding, including massive hemorrhage, associated with fibrinogen deficiency. The applicant further asserted that FIBRYGA® can be stored at room temperature, allowing it to be delivered quickly to bleeding patients and offering an FDA-approved rapid treatment option for acquired hypofibrinogenemia in emergent bleeds. However, we noted that INTERCEPT® Fibrinogen Complex has a 5-day shelf life at room temperature and is immediately available in a ready-to-transfuse form as a fibrinogen source.[46] [47] Therefore, we questioned whether FIBRYGA® and INTERCEPT® Fibrinogen Complex involve the treatment of the same or similar type of disease and the same or similar patient population. In addition, we noted that the applicant asserted that FIBRYGA® has the same mechanism of action as cryoprecipitate and works by providing a source of fibrinogen that the body can use to form blood clots to stop bleeding. We also noted that INTERCEPT® Fibrinogen Complex provides a source of fibrinogen, and therefore, we questioned whether FIBRYGA® and INTERCEPT® Fibrinogen Complex have the same mechanism of action. We also noted that the applicant asserted that use of FIBRYGA® is not expected to change the MS–DRG assignment for cases of acquired hypofibrinogenemia, and we therefore stated that FIBRYGA® would map to the same MS–DRGs as INTERCEPT® Fibrinogen Complex.

Therefore, as it appeared that FIBRYGA® and INTERCEPT® Fibrinogen Complex may use the same or similar mechanism of action to achieve a therapeutic outcome, are assigned to the same MS–DRGs, and treat the same or similar patient population and disease, we stated our belief that these technologies may be substantially similar to each other. We noted that, per our policy, if these technologies are substantially similar to each other, we use the earliest market availability date as the beginning of the newness period for the technologies. Therefore, if FIBRYGA® is substantially similar to INTERCEPT® Fibrinogen Complex, we stated that we believe the newness period for this technology would begin on May 5, 2021, the date INTERCEPT® Fibrinogen Complex became commercially available.[48] In addition, because the 3-year anniversary date of the INTERCEPT® Fibrinogen Complex's entry in the U.S. market (May 5, 2024) occurred in FY 2024, FIBRYGA® would not be considered new and would not be eligible for new technology add-on payments for FY 2026. We stated we were interested in information on how these technologies may differ from each other with respect to the substantial similarity criteria and the newness criterion.

We invited public comments on whether FIBRYGA® meets the newness criterion, including whether FIBRYGA® is substantially similar to INTERCEPT® Fibrinogen Complex for purposes of new technology add-on payments.

Comment: The applicant and another commenter submitted public comments regarding the newness criterion. In response to CMS's question of whether FIBRYGA® and INTERCEPT®

[46] Cerus Corporation. INTERCEPT® Blood System for Cryoprecipitation Package Insert For the manufacturing of Pathogen Reduced Cryoprecipitated Fibrinogen Complex. (Revised 5/2024). Available at: *www.fda.gov/media/143996/download.*

[47] *https://intercept-usa.com/products/intercept-fibrinogen-complex/#:~:text=INTERCEPT%C2%AE%20Fibrinogen%20Complex%20is,day%20post%2Dthaw%20shelf%20life.*

[48] INTERCEPT® Blood System received FDA approval on November 24, 2020, to produce PRCFC; however, as noted in FY 2022 IPPS/LTCH PPS final rule (86 FR 45149), the manufacturers stated that it was not available for sale until May 5, 2021.

Fibrinogen Complex have the same mechanism of action, the applicant and another commenter stated that they have different mechanisms of action. The applicant agreed with CMS that FIBRYGA® and INTERCEPT® Fibrinogen Complex are both used in patients with hemorrhage and acquired hypofibrinogenemia, but asserted that the clinical behavior, regulatory oversight, and administration logistics differ substantially. The applicant stated that, despite sharing a general mechanism of restoration of fibrinogen to support clot formation, the way each product achieves this outcome is materially distinct. The applicant provided a table comparing regulatory status, pathogen inactivation, composition, dosing, administration time, and storage between FIBRYGA® and INTERCEPT® Fibrinogen Complex. Another commenter further detailed that the INTERCEPT® Fibrinogen Complex, a cryoprecipitate, is derived from pooled plasma through the INTERCEPT™ Blood System, which uses amotosalen and UVA light for pathogen reduction, but contains variable concentrations of fibrinogen and other plasma proteins, including factor VIII, vWF, factor XIII, and fibronectin.

The applicant and another commenter stated that FIBRYGA®'s active component is fibrinogen. The other commenter further stated that FIBRYGA® is manufactured through a multi-step purification process including solvent/detergent treatment, ion exchange chromatography, and nanofiltration to remove viral contaminants, resulting in purity levels consistently above 96 percent and a defined fibrinogen concentration of 20 mg/mL, allowing for precise dosing based on patient weight and clinical needs. The applicant stated that the precise biochemical composition of FIBRYGA® ensures that it only works by interacting with thrombin in the last step of secondary hemostasis to promote clot formation via fibrin production from fibrinogen. The applicant and another commenter stated that, in addition to fibrinogen, cryoprecipitate and INTERCEPT® Fibrinogen Complex contain plasma proteins such as von Willebrand factor (vWF), factor VIII, factor XIII, and fibronectin. The applicant stated that this means cryoprecipitate and INTERCEPT® Fibrinogen Complex promote clotting via primary hemostasis, where vWF interacts with platelets to form a plug at the site of bleeding. The applicant further asserted that the presence of factor VIII results in the activation of factor X in the final common pathway of coagulation, resulting in the production of thrombin to promote clot formation. The applicant asserted that FIBRYGA® has a different mechanism of action because it does not work via these pathways.

The applicant also stated that FIBRYGA® is FDA-approved as a biologic for the treatment of acquired and congenital fibrinogen deficiency and is manufactured under a BLA with full FDA batch release and monitoring. The applicant stated that, in contrast, INTERCEPT® Fibrinogen Complex is approved as a blood component for the treatment of acquired fibrinogen deficiency. The applicant stated that INTERCEPT® Fibrinogen Complex is pathogen-inactivated but contains other active coagulation proteins that can potentially affect coagulation and carry risk when treating a patient who is only hypofibrinogenemic. The applicant and another commenter further asserted that since it is regulated as a blood component, fibrinogen content is variable and not standardized. The commenter further stated that a study by Stanford et al. (2023) found significant variability in cryoprecipitate-based products compared to the consistent profile of fibrinogen concentrate whereas, in contrast, Schulz et al. (2018) demonstrated that FIBRYGA® contains negligible amounts of other clotting factors and plasma proteins, creating a different pharmacologic profile than cryoprecipitated plasma products. The commenter also stated that Wikkelsø et al. (2013) demonstrated significant compositional differences between fibrinogen concentrates and cryoprecipitate products, affecting their mechanism of action in clinical settings. The applicant stated that FIBRYGA® is shelf-stable and ready to use immediately without the thawing wait time of INTERCEPT® Fibrinogen Complex. A commenter also expressed concerns regarding the accurate classification of products, reimbursement alignment, and recognition of meaningful clinical and operational differences within fibrinogen replacement therapies. The commenter stated that FDA classified and labeled INTERCEPT® Fibrinogen Complex as a Pathogen-Reduced Cryoprecipitated Fibrinogen Complex to distinguish it as a blood component, rather than a pharmaceutical.

In response to CMS's concern that FIBRYGA [acirc;] would map to the same MS–DRGs as INTERCEPT® Fibrinogen Complex, the commenter stated that while cases utilizing either product may initially map to the same MS–DRGs, substantial evidence indicates FIBRYGA® can affect ultimate MS–DRG assignments through improved outcomes. The commenter further explained that multiple clinical studies demonstrate that FIBRYGA® reduces the need for allogeneic blood product transfusions compared to cryoprecipitate-based products such as INTERCEPT® Fibrinogen Complex. The commenter stated that the FIBRES trial post-hoc analysis revealed a statistically significant decrease in allogeneic blood product use in specific patient populations, particularly those with longer surgical procedures (Bartoszko et al., 2022). The commenter stated that studies demonstrated that patients receiving fibrinogen concentrate had shorter ICU stays (5.13 days) compared to those receiving cryoprecipitate (6.15 days) after cardiac surgery (Ayaganov et al., 2024), and significantly shorter in-hospital and intensive care unit LOS compared to those receiving cryoprecipitate (Joseph et al., 2022). This commenter stated that reduced LOS, combined with the established decreased need for allogeneic blood product transfusion shown in multiple studies, provides strong evidence that patients receiving FIBRYGA® may experience different clinical courses and resource utilization patterns, which could influence MS–DRG-related metrics compared to those receiving INTERCEPT® Fibrinogen Complex.

In response to CMS's question about whether FIBRYGA® and INTERCEPT® Fibrinogen Complex treat the same or similar patient population and disease, the applicant and a commenter agreed with CMS that both treat bleeding associated with acquired fibrinogen deficiency but stated that FIBRYGA® and INTERCEPT® Fibrinogen Complex treat different patients. Specifically, the applicant and commenter asserted that FIBRYGA® is shelf-stable and can be stored in patient care areas such as trauma bays, operating rooms (ORs), Labor and Delivery (L&D) suites, and rural emergency settings for immediate use, and therefore treats a broader patient population than INTERCEPT® Fibrinogen Complex, which must be stored in a temperature-controlled blood bank and requires thawing and has cross-matching requirements. The applicant stated that FIBRYGA® avoids the delivery of vWF and factor VIII proteins present in INTERCEPT® Fibrinogen Complex and cryoprecipitate, which may increase thrombotic risk, especially in cardiovascular, trauma, and obstetric patients. A commenter further stated that due to the varied amounts of coagulation factors and plasma proteins

in the INTERCEPT® Fibrinogen Complex, accurate dosing is challenging in patients with coagulopathic bleeding (Stanford et al., 2023), whereas FIBRYGA® supports a more precise and timely therapeutic approach for those lacking blood type-compatible cryoprecipitate, those requiring urgent fibrinogen replacement, patients who are allergic and/or respond poorly to plasma products, and at-risk immunocompromised patients. The applicant reiterated that FIBRYGA® has been associated with a reduced need for packed red blood cells (PRBCs) and fresh frozen plasma (FFP), lowering the incidence of infections and allergic reactions.

In response to CMS's statement that FIBRYGA® and INTERCEPT® Fibrinogen Complex can be stored at room temperature and are immediately available, the applicant commented that FIBRYGA® may be stored at room temperature with a 48-month shelf life, while INTERCEPT® Fibrinogen Complex may be frozen with a 1-year shelf-life but expires 5 days after thaw. A commenter noted that there are significant differences in practical availability and storage requirements. The commenter agreed with CMS that INTERCEPT® Fibrinogen Complex has a 5-day room temperature shelf life once thawed, while FIBRYGA® has a 30-month shelf life at room temperature (2–25° C) in its unreconstituted form and can be stored directly in emergency departments, operating rooms, and obstetric units. The commenter referenced several additional studies of fibrinogen concentrate as supporting evidence, including Franchini and Lippi (2012), which noted that fibrinogen concentrate is stored as a lyophilized powder at room temperature and can be reconstituted quickly with sterile water and infusion volumes are low, allowing for rapid administration without delays for thawing or cross-matching; Winearls et al. (2021), which found that fibrinogen concentrate administration in trauma patients with major hemorrhage and hypofibrinogenemia was achieved significantly faster than cryoprecipitate; and Sørensen and Bevan (2010), which emphasized the critical difference in storage and availability between fibrinogen concentrate and cryoprecipitate products, noting that the latter's requirement for blood bank processing creates significant barriers to rapid administration in emergent bleeding scenarios.

Response: We appreciate the additional information from the applicant and commenter with respect to whether FIBRYGA® is substantially similar to existing technologies. However, we disagree with the applicant and commenter that FIBRYGA® has a new mechanism of action compared to cryoprecipitate and INTERCEPT® Fibrinogen Complex. We note that the applicant had originally stated in its application that FIBRYGA® works by providing a source of fibrinogen that the body can use to form blood clots to stop bleeding, which is the same mechanism used by cryoprecipitate, and we agree with this statement. We also believe that this is also the same mechanism of action as INTERCEPT® Fibrinogen Complex, a pathogen-inactivated cryoprecipitate, since all three products provide a source of fibrinogen to promote clot formation. We note that the applicant stated in its comment that FIBRYGA® only contains fibrinogen and therefore only works by interacting with thrombin in the last step of secondary hemostasis to promote clot formation and that INTERCEPT® and cryoprecipitate contain additional factors that may affect primary hemostasis. However, these products also contain fibrinogen and therefore the interaction with thrombin in secondary hemostasis remains the same across all three products. In addition, while the applicant and commenter provided differences between FIBRYGA® and INTERCEPT® Fibrinogen Complex in FDA regulatory classifications, pathogen inactivation, composition, dosing, administration time, and storage, we do not believe that the differences described in these public comments constitute a difference in the mechanism of action because, as stated previously, both treatments work by providing a source of fibrinogen the body can use to form blood clots to stop bleeding. Additionally, while the applicant stated that FIBRYGA® and INTERCEPT® Fibrinogen Complex have better safety profiles (thrombotic risk) and exposure risks (due to the need for PRBCs and FFP), we note that these differences in clinical outcomes are not evaluated as part of the mechanism of action, but rather substantial clinical improvement. Therefore, we believe that all three products have the same mechanism of action of providing exogenous fibrinogen to promote clot formation in patients with acquired fibrinogen deficiency.

In regard to the second criterion, whether a technology is assigned to the same or a different MS–DRG, we agree with the applicant's assertion in its application that it is not expected that the use of FIBRYGA® will affect the MS–DRG assignment. We note that outcomes that change as a result of the technology's administration do not change the MS–DRG mapping. We further note that, as the applicant stated in its application, cases requiring this type of treatment include a broad range of clinical situations in which a diagnosis of acquired coagulation factor deficiency or postpartum afibrinogenemia is present. Therefore, we continue to agree with the applicant that the use of FIBRYGA® would not change the MS–DRG assignment.

In regard to the third criterion, whether a technology treats the same or similar type of disease and patient populations, we disagree that the use of FIBRYGA® and INTERCEPT® Fibrinogen Complex involves different patient populations or disease types. Both technologies treat patients with hemorrhage and acquired hypofibrinogenemia and address fibrinogen deficiency in bleeding patients. While the applicant and a commenter commented that FIBRYGA® treats a different patient population than INTERCEPT® Fibrinogen Complex because it is shelf-stable and ready to use immediately, as we stated previously and in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45149), the 5-day shelf life post-thaw of INTERCEPT® Fibrinogen Complex makes it immediately available in a ready-to-transfuse form as a fibrinogen source. While the commenter stated that FIBRYGA® treats a different patient population because certain subsets of patients may benefit from fibrinogen concentrates such as those with plasma allergies or who are immunocompromised and for whom the risk of pathogen-reduced cryoprecipitate remains too great, these represent clinical practice considerations rather than distinct patient populations requiring different therapeutic approaches. Specifically, we note that the FDA label for FIBRYGA® also includes warning regarding risks of allergic reactions and transmission of infectious agents, noting that FIBRYGA® is made from human plasma.[49] Therefore, it seems that the factors described by the commenter relate to treatment preferences and logistical considerations within the same patient population (those with fibrinogen deficiency) rather than identifying a different patient population. We also note that both FIBRYGA® and INTERCEPT® Fibrinogen Complex are indicated for the same disease and the same patient population for which the applicant is seeking new technology add-on payment status. We further disagree that FIBRYGA®'s standardized,

[49] FIBRYGA®. USPI (06–19–25). Section 5: Warnings and Precautions.

purified formulation and ease of administration results in the treatment of a different patient population compared to INTERCEPT® Fibrinogen Complex because while these differences may or may not lead to improved clinical outcomes, they do not differentiate the disease or patient population being treated by the two technologies.

Because FIBRYGA® meets all three of the substantial similarity criteria, we believe FIBRYGA® is substantially similar to the INTERCEPT® Fibrinogen Complex. Therefore, we consider the beginning of the newness period for FIBRYGA® to begin on the date the INTERCEPT® Fibrinogen Complex became commercially available for the treatment and control of bleeding, including massive hemorrhage, associated with fibrinogen deficiency. Since INTERCEPT® Fibrinogen Complex has been on the U.S. market since May 5, 2021, the 3-year anniversary date of its entry onto the market occurred prior to FY 2026, and therefore, FIBRYGA® does not meet the newness criterion and is not eligible for new technology add-on payments for FY 2026. We note that we received public comments with regard to the cost and substantial clinical improvement criteria for this technology, but because we have determined that the technology does not meet the newness criterion and therefore is not eligible for approval for new technology add-on payments for FY 2026, we are not summarizing comments received or making a determination on those criteria in this final rule.

f. GRAFAPEX™ (treosulfan)

Medexus Pharma, Inc. submitted an application for new technology add-on payments for GRAFAPEX™ for FY 2026. According to the applicant, GRAFAPEX™ is a novel conditioning agent for use in combination with fludarabine as a preparative regimen for allogeneic hematopoietic stem cell transplantation (alloHSCT) in adult and pediatric patients one year of age and older with acute myeloid leukemia (AML) or myelodysplastic syndrome (MDS). We note that Medexus Pharma, Inc. submitted an application for new technology add-on payments for GRAFAPEX™ for FY 2023 under the name treosulfan, as summarized in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28296 through 28302), that it withdrew prior to the issuance of the FY 2023 IPPS/LTCH PPS final rule (87 FR 48920).

Please refer to the online application posting for GRAFAPEX™, available at *https://mearis.cms.gov/public/publications/ntap/NTP241007WE8D6*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, GRAFAPEX™ was granted NDA approval from FDA on January 21, 2025, for use in combination with fludarabine as a preparative regimen for alloHSCT in adult and pediatric patients one year of age and older with either AML or MDS. The applicant stated that GRAFAPEX™ became commercially available on February 20, 2025, because the applicant required time after FDA marketing authorization to build inventory and stock the third-party logistic wholesalers prior to commercial launch. We stated that we were interested in additional information regarding the cause of any delay in the technology's commercial availability, such as additional information about building inventory and stocking logistic wholesalers.

According to the applicant, GRAFAPEX™ is administered via intravenous infusion in conjunction with fludarabine from either a 1g or 5g vial after reconstitution with a 20mL or 100mL solution. Per the package insert,[50] the recommended dosage of GRAFAPEX™ is 10g/m^2 body surface area per day, given as a 2-hour intravenous infusion on 3 consecutive days (day -4, -3, -2) in conjunction with fludarabine before hematopoietic stem cell infusion on day 0. Per the applicant, based on the estimated average body size for Medicare patients being treated with GRAFAPEX™ and the labeling for a 3-day treatment, the estimated average dose per inpatient stay is 54g.

[50] Oncotec Pharma Produktion GmbH. GRAFAPEX™ [package insert]. (Revised 2/2025). Available at: *https://www.accessdata.fda.gov/drugsatfda_docs/label/2025/214759s001lbl.pdf.*

According to the applicant, effective October 1, 2022, the following ICD–10–PCS codes may be used to uniquely describe procedures involving the use of GRAFAPEX™: XW04388 (Introduction of treosulfan into central vein, percutaneous approach, new technology group 8) and XW03388 (Introduction of treosulfan into peripheral vein, percutaneous approach, new technology group 8). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for GRAFAPEX™ under the ICD–10–CM coding system. Please refer to the online application posting for the complete list of ICD–10–CM codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that GRAFAPEX™ is not substantially similar to other currently available technologies because GRAFAPEX™ is a new chemical entity with a unique structure and unique mechanism of action that permits it to be metabolized without the liver, resulting in reduced toxicity while still delivering effective treatment, including for older and/or more comorbid patients who are ineligible for myeloablative conditioning (MAC) and face higher relapse risk if reduced intensity conditioning (RIC) is used. The applicant stated that GRAFAPEX™ addresses the unmet need in this patient population and is the only FDA-approved alloHSCT conditioning agent for AML and MDS, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for GRAFAPEX™ for the applicant's complete statements in support of its assertion that GRAFAPEX™ is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	As a prodrug, GRAFAPEX™ is activated under normal physiological conditions with its own distinct cytotoxic activity toward hematopoietic precursor cells. GRAFAPEX™ has a unique mechanism of action that permits it to bypass the liver when it metabolizes, resulting in reduced toxicity while still delivering effective treatment, including for older patients and/or patients with significant comorbidities who are ineligible for MAC. Other alkylating agents used to date in alloHSCT conditioning—for example, busulfan, melphalan, cyclophosphamide—are all metabolized by the liver, which results in higher toxicity and leads to excess regimen-related morbidity and mortality observed in older and comorbid patients. GRAFAPEX™'s mechanism of action differs from other agents in this class because no other alkylating agent has a mechanism of action that bypasses treated patients' liver. GRAFAPEX™ also has a unique chemical structure resulting from two hydroxide (OH) bonds not present in other alkylating agents. Due to these OH bonds, GRAFAPEX™'s mechanism of alkylation is entirely different compared to busulfan and other alkylating agents. Its distinct structure and unique mechanism of alkylation further distinguish GRAFAPEX™'s mechanism of action. GRAFAPEX™'s activity is due to the spontaneous, pH-dependent conversion into a monoepoxide intermediate and diepoxybutan that bypasses liver metabolism. These epoxides alkylate and crosslink nucleophilic centers of DNA and other biological molecules involved in various physiological functions and are responsible for its stem cell depleting, immunosuppressive, and antineoplastic effects. Because GRAFAPEX™ uniquely bypasses liver metabolism, it reduces treatment-related toxicity compared to other alkylating agents used to date for allo-HSCT conditioning.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	Medexus anticipates that inpatient cases involving administration of GRAFAPEX™ typically will be assigned to MS-DRG 014 – Allogeneic Bone Marrow Transplant – because, in a majority of cases, it is anticipated that a patient would undergo GRAFAPEX™-based conditioning during the same inpatient admission as alloHSCT itself. It is Medexus's understanding that other conditioning treatments prior to alloHSCT also would typically be assigned to MS-DRG 014. Some cases also may be assigned to MS-DRG 004.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	GRAFAPEX™ offers a critical new treatment option for alloHSCT conditioning for a different patient population compared to existing technologies. Many patients—especially older patients and/or patients with significant comorbidities who have AML or MDS—are ineligible for MAC and face higher relapse risk with RIC. Multiple studies discuss the unmet need for this patient population based on previously available regimens and show that GRAFAPEX™-based regimens are particularly well-suited and provide significant clinical benefits for this patient population. If approved, GRAFAPEX™ will be the only FDA-approved alloHSCT conditioning agent for AML and MDS. A landmark multicenter RCT discusses how alloHSCT conditioning regimens available to date are not suitable for all patients, especially older and/or more comorbid patients—an important population for Medicare. The limits of MAC and RIC create an unmet medical need particularly for the growing number of older or comorbid AML and MDS transplantation candidates. Peer-reviewed studies confirm GRAFAPEX™ addresses the unmet need for this patient population, including studies comparing GRAFAPEX™-based regimens to busulfan-, melphalan-, cyclophosphamide-, and TBI-based regimens. GRAFAPEX™-based conditioning thus involves treatment of a different patient population compared to previously existing conditioning regimens.

BILLING CODE 4120–01–C

With respect to the substantial similarity criteria, we noted in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18119) that GRAFAPEX™ is an alkylating agent like other drugs used in conditioning, such as busulfan and melphalan. While the applicant stated that GRAFAPEX™ has a unique mechanism of action and a unique structure that allows it to bypass liver metabolism and subsequently reduce treatment related toxicity, we questioned whether bypassing liver metabolism is the mechanism of action of a conditioning agent, or if it instead relates to clinical outcomes, such as the side effect profile of GRAFAPEX™. In

regard to whether GRAFAPEX™ treats the same or similar type of disease and the same or similar patient population compared to existing technologies, we questioned whether GRAFAPEX™ treats a new patient population since MAC, nonmyeloablative conditioning (NMA), and RIC are all options for patients. Additionally, while MAC may not be preferred for older or more comorbid patients, RIC and NMA may still be options for these patients.

We invited public comments on whether GRAFAPEX™ is substantially similar to existing technologies and whether GRAFAPEX™ meets the newness criterion.

Comment: The applicant submitted a public comment reiterating that GRAFAPEX™ is not substantially similar to any existing technology because GRAFAPEX™ does not use the same or similar mechanism of action when compared to existing technologies to achieve a therapeutic outcome and does not involve treatment of the same or similar type of disease and patient population when compared to any existing technology. The applicant explained that GRAFAPEX™ is the first and only FDA-approved alloHSCT conditioning agent for AML and MDS, and that prior to FDA's approval of GRAFAPEX™, patients with AML or MDS had no FDA-approved treatment option for an alloHSCT conditioning agent. In addition, the applicant cited the FY 2020 IPPS/LTCH PPS final rule (84 FR 42243) and asserted that CMS has repeatedly recognized that being the first FDA-approved therapy for a particular indication is relevant to the new technology add-on payment newness criterion and relates to mechanism of action. The applicant further stated that GRAFAPEX™ is the first drug with its mechanism of action approved by FDA to treat patients with AML or MDS and, therefore, GRAFAPEX™ is not substantially similar to existing technologies and meets the newness criterion.

The applicant also reiterated that GRAFAPEX™ is a new chemical entity and novel prodrug of a bifunctional alkylating agent with antileukemic properties used for alloHSCT conditioning. The applicant further specified that GRAFAPEX™ is a non-enzymatically activated prodrug that targets bone marrow cells for alkylation, and the pharmacologically inactive treosulfan is converted spontaneously under physiological conditions into the active monoepoxide intermediate (2S,3S)-1,2-epoxybutane-3,4-diol-4-methanesulfonate) and finally to active L-diepoxibutane (2S,3S)-1,2:3,4-diepoxybutane). The applicant also stated that GRAFAPEX™ has a unique chemical structure resulting from two hydroxide bonds that are not present in other alkylating agents and due to these unique hydroxide bonds, GRAFAPEX™'s mechanism of alkylation is entirely different than that of busulfan and other alkylating agents. The applicant stated that the distinct structure and unique mechanism of alkylation further distinguish GRAFAPEX™'s mechanism of action from all other alkylating agents.

The applicant provided additional explanation of GRAFAPEX™'s mechanism of action and chemical properties of the medication. The applicant stated that not all alkylating agents are prodrugs, and neither busulfan or melphalan are prodrugs. The applicant contrasted the mechanism of action of GRAFAPEX™ with cyclophosphamide, the only other alkylating agent used for alloHSCT conditioning that is also a prodrug, and stated that the mechanism of action for cyclophosphamide requires enzymatic breakdown by the liver to activate the drug. The applicant then stated that GRAFAPEX™'s mechanism of action is uniquely characterized by non-enzymatic bioactivation, which allows GRAFAPEX™ to bypass the liver when activating and producing its effect in the body, unlike other alkylating agents. The applicant asserted that GRAFAPEX™ being a prodrug and an agent that is non-enzymatically activated are especially important in the bone marrow transplant (BMT) space because the act of processing a drug in the liver increases the inflammatory milieu and predisposes patients to adverse events such as veno-occlusive disease and graft-versus-host disease. Additionally, the applicant stated these aspects result in spontaneous conversion under normal physiological conditions, such that it is activated in the blood, as opposed to requiring enzymatic activity in order to activate like other alkylating agents. The applicant added that cyclophosphamide specifically requires the enzyme P450 in order to activate, which is mostly located in the liver. The applicant further explained that other alkylating agents used in alloHSCT conditioning, such as busulfan and melphalan, also require enzymatic activation just as cyclophosphamide does. The applicant asserted that GRAFAPEX™'s uniquely non-enzymatic mechanism of activation is a distinct and critical aspect of its unique mechanism of action.

The applicant stated that the National Cancer Institute's definition of mechanism of action describes how a drug or other substance produces an effect in the body and, in certain cases, may help provide information about the safety of the drug and how it affects the body. The applicant stated that GRAFAPEX™'s unique mechanism of action also has the effect of reducing treatment-related toxicity compared to other alkylating agents used for alloHSCT conditioning. The applicant cited four publications to clarify GRAFAPEX's lower toxicity results from its distinct mechanism of action. The applicant stated that Romanski et al. (2018) noted the low organ toxicity of treosulfan-based conditioning compared with busulfan-based treatment and that the clinical exposure of the lungs and brain to the epoxide (the active form of GRAFAPEX™) was lower than to busulfan while the exposure to bone marrow was similar, indicating that the distinct non-enzymatic activation of GRAFAPEX™ is connected to the clinical observations that treosulfan-based conditioning regimens demonstrate lower hepato-, pulmo-, and neurotoxicity than busulfan-based conditioning regimens, but comparable myeloablation strength.[51] The applicant also stated Chichra et al. (2024) found that patients receiving a GRAFAPEX™-based regimen experienced fewer acute toxicities than the patients receiving a melphalan-based regimen and that severe mucositis and diarrhoea were significantly less frequent with GRAFAPEX™ than melphalan. The applicant cited Lorenzo et al. (2021) regarding the ability for successful pregnancy or fatherhood after alloHSCT with GRAFAPEX™ related to lower gonadal toxicity compared to other alkylating agents such as busulfan.[52] The applicant added that Scheulen et al. (2000) observed these types of differences between GRAFAPEX™ and other alkylating agents, noting that neither severe nephrotoxicity, bladder toxicity, cardiotoxicity, nor severe central nervous system toxicity that had been reported after high-dose treatments with other alkylators such as ifosfamide

[51] Michael Romanski et al., Treosulfan Pharmacokinetics and its Variability in Pediatric and Adult Patients Undergoing Conditioning Prior to Hematopoietic Stem Cell Transplantation: Current State of the Art, In-Depth Analysis, and Perspectives, 57 Clin. Pharmacokinet. 1255, 1255 (2018).

[52] Lorenzo Lazzari et al., Treosulfan-Based Conditioning Regimen Prior to Allogeneic Stem Cell Transplantation: Long-Term Results From a Phase 2 Clinical Trial, 11 Frontiers Oncology art. no. 731478, at 9 (2021); Rohtesh S. Mehta et al., Long-Term Outcomes and Quality of Life with Treosulfan-Based Conditioning in Hematological Malignancies, 9 Blood Advances 2691, 2693 (2025) (''Mehta et al. (2025)'') (''The 16 pregnancies observed in our cohort are encouraging, contrasting with the 4 reported pregnancies in a very large registry study following nonmyeloablative HCT.'').

or cyclophosphamide was evident after high-dose treosulfan.[53] The applicant also stated that Scheulen at al. (2000) discussed these differences in the context of GRAFAPEX™'s mechanism of action, stating that, in contrast to busulfan, high-dose treosulfan did not induce severe hepatotoxicity or veno-occlusive disease in the nine patients treated at or above MTD of 47 g/m2, and that this might be considered a consequence of the different mode of alkylation and the reliable i.v. infusion of high-dose treosulfan. The applicant asserted that these points confirm GRAFAPEX™'s unique mechanism of action and demonstrate that bypassing liver metabolism and allowing for delivery of the alkylating agent directly to the blood is a key aspect of GRAFAPEX™'s mechanism of action by reflecting and underscoring the distinct way that GRAFAPEX™ produces an effect in the body.

In response to CMS's note that MAC, NMA, and RIC are all options for patients with AML or MDS, the applicant stated that this does not reflect the clinical realities, individual patient circumstances, and complex balancing that physicians and patients must work through in treating these conditions. The applicant further stated that while some previously available regimens could be used in older and/or more comorbid patients, not all such patients could be treated with a previously available regimen, and GRAFAPEX™-based conditioning provides a new and critically important option for these patients. The applicant also stated that GRAFAPEX™ is the first and only FDA-approved allo-HSCT conditioning agent to treat patients with AML or MDS. The applicant further stated that, within the population of patients with AML or MDS, GRAFAPEX™ is specifically designed to be used in conditioning regimens for older and/or more comorbid patients who are ineligible for previously existing MAC regimens where RIC may be attempted, but results in compromised effectiveness. The applicant explained that, because of MAC regimens' high toxicity and RIC regimens' higher risk of relapse, and thus, lower effectiveness, many patients would be prevented from pursuing BMT. In addition, the applicant stated that in the absence of GRAFAPEX™ availability, there is a subset of patients who would be viewed as nonviable BMT candidates due to the lack of an appropriate conditioning regimen. The applicant added that many patients with MDS or AML who are older and/or have significant comorbidities are not referred to and do not undergo alloHSCT; but instead, only a highly select group of patients in this sub-population are viewed as viable candidates for this treatment. The applicant cited a review article in which the authors note that age alone was one of the most frequent barriers to BMT because of dated assumptions and bias against older patients, a lack of prospective studies in older adults, perceived higher risks versus benefits, current guidelines, higher levels of comorbidities, and a bias against HSCT as a modality in older adults among physicians.[54] The applicant asserted that GRAFAPEX™ provides an appropriate, and therefore, a critical new conditioning regimen for this subpopulation that can help address the previously observed resistance to providing BMT for these patients.

The applicant cited multiple studies that discuss the unmet need among older patients and/or those with significant comorbidities for alloHSCT. The applicant stated that GRAFAPEX™-based regimens are particularly well-suited and provide significant clinical benefits for this patient population. The applicant reiterated that Scott et al. (2017), submitted as part of its application, discusses how alloHSCT conditioning regimens available prior to FDA approval of GRAFAPEX™, are not suitable for all patients, especially older and/or more comorbid patients. The applicant also stated that published literature recognizes the limits of conventional MAC and RIC regimens. In addition, the applicant stated that multiple peer-reviewed studies submitted in its application confirm that GRAFAPEX™ is a critical novel regimen that addresses the unmet need for older and/or comorbid AML and MDS patients. The applicant also stated GRAFAPEX™-based conditioning uniquely provides a regimen with myeloablative-intensity combined with significantly lower toxicity, without an increase in mortality. The applicant asserted that GRAFAPEX™-based conditioning, thereby fuses RIC regimens' lower organ toxicities with MAC regimens' potent antileukemic properties, expanding the availability of myeloablative conditioning to a new patient population. The applicant reiterated results from Beelen et al. (2022), which per the applicant, demonstrates the superiority of GRAFAPEX™-based conditioning over busulfan-based conditioning in overall survival (OS), event-free survival (EFS), non-relapse mortality (NRM), and adverse events, such as GVHD in older and/or more comorbid patients who were ineligible for MAC. The applicant stated that the authors of the pivotal phase 3 clinical trial, Beelen et al. (2022), concluded that the treosulfan regimen appears particularly suitable for older AML and MDS patients.

In response to CMS's request for additional information regarding the cause of delay in commercial availability, the applicant reiterated that GRAFAPEX™ received FDA approval on January 21, 2025, and the first commercial sale of GRAFAPEX™ occurred on February 20, 2025. The applicant further explained that, in its new technology add-on payment application, it had estimated the amount of time (2 to 3 months) after FDA-approval required to bring GRAFAPEX™ to market, which included building inventory and stocking the third-party logistic wholesalers. The applicant stated that during the 1-month period prior to commercial availability, it undertook critical activities to ensure complete readiness across both product and services to support all stakeholders, which included: transfer of NDA ownership from Medac in Germany to the applicant in the U.S.; submission of required FDA filings; shipping the final drug product from its manufacturing site in Germany to the U.S., which required the product to be cleared by U.S. Customs and Border Protection; labeling and preparation of the product into approved packaging; conduction of batch record reviews; releasing the final product to the applicant's third-party logistics provider for distribution to the market; and ensuring that all wraparound services, such as pharmacovigilance program, medical affairs training and certification, and its patients services hub, were fully operational. The applicant asserted that the newness period for GRAFAPEX™ should begin on the date of commercial availability, February 20, 2025.

Response: We thank the applicant for its comment. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for GRAFAPEX™, we agree with the applicant that GRAFAPEX™ has a unique mechanism

[53] Max E. Scheulen et al., Clinical Phase I Dose Escalation and Pharmacokinetic Study of High-Dose Chemotherapy with Treosulfan and Autologous Peripheral Blood Stem Cell Transplantation in Patients with Advanced Malignancy, 6 Clinical Cancer Research 4209, 4209 (2000).

[54] Colin Flannelly et al., Barriers to Hematopoietic Cell Transplantation for Adults in the United States: A Systematic Review with a Focus on Age, 26 Biol. Blood Marrow Transplant. 2335, 2341 (2020).

of action because it is the first and only FDA-approved allo-HSCT conditioning agent for patients with AML and MDS. Therefore, we agree with the applicant that GRAFAPEX™ is not substantially similar to existing treatment options and meets the newness criterion.

With regards to the commercial availability of GRAFAPEX™, as we have discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. Although the applicant stated in its public comment that GRAFAPEX™ became commercially available on February 20, 2025, the date of first sale, we note that we do not consider the date of first sale of a product, or first shipment of a product, as an indicator of the entry of a product onto the U.S. market; neither of these dates indicate when a technology in fact became available for sale (88 FR 58802). It is unclear from the information provided when the technology first became available for sale and, absent additional information from the applicant, we cannot determine a newness date based on a documented delay in the technology's availability on the U.S. market. Therefore, we consider the beginning of the newness period for GRAFAPEX™ to commence on January 21, 2025, when GRAFAPEX™ received FDA marketing authorization.

With respect to the cost criterion, the applicant provided two analyses to demonstrate that GRAFAPEX™ meets the cost criterion. Each analysis followed the order of operations summarized in the following table.

GRAFAPEX™ COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for GRAFAPEX™.
Claims identified	Scenario 1: 713 claims mapping to 2 MS-DRGs, with 98.46% of claims mapping to MS-DRG 014 (Allogeneic Bone Marrow Transplant) and 1.54% of claims mapping to MS-DRG 004 (Tracheostomy With MV >96 Hours Or Principal Diagnosis Except Face, Mouth And Neck Without Major O.R. Procedures). Scenario 2: 466 claims mapping to two MS-DRGs, with 97.64% of claims mapping to MS-DRG 014 (Allogeneic Bone Marrow Transplant) and 2.36% of claims mapping to MS-DRG 004 (Tracheostomy With MV >96 Hours Or Principal Diagnosis Except Face, Mouth And Neck Without Major O.R. Procedures).
Charges removed for prior technology	The applicant removed 100% of charges associated with drugs and cellular therapies (revenue centers 025x, 026x, and 063x), as an estimate of the percentage of total charges that the technology would replace could not be determined. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Scenario 1: - Average case-weighted threshold amount: $368,736 - Final inflated average case-weighted standardized charge per case: $559,537 Scenario 2: - Average case-weighted threshold amount: $368,795 - Final inflated average case-weighted standardized charge per case: $559,369

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both scenarios, the applicant asserted that GRAFAPEX™ meets the cost criterion.

We invited public comments on whether GRAFAPEX™ meets the cost criterion.

Comment: The applicant reiterated that the two cost criterion analyses submitted with its application demonstrate that GRAFAPEX™ meets the cost criterion.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under both of the scenarios. Therefore, GRAFAPEX™ meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that GRAFAPEX™ offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments because GRAFAPEX™ offers a critical new treatment option and addresses an unmet need for alloHSCT conditioning for older and/or more comorbid patients who have AML or MDS and are ineligible for currently available MAC regimens and face higher relapse risk if a RIC regimen is used. Additionally, per the applicant, GRAFAPEX™ significantly improves clinical outcomes relative to existing technologies because GRAFAPEX™-based conditioning has shown superiority in survival (in terms of overall and event-free survival) and non-relapse mortality, as well as significant reductions in adverse events, such as graft-versus-host disease (GVHD), veno-occulsive disease (VOD), and infections, compared to previously available regimens. The applicant provided 10 studies to support these claims, as well as 1 background article

that, per the applicant, indicates that many patients with AML or MDS, especially those who are older and/or have significant comorbidities, are ineligible for MAC regimens, and face higher risk of relapse with RIC regimens.[55] The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for GRAFAPEX™ for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
GRAFAPEX™ offers a treatment option for allo-HSCT conditioning for older and/or more comorbid patients who have AML or MDS, who are ineligible for currently available MAC regimens. Am J Hematol. 2022;97(8):1023-1034. Shimoni A, Robin M, Iacobelli S, et al. Allogeneic hematopoietic cell transplantation in patients with myelodysplastic syndrome using treosulfan based compared to other reduced-intensity or myeloablative conditioning regimens. A report of the chronic malignancies working party of the EBMT. Br J Haematol. 2021;195(3):417-428. The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	

[55] Background articles are not included in the following table but can be accessed via the online posting for the technology.

GRAFAPEX™ -based conditioning has shown superior outcomes for event-free survival (EFS), overall survival (OS), and non-relapse mortality (NRM), and significant reductions in several adverse events.	Beelen, 2024, *op. cit.* Wedge, 2020, *op. cit.* Fraccaroli, 2024, *op. cit.* Bug, 2023, *op. cit.* Nagler, 2017, *op. cit.* Gavriilaki, 2023, *op. cit.* Pasic, 2024, *op. cit.* Chichra, 2024, *op. cit.* Beelen, 2022, *op. cit.* Shimoni, 2021, *op. cit.*

BILLING CODE 4120–01–C

We also received a public comment in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for GRAFAPEX™, which we summarized in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18121 through 18122).

After review of the information provided by the applicant and the public comment received in response to the New Technology Town Hall meeting, we stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18122 through 18123) that we had the following concerns regarding whether GRAFAPEX™ meets the substantial clinical improvement criterion. The applicant stated GRAFAPEX™ offers a conditioning treatment regimen option for older and/or more comorbid patients with AML or MDS who are ineligible for currently available MAC regimens due to their high toxicity and higher relapse risk with RIC regimens. The applicant provided 11 studies which it stated show that GRAFAPEX™-based regimens reduce the toxicity, non-relapse related mortality, and treatment related mortality associated with MAC without resulting in the increased incidence of relapse associated with RIC. However, we noted that in two studies provided by the applicant comparing a GRAFAPEX™-based regimen to RIC, there was a higher rate of relapse with the GRAFAPEX™-based regimen. Specifically, in Fraccaroli et al. (2024), patients treated with a GRAFAPEX™ regimen demonstrated a higher cumulative incidence of relapse compared to the melphalan treatment group (24 percent vs. 0 percent, p=0.006). Similarly, we noted that Bug et al. (2023) found that a fludarabine plus GRAFAPEX™ conditioning regimen had a higher cumulative incidence of relapse (34.7 percent) compared to a fludarabine plus fractionated total body irradiation conditioning regimen (18.3 percent, p=0.018).

Additionally, we stated that as the applicant noted in its Town Hall comment, GRAFAPEX™-based regimens are not the only intermediate-intensity or RTC regimens. Specifically, the applicant mentioned three additional RTC regimens in addition to GRAFAPEX™-based regimens: fludarabine <160mg/m2 plus busulfan 12.8mg/kg, fludarabine 35mg/m2 × 4 plus busulfan 3.2mg/kg × 2 plus total body irradiation 2Gy, and fludarabine plus melphalan 140mg/m2. We also noted that RIC and NMA are additional options for these patients. Therefore, we questioned if GRAFAPEX™-based regimens are the only treatment options for patients ineligible for MAC.

With respect to the assertion that GRAFAPEX™ significantly improves clinical outcomes relative to services or technologies previously available, the applicant stated that GRAFAPEX™-based conditioning has shown superior outcomes for event-free survival, overall survival, and non-relapse mortality, as well as significant reductions in several adverse events. To support its statements, the applicant provided 1 randomized trial for GRAFAPEX™ and 9 retrospective studies, which were also cited in support of the prior claim. However, we questioned the generalizability of these studies to the Medicare population. First, none of the studies assessing GRAFAPEX™ evaluated the treatment in a U.S. population; rather, all of the studies were conducted outside the U.S, and we questioned whether differences in treatment guidelines and regimens between countries could affect generalizability to the Medicare population. Second, we noted that, of the submitted studies directly assessing GRAFAPEX™, 7 had a majority of participants in the GRAFAPEX™ treatment arm under 65 years and 1 study (Wedge et al., 2020) did not include any participants over 66 years of age in the GRAFAPEX™ treatment group, and we therefore questioned whether outcomes seen in these studies are generalizable to the Medicare population. Third, relative to the number of Medicare patients with AML or MDS who may be eligible for alloHSCT, two studies (Chichra et al., 2023; Fraccaroli et al., 2024) included small sample sizes among the GRAFAPEX™ treatment arms. In particular, Chichra et al. (2023) only contained 11 patients in the matched sibling donor/matched unrelated (MRD/MUD) donor fludarabine plus GRAFAPEX™ group and 16 patients in the haploidentical (Haplo) donor fludarabine plus GRAFAPEX™ group. Fraccaroli et al. (2024) included only 21 patients in the melphalan group and 21 patients in the GRAFAPEX™ group. Given these small sample sizes, we questioned whether these studies would be generalizable to the Medicare population due to the potential influence of confounding variables. We also noted that in Beelen et al. (2024), about half of the data was missing for the comorbidity index and over half of the data was missing regarding the disease risk, which are characteristics that could impact efficacy, making it difficult to fully compare the treatment groups.

We further noted that while some studies showed improved overall survival, a lower NRM, and reduced

adverse events with the GRAFAPEX™-based regimen, there were some conflicting results across studies. First, while the applicant stated GRAFAPEX™-based regimens have shown improved overall survival (OS), we noted that in Bug et al. 2023, Chichra et al. 2023, and Fraccaroli et al. 2024, OS was similar between the GRAFAPEX™-based regimen and RIC. Specifically, 2-year OS was 67.8 percent in the GRAFAPEX™-based regimen in Bug et al. 2023 and 66.9 percent in the fludarabine/TBI group (HR 1.08 (95 percent CI, 0.67–1.75)). In Chichra et al. 2023, 5-year OS was 53 percent in those treated with a GRAFAPEX™-based regimen (Flu-Treo) and 62 percent in those treated with fludarabine/melphalan (Flu-Mel) in the MRD/MUD transplant group (p=0.694) and 28 percent in Flu-Treo and 41 percent in Flu-Mel in the Haplo transplant group (p=0.770). In Fraccaroli et al. (2024), the 2-year survival was 66 percent in both the fludarabine-cyclophosphamide-melphalan and fludarabine-cyclophosphamide-GRAFAPEX™ groups (p=0.8).

Second, the applicant asserted superior outcomes for GRAFAPEX™ in non-relapse mortality (NRM). However, we stated that multiple studies showed that GRAFAPEX™ had a NRM rate that was higher than or similar to other technologies. Per Chichra et al. (2023), the 2-year NRM was similar between Flu-Treo and Flu-Mel in the MRD/MUD and Haplo groups, although the specific numbers were not provided in the study. In Gavriilaki et al. (2023), NRM was similar between fludarabine/GRAFAPEX™ (FT14) (20.8 percent) and fludarabine/busulfan (FB4) (22.6 percent) (p=0.46). Shimoni et al. (2021) found that 5-year NRM was statistically highest among patients who received MAC (34 percent) followed by those who received fludarabine and GRAFAPEX™ (30 percent) and lowest among those who received RIC (27 percent) (p=0.008). In Wedge et al. (2020), 3-year NRM was not statistically different (p=0.425) with a NRM of 13.6 percent for fludarabine/GRAFAPEX™, 33.3 percent for standard myeloablative (SMA) conditioning, and 17.9 percent for nonmyeloablative (NMA) conditioning.

Third, the applicant claimed a significant reduction in several clinically significant adverse events and complications that often lead to treatment-related mortality (TRM), such as graft-versus-host disease (GVHD), veno-occlusive disease (VOD), life-threatening infections, and organ toxicities. However, we stated that some studies showed similar or higher rates of adverse effects with the GRAFAPEX™-based regimen. Specifically, Fraccaroli et al. (2024) reported a similar frequency of GVHD and renal failure, with no cases of VOD in either group and no statistical comparison of infection rates presented. Per Beelen et al. (2022), the frequencies of treatment-emergent adverse events and serious adverse events were equally distributed between the study arms. The incidence of acute GVHD and chronic GVHD was similar between treatment groups or higher with the GRAFAPEX™-based regimen in Chichra et al. (2023), Bug et al. (2023), Gavriilaki et al. (2023), and Pasic et al. (2024). In Shimoni et al. (2021), there was no statistical difference in chronic GVHD among the treatment groups and in Wedge et al. (2020), acute GVHD was similar between FluTreo and NMA.

We invited public comments on whether GRAFAPEX™ meets the substantial clinical improvement criterion.

Comment: A commenter stated its support for the approval of GRAFAPEX™'s new technology add-on payment application. The commenter stated their experience as a physician using GRAFAPEX™ with patients and added that GRAFAPEX™ is the first and only FDA-approved alloHSCT preparative regimen for AML and MDS. The commenter also stated that GRAFAPEX™ uniquely combines myeloablative-level intensity with lower toxicity, making GRAFAPEX™-based conditioning distinctly suitable for the AML or MDS patients who are older and/or have significant co-morbidities and would not be able to tolerate a higher-toxicity MAC regimen, but would have a significant risk of compromised outcomes with a lower-intensity RIC regimen. The commenter described their utilization of GRAFAPEX™ in their clinical practice and research, citing several studies [56] [57] where the commenter was a lead or co-author. In addition, the commenter cited the phase II clinical trial of GRAFAPEX™ conducted by Deeg et al. (2018) [58] and stated it found that GRAFAPEX™ results in minimal toxicity and very low NRM in a cohort of patients up to 70 years old, two-thirds with co-morbidity scores of 3 or higher, patients with a history of prior allo-HSCT, and patients previously treated with cytotoxic therapy for malignancies preceding AML or MDS/CMML. The commenter further stated that GRAFAPEX™ is distinct among alloHSCT conditioning agents due to its unique combination of myeloablative-level intensity with notably lower toxicity, providing an important new tool for patients who are older and/or have significant comorbidities.

Response: We thank the commenter for its input and have taken it into consideration in determining whether GRAFAPEX™ meets the substantial clinical improvement criterion as discussed later in this section.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant stated that GRAFAPEX™ represents a substantial clinical improvement over previously existing therapy options because GRAFAPEX™ offers an alloHSCT conditioning treatment option for older and/or more comorbid patients who have AML or MDS, who are ineligible for previously available MAC regimens. In addition, the applicant asserted that GRAFAPEX™-based conditioning has shown superior outcomes for EFS, OS, NRM, and significant reductions in several adverse events. Further, the applicant stated that clinical tradeoffs in RIC regimens include compromised effectiveness, increased risk of relapse, and additional negative side effects. The applicant asserted that GRAFAPEX™ offers a conditioning regimen for older and/or more comorbid patients with MAC-level intensity without the increased relapse risk of RIC for those that cannot tolerate MAC-level conditioning from a toxicity perspective. The applicant also asserted that its application, Town Hall presentation, and Town Hall comment discuss in detail evidence demonstrating GRAFAPEX's unique clinical benefits and significant clinical improvement for older and/or more comorbid populations with AML or MDS compared to a wide range of many previously available regimens, including conventional MAC regimens, RIC or NMA regimens, and other regimens that potentially could be described as ''reduced toxicity conditioning'' or ''RTC'' regimens.

In response to CMS's note that RIC and NMA are options for older and/or more comorbid patients, the applicant

[56] Filippo Milano et al., Treosulfan-based conditioning is feasible and effective for cord blood recipients: a phase 2 multicenter study, 4 Blood Advances 3302, 3308 (2020).

[57] Mehta RS, Lee SJ, Gooley TA, Thur L, Dahlberg A, Delaney C, Gyurkocza B, Vo PT, Deeg HJ, Milano F. Long-Term Outcomes and Quality of Life with Treosulfan-Based Conditioning in Hematological.

[58] H. Joachim Deeg et al., Transplant Conditioning with Treosulfan/Fludarabine with or without Total Body Irradiation: A Randomized Phase II Trial in Patients with Myelodysplastic Syndrome and Acute Myeloid Leukemia, 24 Biology Blood & Marrow Transplantation 956, 962 (2018).

stated that is not necessarily true for all patients, and the clinical consequences of RIC regimens should be taken into account, namely that such regimens involve reduced treatment intensity leading to higher rates of relapse and other adverse effects. The applicant further stated that GRAFAPEX™ provides a critical treatment option for the set of older and/or more comorbid AML or MDS patients who otherwise would not be candidates for BMT due to the lack of a suitable conditioning regimen. The applicant stated that Scott et al. (2017) concluded that MAC is superior to RIC when patients can tolerate the regimen due to RIC's substantially higher relapse rate with only a modest decrease in transplant-related mortality (TRM). The applicant stated that prior to the availability of GRAFAPEX™, patients would have either no option at all or, in an effort to do something to treat their life-threatening conditions, would be faced with no choice other than RIC and its significantly increased risk of relapse and additional negative side effects. The applicant added that Beelen et al (2022) concluded that the GRAFAPEX™-based conditioning regimen led to superior outcomes after alloHSCT compared with the reference RIC busulfan regimen, thereby appearing particularly suitable for older AML and MDS transplantation candidates. In addition, the applicant stated that other studies, such as Wedge et al. (2020) and Pasic et al. (2024), that have similarly focused on patients ineligible for conventional MAC regimens, have also confirmed the Beelen et al. (2022) results. Specifically, the applicant highlighted that Wedge et al. (2020), which studied mostly MDS patients, found similar overall survival among GRAFAPEX™, standard myeloablative conditioning (SMA), and NMA regimens with GRAFAPEX™ having lower rates of chronic GVHD and similar rates of acute GVHD compared to both SMA and NMA. The applicant also stated that Pasic et al. (2024) found significantly higher overall and event-free survival with GRAFAPEX™ compared to RIC and Nagler et al. (2017) found a relative lack of adverse effects in patients treated with a GRAFAPEX™-based conditioning regimen.

In response to CMS's concern regarding the higher rate of relapse with GRAFAPEX™-based conditioning regimens compared to RIC in Fraccaroli et al. (2024) and Bug et al. (2023), the applicant asserted that the isolated results of overall relapse in these two studies do not reflect the totality of evidence submitted within its application or the overall weight of the data. The applicant stated that this type of isolated analysis fails to acknowledge the positive outcomes reflected in these two studies. The applicant further stated that, in terms of overall relapse, the Fraccaroli et al. (2024) and Bug et al. (2023) results are outliers compared to the multiple additional peer-reviewed, published studies that it provided in its new technology add-on payment application. The applicant asserted that the nature of clinical research is such that results are not always uniform across all studies for every single outcome measure and that they submitted multiple studies for this reason, and state that CMS has noted that it evaluates the new technology add-on payment ''substantial clinical improvement'' criterion based on a ''totality of circumstances'' analysis, and the body of literature presented in their application and their comments reflects a totality of circumstances based on more than ten peer-reviewed published studies showing strong evidence and trends of superiority in key clinical outcomes including EFS, OS, and NRM for GRAFAPEX™-based regimens compared to many other existing conditioning regimens. In addition, the applicant reiterated the Bug et al. (2023) and Fraccaroli et al. (2024) studies' results regarding NRM and stated that NRM is an especially significant outcome measure for older patients and/or those with significant comorbidities, an important subpopulation for Medicare, who may be considered for BMT because they face particularly significant risk of treatment-related mortality.

In response to CMS's questions regarding the submitted studies' generalizability to the Medicare population, the applicant stated the cited literature includes significant percentages and numbers of Medicare-eligible patients which demonstrates the extensive study of treatment with GRAFAPEX-based conditioning in patients who are older and/or have significant comorbidities or disabilities, as is typically reflective of the majority of Medicare beneficiaries. The applicant highlighted several examples of additional peer-reviewed literature which demonstrate that GRAFAPEX™ has been used and studied specifically in U.S. populations, in addition to the Canadian and European cohorts, and stated that these articles indicate positive results with GRAFAPEX-based conditioning that are consistent with the studies previously submitted.[59] [60] [61] [62] The applicant stated that the multiple studies it provided with Canadian and European patient populations are also generalizable to the Medicare population, as clinical guidelines in these countries do not vary in meaningful ways from U.S. clinical guidelines in this area, and there is no evidence indicating that patients' experiences of AML or MDS or responses to conditioning regimens vary depending on the country where they are located. Additionally, the applicant stated that clinical guidelines and treatment practices for older patients with AML or MDS are similar throughout the developed world, including Europe, Canada, and the United States, with data used across the globe to develop treatment recommendations. The applicant also stated that both European and U.S. BMT clinical guidelines include and describe GRAFAPEX™ as a myeloablative conditioning treatment option.

In response to CMS's question whether the age of patients in the studies submitted are generalizable to the Medicare population, the applicant stated that its application and this submitted comment included multiple peer-reviewed published studies that enrolled significant percentages and numbers of both older patients and patients with disabilities and significant comorbidities. The applicant asserted that the patients in its submitted studies are highly generalizable to the Medicare population, which includes not only individuals age 65 or older but also patients with significant comorbidities and disabilities. The applicant summarized the patient demographics of seven studies in its application that included those over 65 years of age and more comorbid participants.[62] [63] [64] [65] [66] [67] [68] [69] The applicant reiterated that there is a subpopulation of AML or MDS patients who are older and/or have significant comorbidities and who, prior to the availability of GRAFAPEX™, were not considered candidates for BMT because their treatment teams concluded there was no appropriate conditioning regimen available. In addition, the

[59] Eneida R. Nemecek et al., Conditioning with treosulfan and fludarabine followed by allogeneic hematopoietic cell transplantation for high-risk hematologic malignancies, 17 Biology Blood & Marrow Transplantation 341 (2011).

[69] Gavriilaki, 2023, op. cit.

applicant stated that AML and MDS are diseases that primarily affect older patient populations, with a median age at diagnosis 69 and 70 years, respectively. The applicant concluded by noting that GRAFAPEX™'s pivotal clinical trial observed no significant differences in safety or effectiveness between subjects age 65 or older and younger subjects.

In response to CMS's question about small sample sizes in two submitted studies and generalizability to the Medicare population, the applicant stated that it is important to place these 2 studies in the broader context of all the studies it submitted in its application and comments, including more than 10 published peer-reviewed studies in which GRAFAPEX™ was used to treat patients, representing hundreds of patients with consistent trends in key results. The applicant added that totaling the participants of all its submitted studies accounts for more than 3,000 patients, of which over 1,200 received treatment with GRAFAPEX™. The applicant emphasized that these studies also included significant numbers of patients 65 years or older and/or patients with significant comorbidities and disabilities, who are highly generalizable to the Medicare population. In addition, the applicant stated that several of the studies provided had significantly larger patient populations, and while the Chichra et al. (2023) and Fraccaroli et al. (2024) had small sample sizes compared to other submitted studies, they provide helpful confirmatory results comparing GRAFAPEX™-based conditioning regimens to other available regimens. The applicant also stated that these two studies focused on the specific patient population and sub-population of interest, contributing to the totality of circumstances in demonstrating GRAFAPEX™'s significant clinical value. In addition, the applicant stated that AML and MDS are life-threatening and relatively rare conditions, and that FDA granted GRAFAPEX™ orphan drug designation in April 2015. The applicant asserted that notwithstanding the realities and challenges of rare diseases, it believes that the totality of data and evidence submitted provides a robust set of peer-reviewed, published literature demonstrating GRAFAPEX™'s significant clinical benefits for AML or MDS patients.

In response to CMS's concern about the Beelen et al. (2024) study's missing data, the applicant stated it is unclear what significance this missing data has to the GRAFAPEX™ results, since it was data for the comparator arms. The applicant asserted that it seems one would have to assume that all missing data was positive for the comparators in order to undermine the results with respect to GRAFAPEX™. The applicant further stated that Beelen et al. (2022) and other submitted studies in its application do not have missing data and demonstrate that GRAFAPEX™-based conditioning demonstrates superior EFS, OS, and NRM compared to previously available conditioning regimens.

The applicant asserted that the overwhelming majority of results and prominent trends of GRAFAPEX™ reflected in the peer-reviewed published literature demonstrate superior outcomes in EFS, OS, and NRM compared to a wide range of other available conditioning regimens, despite isolated outcome measures from certain individual studies. In response to CMS's concern regarding some conflicting outcome results, the applicant stated that the nature of different studies and comparator regimens is that specific data points and outcome measures are not always fully and uniformly consistent with respect to each individual metric across all studies. The applicant further stated that it provided a large body of evidence to present a fulsome picture of GRAFAPEX™'s substantial clinical benefits compared to several other existing conditioning regimens, including conventional MAC, RIC/NMA, and other conditioning regimens that could be described as ''reduced toxicity conditioning'' or ''RTC'' regimens. The applicant stated that the proposed rule did not identify concerns regarding the provided studies that show GRAFAPEX™'s superior EFS.

The applicant reiterated its belief that GRAFAPEX™-based conditioning has shown superior outcomes for EFS, OS, and NRM as well as significant reductions in several adverse events compared to other agents and regimens used in allo-HSCT conditioning. The applicant stated that the randomized, controlled Beelen et al. (2022) clinical trial demonstrated GRAFAPEX™'s superiority in EFS, OS, and NRM compared to busulfan-based conditioning. The applicant further stated that Beelen et al. (2024) replicated these results in GRAFAPEX™-treated patients compared to registries of melphalan- and busulfan-treated patients.

The applicant asserted the overall body of evidence demonstrates that physicians and researchers consistently turn to GRAFAPEX™ for older and/or more comorbid patients, and that GRAFAPEX™ results for NRM and OS are favorable in this patient population. The applicant reiterated the Shimoni et al. (2021) study's results and highlighted that the median age for patients who received a MAC regimen was 8 years younger than those who received GRAFAPEX™-based conditioning. The applicant stated that because clinicians often administer GRAFAPEX™ to older and/or more comorbid patients, when a retrospective cohort demonstrates similar results for GRAFAPEX™ and other treatments, it may at least be in part due to the GRAFAPEX™ cohort's older age and increase in comorbidities. In response to CMS's concern regarding similar OS between GRAFAPEX™-based regimens and RIC in certain studies, the applicant asserted that the selective focus on a single metric in the Bug et al. (2023), Chichra et al. (2024), and Fraccaroli et al. (2024) studies does not account for the multiple other submitted studies in its application in which GRAFAPEX™ demonstrated significantly improved, and even superior, OS compared to other conditioning regimens. The applicant further stated that this focus fails to account for GRAFAPEX™'s superior NRM results in the Fraccaroli et al. (2024) study, significantly improved NRM in the Bug et al. (2023) study, and fewer acute toxicities and infections in the Chichra et al. (2024) study. In addition, the applicant stated that the Chichra et al. (2024) study also highlighted GRAFAPEX™'s reduced hospital LOS compared to the melphalan-based regimen.

In response to CMS's concern regarding GRAFAPEX™'s similar NRM rate compared to other technologies in some studies, the applicant again stated that this isolated analysis fails to account for these studies' positive results as well as other studies in which GRAFAPEX™ showed significantly improved or superior NRM compared to other conditioning regimens. The applicant reiterated results from Chichra et al. (2024), Gavriilaki et al. (2023), Shimoni et al. (2021), and Wedge et al. (2020).

In response to CMS's concern that some studies showed some differences in the rate of adverse effects between the GRAFAPEX™-based regimen and comparators, the applicant asserted that this analysis does not assess or account for the overall body of data and totality of circumstances reflected in its provided studies and fails to account for the positive results for GRAFAPEX-based conditioning in the noted studies. The applicant reiterated the results of studies submitted with its new technology add-on payment application. The applicant also stated that other peer-reviewed publications have

similarly recognized GRAFAPEX™'s low organ toxicity, which multiple publications have attributed to the technology's unique mechanism of action. Specifically, the applicant stated that GRAFAPEX™'s distinct non-enzymatic activation targets the drug to the bone marrow and blood, sparing organs like the brain, lungs, and liver and helps account for the clinically observed lower hepato-, pulmo-, and neurotoxicity compared to busulfan-based conditioning regimens.

The applicant concluded by emphasizing that a one-study-at-a-time, one-metric-at-a-time type of analysis does not account for the overall thrust of the complete body of data and the significant, consistent trends it demonstrates. The applicant urged CMS to evaluate the body of peer-reviewed published literature with an eye toward the overall picture it presents, which it stated overwhelmingly demonstrates that GRAFAPEX-based conditioning has shown superior outcomes for EFS, OS, and NRM and significant reductions in several adverse events compared to other existing conditioning regimens.

Response: We thank the applicant and other commenter for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we agree with the applicant and commenter that GRAFAPEX™ represents a substantial clinical improvement over existing technologies because GRAFAPEX™ improves overall survival with similar or lower frequencies of clinically significant adverse events compared to existing treatments for allo-HSCT conditioning in patients with AML or MDS who are ineligible for MAC.

After consideration of the public comments we received and the information included in the applicant's new technology add-on payment application, we have determined that GRAFAPEX™ meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2026. Cases involving the use of GRAFAPEX™ that are eligible for new technology add-on payments will be identified by ICD–10–PCS codes XW03388 (Introduction of treosulfan into peripheral vein, percutaneous approach, new technology group 8) or XW04388 (Introduction of treosulfan into central vein, percutaneous approach, new technology group 8).

In its application, the applicant stated that the anticipated cost of GRAFAPEX™ is $610 for a 1 g vial and $3,050 for a 5 g vial. Per the applicant, based on the recommended dose (10g/m^2) and estimated average body size for Medicare patients being treated, 18 g of GRAFAPEX™ per treatment (three 1 g vials and three 5 g vials) is required for each day of a three-day course of treatment, totaling an average dose per inpatient stay of 54 g. Therefore, the applicant estimated that the average cost for GRAFAPEX™ is $32,940 per inpatient stay. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of GRAFAPEX™ is $21,411 for FY 2026.

g. IMDELLTRA® (tarlatamab-dlle)

Amgen, Inc. submitted an application for new technology add-on payments for IMDELLTRA® for FY 2026. According to the applicant, IMDELLTRA® is a novel, first-in-class bispecific T-cell engager (BiTE®) molecule for the treatment of adult patients with extensive stage small cell lung cancer (ES–SCLC) with disease progression on or after platinum-based chemotherapy. According to the applicant, IMDELLTRA® works by binding to the delta-like ligand 3 (DLL3) antigen expressed on the surface of SCLC tumor cells and the cluster of differentiation 3 (CD3) co-receptor expressed on the surface of T cells, causing T-cell activation, release of inflammatory cytokines, and lysis of DLL3-expressing cells.

Please refer to the online application posting for IMDELLTRA®, available at *https://mearis.cms.gov/public/publications/ntap/NTP241007BQ3UB*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, IMDELLTRA® was granted accelerated approval of its BLA from FDA on May 16, 2024, for the treatment of adult patients with ES–SCLC with disease progression on or after platinum-based chemotherapy. According to the applicant, IMDELLTRA® was commercially available immediately after FDA approval. The applicant stated that the first dose of IMDELLTRA® is 1 mg and all subsequent doses are 10 mg, with all doses administered by a healthcare provider as a 1-hour intravenous (IV) infusion. Per the applicant, the average inpatient dose is 7.3 mg based on available data. The applicant stated the only inpatient data available is for patients who experience cytokine release syndrome (CRS) or immune effector cell-associated neurotoxicity syndrome (ICANS) after IMDELLTRA® and it is unknown how many patients without these adverse events would receive IMDELLTRA® on an inpatient basis.

The applicant submitted a request for unique ICD–10–PCS procedure codes for IMDELLTRA® and was granted approval for use of the following procedure codes effective October 1, 2025: XW033NA (Introduction of tarlatamab-dlle antineoplastic into peripheral vein, percutaneous approach, new technology group 10) and XW043NA (Introduction of tarlatamab-dlle antineoplastic into central vein, percutaneous approach, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for IMDELLTRA® under the ICD–10–CM coding system. Please refer to the online application posting for the complete list of ICD–10–CM (and PCS) codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that IMDELLTRA® is not substantially similar to other currently available technologies because it has a unique mechanism of action as a BiTE® that simultaneously binds DLL3 on SCLC cells and CD3 on T cells and because it is the only therapy specifically studied and shown to improve outcomes for patients who are relapsed or refractory to two or more other therapies and those with treated, stable brain metastases, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for IMDELLTRA® for the applicant's complete statements in support of its assertion that IMDELLTRA® is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	IMDELLTRA® has a unique mechanism of action as the first and only approved BiTE® therapy targeting DLL3 across all patient populations and as the only BiTE® therapy approved for SCLC. IMDELLTRA®'s mechanism of action involves simultaneously binding the DLL3 antigen on a SCLC cell and the CD3 antigen on the patient's own T cells. The binding of IMDELLTRA® results in the formation of a synapse between T cells and DLL3-expressing cells, including tumor cells, leading to T-cell activation causing the release of inflammatory cytokines and lysis of DLL3-expressing cells. Thus, IMDELLTRA® is unique as the only T-cell directed immunotherapy approved for ES-SCLC. In contrast, other approved ES-SCLC treatments are cytotoxic chemotherapies that work by interfering with the ability of rapidly dividing cells to replicate and divide, which can lead to cell death in both cancerous and noncancerous cells. Lurbinectedin is an alkylating drug that binds to DNA, forming adducts that perturb the cell cycle and cause cell death in dividing cells. Topotecan and irinotecan are topoisomerase-1 inhibitors that bind topoisomerase-1-DNA complex and inhibit the repair of double-strand breaks in DNA in dividing cells. IMDELLTRA® has a novel mechanism of action targeting DLL3 for the treatment of ES-SCLC and is differentiated from existing ES-SCLC treatments due to the uniqueness of both this target and its tissue expression profile, which results in activation of the T cell and lysis of DLL3-expressing SCLC cells.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	The use of IMDELLTRA® to treat ES-SCLC is not expected to change the MS-DRG assignment of the case.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	IMDELLTRA® does not involve the treatment of the same or similar type of disease or the same or similar patient population when compared to existing technology because IMDELLTRA® is the first and only BiTE® therapy available for the treatment of patients with ES-SCLC who have had disease progression on or after platinum-based chemotherapy. Furthermore, although IMDELLTRA® is indicated to treat patients after relapsing on first line (1L) platinum-based chemotherapy, for the subset of these patients who have become relapsed or refractory (R/R) to two or more therapies, IMDELLTRA® is the only therapy that is approved by FDA and has been specifically studied and demonstrated improvements in this population. IMDELLTRA® also is the only FDA-approved second line therapy (2L) that has been studied in SCLC patients with treated, stable brain metastases.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18124), we noted that while the applicant asserted that IMDELLTRA® does not involve the treatment of the same or similar disease or patient population because it is the first BiTE® therapy for patients with ES–SCLC who have had disease progression on or after platinum-based chemotherapy, per the applicant, other FDA-approved therapies for the treatment of the same patient population (patients who have ES–SCLC with disease progression on or after platinum-based chemotherapy) are currently available, such as lurbinectedin and topotecan. Further, with respect to the applicant's statements that IMDELLTRA® is the only FDA-approved therapy that has been specifically studied and demonstrated improvements in the subset of ES–SCLC patients who have become R/R to two or more therapies or that have stable brain metastases, we stated our belief that these assertions may be relevant to substantial clinical improvement rather than newness and these patients may still be treated with lurbinectedin or topotecan. Therefore, we questioned the applicant's assertion that IMDELLTRA® treats a unique patient population compared to existing technology.

We invited public comments on whether IMDELLTRA® is substantially similar to existing technologies and whether IMDELLTRA® meets the newness criterion.

Comment: The applicant submitted a public comment reiterating that IMDELLTRA® meets the newness criterion because it is the first and only approved BiTE® molecule that binds the

antigen DLL3 expressed on the surface of SCLC cells and CD3 expressed on the surface of T cells causing T-cell activation, release of inflammatory cytokines, and lysis of DLL3-expressing cells for the treatment of 2L+ ES–SCLC, and IMDELLTRA® has a unique mechanism of action as the only BiTE® molecule approved for ES–SCLC. The applicant stated its continued belief that IMDELLTRA® treats a unique patient population and reiterated information presented in its application about limited research regarding outcomes of SCLC patients with treated, stable brain metastases treated with existing chemotherapy, like lurbinectedin and topotecan. The applicant also stated that, while some studies have been conducted on topotecan and SCLC patients with brain metastases, topotecan had an ORR of 10.5 percent in a Phase 2 trial, which is empirically lower than IMDELLTRA®'s reported 40 percent ORR in the phase 2 DeLLphi-301 trial. The applicant provided new evidence from the Phase 3 randomized controlled DeLLphi-304 study, which the applicant stated demonstrated a survival benefit in patients with brain metastases (untreated or treated, stable) treated with IMDELLTRA® as compared to standard of care chemotherapy.[70] The applicant stated that although other existing FDA-approved treatments for ES–SCLC may be prescribed in the real world for SCLC patients with brain metastases, given the high unmet need, these existing treatments do not have a randomized controlled Phase 3 trial demonstrating efficacy over the current standard of care. The applicant further stated that IMDELLTRA® does not treat the same or similar disease and same or similar patient population because it is the only FDA-approved treatment option for ES–SCLC patients with or without brain metastases who have progressed after initial platinum-based chemotherapy that has demonstrated improved survival outcomes.

Response: We thank the applicant for its comment. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for IMDELLTRA®, we agree with the applicant that IMDELLTRA® uses a unique mechanism of action because it is the only BiTE® therapy targeting DLL3 for the treatment of adult patients with ES–SCLC with disease progression on or after platinum-based chemotherapy. Therefore, we agree with the applicant that IMDELLTRA® is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on May 16, 2024, the date on which IMDELLTRA® was FDA approved.

With respect to the cost criterion, the applicant provided two analyses to demonstrate that IMDELLTRA® meets the cost criterion. Each analysis followed the order of operations summarized in the following table.

BILLING CODE 4120–01–P

IMDELLTRA® COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for IMDELLTRA®.
Claims identified	Scenario 1: 788 claims mapping to 16 MS-DRGs, with 43.02% of claims mapping to MS-DRG 180 (Respiratory Neoplasms with MCC). Scenario 2: 459 claims mapping to 5 MS-DRGs, with 73.86% of claims mapping to MS-DRG 180 (Respiratory Neoplasms with MCC).
Charges removed for prior technology	The applicant removed 100% of charges associated with drugs and cellular therapies to account for the chemotherapy agent IMDELLTRA® will replace. The applicant noted there may be removed charges for non-chemotherapy agents, but was conservative by removing 100% of the drug and cellular therapy charges. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardization file posted with the FY 2025 IPPS/LTCH PPS final rule and the impact file posted with FY 2023 IPPS/LTCH PPS final rule.
Inflation factor	The applicant applied an inflation factor of 12.9% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of a 10 mg dose of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. Per the applicant, it repeated this calculation for the 1 mg step up dose to confirm that, even if this dose is administered in the inpatient setting, the final inflated average case-weighted standardized charge per case exceeds the average case-weighted threshold for the cost criterion. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Scenario 1: - Average case-weighted threshold amount: $102,317 - Final inflated average case-weighted standardized charge per case: $230,190 Scenario 2: - Average case-weighted threshold amount: $73,433 - Final inflated average case-weighted standardized charge per case: $203,476

[70] Mountzios G, Sun L, Cho BC, et al. Tarlatamab in small-cell lung cancer after platinum-based chemotherapy. N Engl J Med (published online ahead of print June 2, 2025). DOI:10.1056/NEJMoa2502099.

BILLING CODE 4120–01–C

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both scenarios, the applicant asserted that IMDELLTRA® meets the cost criterion.

We invited public comments on whether IMDELLTRA® meets the cost criterion.

Comment: The applicant reiterated that IMDELLTRA® satisfies the cost criterion because the standardized charge per case exceeds the threshold for the cost criterion. The applicant also commented that a maximum new technology add-on payment amount for IMDELLTRA® should be calculated based on an average inpatient dose of 7.3 mg.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under both scenarios. Therefore, IMDELLTRA® meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that IMDELLTRA® represents a substantial clinical improvement over existing technologies because IMDELLTRA® offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments and the technology significantly improves clinical outcomes relative to services or technologies previously available. Specifically, per the applicant, IMDELLTRA® is a novel treatment option that offers substantial clinical improvement through deep and durable response for patients with ES–SCLC relapsed on platinum-based chemotherapy. The applicant further stated that IMDELLTRA® is the only approved DLL3-directed-CD3 T-cell engager for the treatment of ES–SCLC, for which there is a profound unmet need in this population who suffer from devastating outcomes and suboptimal care from limited and ineffective treatment options. The applicant provided four articles regarding outcomes from the phase I DeLLphi-300 and phase II DeLLphi-301 trials and the IMDELLTRA® prescribing information to support these claims, as well as 16 background articles about SCLC and existing treatments for the disease.[71] The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for IMDELLTRA® for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

[71] Background articles are not included in the following table but can be accessed via the online posting for the technology.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
The majority of ES-SCLC patients who are relapsed or refractory to 1L treatment are, or become, unresponsive to previously approved 2L treatments.	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.
There are limited treatment options for ES-SCLC patients who have relapsed, and IMDELLTRA® is a new option for SCLC patients who have relapsed and are resistant to initial treatment options.	Ahn M, Cho B, et al. Tarlatamab for Patients with Previously Treated Small-Cell Lung Cancer. N Eng J Med. 2023;389:2063-75. IMDELLTRA™ (tarlatamab-dlle) injection, for intravenous use; Amgen, Inc., 2024. The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
IMDELLTRA® is the first therapy that has shown meaningful improvements in outcomes in the subset of patients who have failed two or more prior therapies.	Ahn, 2023, *op. cit.* Sands J, Cho BC, et al. Tarlatamab Sustained Clinical Benefit and Safety in Previously Treated SCLC: DeLLphi-301 Phase 2 Extended Follow-up. Oral presentation (#OA10.03) at 2024 World Conference on Lung Cancer in San Diego, California. September 9, 2024. Dingemans A, Ahn M, et al. DeLLphi-301: Tarlatamab phase 2 trial in small cell lung cancer (SCLC) - Efficacy and safety analyzed by presence of brain metastasis. J Clin Oncology. 2024;42:8015. Amgen, Inc., 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
Outcomes on existing therapies for ES-SCLC continue to be very poor, particularly as all previously approved therapies have high relapse rates.	The applicant provided background information to support this claim, which can be accessed via the online posting for the technology.
IMDELLTRA® has shown substantial clinically meaningful improvement in outcomes relative to other available therapies for ES-SCLC patients.	Sands, 2024, *op. cit.* Ahn, 2023, *op. cit.* Amgen, Inc., 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
In ES-SCLC patients with stable brain metastases pre-treated with two or more prior therapies, IMDELLTRA® showed similar clinical outcomes as patients without brain metastases in post-hoc analysis.	Ahn, 2023, *op. cit.* Dingemans, 2024, *op. cit.* Amgen, Inc.,2024, *op. cit.* Dowlati A, Hummel H-D, et al. The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
IMDELLTRA® has a generally manageable safety profile and a low incidence of treatment-related neutropenia.	Amgen, Inc., 2024, *op. cit.* Ahn, 2023, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.

BILLING CODE 4120–01–C

We also received a public comment in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the

substantial clinical improvement criterion for IMDELLTRA®, which we summarized in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18126 through 18127).

We stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18127 through 18128) that, after review of the information provided by the applicant and the public comment received in response to the New Technology Town Hall meeting, we had the following concerns regarding whether IMDELLTRA® meets the substantial clinical improvement criterion. The applicant stated that IMDELLTRA® offers a treatment option for patients with 2L+ ES–SCLC that are unresponsive to, or ineligible for, currently available treatments, however, we stated it was unclear that these patients are unresponsive or ineligible for existing 2L+ treatments for ES–SCLC, such as lurbinectedin and topotecan. The applicant claimed that the majority of ES–SCLC patients who are relapsed or refractory to 1L treatment are or become unresponsive to previously approved 2L treatments. For this claim, the applicant provided background articles regarding treatment of ES–SCLC, but did not indicate a patient population that IMDELLTRA® treats that is ineligible or unresponsive to other 2L treatments. The applicant also claimed that there are limited treatment options for ES–SCLC patients who have relapsed and IMDELLTRA® is a new option for these patients. However, we noted that having limited treatment options does not demonstrate that these patients are unresponsive to or ineligible for any available therapies. In addition, while the applicant provided results from the pivotal DeLLphi-301 study of IMDELLTRA® stating that it is the first therapy that has shown meaningful outcome improvements in patients who have failed two or more prior therapies, the study did not list these therapies, and we also noted that retreatment with platinum-based chemotherapy was considered an additional line of therapy per the study. Therefore, it was unclear that the study demonstrated that patients had failed existing 2L+ treatments, including lurbinectedin and topotecan. For these reasons, we questioned the assertion that IMDELLTRA® offers a treatment for a patient population unresponsive to, or ineligible for, currently available treatments.

With respect to the applicant's statement that IMDELLTRA® improves clinical outcomes over existing technologies because outcomes on existing therapies for ES–SCLC continue to be very poor, particularly as all previously approved therapies have high relapse rates, and that, in the past 2 decades, relapsed ES–SCLC patients who have failed platinum-based chemotherapy have had few treatment options as only topotecan and lurbinectedin are FDA-approved and indicated for these patients, we noted that the applicant provided outcome data for topotecan and lurbinectedin, in addition to highlighting that lurbinectedin, pembrolizumab, and nivolumab failed to show a benefit in OS in the confirmatory phase 3 clinical trials. However, we stated that the applicant did not provide relapse rates for current therapies, including IMDELLTRA®, and did not compare the provided outcome data to IMDELLTRA®, and therefore we questioned how this demonstrates that IMDELLTRA® improves clinical outcomes relative to these therapies.

To support its other statements regarding improved outcomes for IMDELLTRA®, the applicant provided results from DeLLphi-301, a phase 2, single arm, open-label, international trial which evaluated antitumor activity and safety of IMDELLTRA® in patients with advanced SCLC previously treated with two or more lines of therapy.[72] However, we noted that, of the 134 patients treated with the target dose of IMDELLTRA®, only 14 were from North America (without further specification on the country), and we questioned whether differences in treatment guidelines between countries could affect generalizability to the Medicare population. We also noted that 75 percent (101/134) of the patients who took the approved dose of 10 mg in DeLLphi-301 had a previous use of a programmed death ligand 1 (PD–L1) or programmed death 1 (PD–1) inhibitor,[73] which are recommended as part of the initial therapy for ES–SCLC, and we therefore questioned whether the results of the DeLLphi-301 study were different between the group of patients who previously received these therapies versus those who did not. We further noted that the applicant also provided the Sands et al. (2024) presentation and the Dingemans et al. (2024) abstract which are unpublished overviews that do not provide full details on the study methods; therefore, we stated that we did not have sufficient information to evaluate these studies.

With respect to the claim that IMDELLTRA® has shown substantial clinically meaningful improvement in outcomes relative to other available therapies for ES–SCLC patients, we stated that the applicant provided outcomes for IMDELLTRA® from the DeLLphi-301 single arm, phase 2 trial and compared them to outcomes from trials for other approved treatments for patients who have relapsed on first-line chemotherapy. The applicant stated that IMDELLTRA®, lurbinectedin, and topotecan are FDA-approved and no treatments are specifically FDA-approved for 3L treatment. The applicant stated chemotherapy is a 3L treatment and has a mOS of 4.4 months, ORR of 21 percent, mDOR of 2.6 months, and mPFS of 2.3 months.[74] The applicant also noted that lurbinectedin can be used as a 3L agent, but mOS was 5.6 months according to real world data.[75] The applicant also stated IMDELLTRA® had an ORR of 40 percent, mDOR of 9.7 months, mPFS of 4.9 months, and mOS of 14.3 months,[76] with an mOS of 15.2 months after extended follow-up.[77] The applicant further noted that in a subgroup analysis of 22 patients with stable, treated brain metastases, IMDELLTRA® showed similar outcomes with an ORR of 54.5 percent, mPFS of 7.1 months, and mOS of 14.3 months.[78] The applicant stated the registrational study for topotecan included patients with brain metastases and reported a mOS of only 5.8 months,[79] while the pivotal phase II trial for lurbinectedin excluded patients with brain metastases and in a real-world analysis among 14 patients who received 3L therapy with lurbinectedin (11 of which with CNS metastases), the mOS was 5.6 months.[80] However, we noted that the applicant also stated in its Town Hall comment that tumor response (for example, ORR) can be adequately evaluated in a single-arm study, while OS and PFS endpoints must be interpreted with caution in single-arm trials and confirmatory phase 3 trials are needed to confirm OS and PFS results. Therefore, we questioned the applicant's use of OS and PFS to support improved clinical outcomes with IMDELLTRA® compared to previously available therapy. Additionally, the applicant stated that the trial demonstrated mOS of 14.3 months for IMDELLTRA®,[81] and compared it to lurbinectedin's mOS of 5.6 months according to real world

[72] Anh, 2023, *op. cit.*

[73] Anh, 2023, *op. cit.*

[74] Coutinho, 2019, *op. cit.*

[75] Desai, 2023, *op. cit.*

[76] Ahn, 2023, *op. cit.*

[77] Sands, 2024, *op. cit.*

[78] Dingemans, 2024, *op. cit.*

[79] von Pawel, 1999, *op. cit.*

[80] Desai, 2023, *op. cit.*

[81] Ahn, 2023, *op. cit.*

data,[82] but we questioned whether it is appropriate to compare clinical trial and real-world data. We noted, for example, that the phase 2 single arm trial for lurbinectedin noted an OS of 9.3 months (Trigo et al. (2020)), and we therefore questioned how the applicant chose the historical control it used in these comparisons of outcomes. In addition, the applicant noted that ORR can be evaluated in a single-arm study and provides the ORR for IMDELLTRA® (40 percent in 3L therapy [83] and 54.5 percent in patients with stable brain metastases [84]) but did not provide the ORR for topotecan or lurbinectedin in patients with stable brain metastases, nor in patients that are taking 3L therapy. Therefore, we questioned the applicant's assertion of improved clinical outcomes for IMDELLTRA® compared to previously available therapy.

We stated we agreed with the applicant that head-to-head trials, while preferred, are not required for comparing currently available therapy. However, we noted that among the clinical trial and real-world data provided for alternative therapies to IMDELLTRA®, there was no control for confounding variables to ensure similar patients were being compared to those who took IMDELLTRA®. Additionally, we noted that the real-world data provided for lurbinectedin as third line therapy and the data for the subset of patients from DeLLphi-301 with brain metastases were small sample sizes of 14 and 22, respectively, which may limit generalizability of these results to the Medicare population as confounding variables could affect the results. We noted that exclusion of patients with brain metastases from the pivotal phase 2 trial for lurbinectedin does not exclude use of this drug in this patient population.

We further questioned the use of von Pawel et al. (1999) study of topotecan as a comparator to IMDELLTRA® since it was conducted approximately 25 years before the IMDELLTRA® phase 2 trial (Ahn et al., 2023) and included some highly varied patient outcomes (such as topotecan duration of responses ranging from 9.4–50.1 weeks). We noted that guidelines and treatment protocols for SCLC have evolved over this extended period and the resulting changes in care standards may have impacted the outcomes observed from the older study versus the more recent one.

We stated that in addition, the applicant stated that clinical trials of topotecan and lurbinectedin reported higher rates of Grade 3 neutropenia than reported in the DeLLphi-301 study with IMDELLTRA® monotherapy but did not consider other serious adverse events such as cytokine release syndrome (CRS) or immune effector cell-associated neurotoxicity syndrome (ICANS), which are possible side effects for IMDELLTRA® but not for topotecan or lurbinectedin. We further noted that there was no control for potential confounding variables in the patient populations in the comparisons of neutropenia rates, and it is therefore difficult to draw conclusions regarding relative side effect profiles among these different trials.

