CATALOG STRUCTURE AND USE

Full bibliographic citations including keywords and abstracts for National Institute of Standards and Technology (NIST) (formerly National Bureau of Standards (NBS)) papers published and entered into the National Technical Information Service (NTIS) collection are cited in the "NIST Publications Announcements" section of this catalog. (Also included are papers published prior to 1990 but not reported in previous supplements of this annual catalog.) Entries are arranged by NTIS subject classifications which consist of 38 broad subject categories (see back cover) and over 350 subcategories. Within a subcategory, entries are listed alphanumerically by NTIS order number.

Four indexes are included to allow the user to identify papers by personal author, keywords, title, and NTIS order/report number. Each entry lists the appropriate title, the NTIS order number, and the abstract number.

Papers may also be identified by searching the NTIS database either online via commercially available systems such as DIALOG, or in the issues of NTIS's *Government Reports Announcements and Index* and its *Government Reports Annual Index*.

AVAILABILITY AND ORDERING INFORMATION

The highest quality and least expensive copies of NIST publications published as Government documents are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Publications cited with stock numbers (SN) should be ordered by these numbers. GPO will accept payment by check, money order, VISA, MasterCard, or deposit account. For availability and price, write to the GPO or telephone (202) 783-3238. Should an NIST publication be out of print at the GPO, its continued availability is assured at NTIS which sells publications in microfiche or paper copy reproduced from microfiche.

If an entry has a price code, such as PC A04/MF A01, the publication may be ordered from NTIS in paper copy (PC) or microfiche (MF) or both if both codes are given. Order from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. A copy of the latest price code schedule is available from NTIS. NTIS will accept payment by check, money order, VISA, American Express, MasterCard, or deposit account. NTIS is the sole source of Federal Information Processing Standards (FIPS), Interagency Reports (IRs), and Grant/Contract Reports (GCRs). For more information call (703) 487-4650.

Papers noted "Not Available NTIS" may be obtained directly from the author or from the external publisher

cited. Such papers are not for sale by either the GPO or NTIS.

Two other sources for NIST publications are depository libraries (libraries designated to receive Government publications) and Department of Commerce District Offices. The depository libraries listed in Appendix A receive selected NIST publications (see inside back cover for a description of the various NIST publication series). While not every Government publication is sent to all depository libraries, certain depositories designated as Regional Depositories receive and retain one copy of all Government publications made available. Contact the depository library in your area to obtain information on what is available and where.

Department of Commerce District Offices listed in Appendix B provide ready access at the local level to publications, statistical data and summaries, and surveys. Each District Office serves as an official sales agency of the Superintendent of Documents, U.S. Government Printing Office. A wide range of Government publications can be purchased from these offices. In addition, the reference library of each District Office contains review copies of many Government publications.

Abstract

ADMINISTRATION & MANAGEMENT

Management Information Systems

000,001

PB91-120162

PC A05/MF A01

National Inst. of Standards and Technology, Gaithersburg, MD.

Methodology for Certifying Sensitive Computer Applications.

E. Roback. Nov 90, 85p NISTIR-4451

Keywords: *Management, *Data processing security, *Information systems, Information resource management, Methodology, National government, Government policies, Standards, *Computer security, *Computer application certification, *Certification, Office automation, Government agencies, Federal automated information systems security programs.

The Methodology for Certifying Sensitive Computer Applications defines and describes a standard certification methodology employed by the U.S. Department of Commerce to (a) ensure that sensitive applications meet applicable federal policies, regulations, and standards and (b) demonstrate that installed security safeguards are adequate for the sensitivity or criticality of the data processed, as required by OMB Circular A-130. The methodology takes the reader through the certification process step-by-step, including determining whether an application requires certification, defining functional security requirements, defining system security specifications, reviewing system security features design, testing those features, accepting the test results for a certification decision, and the final decision to implement and operate the application. The document also describes how audits, internal control reviews and risk analyses fit into the certification process.

PB90-162108

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Factory Automation Systems Div.

Data Model Development and Validation for Product Data Exchange.

M. J. Mitchell, Y. Yang, S. Ryan, and B. Martin. Feb 90, 17p NISTIR-90/4241

Keywords: *Product development, *Data bases, Manufacturing, Information systems, Proving, Testing, Methodology, Specifications, *Product Data Exchange Specification, Data model.

The paper describes some strategic and technical issues which directly impact the effort. Experience with actual validation activities identified the need to develop additional requirements documentation. The paper serves as the background for a series of papers which will describe the actual methods and processes used in the requirements specification activity. Three types of results came out of the requirements activity. The form of the project deliverables changed considerably. Insights on conducting requirements activities were identified. New issues on the relationship of the work to portions of the specification were identified.

Management Practice

Development Plan Configuration Management Systems and Services.

S. Ressler, and S. Katz. Sep 90, 26p NISTIR-4413
Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC. Computer-aided Acquisition and Logistic Support Program.

Keywords: *Project management, *Management, Objectives, Standards, Manufacturing, Documents, Personnel, Equipment, Computer software, Standard for the Exchange of Product model data, *Product data exchange, *Configuration management, *National Institute of Standards and Technology, Computer aided acquisition and logistics support, Goals, Software engineering.

The paper outlines the development plan for a configuration management system at NIST. This system will control both document and software development for four organizations: the International Organization for Standardization (ISO), the IGES/PDES Organization (IPO), PDES, Inc., and the National PDES Testbed (NPT). The primary goal of configuration management is to provide an orderly framework within which the development of the STEP standard can take place. The paper provides an overview of configuration management, describes the procedural and technical issues that must be handled in developing a system, outlines the steps that will be taken to reach the goal and defines the deliverables and the resources needed.

National Inst. of Standards and Technology (NIST), Gaithersburg, MD. Center for Mfg. Engineering.
Workforce of U.S. Manufacturing in the Post-Industrial Era.

Final rept.
D. A. Swyt. 1988, 21p
Pub. in Technological Forecasting and Social Change 34, p231-251 1988.

Keywords: *Manufacturing, *United States, *Personnel, Forecasting, Personnel development, Vocational guidance, Analyzing, Reprints, *Labor force, Occupations, Training.

United States manufacturing is moving on a well-established trajectory of increased knowledge intensity represented by the rise in the proportion of its workforce in technical-professional occupations. Based on BLS data and a new analytical tool, the paper shows an 80-year linear trend in the evolution of the total workforce; establishes characteristic ages for 20 manufacturing sectors, including 1910 for autos and 2015 for computer equipment; and projects a rise of technical-professional workers in the next century to 50% of the workforce.

Productivity

Physics, Chemistry and Engineering in the 1990's. H. Hellwig. Apr 90, 45p NISTIR-90/4284

Keywords: *Physics, *Chemistry, *Engineering, *Research management, Management planning, Surveys, Trends, Technology, *National Institute of Standards and Technology.

During the past several years, the National Research Council (NRC) commissioned and published four surveys which are directly relevant to physical, chemical and engineering research. The report summarizes the considerable complexity of these surveys and facilitates the planning of research at the National Institute of Standards and Technology. The four surveys, their structure, concept and content are introduced and observations common to all four surveys are reported. Common observations include those on interdisciplinary linkages, 'new disciplines', the continuum of science and engineering, and the importance of instrumentation. The areas of application and the research opportunities in physics, chemistry and engineering, as seen by the respective surveys, are summarized. The report concludes with a listing of priority areas for research as recommended by the four NRC surveys.

Government's Role in Standards-Related Activities: Analysis of Comments.

W. G. Leight. Jul 90, 37p NISTIR-4367
See also PB90-207150.

Keywords: *United States, *Standards, *Standardization, National government, International standards, Certification, Hearings, *National Institute of Standards and Technology.

The National Institute of Standards and Technology, supported by a panel of standards experts from other agencies, conducted a hearing on April 3-5, 1990, to gather information, insights, and comments relating to improving U.S. participation in international standards-related activities and to possible Government actions. Oral presentations were made by 65 organizations and individuals; written submissions were received from 257 others. Thorough review of the hearing transcripts and the complete supplementary written record reveals a number of areas where the private sector and the Federal Government should take constructive actions, especially with respect to coordinating mechanisms for conformity assessment processes.

