Tables of Energy Deposition Distributions in Aluminum and Copper Irradiated  
by Point-Monodirectional Electron Beams with Energies from 1 to 60 MeV<sup>\*</sup>

M. J. Berger and S. M. Seltzer

National Bureau of Standards

Washington, D.C. 20234

This report presents tables of energy deposition distributions in aluminum and copper media irradiated by monoenergetic point-monodirectional electron beams. The distributions are given as functions of the depth in the medium and of the radial distance from the incident beam. Results are given for 7 beam energies between 1 MeV and 60 MeV. As shown earlier in National Bureau of Standards Report NBSIR 82-2451 (1982), the tabulated results from monoenergetic, point-monodirectional sources can be used, by superposition, to obtain spatial distributions of the energy imparted to the medium by parallel beams with arbitrary spectra and finite arbitrary cross sections.

Key words: absorbed-dose distribution; aluminum; copper; electron; point-monodirectional beam; superposition.

---

\*This work was supported by the Office of Naval Research and by the Space Science Data Center at the NASA Goddard Space Flight Center.

## 1. INTRODUCTION

The spatial distribution of energy imparted to a medium irradiated by an electron beam depends on the electron stopping power and on the multiple scattering of the electrons in the medium. Even when the incident beam is narrowly collimated (point-monodirectional), the distribution of imparted energy spreads laterally with depth in the medium, as the result of multiple scattering. The higher the atomic number of the medium, the greater are the effects of multiple scattering.

In a previous report [1]<sup>1</sup> we have presented comprehensive tables of the spatial distribution of imparted energy in a water medium irradiated by point-monodirectional monoenergetic electron beams with energies from 1 to 60 MeV. It was also shown in reference [1] how these "elementary" distributions can be combined by superposition to obtain the spatial distribution of imparted energy from parallel electron beams with finite cross sections of arbitrary shape. Of course one can also use weighted sums of elementary distributions for monoenergetic sources to obtain results for incident electron beams with arbitrary spectra.

The results for water were generated mainly with a view towards applications in biomedical dosimetry, for example in radiation treatment planning. In the present report the calculations are extended to other media of higher atomic number (aluminum and copper) to provide information of interest for radiation damage studies in terms of imparted energy.

## 2. CONDITIONS OF CALCULATION

The calculations were, as in reference [1], carried out with the Monte Carlo transport program ETRAN [2]. A point-monodirectional electron beam with kinetic energy  $T_0$  was assumed to be incident along the z-axis onto a semi-infinite medium that occupies the region  $z \geq 0$ . The electron tracks simulated by random sampling were analyzed to obtain an estimate of the elementary distribution function  $F(\rho, z)$ . This distribution is defined such that  $F(\rho, z)d\rho dz$  represents the average fraction of the incident beam energy that is deposited at depths between  $z$  and  $z + dz$  and at radial distances between  $\rho$  and  $\rho + d\rho$  from the z-axis. This distribution is normalized such that

$$\int_0^{\infty} dz \int_0^{\infty} F(\rho, z) d\rho = 1 \quad . \quad (1)$$

The Monte Carlo results were actually obtained, and were tabulated, in the form of the following histogram distributions:

---

<sup>1</sup>Numbers in brackets indicate literature references at the end of this paper.

a) Distribution of imparted energy in depth intervals,

$$H_n = 100 \int_{z_{n-1}}^{z_n} dz \int_0^{\infty} d\rho' F(\rho', z) . \quad (2)$$

b) Cumulative radial distribution of imparted energy in indicated depth intervals,

$$\psi_n(\rho) = 100 \frac{\int_{z_{n-1}}^{z_n} dz \int_0^{\rho} d\rho' F(\rho', z)}{\int_{z_{n-1}}^{z_n} dz \int_0^{\infty} d\rho' F(\rho', z)} . \quad (3)$$

The boundaries of the depth intervals were chosen such that

$$z_n = nr_0/20, n = 0, 1, 2 \dots \quad (4)$$

where  $r_0$  is the c.s.d.a. range (rectified pathlength computed in the continuous-slowing-down approximation) at the incident-beam energy  $T_0$ . Similarly, tabular values of  $\psi_n(\rho)$  are given for  $\rho$ -values that are specified fractions of  $r_0$ . The distributions of imparted energy are thereby "scaled" in the sense that their dependence on the incident beam energy  $T_0$  is minimized, which facilitates interpolation with respect to  $T_0$ .