We invited public comments on whether IMDELLTRA® meets the substantial clinical improvement criterion.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant stated that it is clear from currently available literature that patients with ES–SCLC after failing on chemotherapy have extremely poor outcomes on existing therapies, where response and survival are measured in just a few months, and that when survival is measured in months, it is clear patients need access to new, more efficacious treatments. The applicant commented that the evidence it previously submitted support that IMDELLTRA® satisfies the substantial clinical improvement criterion, and further stated that additional evidence and publications have become available, reinforcing that IMDELLTRA® is a substantial clinical improvement compared to prior therapy, with IMDELLTRA® representing the first FDA-approved therapy to demonstrate a substantial survival advantage over chemotherapy in 2L SCLC in a Phase 3 study. The applicant stated this new evidence unequivocally shows that IMDELLTRA® is a substantial clinical improvement for 2L+ ES–SCLC patients because it demonstrates that IMDELLTRA® provides statistically significant and clinically meaningful improvement in OS compared to other 2L+ approved therapies. Per the applicant, the new evidence includes results from the DeLLphi-304 trial, as well as an indirect treatment comparison (ITC) assessing the relative efficacy of IMDELLTRA® versus real-world U.S. physicians' choice of therapies in 3L+ ES–SCLC patients.[85]

Per the applicant, the DeLLphi-304 trial was a randomized, open-label, multicenter, global, Phase 3 trial of 509 patients that compared IMDELLTRA® (n=254) to standard of care chemotherapy (n=255) in patients with relapsed SCLC after platinum-based 1L chemotherapy. The applicant stated that standard of care chemotherapy was either topotecan, amrubicin, or lurbinectedin; the primary endpoint was OS; key secondary endpoints were PFS and patient-reported outcomes (PRO); and additional secondary endpoints included ORR, disease control, DOR, and safety. Per the applicant, the median age was 65. The applicant further stated that 45 percent of patients had brain metastases (current or prior), 35 percent had liver metastases at baseline, 71 percent received prior PD–L1 inhibitor therapy, and 44 percent had platinum-resistant disease. Per the applicant, the results demonstrated a higher, more durable anticancer activity for IMDELLTRA® compared to chemotherapy. Specifically, the applicant stated that IMDELLTRA® resulted in significantly longer OS compared to chemotherapy (median, 13.6 months vs. 8.3 months; [HR 0.60, 95% CI, 0.47 to 0.77; p<0.001]), significantly improved PFS (median, 4.2 months vs. 3.7 months [piecewise weighted average HR: 0.71; 95% CI: 0.59, 0.86; P < 0.002, restricted mean survival time (RMST) for PFS), improved ORR (35% vs. 20% [OR 2.13; 95% CI 1.43–3.18]), and a positive benefit:risk profile versus chemotherapy, with chemotherapy resulting in more frequent and high-grade adverse events. The applicant noted Kaplan-Meier estimates for 6-month and 12-month PFS were 30 percent and 20 percent, respectively, in the IMDELLTRA® group, compared with 23 percent and 4 percent in the chemotherapy group. In addition, the applicant stated that approximately 47 percent of responders remained on study without progression or death in the IMDELLTRA® group as compared to 15 percent in the chemotherapy group at the interim analysis; the median DOR was 6.9 months with IMDELLTRA® and 5.5 months with chemotherapy; and the Kaplan-Meier estimate of 12-month DOR was 41 percent with IMDELLTRA® and 13 percent with chemotherapy. The applicant stated that IMDELLTRA® improved PROs with statistically significant and clinically meaningful improvements over chemotherapy in

[82] Desai, 2023, *op. cit.*

[83] Ahn, 2023, *op. cit.*

[84] Dingemans, 2024, *op. cit.*

[85] Tapan U, Takundwa R, et al. (2025, March 26–29). A comparison of tarlatamab with real-world physicians' choice of therapies in patients with previously treated small cell lung cancer [Poster Presentation]. European Lung Cancer Conference, Paris, France.

dyspnea and cough after 18 weeks from baseline in DeLLphi-304, and that changes in chest pain were not statistically significant.

The applicant stated that the ITC, which was recently conducted by Tapan et al. (2025), assessed the relative efficacy of IMDELLTRA® versus real-world physicians' choice of therapies, including lurbinectedin and topotecan, in patients with previously treated ES–SCLC. The applicant stated that the ITC analysis used data from DeLLphi-301 and comparator data from the Flatiron Health Research database, which the applicant stated is a trusted real-world evidence source known for its high-quality, longitudinal, clinical information. The applicant also stated that patients included in the external control cohort from this database were treated with a variety of chemotherapies and/or immunotherapies, including lurbinectedin (18 percent), topotecan (15 percent), nivolumab (13 percent), paclitaxel (8 percent), pembrolizumab (7 percent), nivolumab + ipilimumab (5 percent), and others (34 percent). In addition, the applicant stated that the study employed best practices to enhance the reliability of the ITC assessment of treatment effects for IMDELLTRA® versus comparator regimens. To perform the ITC between balanced patient populations, the applicant stated that the study applied the DeLLphi-301 inclusion/exclusion criteria to the Flatiron Health data and adjusted for differences in a comprehensive list of key prognostic factors. The applicant further stated that E-values for hazard ratios (HRs) were estimated, ranging from 2.15 to 2.86, which suggested low likelihood of bias from potential unmeasured confounding variables.

The applicant stated that the ITC analysis demonstrated significantly longer OS, PFS, and a higher ORR for IMDELLTRA® versus comparator therapies after propensity score (PS) weighting was applied to balance baseline patient characteristics between cohorts. Per the applicant, the mOS was 15.2 months (95% CI: [10.8, NE]) in DeLLphi-301, which the applicant noted represents more than a two-fold increase in survival versus comparator regimens that had a mOS of 6.0 months (95% CI: [5.0, 7.1]) after adjusting for prognostic factors. The applicant stated the hazard ratio (HR) [95% CI] for OS was significantly in favor of IMDELLTRA® over comparator regimens at 0.45 (95% CI: [0.30, 0.68], p<0.001). The applicant stated that patients were free of progression for an extended period in the IMDELLTRA® cohort (mPFS: 4.9 months [2.9, 6.7]) compared to the comparator regimens cohort (mPFS: 3.1 [2.3, 3.7], after weighting) with a HR of 0.61 (95% CI: [0.43, 0.90], p=0.009). Additionally, the applicant noted significantly more patients treated with IMDELLTRA achieved ORR (40 percent) compared with patients receiving comparator regimens (19 percent, after weighting) and the odds of achieving ORR were 2.80 (95% CI: [1.44, 5.83], p=0.004) times higher for IMDELLTRA® versus comparator regimens. Per the applicant, the results for the prespecified sensitivity analyses (intended to examine impact on ITCs with different approaches to define real-world progression, to adjust for imbalances on more baseline variables, and to account for globally available regimens) were consistent or near identical to the primary analysis. The applicant also stated that this consistency across the primary and sensitivity analyses reinforces the robustness of the clinical benefit that IMDELLTRA® may offer over comparator regimens.

In response to CMS's concern about how IMDELLTRA™ demonstrates improved clinical outcomes relative to other current therapies without providing relapse rates or comparing outcome data, the applicant stated that IMDELLTRA® improves survival outcomes compared to previously available treatments. Specifically, the applicant stated that in SCLC, PFS is generally evaluated instead of relapse free survival, which is more commonly used in hematology oncology, and the PFS for lurbinectedin and topotecan may depend on whether there are CNS metastases, although such a difference has not been observed for IMDELLTRA®'s PFS benefit in DeLLphi-301 and DeLLphi-304. The applicant restated information from its application from the Desai et al. (2023) analyses. The applicant further stated that DeLLphi-304 demonstrated a significant PFS benefit with a 4.2 months median PFS with IMDELLTRA® and a 3.7 months median PFS with chemotherapy (piecewise weighted average HR: 0.71; 95% CI: 0.59, 0.86; P < 0.002, RMST for PFS). In addition, the applicant stated the Kaplan–Meier estimates for 6-months and 12-months PFS were 31 percent and 20 percent, respectively, in the IMDELLTRA® group, compared with 23 percent and 4 percent in the chemotherapy group. The applicant also stated that the chemotherapy group included patients on topotecan and lurbinectedin and DeLLphi-304 overall included patients with treated, stable brain metastases and untreated, asymptomatic brain metastases. Per the applicant, a subgroup comparison reported hazard ratios of PFS between IMDELLTRA® versus topotecan/amrubicin of 0.76 (95% CI: 0.62, 0.94) and versus lurbinectedin of 0.56 (95% CI: 0.34, 0.90). Additionally, the applicant stated that among responders, the DOR at 12 months was 41 percent for IMDELLTRA® and 13 percent for standard of care chemotherapies, reaffirming the substantial improvements of IMDELLTRA® in delaying progression compared to chemotherapies such as topotecan and lurbinectedin. Per the applicant, IMDELLTRA® has a significantly more durable anticancer response compared to chemotherapy treatments like lurbinectedin and topotecan, supporting that IMDELLTRA® substantially improves outcomes over previously available treatments for ES–SCLC.

In response to CMS's question about the use of OS and PFS to support improved clinical outcomes in a single-arm study, the applicant stated that DeLLphi-304 is the Phase 3 confirmatory trial needed to confirm superior survival benefit over previously available treatments. Per the applicant, the Phase 2 DeLLphi-301 OS and PFS data is very similar to that reported in the Phase 3 DeLLphi-304 trial with significantly improved OS and PFS, validating the claim that Phase 2 data represent an improved clinical outcome with IMDELLTRA® compared to previously available treatments. The applicant reiterated that based on this Phase 2 data, updated ASCO guidelines stated that the cross-trial comparisons suggest that both lurbinectedin and IMDELLTRA® are more effective than topotecan or other agents, although the DOR of >9 months reported with IMDELLTRA® is substantially longer than that seen with other agents.

In response to CMS's questions about the generalizability of DeLLphi-301 trial data because 14 of the 134 patients treated with the target dose of IMDELLTRA® were from North America (without further specification on the country) and whether differences in treatment guidelines between countries could affect generalizability to the Medicare population, the applicant stated that IMDELLTRA®'s clinical trial data is generalizable to the Medicare population. The applicant stated it was a global multicenter trial with representation from Asia, Europe, and North America; the only trial sites in North America were in the United States; and approximately 48 percent of patients were age 65 years or older. The applicant stated that, similarly, the new DeLLphi-304 data also is generalizable to a Medicare population because the

median age is 65 years. The applicant further stated that real world survival outcomes in 2L+ ES–SCLC do not vary widely among the clinical trial regions of Asia, Europe, and North America, where the main previously available treatment options are chemotherapies like topotecan, amrubicin, irinotecan, taxanes, and lurbinectedin. The applicant also stated that standard of care therapies in these regions show consistently poor outcomes similar to the U.S. population following initiation of 2L and 3L therapy in ES–SCLC patients based on analyses of real-world treatment patterns and outcomes.

In response to CMS's questions about the small sizes of the real-world data that may limit the generalizability of these results to the Medicare population, the applicant stated that Phase 2 clinical trials examine efficacy in a specific patient population and are characterized by relatively small sample sizes of generally 50 to 200 patients. Furthermore, the applicant stated that SCLC is an orphan patient population (only 30,000 to 35,000 new cases diagnosed in the U.S. each year, of which approximately two-thirds are ES–SCLC), and thus trial size is limited by necessity. Per the applicant, as discussed previously, the FDA extrapolated clinical benefit out of the IMDELLTRA® Phase 2 DeLLphi-301 clinical trial, awarded the product Breakthrough Therapy Designation, and approved the product under Accelerated Approval. The applicant further stated that, in DeLLphi-304, the OS benefit with IMDELLTRA® versus chemotherapy was consistent across prespecified patient subgroups, including the 44 percent of patients with brain metastases that received IMDELLTRA® (asymptomatic, untreated or treated). Furthermore, the applicant stated that, given that the median age of the DeLLphi-304 patients was 65 years, it believes that the Phase 3 outcomes are generalizable to the Medicare population and sufficient to determine that IMDELLTRA® represents a substantial clinical improvement in the Medicare population.

In response to CMS's question about whether the results of DeLLphi-301 were different between the group of patients who previously received PD–L1 or PD–1 inhibitors versus those who did not, the applicant stated that IMDELLTRA®'s substantial clinical improvement is consistent regardless of prior PD–L1 therapy. The applicant further stated that DeLLphi-301 reported near identical ORR between the patients with prior PD–L1 and without prior PD–L1. The applicant stated that, in the supplement of Ahn et al. (2023), IMDELLTRA®'s ORR is 39.7 percent for patients previously exposed to PD–L1 therapy versus 40.7 percent for patients without prior PD–L1 exposure. Per the applicant, consistent with the DeLLphi-301 data, DeLLphi-304 also demonstrated a comparable overall survival benefit in patients both with (HR 0.61; 95% CI 0.45–0.82) and without (HR 0.65, 95% CI 0.42–1.03) prior PD–L1 inhibitor treatment, compared to standard of care chemotherapy.

In response to CMS's concern that the Sands et al. (2024) and Dingemans et al. (2024) evidence did not provide full detail on their study methods and therefore did not have sufficient information to evaluate these studies, the applicant stated that, as summarized in its application, Sands et al. (2024) presented efficacy and safety outcomes from a longer follow-up of the DeLLphi-301 study at the 2024 World Conference on Lung Cancer, while Dingemans et al. (2024) is an abstract of a post-hoc analysis of DeLLphi-301. Per the applicant, since both stem from the primary DeLLphi-301 study, the statistical methods are the same and the full protocol is available in the supplement to the New England Journal Medicine article.

In response to CMS's question about whether it was appropriate to compare clinical trial and real-world data, the applicant stated that comparisons to previously available therapies are limited by available evidence. The applicant further stated that its application provided literature ranging from clinical trials, real-world analyses, guidelines, to evidence reviews as treatment advancements for ES–SCLC patients have come slowly in the decades preceding IMDELLTRA®'s FDA approval. The applicant stated that it provided the clinical trial evidence that supported the FDA approvals of topotecan, lurbinectedin and IMDELLTRA® as well as multiple real-world analyses. The applicant stated that, for example, Trigo et al. (2020) reported on the pivotal single arm Phase 2 trial that was the basis for lurbinectedin's approval in 2L ES–SCLC. The applicant further stated in response to CMS's note that lurbinectedin demonstrated an OS of 9.3 months in the single arm trial, that it also provided the randomized controlled Phase 3 ATLANTIS trial where lurbinectedin failed to reach its primary endpoint of OS. In response to CMS's question about how the applicant chose the historical control it used in comparing outcomes, the applicant stated that it recognized the challenges and limitations with comparing separate trials. Per the applicant, this is why, in addition to each therapy's pivotal clinical trial data, it provided more recent evidence in the form of real-world data since topotecan's FDA approval for SCLC was in 1998. The applicant stated that the new ITC analysis from Tapan et al. (2025) as well as the new DeLLphi-304 data confirm what prior literature suggested, which is that IMDELLTRA® provides statistically significant and clinically meaningful improvement in OS compared to other FDA 2L+ approved therapies.

In response to CMS's concern about ORR data for topotecan and lurbinectedin in patients with stable brain metastases as well as in patients that are taking 3L therapy, the applicant stated that IMDELLTRA® is the only FDA-approved therapy for 2L ES–SCLC that demonstrated survival benefit compared to previously available treatments in patients with treated, stable brain metastases and untreated, asymptomatic brain metastases. The applicant stated that both the Phase 2 and 3 studies evaluating the efficacy and safety of IMDELLTRA® included patients with treated, stable brain metastases and untreated, asymptomatic brain metastases. The applicant further stated that while lurbinectedin and topotecan are also approved for 2L therapy in ES–SCLC patients, they were not extensively studied in patients with treated, stable brain metastases; therefore, the applicant stated that it could not provide ORR data for this specific patient population. For lurbinectedin, the applicant stated that patients with brain metastases were excluded from the pivotal trial. Per the applicant, while some studies have been conducted on topotecan and SCLC patients with brain metastases, low response rates were observed. The applicant stated that in a Phase 2 trial, only 2 out of 19 (10.5 percent) SCLC patients with brain metastases responded to topotecan, which did not meet the minimum response requested for study continuation. The applicant stated that, likewise, topotecan and lurbinectedin do not have registrational trial data in 3L+ ES–SCLC patients while IMDELLTRA® does. Per the applicant, while ORR data for topotecan and lurbinectedin as 3L therapy were not available in the respective registrational trials, it did provide real-world evidence of these previously available treatments being used as 3L therapy.

In response to CMS's concern that, among the clinical trial and real-world data provided there was no control for confounding variables to ensure similar patients were being compared, the

applicant stated that in addition to the clinical literature provided in its application regarding outcomes of currently available treatment, the new evidence from the ITC analysis and DeLLphi-304 addresses this concern and further supports the applicant's claims of substantial clinical improvement for IMDELLTRA®. The applicant stated that, for example, the ITC analysis from Tapan et al. (2025) controlled for potential confounding factors by selecting controls based on key DeLLphi-301 inclusion/exclusion criteria and employing propensity score matching. In addition, the applicant stated that the E-value, which measures the likelihood of unmeasured confounding to bias in the ITC estimates, showed that the likelihood of bias is low in the analysis by Tapan et al. (2025).

In response to CMS's concern that exclusion of patients with brain metastases from the pivotal Phase 2 trial for lurbinectedin does not exclude use of this drug in this patient population, the applicant stated that, while registrational trial data is lacking to support its use in this specific patient population, Desai et al. (2023) evaluated the safety and efficacy of lurbinectedin in a real-world setting, focusing on its use as a 2L+ treatment in SCLC patients. The applicant reiterated findings from the Desai et al. (2023) study provided in its original application to further support its statement.

In response to CMS's question about the use of the von Pawel et al. (1999) study of topotecan as a comparator to IMDELLTRA® since it was conducted approximately 25 years before the IMDELLTRA® Phase 2 trial (Ahn et al., 2023), and guidelines and treatment protocols for SCLC have evolved and it included some highly varied patient outcomes, the applicant stated, given the long time periods between treatment advances in this difficult to treat cancer, it provided in its application more recent real-world evidence on previously approved treatments for 2L ES–SCLC. The applicant also reiterated that it provided an ITC analysis and new data from the DeLLphi-304 randomized controlled Phase 3 trial comparing IMDELLTRA® to standard of care chemotherapy, including topotecan, that demonstrate IMDELLTRA® provides a substantial clinical improvement compared to previously available treatments using more contemporary data than the historical literature on these treatments.

In response to CMS's concern that while clinical trials of topotecan and lurbinectedin reported higher rates of ≥ Grade 3 neutropenia, they did not consider other serious adverse events such as CRS or ICANS, the applicant stated that, IMDELLTRA® has a positive benefit:risk safety profile and a low incidence of treatment-related neutropenia. The applicant stated this is further confirmed in the randomized controlled DeLLphi-304 trial, where IMDELLTRA® demonstrated a more favorable toxicity profile than standard chemotherapy, with chemotherapy associated with more frequent and higher-grade adverse events. Per the applicant, in DeLLphi-304, Grade ≥3 TRAEs were significantly lower in the IMDELLTRA® group (27 percent) compared to the chemotherapy group (62 percent). The applicant additionally stated that TRAEs led to dose interruption and/or reduction in 19 percent of patients receiving IMDELLTRA® versus 55 percent in the chemotherapy group, and to discontinuation in 3 percent and 6 percent of patients, respectively.

The applicant further stated that the most common TRAEs across both the Phase 2 and Phase 3 trial was CRS, which was mild and generally manageable with antipyretics, IV fluids and steroids with ≤ 1 percent of patients experiencing CRS ≥ Grade 3. Per the applicant, consistent with this established safety profile, in the randomized controlled DeLLphi-304 trial, CRS and ICANS were observed in 56 percent of patients and 6 percent of patients treated with IMDELLTRA®, respectively, and were mostly Grade 1–2. The applicant stated that in the IMDELLTRA® group only one percent of patients experienced a Grade 3 CRS event and CRS rarely led to treatment interruption (1.6 percent) or discontinuation (0.4 percent). The applicant also stated that all ICANS events were Grade 1 or 2 in severity except for one Grade 5 event and rarely led to treatment interruption (0.8 percent) or discontinuation (0.4 percent). The applicant stated that in DeLLphi-304, CRS and ICANS were mostly Grade 1 or 2 in severity and generally manageable for patients treated with IMDELLTRA®. Per the applicant, overall, the IMDELLTRA® group reported a 27 percent rate of TRAEs with Grade 3 or higher events while the chemotherapy group reported a 62 percent rate. In addition, the applicant stated that TRAEs led to dose interruption and/or dose reduction in 19 percent of patients in the IMDELLTRA® group and in 55 percent of those in the chemotherapy group, and to discontinuation in 3 percent and 6 percent of patients, respectively.

In response to CMS's concern that there was no control for potential confounding variables in the patient populations in the comparisons of neutropenia rates, the applicant stated that while the historical comparisons are informative, the new evidence from the randomized controlled DeLLphi-304 trial provide confirmation that rates of neutropenia are higher for chemotherapy than IMDELLTRA®. The applicant further stated that in the DeLLphi-304 trial, IMDELLTRA® had a four percent rate of Grade 3 or higher neutropenia and a two percent rate of any grade febrile neutropenia. The applicant stated that, in comparison, the chemotherapy group had a rate of 22 percent along with an 11 percent rate of any grade febrile neutropenia. The applicant also stated that, given 2L+ ES–SCLC patients have been exposed to repeated chemotherapy with cumulative toxicities, the lower incidence of neutropenia is notable as this TRAE is known to delay or prevent cancer patients from initiating treatment. Per the applicant, the randomized controlled DeLLphi-304 trial demonstrates a favorable toxicity profile for IMDELLTRA® compared to chemotherapy, with chemotherapy resulting in more frequent and high-grade adverse events. The applicant stated its belief that the safety data included in its application as well as the confirming DeLLphi-304 safety data support that IMDELLTRA® represents a substantial clinical improvement in the Medicare population. The applicant stated that it is clear that IMDELLTRA® substantially improves clinical outcomes relative to previously available treatment and, therefore, meets the substantial clinical improvement criterion.

Additionally, the applicant reiterated that IMDELLTRA® treats a patient population unresponsive to previously available technologies and provided responses to CMS concerns about this assertion from the proposed rule. In response to CMS's concern about whether ES–SCLC patients are unresponsive or ineligible for existing 2L+ treatments, such as lurbinectedin and topotecan, and that having limited treatment options does not demonstrate that patients are unresponsive or ineligible for any available therapies, the applicant stated that, while topotecan and lurbinectedin may have some response in relapsed SCLC, it is short-lived and modest at best. The applicant further stated that for the subpopulation of relapsed SCLC patients that have poor prognostic factors, such as brain metastases and platinum-resistance, this short-lived response is even more pronounced. The

applicant stated, for example, in the pivotal Phase 2 study for lurbinectedin, platinum-resistant patients had a low response rate of 22 percent and a DOR of 4.7 months. Thus, the applicant stated that the poor response supports that patients are largely unresponsive to available treatments. The applicant also stated that in the Phase 3 DeLLphi-304 trial, the median DOR was 6.9 months with IMDELLTRA® versus 5.5 months with chemotherapy. Per the applicant, given that IMDELLTRA® has shown significantly better and longer response, it is evident that IMDELLTRA® treats a patient population unresponsive to previously available technology.

Furthermore, the applicant stated that for ES–SCLC patients with brain metastases, IMDELLTRA® is the only FDA-approved therapy for 2L that has been studied in ES–SCLC patients with treated, stable brain metastases and untreated, asymptomatic brain metastases. Per the applicant, while lurbinectedin and topotecan are also approved as 2L ES–SCLC therapies, they were not extensively studied in patients with treated, stable brain metastases. The applicant reiterated that in the case of lurbinectedin, patients with brain metastases were excluded from the pivotal trial, and in addition, lurbinectedin failed to reach its primary endpoint of OS in the confirmatory Phase 3 ATLANTIS trial. The applicant further stated that, while a Phase 2 study has been conducted on topotecan and SCLC patients with brain metastases, low response rates were observed. The applicant stated new evidence from the Phase 3 randomized controlled DeLLphi-304 study demonstrates the IMDELLTRA®-treated group of SCLC patients with treated, stable brain metastases had similar safety and efficacy outcomes as those patients without brain metastases. Further, the applicant stated that the OS benefit with IMDELLTRA® versus chemotherapy was consistent across prespecified patient subgroups, including the 44 percent of patients with brain metastases who received IMDELLTRA® (asymptomatic, untreated or treated) (HR, 0.45; 95% CI 0.31–0.65). The applicant stated that, although other existing FDA approved treatments for ES–SCLC may be prescribed in the real world for SCLC patients with brain metastases, these existing treatments do not have a randomized controlled Phase 3 trial demonstrating efficacy over the current standard of care. The applicant stated that IMDELLTRA® has demonstrated improved survival outcomes for ES–SCLC patients with or without brain metastases who have progressed after initial platinum-based chemotherapy, a patient population that is effectively unresponsive to existing treatment as demonstrated by low response rates.

Response: We thank the applicant for its comments regarding the substantial clinical improvement criterion. Based on the additional information received, we agree with the applicant that IMDELLTRA™ represents a substantial clinical improvement over existing technologies because it significantly improves OS and PFS with lower rates of Grade 3 or higher TRAEs, including neutropenia, compared to existing treatment options for 2L+ ES–SCLC patients.

After consideration of the public comments we received and the information included in the applicant's new technology add-on payment application, we have determined that IMDELLTRA® meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2026. Cases involving the use of IMDELLTRA® that are eligible for new technology add-on payments will be identified by ICD–10–PCS codes XW033NA (Introduction of tarlatamab-dlle antineoplastic into peripheral vein, percutaneous approach, new technology group 10) or XW043NA (Introduction of tarlatamab-dlle antineoplastic into central vein, percutaneous approach, new technology group 10).

In its application, the applicant stated that the cost of IMDELLTRA® is $1,500 for a 1 mg dose and $15,000 for a 10 mg dose. According to the applicant, the first dose of IMDELLTRA® is 1 mg and all subsequent doses are 10 mg. In its application, the applicant estimated that the weighted average dose of IMDELLTRA® for Medicare patients is 7.3 mg based on about 70 percent of inpatient Medicare administrations being for a 10 mg dose and 30 percent of inpatient Medicare administrations being for a 1 mg dose. Therefore, the average cost per patient for IMDELLTRA® is $10,950 ($1,500 per mg * 7.3 mg). Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of IMDELLTRA® is $7,117.50 for FY 2026.

h. IntelliSep® Test

Cytovale, Inc. submitted an application for new technology add-on payments for the IntelliSep® Test for FY 2026. According to the applicant, the IntelliSep® Test is a semi-quantitative test that assesses cellular host response via a microfluidic deformability cytometry of leukocyte biophysical properties and is intended for use in conjunction with clinical assessments and laboratory findings to aid in the early detection of sepsis with organ dysfunction for adults presenting to the Emergency Department (ED). The IntelliSep® Test generates an index value that falls within 1 of 3 discrete interpretation bands based on the probability of sepsis with organ dysfunction manifesting within the first 3 days after testing.

Please refer to the online application posting for the IntelliSep® Test, available at *https://mearis.cms.gov/public/publications/ntap/NTP24100553685*, for additional detail describing the technology and the disease diagnosed in part by the technology.

With respect to the newness criterion, according to the applicant, the IntelliSep® Test was granted 510(k) clearance from FDA on December 20, 2022, for use in adult patients with signs and symptoms of infection who present to the ED. According to the applicant, the IntelliSep® Test was commercially available immediately after FDA marketing authorization. The applicant stated that one IntelliSep® Test is used per patient per inpatient stay.

The applicant stated that, effective April 1, 2025, the following ICD–10–PCS procedure code may be used to uniquely describe procedures involving the use of the IntelliSep® Test: XXE5X5A (Measurement of immune response, whole blood cellular assessment via microfluidic deformability, new technology group 10). The applicant provided a list of diagnosis codes that may be used to currently identify the indication for the IntelliSep® Test using the ICD–10–CM coding system. Please refer to the online application posting for the complete list of ICD–10–CM codes provided by the applicant.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that the IntelliSep® Test is not substantially similar to other currently available technologies because the IntelliSep® Test is the only FDA-cleared

test that uses a microfluidic deformability cytometry technique for early detection of sepsis in the ED regardless of whether the patient is admitted to the hospital or not and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for the IntelliSep® Test for the applicant's complete statements in support of its assertion that the IntelliSep® Test is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	The IntelliSep® Test is the only test that uses a microfluidic deformability cytometry technique to measure the biophysical properties of thousands of individual leukocytes in rapid succession. These properties have been shown to differ in quiescent white blood cell populations when compared to those in septic patients, enabling for rapid assessment of the host response and the likelihood of having or developing sepsis. Other tests for sepsis exist, but these tests measure biomarker levels or gene expression to generate their signal.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	The use of any test to detect the presence of sepsis does not impact the MS-DRG assignment of the discharge.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	While other tests can be used to detect the presence of sepsis, the IntelliSep® Test is the first and only FDA-cleared test for early detection of sepsis with organ dysfunction in adult patients with signs and symptoms of infection who present to the ED, regardless of whether the patient is admitted to the hospital or not. Other tests indicated for early detection of sepsis can only be administered after the patient has been admitted to the hospital.

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18129 through 18130), we noted the following concerns regarding the substantial similarity criteria. We noted that the applicant did not compare the IntelliSep® Test's mechanism of action to those of other sepsis tests or detection tools, such as the Early Sepsis Indicator for monocyte distribution width (MDW), SeptiCyte® RAPID, and Sepsis ImmunoScore™. We further noted that MDW measurement involves the assessment of white blood cells to detect pathogen-induced infections. Specifically, MDW measures the variability in peripheral monocyte morphologic characteristics that increase during early phases of infection after pathogen-induced monocyte activation.[86] Notably, monocytes (measured for MDW) are one type of leukocyte, and the IntelliSep® Test also evaluates leukocytes in its mechanism of action.[87] While the techniques of leukocyte measurement may differ, we stated that the subject of measurement appears to be the same or similar. Therefore, we questioned whether the IntelliSep® Test's measurement of leukocytes and their deformities is a unique mechanism of action, particularly in comparison to the Early Sepsis Indicator. Further, we questioned whether the measurement of different biomarkers or gene expression to determine the risk of sepsis is different than the measurement of leukocyte properties to determine the risk of sepsis. We stated we were interested in information regarding how the IntelliSep® Test's mechanism of action differs from other such sepsis tests and detection tools.

In addition, while the applicant stated that the use of the IntelliSep® Test does not involve treatment of the same or similar population and disease as existing technologies, we noted that the IntelliSep® Test is a diagnostic tool to evaluate patients with suspected infection, as are other FDA-cleared sepsis diagnostic tools, such as those that calculate Quick Sequential Organ Failure Assessment (qSOFA) scores (for example, SpassageQ[88] or NAVOY CDS®[89]). We stated that furthermore, there are also other means of assessment, including body temperature, respiratory rate, heart rate, blood counts, and blood cultures, that are used to diagnosis sepsis. We also questioned whether a patient's location, whether in the ED, admitted to the hospital, or in the intensive care unit (ICU) constitutes a different population. Further, we noted that there are existing sepsis diagnostic technologies that are also approved for use in the ED such as the Early Sepsis Indicator and Sepsis ImmunoScore™, which were FDA market-authorized on March 18, 2019 and April 2, 2024, respectively.[90] [91] Therefore, we stated it was unclear that there are no existing technologies other than the IntelliSep® Test that are involved with the diagnosis of sepsis in adult patients who have signs and symptoms of infection.

We invited public comments on whether the IntelliSep® Test is substantially similar to existing technologies and whether the IntelliSep® Test meets the newness criterion.

Comment: A commenter submitted a comment stating that both MDW and the IntelliSep® Test quantify biophysical changes in leukocytes to flag sepsis in emergency departments, and that it did not support new technology add-on payment designation for the IntelliSep® Test.

Response: We thank the commenter for its input and have taken it into consideration in determining whether the IntelliSep® Test meets the newness criterion as discussed later in this section.

Comment: The applicant also submitted a public comment regarding substantial similarity. In response to CMS's concern that the applicant did not compare the IntelliSep® Test's mechanism of action to those of other sepsis tests or detection tools, the applicant asserted that the IntelliSep® Test is novel, provides needed information that MDW, SeptiCyte® RAPID, and the Sepsis ImmunoScore™ cannot, and supports a market segment that is underserved by these technologies. The applicant stated that in 2016, International Consensus (Sepsis–3) established a new definition of sepsis, calling the disease a life-threatening organ dysfunction caused by a dysregulated host response to infection, and stating that there is no way to measure this dysregulated host response directly. The applicant stated that, although the Sepsis-3 authors proposed proxy measures for a dysregulated host response, including the organ failure assessment scores SOFA and qSOFA, these measures reflect consequences that are not exclusive to sepsis, making them insufficient for sepsis diagnosis. The applicant further stated that MDW, SeptiCyte® RAPID, and the Sepsis ImmunoScore™ similarly rely on indirect measures or proxy indicators of immune dysfunction, rather than directly measuring immune cells' structural changes that are the hallmark of sepsis. The applicant asserted that the most profound difference between the IntelliSep® Test and other technologies is that the IntelliSep® Test interrogates and visualizes immune cells directly rather than relying on downstream biomarkers or consequences.

The applicant described the IntelliSep® Test's mechanism of action as a real-time assessment of immune dysregulation and sepsis by quantifying the structural changes in white blood cells (WBCs), specifically neutrophils and monocytes, during the formation of Neutrophil Extracellular Trap (NET) or NETosis in cells. The applicant explained that NETs are networks of extracellular fibers, primarily composed of DNA from neutrophils, which bind to pathogens. The applicant stated that the formation of NETosis in neutrophils causes specific and measurable changes in the cells' structural composition. The applicant further stated that the IntelliSep® Test, unlike other sepsis tests, has been shown to correlate strongly with NET formation markers. The applicant stated that the IntelliSep® Test examines cell morphology and immune cell activation through high-speed video imagery with automated analysis and quantification of WBC 's internal structure as they undergo hydrodynamic stress applied in a microfluidic environment, providing a direct measurement of the dysregulated immune response that underlies sepsis. The applicant asserted that, therefore, the IntelliSep® Test is unique in its capability to visualize and quantify the activation level of immune cells compared to other sepsis tests, which provide or aggregate secondary information that may correlate with sepsis.

With regard to MDW and the IntelliSep® Test's subject of measurement appearing to be the same or similar, the applicant stated that both tests examine blood cell characteristics and are used to evaluate patients presenting to the ED, aiming to provide an indication of the level of immune system activation. The applicant explained that MDW measures monocytes' external size variability and is automatically reported with a routine complete blood count, whereas the IntelliSep® Test examines both monocytes and neutrophils' fluid mechanical compression and assesses the changes in cell compliance visually using high speed imagery. The applicant stated that the IntelliSep® Test evaluation of neutrophils adds critical new information, providing a broader signal that is not available from monocytes alone, and thus, not available from MDW. The applicant further stated that differences in method of action are foundational to the IntelliSep® Test's ability to directly indicate immune dysregulation, in contrast to MDW's more indirect, or limited approach. In addition, the applicant stated that Sarani et al. (2024) conducted an independent evaluation of MDW and the IntelliSep® Test and found limited correlation in overall data and especially weak correlation in high-risk groups between the two tests' results. The applicant added that Sarani et al. (2024) asserted that this lack of correlation suggests that MDW and the IntelliSep® Test are measuring different blood cell properties.

The applicant compared the IntelliSep® Test to SeptiCyte® RAPID, the Sepsis ImmunoScore™, qSOFA, and other Systemic Inflammatory Response Syndrome (SIRS) symptoms. The applicant stated SeptiCyte® RAPID aims to indirectly assess host immune activation through proxy gene expression markers for two selected genes and compares them to a specific set of known septic and healthy patient profiles. The applicant asserted that SeptiCyte® RAPID captures only a narrow, indirect signal compared to the broader range of signals evaluated and captured by the IntelliSep® Test. The applicant added that SeptiCyte® RAPID has limitations when it comes to racial disparities and usage outside the ICU.

The applicant stated that the Sepsis ImmunoScore™ measures up to 22 other biomarkers and provides no new independent assessment of a patient's condition. The applicant further stated that Sepsis ImmunoScore™ collates and analyzes measurements from a patient's medical record, calculating a proxy score for immune activation using machine learning algorithms applied to electronic health record data. In addition, the applicant stated that the qSOFA is based on clinical and laboratory indicators of organ dysfunction and does not provide any new information beyond what is already available as the standard of care. The applicant further stated that SIRS symptoms and the sepsis markers based upon them reflect findings from initial clinical assessments and do not offer any new information. In comparison to SeptiCyte® RAPID, the Sepsis ImmunoScore™, qSOFA, and SIRS symptoms, the applicant stated that the IntelliSep® Test delivers a standalone signal of the host response based on a blood sample from the patient and directly evaluates the structure of monocytes and neutrophils under mechanical stress using high-speed video.

In response to CMS's question whether a patient's location, whether in the ED, admitted to the hospital, or in the ICU constitutes a different population, the applicant provided a table to summarize differences between the IntelliSep® Test, SeptiCyte® RAPID, Sepsis ImmunoScore™, and MDW reported by the Early Sepsis Indicator. The applicant provided comparative analyses and asserted that the IntelliSep® Test is the only test of its kind indicated for use in adult patients presenting to the ED with signs and symptoms of infection. The applicant reported the population for Sepsis ImmunoScore™ as patients admitted to the Emergency Department or hospital

with cultures drawn, and for Early Sepsis Indicator as adult patients presenting to the ED in whom a WBC differential was ordered. The applicant elaborated on implications of differences between the IntelliSep® Test and the reported population for SeptiCyte® RAPID, adult patients with SIRS within the first day of ICU admission. The applicant stated that the suspected sepsis population that has been admitted to the ICU is significantly different than the population presenting to the ED, and therefore, the IntelliSep® Test does not involve treatment of the same or similar population and disease as existing technologies, such as SeptiCyte® RAPID. The applicant stated that previous studies found that 68 percent of the IntelliSep® Test tested population were admitted to the hospital and 16.1 percent were admitted to the ICU. The applicant asserted that these findings indicate that providers judged only a small portion of those tested with the IntelliSep® Test severe enough to warrant an ICU level of care. The applicant stated that identifying sepsis early in the ED when symptoms are subtle is challenging, while diagnosing sepsis later when severe organ dysfunction necessitates ICU care is easier. The applicant concluded the value of a test, like the IntelliSep® Test, that can provide an accurate indicator of sepsis in an ED population, is much greater because the opportunity to intervene with effective care is greater.

Response: We thank the applicant and commenter for their comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for the IntelliSep® Test, we agree with the applicant that the IntelliSep® Test uses a unique mechanism of action for early sepsis detection because it is the only FDA-approved test that directly assesses immune dysregulation by quantifying the changes in cell compliance for WBCs to aid in the early detection of sepsis with organ dysfunction. Therefore, we agree with the applicant that the IntelliSep® Test is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on December 20, 2022, the date on which the IntelliSep® Test received FDA market authorization for use with adult patients with signs and symptoms of infection who present to the ED.

With respect to the cost criterion, the applicant provided an analysis to demonstrate that the IntelliSep® Test meets the cost criterion. The analysis followed the order of operations summarized in the following table.

INTELLISEP® TEST COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the IntelliSep® Test.
Claims identified	2,708,804 claims mapping to 717 MS-DRGs, with 18.86% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC).
Charges removed for prior technology	Per the applicant, the IntelliSep® Test is not replacing a prior technology as it provides additional information to the clinician to determine if the patient has sepsis. As such, the applicant did not remove any estimated charges for a prior technology. The applicant stated that 25% of charges associated with Room and Board (revenue centers 011X-015X) and ICU/CCU (021X, 022X) were removed as the use of this technology can reduce average length of stay.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.102 for Laboratory from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Average case-weighted threshold amount: $75,886 Final inflated average case-weighted standardized charge per case: $86,075

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the IntelliSep® Test meets the cost criterion.

We invited public comments on whether the IntelliSep® Test meets the cost criterion.

Comment: The applicant reiterated that the cost criterion analysis submitted with the application demonstrate that the IntelliSep® Test meets the cost criterion.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. Therefore, the IntelliSep® Test meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that the IntelliSep® Test represents a substantial clinical improvement over existing technologies because the IntelliSep® Test is the only technology that is FDA-cleared for use in the ED to rapidly assess immune activation and identify sepsis risk in approximately 10 minutes, providing actionable results that significantly impact clinical decision-making and patient outcomes. The applicant provided 9 studies to support these claims,[92] as well as 19 background articles about international sepsis guidelines, antimicrobial therapy initiation, timing of antibiotic administration, and other topics related to sepsis detection. We noted that two other articles were submitted as supporting evidence (Kraus et al., 2023; Rhee et al., 2017), which we stated we believed should be characterized as background articles because they do not directly assess the use of the IntelliSep®

[92] One of these studies (Sheybani et al., 2024) is a published abstract that was retracted.

Test.[93] Instead, Kraus et al. (2023) focused on evaluating key attributes of rapid host response sepsis tests via an expert review panel, and Rhee et al. (2017) estimated the U.S. incidence of sepsis and sepsis trends using electronic health records. The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for the IntelliSep® Test for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

Substantial Clinical Improvement Assertion #1: The technology offers the ability to diagnose a medical condition in a patient population where that medical condition is currently undetectable or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods.	
Applicant statements in support	**Supporting evidence provided by the applicant**
IntelliSep® Test assists physicians in identifying patients where sepsis is unlikely, allowing for the more rapid pursuit of alternate diagnoses.	Sheybani, Roya, Matt Sorrells, Daniel Henning, et al. 	The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
IntelliSep® Test aids improved compliance with the CMS SEP-1 and Surviving Sepsis Campaign 3-hour bundle compliance.	O'Neal, 2024a, *op. cit.* Jagneaux, 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
IntelliSep® Test aids sepsis antibiotic initiation consistent with current consensus guidelines.	O'Neal, 2024a, *op. cit.* Jagneaux, 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.

BILLING CODE 4120–01–C

We also received a public comment in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for the IntelliSep® Test, which we summarized in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18132).

After review of the information provided by the applicant and the public comment received in response to the New Technology Town Hall meeting, we stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18132 through 18133) that we had the following concerns regarding whether the IntelliSep® Test meets the substantial clinical improvement criterion. Regarding the new study provided by the applicant in the Town Hall comment, we noted that Sarani et al. (2024) does not compare the IntelliSep® Test and MDW with respect to the ability to diagnose sepsis earlier or resulting clinical outcomes (for example, length of stay or mortality).

We stated that the applicant made six claims in regard to the substantial clinical improvement assertion that the IntelliSep® Test offers the ability to diagnose sepsis in a patient population where the condition is currently undetectable or offers the ability to diagnose sepsis earlier in a patient population than allowed by currently available methods; however, we noted that a number of these claims did not address this criterion. Specifically, the applicant stated that the IntelliSep® Test (1) allows clinicians to make early, appropriate antibiotic decisions in patients with suspected sepsis while pursuing antimicrobial stewardship targets; (2) outperforms current sepsis diagnostic tools available for use in the ED; (3) effectively differentiates sepsis from non-specific biomarker elevations in various clinical conditions; (4) is the only FDA-cleared test to assess dysregulated immune response to infection (sepsis) in patients presenting to the ED; and (5) has demonstrated a high NPV for sepsis and therefore allows for it to be ruled out where sepsis is unlikely. We stated that these claims discuss the reliability of the IntelliSep® Test outcomes or the potential benefits of sepsis risk stratification, or relate to not diagnosing sepsis, and do not address the ability of the IntelliSep® Test to diagnose a patient population where sepsis is currently undetectable or offer the ability to diagnose sepsis earlier than other technologies.

We further noted that none of the claims made by the applicant under this assertion provided a comparison of time to diagnosis to currently available sepsis diagnostics in order to demonstrate that the IntelliSep® Test can diagnose sepsis earlier than currently available methods. While the applicant provided O'Neal et al. (2024b), which established the 7.2 minute testing turnaround time for the IntelliSep® Test to support the claim that it provides clinicians with actionable results sooner than pathogen-based detection systems, the only other testing time provided as a comparison was from a study comparing time to positivity between the BacT/Alert and BACTEC blood culture systems (Butler-Laporte et al., 2020). We stated we would appreciate evidence comparing time to diagnosis for the IntelliSep® Test and other existing sepsis detection tools also developed to address the length of time to definite sepsis diagnosis with blood cultures, such as Early Sepsis Indicator or Sepsis ImmunoScore, in order to demonstrate the applicant's assertion that the IntelliSep® Test allows for faster detection of sepsis compared to existing technologies.

We further noted that we did not receive any information demonstrating that clinicians changed the management of patients due to the use of the IntelliSep® Test. The Jagneaux et al. (2024) study measured time-to-bed assignment (TTB) when nurses at one medical center triaged patients in the ED waiting room, tested patients using the IntelliSep® Test, and placed patients with IntelliSep® Band 3 results in ED beds. The study showed that TTB for Band 3 was shorter than TTB for Band 1, but we questioned whether TTB between risk-stratified bands should be considered a change in management. The study did not include a control group or comparison to other sepsis tests or diagnostic tools to demonstrate differences in patient management between the use of the IntelliSep® Test and other standards of care. We further noted that Jagneaux et al. (2024), which is an unpublished abstract, lacked details regarding the patient population, study protocol, and statistical analyses, and is only representative of a single medical center. We stated that we were therefore unclear whether the results may be influenced by potential confounding factors, and we questioned whether they are generalizable to other EDs or geographic regions as well as to the Medicare population.

We stated that the applicant also made seven claims in regard to the substantial clinical improvement assertion that the IntelliSep® Test significantly improves clinical outcomes relative to services or technologies previously available. However, we noted that a number of these claims do not address this criterion. In particular, the applicant stated that the IntelliSep® Test (1) reduces door-to-bed time for patients presenting with occult sepsis who appear clinically stable by triage staff; (2) allows for prompt attention to infection source identification and control through its rapid turnaround time; (3) aids improved compliance with the CMS SEP–1 and Surviving Sepsis Campaign 3-hour bundle compliance; and (4) aids sepsis antibiotic initiation consistent with current consensus guidelines. First, we questioned whether the claim that the IntelliSep® Test reduces door-to-bed time is an appropriate proxy for timely antibiotic administration and the

potential for subsequent clinical outcomes (such as mortality). We stated that the strength of the direct association between time from door-to-bed and clinical outcome improvement or whether any outcomes are inferred from surrogate endpoints was unclear. We also noted that the provided evidence did not demonstrate whether the IntelliSep® Test is the driving factor, among all other tests and clinical practices, that allows timely infection source identification and control and, therefore, decreases mortality. Additionally, we stated we were unclear about the direct association between the IntelliSep® Test and antibiotic initiation for sepsis consistent with current guidelines as this was also only inferred, and the IntelliSep® Test is one tool among others used to diagnose sepsis. We also questioned whether compliance with the CMS SEP–1 and Surviving Sepsis Campaign 3-hour bundles is intended as a proxy for decreased mortality that may occur from reducing the time to antibiotic administration. We noted that a decrease in mortality is only inferred, and the provided evidence does not demonstrate that the IntelliSep® Test decreases mortality. We stated we were unclear how these claims relate to a demonstration of substantial clinical improvement over existing technologies because these claims do not pertain to clinical outcomes described at § 412.87(b)(1)(ii)(C), such as a reduction in mortality or a decreased rate of at least one subsequent diagnostic or therapeutic intervention.

We also noted that the claims and the provided evidence regarding the IntelliSep® Test's ability to significantly improve clinical outcomes relative to services or technologies previously available lack a comparison of the IntelliSep® Test to existing technologies used to diagnose sepsis, such as the previously discussed Early Sepsis Indicator, SeptiCyte® RAPID, and Sepsis ImmunoScore™. While the applicant stated in its Town Hall comment that a comparison between the IntelliSep® Test and SeptiCyte® RAPID is inappropriate due to the differences in indicated location, we questioned whether the impact of testing different patients in different environments within a hospital would be relevant to clinical outcomes such as timely antibiotic administration and mortality. In addition, we noted that both Early Sepsis Indicator and Sepsis ImmunoScore™ are indicated for use in the ED. We stated we were interested in comparative evidence for other sepsis diagnostic technologies in order to evaluate the IntelliSep® Test's clinical outcomes relative to other technologies. We also noted that since much of the evidence provided across claims (Thomas et al. (2025); Thomas et al. (2024a); Thomas et al. (2024b)) is unpublished, the details provided do not include study protocols or statistical methods and measures. As such, we stated we were unable to account for differences in the outcome measures or determine if the results are statistically significant. Further, because these study results are from one academic medical center, we questioned whether the results are generalizable to other hospitals and more broadly to the Medicare population. Where the Jagneaux et al. (2024) study was used to support claims regarding the IntelliSep® Test's ability to significantly improve clinical outcomes relative to services or technologies previously available, we also stated we had the same concerns as previously discussed, including lack of details regarding the patient population, study protocol, and statistical analyses.

In addition, with respect to the claim that IntelliSep® Test results enable ED providers to decrease the use of diagnostic images and testing, resulting in decreased exposure and associated risks, while Thomas et al. (2024a) evaluated the impact of the IntelliSep® Test on blood culture orders, antibiotic usage, and patients' LOS for 1,275 patients who presented to an ED with signs or symptoms of infection, we noted that the study did not determine whether a decrease in these measures resulted in patients experiencing decreased exposure and associated risks or a significant improvement in clinical outcomes relative to technologies previously available.

We stated that while the Jagneaux et al. (2024) study provided by the applicant did not measure mortality, the applicant provided the O'Neal, et al. (2024a) study, which did measure all-cause cumulative hospital mortality stratified by IntelliSep® bands; however, the study only compared the IntelliSep® Test to common traditional sepsis tests or detection tools, such as white blood cell count, procalcitonin, lactate, blood cultures, and the Sequential Organ Failure Assessment (SOFA). O'Neal et al. (2024a) did not provide hospital mortality data to demonstrate the IntelliSep® Test's improved clinical outcomes relative to other technologies that are available, such as Early Sepsis Indicator, SeptiCyte® RAPID, and Sepsis ImmunoScore™.

Regarding the claim that the IntelliSep® Test aids in reducing average LOS among tested patients, the Thomas et al. (2024b) study submitted by the applicant found that incorporating the IntelliSep® Test and releasing its results to clinicians for 413 patients of a large U.S. academic medical center led to a reduction of 1.28 days for inpatients and 2.42 days for ICU patients, when compared to 196 patients in the control group for which the IntelliSep® Test was performed but not released to clinicians. We noted that the study used control and intervention cohorts that were not concurrent, and we questioned the impact from varying confounders, such as changes in clinical policy. We noted that the applicant also included background studies to demonstrate a positive association between longer hospital LOS and the probability of acquiring an infection, readmission, negative emotions, and increased hospital costs.[94] However, these studies did not assess the IntelliSep® Test's ability to affect LOS, rates of infection, readmission, or other clinical outcomes.

Lastly, we questioned how much capability should be attributed to the IntelliSep® Test when making clinical judgments and improving clinical outcomes, and we welcomed additional information.

We invited public comments on whether the IntelliSep® Test meets the substantial clinical improvement criterion.

Comment: A few commenters expressed support for approval of the IntelliSep® Test's new technology add-on payment, inclusive of emphasis on the importance of early sepsis recognition and rapid treatment. Another commenter did not support approval for the IntelliSep® Test, stating that O'Neal et al. (2024) found that the IntelliSep® Test's area under the receiver operating characteristic curve (AUROC) is indistinguishable from procalcitonin. The commenter also stated that head-to-head evidence of the IntelliSep® Test and MDW is even thinner, stating that the Sarani 2025 series reports IntelliSep® Test results only, leaving MDW unmeasured. The commenter also stated that for Sepsis-3 identification, FDA clearance assigned the IntelliSep® Test likelihood ratios of 0.35 (Band 1) and 2.69 (Band 3), but 28 percent of patients fall into the indeterminate Band 2. The commenter further stated MDW delivers comparable discriminatory power (≤20: LR 0.36; >20: LR 0.265) with 100 percent of patients classified, meaning it still

[94] Hassan, M., Tuckman, H. P., Patrick, R. H., Kountz, D. S., & Kohn, J. L. (2010). Hospital length of stay and probability of acquiring infection. *International Journal of Pharmaceutical and Healthcare Marketing, 4*(4), 324–338. *https://doi.org/10.1108/17506121011095182.*

reports when the IntelliSep® Test cannot. According to the commenter, MDW results are available in roughly 2 minutes, widely deployed as part of complete blood counts, and reimbursed at $4.48, unlike the dedicated IntelliSep® Test instrument. The commenter added that the IntelliSep® Test's utility claims hinge on abstracts and single-center slide decks from the site that co-developed the test. The commenter stated that the applicant for the IntelliSep® Test did not offer peer-reviewed publications with robust outcome benefits and that unpublished data from one institution does not establish utility. The commenter stated that MDW, in contrast, has a substantial, peer-reviewed record of both clinical validity and real-world benefit, whereas the IntelliSep® Test shows similar or poorer analytic performance, lacks peer-reviewed utility data, and requires proprietary hardware at higher cost. The commenter, therefore, recommended that the IntelliSep® Test's new technology add-on payment application be denied.

Response: We thank the commenters for their input and have taken it into consideration in determining whether IntelliSep® meets the substantial clinical improvement criterion, discussed later in this section.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant included a recently published paper by Thomas et al. (2025),[95] which the applicant asserted further demonstrates how the IntelliSep® Test provides a substantial clinical improvement in detecting and diagnosing sepsis compared to all other available tests. The applicant explained the article discusses a sepsis quality improvement initiative at a large academic medical center with a high-volume ED that incorporated the IntelliSep® Test into its protocol, enabling rapid diagnostic support for patients flagged by an electronic health record-based alert. The applicant asserted that, per the authors, over the course of 1 year, implementation of the IntelliSep® Test significantly reduced mortality, hospital LOS, and blood culture utilization, demonstrating improved patient outcomes and resource efficiency compared to the pre-implementation period. The applicant further stated that while the study does not have the rigor of some other study designs, it overcomes limitations related to a control population by leveraging protocolized screening, which defines a broad, consistent, and pre-specified analysis group including more than 12,000 diverse patients (median age: 66 years) with no inclusion or exclusion criteria. In addition, the applicant asserted that the article shows that the use of the IntelliSep® Test in an ED triage process enabled the care delivery in a way that was superior to the standard of care in a large population of patients.

The applicant also asserted that the article provides additional documentation regarding multiple concerns that CMS stated in the proposed rule, including those related to reductions in hospital LOS, blood culture utilization, and mortality. First, the applicant stated that it addressed CMS's concerns regarding the Thomas et al. (2024b) study, including the impact from varying confounders and several questions from CMS, specifically providing additional documentation related to reductions in hospital length of stay, blood culture utilization, and mortality. The applicant stated that, in the Thomas et al. (2025) study, the IntelliSep® Test's implementation resulted in a reduction in hospital LOS for sepsis patients of 0.64 days (9.5 percent) for the full cohort and 0.76 days (11.3 percent) for the temporally matched cohort. The applicant stated that this reduction meets the standard provided in 42 CFR 412.87(b), which states: A more rapid beneficial resolution of the disease process treatment including, but not limited to, a reduced length of stay or recovery time. Second, the applicant asserted that the Thomas et al. (2025) study addresses the IntelliSep® Test's ability to reduce diagnostic exposure, because the study showed application of the IntelliSep® Test resulted in a relative reduction in blood culture utilization, from usage in 50.8 to 45.7 percent of patients. The applicant stated that this reduction in cultures meets the standard in 42 CFR 412.87(b) which describes a decreased rate of at least one subsequent diagnostic or therapeutic intervention. In addition, the applicant stated that the Thomas et al. (2025) study demonstrates that, in the temporally matched cohort, application of the IntelliSep® Test produced an absolute reduction in sepsis mortality risk by 4.2 percent (from 10.7 percent to 6.5 percent). The applicant added that this reduction is a significant improvement over the standard of care, which included SIRS symptoms, lactate measurement, and the use of cultures, that no other sepsis test has demonstrated.

In response to CMS's concern that its application lacked a comparison of the IntelliSep® Test to existing technologies used to diagnose sepsis, the applicant stated that the Sepsis ImmunoScore™, SeptiCyte® RAPID, and the Early Sepsis Indicator are not in widespread use, preventing comparative data between these sepsis diagnostic tests and the IntelliSep® Test. The applicant further stated that a 2024 New England Journal of Medicine review article confirmed that no sepsis test is in widespread use. The applicant asserted that, as such, there is no practical way to construct a comparison in sepsis diagnostic tests. The applicant additionally asserted that no other technology has conducted a comparative study documenting improvements in hospital LOS, blood culture utilization, and mortality risk relative to the standard of care as the Thomas et al. (2025) study provides.

In response to CMS's concern that the IntelliSep® Test application did not address its ability to diagnose a patient population where sepsis is currently undetectable or the ability to diagnose sepsis earlier than other technologies, the applicant stated that other sepsis diagnostic tests, including SIRS symptoms, lactate, and blood cultures, assess the symptoms or effects of sepsis, rather than sepsis's immune dysregulation, and are therefore insufficient. The applicant asserted that the IntelliSep® Test provides the novel capability to assess immune activation, which can allow for a sepsis diagnosis based on underlying cell physiology. The applicant further stated that the IntelliSep® Test shows superior performance in sepsis diagnosis (as adjudicated by a physician panel) against the current sepsis detection standards of care for sepsis detection.

Regarding the IntelliSep® Test's ability to diagnose sepsis earlier than other technologies, the applicant stated that the IntelliSep® Test's turnaround time is comparable to some other sepsis tests, such as MDW and the Sepsis ImmunoScore™. The applicant asserted that the IntelliSep® Test's ability to rapidly assess immune dysregulation allows it to identify sepsis across the range of the disease's progression continuum based on ED presentation, where patients may present early in sepsis progression with limited symptoms. In addition, the applicant asserted that, as such, the IntelliSep® Test's sensitivity allows it to identify sepsis patients at an earlier point in the disease's course than other available

[95] Thomas, C. B., Wyler, B., D'Antonio, C. M., Laperouse, M., Alwood, S., Richard, K., Grantham, A., Sheybani, R., Sorrells, M. G., Tan, W.-J., Teague, J. W., O'Neal, H., & Jagneaux, T. (2025). Impact of a Sepsis Quality Improvement Initiative on Clinical and Operational Outcomes. *Healthcare,* 13, 1273. *https://doi.org/10.3390/healthcare13111273.*

tests. The applicant stated that Sarani et al. (2024) showed that the IntelliSep® Test demonstrated improved sepsis detection capability relative to MDW.

In response to CMS's concerns about the Jagneaux et al. (2024) study, the applicant reiterated that the study showed that patients in the waiting room with a Band 3 score from the IntelliSep® Test were immediately put into an ED bed for treatment, which improved time to bed (TTB) relative to the overall mean. The applicant stated that this study did not document patient outcomes but added it demonstrated that patients with Band 3 scores had a 94 percent rate of infection and a 54 percent rate of sepsis based upon discharge, while patients with Band 1 scores had a 1.6 percent rate of sepsis. The applicant asserted that because the IntelliSep® Test results led to faster TTB for patients with Band 3 scores, the test resulted in faster treatment times for high-risk patients. The applicant also stated that while Jagneaux et al. (2024) did not document patient outcomes, Thomas et al. (2025) included these same patients and observed significant decreases in sepsis-associated mortality. The applicant further asserted that given the known association between care timeliness and mortality as well as the known waiting time decrease, it follows that some of the IntelliSep® Test's documented mortality improvement is likely attributable to the advancement in sepsis care it enabled. The applicant concluded that the application of the IntelliSep® Test in clinical practice provides evidence for its substantial clinical improvement and the approval of its new technology add-on payment application.

A commenter who employed the IntelliSep® Test at several facilities submitted a comment and an unpublished abstract to show how the test's adoption impacted patient outcomes at the facilities. The commenter stated that it tracked patient discharge and return rates following the introduction of the IntelliSep® Test, and documented a significant increase (from 14 percent to 24.9 percent) in the patient discharge rate from EDs in the first 4 months following the IntelliSep® Test's implementation. The commenter further stated that the EDs achieved this increase without an increase in the rate of patient returns. The commenter asserted that, taken together with other admission and clinical data, it observed a significant increase (26 days to 27 days) in the return-adjusted hospital free days experienced by patients. The commenter stated that the IntelliSep® Test adoption resulted in a significant clinical impact for its patients. The commenter provided an abstract describing the impact of the IntelliSep® Test use in the ED within their submission.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received and all data received to date, we continue to have concerns as to whether the IntelliSep® Test represents a substantial clinical improvement over existing technologies. Specifically, we disagree with the applicant that the evidence provided is sufficient to establish that the IntelliSep® Test offers the ability to diagnose a medical condition in a patient population where the medical condition is currently undetectable or offers the ability to diagnose a medical condition earlier in a patient population than allowed by currently available methods. Additionally, it remains unclear that the IntelliSep® Test significantly improves clinical outcomes relative to services or technologies previously available.

Regarding the applicant's assertion that the IntelliSep® Test provides a substantial clinical improvement in detecting and diagnosing sepsis compared to all other available tests, we note the recently published and submitted Thomas et al. (2025) study did not compare the IntelliSep® Test to other available sepsis diagnostic technologies, such as the Early Sepsis Indicator and Sepsis ImmunoScore™. Furthermore, the applicant stated that Sarani et al. (2024) showed that the IntelliSep® Test demonstrated improved sepsis detection capability relative to MDW. However, the Sarani et al. (2024) study was conducted in a single medical center with a small sample size (n = 44), and we therefore question the generalizability of the results. We maintain our concern that Sarani et al. (2024) does not compare the IntelliSep® Test and MDW with respect to the ability to diagnose sepsis earlier, and the study does not define a patient population where sepsis is currently undetectable in which the IntelliSep® Test can detect sepsis. The applicant asserted that the O'Neal et al. (2024) study demonstrates that the IntelliSep® Test shows faster time to diagnosis against current standards of care including SIRS, lactate, and blood cultures. However, the applicant stated that the turnaround time of the IntelliSep® Test is comparable with that of MDW (that is, Early Sepsis Indicator) and Sepsis ImmunoScore,™ which both may also have the capability to provide a faster diagnosis of sepsis compared to SIRS, lactate, and blood cultures. Although the applicant stated that the Sepsis ImmunoScore™, SeptiCyte® RAPID, and the Early Sepsis Indicator are not in widespread use, the substantial clinical improvement criterion requires that a technology demonstrate its diagnostic ability relative to currently available methods or technology. The applicant also stated that the sensitivity of the IntelliSep® Test allows it to identify these patients at an earlier point in the patient's course of sepsis than other available tests, but the applicant did not provide evidence demonstrating sepsis identification earlier in the disease process than other diagnostic tools. In addition, the applicant cited the Jagneaux et al. (2024) study, stating that the test led to faster treatment for patients who were ultimately shown to have been at high risk, based on the rate of higher infection in the high risk band. We continue to be concerned that the Jagneaux, et al. (2024) study does not demonstrate how the IntelliSep® Test compares to other currently available diagnostic methods in TTB. Also, while the applicant concluded that because the patients from the Jagneaux, et al. (2024) study were included in the Thomas et al. (2025) patient cohort, some of the mortality improvement documented with the IntelliSep® Test in the Thomas et al. (2025) study is likely attributable to the advancement in sepsis care enabled by the IntelliSep® Test, neither the applicant nor the Jagneaux, et al. (2024) study identify or measure the asserted advancements. It is unclear if TTB resulted in changes in patient management, and if so what those changes were. Our concerns for evidence of differences in the management of patients remain. We also continue to be concerned with the lack of data comparing the IntelliSep® Test to other available sepsis diagnostics, or evidence of a patient population where sepsis is currently undetectable, in which the IntelliSep® Test can detect sepsis. We remain unclear how the IntelliSep® Test compares to other available sepsis diagnostic technology in detecting and diagnosing sepsis.

Regarding the applicant's assertion that the IntelliSep® Test significantly improves clinical outcomes relative to services or technologies previously available, we remain unclear how the IntelliSep® Test compares to other sepsis diagnostic technologies. While the applicant submitted the Thomas et al. (2025) study to show that the IntelliSep® Test demonstrated a significant reduction in mortality, LOS, and blood culture utilization, we remain concerned about the continued lack of

comparative data. We remain unclear how the IntelliSep® Test's clinical outcomes compare to those of other existing sepsis detection tests.

After consideration of all the information received from the applicant as well as the public comments, we are unable to determine that the IntelliSep® Test represents a substantial clinical improvement over existing technologies for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not approving new technology add-on payments for the IntelliSep® Test for FY 2026.

i. Neuroguard IEP® 3-in-1 Carotid Stent and Post-Dilation Balloon System With Integrated Embolic Protection

Contego Medical, Inc. submitted an application for new technology add-on payments for the Neuroguard IEP® 3-in-1 Carotid Stent and Post-Dilation Balloon System with Integrated

Embolic Protection (Neuroguard IEP® System) for FY 2026. According to the applicant, the Neuroguard IEP® System combines a carotid stent with an integrated 40 μm embolic protection filter and post-dilation balloon. Per the applicant, the Neuroguard IEP® System restores and maintains vessel patency while stabilizing plaque, and by capturing small emboli during critical phases, it reduces the risk of stroke during the procedure and helps prevent future stroke.

Please refer to the online application posting for the Neuroguard IEP® System, available at *https://mearis.cms.gov/public/publications/ntap/NTP241004CNKB9*, for additional detail describing the technology and carotid artery disease.

With respect to the newness criterion, according to the applicant, the Neuroguard IEP® System was granted premarket approval (PMA) from FDA on October 11, 2024 for improving the carotid luminal diameter in subjects at high risk for adverse events from a carotid endarterectomy who require carotid revascularization and meet the criteria outlined: patients with symptomatic stenosis of the common or internal carotid artery with 50 percent as determined by angiography using North American Symptomatic Carotid Endarterectomy Trial (NASCET) methodology or patients with asymptomatic stenosis of the common or internal carotid artery with 80 percent as determined by angiography using NASCET methodology; and patients with reference vessel diameters 4.0 mm to 8.0 mm. The applicant and FDA approval letter stated that this technology is also indicated for post-dilation of the stent component with simultaneous capture and removal of embolic material. According to the applicant, the Neuroguard IEP® System is used in conjunction with an available primary distal embolic protection device as described in the Instructions for Use. According to the applicant, the Neuroguard IEP® System was commercially available immediately after its FDA approval. Per the applicant, one Neuroguard IEP® System typically is used per inpatient stay.

The applicant submitted a request for approval for unique ICD–10–PCS procedure codes for the Neuroguard IEP® System and was granted approval to use the following procedure codes effective October 1, 2025: X2AH34B (Right common carotid artery cerebral embolic filtration, single integrated distal filter, percutaneous approach, new technology group 11), X2AJ34B (Left common carotid artery cerebral embolic filtration, single integrated distal filter, percutaneous approach, new technology group 11), X2AK34B (Right internal carotid artery cerebral embolic filtration, single integrated distal filter, percutaneous approach, new technology group 11), and X2AL34B (Left internal carotid artery cerebral embolic filtration, single integrated distal filter, percutaneous approach, new technology group 11). The applicant stated that codes I65.21 (Occlusion and stenosis of right carotid artery), I65.22 (Occlusion and stenosis of left carotid artery), I65.23 (Occlusion and stenosis of bilateral carotid arteries), or I65.29 (Occlusion and stenosis of unspecified carotid artery) may be used to currently identify the indication for the Neuroguard IEP® System under the ICD–10–CM coding system.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that the Neuroguard IEP® System is not substantially similar to other currently available technologies because it is a first-in-class, novel device that uses a different mechanism of action compared to existing technologies by integrating a stent with a 40 μm (3 to 4 times smaller than pores of traditional filters) embolic protection filter and a post-dilation balloon, aiming to streamline the procedure and increase the effectiveness of embolic protection during carotid stenting, and that no other similar device is currently available in the U.S., and therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for the Neuroguard IEP® System for the applicant's complete statements in support of its assertion that the Neuroguard IEP® System is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	Multiple clinical studies have reported that the majority of debris released during carotid stenting is less than 100 microns (μm). The Neuroguard IEP® System features an innovative 40 μm embolic protection filter, with pores 3-4 times smaller than traditional filters used in carotid artery stenting (CAS), providing a substantial clinical improvement in capturing those microembolic particles. Traditional embolic protection devices (EPDs) have pore sizes of 100 to 150 μm, allowing smaller microemboli to pass through, which can result in strokes and cognitive impairment for patients. Unlike other technologies, the Neuroguard IEP® System offers continuous protection during the most critical phases of carotid stenting—stent deployment and balloon dilation—when the risk of plaque dislodgement is highest. Conventional EPDs cannot use smaller pores because they are open throughout the entire procedure and must permit sufficient flow to reduce the risk of thrombosis and complications. In contrast, the Neuroguard IEP® System integrated filter is open only during the critical phases allowing it to use smaller pores (40 μm) without increasing thrombosis risk, delivering enhanced protection while maintaining safety. Unlike conventional CAS systems that rely solely on separate EPDs, the Neuroguard IEP® System's filter is integrated into the device and dynamically adjusted to create a complete seal against the artery wall, ensuring even the smallest micro-emboli are captured. This greatly reduces the risk of embolic particles traveling to the brain, demonstrating a substantial clinical improvement over existing technologies in stroke prevention. The Neuroguard IEP® System stent incorporates a hybrid design that balances flexibility and radial strength, enabling precise deployment and secure vessel scaffolding. This helps to minimize risks such as restenosis or stent migration, challenges often seen with traditional stents that compromise either flexibility or strength. The Neuroguard IEP® System's flexible segments facilitate deployment in challenging anatomy while maintaining long-term vessel support. The stent is designed to enhance precision, reduce trauma or migration risks, and allow for predictable deployment, helping to reduce procedural complications. By integrating embolic protection, stenting, and dilation into one device, the Neuroguard IEP® System eliminates the need for multiple devices, reducing catheter exchanges and procedural complexity. While traditional distal embolic protection devices have larger pores that allow micro-emboli to reach the brain, potentially causing stroke or cognitive impairment, the Neuroguard IEP® System addresses this risk by capturing micro emboli, reducing the likelihood of such adverse events. This new mechanism of action offers a safer and more effective approach to treating carotid artery stenosis, representing a substantial clinical improvement over existing technologies.
Is the technology assigned	Yes	The Neuroguard IEP® System falls under the MS-DRGs related to

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18135), we stated we had the following concerns with regard to the newness criterion. While the applicant asserted that the Neuroguard IEP® System is novel in that it uses a new mechanism of action because its 40 μm embolic protection filter has pores 3–4 times smaller than traditional filters used in CAS, we questioned whether this represents a new mechanism of action as both Neuroguard's filter and existing filters use a porous membrane to capture and remove embolic material while performing angioplasty and stenting procedures in carotid arteries. We noted that the applicant asserted that this change in filter size may impact clinical outcomes, however, this is not relevant to mechanism of action. Furthermore, the Neuroguard IEP® System should always be used in conjunction with an available primary distal embolic protection device as described in the IFU,[96] which suggests that its filter would not impact the mechanism of action of the device. We also noted that there are other existing embolic protection filters used during CAS procedures that have the same 40-micron pore size, such as the Paladin® Carotid Post-Dilation Balloon System with Integrated Embolic Protection (Paladin® System with IEP) from the same manufacturer, which received FDA 510(k) clearance on September 6, 2018.[97]

In addition, while the applicant asserted that the Neuroguard IEP® System has a new mechanism of action because it integrates a stent with an embolic protection filter that opens during stent deployment and balloon

[96] Neuroguard IEP® 3-in-1 Carotid Stent, Post-Dilation Balloon System with Integrated Embolic Protection (*https://www.accessdata.fda.gov/cdrh_docs/pdf24/P240009A.pdf*).

[97] FDA. Section 510(k) premarket notification. Paladin Carotid Post-Dilation Balloon System with Integrated Embolic Protection. K181128. September 6, 2018 (*https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfpmn/pmn.cfm?id=K181128*, accessed 2/5/2025).

dilation to streamline the procedure and increase the effectiveness of embolic protection during CAS, we questioned how integrating existing procedural devices into one device to eliminate the need for multiple devices results in a different mechanism of action, as this appears to describe an ease-of-use feature rather than having an impact on the technology's therapeutic outcome of improving carotid luminal diameter for patients with stenosis of the carotid artery.[98] We stated it was unclear how the way in which the Neuroguard IEP® System treats carotid artery stenosis is different from the way in which the many existing carotid artery stents, filters, and post-dilation balloons available on the market, used together or as part of a system, treat carotid artery stenosis. Therefore, we stated that it appears these technologies may have the same or a similar mechanism of action as the Neuroguard IEP® System. We further noted that the applicant stated that the Neuroguard IEP® System treats the same disease, carotid artery stenosis, in the same patient population as existing carotid stent technologies, and that it maps to the same MS–DRGs for carotid artery stenting procedures.

Accordingly, as we stated that it appears that the Neuroguard IEP® System and existing carotid stents or stent systems, such as the GORE® Carotid Stent, RX Acculink™ Carotid Stent System, or Carotid WALLSTENT® Monorail® Endoprosthesis, or the Paladin® System with IEP used with any available carotid artery stent, may use the same or similar mechanism of action to achieve a therapeutic outcome, would be assigned to the same MS–DRG, and would treat the same or similar patient population and disease, we questioned whether these technologies may be substantially similar to one another. We noted that, per our policy, if technologies are substantially similar to each other, we use the earliest market availability date as the beginning of the newness period for the technologies. Accordingly, we stated if we determine that the Neuroguard IEP® System is substantially similar to existing carotid stents or systems as described previously, because the 3-year anniversary of the FDA clearance of all these current technologies occurred prior to FY 2026,[99] [100] [101] the Neuroguard IEP® System would not be considered new.

We invited public comments on whether the Neuroguard IEP® System is substantially similar to existing technologies and whether the Neuroguard IEP® System meets the newness criterion.

Comment: Several commenters expressed support for the Neuroguard IEP® System. The commenters stated that the 3-in-1 design is new, often based on their clinical experience. A few of the commenters stated that the integrated design streamlines the procedure, shortens the procedure time, and eliminates multiple device exchanges, each of which represents a discrete embolic risk in and of itself. A commenter stated that the Neuroguard IEP System is a paradigm shift in the field of carotid intervention by introducing a new mechanism of action, combining targeted microembolus capture at the most vulnerable stages of the procedure with improved procedural efficiency through reduced device exchanges. A commenter stated that the Neuroguard IEP® System is a true advancement that directly addresses an unmet need posed by traditional or legacy EPDs, which are unable to capture microemboli materials less than 100 microns. Some commenters stated that these smaller particles account for more than 80 percent of the debris generated during carotid stenting and that by functioning in tandem with standard embolic protection, the Neuroguard IEP® System offers dual protection. Another commenter stated that the Neuroguard IEP® System eliminates the need to maneuver through the cervical loop to capture additional filters, thereby reducing the risks to patients and decreasing the overall procedure time. A commenter stated that the Neuroguard IEP® System introduces a novel dual embolic protection mechanism while maintaining required primary protection throughout the procedure. Per the commenter, this integrated approach creates therapeutic capabilities not available with existing technologies. A commenter stated that this technology has broader implications, particularly in the treatment of tandem occlusions during anterior circulation stroke, since these are complex cases involving both an intracranial large vessel occlusion and a proximal cervical internal carotid artery lesion, often of atherosclerotic origin. Some commenters stated that the closed-cell design of the stent enhances plaque coverage without reducing vessel conformability.

Response: We thank the commenters for their input and have taken it into consideration in determining whether the Neuroguard IEP® meets the newness criterion as discussed later in this section.

Comment: The applicant submitted a public comment asserting that the Neuroguard IEP® System represents a groundbreaking advancement in CAS with a novel 3-in-1 design combining a carotid stent, post-dilation balloon, and 40-micron pore integrated embolic filter in 1 device. The applicant reiterated that the technology's design distinctions enable a novel mechanism of action that directly addresses the root cause of procedure-related embolic events, microemboli generated during stent deployment and post-dilation, when perioperative stroke risk is highest.[102] [103] [104] The applicant reiterated that the Neuroguard IEP® System enables the placement of a 40-micron pore filter, deployment of the stent, and post-dilation ballooning all through a single catheter. Per the applicant, the Neuroguard IEP® System's revolutionary mechanism of action directly addresses the primary limitation of traditional carotid stenting technologies and offers advantages not achievable through any combination of existing devices, including (1) smaller filter size and selective deployment combined with standard embolic protection offers dual protection; and (2) integration enables usage of 40-micron pore protection and real-time filter control with no catheter exchanges.

The applicant also referred to CMS's determination in the FY 2021 IPPS/LTCH PPS final rule that the Eluvia™ Drug Eluting Stent (Eluvia™) had a unique mechanism of action (85 FR 58648) and discussed how the same approach can be applied to the determination of the Neuroguard IEP®

System's mechanism of action. According to the applicant, because CMS recognized that Eluvia™'s long-term drug release profile constituted a unique mechanism of action although the device used paclitaxel like other peripheral drug-eluting stents, it asserted that CMS was stating that integrating a novel distinction to existing technology to address a critical treatment limitation such as sustained drug delivery constituted a novel mechanism of action. The applicant stated that similarly, the Neuroguard IEP® System integrates a critical function that fundamentally alters treatment for carotid stenting because it uniquely addresses the lack of micro-embolic protection during stent deployment and post-dilation.

In response to CMS's question about whether the requirement that the Neuroguard IEP® System must always be used in conjunction with an available primary distal embolic protection device suggests that its filter would not impact the mechanism of action of the device, the applicant stated that this requirement does not diminish its novel mechanism of action, but rather underscores its innovative complementary approach to solving a critical clinical limitation in carotid stenting procedures. The applicant explained that the Neuroguard IEP® System offers complementary, not redundant, protection by pairing a standard filter that protects against large emboli (>100 microns) throughout the procedure with its integrated 40-micron pore filter, which captures microemboli during the highest-risk phases of the procedure. Per the applicant, traditional filters must maintain minimum pore sizes of 100 microns to avoid filter thrombosis during prolonged use throughout the carotid stenting procedure, but that approximately 69 percent to 90 percent of embolic particles released during carotid artery stenting procedures are less than 100 microns in size, and thus may reach the cerebral circulation despite the use of these large pore distal filters. The applicant stated that the Neuroguard IEP® System's unique mechanism of action is not possible with other commercially available technologies, including first-generation embolic protection devices and FDA-approved dual-layer stents. The applicant asserted that the Neuroguard IEP® System's clinical outcomes reflect a distinct function that cannot be explained by simply combining existing technologies.

In response to CMS's question about similarity to other existing embolic protection filters used during CAS procedures that have the same 40-micron pore size, such as the Paladin® System with IEP from the same manufacturer, the applicant stated that the Neuroguard IEP® System fundamentally differs from the Paladin® System with IEP in mechanism of action and clinical utility, despite both featuring a 40-micron pore filter. The applicant explained that the key differences are related to procedural coverage and device integration, both of which set the two technologies apart and are critical for understanding why the Neuroguard IEP® System represents a novel therapeutic approach. In terms of procedural coverage differences, the applicant stated that the Paladin® System with IEP's balloon is a separate balloon catheter with integrated embolic protection (without a stent) that can provide small-pore coverage only during balloon dilation before or after a traditional carotid stent placement. According to the applicant, the Paladin® System with IEP's 2018 and 2022 510(k) clearances were limited to balloon angioplasty and post-dilation of a deployed self-expanding stent. Thus, per the applicant, the Paladin® System with IEP cannot be used with a stent during stent deployment, leaving patients unprotected during the high-risk stent deployment phase of the procedure. The applicant stated that the Neuroguard IEP® System's integrated design, in contrast, provides 40-micron pore protection during both the stent deployment and post-dilation phases. In terms of device integration and impact, the applicant stated that the Paladin® System with IEP's balloon must be used with separate stenting systems, which requires additional catheter exchanges and therefore increases embolic risk, whereas the Neuroguard IEP® System consists of a stent, balloon, and filter on a single platform, providing comprehensive protection and eliminating exchanges that increase the risk of microemboli. The applicant also stated that the Neuroguard IEP® System received FDA PMA approval as a novel device with no predicate, and that its comprehensive integrated solution not only enhances protection but also improves procedural efficiency, which was validated by the more rigorous PMA process. The applicant also added that the Paladin® System with IEP's balloon was not widely commercialized in the U.S., as company records show no to minimal sales from 2021 to 2024.

Response: We appreciate the additional information from the applicant and commenters with respect to whether the Neuroguard IEP® System is substantially similar to existing technologies. However, we remain unclear that the Neuroguard IEP® System does not use the same or a similar mechanism of action as existing technologies. While the applicant and commenters describe differences between the Neuroguard IEP® System and other technologies that require a separate EPD, stent, and post-dilation balloon, we believe that the mechanisms of action for the Neuroguard IEP® System to perform individual tasks, like capturing debris, dilating a vessel, and expanding a stent against vessel walls, remain similar to that of existing EPDs, carotid stents, and post-dilation balloons. The applicant asserted that the Neuroguard IEP® System's integrated design, which allows for simultaneous deployment, is absent in other technologies, and that this design in addition to the smaller pore size captures more microemboli. However, the amount of microembolic material captured between EPD types refers to how well each technology performs that task. Thus, the difference in pore size between the EPD of Neuroguard IEP® System and other EPDs, their differential capabilities in capturing microemboli, and the potential impact on clinical outcomes are related to performance differences rather than differences in mechanism of action. Similarly, while the applicant states that by capturing more microemboli, the Neuroguard IEP® System will likely protect patients from strokes post-procedure, this relates to the assessment of substantial clinical improvement rather than the newness criterion. We also note that while, according to the applicant, the Neuroguard IEP® System's integrated design enables the EPD to be deployed during both the stenting and post-dilation phases, reducing the risks for thrombosis, this also relates to assessment of substantial clinical improvement rather than the newness criterion. In addition, while commenters described potential benefits in terms of the Neuroguard IEP® System's closed-cell design, vessel conformability, potential applications for treating complex patients, ease of use, or improving workflow efficiency, these do not describe a new mechanism of action. Since the stent of the Neuroguard IEP® System expands the carotid luminal diameter by propping open a narrow blood vessel physically and providing structural support to the vessel walls, its mechanism of action is similar to that of existing carotid stents. By the same token, the mechanism of action by which existing EPDs and the EPD in the Neuroguard IEP® System capture debris is fundamentally similar. Similarly, regarding the Paladin®

System with IEP, the mechanism of action by which the EPD of the Paladin® System with IEP captures and removes microemboli appears to be the same as that of the EPD of the Neuroguard IEP® System, as well as existing stents and EPDs. We note that we do not believe that the volume of sales is a relevant consideration for making the determination as to whether a product is considered ''new'' for the purposes of new technology add-on payments. Consistent with the statute and our implementing regulations, a technology is no longer considered ''new'' once it is more than 2 to 3 years old, and the costs of the procedures are considered to be included in the relative weights irrespective of how frequently the technology has been used in the Medicare population (89 FR 69126).

With regard to the applicant's comment about Eluvia™, we determined in the FY 2021 IPPS/LTCH PPS final rule that the Eluvia™ Drug-Eluting Stent uses a unique mechanism of action because the sustained release of paclitaxel combats restenosis for 12 to 15 months as compared to other drug-coated balloons or drug-coated stents that deliver drug to the artery for about two months (85 FR 58649). We disagree with the applicant's conclusions that our determination of a new mechanism of action for Eluvia™ means that addressing a treatment limitation constitutes a new mechanism of action. We note that Eluvia™ allowed for gradual degradation of the polymer to control the release of paclitaxel into the bloodstream, while stents that were commercially available before Eluvia™ lacked any mechanism of sustained and controlled release of paclitaxel. Like all EPDs in the market, the EPD of the Neuroguard IEP® System is designed with a filter basket that captures and traps microembolic materials. In this way, its mechanism of action is the same as that of existing EPDs. While existing EPDs are deployed alone and remain open during the entire procedure, and the EPD of the Neuroguard IEP® System is deployed selectively, they all use a basket-like component to catch microembolic materials. Similarly, despite the differences in the pore size of this basket-like component in the Neuroguard IEP® System and existing EPDs, they use the same method to stop microembolic materials from escaping into the bloodstream. Thus, the Neuroguard IEP® System's mechanism of action is the same as that of existing technologies because the mechanism by which each of its components performs a specific task is the same as that of existing technologies.

After consideration of the comments received, and for the reasons discussed, we believe that that the Neuroguard IEP® System uses a similar mechanism of action as existing technologies by using a balloon to dilate blood vessels physically, using a stent to support the vessel wall and keep the vessels open, and using an EPD to capture embolic materials. Furthermore, as discussed previously, the Neuroguard IEP® System and existing technologies map to the same MS–DRGs and treat the same disease, carotid artery stenosis, in the same patient population as existing carotid stent technologies and EPDs. Accordingly, because the Neuroguard IEP® System meets all three of the substantial similarity criteria, we believe that the Neuroguard IEP® System is substantially similar to existing carotid artery stents. In accordance with our policy, because these technologies are substantially similar to each other, we use the earliest market availability date as the beginning of the newness period. Because carotid artery stents and EPDs have been on the market for many years, the 3-year anniversary for the Neuroguard IEP® System occurred prior to FY 2026. Therefore, the Neuroguard IEP® System does not meet the newness criterion and is not eligible for new technology add-on payments for FY 2026. We note that we received public comments with regard to the cost and substantial clinical improvement criteria for this technology, but because we have determined that the technology does not meet the newness criterion and therefore is not eligible for approval for new technology add-on payments for FY 2026, we are not summarizing comments received or making a determination on those criteria in this final rule.

j. RYSTIGGO® (Rozanolixizumab-Noli)

UCB, Inc. submitted an application for new technology add-on payments for RYSTIGGO® for FY 2026. According to the applicant, RYSTIGGO® is a neonatal Fc receptor (FcRn) blocker indicated for the treatment of generalized myasthenia gravis (gMG) in adult patients who are anti-acetylcholine receptor (AChR) or anti-muscle-specific tyrosine kinase (MuSK) antibody positive (ab+). The applicant stated that gMG is a rare chronic autoimmune disorder in which antibodies destroy the communication between nerves and muscle, resulting in weakness of the skeletal muscles, particularly the eyes, mouth, throat, and limbs. Per the applicant, some gMG patients have MuSK ab+, a subtype of gMG that may lead to more severe symptoms and limited treatment options.

Please refer to the online application posting for RYSTIGGO®, available at *https://mearis.cms.gov/public/publications/ntap/NTP2410073H0PQ*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, RYSTIGGO® was granted BLA approval from FDA on June 26, 2023, for the treatment of gMG in adult patients who are AChR ab+ or MuSK ab+. According to the applicant, RYSTIGGO® was not available for sale until July 20, 2023, the date on which the product was released from U.S. Customs after being shipped from an overseas manufacturing facility. Per the applicant, RYSTIGGO® is administered as a subcutaneous infusion once each week for 6 weeks. Per the applicant, RYSTIGGO® is available in single-dose vials that contain 280 mg, 420 mg, 560 mg, or 840 mg of RYSTIGGO® at a concentration of 140 mg/mL. The applicant noted it used the following equation to calculate the weighted average cost per inpatient stay: [(percent of patients whose weight aligns to the 3mL vial × cost of the 3mL vial) + (percent of patients whose weight aligns to the 4mL vial × cost of the 4mL vial) + (percent of patients whose weight aligns to the 6mL vial × cost of the 6mL vial/100%] × 2 doses. The applicant stated that the typical inpatient stay for patients with gMG is 11 to 13 days, and thus, 2 doses would usually be administered during a typical inpatient stay.