PB90-235250 (Order as PB90-235243, PC A06)
National Inst. of Standards and Technology, Gaithersburg, MD.

New Program and Directions at the National Institute of Standards and Technology.

Bi-monthly rept.
D. R. Johnson. 1990, 5p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n1 p1-5 Jan-Feb 90.

Keywords: *Research projects, Manufacturing, Standards, Trade, Organization charts, Technology transfer, *US NBS, *US NIST.

The Trade Act of 1988 created the National Institute of Standards and Technology (NIST) from the National Bureau of Standards (NBS). In addition to explicitly defining and reconfirming the traditional measurement services, the law assigned new responsibilities to NIST to assist U.S. industry in capitalizing on new technologies developed in the U.S. scientific and technical community at a faster rate. This article describes the new programs being established at NIST to comply with this mandate and the new organizational unit at NIST that brings together the traditional services and the new programs.

National Inst. of Standards and Technology, Gaithersburg, MD.

Technology-Based Economic Development: A Study of State and Federal Technical Extension Services.

Special pub. (Final).

R. E. Chapman, M. K. Clarke, and E. Dobson. Jun 90, 169p NIST/SP-786

Also available from Supt. of Docs. as SN003-003-03026-1. Prepared in cooperation with National Governors' Association, Washington, DC. Center for Policy Research and Analysis.

Keywords: *Economic development, *Technology innovation, *State government, *Technology transfer, Technical assistance, Promoting, Government policies, National government, Reviews, Surveys, Information services, Directories, *Small businesses, *Industrial development, *State programs.

The document reports on a study of state and federal technology extension services. The study was requested to capture information on the various programs the states are using to promote technological innovation. To date, no study of state economic development - technological innovation activities has focused on identifying those programs which reach out to provide technological assistance to businesses at the local level, or on the degree to which such programs make use of federal programs and activities in carrying out their missions. The study serves to document these activities as well as identify potential sources of synergism between the states and federal technology transfer programs. The purpose of the report is to summarize the study's major findings and to provide recommendations on the future federal role in technology extension. A two-pronged approach was used in carrying out the study. The first part of the study focused on an in-depth review of the literature on technology transfer and technology extension services. The second part of the study involved a nationwide survey of state and federal extension services.

Innovation: Analyzing the Process.

Final rept.

G. P. Lewett. 1985, 16p

Sponsored by Utah Innovation Center, Salt Lake City. Pub. in Proceedings of International Technical Innovation and Entrepreneurship Symposium (1st), Salt Lake City, UT., September 11-13, 1985, 16p.

Keywords: *Technology innovation, Research management, Technology transfer, Reprints, *Small businesses, *Entrepreneurship, ERIP(Energy Related Inventions Program), Commercialization.

The paper is based on findings and projections from operation of the Energy Related Inventions Program (ERIP) which is conducted by the Department of Energy (DOE) and the National Bureau of Standards (NBS). In ERIP, the Government role is to facilitate operation of the private sector-small business innovation process. While many major inventions have come from individuals and very small businesses, the general lack of credibility of the individual inventor and the very small business is a deterrent to potential supporters. ERIP is designed to counter this barrier. In addition, however, the program also serves as a 'test-bed.' That is, data are developed and insights gained as to significant factors involved in the overall national innovation process; activities are then initiated to stimulate and improve process operation. The presentation calls attention to this facet of ERIP, and to two specific areas in which activity could have a favorable impact on innovation.

Wind Tunnel Tests and Equivalent 1-Minute Loads for the Design of Cladding Glass.

Final rept.

E. Simiu, and E. M. Hendrickson. 1988, 10p

Pub. in Jnl. of Wind Engineering and Industrial Aerodynamics 29, n1-3 p49-58 1988.

Keywords: *Glass, *Design, *Wind pressure, Stress analysis, Loads(Forces), Strength, Mechanical properties, Estimating, Fracturing, Reprints, *Wind tunnel tests, *Wind loads.

Three methods for converting fluctuating wind loads to equivalent 1-minute constant loads have been proposed in the literature: (1) a method based on fracture mechanics models and nonlinear stress analysis, developed at the National Bureau of Standards; (2) a simplified method applicable to annealed glass that assumes a linear load-stress relationship; and (3) a simplified method that assumes a linear load-stress relationship and, in addition, that the glass strength is affected only by the peak wind pressure rather than by the whole time history of the load. The paper compares the three methods for estimating equivalent 1-minute wind loads and examines the effect on the estimates of assuming different distribution parameters of glass strength and different fracture mechanics parameters. The results suggest that the second of the above methods is adequate in most cases but that the third method yields equivalent 1-minute loads that are too low by about 15% for annealed glass and about 50% for heat strengthened glass.

Recent Improvements in Time-Domain EMC (Electromagnetic Compatibility) Measurement System.

J. W. Adams, A. R. Ondrejka, K. H. Cavcey, J. E.

Cruz, H. W. Medley, and J. H. Grosvenor. Nov 89,

27p NISTIR-89/3927

Sponsored by Army Aviation Systems Command, St. Louis, MO.

Keywords: *Electromagnetic compatibility, *Electromagnetic fields, *Aircraft, Power spectra, Electromagnetic radiation, Horn antennas, Graphs(Charts), Tests, Resonant frequency, Electric fields.

Improved techniques for determining critical resonant frequencies and the current response of internal wiring due to external fields for rotary-wing aircraft are given. The measurement method uses a train of low-level, radiated pulses. These do not disturb other spectrum users, nor do other spectrum users significantly disturb the measurements. The fields are low, a distinct advantage from both cost and personnel hazard standpoints. The problems that should be addressed before the full potential of the technique can be realized are discussed.

World Modeling for Sensory Interactive Trajectory Generation.

Final rept.

L. Kelmar, and R. Lumia. 1990, 8p

Pub. in Proceedings of International Symposium on Robotics and Manufacturing (3rd), Vancouver, Canada, July 18-20, 1990, 8p.

Keywords: *Models, Systems engineering, Manipulators, Algorithms, Reprints, *Trajectory control, *Robotics, Control systems, Computer vision, Sensory feedback.

A major consideration in the design of sensory interactive trajectory generation software for a Flight Telerobotic Servicer (FTS) is the availability and maintenance of a current model of the manipulator's world. The paper discusses the role of world modeling in support of trajectory generation and execution. The paper discusses the world modeling modules of a hierarchical control system which facilitate sensory interactive trajectories by decoupling and supporting the sensory and manipulator planning processes. It defines the types of information which should be included in the interfaces to the modules, as well as the modules' structure and function. Finally, it discusses the implementation and results of a particular sensory interactive algorithm performed in our laboratory.

Examination of Gamma-Irradiated Fruits and Vegetables by Electron Spin Resonance Spectroscopy.

Final rept.

M. F. Desrosiers, and W. L. McLaughlin. 1989, 4p

Pub. in Radiation Physics and Chemistry 34, n6 p895-898 Dec 89.

Keywords: *Fruits, *Vegetables, *Gamma irradiation, *Electron paramagnetic resonance, Irradiated foods, Electromagnetic radiation detection, Dosimetry, Reprints.

The electron spin resonance (ESR) spectra of the seeds, pits, shells, and skins of a variety of irradiated fruits and vegetables were measured. All spectra, control and irradiated, contained a single resonance with a g-factor of 2.00. Additional resonances due to Mn(2+) were observed for the drupelets of blackberries and red raspberries. An unusual radiation-induced radical

Food Technology

was observed for irradiated mango seed; however, the signal decayed completely within a few days. It was concluded that only in a few specialized cases could the ESR resonances observed be suitable for postirradiation monitoring or dosimetry.

000,021
PB90-254368 Not available NTIS
 National Inst. of Standards and Technology (NML), Gaithersburg, MD. Office of Standard Reference Materials.
NBS Standard Reference Materials for Validating Determinations of Micronutrients and Toxic Substances in Foods.
 Final rept.
 R. Alvarez. 1989, 3p
 Pub. in Nutrient Availability: Chemical and Biological Aspects, p66-68 1989.

