II. Discussion

As directed in SRM-SECY-11-0089, “Options for Proceeding with Future Level 3 Probabilistic Risk Assessment (PRA) Activities,” the staff is conducting a full-scope multi-unit site Level 3 PRA (Level 3 PRA project) that addresses all internal and external hazards; all plant operating modes; and all reactor units, spent fuel pools, and dry cask storage. For definitional purposes, a Level 1 PRA estimates the frequency of accidents that cause damage to the nuclear reactor core; this is commonly called core damage frequency. A Level 2 PRA starts with the Level 1 core damage accidents and estimates the frequency of accidents that release radioactivity from the nuclear power plant. A Level 3 PRA starts with the Level 2 radioactivity release accidents and estimates the consequences in terms of injury to the public and damage to the environment.

The reference site for this study contains 2 four-loop Westinghouse pressurized water reactors with large dry containments. The objectives of the Level 3 PRA project are to (1) develop a Level 3 PRA, generally based on

current state-of-practice methods, tools, and data, that (a) reflects technical advances since the last NRC-sponsored Level 3 PRAs (NUREG-1150), which were completed over 30 years ago, and (b) addresses scope considerations that were not previously considered (e.g., low-power and shutdown risk, multi-unit risk, other radiological sources); (2) extract new insights to enhance regulatory decision making and to help focus limited NRC resources on issues most directly related to the agency’s mission to protect public health and safety; (3) enhance PRA staff capability and expertise and improve documentation practices to make PRA information more accessible, retrievable, and understandable; and (4) demonstrate technical feasibility and evaluate the realistic cost of developing new Level 3 PRAs.

The work performed under this project is being documented as a multi-volume report. The current Level 3 PRA project reports (Volume 5) describe the analyses and results for the reactor, low-power and shutdown, Level 1, 2, and 3 PRAs for internal events. Each set of Level 3 PRA project reports covering the Level 1, 2, and 3 PRAs for a specific site radiological source, plant operating state, and hazard group (or groups) is accompanied by an overview report. The overview reports summarize the results and insights from all three PRA levels.

The Level 3 PRA project analyses reflect the reference plant as it was designed and operated as of 2012. To provide results and insights better aligned with the current design and operation of the reference plant, the overview reports also provide a reevaluation of the plant risk based on a set of new plant equipment and PRA model assumptions and compare the results of the reevaluation to the original study results. This reevaluation reflects the potential impact of FLEX strategies (which reduce the risk to the public), as well as the current reactor coolant pump shutdown seal design (which has limited risk impact during low-power and shutdown conditions).

As documented in Section 2 of the Volume 5 overview report, the results of the original Level 3 PRA project analyses and the reevaluation both show that the combination of this plant design and site location has substantial margin to the quantitative health objectives related to the NRC’s safety goal policy when considering internal events during reactor shutdown, though the margins are noticeably less for the surrogate risk metrics of core damage frequency and large, early release frequency. Even though these margins can vary for other

plants due to variations in their design and siting, the estimates derived for the reference plant, when adjusted for siting and design variations, would provide

useful qualitative risk insights for other U.S. operating plants.