The applicant submitted a request for approval for a unique ICD–10–PCS procedure code for RYSTIGGO® and was granted approval to use the following procedure code effective October 1, 2025: XW013TB (Introduction of rozanolixizumab-noli monoclonal antibody into subcutaneous tissue, percutaneous approach, new technology group 11). The applicant stated that G70.00 (Myasthenia gravis without (acute) exacerbation) and G70.01 (Myasthenia gravis with (acute) exacerbation) may be used to currently identify the indication for RYSTIGGO® under the ICD–10–CM coding system.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted

that RYSTIGGO® is not substantially similar to other currently available technologies because, while other treatments are available for gMG, about 40 percent of patients continue to experience exacerbations, and that RYSTIGGO® is the only treatment for patients with gMG who are AChR or MuSK ab+, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for RYSTIGGO® for the applicant's complete statements in support of its assertion that RYSTIGGO® is not substantially similar to other currently available technologies.

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	RYSTIGGO® is a subcutaneously infused monoclonal antibody (mAb) that specifically targets FcRn with high affinity, permitting the accelerated removal of all subclasses of immunoglobulin G (IgG). There are specific differences in FcRn affinities between RYSTIGGO® and other FcRn inhibitors. RYSTIGGO® is the only FcRn inhibitor that is FDA-approved for MuSK ab+ gMG in adults.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	The administration of RYSTIGGO® to treat gMG is not expected to change the MS-DRG assignment of the discharge.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	While other treatments are available for gMG, about 40% of patients continue to experience gMG exacerbation, suggesting an inadequate response to existing treatment. RYSTIGGO® is the only FDA-approved treatment for patients with gMG that are MuSK ab+.

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18139), with respect to the substantial similarity criteria, while the applicant stated that RYSTIGGO® does not use the same or a similar mechanism of action as compared to existing technologies because there are specific differences in FcRn affinities between RYSTIGGO® and other FcRn inhibitors, we stated that we were unclear as to what the specific differences are and whether they rise to the level of a new mechanism of action. We noted that VYVGART® is also an FcRn inhibitor approved for use in patients with gMG, and per FDA prescribing information, both technologies bind to the FcRn resulting in the reduction of circulating IgG.[105] [106] We welcomed additional information about how the mechanism of action for RYSTIGGO® differs from other existing FDA-approved therapies, including FcRn inhibitors such as VYVGART®. We noted that the applicant also stated that RYSTIGGO® does not involve the treatment of the same or similar type of disease and the same or similar patient population when compared to an existing technology because, while there are other treatments for gMG, about 40 percent of patients continue to experience gMG exacerbation, suggesting an inadequate response to existing treatment and RYSTIGGO® is the only FDA-approved treatment for patients with gMG that are MuSK ab+. However, we noted there are other standard of care treatment options for patients with AChR ab+ and MuSK ab+ gMG, such as pyridostigmine, glucocorticoid therapy, and plasmapheresis. In addition, VYVGART®, ULTOMIRIS®, ZILBRYSQ®, and SOLIRIS® are also treatment options for patients with AChR ab+ gMG. Therefore, we questioned the assertion that RYSTIGGO® does not involve the treatment of the same or similar type of disease and the same or similar patient population when compared to existing technology.

We invited public comments on whether RYSTIGGO® is substantially similar to existing technologies and whether RYSTIGGO® meets the newness criterion.

Comment: The applicant submitted a public comment regarding the newness criterion. The applicant stated that RYSTIGGO® meets the newness criterion for new technology add-on payment status because it was just recently approved by FDA on June 26, 2023, and was not available for sale until July 20, 2023 and there are no other treatments for the disease or condition that RYSTIGGO® treats or diagnoses. The applicant noted that RYSTIGGO® is the first treatment approved by FDA specifically for patients with either AChR ab+ or MuSK ab+ gMG. The applicant also reiterated information from its application regarding its claim that RYSTIGGO® does not use the same or a similar mechanism of action compared to existing technologies to achieve a therapeutic outcome and does not treat the same or similar type of disease or patient population compared to existing therapies.

In response to CMS's request for additional information about how the mechanism of action for RYSTIGGO® differs from existing FDA-approved therapies, including FcRn inhibitors such as VYVGART®, the applicant stated that while technically, both RYSTIGGO® and VYVGART® are FcRn blockers, RYSTIGGO® was specifically studied for the MuSK ab+ patient population, and FDA granted an expedited review of the product for this subset of gMG patients, for which there was previously no other indicated product. The applicant also commented that RYSTIGGO® differs from IMAAVY® in that IMAAVY® is

[105] argenx US, Inc. *VYVGART® (efgartigimod alfa-fcab) injection* [Package Insert]. (Revised 8/2024). Available at: *https://www.accessdata.fda.gov/drugsatfda_docs/label/2024/761195s004,761304s003lbl.pdf.*

[106] UCB, Inc. *RYSTIGGO® (rozanolixizumab-noli) injection, for subcutaneous use* [Package Insert]. (Revised 6/2024). Available at: *https://www.accessdata.fda.gov/spl/data/c6e71126-50c1-4ae2-9d82-b053d605b9cb/c6e71126-50c1-4ae2-9d82-b053d605b9cb.xml.*

immuno-selective, only targeting IgG1 levels, while RYSTIGGO® targets IgG1, IgG2, IgG3, and IgG4 levels.

The applicant commented that while several treatments have been approved by FDA for gMG, including SOLIRIS®, ULTOMIRIS®, and VYVGART®, these treatments do not adequately assist those gMG patients with anti-muscle specific tyrosine kinase antibodies. In response to CMS's concern with regards to the applicant's assertion that RYSTIGGO® does not involve the treatment of the same or similar type of disease and the same or similar patient population because there are other standard of care treatment options, the applicant stated that RYSTIGGO® is a targeted therapy with a safety and efficacy profile established in a randomized clinical trial, as well as real world evidence. The applicant further stated that at the time RYSTIGGO® was approved, there were no other available approved treatments for gMG in adult patients who are MuSK ab+, and all other treatments for gMG cited by CMS have been used off-label. According to the applicant, RYSTIGGO® is now able to meet this patient population's need and as such, it is effectively the new standard of care for the MuSK ab+ patient population.

Response: We appreciate the additional information from the applicant. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for RYSTIGGO®, we agree with the applicant that RYSTIGGO® uses a unique mechanism of action for the treatment of MuSK ab+ gMG because at the time the new technology add-on application was submitted, it was the only FcRn inhibitor FDA-approved for the treatment of adult patients with gMG who are MuSK ab+. Therefore, we agree that RYSTIGGO® is not substantially similar to existing treatment options and meets the newness criterion, specifically for the MuSK ab+ gMG indication. We consider the beginning of the newness period to commence on July 20, 2023, the date on which RYSTIGGO® became commercially available.

However, we have concerns with regard to the substantial similarity criteria for RYSTIGGO® for the treatment of AChR ab+ gMG in adults. We note that the applicant has not provided any information to differentiate RYSTIGGO®'s mechanism of action from that of VYVGART®, and we therefore believe that the two technologies have the same or a similar mechanism of action as FcRn inhibitors approved for use in patients with AChR ab+ gMG. As there are many other treatment options for patients with AChR ab+ gMG, including VYVGART®, ULTOMIRIS®, ZILBRYSQ®, and SOLIRIS®, we also believe that RYSTIGGO® does not treat a new patient population or disease with respect to AChR ab+ gMG. In addition, we agree with the applicant that RYSTIGGO® would be assigned to the same MS–DRG as existing technologies.

Because RYSTIGGO® for the treatment of adults with AChR ab+ gMG meets all three of the substantial similarity criteria, we believe that RYSTIGGO® is substantially similar to VYVGART® for this indication. Therefore, in accordance with our policy, we consider the beginning of the newness period for RYSTIGGO® to begin on December 17, 2021, the date on which VYVGART® received FDA marketing authorization for the treatment of adults with AChR ab+ gMG. Since the 3-year anniversary date of VYVGART®'s entry onto the market occurred prior to FY 2026, RYSTIGGO® for the treatment of adults with AChR ab+ gMG does not meet the newness criterion and is not eligible for new technology add-on payments for FY 2026. We note that because we have determined that the technology does not meet the newness criterion for the treatment of adults with AChR ab+ gMG and therefore is not eligible for approval for new technology add-on payments for FY 2026 for this indication, we are not summarizing comments received or making a determination on the cost or substantial clinical improvement criteria for the AChR ab+ gMG indication in this final rule.

With respect to the cost criterion, the applicant provided an analysis to demonstrate that RYSTIGGO® meets the cost criterion. The analysis followed the order of operations summarized in the following table.

RYSTIGGO® COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for RYSTIGGO®.
Claims identified	22,213 claims mapping to 641 MS-DRGs, with none exceeding more than 8.28% of the total identified cases.
Charges removed for prior technology	Per the applicant, use of the technology may replace current drug charges for therapies. The applicant removed 100% of drug charges from the identified cases, which, as the applicant stated, is likely an overestimation of charges that would be replaced by RYSTIGGO® since patients may receive some ancillary drug treatments with RYSTIGGO®. The applicant did not remove indirect charges related to the new technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS interim final action with comment period.
Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Average case-weighted threshold amount: $80,760 Final inflated average case-weighted standardized charge per case: $236,731

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that RYSTIGGO® meets the cost criterion.

We invited public comments on whether RYSTIGGO® meets the cost criterion.

Comment: The applicant reiterated that the cost criterion analysis submitted with the application demonstrates that RYSTIGGO® meets the cost criterion.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. Therefore, RYSTIGGO® meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that RYSTIGGO® represents a substantial clinical improvement over existing technologies because RYSTIGGO® is the only FDA-approved product for anti-MuSK ab+ gMG in adult patients, and is an option for patients unresponsive to, and not treated by, conventional therapies. The applicant also asserted that RYSTIGGO® significantly improves clinical outcomes relative to services or technologies previously available. The applicant provided seven articles regarding the MycarinG study and its open-label extension studies, as well as a meta-analysis regarding efficacy of newer therapies for MG, to support these claims. The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for RYSTIGGO® for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
RYSTIGGO® is the only FDA-approved therapy for gMG in adult patients who are MuSK ab+.	Habib AA, Sacconi S, Antonini G, et al. Efficacy and safety of rozanolixizumab in patients with muscle-specific tyrosine kinase antibody-positive generalised myasthenia gravis: a subgroup analysis of the randomised, double-blind, placebo-controlled, adaptive phase III MycarinG study. AAN 2024b.

We also received written public comments in response to the New Technology Town Hall meeting notice published in the **Federal Register** regarding the substantial clinical improvement criterion for RYSTIGGO®, which we summarized in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18140 through 18141).

After review of the information provided by the applicant and the public comments received in response to the New Technology Town Hall meeting, we stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18141 through 18142) that we had the following concerns regarding whether RYSTIGGO® meets the substantial clinical improvement criterion. While the applicant stated that RYSTIGGO® is the only FDA-approved therapy for gMG in adult patients who are MuSK ab+, and that this subtype is challenging to treat, as patients are usually unresponsive and often intolerant of pyridostigmine (a standard first-line MG therapy), we noted that the applicant also stated that 3,4-diaminopyridine treatments may have a mild to moderate effect. We further noted that, as mentioned previously, other therapies such as pyridostigmine, glucocorticoid therapy, and plasmapheresis are also available options for these patients, and we therefore questioned whether RYSTIGGO® offers a treatment option for patients with MuSK ab+ gMG who have no other treatment options. The applicant also stated that RYSTIGGO® provides a treatment option for the approximately 10 to 20 percent of patients with gMG whose disease is not responsive to, and not treated by, conventional therapies due to inadequate response or intolerable side effects, however, we questioned whether the evidence provided demonstrates that there is a population of patients with gMG with no other treatment options. To support this claim, the applicant provided the double-blind, placebo-controlled, phase 3 MycarinG study, which randomized 200 patients (1:1:1) to receive RYSTIGGO® 7 mg/kg, RYSTIGGO® 10 mg/kg, or placebo in addition to their current gMG treatment (where permitted by the study inclusion criteria) for 6 weeks, as well as an abstract of a post hoc subgroup analysis of this study (Vu et al., 2023) which stratified trial results based on the number of prior therapies.[107] The applicant stated that the MycarinG study demonstrated RYSTIGGO®, in addition to standard of care, significantly improved clinical outcomes by reducing MG–ADL, QMG, and MG Composite (MGC) scores in adult patients with gMG, including those with prior standard of care treatments such as corticosteroids, parasympathomimetics, and non-steroidal immunosuppressants. We noted that permitted concomitant medications were cholinesterase inhibitors, oral corticosteroids, azathioprine, ciclosporin, methotrexate, mycophenolate mofetil, and tacrolimus. All of these medications, except for cholinesterase inhibitors, required a stable dose. We questioned if the cholinesterase inhibitor dose may have affected the results of the study since the dose may not have been stable throughout the trial. In addition, other standard of care treatment options for patients were excluded, including rituximab products, VYVGART®, ULTOMIRIS®, ZILBRYSQ®, and SOLIRIS®, and we therefore questioned if RYSTIGGO® is the only treatment option for patients with gMG who have failed conventional therapy.

We stated that the applicant also provided an abstract of a subgroup analysis (Vu et al., 2023) of the MycarinG study and stated the subgroup analysis demonstrated that RYSTIGGO® significantly improved outcomes based on a reduction in MG–ADL in patients who had previously undergone myasthenia gravis standard treatments based on stratification on a number of prior therapies, excluding acetylcholinesterase inhibitors, but including corticosteroids, non-steroidal immunosuppressants, IVIg, and plasma exchange. However, we stated that it was unclear how a subgroup analysis on the number of prior therapies provides evidence that RYSTIGGO® is the only treatment option for patients unresponsive to conventional therapies. We also noted that acetylcholinesterase inhibitors were excluded from this subgroup analysis, but these are part of the standard of care for MG.

With respect to the applicant's assertion that RYSTIGGO® improves clinical outcomes over existing therapies, the applicant submitted three presentation posters (Bril et al., 2023b; Sacconi et al., 2023; Habib et al., 2024b) that provided efficacy and safety results from the MycarinG study and 2 open-label extension studies (MG0004 and MG007) which we noted are not published or peer-reviewed. We noted that two of the poster presentations (Bril et al., 2023b and Habib et al., 2024b) do not report the statistical significance of results and, therefore, we were uncertain as to how significant the results are. We stated that with regards to the MycarinG study, per the applicant's Town Hall comment, patients were allowed to remain on standard of care therapies such as non-steroidal immunosuppressive therapy, steroids, and pyridostigmine. However, we noted that various other standard of care therapies were excluded such as rituximab products, VYVGART®, ULTOMIRIS®, ZILBRYSQ®, and SOLIRIS®. Without a comparison to these therapies, we questioned whether RYSTIGGO® improves clinical outcomes relative to all previously available therapies. Given the 6-week duration of the trial, we also questioned how natural changes in symptoms were accounted for since symptoms can wax and wane in patients with gMG. We further noted that the MycarinG and the open-label extension studies involved only 8 weeks (MycarinG and MG0004) or 16 weeks (MG0007) of observation, which makes it more difficult to assess the frequency of prolonged remission rates and how the adverse event rates, such as for cancer and infection, compare with existing therapies. We stated that we were also interested in more information on the lack of a dose-response effect with RYSTIGGO®. For instance, there was a least squares mean (LSM) in MG–ADL of −7.28 in the rozanolixizumab (RLZ) 7 mg/kg group and −4.16 in the RLZ 10 mg/kg group within the MuSK ab+ population and an LSM of −3.03 in the RLZ 7 mg/kg group and a similar LSM of −3.36 in the RLZ 10 mg/kg group within the AChR ab+ population. We also noted there is only about a 2 to 2.5-point difference between RYSTIGGO® and placebo for MG–ADL in the AChR ab+ subpopulation and the overall population. Specifically, for the AChR ab+ population, the LSM difference versus placebo in the RLZ 7 mg/kg group was −1.94 and in the RLZ 10 mg/kg group was −2.26 and for the overall population, the LSM difference versus placebo was −2.59 in the RLZ 7 mg/kg group and −2.62 in the RLZ 10 mg/kg group. The applicant stated that these findings were statistically significant. We noted that the study considered a 2-point difference in MG–ADL as a clinically meaningful improvement. We stated that we would appreciate clarification on how the study defined clinically meaningful improvement.

In addition, with respect to the MuSK ab+ population in the MycarinG trial, we noted there were 21 MuSK ab+ patients in the studies submitted by the applicant. We further noted that the FDA Integrated Review for RYSTIGGO® indicated that 16 patients tested positive for the MuSK ab+ and we stated that we would appreciate clarification regarding this discrepancy in numbers. We noted

[107] Bril, 2023a, *op. cit.*

that in its Town Hall comment, the applicant emphasized that gMG, particularly MuSK positive gMG, is a rare disease and the number of patients in the study is consistent with other rare disease treatment clinical trials and was acceptable to FDA. However, we questioned if the results are generalizable to the Medicare population since only 2 patients treated with RYSTIGGO® were from the U.S. and only 1 patient treated was 65 years or older.[108] We also noted that not all efficacy outcomes were statistically significant within the MuSK ab+ population. Specifically, the LSM difference in QMG between RYSTIGGO® and placebo was not statistically significant for either the RLZ 7 mg/kg group (97.5 percent confidence interval −14.24, 0.41) nor the RLZ 10 mg/kg group (97.5 percent confidence interval −9.73, 3.45). Further, we noted there appears to be a difference in the disease severity between the MuSK ab+ patients in the placebo and treatment arms. For example, results from Habib et al. (2024a) indicated that among the MuSK ab+ population of the MycarinG study, all patients with severe (Class IV) disease at baseline, per the Myasthenia Gravis Foundation of America (MGFA) classification system, were in the placebo arm (3/8), while individuals in the treatment groups all had mild or moderate (Class II or Class III) disease at baseline. We questioned how this difference may have impacted the placebo group's outcomes relative to those of the treatment groups. Additionally, a higher percentage of patients were taking corticosteroids in the RYSTIGGO® groups (80 percent in 7 mg/kg group and 87.5 percent in 10 mg/kg group) compared to placebo (62.5 percent) and we questioned if this difference in background therapy could have affected the outcomes, since oral corticosteroids were a permitted concomitant medication in the trial. We also noted that the trial excluded individuals with severe oropharyngeal or respiratory weakness, and we questioned whether this exclusion would affect the generalizability of the results for this MuSK ab+ subpopulation, as the applicant indicated that patients with MuSK ab+ gMG tend to have more severe disease with a potential unmet need for treatment options.

We stated that the applicant also provided a meta-analysis comparing innovative therapies in MG, stating that it demonstrated that anti-FcRn treatments such as RYSTIGGO® showed greater effects on QMG, MGC, and MG-QoL15 compared to complement inhibitors, with VYVGART® and RYSTIGGO® having the highest probabilities of being the most effective treatment for MG–ADL and QMG. However, we noted that the same article indicated no significant difference in MG–ADL between complement inhibitors and anti-FcRn treatments. Additionally, we noted that the analysis found that VYVGART® had the highest probability of being the best treatment, followed by RYSTIGGO®.[109] We noted that we did not receive any other evidence comparing complement inhibitors or anti-FcRn treatments with RYSTIGGO® to demonstrate improved outcomes. Therefore, we requested additional information comparing RYSTIGGO® to these other therapies in order to inform our assessment of whether RYSTIGGO® demonstrates a substantial clinical improvement over existing technologies. In addition, we noted that the meta-analysis included seven clinical trials, only two of which included patients positive for MuSK ab+, MycarinG and ADAPT, a trial studying VYVGART®. The meta-analysis did not include trials studying other standard of care therapies in patients with MuSK ab+ gMG. Since the meta-analysis did not include a comparison of current therapies in patients with MuSK ab+ gMG, we questioned how this analysis demonstrates RYSTIGGO® improves clinical outcomes relative to previously available therapy for patients with MuSK ab+ gMG.

We also noted that, while the applicant stated that RYSTIGGO® meets patient preferences for convenience by its ability to be administered via a subcutaneous infusion by a healthcare provider, either at an infusion clinic or at home with nurse assistance, the applicant did not provide a comparison of administration to other available therapies. We stated that we would further appreciate additional information on how the administration method for RYSTIGGO® demonstrates that the technology significantly improves one or more of the clinical outcomes described under the regulations at § 412.87(b)(1)(ii)(C).

We invited public comments on whether RYSTIGGO® meets the substantial clinical improvement criterion.

Comment: A few commenters expressed general support for RYSTIGGO®'s eligibility for new technology add-on payments. A commenter stated its belief that use of RYSTIGGO® for the FDA-labeled indications would require hospitals to incur costs that, without a new technology add-on payment, would have to be fully absorbed by the treating hospital. The commenter stated that the new technology add-on payment mechanism was created to eliminate the limitations in access to new therapies due to lack of reimbursement in the inpatient setting.

Response: We thank the commenters for their input.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant also reiterated information from its application regarding the claim that RYSTIGGO® meets the substantial clinical improvement criterion because it offers a treatment option for gMG patients unresponsive to, or ineligible for, currently available treatments, and that, RYSTIGGO® offers further clinical improvement in addition to standard of care therapies for adult patients with gMG.

In response to CMS's note that there are other therapy options for patients with MuSK ab+ gMG, the applicant reiterated RYSTIGGO® is the first approved treatment for gMG in adult patients who are MuSK ab+, and all other treatments are used off-label. In addition, the applicant discussed a case report of an adult patient with MuSK ab+ gMG that illustrated that the patient was responsive to and tolerant of 3,4-diaminopyridine (DAP). According to the applicant, the case report qualifies as Class IV evidence and is a single observational study without controls. The applicant further stated that, while in the abstract it would be ideal if the safety and efficacy of 3,4-DAP in patients with MuSK ab+ gMG were confirmed in randomized trials, the evidence to-date, along with real world data and patient reports, supports the conclusion that RYSTIGGO® is unique in being the first drug to treat the gMG MuSK ab+ population.

In response to CMS's question whether the evidence provided demonstrates that there is a population of patients with gMG with no other treatment options, which refers to the 10 to 20 percent of patients with gMG whose disease was not responsive to and not treated by conventional therapies due to inadequate response or intolerable side effects, the applicant stated that the 10 to 20 percent of patients with gMG referenced are those patients who are MuSK ab+, and thus did not have effective treatments

[108] U.S. FDA CDER, 2023, *op. cit.*

[109] Saccà, 2023, *op. cit.*

available until the approval of RYSTIGGO®.

In response to CMS's question if RYSTIGGO® is the only treatment option for patients with gMG who have failed conventional therapy, given that some standard of care treatment options for patients were excluded from the MycarinG study, including rituximab products, VYVGART®, ULTOMIRIS®, ZILBRYSQ®, and SOLIRIS®, the applicant restated that RYSTIGGO® was the first treatment option approved for the MuSK ab+ patient population and noted rituximab is not indicated for the treatment of MG even if it is sometimes used off-label in the MuSK ab+ patient population. According to the applicant, rituximab, an anti-CD20 mAb, is reserved for patients who are refractory to conventional oral immunosuppressants and used as part of an escalation therapy, which is supported in the International Consensus guidance. The applicant stated that safety concerns related to the risk of virus-related progressive multifocal leukoencephalopathy remain. Per the applicant, biologics have added to the more targeted treatment options for gMG, with SOLIRIS® being a first-in-class humanized mAb targeting the terminal complement complex, blocking the enzymatic cleaving of complement 5 (C5), and thereby preventing the activation of the complement complex. The applicant further stated that due to lack of complement involvement in the pathophysiology of MuSK ab+ patients with gMG, this difficult-to-treat subgroup of patients does not benefit from C5 inhibitor treatment. The applicant commented that immunosuppressive treatment of gMG is dominated by untargeted treatments, such as steroids and nonsteroidal immunosuppressants, and that both steroids and nonsteroidal immunosuppressants target the immune system non-specifically with the goal of reducing autoimmune reactivity in MG. The applicant stated that the treatments with these agents are associated with well-documented short-term as well as long-term toxicities, and that the delayed beneficial effect combined with early onset of tolerability issues frequently discourages patients from continuing therapy. The applicant further commented that both plasma exchange (PLEX) and IVIg are considered for patients with gMG who have exhausted all of their other treatment options, and whose clinical status is deteriorating despite ongoing immunosuppressive and acetylcholinesterase inhibitors (AChEI) therapies. According to the applicant, although treatment with PLEX or IVIg is mentioned in the International Consensus guidance for management of MG, neither treatment is approved in the U.S. for gMG. The applicant stated that the availability of IVIg (including shortages and increasing demand over supply) and repetitive cycles of IVIg and PLEX administered in a hospital setting are burdensome and time consuming for patients, caregivers, and healthcare professionals, and are not considered a viable long-term treatment option for the majority of patients with MG.

In response to CMS's question on how a subgroup analysis of the MycarinG study, in the Vu et al. (2023) abstract, provides evidence that RYSTIGGO® is the only treatment option for patients unresponsive to the prior standard of care, the applicant stated that MycarinG is a pivotal Phase III trial that led to the approval of RYSTIGGO®, and Phase III trials typically don't include head-to-head analyses. The applicant stated that the MycarinG study demonstrates that RLZ is a possible option for patients who have had or have not had prior therapies. In response to CMS's further concern about why AChEIs were excluded from this subgroup analysis even though they are part of the standard of care for MG, the applicant stated that ''prior therapies (0 1, 2 prior MG therapies excluding AChEI)'' refers to patients who had been on two therapies that did not include AChEIs, not that the patient had not received AChEIs. The applicant clarified that this includes patients who might have received three prior therapies (for example AChEI, corticosteroids, and non-steroidal immunosuppressive therapies). According to the applicant, patients in the zero prior therapy group could have received AChEI but no other treatment and 86 percent of patients in MycarinG were on AChEIs.

With regards to the concern that two poster presentations (Bril et al., 2023b and Habib et al., 2024b) do not report statistically significant results, the applicant stated that the Bril et al. (2023b) poster did not report statistical significance because the poster included pooled extension data, so there was no placebo group to compare against, and therefore, no statistical test. Similarly, the applicant stated that the Habib et al. (2024b) poster did not report statistical significance given the reported significant change from baseline at day 43 in muscle weakness fatigability and physical fatigue, confirming the Bril et al. (2023b) study. Per the applicant, the Habib et al. (2024b) poster further shows the clinical meaningfulness for those data by applying the meaningful change thresholds that were determined post hoc. However, according to the applicant, because of the novel nature of the Myasthenia Gravis Symptoms Patient Reported Outcome (MGSPRO), the threshold of responder is a range, as described in the poster. The applicant stated that because both ends of the range of the threshold were applied, statistical significance does not apply here. The applicant stated that CMS posed several questions about the MycarinG study, which allowed trial participants to remain on standard of care therapies such as non-steroidal immunosuppressive therapy, steroids, and pyridostigmine, but not on other treatments, such as rituximab products, VYVGART®, ULTOMIRIS®, ZILBRYSQ®, and SOLIRIS®. In response to CMS's questions about the lack of comparison to other treatments, the applicant stated it appreciates that it would be ideal if all study designs were identical, allowing for both head-to-head comparative results between different therapies and dose-response results in tests of identical duration. Per the applicant, there was a clearing out period for some of these therapies because, while no head-to-head studies have been conducted, continued use would potentially lead to immunosuppression that would be more severe and lead to other major side effects. In response to CMS's questions about the 6-week trial duration given patient symptom variability, the applicant stated that the reason the study included 6 weeks of administration was that IgG levels were tracked and showed a 70 percent reduction at 6 weeks. In response to CMS's questions about the difficulty in comparing results with 8-week studies (such as MycarinG and MG0004) or 16-week studies (MG0007), the applicant stated that the reason for the 8 weeks of observation in the pivotal trial and then 16 weeks in the open-label extension study is that patients were only reinitiated with therapy based on emerging symptoms, which speaks to the long-lasting durability of the product.

In response to CMS's question about whether there is a dose-response effect and the definition of a clinically meaningful improvement, the applicant stated the study considered a two-point difference in MG–ADL as a clinically meaningful improvement. The applicant reiterated that more patients achieved meaningful symptom expression (MSE) in both rozanolixizumab groups than in the placebo group, and the change from baseline to day 43 in MGII was greater in both rozanolixizumab groups than in the placebo group.

A commenter provided a response to CMS's concern on the validity of the endpoints used in the RYSTIGGO® study, including the rationale for using MG–ADL as the primary endpoint. The commenter stated that the choice of endpoints is largely driven by FDA preferences, and while sponsors may choose to select endpoints other than those outlined as acceptable within a review toward approval, few would assume the risk in doing so. The commenter stated that it is aware that FDA's preferences on specific endpoints evolves over time and could change while a study incorporating an older endpoint is in progress. The commenter asserted that, while it believes there are often flaws in FDA's determination on endpoints for specific rare and ultra-rare conditions, once a study has started (and certainly after FDA has granted approval based on that endpoint), CMS should not make an independent decision impacting access based on choice of endpoints. The commenter further stated that CMS's analyses related to RYSTIGGO® focused primarily on whether there is a particular subpopulation for which the treatment under review offers a significant improvement over other treatments. The commenter stated that these inquiries appeared to examine whether other products existed and the extent to which there was a direct comparison between those therapies and the product under review. The commenter stated the time from approval to expiration of any new technology add-on payment period is 3 years, far too short for any comparative effectiveness study. The commenter stated its belief that the expectation of data that unequivocally demonstrates superiority of a newly approved treatment over existing branded therapies is simply not realistic.

In response to CMS's question with respect to the discrepancy in numbers between 21 MuSK ab+ patients included in the MycarinG study submitted by the applicant and 16 patients tested positive for the MuSK ab+ in the FDA Integrated Review for RYSTIGGO®, the applicant clarified that the 21 MuSK ab+ patients is the number of historical MG-specific autoantibody status patients, and the baseline MG-specific autoantibody status was 16 patients.

In response to CMS's question if the results of the MycarinG study are generalizable to the Medicare population due to the small sample size,[110] the applicant commented that MuSK ab+ gMG is a rare disease, and limited U.S. enrollment is not unusual in global trials for rare conditions. The applicant commented that FDA's acceptance of the sample size and international enrollment is consistent with rare disease norms. Additionally, a commenter stated that it urges CMS to accept the manufacturers assertion that small study samples are not only common to rare disease studies but that they are accepted by FDA to support approval. The commenter stated that with respect to generalizability to the Medicare population, it urges CMS to recognize that recruitment of patients over age 65 has been a challenge for researchers regardless of patient population size, and additionally, Medicare's beneficiary population extends beyond those over age 65 to include disabled individuals. Per the commenter, approximately 10 percent of individuals qualifying for SSDI payments (and subsequently eligible for Medicare benefits) are disabled due to a condition of nervous system and sense organs such as MG.

In response to CMS's concern that in the MycarinG study not all efficacy outcomes were statistically significant within the MuSK ab+ population, the applicant stated that as a rare disease with a small patient population in the pivotal study, it is not unusual that some endpoints may not demonstrate statistical significance. The applicant acknowledged that the QMG score difference between RYSTIGGO® and placebo in the MuSK ab+ subgroup did not reach statistical significance, as the 97.5 percent CIs crossed zero. The applicant stated that the MG–ADL and MGC endpoints were statistically significant or numerically favored RYSTIGGO®. According to the applicant, the small size of the MuSK ab+ subgroup (n=21) results in limited power, but multiple endpoints consistently showed improvement. The applicant stated that this trend across endpoints supports clinical benefit, notwithstanding the absence of ideal statistical uncertainty. The applicant reiterated that as with many rare disease indications, the limited power of the studies necessarily will constrain the nature of the data, and FDA was comfortable approving the biologic and found the available statistical evidence sufficient.

In response to CMS's concern that in the MycarinG study there was a difference in the disease severity between the MuSK ab+ patients in the placebo and treatment arms, the applicant stated that patients were randomized. The applicant also stated that consistent improvements across MG–ADL, QMG, and MGC (in the context of randomization) suggest efficacy notwithstanding baseline severity differences.

In response to CMS's question on whether the difference in corticosteroid use between treatment and placebo groups in the clinical trial could have impacted the trial results, the applicant commented that this variability is inevitable in rare disease clinical trials that necessarily involve relatively small numbers of patients. The applicant further stated that the extensive data analysis that followed the trial did not produce any suggestion that corticosteroid use influenced trial results. The applicant commented that, whether or not corticosteroids could enhance response and amplify the treatment effect, RYSTIGGO® still demonstrated a benefit over placebo despite corticosteroids being allowed across arms. In response to CMS's question on the choice of the clinical study design to exclude individuals with severe oropharyngeal or respiratory weakness, and whether the trial results would apply to such patients, the applicant commented that while additional data or trials including this subgroup would enhance relevance for the Medicare population with more severe disease, the clinical trial design that was accepted by FDA did not require the inclusion of these patients to demonstrate efficacy.

The applicant commented in response to CMS's concerns about a meta-analysis comparing innovative therapies in MG. In response to CMS's question why there was no significant difference in MG–ADL between complement inhibitors and anti-FcRn treatments, the applicant stated that the meta-analysis suggests that anti-FcRn therapies, including RYSTIGGO®, are among the most promising emerging treatments for gMG based on multiple outcome measures, with statistically superior results to complement inhibitors in QMG, MG-QoL15, and a trend toward improved MGC. In response to CMS's requested additional information comparing RYSTIGGO® to other therapies, the applicant stated that, notwithstanding the conclusions of the meta-analysis, the totality of available evidence for RYSTIGGO®—the meta-analysis by Saccà et al. (2023), differentiation in patient populations treated (particularly MuSK ab+), subcutaneous route with home administration, rapid onset of effect, and favorable safety profile without the need for complement blockade monitoring—supports the conclusion that RYSTIGGO® represents a substantial clinical improvement over existing therapies for appropriate patients with gMG. In response to

[110] U.S. FDA CDER, 2023, *op. cit.*

CMS's question of how the meta-analysis demonstrates improved clinical outcomes without a comparison to current therapies in patients with MuSK ab+ gMG, the applicant stated its view that the clinical trial data in both the pivotal studies and from the meta-analysis contain sufficient evidence to conclude that RYSTIGGO® offers clinical superiority over the existing standard of care for the MuSK ab+ patients at the time of approval. Further, the applicant commented that the meta-analysis included two clinical trials with MusK ab+ patient data, MycarinG and ADAPT, while the remaining five trials primarily enrolled patients with AChR ab+ gMG. The applicant stated that it agrees that the meta-analysis, as published, does not allow for a subgroup-level indirect comparison of RYSTIGGO® with standard of care therapies specifically in the MuSK ab+ population. According to the applicant, the meta-analysis did not include trials assessing standard of care therapies (for example, corticosteroids, cholinesterase inhibitors, or non-steroidal immunosuppressants) in MuSK ab+ gMG. The applicant stated that this gap reflects a broader evidence limitation in the field but does not detract from the conclusions of the literature and clinical results demonstrating that RYSTIGGO® was the first FDA-approved treatment specifically indicated for MuSK ab+ gMG in adult patients. The applicant also stated that the evidence demonstrates that patients with MuSK Ab+ gMG often do not respond to cholinesterase inhibitors and may have intolerances or inadequate responses to corticosteroids and immunosuppressants. The applicant further stated the MycarinG study included a subgroup of 21 patients with MuSK ab+ gMG, representing a rare disease cohort. The applicant noted that these patients demonstrated rapid onset of clinical improvement in MG–ADL and MGC scores by Day 8, numerically greater improvements versus placebo across multiple endpoints (MG–ADL, MGC, QMG, PRO measures), and an MG–ADL responder rate of 100 percent in both RYSTIGGO® treatment arms compared to 14 percent in placebo. Per the applicant, these results were achieved in the context of a randomized, placebo-controlled, double-blind phase 3 trial, representing the highest level of evidence currently available for this subgroup. The applicant stated that in summary, the clinical trials reflect the clinical benefits of RYSTIGGO® for the MuSK ab+ rare disease population notwithstanding the absence of standard of care-controlled RCTs.

In response to CMS's request for additional information comparing RYSTIGGO®'s administration method to other therapies and regarding how the administration method for RYSTIGGO® demonstrates that the technology significantly improves one or more of the clinical outcomes described under the regulations at § 412.87(b)(1)(ii)(C), the applicant commented that patient preference is directly related to an improvement in the quality of the patient's life when on therapy, § 412.87(b)(1)(ii)(C)(6), and patient preference is directly related to greater medication adherence. The applicant stated that patient preference is implicated by the regulatory factors that CMS must consider in evaluating clinical superiority. The applicant commented that RYSTIGGO®'s subcutaneous delivery with optional home administration offers potential convenience over IV therapies like IVIg or PLEX, which require clinic settings.

Response: We thank the applicant and the commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we continue to have concerns as to whether RYSTIGGO® for the treatment of MuSK ab+ gMG meets the substantial clinical improvement criterion to be approved for new technology add-on payments. We note that whether a particular treatment improves outcomes does not demonstrate that the treatment offers an option for patients with no other options. We also note that being the first treatment with a specific (narrower) indication, does not singularly demonstrate substantial clinical improvement, particularly when there are other treatments available which are considered the standard of care, and which have broader indications. Therefore, we continue to question that the evidence provided demonstrates both that there is a population of patients with MuSK ab+ gMG with no other treatment options, and that RYSTIGGO® offers further clinical improvement over currently available standard of care therapies for adult patients with MuSK ab+ gMG. We also did not receive data to indicate that potential confounders such as differences in disease severity and other therapies received among the treatment groups in MycarinG could not have impacted the study results. We also continue to question the assertion of improved clinical outcomes with RYSTIGGO® compared to other therapies without adequate comparison data to other therapies in the MuSK ab+ patient population. In addition, we question whether the clinical outcome results provided by the applicant adequately distinguish the effect of RYSTIGGO® from natural changes in symptoms.

The applicant and another commenter highlighted that the study design, including endpoints, sample size, and international enrollment, was accepted by FDA. As previously stated, while FDA has regulatory responsibility for decisions related to marketing authorization, we do not rely upon FDA criteria in our evaluation of substantial clinical improvement for purposes of determining what services and technologies qualify for new technology add-on payments under Medicare. This criterion does not depend on the standard of safety and efficacy on which FDA relies but on a demonstration of substantial clinical improvement in the Medicare population. In addition, with regard to the generalizability of the MycarinG study results to the Medicare population, while we acknowledge that Medicare does include beneficiaries under the age of 65 years who are disabled, we are unclear that the MycarinG study included any patients generalizable to disabled Medicare patients since it excluded patients with more severe disease (severe oropharyngeal or respiratory weakness). Also, as stated previously, all MuSK ab+ patients in the treatment arms of the MycarinG study had mild or moderate disease. Given this, and that only one patient who received RYSTIGGO® was 65 years or older, the age of the majority of the Medicare population, we remain unclear that the patient population of the MycarinG trial represented the Medicare population that is eligible for this technology.

Finally, we note the applicant did not provide any evidence linking patient preference to greater medication adherence or greater quality of life for patients treated with RYSTIGGO®, nor any comparison of these outcomes to other treatment options. Therefore, we disagree that the administration method for RYSTIGGO® for patients with MuSK ab+ gMG demonstrates that the technology significantly improves clinical outcomes over other available treatments.

After consideration of all the information received from the applicant, as well as the public comments we received, we are unable to determine that RYSTIGGO® for patients with MuSK ab+ gMG represents a substantial clinical improvement over existing technologies for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not

approving new technology add-on payments for RYSTIGGO® for FY 2026.

k. SYMVESS™ (Acellular Tissue Engineered Vessel-Tyod)

Humacyte, Inc. submitted an application for new technology add-on payments for SYMVESS™ for FY 2026. According to the applicant, SYMVESS™ is a bioengineered, implantable blood vessel indicated for use in adults as a vascular conduit for extremity arterial injury when urgent revascularization is needed to avoid imminent limb loss and when autologous vein grafting is not feasible. The applicant stated that SYMVESS™ is composed of organized extracellular matrix proteins in the tubular form of a blood vessel and is used to repair, bypass, or replace arteries that have sustained traumatic injuries.

Please refer to the online application posting for SYMVESS™, available at *https://mearis.cms.gov/public/publications/ntap/NTP24100639G2M*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, SYMVESS™ was granted BLA approval from FDA on December 19, 2024, for use in adults as a vascular conduit for extremity arterial repair when urgent revascularization is needed to avoid imminent limb loss, and when autologous vein grafting is not feasible. The applicant stated that FDA required a lot release that shows results of all applicable tests prior to distribution of SYMVESS™ and that it submitted the required paperwork to FDA on December 26, 2024. The applicant stated that on February 26, 2025, FDA notified the applicant that the required review of commercial batch information was completed and authorized the applicant to commence commercial shipment; therefore, per the applicant, SYMVESS™ became commercially available as of February 26, 2025. Per the applicant, the average number of units of SYMVESS™ anticipated to be used per inpatient stay is 1 unit.

The applicant stated that, effective October 1, 2024, the following ICD–10–PCS codes may be used to uniquely describe procedures involving the use of SYMVESS™: X2R50WA (Replacement of right upper extremity artery using bioengineered human acellular vessel, open approach, new technology group 10), X2R60WA (Replacement of left upper extremity artery using bioengineered human acellular vessel, open approach, new technology group 10), X2R70WA (Replacement of right lower extremity artery using bioengineered human acellular vessel, open approach, new technology group 10), and X2R80WA (Replacement of left lower extremity artery using bioengineered human acellular vessel, open approach, new technology group 10).

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that SYMVESS™ is not substantially similar to other currently available technologies because it does not use the same or a similar mechanism of action compared to existing technologies, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for SYMVESS™ for the applicant's complete statements in support of its assertion that SYMVESS™ is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	SYMVESS™ uses a unique mechanism of action compared to existing guideline-recommended treatments for the anticipated indication. SYMVESS™ is a bioengineered implantable vessel that is grown from human cells and then decellularized. The resulting SYMVESS™ consists of extracellular matrix proteins, in the form of a tubular blood vessel, that stimulate patient cell recruitment after implantation. Cellular repopulation and remodeling of the SYMVESS™ result in a living, functional part of the vasculature. The autologous vein grafts' mechanism of action involves biological integration, promoting natural endothelial function, reducing thrombosis risk, and adapting to the arterial environment through arterialization. SYMVESS™'s mechanism of action offers several advantages: (1) reduces time to revascularization with an off-the-shelf option; (2) avoids vein harvesting complications; (3) provides a consistent conduit size; and (4) regenerates into a living blood vessel. The synthetic grafts' mechanism of action provides immediate revascularization but does not integrate into the host and is not remodeled by patient cells. Synthetic grafts are made of non-biodegradable polymers that often stimulate foreign body responses, fibrosis, and thrombosis when implanted into patients. Lacking native extracellular matrix proteins architecture, synthetic grafts also interact poorly with the patient's immune system, which raises the risk of graft infection in contaminated wound beds. SYMVESS™, which is comprised of human extracellular matrix proteins, repopulates with cells, has a low infection rate, and does not stimulate fibrosis nor a foreign body reaction. The mechanism of action of ligation is to stop blood flow through the injured artery but without revascularization, while amputation functions by removing part or all the injured limb to prevent further complications and save a patient's life. SYMVESS™ offers an alternative by providing a vessel capable of restoring blood flow, preserving limb functionality.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	The use of SYMVESS™ will likely be assigned to the same MS-DRGs where existing technologies to treat significantly damaged arteries due to traumatic injuries, are assigned.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	Yes	SYMVESS™ is used to treat the same type of disease in a similar patient population as existing technologies. Traumatic vascular injury can be caused by motor vehicle accidents, industrial accidents, falls, gunshot wounds, knife wounds, etc. For all these types of injuries to the extremities, if an autologous vein is available for arterial repair, then such injuries are typically repaired using a harvested vein from the patient. However, regardless of the mechanism of injury, in some cases, an autologous vein is not available, or its use is not feasible in a given trauma situation. In some situations, there may not be enough time to harvest the vein, or the trauma surgeon may not have the necessary training to harvest a vein. Regardless of the situation, the patient or the injury mechanism, SYMVESS™ is anticipated to provide a new treatment option to patients where revascularization using a harvested autologous vein is not feasible. By addressing the needs of these specific patients, SYMVESS™ expands the treatment options available for saving life and limb following vascular trauma, ensuring better outcomes for a broader patient population.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18144), we stated we had the following concerns with regard to the newness criterion. The applicant stated that SYMVESS™ has a novel mechanism of action based on its manufacturing, composition, and post-operative regenerative properties. However, we stated we were interested in more information about how the composition of SYMVESS™ is associated with its post-operative regenerative properties, and specifically how these regenerative properties are associated with its mechanism of action to achieve a therapeutic outcome, as well as how the association between SYMVESS™'s regenerative properties and mechanism of therapeutic action differs from that of autologous vein grafts. In addition, we questioned whether physiological changes, such as arterialization, cellular repopulation, and fibrosis, that occur after a conduit is implanted, should be considered part of the mechanism of action. We also noted that the applicant stated that the mechanism of action of synthetic grafts is immediate revascularization, and we questioned whether that is not also the mechanism of action of SYMVESS™ and/or autologous vein grafts.

We invited public comments on whether SYMVESS™ is substantially similar to existing technologies, including whether post-implantation physiological changes should be considered as part of a technology's mechanism of action, and whether SYMVESS™ meets the newness criterion.

Comment: The applicant submitted a public comment regarding the newness criterion. The applicant reiterated that SYMVESS™ is not substantially similar to other currently available technologies because it does not use the same or a similar mechanism of action compared to existing technologies, and therefore, the technology meets the newness criterion. In response to CMS's question about how SYMVESS™' composition is associated with regenerative properties and how these properties are associated with its mechanism of action, the applicant asserted that the composition of SYMVESS™ is unique amongst vascular conduits, which leads to its regenerative properties and new mechanism of action. Specifically, the applicant stated that unlike native veins and arteries, SYMVESS™ is a unique vascular conduit that lacks living cells and elastin. The applicant explained that SYMVESS™' absence of living cells prevents cellular injury and inflammatory responses upon implantation, reducing risks like fibrosis, neointimal hyperplasia, and vessel occlusion. The applicant added that the lack of elastin contributes to SYMVESS™' resistance to calcification, as calcification in native vessels often occurs near elastin proteins. The applicant further stated that SYMVESS™ contains over 40 extracellular matrix molecules typically found in the human aorta, including fibronectin, vitronectin, and collagens (types I and III), which support vascular cell adhesion, survival, migration, and integration. The applicant explained that these human extracellular matrix proteins in SYMVESS™ interact with vascular cells through specific binding motifs, facilitating cellular adhesion, migration, differentiation, and repopulation and transforming the conduit into a living blood vessel capable of consistent blood flow, long-term durability, and self-repair. The applicant further asserted that SYMVESS™' composition, which does not contain synthetic materials or xenogeneic proteins, facilitates cellular ingrowth, remodeling, and integration without triggering foreign body reactions or fibrosis. The applicant explained that because SYMVESS™ transforms into tissue resembling the patient's native vascular structure post-implantation, critical cellular repopulation occurs, as proteins like collagen have a finite half-life in vivo, and the conduit does not then mechanically fail due to foreign proteins. The applicant emphasized that this cellular integration and matrix upkeep are key to SYMVESS™' therapeutic effectiveness and mechanical resilience over time. The applicant stated that long-term follow-up from the V005 clinical study demonstrate SYMVESS™' mechanical durability and stability in treating extremity vascular trauma, with excellent limb salvage rates, low infection incidence, and no spontaneous rupture over 3 years of follow-up, across a high-risk population with many severe injuries and contaminated wounds. The applicant further stated that duplex ultrasound assessments through 36 months demonstrated stable conduit dimensions without trends toward dilation or stenosis.

In response to CMS's question as to how the association between SYMVESS™' regenerative properties and mechanism of therapeutic action differs from that of autologous vein grafts, the applicant asserted that there are important differences between SYMVESS™ and autologous vein grafts related to composition, mechanism of action, and regenerative properties after implantation. The applicant stated that SYMVESS™ has greater mechanical strength than autologous vein grafts, making it a more effective option for arterial implantation. The applicant further explained that, while autologous vein grafts have a rupture strength of approximately 1,600 mmHg, SYMVESS™ has a rupture strength exceeding 3,000 mmHg, comparable to native arteries. The applicant asserted that SYMVESS™' mechanical strength prevents over-distension and maintains its original diameter post-implantation, whereas autologous vein grafts become distended under arterial pressure, leading to cellular damage and death, which triggers inflammatory and pro-fibrotic responses, neo-intimal hyperplasia, and eventual graft occlusion. The applicant further explained SYMVESS™ avoids over-proliferation in the vascular wall due to its acellular structure, absence of an intima, and non-inflammatory protein matrix, which collectively prevent cellular over-proliferation and neo-intimal hyperplasia, ensuring long-term functionality without the need for additional interventions.

In response to CMS's question about whether physiological changes, such as arterialization, cellular repopulation, and fibrosis, that occur after a conduit is implanted should be considered part of SYMVESS™' mechanism of action, the applicant stated that these physiological changes are directly part of SYMVESS™' mechanism of action and support its ability to provide durable blood flow to injured extremities. The applicant stated that SYMVESS™' composition of human proteins drives cellular responses post-implantation and is central to its mechanism of action. The applicant also stated that multiple publications have not observed fibrosis, which can be triggered by synthetic materials and the production of foreign-body giant cells, after SYMVESS™ implantation. In addition, the applicant stated that SYMVESS™ conduits' physiological transformation after implantation closely mimics native vascular tissue, which cannot be achieved with synthetic grafts which remain inert and foreign to the body.

In response to CMS's question whether immediate revascularization is not also the mechanism of action of SYMVESS™ and/or autologous vein grafts, the applicant asserted that SYMVESS™' mechanism of action is the sustained and durable blood flow after implantation made possible by its unique human protein composition and resultant mechanical and biological properties. Per the applicant, this is inherently different from that of synthetic grafts, which cannot interact with human cells in the way that SYMVESS™ does, and from autologous vein grafts, which create extensive cellular damage and death after implantation which impairs the ability of the vein to maintain patency due to endothelial and smooth muscle damage. The applicant stated that SYMVESS™' immediate physiological effect of implantation for revascularization is restoration of blood flow, which would be similar to the effect of implanting any tubular conduit, regardless of material or composition, into arterial circulation. The applicant further explained that immediate restoration of blood flow is not the important mechanism of action and associated clinical benefit of an arterial conduit, since it may not be a durable benefit for the patient. The applicant asserted that any conduit's true therapeutic effect, and hence its mechanism of action, lies in its long-term functionality and maintained post-implantation blood perfusion within the body. The applicant reiterated that SYMVESS™' composition (both what it contains in terms of proteins that interact with cells, and what it lacks in terms of cellular content) contributes to its mechanism of action as a durable conduit that supports cellular repopulation and sustained mechanical function while avoiding cellular damage and inflammation at the time of implantation. The applicant also reiterated long-term outcomes from the V005 study regarding SYMVESS™' durability.

Several commenters also voiced support for SYMVESS™ and asserted that SYMVESS™ has a different mechanism of action than synthetic grafts. A commenter asserted that SYMVESS™ operates through a targeted mechanism of action designed to improve blood flow, vessel wall stabilization, capacity for remodeling, and long-term viability. Other commenters described its immediate availability similar to that of synthetic grafts but stated it has a unique mechanism of action which enables integration into native vasculature. Another commenter provided its personal experience that imaging of patients post-SYMVESS™ repair often reveals no visible graft. Per the commenter, this suggests natural tissue integration and effective healing, which the commenter has not seen with other conduits. Other commenters stated that due to its acellular nature, SYMVESS™' unique composition avoids cellular damage post-implantation, enabling better interaction with human cells, and maintaining patency, which drives its distinct regenerative properties compared to other vascular conduits.

Response: We appreciate the additional information from the applicant and commenters with respect to whether SYMVESS™ is substantially similar to existing technologies. However, we disagree with the applicant and commenters that SYMVESS™ has a unique mechanism of action compared to currently available synthetic grafts. While the applicant asserted that SYMVESS™ has a novel composition, we note that, as stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58847), the composition of a technology does not represent the mechanism of action. Further, we note the applicant's assertions that SYMVESS™'s mechanism of action is the restoration and maintenance of durable blood flow through the conduit post-implantation, achieved through a combination of immediate revascularization and long-term cellular repopulation and remodeling, and that SYMVESS™'s regenerative properties, including cellular repopulation, matrix remodeling and tissue integration are central to SYMVESS™'s mechanism of action and therapeutic effectiveness. However, we note that, per FDA, definitive studies that characterize the behavior of SYMVESS™ and how long it would take for cells to migrate and repopulate the graft have not been conducted, and that the exact mechanism of action has not been established.[111] [112] We remain unclear that these potential downstream effects are critical to the way SYMVESS™ provides for urgent arterial repair following extremity vascular trauma to avoid limb loss. Furthermore, we disagree with the applicant that SYMVESS™'s avoidance of cellular damage and inflammatory responses represents a novel mechanism of action. While these attributes may reduce complications such as fibrosis and neointimal hyperplasia, they do not change the fact that SYMVESS™ functions as a vascular conduit by facilitating blood flow, similar to other vascular grafts. Similarly, the long-term clinical results described by the applicant to demonstrate mechanical durability, patency, and low rates of complications relate to SYMVESS™'s clinical outcome and not mechanism of action. Similarly, with respect to the comments by several commenters that the absence of visible grafts in imaging studies post-SYMVESS™ implantation suggest natural tissue integration and effective healing, we note that this observation may reflect SYMVESS™'s biocompatibility and regenerative properties, but it does not, on its own, establish a novel mechanism of action. Tissue integration and remodeling are expected outcomes for many vascular conduits, as stated previously, and are influenced by the material and design of the graft rather than representing a new therapeutic mechanism.

After review of the information provided in the comments, including the applicant's assertions regarding SYMVESS™'s composition, post-implantation healing characteristics, and mechanism of action, we disagree with the applicant that the evidence provided demonstrates that SYMVESS™ has a unique mechanism of action compared to previously available technologies. Because we agree with applicant that SYMVESS™ will be assigned to the same MS–DRGs and used to treat the same type of disease in a similar patient population as existing technologies for treating significantly damaged arteries due to traumatic injuries, SYMVESS™ meets all three of the substantial similarity criteria. Therefore, we believe SYMVESS™ is substantially similar to currently approved or cleared synthetic grafts, and we consider the beginning of the newness period for SYMVESS™ to begin on the date on which those existing synthetic grafts received FDA marketing authorization. Since those technologies have been on the U.S. market for longer than 3 years, SYMVESS™ does not meet the newness criterion and is not eligible for new technology add-on payments for FY 2026. We note that we received public comments with regard to the cost and substantial clinical improvement criteria for this technology, but because we have determined that the technology does not meet the newness criterion and, therefore is not eligible for approval for new technology add-on payments for FY 2026, we are not summarizing comments received or making a determination on those criteria in this final rule.

[111] SYMVESS. USPI Section 12: Clinical Pharmacology, p. 10.

[112] December 18, 2024 Clinical Review Memo—SYMVESS, *https://www.fda.gov/media/185229.*

l. TECELRA® (Afamitresgene Autoleucel)

Adaptimmune, LLC submitted an application for new technology add-on payments for TECELRA® for FY 2026. According to the applicant, TECELRA® is a melanoma-associated antigen A4 (MAGE–A4)-directed genetically modified autologous T-cell immunotherapy (also referred to as an autologous T-cell receptor (TCR) therapy) indicated for the treatment of adults with unresectable or metastatic synovial sarcoma who have received prior chemotherapy, are HLA–A*02 subtype positive, and whose tumor expresses the MAGE–A4 antigen. Per the applicant, TECELRA® is composed of T cells genetically modified to express affinity-enhanced TCRs specific to the MAGE–A4 protein, which is expressed by synovial sarcoma tumor cells at varying frequencies.

Please refer to the online application posting for TECELRA®, available at *https://mearis.cms.gov/public/publications/ntap/NTP241004LTDY2*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, TECELRA® was granted BLA accelerated approval from FDA on August 1, 2024 for treatment of adults with unresectable or metastatic synovial sarcoma who have received prior chemotherapy; are HLA–A*02:01P, HLA–A*02:02P, HLA–A*02:03P, or HLA–A*02:06P positive; and whose tumor expresses the MAGE–A4 antigen as determined by FDA-approved or cleared companion diagnostic devices. Per the applicant, TECELRA® was commercially available immediately after receiving FDA marketing authorization. The applicant stated that TECELRA® is a single, one-time, patient-specific treatment delivered as an intravenous infusion containing 2.68×10^9 to 10×10^9

MAGE–A4 TCR positive T-cells, in one or more infusion bag(s).

The applicant stated that, effective October 1, 2022, the following ICD–10–PCS codes may be used to uniquely describe procedures involving the use of TECELRA®: XW03368 (Introduction of afamitresgene autoleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 8) or XW04368 (Introduction of afamitresgene autoleucel immunotherapy into central vein, percutaneous approach, new technology group 8).

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that TECELRA® is not substantially similar to other currently available technologies because TECELRA® is the first FDA-approved engineered TCR T-cell therapy with a unique mechanism of action that is distinct from that of other marketed therapeutic products, the only therapy approved for synovial sarcoma assigned to MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies), and the only therapy studied specifically in the synovial sarcoma patient population and FDA-approved specifically for the treatment of synovial sarcoma. Therefore, according to the applicant, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for TECELRA® for the applicant's complete statements in support of its assertion that TECELRA® is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	TECELRA®'s mechanism of action is distinct from that of other marketed therapeutic products. TECELRA® is a type of adoptive cell therapy, which are innovative cancer immunotherapies that involve collecting lymphocytes (white blood cells, or peripheral blood mononuclear cells) from the patient for the purpose of genetically modifying and expanding the lymphocytes to improve their tumor-fighting capabilities before returning the re-engineered cells to the patient. Although CAR T-cell therapies are also adoptive cell therapies, their mechanism of action is different compared to TCR T-cell therapies such as TECELRA®. Specifically, CAR T-cell therapies use an antibody-derived single-chain antibody-variable fragment (scFv) that recognizes cell surface antigens. By contrast, TCR T-cell therapies recognize a specific peptide presented at the cancer cell surface as peptide-HLA complexes. TECELRA® is comprised of T cells that have hypervariable CDRs modified to express affinity to the MAGE-A4 protein, which is expressed in certain solid tumors at varying frequencies. TECELRA® is the first and only FDA-approved MAGE-A4 targeted therapy of any kind. Although other therapies are utilized for the treatment of patients with unresectable or metastatic synovial sarcoma who have received prior chemotherapy, pazopanib (VOTRIENT), a small molecule antiangiogenic tyrosine kinase inhibitor, is the only agent indicated for second-line (2L) treatment of soft tissue sarcoma (STS).
Is the technology assigned to the same MS-DRG as existing technologies?	No	As reflected in the FY 2025 Medicare IPPS Final Rule, CMS assigned TECELRA®'s unique ICD-10-PCS codes (XW03368 (Introduction of afamitresgene autoleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 8) and XW04368 (Introduction of afamitresgene autoleucel immunotherapy into central vein, percutaneous approach, new technology group 8)) to MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies). TECELRA® is the only therapy approved for synovial sarcoma assigned to MS-DRG 018 and the only TCR T-cell therapy assigned to MS-DRG 018. Other technologies assigned to MS-DRG 018 do not treat synovial sarcoma and have different mechanisms of action.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	TECELRA® is the first FDA-approved engineered TCR T-cell therapy and the only therapy specifically studied in and approved for synovial sarcoma patients. Synovial sarcoma is a specific form of STS and is a rare disease that tends to occur in younger individuals, with a median age of initial clinical presentation being in the third decade of life. Prior to TECELRA®, there were no FDA-approved therapies specifically for the treatment of synovial sarcoma. Pazopanib was studied in broader STS populations that included a subgroup of patients with synovial sarcoma (less than 10% of patients) but was not approved by FDA specifically for the treatment of synovial sarcoma. No other technology is specifically indicated for the treatment of adult patients with synovial sarcoma. To the extent other therapies are used for the treatment of synovial sarcoma off-label consistent with National Comprehensive Cancer Network (NCCN) clinical guidelines, synovial sarcoma patients were mere subpopulations of a larger STS subject pool across multiple histologies and without formal a priori subgroup efficacy analyses. Thus, we know of no studies in which synovial sarcoma patients were the focus population to determine safety and efficacy of the treatments.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18150), we noted that the applicant stated that TECELRA® is the only FDA-approved therapy specifically studied and approved for patients with synovial sarcoma, therefore, it does not involve the treatment of a similar type of disease or patient population as existing technologies. While the applicant stated that other therapies in the National Comprehensive Cancer Network Clinical Practice Guidelines (NCCN Guidelines®), such as pazopanib, are indicated for use in the broader STS population rather than specifically for synovial sarcoma, we noted that synovial sarcoma is a type of STS. Consequently, we questioned whether existing treatments indicated for STS, which can be used for the treatment of specific subtypes of STS, such as synovial sarcoma, would treat the same or similar patient population as TECELRA®.

We invited public comments on whether TECELRA® is substantially similar to existing technologies and whether TECELRA® meets the newness criterion.

Comment: The applicant submitted a public comment reiterating that

TECELRA® meets the newness criterion because it is the first FDA-approved engineered TCR T-cell therapy with a unique mechanism of action that is distinct from that of other marketed therapeutic products, the only therapy approved for synovial sarcoma assigned to MS–DRG 018, and the only therapy studied specifically in the synovial sarcoma patient population and FDA-approved for the treatment of synovial sarcoma. In response to CMS's question about whether existing treatment indicated for STS, which can be used for the treatment of specific subtypes of STS, such as synovial sarcoma, would treat the same or similar patient population as TECELRA®, the applicant stated that existing treatments used for STS do not treat the same, or similar, patient population as TECELRA®. The applicant explained that STS is a broad and heterogeneous group of solid tumors with more than 50 different histologic subtypes of STS identified, differing widely in morphology, genetic aberrations, and expression of tumor antigens. The applicant submitted a review article by Beck et al. (2009),[113] which stated that synovial sarcoma is a distinct subtype of STS with a pattern of dysregulated gene expression and a cluster that separates it from other STS. Specifically, the applicant stated that Beck et al. (2009) explained that synovial sarcoma has a unique gene expression that includes increased expression of genes associated with neural differentiation, the retinoic acid pathway, and epidermal and fibroblast growth factor receptor signaling pathways. The applicant further explained that, given the lack of data and FDA-approved synovial sarcoma-specific therapies, the NCCN Guidelines recommend systemic therapies for patients with unresectable recurrent or metastatic disease while acknowledging that the benefits of systemic therapy are very limited. The applicant stated that the SPEARHEAD–1 trial studied TECELRA® in a targeted population, of which the majority (44 out of 52) of patients had synovial sarcoma. The applicant added that the SPEARHEAD–1 trial was unique in the STS field because it was designed to utilize the specific tumor antigen (MAGE–A4) expression expressed in 70 percent of the synovial sarcoma patient population. Given the results of the SPEARHEAD–1 trial, the applicant asserted that TECELRA® is the only product in the recently updated NCCN Guidelines specifically recommended for synovial sarcoma.

Response: We thank the applicant for its comment. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for TECELRA®, we agree with the applicant that TECELRA® uses a unique mechanism of action because its modified T-cells target and destroy MAGE–A4 expressing cancer cells in adults with unresectable or metastatic synovial sarcoma who have received prior chemotherapy, are HLA–A*02 subtype positive, and whose tumor expresses the MAGE–A4 antigen. We also agree with the applicant that TECELRA® is the only synovial sarcoma therapy assigned to MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies). Therefore, we agree with the applicant that TECELRA® is not substantially similar to existing treatment options and meets the newness criterion. We consider the beginning of the newness period to commence on August 1, 2024, the date on which TECELRA® received FDA market authorization for treatment of adults with unresectable or metastatic synovial sarcoma who have received prior chemotherapy; are HLA–A*02:01P, HLA–A*02:02P, HLA–A*02:03P, or HLA–A*02:06P positive; and whose tumor expresses the MAGE–A4 antigen as determined by FDA-approved or cleared companion diagnostic devices.

With respect to the cost criterion, the applicant provided four analyses to demonstrate that TECELRA® meets the cost criterion. Each analysis followed the order of operations summarized in the following table.

BILLING CODE 4120–01–P

[113] Beck, A.H., West, R.B., & van de Rijn, M. (2009). Gene expression profiling for the investigation of soft tissue sarcoma pathogenesis and the identification of diagnostic, prognostic, and predictive biomarkers. *Virchows Arch* 456(1): 141–151. *https://doi.org/10.1007/s00428-009-0774-2.*

TECELRA® COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for TECELRA®.
Claims identified	Scenario 1: 1,123 claims mapping to MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies) Scenario 2: 374 claims mapping to MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies) Scenario 3: 374 claims mapping to MS-DRG 018 (Chimeric Antigen Receptor (CAR) T-Cell and Other Immunotherapies) Scenario 4: 2,174 claims mapping to 37 MS-DRGs, with 10.81% of claims mapping to MS-DRG 464 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal System and Connective Tissue Disorders with CC)
Charges removed for prior technology	Scenarios 1-3: Per the applicant, claim charges for cell and gene therapy products were removed when they were reported on the claims. For all other claims, the applicant removed the total drug charges from the claims. The applicant stated that removing all drugs charges is an overestimate of charges needing to be removed. Scenario 4: Per the applicant, no prior technology charges were removed since these cases likely do not include any high-cost therapies like MS-DRG 018 does. The applicant did not remove indirect charges related to the prior technology in all four scenarios.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application.
Inflation factor	The applicant applied an inflation factor of 8.406% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the wholesale acquisition cost of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
Cost analysis results	Average case-weighted threshold amount: $1,554,026 Final inflated average case-weighted standardized charge per case: - Scenario 1: $4,286,667 - Scenario 2: $4,383,746 - Scenario 3: $4,207,244 - Scenario 4: $4,186,358

BILLING CODE 4120–01–C

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all four scenarios, the applicant asserted that TECELRA® meets the cost criterion.

We invited public comments on whether TECELRA® meets the cost criterion.

Comment: The applicant reiterated that the four cost criterion analyses submitted with its application demonstrated that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, and therefore, TECELRA® meets the cost criterion.

Response: We thank the applicant for its comment. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under all scenarios. Therefore, TECELRA® meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that TECELRA® represents a substantial clinical improvement over existing technologies because TECELRA® is the first and only FDA-approved therapy for eligible patients with unresectable or metastatic synovial sarcoma; is a new treatment option for eligible patients with unresectable or metastatic synovial sarcoma, who are unresponsive to existing systemic therapies after first-line (1L) progression; offers significant clinical improvement in overall response rate (ORR) and overall survival (OS) compared to existing therapies; and is well-tolerated with a manageable safety profile. The applicant provided 1 published study, TECELRA®'s prescribing information, and an FDA press release to support these claims, as well as 15 background articles about TCR T-cell therapies, expression of MAGE–A4 in tumors, the prevalence of HLA–A subtypes, other 2L synovial sarcoma treatments, and the burden of illness for patients with synovial sarcoma and myxoid/round cell liposarcoma (MRCLS).[114] The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for TECELRA® for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

[114] Background articles are not included in the following table but can be accessed via the online posting for the technology.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
TECELRA® is the first and only FDA-approved engineered TCR T-cell therapy.	FDA Press Release. FDA Approves First Gene Therapy to Treat Adults with Metastatic Synovial Sarcoma. August 2, 2024. Available from: https://www.fda.gov/news-events/press-announcements/fda-approves-first-gene-therapy-treat-adults-metastatic-synovial-sarcoma The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
TECELRA® is the first and only FDA-approved therapy for patients with unresectable or metastatic synovial sarcoma.	U.S. Food and Drug Administration, 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
TECELRA® is a new treatment option for patients with unresectable/metastatic synovial sarcoma, unresponsive to existing systemic therapies after first-line progression due to limited effectiveness, ORRs and OS.	D'Angelo SP, Araujo DM, Abdul Razak AR, et al. Afamitresgene autoleucel for advanced synovial sarcoma and myxoid round cell liposarcoma (SPEARHEAD-1): an international, open-label, phase 2 trial (2024): Lancet 403;10435:1460-1471. TECELRA [package insert]. Philadelphia, PA: Adaptimmune, LLC; 2024. The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
TECELERA® offers a significant clinical improvement in ORR and OS as compared to existing therapies.	D'Angelo, 2024, *op. cit.* Adaptimmune, 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.
TECELERA® is well tolerated and has a manageable safety profile.	D'Angelo, 2024, *op. cit.* Adaptimmune, 2024, *op. cit.* The applicant also provided background information to support this claim, which can be accessed via the online posting for the technology.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18152), after review of the supporting evidence provided by the applicant, we stated we had the following concerns regarding whether TECELRA® meets the substantial clinical improvement criterion. With respect to the assertion that TECELRA® offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments, we noted that TECELRA®, being the first approved TCR therapy, may relate to mechanism of action under the newness criterion, but is not relevant to the demonstration of substantial clinical improvement. Further, while the applicant stated that TECELRA® is the first and only therapy approved specifically for patients with unresectable or metastatic synovial sarcoma, we noted that synovial sarcoma is a subtype of the broader STS group. According to the applicant, there were no therapies approved by FDA specifically for synovial sarcoma, and pazopanib and trabectedin are two therapies that may be used to manage synovial sarcoma in subsequent-line settings. However, according to the NCCN Clinical Guidelines® for STS, there are other available treatments that treat advanced and metastatic STS, including synovial sarcoma, which include pazopanib and trabectedin. Therefore, we questioned whether the applicant's claim supports that TECELRA® offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments given there are other available treatments for patients with STS that would also treat patients with unresectable or metastatic synovial sarcoma. In addition, while the applicant stated that TECELRA® is a new treatment option for patients with unresectable or metastatic synovial sarcoma unresponsive to existing systemic therapies after previous 1L treatments such as anthracycline-based or ifosfamide-based therapy due to limited effectiveness, ORR, and OS, it is unclear whether this patient population is unresponsive to or ineligible for other existing treatments such as trabectedin, in which higher response rates of 27–51 percent have been reported.[115] We noted that while patients in the SPEARHEAD–1 study received multiple

[115] Takahashi M, Takahashi S, Araki N, et al. Efficacy of trabectedin in patients with advanced translocation-related sarcomas: pooled analysis of two phase II studies. Oncologist 2017; 22: 979–88.

previous lines of systemic therapy, the study did not list these therapies while noting that bridging therapy, including pazopanib, trabectedin, ifosfamide, or doxorubicin, was permissible between leukapheresis and lymphodepletion at the investigators' discretion. Therefore, we questioned whether TECELRA® offers a treatment for a patient population unresponsive to, or ineligible for, currently available treatments.

With regard to the claim that TECELRA® offers a significant clinical improvement in ORR and OS compared to existing therapies, we stated that the applicant provided the SPEARHEAD–1 phase II clinical trial (D'Angelo et al., 2024), which assessed TECELRA®'s efficacy in 44 patients (aged 16 to 75 years) with metastatic or unresectable synovial sarcoma who previously received at least 1 prior line of anthracycline-containing or ifosfamide-containing chemotherapy. The SPEARHEAD–1 study found that synovial sarcoma patients treated with TECELRA® had an ORR of 39 percent and a median OS (mOS) of 16.9 months. According to the applicant, the study demonstrated a higher ORR and longer mOS than those from historical studies with pazopanib (18.9 percent, 10.3 months), trabectedin (12.3 percent, 10.4 months), gemcitabine/docetaxel (4.5–5.0 percent, 8.4–14 months), and regorafenib (8 percent, 13.4 months).[116] [117] [118] [119] The applicant also stated that, although listed in the NCCN Clinical Guidelines® for STS, eribulin, dacarbazine, temozolomide, and vinorelbine have not been adequately studied in previously treated unresectable or metastatic synovial sarcoma patients, and therefore, their effectiveness for this patient population cannot be determined (NCCN, 2024). However, we noted that patients with unresectable or metastatic synovial sarcoma treated with TECELRA® demonstrated a mOS of 16.9 months, which is similar to the historical benchmark results from patients treated with gemcitabine/docetaxel (8.4 to 14 months) and regorafenib (13.4 months). In addition, we noted that the mOS for SPEARHEAD–1 non-responders was comparable to existing therapies, and we questioned whether the baseline characteristics of the study population, such as biomarkers of resistance to TECELRA® rather than the treatment itself, may account for the observed survival outcomes. Furthermore, we noted that TECELRA® is indicated for patients with tumors expressing the MAGE–A4 tumor antigen, and we questioned whether the provided historical benchmark results for other treatments in which study participants were not tested for biomarkers, such as MAGE–A4, may represent different target populations from that of TECELRA®. Finally, we noted that the applicant compared the clinical outcomes from the SPEARHEAD–1 study to historical controls without appropriate statistical adjustments to account for differences in study designs. We questioned whether these differences may introduce confounders which could reduce the validity of the results of the comparison.

With respect to the claim that TECELRA® is well-tolerated and has a manageable safety profile, we stated that the applicant stated that the SPEARHEAD–1 clinical trial found that 75 percent of patients experienced cytokine release syndrome (CRS), with only one patient experiencing grade ≥3 CRS, and one patient experienced symptoms consistent with grade 1 immune effector cell-associated neurotoxicity syndrome (ICANS). The applicant stated that, compared to CAR T-cell therapies, the CRS associated with TECELRA® is modest (Tsimberidou et al., 2021). However, we stated we were unclear why the applicant compared the safety profile of TECELRA® to CAR T-cell therapies (which are not approved for use in STS) rather than other available therapies that treat unresectable or metastatic synovial sarcoma. Therefore, we stated we were interested in evidence comparing TECELRA®'s safety profile to other, non-CAR T-cell treatments for unresectable or metastatic synovial sarcoma. The applicant also stated that because TECELRA® is a single administration, recipients are less likely to experience repeated adverse events from the infusion compared to treatments requiring multiple/regular continuous or cyclical administrations; however, we questioned the basis for this claim as the applicant did not provide any supporting evidence.

We invited public comments on whether TECELRA® meets the substantial clinical improvement criterion.

Comment: Several commenters stated support for the approval of TECELRA® for the new technology add-on payment program. A few commenters further stated that approval would allow for increased patient access to this new therapy. A few commenters also underlined their support for approval by stating TECELRA® is an innovative, significantly advanced and meaningful therapy that addresses an unmet need in the treatment of synovial sarcoma, an ultrarare cancer accounting for <10 percent of all STS, and asserted that new technology add-on payments for TECELRA® would make it financially feasible for hospitals to provide innovative care that improves patient outcomes.

Response: We thank the commenters for their input and have taken it into consideration in determining whether TECELRA® meets the substantial clinical improvement criterion as discussed later in this section.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. The applicant reiterated that TECELRA® meets the substantial clinical improvement criterion because it offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments and significantly improves clinical outcomes relative to previously available services or technologies. In response to CMS's concern whether TECELRA® offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments given there are other available treatments for patients with STS that would also treat patients with unresectable or metastatic synovial sarcoma, the applicant stated that advanced synovial sarcoma patients have limited treatment options because, as they experience disease progression, patients develop resistance, or in some cases intolerance, to treatment. The applicant also reiterated that the current treatment options listed in the NCCN Guidelines were not studied or approved specifically for the treatment

of synovial sarcoma. The applicant asserted that other current treatment options have a minimal impact on ORR and OS in this patient population. The applicant further explained that due to the broad and heterogenous subtypes of STS, clinical studies face challenges in enrolling patients for only one subtype due to limited numbers. The applicant stated that studies like PALETTE (44 out of 369 patients had SyS) and REGOSARC (27 out of 182 patients had SyS) provide limited data for synovial sarcoma, leaving clinicians reliant on limited results applicable to synovial sarcoma for treatment decisions. The applicant reiterated that the SPEARHEAD–1 clinical trial studied TECELRA® in heavily pretreated patients, many of whom had failed multiple prior therapies. The applicant asserted that, given that the SPEARHEAD–1 participants failed multiple prior lines of treatment and were no longer eligible for other treatment options due to toxicity, it is reasonable to conclude that this patient population is unresponsive to or ineligible for other currently available treatment options.

In response to CMS's concern that it was unclear whether patients with unresectable or metastatic synovial sarcoma who are unresponsive to existing systemic therapies after previous 1L treatments are unresponsive to or ineligible for other existing treatments, such as trabectedin, in which higher response rates have been reported, the applicant stated that higher response rates for other existing treatment options have not been reported. The applicant asserted that TECELRA® demonstrated a significant clinical improvement for synovial sarcoma patients by achieving a 43.2 percent ORR compared to historical controls, such as trabectedin (up to 12.3 percent) and pazopanib (up to 18.9 percent). The applicant further stated that the higher ORR rates (27 to 51 percent) referenced by CMS were not specific to synovial sarcoma, but rather pooled analyses of other sarcoma subtypes, with synovial sarcoma showing much lower response rates (5.9 percent for trabectedin). The applicant stated that a meta-analysis of trabectedin and pazopanib reported similar results in patients with metastatic synovial sarcoma, with trabectedin and pazopanib producing an ORR of 7 and 13.2 percent in clinical trials and 12.3 and 18.9 percent in real-world studies, respectively. The applicant reiterated that the SPEARHEAD–1 trial for TECELRA® used a benchmark ORR of 18 percent based on historical second-line therapies and agreed upon by FDA, and TECELRA®'s ORR significantly exceeded this benchmark, underscoring its efficacy in treating heavily pretreated synovial sarcoma patients.

In response to CMS's concern that the SPEARHEAD–1 study allowed bridging therapy including pazopanib, trabectedin, ifosfamide, or doxorubicin, between leukapheresis and lymphodepletion at the investigators' discretion putting into question whether the results can solely be attributable to TECELRA®, the applicant reiterated that TECELRA® provides a treatment option for synovial sarcoma patients who are unresponsive to or ineligible for existing therapies, which have limited efficacy and are not specifically approved for synovial sarcoma. The applicant further explained that patients in the SPEARHEAD–1 study were heavily pretreated with a median of three prior lines of therapy, including standard agents like ifosfamide, doxorubicin, and pazopanib. The applicant stated that some patients received bridging therapy to control disease progression temporarily, but these strategies required a washout period before TECELRA® treatment. The applicant also stated that patients who received bridging therapy notably had a lower ORR of 25 percent compared to 46 percent for those who did not, indicating that bridging therapies did not contribute to improved outcomes.

In response to CMS's concern that patients with unresectable or metastatic synovial sarcoma treated with TECELRA® demonstrated a similar mOS to historical benchmark results of gemcitabine/docetaxel and regorafenib, the applicant reiterated that TECELRA® offers a significant clinical improvement in OS compared to existing therapies. The applicant stated that patients with advanced synovial sarcoma who were treated with TECELRA® demonstrated a mOS of 16.9 months (95 percent CI 10.9-not estimable) in the SPEARHEAD–1 phase II clinical trial conducted at 23 sites in Canada, the U.S., and Europe. The applicant stated that the data referenced in its application for other therapies comes from studies of various designs and scientific rigor, conducted at limited treatment sites, and showed limited efficacy and no statistical benefit over placebo in trials. In contrast, the applicant stated that the SPEARHEAD–1 trial for TECELRA® was an open-label, single arm, phase II trial specifically designed to evaluate efficacy and safety outcomes in populations of advanced synovial sarcoma and MRCLS patients, with a primary endpoint of ORR, a secondary endpoint of OS, and a prespecified statistical analysis plan. The applicant highlighted that Carroll et al. (2022) conducted a meta-analysis that evaluated clinical trials and real-world studies of pazopanib and trabectedin in previously treated metastatic synovial sarcoma patients and found: an mOS of 10.3 months (95 percent CI 8.4–12.6) for 4 pazopanib studies that included 4 to 38 patients; an mOS of 10.5 months (95 percent CI 8.2–13.4) when restricted to pazopanib studies with greater than or equal to ten participants; a mOS of 10.4 months (95 percent CI 7.3–14.8) when using 4 trabectedin studies with 3 to 101 patients; and 10.8 months (95 percent CI 8.4–13.9) when restricted to 3 trabectedin studies with 10 or more participants.

As for the data supporting gemcitabine and docetaxel in synovial sarcoma, the applicant stated the data are limited and come from analyses of various designs and two studies that show partial response in only one patient. In contrast, the applicant reiterated that the SPEARHEAD–1 study demonstrated an ORR of 39 percent in patients with synovial sarcoma and a mOS of 16.9 months (95 percent CI 10.9–NE). The applicant further stated that the OS among patients who responded to TECELRA® (mOS not reached; 95 percent CI 15.4–NE) was significantly improved versus non-responders (10.9 months; 95 percent CI 5.2–20.9; $p<0.0001$). The applicant stated that, when FDA re-evaluated the efficacy information during its review of the TECELRA® BLA, the ORR was revised to 43.2 percent (19 of 44 patients) including 2 incomplete responses (4.5 percent) and 17 partial responses (38.6 percent). The applicant stated that, given the study design, it is confident that the ORR of 39 to 43.2 percent is accurate. Lastly, the applicant stated that, even though mOS was not the primary endpoint of the SPEARHEAD–1 study, the strengths of the study provide confidence that the mOS of 16.9 months represent real improvement in patients with synovial sarcoma.

In response to CMS's concern that TECELRA® is indicated for patients with tumors expressing the MAGE–A4 tumor antigen and, therefore, the provided historical benchmark results from other studies may represent different target populations from that of TECELRA®, the applicant stated that the baseline characteristics of the SPEARHEAD–1 study population, including non-responders, are consistent with those of the broader synovial sarcoma population. The applicant stated that TECELRA® targets

a novel antigen with a unique mechanism of action and biomarkers of resistance have not been observed. The applicant stated that the patient population in Carroll et al. (2022) had similar baseline characteristics to the patient population in the SPEARHEAD–1 study. The applicant explained that, although cancer-testis antigen expression in solid tumors, such as MAGE–A4 in synovial sarcoma, was not used to select patients in past studies, current evidence by immunohistochemistry shows that 70 to 82 percent of synovial sarcoma tumors express MAGE–A4. The applicant stated that, therefore, it expects to see the same prevalence of antigen expression as in prior studies. The applicant further stated that a retrospective study of adult patients with metastatic synovial sarcoma from the French Sarcoma Group NetSARC database found that expression of MAGE–A4 and HLA–A genotype did not affect prognosis in synovial sarcoma. The applicant asserted that patients with metastatic synovial sarcoma who are MAGE–A4 positive/HLA–A*02 eligible exhibited similar prognosis as the rest of the population, strengthening the absence of selection bias in TECELRA® trials.

Similarly, a commenter stated that there are no biomarkers for synovial sarcoma prognosis and that MAGE–A4 positive synovial sarcoma is not a different disease than MAGE–A4 negative synovial sarcoma. According to this commenter, there is no evidence that MAGE–A4 tumor expression is associated with synovial sarcoma prognosis, and there is no biological reason to suspect that it could be the case.

In response to CMS's question whether the applicant had compared clinical outcomes from the SPEARHEAD–1 study to historical controls without appropriate statistical adjustment to account for differences in the study designs, the applicant submitted two analyses containing indirect treatment comparisons to assess the relative efficacy of TECELRA® versus relevant comparators (pazopanib, trabectedin, gemcitabine/docetaxel, and regorafenib) in patients with advanced or metastatic synovial sarcoma. The applicant stated that, since most trials that included patients with synovial sarcoma were single-arm trials, it conducted unanchored matching-adjusted indicated comparisons (MAICs) to assess ORR and OS and a simulated treatment comparison analysis for these endpoints to serve as a sensitivity analysis to the MAICs. The applicant asserted that the point estimates from these analyses were either statistically significant or trended in favor of TECELRA® for both ORR and OS. The applicant further stated that, in those instances where point estimate results were not statistically significant, interpretation of the 95 percent CI demonstrated clinical meaningfulness in favor of TECELRA® (lower limits of CI for ORR and upper limits of CI on the HRs for OS).

In response to CMS's question as to why the applicant compared the safety profile of TECELRA® to CAR T-cell therapies (which are not approved for use in STS) rather than other available therapies that treat unresectable or metastatic synovial sarcoma, the applicant stated that it made the comparison to CAR T-cell therapies because of the unique hematological aspects of cellular therapy for any indication. The applicant also provided a side-by-side adverse event list comparing TECELRA® to other treatments for STS (pazopanib, trabectedin, and regorafenib).

In response to CMS's question about the support for the applicant's statement that, because TECELRA® is a single administration, recipients are less likely to experience repeated adverse events from the infusion, compared to treatments requiring multiple or regular continuous or cyclical administrations, the applicant stated that the most common adverse events for TECELRA® were expected, reversible, and manageable with supportive care. The applicant further stated that, unlike TECELRA®'s one-time administration, other therapies currently used for STS involve continuous or cyclical dosing with repeated or long-term AEs. The applicant noted that for trabectedin, repeated dosing may lead to rhabdomyolysis, hepatotoxicity, and cardiomyopathy; for pazopanib, continuous dosing is associated with hepatotoxicity and hypertension within 18 weeks; and for regorafenib, cyclical administration can lead to liver dysfunction due to hepatocellular injury within 2 months. The applicant asserted that TECELRA® offers a favorable benefit-risk profile with a single-dose regimen and manageable adverse events, making it a viable option for patients with contraindications to or risks associated with toxicities from other current treatments used for STS. Similarly, a few commenters stated that TECELRA® provides a safe and more tolerable treatment option for patients with synovial sarcoma. Lastly, a commenter stated that, compared to traditional therapies that require multiple cycles and prolonged exposure to toxic side effects, synovial sarcoma patients treated with TECELRA® have reported improved quality of life due to the convenience of a single treatment administration and the reduced exposure to ongoing toxicities associated with traditional therapies, representing a significant step forward in the treatment of synovial sarcoma.

Response: We thank the applicant and other commenters for their comments regarding the substantial clinical improvement criterion. Based on the additional information received, we agree with the applicant and other commenters that TECELRA® represents a substantial clinical improvement over existing technologies because it offers an improvement in ORR of 43.2 percent compared to up to 18.9 percent for existing treatments with a single treatment for adults with unresectable or metastatic synovial sarcoma who have received prior chemotherapy, are HLA–A*02 subtype positive, and whose tumor expresses the MAGE–A4 antigen.

After consideration of the public comments we received and the information included in the applicant's new technology add-on payment application, we have determined that TECELRA® meets the criteria for approval for new technology add-on payment. Therefore, we are approving new technology add-on payments for this technology for FY 2026. Cases involving the use of TECELRA® that are eligible for new technology add-on payments will be identified by ICD–10–PCS code XW03368 (Introduction of afamitresgene autoleucel immunotherapy into peripheral vein, percutaneous approach, new technology group 8) or XW04368 (Introduction of afamitresgene autoleucel immunotherapy into central vein, percutaneous approach, new technology group 8).

In its application, the applicant estimated that the cost of the one-time TECELRA® infusion is $727,000 per patient based on a single, one-time, patient-specific treatment delivered as a cell suspension for intravenous infusion containing 2.68×10^9 to 10×10^9 MAGE–A4 TCR positive T-cells. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of TECELRA® is $472,550 for FY 2026.

m. ZIIHERA® (Zanidatamab-hrii)

Jazz Pharmaceuticals, Inc. submitted an application for new technology add-on payments for ZIIHERA® for FY 2026. According to the applicant, ZIIHERA® is

a bispecific human epidermal growth factor receptor 2 (HER2)-directed antibody for the treatment of adults with previously treated, unresectable or metastatic HER2-positive (IHC 3+) biliary tract cancer (BTC).

Please refer to the online application posting for ZIIHERA®, available at *https://mearis.cms.gov/public/publications/ntap/NTP240925MW5YD*, for additional detail describing the technology and the disease treated by the technology.