Keywords: *Food analysis, *Food contamination, *Nutrients, Cholesterol, Vitamins, Trace elements, Quality control, Chemical analysis, Reprints, *Standard reference materials, *Toxic substances.

Instrumental methods for determining nutrients and potentially hazardous substances in foods and other biological materials have replaced older, time-consuming procedures. Because the instruments are usually calibrated with laboratory synthetic standards, the accuracy of the results depends on the reliability of the standards. If the constituents of interest and matrix components are of questionable purity, the analytical determinations, especially of micronutrients and hazardous constituents will be suspect. An independent method for validating analytical results is to use certified reference materials, such as those issued by the National Bureau of Standards as Standard Reference Materials. Examples of such SRMs include the recently characterized materials, wheat flour, (SRM 1567a) and rice flour (SRM 1568a), which are certified for nutrients and potentially toxic trace elements, and a fortified coconut oil (SRM 1563), which is certified for cholesterol and selected fat soluble vitamins.

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Mathematical Analysis Div.
Gylden Systems: Rotation of Pericenters.
 Final rept.
 A. Deprit, B. R. Miller, and C. A. Williams. 1989, 32p
 Pub. in Astrophysics and Space Science 159, p239-270 1989.

Keywords: *Celestial mechanics, Perturbation theory, Planetary orbits, Solar wind, Gravitation, Reprints, Canonical transformations.

A canonical transformation in phase space and a rescaling of time are proposed to reduce a Keplerian system with a time dependent Gaussian parameter to a perturbed Keplerian system with a constant Gaussian parameter. When the time variation is slow, the perturbation through second order in the reduced problem is conservative, and, as a result, the orbital space of the averaged system is a sphere on which the phase flow causes a differential rotation representing a circulation of the line of apsides. The flow presents two isolated singularities corresponding to circular orbits travelled respectively in the direct and in the retrograde sense, and a degenerate manifold of fixed points corresponding to the collision orbits. As an application, an estimate is offered for the apsidal rotation that a second order time derivative in the mass of the sun would induce on planetary orbits.

 Pub. in Proceedings of NASA Workshop Astrophysics from the Moon, Annapolis, MD., February 5-7, 1990, p647-653 1990.

Keywords: *Radio transponders, Microwave equipment, General relativity, Geodynamics, Tests, Reprints, Optical transponders, Earth rotation, Lunar bases, Lunar librations, Lunar orbits, Lunar tides, K band.

The location at a lunar base of an additional laser ranging retroreflector package and a tracking beacon would result in increased ranging accuracy through augmentation of the data rate and from more uniform coverage through the lunar cycle. However, an even more attractive approach would be to place a combination of small microwave and optical transponders on the moon. This could improve the lunar ranging accuracy by nearly two orders of magnitude and also simplify the measurements. The K-band microwave transponders would be operated at the lunar base and at two remote sites to permit much improved lunar libration and tidal displacement measurements. A two-wavelength laser transponder also would be operated at the lunar base so that accurate tropospheric propagation corrections can be made. This would make possible major improvements in measurements of the lunar orbit and of the Earth's rotation, as well as in tests of general relativity.

Nova Outburst Modeling and Its Application to the Recurrent Nova Phenomenon.
 W. M. Sparks, S. Starrfield, and J. Truran. Dec 85, 13p LA-UR-86-806, CONF-851272-1
 Contract W-7405-ENG-36
 Conference on RS Ophiuchi and the recurrent nova phenomenon, Manchester, England, 1 Dec 1985.

Keywords: *Novae, Calculation Methods, Hydrodynamics, Star Accretion, Star Evolution, Star Models, ERDA/640102.

The thermonuclear runaway (TNR) theory for the cause of the common novae is reviewed. Numerical simulations of this theory were performed using an implicit hydrodynamic Lagrangian computer code. Rele-

vant physical phenomena are explained with the simpler envelope-in-place calculations. Next the models that include accretion are discussed. The calculations agree very well with observations of common novae. The observational differences between common novae and recurrent novae are examined. We propose input parameters to the TNR model which can give the outburst characteristics of RS Ophiuchi and discuss the implications. This review is concluded with a brief discussion of two current topics in novae research: shear mixing on the white dwarf and Neon novae. 36 refs., 4 figs. (ERA citation 11:028651)

The nova outburst is the second most violent explosion that occurs in a galaxy. This review presents the recent observational and theoretical studies that have demonstrated that there exist two classes of nova outburst. One type of nova occurs on a CO white dwarf and the other type of nova occurs on an ONeMg white dwarf. The second class of outbursts are much more violent and occur much more frequently than the first class of outbursts. Hydrodynamic simulations of both kinds of outbursts are in excellent agreement with the observations. 51 refs. (ERA citation 12:012569)

 IAP recontre on nuclear astrophysics, Paris, France, 7 Jul 1986.

Keywords: *Dwarf Stars, Carbon, Helium, Hydrogen, Oxygen, *Pulsating Variable Stars, Star Evolution, Surfaces, ERDA/640102.

Recent observational and theoretical studies of the ZZ Ceti variables (DA degenerate dwarfs), the DBV variables (DB degenerate dwarfs), and the GW Vir variables (DO degenerate dwarfs) have shown them to be pulsating in nonradial g sup + -modes. The pulsation mechanism has been identified for each class of variable star and, in all cases, involves predictions of the stars envelope composition. The ZZ Ceti variables must have pure hydrogen surface layers, the DBV stars must have pure helium surface layers, and the GW Vir stars must have carbon and oxygen rich surface layers. 44 refs. Application of PN and Avalanche Silicon Photodiodes to Low-Level Optical Radiation Measurements.
 G. Eppeldauer, and A. R. Schaefer. Sep 88, 41p
 In NASA, Ames Research Center, Second Workshop on Improvements to Photometry p 111-151.

Keywords: Detectors, Light (Visible radiation), Optical measurement, *Photodiodes, Radiation measuring instruments, *Research facilities, Amplifiers, Design analysis, Silicon, Solid state, Silicon diodes, Avalanche diodes.

New approaches to the discovery of other planetary systems require very sensitive and stable detection techniques in order to succeed. Two methods in particular, the astrometric and the photometric methods, require this. To begin understanding the problems and limitations of solid state detectors regarding this application, preliminary experiments were performed at the National Bureau of Standards and a low light level detector characterization facility was built. This facility is briefly described, and the results of tests conducted in it are outlined. A breadboard photometer that was used to obtain stellar brightness ratio precision data is described. The design principles of PN and avalanche silicon photodiodes based on low light level measuring circuits are discussed.

area filling factor (f) occupied by these fields, refer to magnetic regions outside of spot umbrae. Attention is called to important trends emerging in the data that provide empirical constraints on acceptable dynamo theories: (1) B increases toward T sub eff and larger g such that B approximately = B sub eq = (δp IP sub gas) sup 0.5. Thus in the photosphere B is determined by the balance of magnetic pressure and the gas pressure, largely independent of the nature of the dynamo; (2) B and f are uncorrelated and fB is not a constant; (3) f does not depend on T sub eff; and (4) B is independent of stellar age, but f varies as t sup -0.6 for stars older than the Pleiades. This result is consistent with theoretical predictions of the angular momentum history of dwarf stars. It is concluded that decrease in activity with stellar age is due to the decrease in f as a star evolves.

Introduction to Blocked Impurity Band Detectors (Abstract Only).

J. Geist, Sep 88, 1p
In NASA, Ames Research Center, Second Workshop on Improvements to Photometry p 193.

Keywords: *Detectors, Impurities, Photomultiplier tubes, Spectral bands, Accuracy, Astronomy, Light (Visible radiation), Planets, Seismology, Stars.

Blocked impurity band detectors fabricated using standard silicon technologies offer the possibility of combining high sensitivity and high accuracy in a single detector operating in a low background environment. The solid state photomultiplier described by Petroff et al., which is a new type of blocked impurity band detector, offers even higher sensitivity as well as operation in the visible spectral region. The principle of operation and possible application of blocked impurity band detectors for stellar seismology and the search for extra-solar planets are described.

IUE's Legacy for the Future: The Final Archive and Goals for Its Implementation.

