

Revisions to This Information Collection

ATF is revising this information collection, OMB 1140–0005, to reflect an increase in the number of persons who submit requests to import, from 10,000 three years ago to 13,777 in 2025, an increase of 3,777 requests annually. In addition, the collection has been revised to reflect a change in the amount of time it takes to complete and submit the information, due to technological developments. More than 90 percent of respondents now respond via ATF's online eForms system, cutting out the time involved in completing and mailing paper forms. As a result of these combined changes, the information collection has been revised to reflect a decrease in the total annual hourly burden, from 5,000 hours three years ago to 3,869 in 2025, a decrease of 1,131 hours. In addition, ATF is including monetized value of this time due to recent OMB changes and has also made small revisions to the title to make it easier to read.

SUPPLEMENTARY INFORMATION:

I. Background

The lack of comprehensive disability clinical-care education and disability competency training among medical, nursing and other healthcare professionals can perpetuate discrimination in healthcare against people with disabilities and significantly contributes to the disparate health outcomes of people with disabilities. Most Federally financed medical, nursing, healthcare professional, and allied health professional schools, as well as post-graduate residency and fellowship programs, do not incorporate disability clinical care into curricula or training. Consequently, physicians often lack the knowledge, experience, and skills to distinguish clinical concerns arising from disability from those related to other health conditions. One's apparent disability—even when unrelated to the reason for one's health care visit—can result in diagnostic overshadowing the clinical concern and can have negative impact during the health care visit. This lack of familiarity and understanding of disability is detrimental to quality of care, contributing to delays in diagnosis and treatment, unsafe care, and inequities in care.

Due to a lack of training and familiarity, people with disabilities are sometimes viewed as asexual.ⁱ These assumptions may contribute to the finding that women with disabilities undergo colon cancer screening at similar rates as their nondisabled peers, but experience disparities in breast cancer and cervical cancer screening.ⁱⁱ