With respect to the newness criterion, according to the applicant, ZIIHERA® was granted BLA approval from FDA on November 20, 2024, for the treatment of adults with previously treated, unresectable or metastatic HER2-positive (IHC 3+) BTC as detected by an FDA-approved test. According to the applicant, ZIIHERA®'s market availability was delayed to allow for final packaging with FDA approved labels and package inserts as well as to allow time for shipment to channel distribution points, therefore, ZIIHERA® became commercially available as of December 2, 2024. We stated we were interested in additional information regarding the cause of any delay in the technology's commercial availability, such as related to packaging and shipment to channel distribution points.

According to the applicant, ZIIHERA® is administered intravenously in doses of 20 mg/kg once every 2 weeks until disease progression or unacceptable toxicity; therefore, the dose per inpatient stay is 1,400 mg.

The applicant stated that effective October 1, 2024, the following ICD–10–PCS codes may be used to uniquely describe procedures involving the use of ZIIHERA®: XW033CA (Introduction of zanidatamab antineoplastic into peripheral vein, percutaneous approach, new technology group 10) or XW043CA (Introduction of zanidatamab antineoplastic into central vein, percutaneous approach, new technology group 10). The applicant stated that C22.1 (Intrahepatic bile duct carcinoma), C23 (Malignant neoplasm of gallbladder), C24.0 (Malignant neoplasm of extrahepatic bile duct), C24.8 (Malignant neoplasm of overlapping sites of biliary tract), C24.9 (Malignant neoplasm of biliary tract, unspecified); or Z51.11 (Encounter for antineoplastic chemotherapy) may be used to currently identify the indication for ZIIHERA® under the ICD–10–CM coding system.

As previously discussed, if a technology meets all three of the substantial similarity criteria under the newness criterion, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purpose of new technology add-on payments.

With respect to the substantial similarity criteria, the applicant asserted that ZIIHERA® is not substantially similar to other currently available technologies because ZIIHERA®'s novel and distinct mechanisms of action are not the same or substantially similar to those of other currently available therapies used for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC. In addition, the applicant asserted that ZIIHERA® is the first and only bispecific HER2-directed antibody indicated for this population, and that therefore, the technology meets the newness criterion. The following table summarizes the applicant's assertions regarding the substantial similarity criteria. Please see the online application posting for ZIIHERA® for the applicant's complete statements in support of its assertion that ZIIHERA® is not substantially similar to other currently available technologies.

BILLING CODE 4120–01–P

Substantial Similarity Criteria	Applicant Response	Applicant assertions regarding this criterion
Does the technology use the same or similar mechanism of action to achieve a therapeutic outcome?	No	ZIIHERA® is not the same or substantially similar to any therapies currently used to treat adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC. It is a bispecific HER2-directed, biparatopic antibody that simultaneously binds to 2 nonoverlapping, distinct sites on HER2: the ECD4 and ECD2 domains. Trans-binding of ZIIHERA® with HER2 results in receptor crosslinking, clustering, and internalization, which leads to a reduction of HER2 from the cell surface. It reduces phosphorylation of HER2 family members (including EGFR, HER2, and HER3), downstream signaling, and ligand-dependent and -independent proliferation. Distinctly, ZIIHERA® potently induces CDC, ADCC, and ADCP. ZIIHERA® is substantially differentiated mechanistically and clinically from currently available anti-HER2 agents: HERCEPTIN®, indicated for the treatment of HER2-overexpressing breast cancer and metastatic gastric or gastroesophageal junction adenocarcinoma; PERJETA®, indicated for use in combination with HERCEPTIN® and DOCETAXEL for HER2+ metastatic breast cancer; and ENHERTU®, indicated for HER2+ and HER2-low breast cancer, non-small cell lung cancer (NSCLC) activating HER2 mutations, HER2+ gastric or gastroesophageal junction adenocarcinoma, and HER2+ solid tumors (not specifically studied in BTC), when no other satisfactory treatment options for unresectable/metastatic HER2 (IHC 3+) BTC exist. ZIIHERA®'s distinct mechanisms of action were confirmed in preclinical models where ZIIHERA® exhibited improved antitumor activity compared with HERCEPTIN® alone and HERCEPTIN®+PERJETA® in head-to-head comparisons across a range of tumors and HER2 expression levels: 1) ZIIHERA® binds adjacent HER2 reorganization not observed with HERCEPTIN® or PERJETA®; 2) ZIIHERA®, but not HERCEPTIN® or HERCEPTIN®+PERJETA®, elicit potent CDC against high HER2-expressing tumor cells in vitro (the only HER2 agent that can elicit CDC); and 4) ZIIHERA® mediates HER2 internalization and downregulation, inhibition of both cell signaling and tumor growth, ADCC and ADCP, and shows superior in vivo antitumor activity compared to HERCEPTIN®+PERJETA® in a HER2-expressing xenograft model. ZIIHERA® is also highly differentiated mechanistically and clinically from chemotherapeutic regimens or other therapies used in first line (1L) and second line (2L) treatment of BTC. It is not a chemotherapy. Its unique asymmetric design, its biparatopic bispecific binding, and ability to induce HER2 receptor crosslinking is believed to drive the multiple mechanisms of action of ZIIHERA® and its clinical activity as a single agent. ZIIHERA® is the first and only bispecific HER2-directed antibody indicated for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC.
Is the technology assigned to the same MS-DRG as existing technologies?	Yes	While ZIIHERA® will not map to MS-DRGs distinct from other treatments administered to patients diagnosed with BTC, patient cases receiving intravenous infusion of ZIIHERA® will be identified by unique ICD-10-PCS procedures codes for ZIIHERA® administration: XW033CA and XW043CA, effective October 1, 2024.
Does new use of the technology involve the treatment of the same/similar type of disease and the same/similar patient population when compared to an existing technology?	No	ZIIHERA® is the first and only bispecific HER2-directed, biparatopic antibody approved by FDA for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC. Results from the pivotal, single-arm phase IIb HERIZON-BTC-01 study support ZIIHERA® having meaningful clinical benefit and potential as a new standard of care for patients with HER2+ (IHC 3+) BTC.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18154), after review of the information provided by the applicant, we noted that while the applicant stated that ZIIHERA® is the first and only bispecific HER2-directed, biparatopic antibody approved by FDA for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC, there are several existing treatment options for patients with unresectable/metastatic HER2+ (IHC 3+) BTC such as FOLFOX, FOLFIRI, STIVARGA®, or

ENHERTU®.[120] Therefore, we stated it was unclear how ZIIHERA® treats a new patient population or disease as compared to these existing treatments.

We invited public comments on whether ZIIHERA® is substantially similar to existing technologies and whether ZIIHERA® meets the newness criterion.

Comment: A commenter submitted a public comment stating that ZIIHERA®'s bispecific design targets two non-overlapping HER2 epitopes, enhancing receptor clustering, internalization, and immune-mediated cytotoxicity. The commenter stated that this dual engagement mechanism distinguishes it from other HER2-directed agents used in BTC, such as trastuzumab deruxtecan (T–DXd), which relies on a cytotoxic payload, or trastuzumab-based combinations, which may provide less potent HER2 blockade in this disease context.

Response: We thank the commenter for its comment.

Comment: The applicant submitted a public comment regarding the newness criterion. The applicant reiterated its statements from its new technology add-on payment application in support of its assertion that ZIIHERA® meets the newness criterion, including that it is the first and only FDA-approved, HER2-directed bispecific antibody indicated for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC3+) BTC, and that it has a unique mechanism of action. The applicant reiterated that ZIIHERA®'s unique asymmetric antibody design, its biparatopic bispecific binding, and its ability to induce HER2 receptor crosslinking and internalization is hypothesized to drive multiple mechanisms of action that lead to a reduction of HER2 from the cell surface and reduction in downstream signaling as well as complement-dependent cytotoxicity (CDC), antibody-dependent cellular cytotoxicity (ADCC), and antibody-dependent cellular phagocytosis (ADCP) to destroy and eliminate HER2-express tumor cells, all of which may support its clinical activity as a single agent. The applicant provided additional information, including figures detailing its study of ZIIHERA®'s mechanism of action observed in pre-clinical trials. The applicant stated that ZIIHERA® provides an opportunity to circumvent potential resistance mechanisms from single site HER2 agents.

In response to CMS's concern about whether ZIIHERA® treats a new patient population or disease as compared to existing treatments, such as FOLFOX, FOLFIRI, STIVARGA®, or ENHERTU®, the applicant reiterated that ZIIHERA® is the first and only FDA-approved, HER2-directed bispecific antibody indicated for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC3+) BTC. The applicant stated that prior to the FDA approval of ZIIHERA® and its NCCN addition as a Category 2A treatment option for BTC, the preferred subsequent-line therapy option for patients with advanced BTC who progress was FOLFOX (fluorouracil, leucovorin, and oxaliplatin) chemotherapy, as well as other systemic therapy options recommended for 2L therapy in BTC, such as FOLFIRI (fluorouracil, leucovorin, and irinotecan) and, with Category 2B evidence, STIVARGA® (regorafenib) and liposomal irinotecan plus 5-fluorouracil plus leucovorin. The applicant reiterated that, overall, these and other regimens used in the 2L or later setting are associated with response rates of approximately 3 percent to 15 percent, median PFS of approximately 3 to 7 months, and median OS of approximately 6 to 9 months, and that historically, chemotherapies have shown modest clinical benefit in the 2L or later setting and are associated with significant toxicity burden for the patients, with up to a third reported to discontinue chemotherapy because of the toxicities. The applicant also stated that chemotherapy-related toxicity may be cumulative by the time patients make it to 2L since treatment guidelines recommend the use of cisplatin and gemcitabine with or without immunotherapy as 1L treatment for patients with metastatic BTC. The applicant stated that there is a need for a chemotherapy-free option in the 2L+ setting. The applicant further stated that HER2 is an important targetable alteration, accounting for ~20 percent of BTC and provided a study that included 122 previously treated patients with HER2-amplified solid tumors including BTC that demonstrated patients who received HER2-targeted therapy had numerical improvement in mOS compared to those who did not (18.6 vs 10.9 months; hazard ratio [HR], 0.60; 95% CI, 0.34 to 1.06; P=.07), highlighting ZIIHERA®'s potential to address the serious unmet treatment need and further provide a chemotherapy-free option. In regards to ENHERTU®, the applicant commented that the FDA approval and NCCN recommendation were based on the DESTINY-PanTumor2 basket trial including 41 patients with BTC who had received a median of 2 lines of prior therapy (range, 1–5), 16 of which were HER2+ (IHC3+) BTC, stating that ENHERTU® had a cORR of 56.3 percent (95% CI 29.9, 80.2), an observed mOS of 12.4 (2.8, NR) months, and a mDOR of 10.9 months (5.5, NE) while emphasizing that ENHERTU®'s FDA-approved indication is for the treatment of adult patients with unresectable or metastatic HER2-positive (IHC3+) solid tumors who have received prior systemic treatment and have no satisfactory alternative treatment options.

With respect to assignment to the same MS–DRG as existing technologies, the applicant stated that it agrees with CMS that ZIIHERA® will not map to MS–DRGs distinct from other treatments administered to patients with BTC.

In response to CMS's request for additional information regarding the cause of any delay in commercial availability, the applicant stated that the newness period for ZIIHERA® should begin on the date of its first market availability, December 2, 2024, and not the FDA approval date of November 20, 2024. Specifically, the applicant explained that the gap in time from FDA approval to commercial availability was to allow for final packaging with FDA-approved labels and package inserts as well as to allow time for shipment to all critical distribution points. ZIIHERA® inventory was received by specialty distributors on December 3, 2024, and was able to be ordered by end users on that date. The applicant stated its understanding that CMS's use of either date will result in the 3-year anniversary of ZIIHERA®'s entry onto the U.S. market occurring after October 1, 2027, and so long as this understanding is correct, it does not object to CMS using November 20, 2024, as the date of ZIIHERA® market availability.

Response: We thank the applicant and other commenters for their comments. Based on our review of comments received and information submitted by the applicant as part of its FY 2026 new technology add-on payment application for ZIIHERA®, we agree with the applicant that ZIIHERA® uses a unique mechanism of action because it is a bispecific HER2-directed, biparatopic antibody approved by FDA for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC. Therefore, we agree with the applicant that ZIIHERA® is not substantially similar to existing treatment options and meets the newness criterion. We consider the

[120] National Comprehensive Care Network (NCCN). (2024, November 27). NCCN Guidelines Version 5.2024 Biliary Tract Cancers. Retrieved on January 8, 2025, from *https://www.nccn.org*.

beginning of the newness period to commence on December 2, 2024, the date on which ZIIHERA® became commercially available.

With respect to the cost criterion, the applicant provided multiple analyses to demonstrate that ZIIHERA® meets the cost criterion. Each analysis followed the order of operations summarized in the following table.

ZIIHERA® COST ANALYSIS	
Inclusion/exclusion criteria	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for ZIIHERA®.
Claims identified	Scenario 1: 152 claims mapping to 13 MS-DRGs, with 12.50% of claims mapping to MS-DRG 847 (Chemotherapy Without Acute Leukemia as Secondary Diagnosis with CC). Scenario 2: 3,807 claims mapping to 30 MS-DRGs, with 44.44% of claims mapping to MS-DRG 435 (Malignancy of Hepatobiliary System or Pancreas with MCC).
Charges removed for prior technology	Per the applicant, the utilization of ZIIHERA® would replace chemotherapy charges. The applicant removed 15.9% of radiology charges from identified cases in which BTC was the primary diagnosis and removed 19.9% of radiology charges from identified cases in which BTC was a secondary diagnosis. Per the applicant, these percentages were derived based on an analysis of the revenue center file from the 100% Inpatient Standard Analytic File (SAF) in FY 2023. The applicant estimated the percentage of chemotherapy therapy-related radiology charges for each set of cases by dividing the sum of charges for chemotherapy-related revenue codes (0331, 0332, 0335) by the sum of charges for the revenue codes comprising total radiology charges. The applicant did not remove indirect charges related to the prior technology.
Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
Inflation factor	The applicant applied an inflation factor of 8.406% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology
Cost analysis results	Scenario 1: - Average case-weighted threshold amount: $87,202 - Final inflated average case-weighted standardized charge per case: $197,284 Scenario 2: - Average case-weighted threshold amount: $93,683 - Final inflated average case-weighted standardized charge per case: $209,487

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both scenarios, the applicant asserted that ZIIHERA® meets the cost criterion.

We invited public comments on whether ZIIHERA® meets the cost criterion.

Comment: The applicant stated that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount for both the primary cohort and the sensitivity cohort, and thus ZIIHERA® meets the cost criterion.

Response: We thank the applicant for its comments. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount under all scenarios. Therefore, ZIIHERA® meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant asserted that ZIIHERA® represents a substantial clinical improvement over existing technologies because it is a bispecific HER2-directed antibody with multiple, distinct mechanisms of action and a differentiated clinical profile, and it is the first and only FDA-approved treatment for HER2+ (IHC 3+) BTC. In addition, the applicant asserted that ZIIHERA® fulfills an unmet need for this patient population by providing an optimal chemotherapy-free treatment option, where patients also have the potential to achieve meaningfully improved clinical benefits. The applicant provided 1 study and 2 poster presentations of the same study to support these claims, as well as 3 background articles on other treatments for advanced BTC.[121] The following table summarizes the applicant's assertions regarding the substantial clinical improvement criterion. Please see the online posting for ZIIHERA® for the applicant's complete statements regarding the substantial clinical improvement criterion and the supporting evidence provided.

BILLING CODE 4120–01–P

[121] Background articles and supplemental material are not included in the following table but can be accessed via the online posting for the technology.

Substantial Clinical Improvement Assertion #1: The technology offers a treatment option for a patient population unresponsive to, or ineligible for, currently available treatments	
Applicant statements in support	**Supporting evidence provided by the applicant**
ZIIHERA® is the first and only bispecific HER2-directed antibody for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC.	Pant S, et al. Zanidatamab in previously treated HER2-positive biliary tract cancer: overall survival and longer follow-up from the phase 2b HERIZON-BTC-01 study. American Society of Clinical Oncology annual meeting. 2024. Abstract; Poster 4091. Harding JJ, et al. Zanidatamab for HER2-amplified, unresectable, locally advanced or metastatic biliary tract cancer (HERIZON-BTC-01): a multicentre, single-arm, phase 2b study. Lancet Oncol. 2023;24(7):772-82. The applicant also provided background information and supplemental material to support this claim, which can be accessed via the online posting for the technology.
Substantial Clinical Improvement Assertion #2: The technology significantly improves clinical outcomes relative to services or technologies previously available	
In HERIZON-BTC-01, ZIIHERA® demonstrated clinical benefit of sustained/durable response rates and longer overall survival compared to previously reported outcomes of 2L therapies for advanced BTC.	Pant, 2024, *op. cit.* Harding, 2023, *op. cit.* The applicant also provided background information and supplemental material to support this claim, which can be accessed via the online posting for the technology.
Treatment with ZIIHERA® provides a marked clinical benefit with a significantly higher response rate than previously reported for currently preferred 2L chemotherapy regimen	Pant, 2024, *op. cit.* Harding, 2023, *op. cit.* The applicant also provided background information and supplemental material to support this claim, which can be accessed via the online posting for the technology.
The overall benefit:risk assessment of ZIIHERA® is favorable. ZIIHERA® fulfills an unmet medical need and provides an option for patients to receive clinical benefit with a low risk of harm.	Harding, 2023, *op. cit.* Wasan H, et al. Health-related quality of life outcomes in patients with zanidatamab-treated HER2-positive biliary tract cancer in the Phase 2b HERIZON-BTC-01 study. Presented at European Society for Medical Oncology (ESMO) 2023; Poster presentation, Poster 101P. Pant, 2024, *op. cit.* The applicant also provided background information and supplemental material to support this claim, which can be accessed via the online posting for the technology.

BILLING CODE 4120–01–C

In the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18156), after review of the information provided by the applicant, we stated we had the following concerns regarding whether ZIIHERA® meets the substantial clinical improvement criterion. With respect to the assertion that ZIIHERA® offers a treatment option for a patient population unresponsive to or ineligible for existing therapies, the applicant stated that ZIIHERA® is the first and only FDA-approved bispecific HER2-directed antibody for the treatment of adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC. However, we noted that while the target (HER2+) and type of therapy (bispecific antibody) for a particular indication may relate to mechanism of action under the newness criterion, it is not relevant to the demonstration of substantial clinical improvement. Further, we noted that the applicant stated that FOLFOX is the preferred subsequent line therapy option for these patients, and we also noted that NCCN guidelines list additional available therapies including: FOLFIRI, ENHERTU®, and HERCEPTIN® plus TUKYSA®. We further noted that while the applicant provided studies describing outcomes from the HERIZON–BTC–01 trial of ZIIHERA® as well as background studies describing outcomes for other treatment options in 2L advanced BTC, the studies did not demonstrate that patients eligible for treatment with ZIIHERA® are unable to receive other existing therapies. Therefore, we questioned whether ZIIHERA® offers a treatment option for a patient population unresponsive to, or ineligible for other existing therapies.

With respect to the assertion that ZIIHERA® significantly improves clinical outcomes relative to services or technologies previously available, the applicant provided 1 published peer-reviewed study of HERIZON–BTC–01

(Harding et al., 2023) and 2 poster presentations that are analyses of HERIZON–BTC–01 (Pant et al., 2024; Wasan et al., 2023) in support of its claims. Harding et al. (2023) and Pant et al. (2024) provided results of the phase IIB HERIZON–BTC–01, a global, multicenter, single arm, cohort study assessing ZIIHERA® treatment in 87 patients with HER2+ BTC, which were grouped into cohorts based on immunohistochemistry (IHC): cohort 1, n=80 (HER2+ (IHC 2+ or IHC 3+)) and cohort 2, n=7 (IHC 0 or IHC 1+). We noted that the HERIZON–BTC–01 study did not compare ZIIHERA® outcomes to outcomes for other existing treatments, and therefore we questioned the extent to which this can be relied upon for a finding of substantial clinical improvement. We noted that 63 percent of the study's patients were enrolled at clinical trial sites in Asia, and we questioned whether the location of the clinical trial sites being outside of the US could affect the generalizability of the findings to the U.S. Medicare patient population. We also questioned whether the study's sample size may have impacted the ability to perform or interpret comparative analyses within and between the two different patient cohorts.

With respect to the applicant's claim that, in HERIZON–BTC–01 study (Harding et al., 2023), ZIIHERA® demonstrated a clinical benefit of sustained/durable response rates, longer OS, and a significantly higher response rate compared to previously reported outcomes of 2L advanced BTC therapies, we noted that while the applicant provided background studies comparing FOLFOX and FOLFIRI to ZIIHERA®, the supporting evidence provided did not compare ZIIHERA® to other FDA-approved therapies used for unresectable/metastatic BTC such as ENHERTU®. The applicant stated that ZIIHERA®'s median confirmed objective response rate (cORR) of 51.6 percent represents a marked clinical benefit for the target population, which is approximately 10-fold higher than the previously reported median ORR for FOLFOX and significantly more than the historical response rate of 7.7 percent for 2L chemotherapy regimens, noting the highest historical rate reported of 14.8 percent was seen in the FOLFIRI regimen. However, we questioned whether the differences in the studies' reported responses are comparable given that the studies are different in design, protocol, and methodology, which may limit the ability to interpret the outcomes. While the applicant stated that FOLFOX chemotherapy regimen remains the preferred 2L treatment of advanced BTC, as there are other treatments used in the 2L+ treatment of advanced BTC, we stated we would appreciate additional information on the comparison of outcomes with ZIIHERA® to those with other FDA-approved therapies used for advanced/metastatic BTC.

With respect to the claim that ZIIHERA® has a manageable safety profile with favorable tolerability in adults with previously treated, unresectable/metastatic HER2+ (IHC 3+) BTC, the applicant stated that, in contrast to chemotherapy regimens used as 2L or later therapies, ZIIHERA® as a single agent is well tolerated in the pretreated BTC patient population and the resulting adverse events are manageable. In support of this claim, the applicant provided results of the HERIZON–BTC–01 study (Harding et al., 2023, Wasan et al., 2023, and Pant et al., 2024), which measured safety and quality of life in 87 patients. We stated we were concerned that the safety and quality of life data were combined in both the Harding et al. (2023) and Pant et al. (2024) studies for cohort 1 (n=80) (HER2+ (IHC 3+ or IHC 2+)) and cohort 2 (n=7) (IHC 1+ or IHC 0), and the Wasan paper reported from cohort 1 (HER2+ (IHC 3+ or IHC 2+)). Therefore, these studies did not provide data on safety and treatment-related adverse events for IHC 3+ BTC patients separately. We noted that since ZIIHERA® is indicated for use in patients with HER2+ (IHC 3+) BTC only, we questioned whether the inclusion of patients with HER2+ (IHC 2+) BTC and patients with IHC 1+ or IHC 0 BTC is appropriate to demonstrate outcomes for HER2+ (IHC 3+) BTC patients specifically. We questioned whether this analysis provides sufficient evidence as to ZIIHERA®'s overall benefit-risk profile and how it compares to other treatments given that Wasan et al. and Pant et al., which are unpublished and non-peer-reviewed conference posters, do not include full details of the study and methodology, which therefore may limit our ability to interpret the results. We further noted that HERIZON–BTC–01 was a single arm study and that the clinical outcome and HRQoL data are not specific to IHC 3+ BTC patients, in accordance with ZIIHERA®'s FDA indication.

We invited public comments on whether ZIIHERA® meets the substantial clinical improvement criterion.

Comment: We received several comments that expressed general support for new technology add-on payment approval for ZIIHERA®. Some of the commenters stated that ZIIHERA® addresses a critical unmet need in this patient population by offering a targeted, chemotherapy-free treatment option that has demonstrated meaningful and durable responses in a setting where conventional therapies have limited efficacy, and that the ability to initiate or continue ZIIHERA® in the inpatient setting may help stabilize disease, reduce symptom burden, and facilitate discharge planning, offering both clinical and health system benefits. A commenter expressed support for ZIIHERA® as a chemotherapy-free treatment option for patients with biliary obstruction, poor performance status, and comorbidities that limit chemotherapy tolerance. Many commenters also stated that in the HERIZON–BTC–01 trial, ZIIHERA® demonstrated meaningful results with an ORR of 52 percent with a mDOR of 14.9 months. One of the commenters stated that a small but clinically relevant subset of BTCs have HER2-amplification for which HER2-targeted therapy is vastly superior to traditional chemotherapy. Another commenter stated that for patients with HER2 overexpression after progression on first-line therapy, ZIIHERA® offers a singularly advantageous profile based upon a host of parameters including the lack of myelosuppression which is important in a population at high risk for cholangitis or biliary sepsis and that because ZIIHERA® does not require significant hepatic metabolism, it is also a preferred choice in patients with biliary obstruction and risk for fluctuating hepatic function. The commenter stated that alternate HER2-targeted therapies, such as trastuzumab deruxtecan or tucatinib-based regiments, are not options in these settings due to risk for hepatic toxicity or worsening infection. A commenter further stated that currently available options for patients with HER2+ (IHC3+) BTC, such as chemotherapy or ENHERTU®, have important limitations, especially in 2L where patients may already be fragile and chemotherapy-intolerant, and that ZIIHERA® represents an important option because it offers a chemotherapy-free, HER2-targeted approach. The commenter stated the availability of a well-tolerated, targeted 2L regimen such as ZIIHERA® could expand access especially for patients who might otherwise forgo treatment due to poor performance status or inability to tolerate the toxicity of current standard regimens. Additionally, another commenter stated that traditionally,

antineoplastic therapies have not been given in the inpatient setting due to them being unsafe for people that are acutely ill because they have cytotoxic mechanisms of action that can cause infection, cytopenias, bleeding and other complications and that having inpatient access to ZIIHERA® would allow patients to start it sooner or to continue treatment on schedule, rather than missing doses.

Response: We thank the commenters for their input and have taken it into consideration in determining whether ZIIHERA® meets the substantial clinical improvement criterion as discussed later in this section.

Comment: The applicant submitted a public comment regarding the substantial clinical improvement criterion and provided responses to CMS's concerns from the proposed rule. In response to CMS's questions regarding the applicant's assertion that ZIIHERA® offers a treatment option for a patient population unresponsive to, or ineligible for, other existing therapies, the applicant stated that prior to FDA approval of ZIIHERA® and its addition as a Category 2A treatment option for BTC, the preferred subsequent-line therapy option for patients with advanced BTC was FOLFOX chemotherapy, although survival rates remain poor (6.2 months OS and 4.0 months mPFS) and response rates are low (5 percent). The applicant asserted that among patients receiving FOLFOX, Grade 3 to 5 adverse events occurred in 69 percent of patients, and 3 chemotherapy-related deaths were reported. The applicant explained that additional treatment options recommended for 2L therapy in BTC were FOLFIRI, STIVARGA®, and liposomal irinotecan plus 5-fluorouracil plus leucovorin, and provided two tables displaying the efficacy, and safety and tolerability of select 2L therapies in BTC. The applicant commented that historically, there were no HER2-targeted therapies that were specifically studied in a trial dedicated to patients with BTC as most of these trials were basket trials. Per the applicant, with the addition of ZIIHERA®, four HER2-targeted therapies are now recommended in the NCCN guidelines. The applicant stated that ZIIHERA® was studied in the largest phase 2b clinical trial dedicated to BTC with 80 patients with HER2+ disease, 62 of which were IHC3+ and that aside from ZIIHERA®, only ENHERTU® has reported efficacy data in centrally confirmed HER2+ (IHC3+) BTC (n=16). The applicant further stated that two of the guideline-recommended HER2-targeted agents, trastuzumab + pertuzumab, which was investigated in a phase 2 basket trial (SGNTUC–019) in patients with HER2+ solid tumors, including 30 patients with HER2+ advanced BTC, and trastuzumab + tucatinib, which was investigated for the treatment of patients with previously treated, locally advance/metastatic HER2+ BTC in phase 2 multiple-basket study (MyPathway), are not FDA-approved for use in patients with HER2+ BTC. The applicant provided two figures that describe the efficacy outcomes in previously treated HER2+ BTC for fam-trastuzumab-deruxtecan, tucatinib + trastuzumab, and trastuzumab + pertuzumab, as well as the TEAEs with HER2-targeted subsequent-line therapies for treatment of BTC. The applicant reiterated that a significant and urgent unmet medical need exists for optimal and tolerable treatment options for patients with unresectable/metastatic HER2+ (IHC3+) BTC who have progressed on prior systemic therapy or for those who are ineligible for chemotherapy, and that the outcomes demonstrated by ZIIHERA® support the potential for a new standard of care for patients who progress on 1L options. The applicant further stated that ZIIHERA® offers the only FDA-approved chemotherapy-free treatment option and noted that ENHERTU® has a chemotherapeutic payload and is approved for use when no satisfactory alternative treatment option remains.

With respect to the assertion that ZIIHERA® significantly improves clinical outcomes relative to service or technologies previously available, the applicant reiterated findings from the HERIZON–BTC–01 trial and stated that the data continue to demonstrate rapid, sustained, and durable responses in comparison to FOLFOX and FOLFIRI while highlighting the clinical benefit of continued treatment with chemotherapy-free, single-agent ZIIHERA®. The applicant further commented that given the aggressive and rare nature of advanced HER2+ BTC (affecting about 4.4 per 100,000 in the U.S.), the conduct of randomized studies can be challenging in this biomarker-selected population and that HERIZON–BTC–01 is a single-arm study without comparator arm as there is no approved standard of care in this setting. The applicant stated that, acknowledging the hazards of cross-trial indirect comparison, the anti-tumor activity observed for ZIIHERA® in patients with HER2+ BTC compares favorably to historic controls from clinical studies in similar and relevant populations. The applicant provided several figures that describe the efficacy outcomes (ORR, mDOR in months, mPFS in months, and mOS in months) in previously treated HER2+ BTC for fam-trastuzumab-deruxtecan, tucatinib + trastuzumab, and trastuzumab + pertuzumab, noting that the table is for illustrative purposes only and is not intended as a direct comparison across trials. The applicant further stated that with the rarity of BTC and a further reduced subset of patients with HER2-expressing tumors, the sample size of HERIZON–BTC–01 (n=80, Cohort 1; median age 64 years [IQR 58–70]) is representative of the small BTC population, and that a sample size of approximately 75 patients in Cohort 1 was informed by Clopper-Pearson exact binomial 95 percent CIs using a historical response rate of 10 percent. The applicant reiterated that the HERIZON–BTC–01 study population represented the largest study in the 2L setting conducted in this rare disease. The applicant also stated that a conscious effort was made to target a broad range of clinical sites in wide geographic locations for the HERIZON–BTC–01 study, with study participants enrolled at sites in the U.S., Canada, Spain, France, U.K., Italy, Chile, China, and Korea. The applicant reiterated that the largest components of participants in Cohort 1 (IHC3+) were Asian (61.3 percent) and White (30.6 percent) but asserted that these demographic characteristics are representative of the target indication population of patients with BTC, which has a higher prevalence in Asian populations. The applicant stated that Harding et al. (2023) concluded that the ORRs were similar in patients enrolled in Asia compared with those enrolled in the rest of the world, indicating that geographical variation is unlikely to affect the therapeutic use of ZIIHERA®. The applicant stated these data demonstrate that HERIZON–BTC–01 results are generalizable to the U.S. BTC population, including the Medicare-age patient population. Furthermore, the applicant stated that prespecified subgroup analysis of cORR based on age (<65 or 65 or <75 or 75), sex (female or male), race (Asian or non-Asian), geographical region (North America, Asia, or other), HER2+ IHC score (2+ or 3+), anatomic site (gallbladder cancer, intrahepatic cholangiocarcinoma, and extrahepatic cholangiocarcinoma), number of previous therapies for advanced disease (<2 or 2), disease stage at baseline (stage III or stage IV), intolerance to most recent previous treatment (yes or no), and baseline ECOG performance status (0 or 1) were also examined. The applicant stated that

ZIIHERA® provided treatment benefit regardless of the anatomic subtype, geographical region, and lines of previous treatment and that the ORR results were similar across age groups (<65; 65; <75).

In regard to the claim that the overall benefit:risk assessment of ZIIHERA® is favorable and ZIIHERA® fulfills an unmet medical need and provides an option for patients to receive clinical benefit with a low risk of harm, the applicant reiterated that in contrast to chemotherapy regimens used in the 2L or later setting, ZIIHERA® as a single agent is well tolerated in the pretreated BTC patient population with AEs that are manageable and that ZIIHERA®, a HER2-directed, non-chemotherapy treatment approach, provides a clear clinical benefit, fulfills an unmet medical need for the intended patient population, and provides an option for patients to receive clinical benefit with a low risk of harm. The applicant further stated that the BLA safety analysis for ZIIHERA® was based on cohort 1 (n=80) of the pivotal, single arm Phase 2b HERIZON–BTC–01, and that for the cohort 1 subgroup of IHC3+ patients (n=62), 80.6 percent of patients experienced any TRAEs, with 59.7 percent of patients having a Grade 1 or 2 TRAE, 19.4 percent having a Grade 3 TRAE, 1.6 percent having a Grade 4 TRAE, none having a Grade 5 TRAE, and 2.3 percent having a TRAE leading to discontinuation. The applicant provided a figure with a summary of TRAEs. Furthermore, the applicant stated that the subgroup analysis by IHC status indicates that patients with IHC3+ had an ORR of 51.6 percent (32 of 62 patients) and those with IHC2+ had a response rate of 5.6 percent (one of 18 patients). The applicant stated that substantial improvements in quality of life were seen in patients who had a response, which was primarily in patients with HER2+ IHC3+ BTC (32/33 responders). The applicant also stated that the present analysis of quality of life was based on cohort 1: HER2+ patients defined as IHC3+ or IHC2+. The applicant stated that there were no responders in cohort 2 (IHC1+ or IHC0), and therefore, Cohort 2 was not included in any of the analysis. The applicant also explained that a Phase 3 clinical trial is underway investigating the use of ZIIHERA® in combination with standard of care versus standard of care alone as 1L therapy in advanced HER2+ BTC and will serve as the confirmatory trial.

Response: We thank the applicant for its comment regarding the substantial clinical improvement criterion. Based on the additional information received, we continue to have concerns as to whether ZIIHERA® meets the substantial clinical improvement criterion to be approved for new technology add-on payments.

Regarding the applicant's assertion that ZIIHERA® offers a treatment option for a patient population unresponsive to or ineligible for other existing therapies, since the information provided in the application for this assertion as well as the updated NCCN guidelines note that there are additional therapy options, we disagree that the material presented adequately supports that patients treated with ZIIHERA® have no other treatment options. Specifically, we note that the NCCN guidelines recommend other treatment options for patients with unresectable or metastatic BTC, including FOLFOX, FOLFIRI, liposomal irinotecan plus 5-fluorouracil plus leucovorin, and STIVARGA®, or targeted therapy for patients with HER2+ unresectable or metastatic BTC, including ENHERTU®, PERJETA® plus HERCEPTIN®, and TUKYSA® plus HERCEPTIN®, as well as ZIIHERA®. In addition, while ZIIHERA® may provide a treatment option for patients unable to tolerate the toxicity of current standard chemotherapy regimens as described by the applicant and commenters, it is unclear that patients who are unable to tolerate these chemotherapy regimens are also ineligible for other targeted therapies such as ENHERTU®.

We also continue to question that ZIIHERA® improves outcomes over existing targeted therapies like ENHERTU®. While the applicant provided outcomes for ZIIHERA® and ENHERTU® from their respective trials, we note the similarity of the clinical outcomes data in the information provided. For example, while the applicant stated ZIIHERA® demonstrated a cORR of 51.6 percent (95 percent CI: 38.6, 64.5) in the HERIZON–BTC–01 which the applicant stated was significantly more than the historical response rate of 7.7 percent, we note that ENHERTU® demonstrated a cORR of 56.3 percent in the DESTINY-PanTumor02 trial. We also question whether the data provided by the applicant comparing outcomes and TRAEs for the HER2-targeted therapies allows for direct comparison given there are differences in the sample size and differences in the number of prior treatments between the two studies. Therefore, we remain unclear that ZIIHERA® improves outcomes or TRAEs compared to other HER2-targeted therapies such as ENHERTU® for patients with 2L unresectable or metastatic HER2+ (IHC 3+) BTC.

After consideration of all the information received from the applicant, as well as the public comments we received, we are unable to determine that ZIIHERA® represents a substantial clinical improvement over existing technologies for the reasons discussed in the proposed rule and in this final rule, and therefore, we are not approving new technology add-on payments for ZIIHERA® for FY 2026.

6. FY 2026 Applications for New Technology Add-On Payments (Alternative Pathways)

As discussed previously, beginning with applications for FY 2021, a medical device designated under FDA's Breakthrough Devices Program that has received marketing authorization for the indication covered by the Breakthrough Device designation, may qualify for the new technology add-on payment under an alternative pathway. Additionally, beginning with FY 2021, a medical product that is designated by FDA as a Qualified Infectious Disease Product (QIDP) and has received marketing authorization for the indication covered by the QIDP designation, and, beginning with FY 2022, a medical product that is a new medical product approved under FDA's Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD) and used for the indication approved under the LPAD pathway, may also qualify for the new technology add-on payment under an alternative pathway. Under an alternative pathway, a technology will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS and will not need to meet the requirement that it represents an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. These technologies must still be within the 2-to-3-year newness period to be considered ''new,'' and must also still meet the cost criterion.

As discussed previously, in the FY 2023 IPPS/LTCH PPS final rule, we finalized our proposal to publicly post online applications for new technology add-on payment beginning with FY 2024 applications (87 FR 48986 through 48990). As noted in the FY 2023 IPPS/LTCH PPS final rule, we are continuing to summarize each application in this final rule. However, while we are continuing to provide discussion of the concerns or issues we identified with respect to applications submitted under the alternative pathway, we are providing more succinct information as part of the summaries in the proposed

and final rules regarding the applicant's assertions as to how the medical service or technology meets the applicable new technology add-on payment criteria. We refer readers to *https://mearis.cms.gov/public/publications/ntap* for the publicly posted FY 2026 new technology add-on payment applications and supporting information (with the exception of certain cost and volume information, and information or materials identified by the applicant as confidential or copyrighted), including tables listing the ICD–10–CM codes, ICD–10–PCS codes, and/or MS–DRGs related to the analyses of the cost criterion for certain technologies for the FY 2026 new technology add-on payment applications. In addition, for certain FY 2026 new technology add-on payment applications, in the FY 2026 IPPS/LTCH PPS proposed rule, we noted we made available separate tables listing the ICD–10–CM codes and/or ICD–10–PCS codes that we believed would be used to identify cases relevant to the Breakthrough Device-designated indications, or would be appropriate to exclude for cases related to FDA market authorized indications that are not covered by the Breakthrough Device designation indications, for purposes of the new technology add-on payment, if approved, in Table 10 associated with the proposed rule, available via the internet on the CMS website at *https://www.cms.gov/medicare/medicare-fee-for-service-payment/acuteinpatientpps.* Click on the link on the left side of the screen titled ''FY 2026 IPPS Proposed Rule Home Page'' or ''Acute Inpatient—Files for Download''. Please see section VI of the Addendum of the proposed rule for additional information regarding tables associated with the proposed rule.

Table 10 associated with this final rule reflects the finalized lists of ICD–10–CM codes or ICD–10–PCS codes that would be used to identify cases relevant to the Breakthrough Device-designated indication for the RECELL® Autologous Cell Harvesting Device for purposes of the new technology add-on payment for FY 2026, and is available on the CMS website at: *https://www.cms.gov/medicare/medicare-fee-for-service-payment/acuteinpatientpps.*

We received 34 applications for new technology add-on payments for FY 2026 under the new technology add-on payment alternative pathway. As discussed in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58948 through 58958) and the FY 2025 IPPS/LTCH PPS final rule (89 FR 69242 through 69245), we finalized that beginning with the new technology add-on payment applications for FY 2025, for technologies that are not already FDA market authorized for the indication that is the subject of the new technology add-on payment application, applicants must have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and must provide documentation of FDA acceptance or filing to CMS at the time of application submission, consistent with the type of FDA marketing authorization application the applicant has submitted to FDA. See § 412.87(e) and further discussion in the FY 2024 and the FY 2025 IPPS/LTCH PPS final rules (88 FR 58948 through 58958; 89 FR 69242 through 69245). Of the 34 applications received under the alternative pathway, 1 application was not eligible for consideration for new technology add-on payment because it did not meet these requirements; and 4 applicants withdrew their applications prior to the issuance of the proposed rule. Subsequently, prior to the issuance of this final rule, 7 additional applicants (for the Dexcom G7 Hospital Continuous Glucose Monitoring System, DrugSorb-ATR Device, Nelli Seizure Monitoring System, PearlMatrix P–15 Peptide Enhanced Bone Graft, Provizio® SEM Scanner, Spur Peripheral Retrievable Stent System, and the Ventura® Interatrial Shunt System) withdrew their applications, or did not meet the May 1 deadline for FDA approval or clearance of the technology and therefore are not eligible for consideration for new technology add-on payments for FY 2026. We are not including in this final rule the description and discussion of applications that were withdrawn or that are ineligible for consideration for FY 2026. We are addressing the remaining 22 applications. Of the remaining 22 applications, 20 of the technologies received a Breakthrough Device designation from FDA. The remaining two applications were designated as a QIDP by FDA. We did not receive any applications for technologies approved through the LPAD pathway.

In accordance with the regulations under § 412.87(f)(2), applicants for new technology add-on payments for FY 2026 for Breakthrough Devices must have FDA marketing authorization by May 1 of the year prior to the beginning of the fiscal year for which the application is being considered. Under § 412.87(f)(3), applicants for new technology add-on payments for FY 2026 for QIDPs and technologies approved under the LPAD pathway must have FDA marketing authorization by July 1 of the year prior to the beginning of the fiscal year for which the application is being considered. The policy finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58742) provides for conditional approval for a technology for which an application is submitted under the alternative pathway for certain antimicrobial products (QIDPs and LPADs) at § 412.87(d) that does not receive FDA marketing authorization by July 1 prior to the particular fiscal year for which the applicant applied for new technology add-on payments, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments. We refer the reader to the FY 2021 IPPS/LTCH final rule for a complete discussion of this policy (85 FR 58737 through 58742).

As we did in the FY 2025 IPPS/LTCH PPS proposed rule, for applications under the alternative new technology add-on payment pathway, in the FY 2026 IPPS/LTCH PPS proposed rule we made a proposal to approve or disapprove each of these 22 applications for FY 2026 new technology add-on payments. Therefore, in this section of the preamble of this final rule, we provide a table summarizing background information and the cost analysis for each of the remaining alternative pathway applications and our determination on whether or not each technology is eligible for the new technology add-on payment for FY 2026. We refer readers to section II.H.8. of the preamble of the FY 2020 IPPS/LTCH PPS final rule (84 FR 42292 through 42297) and FY 2021 IPPS/LTCH PPS final rule (85 FR 58715 through 58733) for further discussion of the alternative new technology add-on payment pathways for these technologies.

a. Alternative Pathway for Breakthrough Devices

(1) 4WEB Medical Ankle Truss System

The following table summarizes the information provided in the new technology add-on payment application for the 4WEB Medical Ankle Truss System. We note that 4WEB Medical, Inc. submitted an application for new technology add-on payments for the 4WEB Medical Ankle Truss System for FY 2024, as summarized in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26924 through 26926), which the applicant withdrew prior to the issuance of the FY 2024 IPPS/LTCH PPS final rule (88 FR 58919).

BILLING CODE 4120–01–P

	4WEB Medical Ankle Truss System	
Technology Info	**Applicant**	4WEB Medical, Inc.
	Description	Per the applicant, the 4WEB Medical Ankle Truss System (ATS) is for use with a premarket authorized tibiotalocalcaneal (TTC) nail as part of a TTC fusion system to manage ankle bone defects that occur after a failed ankle arthrodesis or arthroplasty.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241005L44VA
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the 4WEB Medical ATS is for use with a premarket authorized TCC nail as part of a TTC fusion system to manage ankle bone defects that may be associated with the following indications: - Failed ankle arthrodesis - Failed ankle arthroplasty The anatomical landmarks necessary for the design and creation of ATS PMDs must be present and identifiable on appropriate radiography scans. The ATS is intended for use with autograft and/or allogenic bone graft comprised of cancellous and/or corticocancellous bone graft.
	FDA marketing authorization indication	The 4WEB Medical ATS is for use as an accessory to the Stryker T2 Ankle Arthrodesis Nail or the Stryker Valor Hindfoot Fusion Nail as part of a TCC fusion construct in a salvage procedure following failed ankle arthrodesis or failed ankle arthroplasty for patients at risk for loss of limb. The ATS is not intended for standalone use. The anatomical landmarks necessary for the design and creation of ATS devices that are patient matched must be present and identifiable on appropriate radiography scans. The ATS is intended for use with autograft and/or allogenic bone graft comprised of cancellous and/or corticocancellous bone graft.
	FDA marketing authorization information	Per the applicant, the Breakthrough Device designation includes the use of the device after a failed ankle arthrodesis or failed ankle arthroplasty, which would be considered a salvage procedure as indicated in the FDA-cleared indication.
	FDA marketing authorization date	March 21, 2024
	Commercial availability	According to the applicant, the 4WEB Medical ATS was not immediately available for sale as the technology must be used with an FDA-cleared nail, and therefore a third-party distributor had to be engaged that could distribute the ATS System with an FDA-cleared nail. The applicant stated that the production of the ATS System could not be started until the distribution agreement was executed. Per the applicant, when scaling up to the production printing quantity, the manufacturer had to scrap the first batch of implants because part of the build did not print correctly. According to the applicant, this was not discovered until inspection, which by the time that occurred, was approximately one month later. Per the applicant, it did not receive the first batch that passed inspection until January 8th, 2025, which was the first date the device was available.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2023, the following ICD-10-PCS codes may be used to uniquely describe procedures involving the use of the 4WEB Medical ATS: XRGJ0B9 (Fusion of right ankle joint using open-truss design internal fixation device, open approach, new technology group 9), XRGK0B9 (Fusion of left ankle joint using open-truss design internal fixation device, open approach, new technology group 9), XRGL0B9 (Fusion of right tarsal joint using open-truss design internal fixation device, open approach, new technology group 9), or XRGM0B9 (Fusion of left tarsal joint using open-truss design internal fixation device, open approach, new technology group 9).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.

Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the 4WEB Medical Ankle Truss System.
	Claims identified	Scenario 1: 67 claims mapping to 6 MS-DRGs, with 17.91% of claims mapping to MS-DRG 493 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with CC). Scenario 2: 255 claims mapping to 19 MS-DRGs, with 18.82% of claims mapping to MS-DRG 493 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with CC).
	Charges removed for prior technology	The applicant removed 100% of charges associated with Medical/Surgical Supplies and Devices (revenue centers 027x, and 0624). The applicant stated that the use of the technology is expected to replace a portion of devices included in these claims, although it will not replace all devices, nor any medical supplies required to perform the procedure. However, an estimate of the percentage of these total charges for devices that would be replaced could not be determined. The applicant explained that to be as conservative as possible, the analysis removed 100% of these charges. The applicant did not remove any indirect charges related to the prior technology as it believed that financial impact of utilizing the ATS on hospital resources compared to prior technologies is minimal.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the expected hospital acquisition cost of the technology by the national cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Scenario 1: - Average case-weighted threshold amount: $103,093 - Final inflated average case-weighted standardized charge per case: $188,608 Scenario 2: - Average case-weighted threshold amount: $106,780 - Final inflated average case-weighted standardized charge per case: $194,544 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both scenarios, the applicant asserted that the 4WEB Medical ATS meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received 510(k) clearance is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-cleared indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We agreed with the applicant that the 4WEB Medical ATS meets the cost criterion and therefore proposed to approve the 4WEB Medical ATS for new technology add-on payments for FY 2026 for use as an accessory to the Stryker T2 Ankle Arthrodesis Nail or the Stryker Valor Hindfoot Fusion Nail as part of a TCC fusion construct in a salvage procedure following failed ankle arthrodesis or failed ankle arthroplasty for patients at risk for loss of limb.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the 4WEB Medical ATS to the hospital to be $23,500 per patient. Per the applicant, one 4WEB Medical ATS is used per patient per hospital discharge. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the 4WEB Medical ATS would be $15,275 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the 4WEB Medical ATS meets the cost criterion and our proposal to approve new technology add-on payments for the 4WEB Medical ATS for FY 2026.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the 4WEB Medical ATS. Commenters stated that the technology meets all the eligibility requirements and requested that CMS finalize the proposal to approve the new technology add-on payments for FY 2026.

The applicant also confirmed that the per-patient cost to the hospital of the device of $23,500 provided in the new technology add-on payments application has not changed. The applicant submitted a summary of relevant dates related to commercial availability, noting that 510(k) clearance was received from FDA on March 21, 2024, and a third-party distribution agreement between the applicant and Stryker Corporation (Stryker) was executed on July 26, 2024, to give

Stryker exclusive rights to distribute and sell the device. The applicant stated that there was a delay between July 26, 2024, and January 8, 2025, because manufacturing could not begin until the distribution agreement was executed, and the first batch of implants for commercial use were received on January 8, 2025. Per the applicant, it completed its inspection of the device and shipped the first batch to Stryker on January 28, 2025, and Stryker completed its processes on January 31, 2025 and made the device available for sale. The applicant noted that this date represents the date the device was commercially available and does not represent the date of first implant. The applicant stated that the first 4WEB Medical ATS implantation occurred on February 7, 2025. Given the timeline of events, the applicant requested that CMS utilize January 31, 2025, as the date of first commercial availability.

Response: We thank the commenters for their comments and support.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe 4WEB Medical ATS meets the cost criterion. The technology received 510(k) clearance on March 21, 2024, with an indication for use as an accessory to the Stryker T2 Ankle Arthrodesis Nail or the Stryker Valor Hindfoot Fusion Nail as part of a TCC fusion construct in a salvage procedure following failed ankle arthrodesis or failed ankle arthroplasty for patients at risk for loss of limb, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for 4WEB Medical ATS for FY 2026. We consider the beginning of the newness period to commence on January 31, 2025, the date on which the technology became commercially available for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of 4WEB Medical ATS to the hospital is $23,500 per patient. Per the applicant, one 4WEB Medical ATS is used per patient per hospital discharge. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of 4WEB Medical ATS is $15,275 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of 4WEB Medical ATS that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes: XRGJ0B9 (Fusion of right ankle joint using open-truss design internal fixation device, open approach, new technology group 9), XRGK0B9 (Fusion of left ankle joint using open-truss design internal fixation device, open approach, new technology group 9), XRGL0B9 (Fusion of right tarsal joint using open-truss design internal fixation device, open approach, new technology group 9), or XRGM0B9 (Fusion of left tarsal joint using open-truss design internal fixation device, open approach, new technology group 9).

(2) AeroPace® System

The following table summarizes the information provided in the new technology add-on payment application for the AeroPace® System.

BILLING CODE 4120–01–P

	AeroPace® System	
Technology Info	**Applicant**	Lungpacer(R) Medical Inc.
	Description	Per the applicant, the AeroPace® System is intended for temporary stimulation of the phrenic nerve(s) to increase diaphragmatic strength. Per the applicant, it is indicated to improve weaning success increase weaning, reduce ventilator days, and reduce reintubation – in patients ages 18 years or older on mechanical ventilation (MV) ≥96 hours and who have not weaned.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241004B25FM
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the proposed indication for use is to achieve earlier weaning from invasive MV in patients aged 18 years or older, who are not hypervolemic, and who have failed at least two spontaneous breathing trials.
	FDA marketing authorization indication	The AeroPace® System is indicated to improve weaning success - increase weaning, reduce ventilator days, and reduce reintubation - in patients ages 18 years or older on MV ≥96 hours and who have not weaned.
	FDA marketing authorization information	Per the applicant, the FDA-approved indication is consistent with its clinical trials and Breakthrough Device designation and MV treatment guidelines. The applicant stated that the Lungpacer Diaphragm Pacing Therapy System is the generic name, while the AeroPace® System is the commercial name for the device.
	FDA marketing authorization date	December 4, 2024
	Commercial availability	According to the applicant, the AeroPace® System is not commercially available immediately after FDA approval as it will take time following FDA approval to finalize the company's commercial operations and market materials to include the final labeling and regulatory information. The applicant stated that it anticipates the AeroPace® System to be commercially available on October 1, 2025.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the AeroPace® System.
	Claims identified	Broad Analysis: 83,011 claims mapping to 344 MS-DRGs, with 30% of claims mapping to MS-DRG 870 (Septicemia or Severe Sepsis with MV >96 Hours). Narrow Analysis: 15,925 claims mapping to 264 MS-DRGs, with 31% of claims mapping to MS-DRG 870 (Septicemia or Severe Sepsis with MV >96 Hours).
	Charges removed for prior technology	According to the applicant, the use of the AeroPace® System would be additive to the current practice. The applicant did not remove any direct charges for prior technologies being replaced, as there is no current technology for patients who may be treated with temporary transvenous diaphragm activation (TTDA) using the AeroPace® System. The applicant removed the indirect charges in the cost analysis. Per the applicant, the AeroPace® System may result in up to three fewer days on MV. The applicant estimated the charges per day associated with MV based on a presentation published by the Agency for Healthcare Research and Quality (AHRQ) in 2017. The applicant multiplied the charges per day by three days and inflated the charges using the annual IPPS rate-of-change for charges amount from FY 2018 through FY 2023. The applicant then applied the three-year inflation factor from the IPPS outlier fixed-loss threshold calculation to the respective amounts.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2025 IPPS/LTCH PPS final rule and the impact file posted with the FY 2023 IPPS/LTCH PPS final rule.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant did not add any direct nor indirect charges related to the new technology. Per the applicant, the clinical data indicates that ICU days and charges for other indirect services are unchanged and are determined or influenced based on other patient clinical factors.
	Cost analysis results	Broad Analysis: - Average case-weighted threshold amount: $226,579 - Final inflated average case-weighted standardized charge per case: $374,929 Narrow Analysis: - Average case-weighted threshold amount: $230,227 - Final inflated average case-weighted standardized charge per case: $365,719 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both analyses, the applicant asserted that the AeroPace® System meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received PMA

approval from FDA is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-approved indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We noted that the applicant stated that the technology is not yet available for sale because it would take time following FDA approval to finalize its commercial operations and market materials to include the final labeling and regulatory information. We stated in the proposed rule that we were interested in additional information regarding the cause for any delay in the technology's market availability, as it received FDA approval on December 4, 2024, and the applicant stated that it is not expected to be commercially available until October 1, 2025.

We agreed with the applicant that the AeroPace® System meets the cost criterion and therefore proposed to approve the AeroPace® System for new technology add-on payments for FY 2026, for use to improve weaning success—increase weaning, reduce ventilator days, and reduce reintubation—in patients ages 18 years or older on MV ≥96 hours and who have not weaned.

The applicant had not provided an estimate for the cost of the AeroPace® System at the time of the proposed rule. The applicant stated that the operating components include the AeroPace® Catheter and the Airway Sensor. The applicant also noted the capital components of the AeroPace® Neurostimulation Console, Catheter Cable, Handheld Controller, and Airway Sensor Cable. Because section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services or technologies under the payment system established under that subsection, which establishes the system for payment of the operating costs of inpatient hospital services, we stated that we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (86 FR 45145). As noted, the applicant stated that the cost of the AeroPace® Neurostimulation Console, Catheter Cable, Handheld Controller, and Airway Sensor Cable are capital costs. Therefore, we stated that it appears that these components are not eligible for new technology add-on payment because, as discussed in prior rulemaking and as noted, we only make new technology add-on payments for operating costs (72 FR 47307 through 47308). We stated that we expected the applicant to submit cost information prior to the final rule, and that we would provide an update regarding the new technology add-on payment amount for the technology, if approved, in the final rule. Any new technology add-on payment for the AeroPace® System would be subject to our policy under § 412.88(a)(2) where we limit new technology add-on payment to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case.

We invited public comments on whether the AeroPace® System meets the cost criterion and our proposal to approve new technology add-on payments for the AeroPace® System for FY 2026.

Comment: A few commenters, including the applicant, submitted public comments expressing support for our proposal to approve new technology add-on payment for the AeroPace® System for FY 2026.

In response to CMS's request for additional information regarding the delay in the technology's market availability, the applicant stated that the company is currently manufacturing devices and anticipates first commercial use and launch beginning October 1, 2025. Regarding the delay, the applicant stated that based on average FDA PMA review times, the applicant targeted its preparation of commercial operations for manufacturing, and its fundraising to support manufacturing and hiring of sales personnel based on the anticipated FDA approval timeline of early Q2 2025. Per the applicant, the FDA review process occurred in less time than anticipated and given the lead time for manufacturing, building inventory, establishing its commercial operation, and costs, there was not sufficient time to accelerate commercialization sooner than planned.

The applicant also provided the costs for the single-patient use components that are eligible for new technology add-on payment, the AeroPace® Neurostimulation Catheter and the Airway Sensor. The applicant noted that the total per-patient cost of the AeroPace® System single-patient use components to the hospital is $36,386. Per the applicant, each AeroPace® Neurostimulation Catheter is $24,995 and each Airway Control Sensor is $995, and based on the clinical trial data, patients will use 1.4 AeroPace® Neurostimulation Catheters and Airway Sensors on average.

Response: We thank the commenters for their comments and the updated cost information.

As we have discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that it anticipates first commercial use and launch beginning October 1, 2025, but it is unclear whether the technology would be available for sale prior to that date. In addition, we note that we do not consider the date of first sale of a product, or first shipment of a product, as an indicator of the entry of a product onto the U.S. market; neither of these dates indicate when a technology in fact became available for sale (88 FR 58802). At this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we therefore consider the newness date for this technology to be December 4, 2024.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe AeroPace® System meets the cost criterion. The technology received FDA premarket approval on December 4, 2024, with an indication for use to improve weaning success—increase weaning, reduce ventilator days, and reduce reintubation—in patients ages 18 years or older on MV 96 hours and who have not weaned, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for AeroPace® System for FY 2026. Absent additional information from the applicant, we consider the beginning of the newness period to commence on December 4, 2024, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of AeroPace® System is $36,386. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of AeroPace® System is $23,650.90 for FY 2026 (that is, 65 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for a unique ICD–10–PCS procedure code for the AeroPace® System beginning in FY

2026. Therefore, cases involving the use of AeroPace® System that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code X2H13XB (Insertion of temporary phrenic nerve/diaphragm stimulation electrodes into superior vena cava, percutaneous approach, new technology group 11).

(3) AGENT™ Paclitaxel-Coated Balloon Catheter

The following table summarizes the information provided in the new technology add-on payment application for the AGENT™ Paclitaxel-Coated Balloon Catheter.

BILLING CODE 4120–01–P

	AGENT™ Paclitaxel-Coated Balloon Catheter	
Technology Info	**Applicant**	Boston Scientific Corporation
	Description	Per the applicant, the AGENT™ Paclitaxel-Coated Balloon Catheter is a semi-compliant percutaneous coronary intervention (PCI) catheter; the balloon portion of the device is coated with a TransPax coating. Per the applicant, the AGENT™ Drug Coated Balloon is designed to inhibit restenosis by delivering the drug, paclitaxel, to the diseased coronary arterial tissue.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007T6YMA
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the AGENT Paclitaxel Drug Coated Balloon Catheter (Agent DCB) is indicated for Percutaneous Transluminal Coronary Angioplasty (PTCA) in coronary arteries 2.0 mm to 4.0 mm in diameter to treat in-stent restenosis (ISR), up to 26mm in length, for the purpose of improving myocardial perfusion.
	FDA marketing authorization indication	The AGENT™ Paclitaxel-Coated Balloon Catheter is intended to be used after appropriate vessel preparation in adult patients undergoing PCI in coronary arteries 2.0 mm to 4.0 mm in diameter and lesions up to 26 mm in length for the purpose of improving myocardial perfusion when treating ISR.
	FDA marketing authorization information	Per the applicant, the FDA-approved indication is for the same patient population as the Breakthrough Device designation, but the language is slightly different because changes to the indication verbiage were made to provide additional clarity.
	FDA marketing authorization date	February 29, 2024
	Commercial availability	The applicant stated that the technology was commercially available immediately after FDA approval.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant provided a list of procedure codes that, effective October 1, 2024, may be used to uniquely identify procedures involving the use of the AGENT™ Paclitaxel-Coated Balloon Catheter under the ICD-10-PCS coding system in the online application posting.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the AGENT™ Paclitaxel-Coated Balloon Catheter.
	Claims identified	15,435 claims mapping to 101 MS-DRGs, with 33.86% of claims mapping to MS-DRG 321 (Percutaneous Cardiovascular Procedures with Intraluminal Device with MCC or 4+ Arteries/Intraluminal Devices) and 23.79% of claims mapping to MS-DRG 322 (Percutaneous Cardiovascular Procedures with Intraluminal Device without MCC).
	Charges removed for prior technology	The applicant did not remove charges for PCI angioplasty procedures with a "Z" in the 6th position of the ICD-10-PCS code indicating no stent was utilized. The applicant removed estimated charges for PCI stent procedures with a "D","E","F","G" in the 6th position of the code indicating one or more bare metal stents (BMS) were utilized. Per the applicant, the median cost of C1876 (Stent, non-coated/non-covered, with delivery system) published by CMS in the documentation released with the CY25 OPPS proposed rule rate setting file was converted to charges using the national departmental cost-to-charge ratio for Implantable Devices published in the FY 2025 IPPS/LTCH PPS final rule. The applicant removed charges for PCI stent procedures with a "4","5","6","7" in the 6th position of the ICD-10-PCS code indicating one or more drug-eluding stents (DES) were utilized. Per the applicant, the median cost of C1874 (coated/covered, with delivery system) published by CMS in the documentation released with the CY25 OPPS proposed rule rate setting file was converted to charges using the national departmental cost-to-charge ratio for implantable devices published in the FY 2025 IPPS/LTCH PPS final rule. In both scenarios, the applicant removed charges for only one stent, regardless of the number of arteries and devices indicated by the procedure code because it was unclear how many stents would be replaced by the technology, as the ISR diagnosis code is not artery specific. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2025 IPPS/LTCH PPS final rule and the impact file posted with the FY 2023 IPPS/LTCH final rule.
	Inflation factor	The applicant applied a 3-year inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges associated with one AGENT™ Drug-Coated Balloon by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Average case-weighted threshold amount: $139,326 Final inflated average case-weighted standardized charge per case: $186,485 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the AGENT™ Paclitaxel-Coated Balloon Catheter meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received PMA

approval from FDA is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-approved indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.[122]

We agreed with the applicant that the AGENT™ Paclitaxel-Coated Balloon Catheter meets the cost criterion and therefore proposed to approve the AGENT™ Paclitaxel-Coated Balloon Catheter for new technology add-on payments for FY 2026 for use after appropriate vessel preparation in adult patients undergoing PCI in coronary arteries 2.0 mm to 4.0 mm in diameter and lesions up to 26 mm in length for the purpose of improving myocardial perfusion when treating ISR.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the AGENT™ Paclitaxel-Coated Balloon Catheter to the hospital to be $6,175 per patient. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the AGENT™ Paclitaxel-Coated Balloon Catheter would be $4,013.75 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the AGENT™ Paclitaxel-Coated Balloon Catheter meets the cost criterion and our proposal to approve new technology add-on payments for the AGENT™ Paclitaxel-Coated Balloon Catheter for FY 2026.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the AGENT™ Paclitaxel-Coated Balloon Catheter. Commenters stated that the device meets all requirements for approval and requested that CMS finalize its proposal for new technology add-on payments for FY 2026. The applicant requested that CMS finalize the approval of new technology add-on payments with a maximum payment of $4,013.75 starting October 1, 2025.

Response: We thank the commenters for their comments. Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe AGENT™ Paclitaxel-Coated Balloon Catheter meets the cost criterion. The technology received FDA premarket approval on February 29, 2024, with an indication for use after appropriate vessel preparation in adult patients undergoing PCI in coronary arteries 2.0 mm to 4.0 mm in diameter and lesions up to 26 mm in length for the purpose of improving myocardial perfusion when treating ISR, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for AGENT™ Paclitaxel-Coated Balloon Catheter for FY 2026. We consider the beginning of the newness period to commence on February 29, 2024, the date on which technology received its premarket authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of AGENT™ Paclitaxel-Coated Balloon Catheter is $6,175. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of AGENT™ Paclitaxel-Coated Balloon Catheter is $4,013.75 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of AGENT™ Paclitaxel-Coated Balloon Catheter that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes:

BILLING CODE 4120–01–P

[122] Breakthrough Devices Program *https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program.*

ICD-10-PCS Code	Description
XW0J3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0J3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, one artery, percutaneous approach, new technology group 10
XW0K3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0K3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, two arteries, percutaneous approach, new technology group 10
XW0L3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0L3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, three arteries, percutaneous approach, new technology group 10
XW0M3HA	Introduction of paclitaxel-coated balloon technology, one balloon into coronary artery, four or more arteries, percutaneous approach, new technology group 10
XW0M3JA	Introduction of paclitaxel-coated balloon technology, two balloons into coronary artery, four or more arteries, percutaneous approach, new technology group 10
XW0M3KA	Introduction of paclitaxel-coated balloon technology, three balloons into coronary artery, four or more arteries, percutaneous approach, new technology group 10
XW0M3LA	Introduction of paclitaxel-coated balloon technology, four or more balloons into coronary artery, four or more arteries, percutaneous approach, new technology group 10

(4) alfapump® system

The following table summarizes the information provided in the new technology add-on payment application for the alfapump® system.

	alfapump® system	
Technology Info	**Applicant**	Sequana Medical NV
	Description	Per the applicant, the alfapump® system is an implanted subcutaneous device with rechargeable battery allowing fluid removal from the peritoneal cavity to the urinary bladder where it is then eliminated via urination. Per the applicant, the alfapump® system provides an alternative to standard treatments for refractory ascites, that is, large volume paracentesis (LVP) with albumin and transjugular intrahepatic shunts.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP240930MJNT7
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the alfapump® System is intended for single patient use only in adult patients with refractory or recurrent ascites due to liver cirrhosis. It is indicated for the removal of excess peritoneal fluid from the peritoneal cavity into the bladder, where it can be eliminated through normal urination.
	FDA marketing authorization information	This device is intended for single patient use only in adult patients with refractory or recurrent ascites due to liver cirrhosis. It is indicated for the removal of excess peritoneal fluid from the peritoneal cavity into the bladder, where it can be eliminated through normal urination.
	FDA marketing authorization date	December 20, 2024
	Commercial availability	According to the applicant, the alfapump® system is not expected to be commercially available immediately after FDA approval due to internal production capacity and the phased roll out plan into Liver Transplant centers to have the best possible care for patients suffering from recurrent and refractory ascites. The applicant stated that the alfapump® system would not be commercially available until July 2025.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2020, the following ICD-10-PCS codes may be used to uniquely describe procedures involving the use of the alfapump® system: 0W1G3J6 (Bypass peritoneal cavity to bladder with synthetic substitute, percutaneous approach) and 0JH80YZ (Insertion of other device into abdomen subcutaneous tissue and fascia, open approach).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the alfapump® system.
	Claims identified	838 claims mapping to 3 MS-DRGs, with 75.3% of claims mapping to MS-DRG 423 (Other Hepatobiliary or Pancreas O.R. Procedures with MCC).
	Charges removed for prior technology	The applicant estimated the charges for the prior technology by calculating the average of the total revenue charges per claim from revenue centers 0274, 0278, and 0279 for each MS-DRG. The applicant stated that while revenue centers 0278 and 0279 would be used a proxy for device charges of prior technologies, a small number of cases (<11) also include line item charges in revenue center 0274, and therefore, the applicant added revenue center 0274 to accurately remove all prior device charges. The applicant removed indirect charges related to prior technology using a length of stay (LOS) reduction, along with the sum of the average specific identified drug charges, average ICU charges, average CCU charges, and average OR charges of analyzed claims for each MS-DRG. According to the applicant, the LOS reduction adjusts room and board charges to account for potentially shorter LOS for the use of technology than the analyzed hospital claims. The applicant determined the room and board charges by summing the total revenue line-item charges per claim for Room and Board (revenue centers 0110, 0111, 0117, 0119, 0120, 0121, 0127, 0129, 0131, 0151, and 0164) and calculated the average for each MS-DRG. The applicant estimated the LOS for implantation of the alfapump® system based on its clinical trial. The applicant calculated the LOS reduction by reducing the average room and board charges for hospital claims by the proportional difference between the average LOS for hospital claims and the implantation of the alfapump® system. The applicant determined the specific identified drug, ICU, CCU, and OR charges by summing the total revenue line-item charges per claim associated with ICU (revenue centers 0200, 0201, 0202, 0206, 0208, and 0209), CCU (revenue centers 0210, 0214, and 0219), OR (revenue centers 0360, 0361, and 0369), and Specific Drug (revenue centers 0634, 0635, and 0636). Per the applicant, radiology, CT scans, and other diagnostic imaging are assumed to be utilized regardless of prior or new technology used. The applicant stated that other medical and sterile surgical supplies as well as general anesthesia are expected to be utilized at a similar rate to prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule and correction amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the alfapump® system by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. To calculate the average operating room costs for implantation of the alfapump® system, the applicant used an estimated surgical time based on its clinical trial and an estimated average operating room cost per minute based on the literature. The applicant added indirect charges related to the new technology

		by dividing the average operating room costs related to the new technology by the national average cost-to-charge ratio of 0.16 for Operating Room from the FY 2025 IPPS/LTCH PPS final rule.
	Cost analysis results	Average case-weighted threshold amount: $130,906 Final inflated average case-weighted standardized charge per case: $260,109 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the alfapump® system meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that the applicant stated that the technology is not expected to be commercially available until July 2025 due to its internal production capacity and the phased roll out plan into Liver Transplant centers. We stated in the proposed rule that we were interested in additional information regarding any delay, such as whether the technology would be available for sale during its phased roll out plan.

We agreed with the applicant that the alfapump® system meets the cost criterion and therefore proposed to approve the alfapump® system for new technology add-on payments for FY 2026, in adult patients with refractory or recurrent ascites due to liver cirrhosis for the removal of excess peritoneal fluid from the peritoneal cavity into the bladder.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the alfapump® system to the hospital to be $30,000 per patient. Per the applicant, the alfapump® system is a single patient use implantable device, and one device is used per hospital stay. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the alfapump® system would be $19,500 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the alfapump® system meets the cost criterion and our proposal to approve new technology add-on payments for the alfapump® system.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the alfapump® system.

In response to CMS's request for additional information regarding the delay in the technology's market availability the applicant stated that the alfapump® was not available for sale as of June 2025 and that it anticipates that the first cases and sales will now occur during the month of August 2025.

The applicant also provided updated cost information and stated that the price of the alfapump® kit will be revised from the original cost of $30,000 to a new cost of $33,000, given various commercial factors. Per the applicant, this results in a revised final average case weighted standardized charge per case of $271,692, as compared to the prior figure of $260,109, against the case weighted threshold of $130,906. The applicant requested a revised calculation using the revised cost of $33,000 for a maximum allowable new technology add-on payment of $21,450.

Response: We thank the applicant and commenters for their comments and support.

As we have discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that it anticipates first commercial use and launch beginning August 2025, but it is unclear whether the technology would be available for sale prior to that date. At this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we therefore consider the newness date for this technology to be December 20, 2024.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comment we received, we believe the alfapump® system meets the cost criterion. The technology received FDA marketing authorization on December 20, 2024, with an indication for use in adult patients with refractory or recurrent ascites due to liver cirrhosis for the removal of excess peritoneal fluid from the peritoneal cavity into the bladder, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the alfapump® system for FY 2026. Absent additional information from the applicant, we consider the beginning of the newness period to commence on December 20, 2024, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the alfapump® system is $33,000. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the alfapump® system is $21,450 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of the alfapump® system that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code 0W1G3J6 (Bypass peritoneal cavity to bladder with synthetic substitute, percutaneous approach) in combination with 0JH80YZ (Insertion of other device into abdomen subcutaneous tissue and fascia, open approach).

(5) Aprevo®-C Cervical Interbody Fusion Device

The following table summarizes the information provided in the new technology add-on payment application for the aprevo®-C cervical interbody fusion device.

BILLING CODE 4120–01–P

	aprevo®-C cervical interbody fusion device	
Technology Info	**Applicant**	Carlsmed, Inc.
	Description	Per the applicant, the aprevo®-C cervical interbody fusion devices are intended to stabilize intervertebral spaces of the cervical spine (C2-T1) and facilitate fusion. Per the applicant, the devices are custom-made to achieve a patient-specific cervical alignment plan and have surfaces that match the irregular topography of each patient's cervical vertebral endplates.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007U130K
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the aprevo®-C cervical interbody fusion devices are intended for use in skeletally mature patients with degenerative cervical conditions including cervical disc degeneration, stenosis, deformity, and/or instability of the cervical spine (C2-T1) at one or more levels. Degenerative disc disease (DDD) is defined as discogenic pain with degeneration of the disc confirmed by history and radiographic studies. These patients should have had at least six weeks of non-operative treatment. These devices are to be filled with autograft bone and/or allogenic bone graft composed of cancellous, cortical, and/or cortico-cancellous bone. The aprevo®-C cervical interbody fusion devices can be used with supplemental fixation, such as an anterior plate or as a standalone construct to be used integrated bone screw fixation.
	FDA marketing authorization indication	The aprevo® Cervical ACDF Interbody System are interbody fusion devices indicated at one or more levels of the cervical spine (C2-T1) in patients with the following degenerative cervical conditions: cervical disc disease, instability, trauma including fractures, deformity defined as kyphosis, lordosis, or scoliosis, cervical spondylotic myelopathy, spinal stenosis, and failed previous fusion. Cervical disc disease is defined as discogenic pain with degeneration of the disc confirmed by history and radiographic studies. These patients should be skeletally mature and have had at least six (6) weeks of non-operative treatment. These devices are to be filled with autograft bone and/or allogenic bone graft composed of cancellous, cortical, and/or cortico-cancellous bone. The aprevo® Cervical ACDF Interbody System must be used with supplemental fixation systems. For hyperlordotic corrections (≥ 20 lordosis), the system must be used with at least an anterior cervical plate as supplemental fixation. The aprevo® Cervical ACDF-X Interbody System are interbody fusion devices indicated at one or more levels of the cervical spine (C2-T1) in patients with the following degenerative cervical conditions: cervical disc disease, instability, trauma including fractures, deformity defined as kyphosis, lordosis, or scoliosis, cervical spondylotic myelopathy, spinal stenosis, and failed previous fusion. Cervical disc disease is defined as discogenic pain with degeneration of the disc confirmed by history and radiographic studies. These patients should be skeletally mature and have had at least six (6) weeks of non-operative treatment. These devices are to be filled with autograft bone and/or allogenic bone graft composed of cancellous, cortical, and/or cortico-cancellous bone. When used as a standalone system, the aprevo® Cervical ACDF-X Interbody implant with integrated screw fixation is intended for use at multiple contiguous levels, or up to two levels when used in trauma, deformity or failed previous fusions. Deformity procedures to correct coronal angulation or any use of hyperlordotic correction (>20 °) must include supplemental fixation such as posterior cervical screw fixation or anterior plating.
	FDA marketing authorization information	Per the applicant, the FDA 510(k) indication was modified from the Breakthrough Device designation indications to remove the unlimiting terminology "degenerative cervical conditions including…" and to describe the specific indications using language that matches that use in predicate cervical interbody devices. The applicant also stated that there are two separate Indications for Use statements to distinguish between supplemental fixation and the standalone indication in which integrated fixation is used, both of which were included in the Breakthrough Device designation.
	FDA marketing authorization date	November 15, 2024
	Commercial availability	According to the applicant, the aprevo®-C cervical interbody fusion device will not be immediately available for sale because the commercial release date will align with the start of the new technology add-on payment. The applicant stated that the technology is expected to be commercially available on October 1, 2025.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-PCS codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the aprevo®-C cervical interbody fusion device.
	Claims identified	Cost Analysis 1: 17,041 claims mapping to 69 MS-DRGs, with 42.57% of claims mapping to MS-DRG 472 (Cervical Spinal Fusion with CC). Cost Analysis 2: 15,140 claims mapping to 5 MS-DRGs, with 47.92% of claims mapping to MS-DRG 472 (Cervical Spinal Fusion with CC).
	Charges removed	Per the applicant, the aprevo®-C cervical interbody fusion device will replace other implantable

	for prior technology	devices, but it is difficult to identify the exact differences in care that patients treated with the aprevo®-C cervical interbody fusion device would receive, both before and in conjunction with treatment with the aprevo®-C cervical interbody fusion device. Therefore, to be conservative, the applicant removed 100% of charges associated with implantable devices. The applicant stated that this removal could over-estimate charges for other devices that would be replaced by the aprevo®-C cervical interbody fusion device. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS interim final action with comment period.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the aprevo®-C cervical interbody fusion device by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Cost Analysis 1: - Average case-weighted threshold amount: $140,223 - Final inflated average case-weighted standardized charge per case: $246,092 Cost Analysis 2: - Average case-weighted threshold amount: $135,395 - Final inflated average case-weighted standardized charge per case: $230,290 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both analyses, the applicant asserted that the aprevo®-C cervical interbody fusion device meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received 510(k) clearance from FDA is included within the scope of the Breakthrough Device designation, it appears that the FDA 510(k) clearance indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We noted that the applicant stated that the technology is expected to be commercially available starting October 1, 2025, to align with the start of the new technology add-on payment. We were interested in additional information regarding the cause for any delay in the technology's market availability as the technology received FDA clearance on November 15, 2024.

We agreed with the applicant that the aprevo®-C cervical interbody fusion device meets the cost criterion and therefore proposed to approve the aprevo®-C cervical interbody fusion device for new technology add-on payments for FY 2026, as interbody fusion devices indicated at one or more levels of the cervical spine (C2–T1) in patients with the following degenerative cervical conditions: cervical disc disease, instability, trauma including fractures, deformity defined as kyphosis, lordosis, or scoliosis, cervical spondylotic myelopathy, spinal stenosis, and failed previous fusion.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the aprevo®-C cervical interbody fusion device to the hospital to be $32,500 per patient. The applicant stated that the average number of cervical interbody fusion (CIBF) devices per procedure is 4.42 if the patient has a deformity and 1.7 if the patient has a degenerative condition. Per the applicant, based on the projected mix between these diagnoses, the average number of aprevo®-C CIBF per procedure is expected to be 3.25. The applicant stated that the selling price will be $19,000 for the first level, and $6,000 for each additional level. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the aprevo®-C cervical interbody fusion device would be $21,125 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the aprevo®-C cervical interbody fusion device meets the cost criterion and our proposal to approve new technology add-on payments for the aprevo®-C cervical interbody fusion device for FY 2026.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the aprevo®-C cervical interbody fusion device. The applicant stated that the aprevo®-C cervical interbody fusion device meets the cost criterion. In response to CMS's request for additional information regarding the delay in the technology's market availability, the applicant stated that the commercial availability of the product is scheduled for October 1, 2025, to align with the new technology add-on payment start date because the higher hospital acquisition cost of the technology must be mitigated by the new technology add-on payment to secure the hospital value analysis committee approval.

Response: We thank the commenters for their comments. As we have discussed in prior rulemaking (86 FR 45132 and 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that it anticipates commercial availability beginning October 1, 2025, but it is unclear whether the technology would be available for sale prior to that date. At this time, there is not sufficient

information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we therefore consider the newness date for this technology to be November 15, 2024.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the aprevo®-C cervical interbody fusion device meets the cost criterion. The technology received 510(k) clearance from FDA on November 15, 2024, with an indication for use as interbody fusion devices indicated at one or more levels of the cervical spine (C2–T1) in patients with the following degenerative cervical conditions: cervical disc disease, instability, trauma including fractures, deformity defined as kyphosis, lordosis, or scoliosis, cervical spondylotic myelopathy, spinal stenosis, and failed previous fusion, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the aprevo®-C cervical interbody fusion device for FY 2026. We consider the beginning of the newness period to commence on November 15, 2024, the date on which the technology received FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the aprevo®-C cervical interbody fusion device is $32,500. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the aprevo®-C cervical interbody fusion device is $21,125 for FY 2026 (that is, 65 percent of the average cost of the technology). The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for the aprevo®-C cervical interbody fusion device beginning in FY 2026. Therefore, cases involving the use of the aprevo®-C cervical interbody fusion device that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes:

BILLING CODE 4120–01–P

ICD-10-PCS Code	Description
XRG10RB	Fusion of cervical vertebral joint using custom-made anatomically designed interbody fusion device, open approach, new technology group 11
XRG13RB	Fusion of cervical vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 11
XRG14RB	Fusion of cervical vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 11
XRG20RB	Fusion of 2 or more cervical vertebral joints using custom-made anatomically designed interbody fusion device, open approach, new technology group 11
XRG23RB	Fusion of 2 or more cervical vertebral joints using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 11
XRG24RB	Fusion of 2 or more cervical vertebral joints using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 11
XRG40RB	Fusion of cervicothoracic vertebral joint using custom-made anatomically designed interbody fusion device, open approach, new technology group 11
XRG43RB	Fusion of cervicothoracic vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous approach, new technology group 11
XRG44RB	Fusion of cervicothoracic vertebral joint using custom-made anatomically designed interbody fusion device, percutaneous endoscopic approach, new technology group 11

(6) CERAMENT® G

The following table summarizes the information provided in the new technology add-on payment application for CERAMENT® G.

	CERAMENT® G	
Technology Info	**Applicant**	BONESUPPORT, Inc.
	Description	Per the applicant, CERAMENT® G is an implantable bone void filler (device/drug combination product), consisting of calcium sulfate, hydroxyapatite, and gentamicin sulfate. Per the applicant, CERAMENT® G elutes 17.5 mg gentamicin/ mL paste.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP2410079G5KA
FDA Info	**Breakthrough Device designation indication**	Per the applicant, CERAMENT G is a resorbable, gentamicin-containing ceramic bone graft indicated for use as a bone void filler as part of the surgical procedure where there is a risk of bacterial contamination such as open, fresh fractures with osseous defects which are surgically created or a result of traumatic injury to the bone. CERAMENT G can augment provisional hardware to help support bone fragments during the surgical procedure. CERAMENT G resorbs and is replaced by bone during the healing process and is protected from bacterial colonization by gentamicin. CERAMENT™ G protects bone healing by reducing subsequent colonization of the bone void filler in orthopedic surgical procedures.
	FDA marketing authorization indication	CERAMENT G is a resorbable, gentamicin-eluting ceramic bone void filler intended for use in defects in the extremities of skeletally mature patients as an adjunct to systemic antibiotic therapy and surgical debridement as part of the standard treatment approach to bone infection and open fractures. By eluting gentamicin, CERAMENT G can reduce the occurrence and reoccurrence of bone infection from gentamicin sensitive microorganisms in order to protect bone healing. CERAMENT G can augment provisional hardware to help support bone fragments during the surgical procedure. The cured paste acts only as a temporary support media and is not intended to provide structural support during the healing process. CERAMENT G resorbs and is replaced by bone during the healing process.
	FDA marketing authorization information	The applicant stated that open fracture is included in both the Breakthrough Device Designation and FDA 510(k) clearance indication.
	FDA marketing authorization date	March 13, 2024
	Commercial availability	The applicant stated that the technology was commercially available immediately after FDA clearance.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2021, the following ICD-10-PCS codes may be used to uniquely describe procedures involving the use of CERAMENT® G: XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and ICD-10-PCS codes used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for CERAMENT® G.
	Claims identified	6,521 claims mapping to 39 MS-DRGs, with 20.92% of claims mapping to MS-DRG 493 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with CC).
	Charges removed for prior technology	Per the applicant, no prior technology is expected to be replaced by CERAMENT® G based on discussions with surgeons and a review of published literature on open fracture management. The applicant stated that it did not remove any direct charges for prior technologies being replaced, as it believed that there are no standard treatments given to reduce the occurrence of infection in open fractures beyond standard systemic antibiotics, which will still be provided to patients treated with CERAMENT® G. The applicant did not remove any indirect charges as it believed that the choice of device is the sole difference between cases treated with CERAMENT® G and cases treated with prior technology. The applicant stated that besides the choice of device, the procedure is the same, and the services provided during the course of the hospitalization are the same.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the FY 2023 MedPAR preliminary rule file (fee for service claims only) and impact and standardizing files posted with the FY 2024 IPPS/LTCH PPS final rule.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for CERAMENT® G by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.297 for Supplies and Equipment from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology, as it believed that there are no differences from prior technology other than choice of device.
	Cost analysis results	Average case-weighted threshold amount: $116,339.66 Final inflated average case-weighted standardized charge per case: $203,490.37 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that CERAMENT® G meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that under the eligibility criteria for approval under the alternative pathway for certain transformative devices, only the

use of the technology for the indication that corresponds to the technology's Breakthrough Device designation would be eligible for the new technology add-on payment. Therefore, we noted that only the use of CERAMENT® G for open fractures, and the FDA Breakthrough Device designation it received for that use, were relevant for purposes of the new technology add-on payment application for FY 2026. We noted that CERAMENT® G is also indicated for use for bone infections and was approved for new technology add-on payment for that indication in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48961 through 48966). As discussed in section II.E.4. of the preamble of the proposed rule, we proposed to discontinue making new technology add-on payments for FY 2026 for use of CERAMENT® G for bone infections. We believed cases involving the use of CERAMENT® G related to bone infections, which would no longer be eligible for new technology add-on payment in FY 2026, would be identified by the ICD–10–PCS code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) in combination with the ICD–10–CM codes in category M86 (Osteomyelitis). We invited public comments on the use of these codes to exclude the indication for use of CERAMENT® G related to bone infections, which would not be eligible for the new technology add-on payment for FY 2026, if approved.

We agreed with the applicant that CERAMENT® G meets the cost criterion and therefore proposed to approve CERAMENT® G for new technology add-on payments for FY 2026 for use as a bone void filler intended for use in defects in the extremities of skeletally mature patients as an adjunct to systemic antibiotic therapy and surgical debridement as part of the standard treatment approach to open fractures.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost to the hospital to be $8,750 per patient. The applicant stated that the cost of 10 cc of CERAMENT® G would be $8,750, and expected that 10 cc of CERAMENT® G would be used per patient as indicated in a long-term study of 81 patients with open fractures.[123] We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of CERAMENT® G would be $5,687.50 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether CERAMENT® G meets the cost criterion and our proposal to approve new technology add-on payments for CERAMENT® G for FY 2026.

Comment: We received comments expressing support for technologies under consideration for new technology add-on payments for FY 2026. We also received comments expressing general support of the proposed ICD–10–CM codes for which CMS specifically sought input.

Response: We thank the commenters for their comments. Based on the information provided in the application for new technology add-on payments, we believe CERAMENT® G meets the cost criterion. The technology received FDA 510(k) clearance on March 13, 2024, with an indication for use in defects in the extremities of skeletally mature patients as an adjunct to systemic antibiotic therapy and surgical debridement as part of the standard treatment approach to open fractures. Therefore, we are finalizing our proposal to approve new technology add-on payments for CERAMENT® G for FY 2026. As noted earlier in this section, only the use of CERAMENT® G for open fractures, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2026. We consider the beginning of the newness period to commence on March 13, 2024, the date on which technology received its 510(k) clearance for the indication of open fractures covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of CERAMENT® G is $8,750. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of CERAMENT® G is $5,687.50 for FY 2026 (that is, 65 percent of the average cost of the technology).

As noted, CERAMENT® G is also indicated for use for bone infections and was approved for new technology add-on payment for that indication in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48961 through 48966). As discussed in section II.E.4. of the preamble of this final rule, we are finalizing our proposal to discontinue making new technology add-on payments for FY 2026 for use of CERAMENT® G for bone infections. Therefore, cases involving the use of CERAMENT® G that are eligible for new technology add-on payments in FY 2026 will be identified by ICD–10–PCS procedure code XW0V0P7 (Introduction of antibiotic-eluting bone void filler into bones, open approach, new technology group 7) without any of the ICD–10–CM diagnosis codes in category M86 (Osteomyelitis).