J. L. Linsky, and J. Nichols-bohlin. cJun 88, 5p
In Esa, Proceedings of the Celebratory Symposium on a Decade of Uv Astronomy with the Iue Satellite, Volume 2 p 391-395.

Keywords: *Data bases, *IUE, Spaceborne astronomy, Ultraviolet astronomy, Ultraviolet spectra, Data processing, Signal to noise ratios, Spectrum analysis, User requirements.

Requirements for the IUE archive, and how the signal/noise (S/N) ratio in photometrically corrected images can be enhanced considerably by cross-correlating the fixed pattern in a data image with that in a suitable flat-field image are described. From these cross-correlations it is feasible to derive an accurate geometrical correction to apply to the data image before applying the intensity transfer functions. The standard IUE processing software does not generate a sufficiently accurate geometric correction so that typical spatial errors of 1 to 2 pixels conspire with the large fixed pattern in raw images to produce significant misregistration noise. Tests on flat-field images demonstrate that an explicit geometric correction procedure can avoid most of the misregistration noise and can thereby improve the S/N ratio of IUE data by factors of 1.5 to 2.4.

Coronal Temperatures of Selected Active Cool Stars as Derived from Low Resolution 'Einstein' Observations.

Final rept.
O. Vilhu, and J. L. Linsky. 1990, 4p
Contract NSG5-986

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Advances in Space Research 10, n2 p139-142 1990.

Keywords: X ray spectra, Temperature, Reprints, *Cool stars, *Stellar coronas, HEAO 2.

Mean coronal temperatures of some active G-K stars were derived from Rev1-processed EINSTEIN-observatory's IPC-spectra. The combined X-ray and transition region emission line data are in rough agreement with static coronal loop models. Although the sample is too small to derive any statistically significant conclusions, it suggests that the mean coronal temperature depends linearly on the inverse Rossby-number, with saturation at short rotation periods. For an individual active star (VW Cep), the IPC-temperature was found to depend on the (variable) X-ray flux.

Ultraviolet Variability of HD 45166 (qWR+B8 V): Evidence for Stellar Wind Radiative Instabilities.

Final rept.
A. J. Willis, I. D. Howarth, D. J. Stickland, and S. R. Heap. 1989, 13p
Pub. in Astrophysical Jnl. 347, p413-425, 1 Dec 89.

Keywords: Ultraviolet spectra, Reprints, *HD 45166 star, *Stellar winds, *Wolf-Rayet stars, High resolution, Instability, IUE.

High-resolution IUE spectroscopy of the low-mass qWR star HD 45166, obtained at several epochs during 1980-1988, reveals a complex pattern of variability in its stellar wind emission lines, P Cygni profiles, and highly ionized photospheric absorption spectrum. The authors' most intensive observations, obtained during a 36 hr continuous run in 1988 February, show the presence of discrete absorption components (DACs) in the C IV wavelength 1550 resonance doublet. These DACs can blend to give the appearance of a well-developed P Cygni absorption profile seen at some other times, roughly doubling the column density of the ground state C(3+) ions in the wind.

Stability of Kuzmin/Toomre Discs.

Final rept.
J. Frank, and I. Shlosman. 1989, 4p
Contract NAGW-766

Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Astrophysical Jnl. 346, p118-121, 1 Nov 89.

Keywords: Stability, Reprints, *Stellar disks, Stellar envelopes.

The authors consider a simple two-component system consisting of a Kuzmin/Toomre disk embedded in a spherically symmetrical 'halo' with Plummer's density distribution. They examine analytically the bounds on the mass fraction of the disk component which result from applying the semiempirical criterion against bar instabilities due to Ostriker and Peebles, and compare their results with recent numerical simulations. They find that the locus $t = 0.14$, calculated using analytic approximations for a variety of rotation laws, agrees

reasonably well with the neutral stability line derived from numerical results.

Survey of the Radio Continuum Emission of RS Canum Venaticorum and Related Active Binary Systems.

Final rept.
S. A. Drake, T. Simon, and J. L. Linsky. 1989, 26p
Grant NGL-06-003-057

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Astrophysical Jnl. Supplement Series 71, p905-930 Dec 89.

Keywords: *Binary stars, *Radio sources(Astronomy), Surveys, Reprints.

The authors have observed 77 RS CVn and related active binary systems with the VLA (Very Large Array) at a continuum frequency of 4.86 GHz, and have detected 33 as radio sources above a typical (3 Sigma) threshold of 0.2 mJy. Combining their new data with other VLA 6 cm observations of these and similar systems, they bring the total number thus observed to 122, of which 66 were detected on one or more occasions. The authors have searched for correlations of the radio properties of these systems with various systemic and stellar parameters, e.g., orbital and rotational periods, rotational velocities, and with C IV and X-ray emissions, using a maximum-likelihood technique in order to include the radio upper limits in the correct statistical way.

IUE Observations of the M Dwarfs CM Draconis and Rossiter 137B: Magnetic Activity at Saturated Levels.

Final rept.
O. Vilhu, C. W. Ambruster, J. E. Neff, J. L. Linsky, A. Brandenburg, I. V. Ilyin, and N. I. Shakovskaya. 1989, 8p

Pub. in Astronomy and Astrophysics 222, p179-186 1989.

Keywords: *Dwarf stars, *Binary stars, Reprints, *CM Draconis star, *Rossiter 137B star, Pre-main sequence stars, M stars, Stellar flares, Stellar activity, Stellar magnetic fields, IUE.

The authors present IUE observations of two active M dwarfs, CM Draconis and Rossiter 137B, that they expect to be almost totally convective. CM Dra was also monitored optically during the IUE observations, and two flares were detected. CM Dra is a binary star (M4+M4, P=1.27d) and Rst 137B(M3-5) forms a physical pair with the rapidly rotating pre-main sequence K star AB Dor (HD 36705). The activity of CM Dra is due to the forced rotation in a close binary, while the authors suppose Rst 137B to rotate fast enough (due to its young age) to generate its magnetic activity.

Astrophysics

National Inst. of Standards and Technology (NML), Gaithersburg, MD. Molecular Spectroscopy Div. **Search for Methylene in the Orion Nebula.** Final rept. J. M. Hollis, P. R. Jewell, and F. J. Lovas. 1989, 5p Sponsored by National Aeronautics and Space Administration, Washington, DC. Pub. in *Astrophysical Jnl.* 346, p794-798, 15 Nov 89.

Keywords: *Interstellar matter, Chemical radicals, Rotational spectra, Microwave spectra, Radio astronomy, Reprints, *Orion Nebula, *Methylene radicals, Interstellar radiation.

The authors have conducted a deep search for the J = 4-3 and 5-4 fine-structure components of the N(KK) = 4(04)-3(13) rotational transition of methylene (CH₂) toward the hot core of the Orion-KL nebula. They detected an approximate sigma emission feature which is frequency-coincident with a hyperfine blend of the J = 4-3 component and observed weak features (approximate 2-3 sigma) frequency-coincident with the resolved F = 6-5 and 5-4 hyperfine components of the J = 5-4 component. The relative intensities of these spectral features and their observational repeatability suggest that assignment to interstellar CH₂ is likely correct, although the result must be confirmed. The authors also report new interstellar transitions of known interstellar molecules detected in the CH₂ search bandpasses: CH₃OH, CH₃CCH, SO₂, HCOOCH₃, C₂H₅CN, (CH₃)₂O, and an unidentified line at 68320 MHz toward Orion-KL as well as SiC₂, and CH₃CN toward IRC + 10216.

Pub. in *Proceedings of NASA Workshop on Relativistic Gravitation Experiments in Space*, Annapolis, MD., June 28-30, 1988, p80-88 1989.

Keywords: *Optical interferometers, Spaceborne detectors, Precision, Design, Reprints, *Gravitational waves, *Laser interferometers, Spacecraft instruments, Gravitational collapse.