### 3. ELECTRON RANGES

The Monte Carlo calculations for this report were done some time ago, with the best cross sections then available for the electron energy loss per unit pathlength. Since then, the collision stopping power (mean energy loss per unit pathlength due to excitations and ionizations) and the radiative stopping power (mean energy loss per unit pathlength due to the emission of bremsstrahlung) have been revised [3]. For the collision stopping power, more up-to-date experimental values were used for the mean excitation energy (the key parameter of the Bethe stopping power formula). Moreover, the density-effect correction (reduction of energy loss due to the polarization of the medium) was improved. The universal approximation formula of Sternheimer and Peierls [4] was no longer used. Instead, the density-effect was evaluated according to the original method of Sternheimer [5], using up-to-date values of the mean excitation

energy and of the atomic binding energies needed for the modeling of the dispersion properties of the medium. In regard to the radiative stopping power, the principal changes consist of the use of the new theoretical cross sections of Pratt *et al.* [6] below 2 MeV, the re-evaluation of the cross sections of Davies, Bethe, Maximon, and Olsen [7] above 50 MeV, and the use of interpolation with respect to electron energy to cover the region from 2 to 50 MeV.

Fortunately the use of improved cross sections resulted in relatively small changes in the stopping powers for aluminum and copper compared to those used in the Monte Carlo calculations, and the corresponding changes of the c.s.d.a. ranges, shown in table 1, are equally small. It is expected to be a good approximation to assume that the scaled spatial distributions of imparted energy, expressed in terms of the variables  $\rho/r_0$  and  $z/r_0$ , are not affected by the change of cross sections. The appropriate adjustment to the new cross sections can then be made simply by using the new range values when converting the spatial distributions from the scaled form into unscaled distributions as functions of  $\rho$  and  $z$ .

#### 4. RESULTS

Spatial distributions of imparted energy from point monodirectional electron beams, are given for 7 beam energies from 1 MeV to 60 MeV. The results at each energy are based on a sample of 10,000 tracks of primary electrons as well as the tracks of all generations of secondary electrons (including those set in motion by bremsstrahlung photons). Tables 2A and 2B give the histogram distributions  $H_n$  with respect to depth, for aluminum and copper. Tables 3A and 3B give the cumulative histogram distributions  $\psi_n(\rho)$  with respect to radial distance from the incident beam, in various depth intervals, for aluminum and copper.

TABLE 3A. Normalized cumulative radial distribution of deposited energy in aluminum. The numbers in the column headed "Scaled radius" represent the scaled radial distance from the z-axis,  $\rho/r_0$ . The "Scaled depth intervals" have the same meaning as in Table 2A. The entries for each depth interval are the quantities  $\Psi_n(\rho)$  as defined by Eq (3). The percentage of the incident beam energy deposited in the indicated depth interval, at radial distances  $\leq \rho$ , is equal to  $H_n \Psi_n(\rho)/100$ , where  $H_n$  is given in Table 2A.

TABLE 3B. Normalized cumulative radial distribution of deposited energy in copper. The numbers in the column headed "Scaled radius" represent the scaled radial distance from the z-axis,  $\rho/r_0$ . The "Scaled depth intervals" have the same meaning as in Table 2B. The entries for each depth interval are the quantities  $\Psi_n(\rho)$  as defined by Eq (3). The percentage of the incident beam energy deposited in the indicated depth interval, at radial distances  $\leq \rho$ , is equal to  $H_n \Psi_n(\rho)/100$ , where  $H_n$  is given in Table 2B.

<b>10. SUPPLEMENTARY NOTES</b>  <input type="checkbox"/> Document describes a computer program; SF-185, FIPS Software Summary, is attached.			
<b>11. ABSTRACT</b> <i>(A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here)</i>  This report presents tables of energy deposition distributions in aluminum and copper media irradiated by monoenergetic point-monodirectional electron beams. The distributions are given as functions of the depth in the medium and of the radial distance from the incident beam. Results are given for 7 beam energies between 1 MeV and 60 MeV. As shown earlier in National Bureau of Standards Report NBSIR 82-2451 (1982), the tabulated results from monoenergetic, point-monodirectional sources can be used, by superposition, to obtain spatial distributions of the energy imparted to the medium by parallel beams with arbitrary spectrum and finite arbitrary cross section.			
<b>12. KEY WORDS</b> <i>(Six to twelve entries; alphabetical order; capitalize only proper names; and separate key words by semicolons)</i> absorbed-dose distribution; aluminum; copper; electron; point-monodirectional beam; superposition.