(7) Emily's Care Nourish Test System (Model 1)

The following table summarizes the information provided in the new technology add-on payment application for the Emily's Care Nourish Test System (Model 1).

BILLING CODE 4120–01–P

[123] Henry, J, Ali, A., and Elkhidir, I et al. (2023). Long-term follow-up of open Gustilo-Anderson IIIB fractures treated with an adjuvant local antibiotic hydroxyapatite bio-composite. *Cureus* 15(5): e39103. DOI 10.7759/cureus.39103.

	Emily's Care Nourish Test System (Model 1)	
Technology Info	**Applicant**	Lactation Lab Inc.
	Description	Per the applicant, the Emily's Care Nourish Test System (Model 1) is an FDA cleared Breakthrough Device. Per the applicant, it is an analytical system designed to measure the concentration of fat, carbohydrates (lactose), and protein in human milk at point of care using an enzyme-based test strip and a smartphone camera with an associated application.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241006EAA50
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the macronutrient breast milk test strip quantitatively measures the concentration of fat, carbohydrate, and protein in human milk. The associated smartphone app provides a calculated value for energy (calories) and is intended to be used in conjunction with other clinical assessments to aid in the nutritional management and treatment of very low birth weight (VLBW) in the NICU, for both neonates and infants less than 6 months of age.
	FDA marketing authorization indication	The Emily's Care Nourish Test System (Model 1) quantitatively measures the concentration of protein, fat (triglycerides), and carbohydrates (lactose) in human milk. It also provides calculated values for calories (energy). These measurements, in conjunction with other clinical assessments, may be used to aid in the nutritional management of newborns, including preterm, and infants.
	FDA marketing authorization information	Per the applicant, the device was not named in the Breakthrough Device designation, and the device has since been named Emily's Care Nourish Test System (Model 1).
	FDA marketing authorization date	May 3, 2024
	Commercial availability	The applicant stated the technology was not commercially available immediately after FDA clearance because the applicant is a small business that needs to raise capital for manufacturing and because of manufacturing delays. The applicant anticipates the technology will become available on May 1, 2025.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	The applicant identified 2 MS-DRGs, MS-DRG 790 (Extreme Immaturity or Respiratory Distress Syndrome, Neonate) and MS-DRG 791 (Prematurity with Major Problems), as relevant to the cost analysis for this technology. The applicant did not provide a cost criterion codes and MS-DRGs attachment listing applicable codes used for purposes of its cost analysis.
	Claims identified	The applicant estimated there would be 25,000 claims mapping to 2 MS-DRGs, with 30% of claims mapping to MS-DRG 790 (Extreme Immaturity or Respiratory Distress Syndrome, Neonate) and 70% of claims mapping to MS-DRG 791 (Prematurity with Major Problems). To estimate the claim volume, the applicant estimated the total live births in the US was 4 million, and stated that 10.4% of infants would be premature based on data from March of Dimes. The applicant estimated that low birth weight (LBW) infants would be 8.6% of births (344,000), and VLBW infants would be 1.4% of births (56,000). The applicant stated that 50% of VLBW infants would be in MS-DRG 790 (28,000), and 50% of LBW infants would be in MS-DRG 791 (172,000), resulting in 200,000 total annual cases. The applicant estimated that initial rollout would be 25% of cases, resulting in 25,000 claims.
	Charges removed for prior technology	The applicant did not remove direct or indirect charges related to the prior technology.
	Standardized charges	For the average standardized charge per case, the applicant used the same values as the average charge per case (unstandardized with case weight).
	Inflation factor	The applicant applied an inflation factor of 1.04118% to the standardized charges.
	Charges added for the new technology	The applicant added charges for the new technology. The applicant also added indirect additional charges for training and additional time for measuring milk.
	Cost analysis results	Average case-weighted threshold amount: $52,165.00 Final inflated average case-weighted standardized charge per case: $837,658.83 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the Emily's Care Nourish Test System (Model 1) meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, after review of the information provided by the applicant, we noted that under the eligibility criteria for approval under the alternative pathway for certain transformative devices, only the use of the technology for the indication that corresponds to the technology's Breakthrough Device designation would be eligible for the new technology add-on payment for FY 2026. Therefore, we noted that only the use of the Emily's Care Nourish Test System (Model 1) for VLBW neonates and infants in the NICU, and the FDA Breakthrough

Device designation it received for that use, were relevant for purposes of the new technology add-on payment application for FY 2026.

We noted the following concerns with respect to the cost criterion. We were unclear how the applicant identified the 25,000 claims used in its cost analysis, including the type of source data and the data year that were used to identify cases. The applicant did not provide a completed cost criterion codes and MS–DRGs worksheet and we were unclear how ICD–10–PCS and/or -CM codes were used to identify potential cases representing patients that may be eligible for use of the Emily's Care Nourish Test System (Model 1). We noted that MS–DRGs 790 and 791 identified by the applicant may represent a patient population broader than those cases that would be included within the scope of the Breakthrough Device designation indication that is appropriate for consideration for new technology add-on payment under the alternative pathway criteria (VLBW neonates and infants less than 6 months of age in the NICU), and we questioned whether using these MS–DRGs without additional inclusion and/or exclusion criteria would be representative of cases eligible for new technology add-on payment.

Furthermore, we noted that it appeared that the applicant did not identify relevant cases from a claims database such as the MedPAR file for its cost analysis, but instead calculated a case volume based on assumptions using the number of total live births in the United States. In addition, we questioned the assumptions used in the cost analysis regarding the potential Medicare volume for the technology. As we noted, in the FDA clearance letter for this device,[124] its intended patient population is newborns, including preterm, and infants. We stated that the applicant asserted that after a premature infant is delivered, the infant may be eligible for Medicare coverage if it qualifies under specific criteria, such as disability or end-stage renal disease (ESRD). Although we agreed that infants may be eligible for Medicare if they have ESRD and need regular dialysis or have had a kidney transplant,[125] we noted that Medicare Part A entitlement—for inpatient hospital services—based on child disability benefit entitlement can never begin before the month the person attains age 20 (or age 18 if the individual's disability is Amyotrophic Lateral Sclerosis).[126]

Furthermore, we were unclear how the average charge per case (unstandardized with no case weight) was calculated as it is unclear what claims data was used to determine the average charges for MS–DRG 790 and MS–DRG 791. We were also unclear as to the applicant's methodology for calculating the average charge per case (unstandardized with case weight), as it appeared the applicant multiplied the average charge per case (unstandardized with no case weight) by 5.6671 for the charges in MS–DRG 790, and by 3.8704 for the charges in MS–DRG 791.

Although the applicant did not remove charges related to the technology being replaced, we noted that the applicant stated that targeted fortification leads to a decreased length of stay (LOS) by 2.5 days, and we questioned if charges should be removed to account for the decreased LOS for patients using this technology.

We were also unclear as to the applicant's methodology for calculating the average standardized charge per case as the applicant used the same values from the average charge per case (unstandardized with case weight), which were the average charge per case (unstandardized with no case weight) multiplied by 5.6671 for the charges in MS–DRG 790, and by 3.8704 for the charges in MS–DRG 791.

To calculate the inflated average standardized charge per case, the applicant applied an inflation factor of 1.04118 percent. We stated in the proposed rule that we were interested in additional information regarding the basis for using this inflation factor and how it corresponded to the source data and year used for the cost analysis.

We noted the applicant added direct and indirect charges related to the new technology. However, although the applicant identified a cost-to-charge ratio of 0.36 for intensive inpatient admission days, we stated it was unclear how this cost-to-charge ratio was used to convert costs for the technology and indirect costs to charges, and how these charges were calculated using the costs of the device itself or costs related to additional time for training or measuring milk.

Therefore, because the applicant had not provided sufficient information as part of its cost analysis to demonstrate that the Emily's Care Nourish Test System (Model 1) meets the cost criterion, we proposed to disapprove new technology add-on payments for the Emily's Care Nourish Test System (Model 1) for FY 2026. However, in the event we were to receive updated information to establish that the Emily's Care Nourish Test System (Model 1) meets the cost criterion, we provided the following information regarding the new technology add-on payment.

We noted the applicant stated that the technology, which received FDA clearance on May 3, 2024, was expected to be commercially available May 1, 2025, and we stated that we would appreciate more information about the cause for any delay in the commercial availability of the device following FDA clearance.

We believed the relevant ICD–10–CM codes to identify the Breakthrough Device-designated indication for use of the technology in VLBW neonates and infants would be the following codes:

[124] *https://www.accessdata.fda.gov/cdrh_docs/pdf23/K234088.pdf.*

[125] Centers for Medicare & Medicaid Services. End-stage renal disease (*https://www.medicare.gov/basics/end-stage-renal-disease*, accessed 1/16/2024).

[126] Centers for Medicare & Medicaid Services. Original Medicare (Part A and B) Eligibility and Enrollment (*https://www.cms.gov/medicare/enrollment-renewal/health-plans/original-part-a-b*, accessed 1/16/2024).

ICD-10-CM Code	Description
P05.01	Newborn light for gestational age, less than 500 grams
P05.02	Newborn light for gestational age, 500-749 grams
P05.03	Newborn light for gestational age, 750-999 grams
P05.04	Newborn light for gestational age, 1000-1249 grams
P05.05	Newborn light for gestational age, 1250-1499 grams
P05.11	Newborn small for gestational age, less than 500 grams
P05.12	Newborn small for gestational age, 500-749 grams
P05.13	Newborn small for gestational age, 750-999 grams
P05.14	Newborn small for gestational age, 1000-1249 grams
P05.15	Newborn small for gestational age, 1250-1499 grams
P07.00	Extremely low birth weight newborn, unspecified weight
P07.01	Extremely low birth weight newborn, less than 500 grams
P07.02	Extremely low birth weight newborn, 500-749 grams
P07.03	Extremely low birth weight newborn, 750-999 grams
P07.14	Other low birth weight newborn, 1000-1249 grams
P07.15	Other low birth weight newborn, 1250-1499 grams

We invited public comments on the use of these ICD–10–CM diagnosis codes to identify the Breakthrough Device-designated indication for purposes of the new technology add-on payment, if approved.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost to the hospital for the Emily's Care Nourish Test System (Model 1) to be $3,000 per patient before discounts and $1,800 after discounts, based on the contents of the kit, which provides enough supplies for testing over a typical NICU stay (36 tests). The applicant stated the contents of the kit include: 36 test strips, pipettes, reference cards, 2 control solutions, and a reusable lightbox (iPhone not included). The applicant also provided additional information on the costs for the annual use of the technology to the hospital of $25,000, consisting of $10,000 for the kit including the lease of the lightbox and iPhone, and $15,000 for the device's operation (labor, testing milk, analysis interpretation, adjustment of feeding protocols). However, we noted that the costs to the hospital, per patient, per inpatient stay remains unclear, and that the provided costs also include additional costs related to use of the device as well as capital costs for the lease of the lightbox and iPhone.

We stated that, as we had discussed in prior rulemaking, when determining a new technology add-on payment, we provide payment based on the cost of the actual technology (such as the drug or device itself) and not for additional costs related to the use of the device (86 FR 45146). Therefore, we would not include costs of staff labor for the device's operation in the relevant costs for purposes of determining the new technology add-on payment amount.

In addition, because section 1886(d)(5)(K)(i) of the Act requires that the Secretary establish a mechanism to recognize the costs of new medical services or technologies under the payment system established under that subsection, which establishes the system for payment of the operating costs of inpatient hospital services, we stated that we do not include capital costs in the add-on payments for a new medical service or technology or make new technology add-on payments under the IPPS for capital-related costs (86 FR 45145). We stated that the costs to lease the lightbox and iPhone are capital costs. As such, we noted that these components would not be eligible for new technology add-on payment because, as discussed in prior rulemaking and as noted, we only make new technology add-on payments for operating costs (72 FR 47307 through 47308).

Without a breakdown of the costs of this technology to the hospital, per patient, per inpatient stay, for the operating components of the kit, we stated we were unable to identify the relevant costs for purposes of determining the new technology add-on payment amount. In addition, the applicant had indicated that the cost of the device would be discounted to hospitals, and the Medicare program expects providers to take advantage of available discounts.[127] We stated it was unclear how potential discounts would affect the relevant estimated operating costs of the device. We also stated we would be interested in additional information regarding the current or anticipated average cost of the technology to the hospital per inpatient stay.

We invited public comments on whether the Emily's Care Nourish Test System (Model 1) meets the cost criterion and our proposal to disapprove new technology add-on payments for the Emily's Care Nourish Test System (Model 1) for FY 2026. We also invited public comments on the operating costs for the device, in the event we received updated information to establish that the Emily's Care Nourish Test System (Model 1) meets the cost criterion.

Comment: We received a comment from Prolacta Biosciences stating that subsequent to submission of the new technology add-on payment application for Emily's Care Nourish Test System (Model 1), Prolacta Bioscience acquired Lactation Lab Inc. and that Prolacta Bioscience should now officially be considered the applicant, and asked that all correspondence regarding the new technology add-on payments for FY 2026 application and any questions be directed to Prolacta Biosciences.

Response: We thank the commenter for its comment and note that for this final rule Prolacta Biosciences is identified as the applicant in the following section.

Comment: Multiple commenters, including the applicant, expressed support for approving new technology add-on payment for the Emily's Care Nourish Test System (Model 1). Some commenters shared their personal experiences as practicing clinicians or as mothers who had infants in the NICU. A few commenters submitted citations and studies that emphasized the importance of human milk and targeted fortification for VLBW infants in the NICU. Other commenters stated that Medicare-eligible mothers may have disabilities which raise the risk of

[127] Medicare Department of Health & Human Services (DHHS) Provider Reimbursement Manual Part 1—Chapter 8, Purchase Discounts; Allowances; Refunds of Expenses (Date: March 8, 2013) *https://www.cms.gov/regulations-and-guidance/guidance/transmittals/downloads/r456pr1.pdf.*

preterm birth, low birth weight, and NICU admission. Several commenters stated that during these admissions, Emily's Care Nourish Test System (Model 1) may be used by the hospital at the point of care to test the mother's milk.

In response to CMS's concerns regarding the potential Medicare volume for this technology and the eligible Medicare patient population, the applicant stated that testing with the device impacts both maternity-related admissions (as the subject of the nutritional analysis is the mother's breast milk) and neonatal care (as the results of the nutritional analysis guide treatment for the infant). The applicant and other commenters referenced maternal testing, measures such as the Maternal Morbidity Structural Measure in the Hospital Inpatient Quality Reporting (IQR) Program and the Exclusive Breast Milk Feeding electronic clinical quality measure, and Medicare designation of Birthing-Friendly hospitals as evidence for CMS's role in maternal and infant care. A few commenters urged CMS to approve the application for infants regardless of the insurance they hold.

The applicant stated that it agrees with the proposed rule analysis that there is an extremely low volume of Medicare claims for MDC 15 (Newborns & Other Neonates with Conditions Originating in Perinatal Period). However, the applicant maintained that since extremely low-volume MS–DRGs are active, Medicare payment for newborn and neonatal services should accurately reflect resource utilization, regardless of claims volume. Based on these examples cited, the applicant stated that new technology add-on payment eligibility for Emily's Care Nourish Test System is consistent with prior CMS policy with regard to Medicare IPPS reimbursement for maternal services and neonatal care.

Response: We thank the applicant and other commenters for their comments. While we share commenters' interests in improving maternal and infant outcomes, we do not believe that maternal care is relevant to this technology, which received a Breakthrough Device designation to measure the concentration of fat, carbohydrate, and protein in human milk to aid in the nutritional management and treatment of VLBW in the NICU, for both neonates and infants less than 6 months of age. We note that after the infant is delivered, items and services furnished to the infant cannot be covered and reimbursed under Medicare on the basis of the mother's eligibility.[128] Therefore, an infant would need to meet Medicare eligibility criteria, regardless of the mother's Medicare eligibility. As we noted in the proposed rule, infants may be eligible for Medicare if they have ESRD and need regular dialysis or have had a kidney transplant.[129] Therefore, we believe the relevant patient population for the purpose of the new technology add-on payment are VLBW neonates and infants less than 6 months of age with ESRD that need regular dialysis or have had a kidney transplant. Furthermore, the Breakthrough Device designation does not limit the sample source of the device to human milk from the mother. For example, donor human milk may be used in the NICU, as noted by a commenter.

Comment: In response to CMS's concerns with respect to the cost criterion, the applicant submitted a revised cost analysis, updated cost criterion codes, and a calculation narrative. The applicant stated that it conducted three different cost calculations. Per the applicant, the first, and most restrictive, calculation used the diagnosis codes suggested by CMS in the proposed rule discussion and MS–DRGs identified by the applicant related to childbirth or potential maternal nutritional issues. The applicant then identified cases that contained at least one code from the diagnosis code list and were also on the list of MS–DRGs. In this analysis, the applicant identified less than 11 claims mapping to each of two MS–DRGs: 641 (Miscellaneous Disorders of Nutrition, Metabolism, Fluids and Electrolytes without MCC) and 807 (Vaginal Delivery without Sterilization/D&C without CC/MCC), and therefore imputed a value of 11 cases for its cost analysis. The applicant calculated a final inflated average case-weighted standardized charge per case of $39,225, which exceeded the average case-weighted threshold amount of $32,060.

The applicant stated that the second analysis used a diagnosis code list with four additional diagnosis codes that it had identified could be appropriate. These codes are P07.21 (Extreme immaturity of newborn, gestational age less than 23 completed weeks), P07.24 (Extreme immaturity of newborn, gestational age less than 25 completed weeks), P07.25 (Extreme immaturity of newborn, gestational age less than 26 completed weeks) and P07.26 (Extreme immaturity of newborn, gestational age less than 27 completed weeks). The applicant stated that these diagnosis codes for extreme immaturity may be used in place for birthweight diagnosis. The applicant further stated these additional diagnosis codes expanded the number of claims and produced a selection of MS–DRGs unrelated to childbirth. Per the applicant, one hypothesis for the additional MS–DRGs present is that early childbirth may have been induced as the result of the mother's illness. The applicant provided rationale that medical coders and billers preferentially use gestational age over birth weight for coding and reimbursement due to clinical, regulatory, and practical considerations. Per the applicant, the claims data provides some merit for this hypothesis as it contained several claims which appeared to be outliers. The applicant stated the presence of likely outliers for non-neonate patients implies the mother was quite ill, and standardized charges for these outlier cases far exceeded CMS's MS–DRG thresholds. Therefore, the applicant calculated the second analysis two ways: with and without the apparent outlier claims. For the scenario with outlier claims, the applicant calculated a final inflated average case-weighted standardized charge per case of $175,383, which exceeded the average case-weighted threshold amount of $53,328. For the scenario without outlier claims, the applicant calculated a final inflated average case-weighted standardized charge per case of $49,284, which exceeded the average case-weighted threshold amount of $46,604.

Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the Emily's Care Nourish Test System (Model 1) meets the cost criterion.

Response: We thank the applicant for its comments and updated cost analysis. We disagree that the additional ICD–10–CM diagnosis codes proposed by the applicant are relevant because gestational age is preferentially used over birthweight for coding and reimbursement due to clinical, regulatory, and practical considerations. We note that, under the eligibility criteria for approval under the alternative pathway for certain transformative new devices, only the indication for use of the Emily's Care Nourish Test System (Model 1) that is covered by the FDA Breakthrough Device designation is relevant for

[128] Medicare Benefit Policy Manual Chapter 1—Inpatient Hospital Services Covered Under Part A (Rev. 10892, 08–06–21) *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/downloads/bp102c01.pdf.*

[129] Centers for Medicare & Medicaid Services. End-stage renal disease (*https://www.medicare.gov/basics/end-stage-renal-disease*, accessed 1/16/2024).

purposes of the new technology add-on payment application. Therefore, we continue to believe that the birthweight-related ICD–10–CM diagnosis codes are most appropriate to identify the use of the technology for VLBW neonates and infants that is relevant to the Breakthrough Device designation for the purposes of new technology add-on payment.

However, we note that the analyses using these additional gestational age-related diagnosis codes were provided as additional analyses. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in the most restrictive scenario. Therefore, the Emily's Care Nourish Test System (Model 1) meets the cost criterion.

Comment: In response to CMS's requests for information about discounts to hospitals, length of stay, and cost breakdown, the applicant stated it does not anticipate providing routine discounts off the cost of the device and any discounts would be a volume discount and should not impact the calculation of new technology add-on payment. The applicant stated that the reference to expected reductions in length of stay was included in error, as it was not included in the labeled claims and resulted from the applicant's misunderstanding of the factors that are relevant to the device cost calculations. The applicant stated the length of stay for maternal cases is not expected to be materially impacted by testing via the Emily's Care Nourish Test System (Model 1). The applicant provided a revised cost of $5,150 per patient, per inpatient stay. The applicant stated that the costs for consumables and single-use disposables is due to an increase in the cost of raw materials and increased cost of control solutions.

In response to CMS's request for additional information regarding the delay in the technology's market availability the applicant stated that as a startup in the maternal and child health sector, Lactation Lab encountered typical early-stage funding obstacles. The applicant stated there was a delay due to restricted access to capital and establishment of the essential infrastructure for achieving scalable manufacturing. Per the applicant, it consequently acquired Lactation Lab and will be manufacturing the device. The applicant expected to be fully commercial by Q4 of 2025.

Response: We thank the applicant for its comment. As we have discussed in prior rulemaking (86 FR 45132 and 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that it anticipates that the device will be fully commercial by Q4 of 2025, but it is unclear whether the technology would be available for sale earlier, in limited quantities. At this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we therefore consider the newness date for this technology to be May 3, 2024.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the Emily's Care Nourish Test System (Model 1) meets the cost criterion. The technology received FDA clearance on May 3, 2024, with an indication for use to aid in the nutritional management of newborns, including preterm, and infants. As noted earlier in this section, Emily's Care Nourish Test System (Model 1) has received FDA clearance for multiple indications, and only the use of the Emily's Care Nourish System (Model 1) for VLBW neonates and infants in the NICU, and the FDA Breakthrough Device designation it received for that use, are relevant for purposes of the new technology add-on payment application for FY 2026. Therefore, we are finalizing to approve new technology add-on payments for the Emily's Care Nourish Test System (Model 1) for FY 2026. Absent additional information from the applicant, we consider the beginning of the newness period to commence on May 3, 2024, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation. Based on the information available at the time of this final rule, the cost per case of Emily's Care Nourish Test System (Model 1) is $5,150 per patient, per inpatient stay. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of Emily's Care Nourish Test System (Model 1) is $3,347.50 for FY 2026 (that is, 65 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for a unique ICD–10–PCS procedure code for the Emily's Care Nourish Test System (Model 1) beginning in FY 2026. Therefore, cases involving the use of Emily's Care Nourish Test System (Model 1) that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code XXEZXAB (Measurement of macronutrient content, computer-aided assessment for nutrition management, new technology group 11) in combination with one of the following ICD–10–CM diagnosis codes:

ICD-10-CM Code	Description
P05.01	Newborn light for gestational age, less than 500 grams
P05.02	Newborn light for gestational age, 500-749 grams
P05.03	Newborn light for gestational age, 750-999 grams
P05.04	Newborn light for gestational age, 1000-1249 grams
P05.05	Newborn light for gestational age, 1250-1499 grams
P05.11	Newborn small for gestational age, less than 500 grams
P05.12	Newborn small for gestational age, 500-749 grams
P05.13	Newborn small for gestational age, 750-999 grams
P05.14	Newborn small for gestational age, 1000-1249 grams
P05.15	Newborn small for gestational age, 1250-1499 grams
P07.00	Extremely low birth weight newborn, unspecified weight
P07.01	Extremely low birth weight newborn, less than 500 grams
P07.02	Extremely low birth weight newborn, 500-749 grams
P07.03	Extremely low birth weight newborn, 750-999 grams
P07.14	Other low birth weight newborn, 1000-1249 grams
P07.15	Other low birth weight newborn, 1250-1499 grams

(8) Esprit™ BTK Everolimus Eluting Resorbable Scaffold System

The following table summarizes the information provided in the new technology add-on payment application for the Esprit™ BTK Everolimus Eluting Resorbable Scaffold System

BILLING CODE 4120–01–P

	Esprit™ BTK Everolimus Eluting Resorbable Scaffold System	
Technology Info	**Applicant**	Abbott Laboratories
	Description	Per the applicant, the Esprit™ BTK Everolimus Eluting Resorbable Scaffold is a temporary scaffold that will resorb over time and is indicated for improving luminal diameter in infrapopliteal lesions in patients with chronic limb threatening ischemia (CLTI).
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241004V78CP
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the Absorb GT1 BVS is a temporary scaffold that will fully resorb over time and is indicated for improving luminal diameter in infrapopliteal lesions in patients with critical limb ischemia (CLI). In all cases, the treated lesion length should be less than the total scaffolding length with a reference vessel diameter of ≥ 2.5 mm and ≤ 3.75 mm.
	FDA marketing authorization indication	The Esprit™ BTK Everolimus Eluting Resorbable Scaffold System is indicated for improving luminal diameter in infrapopliteal lesions in patients with CLTI and total scaffolding length up to 170 mm with a reference vessel diameter of ≥ 2.5 mm and ≤ 4.00 mm.
	FDA marketing authorization information	Per the applicant, the primary difference in the FDA-approved indication and the Breakthrough Device indication is that the FDA-approved indication includes a total scaffolding length up to 170 mm and larger upper limit for the reference vessel diameter (≥ 2.5 mm and ≤ 4.00 mm). According to the applicant, the trade name had been updated to the Esprit™ BTK Everolimus Eluting Resorbable Scaffold System (Esprit™ BTK System).
	FDA marketing authorization date	April 26, 2024
	Commercial availability	The applicant stated that the technology was commercially available immediately after FDA approval.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant provided a list of procedure codes that, effective October 1, 2024, may be used to uniquely describe procedures involving the use of the Esprit™ BTK Everolimus Eluting Resorbable Scaffold under the ICD-10-PCS coding system in the online application posting. X27P3TA (Dilation of right anterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10) X27Q3TA (Dilation of left anterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10) (X27R3TA - Dilation of right posterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10) X27S3TA (Dilation of left posterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10) X27T3TA (Dilation of right peroneal artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10) X27U3TA (Dilation of left peroneal artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10)
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the Esprit™ BTK Everolimus Eluting Resorbable Scaffold.
	Claims identified	Scenario 1: 12,850 claims mapping to 139 MS-DRGs, with 15.86% of claims mapping to MS-DRG 271 (Other Major Cardiovascular Procedures with CC) and 15.18% of claims mapping to MS-DRG 253 (Other Vascular Procedures with CC). Scenario 2: 2,751 claims mapping to 81 MS-DRGs, with 15.92% of claims mapping to MS-DRG 271 (Other Major Cardiovascular Procedures with CC) and 13.89% of claims mapping to MS-DRG 253 (Other Vascular Procedures with CC).
	Charges removed for prior technology	To be as conservative as possible, the applicant removed 100% of charges associated with Medical/Surgical Supplies and Devices (revenue centers 0275, 0276, 0278 and 0624) because the device is expected to replace a portion of devices included in these claims, although it will not replace all devices, nor any medical supplies required to perform the procedure, and an estimate of the percentage of total charges that the technology would replace could not be determined. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant has received FDA

marketing authorization is included within the scope of the Breakthrough Device designation indication, it appears that the FDA marketing authorization is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.[130]

We agreed with the applicant that the Esprit™ BTK Everolimus Eluting Resorbable Scaffold meets the cost criterion and therefore proposed to approve the Esprit™ BTK Everolimus Eluting Resorbable Scaffold for new technology add-on payments for FY 2026 for the indication of improving luminal diameter in infrapopliteal lesions in patients with CLTI and total scaffolding length up to 170 mm with a reference vessel diameter of 2.5 mm and 4 mm.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the Esprit™ BTK Everolimus Eluting Resorbable Scaffold to the hospital to be $6,000 per patient. According to the applicant, the costs of the technology include the Esprit™ BTK Scaffold ($2,750) and the Esprit™ BTK Delivery System ($250). The applicant stated that per the IDE Clinical Study, on average two Esprit™ BTK Everolimus Eluting Resorbable Scaffolds were used per patient. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the Esprit™ BTK Everolimus Eluting Resorbable Scaffold would be $3,900 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the Esprit™ BTK Everolimus Eluting Resorbable Scaffold meets the cost criterion and our proposal to approve new technology add-on payments for the Esprit™ BTK Everolimus Eluting Resorbable Scaffold for FY 2026.

Comment: Multiple commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the Esprit™ BTK Everolimus Eluting Resorbable Scaffold.

The applicant also requested that CMS increase the maximum new technology add-on payments for FY 2026. To support this request, the applicant described two-year data from its randomized controlled trial,[131] stating that among trial subjects, the clinical success of the treatment was not based on a specific number of scaffolds used, but rather on the clinical treatment protocol, which required scaffolds to be placed along the entire length of the diseased artery, also known as ''healthy-to-healthy'' vessel treatment. The applicant stated that while two scaffolds per case were implanted on average to treat the average lesion length of 44 mm, as indicated in its application, a range of one to six scaffolds were implanted depending on the length of the lesion being treated and the corresponding healthy-to-healthy clinical need of the patient. The applicant stated that it also summarized 16 recent studies evaluating infrapopliteal lesions in patients with chronic limb-threatening ischemia, and that lesion lengths ranged from 41 mm to 244.7 mm, with a calculated weighted average of 135.1 mm based on the analyses reflecting real-world clinical practice. In addition, the applicant stated that data in the RECCORD registry showed 40.4 percent of lesions were <10 cm (100 mm), 40.4 percent were 10–20 cm (100 − 200 mm), and 19.2 percent were >20 cm (200 mm) in length, among patients treated solely for infrapoliteal lesions.

Therefore, the applicant requested that CMS revise the maximum new technology add-on payment to $6,933 to reflect a conservative average of 3.55 scaffolds needed to cover the real-world average lesion length of 135.1 mm (65 percent of 3.55 scaffolds, priced at $3,000 each).

Response: We thank the commenters for their comments and for the additional cost and trial information. We note that, based on the information provided by the applicant about the estimated average cost of the technology, the maximum new technology add-on payment for a case would be $6,922.50. Specifically, the applicant stated that an average of 3.55 scaffolds would be used, priced at $3,000 each. Therefore, the estimated average cost per case would be $10,650 and 65 percent of the average cost of the technology ($10,650) is $6,922.50.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe Esprit™ BTK Everolimus Eluting Resorbable Scaffold meets the cost criterion. The technology received FDA marketing authorization on April 26, 2024, with an indication of improving luminal diameter in infrapopliteal lesions in patients with CLTI and total scaffolding length up to 170 mm with a reference vessel diameter of 2.5 mm and 4 mm, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for Esprit™ BTK Everolimus Eluting Resorbable Scaffold for FY 2026. We consider the beginning of the newness period to commence on April 26, 2024, the date on which the technology received its FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of Esprit™ BTK Everolimus Eluting Resorbable Scaffold is $10,650.00. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of Esprit™ BTK Everolimus Eluting Resorbable Scaffold is $6,922.50 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of Esprit™ BTK Everolimus Eluting Resorbable Scaffold that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes:

[130] Breakthrough Devices Program *https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program.*

[131] DeRubertis, Brian (2024, November 3–6) Two-Year Outcomes of the LIFE–BTK Randomized Controlled Trial Evaluating the Esprit BTK Drug-eluting Resorbable Scaffold for Treatment of Infrapopliteal Lesions. VIVA 2024 Conference, Las Vegas, NV, United States.

ICD-10-PCS Code	Description
X27P3TA	Dilation of right anterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10
X27Q3TA	Dilation of left anterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10
X27R3TA	Dilation of right posterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10
X27S3TA	Dilation of left posterior tibial artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10
X27T3TA	Dilation of right peroneal artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10
X27U3TA	Dilation of left peroneal artery with intraluminal device, everolimus-eluting resorbable scaffold(s), percutaneous approach, new technology group 10

(9) EUROPA™ Posterior Cervical Fusion System

The following table summarizes the information provided in the new technology add-on payment application for the EUROPA™ Posterior Cervical Fusion System.

BILLING CODE 4120–01–P

	EUROPA™ Posterior Cervical Fusion System	
Technology Info	**Applicant**	MiRus, LLC
	Description	Per the applicant, the EUROPA™ Posterior Cervical Fusion System is a posterior cervical screw system intended to provide structural stability and mechanical support to the cervical spine through posterior cervical fusion. Per the applicant, the EUROPA™ Posterior Cervical Fusion System implants are offered in multiple configurations and different sizes to accommodate various needs.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007BVT6M
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the EUROPA™ Posterior Cervical Fusion System is intended to provide immobilization and stabilization of spinal segments as an adjunct to fusion for the following acute and chronic instabilities of the cervical spine (C1 to C7) and the thoracic spine from T1-T3: traumatic spinal fractures and/or traumatic dislocations; instability or deformity; failed previous fusions (for example, pseudarthrosis); tumors involving the cervical/thoracic spine; and degenerative disease, including intractable radiculopathy and/or myelopathy, neck and/or arm pain of discogenic origin as confirmed by radiographic studies, and degenerative disease of the facets with instability. The EUROPA™ Posterior Cervical Fusion System is also intended to restore the integrity of the spinal column even in the absence of fusion for a limited time period in patients with advanced stage tumors involving the cervical spine in whom life expectancy is of insufficient duration to permit achievement of fusion. In order to achieve additional levels of fixation, the EUROPA™ Posterior Cervical Fusion System may be connected to the EUROPA™ Pedicle Screw System via the rod-to-rod connectors.
	FDA marketing authorization indication	The EUROPA™ Posterior Cervical Fusion System is intended to provide immobilization and stabilization of spinal segments as an adjunct to fusion for the following acute and chronic instabilities of the cervical spine (Cl to C7) and the upper thoracic spine (T1 to T3): * Traumatic spinal fractures and/or traumatic dislocations * Instability or deformity * Failed previous fusions (for example, pseudarthrosis) * Tumors involving the cervical/thoracic spine * Degenerative disease, including intractable radiculopathy and/or myelopathy * Neck and/or arm pain of discogenic origin as confirmed by radiographic studies * Degenerative disease of the facets with instability. The EUROPA™ Posterior Cervical Fusion System is also intended to restore the integrity of the spinal column even in the absence of fusion for a limited time period in patients with advanced stage tumors involving the cervical spine in whom life expectancy is of insufficient duration to permit achievement of fusion. In order to achieve additional levels of fixation, the EUROPA™ Posterior Cervical Fusion System may be connected to the EUROPA™ Pedicle Screw System via the rod to rod connectors.
	FDA marketing authorization date	November 19, 2024
	Commercial availability	According to the applicant, the EUROPA™ Posterior Cervical Fusion System is not commercially available, as the applicant planned to start manufacturing this technology and make available for commercial use based on project timelines after FDA clearance. The applicant anticipates the technology will become available in the fourth quarter of 2025.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the EUROPA™ Posterior Cervical Fusion System.
	Claims identified	28,953 claims mapping to 31 MS-DRGs, with 20.41% of claims mapping to MS-DRG 472 (Cervical Spinal Fusion with CC).
	Charges removed for prior technology	The applicant calculated the cost estimate for prior technology using the average price for the screws, rods, and set screws that are used during the average spinal procedure. The applicant then converted the cost for an average procedure to a charge using national cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not remove any indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2025 IPPS/LTCH PPS final rule correction notice.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant calculated the cost per patient based on the prices of the implants used in a construct and weighted by the length of the construct and the percentage of those procedures across different levels of fusion. The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Average case-weighted threshold amount: $175,355 Final inflated average case-weighted standardized charge per case: $688,679 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the EUROPA™ Posterior Cervical Fusion System meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant has received FDA marketing authorization is included within the scope of the Breakthrough Device designation indication, it appears that the FDA marketing authorization is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We noted in the proposed rule that according to the applicant, the technology, which received FDA clearance on November 19, 2024, is not yet available for sale due to project timelines. The applicant stated that the technology is not expected to be

commercially available until the fourth quarter of 2025. We stated in the proposed rule that we were interested in additional information regarding the cause of any delay in the technology's market availability.

We agreed with the applicant that the EUROPA™ Posterior Cervical Fusion System meets the cost criterion and therefore proposed to approve the EUROPA™ Posterior Cervical Fusion System for new technology add-on payments for FY 2026, to provide immobilization and stabilization of spinal segments as an adjunct to fusion for the acute and chronic instabilities of the cervical spine (Cl to C7) and the upper thoracic spine (T1 to T3) listed in both the Breakthrough Device designation and FDA clearance letter.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the EUROPA™ Posterior Cervical Fusion System to the hospital to be $123,920 per patient. According to the applicant, there are approximately 374 different components associated with the technology, including Pedicle Screws, Set Screws, Rods, and Connectors, all of which are operating costs and new components. The applicant stated that the majority of posterior cervical fusion procedures are inpatient Medicare procedures in most hospitals, but there may be exceptions based on individual clinical practice. Per the applicant, most of these procedures are C1–T3 or C2–T3 with some exceptions being 2–3 levels. The applicant calculated the total cost based on the unit prices of the implants used in a construct (Rod $9,000.00; Pedicle Screw $5,000.00; Smooth Shank Screw $5,000.00; Set Screw $500.00; Connector $4,000.00), weighted by the length of the construct (1- through 9-level), and the percentage of those procedures across different levels of fusion (10 percent for 2- through 4-level; 90 percent for 5 or more levels). We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2)(ii)(B), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the EUROPA™ Posterior Cervical Fusion System would be $80,548 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the EUROPA™ Posterior Cervical Fusion System meets the cost criterion and our proposal to approve new technology add-on payments for the EUROPA™ Posterior Cervical Fusion System for FY 2026.

Comment: We received comments, including from the applicant, expressing support for our proposal to approve new technology add-on payment for the EUROPA™ Posterior Cervical Fusion System.

In response to CMS's request for additional information regarding the delay in the technology's market availability, the applicant stated that following FDA clearance of the EUROPA™ Posterior Cervical Fusion System on November 19, 2024, the company initiated final steps toward market release, with product availability anticipated around August 2025. The applicant stated that the EUROPA™ Posterior Cervical Fusion System is manufactured using its proprietary MoRe alloy, which requires a different manufacturing process compared to conventional spinal implant materials. Per the applicant, the raw materials have a long lead time and are further complicated by the current macro-economic conditions, and the MoRe alloy is 3 to 4 times more expensive to produce and requires specialized tooling, extended machining time, and rigorous quality processes. Per the applicant, scaling up production while maintaining consistency and compliance with FDA cleared specifications also contributes to the extended timeline. The applicant stated that finalizing the production capabilities has taken additional time with current market considerations including supplier reliability, global tariff impacts, affecting increased demand on local manufacturing companies and delays in timeline. Per the applicant, additional time is needed to finalize regulatory labeling, sterilization, and transportation validation requirements. The applicant stated that all documentation must undergo internal review, printing, and packaging verification processes. To support commercialization, the applicant stated that it has begun conversations with large hospitals and other organizations to add the products to contracts, and that approvals have taken longer than expected. The applicant stated that it will continue communicating with CMS regarding any additional delays or updates in this timeline as the launch date approaches. The applicant stated that this timing ensures appropriate product training, manufacturing capacity, packaging readiness, and hospital system and facility approvals are in place to support a safe and successful launch.

Response: We thank the commenters for their comments and the applicant for its detailed explanation for delay in commercial market availability. As we have discussed in prior rulemaking (86 FR 45132 and 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that it anticipates first commercial use and launch beginning around August 2025, but it is unclear whether the technology would be available for sale prior to that date. At this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we therefore consider the newness date for this technology to be November 19, 2024.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comment we received, we believe the EUROPA™ Posterior Cervical Fusion System meets the cost criterion. The technology received FDA clearance on November 19, 2024, with an indication to provide immobilization and stabilization of spinal segments as an adjunct to fusion for the acute and chronic instabilities of the cervical spine (Cl to C7) and the upper thoracic spine (T1 to T3), which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the EUROPA™ Posterior Cervical Fusion System for FY 2026. Absent additional information from the applicant, we consider the beginning of the newness period to commence on November 19, 2024, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the average cost per case of the EUROPA™ Posterior Cervical Fusion System is $123,920, based on the unit prices of the implants used in a construct (Rod $9,000.00; Pedicle Screw $5,000.00; Smooth Shank Screw $5,000.00; Set Screw $500.00; Connector $4,000.00), weighted by the length of the construct (1- through 9-level), and the percentage of those procedures across different levels of fusion (10 percent for 2- through 4-level; 90 percent for 5 or more levels). Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost

of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the EUROPA™ Posterior Cervical Fusion System is $80,548 for FY 2026 (that is, 65 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for the EUROPA™ Posterior Cervical Fusion System beginning in FY 2026. Therefore, cases involving the use of the EUROPA™ Posterior Cervical Fusion System that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes:

ICD-10-PCS Code	Description
XRH10GB	Insertion of molybdenum rhenium alloy spinal stabilization device into cervical vertebral joint, open approach, new technology group 11
XRH13GB	Insertion of molybdenum rhenium alloy spinal stabilization device into cervical vertebral joint, percutaneous approach, new technology group 11
XRH14GB	Insertion of molybdenum rhenium alloy spinal stabilization device into cervical vertebral joint, percutaneous endoscopic approach, new technology group 11
XRH20GB	Insertion of molybdenum rhenium alloy spinal stabilization device into 2 or more cervical vertebral joints, open approach, new technology group 11
XRH23GB	Insertion of molybdenum rhenium alloy spinal stabilization device into 2 or more cervical vertebral joints, percutaneous approach, new technology group 11
XRH24GB	Insertion of molybdenum rhenium alloy spinal stabilization device into 2 or more cervical vertebral joints, percutaneous endoscopic approach, new technology group 11
XRH40GB	Insertion of molybdenum rhenium alloy spinal stabilization device into cervicothoracic vertebral joint, open approach, new technology group 11
XRH43GB	Insertion of molybdenum rhenium alloy spinal stabilization device into cervicothoracic vertebral joint, percutaneous approach, new technology group 11
XRH44GB	Insertion of molybdenum rhenium alloy spinal stabilization device into cervicothoracic vertebral joint, percutaneous endoscopic approach, new technology group 11
XRH60GB	Insertion of molybdenum rhenium alloy spinal stabilization device into thoracic vertebral joint, open approach, new technology group 11
XRH63GB	Insertion of molybdenum rhenium alloy spinal stabilization device into thoracic vertebral joint, percutaneous approach, new technology group 11
XRH64GB	Insertion of molybdenum rhenium alloy spinal stabilization device into thoracic vertebral joint, percutaneous endoscopic approach, new technology group 11

(10) iFuse TORQ TNT™ Implant System

The following table summarizes the information provided in the new technology add-on payment application for the iFuse TORQ TNT™ Implant System.

BILLING CODE 4120–01–P

	iFuse TORQ TNT™ Implant System	
Technology Info	**Applicant**	SI-BONE, Inc.
	Description	Per the applicant, the iFuse TORQ TNT™ Implant System consists of a fully threaded, 3D-printed porous anatomy-specific implant with optional washers along with instruments used to place the implant under either fluoroscopic guidance or with certain navigation systems. According to the applicant, the implant has features specific to pelvic anatomy for fracture fixation or sacroiliac joint fusion.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241002J7XRV
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the iFuse TNT Implant System is indicated for fracture fixation of the pelvis, including acute, nonacute and non-traumatic fractures. The iFuse TNT Implant System is indicated for sacroiliac joint fusion for sacroiliac joint dysfunction including sacroiliac joint disruption and degenerative sacroiliitis. The iFuse TNT Navigation instruments are intended to be used with the iFuse TNT Implant System to assist the surgeon in precisely locating anatomical structures in iFuse TNT Implant System procedures, in which the use of stereotactic surgery may be appropriate, and where reference to a rigid anatomical structure, such as the pelvis or vertebra, can be identified relative to the acquired image (CT, MR, 2D fluoroscopic image or 3D fluoroscopic image reconstruction) and/or an image data based model of the anatomy.
	FDA marketing authorization indication	The iFuse TORQ TNT Implant System is indicated for fracture fixation of the pelvis, including acute, non-acute and non-traumatic fractures. The iFuse TORQ TNT Implant System is indicated for sacroiliac joint fusion for: - Sacroiliac joint dysfunction including sacroiliac joint disruption and degenerative sacroiliitis. - Augmenting immobilization and stabilization of the sacroiliac joint in skeletally mature patients undergoing sacropelvic fixation as part of a lumbar or thoracolumbar fusion.

		The iFuse TORQ TNT Navigation instruments are intended to be used with the iFuse TORQ TNT Implant System to assist the surgeon in precisely locating anatomical structures in iFuse TORQ TNT Implant System procedures, in which the use of stereotactic surgery may be appropriate, and where reference to a rigid anatomical structure, such as the pelvis or vertebra, can be identified relative to the acquired image (CT, MR, 2D fluoroscopic image or 3D fluoroscopic image reconstruction) and/or an image data based model of the anatomy. iFuse TORQ TNT Navigation instruments are intended to be used with the Medtronic StealthStation System.
	FDA marketing authorization information	The applicant asserted that the same device is applicable to both the Breakthrough Device designation and the FDA marketing authorization, despite slight difference in the name of the technology. According to the applicant, the current SI-BONE labeling materials for the iFuse TORQ TNT™ Implant System include indications for use that match the Breakthrough Device designation, except for a statement which describes an "augmenting" indication. The applicant stated that only after the completion of the appropriate SI-BONE design control activities will the indications statement in the labeling materials for the iFuse TORQ TNT™ Implant System be updated to include the additional "augmenting" indication.
	FDA marketing authorization date	August 19, 2024
	Commercial availability	The applicant stated that the technology was commercially available immediately after FDA clearance.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the iFuse TORQ TNT™ Implant System.
	Claims identified	Fracture Fixation with TNT Analysis: 853 claims mapping to 43 MS-DRGs, with none of the MS-DRGs exceeding more than 12.66% of the total identified cases. SI Joint Fusion with TNT Analysis: 642 claims mapping to 21 MS-DRGs, with 28.04% of claims mapping to MS-DRG 448 (Multiple Level Spinal Fusion Except Cervical Without MCC).
	Charges removed for prior technology	The applicant removed 75% of charges associated with Medical/Surgical Supplies and Devices (revenue centers 027X, and 0624). According to the applicant, the use of the technology is expected to replace a portion of devices included in these claims, but it will not replace all devices or medical supplies required to perform the procedure. The applicant stated that the estimate of the percentage of these total charges for devices that would be replaced could not be determined. The applicant, therefore, adopted a conservative approach to removed 75% of these charges. The applicant did not remove indirect charges related to the prior technology as it stated that the financial impact of utilizing the technology on hospital resources compared to prior technologies is minimal.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology as it stated that no other hospital charges were assumed to be required for implanting the technology.
	Cost analysis results	Fracture Fixation with TNT Analysis: - Average case-weighted threshold amount: $153,117 - Final inflated average case-weighted standardized charge per case: $264,101 Fracture Fixation with TNT Analysis: - Average case-weighted threshold amount: $173,990 - Final inflated average case-weighted standardized charge per case: $201,625 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both analyses, the applicant asserted that the iFuse TORQ TNT™ Implant System meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, after review of the information provided by the applicant, we noted that under the eligibility criteria for approval under the

alternative pathway for certain transformative devices, only the use of the technology for the indication that corresponds to the technology's Breakthrough Device designation would be eligible for the new technology add-on payment for FY 2026. As noted by the applicant, the FDA clearance describes an additional indication for sacroiliac joint fusion for augmenting immobilization and stabilization of the sacroiliac joint in skeletally mature patients undergoing sacropelvic fixation as part of a lumbar or thoracolumbar fusion, which is not included in the Breakthrough Device designation. Therefore, we noted that it appeared that this indication was not relevant for purposes of the new technology add-on payment application for FY 2026.

Please see Table 10.2.-iFuse TORQ TNT™ Implant System associated with the proposed rule for the list of ICD–10–PCS procedure codes that we believed would be appropriate to exclude when reported in combination with use of the iFuse TORQ TNT™ Implant System. We invited public comments on the exclusion of cases reporting these ICD–10–PCS procedure codes in combination with the procedure codes that identify use of the iFuse TORQ TNT™ Implant System for augmenting immobilization and stabilization of the sacroiliac joint in skeletally mature patients undergoing sacropelvic fixation as part of a lumbar or thoracolumbar fusion, which we stated would not be eligible for new technology add-on payment, if approved.

We agreed with the applicant that the iFuse TORQ TNT™ Implant System meets the cost criterion and therefore proposed to approve the iFuse TORQ TNT™ Implant System for new technology add-on payments for FY 2026 when used for fracture fixation of the pelvis, including acute, non-acute and nontraumatic fractures and sacroiliac joint fusion for sacroiliac joint dysfunction including sacroiliac joint disruption and degenerative sacroiliitis.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the iFuse TORQ TNT™ Implant System to the hospital to be $6,573 per patient. The applicant stated that the iFuse TORQ TNT™ Implant System includes the operating unit costs of the TNT Implant ($3,150), Drill Bit ($200), Guide Pin ($100), Blunt Pin ($100), and Washer ($50). The applicant estimated the average number of each component used per case for pelvic fixation and sacroiliac joint fusion cases separately, and calculated the costs of the new technology by multiplying the component costs by the average number of components used per case. The applicant used internal sales data to estimate the percentages of pelvic fixation (80 percent) and sacroiliac joint (20 percent) fusion cases in an average hospital. The applicant then calculated the total cost of the iFuse TORQ TNT™ Implant System to the hospital by taking the weighted average of the cost per pelvic fixation case and cost per sacroiliac joint fusion case.

We noted that it appeared that the TNT Implant and Washers are components of the Breakthrough device. However, we noted that the Drill Bit, Guide Pin, and Blunt Pin are instrumentation used for the implantation of the TNT Implant. We stated that as we have discussed in prior rulemaking, when determining a new technology add-on payment, we provide payment based on the cost of the actual technology (such as the drug or device itself) and not for additional costs related to the use of the device (86 FR 45146). We noted it appeared that the cost of the instrumentation (the Drill Bit, Guide Pin, and Blunt Pin) are costs related to the use of the technology, rather than a cost of the technology itself. In addition, we stated it was not clear if the Drill Bit, Guide Pin, and Blunt Pin are new and unique components for this technology, or if they may be reused and/or may be purchased separately in support of other technologies. Therefore, we noted it appeared any add-on payment for the iFuse TORQ TNT™ Implant System would include only the weighted average cost per pelvic fixation case and cost per sacroiliac joint fusion case of the TNT Implant and Washers ($6,093).

We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the iFuse TORQ TNT™ Implant System would be $3,960.45 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the iFuse TORQ TNT™ Implant System meets the cost criterion and our proposal to approve new technology add-on payments for the iFuse TORQ TNT™ Implant System for FY 2026.

Comment: Multiple commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the iFuse TORQ TNT™ Implant System for FY 2026. Several commenters described their positive experience with the technology in their clinical practice and in enabling their elderly patients to return home instead of being discharged to skilled nursing facilities. Commenters stated that the technology enhances patient quality of life, reduces the need for revision surgeries, and facilitates earlier mobilization. A few commenters stated that the initial cost of the iFuse TORQ TNT™ Implant System may present a barrier to broader adoption, but that new technology add-on payment designation would help address this challenge, encourage wider use among surgeons, and enable quicker adoption in hospitals to care for Medicare patients.

Response: We thank the commenters for their comments.

Comment: We received comments expressing general support of the proposed ICD–10–PCS codes for which CMS specifically sought input. Some commenters, including the applicant, submitted public comments regarding the exclusion of new technology add-on payment for cases reporting iFuse TORQ TNT™ Implant System in combination with certain ICD–10–PCS codes noted in Table 10.2 of the proposed rule describing lumbar or thoracolumbar fusion procedures. The applicant stated that the iFuse TORQ TNT™ Implant System has marketing authorization by FDA for placing the implant in a specific trajectory (sacro-alar iliac, or SAI) when adjacent to pelvic fixation screws during the thoracolumbar fusion procedures extending to the pelvis. Per the applicant, this authorization is a ''pre-clearance'' function of a Predetermined Change Control Plan (PCCP) as part of the iFuse TORQ TNT™ Implant System 510(k) application, so that the applicant may conduct future work in this trajectory without the need for submitting another 510(k). The applicant stated that it would be inappropriate to exclude new technology add-on payment for a case using iFuse TORQ TNT™ Implant System as part of a lumbar or thoracolumbar fusion procedure in the same encounter because it is part of iFuse TORQ TNT™ Implant System's approved use and is in-line with its BDD application and pre-cleared indications. Another commenter also questioned whether there was the potential for a multiple level fusion that would involve the sacroiliac fusion using the iFuse TORQ TNT™ Implant System simultaneously with lumbar or thoracolumbar fusion and that it would be inappropriate to exclude cases

simply because the patient is receiving two levels of fusion in the same surgical encounter. The applicant encouraged CMS not to finalize its proposal to exclude ICD–10–PCS procedure codes noted in Table 10.2 in the proposed rule.

Response: We thank the applicant and other commenters for their comments. We agree with the commenters that there may be cases in which a lumbar or thoracolumbar fusion procedure may occur in the same encounter as sacroiliac joint fusion using the iFuse TORQ TNT™ Implant System. We agree that the use of the device for sacroiliac joint fusion is covered by its Breakthrough Device designation, whether it is used to treat sacroiliac joint dysfunction as a standalone procedure or when it is used for sacroiliac joint fusion that also occurs in the setting of other simultaneous procedures (such as lumbar or thoracolumbar fusions). Therefore, we are not finalizing to exclude cases reporting the ICD–10–PCS procedure codes listed in Table 10.2.-iFuse TORQ TNT™ Implant System associated with the proposed rule in combination with use of the iFuse TORQ TNT™ Implant System.

C*omment:* In response to CMS's proposed maximum new technology add-on payment, the applicant requested that CMS increase the per-case maximum amount. Per the applicant, while some of the instruments within the iFuse TORQ TNT™ Implant System may not be unique or part of the Breakthrough Device (that is, Blunt Pin and Drill Bit), the TNT Guide Pins are single-use instruments that were noted in the Breakthrough Device designation application with FDA as new and unique, as they were developed specifically for the iFuse TORQ TNT™ Implant System to support navigation compatibility. The applicant stated that the TNT Guide Pins used in both Pelvic Fixation cases (2.5 units) and SI Joint Fusion cases (3.5 units) are a part of the Breakthrough Device technology, as they are navigational aids, enabling surgeons to accurately position implants, drills, or other tools while minimizing risks to surrounding tissues. Per the applicant, taking into consideration the costs of the new and unique TNT Implant, Washers, and Guide Pins, the weighted average cost per pelvic fixation case (80 percent of mix) and cost per sacroiliac joint fusion case (20 percent of mix), the new technology cost increases to $6,363. The applicant proposed an updated maximum new technology add-on payment for a case of $4,135.95 for FY 2026 (65 percent of the average cost of the technology).

Response: We thank the applicant for its comment and cost information. We agree that the TNT Guide Pins are also a new and unique component of the iFuse TORQ TNT™ Implant System and should be included in the maximum new technology add-on payment.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comment we received, we believe the iFuse TORQ TNT™ Implant System meets the cost criterion. The technology received FDA clearance on August 12, 2024, with an indication for fracture fixation of the pelvis, including acute, non-acute and nontraumatic fractures and sacroiliac joint fusion for sacroiliac joint dysfunction including sacroiliac joint disruption and degenerative sacroiliitis. Therefore, we are finalizing our proposal to approve new technology add-on payments for the iFuse TORQ TNT™ Implant System for FY 2026. We consider the beginning of the newness period to commence on August 19, 2024, the date on which technology received its FDA clearance for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the average cost per case of the iFuse TORQ TNT™ Implant System is $6,363, based on the weighted average cost per pelvic fixation case and cost per sacroiliac joint fusion case of the TNT Implant, Washers, and Guide Pins. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the iFuse TORQ TNT™ Implant System is $4,135.95 for FY 2026 (that is, 65 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for the iFuse TORQ TNT™ Implant System beginning in FY 2026. Therefore, cases involving the use of the iFuse TORQ TNT™ Implant System that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes:

ICD-10-PCS Code	Description
XRGE0HB	Fusion of right sacroiliac joint using bone-density-specific thread and porosity pattern internal fixation device, open approach, new technology group 11
XRGE3HB	Fusion of right sacroiliac joint using bone-density-specific thread and porosity pattern internal fixation device, percutaneous approach, new technology group 11
XRGF0HB	Fusion of left sacroiliac joint using bone-density-specific thread and porosity pattern internal fixation device, open approach, new technology group 11
XRGF3HB	Fusion of left sacroiliac joint using bone-density-specific thread and porosity pattern internal fixation device, percutaneous approach, new technology group 11
XNSN0HB	Reposition right pelvic bone with bone-density-specific thread and porosity pattern internal fixation device, open approach, new technology group 11
XNSN3HB	Reposition right pelvic bone with bone-density-specific thread and porosity pattern internal fixation device, percutaneous approach, new technology group 11
XNSP0HB	Reposition left pelvic bone with bone-density-specific thread and porosity pattern internal fixation device, open approach, new technology group 11
XNSP3HB	Reposition left pelvic bone with bone-density-specific thread and porosity pattern internal fixation device, percutaneous approach, new technology group 11
XNH60HB	Insertion of bone-density-specific thread and porosity pattern internal fixation device into right pelvic bone, open approach, new technology group 11
XNH63HB	Insertion of bone-density-specific thread and porosity pattern internal fixation device into right pelvic bone, percutaneous approach, new technology group 11
XNH70HB	Insertion of bone-density-specific thread and porosity pattern internal fixation device into left pelvic bone, open approach, new technology group 11
XNH73HB	Insertion of bone-density-specific thread and porosity pattern internal fixation device into left pelvic bone, percutaneous approach, new technology group 11

(11) Merit Wrapsody® Cell Impermeable Endoprosthesis (CIE)

The following table summarizes the information provided in the new technology add-on payment application for the Merit Wrapsody® Cell Impermeable Endoprosthesis (CIE).

BILLING CODE 4120–01–P

	Merit Wrapsody® Cell Impermeable Endoprosthesis (CIE)	
Technology Info	**Applicant**	Merit Medical
	Description	Per the applicant, the Merit Wrapsody® is a flexible self-expanding CIE to treat venous outflow circuit stenosis or occlusion in patients with hemodialysis fistula or graft. Per the applicant, FDA Breakthrough prevents transgraft cellular migration resulting in randomized controlled trial (RCT) multicenter 6-month target lesion primary patency (TLPP) (90% vs 63%) compared to percutaneous transluminal angioplasty (PTA) and equal safety.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP2410062MPCC
FDA Info	**Breakthrough Device designation indications**	Per the applicant, the proposed indications for use includes treatment of stenosis or occlusion within the dialysis outflow circuit, including stenosis or occlusion: • within the peripheral veins in the arm of the Arteriovenous Fistula (AVF) patients, and • within the thoracic central veins, up to the superior vena cava, in Arteriovenous Graft (AVG) patients. The proposed indications for use include treatment of stenosis or occlusion within the dialysis outflow circuit of patients with a synthetic arteriovenous graft, including stenosis or occlusion: • at the venous anastomosis and • within the peripheral veins of the outflow circuit up to but not including the subclavian vein.
	FDA marketing authorization indication	The WRAPSODY® Cell-Impermeable Endoprosthesis is a flexible, self-expanding endoprosthesis indicated for use in hemodialysis patients for the treatment of stenosis or occlusion within the dialysis access outflow circuit, including stenosis or occlusion: • In the peripheral veins of individuals with an arteriovenous (AV) fistula, • At the venous anastomosis of a synthetic AV graft.
	FDA marketing authorization information	Per the applicant, the original FDA Breakthrough Device designation indications for use (IFU) are different from the current IFU to reflect the patients enrolled for analysis in the RCT. According to the applicant, the current IFU no longer includes patients with a dysfunction within the thoracic central veins and instead reflects the predominant hemodialysis AVG dysfunction enrolled in the RCT, meeting the safety and efficacy end points. Per the applicant, the name of the technology was updated to the Merit Wrapsody® Cell Impermeable Endoprosthesis after validation of the clinical effectiveness and patent issuance.
	FDA marketing authorization date	December 19, 2024
	Commercial availability	The applicant stated the Merit Wrapsody® CIE was commercially available on 1/02/2025 with 3 purchase orders in 3 days. Per the applicant, it is marketed in accordance with the conditions of the sale and distribution restricted to prescription use in accordance with 21 CFR 801.109 and under section 515(d)(1)(B)(ii) of the Federal FDA Act (the act). The applicant noted that the device is further restricted under section 515(d)(1)(B)(ii) of the act insofar as the labeling must specify the specific training or experience practitioners need in order to use the device.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the Merit Wrapsody® CIE. The applicant noted that "Set A Cost Thresh" was for its cost threshold calculations.
	Claims identified	44,393 claims mapping to 7 MS-DRGs, with 38.12% of claims mapping to MS-DRG 252 (Other Vascular Procedures with MCC).
	Charges removed for prior technology	The applicant removed charges for routine PTA catheters or stents by estimating a weighted cost based on 70% of procedures using a catheter for PTA and 30% of procedures for stent placement. The applicant then converted the cost to charges using the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used relevant values reported in the impact file and standardizing file posted with the FY 2023 IPPS/LTCH PPS final rule and correction notice, as well as the labor share percent from the FY 2025 IPPS/LTCH PPS final rule.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Average case-weighted threshold amount: $115,373 Final inflated average case-weighted standardized charge per case: $161,315 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the Merit Wrapsody® CIE meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received PMA

approval from FDA is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-approved indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We noted that the application stated that commercialization of the device was initiated on January 2, 2025, with 3 purchase orders in 3 days. We were interested in additional information regarding any delay in commercial availability between its FDA approval on December 19, 2024, and the date commercialization was initiated, including if the device was available for sale prior to January 2, 2025.

We agreed with the applicant that the Merit Wrapsody® CIE meets the cost criterion and therefore proposed to approve the Merit Wrapsody® CIE for new technology add-on payments for FY 2026, for use in hemodialysis patients for the treatment of stenosis or occlusion within the dialysis access outflow circuit, including stenosis or occlusion in the peripheral veins of individuals with an AV fistula or at the venous anastomosis of a synthetic AV graft.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the cost of the Merit Wrapsody® CIE to the hospital to be $5,800 per patient, inclusive of all components and accessories. The applicant also provided an additional cost for operating room time because the facility operation room time may be 8–12 minutes greater than similar current procedures. However, as discussed in prior rulemaking, when determining a new technology add-on payment, we provide payment based on the cost of the actual technology (such as the drug or device itself) and not for additional costs related to the use of the device, such as the ongoing use of the device including maintenance and processing fees. For example, if a technology required an extra hour of operating room time, or reduced the amount of procedure time, we would neither add nor deduct costs based on this, and would only consider the actual cost of the technology at the time of purchase in our determination of the add-on payment (86 FR 45146).

We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the Merit Wrapsody® CIE would be $3,770 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the Merit Wrapsody® CIE meets the cost criterion and our proposal to approve new technology add-on payments for the Merit Wrapsody® CIE for FY 2026.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the Merit Wrapsody® CIE and agreed with the proposed maximum new technology add-on payment.

In response to CMS's request for additional information regarding the delay in the technology's market availability, commenters stated that the date of the first sale was January 2, 2025, and that sales were delayed due to the holiday season. Per the commenters, the date of FDA clearance on December 19, 2024, occurred before the holiday week and the sales team had completed product training based off the approved indication for use. Per the commenters, in compliance with FDA marketing rules, sales communication about the Merit Wrapsody® CIE did not commence until PMA FDA approval. The commenters stated that manufacturing and production time was needed to assemble finished goods to fulfill customer purchasing. Per the applicant, approval within customers facilities and meetings were scheduled after the Christmas holiday, which led to a delay in purchasing decision until January 2, 2025.

Response: We thank the commenters for their comments and for the additional information.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the Merit Wrapsody® CIE meets the cost criterion. The technology received PMA approval on December 19, 2024, with an indication for use in hemodialysis patients for the treatment of stenosis or occlusion within the dialysis access outflow circuit, including stenosis or occlusion in the peripheral veins of individuals with an AV fistula or at the venous anastomosis of a synthetic AV graft, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the Merit Wrapsody® CIE for FY 2026. We consider the beginning of the newness period to commence on January 2, 2025, the date on which the technology became commercially available for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the Merit Wrapsody® CIE is $5,800. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the Merit Wrapsody® CIE is $3,770 for FY 2026 (that is, 65 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for the Merit Wrapsody® CIE beginning in FY 2026. Therefore, cases involving the use of the Merit Wrapsody® CIE that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes:

ICD-10-PCS Code	Description
X27535B	Dilation of right subclavian vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27635B	Dilation of left subclavian vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27735B	Dilation of right axillary vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27835B	Dilation of left axillary vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27935B	Dilation of right brachial vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27A35B	Dilation of left brachial vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27B35B	Dilation of right basilic vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27C35B	Dilation of left basilic vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27D35B	Dilation of right cephalic vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11
X27E35B	Dilation of left cephalic vein with cell impermeable intraluminal device, percutaneous approach, new technology group 11

12. Minima Stent System

The following table summarizes the information provided in the new technology add-on payment application for the Minima Stent System.

	Minima Stent System	
Technology Info	**Applicant**	Renata Medical, Inc.
	Description	Per the applicant, the Minima Stent System is the first and only stent designed, tested, clinically trialed, and FDA approved for treating coarctation of aorta and pulmonary artery stenosis in neonates, infants, and young children > 1.5 kg. Per the applicant, not only can the device be implanted that small, but it is also designed to be re-expanded over time up to adult size vessels.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241004LBYDY
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the Renata Minima Stent System is indicated for use in the treatment of common congenital and post-operative discrete coarctation of the aorta without significant arch hypoplasia in patients less than 20kg and in the treatment of pulmonary artery stenoses.
	FDA marketing authorization indication	The Minima Stent System is indicated for use in the treatment of native or acquired pulmonary artery stenoses or coarctation of the aorta in neonates, infants, and children at least 1.5 kg in weight.
	FDA marketing authorization date	August 28, 2024
	Commercial availability	The applicant stated that the technology was commercially available immediately after FDA marketing authorization.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-PCS codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the Minima Stent System.
	Claims identified	75,638 claims mapping to 6 MS-DRGs, with 26.50% of claims mapping to MS-DRG 252 (Other Vascular Procedures with MCC).
	Charges removed for prior technology	The applicant did not remove charges or indirect charges related to the prior technology as the applicant stated that the technology would not replace a device and is not expected to significantly change cost in other revenue/cost centers.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Average case-weighted threshold amount: $128,762 Final inflated average case-weighted standardized charge per case: $270,295 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the Minima Stent System meets the cost criterion.

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received PMA approval from FDA is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-approved indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.[132]

With respect to the cost criterion, we noted that the applicant identified 6 relevant MS–DRGs using 8 ICD–10–PCS codes that most closely resemble the procedure to insert and/or dilate the great vessels using the Minima Stent System. We noted that, per the applicant, the Minima Stent System is used in the pediatric population and no cases appear in Medicare data; therefore, the applicant used CY 2022 and CY 2023 Medicare charge and discharge data accessed via Definitive Healthcare as well as data from the AOR/BOR File published as part of the FY 2025 IPPS/LTCH PPS final rule, correction notice and interim final action with comment period Data and Supplemental Files and FY 2023 IPPS/LTCH PPS final rule and correcting amendment files. However, we questioned whether using the total charges for the Medicare claims within the 6 identified MS–DRGs would provide an accurate estimate for eligible cases in a pediatric patient population where the Minima Stent System would be used.

Subject to the applicant adequately addressing this concern, we agreed that the technology meets the cost criterion and proposed to approve the Minima Stent System for new technology add-on payments for FY 2026 for use in the treatment of native or acquired pulmonary artery stenoses or coarctation of the aorta in neonates, infants, and children at least 1.5 kg in weight.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the Minima Stent

[132] Breakthrough Devices Program *https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program.*

System to the hospital to be $34,900 per patient. Per the applicant, total cost per inpatient stay was calculated based on the assumption that only one unit will be used per patient for each inpatient stay. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the Minima Stent System would be $22,685 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the Minima Stent System meets the cost criterion and our proposal to approve new technology add-on payments for the Minima Stent System for FY 2026.

Comment: A few commenters, including the applicant expressed support for our proposal to approve new technology add-on payment for the Minima Stent System.

In response to CMS's concern about using the total charges for the Medicare claims within the six identified MS–DRGs to estimate eligible cases in a pediatric patient population, the applicant stated that the Minima Stent System was FDA-approved ten months ago and that given the newness of the procedure and absence of pediatric cases in Medicare data and other available claims data, its approach of using Medicare claims within six identified MS–DRGs was reasonable. The applicant stated that while Medicare coverage is expected to be rare with fewer than 10 cases during the new technology add-on payment period, there are circumstances where medically complex children will be covered under Medicare, citing precedent with the new technology add-on payment approval for the MAGEC® Spinal Bracing Distraction system for pediatric use in FY 2017. The applicant stated that in its original cost analysis, using Medicare cases, the new charge per case of $135,000 for the device alone surpassed the case-weighted threshold of $128,762 without including other inpatient stay charges, and that since the Minima Stent device is not replacing an existing technology, it would meet the cost criterion regardless of the applicability of Medicare charges to eligible pediatric cases.

To verify if the Medicare threshold might be too low, the applicant also reviewed data from the Healthcare Cost and Utilization Project (HCUP) Kids' Inpatient Database (KID) and HCUP National Inpatient Sample (NIS) to evaluate case distribution threshold. The applicant identified 6,855 HCUP KID cases compared to 75,638 cases Medicare cases across the six MS–DRGs used in its cost analysis. The applicant noted that pediatric cases were distributed differently compared to Medicare cases, resulting in a higher case-weighted threshold of $141,341. The applicant also stated that pediatric inpatient stays had a higher average length of stay, higher average charges, and higher average costs per stay. Based on the distribution of pediatric cases, the applicant conducted an additional cost analysis and calculated a final inflated average case-weighted standardized charge per case of $281,314, which exceeded the average case-weighted threshold amount of $141,341.

Per the applicant, data from HCUP NIS and HCUP KID suggest that for the six identified MS–DRGs, pediatric inpatient stays have higher average length of stay, higher average charges and higher average costs per stay compared to inpatient stays across all ages. Per the applicant, this suggests that using total Medicare charges in the cost criterion analysis likely resulted in an underestimated inflated case-weighted standardized charge per case for the Minima stent and that while Medicare charges are not a perfect estimate, they are a reasonable and conservative substitute.

Response: We thank the applicant and other commenters for their comments. We acknowledge the challenges of estimating charges related to use of a pediatric device using Medicare data and agree that the Medicare charges used in this analysis are reasonable based on the additional information provided by the applicant.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the Minima Stent System meets the cost criterion. The technology received PMA approval on August 28, 2024, with an indication for use in the treatment of native or acquired pulmonary artery stenoses or coarctation of the aorta in neonates, infants, and children at least 1.5 kg in weight, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the Minima Stent System for FY 2026. We consider the beginning of the newness period to commence on August 28, 2024, the date on which the technology received its premarket approval for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the Minima Stent System is $34,900. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the Minima Stent System is $22,685 for FY 2026 (that is, 65 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for the Minima Stent System beginning in FY 2026. Therefore, cases involving the use of the Minima Stent System that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes: X27339B (Dilation of right pulmonary artery with expandable intraluminal device, percutaneous approach, new technology group 11), X27439B (Dilation of left pulmonary artery with expandable intraluminal device, percutaneous approach, new technology group 11), X27W39B (Dilation of thoracic aorta, descending with expandable intraluminal device, percutaneous approach, new technology group 11), or X27X39B (Dilation of thoracic aorta, ascending/arch with expandable intraluminal device, percutaneous approach, new technology group 11).

(12) MY01 Continuous Compartmental Pressure Monitor

The following table summarizes the information provided in the new technology add-on payment application for the MY01 Continuous Compartmental Pressure Monitor.

BILLING CODE 4120–01–P

	MY01 Continuous Compartmental Pressure Monitor	
Technology Info	**Applicant**	MY01 Inc.
	Description	Per the applicant, the MY01 Continuous Compartmental Pressure Monitor is a single-use device that measures and displays in real-time muscle compartment pressure as an aid in Compartment Syndrome diagnosis. Per the applicant, the companion Mobile App displays identical muscle pressure data together with calculated perfusion pressure using a manually entered diastolic blood pressure.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007X55AR
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the MY01 device is used for real-time and continuous measurement of muscle pressures. The measured muscle pressure can be used as an aid in the diagnosis of acute compartment syndrome (ACS). The MY01 Mobile Application is an application intended for storing and displaying identical pressure values from the MY01 device and calculating critical muscle perfusion pressure utilizing diastolic pressure manual entry by the physician. Diagnosis should always be made in conjunction with clinical assessments.
	FDA marketing authorization indication	The MY01 Continuous Compartmental Pressure Monitor is used for real-time and continuous measurement of the muscle compartment pressure. The measured muscle compartment pressure can be used as an aid in diagnosis of Compartment Syndrome (Acute and Chronic). The MY01 Mobile Application is an application intended for storing and displaying identical pressure values from the MY01 Continuous Compartmental Pressure Monitor device and calculating critical muscle perfusion pressure utilizing diastolic pressure manual entry by the physician. Diagnosis should always be made in conjunction with clinical assessments.
	FDA marketing authorization information	Per the applicant, the FDA indication for use is similar to the Breakthrough Device designation, but the language was modified for clarity and accuracy. Per the applicant: the device name was changed from "MY01 device" to "MY01 Continuous Compartmental Pressure Monitor"; the term "muscle pressure" was changed to "muscle compartment pressure"; the indications were expanded from including only "acute compartment syndrome" to include both "(Acute and Chronic) [compartment syndrome]"
	FDA marketing authorization date	March 13, 2025
	Commercial availability	According to the applicant, the MY01 Mobile Application is not yet available for use because the applicant is completing final testing of the application before it is available on the Apple App Store and the Google Play App Store. The applicant anticipates the app will be available for download by April 30, 2025.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2023, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of the MY01 Continuous Compartmental Pressure Monitor: XX2F3W9 (Monitoring of musculoskeletal muscle compartment pressure, micro-electro-mechanical system, percutaneous approach, new technology group 9).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the MY01 Continuous Compartmental Pressure Monitor.
	Claims identified	78,166 claims mapping to 90 MS-DRGs, with 13.69% of claims mapping to MS-DRG 563 (Fracture, Sprain, Strain and Dislocation Except Femur, Hip, Pelvis and Thigh without MCC) and 13.54% of claims mapping to MS-DRG 493 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with CC).
	Charges removed for prior technology	The applicant conducted an analysis of sales data to collect the cost of each component of the prior technology. To calculate the charges for the prior technology, the applicant converted the cost to charge by using the national average cost-to-charge ratio of 0.297 for Supplies and Equipment from the FY 2025 IPPS/LTCH PPS final rule. The applicant estimated that the technology would be used on 50% of patients and therefore removed charges for 50% of the charges for the prior technology. The applicant did not remove charges related to the prior technology as it believed that the choice of device is the sole difference between cases treated with the MY01 Continuous Compartmental Pressure Monitor and cases treated with the prior technology. Per the applicant, besides the choice of device, the procedure is the same, and the services provided during the course of the hospitalization are also the same.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.297 for Supplies and Equipment from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology, as the services provided during the course of hospitalization are not affected by the use of the technology.
	Cost analysis results	Average case-weighted threshold amount: $86,011 Final inflated average case-weighted standardized charge per case: $112,813 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the MY01 Continuous Compartmental Pressure Monitor meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant has received FDA

marketing authorization is included within the scope of the Breakthrough Device designation indication, it appears that the FDA marketing authorization is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.[133]

We noted in the proposed rule that according to the applicant, the MY01 Mobile Application was not yet available for use because the applicant was completing final testing of the application before it is available for download. We stated that we were interested in additional information on when the MY01 Continuous Compartmental Pressure Monitor, which is the subject of this new technology add-on payment application, became available for sale.

We agreed with the applicant that the MY01 Continuous Compartmental Pressure Monitor meets the cost criterion and therefore proposed to approve the MY01 Continuous Compartmental Pressure Monitor for new technology add-on payments for FY 2026, for real-time and continuous measurement of the muscle compartment pressure.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the MY01 Continuous Compartmental Pressure Monitor to the hospital to be $3,250 per patient. Per the applicant, only one device is used per inpatient stay, and the companion MY01 Mobile Application is provided at no additional cost for any physician registered to use the device. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the MY01 Continuous Compartmental Pressure Monitor would be $2,112.50 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the MY01 Continuous Compartmental Pressure Monitor meets the cost criterion and our proposal to approve new technology add-on payments for the MY01 Continuous Compartmental Pressure Monitor for FY 2026.

Comment: We received comments expressing support for technologies under consideration for new technology add-on payments for FY 2026.

The applicant submitted a public comment in response to CMS's request for additional information regarding the delay in the technology's market availability. The applicant stated that there was a slight market availability delay for the MY01 Mobile App due to launch and distribution orchestration and post approval compliance documentation. Per the applicant, the MY01 Mobile App was available on the Apple App Store and the Google Play Store on April 29, 2025.

Response: We thank the commenters for their comments. Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe MY01 Continuous Compartmental Pressure Monitor meets the cost criterion. The technology received FDA marketing authorization on March 13, 2025, with an indication for real-time and continuous measurement of the muscle compartment pressure, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for MY01 Continuous Compartmental Pressure Monitor for FY 2026. We consider the beginning of the newness period to commence on April 29, 2025, the date on which the technology became commercially available for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of MY01 Continuous Compartmental Pressure Monitor is $3,250. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of MY01 Continuous Compartmental Pressure Monitor is $2,112.50 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of MY01 Continuous Compartmental Pressure Monitor that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code XX2F3W9 (Monitoring of musculoskeletal muscle compartment pressure, micro-electro-mechanical system, percutaneous approach, new technology group 9).

(13) Positive Blood Culture (PBC) Separator With Selux AST System

The following table summarizes the information provided in the new technology add-on payment application for the PBC Separator with Selux AST System. We note that Selux Diagnostics, Inc. submitted an application for new technology add-on payments for the PBC Separator with Selux AST System for FY 2024 under the name Selux NGP System, as summarized in the FY 2024 IPPS/LTCH PPS proposed rule (88 FR 26946 through 26949), that it withdrew prior to the issuance of the FY 2024 IPPS/LTCH PPS final rule (88 FR 58919).

BILLING CODE 4120–01–P

[133] Breakthrough Devices Program *https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program.*

	PBC Separator with Selux AST System	
Technology Info	**Applicant**	Selux Diagnostics, Inc.
	Description	Per the applicant, the PBC Separator with Selux AST System is a phenotypic antimicrobial susceptibility testing (AST) system, intended to assist medical professionals in the identification of in vitro susceptibility or resistance to specific antimicrobial agents.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007LLY3U
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the Selux Positive Blood Culture Separator and Selux System is intended for use with bacteria separated from monomicrobial positive blood cultures and sterile body fluid culture samples from non-charcoal-containing types of BACTEC, BacT/ALERT, VIRTUO and VersaTREK blood culture bottles.
	FDA marketing authorization indication	The PBC Separator with Selux AST System is an automated inoculum preparation system that uses lysis, centrifugation and sequential optical density measurements to generate a McFarland equivalent suspension from positive blood culture samples that can be used for quantitative in vitro AST by the Selux AST System. Samples are processed directly from blood culture samples identified as positive by a continuous monitoring blood culture system. Samples should be confirmed as monomicrobial, gram negative rods by Gram stain. Organism identification is required for AST result interpretation and reporting, per the Selux AST System instructions for use.
	FDA marketing authorization information	Per the applicant, the Selux Positive Blood Culture Separator and Selux System is the same technology as the PBC Separator with Selux AST System from the FDA 510(k) clearance associated with this application. The applicant stated that during the 510(k) clearance process, FDA requested that Selux change the name to make it clear that this clearance was specific to the positive blood culture indication of the previously cleared AST system.
	FDA marketing authorization date	February 15, 2024
	Commercial availability	Per the applicant, the technology was commercially available immediately after FDA marketing authorization.

Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2023, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of the PBC Separator with Selux AST System: XXE5XY9 (Measurement of infection, other positive blood/isolated colonies bimodal phenotypic susceptibility technology, new technology group 9).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, and/or MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the PBC Separator with Selux AST System.
	Claims identified	Simulation 1: 1,319,069 claims mapping to 37 MS-DRGs, with 41.42% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC) Simulation 2: 1,793,579 claims mapping to 742 MS-DRGs, with 30.32% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC) Simulation 3: 2,117,455 claims mapping to 742 MS-DRGs, with 25.80% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC) Simulation 4: 368,389 claims mapping to 589 MS-DRGs, with 42.01% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC) Simulation 5: 1,437,546 claims mapping to 592 MS-DRGs, with 38.00% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV >96 Hours with MCC)
	Charges removed for prior technology	The applicant did not remove direct or indirect charges related to the prior technology. Per the applicant, the technology is not expected to remove the need for prior technologies or remove the costs associated with prior technologies.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2025 IPPS/LTCH PPS final rule.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.102 for Laboratory from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Simulation 1: - Average case-weighted threshold amount: $73,418 - Final inflated average case-weighted standardized charge per case: $84,339 Simulation 2: - Average case-weighted threshold amount: $81,998 - Final inflated average case-weighted standardized charge per case: $107,616 Simulation 3: - Average case-weighted threshold amount: $78,365 - Final inflated average case-weighted standardized charge per case: $99,821 Simulation 4: - Average case-weighted threshold amount: $90,005 Final inflated average case-weighted standardized charge per case: $133,372 Simulation 5: - Average case-weighted threshold amount: $75,671 Final inflated average case-weighted standardized charge per case: $92,088 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the PBC Separator with Selux AST System meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received 510(k)

clearance from FDA is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-cleared indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We agreed with the applicant that the PBC Separator with Selux AST System meets the cost criterion and therefore proposed to approve the PBC Separator with Selux AST System for new technology add-on payments for FY 2026 for use as an automated inoculum preparation system that uses lysis, centrifugation and sequential optical density measurements to generate a McFarland equivalent suspension from positive blood culture samples that can be used for quantitative in vitro AST by the Selux AST System.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the PBC Separator with Selux AST System to the hospital to be $135.04 per patient. Per the applicant, the cost per patient includes $80 for the Selux AST Gram Negative and Selux AST Gram Positive AST Kit, $50 for the Selux AST Positive Blood Culture Kit, $4.79 for the Selux AST Analyzer Reagent Kit, and $0.25 for the Selux AST Waste Kit.

We noted that according to the applicant, the Selux AST System has been granted multiple previous FDA clearances for a different indication and sample type.[134] However, we stated that per the applicant, the Breakthrough Device designation is for the Selux Positive Blood Culture Separator and Selux [AST] System. We stated that the previous FDA clearances for the Selux AST System were not considered Breakthrough Devices. Therefore, we noted that it appeared that the components of the Selux AST System, including the Selux AST Gram Negative and Selux AST Gram Positive AST Kit, Selux AST Analyzer Reagent Kit, and Selux AST Waste Kit are eligible for new technology add-on payment only when used in conjunction with the PBC Separator on positive blood culture samples. We further noted that the Selux AST System first received FDA 510(k) clearance on January 18, 2023, and therefore the components of the Selux AST System would still be new for FY 2026.

We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2) we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the PBC Separator with Selux AST System would be $87.78 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the PBC Separator with Selux AST System meets the cost criterion and our proposal to approve new technology add-on payments for the PBC Separator with Selux AST System for FY 2026.

Comment: We received comments expressing support for technologies under consideration for new technology add-on payments for FY 2026.

Response: We thank the commenters for their comments. Based on the information provided in the application for new technology add-on payments, we believe the PBC Separator with Selux AST System meets the cost criterion. The technology received 510(k) clearance on February 15, 2024, with an indication for use as an automated inoculum preparation system that uses lysis, centrifugation and sequential optical density measurements to generate a McFarland equivalent suspension from positive blood culture samples that can be used for quantitative in vitro AST by the Selux AST System, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the PBC Separator with Selux AST System for FY 2026. We consider the beginning of the newness period to commence on February 15, 2024, the date on which technology received its premarket approval for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the PBC Separator with Selux AST System is $135.04. As noted earlier in this section, the Selux AST System has been granted multiple previous FDA clearances for a different indication and sample type.[135] However, per the applicant, the Breakthrough Device designation is for the Selux Positive Blood Culture Separator and Selux [AST] System. The previous FDA clearances for the Selux AST System were not considered Breakthrough Devices. Therefore, it appears that the components of the Selux AST System, including the Selux AST Gram Negative and Selux AST Gram Positive AST Kit, Selux AST Analyzer Reagent Kit, and Selux AST Waste Kit are eligible for new technology add-on payment only when used in conjunction with the PBC Separator on positive blood culture samples. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the PBC Separator with Selux AST System is $87.78 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of the PBC Separator with Selux AST System that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code XXE5XY9 (Measurement of infection, other positive blood/isolated colonies bimodal phenotypic susceptibility technology, new technology group 9).

(14) RECELL® Autologous Cell Harvesting Device

The following table summarizes the information provided in the new technology add-on payment application for the RECELL® Autologous Cell Harvesting Device.

BILLING CODE 4120–01–P

[134] *https://www.accessdata.fda.gov/cdrh_docs/pdf21/K211759.pdf* and *https://www.accessdata.fda.gov/cdrh_docs/pdf21/K211748.pdf.*

[135] *https://www.accessdata.fda.gov/cdrh_docs/pdf21/K211759.pdf* and *https://www.accessdata.fda.gov/cdrh_docs/pdf21/K211748.pdf.*

	RECELL® Autologous Cell Harvesting Device	
Technology Info	**Applicant**	AVITA Medical
	Description	Per the applicant, the RECELL® Autologous Cell Harvesting Device is a stand-alone, single-use, battery-powered medical device that is used to process and apply a skin cell suspension autograft for the treatment of thermal burn wounds and full thickness skin defects. Per the applicant, this NTAP application is for the full thickness skin defects indication.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007VBAM0
FDA Info	**Breakthrough Device designation Indication**	Per the applicant, the proposed indication for use is for the treatment of patients with acute nonthermal full thickness skin wounds after traumatic avulsion, surgical excision (for example, necrotizing soft tissue infection), or resection (for example, skin cancer), in combination with meshed autografting.
	FDA marketing authorization indication	The RECELL® Autologous Cell Harvesting Device is used by an appropriately licensed and trained healthcare professional at the patient's point-of-care to prepare autologous Spray-On Skin Cells for direct application to acute partial-thickness thermal burn wounds in patients 18 years of age or older, or application in combination with meshed autografting for acute full-thickness thermal burn wounds in pediatric and adult patients and full-thickness skin defects after traumatic avulsion (for example, degloving) or surgical excision (for example, necrotizing soft tissue infection) or resection (for example, skin cancer) in patients 15 years of age and older.
	FDA marketing authorization information	The applicant stated that the following FDA-approved indication is the subject of the new technology add-on payment application: for the use of the RECELL® Autologous Cell Harvesting Device in combination with meshed autografting for full thickness skin defects resulting from traumatic avulsion (for example, degloving), surgical excision (for example, necrotizing soft tissue infection), or resection (for example, skin cancer) in patients 15 years of age and older.
	FDA marketing authorization date	June 7, 2023
	Commercial availability	Per the applicant, the RECELL® Autologous Cell Harvesting Device was commercially available immediately after FDA approval for the indication of full thickness skin defects.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant provided a list of procedure codes that, effective October 1, 2019, may be used to uniquely identify procedures involving the use of the RECELL® Autologous Cell Harvesting Device under the ICD-10-PCS coding system in the online application posting.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and list of MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the RECELL® Autologous Cell Harvesting Device.
	Claims identified	Cost Analysis 1: 17,183 claims mapping to 11 MS-DRGs, with 36.87% of claims mapping to MS-DRG 464 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connectivity Tissue Disorders with CC). Cost Analysis 2: 13,539 claims mapping to 4 MS-DRGs, with 46.79% of claims mapping to MS-DRG 464 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connectivity Tissue Disorders with CC). Cost Analysis 3: 17,183 claims mapping to 11 MS-DRGs, with 36.87% of claims mapping to MS-DRG 464 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal and Connectivity Tissue Disorders with CC).
	Charges removed for prior technology	According to the applicant, the RECELL® Autologous Cell Harvesting Device is a novel device and does not replace any prior technology. Therefore, the applicant did not remove any direct charges for prior technology being replaced. The applicant stated that the RECELL® Autologous Cell Harvesting Device is indicated for use in combination with the standard of care, split-thickness skin grafting (STSG), for full-thickness skin defects, complementing but not replacing the STSG procedure. The applicant believed the same resources required for a standard STSG are also needed when the RECELL® Autologous Cell Harvesting Device is used. Therefore, the applicant did not remove any indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	Cost analysis 1 and 2: The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.