The present design concepts for a Laser Gravitational-Wave Observatory in Space are described. Laser heterodyne distance measurements are made between test masses located in three spacecraft separated by roughly one million km. The major technology issues are: the reduction of spurious acceleration noise for the test masses; and the measurement of changes in the difference of the antenna arm lengths with high reliability. The science objectives are: to measure discrete sinusoidal gravitational wave signals from individual sources with periods of 1 second to 1 day, to measure the stochastic background due to unresolved binaries, and to search for gravitational wave pulses with periods longer than 1 second from possible exotic sources such as gravitational collapse of very massive objects.

Keywords: Mathematical models, Reprints, *Accretion disks, *Algal disks.

A brief review of various theoretical approaches to model accretion disks is presented. Emphasis is given to models that determine self-consistently the structure of a disk, together with the radiation field. It is argued that a proper treatment of the vertical structure is essential for calculating theoretical spectra to be compared with observations. In particular, it is shown that the hot layers above an accretion disk (sometimes called disk 'chromospheres' or 'coronae'), whose presence is indicated by recent UV observations of strong emission lines of highly ionized species, may be explained using simple energy balance arguments.

 National Inst. of Standards and Technology (NML), Boulder, CO. Quantum Physics Div. **Goals for the Application of High-Resolution X-ray Spectroscopy to the Diagnosis of Stellar Coronal Plasmas.** Final rept. J. L. Linsky. 1990, 17p Contract NASA-H-805318 Sponsored by National Aeronautics and Space Administration, Washington, DC. Pub. in *Proceedings of IAU Colloquium 115, High Resolution X-ray Spectroscopy of Cosmic Plasmas*, Cambridge, MA., August 22-25, 1988, p94-109 1990.

Keywords: *X ray spectroscopy, *Plasma diagnostics, Reprints, *Stellar coronas, High resolution, Electron density.

Examples are given of how high-resolution x-ray spectra may be used to determine the temperature and emission measure distributions, electron densities, steady and transient flow velocities, and location of active regions in stellar coronae. For each type of measurement, the author estimates the minimum spectral resolution required to resolve the most useful spectral features. In general, high sensitivity is required to obtain sufficient signal-to-noise to exploit the high spectral resolution. Although difficult, each measurement should be achievable with the instrumentation proposed for AXAF.

Einstein and Stellar Sources.

Final rept.
J. L. Linsky. 1990, 22p
Contract NAGW-766
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Proceedings of 'From Einstein to AXAF' Symposium, Cambridge, MA., December 13-15, 1988, p39-59 May 90.

Keywords: Extraterrestrial radio waves, X rays, Reprints, *Stellar coronas, Stellar radiation, Magnetic stars, X-ray sources, HEAO 2.

The major accomplishments of the Einstein Observatory concerning the coronae of nondegenerate stars of each spectral type are reviewed. Einstein was particularly productive in discovering coronal emission from nearly all types of stars, including pre-main sequence, main sequence, and certain classes of post-main sequence stars. The similarities and differences between the coronae of each type of star and the more familiar solar corona are highlighted. An unforeseen picture is now developing in which nearly all types of x-ray emitting stars have both hot thermal plasma and nonthermal electrons that are heated and accelerated by magnetic processes. This picture can explain in principle the stellar x-ray and radio emission, although the details of how magnetic fields lead to this emission differ substantially across the H-R diagram. AXAF is required to answer the many fundamental questions which Einstein observations have raised.

Transition from Red Giant to Planetary Nebula.

Final rept.
S. Kwok. 1990, 12p
Pub. in Proceedings of the Cambridge Workshop on Cool Stars, Stellar Systems and the Sun (6th), Seattle, WA., September 1989, p438-449 1990.

Keywords: *Planetary nebulae, *Stellar evolution, Reprints, *Red giant stars, Stellar envelopes.

Over the past decade, astronomers have come to realize that mass loss on the asymptotic giant branch (AGB) plays a significant role in the formation of planetary nebulae (PN). Characteristics of the circumstellar envelopes of AGB stars such as dust continuum emission and molecular line emissions have now been detected in PN. In the review, it is shown that the evolution from AGB to PN can be traced in a continuous infrared sequence. This sequence predicts properties of proto-PN which allow them to be identified.

Gravitational Radiation from the Galaxy.

Final rept.
D. Hils, P. L. Bender, and R. F. Webbink. 1990, 20p
Contract NAGW-822
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Astrophysical Jnl. 360, n1 p75-94, 1 Sep 90.

Keywords: *Binary stars, Extraterrestrial radiation, Reprints, *Gravitational waves, White dwarf stars, Black holes, Cataclysmic variables, Neutron stars.

The authors calculate the spectral flux of gravitational radiation incident on earth due to major binary compo-

nents in the Galaxy. Binary systems considered are the following: W UMa binaries, unevolved binaries, cataclysmic binaries, neutron star binaries, black hole-neutron star binaries, and close white dwarf binary systems. Tables of various useful quantities such as average gravitational wave luminosity, spectral space density, and energy spectral flux density, and gravitational wave strain amplitude are given.

Spectroscopic Orbic and Evolution of HD 128220, a System Containing an O Subdwarf.

Final rept.
I. D. Howarth, and U. Heber. 1990, 8p
Pub. in Publication of the Astronomical Society of the Pacific 102, n654 p912-919 Aug 90.

Keywords: *Binary stars, Stellar evolution, Reprints, *HD 128220 stars, Stellar mass ejection, Stellar orbits, Subdwarf stars, O stars, Radial velocity.

The authors present radial-velocity measurements for both components of the HD 128220 system, the only double-lined binary with a published orbit which has as one of its members a subdwarf O star. The authors also derive the mass of the G-giant primary, the distance to the system, and the radii and luminosities of the components (all with $\sin i$ dependences). The subdwarf characteristics are in good agreement with evolutionary calculations for a post-AGB star. The authors discuss the evolutionary history of the system in light of their results.

Unusual Infrared Line Profiles in the Post-Asymptotic Giant Branch Star HD 56126.

Final rept.
S. Kwok, B. J. Hrivnak, and T. R. Geballe. 1990, 4p
Pub. in Astrophysical Jnl. 360, n1 pL23-L26, 1 Sep 90.

Keywords: *Stellar spectra, Infrared spectra, Planetary nebulae, Stellar evolution, Reprints, *HD 56126 star, Stellar mass ejection, Stellar envelopes.

Brackett series lines with very broad inverted P Cygni and shell-like profiles have been detected toward the post-AGB star HD 56126. These profiles suggest that an active phase of mass loss has begun recently in this star. The star has had at least one previous episode of intense mass loss, attested to by its strong far-infrared emission. HD 56126 is also known for having a broad emission feature at 21 micrometers. The unidentified emission bands at 3.3 and 3.4 micrometers are also present in the spectrum of HD 56126, but the near-infrared spectrum provides little help in establishing the carrier of the 21 micrometer band.

Thermodynamic Property Formulation for Air. 2. Pressure and Density Estimation Functions for the Dew and Bubble Lines.

Final rept.
R. T. Jacobsen, W. P. Clarke, S. W. Beyerlein, M. Rousseau, L. J. Van Poolen, and J. C. Rainwater. 1990, 11p
Pub. in International Jnl. of Thermophysics 11, n1 p179-188 1990.

Keywords: *Air, *Thermodynamic properties, Dew point, Bubbles, Nitrogen, Oxygen, Argon, Reprints, Phase equilibrium.

As a companion to a new correlation for the thermodynamic properties of air in single-phase states, new values for the properties on the dew and bubble lines have been calculated. Phase equilibrium properties for air at low and moderate pressures were predicted from accurate equations of state for argon, nitrogen, and oxygen using extended corresponding-states (ECS) methods. For pressures near the critical pressure, property values were calculated using a modified Leung-Griffiths model for mixtures of argon, nitrogen, and oxygen. Available experimental data and newly predicted values have been used in developing new correlating functions for estimating density and pressure on the dew and bubble lines of air. Estimates of the accuracies of these correlations based upon comparisons of calculated properties to data from other sources are also included.

gence, Graphic arts, Pattern recognition, Reprints,
*Computer applications.

The title suggests an Artificial Intelligence approach to the use of computers in the fine arts. A powerful tutorial mechanism to use for computers to learn about art is the picture grammar, which allows large classes of compositional structures to be described to a computer by the scholar who has a deep understanding of the art works. A grammar has been developed and implemented to describe and analyze the compositional structure of the contemporary artist Richard Diebenkorn. With such grammatical instruction, the computer can analyze existing paintings, generate new ones of the same style, and provide a beginning to a computational theory of style.

Keywords: *Archaeology, Isotopic labeling, Europe, Lead isotopes, Spain, Chemical analysis, Beads, Reprints, *San Salvador Island, *Artifacts, Laboratory tests, Money.

Recent excavations at The Long Bay Site uncovered artifacts of European manufacture intermingled with native Indian artifacts. These include seven very small glass beads (and fragments of three others), a coin, a small metal buckle, a "D-ring", 32 sherds of melado ware, and two small sherds of white-glazed ware. Laboratory studies have been conducted to help determine the origins and dates of these artifacts. The glass beads are wire-wound and have an extremely unusual high-lead chemical composition. The coin is a billon blanca of Henry IV minted between 1471 and 1474. Both buckles were found to be lightly-leaded bronzes. The melado ware has a lead glaze, as do the white wares, although the latter also contain tin. All of the artifacts contain intentionally-added lead. Their isotope ratios spread over a range, but all are consistent with Spanish origins. The data indicate that the San Salvador artifacts were made in three locations within Spain.

Final rept.

H. R. Kase, and J. A. Tesk. 1989, 5p

Pub. in Dental Materials 5, p289-293 Sep 89.

Keywords: *Nickel, *Chromium, Elastic properties, Temperature, Reprints, *Dental alloys.

Dental porcelain are fused to metals at elevated temperatures. Therefore, the development of stress that affects the stability of porcelain-fused-to-metal systems may be influenced by the temperature dependence of the elastic constants of both materials. The sonic resonance technique was used to determine the elastic moduli for three nickel-based dental alloys. In addition to room temperature data, the temperature dependencies of the Young's modulus and the shear modulus were determined up to 600 C (873 K). The measured values for the resonant frequencies decreased with increasing temperatures, which resulted in correspondingly low moduli. The decrement of the elastic constants over the temperature range considered is less than 10%. The change of Poisson's ratio as a function of temperature for the alloys considered is presented in the paper.

Pub. in International Dental Jnl. 39, p247-252 1989.

Keywords: *Adhesives, *Dentistry, Inflammation, Reprints, *Biocompatible materials, Ferric compounds, Tooth extraction.

Previous studies have shown that sequential application of an acidified solution of ferric oxalate, N-phenylglycine, and PMDM (the reaction product of pyromellitic dianhydride and hydroxyethyl methacrylate) yields strong adhesive bonding of composite resins to both dentin and enamel. The purpose of the study was to evaluate clinical characteristics and biocompatibility of this system in human teeth scheduled for orthodontic treatment extraction. Controls were light-cured Scotchbond or ZOE in contralateral teeth. Evaluation criteria, which included clinical feasibility, patient acceptability, retention, margin aesthetics and human pulp response, were met. Within the 4-241 day observation periods, there was no postoperative sensitivity, pain, loss of retention, staining, or discoloration. All pulp responses (double blind pulp analysis including all teeth) were acceptable. With mean RDT (remaining dentin thickness) of 0.67 mm (sd 0.35 mm), all indicators of pulp inflammation (displacement, superficial response, deep response, etc.) averaged between none and slight, < 1 on a 0-4 scale.

A. Sugawara, H. Chohayeb, L. C. Chow, and S. Takagi. 1987, 1p

Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Jnl. of Dental Research 66, p296 1987.

Keywords: *Calcium phosphates, *Dentistry, *Acid bonded reaction cements, *Dental material, Fillers, Sealers, Reprints, *Root canal obturation.

A calcium phosphate cement (CPC) was examined for ability to provide effective obturation of root canals when used as a sealer-filler combination. Extracted human teeth were chemomechanically prepared and divided into four groups. Root canals were filled with either (1) CPC paste containing dicalcium phosphate anhydrous, (2) CPC containing dicalcium phosphate dihydrate, (3) gutta-percha points sealed with Grossman's cement (GC), or (4) GC alone. After filling, all specimens were kept in 100% humidity for 1 day, immersed in a calcium phosphate (CaPO₄) solution or distilled water at 37 C for 1 week, and then immersed in 1% Poly-R dye solution at 37 C for 1 week after which they were rinsed and sectioned in a buccal-lingual direction for microscopic examination. Extensive dye penetration from the apex into the material-canal wall interface was observed in (3) and (4). Specimens in (1) and (2) showed considerably less dye penetration, especially those aged in the CaPO₄ solution.

p1195-1197 1989.

Keywords: *Dental enamel, *Free radicals, Dosimetry, Ionizing radiation, Archaeology, Electron paramagnetic resonance, Reprints.

Mechanical instrumentation of enamel leads to the formation of long-lived free radicals that can be conveniently measured by electron paramagnetic resonance (EPR) spectroscopy. Powdered enamel tissue exhibited EPR signals remarkably similar to the radicals formed by ionizing radiation. The observations described lead to the conclusion that physical stress will induce a free-radical formation in dental tissues. The observations have significance for other areas of study such as dosimetry and archeological dating.

Final rept.

D. N. Misra. 1989, 9p

Sponsored by American Dental Association Health Foundation, Chicago, IL.

Pub. in Surfactants in Solution, v9 p425-433 1989.

Keywords: *Adsorption, *Dental materials, Isotherms, Dentin, Enamel, Polymerization, Reprints, *Hydroxyapatite, *Phenoxyacetic acid, *Trans cinnamic acid.

Adsorption characteristics of phenoxyacetic acid and trans-cinnamic acid were studied for two purposes: to explore whether polymerization is initiated, like that of N-phenylglycine, in a system containing a monomeric resin with an adsorbate-treated synthetic hydroxyapatite, and to investigate their role in a bonding procedure of restorative resin to dentin and enamel. The adsorption isotherm of phenoxyacetic acid is reversible (and Langmuirian) from absolute ethanol but is irreversible from benzene or methylene chloride. The isotherm of trans-cinnamic acid from methylene chloride is also irreversible. For both acids, the irreversible adsorption is exhaustive below a threshold concentration and is constant above it. The irreversibly adsorbed compounds may be completely washed off by excess

water or ethanol. At maximum adsorption the phenyl ring of the reversibly adsorbed molecules is presumably parallel to the apatite surface while that of the irreversibly adsorbed molecules is perpendicular with respect to the substrate. The adsorbate molecules in both configurations may be anchored to the surface primarily via hydrogen bonding with the carboxyl groups.

Transient and Residual Stress in a Porcelain-Metal Strip.
 Final rept.
 K. Asaoka, and J. A. Tesk. 1990, 7p
 Pub. in Jnl. of Dental Research 69, n2 p463-469 Feb 90.

Keywords: *Dental materials, Composite materials, Porcelain, Ceramics, Metals, Crack propagation, Residual stress, Cooling curves, Reprints, Temperature dependence, Solid-solid interfaces.

Porcelain-fused-to-metal (PFM) restorations may develop cracks during processing or in-mouth service if the relative physico-mechanical properties of the porcelain and metal are highly mismatched. A computer simulation of stress developed in a PFM beam was conducted. The simulation considers cooling from temperatures higher than the porcelain saggpoint. The results suggest that transient tensile stress at the porcelain alloy interface may result in cracks in the porcelain during cooling. Occlusal forces may set up stresses to cause cracking at the surface of the porcelain if the compressive residual stress is not high enough. PFM restorations with an alloy of high thermal expansion coefficient require rapid cooling; on the contrary, PFM restorations with the alloys of lower coefficients require slow cooling. A high cooling rate can make up for thermal expansion mismatches between the alloy and the porcelain up to 2×10 (sup -6)/C. Finally, the results indicated that curvature was not a sensitive indication of stress for a multimaterial beam when visco-elastic relaxation and high cooling rates are involved.

Adsorption of Zinc 3,3-Dimethylacrylate and 3,3-Dimethylacrylic Acid on Hydroxyapatite from Solution: Reversibility and Variability of Isotherms.
 Final rept.
 D. N. Misra. 1990, 11p
 Sponsored by American Dental Association Health Foundation, Chicago, IL.
 Pub. in Jnl. of Colloid and Interface Science 135, n2 p363-373, 15 Mar 90.