		Cost analysis 3: The applicant did not apply an inflation factor to the standardized charges.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology because it believed the same resources required for a standard STSG are also needed when the RECELL® Autologous Cell Harvesting Device is used.
	Cost analysis results	Cost Analysis 1: - Average case-weighted threshold amount: $114,718 - Final inflated average case-weighted standardized charge per case: $175,809 Cost Analysis 2: - Average case-weighted threshold amount: $113,758 - Final inflated average case-weighted standardized charge per case: $172,998 Cost Analysis 3: - Average case-weighted threshold amount: $114,718 - Final inflated average case-weighted standardized charge per case: $159,065 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all analyses, the applicant asserted that the RECELL® Autologous Cell Harvesting Device meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, after review of the information provided by the applicant, we noted that the RECELL® Autologous Cell Harvesting Device is also indicated for acute partial-thickness thermal burn wounds and acute full-thickness thermal burn wounds. However, we noted that under the eligibility criteria for approval under the alternative pathway for certain transformative devices, only the use of the technology for the indication that corresponds to the technology's Breakthrough Device designation would be eligible for the new technology add-on payment for FY 2026. Therefore, we noted that only the use of the RECELL® Autologous Cell Harvesting Device for acute nonthermal full thickness skin wounds after traumatic avulsion, surgical excision (for example, necrotizing soft tissue infection), or resection (for example, skin cancer), and the FDA Breakthrough Device designation it received for those uses, were relevant for purposes of the new technology add-on payment application for FY 2026.

Please see Table 10.1.A.-RECELL® Autologous Cell Harvesting Device associated with the proposed rule for the list of relevant ICD–10–CM diagnosis codes that we believed would identify the Breakthrough Device-designated indication of acute nonthermal full thickness skin wounds after traumatic avulsion. Please see Table 10.1.B.-RECELL® Autologous Cell Harvesting Device associated with the proposed rule for the list of relevant ICD–10–PCS procedure codes that we believed would be appropriate to report in combination with use of the RECELL® Autologous Cell Harvesting Device to identify use of the technology for the Breakthrough Device-designated indication of acute nonthermal full thickness skin wounds after surgical excision (for example, necrotizing soft tissue infection) or resection (for example, skin cancer). We invited public comments on the use of these ICD–10–CM diagnosis and ICD–10–PCS procedure codes to identify use of the technology for the Breakthrough Device-designated indications for purposes of the new technology add-on payment, if approved.

We agreed with the applicant that the RECELL® Autologous Cell Harvesting Device meets the cost criterion and therefore proposed to approve the RECELL® Autologous Cell Harvesting Device for new technology add-on payments for FY 2026, when used in combination with meshed autografting for acute full-thickness thermal burn wounds in pediatric and adult patients and full-thickness skin defects after traumatic avulsion (for example, degloving) or surgical excision (for example, necrotizing soft tissue infection) or resection (for example, skin cancer).

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the RECELL® Autologous Cell Harvesting Device to the hospital to be $7,500 per device. The applicant estimated that, on average, one device is used per inpatient stay for patients with a full-thickness skin defect. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, proposed that the maximum new technology add-on payment for a case involving the use of the RECELL® Autologous Cell Harvesting Device would be $4,875 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the RECELL® Autologous Cell Harvesting Device meets the cost criterion and our proposal to approve new technology add-on payments for the RECELL® Autologous Cell Harvesting Device for FY 2026.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the RECELL® Autologous Cell Harvesting Device. We received comments expressing general support of the proposed ICD–10–CM/PCS codes for which CMS specifically sought input. The applicant further stated its support for the use of the ICD–10–CM diagnosis codes listed in Table 10.1.A and the ICD–10–PCS procedure codes listed in Table 10.1.B to identify cases eligible for new technology add-on payments for FY 2026, and agreed that new technology

add-on payment eligibility is limited to the Breakthrough-designated indication for nonthermal full-thickness wounds. The applicant also supported CMS's proposal to establish a maximum payment of $4,875 per case, based on the cost of $7,500 per device.

A commenter requested more clarity regarding the circumstances in which a hospital is eligible to receive new technology add-on payments for the RECELL® Autologous Cell Harvesting Device. Per the commenter, the technology's use in combination with another procedure (meshed autografting) is atypical and stated that it would expect that such a claim must include: (i) an ICD–10–PCS code for the use of the RECELL® Autologous Cell Harvesting Device; (ii) an ICD–10–PCS code for meshed autografting; and (iii) an ICD–10–CM code to reflect use for patients with acute nonthermal full thickness skin wounds. The commenter stated that the need for the latter two seemed to be implicit in CMS's development of Table 10.1.B and Table 10.1.A, respectively, in connection with the proposed rule. However, the commenter stated that the messaging should not be implicit, but that CMS should issue a clear statement in the final rule, or consider communicating it in an implementing transmittal, or in a Medicare Learning Network (MLN) issuance.

The commenter also recommended that CMS reassess the scope of the new technology add-on payments for FY 2026 to ensure that we had identified the appropriate ICD–10–PCS and ICD–10–CM codes to capture what would be appropriate to report in combination with the use of the RECELL® Autologous Cell Harvesting Device and that would identify the pertinent Breakthrough Device indication. Per the commenter, the listed ICD–10–PCS codes in Table 10.1.B are all for excision procedures and should be removed so that CMS can populate the table with procedures for meshed autografting. The commenter also stated its concern with the listed ICD–10–CM codes in Table 10.1.A as it stated many of the listed codes are for lacerations and lacerations typically do not correlate to full thickness wound. Accordingly, the commenter stated that it is important for CMS to ensure that Table 10.1.A be populated with diagnosis codes that capture nonthermal, full thickness wounds.

Response: We thank the applicant and other commenters for their comments.

We disagree that the procedure codes for meshed autografting should be included in Tables 10.1.A or 10.1.B. Table 10.1.A.-RECELL® Autologous Cell Harvesting Device associated with the proposed rule provided the list of relevant ICD–10–CM diagnosis codes that we believed would identify the Breakthrough Device-designated indication of acute nonthermal full thickness skin wounds after traumatic avulsion. Table 10.1.B.-RECELL® Autologous Cell Harvesting Device associated with the proposed rule provided the list of relevant ICD–10–PCS procedure codes that we believed would be appropriate to report in combination with use of the RECELL® Autologous Cell Harvesting Device to identify use of the technology for the Breakthrough Device-designated indication of acute nonthermal full thickness skin wounds after surgical excision (for example, necrotizing soft tissue infection) or resection (for example, skin cancer). We had listed ICD–10–PCS procedure codes in Table 10.1.B.-RECELL® Autologous Cell Harvesting Device to identify use of the technology after surgical excision or resection because these describe procedures, not diagnoses. Either a code from Table 10.1.A or Table 10.1.B. associated with the proposed rule may be used to identify the Breakthrough Device-designated indication for the RECELL® Autologous Cell Harvesting Device.

As we noted in the proposed rule, although the RECELL® Autologous Cell Harvesting Device is also indicated for acute partial-thickness thermal burn wounds and acute full-thickness thermal burn wounds, only the use of the device for acute nonthermal full thickness skin wounds after traumatic avulsion, surgical excision (for example, necrotizing soft tissue infection), or resection (for example, skin cancer), and the FDA Breakthrough Device designation it received for those uses, were relevant for purposes of the new technology add-on payment application for FY 2026. According to its FDA indication for use, the RECELL® Autologous Cell Harvesting Device is used for application in combination with meshed autografting for both acute full-thickness thermal burn wounds and full-thickness skin defects. Therefore, it is not possible to differentiate between use of the device for acute full-thickness thermal burn wounds and full-thickness skin defects using the procedure codes for meshed autografting, and these codes are not relevant to our proposal.

Although we agree with the commenter that some of the listed diagnosis codes in Table 10.1.A associated with the proposed rule may not correlate to full thickness skin wounds after traumatic avulsion in all instances, we note that these diagnosis codes must be reported in combination with use of the RECELL® Autologous Cell Harvesting Device to be eligible for new technology add-on payment. The RECELL® Autologous Cell Harvesting Device is FDA market authorized for use in full-thickness skin defects. Therefore, we believe that when these diagnosis codes are used in combination with the list of procedure codes that uniquely identify procedures involving the use of the RECELL® Autologous Cell Harvesting Device, they would describe full thickness skin defects. Therefore, we are finalizing the lists of codes in Tables 10.1.A.- and 10.1.B.-RECELL® Autologous Cell Harvesting Device associated with the proposed rule as proposed. We note that Tables 10.A.- and 10.B.-RECELL® Autologous Cell Harvesting Device associated with this final rule are the same as Tables 10.1.A.- and 10.1.B.-RECELL® Autologous Cell Harvesting Device associated with the proposed rule, respectively, but the names of the tables were updated for this final rule.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the RECELL® Autologous Cell Harvesting Device meets the cost criterion. The technology received FDA marketing authorization on June 7, 2023, with an indication for use in combination with meshed autografting for acute full-thickness thermal burn wounds in pediatric and adult patients and full-thickness skin defects after traumatic avulsion (for example, degloving) or surgical excision (for example, necrotizing soft tissue infection) or resection (for example, skin cancer), which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the RECELL® Autologous Cell Harvesting Device for FY 2026. We consider the beginning of the newness period to commence on June 7, 2023, the date on which the technology received its FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the RECELL® Autologous Cell Harvesting Device is $7,500. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the RECELL® Autologous Cell

Harvesting Device is $4,875 for FY 2026 (that is, 65 percent of the average cost of the technology). As noted earlier in this section, the RECELL® Autologous Cell Harvesting Device is also indicated for acute partial-thickness thermal burn wounds and acute full-thickness thermal burn wounds. However, we note that under the eligibility criteria for approval under the alternative pathway for certain transformative devices, only the use of the technology for the indication that corresponds to the technology's Breakthrough Device designation would be eligible for the new technology add-on payment for FY 2026. Therefore, only the use of the RECELL® Autologous Cell Harvesting Device for acute nonthermal full thickness skin wounds after traumatic avulsion, surgical excision (for example, necrotizing soft tissue infection), or resection (for example, skin cancer), and the FDA Breakthrough Device designation it received for those uses, are relevant for purposes of the new technology add-on payment for FY 2026.

Therefore, cases involving the use of the RECELL® Autologous Cell Harvesting Device that are eligible for new technology add-on payments will be identified by one of the following ICD–10–PCS procedure codes, in combination with any of the ICD–10–CM diagnosis codes listed in Table 10.A.-RECELL® Autologous Cell Harvesting Device or ICD–10–PCS procedure codes listed in Table 10.B.-RECELL® Autologous Cell Harvesting Device associated with this final rule.

ICD-10-PCS Code	Description
0HR0X72	Replacement of scalp skin with autologous tissue substitute, cell suspension technique, external approach
0HR1X72	Replacement of face skin with autologous tissue substitute, cell suspension technique, external approach
0HR2X72	Replacement of right ear skin with autologous tissue substitute, cell suspension technique, external approach
0HR3X72	Replacement of left ear skin with autologous tissue substitute, cell suspension technique, external approach
0HR4X72	Replacement of neck skin with autologous tissue substitute, cell suspension technique, external approach
0HR5X72	Replacement of chest skin with autologous tissue substitute, cell suspension technique, external approach
0HR6X72	Replacement of back skin with autologous tissue substitute, cell suspension technique, external approach
0HR7X72	Replacement of abdomen skin with autologous tissue substitute, cell suspension technique, external approach
0HR8X72	Replacement of buttock skin with autologous tissue substitute, cell suspension technique, external approach
0HR9X72	Replacement of perineum skin with autologous tissue substitute, cell suspension technique, external approach
0HRAX72	Replacement of inguinal skin with autologous tissue substitute, cell suspension technique, external approach
0HRBX72	Replacement of right upper arm skin with autologous tissue substitute, cell suspension technique, external approach
0HRCX72	Replacement of left upper arm skin with autologous tissue substitute, cell suspension technique, external approach
0HRDX72	Replacement of right lower arm skin with autologous tissue substitute, cell suspension technique, external approach
0HREX72	Replacement of left lower arm skin with autologous tissue substitute, cell suspension technique, external approach
0HRFX72	Replacement of right hand skin with autologous tissue substitute, cell suspension technique, external approach
0HRGX72	Replacement of left hand skin with autologous tissue substitute, cell suspension technique, external approach
0HRHX72	Replacement of right upper leg skin with autologous tissue substitute, cell suspension technique, external approach
0HRJX72	Replacement of left upper leg skin with autologous tissue substitute, cell suspension technique, external approach
0HRKX72	Replacement of right lower leg skin with autologous tissue substitute, cell suspension technique, external approach
0HRLX72	Replacement of left lower leg skin with autologous tissue substitute, cell suspension technique, external approach
0HRMX72	Replacement of right foot skin with autologous tissue substitute, cell suspension technique, external approach
0HRNX72	Replacement of left foot skin with autologous tissue substitute, cell suspension technique, external approach

(15) restor3d TIDAL™ Fusion Cage

The following table summarizes the information provided in the new technology add-on payment application for the restor3d TIDAL™ Fusion Cage.

We note that restor3d submitted an application for new technology add-on payments for the restor3d TIDAL™ Fusion Cage for FY 2025, as summarized in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36124 through 36125), that it withdrew prior to the issuance of the FY 2025 IPPS/LTCH PPS final rule (89 FR 69204).

BILLING CODE 4120–01–P

	restor3d TIDAL™ Fusion Cage	
Technology Info	**Applicant**	restor3d
	Description	Per the applicant, the restor3d TIDAL™ Fusion Cages are additively manufactured porous cages intended to be used as an accessory to an intramedullary nail for internal bone fixation for bone fractures, bone voids, or surgical resections in the hindfoot and tibia.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP2410022M84U
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the restor3d Fusion Cage System is intended for tibiotalocalcaneal arthrodesis (fusion) to provide stabilization of the hindfoot and ankle with critical size bone defect, in lieu of bulk allograft in procedures such as: post-traumatic and degenerative arthritis; post-traumatic or primary arthrosis involving both ankle and subtalar joints; revision after failed ankle arthrodesis with subtalar involvement; failed total ankle arthroplasty; non-union ankle arthrodesis; rheumatoid hindfoot; talectomy; avascular necrosis of the talus; neuroarthropathy; neuromuscular disease and severe deformity; osteoarthritis; Charcot foot; and previously infected arthrosis, second degree.
	FDA marketing authorization information	The applicant anticipates a 510(k) clearance decision from FDA before May 1, 2025, consistent with its Breakthrough Device designation. Per the applicant, the proposed FDA indications are a subset of the indications from the Breakthrough Designation and that the restor3d TIDAL™ Fusion Cage indications have been restricted to use the DynaNail, with indications limited to revision applications for patients at risk of limb loss.
	Commercial availability	The applicant anticipates the technology will be immediately available for sale after FDA marketing authorization.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2024, the following ICD-10-PCS codes may be used to uniquely describe procedures involving use of the restor3d TIDAL™ Fusion Cage: XRGK0CA (Fusion of left ankle joint using gyroid-sheet lattice design internal fixation device, open approach), XRGM0CA (Fusion of left tarsal joint using gyroid-sheet lattice design internal fixation device, open approach), XRGJ0CA (Fusion of right ankle joint using gyroid-sheet lattice design internal fixation device, open approach), and XRGL0CA (Fusion of right tarsal joint using gyroid-sheet lattice design internal fixation device, open approach).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the list of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the restor3d TIDAL™ Fusion Cage. The applicant used FY 2022 MedPAR data to identify cases used in the cost analysis.
	Claims identified	14,247 claims mapping to 24 MS-DRGs, with 15.82% of claims mapping to MS-DRG 617 (Amputation of Lower Limb for Endocrine, Nutritional and Metabolic Disorders With CC) and 15.61% of claims mapping to MS-DRG 853 (Infectious and Parasitic Diseases with O.R. Procedures with MCC).
	Charges removed for prior technology	The applicant removed charges for the prior technology by estimating the cost of the technology being replaced using market intelligence data and the CMS Public Data file. The applicant then calculated charges for the technology by using the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file and standardizing file posted with the FY 2025 IPPS/LTCH PPS final rule.
	Inflation factor	The applicant applied an inflation factor of 17.52% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant added indirect charges related to the new technology by using market intelligence data to estimate the cost related to use of the technology. The applicant then calculated charges using the Implantable Devices cost-to-charge ratio (0.259).
	Cost analysis results	Average case-weighted threshold amount: $113,613 Final inflated average case-weighted standardized charge per case: $320,053 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the restor3d TIDAL™ Fusion Cage meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, we agreed with the applicant that the restor3d TIDAL™ Fusion Cage meets the cost criterion and therefore proposed to approve the

restor3d TIDAL™ Fusion Cage for new technology add-on payments for FY 2026 subject to the technology receiving FDA marketing authorization for the indication corresponding to the Breakthrough Device designation by May 1, 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the cost of the restor3d TIDAL™ Fusion Cage to the hospital to be $27,995 per patient. In addition, the applicant noted the costs related to the technology for required supporting instruments and materials consist of one unit each of the Instrument Kit ($6,995), TTC Fusion Nail ($7,500), and Graft Material ($1,500). The applicant estimated the total cost to the hospital to be $43,990 for each procedure per patient, including the related cost of the technology. As we discussed in the FY 2025 IPPS/LTCH PPS proposed rule (89 FR 36125) and in prior rulemaking, when determining a new technology add-on payment, we provide payment based on the cost of the actual technology (such as the drug or device itself) and not for additional costs related to the use of the device (86 FR 45146). We noted that based on the information provided by the applicant, the cost of the Instrument Kit was included in the costs of the supporting instruments and materials for each procedure related to the use of the technology, rather than the cost of the technology itself. In addition, we noted it appeared that the TTC Fusion Nail and Bone Graft were not new and unique components for this technology and could be purchased separately in support of other technologies. Furthermore, we noted that the Instrument Kit was not included in the Breakthrough Device designation, and it therefore appeared that only the restor3d TIDAL™ Fusion Cage would be designated as the Breakthrough Device once market authorized and would be eligible for new technology add-on payments under the alternative pathway. Therefore, we stated it appeared any add-on payment for the restor3d TIDAL™ Fusion Cage would include only the cost of the restor3d TIDAL™ Fusion Cage ($27,995).

We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the restor3d TIDAL™ Fusion Cage would be $18,196.75 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the restor3d TIDAL™ Fusion Cage meets the cost criterion and our proposal to approve new technology add-on payments for the restor3d TIDAL™ Fusion Cage for FY 2026, subject to the technology receiving FDA marketing authorization for the indication corresponding to the Breakthrough Device designation by May 1, 2025.

Comment: We received comments expressing support for technologies under consideration for new technology add-on payments for FY 2026.

The applicant submitted a public comment noting that the restor3d TIDAL Fusion Cage received FDA 510(k) clearance (K242356) effective March 24, 2025, and that the Indications for Use are a subset of the Breakthrough Device designation indications.

Response: We thank the commenters for their comments.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe restor3d TIDAL™ Fusion Cage meets the cost criterion. The technology received 510(k) clearance from FDA on March 24, 2025, with an indication for use as part of a tibiotalocalcaneal fusion construct in a salvage procedure following failed ankle arthrodesis or failed ankle arthroplasty for patients at risk of limb loss, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for restor3d TIDAL™ Fusion Cage for FY 2026. We consider the beginning of the newness period to commence on March 24, 2025, the date on which technology received its 510(k) clearance for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of TIDAL Fusion Cage System is $27,995. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of TIDAL Fusion Cage System is $18,196.75 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of TIDAL Fusion Cage System that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes: XRGK0CA (Fusion of left ankle joint using gyroid-sheet lattice design internal fixation device, open approach), XRGM0CA (Fusion of left tarsal joint using gyroid-sheet lattice design internal fixation device, open approach), XRGJ0CA (Fusion of right ankle joint using gyroid-sheet lattice design internal fixation device, open approach), or XRGL0CA (Fusion of right tarsal joint using gyroid-sheet lattice design internal fixation device, open approach).

(16) ShortCut™

The following table summarizes the information provided in the new technology add-on payment application for the ShortCut™.

	ShortCut™	
Technology Info	**Applicant**	Pi-Cardia Ltd
	Description	Per the applicant, the ShortCut™ is indicated for use as a splitting device of bioprosthetic aortic valve leaflets to facilitate valve-in-valve procedures for patients at risk of coronary obstruction.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP2410045YWFH
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the ShortCut™ is indicated for use as a splitting device of bioprosthetic aortic valve leaflets to facilitate valve-in-valve procedures for patients at risk for coronary obstruction.
	FDA marketing authorization indication	The ShortCut™ is indicated for use as a splitting device of bioprosthetic aortic valve leaflets to facilitate valve-in-valve procedures for patients at risk for coronary obstruction.
	FDA marketing authorization date	September 27, 2024
	Commercial availability	The applicant stated that the technology was commercially available immediately after FDA market authorization.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2024, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of the ShortCut™: X28F3VA (Division of aortic valve using intraluminal bioprosthetic valve leaflet splitting technology in existing valve, percutaneous approach, new technology group 10).
	ICD-10-CM Code(s)	The applicant stated the ICD-10-CM code I35.0 (Nonrheumatic aortic (valve) stenosis) may be used to currently identify the indication under the ICD-10-CM coding system.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the ShortCut™. The applicant used FY 2023 MedPAR data to identify cases used in the cost analysis.
	Claims identified	39,533 claims mapping to 2 MS-DRGs, with 68.3% of claims mapping to MS-DRG 267 (Endovascular Cardiac Valve Replacement and Supplement Procedures without MCC).
	Charges removed for prior technology	The applicant did not remove charges or indirect charges related to prior technology as the applicant stated there is no existing technology to be replaced.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.297 for Supplies & Equipment from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Average case-weighted threshold amount: $192,802 Final inflated average case-weighted standardized charge per case: $275,030 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that the ShortCut™ meets the cost criterion.

After review of the information provided by the applicant, we agreed with the applicant that the ShortCut™ meets the cost criterion and therefore proposed to approve the ShortCut™ for new technology add-on payments for FY 2026 for use as a splitting device of bioprosthetic aortic valve leaflets to facilitate valve-in-valve procedures for patients at risk for coronary obstruction.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the ShortCut™ to the hospital to be $15,000 per patient. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the ShortCut™ would be $9,750 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the ShortCut™ meets the cost criterion and our proposal to approve new technology add-on payments for the ShortCut™ for FY 2026.

Comment: Multiple commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the ShortCut™ device for FY 2026. Some commenters provided their perspectives regarding the clinical need for the device. Several commenters, including the applicant, noted that the device enabled splitting of pre-existing valve leaflets after insertion of the transcatheter heart valve to allow blood flow into the adjacent or ''at risk'' coronary artery. Per commenters, approving new technology add-on payments for ShortCut™ would make it economically feasible for hospitals to offer this breakthrough technology to Medicare patients without incurring steep losses

The applicant further reiterated that the ShortCut™ device received FDA

Breakthrough Device Designation on January 18, 2024, and FDA market clearance on September 27, 2024. The applicant also noted that CMS created a new ICD–10–PCS procedure code (X28F3VA) effective October 1, 2024, responding to the growing need for leaflet splitting in patients undergoing valve-in-valve transcatheter aortic valve replacement.

Response: We thank the commenters for their comments.

Based on the information provided in the application for new technology add-on payments, we believe the ShortCut™ meets the cost criterion. The technology received FDA marketing authorization on September 27, 2024, with an indication for use as a splitting device of bioprosthetic aortic valve leaflets to facilitate valve-in-valve procedures for patients at risk of coronary obstruction, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the ShortCut™ for FY 2026. We consider the beginning of the newness period to commence on September 27, 2024, the date on which technology received its FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the ShortCut™ is $15,000. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the ShortCut™ is $9,750 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of the ShortCut™ that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code X28F3VA (Division of aortic valve using intraluminal bioprosthetic valve leaflet splitting technology in existing valve, percutaneous approach, new technology group 10).

(17) The WiSE CRT System

The following table summarizes the information provided in the new technology add-on payment application for The WiSE CRT System.

	The WiSE CRT System	
Technology Info	**Applicant**	EBR Systems, Inc
	Description	Per the applicant, The WiSE CRT System is indicated for patients who meet current guidelines for cardiac resynchronization therapy (CRT) with previously acute or chronic failed implants or patients that are high-risk upgrades to a traditional CRT device.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP2410056PHBK
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the WiSE CRT System is indicated for patients who meet current guidelines for CRT device implantation and satisfy at least one of the following criteria: patients with previously implanted CRT device, who have not responded to CRT – referred to as "non-responders;" patients in whom previous coronary sinus lead implantation procedure was unsuccessful, or where an implanted lead has been turned off – referred to as "previously untreatable;" and patients with previously implanted pacemakers or ICD's in whom standard CRT upgrade is not advisable due to known relative contraindications for CS lead or CRT device implantation – referred to as "high-risk upgrades."
	FDA marketing authorization information	The applicant stated that it anticipates a PMA decision from FDA before May 1, 2025. According to the applicant, the proposed FDA indication includes two of the three indications for which Breakthrough Device Designation was approved, specifically patients that are "previously untreatable" and "high-risk upgrades."
	Commercial availability	The applicant anticipates The WiSE CRT System will be commercially available immediately after FDA marketing authorization.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for The WiSE CRT System.
	Claims identified	Scenario 1: 396 claims mapping to 2 MS-DRGs, with 53.79% of claims mapping to MS-DRG 229 (Other Cardiothoracic Procedures without MCC). Scenario 2: 934 claims mapping to 2 MS-DRGs, with 64.45% of claims mapping to MS-DRG 229 (Other Cardiothoracic Procedures without MCC).
	Charges removed for prior technology	The applicant removed 100% of charges associated with Medical/Surgical Supplies and Devices (revenue centers 027x, and 0624), because the technology is expected to replace a portion of devices included in these claims (although it will not replace all devices, nor any medical supplies required to perform the procedure) and an estimate of the percentage of total charges that the technology would replace could not be determined. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2023 IPPS/LTCH PPS final rule correcting amendment.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.259 for Implantable Devices from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Scenario 1: - Average case-weighted threshold amount: $156,573 - Final inflated average case-weighted standardized charge per case: $362,465 Scenario 2: - Average case-weighted threshold amount: $150,937 - Final inflated average case-weighted standardized charge per case: $356,495 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both scenarios, the applicant asserted that The WiSE CRT System meets the cost criterion.

In the proposed rule, we noted that after review of the information provided by the applicant, we agreed with the applicant that the WiSE CRT System meets the cost criterion and therefore proposed to approve the WiSE CRT System for new technology add-on payments for FY 2026, subject to the technology receiving FDA marketing authorization for the indication corresponding to the Breakthrough Device designation by May 1, 2025.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the WiSE CRT System to the hospital to be $63,300 per patient. The components included the electrode

and catheter ($21,970), the delivery sheath ($2,590), the battery ($12,870), and the transmitter ($25,870). We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the WiSE CRT System would be $41,145 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the WiSE CRT System meets the cost criterion and our proposal to approve new technology add-on payments for the WiSE CRT System for FY 2026, subject to the technology receiving FDA marketing authorization for the indication corresponding to the Breakthrough Device designation by May 1, 2025.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the WiSE CRT System. The applicant further stated that the WiSE CRT System received FDA approval on April 11, 2025, and that the approved indications are consistent with the Breakthrough Device designation indications. The applicant also noted that the total price of the technology is unchanged.

Response: We thank the commenters for their comments.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the WiSE CRT System meets the cost criterion. The technology received premarket approval from FDA on April 11, 2025, with an indication for adult patients who are at least 22 years of age, are indicated for CRT, have an existing or are eligible for an implanted right ventricular pacing system, and are in one of the following two categories: •Patients in whom previous coronary sinus (CS) lead implantation was unsuccessful, or where an implanted lead has been turned off, referred to as ''previously untreatable''; •Patients with previously implanted pacemakers or Implantable Cardioverter-Defibrillators (ICDs) in whom standard CRT upgrade is not advisable due to known relative contraindications for CS lead or CRT device implantation, referred to as ''high risk upgrades,'' which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the WiSE CRT System for FY 2026. We consider the beginning of the newness period to commence on April 11, 2025, the date on which the technology received premarket approval for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the WiSE CRT System is $63,300. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the WiSE CRT System is $41,145 for FY 2026 (that is, 65 percent of the average cost of the technology). The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for the WiSE CRT System beginning in FY 2026. Therefore, cases involving the use of the WiSE CRT System that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code X2HN37B (Insertion of endocardiac pacing electrode into left ventricle, percutaneous approach, new technology group 11) in combination with XHH80HB (Insertion of ultrasound transmitter and battery for endocardiac pacing electrode into chest subcutaneous tissue and fascia, open approach, new technology group 11).

(18) TriVerity Test

The following table summarizes the information provided in the new technology add-on payment application for the TriVerity Test.

	TriVerity Test	
Technology Info	**Applicant**	Inflammatix, Inc.
	Description	Per the applicant, the TriVerity test is a blood test that rapidly "reads" the body's immune response to infection using machine learning-derived algorithms. Per the applicant, the test informs on the presence of infection and risk of progression to severe illness in adult patients suspected of acute infection or sepsis in the emergency department.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007260BW
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the TriVerity Test is an automated, semi-quantitative in vitro diagnostic test that measures the relative expression levels of host response genes in RNA isolated from whole blood collected in the PAXgene Blood RNA tube using reverse transcription loop-mediated isothermal amplification (RT-LAMP) on the Myrna instrument. The results are generated using two fixed classifiers. The TriVerity Test is indicated for use in conjunction with clinical assessments and other laboratory findings as an aid to differentiate bacterial infections, viral infections, and non-infectious illness, as well as the likelihood of disease progression in adult patients with suspected acute infection or sepsis presenting to the emergency department. The test generates three scores that fall within one of five discrete interpretation bands based on the likelihoods of: 1) bacterial infection, 2) viral infection, and 3) severe illness, as defined by the need for mechanical ventilation, vasopressors, and/or renal replacement therapy (RRT) within seven days.
	FDA marketing authorization information	The TriVerity test is an automated, semi-quantitative in vitro diagnostic test that measures the relative expression levels of host response genes in RNA isolated from whole blood collected in the PAXgene Blood RNA tube using reverse transcription loop-mediated isothermal amplification (RT-LAMP) on the Myrna instrument. The TriVerity test is indicated for use in conjunction with clinical assessments and other laboratory findings as an aid to differentiate bacterial infections, viral infections, and non-infectious illness, as well as to determine the likelihood of 7-day need for mechanical ventilation, vasopressors, and/or renal replacement therapy in adult patients with suspected acute infection or suspected sepsis presenting to the emergency department. The test generates three scores that each fall within one of five discrete interpretation bands based on the increasing likelihood of 1) bacterial infection, 2) viral infection, and 3) severe illness, as defined by the need for mechanical ventilation, vasopressors, and/or renal replacement therapy (RRT) within seven days.
	FDA marketing authorization date	January 10, 2025
	Commercial availability	Per the applicant, the technology was not commercially available immediately after FDA marketing authorization because it is working to transition its test system manufacturing to be able to roll out TriVerity cartridges for routine clinical use including: (1) updating labeling, (2) build-up of TriVerity cartridge inventory, and (3) updating documents within its QMS. Per the applicant, its target date for commercial availability is March 6, 2025.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a diagnosis code that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and/or MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the TriVerity Test.
	Claims identified	Cost Analysis 1: 1,321,764 claims mapping to 42 MS-DRGs, with 39.73% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC). Cost Analysis 2: 2,269,088 claims mapping to 727 MS-DRGs, with 23.05% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC).
	Charges removed for prior technology	The applicant stated that the TriVerity Test is expected to be used as an aid in the Emergency Department to help identify which patients should receive antibiotics, undergo further diagnostic testing, and be admitted for further treatment, and would be additive to the cases identified. Therefore,

		the applicant did not remove any direct or indirect charges for prior technologies being replaced.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS interim final action with comment period.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant did not add direct or indirect charges related to the new technology.
	Cost analysis results	Cost Analysis 1: - Average case-weighted threshold amount: $67,984 - Final inflated average case-weighted standardized charge per case: $70,025 Cost Analysis 2: - Average case-weighted threshold amount: $73,258 - Final inflated average case-weighted standardized charge per case: $81,393 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in both analyses, the applicant asserted that the TriVerity Test meets the cost criterion.

In the proposed rule, after review of the information provided by the applicant, we noted the applicant stated that the technology was not commercially available immediately after FDA clearance. We stated in the proposed rule that we were interested in additional information regarding the cause of any delay in the technology's commercial availability, including the significance of building up TriVerity cartridge inventory on its availability for routine clinical use.

With regard to the cost criterion, we stated that the applicant stated the technology is used as an aid to differentiate bacterial infections, viral infections, and non-infectious illness, as well as the likelihood of disease progression in adult patients. However, we noted that the applicant included diagnosis codes related to sepsis of newborn in the second cost criterion analysis. We questioned whether diagnosis codes related to newborns were applicable to this technology because it is indicated for use in adult patients, and whether the applicant should have removed these diagnosis codes to identify eligible cases more accurately.

Subject to the applicant adequately addressing this concern, we agreed that the technology meets the cost criterion and proposed to approve the TriVerity Test for new technology add-on payments for FY 2026, for use in conjunction with clinical assessments and other laboratory findings as an aid to differentiate bacterial infections, viral infections, and non-infectious illness, as well as to determine the likelihood of 7-day need for mechanical ventilation, vasopressors, and/or renal replacement therapy in adult patients with suspected acute infection or suspected sepsis presenting to the emergency department.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the TriVerity Test to the hospital to be $388 per patient. The applicant stated that there would be two components for the operating cost of the technology: the TriVerity Cartridge ($375) and the PAXgene Blood RNA Tube ($13). We noted that per the applicant, the PAXgene Blood RNA Tube is an FDA-cleared tube distributed by BD and is a necessary component for hospitals to use the TriVerity Test. The applicant stated that hospitals can purchase the PAXgene Blood RNA Tubes directly from BD or from the applicant. Although the applicant stated that the PAXgene Blood RNA Tube is a new component of the device, we noted that the PAXgene Blood RNA Tube is also commercially available for other uses as a standalone sample collection device, and received FDA marketing authorization as early as April 18, 2005.[136] Therefore, we stated that it appeared that only the cost of the TriVerity Cartridge was appropriate for consideration for new technology add-on payment. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the TriVerity Test would be $243.75 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the TriVerity Test meets the cost criterion and our proposal to approve new technology add-on payments for the TriVerity Test for FY 2026.

Comment: A few commenters, including the applicant, expressed support for our proposal to approve new technology add-on payment for the TriVerity Test for FY 2026.

In response to CMS's request for additional information regarding the delay in the technology's market availability, the applicant stated that the TriVerity Test was cleared by FDA on January 10, 2025, and commercial product inventory became available for hospital customers on March 13, 2025. The applicant stated that Inflammatix manufactures TriVerity cartridges at their headquarters in Sunnyvale, CA and has both an active cartridge production line and storage facilities of TriVerity cartridge inventory. The applicant stated that it affirms it has built up cartridge inventory to meet hospital customer demand for routine use of the TriVerity test.

In response to CMS's question about including diagnosis codes related to sepsis of newborn in the second cost criterion analysis, the applicant stated that while these codes were included in the algorithm to select cases for the analysis, it did not actually identify any cases with the newborn sepsis ICD–10–CM diagnosis codes. Per the applicant, removal of those codes from the case selection algorithm does not affect the results of the cost criterion analysis and the final inflated case weighted

[136] *https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfpmn/denovo.cfm?id=DEN050003.*

standardized charge per case of $81,393 exceeded the case weighted threshold of $73,258 by $8,135. The applicant reiterated that the other cost criterion analysis scenario had a final inflated case weighted standardized charge per case of $70,025, which exceeded the case weighted threshold of $67,984 by $2,041 and that the TriVerity Test meets the cost criterion under both scenarios.

The applicant also agreed with CMS's statement that only the cost of the TriVerity Cartridge should be included in the new technology add-on payment calculation.

Response: We thank the applicant and other commenters for their comments. We agree that the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount. Therefore, the TriVerity Test meets the cost criterion.

We stated in the proposed rule that we were interested in additional information regarding the cause of any delay in the technology's commercial availability, including the significance of building up TriVerity cartridge inventory on its availability for routine clinical use. Although the applicant affirmed that it has built up cartridge inventory to meet demand for routine use of the TriVerity Test, we note that we did not receive any information regarding the cause of any delay in the technology's commercial availability. Therefore, at this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we consider the beginning of the newness period to commence on January 10, 2025, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the TriVerity Test meets the cost criterion. The technology received FDA marketing authorization on January 10, 2025, with an indication for use in conjunction with clinical assessments and other laboratory findings as an aid to differentiate bacterial infections, viral infections, and non-infectious illness, as well as to determine the likelihood of 7-day need for mechanical ventilation, vasopressors, and/or renal replacement therapy in adult patients with suspected acute infection or suspected sepsis presenting to the emergency department. Therefore, we are finalizing our proposal to approve new technology add-on payments for the TriVerity Test for FY 2026. We consider the beginning of the newness period to commence on January 10, 2025, the date of FDA marketing authorization for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the TriVerity Test for the TriVerity Cartridge component is $375. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the TriVerity Test is $243.75 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of the TriVerity Test that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code XXE5XBB (Measurement of infection and immune response, gene expression testing system, new technology group 11).

(19) VITEK® REVEAL™ AST System

The following table summarizes the information provided in the new technology add-on payment application for the VITEK® REVEAL™ AST System.

BILLING CODE 4120–01–P

	VITEK® REVEAL™ AST System	
Technology Info	**Applicant**	bioMerieux
	Description	Per the applicant, the VITEK® REVEAL™ Antimicrobial Susceptibility Testing (AST) System is an in vitro diagnostic (IVD) automated system for the quantitative AST of organisms from positive blood culture. Per the applicant, test results are intended to be used in conjunction with Gram stain, organism identification and other clinical findings to inform antibiotic therapy treatment decisions.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241007GL4LH
FDA Info	**Breakthrough Device designation indication**	Per the applicant, the Reveal Rapid AST System is indicated for use as an IVD automated system for quantitative AST of organisms direct from positive blood culture or isolate dilution. The Reveal GN BC AST Assay is indicated for susceptibility testing of specific gram-negative pathogenic bacteria commonly associated with or causing bacteremia. Results are intended to be used in conjunction with Gram stain, organism identification and other clinical laboratory findings.
	FDA marketing authorization indication	The VITEK® REVEAL™ AST System is an automated system for quantitative and qualitative AST of organisms direct from positive blood culture. The VITEK® REVEAL™ AST System does not provide organism identification. The VITEK® REVEAL™ AST System is an automated system that uses an array of sensors to detect volatile organic compounds emitted by growing bacteria for the IVD quantitative and qualitative determination of antimicrobial susceptibility. The VITEK® REVEAL™ GN AST Assay is indicated for susceptibility testing direct from positive blood culture samples signaled positive by a continuous monitoring blood culture system and confirmed to contain gram-negative bacilli by Gram stain. Organism identification is required for the AST result interpretation and reporting.
	FDA marketing authorization information	Per the applicant, the FDA-cleared device name is slightly different than the Breakthrough Device name, as the word "Rapid" was removed from the name by FDA as a condition of clearance. The applicant stated that the FDA-cleared device name is VITEK® REVEAL™ AST System.
	FDA marketing authorization date	June 20, 2024
	Commercial availability	According to the applicant, the VITEK® REVEAL™ AST System became commercially available on October 21, 2024. Per the applicant, there was a delay in market availability due to lead times in the supply chain and implementation of system modifications due to FDA requirements.
Coding	**Unique ICD-10-PCS Code(s)**	Effective October 1, 2024, the following ICD-10-PCS code may be used to uniquely describe procedures involving the use of the VITEK® REVEAL™ AST System: XXE5X4A (Measurement of infection, positive blood culture small molecule sensory array technology, new technology group 10).
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for the VITEK® REVEAL™ AST System.
	Claims identified	Simulation 1: 1,417,026 claims mapping to 579 MS-DRGs, with 35.52% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC) Simulation 2: 619,445 claims mapping to 3 MS-DRGs, with 81.25% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC) Simulation 3: 417,648 claims mapping to 585 MS-DRGs, with 49.81% of claims mapping to MS-DRG 871

		(Septicemia or Severe Sepsis without MV>96 Hours with MCC) Simulation 4: 798,340 claims mapping to 44 MS-DRGs, with 61.16% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC)
	Charges removed for prior technology	Per the applicant, the technology is not expected to remove the need for prior technologies or remove the costs associated with prior technologies. Therefore, the applicant did not remove any direct or indirect charges for prior technologies being replaced.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the standardizing file posted with the FY 2025 IPPS/LTCH PPS final rule.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.102 for Laboratory from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Simulation 1: - Average case-weighted threshold amount: $81,102 - Final inflated average case-weighted standardized charge per case: $104,143 Simulation 2: - Average case-weighted threshold amount: $76,738 - Final inflated average case-weighted standardized charge per case: $87,170 Simulation 3: - Average case-weighted threshold amount: $78,518 - Final inflated average case-weighted standardized charge per case: $94,050 Simulation 4: - Average case-weighted threshold amount: $81,248 - Final inflated average case-weighted standardized charge per case: $93,942 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all scenarios, the applicant asserted that the VITEK® REVEAL™ AST System meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received 510(k) clearance is included within the scope of the Breakthrough Device designation indication, it appears that the FDA-cleared indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.[137]

We noted the applicant stated the device was not commercially available until October 21, 2024, due to lead times in the supply chain and implementation of system modifications due to FDA requirements. We stated that we were interested in additional information regarding the cause for any delay in the technology's commercial availability, as it received FDA clearance on June 20, 2024, and it was not clear how lead times in the supply chain affected its availability on the market and what system modifications were required.

We agreed with the applicant that the VITEK® REVEAL™ AST System meets the cost criterion and therefore proposed to approve the VITEK® REVEAL™ AST System for new technology add-on payments for FY 2026, indicated for susceptibility testing direct from positive blood culture samples signaled positive by a continuous monitoring blood culture system and confirmed to contain gram-negative bacilli by Gram stain.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of the VITEK® REVEAL™ AST System to the hospital to be $125 per patient for the VITEK® REVEAL™ Sensor Array. Per the applicant, while there are additional capital costs for the technology, these costs were not included in the device's cost to the hospital per patient per inpatient stay. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of the VITEK® REVEAL™ AST System would be $81.25 for FY 2026 (that is, 65 percent of the average cost of the technology).

We invited public comments on whether the VITEK® REVEAL™ AST System meets the cost criterion and our proposal to approve new technology add-on payments for the VITEK® REVEAL™ AST System for FY 2026.

Comment: A few commenters, including the applicant, submitted public comments expressing support for our proposal to approve new technology add-on payment for the VITEK® REVEAL™ AST System for FY 2026. The applicant also stated that the technology meets the newness criterion for FY 2026, does not have to demonstrate substantial clinical improvement in order to qualify for new technology add-on payments, reiterated that it met the cost criterion, and agreed

[137] Breakthrough Devices Program *https://www.fda.gov/medical-devices/how-study-and-market-your-device/breakthrough-devices-program.*

with the proposed maximum new technology add-on payment of $81.25.

In response to CMS's request for additional information regarding the delay in the technology's market availability, the applicant stated the VITEK® REVEAL™ received FDA clearance in June 2024, but the technology was not commercially available until October 21, 2024. Per the applicant, the basis for the delay was due to the implementation of a software requirement from FDA that could not be validated until a validation panel was available. The applicant stated that an external entity was not able to provide the aforementioned panel until September 2024, and that validation was initiated upon receipt of the panel and completed in October. Per the applicant, it had to delay commercial availability until this step was completed.

Response: We thank the commenters for their comments.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe the VITEK® REVEAL™ AST System meets the cost criterion. The technology received 510(k) clearance on June 20, 2024, with an indication for susceptibility testing direct from positive blood culture samples signaled positive by a continuous monitoring blood culture system and confirmed to contain gram-negative bacilli by Gram stain, which is covered by its Breakthrough Device designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for the VITEK® REVEAL™ AST System for FY 2026. We consider the beginning of the newness period to commence on October 21, 2024, the date on which the technology became commercially available for the indication covered by its Breakthrough Device designation.

Based on the information available at the time of this final rule, the cost per case of the VITEK® REVEAL™ AST System is $125. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 65 percent of the average cost of the technology, or 65 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of the VITEK® REVEAL™ AST System is $81.25 for FY 2026 (that is, 65 percent of the average cost of the technology). Cases involving the use of the VITEK® REVEAL™ AST System that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code XXE5X4A (Measurement of infection, positive blood culture small molecule sensor array technology, new technology group 10).

b. Alternative Pathways for Qualified Infectious Disease Products (QIDPs)

(1) EMBLAVEO™ (aztreonam-avibactam)

The following table summarizes the information provided in the new technology add-on payment application for EMBLAVEO™ (also referred to as ATM–AVI).

	EMBLAVEO™ (aztreonam-avibactam)	
Technology Info	**Applicant**	AbbVie
	Description	Per the applicant, ATM-AVI is an intravenous antibiotic treatment for infections caused by Gram-negative bacteria with limited treatment options. Per the applicant, it combines aztreonam, a monobactam β-lactam, with avibactam, a potent broad-spectrum β-lactamase inhibitor.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP241005WY6F6
FDA Info	**QIDP designation indication**	Per the applicant, ATM-AVI is designated as a QIDP for treatment of complicated intra-abdominal infections (cIAI), complicated urinary tract infections (cUTI), and hospital-acquired bacterial pneumonia (HABP)/ventilator-associated bacterial pneumonia (VABP).
	FDA marketing authorization indication	Emblaveo, in combination with metronidazole, is indicated in patients 18 years and older who have limited or no alternative options for the treatment of complicated intraabdominal infections (cIAI) including those caused by the following susceptible gram-negative microorganisms: *Escherichia coli, Klebsiella pneumoniae, Klebsiella oxytoca, Enterobacter cloacae complex, Citrobacter freundii complex*, and *Serratia marcescens*.
	FDA marketing authorization date	February 7, 2025
	Commercial availability	The applicant anticipates EMBLAVEO™ will be available for use and purchase in the United States by quarter 3 (Q3) of calendar year (CY) 2025 due to product availability.
Coding	**Unique ICD-10-PCS Code(s)**	The applicant submitted a request for approval for a unique ICD-10-PCS procedure code beginning in FY 2026.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes, ICD-10-PCS codes, and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for EMBLAVEO™ (aztreonam-avibactam).
	Claims identified	57,785 claims mapping to 369 MS-DRGs, with 18.17% of claims mapping to MS-DRG 853 (Infectious and Parasitic Diseases with O.R. Procedures with MCC).
	Charges removed for prior technology	The applicant did not remove any charges for drugs from the identified cases because the technology is expected to be additive to current treatments. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS interim final action with comment period.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant did not add direct or indirect charges related to the technology.
	Cost analysis results	Average case-weighted threshold amount: $126,084 Final inflated average case-weighted standardized charge per case: $195,074 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount, the applicant asserted that EMBLAVEO™ meets the cost criterion.

In the proposed rule, we noted that after review of the information provided by the applicant, since the indication for which the applicant received NDA approval is included within the scope of the QIDP designation indication, it appears that the FDA-approved indication is appropriate for consideration for new technology add-on payment under the alternative pathway criteria.

We noted that the applicant stated that the technology is expected to be commercially available by Q3 of CY 2025 due to product availability. We stated we were interested in additional information regarding the cause for any delay in the technology's market availability as the technology received FDA approval on February 7, 2025.

We agreed with the applicant that EMBLAVEO™ meets the cost criterion and therefore proposed to approve EMBLAVEO™ for new technology add-on payments for FY 2026 for use in patients 18 years and older who have limited or no alternative options for the treatment of cIAI.

The applicant had not provided an estimate for the cost of EMBLAVEO™ at the time of the proposed rule. We stated that we expected the applicant to submit cost information prior to the final rule, and that we would provide an update regarding the new technology add-on payment amount for the technology, if approved, in the final rule. We stated that any new technology add-on payment for EMBLAVEO™ would be subject to our policy under § 412.88(a)(2)(ii)(B) where we limit new technology add-on payment for QIDPs to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case.

We invited public comments on whether EMBLAVEO™ meets the cost criterion and our proposal to approve new technology add-on payments for EMBLAVEO™ for FY 2026.

Comment: A few commenters, including the applicant submitted public comments expressing support for our proposal to approve new technology add-on payment for EMBLAVEO™ for FY 2026, with the applicant further reiterating that the product meets the cost criterion.

In response to CMS's request regarding the cause for delay in the technology's market availability, the applicant stated that it expected that EMBLAVEO™ would be commercially available for use and purchase in the United States by quarter 3 (Q3) of calendar year (CY) 2025 due to delays related to first run manufacturing for the product and packaging and other processes such as securing an export license to ship the drug to the U.S., followed by customs clearance. The applicant stated that the product will not be commercially available in the U.S. until after these processes are complete and that it would notify CMS of the date when EMBLAVEO™ is first available in the U.S. The applicant requested that the newness period for the product begin on that date.

The applicant also provided the cost for EMBLAVEO™ at $327 per vial as of June 9, 2025. The applicant stated that the anticipated cost of EMBLAVEO™ in the hospital setting is $12,000.90, which was calculated using data from the clinical trials and accounted for the loading dose, patients' estimated creatinine clearance, and treatment duration. The applicant requested that CMS set the maximum new technology add-on payment for cases involving the use of EMBLAVEO™ at $9,000.68 for FY 2026 (that is, 75 percent of the average cost of the technology), because EMBLAVEO™ is a designated QIDP.

Response: We thank the commenters for their support and additional information.

As we have discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that EMBLAVEO™ is expected to be commercially available by Q3 of CY 2025 due to product availability, but it is unclear whether the technology would be available for sale prior to that date. At this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market. Absent additional information, we therefore consider the newness date for this technology to be February 7, 2025.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe EMBLAVEO™ meets the cost criterion. The technology received NDA approval on February 7, 2025, with an indication for use in patients 18 years and older who have limited or no alternative options for the treatment of cIAI, which is covered by its QIDP designation. Therefore, we are finalizing our proposal to approve new technology add-on payments for EMBLAVEO™ for FY 2026. Absent additional information from the applicant, we consider the beginning of the newness period to commence on February 7, 2025, the date of FDA marketing authorization for the indication covered by its QIDP designation.

Based on the information available at the time of this final rule, the cost per case of EMBLAVEO™ is $12,000.90. Under § 412.88(a)(2), we limit new technology add-on payments for QIDPs to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that the maximum new technology add-on payment for a case involving the use of EMBLAVEO™ is $9,000.68 for FY 2026 (that is, 75 percent of the average cost of the technology).

The applicant submitted a request and was granted approval for unique ICD–10–PCS procedure codes for EMBLAVEO™ beginning in FY 2026. Therefore, cases involving the use of EMBLAVEO™ that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes XW033PB (Introduction of aztreonam-avibactam anti-infective into peripheral vein, percutaneous approach, new technology group 11) or XW043PB (Introduction of aztreonam-avibactam anti-infective into central vein, percutaneous approach, new technology group 11).

(2) CONTEPO™ (fosfomycin)

The following table summarizes the information provided in the new technology add-on payment application for CONTEPO™ (fosfomycin). We note that Nabriva Therapeutics submitted an application for CONTEPO™ for FY 2021 and FY 2022, as summarized in the FY 2021 and FY 2022 IPPS/LTCH PPS proposed rules (85 FR 32682 through 32683; 86 FR 25390 through 25392), and received conditional approval subject to the technology receiving FDA marketing authorization before July 1 of the particular fiscal year for which the applicant applied for new technology add-on payments (85 FR 58723 through 58725; 86 FR 45154 through 45155). CONTEPO™ did not receive FDA marketing authorization by the applicable July 1 deadlines, and was therefore not eligible for new technology add-on payments for FY 2021 or FY 2022 (86 FR 44972; 87 FR 48909).

Per the applicant, Meitheal Pharmaceuticals Inc. has acquired the rights to CONTEPO™ in the U.S. and is submitting the new technology add-on payment application for FY 2026.

BILLING CODE 4120–01–P

	CONTEPO™ (fosfomycin)	
Technology Info	**Applicant**	Meitheal Pharmaceuticals Inc.
	Description	Per the applicant, CONTEPO™ for injection is a broad spectrum intravenous antibiotic for the treatment of complicated urinary tract infection (cUTI), including acute pyelonephritis, due to difficult to treat Gram-negative and Gram-positive bacteria.
	Online application	https://mearis.cms.gov/public/publications/ntap/NTP2410073U85N
FDA Info	**QIDP designation Indication**	Per the applicant, ZTI-01 (fosfomycin disodium) is designated for IV use as a QIDP for cUTI.
	FDA marketing authorization information	The applicant anticipates an NDA decision from FDA before July 1, 2025, consistent with its QIDP designation. According to the applicant, the QIDP designation indication refers to ZTI-01 and the generic name fosfomycin disodium, as the brand name CONTEPO™ was not yet established at the time of QIDP designation.
	Commercial availability	According to the applicant, CONTEPO™ is expected to be commercially available within 3 months of FDA approval due to manufacturing scheduling, final label implementation and printing and supply chain fulfilment.
Coding	**Unique ICD-10-PCS Code(s)**	A code proposal in association with the Spring 2025 ICD-10 Coordination and Maintenance Committee Update regarding a unique procedure code beginning in FY 2026 was made available in the ICD-10-PCS Topics Open for Public Comment materials located at: https://www.cms.gov/medicare/coding-billing/icd-10-codes/icd-10-coordination-maintenance-committee-materials.
	ICD-10-CM Code(s)	The applicant provided a list of diagnosis codes that may be used to currently identify the indication under the ICD-10-CM coding system in the online application posting.
Cost Criterion	**Inclusion/exclusion criteria**	For the Inclusion/Exclusion criteria used in the Cost Analysis, including the data source and lists of ICD-10-CM codes and MS-DRGs used by the applicant, see the cost criterion codes and MS-DRGs attachment included in the online posting for CONTEPO™.
	Claims identified	Cost Analysis 1: 528,518 claims mapping to 575 MS-DRGs, with 15.84% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC). Cost Analysis 2: 396,786 claims mapping to 559 MS-DRGs, with 16.81% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC). Cost Analysis 3: 371,862 claims mapping to 20 MS-DRGs, with 22.51% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC). Cost Analysis 4: 319,332 claims mapping to 10 MS-DRGs, with 26.22% of claims mapping to MS-DRG 871 (Septicemia or Severe Sepsis without MV>96 Hours with MCC).
	Charges removed for prior technology	Per the applicant, it is likely that CONTEPO™ will replace other antibiotics during some patients' inpatient stays, but it is difficult to identify the exact differences in drug regimen that patients treated with CONTEPO™ would receive, both before and in conjunction with treatment with CONTEPO™. Therefore, to make the estimate conservative, the applicant removed all drug charges on the original claims. The applicant stated that this is likely an overestimation of the charges of the drugs that will be replaced, as patients may receive drugs in addition to CONTEPO™ for care during their hospitalization. The applicant did not remove indirect charges related to the prior technology.
	Standardized charges	The applicant used the standardization formula provided in Appendix A of the application. The applicant used all relevant values reported in the impact file posted with the FY 2025 IPPS/LTCH PPS interim final action with comment period.
	Inflation factor	The applicant applied an inflation factor of 12.87% to the standardized charges, based on the inflation factor used to calculate outlier threshold charges in the FY 2025 IPPS/LTCH PPS final rule.
	Charges added for the new technology	The applicant added charges for the new technology by dividing the cost of the new technology by the national average cost-to-charge ratio of 0.178 for Drugs and Cellular Therapies from the FY 2025 IPPS/LTCH PPS final rule. The applicant did not add indirect charges related to the new technology.
	Cost analysis results	Cost Analysis 1: - Average case-weighted threshold amount: $71,141 - Final inflated average case-weighted standardized charge per case: $132,960 Cost Analysis 2: - Average case-weighted threshold amount: $66,939 - Final inflated average case-weighted standardized charge per case: $ 115,271

		Cost Analysis 3: - Average case-weighted threshold amount: $67,176 - Final inflated average case-weighted standardized charge per case: $124,459 Cost Analysis 4: - Average case-weighted threshold amount: $65,055 - Final inflated average case-weighted standardized charge per case: $ 121,799 Because the final inflated average case-weighted standardized charge per case exceeded the average case-weighted threshold amount in all analyses, the applicant asserted that CONTEPO™ meets the cost criterion.

BILLING CODE 4120–01–C

In the proposed rule, after review of the information provided by the applicant, we noted that the applicant stated that the technology is expected to be commercially available within 3 months of FDA approval, and we stated that we would appreciate more information on the reasons for any delay in the commercial availability of CONTEPO™ following FDA approval.

We agreed with the applicant that CONTEPO™ meets the cost criterion and therefore proposed to approve CONTEPO™ for new technology add-on payments for FY 2026, subject to the technology receiving FDA marketing authorization for the indication corresponding to the QIDP designation by July 1, 2025. We stated that as an application submitted under the alternative pathway for certain antimicrobial products at § 412.87(d), CONTEPO™ is eligible for conditional approval for new technology add-on payments if it does not receive FDA marketing authorization by July 1, 2025, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments (that is, July 1, 2026), as provided in § 412.87(f)(3). We stated that if CONTEPO™ receives FDA marketing authorization before July 1, 2026, the new technology add-on payment for cases involving the use of this technology would be made effective for discharges beginning in the first quarter after FDA marketing authorization is granted. If FDA marketing authorization is received on or after July 1, 2026, no new technology add-on payments would be made for cases involving the use of CONTEPO™ for FY 2026.

Based on preliminary information from the applicant at the time of the proposed rule, the applicant anticipated the total cost of CONTEPO™ to the hospital to be $11,700 per patient. The applicant estimated that each vial costs $325 and that 3 doses are needed each day for an average treatment duration of 12 days. We noted that the cost information for this technology may be updated in the final rule based on revised or additional information CMS receives prior to the final rule. Under § 412.88(a)(2)(ii)(B), we limit new technology add-on payment for technologies designated as QIDPs to the lesser of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case. As a result, we proposed that the maximum new technology add-on payment for a case involving the use of CONTEPO™ would be $8,775 for FY 2026 (that is, 75 percent of the average cost of the technology).

We invited public comments on whether CONTEPO™ meets the cost criterion and our proposal to approve new technology add-on payments for CONTEPO™ for FY 2026, subject to the technology receiving FDA marketing authorization consistent with its QIDP designation by July 1, 2025.

Comment: We received comments expressing support for technologies under consideration for new technology add-on payments for FY 2026.

The applicant submitted a public comment in response to CMS's request for additional information regarding the expected delay in the commercial availability of CONTEPO™ following FDA approval. The applicant stated that once CONTEPO™ receives marketing authorization from FDA, the final label needs to be implemented and printed, and product packaging needs to be finalized and produced. The applicant stated that logistics in the supply chain and proper loading of product information in the supply chain systems would altogether take an anticipated three months from approval. The applicant stated that this was the basis of its assessment of product availability 3 months after FDA approval.

Response: We thank the commenters for their comments. As we have discussed in prior rulemaking (86 FR 45132; 77 FR 53348), generally, our policy is to begin the newness period on the date of FDA approval or clearance or, if later, the date of availability of the product on the U.S. market. The applicant states that it anticipates three months from FDA approval for commercial availability, but it is unclear when the technology would be available for sale. At this time, there is not sufficient information to determine a newness date based on a documented delay in the technology's availability on the U.S. market.

Based on the information provided in the application for new technology add-on payments, and after consideration of the public comments we received, we believe CONTEPO™ meets the cost criterion. Therefore, we are granting a conditional approval for CONTEPO™ for new technology add-on payments for FY 2026, subject to the technology receiving FDA marketing authorization before July 1, 2026 (that is, before July 1 of the fiscal year for which the applicant applied for new technology add-on payments (2026)). In the proposed rule we stated that as an application submitted under the alternative pathway for certain antimicrobial products at § 412.87(d), CONTEPO™ is eligible for conditional approval for new technology add-on payments if it does not receive FDA marketing authorization by July 1, 2025, provided that the technology receives FDA marketing authorization before July 1 of the fiscal year for which the applicant applied for new technology add-on payments (that is, July 1, 2026), as provided in § 412.87(f)(3) (90 FR 18217). If CONTEPO™ receives FDA marketing authorization before July 1, 2026, the new technology add-on payment for cases involving the use of this technology would be made effective for discharges beginning in the first quarter after FDA marketing authorization is granted. If FDA marketing authorization is received on or after July 1, 2026, no new technology add-on payments will be made for cases involving the use of CONTEPO™ for FY 2026.

Based on the information available at the time of this final rule, the cost per case of CONTEPO™ is $11,700. Under § 412.88(a)(2), we limit new technology add-on payments for QIDPs to the lesser

of 75 percent of the average cost of the technology, or 75 percent of the costs in excess of the MS–DRG payment for the case. As a result, we are finalizing that, subject to CONTEPO™ receiving FDA marketing authorization before July 1, 2026, the maximum new technology add-on payment for a case involving the use of CONTEPO™ is $8,775 for FY 2026 (that is, 75 percent of the average cost of the technology). Cases involving the use of CONTEPO™ that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes XW033WB (Introduction of fosfomycin anti-infective into peripheral vein, percutaneous approach, new technology group 11) or XW043WB (Introduction of fosfomycin anti-infective into central vein, percutaneous approach, new technology group 11).

7. Other Comments

We received several public comments requesting changes to the new technology add-on payment policies such as, but not limited to: modifying or removing the requirement for a complete and active FDA marketing authorization request, changing the deadline for an applicant for new technology add-on payments to receive FDA marketing authorization, and establishing a more frequent (such as quarterly or biannual) process to apply for new technology add-on payment. We also received comments on technologies that were not under consideration for new technology add-on payments for FY 2026. These comments were outside the scope of the proposals included in the FY 2026 IPPS/LTCH PPS proposed rule and we are therefore not addressing them in this final rule.

III. Changes to the Hospital Wage Index for Acute Care Hospitals

A. Background

1. Legislative Authority

Section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary adjust the standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We currently define hospital labor market areas based on the delineations of statistical areas established by the Office of Management and Budget (OMB). A discussion of the FY 2026 hospital wage index based on the statistical areas appears under section III.B. of the preamble of this final rule.

Section 1886(d)(3)(E) of the Act requires the Secretary to update the wage index annually and to base the update on a survey of wages and wage-related costs of short-term, acute care hospitals. CMS collects these data on the Medicare cost report, CMS Form 2552–10, Worksheet S–3, Parts II, III, IV. The aforementioned information collection requirements are in Worksheet S–3, Parts II, III, IV. of the information collection request titled ''Hospitals and Health Care Complex Cost Report (CMS Form 2552–10)''. The information collection request is currently approved under OMB control number is 0938–0050 and has a September 30, 2025, expiration date. We have submitted the information collection request to OMB for reapproval. Section 1886(d)(3)(E) of the Act also requires that any updates or adjustments to the wage index be made in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. The adjustment for FY 2026 is discussed in section II.B. of the Addendum to this final rule.

As discussed in section III.I. of the preamble of this final rule, we also take into account the geographic reclassification of hospitals in accordance with sections 1886(d)(8)(B) and 1886(d)(10) of the Act when calculating IPPS payment amounts. Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amounts so as to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B), 1886(d)(8)(C), and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. The budget neutrality adjustment for FY 2026 is discussed in section II.A.4.b. of the Addendum to this final rule.

Section 1886(d)(3)(E) of the Act also provides for the collection of data every 3 years on the occupational mix of employees for short-term, acute care hospitals participating in the Medicare program to construct an occupational mix adjustment to the wage index. The information collection request is currently approved under OMB control number is 0938–0907 and has a January 31, 2026, expiration date. We plan to submit the information collection request to OMB for reapproval in the near future. A discussion of the occupational mix adjustment that we are applying to the FY 2026 wage index appears under section III.E. of the preamble of this final rule.

2. Core-Based Statistical Areas (CBSAs) for the FY 2026 Hospital Wage Index

The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005 (69 FR 49026 through 49032), we delineate hospital labor market areas based on OMB-established Core-Based Statistical Areas (CBSAs). In the July 16, 2021, **Federal Register** (86 FR 37777), OMB finalized a schedule for future updates based on results of the decennial Census updates to commuting patterns from the American Community Survey (ACS). In accordance with that schedule, on July 21, 2023, OMB released Bulletin No. 23–01. The current statistical areas (which were implemented beginning with FY 2025) are based on revised OMB delineations issued on July 21, 2023, in OMB Bulletin No. 23–01. According to OMB, the delineations reflect the 2020 Standards for Delineating Core Based Statistical Areas (''the 2020 Standards''), which appeared in the **Federal Register** on July 16, 2021 (86 FR 37770 through 37778), and the application of those standards to Census Bureau population and journey-to-work data (that is, 2020 Decennial Census, the ACS, and Census Population Estimates Program data) (we refer to these revised OMB delineations as the ''new OMB delineations'' in this final rule). A copy of OMB Bulletin No. 23–01 may be obtained at *https://bidenwhitehouse.archives.gov/wp-content/uploads/2023/07/OMB-Bulletin-23-01.pdf*. We refer readers to the FY 2025 IPPS/LTCH PPS final rule (89 FR 69253 through 69266) for a full discussion of our implementation of the new OMB delineations for the FY 2025 wage index. For FY 2026, we are continuing to use the new OMB delineations that we adopted beginning with FY 2025 to calculate the area wage indexes and the transition periods.

3. Codes for Constituent Counties in CBSAs

CBSAs are made up of one or more constituent counties. Each CBSA and constituent county has its own unique identifying codes. The Federal Information Processing Standard (FIPS) county codes are maintained by the U.S. Census Bureau. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38129 through 38130), we adopted a policy to use the FIPS county codes for purposes of crosswalking counties to CBSAs. In addition, in the same rule, we implemented the latest FIPS code updates, which were effective October 1, 2017, beginning with the FY 2018

wage indexes. These updates have been used to calculate the wage indexes in a manner generally consistent with the CBSA-based methodologies finalized in the FY 2005 IPPS final rule and the FY 2015 IPPS/LTCH PPS final rule. We refer the reader to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38129 through 38130) for a complete discussion of our adoption of FIPS county codes. For FY 2026, we are continuing to use only the FIPS county codes for purposes of crosswalking counties to CBSAs. For FY 2026, Tables 2 and 3 associated with this final rule and the County to CBSA Crosswalk File and Urban CBSAs and Constituent Counties for Acute Care Hospitals File posted on the CMS website reflect the latest FIPS county code updates.

B. Worksheet S–3 Wage Data for the FY 2026 Wage Index

1. Cost Reporting Periods Beginning in FY 2022 for FY 2026 Wage Index

The FY 2026 wage index values are based on the data collected from the Medicare cost reports submitted by hospitals for cost reporting periods beginning in FY 2022 (the FY 2025 wage indexes were based on data from cost reporting periods beginning during FY 2021).

The FY 2026 wage index includes all of the following categories of data associated with costs paid under the IPPS (as well as outpatient costs):

- Salaries and hours from short-term, acute care hospitals (including paid lunch hours and hours associated with military leave and jury duty).
- Home office costs and hours.
- Certain contract labor costs and hours including direct patient care (which includes nursing), certain top management, pharmacy, laboratory, and nonteaching physician Part A services, and certain contract indirect patient care services (as discussed in the FY 2008 final rule with comment period (72 FR 47315 through 47317)).
- Wage-related costs, including pension costs (based on policies adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51586 through 51590) and modified in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49505 through 49508)) and other deferred compensation costs.

Consistent with the wage index methodology for FY 2025, the wage index for FY 2026 excludes the direct and overhead salaries and hours for services not subject to IPPS payment, such as skilled nursing facility (SNF) services, home health services, costs related to Graduate Medical Education (GME) (teaching physicians and residents) and certified registered nurse anesthetists (CRNAs), and other subprovider components that are not paid under the IPPS. The FY 2026 wage index also excludes the salaries, hours, and wage-related costs of hospital-based rural health clinics (RHCs), and federally qualified health centers (FQHCs), because Medicare pays for these costs outside of the IPPS (68 FR 45395). In addition, as explained in the FY 2004 IPPS final rule (68 FR 45397 through 45398), salaries, hours, and wage-related costs of critical access hospitals (CAHs) are excluded from the wage index as we believe that removing CAHs from the wage index is prudent policy, given the substantial negative impact these hospitals have on the wage indexes in the areas where they are located and the minimal impact they have on the wage indexes of other areas. We refer the reader to the FY 2004 IPPS final rule (68 FR 45397 through 45398) for a complete discussion regarding the exclusion of CAHs from the wage index. Similar to our treatment of CAHs, as discussed later in this section, we exclude rural emergency hospitals (REHs) from the wage index.

For FY 2020 and subsequent years, other wage-related costs are also excluded from the calculation of the wage index. As discussed in the FY 2019 IPPS/LTCH final rule (83 FR 41365 through 41369), other wage-related costs reported on Worksheet S–3, Part II, Line 18 and Worksheet S–3, Part IV, Line 25 and subscripts, as well as all other wage-related costs, such as contract labor costs, are excluded from the calculation of the wage index.

2. Use of Wage Index Data by Suppliers and Providers Other Than Acute Care Hospitals Under the IPPS

Data collected for the IPPS wage index also are currently used to calculate wage indexes applicable to suppliers and other providers, such as SNFs, home health agencies (HHAs), ambulatory surgical centers (ASCs), and hospices. In addition, they are used for prospective payments to IRFs, IPFs, and LTCHs, and for hospital outpatient services. We note, in the calendar year (CY) 2025 ESRD PPS final rule (89 FR 89097 through 89116), CMS finalized a new ESRD PPS-specific wage index that will be used to adjust ESRD PPS payments for geographic differences in area wages. We refer the reader to the CY 2025 ESRD PPS final rule for complete details regarding ESRD wage index. We further note that, in the IPPS rules, we do not address comments pertaining to the wage indexes of any supplier or provider except IPPS providers and LTCHs. Such comments should be made in response to separate proposed rules for those suppliers and providers.

3. Verification of Worksheet S–3 Wage Data

The wage data for the FY 2026 wage index were obtained from Worksheet S–3, Parts II, III, and IV of the Medicare cost report, CMS Form 2552–10 (OMB Control Number 0938–0050 with an expiration date September 30, 2025) for cost reporting periods beginning on or after October 1, 2021, and before October 1, 2022. For wage index purposes, we refer to cost reports beginning on or after October 1, 2021, and before October 1, 2022, as the ''FY 2022 cost report,'' the ''FY 2022 wage data,'' or the ''FY 2022 data.'' Instructions for completing the wage index sections of Worksheet S–3 are included in the Provider Reimbursement Manual (PRM), Part 2 (Pub. 15–2), Chapter 40, Sections 4005.2 through 4005.4. The data file used to construct the FY 2026 wage index includes FY 2022 data submitted to us as of January 31, 2025. As in past years, we performed an extensive review of the wage data, mostly through the use of edits designed to identify aberrant data.

We note, in previous fiscal years, we reviewed and evaluated the audited wage data, and the impacts of the COVID–19 PHE on such data. For FY 2026, we have not identified any significant issues with the FY 2022 wage data itself in terms of our audits of this data. As usual, the data was audited by the Medicare Administrative Contractors (MACs), and there were no significant issues reported across the data for all hospitals.

We requested that our MACs revise or verify data elements that resulted in specific edit failures. For the proposed FY 2026 wage index, we identified and excluded 79 providers with aberrant data that should not be included in the wage index. However, we stated that if data elements for some of these providers are corrected, we intend to include data from those providers in the final FY 2026 wage index. We also adjusted certain aberrant data and included these data in the wage index. For example, in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). We instructed MACs to complete their verification of questionable data elements and to transmit any changes to the wage data no later than March 21, 2025. After we

issued the proposed rule, for the final FY 2026 wage index, we restored the data of 15 hospitals to the wage index, because their data was either verified or improved and removed the data of 2 hospitals with aberrant data. Thus, 66 hospitals with aberrant data remain excluded from the FY 2026 wage index (79 − 15 + 2 = 66).

In constructing the proposed FY 2026 wage index, we included the wage data for facilities that were IPPS hospitals in FY 2022, inclusive of those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We stated in the proposed rule (90 FR 18219) that we believe that including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages.

As discussed in the FY 2004 IPPS final rule (68 FR 45397 through 45398) and FY 2025 IPPS/LTCH final rule (89 FR 69268), any hospital that is designated as a CAH or REH by 7 days prior to the publication of the preliminary wage index public use file (PUF) is excluded from the calculation of the wage index.

For the proposed FY 2026 wage index, we removed 7 hospitals that converted to CAH status and 5 hospitals that converted to REH status on or after January 24, 2024, the cut-off date for CAH and REH exclusion from the FY 2025 wage index, and through and including January 24, 2025, the cut-off date for CAH and REH exclusion from the FY 2026 wage index. We did not receive any comments with regard to this proposal, and we are finalizing as proposed to exclude hospitals that have subsequently converted to CAH and/or REH from the wage index calculation. Since we issued the proposed rule, we learned of 6 more hospitals that converted to CAH and/or REH status on or after January 24, 2024, and through and including January 24, 2025. We removed these additional hospitals from the FY 2026 wage index due to their conversion to CAH and/or REH status. In summary, we calculated the FY 2026 wage index using the Worksheet S–3, Parts II and III wage data of 3,036 hospitals.

For the FY 2026 wage index, we allotted the wages and hours data for a multicampus hospital among the different labor market areas where its campuses are located using campus full-time equivalent (FTE) percentages as originally finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51591). Table 2, which contains the FY 2026 wage index associated with this final rule (available via the internet on the CMS website), includes separate wage data for the campuses of 29 multicampus hospitals. The following chart lists the multicampus hospitals by CMS certification number (CCN) and the FTE percentages on which the wages and hours of each campus were allotted to their respective labor market areas:

CCN of Main Campus of Multicampus Hospital	Full-Time Equivalent Percentage of Main Campus	CCN of Sub Campus of Multicampus Hospital	Full-Time Equivalent Percentage of Sub Campus	CCN of Second Sub Campus of Multicampus Hospital	Full-Time Equivalent Percentage of Second Sub Campus
050121	0.86	05B121	0.14		
070010	0.85	07B010	0.15		
070022	0.99	07B022	0.01		
100029	0.52	10B029	0.48		
140010	0.81	14B010	0.19		
220074	0.9	22B074	0.1		
310069	0.17	31B069	0.83		
330103	0.69	33B103	0.31		
330195	0.9	33B195	0.1		
330214	0.77	33B214	0.23		
330234	0.79	33B234	0.21		
340040	0.93	34B040	0.07		
340115	0.82	34B115	0.13	34C115	0.05
360020	0.97	36B020	0.03		
390115	0.82	39B115	0.18		
390142	0.83	39B142	0.17		
390307	0.89	39B307	0.11		
420004	0.96	42B004	0.04		
450033	0.96	45B033	0.04		
450330	0.96	45B330	0.04		
460051	0.77	46B051	0.23		
510022	0.94	51B022	0.06		
520009	0.72	52B009	0.28		
520030	0.98	52B030	0.02		
520189	0.72	52B189	0.28		
670062	0.84	67B062	0.16		
670102	0.68	67B102	0.32		
670107	0.69	67B107	0.31		
670116	0.66	67B116	0.34		

We note that, in past years, in Table 2, we have placed a ''B'' to designate the subordinate campus in the fourth position of the hospital CCN. However, for the FY 2019 IPPS/LTCH PPS proposed and final rules and subsequent rules, we have moved the ''B'' to the third position of the CCN. Because all IPPS hospitals have a ''0'' in the third position of the CCN, we believe that placement of the ''B'' in this third position, instead of the ''0'' for the subordinate campus, is the most efficient method of identification and interferes the least with the other variable digits in the CCN. We also note that provider 340115 has an additional second sub campus located in a different CBSA then the main campus and its other sub campus. Therefore, in order to uniquely identify this second sub campus, we have placed a ''C'' in the third position of the CCN.

4. Process for Requests for Wage Index Data Corrections

a. Process for Hospitals To Request Wage Index Data Corrections

The preliminary, unaudited Worksheet S–3 wage data files for the proposed FY 2026 wage index were made available on May 23, 2024, through the internet on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/wage-index-files/fy-2026-wage-index-home-page*. The FY 2026 preliminary Worksheet S–3 wage data file inadvertently contained cost report data with a begin date before 10/01/2021 and cost report data with a begin date after 10/01/2022. We removed these cost reports and added cost reports that were inadvertently omitted from the file originally posted on May 23. Therefore, on June 20, 2024, we posted an updated FY 2026 preliminary Worksheet S–3 wage data file.

On January 31, 2025, we posted a public use file (PUF) at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/wage-index-files/fy-2026-wage-index-home-page* containing FY 2026 wage index data available as of January 31, 2025. This PUF contains a tab with the Worksheet S–3 wage data (which includes Worksheet S–3, Parts II and III wage data from cost reporting periods beginning on or after October 1, 2021, through September 30, 2022; that is, FY 2022 wage data), a tab with the occupational mix data (which includes data from the CY 2022 occupational mix survey, Form CMS–10079), a tab containing the Worksheet S–3 wage data of hospitals deleted from the January 31, 2025 wage data PUF, and a tab containing the CY 2022 occupational mix data of the hospitals deleted from

the January 31, 2025 occupational mix PUF. In a memorandum dated January 31, 2025, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the January 31, 2025, wage index data PUFs, and the process and timeframe for requesting revisions in accordance with the FY 2026 Hospital Wage Index Development Time Table available at *https://www.cms.gov/files/document/fy-2026-hospital-wage-index-development-time-table.pdf*.

In the interest of meeting the data needs of the public, beginning with the proposed FY 2009 wage index, we post an additional PUF on the CMS website that reflects the actual data that are used in computing the proposed wage index. The release of this file does not alter the current wage index process or schedule.

In a memorandum dated April 17, 2024, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the preliminary wage index data files and the CY 2022 occupational mix survey data files posted on May 23, 2024, and the process and timeframe for requesting revisions.

If a hospital wished to request a change to its data as shown in the May 23, 2024, preliminary wage data files and occupational mix data files, the hospital had to submit corrections along with complete, detailed supporting documentation to its MAC so that the MAC received them by September 3, 2024. Hospitals were notified of these deadlines and of all other deadlines and requirements, including the requirement to review and verify their data as posted in the preliminary wage index data files on the internet, through the letters sent to them by their MACs.

November 1, 2024, was the date by when MACs notified State hospital associations regarding hospitals that failed to respond to issues raised during the desk reviews. Additional revisions made by the MACs were transmitted to CMS throughout January 2025. CMS published the wage index PUFs that included hospitals' revised wage index data on January 31, 2025. Hospitals had until February 18, 2025, to submit requests to the MACs to correct errors in the January 31, 2025, PUF due to CMS or MAC mishandling of the wage index data, or to revise desk review adjustments to their wage index data as included in the January 31, 2025, PUF. Hospitals also were required to submit sufficient documentation to support their requests. Hospitals' requests and supporting documentation must have been received by the MAC by the February deadline (that is, by February 18, 2025, for the FY 2026 wage index).

After reviewing requested changes submitted by hospitals, MACs were required to transmit to CMS any additional revisions resulting from the hospitals' reconsideration requests by March 21, 2025. Under our current policy as adopted in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38153), the deadline for a hospital to request CMS intervention in cases where a hospital disagreed with a MAC's handling of wage data on any basis (including a policy, factual, or other dispute) was April 4, 2025. Data that were incorrect in the preliminary or January 31, 2025, wage index data PUFs, but for which no correction request was received by the February 18, 2025, deadline, are not considered for correction at this stage. In addition, April 4, 2025, was the deadline for hospitals to dispute data corrections made by CMS of which the hospital was notified after the January 31, 2025, PUF and at least 14 calendar days prior to April 4, 2025 (that is, March 21, 2025), that do not arise from a hospital's request for revisions. The hospital's request and supporting documentation must be received by CMS (and a copy received by the MAC) by the April deadline (that is, by April 4, 2025, for the FY 2026 wage index). We refer readers to the FY 2026 Hospital Wage Index Development Time Table for complete details.

Hospitals were given the opportunity to examine Table 2 associated with the proposed rule, which is listed in section VI. of the Addendum to the proposed rule and available via the internet on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/wage-index-files/fy-2026-wage-index-home-page*. Table 2 associated with the proposed rule contained each hospital's proposed adjusted average hourly wage used to construct the wage index values for the past 3 years, including the proposed FY 2026 wage index, which was constructed from FY 2022 data. We noted in the proposed rule that the proposed hospital average hourly wages shown in Table 2 only reflected changes made to a hospital's data that were transmitted to CMS by late January 2025.

We posted the final wage index data PUFs on April 30, 2025, on the CMS website at *https://www.cms.gov/medicare/payment/prospective-payment-systems/acute-inpatient-pps/wage-index-files/fy-2026-wage-index-home-page*. The April 2025 PUFs are made available solely for the limited purpose of identifying any potential errors made by CMS or the MAC in the entry of the final wage index data that resulted from the correction process (the process for disputing revisions submitted to CMS by the MACs by March 21, 2025, and the process for disputing data corrections made by CMS that did not arise from a hospital's request for wage data revisions as discussed earlier), as previously described.

After the release of the April 2025 wage index data PUFs, changes to the wage and occupational mix data can only be made in those very limited situations involving an error by the MAC or CMS that the hospital could not have known about before its review of the final wage index data files. Specifically, neither the MAC nor CMS will approve the following types of requests:

- Requests for wage index data corrections that were submitted too late to be included in the data transmitted to CMS by the MACs on or before March 21, 2025.
- Requests for correction of errors that were not, but could have been, identified during the hospital's review of the January 31, 2025, wage index PUFs.
- Requests to revisit factual determinations or policy interpretations made by the MAC or CMS during the wage index data correction process.

If, after reviewing the April 2025 final wage index data PUFs, a hospital believes that its wage or occupational mix data are incorrect due to a MAC or CMS error in the entry or tabulation of the final data, the hospital is given the opportunity to notify both its MAC and CMS regarding why the hospital believes an error exists and provide all supporting information, including relevant dates (for example, when it first became aware of the error). The hospital was required to send its request to CMS and to the MAC so that it was received no later than May 30, 2025. May 30, 2025, was also the deadline for hospitals to dispute data corrections made by CMS of which the hospital was notified on or after 13 calendar days prior to April 4, 2025 (that is, March 22, 2025), and at least 14 calendar days prior to May 30, 2025 (that is, May 16, 2025), that did not arise from a hospital's request for revisions. (Data corrections made by CMS of which a hospital is notified on or after 13 calendar days prior to May 30, 2025 (that is, May 17, 2025), may be appealed to the Provider Reimbursement Review Board (PRRB)). In accordance with the FY 2026 Hospital Wage Index Development Time Table posted on the CMS website at *https://www.cms.gov/files/document/fy-2026-hospital-wage-index-development-time-table.pdf*, the May appeals were required to be submitted to CMS

through an online submission process or through email. We refer readers to the FY 2026 Hospital Wage Index Development Time Table for complete details.

Verified corrections to the wage index data received timely (that is, by May 30, 2025) by CMS and the MACs were incorporated into the final FY 2026 wage index, which will be effective October 1, 2025.

We created the processes previously described to resolve all substantive wage index data correction disputes before we finalize the wage and occupational mix data for the FY 2026 payment rates. Accordingly, hospitals that do not meet the procedural deadlines set forth earlier will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes. Specifically, our policy is that hospitals that do not meet the procedural deadlines as previously set forth (requiring requests to MACs by the specified date in February and, where such requests are unsuccessful, requests for intervention by CMS by the specified date in April) will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision. We refer readers also to the FY 2000 IPPS final rule (64 FR 41513) for a discussion of the parameters for appeals to the PRRB for wage index data corrections. As finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156), this policy also applies to a hospital disputing corrections made by CMS that do not arise from a hospital's request for a wage index data revision. That is, a hospital disputing an adjustment made by CMS that did not arise from a hospital's request for a wage index data revision is required to request a correction by the first applicable deadline. Hospitals that do not meet the procedural deadlines set forth earlier will not be afforded a later opportunity to submit wage index data corrections or to dispute CMS' decision with respect to changes.

Again, we believe the wage index data correction process described earlier provides hospitals with sufficient opportunity to bring errors in their wage and occupational mix data to the MAC's attention. Moreover, because hospitals had access to the final wage index data PUFs by late April 2025, they have an opportunity to detect any data entry or tabulation errors made by the MAC or CMS before the development and publication of the final FY 2026 wage index by August 2025, and the implementation of the FY 2026 wage index on October 1, 2025. Given these processes, the wage index implemented on October 1 should be accurate. Nevertheless, in the event that errors are identified by hospitals and brought to our attention after May 30, 2025, we retain the right to make midyear changes to the wage index under very limited circumstances.

Specifically, in accordance with § 412.64(k)(1) of our regulations, we make midyear corrections to the wage index for an area only if a hospital can show that: (1) The MAC or CMS made an error in tabulating its data; and (2) the requesting hospital could not have known about the error or did not have an opportunity to correct the error, before the beginning of the fiscal year. For purposes of this provision, ''before the beginning of the fiscal year'' means by the May deadline for making corrections to the wage data for the following fiscal year's wage index (for example, May 30, 2025, for the FY 2026 wage index). This provision is not available to a hospital seeking to revise another hospital's data that may be affecting the requesting hospital's wage index for the labor market area. As indicated earlier, because CMS makes the wage index data available to hospitals on the CMS website prior to publishing both the proposed and final IPPS rules, and the MACs notify hospitals directly of any wage index data changes after completing their desk reviews, we do not expect that midyear corrections will be necessary. However, under our current policy, if the correction of a data error changes the wage index value for an area, the revised wage index value will be effective prospectively from the date the correction is made.

In the FY 2006 IPPS final rule (70 FR 47385 through 47387 and 47485), we revised § 412.64(k)(2) to specify that, effective on October 1, 2005, that is, beginning with the FY 2006 wage index, a change to the wage index can be made retroactive to the beginning of the Federal fiscal year only when CMS determines all of the following: (1) The MAC or CMS made an error in tabulating data used for the wage index calculation; (2) the hospital knew about the error and requested that the MAC and CMS correct the error using the established process and within the established schedule for requesting corrections to the wage index data, before the beginning of the fiscal year for the applicable IPPS update (that is, by the May 30, 2025, deadline for the FY 2026 wage index); and (3) CMS agreed before October 1 that the MAC or CMS made an error in tabulating the hospital's wage index data and the wage index should be corrected.