Keywords: *Dental materials, *Adsorption, *Isotherms, Solutions, Adsorbents, Entropy, Tensile strength, Reprints, *Acrylic acid/(zinc-salt)-dimethyl, *Acrylic acid/dimethyl, *Apatite/hydroxy, Resin matrix composites.

Adsorption of zinc 3,3-dimethylacrylate, a compound specifically prepared to act as a coupling agent between bone or tooth mineral and a prosthetic resin, was studied from ethanol onto synthetic hydroxyapatite at room temperature. The adsorption isotherms are irreversible and Langmuirian and vary with the volume of solution when the amount of adsorbent is kept constant. The adsorption remains constant if the same amounts of solute and adsorbent are used in different volumes of solution. Similar results were obtained for 3,3-dimethylacrylic acid adsorbed from dichloromethane solution. It may be deduced from their adsorptive behavior that it is an effective interaction of the solute and not the solvent with the adsorbed molecules that controls the adsorption equilibria. The adsorbed amounts of the salt or the acid at maximum adsorption, as derived from the Langmuir plots for different isotherms, remain constant for each adsorbate, but the heat terms are directly proportional to the volumes of the solution. The latter fact is explained by a simple analysis of the Langmuirian isotherm and the partition function of free translational motion of a molecule in a shared space. The tensile strength of a polymer composite containing hydroxyapatite as a filler is not affected whether the apatite is coated with the solutes or not.

Multidimensional Internal Setting Expansion of a Phosphate-Bonded Casting Investment Measured with Strain Gauges.
 Final rept.
 R. A. Engler, W. G. de Rijk, J. A. Tesk, and D. Morris. 1990, 6p
 Pub. in the Jnl. of Prosthetic Dentistry 63, n3 p353-358 Mar 90.

Keywords: *Dental materials, *Investment casting, *Phosphate coatings, Strain gages, Expansion, Setting time, Measurement, Reprints.

Strain gauges were used to determine the setting expansion of phosphate-bonded casting investments. The gauges were placed at the approximate site of the wax pattern. The isotropy of the expansion was evaluated with multidirectional strain gauges that measured the difference in expansion in two orthogonal directions. A large difference was found between the setting expansion measured externally (1% to 1.5%) and the method described here (0.01%). For casting rings lined with a nonasbestos layer, no statistically significant differences were found in the setting expansion parallel to the long axis of the ring and the expansion in the direction perpendicular to the long axis.

Cyclopolymerizable Monomers for Use in Dental Resin Composites.
 Final rept.
 J. W. Stansbury. 1990, 5p
 Pub. in Jnl. of Dental Research 69, n3 p844-848 Mar 90.

Keywords: *Dental materials, *Polymers, *Acrylates, Aldehyde polymers, Shrinkage, Cyclization, Polyether resins, Mechanical tests, Reprints, Monomers.

The simple reaction of conventional monofunctional acrylate monomers with paraformaldehyde has yielded a new class of difunctional monomers. The unique proximity of the double bonds within the compounds allows a facile cyclopolymerization to incorporate a cyclic ether structure into the polymer backbone. The external position of the acrylate esters means that the pendant groups can be varied for alteration of the physical properties of the monomers and the corresponding polymers. A series of the new monomers has been prepared and polymerized under dilute solution and bulk conditions to yield non-crosslinked and cross-linked polymers, respectively. The polymers exhibited high degrees of conversion and significantly reduced polymerization shrinkage, compared with polymers obtained from conventional diacrylate or dimethacrylate monomers. The combination of improved conversion to polymer with less contraction makes the monomers ideal candidates for use in dental resin composites.

Standard Reference Materials: Description and Use of a Precision Thermometer for the Clinical Laboratory, SRM 934.
 Special pub. (Final).
 B. W. Mangum, and J. A. Wise. Jun 90, 23p NIST/SP-260/113
 Also available from Supt. of Docs. as SN003-003-03021-0. Supersedes COM-74-50533.

Keywords: Temperature measurement, Precision, *Clinical laboratories, *Thermometers, *Standard reference materials, Enzymology, Calibration.

Because of the high sensitivity to temperature of many facets of the clinical laboratory, e.g., in enzyme reactions and in pH and blood gas analysis, there is a need for accurate temperature measurement and its control. In order to help satisfy these needs and to aid in getting a usable and accurate temperature scale into the clinical laboratory, the National Institute of Standards and Technology developed SRM 934. This is a precision thermometer that is calibrated at 0 C, 25 C, 30 C, and 37 C. The description, calibration, and the procedures for proper usage of this thermometer are discussed. This SP 260 supersedes SP 260-48 describing both SRMs 933 and 934. SRM 933 will no longer be issued by the SRM Program. The publication is the same as SP 260-48 with the exception that all references to SRM 933 have been removed.

Synthesis and Properties of a Polyfluorinated Prepolymer Multifunctional Urethane Methacrylate.
 Final rept.
 J. M. Antonucci, J. W. Stansbury, and S. Venz. 1990, 12p
 Pub. in Progress in Biomedical Polymers, p121-131 1990.

Keywords: *Methacrylates, *Polymers, *Dental materials, *Resins, Synthesis(Chemistry), Acid resistance tests, Composite materials, Fluorine organic compounds, Surface energy, Urethanes, Hydrochloric acid, Reprints, *Prepolymers, Hydrophobic materials.

The concept of using low surface energy resin binders, having solubility parameters far different from that of oral fluids, as a means of enhancing the intra-oral resistance of resin based dental materials led to the synthesis of a unique polyfluorinated prepolymer multifunctional methacrylate, (PFMA), which yields extremely hydrophobic composites of moderate strength. The study describes the synthesis and properties of an analogous poly-fluorinated prepolymer multifunctional urethane methacrylate, (PFUMA), which is also a low surface energy resin but with greater cohesive energy density than (PFMA). (PFUMA) was isolated in excellent yield from the reaction of 2-isocyanatoethylmethacrylate (IEM) and the same polyfluorinated prepolymer polyol, (PFP), used in the synthesis of (PFMA). Preliminary results indicate that composites based on (PFUMA) are stronger and almost as hydrophobic as those derived from (PFMA).

Keywords: *Dental materials, *Acid bonded reaction cements, In vitro analysis, Teeth, Calcium phosphates, Sealing compounds, Fillers, Microscopy, Dyeing, Water, Surface chemistry, Reprints, *Endodontics.

A calcium phosphate cement (CPC) was examined for its ability to seal the root canal when used as a sealer-filler. Extracted human teeth were divided into three groups. Root canals were filled with either CPC paste containing dicalcium phosphate anhydrous (group 1), CPC containing dicalcium phosphate dihydrate (group 2), or gutta-percha points sealed with Grossman's cement (group 3). After filling, all specimens were kept in 100% humidity for 1 day, immersed in a CaPO₄ solution or distilled water at 37C for 1 wk, and then immersed in 1% Poly-R dye solution at 37C for 1 wk, after which they were rinsed and sectioned longitudinally for microscopic examination. Specimens in groups 1 and 2, especially those aged in the CaPO₄ solution showed considerably less dye penetration than those in group 3. The good sealing ability of the CPC against dye penetration in vitro suggests that it may provide an adequate seal of the canal without a separate sealer.

Brushing Up on the History of Intermetallics in Dentistry.
 Final rept.

R. M. Waterstrat. 1990, 8p
 Sponsored by American Dental Association Health Foundation, Chicago, IL.
 Pub. in JOM, Jnl. of the Minerals, Metals, and Materials Society 42, n3 p8-14 Mar 90.

Keywords: *Dental materials, *Intermetallics, *Mercury amalgams, Silver alloys, Tin alloys, Mercury alloys, Dental caries, Fillers, History, Reprints.

Employing a silver-tin-mercury intermetallic to repair cavities may seem a little unusual, but intermetallics are quite common in dentistry, ranging from gold crowns to braces. Although the human mouth can be unfriendly territory for a brittle intermetallic alloy, dental amalgam has been around since 659 A.D., and its technology has been developed to the point where a filling can be expected to last 30 years or more.