In those circumstances where a hospital requested a correction to its wage index data before CMS calculated the final wage index (that is, by the May 30, 2025 deadline for the FY 2026 wage index), and CMS acknowledges that the error in the hospital's wage index data was caused by CMS' or the MAC's mishandling of the data, we believe that the hospital should not be penalized by our delay in publishing or implementing the correction. As with our current policy, we indicated that the provision is not available to a hospital seeking to revise another hospital's data. In addition, the provision cannot be used to correct prior years' wage index data; it can only be used for the current Federal fiscal year. In situations where our policies would allow midyear corrections other than those specified in § 412.64(k)(2)(ii), we continue to believe that it is appropriate to make prospective-only corrections to the wage index.

We note that, as with prospective changes to the wage index, the final retroactive correction will be made irrespective of whether the change increases or decreases a hospital's payment rate. In addition, we note that the policy of retroactive adjustment will still apply in those instances where a final judicial decision reverses a CMS denial of a hospital's wage index data revision request.

b. Process for Data Corrections by CMS After the January 31, 2025, Public Use File (PUF)

The process set forth with the wage index timetable discussed in section III.C.4. of the preamble of this final rule allows hospitals to request corrections to their wage index data within prescribed timeframes. In addition to hospitals' opportunity to request corrections of wage index data errors or MACs' mishandling of data, CMS has the authority under section 1886(d)(3)(E) of the Act to make corrections to hospital wage index and occupational mix data to ensure the accuracy of the wage index. As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49490 through 49491) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56914), section 1886(d)(3)(E) of the Act requires the Secretary to adjust the proportion of hospitals' costs attributable to wages and wage-related costs for area differences reflecting the relative hospital wage level in the geographic areas of the hospital compared to the national average hospital wage level. We believe that, under section 1886(d)(3)(E) of the Act, we have discretion to make corrections to hospitals' data to help

ensure that the costs attributable to wages and wage-related costs in fact accurately reflect the relative hospital wage level in the hospitals' geographic areas.

We have an established multistep, 15-month process for the review and correction of the hospital wage data that is used to create the IPPS wage index for the upcoming fiscal year. Since the origin of the IPPS, the wage index has been subject to its own annual review process, first by the MACs, and then by CMS. As a standard practice, after each annual desk review, CMS reviews the results of the MACs' desk reviews and focuses on items flagged during the desk review, requiring that, if necessary, hospitals provide additional documentation, adjustments, or corrections to the data. This ongoing communication with hospitals about their wage data may result in the discovery by CMS of additional items that were reported incorrectly or other data errors, even after the posting of the January 31, 2025, PUF, and throughout the remainder of the wage index development process. In addition, the fact that CMS analyzes the data from a regional and even national level, unlike the review performed by the MACs that review a limited subset of hospitals, can facilitate additional editing of the data the need for which may not be readily apparent to the MACs. In these occasional instances, an error may be of sufficient magnitude that the wage index of an entire CBSA is affected. Accordingly, CMS uses its authority to ensure that the wage index accurately reflects the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level, by continuing to make corrections to hospital wage data upon discovering incorrect wage data, distinct from instances in which hospitals request data revisions.

We note that CMS corrects errors to hospital wage data as appropriate, regardless of whether that correction will raise or lower a hospital's average hourly wage. For example, as discussed in section III.C. of the preamble of the FY 2019 IPPS/LTCH PPS final rule (83 FR 41364), in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967). Furthermore, if CMS discovers after conclusion of the desk review, for example, that a MAC inadvertently failed to incorporate positive adjustments resulting from a prior year's wage index appeal of a hospital's wage-related costs such as pension, CMS will correct that data error, and the hospital's average hourly wage will likely increase as a result.

While we maintain CMS' authority to conduct additional review and make resulting corrections at any time during the wage index development process, in accordance with the policy finalized in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156) and as first implemented with the FY 2019 wage index (83 FR 41389), hospitals are able to request further review of a correction made by CMS that did not arise from a hospital's request for a wage index data correction. Instances where CMS makes a correction to a hospital's data after the January 31, 2025, PUF based on a different understanding than the hospital about certain reported costs, for example, could potentially be resolved using this process before the final wage index is calculated. We believe this process and the timeline for requesting review of such corrections (as described earlier and in the FY 2018 IPPS/LTCH PPS final rule) promote additional transparency in instances where CMS makes data corrections after the January 31, 2025 PUF and provide opportunities for hospitals to request further review of CMS changes in time for the most accurate data to be reflected in the final wage index calculations. These additional appeals opportunities are described earlier and in the FY 2026 Hospital Wage Index Development Time Table, as well as in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38154 through 38156).

C. Method for Computing the FY 2026 Unadjusted Wage Index

The method used to compute the FY 2026 wage index without an occupational mix adjustment follows the same methodology that we used to compute the wage indexes without an occupational mix adjustment in the FY 2021 IPPS/LTCH PPS final rule (see 85 FR 58758 through 58761), and we did not propose any changes to this methodology. We have restated our methodology in this section the preamble of this final rule.

Step 1.—We gathered data from each of the non-Federal, short-term, acute care hospitals for which data were reported on the Worksheet S–3, Parts II and III of the Medicare cost report for the hospital's cost reporting period relevant to the wage index (in this case, for FY 2026, these were data from cost reports for cost reporting periods beginning on or after October 1, 2021, and before October 1, 2022). In addition, we included data from hospitals that had cost reporting periods beginning prior to the October 1, 2021, begin date and extending into FY 2022 but that did not have any cost report with a begin date on or after October 1, 2021, and before October 1, 2022. We include this data because no other data from these hospitals will be available for the cost reporting period as previously described, and because particular labor market areas might be affected due to the omission of these hospitals. However, we generally describe these wage data as data applicable to the fiscal year wage data being used to compute the wage index for those hospitals. We note that, if a hospital had more than one cost reporting period beginning during FY 2022 (for example, a hospital had two short cost reporting periods beginning on or after October 1, 2021, and before October 1, 2022), we include wage data from only one of the cost reporting periods, the longer, in the wage index calculation. If there was more than one cost reporting period and the periods were equal in length, we included the wage data from the later period in the wage index calculation.

Step 2.—Salaries.—The method used to compute a hospital's average hourly wage excludes certain costs that are not paid under the IPPS. (We note that, beginning with FY 2008 (72 FR 47315), we included what were then Lines 22.01, 26.01, and 27.01 of Worksheet S–3, Part II of CMS Form 2552–96 for overhead services in the wage index. Currently, these lines are lines 28, 33, and 35 on CMS Form 2552–10. However, we note that the wages and hours on these lines are not incorporated into Line 101, Column 1 of Worksheet A, which, through the electronic cost reporting software, flows directly to Line 1 of Worksheet S–3, Part II. Therefore, the first step in the wage index calculation is to compute a ''revised'' Line 1, by adding to the Line 1 on Worksheet S–3, Part II (for wages and hours respectively) the amounts on Lines 28, 33, and 35.) In calculating a hospital's Net Salaries (we note that we previously used the term ''average'' salaries in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592), but we now use the term ''net'' salaries) plus wage-related costs, we first compute the following: Subtract from Line 1 (total salaries) the GME and CRNA costs reported on CMS Form 2552–10, Lines 2, 4.01, 7, and 7.01, the Part B salaries reported on Lines 3, 5 and 6, home office salaries reported on Line 8, and exclude salaries reported on Lines 9 and 10 (that is, direct salaries attributable to SNF services, home health services, and other subprovider components not subject to the IPPS). We also subtract

from Line 1 the salaries for which no hours were reported. Therefore, the formula for Net Salaries (from Worksheet S–3, Part II) is the following:

((Line 1 + Line 28 + Line 33 + Line 35) − (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)).

To determine Total Salaries plus Wage-Related Costs, we add to the Net Salaries the costs of contract labor for direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services (Lines 11, 12 and 13), home office salaries and wage-related costs reported by the hospital on Lines 14.01, 14.02, and 15, and nonexcluded area wage-related costs (Lines 17, 22, 25.50, 25.51, and 25.52). We note that contract labor and home office salaries for which no corresponding hours are reported are not included. In addition, wage-related costs for nonteaching physician Part A employees (Line 22) are excluded if no corresponding salaries are reported for those employees on Line 4. The formula for Total Salaries plus Wage-Related Costs (from Worksheet S–3, Part II) is the following: ((Line 1 + Line 28 + Line 33 + Line 35) − (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)) + (Line 11 + Line 12 + Line 13 + Line 14.01 + 14.02 + Line 15) + (Line 17 + Line 22 + 25.50 + 25.51 + 25.52).

Step 3.—Hours.—With the exception of wage-related costs, for which there are no associated hours, we compute total hours using the same methods as described for salaries in Step 2. The formula for Total Hours (from Worksheet S–3, Part II) is the following:

((Line 1 + Line 28 + Line 33 + Line 35) − (Line 2 + Line 3 + Line 4.01 + Line 5 + Line 6 + Line 7 + Line 7.01 + Line 8 + Line 9 + Line 10)) + (Line 11 + Line 12 + Line 13 + Line 14.01 + 14.02 + Line 15).

Step 4.—For each hospital reporting both total overhead salaries and total overhead hours greater than zero, we then allocate overhead costs to areas of the hospital excluded from the wage index calculation. First, we determine the ''excluded rate'', which is the ratio of excluded area hours to Revised Total Hours (from Worksheet S–3, Part II) with the following formula: (Line 9 + Line 10)/(Line 1 + Line 28 + Line 33 + Line 35) − (Lines 2, 3, 4.01, 5, 6, 7, 7.01, and 8 and Lines 26 through 43). We then compute the amounts of overhead salaries and hours to be allocated to the excluded areas by multiplying the previously discussed ratio by the total overhead salaries and hours reported on Lines 26 through 43 of Worksheet S–3, Part II. Next, we compute the amounts of overhead wage-related costs to be allocated to the excluded areas using three steps:

- We determine the ''overhead rate'' (from Worksheet S–3, Part II), which is the ratio of overhead hours (Lines 26 through 43 minus the sum of Lines 28, 33, and 35) to revised hours excluding the sum of lines 28, 33, and 35 (Line 1 minus the sum of Lines 2, 3, 4.01, 5, 6, 7, 7.01, 8, 9, 10, 28, 33, and 35). We note that, for the FY 2008 and subsequent wage index calculations, we have been excluding the overhead contract labor (Lines 28, 33, and 35) from the determination of the ratio of overhead hours to revised hours because hospitals typically do not provide fringe benefits (wage-related costs) to contract personnel. Therefore, it is not necessary for the wage index calculation to exclude overhead wage-related costs for contract personnel. Further, if a hospital does contribute to wage-related costs for contracted personnel, the instructions for Lines 28, 33, and 35 require that associated wage-related costs be combined with wages on the respective contract labor lines. The formula for the Overhead Rate (from Worksheet S–3, Part II) is the following: (Lines 26 through 43—Lines 28, 33 and 35)/ ((((Line 1 + Lines 28, 33, 35) − (Lines 2, 3, 4.01, 5, 6, 7, 7.01, 8, and 26 through 43)) − (Lines 9 and 10)) + (Lines 26 through 43 − Lines 28, 33, and 35)).
- We compute overhead wage-related costs by multiplying the overhead hours ratio by wage-related costs reported on Part II, Lines 17, 22, 25.50, 25.51, and 25.52.
- We multiply the computed overhead wage-related costs by the previously described excluded area hours ratio.

Finally, we subtract the computed overhead salaries, wage-related costs, and hours associated with excluded areas from the total salaries (plus wage-related costs) and hours derived in Steps 2 and 3.

Step 5.—For each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2021, through April 15, 2023, for private industry hospital workers from data obtained from the Bureau of Labor Statistics' (BLS') Office of Compensation and Working Conditions. We use the ECI because it reflects the price increase associated with total compensation (salaries plus fringe benefits) rather than just the increase in salaries. In addition, the ECI includes managers as well as other hospital workers. This methodology to compute the monthly update factors uses actual quarterly ECI data and assures that the update factors match the actual quarterly and annual percent changes. We also note that, since April 2006 with the publication of March 2006 data, the BLS' ECI uses a different classification system, the North American Industrial Classification System (NAICS), instead of the Standard Industrial Codes (SICs), which no longer exist. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we did not propose to make any changes to the usage of the ECI for FY 2026. The factors used to adjust the hospital's data are based on the midpoint of the cost reporting period, as indicated in this final rule.

Step 6.—Each hospital is assigned to its appropriate urban or rural labor market area before any reclassifications under section 1886(d)(8)(B), 1886(d)(8)(E), or 1886(d)(10) of the Act. Within each urban or rural labor market area, we add the total adjusted salaries plus wage-related costs obtained in Step 5 for all hospitals in that area to determine the total adjusted salaries plus wage-related costs for the labor market area.

Step 7.—We divide the total adjusted salaries plus wage-related costs obtained under Step 6 by the sum of the corresponding total hours (from Step 4) for all hospitals in each labor market area to determine an average hourly wage for the area.

Step 8.—We add the total adjusted salaries plus wage-related costs obtained in Step 5 for all hospitals in the Nation and then divide the sum by the national sum of total hours from Step 4 to arrive at a national average hourly wage.

Step 9.—For each urban or rural labor market area, we calculate the hospital wage index value, unadjusted for occupational mix, by dividing the area average hourly wage obtained in Step 7 by the national average hourly wage computed in Step 8.

Step 10.—For each urban labor market area for which we do not have any hospital wage data (either because there are no IPPS hospitals in that labor market area, or there are IPPS hospitals in that area but their data are either too new to be reflected in the current year's wage index calculation, or their data are aberrant and are deleted from the wage index), we finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42305) that, for FY 2020 and subsequent years' wage index calculations, such CBSAs' wage index will be equal to total urban

salaries plus wage-related costs (from Step 5) in the State, divided by the total urban hours (from Step 4) in the State, divided by the national average hourly wage from Step 8 (see 84 FR 42305 and 42306). We believe that, in the absence of wage data for an urban labor market area, it is reasonable to use a statewide urban average, which is based on actual, acceptable wage data of hospitals in that State, rather than impute some other type of value using a different methodology. For calculation of the FY 2026 wage index, we note there is one urban CBSA for which we do not have IPPS hospital wage data. In Table 3 (which is available via the internet on the CMS website and contains the area wage indexes), we include a footnote to indicate to which CBSA this policy applies. This CBSA's wage index is calculated as described, based on the FY 2020 IPPS/LTCH PPS final rule methodology (84 FR 42305). Under this step, we also apply our policy with regard to how dollar amounts, hours, and other numerical values in the wage index calculations are rounded.

We refer readers to section II. of Appendix B of this final rule for the policy regarding rural areas that do not have IPPS hospitals.

Step 11.—Section 4410 of Public Law 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. The areas affected by this provision are identified in Table 2 listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website.

The following is our policy with regard to rounding of the wage data (dollar amounts, hours, and other numerical values) in the calculation of the unadjusted and adjusted wage index, as finalized in the FY 2020 IPPS/LTCH final rule (84 FR 42306). For data that we consider to be ''raw data,'' such as the cost report data on Worksheets S–3, Parts II and III, and the occupational mix survey data, we use such data ''as is,'' and do not round any of the individual line items or fields. However, for any dollar amounts within the wage index calculations, including any type of summed wage amount, average hourly wages, and the national average hourly wage (both the unadjusted and adjusted for occupational mix), we round the dollar amounts to 2 decimals. For any hour amounts within the wage index calculations, we round such hour amounts to the nearest whole number. For any numbers not expressed as dollars or hours within the wage index calculations, which could include ratios, percentages, or inflation factors, we round such numbers to 5 decimals. However, we continue rounding the actual unadjusted and adjusted wage indexes to 4 decimals, as we have done historically.

As discussed in the FY 2012 IPPS/LTCH PPS final rule, in ''Step 5,'' for each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the ECI for compensation for each 30-day increment from October 14, 2021, through April 15, 2023, for private industry hospital workers from the BLS' Office of Compensation and Working Conditions data. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we did not propose any changes to the usage of the ECI for FY 2026. The factors used to adjust the hospital's data were based on the midpoint of the cost reporting period, as indicated in the following table.

MIDPOINT OF COST REPORTING PERIOD

After	Before	Adjustment Factor
10/14/2021	11/15/2021	1.07227
11/14/2021	12/15/2021	1.06742
12/14/2021	01/15/2022	1.06250
01/14/2022	02/15/2022	1.05755
02/14/2022	03/15/2022	1.05259
03/14/2022	04/15/2022	1.04772
04/14/2022	05/15/2022	1.04303
05/14/2022	06/15/2022	1.03854
06/14/2022	07/15/2022	1.03412
07/14/2022	08/15/2022	1.02967
08/14/2022	09/15/2022	1.02518
09/14/2022	10/15/2022	1.02072
10/14/2022	11/15/2022	1.01637
11/14/2022	12/15/2022	1.01212
12/14/2022	01/15/2023	1.00797
01/14/2023	02/15/2023	1.00393
02/14/2023	03/15/2023	1.00000
03/14/2023	04/15/2023	0.99617

For example, the midpoint of a cost reporting period beginning January 1, 2022, and ending December 31, 2022, is June 30, 2022. An adjustment factor of 1.03412 was applied to the wages of a

hospital with such a cost reporting period.

Previously, we also would provide a Puerto Rico overall average hourly wage. As discussed in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915), prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we calculated a Puerto Rico specific wage index that was applied to the labor-related share of the Puerto Rico-specific standardized amount. Section 601 of Division O, Title VI (section 601) of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. As we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56915 through 56916), because Puerto Rico hospitals are no longer paid with a Puerto Rico specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act, as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need to calculate a Puerto Rico specific average hourly wage and wage index. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national average hourly wage (unadjusted for occupational mix) and the national wage index, which is applied to the national labor-related share of the national standardized amount. Therefore, for FY 2026, there is no Puerto Rico-specific overall average hourly wage or wage index.

Based on the previously described methodology, the final FY 2026 unadjusted national average hourly wage is the following:

Final FY 2026 Unadjusted Average Hourly Wage: $57.92

D. Occupational Mix Adjustment to the FY 2026 Wage Index

As stated earlier, section 1886(d)(3)(E) of the Act provides for the collection of data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, to construct an occupational mix adjustment to the wage index, for application beginning October 1, 2004 (the FY 2005 wage index). The purpose of the occupational mix adjustment is to control for the effect of hospitals' employment choices on the wage index. For example, hospitals may choose to employ different combinations of registered nurses, licensed practical nurses, nursing aides, and medical assistants for the purpose of providing nursing care to their patients. The varying labor costs associated with these choices reflect hospital management decisions rather than geographic differences in the costs of labor.

1. Use of 2022 Medicare Wage Index Occupational Mix Survey for the FY 2026 Wage Index

Section 304(c) of Appendix F, Title III of the Consolidated Appropriations Act, 2001 (Pub. L. 106–554) amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program and to measure the earnings and paid hours of employment for such hospitals by occupational category. As discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69275 through 69278), we collected data in 2022 to compute the occupational mix adjustment for the FY 2025, FY 2026, and FY 2027 wage indexes.

The FY 2026 occupational mix adjustment is based on a calendar year (CY) 2022 survey. Hospitals were required to submit their completed 2022 surveys (Form CMS–10079, OMB Control Number 0938–0907, expiration date January 31, 2026) to their MACs by July 1, 2023. The preliminary, unaudited CY 2022 survey data were posted on the CMS website on July 12, 2023. As with the Worksheet S–3, Parts II and III cost report wage data, as part of the FY 2026 desk review process, the MACs revised or verified data elements in hospitals' occupational mix surveys that resulted in certain edit failures.

2. Calculation of the Occupational Mix Adjustment for FY 2026

For FY 2026, we proposed to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index (76 FR 51582 through 51586) and to apply the occupational mix adjustment to 100 percent of the FY 2026 wage index. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42308), we modified our methodology with regard to how dollar amounts, hours, and other numerical values in the unadjusted and adjusted wage index calculation are rounded, to ensure consistency in the calculation. According to the policy finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42308 and 42309), for data that we consider to be ''raw data,'' such as the cost report data on Worksheets S–3, Parts II and III, and the occupational mix survey data, we continue to use these data ''as is'', and not round any of the individual line items or fields. However, for any dollar amounts within the wage index calculations, including any type of summed wage amount, average hourly wages, and the national average hourly wage (both the unadjusted and adjusted for occupational mix), we round such dollar amounts to 2 decimals. We round any hour amounts within the wage index calculations to the nearest whole number. We round any numbers not expressed as dollars or hours in the wage index calculations, which could include ratios, percentages, or inflation factors, to 5 decimals. However, we continue rounding the actual unadjusted and adjusted wage indexes to 4 decimals, as we have done historically.

Similar to the method we use for the calculation of the wage index without occupational mix, salaries and hours for a multicampus hospital are allotted among the different labor market areas where its campuses are located. Table 2 associated with this final rule (which is available via the internet on the CMS website), which contains the final FY 2026 occupational mix adjusted wage index, includes separate wage data for the campuses of multicampus hospitals. We refer readers to section III.C. of the preamble of this final rule for a chart listing the multicampus hospitals and the FTE percentages used to allot their occupational mix data.

Because the statute requires that the Secretary measure the earnings and paid hours of employment by occupational category not less than once every 3 years, all hospitals that are subject to payments under the IPPS, or any hospital that would be subject to the IPPS if not granted a waiver, must complete the occupational mix survey, unless the hospital has no associated cost report wage data that are included in the proposed FY 2026 wage index. For the proposed FY 2026 wage index, we used the Worksheet S–3, Parts II and III wage data of 3,029 hospitals, and we used the occupational mix surveys of 2,945 hospitals for which we also had Worksheet S–3 wage data, which represented a ''response'' rate of 97 percent (2,945/3,029). For the proposed FY 2026 wage index, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this

methodology, the proposed FY 2026 occupational mix adjusted national average hourly wage was $57.63.

We did not receive any comments on our proposed calculation of the occupational mix adjustment to the FY 2026 wage index. Thus, for the reasons discussed in this final rule and in the FY 2026 IPPS/LTCH PPS proposed rule, we are finalizing our proposal without modification to calculate the occupational mix adjustment factor using the same methodology that we have used since the FY 2012 wage index and to apply the occupational mix adjustment to 100 percent of the FY 2026 wage index.

For the final FY 2026 wage index, we are using the Worksheet S–3, Parts II and III wage data of 3,036 hospitals, and we are using the occupational mix surveys of 2,952 hospitals for which we also had Worksheet S–3 wage data, which represented a ''response'' rate of 97 percent (2,952/3,036). For the final FY 2026 wage index, we are applying proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this methodology, the final FY 2026 occupational mix adjusted national average hourly wage is the following:

Final FY 2026 Occupational Mix Adjusted National Average Hourly Wage: $57.86

3. Occupational Mix Adjustment and the FY 2026 Occupational Mix Adjusted Wage Index

As discussed in section III.E. of the preamble of this final rule, for FY 2026, we are applying the occupational mix adjustment to 100 percent of the FY 2026 wage index. We calculated the occupational mix adjustment using data from the 2022 occupational mix survey, using the methodology described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51582–51586).

Based on the 2022 occupational mix survey data, the FY 2026 national average hourly wages for each occupational mix nursing subcategory as calculated in Step 2 of the occupational mix calculation are as follows:

OCCUPATIONAL MIX NURSING SUBCATEGORY	AVERAGE HOURLY WAGE
National RN	$60.47
National LPN and Surgical Technician	$35.05
National Nurse Aide, Orderly, and Attendant	$23.53
National Medical Assistant	$23.16
National Nurse Category	$50.12

The national average hourly wage for the entire nurse category is computed in Step 5 of the occupational mix calculation. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of greater than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of less than 1.0. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of less than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of greater than 1.0.

Based on the 2022 occupational mix survey data, we determined (in Step 7 of the occupational mix calculation) the following:

National Percentage of Hospital Employees in the Nurse Category: 45%

National Percentage of Hospital Employees in the All Other Occupations Category: 55%

E. Hospital Redesignations and Reclassifications

The following sections III.E.1 through III.E.4 discuss revisions to the wage index based on hospital redesignations and reclassifications. Specifically, hospitals may have their geographic area changed for wage index payment by applying for urban to rural reclassification under section 1886(d)(8)(E) of the Act (implemented at § 412.103), reclassification by the Medicare Geographic Classification Review Board (MGCRB) under section 1886(d)(10) of the Act, Lugar status redesignations under section 1886(d)(8)(B) of the Act, or a combination of the foregoing.

1. Urban to Rural Reclassification Under Section 1886(d)(8)(E) of the Act, Implemented at § 412.103

Under section 1886(d)(8)(E) of the Act, a qualifying prospective payment hospital located in an urban area may apply for rural status for payment purposes separate from reclassification through the MGCRB. Specifically, section 1886(d)(8)(E) of the Act provides that, not later than 60 days after the receipt of an application (in a form and manner determined by the Secretary) from a subsection (d) hospital that satisfies certain criteria, the Secretary shall treat the hospital as being located in the rural area (as defined in paragraph (2)(D)) of the State in which the hospital is located. We refer readers to the regulations at § 412.103 for the general criteria and application requirements for a subsection (d) hospital to reclassify from urban to rural status in accordance with section 1886(d)(8)(E) of the Act (such hospitals are referred to herein as ''§ 412.103 hospitals''). The FY 2012 IPPS/LTCH PPS final rule (76 FR 51595 through 51596) includes our policies regarding the effect of wage data from reclassified or redesignated hospitals. We refer readers to the FY 2024 IPPS/LTCH final rule (88 FR 58971 through 58977) for a review of our policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49004) to calculate the rural floor with the wage data of urban hospitals reclassifying to rural areas under § 412.103, and discussion of our modification to the calculation of the rural wage index and its implications for the rural floor.

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41369 through 41374), we codified certain policies regarding multicampus hospitals in the regulations at §§ 412.92, 412.96, 412.103, and 412.108. We stated that reclassifications from urban to rural under § 412.103 apply to the entire hospital (that is, the main campus and its remote location(s)). We also stated that a main campus of a hospital cannot obtain Sole Community Hospital (SCH), Rural Referral Center (RRC), or Medicare Dependent Hospital (MDH) status, or rural reclassification under § 412.103, independently or separately from its remote location(s), and vice versa. In the

FY 2023 IPPS/LTCH PPS final rule (87 FR 49012 and 49013), we added § 412.103(a)(8) to clarify that for a multicampus hospital, approved rural reclassification status applies to the main campus and any remote location located in an urban area, including a main campus or any remote location deemed urban under section 1886(d)(8)(B) of the Act. If a remote location of a hospital is located in a different CBSA than the main campus of the hospital, it is CMS' longstanding policy to assign that remote location a wage index based on its own geographic area to comply with the statutory requirement to adjust for geographic differences in hospital wage levels (section 1886(d)(3)(E) of the Act). Hospitals are required to identify and allocate wages and hours based on FTEs for remote locations located in different CBSAs on Worksheet S–2, Part I, Lines 165 and 166 of form CMS–2552–10. In calculating wage index values, CMS identifies the allocated wage data for these remote locations in Table 2 with a ''B'' in the 3rd position of the CCN. These remote locations of hospitals with § 412.103 rural reclassification status in a different CBSA are identified in Table 2, and hospitals should evaluate potential wage index outcomes for their remote location(s) when withdrawing or terminating MGCRB reclassification, or canceling § 412.103 rural reclassification status.

We also note that in the FY 2025 IPPS/LTCH PPS Final Rule (89 FR 69279 through 69280), we reminded hospitals located in rural areas becoming urban under the adoption of the revised OMB delineations in FY 2025 that if they have SCH, MDH, or RRC status, they may choose to apply for a § 412.103 urban to rural reclassification if qualifying criteria are met to maintain the SCH, MDH, or RRC status. We advised hospitals to evaluate their options and if desired, apply for § 412.103 urban to rural reclassification before the beginning of FY 2025, to avoid a lapse in SCH, MDH, or RRC status at the beginning of FY 2025. We note that the ''Am I Rural'' tool currently available on the Rural Health Information Hub[138] website at *https://www.ruralhealthinfo.org/am-i-rural* was updated on November 21, 2024, based on data provided by the Federal Office of Rural Health Policy which is available at *https://www.hrsa.gov/rural-health/about-us/what-is-rural/data-files*. As discussed at § 412.103(f), the duration of an approved rural reclassification remains in effect without need for reapproval unless there is a change in the circumstances under which the classification was approved. If a hospital located in an urban area was approved for a rural reclassification under § 412.103(a)(1), that reclassification will no longer be valid if the hospital is no longer located within a rural census tract of an MSA as determined by the Federal Office of Rural Health Policy (FORHP) of the Health Resources and Services Administration (HRSA). Therefore, we encourage all hospitals and CAHs with active rural reclassifications under section 1886(d)(8)(E) of the Act to review their original reclassification application and determine whether the reclassification status will still apply.

Finally, in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69280), CMS finalized a policy regarding terminated or ''tied-out'' hospitals, to address our concerns regarding the impacts these hospitals would have on rural wage index values. Specifically, we finalized a policy that § 412.103 reclassifications would be considered cancelled for the purposes of calculating the area wage index for any hospital with a CCN listed as terminated or ''tied-out'' as of the date that the hospital ceased to operate with an active CCN. We stated that we will obtain and review the best available CCN termination status lists as of the § 412.103(b)(6) ''lock-in'' date (60 days after the proposed rule for the FY is displayed in the **Federal Register**), consistent with the wage index development timeline. The lock-in date is used to determine whether a hospital has been approved for § 412.103 reclassification in time for that status to be included in the upcoming year's wage index development.

We noted that our policy to consider § 412.103 reclassifications cancelled for the purposes of calculating area wage index for any hospital with a CCN listed as terminated or ''tied-out'' is not intended to alter or affect the qualification for Critical Access Hospital (CAH), Sole Community Hospital (SCH), or Rural Emergency Hospital (REH) statuses or to have other effects unrelated to hospital wage index calculations. The rural reclassification status will remain in effect for any period that the original PPS hospital remains in operation with an active CCN. For REH qualification requirement purposes, this will include the date of enactment of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260), which was December 27, 2020.

2. General Policies and Effects of MGCRB Reclassification and Treatment of Dual Reclassified Hospitals

Under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (usually by September 1). Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions not later than the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in §§ 412.230 through 412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) The general policies for reclassifications and redesignations and the policies for the effects of hospitals' reclassifications and redesignations on the wage index are discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596).

In addition, in the FY 2012 IPPS/LTCH PPS final rule, we discussed the effects on the wage index of urban hospitals reclassifying to rural areas under § 412.103. In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42332 through 42336), we finalized a policy to exclude the wage data of urban hospitals reclassifying to rural areas under § 412.103 from the calculation of the rural floor, but we reverted to the pre-FY 2020 policy in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49002 through 49004). Hospitals that are geographically located in States without any rural areas are ineligible to apply for rural reclassification in accordance with the provisions of § 412.103.

On April 21, 2016, we published an interim final rule with comment period (IFC) in the **Federal Register** (81 FR 23428 through 23438) that included provisions amending our regulations to allow hospitals nationwide to have simultaneous § 412.103 urban to rural and MGCRB reclassifications. Prior to this amendment to the regulations, hospitals had to choose between a § 412.103 urban to rural reclassification which confers other rural benefits

[138] The Rural Health Information Hub is supported by the Health Resources and Services Administration (HRSA) of HHS under Grant Number U56RH05539 (Rural Assistance Center for Federal Office of Rural Health Policy Cooperative Agreement). Any information, content, or conclusions on this website are those of the authors and should not be construed as the official position or policy of, nor should any endorsements be inferred by HRSA, HHS or the U.S. Government.

(Medicare provisions such as payments to disproportionate share hospitals (DSHs), and non-Medicare payment provisions, such as the 340B Drug Pricing Program administered by HRSA) besides the wage index under section 1886(d) of the Act or a reclassification under the MGCRB to solely increase its wage index. Under the amended regulations, a hospital that has an active MGCRB reclassification and is then approved for an urban to rural reclassification under § 412.103 will not lose its MGCRB reclassification. Additionally, a hospital is no longer required to cancel its § 412.103 reclassification in order to be approved for an MGCRB reclassification. By amending the regulations and allowing a hospital to pursue reclassification under the MGCRB while also maintaining a rural reclassification under § 412.103, hospitals are accorded the benefits of a § 412.103 urban to rural reclassification and the ability to use distance and average hourly wage criteria designated for rural hospitals to obtain a higher wage index value through an MGCRB reclassification. We note, for wage index calculation and payment purposes, when there is both a § 412.103 reclassification and an MGCRB reclassification, the MGCRB reclassification controls for wage index calculation and payment purposes.

Prior to FY 2024, we excluded hospitals with § 412.103 urban to rural redesignations from the calculation of the reclassified rural wage index if they also have an active MGCRB reclassification to another area. That is, if an application for urban reclassification through the MGCRB is approved and is not withdrawn or terminated by the hospital within the established timelines, we considered the hospital's geographic CBSA and the urban CBSA to which the hospital is reclassified under the MGCRB for the wage index calculation. We refer readers to the April 21, 2016, IFC (81 FR 23428 through 23438) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 56922 through 56930), in which we finalized the April 21, 2016, IFC, for a full discussion of the effect of simultaneous reclassifications under both the § 412.103 and the MGCRB processes on wage index calculations. For FY 2024 and subsequent years, we refer readers to the FY 2024 IPPS/LTCH PPS final rule for discussion of our policy to include hospitals with a § 412.103 reclassification that also have an active MGCRB reclassification to another area in the calculation of the reclassified rural wage index (88 FR 58971 through 58977).

3. MGCRB Reclassification Issues for FY 2026

a. FY 2026 Reclassification Application Requirements and Approvals

As previously stated, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in regulations under 42 CFR 412.230 through 412.280. There are 465 hospitals approved for wage index reclassifications by the MGCRB starting in FY 2026. Because MGCRB wage index reclassifications are effective for 3 years, for FY 2026, hospitals reclassified beginning in FY 2024 or FY 2025 are eligible to continue to be reclassified to a particular labor market area based on such prior reclassifications for the remainder of their 3-year period. There were 309 hospitals approved for wage index reclassifications in FY 2024 that will continue for FY 2026, and 335 hospitals approved for wage index reclassifications in FY 2025 that will continue for FY 2026. Of all the hospitals approved for reclassification for FY 2024, FY 2025, and FY 2026, 1,109 hospitals (approximately 30 percent of IPPS hospitals) are in a MGCRB reclassification status for FY 2026 (with 258 of these hospitals reclassified back to their urban geographic location). We noted in the proposed rule that several hospitals approved for MGCRB reclassifications may opt to withdraw this status after the proposed rule,[139] and in some cases prior year reclassification would become effective in its place. There are 88 fewer hospitals in MGCRB reclassification status in this final rule than in the proposed rule due to withdrawals and terminations of MGCRB status. We refer readers to section III.F.3.b. of the preamble of this final rule for information on the effects of implementation of new OMB labor market area delineations on reclassified hospitals.

Under the regulations at § 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications if the request for withdrawal is received by the MGCRB any time before the MGCRB issues a decision on the application, or after the MGCRB issues a decision, provided the request for withdrawal is received by the MGCRB within 45 days of the date of filing for public inspection of the proposed rule at the website of the Office of the Federal Register, or within 7 calendar days of receiving a decision of the Administrator's in accordance with § 412.273, whichever is later.

For information about the current process for withdrawing, terminating, or canceling a previous withdrawal or termination of a 3-year reclassification for wage index purposes, we refer readers to § 412.273, as well as section III.E.3.b. of the preamble of this final rule, and the FY 2002 IPPS final rule (66 FR 39887 through 39888) and the FY 2003 IPPS final rule (67 FR 50065 through 50066). Additional discussion on withdrawals and terminations was included in the FY 2008 IPPS final rule (72 FR 47333) and the FY 2018 IPPS/LTCH PPS final rule (82 FR 38148 through 38150).

Applications for FY 2027 reclassifications are due to the MGCRB by September 2, 2025 (*Note*: While the deadline for reclassification applications is not later than 13 months prior to the start of the fiscal year for which reclassification is sought, usually by September 1, the Board has historically allowed submission up to the first business day in September, which is September 2, 2025, due to Labor Day). This is also the current deadline for canceling a previous wage index reclassification withdrawal or termination under § 412.273(d) for the FY 2026 cycle.

Applications and other information about MGCRB reclassifications may be obtained beginning in mid-July 2025 via the internet on the CMS website at *https://www.cms.gov/medicare/regulations-guidance/geographic-classification-review-board*. This collection of information was previously approved under OMB Control Number 0938–0573, which expired on January 31, 2021. A reinstatement of this PRA package is currently being developed. The public will have an opportunity to review and submit comments regarding the reinstatement of this PRA package through a public notice and comment period separate from this rulemaking.

Comment: A commenter stated that the MGCRB decisions for FY 2026 were rendered earlier than in the past, which prevented hospitals from submitting rural or rural referral center (RRC) approval letters prior to the MGCRB's decision. The commenter stated that while the Administrator reversed the MGCRB ruling on appeal, it did not do so in time for the approved reclassification to be reflected in the proposed rule datasets. Therefore, the

[139] We note that in the FY 2026 IPPS/LTCH PPS proposed rule (82 FR 18228), we inadvertently stated that hospitals approved for MGCRB reclassifications beginning in FY 2026 may opt to withdraw this status after the final rule. This was an error, and the correct statement should have read ''after the proposed rule''.

commenter contended that the FY 2026 proposed rule included inaccurate or incomplete information that hospitals relied upon for withdrawal decisions. Consequently, the commenter requested that CMS allow hospitals a 15-day window following the release of the final rule to withdraw MGCRB reclassification requests without penalty after reassessing their decisions using the corrected and finalized data.

Response: As we stated in response to a comment in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58983), we believe hospitals should submit applications complete with supporting documentation at the time MGCRB applications are due. We stated that hospitals taking advantage of the MGCRB's practice of accepting supporting documentation to supplement applications until the date of the MGCRB's review are aware that the review is not held on the same date annually. Furthermore, rural reclassification may be obtained at any time, and hospitals seeking the benefits of rural status for MGCRB reclassification purposes should plan accordingly.

In response to the commenter's specific request for CMS to allow hospitals a 15-day window following the release of the final rule to withdraw MGCRB reclassification requests, we stated in response to a similar comment in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58769 through 58770) that we maintain that the information provided in the proposed rule constitutes the best available data to assist hospitals in making reclassification decisions. In addition, section 1886(d)(8)(D) of the Act requires the Secretary to adjust the standardized amounts to ensure that aggregate payments under the IPPS after implementation of the provisions of certain sections of the Act, including section 1886(d)(10) of the Act for geographic reclassifications by the MGCRB, are equal to the aggregate prospective payments that would have been made absent these provisions. If hospitals were to withdraw or terminate reclassification statuses after the publication of the final rule, as the commenter suggested CMS permit, any resulting changes in the wage index would not have been taken into account when calculating the IPPS standardized amounts in the final rule in accordance with the statutory budget neutrality requirement. Therefore, it is necessary that the values published in the final rule represent the final wage index values reflective of reclassification decisions.

b. Revisions to § 412.273 To Simplify MGCRB Reinstatements

As discussed in the previous section, under the regulations at § 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications if the request for withdrawal is received by the MGCRB any time before the MGCRB issues a decision on the application, or after the MGCRB issues a decision, provided the request for withdrawal is received by the MGCRB within 45 days of the date of filing for public inspection of the proposed rule at the website of the Office of the Federal Register, or within 7 calendar days of receiving a decision of the Administrator's in accordance with § 412.273, whichever is later. Hospitals may also terminate an existing approved reclassification, effective for the second and third year of the three year reclassification period or both, provided the request for termination is received by the MGCRB within 45 days of the date of filing for public inspection of the proposed rule at the website of the Office of the Federal Register, or within 7 calendar days of receiving a decision of the Administrator's in accordance with § 412.273, whichever is later.

Furthermore, these withdrawal and termination requests may be cancelled by submitting a request by the next application deadline for MGCRB application, reinstating the withdrawn or terminated reclassification for the remaining years of the reclassification.

We believe this process allows hospitals to maintain flexibility in choosing the optimal reclassification status for any given fiscal year, while balancing the need for consistency and predictability of the wage index system. However, we also believe the regulations § 412.273 can be confusing and contain complicated definitions and language. We proposed revisions to multiple paragraphs of § 412.273 to clarify current policy and revise definitions in a more straightforward and understandable manner.

The first consideration is CMS's definitions of a withdrawal and a termination in § 412.273(a). *Termination* refers to the termination of an already existing 3-year MGCRB reclassification where such reclassification has already been in effect for 1 or 2 years, and there are 1 or 2 years remaining on the 3-year reclassification. A termination is effective only for the full fiscal year(s) remaining in the 3-year period at the time the request is received. Requests for terminations for part of a fiscal year are not considered. *Withdrawal* refers to the withdrawal of a 3-year MGCRB reclassification that has not yet gone into effect or where the MGCRB has not yet issued a decision on the application.

Stated generally, a withdrawal is an action taken upon a reclassification that has either not yet been reviewed by the MGCRB, or an approved reclassification due to go into effect in that upcoming fiscal year, and a termination is an action taken on an approved reclassification that has already gone into effect. There are policy considerations for defining withdrawals and terminations separately. For example, county group reclassification withdrawals must include all parties to the application, while a termination may be submitted by any individual hospital that is party to the application. For reasons discussed later in this section, we stated in the proposed rule that we continue to believe this is the appropriate policy. However, we also stated that we believe that specifically citing this policy exception in regulation is more straightforward than maintaining differing definitions for substantially similar actions. Therefore, for consistency and simplicity we proposed to modify the definition of a withdrawal to only include requests made prior to a decision being made by the MGCRB. The definition of termination would encompass all post-decision actions to forgo the upcoming years of an approved reclassification. Specifically, we proposed to modify § 412.273(a) to provide that a *termination* refers to the termination of an approved 3-year MGCRB reclassification. A termination is effective only for the full fiscal year(s) remaining in the 3-year period at the time the request is received. Requests for terminations for part of a fiscal year are not considered. We also specified that a *withdrawal* refers to the withdrawal of a 3-year MGCRB reclassification where the MGCRB has not yet issued a decision on the application.

We also proposed to remove § 412.273(c)(1)(i) and (ii) and revise paragraph (c)(1) to indicate that a request for withdrawal must be received by the MGCRB at any time before the MGCRB issues a decision on the application.

There is also a current process for cancelling an eligible withdrawal or termination in order to make the reclassification effective for any remaining years of the 3-year reclassification period. We noted that this process is widely referring to as a request for ''reinstatement.'' To provide clarity and consistency, we proposed to modify several references in

§ 412.273(d) from ''cancelling'' or a ''cancellation'' to ''reinstating'' or ''reinstatement.'' As we proposed that withdrawals be limited to applications prior to approval, a proposed reinstatement will only apply to the proposed modified definition of a termination. Therefore, we proposed to delete the references to withdrawals from § 412.273(d)(1).

As discussed earlier in this section, we continue to believe that all parties to a county group reclassification must participate on any action prior to the effective date of a group reclassification. Under current policy, this will include whether to withdraw a reclassification in the timeframe described at § 412.273(c)), and whether to cancel an approved reclassification withdrawal request to reinstate the remaining second and third year of the approved group reclassification, as described at § 412.273(d)(2). In the proposed rule, we stated that we believe that requiring these actions to include all parties to the group reclassification reduces the possibility of one or more parties withdrawing from a reclassification to the benefit or detriment of other hospitals reclassified to that labor market area. For example, a hospital may be incentivized to withdraw a potentially beneficial reclassification if the exclusion of its wage data in the reclassified area will increase the wage index value. This type of manipulation of reclassification policy does not encourage stability or predictability of wage index system and is contrary to the concept of providing hospitals in a county an opportunity to obtain a reclassification that they may not be able to obtain through an individual reclassification. Therefore, we proposed to continue the current policy by modifying the current regulation to explicitly state that the proposed modified withdrawal requests and proposed modified termination and reinstatement requests made prior to the effective date of the reclassification (that is, any request made prior to the first year the reclassification goes into effect), must include all parties to the application. Specifically, we proposed to modify § 412.273(e), by modifying paragraph (e)(2) to state that a request to terminate an approved individual reclassification must be submitted in writing to the MGCRB according to the method prescribed by the MGCRB and adding a new paragraph (e)(3) specifying that a request to terminate or reinstate an approved group reclassification must be submitted in writing to the MGCRB according to the method prescribed by the MGCRB. A request to terminate or reinstate an approved group reclassification that has not yet gone into effect must include all hospitals party to the reclassification. Termination requests for group reclassification for the second or third year of the 3-year wage index reclassification period and reinstatement requests for a group reclassification effective for the third year of the 3-year wage index reclassification period may be submitted by any individual hospital that is party to the reclassification.

We stated that we believe that this proposal to explicitly state this policy regarding county group reclassification in regulation reduces confusion for hospitals and more clearly addresses our intent.

To provide clarity, we also proposed to state that a termination of a 3-year reclassification defined at § 412.273(d)(4) is not eligible to be reinstated. This type of termination of an approved reclassification occurs when a hospital receives a different MGCRB reclassification in a subsequent fiscal year. Under current policy, hospitals may effectively choose between accepting a newly approved reclassification, or to withdraw it and ''fallback'' to a previously approved reclassification. We stated in the proposed rule that we believe this provides sufficient flexibility for hospitals to obtain the most beneficial reclassification. However, once an approved reclassification goes into effect, we believe it is appropriate to permanently terminate other previously approved reclassifications. Doing so provides a degree of predictability and consistency in the wage index calculations by limiting hospitals to a total of two potential MGCRB reclassification options. This is the current policy of CMS and the current practice of the MGCRB. We proposed specifically to state this policy in regulation by providing in § 412.273(d)(4) that the terminated reclassification in such a case is not eligible for reinstatement.

We proposed the preceding changes to become effective for requests made beginning in FY 2026. The current policies and definitions will continue for the remainder of FY 2025. We noted that hospitals currently use the Office of Hearings Case and Document Management System (OH CDMS) to enter and maintain their MGCRB cases, and to correspond with the Office of Hearings. We are aware that the proposed changes would require system changes to the OH CDMS, and there could be some delay in revising certain terminology. However, these changes are not intended to significantly modify current policies and practices. Instead, they serve to clarify and simplify the process of determining whether an approved reclassification should be accepted and applied in a given fiscal year. We also stated that we believe that in making these changes, the regulation will provide clearer instructions to hospitals.

Finally, we noted that under the current and proposed policies, there is no negative effect for a hospital to reinstate (cancel a withdrawal or termination) for a subsequent year, as the reclassification could be terminated in the following year, and hospitals are eligible to reapply for wage index reclassification to a different labor market area. When eligible, a large majority of hospitals already do this, as it provides greater flexibility and options for wage index reclassification. Before the introduction of the OH CDMS, these reinstatement requests were often submitted simultaneously with a withdrawal or termination request. However, in the online system, the option to reinstate is typically only made available after all withdrawal and termination requests have been processed. We stated that we have considered a policy modification to make termination requests effective for only one fiscal year. That is, all requests to withdraw or terminate a reclassification made in the timeframe specified at § 412.273(c) would automatically be reinstated for any remaining fiscal years, without the need of a second action to reinstate it. We have not fully evaluated the impact of such a policy but may consider it in future rulemaking.

We did not receive any comments regarding the proposed changes to § 412.273 and are finalizing the proposed changes without revision. These changes, including the revised definitions, will be effective for all reclassification requests made on or after October 1, 2026 (FY 2026).

4. Redesignations Under Section 1886(d)(8)(B) of the Act

a. Lugar Status Determinations

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), we adopted the policy that, beginning with FY 2012, an eligible hospital that waives its Lugar status to receive the out-migration adjustment has effectively waived its deemed urban status and, thus, is rural for all purposes under the IPPS effective for the fiscal year in which the hospital receives the outmigration adjustment. In addition, in that rule, we adopted a minor

procedural change that will allow a Lugar hospital that qualifies for and accepts the out-migration adjustment (through written notification to CMS within 45 days from the issuance of the proposed rule in the **Federal Register**) to waive its urban status for the full 3-year period for which its out-migration adjustment is effective. By doing so, such a Lugar hospital will no longer be required during the second and third years of eligibility for the out-migration adjustment to advise us annually that it prefers to continue being treated as rural and receive the out-migration adjustment. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 56930), we further clarified that if a hospital wishes to reinstate its urban status for any fiscal year within this 3-year period, it must send a request to CMS within 45 days of the issuance of the proposed rule in the **Federal Register** for that particular fiscal year. We indicated that such reinstatement requests may be sent electronically to *wageindex@cms.hhs.gov*. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38147 through 38148), we finalized a policy revision to require a Lugar hospital that qualifies for and accepts the out-migration adjustment, or that no longer wishes to accept the out-migration adjustment and instead elects to return to its deemed urban status, to notify CMS within 45 days from the date of public display of the proposed rule at the Office of the Federal Register. These revised notification timeframes were effective beginning October 1, 2017. In addition, in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38148), we clarified that both requests to waive and to reinstate Lugar status may be sent to *wageindex@cms.hhs.gov*. To ensure proper accounting, we request hospitals to include their CCN, and either ''waive Lugar'' or ''reinstate Lugar'', in the subject line of these requests. When applicable, this election will result in a cancelation of a hospital's rural reclassification status under § 412.103, effective October 1, 2025. We also inform hospitals that for the request to be approved, the hospital must withdraw or terminate any active MGCRB reclassification. All requests, once approved, will remain in effect for the remainder of the 3-year out-migration adjustment period.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42314 and 42315), we clarified that in circumstances where an eligible hospital elects to receive the outmigration adjustment within 45 days of the public display date of the proposed rule at the Office of the Federal Register in lieu of its Lugar wage index reclassification, and the county in which the hospital is located will no longer qualify for an outmigration adjustment when the final rule (or a subsequent correction notice) wage index calculations are completed, the hospital's request to accept the outmigration adjustment will be denied, and the hospital will be automatically assigned to its deemed urban status under section 1886(d)(8)(B) of the Act. We stated that final rule wage index values will be recalculated to reflect this reclassification, and in some instances, after taking into account this reclassification, the out-migration adjustment for the county in question could be restored in the final rule. However, as the hospital is assigned a Lugar reclassification under section 1886(d)(8)(B) of the Act, it will be ineligible to receive the county outmigration adjustment under section 1886(d)(13)(G) of the Act.

We received two timely requests from hospitals to accept the county out-migration adjustment in lieu of its Lugar reclassification. The requests were from CCNs 180056 and 320033. When applicable, we informed the hospital that for the request to be approved, the hospital must withdraw or terminate any active MGCRB reclassification. All requests have been approved and will remain in effect for the remainder of the 3-year county outmigration adjustment period.

We receive one timely request from CCN 390183 to reinstate its Lugar reclassification. This request was approved, and the hospital will be reclassified to CBSA 39740 for FY 2026.

F. Wage Index Adjustments: Rural Floor, Imputed Floor, State Frontier Floor, Out-Migration Adjustment, Low Wage Index Hospital, and Cap on Wage Index Decrease Policies

The following adjustments to the wage index are listed in the order that they are generally applied. First, the rural floor, imputed floor, and state frontier floor provide a minimum wage index. The rural floor at section 4410(a) of the Balanced Budget Act of 1997 (Pub. L. 105–33) provides that the wage index for hospitals in urban areas of a State may not be less than the wage index applicable to hospitals located in rural areas in that State. The imputed floor at section 1886(d)(3)(E)(iv) of the Act provides a wage index minimum for all-urban states. The state frontier floor at section 1886(d)(3)(E)(iii) of the Act requires that hospitals in frontier states cannot be assigned a wage index of less than 1.0000. Next, the out-migration adjustment at section 1886(d)(13)(A) of the Act is applied, potentially increasing the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county or counties with a higher wage index. For FY 2026 and subsequent fiscal years, as discussed later in this section, after considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* we are finalizing as proposed to discontinue the low wage index hospital policy. Because we are finalizing as proposed to discontinue the low wage index hospital policy for FY 2026 and subsequent fiscal years, we are no longer applying a low wage index budget neutrality factor to the standardized amounts. Finally, all hospital wage index decreases are capped at 95 percent of the hospital's final wage index in the prior fiscal year, according to the policy finalized in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021).

1. Rural Floor

Section 4410(a) of the Balanced Budget Act of 1997 (Pub. L. 105–33) provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. This provision is referred to as the rural floor. Section 3141 of the Patient Protection and Affordable Care Act (Pub. L. 111–148) also requires that a national budget neutrality adjustment be applied in implementing the rural floor. Based on the FY 2026 wage index associated with this final rule (which is available on the CMS website), and based on the calculation of the rural floor including the wage data of hospitals that have reclassified as rural under § 412.103, we estimate that 961 hospitals will receive the rural floor in FY 2026. The budget neutrality impact of the application of the rural floor is discussed in section II.A.4.e. of Addendum A of this final rule.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 48784), CMS finalized a policy change to calculate the rural floor in the same manner as we did prior to the FY 2020 IPPS/LTCH PPS final rule, in which the rural wage index sets the rural floor. We stated that for FY 2023 and subsequent years, we would include the wage data of § 412.103 hospitals that have no Medicare Geographic Classification Review Board (MGCRB) reclassification in the calculation of the rural floor, and include the wage data of such hospitals in the calculation of ''the wage index for rural areas in the State in which the

county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act.

In the FY 2024 IPPS/LTCH final rule (88 FR 58971 through 58977), we finalized a policy change beginning that year to include the data of *all* § 412.103 hospitals, even those that have an MGCRB reclassification, in the calculation of the rural floor and the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. We explained that after revisiting the case law, prior public comments, and the relevant statutory language, we agreed that the best reading of section 1886(d)(8)(E)'s text that CMS ''shall treat the [§ 412.103] hospital as being located in the rural area'' is that it instructs CMS to treat § 412.103 hospitals the same as geographically rural hospitals for the wage index calculation.

Accordingly, in the FY 2024 IPPS/LTCH PPS final rule, we finalized a policy to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) that are implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. (For additional information on these changes, we refer readers to the FY 2024 IPPS/LTCH PPS final rule (88 FR 58971 through 58977).)

Comment: Some commenters expressed continued support for CMS's treatment of urban hospitals reclassified as rural under § 412.103 in the same manner as geographically rural hospitals for the rural wage index and rural floor calculations. These commenters stated that restoring equality between a state's rural floor and its rural wage index is an appropriate and fair implementation of the statute.

Conversely, several commenters expressed concern that the current rural floor methodology and associated budget neutrality adjustment exacerbates inequities. A commenter stated that the rural floor magnifies Medicare underpayment to hospitals in high-cost regions, since payments to such hospitals are reduced due to the budget neutrality adjustment. Several commenters stated that hospitals in low-wage states are hurt when their payments are reduced to drive inflated reimbursement to hospitals in states gaming the rural floor. These commenters cited examples of states with high-wage urban hospitals reclassifying to rural to set the rural wage index for the state. The commenters urged CMS to reverse its current policy and calculate the rural wage index using wage data only from geographically rural hospitals in the state.

Response: While we did not propose any changes to the rural floor policy in the FY 2026 IPPS/LTCH PPS proposed rule, we appreciate the commenters' continued support.

We understand the commenters' concerns regarding the effect that the rural floor budget neutrality factor has on some hospitals as other hospitals make reclassification decisions to take advantage of the rural floor policy. As we noted in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58975 through 58976) and the FY 2025 IPPS/LTCH PPS final rule (89 FR 69299), we expect that the number of IPPS hospitals assigned their State's rural wage index will increase in future years as hospitals adjust to the policy and as the relative value of States' rural wage index values increase due to the inclusion of hospitals that strategically obtain § 412.103 reclassification. As a result, the majority of hospitals (if not all) will be assigned identical wage index values within their states. For example, in FY 2025, 58 percent of geographically urban hospitals received a wage index equal to their State's rural floor, imputed floor, or frontier floor prior to any outmigration, or 5 percent decrease cap adjustments. For FY 2026, approximately 70 percent of geographically urban hospitals will receive a wage index equal to their State's rural floor, imputed floor, or frontier floor prior to any outmigration, or 5 percent decrease cap adjustments. As we stated in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58975) and the FY 2025 IPPS/LTCH PPS final rule (89 FR 69299), as substantially more hospitals receive the rural floor, there will be a consequently greater budget neutrality impact. However, we believe this result would be unavoidable given the requirement of section 1886(d)(8)(E) of the Act to treat § 412.103 hospitals 'as being located in the rural area' of the state, as well as the requirement at sections 4410(b) of the BBA 1997 and 3141 of the Patient Protection and Affordable Care Act (Pub. L. 111–148) that a uniform, national budget neutrality adjustment be applied in implementing the rural floor.

Comment: Several commenters disagreed with CMS' current application of the rural floor and rural floor budget neutrality adjustment. These commenters asserted that section 4410(b) of the Balanced Budget Act of 1997 (BBA) exempts urban and reclassified rural hospitals that receive the rural floor from having their wage indexes reduced through the application of the rural floor budget neutrality adjustment. According to these commenters, the rural floor budget neutrality adjustment should be applied only to the wage indexes of hospitals not receiving the rural floor (that is, non- reclassified rural hospitals, and urban hospitals with wage indexes above the rural floor).

Response: As we stated in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69299) in response to similar comments that we had received, we disagree with the commenters' assertion that urban and reclassified rural hospitals that receive the rural floor should be excluded from the application of the rural floor budget neutrality factor. We considered this approach in the FY 2008 IPPS proposed and final rules (72 FR 24787 and 72 FR 47325) and believe we have applied the rural floor budget neutrality adjustment in a manner consistent with the statute. Specifically, in the FY 2008 IPPS proposed rule, we rejected a reading of section 4410(b) of the BBA requiring that the budget neutrality adjustment would be applied only to those hospitals that do not receive the rural floor, because urban hospitals receiving the rural floor would receive a higher wage index than the rural hospitals within the same State (because hospitals receiving the rural floor would not be subject to budget neutrality, whereas rural hospitals would be) (72 FR 24787). We continue to believe that such a reading would not be consistent with the best reading of the statute. The statute sets a floor for urban hospitals. The statute does not instruct CMS to pay urban hospitals a wage index higher than the wage index applicable to rural hospitals and contains no suggestion that the general budget neutrality provisions of section 1886(d)(8)(D)—which expressly apply to the adjustments made in section 1886(d)(C)—should not apply. In the FY 2008 IPPS final rule, we adopted the current approach to implement rural floor budget neutrality by applying a uniform, national adjustment to the wage index (72 FR 47325). Since then, Congress specifically endorsed our approach in section 3141 of the Patient Protection and Affordable Care Act (Pub. L. 111–148), which requires that the rural floor budget neutrality adjustment be applied ''in the same manner as the Secretary administered such [adjustment] for discharges occurring during fiscal year 2008 (through a uniform, national adjustment to the area wage index).'' In addition, we note that section 4410 of the BBA to which the commenters refer provides

that the rural floor is equal to ''the area wage index applicable under [section 1886(d)(3)(E) of the Social Security Act] to hospitals located in rural areas in the State.'' Under our existing policy, the rural floor and the rural wage index for the state are the same after application of the rural floor budget neutrality adjustment factor, and nothing in section 4410 of the BBA requires otherwise. Put differently, CMS' methodology amounts to merely calculating the amount of the rural floor such that it is the same as the final rural wage index for the state, rather than reducing the wage indices of low wage urban hospitals or reclassified rural hospitals that receive the rural floor relative to what they would be otherwise—in that way it appropriately implements both section 4410 of the BBA and section 3141 of the ACA. Thus, consistent with our longstanding methodology for implementing the rural floor, we believe it is appropriate to continue to apply a budget neutrality adjustment to all hospitals' wage indexes.

2. Imputed Floor

In the FY 2005 IPPS final rule (69 FR 49109 through 49111), we adopted the imputed floor policy as a temporary 3-year regulatory measure to address concerns from hospitals in all-urban States that have stated that they are disadvantaged by the absence of rural hospitals to set a wage index floor for those States. We extended the imputed floor policy eight times since its initial implementation, the last of which was adopted in the FY 2018 IPPS/LTCH PPS final rule and expired on September 30, 2018. We refer readers to further discussions of the imputed floor in the IPPS/LTCH PPS final rules from FYs 2014 through 2019 (78 FR 50589 through 50590, 79 FR 49969 through 49971, 80 FR 49497 through 49498, 81 FR 56921 through 56922, 82 FR 38138 through 38142, and 83 FR 41376 through 41380, respectively) and to the regulations at § 412.64(h)(4). For FYs 2019, 2020, and 2021, hospitals in all-urban states received a wage index that was calculated without applying an imputed floor, and we no longer included the imputed floor as a factor in the national budget neutrality adjustment.

Section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2), enacted on March 11, 2021, amended section 1886(d)(3)(E)(i) of the Act and added section 1886(d)(3)(E)(iv) of the Act to establish a minimum area wage index for hospitals in all-urban States for discharges occurring on or after October 1, 2021. Specifically, section 1886(d)(3)(E)(iv)(I) and (II) of the Act provides that for discharges occurring on or after October 1, 2021, the area wage index applicable to any hospital in an all-urban State may not be less than the minimum area wage index for the fiscal year for hospitals in that State established using the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018. Unlike the imputed floor that was in effect from FYs 2005 through 2018, section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index shall not be applied in a budget neutral manner. Section 1886(d)(3)(E)(iv)(IV) of the Act provides that, for purposes of the imputed floor wage index under clause (iv), the term all-urban State means a State in which there are no rural areas (as defined in section 1886(d)(2)(D) of the Act) or a State in which there are no hospitals classified as rural under section 1886 of the Act. Under this definition, given that it applies for purposes of the imputed floor wage index, we consider a hospital to be classified as rural under section 1886 of the Act if it is assigned the State's rural area wage index value.

Effective beginning October 1, 2021 (FY 2022), section 1886(d)(3)(E)(iv) of the Act reinstated the imputed floor wage index policy for all-urban States, with no expiration date, using the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018. We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45176 through 45178) for further discussion of the original imputed floor calculation methodology implemented in FY 2005 and the alternative methodology implemented in FY 2013.

Based on data available for this final rule, States that will be all-urban States as defined in section 1886(d)(3)(E)(iv)(IV) of the Act, and thus hospitals in such States that will be eligible to receive an increase in their wage index due to application of the imputed floor for FY 2026, are identified in Table 3 (which is available on the CMS website) associated with this final rule. States with a value in the column titled ''State Imputed Floor'' are eligible for the imputed floor.

The regulations at § 412.64(e)(1) and (4) and (h)(4) and (5) implement the imputed floor required by section 1886(d)(3)(E)(iv) of the Act for discharges occurring on or after October 1, 2021. The imputed floor will continue to be applied for FY 2026 in accordance with the policies adopted in the FY 2022 IPPS/LTCH PPS final rule. For more information regarding our implementation of the imputed floor required by section 1886(d)(3)(E)(iv) of the Act, we refer readers to the discussion in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45176 through 45178).

Comment: We received comments supporting the application of the imputed floor.

Response: We thank the commenters for their input. As discussed earlier, the imputed floor is a statutory requirement under section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2) which requires the Secretary to establish a minimum area wage index for hospitals in all-urban States for discharges occurring on or after October 1, 2021. We did not propose any changes to the methodology for calculating the imputed floor as set forth in § 412.64(e)(1) and (4) and (h)(4) and (5). Therefore, in accordance with the statute and existing regulations, we are applying the imputed floor for hospitals in all-urban States for FY 2026.

3. State Frontier Floor for FY 2026

Section 10324 of Public Law 111–148 requires that hospitals in frontier States cannot be assigned a wage index of less than 1.0000. (We refer readers to the regulations at § 412.64(m) and to a discussion of the implementation of this provision in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 through 50161).) In the FY 2026 IPPS/LTCH PPS proposed rule, we did not propose any changes to the frontier floor policy for FY 2026. In the proposed rule we stated 40 hospitals would receive the frontier floor value of 1.0000 for their FY 2026 proposed wage index. These hospitals are located in Montana, North Dakota, South Dakota, and Wyoming.

We did not receive any public comments on the application of the State frontier floor for FY 2026. In this final rule, 23 hospitals will receive the frontier floor value of 1.0000 for their FY 2026 wage index. These hospitals are located in Montana, North Dakota, South Dakota, and Wyoming. We note that while Nevada meets the criteria of a frontier State, all hospitals within the State currently receive a wage index value greater than 1.0000.

The areas affected by the rural and frontier floor policies for the final FY 2026 wage index are identified in Table 3 associated with this final rule, which is available via the internet on the CMS website.

4. Out-Migration Adjustment Based on Commuting Patterns of Hospital Employees

In accordance with section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, beginning with FY 2005, we established

a process to make adjustments to the hospital wage index based on commuting patterns of hospital employees (the ''out-migration'' adjustment). The process, outlined in the FY 2005 IPPS final rule (69 FR 49061), provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county (or counties) with a higher wage index.

Section 1886(d)(13)(B) of the Act requires the Secretary to use data the Secretary determines to be appropriate to establish the qualifying counties. When the provision of section 1886(d)(13) of the Act was implemented for the FY 2005 wage index, we analyzed commuting data compiled by the U.S. Census Bureau that were derived from a special tabulation of the 2000 Census journey-to-work data for all industries (CMS extracted data applicable to hospitals). These data were compiled from responses to the ''long-form'' survey, which the Census Bureau used at that time, and which contained questions on where residents in each county worked (69 FR 49062). However, the 2010 Census was ''short form'' only; information on where residents in each county worked was not collected as part of the 2010 Census. The Census Bureau worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked in 2010, for use in developing a new out-migration adjustment based on new commuting patterns developed from the 2010 Census data beginning with FY 2016.

To determine the out-migration adjustments and applicable counties for FY 2016, we analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the American Community Survey (ACS), an official Census Bureau survey, utilizing 2008 through 2012 (5-year) Microdata. The data were compiled from responses to the ACS questions regarding the county where workers reside and the county to which workers commute. As we discussed in prior IPPS/LTCH PPS final rules, we have applied the same policies, procedures, and computations since FY 2012. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49500 through 49502) for a full explanation of the revised data source. We also stated that we will consider determining out-migration adjustments based on data from the next Census or other available data, as appropriate.

As discussed previously in section III.A.2., in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69253 through 69266), CMS adopted revised delineations from the OMB Bulletin 23–01, published July 21, 2023. The revised delineations incorporated population estimates based on the 2020 decennial census, as well as updated journey-to-work commuting data. The Census Bureau once again worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked, for use in developing a new out-migration adjustment based on new commuting patterns. We analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the ACS, utilizing 2016 through 2020 data. The Census Bureau produces county level commuting flow tables every 5 years using non-overlapping 5-year ACS estimates. The data include demographic characteristics, home and work locations, and journey-to-work travel flows. The custom tabulation requested by CMS was specific to general medical and surgical hospital and specialty (except psychiatric and substance use disorder treatment) hospital employees (hospital sector Census code 8191/NAICS code 6221 and 6223) who worked in the 50 States, Washington, DC, and Puerto Rico and, therefore, provided information about commuting patterns of workers at the county level for residents of the 50 States, Washington, DC, and Puerto Rico.

For the ACS, the Census Bureau selects a random sample of addresses where workers reside to be included in the survey, and the sample is designed to ensure good geographic coverage. The ACS samples approximately 3.5 million resident addresses per year.[140] The results of the ACS are used to formulate descriptive population estimates, and, as such, the sample on which the dataset is based represents the actual figures that will be obtained from a complete count.

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69301), we finalized that for FY 2025 and subsequent years, the out-migration adjustment will be based on the data derived from the previously discussed custom tabulation of the ACS utilizing 2016 through 2020 (5-year) Microdata. As discussed earlier, we believe that these data are the most appropriate to establish qualifying counties, because they are the most accurate and up-to-date data that are available to us. For FY 2026, we did not propose any changes to the methodology or data source for calculating the out-migration adjustment. Specifically, we proposed that the FY 2026 out-migration adjustments continue to be based on the same policies, procedures, and computation that were used for the FY 2012 out-migration adjustment. We did not receive any comments on this proposal. We are finalizing as proposed that the FY 2026 out-migration adjustments continue to be based on the same policies, procedures, and computation that were used for the FY 2012 out-migration adjustment. We have applied these same policies, procedures, and computations since FY 2012, and we believe they continue to be appropriate for FY 2026. We refer readers to a full discussion of the out-migration adjustment, including rules on deeming hospitals reclassified under section 1886(d)(8) or section 1886(d)(10) of the Act to have waived the out-migration adjustment, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51601 through 51602). Table 2 of this final rule (which is available on the CMS website) lists the out-migration adjustments for the FY 2026 wage index. In addition, Table 4A associated with this final rule, ''List of Counties Eligible for the Out Migration Adjustment under Section 1886(d)(13) of the Act'' (also available on the CMS website), consists of the following: A list of counties that are eligible for the outmigration adjustment for FY 2026 identified by FIPS county code, the FY 2026 out-migration adjustment, and the number of years the adjustment will be in effect. We refer readers to section V.I. of the Addendum of this final rule for instructions on accessing IPPS tables that are posted on the CMS websites identified in this final rule.

5. Discontinuation of the Low Wage Index Hospital Policy and Budget Neutrality Adjustment

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339), we finalized a policy to address increasing wage index disparities, based in part on comments we received in response to our request for information included in our FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20372 through 20377). Accordingly, we finalized a policy that provided certain low wage index hospitals with an opportunity to increase employee compensation without the usual lag in those increases being reflected in the calculation of the wage index (as they would expect to do if not for the lag). We accomplished this

[140] According to the Census Bureau, the effects of the public health emergency (PHE) on ACS activities in 2020 resulted in a lower number of addresses (~2.9 million) in the sample, as well as fewer interviews than a typical year.

by temporarily increasing the wage index values for certain hospitals with low wage index values and doing so in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals. We increased the wage index for hospitals with a wage index value below the 25th percentile wage index value for a fiscal year by half the difference between the otherwise applicable final wage index value for a year for that hospital and the 25th percentile wage index value for that year across all hospitals (the low wage index hospital policy).

When we adopted the low wage index hospital policy in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42326 through 42328), we stated our intention that this policy would be effective for at least 4 years, beginning in FY 2020, to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. We also stated we intended to revisit the issue of the duration of this policy in future rulemaking as we gained experience under the policy. For FY 2024, we continued to apply the low wage index hospital policy and the related budget neutrality adjustment (88 FR 58977 through 58980). In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69301 through 69308), we adopted an extension of the low wage index hospital policy and the related budget neutrality adjustment effective for at least three more years, beginning in FY 2025, in order for sufficient wage data from after the end of the COVID–19 Public Health Emergency to become available.

On July 23, 2024, the Court of Appeals for the D.C. Circuit held that the Secretary lacked authority under section 1886(d)(3)(E) of the Act or under the ''adjustments'' language of section 1886(d)(5)(I)(i) of the Act to adopt the low wage index hospital policy for FY 2020, and that the policy and related budget neutrality adjustment must be vacated.[141] After considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* in the interim final action with comment period (IFC) titled ''Medicare Program; Changes to the Fiscal Year 2025 Hospital Inpatient Prospective Payment System (IPPS) Rates Due to Court Decision'' (referred to herein as the FY 2025 IFC) (89 FR 80405 through 80421), we recalculated the FY 2025 IPPS hospital wage index to remove the low wage index hospital policy for FY 2025. We also removed the low wage index budget neutrality factor from the FY 2025 standardized amounts. We refer the reader to the applicable year final rule discussions (FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339); FY 2024 IPPS/LTCH PPS final rule (88 FR 58977 through 58980)) regarding the implementation of the low wage index hospital policy and the FY 2025 IFC for a complete discussion regarding the removal of the low wage index hospital policy for FY 2025.

For FY 2026 and subsequent fiscal years, after considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* we proposed to discontinue the low wage index hospital policy. Because we proposed to discontinue the low wage index hospital policy for FY 2026 and subsequent fiscal years, we stated that we would no longer apply a low wage index budget neutrality factor to the standardized amounts.

Comment: Many commenters supported the discontinuation of the low wage index hospital policy in light of the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra.* Commenters agreed with the court that the FY 2020 low wage index hospital policy is unlawful. These commenters stated that ending the low wage index hospital policy, under which the wage indexes of hospitals in the bottom quartile were raised at the expense of all hospitals nationwide due to a budget neutrality adjustment, would restore fairness and consistency to the wage index and align the true cost of care within an area.

Other commenters strongly urged CMS to continue the low wage index hospital policy. While most commenters acknowledged the court's decision, they expressed concern regarding the impact of ending the policy on low wage hospitals. They stated that the rationales for implementing the low wage index hospital policy remain, and discontinuing the policy will end critical support to vulnerable low wage and often rural hospitals. Two commenters specifically asked CMS to explore the impacts of discontinuing the low wage index hospital policy on other policies and hospital payment programs before finalizing, report on the effects of this policy change, and examine how concurrent wage index adjustments may compound or offset the effects. Similarly, another commenter supported the discontinuation of the low wage index hospital policy but expressed concern regarding the impact of ending the policy on rural hospitals. The commenter believes that other programs such as the low volume payment adjustment should provide support.

Response: We thank the commenters for their support for our proposal. With regard to the commenters opposing the discontinuation of the low wage index hospital policy, we understand the commenters' concerns that the rationales for implementing the low wage index hospital policy remain. However, as discussed in the FY 2025 IFC (89 FR 80407), although we respectfully disagree with the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra* and believed that the low wage index hospital policy and the related budget neutrality adjustment should be effective for at least three more years for the reasons stated in the FY 2025 IPPS rulemaking, after considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* we proposed to discontinue the low wage index hospital policy for FY 2026 and subsequent fiscal years. In response to concerns regarding the impact of ending the policy on low wage hospitals, we believe we have addressed those concerns with policies to mitigate any large decline in wage indexes. We refer readers to Section III.F.5 and III.F.6 for detailed discussions of the cap on wage index decreases and transition for the discontinuation of the low wage index hospital policy. With regard to comments requesting that we explore and report on the effects of discontinuing the low wage index hospital policy, we believe that Table 2 associated with this final rule (which is available on the CMS website) provides a clear analysis. Specifically, Table 2 contains columns with each hospital's FY 2026 wage index without and with the 5 percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, and the value with the transitional payment exception for the discontinuation of the low wage index hospital policy, if applicable. With regard to examining how concurrent wage index adjustments and payment programs like the low volume payment adjustment may compound or offset the effects of discontinuing the low wage index hospital policy, we believe this is a payment analysis best performed by each hospital individually considering each hospital's unique circumstances and eligibility for different adjustments.

Comment: Many commenters urged CMS to consider alternative policies to help low wage hospitals, specifically permanent solutions that address wage index inequities. Some commenters cited reports from the Office of Inspector General (OIG), the Institute of Medicine (IOM), and MedPAC that recognize flaws in the current wage

[141] *Bridgeport Hosp.* v. *Becerra,* 108 F.4th 882, 887–91 & n.6 (D.C. Cir. 2024).

index system, and emphasized that comprehensive reform is necessary to protect care in rural and underserved communities in the absence of the low wage index hospital policy. Commenters requested that CMS develop a permanent, statutory solution to address the circularity affecting low wage hospitals by working with Congress to codify the low wage index hospital policy in a manner that complies with the court's decision. A commenter specifically asked CMS to expand on its administrative discretion to assist low wage hospitals. Another commenter encouraged CMS to continue developing policies that address low wage index hospitals without negatively impacting other hospitals by soliciting input from the hospital community. Similarly, many commenters also encouraged CMS to further investigate the specific factors causing wage disparities as part of developing a solution. A few commenters suggested that CMS establish a wage index floor for all hospitals.

Response: We appreciate the varied solutions suggested by commenters to help low wage hospitals and reduce wage index disparities. We note that many of the suggested solutions may require changes to the Medicare statute. We also note that exercising CMS's administrative discretion in a manner that would help low wage hospitals must consider the recent decision and analysis of the D.C. Circuit in *Bridgeport Hosp.* v. *Becerra.* Regarding the commenters' suggestions to solicit input from the hospital community and investigate the causes of wage index disparities, we refer readers to the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20372), in which we invited the public to submit comments, suggestions, and recommendations for regulatory and policy changes to the Medicare wage index, and to the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19393 through 19394) for a summary of the responses received from that request for information (RFI). In response to the commenters' suggesting that CMS establish a wage index floor for all hospitals, we refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42326), where we considered that alternative. Specifically, we stated that we believe the rank order of wage indexes generally reflects meaningful distinctions between the employee compensation costs faced by hospitals in different geographic areas.

Comment: Many commenters requested that CMS implement a less restrictive reclassification mechanism for the lowest wage index hospitals (for a MGCRB reclassification). Specifically, commenters suggested regulatory changes to § 412.230(d) to allow a low wage index hospital that is within 50 miles of a higher paid wage area (urban or rural) to reclassify to that area and receive the wage index that is paid to hospitals in that area. The commenters also suggested CMS add a low wage hospital exception as § 412.230(d)(6) for any hospital that was in the lowest quartile of wage indexes nationally in any of the FYs 2020 through 2025. As a policy justification, the commenters stated that 50 miles reflect real-world commuting standards, and that altering the average hourly wage comparison test for low wage hospitals advances health equity. Overall, the commenters posited that their suggested regulation text and policy change would reduce disparities and enhance access to care.

Response: We thank the commenters for their suggested policy and regulation changes to implement a less restrictive reclassification mechanism for the lowest wage index hospitals (for a MGCRB reclassification). We did not propose any changes to § 412.230 in the FY 2026 IPPS/LTCH PPS proposed rule. Additionally, under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amount to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. Any changes that would allow more hospitals to reclassify would increase the budget neutrality adjustment under section 1886(d)(8)(D) of the Act and would further increase the adjustment made to the standardized amount for all hospitals. We believe it is important to receive public comments with regard to such changes.

We note that we received comments that were out of scope with regard to our proposal to discontinue the low wage index hospital policy for FY 2026 and subsequent fiscal years. Therefore, we are not responding to these comments in this final rule.

After consideration of the public comments received and the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* in this final rule, we are finalizing without modification for FY 2026 and subsequent fiscal years, our proposal to discontinue the low wage index hospital policy. Because we are finalizing our proposal to discontinue the low wage index hospital policy for FY 2026 and subsequent fiscal years, we will no longer apply a low wage index budget neutrality factor to the standardized amounts.

6. Cap on Wage Index Decreases and Budget Neutrality Adjustment

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021), we finalized a wage index cap policy and associated budget neutrality adjustment for FY 2023 and subsequent fiscal years. Under this policy, we apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline. A hospital's wage index will not be less than 95 percent of its final wage index for the prior FY. If a hospital's prior FY wage index is calculated with the application of the 5-percent cap, the following year's wage index will not be less than 95 percent of the hospital's capped wage index in the prior FY. We note, the FY 2025 wage index was established in the FY 2025 IFC which removed the low wage index hospital policy (89 FR 80405 through 80421). Therefore, for FY 2026, the prior year wage index for purposes of the cap will be based on the wage index established in the IFC. We also note that in that same IFC, we established a transitional payment exception for FY 2025. The 5-percent cap for FY 2026 will be applied irrespective of the FY 2025 transitional payment exception. We finally note, as discussed later in this section, that for FY 2026 we proposed a transitional payment exception that addresses the effects of the removal of the low wage index hospital policy. We proposed that this transitional payment exception would be applied after the application of the 5-percent cap.

Except for newly opened hospitals, we apply the cap for a FY using the final wage index applicable to the hospital on the last day of the prior FY. A newly opened hospital will be paid the wage index for the area in which it is geographically located for its first full or partial fiscal year, and it will not receive a cap for that first year, because it will not have been assigned a wage index in the prior year. The wage index cap policy is reflected at § 412.64(h)(7). We apply the cap in a budget neutral manner through a national adjustment to the standardized amount each fiscal year. For more information about the wage index cap policy and associated budget neutrality adjustment, we refer readers to the discussion in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021).

For FY 2026, we will apply the wage index cap and associated budget neutrality adjustment in accordance with the policies adopted in the FY

2023 IPPS/LTCH PPS final rule. We refer readers to the Addendum of this final rule for further information regarding the budget neutrality calculations.

Comment: Commenters, including MedPAC, supported the policy to cap wage index decreases. MedPAC urged CMS to apply a cap to wage index increases as well. Many commenters thanked CMS for recognizing that significant year-to-year changes in the wage index can occur due to external factors beyond a hospital's control and stated that this policy increases predictability in IPPS payments. However, many commenters urged CMS to apply this policy in a non-budget neutral manner.

Response: We thank the commenters for their support. We note that we did not propose any changes to this policy in the FY 2026 IPPS/LTCH PPS proposed rule. We appreciate MedPAC's suggestion that the cap on wage index changes should also be applied to increases in the wage index. However, as we stated in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49021), one purpose of the policy is to help mitigate the significant negative impacts of certain wage index changes. That is, we cap decreases because we believe that a hospital would be able to more effectively budget and plan when there is predictability about its expected minimum level of IPPS payments in the upcoming fiscal year. We do not have a policy to limit wage index increases because we do not believe such a policy is needed to enable hospitals to more effectively budget and plan their operations. Therefore, we believe it is appropriate for hospitals that experience an increase in their wage index value to receive that wage index value. With regard to the commenters requesting that CMS apply this policy in a non-budget neutral manner, we refer readers to our response to similar comments in the FY 2024 IPPS/LTCH PPS final rule (88 FR 58981).

7. Transition for the Discontinuation of the Low Wage Index Hospital Policy

As discussed previously, in the FY 2025 IFC we recalculated the FY 2025 IPPS hospital wage index to remove the low wage index hospital policy for FY 2025. We also removed the low wage index budget neutrality factor from the FY 2025 standardized amounts. For FY 2026 and subsequent fiscal years, consistent with the FY 2025 IFC, after considering the D.C. Circuit's decision in *Bridgeport Hosp.* v. *Becerra,* we proposed to discontinue the low wage index hospital policy. Because we proposed to discontinue the low wage index hospital policy for FY 2026 and subsequent fiscal years, we would no longer apply the low wage index budget neutrality factor to the standardized amounts.

In the past, we have established temporary transition policies when there have been significant changes to payment policies, and we have limited the duration of each transition in order to phase in the effects of those payment policy changes. In taking this temporary approach in the past, we have sought to mitigate short-term instability and payment fluctuations that can negatively impact hospitals consistent with principles of certainty and predictability under prospective payment systems. For example, CMS has recognized that hospitals in certain areas may experience a negative impact on their IPPS payment due to the adoption of revised OMB delineations for wage index purposes and has finalized transition policies to mitigate negative financial impacts and provide stability to year-to-year wage index variations. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49956 through 49962) for a discussion of the transition period finalized when CMS adopted revised OMB delineations after the 2010 decennial census. For FY 2025, consistent with our past practice, we established an interim transition policy for hospitals significantly impacted by the removal of the FY 2025 low wage index hospital policy using our authority under section 1886(d)(5)(I) of the Act. Specifically, the transitional payment exception for FY 2025 for those hospitals is equal to the additional FY 2025 amount a hospital would have been paid under the IPPS if its FY 2025 wage index were equal to 95 percent of its FY 2024 wage index. For a discussion of the removal of the low wage index hospital policy and the establishment of the interim transition policy, we refer readers to the FY 2025 IFC (89 FR 80405 through 80421).

We currently have a wage index cap policy at 42 CFR 412.64(h)(7), under which we apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY in a budget neutral manner, regardless of the circumstances causing the decline, so that a hospital's final wage index for the upcoming fiscal year will not be less than 95 percent of its final wage index from the prior fiscal year. In accordance with 42 CFR 412.64(e)(1)(ii), CMS applies a budget neutrality adjustment to offset the increase in total payments resulting from the application of that cap.

We stated in the proposed rule that some hospitals that previously benefitted from the low wage index hospital policy would experience decreases of 10 percent or more over the two years from their FY 2024 wage index (with the low wage index hospital policy applied) to their proposed FY 2026 wage index (that is, approximately 5 percent or more per year over that time period). Similar to how 42 CFR 412.64(h)(7) operates, and how our interim transitional policy established in the FY 2025 IFC for these hospitals operates in FY 2025, we proposed to establish a narrow transitional exception to the calculation of FY 2026 payments for these hospitals.

As described previously, if the combined payment effect of the FY 2025 wage index and the transitional payment exception for FY 2025 had been attributable solely to the FY 2025 wage index, then the wage index cap policy at 42 CFR 412.64(h)(7) would have mitigated these FY 2026 wage index decreases and would have done so in a budget neutral manner under our current regulations. As discussed in the FY 2025 IFC (89 FR 80407–80408), while CMS is not necessarily required by the statute to budget neutralize every exception or adjustment under section 1886(d)(5)(I), it has often done so by exercising its discretion under section 1886(d)(5)(I) of the Act twice: first to adopt an exception or adjustment, and then again to make that exception or adjustment budget neutral.[142] For the FY 2025 interim transition policy, under the unique circumstances and due to the timing of the appellate court's decision in *Bridgeport Hosp.* v. *Becerra* so close to the beginning of FY 2025, we declined to exercise our discretion to budget neutralize that interim FY 2025 transition policy. We stated that unlike most policies relevant to the calculation of the hospital wage index, the timing of the court's decision shortly before the beginning of the fiscal year necessitated swift action by the agency via an IFC, rather than providing for prior notice and opportunity for comment. The agency's action in that IFC was intended to promote certainty regarding FY 2025 IPPS payments in light of the reasoning of *Bridgeport,* which risked creating ongoing confusion for hospitals extending into FY 2025 about the amount of their IPPS payments. In that circumstance, the lack of an opportunity to notify interested parties in a notice of proposed rulemaking about changes to their wage index that would result from

[142] For example, CMS has stated in the past that it would exercise its discretion under section 1886(d)(5)(I) of the Act to make the low wage index hospital policy budget neutral even if budget neutrality were not required by statute (88 FR 58979).

budget neutralizing the transition policy, and for the agency to consider before the policy's effective date issues hospitals might raise when commenting on those changes, weighed in favor of an approach that did not adversely affect the significant majority of hospitals. For these reasons, and as discussed in the IFC, we declined to budget neutralize the interim FY 2025 transition policy.

In contrast, we proposed the FY 2026 transition policy under very different circumstances. We are not facing the timing constraints of a court decision issued shortly before the beginning of a fiscal year that necessitated swift action through an IFC to promote certainty and prevent ongoing confusion by hospitals. Rather, we proposed the FY 2026 transition policy through the normal course of our annual rulemaking for the IPPS, which allows both for advance notice of the policy and for us to consider issues interested parties might raise in comments on the proposed rule. We proposed to make this policy budget neutral through an adjustment applied to the standardized amount for all hospitals because: (1) the wage index cap policy at 42 CFR 412.64(h)(7) would have mitigated these FY 2026 wage index decreases had the combined payment effect of the FY 2025 wage index and the transitional payment exception been reflected solely in the FY 2025 wage index, and it would have done so in a budget neutral manner under our current regulations; and (2) the circumstances described previously that caused us to decline to budget neutralize the interim FY 2025 transition policy are not applicable to the proposed FY 2026 transition policy. In addition, we noted that implementing the proposed FY 2026 transition policy in a budget neutral manner would be consistent with past practice. For example, we budget neutralized the FY 2015 wage index transition budget neutrality policy discussed earlier (79 FR 49956 through 49962). As we have discussed in other instances (89 FR 19398), we believed, and continue to believe, that transition policies should not increase estimated aggregate Medicare payments beyond the payments that would be made had we never proposed these transition policies. Therefore, we proposed to use our authority under section 1886(d)(5)(I)(i) of the Act twice. First, we proposed to adopt a narrow transitional exception to the calculation of FY 2026 IPPS payments for low wage index hospitals significantly impacted by the discontinuation of the low wage index hospital policy. Second, we proposed to exercise our authority again to do so in a budget neutral manner.[143] [144] We refer the reader to section II.A.4.g. of the Addendum of this final rule for complete details regarding the application of the transition for the discontinuation of the low wage index hospital policy budget neutrality factor.

The transitional exception policy we proposed applies to hospitals that benefitted from the FY 2024 low wage index hospital policy. For those hospitals, we stated that we would compare the hospital's proposed FY 2026 wage index to the hospital's FY 2024 wage index. If the hospital is significantly impacted by the discontinuation of the low wage index hospital policy, meaning the hospital's proposed FY 2026 wage index is decreasing by more than 9.75 percent [145] from the hospital's FY 2024 wage index, then the transitional payment exception for FY 2026 for that hospital would be equal to the additional FY 2026 amount the hospital would be paid under the IPPS if its FY 2026 wage index were equal to 90.25 percent [146] of its FY 2024 wage index.[147] We noted this proposed transitional payment exception would be applied after the application of the 5-percent cap described at 42 CFR 412.64(h)(7). We provided the following example in the proposed rule: assume the FY 2024 wage index for a hospital that benefitted from the low wage index hospital policy is 0.7600, and the hospital's proposed FY 2026 wage index is 0.6500. (If applicable, this proposed FY 2026 wage index value would include the 5-percent cap based on a comparison of the hospital's FY 2026 wage index prior to application of the 5-percent cap, to the hospital's FY 2025 wage index. We noted that the FY 2025 wage index that will be used in this comparison is generally the FY 2025 wage index listed in Table 2 from the FY 2025 IFC in the column labeled ''FY 2025 Wage Index With Cap''. We noted that all hospitals, regardless of whether the cap was applied to their FY 2025 wage index, have a value in the column ''FY 2025 Wage Index With Cap''. Hospitals that did not have a cap applied to their FY 2025 wage index will display a wage index in this column without the cap.) The hospital's proposed FY 2026 wage index is decreasing by more than 9.75 percent from the hospital's FY 2024 wage index [that is, 0.6500 < 0.6859 where 0.6859 = (0.9025 times 0.7600)]. The proposed transitional payment exception for FY 2026 for this hospital is equal to the additional amount the hospital would be paid under the IPPS if its FY 2026 wage index were equal to 0.6859, which is 90.25 percent of 0.7600, its FY 2024 wage index.

Under the capital IPPS, the adjustment for local cost variation is based on the hospital wage index value that is applicable to the hospital under the operating IPPS. We adjust the capital standard Federal rate so that the effects of the annual changes in the geographic adjustment factor (GAF) are budget neutral. The low wage index hospital policy has been reflected in the capital IPPS GAFs since FY 2020 (84 FR 42638). The removal of the low wage index hospital policy for FY 2025 also affects the FY 2025 GAFs. Because we are now no longer applying the low wage index hospital policy in FY 2025, we are also no longer making an adjustment to the FY 2025 capital standard Federal rate to ensure budget neutrality for the low wage index hospital policy.

As discussed in the FY 2025 IFC (89 FR 80408), since FY 2023, the GAFs reflect the wage index cap policy that limits any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline, to 95 percent of its prior year value. As described previously, some hospitals that previously benefitted from the low wage index hospital policy will experience

[143] We note that even more so than was the case for the FY 2025 interim transition policy, the scope and magnitude of the FY 2026 transitional policy are much smaller than the low wage index hospital policy. As discussed in section VI. of the preamble of this final rule, we estimate only 54 hospitals out of the over 3,000 hospitals paid under the IPPS will receive FY 2026 transitional exception payments, and the total payment impact of the transitional policy is an increase in IPPS operating payments by approximately $27 million. For the FY 2025 interim transition policy the corresponding figures were 113 hospitals and an increase in IPPS operating payments by approximately $37 million (89 FR 80417).

[144] We note that because creating an exception to the calculation of the FY 2026 payments is in this circumstance functionally equivalent to adjusting the FY 2026 payments, the transitional exception can be alternatively considered a transitional adjustment.

[145] Under the wage index cap policy at 42 CFR 412.64(h)(7), a hospital's wage index for a FY cannot be lower than 0.95 * its wage index from the prior FY. Over a 2-year period if its wage index were decreasing by more than 5 percent each year, this will mean a hospital's wage index for a FY cannot be lower than (0.95*0.95) times its wage index from two years earlier. Similarly for our proposed FY 2026 transitional exception policy, we proposed that a hospital is significantly impacted by the discontinuation of the low wage index hospital policy if its FY 2026 wage index is less than (0.95*0.95) of its FY 2024 wage index, which equates to a decrease of more than 9.75 percent.

[146] 90.25 percent = 95 percent for FY 2025 * 95 percent for FY 2026.

[147] We note that we are not proposing to change the FY 2026 wage index values under section 1886(d)(3)(E) for hospitals eligible for the proposed FY 2026 transitional exception policy on the basis of the exception; the proposed change will be applied as a separate step only for purposes of determining the hospitals' FY 2026 IPPS payments.

decreases of 10 percent or more over the two years from their FY 2024 wage index (with the low wage index hospital policy applied) to their proposed FY 2026 wage index (that is, approximately 5 percent or more per year over that time period). As such, similar to the FY 2025 interim transition policy established in the FY 2025 IFC, we proposed to make a budget neutral equivalent exception under the capital IPPS.

Comment: Commenters generally supported a transition for the discontinuation of the low wage index hospital policy. However, a few commenters expressed concern that CMS's proposed transition for FY 2026 is too narrow in scope and duration and suggested that CMS extend the transition for more years.

Response: We thank the commenters for their support. For FY 2026, as discussed later in the section, we are finalizing as proposed without modification the transitional payment exception for FY 2026 in a budget neutral manner. With regard to extending the transition for additional years, we may consider this in future rulemaking.

Comment: Regarding the budget neutrality adjustment for the transition, a commenter was supportive and explained that the budget neutrality adjustment will have only a very narrow impact. Most commenters, however, urged CMS to adopt the transition policy on a non-budget neutral basis. Some of these commenters stated that the statute does not require CMS to implement the policy in a budget neutral manner, and CMS could apply the transition in the same manner as in FY 2025. A few commenters maintained that CMS does not have the authority under 1886(d)(5)(I)(i) to apply budget neutrality, stating that the only authority for budget neutrality is under section 1886(d)(5)(I)(ii) of the Act when making adjustments for transfer cases. Multiple commenters maintained that a budget neutrality adjustment to fund the transition perpetuates the same issue the courts rejected by increasing payments to low wage hospitals at the expense of other hospitals. Similarly, a commenter stated that if CMS lacks the authority to implement the low wage index hospital policy, the burden should be on CMS to pay for a transition for hospitals benefiting from the unlawful policy, not on other hospitals. Other reasons given by commenters for a non-budget neutral transition included avoiding additional instability and the modest cost due to the relatively small number of hospitals benefiting from the policy.

Response: We thank the commenter supportive of the budget neutrality adjustment. In response to the commenters urging CMS to finalize the transition without a budget neutrality adjustment like the FY 2025 transition, we continue to believe that the circumstances that caused us to decline to budget neutralize the interim FY 2025 transition policy are not applicable in FY 2026, and that the reasons we stated in the proposed rule for budget neutralizing the transition continue to apply.

Regarding the comments challenging CMS's authority under 1886(d)(5)(I)(i) to apply the transition for FY 2026 in a budget neutral manner, we disagree with the commenters that we are not permitted to make budget neutral exceptions under section 1886(d)(5)(I)(i) of the Act. Consistent with our response to similar comments about the authority for budget neutrality in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58767), we believe that we have authority under section 1886(d)(5)(I)(i) of the Act to promulgate a budget neutrality adjustment to the national standardized amount and that this authority is not limited to transfer cases.

In response to the commenters asserting that CMS should not budget neutralize a transition from a policy that a court ruled exceeded the Secretary's statutory authority, and other reasons given by commenters in support of a non-budget neutral transition, we continue to believe as we have stated in the past (89 FR 19398) that transition policies should not increase estimated aggregate Medicare payments beyond the payments that would have been made had we never proposed these transition policies. Also, as noted earlier, this is a narrow transition and the scope and magnitude of the FY 2026 transitional policy are much smaller. This is an appropriate budget neutral transition for hospitals.

After consideration of the public comments we received, we are finalizing as proposed without modification to use our authority under section 1886(d)(5)(I)(i) of the Act twice. First, to adopt a narrow transitional exception to the calculation of FY 2026 IPPS payments for low wage index hospitals that benefitted from the FY 2024 low wage index hospital policy and are significantly impacted by the discontinuation of the low wage index hospital policy. Second, we are exercising our authority again to do so in a budget neutral manner through an adjustment applied to the standardized amount for all hospitals. We are also finalizing our proposal to make a budget neutral equivalent exception under the capital IPPS.

G. FY 2026 Wage Index Tables

In this FY 2026 IPPS/LTCH PPS final rule, we have included the following wage index tables: Table 2 titled ''Case-Mix Index and Wage Index Table by CCN''; Table 3 titled ''Wage Index Table by CBSA''; Table 4A titled ''List of Counties Eligible for the Out-Migration Adjustment under Section 1886(d)(13) of the Act''; and Table 4B titled ''Counties redesignated under section 1886(d)(8)(B) of the Act (Lugar Counties).'' We refer readers to section VI. of the Addendum to this final rule for a discussion of the wage index tables for FY 2026.

H. Labor-Related Share for the FY 2026 Wage Index

Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs that are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the portion of hospital costs attributable to wages and wage-related costs as the labor-related share. The labor-related share of the prospective payment rate is adjusted by an index of relative labor costs, which is referred to as the wage index.

Section 403 of Public Law 108–173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless this would result in lower payments to a hospital than would otherwise be made. However, this provision of Public Law 108–173 did not change the legal requirement that the Secretary estimate from time to time the proportion of hospitals' costs that are attributable to wages and wage-related costs. Thus, hospitals receive payment based on either a 62-percent labor-related share, or the labor-related share estimated from time to time by the Secretary, depending on which labor-related share results in a higher payment.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45208), we rebased and revised the hospital market basket to a 2018-based IPPS hospital market basket, which replaced the 2014-

based IPPS hospital market basket, effective beginning October 1, 2021. Using the 2018-based IPPS market basket, we finalized a labor-related share of 67.6 percent for discharges occurring on or after October 1, 2021. In addition, in FY 2022, we implemented this revised and rebased labor-related share in a budget neutral manner (86 FR 45193, 86 FR 45529 through 45530). However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

As described in section IV. of the preamble of this final rule, effective beginning FY 2026, in the FY 2026 IPPS/LTCH proposed rule, we proposed to rebase and revise the IPPS market basket to reflect a 2023 base year. We also proposed to recalculate the labor-related share for discharges occurring on or after October 1, 2025, using the proposed 2023-based IPPS market basket. As discussed in Appendix A of this final rule, we proposed this rebased and revised labor-related share in a budget neutral manner. However, consistent with section 1886(d)(3)(E) of the Act, we stated that we would not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

The labor-related share is used to determine the proportion of the national IPPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share if the costs are labor intensive and vary with the local labor market. As described in section IV. of the preamble of this final rule, beginning with FY 2026, we proposed to include in the labor-related share the national average proportion of operating costs that are attributable to the following cost categories in the proposed 2023-based IPPS market basket: Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; and All Other: Labor-Related Services as measured in the proposed 2023-based IPPS market basket. Therefore, for FY 2026, we proposed to use a labor-related share of 66.0 percent for discharges occurring on or after October 1, 2025.

As discussed in section VI.B. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we applied the Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage to the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need for us to calculate a Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage for application to the Puerto Rico-specific standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national labor-related share and nonlabor-related share percentages that are applied to the national standardized amount. Accordingly, for FY 2026, we did not propose a Puerto Rico-specific labor-related share percentage or a nonlabor-related share percentage.

Comment: A commenter stated that while they understood that the rebasing of the market basket to a 2023 base year requires recalibrating cost weights, CMS is not required to reweight the labor related share under section 1886(d)(2)(H) as part of that rebasing. They urged CMS to maintain the current 67.6 percent labor-related share in light of rising labor costs borne by essential hospitals. Some commenters were concerned that the reduction to the labor-related share from 67.6 percent to 66 percent would disproportionally negatively impact hospitals with a wage index greater than 1.000.

Response: We thank the commenters for their comments. As stated previously, in the FY 2006 IPPS final rule (70 FR 47403), in accordance with section 404 of Public Law 108–173, CMS determined a new frequency for rebasing the hospital market basket. We established a rebasing frequency of every 4 years and, therefore, we rebase and revise the IPPS market basket effective for the FY 2026 IPPS update since it was last rebased effective for the FY 2022 IPPS update (the base year for the cost weights is being updated from 2018 to 2023). Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from ''time to time'' the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from ''time to time'') of hospitals' costs that are attributable to wages and wage-related costs of the DRG prospective payment rates. In order to meet the statutory requirement of ''time to time'', when we rebase and revise the IPPS market basket it is our longstanding practice to also recalculate the labor-related share using the rebased and revised IPPS market basket. Finally, we believe it is appropriate for FY 2026 to update the labor-related share to reflect the more recent cost structures of IPPS hospitals from the 2023-based IPPS market basket rather than continue to use the 2018-based IPPS market basket.

After consideration of public comments, as discussed in section IV. of the preamble of this final rule, we are finalizing the rebasing of the 2023-based IPPS market basket without modification and the derivation of a labor-related share of 66.0 percent based on the final 2023-based IPPS market basket. Therefore, we are finalizing a labor-related share of 66.0 percent based on the 2023-based IPPS market basket. We refer the reader to section IV. of the preamble of this final rule for complete details regarding the rebasing of the labor-related share.

Tables 1A and 1B, which are published in section VI. of the Addendum to this FY 2026 IPPS/LTCH PPS final rule and available via the internet on the CMS website, reflect the national labor-related share. Table 1C, in section VI. of the Addendum to this FY 2026 IPPS/LTCH PPS final rule and available via the internet on the CMS website, reflects the national labor-related share for hospitals located in Puerto Rico. For FY 2026, for all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are less than or equal to 1.0000, we are finalizing to apply the wage index to a labor-related share of 62 percent of the national standardized amount. For all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are greater than 1.000, for FY 2026, we are finalizing to apply the wage index to a labor-related share of 66.0 percent of the national standardized amount.

IV. Rebasing and Revising of the Hospital Market Baskets for Acute Care Hospitals

A. Background

Effective for cost reporting periods beginning on or after July 1, 1979, we developed and adopted a hospital input price index (that is, the hospital market basket for operating costs). Although ''market basket'' technically describes the mix of goods and services used in providing hospital care, this term is also commonly used to denote the input price index (that is, cost category weights and price proxies combined) derived from that market basket. Accordingly, the term ''market basket'' as used in this document refers to the hospital input price index.

The percentage change in the market basket reflects the average change in the price of goods and services hospitals purchase in order to provide inpatient care. We first used the market basket to adjust hospital cost limits by an amount that reflected the average increase in the prices of the goods and services used to provide hospital inpatient care. This approach linked the increase in the cost limits to the efficient utilization of resources.

Since the inception of the IPPS, the projected change in the hospital market basket has been the integral component of the update factor by which the prospective payment rates are updated every year. An explanation of the hospital market basket used to develop the prospective payment rates was published in the **Federal Register** on September 1, 1983 (48 FR 39764). We also refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45207) in which we discussed the most recent previous rebasing of the hospital input price index.

The hospital market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres-type price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix of goods and services (that is, intensity) purchased over time relative to the base period are not measured.

The index itself is constructed in three steps. First, a base period is selected (in the proposed rule, we proposed to use 2023 as the base period) and total base period costs are estimated for a set of mutually exclusive and exhaustive spending categories, with the proportion of total costs that each category represents being calculated. These proportions are called cost weights. Second, each cost category is matched to an appropriate price or wage variable, referred to as a ''price proxy.'' In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the cost weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the cost weights multiplied by their price index levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe.

As previously noted, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to provide hospital services. The effects on total costs resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a hospital hiring more nurses to accommodate the needs of patients would increase the volume of goods and services purchased by the hospital but would not be factored into the price change measured by a fixed-weight hospital market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent changes in the mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care between base periods.

We last rebased the hospital market basket cost weights effective for FY 2022 (86 FR 45194 through 45207), with 2018 data used as the base period for the construction of the market basket cost weights. Effective for FY 2026, we proposed to rebase the IPPS operating market basket to reflect the 2023 cost structure for IPPS hospitals and to revise applicable cost categories and price proxies used to determine the IPPS market basket, as discussed in this final rule. We also proposed to rebase and revise the Capital Input Price Index (CIPI) as described in section IV.D. of the preamble of this final rule.

In the following discussion, we provide an overview of the proposed IPPS market basket, describe the proposed methodologies for developing the cost weights, and provide information on the proposed price proxies. In each section, we describe any comments received, responses to these comments, and our final policies for this final rule. Then, we present the FY 2026 market basket update and labor-related share based on the 2023-based IPPS market basket.

B. Rebasing and Revising the IPPS Market Basket

The terms ''rebasing'' and ''revising,'' while often used interchangeably, actually denote different activities. ''Rebasing'' means moving the base year for the structure of costs of an input price index (for example, in the proposed rule, we proposed to shift the base year cost structure for the IPPS hospital index from 2018 to 2023). ''Revising'' means changing data sources or price proxies used in the input price index. As published in the FY 2006 IPPS final rule (70 FR 47403), in accordance with section 404 of Public Law 108–173, CMS determined a new frequency for rebasing the hospital market basket. We established a rebasing frequency of every 4 years and, therefore, we proposed to rebase and revise the IPPS market basket effective for the FY 2026 IPPS update since it was last rebased effective for the FY 2022 IPPS update (the base year for the cost weights is being updated from 2018 to 2023). We note that comments we received on the overall market basket method (including frequency of rebasings), transparency of the method, and resulting market basket updates are discussed in section IV.B.2. of the preamble of this final rule and comments we received on the labor-related share are discussed in section IV.B.3. of the preamble of this final rule.

1. Development of Cost Categories and Weights

a. Use of Medicare Cost Report Data

The major source of expenditure data for developing the proposed rebased and revised hospital market basket cost weights is the 2023 Medicare cost reports. These 2023 Medicare cost reports are for cost reporting periods beginning on and after October 1, 2022, and before October 1, 2023. We proposed to use 2023 as the base year because we believe that the 2023 Medicare cost reports represent the most recent, complete set of Medicare cost report data available to develop cost weights for IPPS hospitals at the time of rulemaking. As was done in previous rebasings, these cost reports are from IPPS hospitals only (hospitals excluded from the IPPS (including CAHs and rural emergency hospitals) are not

included) and are based on IPPS Medicare-allowable operating costs. IPPS Medicare-allowable operating costs are costs that are eligible to be paid under the IPPS. For example, the IPPS market basket excludes home health agency (HHA) costs as these costs would be paid under the HHA PPS and, therefore, these costs are not IPPS Medicare-allowable costs.

The current set of instructions for the Medicare cost reports for hospitals (Form 2552–10, OMB Control Number 0938–0050) can be found in Chapter 40 at the following website (*https://www.cms.gov/Regulations-and-Guidance/Guidance/ManuFals/Paper-Based-Manuals-Items/CMS021935*).

The major types of costs underlying the 2023-based IPPS market basket are derived from the Medicare cost reports (Form 2552–10, OMB Control Number 0938–0050). Specifically, we proposed to use the Medicare cost reports for seven specific types of costs: Wages and Salaries, Employee Benefits, Contract Labor, Pharmaceuticals, Professional Liability Insurance (Malpractice), Blood and Blood Products, and Home Office/Related Organization Contract Labor. A residual category is then estimated and reflects all remaining costs not captured in the seven types of costs identified previously. The 2018-based IPPS market basket similarly used the Medicare cost reports.

In order to create a market basket that is representative of IPPS hospitals serving Medicare patients and to help ensure the major cost weights accurately reflect the percent of total Medicare-allowable operating costs, as defined in this final rule, we proposed to apply edits to remove reporting errors and outliers. Specifically, the IPPS Medicare cost reports used to calculate the market basket cost weights exclude any providers that reported costs less than or equal to zero for the following categories: total Medicare inpatient costs (Worksheet D–1, Part II, column 1, line 49); Medicare PPS payments (Worksheet E, Part A, column 1, line 59); Total salary costs (Worksheet S–3, Part II, column 2, line 1). We also limited our sample to providers that had a Medicare cost reporting period that was between 10 and 14 months. The final sample used includes roughly 2,900 Medicare cost reports (about 93 percent of the universe of IPPS Medicare cost reports for 2023). The sample of providers is representative of the national universe of providers by ownership-type (proprietary, nonprofit, and government) and by urban/rural status.

In the proposed rule, we proposed to calculate total Medicare-allowable operating costs for each hospital to be equal to noncapital costs (Worksheet B, Part I, column 26 less Worksheet B, Part II, column 26) that are attributable to the Medicare-allowable cost centers of the hospital. We proposed that Medicare-allowable cost centers are lines 30 through 35, 50 through 60, 62 through 76, 90, 91, 92.01, 93, 96 and 97. This is the same methodology that was used for the 2018-based IPPS market basket.

(1) Wages and Salaries Costs

To derive wages and salaries costs for the Medicare-allowable cost centers, we proposed to first calculate total unadjusted wages and salaries costs as reported on Worksheet S–3, Part II, column 4, line 1. We then proposed to remove the wages and salaries attributable to non-Medicare-allowable cost centers (that is, excluded areas) as well as a portion of overhead wages and salaries attributable to these excluded areas. This is the same methodology that was used to derive wages and salaries costs for the 2018-based IPPS market basket.

Specifically, we proposed to calculate excluded area wages and salaries as equal to the sum of Worksheet S–3, Part II, column 4, lines 3, 4.01, 5, 6, 7, 7.01, 8, 9, and 10 less Worksheet A, column 1, lines 20 and 23. Overhead wages and salaries are attributable to the entire IPPS facility. Therefore, we proposed to only include the proportion attributable to the Medicare-allowable cost centers. Specifically, we proposed to estimate the proportion of overhead wages and salaries that are not attributable to Medicare-allowable cost centers (that is, excluded areas) by first calculating the ratio of total Medicare-allowable operating costs (as previously defined) to total facility operating costs (Worksheet B, Part I, column 26, line 202 less Worksheet B, Part I, column 0, lines 1 and 2). We then proposed to multiply this ratio by total overhead wages and salaries (Worksheet S–3, Part II, column 4, lines 26, 27, 29 through 32, 34, and 36 through 43) to estimate Medicare allowable overhead wages and salaries. The difference between total overhead wages and salaries and Medicare allowable overhead wages and salaries is equal to the overhead wages and salaries attributable to the excluded areas.

Therefore, we proposed wages and salaries costs used for the 2023-based IPPS market basket are equal to total wages and salaries costs less: (a) excluded area wages and salaries costs; and (b) overhead wages and salaries costs attributable to the excluded areas.

(2) Employee Benefits Costs

We proposed to derive employee benefits costs using a similar methodology as the wages and salaries costs; that is, reflecting employee benefits costs attributable to the Medicare-allowable cost centers. First, we calculate total unadjusted employee benefits costs as the sum of Worksheet S–3, Part II, column 4, lines 17, 18, 20, 22, and 25.52.

We then exclude those employee benefits attributable to the overhead wages and salaries for the non-Medicare-allowable cost centers (that is, excluded areas). Employee benefits attributable to the non-Medicare-allowable cost centers are derived by multiplying the ratio of total employee benefits (equal to the sum of Worksheet S–3, Part II, column 4, lines 17, 18, 19, 20, 21, 22, 22.01, 23, 24, 25, 25.50, 25.51, 25.52, and 25.53) to total wages and salaries (Worksheet S–3, Part II, column 4, line 1) (which we hereafter refer to as the ''IPPS benefits ratio'') by excluded overhead wages and salaries (as previously described in section IV.B.1.a.(1). of the preamble of this final rule for wages and salaries costs). The same methodology was used in the 2018-based IPPS market basket.

Therefore, we proposed employee benefit costs used for the 2023-based IPPS market basket are equal to total employee benefit costs less: (a) excluded area benefit costs; and (b) overhead benefit costs attributable to the excluded areas.

(3) Contract Labor Costs

Contract labor costs are primarily associated with direct patient care services. Contract labor costs for services such as accounting, billing, and legal are estimated using other government data sources as described in this final rule. We proposed to derive contract labor costs for the 2023-based IPPS market basket as the sum of Worksheet S–3, Part II, column 4, lines 11, 13, and 15. The same methodology was used in the 2018-based IPPS market basket.

(4) Professional Liability Insurance Costs

We proposed that professional liability insurance (PLI) costs (often referred to as malpractice costs) be equal to premiums, paid losses, and self-insurance costs reported on Worksheet S–2, Part I, columns 1 through 3, line 118.01. The same methodology was used for the 2018-based IPPS market basket.

(5) Pharmaceuticals Costs

We proposed to calculate pharmaceuticals costs as total costs reported for the Pharmacy cost center (Worksheet B, Part I, column 0, line 15) and Drugs Charged to Patients cost center (Worksheet B, Part I, column 0, line 73) less wages and salaries attributable to these two cost centers (Worksheet S–3, Part II, column 4, line 40 and Worksheet A, column 1, line 73) less estimated employee benefits attributable to these two cost centers. We proposed to estimate the employee benefits costs by multiplying the IPPS benefits ratio as described in section IV.B.1.a.(2) of the preamble of this final rule by total wages and salaries costs for the Pharmacy and Drugs Charged to Patients cost centers (equal to the sum of Worksheet S–3, Part II, column 4, line 40 and Worksheet A, column 1, line 73). The same methodology was used for the 2018-based IPPS market basket.

(6) Blood and Blood Products Costs

We proposed to calculate blood and blood products costs as total costs reported for the Whole Blood & Packed Red Blood Cells cost center (Worksheet B, Part I, column 0, line 62) and the Blood Storing, Processing, & Transfusing cost center (Worksheet B, Part I, column 0, line 63) less wages and salaries attributable to these two cost centers (Worksheet A, column 1, lines 62 and 63) less estimated employee benefits attributable to these two cost centers. We estimate these employee benefits costs by multiplying the IPPS benefits ratio as described in section IV.B.1.a.(2) of the preamble of this final rule by total wages and salaries for the Whole Blood & Packed Red Blood Cells and Blood Storing, Processing, & Transfusing cost centers (equal to the sum of Worksheet A, column 1, lines 62 and 63). The same methodology was used for the 2018-based IPPS market basket.

(7) Home Office/Related Organization Contract Labor Costs

We proposed to determine home office/related organization contract labor costs using data reported on Worksheet S–3, Part II, column 4, lines 14.01, 14.02, 25.50, and 25.51. The same methodology was used for the 2018-based IPPS market basket.

b. Final Major Cost Category Computation

After we derived costs for the major cost categories for each provider using the Medicare cost report data as previously described, we proposed to address data outliers using the following steps.

First, for each of the major cost weights except the Home Office/Related Organization Contract Labor cost weight, we proposed to trim the data to remove outliers (a standard statistical process) by: (step 1) requiring that major expenses (such as Wages and Salaries costs) and total Medicare-allowable operating costs be greater than zero; (step 2) dividing the costs for each of the six categories (calculated as previously described in this section) by total Medicare-allowable operating costs to obtain cost weights for each PPS hospital; and (step 3) excluding the top and bottom 5 percent of the major cost weight (for example, Wages and Salaries costs as a percent of total Medicare-allowable operating costs). We note that missing values are assumed to be zero consistent with the methodology for how missing values were treated in the 2018-based IPPS market basket.

For the Home Office/Related Organization Contract Labor cost weight, we proposed to exclude outliers using a slightly different method by (step 1) requiring that total Medicare-allowable operating costs are greater than zero; (step 2) dividing the home office/related organization contract labor costs (calculated as previously described in this section) by total Medicare-allowable operating costs to obtain a cost weight for each PPS hospital; and (step 3) applying a trim that excludes those reporters with a Home Office/Related Organization Contract Labor cost weight above the 99th percentile. This allows all providers' Medicare-allowable costs to be included, even if their home office/related organization contract labor costs were reported to be zero. The Medicare cost report data (Worksheet S–2, Part I, line 140) indicate that not all hospitals have a home office. IPPS hospitals without a home office would report administrative costs that might typically be associated with a home office in the Wages and Salaries and Employee Benefits cost weights, or these costs would be reflected in the residual cost weight if they purchased these types of services from external contractors. We believe the trimming methodology that excludes those who report a Home Office/Related Organization Contract Labor cost weight above the 99th percentile is appropriate as it removes extreme outliers while also allowing providers with zero home office/related organization contract labor costs to be included in the Home Office/Related Organization Contract Labor cost weight calculation.

After the outliers have been removed, we sum the costs for each category across all remaining providers. We then divide this by the sum of total Medicare-allowable operating costs across all remaining providers to obtain a cost weight for the 2023-based IPPS market basket for the given category. This is the same methodology used for the 2018-based IPPS market basket.

The trimming process is done individually for each cost category so that providers excluded from one cost weight calculation are not automatically excluded from another cost weight calculation. We note that these proposed trimming methods are the same types of edits performed for the 2018-based IPPS market basket, as well as other PPS market baskets (including but not limited to SNF market basket and home health market basket). We note that for each of the cost weights we evaluated the distribution of providers and costs by ownership-type, and by urban/rural status. For all of the cost weights, the trimmed sample was nationally representative.

Finally, we calculate the residual ''All Other'' cost weight that reflects all remaining costs that are not captured in the seven cost categories listed.

We received the following comments on our proposed methodology for deriving the major cost weights of the proposed 2023-based IPPS market basket.

Comment: A commenter stated that contract labor has been substituted for employed labor in recent years and accelerated with the COVID–19 PHE, and as a result their expectation would be that any decrease in labor costs for employee benefits would be more than offset by the increased costs for contract labor. The commenter requested that CMS reexamine its methodology for allocating home office costs to contract labor to ensure that it is appropriately resulting in an increase that offsets the decline in employee benefits as contract labor now represents a significantly higher share of total hospital labor costs. The commenter stated that the Employee Benefits cost weight is the largest factor in the decreasing labor-related share (1.2 percentage points).

Response: We note that the discussion of the labor-related share as mentioned by the commenter is provided in section IV.B.3. of the preamble of this final rule. Our analysis of the Medicare cost report data indicates that the increase in the Home Office/Related Organization Contract Labor cost weight of 0.8 percentage point from 2018 to 2023 is more than offset by the estimated overhead compensation cost weight (excluding Home Office/Related Organization Contract Labor costs), which decreased about 1.4 percentage points over the same period. Overhead

compensation costs (as indicated in the FY 2026 IPPS/LTCH proposed rule (90 FR 18238)) would be reflected in the Wages and Salaries and Employee Benefits cost weights. Therefore, it is possible that hospitals are substituting some of their in-house administrative compensation costs for Home Office/ Related Organization administrative compensation costs as the commenter alluded. We note that direct patient care contract labor costs are allocated to the Wages and Salaries and Employee Benefits cost weights based on their relative proportions for employed labor under the assumption that direct patient care contract labor costs are comprised of both wages and salaries and employee benefits and then these cost weights are proxied by the ECI for All Civilian Workers in Hospitals. As stated in the FY 2026 IPPS/LTCH proposed rule (90 FR 18245 through 18246), we proposed to allocate the Home Office/ Related Organization Contract Labor cost weight to the Professional Fees: Labor-Related and Professional Fees: Nonlabor-related cost weights (both of which are proxied by ECI for Total Compensation for Private Industry Workers in Professional and Related).

After consideration of public comments, we are finalizing the major cost weights without modification. We note that comments we received on the overall market basket method (including frequency of rebasings), transparency of the method, and resulting market basket updates are discussed in section IV.B.2. of the preamble of this final rule and comments on the labor-related share are discussed in section IV.B.3 of the preamble of this final rule. Table IV–01 shows the resulting proposed and final cost weights for these major cost categories of the 2023-based IPPS market basket compared to the 2018-based IPPS market basket.

TABLE IV-01.—MAJOR COST CATEGORIES AS DERIVED FROM THE MEDICARE COST REPORTS

Major Cost Categories	2018-based IPPS Market Basket	2023-based IPPS Market Basket
Wages and Salaries	39.7	37.8
Employee Benefits	11.3	9.8
Contract Labor	2.0	3.6
Professional Liability Insurance (Malpractice)	1.0	1.0
Pharmaceuticals	7.1	7.4
Blood and Blood Products	0.6	0.5
Home Office/Related Organization Contract Labor	5.9	6.7
All Other	32.4	33.2

Note: Weights rounded to one decimal for presentation purposes.

From 2018 to 2023, the Wages and Salaries and Employee Benefits cost weights as calculated directly from the Medicare cost reports decreased by 1.9 percentage points and 1.5 percentage points, respectively, while the Contract Labor cost weight increased by 1.6 percentage points.

As we did for the 2018-based IPPS market basket (86 FR 45198), we proposed to allocate contract labor costs to the Wages and Salaries and Employee Benefits cost weights based on their relative proportions for employed labor under the assumption that contract labor costs are comprised of both wages and salaries and employee benefits. The contract labor allocation proportion for wages and salaries is equal to the Wages and Salaries cost weight as a percent of the sum of the Wages and Salaries cost weight and the Employee Benefits cost weight. Using the 2023 Medicare cost report data, this percentage is 79 percent. Therefore, we proposed to allocate approximately 79 percent of the Contract Labor cost weight to the Wages and Salaries cost weight and 21 percent to the Employee Benefits cost weight. The 2018-based IPPS market basket allocated 78 percent of the Contract Labor cost weight to the Wages and Salaries cost weight. We received no comments on the proposed methodology to allocate the Contract Labor cost weight to the Wages and Salaries cost weight and Employee Benefits cost weight and therefore, are finalizing this methodology without modification.

Table IV–02 shows the Wages and Salaries and Employee Benefits cost weights after contract labor allocation for the 2018-based IPPS market basket and the proposed and final 2023-based IPPS market basket. In aggregate, the Compensation cost weight (calculated using more detailed decimal places) decreased from 53.0 percent to 51.1 percent, or 1.9 percentage points.

TABLE IV-02.—WAGES AND SALARIES AND EMPLOYEE BENEFITS COST WEIGHTS AFTER CONTRACT LABOR ALLOCATION

Major Cost Categories	2018-Based IPPS Market Basket	2023-Based IPPS Market Basket
Total Compensation	**53.0**	**51.1**
Wages and Salaries	41.2	40.6
Employee Benefits	11.7	10.5

Note: Detail may not add to total due to rounding.

c. Derivation of the Detailed Cost Weights

To further divide the ''All Other'' residual cost weight estimated from the 2023 Medicare cost report data into more detailed cost categories, we proposed to use the 2017 Benchmark I–O, ''The Use Table (Supply-Use Framework),'' for NAICS 622000, Hospitals, published by the Bureau of Economic Analysis (BEA). These data are publicly available at the following website: *https://www.bea.gov/industry/input-output-accounts-data.* The BEA Benchmark I–O data are generally scheduled for publication every 5 years on a lagged basis, with the most recent data available for 2017. The 2017 Benchmark I–O data are derived from the 2017 Economic Census and are the building blocks for BEA's economic accounts. Therefore, they represent the most comprehensive and complete set of data on the economic processes or mechanisms by which output is produced and distributed.[148] BEA also produces Annual I–O estimates. However, while based on a similar methodology, these estimates reflect less comprehensive and less detailed data sources and are subject to revision when benchmark data become available. Instead of using the less detailed Annual I–O data, we proposed to inflate the detailed 2017 Benchmark I–O data forward to 2023 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2017 Benchmark I–O data and calculated the cost shares that each cost category represents using the inflated data. These resulting 2023 cost shares were applied to the residual ''All Other'' cost weight to obtain the detailed cost weights for the 2023-based IPPS market basket. For example, the cost for Food: Direct Purchases represents 4.0 percent of the sum of the residual ''All Other'' 2017 Benchmark I–O Hospital Expenditures inflated to 2023. Therefore, the Food: Direct Purchases cost weight represents 4.0 percent of the 2023-based IPPS market basket's ''All Other'' cost category (33.2 percent), yielding a Food: Direct Purchases proposed cost weight of 1.3 percent in the 2023-based IPPS market basket (0.040×33.2 percent = 1.3 percent). For the 2018-based IPPS market basket (86 FR 45198), we used the same methodology utilizing the 2012 Benchmark I–O data (aged to 2018).

Using this methodology, we proposed to derive 17 detailed cost categories from the 2023-based IPPS market basket residual cost weight (33.2 percent). These categories are: (1) Fuel: Oil and Gas; (2) Electricity and Other Non-Fuel Utilities; (3) Food: Direct Purchases; (4) Food: Contract Services; (5) Chemicals; (6) Medical Instruments; (7) Rubber and Plastics; (8) Paper and Printing Products; (9) Miscellaneous Products; (10) Professional Fees: Labor-Related; (11) Administrative and Facilities Support Services; (12) Installation, Maintenance, and Repair Services; (13) All Other: Labor-Related Services; (14) Professional Fees: Nonlabor-Related; (15) Financial Services; (16) Telephone Services; and (17) All Other: Nonlabor-Related Services. We note that these are the same categories that were used in the 2018-based IPPS market basket.

We received a few specific comments on our derivation of the Professional Fees: Labor-related and Professional Fees: Nonlabor-related cost weights as they relate to the proposed labor-related share. Those comments are summarized and responded to in section IV.B.3. of the preamble of this final rule.

2. Selection of Proposed Price Proxies

After computing the 2023 cost weights for the IPPS market basket, it was necessary to select appropriate wage and price proxies to reflect the rate of price change for each expenditure category. With the exception of the proxy for professional liability insurance (PLI), all the proxies we proposed are based on Bureau of Labor Statistics (BLS) data and are grouped into one of the following BLS categories:

- Producer Price Indexes—Producer Price Indexes (PPIs) measure the average change over time in the selling prices received by domestic producers for their output. The prices included in the PPI are from the first commercial transaction for many products and some services (*https://www.bls.gov/ppi/*).
- Consumer Price Indexes—Consumer Price Indexes (CPIs) measure the average change over time in the prices paid by urban consumers for a market basket of consumer goods and services (*https://www.bls.gov/cpi/*). CPIs are only used when the purchases are similar to those of retail consumers rather than purchases at the producer level, or if no appropriate PPIs are available.
- Employment Cost Indexes—Employment Cost Indexes (ECIs) measure the rate of change in employee wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. ECIs are superior to Average Hourly Earnings (AHE) as price proxies for input price indexes because they are not affected by shifts in occupation or industry mix, and because they measure pure price change and are available by both occupational group and by industry. The industry ECIs are based on the NAICS and the occupational ECIs are based on the Standard Occupational Classification System (SOC).

We evaluated the price proxies using the criteria of reliability, timeliness, availability, and relevance:

- Reliability. Reliability indicates that the index is based on valid statistical methods and has low sampling variability. Widely accepted statistical methods ensure that the data were collected and aggregated in a way that can be replicated. Low sampling variability is desirable because it indicates that the sample reflects the typical members of the population. (Sampling variability is variation that occurs by chance because only a sample was surveyed rather than the entire population.)
- Timeliness. Timeliness implies that the proxy is published regularly, preferably at least once a quarter. The market basket levels are updated quarterly, and therefore, it is important for the underlying price proxies to be up-to-date, reflecting the most recent data available. We believe that using proxies that are published regularly (at least quarterly, whenever possible) helps to ensure that we are using the most recent data available to update the market basket. We strive to use publications that are disseminated frequently, because we believe that this is an optimal way to stay abreast of the most current data available.
- Availability. Availability means that the proxy is publicly available. We prefer that our proxies are publicly available because this will help ensure that our market basket updates are as transparent to the public as possible. In addition, this enables the public to be able to obtain the price proxy data on a regular basis.
- Relevance. Relevance means that the proxy is applicable and representative of the cost category weight to which it is applied.

We believe the proposed PPIs, CPIs, and ECIs selected meet these criteria. Therefore, we believe that they continue to be the best proxy of price changes for the cost categories to which they would be applied.

In this final rule, we present a detailed explanation of the price proxies that we proposed for each cost category weight.

[148] *https://www.bea.gov/papers/pdf/IOmanual_092906.pdf.*

a. Wages and Salaries

We proposed to use the ECI for Wages and Salaries for All Civilian Workers in Hospitals (BLS series code CIU1026220000000I) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

b. Employee Benefits

We proposed to use the ECI for Total Benefits for All Civilian Workers in Hospitals to proxy the price growth of this cost category. This ECI is calculated using the ECI for Total Compensation for All Civilian Workers in Hospitals (BLS series code CIU1016220000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used in the 2018-based IPPS market basket.

c. Fuel: Oil and Gas

For the 2023-based IPPS market basket, we proposed to use a blend of the PPI Industry for Petroleum Refineries (NAICS 3241), PPI for Other Petroleum and Coal Products (NAICS 32419) and the PPI Commodity for Natural Gas. Our analysis of the Bureau of Economic Analysis' 2017 Benchmark I–O data for NAICS 622000 Hospitals shows that Petroleum Refineries expenses account for approximately 86 percent, Other Petroleum and Coal Products expenses account for about 7 percent and Natural Gas expenses account for approximately 7 percent of Hospitals' (NAICS 622000) total Fuel: Oil and Gas expenses. Therefore, we proposed to use a blend of 86 percent of the PPI Industry for Petroleum Refineries (BLS series code PCU324110324110), 7 percent of the PPI for Other Petroleum and Coal Products (BLS series code PCU32419) and 7 percent of the PPI Commodity Index for Natural Gas (BLS series code WPU0531) as the price proxy for this cost category. The 2018-based IPPS market basket used a 90/10 blend of the PPI Industry for Petroleum Refineries and PPI Commodity for Natural Gas, reflecting the 2012 I–O data (86 FR 45199). We believe that the three proposed price proxies are the most technically appropriate indices available to proxy the price growth of the Fuel: Oil and Gas cost category in the 2023-based IPPS market basket.

d. Electricity and Other Non-Fuel Utilities

We proposed to use the PPI Commodity for Commercial Electric Power (BLS series code WPU0542) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

e. Professional Liability Insurance

We proposed to proxy price changes in hospital professional liability insurance premiums (PLI) using percentage changes as estimated by the CMS Hospital Professional Liability Index. To generate these estimates, we collect commercial insurance medical liability premiums for a fixed level of coverage while holding nonprice factors constant (such as a change in the level of coverage). This is the same price proxy used in the 2018-based IPPS market basket.

f. Pharmaceuticals

We proposed to use the PPI Commodity for Pharmaceuticals for Human Use, Prescription (BLS series code WPUSI07003) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

g. Food: Direct Purchases

We proposed to use the PPI Commodity for Processed Foods and Feeds (BLS series code WPU02) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

h. Food: Contract Services

We proposed to use the CPI for Food Away From Home (All Urban Consumers) (BLS series code CUUR0000SEFV) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

i. Chemicals

Similar to the 2018-based IPPS market basket, we proposed to use a four-part blended PPI as the proxy for the Chemicals cost category in the 2023-based IPPS market basket. The proposed blend is composed of the PPI Industry for Industrial Gas Manufacturing, Primary Products (BLS series code PCU325120325120P), the PPI Industry for Other Basic Inorganic Chemical Manufacturing (BLS series code PCU32518–32518), the PPI Industry for Other Basic Organic Chemical Manufacturing (BLS series code PCU32519–32519), and the PPI Industry for Other Miscellaneous Chemical Product Manufacturing (BLS series code PCU325998325998). For the 2023-based IPPS market basket, we proposed to derive the weights for the PPIs using the 2017 Benchmark I–O data. The 2018-based IPPS market basket used the 2012 Benchmark I–O data to derive the weights for the four PPIs (86 FR 45200). We did not receive comments on the proposed methodology to derive the blended Chemicals price proxy using the 2017 Benchmark I–O and therefore are finalizing this methodology without modification.

Table IV–03 shows the proposed and final weights for each of the four PPIs used to create the blended index compared to those used for the 2018-based IPPS market basket.

TABLE IV-03.—BLENDED CHEMICAL PPI WEIGHTS

NAICS	Name	2018-Based IPPS Weights	2023-Based IPPS Weights
325120	PPI Industry for Industrial Gas Manufacturing	19%	26%
325180	PPI Industry for Other Basic Inorganic Chemical Manufacturing	13%	10%
325190	PPI Industry for Other Basic Organic Chemical Manufacturing	60%	49%
325998	PPI Industry for Other Miscellaneous Chemical Product Manufacturing	8%	15%

j. Blood and Blood Products

We proposed to use the PPI Industry for Blood and Organ Banks (BLS series code PCU621991621991) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

k. Medical Instruments

We proposed to use a blended price proxy for the Medical Instruments category, as shown in Table IV–04. The 2017 Benchmark I–O data shows the majority of medical instruments and supply costs are for NAICS 339112—Surgical and medical instrument manufacturing costs (approximately 64

percent) and NAICS 339113—Surgical appliance and supplies manufacturing costs (approximately 36 percent). To proxy the price changes associated with NAICS 339112, we proposed using the PPI Commodity for Surgical and medical instruments (BLS series code WPU1562). To proxy the price changes associated with NAICS 339113, we proposed to use a 50/50 blend of the PPI Commodity for Medical and surgical appliances and supplies (BLS series code WPU1563) and the PPI Commodity for Miscellaneous products, Personal safety equipment and clothing (BLS series code WPU1571). We proposed to include the latter price proxy as it would reflect personal protective equipment including but not limited to face shields and protective clothing. The 2017 Benchmark I–O data does not provide specific expenses for these products. However, we recognize that this category reflects costs faced by IPPS hospitals. These are the same price proxies used in the 2018-based IPPS market basket. We did not receive comments on the proposed methodology to derive the blended Medical Instruments price proxy using the 2017 Benchmark I–O data and therefore are finalizing this methodology without modification.

TABLE IV-04.—BLENDED MEDICAL INSTRUMENTS PPI WEIGHTS

NAICS	Name	2018-Based IPPS Weights	2023-Based IPPS Weights
339112	PPI Commodity for Surgical and medical instruments	56%	64%
339113	PPI - Commodity for Medical and surgical appliances and supplies	22%	18%
	PPI Commodity for Miscellaneous products, Personal safety equipment and clothing	22%	18%

l. Rubber and Plastics

We proposed to use the PPI Commodity for Rubber and Plastic Products (BLS series code WPU07) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

m. Paper and Printing Products

We proposed to use a 61/39 blend of the PPI Commodity for Publications Printed Matter and Printing Material (BLS Series Code WPU094) and the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) to proxy the price growth of this cost category. The 2017 Benchmark I–O data shows that 61 percent of paper and printing expenses are for Printing (NAICS 323110) and the remaining expenses are for Paper manufacturing (NAICS 322). The 2018-based IPPS market basket (86 FR 45201) used the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) as this comprised the majority of expenses as reported in the 2012 Benchmark I–O data.

n. Miscellaneous Products

We proposed to use the PPI Commodity for Finished Goods Less Food and Energy (BLS series code WPUFD4131) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

o. Professional Fees: Labor-Related

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to proxy the price growth of this category. It includes occupations such as legal, accounting, and engineering services. This is the same price proxy used in the 2018-based IPPS market basket.

p. Administrative and Facilities Support Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Office and Administrative Support (BLS series code CIU2010000220000I) to proxy the price growth of this category. This is the same price proxy used in the 2018-based IPPS market basket.

q. Installation, Maintenance, and Repair Services

We proposed to use the ECI for Total Compensation for All Civilian Workers in Installation, Maintenance, and Repair (BLS series code CIU1010000430000I) to proxy the price growth of this cost category. This is the same proxy used in the 2018-based IPPS market basket.

r. All Other: Labor-Related Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

s. Professional Fees: Nonlabor-Related

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to proxy the price growth of this category. This is the same price proxy that we proposed to use for the Professional Fees: Labor-Related cost category and the same price proxy used in the 2018-based IPPS market basket.

t. Financial Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Financial Activities (BLS series code CIU201520A000000I) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

u. Telephone Services

We proposed to use the CPI for Telephone Services (BLS series code CUUR0000SEED) to proxy the price growth of this cost category. This is the same price proxy used in the 2018-based IPPS market basket.

v. All Other: Nonlabor-Related Services

We proposed to use the CPI for All Items Less Food and Energy (BLS series code CUUR0000SA0L1E) to proxy the price growth of this cost category. We believe that using the CPI for All Items Less Food and Energy avoids double counting of changes in food and energy prices as they are already captured elsewhere in the market basket. This is the same price proxy used in the 2018-based IPPS market basket.

We received the following comments on our proposed price proxies for the 2023-based IPPS market basket.

Comment: Several commenters urged CMS to adjust its methodology for calculating the annual payment update (including the adoption of additional data elements in the IPPS market basket) to ensure it provides a robust payment update that adequately incorporates the effects of rising workforce costs on hospitals, which they believe is not being captured by the ECI used in the IPPS market basket. The commenters stated that the use of the ECI may not be adequately capturing employment

and labor cost growth. Commenters stated that CMS should identify and use data inputs that better capture these price increases—for example, incorporating more recent wage data that include contract labor expenses, which the ECI currently does not fully reflect. They stated that they continue to stand ready to work with CMS to examine the market basket compensation indices and proxies to improve the accuracy of these measures.

Response: We believe that the ECI for wages and salaries for hospital workers is accurately reflecting the price change associated with the labor used to provide hospital care. The ECI appropriately does not reflect other factors that might affect the rate of price changes associated with labor costs, such as a shift in the occupations that may occur due to increases in case-mix or shifts in hospital purchasing decisions (for instance, to hire or to use contract labor). We believe that the prices of employed staff and contract labor are influenced by the same factors and should generally grow at similar rates. In most periods when there are not significant occupational shifts or significant shifts between employed and contract labor, the data has shown that the growth in the ECI for wages and salaries for hospital workers has generally been consistent with overall hospital wage trends. For example, our more recent analysis of the Medicare cost report data shows from 2018 to 2023, the compound annual growth rate of IPPS Medicare allowable salaries, benefits and contract labor costs per hour was about 4 percent, consistent with the growth rate of the compensation price increases in the 2023-based IPPS market basket as measured by the ECIs for hospital workers over the same period. For this final rule, based on the more recent IGI second quarter 2025 forecast with historical data through the first quarter of 2025, the projected 2023-based IPPS market basket increase factor for FY 2026 reflects a projected increase in compensation prices of 3.4 percent.

After consideration of public comments, we are finalizing the price proxies for the 2023-based IPPS market basket as proposed without modification. Table IV–05 sets forth the 2023-based IPPS market basket, including the cost categories and their respective weights and price proxies. For comparison purposes, the corresponding 2018-based IPPS market basket cost weights also are listed.

BILLING CODE 4120–01–P

TABLE IV-05.— 2023-BASED IPPS MARKET BASKET COST CATEGORIES, COST WEIGHTS, AND PRICE PROXIES COMPARED TO 2018-BASED IPPS MARKET BASKET COST WEIGHTS

Cost Categories	2018-Based IPPS Market Basket Cost Weights	2023-Based IPPS Market Basket Cost Weights	2023-Based IPPS Market Basket Price Proxies
1. Compensation	53.0	51.1	--
A. Wages and Salaries[1]	41.2	40.6	ECI for Wages and Salaries for All Civilian Workers in Hospitals
B. Employee Benefits[1]	11.7	10.5	ECI for Total Benefits for All Civilian Workers in Hospitals
2. Utilities	2.3	1.8	--
A. Electricity and Other Non-Fuel Utilities	1.5	1.5	PPI Commodity for Commercial Electric Power
B. Fuel: Oil and Gas	0.8	0.4	Blend of PPIs
3. Professional Liability Insurance	1.0	1.0	CMS Hospital Professional Liability Insurance Premium Index
4. All Other	43.8	46.0	--
A. All Other Products	18.4	20.5	--
(1.) Pharmaceuticals	7.1	7.4	PPI Commodity for Pharmaceuticals for Human Use, Prescription
(2.) Food: Direct Purchases	1.6	1.3	PPI Commodity for Processed Foods and Feeds
(3.) Food: Contract Services	1.8	2.2	CPI for Food Away From Home
(4.) Chemicals	0.6	0.6	Blend of PPIs
(5.) Blood and Blood Products	0.6	0.5	PPI Industry for Blood and Organ Banks
(6.) Medical Instruments	4.1	5.3	Blend of PPIs
(7.) Rubber and Plastics	0.6	0.7	PPI Commodity for Rubber and Plastic Products
(8.) Paper and Printing Products	0.9	0.9	Blend of PPIs
(9.) Miscellaneous Products	1.2	1.5	PPI Commodity for Finished Goods less Food and Energy
B. Labor-Related Services	14.7	14.8	--
(1.) Professional Fees: Labor-Related	8.6	10.0	ECI for Total Compensation for Private Industry Workers in Professional and Related
(2.) Administrative and Facilities Support Services	1.1	0.8	ECI for Total Compensation for Private Industry Workers in Office and Administrative Support
(3.) Installation, Maintenance and Repair Services	2.4	1.5	ECI for Total Compensation for Civilian Workers in Installation, Maintenance, and Repair
(4.) All Other: Labor-Related Services	2.6	2.6	ECI for Total Compensation for Private Industry Workers in Service Occupations
C. Nonlabor-Related Services	10.7	10.7	--

Cost Categories	2018-Based IPPS Market Basket Cost Weights	2023-Based IPPS Market Basket Cost Weights	2023-Based IPPS Market Basket Price Proxies
(1.) Professional Fees: Nonlabor-Related	7.0	7.0	ECI for Total Compensation for Private Industry Workers in Professional and Related
(2.) Financial Services	1.4	1.8	ECI for Total Compensation for Private Industry Workers in Financial Activities
(3.) Telephone Services	0.4	0.3	CPI for Telephone Services
(4.) All Other: Nonlabor-Related Services	1.8	1.5	CPI for All Items less Food and Energy
Total	100.0	100.0	--

Note: The cost weights are calculated using 3 decimal places. For presentational purposes, we are displaying one decimal and, therefore, the detail may not add to the total due to rounding.

[1] Contract labor is distributed to wages and salaries and employee benefits based on the share of total compensation that each category represents.

BILLING CODE 4120–01–C

Table IV–06 compares both the historical and forecasted percent changes in the 2018-based IPPS market basket and the final 2023-based IPPS market basket. The forecasted growth rates in Table IV–06 are based on IHS Global Inc.'s (IGI's) second quarter 2025 forecast with historical data through first quarter 2025.

TABLE IV-06.--2018-BASED AND 2023-BASED IPPS HOSPITAL MARKET BASKET PERCENT CHANGE, FY 2021 THROUGH FY 2028

Fiscal Year (FY)	2018-Based IPPS Market Basket Percent Change	2023-Based IPPS Market Basket Percent Change
Historical data:		
FY 2021	3.0	2.8
FY 2022	5.7	5.3
FY 2023	4.8	4.9
FY 2024	3.6	3.7
Average FYs 2021-2024	4.3	4.2
Forecast:		
FY 2025	3.5	3.5
FY 2026	3.3	3.3
FY 2027	3.0	3.0
FY 2028	3.0	3.0
Average FYs 2025-2028	3.2	3.2

Source: IHS Global, Inc., 2nd Quarter 2025 forecast.

The average historical percent change of the 2023-based IPPS market basket is slightly lower than the average percent change of the 2018-based IPPS market basket over the FY 2021 through FY 2024 time period. The average projected percent change of the 2023-based IPPS market basket is equal to the average percent change of the 2018-based IPPS market basket over the FY 2025 through FY 2028 time period. For FY 2026, the 2023-based IPPS market basket is projected to increase 3.3 percent, which is the same as the FY 2026 projected increase of the 2018-based IPPS market basket. This is 0.1 percentage point higher than the FY 2026 projected increase of 3.2 percent that we proposed in the FY 2026 IPPS/LTCH PPS proposed rule. We note that while there are multiple offsetting factors contributing to differences in the forecasts underlying the proposed and final rules, the final FY 2026 IPPS market basket increase is slightly higher due to economic uncertainty.

We summarize and respond to the public comments we received on the adequacy of the proposed IPPS market basket increase in section VI.B.1. of the preamble of this final rule. In this section, we summarize and respond to comments we received regarding the proposal to rebase the IPPS market basket.

Comment: A commenter appreciated CMS' efforts to rebase the IPPS market basket this year, as scheduled, but the commenter expressed concern that CMS' analyses are not fully representative of the input costs for providing care. Another commenter requested CMS rebase the market baskets more frequently and at least

every 3 years to ensure the market basket reflects the appropriate mix of services provided to Medicare beneficiaries.

Several commenters stated that the 3.2 percent market basket increase is lower than what it would have been absent the rebasing and revising of the hospital market basket. They stated that based on the growth in their costs that they expect to experience in the coming federal fiscal year, they are concerned that this rebasing has incorrectly lowered the calculated rate of growth of hospital costs.

Response: We appreciate the commenters' support for the rebasing and revising of the IPPS market basket, which we believe appropriately reflects a more recent input cost structure for IPPS hospitals for providing care. The major cost weights (accounting for about 70 percent of the proposed 2023-based IPPS operating market basket) were derived using 2023 Medicare cost report data for IPPS hospitals. We then supplement these data with Benchmark Input-Output data for NAICS 622000, Hospitals from ''The Use Table (Supply-Use Framework)'' to derive more detailed cost weights that reflect the complex cost structure of hospitals (reflecting costs such as compensation, food, and medical supplies/equipment). We believe both of these data sources are representative of the cost weights for IPPS hospitals providing services to Medicare beneficiaries.

As discussed in the proposed rule, as published in the FY 2006 IPPS final rule (70 FR 47403), in accordance with section 404 of Public Law 108–173, CMS determined a new frequency for rebasing the hospital market basket. We established a rebasing frequency of every 4 years based on our evaluation of data and methods at the time of the FY 2006 IPPS final rule and we continue to believe a rebasing frequency of every 4 years is appropriate. We refer readers to the FY 2006 IPPS final rule (70 FR 47404 through 47407) for the research we conducted at the time to determine this, which included reviewing the frequency and availability of the data needed to produce the market basket and analyzing the impact on the market basket of determining the market basket weights under various frequencies. Therefore, we proposed to rebase and revise the IPPS market basket effective for the FY 2026 IPPS update since it was last rebased effective for the FY 2022 IPPS update (the base year for the cost weights is being updated from 2018 to 2023). Despite this established frequency, we regularly monitor the Medicare cost report data to assess whether a rebasing is technically appropriate, and we will continue to do so in the future.

The IPPS market basket is designed to measure price inflation for IPPS hospitals and would not reflect increases in costs associated with changes in the volume or intensity of input goods and services. As noted by the commenters and stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18244), based on IGI's fourth quarter 2024 forecast with historical data through third quarter 2024, the proposed 2023-based IPPS market basket rate-of-increase was 0.1 percentage point lower (after rounding to a tenth of a percentage point) compared to the 2018-based IPPS market basket rate-of-increase. Based on more recent data available for this FY 2026 IPPS/LTCH PPS final rule (that is, IGI's second quarter 2025 forecast of the 2023-based IPPS market basket rate-of-increase with historical data through the first quarter of 2025), we estimate that the FY 2026 IPPS market basket update used to determine the applicable percentage increase is 3.3 percent (the same percentage increase of the 2018-based IPPS market basket after rounding to a tenth of a percentage point).

3. Labor-Related Share

Under section 1886(d)(3)(E) of the Act, the Secretary estimates from time to time the proportion of payments that are labor-related. Section 1886(d)(3)(E) of the Act states that the Secretary shall adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs, of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the ''labor-related share.''

The labor-related share is used to determine the proportion of the national PPS base payment rate to which the area wage index is applied. We include a cost category in the labor-related share if the costs are *labor intensive* and *vary with the local labor market.* We proposed to include in the labor-related share the national average proportion of operating costs that are attributable to the following cost categories in the 2023-based IPPS market basket: Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation, Maintenance, and Repair Services, and All Other: Labor-Related Services, as we did in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45204).

Similar to the 2018-based IPPS market basket, for the 2023-based IPPS market basket we proposed to classify expenses into the Professional Fees: Labor-Related cost category using the Benchmark I–O data, and then for this rebasing supplement these estimates with data obtained from the Medicare hospital cost report regarding the proportion of expenses classified as professional fees (for example, advertising, legal services, accounting and auditing, engineering, and management consulting) that are purchased within the local area labor market. The 2018-based IPPS market basket (86 FR 45204 through 45205) used a survey of hospitals conducted by CMS in 2008 (OMB Control Number 0938–1036) to supplement the Benchmark I–O data and determine this proportion. Effective for transmittal 18 (*https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/Transmittals/r18p240i*, the hospital Medicare cost report (CMS Form 2552–10, OMB No. 0938–0050) Worksheet S–2, Part I collects information on whether a hospital purchased professional services (for example, legal, accounting, tax preparation, bookkeeping, payroll, advertising, and management/consulting services or both) from an unrelated organization and if the majority of these expenses were purchased from unrelated organizations located outside of the main hospital's local area labor market.

For the 2023-based IPPS market basket, we proposed to determine the proportion of expenses classified as professional fees that meet our definition of labor-related services based on the Medicare cost report data. Based on these data, approximately 73 percent of IPPS hospitals (approximately 2,100) purchased professional services from an unrelated organization in 2023 as reported on Worksheet S–2, Part I, column 1, line 123 (that is, answered Yes) and also indicated whether the majority of these expenses are purchased outside their local labor market (reported Yes or No on Worksheet S–2, Part I, column 2, line 123). Of those hospitals, 37 percent of them purchased the majority of these expenses from unrelated organizations located in a CBSA outside of the main hospital CBSA as reported on Worksheet S–2, Part I, column 2, line 123. For these reporters (which accounted for 32 percent of total Medicare allowable operating costs) that indicated they purchased the majority of these services outside of the local labor market, we need to estimate a specific proportion of these services that are purchased inside the local labor market. For these reporters, we use 25 percent

(the median of 1 percent to 49 percent range) to estimate the proportion of these services that are purchased inside of the local labor market. For the remaining reporters (which accounted for 68 percent of total Medicare allowable operating costs) that indicated they purchased the majority of these services inside the local labor market we use 75 percent (the median of 51 percent to 100 percent). To estimate the overall proportion of expenses classified as professional fees that meet our definition of labor-related services (that is, reflects services purchased inside of the local labor market), for the first group of reporters we multiply 32 percent times 25 percent, which yields an estimate of 8 percent, and for the second group of reporters multiply 68 percent times 75 percent, which yields an estimated proportion of 51 percent. Combining these two measures yields 59 percent (8 percent plus 51 percent), which reflects the overall proportion of total Medicare allowable operating expenses that are purchased inside the local labor market and will be reflected in our labor-related measure. Therefore, we proposed to allocate 59 percent of the Benchmark I–O expenses classified as professional fees to estimate Professional Fees: Labor-Related cost weight, and 41 percent of the Benchmark I–O expenses classified as professional fees to estimate Professional Fees: Nonlabor-Related cost weight.

In the 2023-based IPPS market basket, expenses classified as professional fees that are subject to allocation represent approximately 9.8 percent of total operating costs. Based on the Medicare cost report results, we proposed to apportion 5.8 percentage points of the 9.8 percentage point figure into the Professional Fees: Labor-Related cost category (59 percent of 9.8 percent) and designate the remaining approximately 4.0 percentage points into the Professional Fees: Nonlabor-Related cost category (41 percent of 9.8 percent). We note that in the 2018-based IPPS market basket given the data available from the 2008 survey, we classified some expenses from the 2012 Benchmark I–O data as Professional Fees: Labor-Related, some expenses as Professional Fees: Nonlabor-Related, and some expenses as professional fees subject to allocation based on the survey. We then applied the 2008 survey results to the following specific categories of expenses: Legal services, Accounting, tax preparation, bookkeeping, and payroll services, Architectural, engineering and related services, and Management consulting services. However, for the 2023-based IPPS market basket, we proposed to revise the methodology to now use the data as reported on the Medicare cost reports (Worksheet S–2, Part I) to allocate all of the expenses we proposed to classify as professional fees costs from the 2017 Benchmark I–O data. The impact of this proposed change is an increase in the 2023-based Professional Fees: Labor-Related cost weight of about 1 percentage point.

In addition to the professional services listed earlier, we also classify a proportion of the Home Office/Related Organization Contract Labor cost weight into the Professional Fees: Labor-Related cost category as was done in the previous rebasing. We believe that many of these costs are labor-intensive and vary with the local labor market. However, data indicate that not all IPPS hospitals with home offices have home offices located in their local labor market. Therefore, we proposed to include in the labor-related share only a proportion of the Home Office/Related Organization Contract Labor cost weight based on the methodology described in this final rule.

For the 2023-based IPPS market basket, based on Medicare cost report data, we found that approximately 71 percent of IPPS hospitals reported some type of home office information on their Medicare cost report for 2023 (for example, city, State, and zip code). Using the data reported on the Medicare cost report, we compared the location of the hospital with the location of the hospital's home office. We then determined the proportion of home office/related organization contract labor cost that should be allocated to the labor-related share based on the percent of the home office/related organization contract labor costs for those hospitals that had home offices located in their respective local labor markets—defined as being in the same MSA. We determined a hospital's and home office's MSAs using their zip code information from the Medicare cost report.

Based on these data, we determined the proportion of costs that should be allocated to the labor-related share based on the percent of hospital home office/related organization contract labor costs (equal to the sum of Worksheet S–3, Part II, column 4, lines 14.01, 14.02, 25.50, and 25.51). Using this methodology, we determined that 62 percent of hospitals' home office compensation costs were for home offices located in their respective local labor markets. Therefore, we proposed to allocate 62 percent of Home Office/Related Organization Contract Labor cost weight to the labor-related share. The 2018-based IPPS market basket used a 60 percent proportion, which was based on the same methodology and the 2018 Medicare cost report data.

In the 2023-based IPPS market basket, the Home Office/Related Organization Contract Labor cost weight that is subject to allocation based on the home office allocation methodology represented 6.7 percent of total operating costs. Based on the results of the home office analysis, as previously discussed, we apportioned approximately 4.2 percentage points of the 6.7 percentage points figure into the Professional Fees: Labor-Related cost category and designated the remaining approximately 2.6 percentage points into the Professional Fees: Nonlabor-Related cost category.[149] In summary, based on the two previously mentioned allocations, we apportioned 10.0 percentage points (sum of the professional fees (5.8 percentage points) and Home Office/Related Organization Contract Labor cost weight (4.2 percentage points)) into the Professional Fees: Labor-Related cost category. Using these two methods, we then apportion 6.6 percentage points (sum of the professional fees (4.0 percentage points) and Home Office/Related Organization Contract Labor cost weight (2.6 percentage points)) to the Professional Fees: Nonlabor-related cost category to be included with other costs classified as Professional Fees: Nonlabor-Related (approximately 0.4 percentage point), resulting in a Professional Fees: Nonlabor-related cost weight of 7.0 percent. The resulting 2023-based Professional Fees: Labor-related cost weight is about 1.4 percentage points higher than the 2018-based Professional Fees: Labor-related cost weight.

Using the proposed 2023-based IPPS market basket cost weights, we derived a proposed labor-related share of 66.0 percent based on the proposed 2023-based IPPS market basket. We summarize and respond to the public comments we received on our proposed methodology for deriving the proposed labor-related share for FY 2026 here.

Comment: A commenter was supportive of the proposed update to the labor-related share and encouraged CMS to review the labor-related share of all states to ensure that the labor proportion is accurate to current costs incurred by hospitals. Several commenters were concerned about the downward adjustment of the labor-related share from 67.6 percent to 66

[149] *Note:* The cost weights are calculated using 3 decimal places. For presentational purposes, we are displaying one decimal and therefore, the detail may not add to the total due to rounding.

percent in FY 2026 stating that they believe it does not reflect hospital labor and non-labor cost pressures. They stated that per-discharge labor costs have dramatically increased in recent years, citing that according to one study, 37 percent from 2019 to 2022.

A few commenters noted the labor-related share has declined in five of the last six rebasings of the hospital market basket. The commenters stated that this continued decline only negatively impacts hospitals with a wage index over 1.0 without a clearly delineated budget neutrality adjustment to ensure overall Medicare hospital reimbursement is maintained. The commenters stated that given the current healthcare workforce crisis and the growing wage demands on hospitals, labor costs as a share of total hospital costs have grown since the 2018 base year, not declined.

A few commenters stated that they understood the need for rebasing the labor share but requested that CMS release additional information on how it arrived at its proposed estimate for the national labor-related share for FY 2026. Commenters stated that to accurately replicate and verify the labor related share, they requested CMS publish a table of their intermediate steps reflective of the numerators and denominators utilized in each cost category and calculation step. These commenters requested CMS include the dollar values used to calculate the percentage of each cost category.

A commenter stated that the proposed reduction in the national labor-related share could lead to lower payments for hospitals with higher wage indexes, as a smaller share of the payment rate will reflect local labor costs. Accordingly, the commenter requested that CMS, at a minimum, reconsider labor expense calculations to provide a more appropriate update based on growing and unsustainable costs.

Response: The purpose of the labor-related share is to reflect the proportion of the national IPPS standardized amount that is adjusted by the hospital's wage index (representing the relative costs of their local labor market to the national average). We proposed to derive the labor-related share using the 2023-based IPPS market basket, reflecting average national cost weights for IPPS hospitals. As stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18239), for each cost weight included in the 2023-based IPPS market basket we utilized reported data from all IPPS hospitals reporting Medicare IPPS payments and facility operating costs with proposed trims to the data to remove outliers. For each of the cost weights, we evaluated the distribution of providers and costs by ownership-type and by urban/rural status to make sure they were nationally representative.

We appreciate the commenters' request to explain the decrease in the labor-related share in more detail. The decrease in the labor-related share from 67.6 percent to 66.0 percent is primarily due to the lower compensation cost weight (calculated using the Medicare cost report data) in the 2023-based IPPS market basket (51.1 percent) compared to the compensation cost weight in the 2018-based IPPS market basket (53.0 percent) as these costs increased at a slower rate than total operating costs. Our analysis of the Medicare cost report data showed that on a per inpatient day basis, compensation costs, which largely reflect direct patient care salaries, grew by about 4 percent per year from 2018 to 2023 while total operating costs grew by about 5 percent per year. The slower growth in compensation costs also reflected slower growth in employee benefit costs (particularly qualified defined benefit plan costs) and overhead employee salaries at about 3 percent per year. Contract labor costs for direct patient care, on the other hand, offset some of this experience as costs grew nearly 18 percent per year over this same period. For noncompensation costs, which grew nearly 6 percent per year from 2018–2023, key contributors were costs for home office contract labor (about 8 percent growth per year) and pharmaceuticals (about 6 percent growth per year). Consistent with some of the commenter's findings, our analysis of the Medicare cost report data shows that compensation costs have been increasing at a faster rate between the 2018 to 2023 time period compared to the prior 4-year period; however, these compensation costs have been growing slower than noncompensation costs, which results in a decrease in the compensation cost weight. In addition, from 2018 to 2023, we have seen faster growth in the Professional Fees costs and Home Office/Related Organization costs resulting in an increase in the professional fees cost weights and Home Office/Related Organization cost weight, which are partially offsetting the decrease in compensation cost weight as shown in Table IV–05.

In response to commenters' request for additional information on the methodology for calculating the labor related share, as stated in the FY 2026 IPPS/LTCH PPS proposed rule (90 FR 18240), we derive the Professional Fees cost weight using the 2017 Benchmark I–O, ''The Use Table (Supply-Use Framework),'' for NAICS 622000, Hospitals, published by the Bureau of Economic Analysis (BEA). First, to obtain an amount for the Professional Fees costs subject to the allocation percentage from the Medicare cost reports, we calculated the sum of I–O expenses for Professional, Scientific, and Technical Services (NAICS 54) excluding Veterinary services (which we include in the Professional Fees: Nonlabor-Related), I–O expenses for Business Support Services (NAICS 5614), Data Processing, Hosting and Related services (NAICS 5182) and I–O expenses for Lessors of Nonfinancial Intangible Assets (NAICS 533). In addition, we also are adding in 34 percent of Employment Services (NAICS 5613) as Census and BEA data indicate that these expenses reflect more than just direct patient care contract labor (which we directly obtain from Worksheet S–3, Part II, column 4, lines 11, 13, and 15 from the Medicare cost report as noted in the proposed rule). The sum of these costs reflect total Professional Fees from the 2017 Benchmark I–O data that are subject to the allocation percentage from the Medicare cost reports, or 30.2 percent of total ''All Other'' costs from the 2017 Benchmark I–O data. The ''All Other'' costs are equal to the sum of the Benchmark I–O data for the detailed cost categories as described in section IV.B.c. of the preamble of the FY 2026 IPPS/LTCH proposed rule.

Second, we proposed to inflate the detailed 2017 Benchmark I–O data forward to 2023 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2017 Benchmark I–O data (for instance, for the Professional Fees category we applied the growth in the ECI for Total Compensation for Private industry workers in Professional and Related). After inflating the 2017 costs to 2023 and calculating the cost shares we determined that the resulting cost share was 29.5 percent of ''All Other'' costs in 2023 dollars.

Third, these resulting 2023 cost shares were applied to the residual ''All Other'' cost weight to obtain the detailed cost weights for the proposed 2023-based IPPS market basket. For example, we apply the Professional Fees cost share (29.5 percent of total ''All Other'' costs) to the residual ''All Other'' cost weight of 33.2 percent, resulting in a total Professional Fees cost weight from the Benchmark I–O data of approximately 9.8 percent of the 2023-based IPPS market basket.

Lastly, this is then allocated between Professional Fees: Labor-Related and Professional Fees: Nonlabor-Related as

described later in this section. As stated in the FY 2026 IPPS/LTCH proposed rule (90 FR 18245) for the 2018-based IPPS market basket given the data available from the 2008 survey, we classified some expenses from the 2012 Benchmark I–O data as Professional Fees: Labor-Related, some expenses as Professional Fees: Nonlabor-Related, and some expenses as professional fees subject to allocation based on the survey. We then applied the 2008 survey results to the following specific categories of expenses: Legal services, Accounting, tax preparation, bookkeeping, and payroll services, Architectural, engineering and related services, and Management consulting services (all of which are reported in NAICS 54). However, for the 2023-based IPPS market basket, since we proposed to revise the methodology to use the data as reported on the Medicare cost reports (Worksheet S–2, Part I), we proposed to apply the allocation percentage of 59 percent obtained from the Medicare cost reports to all of the professional fees costs we identified from the 2017 Benchmark I–O data as described previously. This proposal to apply the percentage to all of the professional fees costs is a result of the revised scope of expenses captured in the question when we switched to using the Medicare cost report data. Specifically, the professional fees question on Worksheet S–2, Part I of the Medicare cost report stated a wider range of types of costs as an example (legal, accounting, tax preparation, bookkeeping, payroll, advertising, and management/consulting services) while the survey conducted by CMS in 2009 was more limited and had specific questions for each type of cost (legal services, accounting and auditing, engineering, and management consulting). The impact of this proposed methodology change in order to be consistent with the Medicare cost report professional fees question is an increase in the proposed 2023-based Professional Fees: Labor-Related cost weight of about 1 percentage point.

For even greater transparency, as requested by the commenter, we are posting a table providing the calculations of the detailed cost category weights for the 2023-based IPPS market basket using the publicly available I–O data. This table along with other market basket information can be found at *https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information*.

We believe it is technically appropriate to update the labor-related share to reflect the cost structures of IPPS hospitals from the 2023-based IPPS market basket rather than continue to use the less recent 2018-based IPPS market basket.

Comment: A few commenters were grateful that CMS proposed to use Medicare cost report data to inform the determination of the proportion of expenses classified as professional fees that are purchased within the local area labor market rather than relying on survey data as had been done in previous calculations of the labor-related share. However, the commenters were disappointed that CMS has not revised the calculation to reflect that professional fees purchased outside the local area labor market are also ''related to, influenced by, or vary with the local market.'' They believe the cost of professional fees purchased outside of the hospital's local area market should be considered labor-related, because providers of these professional services must adjust their pricing to reflect what local markets are able to bear. Commenters stated that an accounting firm will not necessarily charge a hospital located in a major urban area the same that it would charge a hospital in a small rural area for the same services. Several commenters recommended CMS increase the labor-related portion of professional fees from 59 percent (which reflects CMS's estimate of the proportion of professional fees purchased within hospitals' local area labor markets) to a higher percentage. Another commenter stated that CMS should revise its methodology for rebasing the labor-related share, to account for the geographic wage variation inherent in all non-clinical professional services costs.

Response: We appreciate the commenters' support to use the Medicare cost report data to determine the proportion of professional fees that are purchased in the local labor market.

However, we disagree that the proportion of professional fees services costs purchased by hospitals outside the local area labor market should be included in the labor-related share. The labor-related share of the IPPS standardized amount is adjusted to account for geographic differences in area wage levels by applying the applicable IPPS wage index. The purpose of the labor-related share is to reflect the proportion of the national IPPS standardized amount that is adjusted by the hospital's wage index (representing the relative costs of their local labor market to the national average). Therefore, we include a cost category in the labor-related share if the costs are labor intensive and vary with the local labor market.

As acknowledged by the commenter and confirmed by the Medicare cost report data for IPPS hospitals, professional services can be purchased from local firms as well as national and regional professional services firms. It is not necessarily the case, as asserted by the commenter, that these national and regional firms have fees that match those in the local labor market even though providers have the option to utilize those firms. That is, fees for services purchased from firms outside the local labor market may differ from those that would be purchased in the local labor market for any number of reasons (including but not limited to, the skill level of the contracted personnel, higher capital costs, etc.). We believe it is reasonable to conclude that the 59 percent of those Professional Fees costs purchased directly within the local labor market are directly related to local labor market conditions and, thus, should be included in the labor-related share. The remaining approximately 41 percent of Professional Fees costs, which are purchased outside the local labor market, reflect different and additional factors outside the local labor market and, thus, should be excluded from the labor-related share. In addition, we note the compensation costs of professional services provided by hospital employees (which would reflect the local labor market) are included in the labor-related share as they are included in the Wages and Salaries and Employee Benefits cost weights. Therefore, for the reasons discussed, we believe our proposed methodology of continuing to allocate only a portion of Professional Fees to the Professional Fees: Labor-Related cost category is appropriate.

After consideration of public comments, we are finalizing the rebasing of the 2023-based IPPS market basket without modification and the derivation of a labor-related share of 66.0 percent based on the final 2023-based IPPS market basket. Table IV–07 presents a comparison of the proposed and final 2023-based labor-related share and the 2018-based labor-related share. As discussed in section IV.B.1.b. of the preamble of this final rule, the Wages and Salaries and Employee Benefits cost weights reflect contract labor costs.

TABLE IV-07.—COMPARISION OF THE 2018-BASED LABOR-RELATED SHARE AND THE 2023-BASED LABOR-RELATED SHARE

	2018-Based IPPS Market Basket Cost Weights	2023-Based IPPS Market Basket Cost Weights
Wages and Salaries	41.2	40.6
Employee Benefits	11.7	10.5
Professional Fees: Labor-Related	8.6	10.0
Administrative and Facilities Support Services	1.1	0.8
Installation, Maintenance, and Repair Services	2.4	1.5
All Other: Labor-Related Services	2.6	2.6
Total Labor-Related Share	**67.6**	**66.0**

Note: Detail may not add to total due to rounding.

Using the cost category weights from the 2023-based IPPS market basket, we calculated a labor-related share of 66.0 percent, 1.6 percentage points lower than the current labor-related share of 67.6 percent. This downward revision to the labor-related share is primarily the result of incorporating the more recent 2023 Medicare cost report data for Wages and Salaries, Employee Benefits, and Contract Labor costs. This is partially offset by an increase in the Professional Fees: Labor-Related cost weight.

Therefore, we proposed and are finalizing a labor-related share of 66.0 percent based on the 2023-based IPPS market basket. We continue to believe, as we have stated in the past, that these operating cost categories are related to, influenced by, or vary with the local markets. Therefore, our definition of the labor-related share continues to be consistent with section 1886(d)(3) of the Act. We note that section 403 of Public Law 108–173 amended sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless 62 percent would result in lower payments to a hospital than will otherwise be made.

C. Market Basket for Certain Hospitals Presently Excluded From the IPPS

As explained in the FY 2006 IPPS final rule (70 FR 47396 through 47398), beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, and RNHCIs.

Consistent with the regulations at §§ 412.23(g) and 413.40(a)(2)(ii)(A) and (c)(3)(viii), we also have used the percentage increase in the IPPS operating market basket to update target amounts for short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. In the FY 2018 IPPS/LTCH PPS final rule, we rebased and revised the IPPS operating market basket to a 2014 base year, effective for FY 2018 and subsequent fiscal years (82 FR 38158 through 38175), and finalized the use of the percentage increase in the 2014-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2018 and subsequent fiscal years. Effective for the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45207), we rebased and revised the IPPS operating market basket to a 2018 base year. Therefore, we used the percentage increase in the 2018-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2022 and subsequent fiscal years.

As discussed in this section IV. of the preamble of this final rule, we proposed and are finalizing to rebase and revise the IPPS operating market basket to a 2023 base year. We continue to believe that it is appropriate to use the increase in the IPPS operating market basket to update the target amounts for these excluded facilities, as discussed in prior rulemaking. Therefore, we proposed to use the percentage increase in the 2023-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2026 and subsequent fiscal years. Accordingly, for FY 2026, the rate-of increase percentage to be applied to the target amount for these hospitals would be the FY 2026 percentage increase in the 2023-based IPPS operating market basket.

We received no comments on this proposal and therefore are finalizing this proposal without modification.

D. Rebasing and Revising the Capital Input Price Index (CIPI)

The CIPI was originally described in the FY 1993 IPPS final rule (57 FR 40016). There have been subsequent discussions of the CIPI presented in the IPPS proposed and final rules. The FY 2022 IPPS/LTCH PPS final rule (86 FR 45208 through 45213) described the most recent rebasing and revising of the CIPI to a 2018 base year, which reflected the capital cost structure of IPPS hospitals available at that time.

Effective for FY 2026, we proposed to rebase and revise the CIPI to a 2023 base year to reflect a more current structure of capital costs for IPPS hospitals. This 2023-based CIPI was derived using data from the 2023 cost reports for IPPS hospitals, which includes providers whose cost reporting period began on or after October 1, 2022, and prior to September 30, 2023. We also proposed to start with the same subset of Medicare cost reports from IPPS hospitals as previously described in section IV.B.1.a. of the preamble of this final rule. As with the 2018-based index, we proposed to develop two sets of weights to derive the 2023-based CIPI. The first set of weights identifies the proportion of hospital capital expenditures attributable to each expenditure category, while the second set of weights is a set of relative vintage weights for depreciation and interest. The set of vintage weights is used to identify the proportion of capital expenditures within a cost category that is attributable to each year over the

useful life of the capital assets in that category. A more thorough discussion of vintage weights is provided later in this section.

Using 2023 Medicare cost reports (CMS Form 2552–10, OMB Control number 0938–0050), we are able to obtain capital costs for the following categories: Depreciation, Interest, Lease, and Other. Specifically, we proposed to determine what proportion of total capital costs that each category represents using the data reported by IPPS hospitals on Worksheet A–7, Part III. We proposed that Depreciation costs are equal to the sum of Worksheet A–7, Part III, column 9, lines 1 and 2. We proposed that Interest costs are equal to the sum of Worksheet A–7, Part III, column 11, lines 1 and 2. We proposed that Lease costs are equal to the sum of Worksheet A–7, Part III, column 10, lines 1 and 2. We proposed that Other costs are equal to the sum of Worksheet A–7, Part III, columns 12 through 14, lines 1 and 2. We proposed that Total Capital costs are equal to the sum of Worksheet A–7, Part III, column 15, lines 1 and 2. We proposed to derive cost weights for each IPPS hospital for each CIPI cost category by calculating the ratio of the costs reported for each cost category (for example, Depreciation) to Total Capital costs. Finally, we proposed to apply a set of simultaneous trims based on these derived cost weights to remove outliers. Specifically, we proposed to only include cost reports for providers where their Depreciation cost weight is between 25 percent and 90 percent; Interest cost weight is between 0 and 75 percent, Lease cost weight is between 0 and 50 percent and Total Capital costs are greater than zero and less than Total Facility Costs reported on Worksheet B, Part I, column 26, line 202. The trimming process is done simultaneously on each cost category so that if a cost weight is outside the specific range for one or more of the cost weight criteria mentioned, the provider is excluded from the sample. We note that these proposed trimming methods are the same types of edits performed for the 2018-based CIPI. We then proposed to sum the costs for each cost category (Depreciation, Interest, Lease, and Other) and divide each sum by the sum of Total Capital costs for this same set of IPPS hospitals. The ratio of the total costs for each category to the sum of Total Capital costs represents the cost weight for each of the Depreciation, Interest, Lease and Other cost categories. This is the same methodology as was used for the 2018-based CIPI. As shown in the left column of Table IV–08, in 2023 depreciation expenses accounted for 67.2 percent of total capital costs, interest expenses accounted for 15.2 percent, leasing expenses accounted for 11.6 percent, and other capital expenses accounted for 6.0 percent.

We also proposed to allocate lease costs across each of the remaining capital cost categories as was done in the 2018-based CIPI. We proposed to proportionally distribute leasing costs among the cost categories of Depreciation, Interest, and Other, reflecting the assumption that the underlying cost structure of leases is similar to that of capital costs in general. As was done for the 2018-based CIPI, we proposed to assume that 10 percent of the lease costs as a proportion of total capital costs represents overhead and to assign those costs to the Other capital cost category accordingly. Therefore, we are assuming that approximately 1.2 percent (11.6 percent $\times$ 0.1) of total capital costs represent lease costs attributable to overhead, and we proposed to add this 1.2 percent to the 6.0 percent Other cost category weight. We then proposed to distribute the remaining lease costs (10.4 percent, or 11.6 percent $-$ 1.2 percent) proportionally across the three cost categories (Depreciation, Interest, and Other) based on the proportion that these categories comprise of the sum of the Depreciation, Interest, and Other cost categories (excluding lease expenses). For example, the Other cost category represented 6.7 percent of all three cost categories (Depreciation, Interest, and Other) prior to any lease expenses being allocated. This 6.7 percent is applied to the 10.4 percent of remaining lease expenses so that another 0.7 percent of lease expenses as a percent of total capital costs is allocated to the Other cost category. Therefore, the resulting proposed Other cost weight is 7.8 percent (calculated using unrounded numbers, which is approximately equal to 6.0 percent + 1.2 percent + 0.7 percent). This is the same methodology used for the 2018-based CIPI.

We did not receive any comments on the proposed methodology to derive the cost weights of the 2023-based CIPI and therefore are finalizing this methodology without modification. The resulting cost weights of the allocation of lease expenses are shown in the right column of Table IV–08.

TABLE IV-08.— ALLOCATION OF LEASE EXPENSES FOR THE 2023-BASED CIPI

Cost Categories	Cost Shares Obtained from Medicare Cost Reports (Percent of Total Capital Costs)	Cost Shares After Allocation of Lease Expenses (Percent of Total Capital Costs)
Depreciation	67.2	75.1
Interest	15.2	17.0
Lease	11.6	-
Other	6.0	7.8

Note: Detail may not add to 100 percent due to rounding

Finally, we proposed to further divide the Depreciation and Interest cost categories. We proposed to separate the Depreciation cost category into the following two categories: (1) Building and Fixed Equipment and (2) Movable Equipment. We also proposed to separate the Interest cost category into the following two categories: (1) Government/Nonprofit; and (2) For-profit. These are the same categories used for the 2018-based CIPI.