Methacrylate Oligomers with Pendant Isocyanate Groups as Tissue Adhesives.
 Final rept.

G. M. Brauer, and C. Lee. 1990, 11p
 See also PB89-137533. Sponsored by National Inst. of Dental Research, Bethesda, MD.
 Pub. in Progress in Biomedical Polymers, p41-51 1990.

Keywords: *Dental materials, *Polymers, *Acid bonded reaction cements, Methacrylates, Isocyanates, Unsaturated organic compounds, Synthesis(Chemistry), Bones, Molecular weight, Thermal cycling tests, Dentin, Reprints, Prepolymers.

Oligomers containing pendant isocyanate groups and residual double bonds were synthesized from m-isopropenylidimethylbenzyl isocyanate (TMI) and/or 2-isocyanatoethyl methacrylate (IEM) and methacrylate or vinyl monomers. The compounds were characterized by physico-chemical means. Most of the oligomers are liquids at room temperature, stable in air, have a MW range from 1400 to 2600 and an isocyanate content from 5% to 18%. The compounds, especially those with TMI or IEM and TMI and methacrylate constituents dissolved in suitable solvents and yielded stronger, more permanent bonds to glutaraldehyde treated bone than other tissue adhesives. Thermocycling in water for one week between 5 C and 55 C did not decrease adhesion indicating that exposure to

water or thermal shock produced no deterioration of the bond. No correlation between bonding efficiency and -NCO content or increase in molecular weight could be established. Tensile adhesion of human dentin joined to composite restorative resins by means of the oligomers was similar to that of the best dental bonding agents.

Evaluation of Spiro Orthocarbonate Monomers Capable of Polymerization with Expansion as Ingredients in Dental Composite Materials.
 Final rept.

J. W. Stansbury, and W. J. Bailey. 1990, 7p
 Sponsored by National Inst. of Dental Research, Bethesda, MD.
 Pub. in Progress in Biomedical Polymers, p133-139 1990.

Keywords: *Dental materials, *Polymers, *Acid bonded reaction cements, Dentin, Polymerization, Free radicals, Synthesis(Chemistry), Shrinkage, Expansion, Carbonates, Unsaturated organic compounds, Reprints, Prepolymers.

An efficient synthesis of unsymmetrically substituted spiro orthocarbonate monomers has been devised and their ring-opening polymerization with a 2-3% expansion in volume was investigated. Various techniques for incorporating the spiro monomers into conventional dental composite resins were related to polymerization shrinkage and physical properties observed for these cured experimental systems. Depending on the formulation method, the addition of spiro orthocarbonates to conventional dental monomers yielded materials with significantly reduced polymerization contraction and dramatically improved adhesion. A strong correlation between the degree of polymerization shrinkage and the adhesive strength of the dental composite was apparent.

Lighting for Color Vision.
 Final rept.
 J. A. Worthey. 1988, 7p
 Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) - Optics, Illumination, and Image Sensing for Machine Vision II, v850 p38-44 1988.

Keywords: *Color vision, *Illuminating, Robots, Visual perception, Models, Reprints, *Computer vision, Metamerism.

Results concerning lighting for human color vision may apply to robot color vision as well. In humans, the spectral sensitivities of the R and G receptors show a large overlap, while that of the B receptors overlaps little with the other two. A color vision model that proves useful for lighting work, and which also models many features of human vision, is one in which the 'opponent color' signals are $T = R - G$, and $D = B - R$. That is, a 'red minus green' signal comes from the receptors with greatest spectral overlap, while a 'blue minus yellow' signal comes from the two with the least overlap. Using the model, the author finds that many common light sources attenuate red-green contrasts, relative to daylight, while special lights can enhance red-green contrast slightly. When lighting changes cannot be avoided, the eye has some ability to compensate for them. In most models of 'color constancy,' only the light's color guides the eye's adjustment, so a lighting-induced loss of color contrast is not counteracted. Also, no constancy mechanism can overcome metamerism--the effect of unseen spectral differences between objects. However, one can calculate the extent to which a particular lighting change will reveal metamerism.

 Sponsored by National Inst. of Justice, Washington, DC.
 Pub. in NIJ (National Institute of Justice) Guide 100-87, 26p Feb 89. Available from National Criminal Justice Reference Service, Washington, DC. 20531.

Keywords: *Combat uniforms, *Protective clothing, *Body armor, Police, Performance evaluation, Survival clothing, Reprints.

The guide provides information to assist police in the selection of body armor to provide full-time protection throughout a full shift of duty. Data are provided to demonstrate the effectiveness of body armor in protecting police. Specific weapon threats are related to ballistic protection and the six armor type classifications included within the voluntary national performance standard for police body armor, NIJ Standard-0101.03. The National Institute of Justice effort to develop an armor suitable for full-time use is described and information is provided to acquaint the reader with the factors that are important to the performance and wearability of body armor. The use and maintenance of police body armor are discussed, as are the service life of armor and administrative considerations.

Daylighting and Thermal Performance of Roof Glazing in Atrium Spaces.
 Final rept.
 G. Gillette, and S. Treado. 1988, 11p
 Sponsored by Department of Energy, Washington, DC., and American Architectural Mfrs. Association, Des Plaines, IL.
 Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions 94, pt1 p826-836 1988.

Keywords: *Roofs, *Window glazing, *Daylighting, Interior lighting, Skylights, Thermal analysis, Performance evaluation, Architecture, Fuel consumption, Heat transfer, Reprints, *Energy conservation, Energy efficiency.

The effect of large areas of roof glazing in atrium spaces is assessed using site energy and peak demand loads as performance measures. Special attention is given to the role daylighting plays in the net performance of the glazing system. A detailed thermal transport and daylighting analysis computer program provided data on three aspects of roof glazing performance: the effects of the atrium alone, the atrium and its surrounding daylighting zone of influence, and the atrium and the coupled building as a whole. The results are presented in terms of comparative performance using a base case building configuration without glazing. The net change in performance due to the inclusion of the roof glazing is systematically evaluated. The results demonstrate the benefits of roof glazing on reducing the lighting energy requirements, and in turn, reducing site energy. These benefits, however, are tempered somewhat by the increased peak demand loads.

Ventilation and Air Quality Investigation of the Madison Building, Phase 1 Report.
 A. K. Persily, and W. S. Dols. Dec 89, 38p NISTIR-89/4219
 Sponsored by Department of Energy, Washington, DC.

Keywords: *Ventilation, *Office buildings, *Air circulation, Air flow, Safety engineering, Environmental engineering, Contaminants, Carbon monoxide, Radon, *Library of Congress, *Indoor air quality, HVAC systems, Indoor air pollution.

The National Institute of Standards and Technology (NIST, formerly the National Bureau of Standards) is conducting a long-term study of ventilation and air quality in the Madison Building of the Library of Congress. NIST is conducting continuous measurements of whole building air exchange rates, as well as periodic measurements of local ventilation characteristics and indoor levels of carbon dioxide, carbon monoxide, respirable particulates, radon and radon progeny, and volatile organic compounds. During the first phase of the study, NIST measured whole building air exchange rates, local air exchange characteristics, and indoor concentrations of carbon dioxide and carbon monoxide. The report presents the techniques used to make these measurements and the results that have been obtained as of September 1989. The results indicate that the whole building air exchange rate is relatively constant over time and that the ventilation air is well distributed throughout the building.

Suprathreshold Visibility Meter to Directly Assess the Conspicuity of Office Tasks.
 Final rept.
 G. T. Yonemura, and K. Lister. Jan 90, 33p NISTIR-89/4226
 Sponsored by Department of Energy, Washington, DC. Building Services Div.

Keywords: *Office equipment, *Visibility, *Illuminating, Interior lighting, Visual perception, Thresholds(Perception), Light(Visible radiation), Measuring instruments, Human factors engineering.

An apparatus and methodology for evaluating the relative difficulty of visibility related office tasks are described. The methodology differs from current evaluation techniques in that tasks are assessed in the laboratory as seen in the real world. The contrast of a reference task (5-bar grating) is varied until the conspicuity (how well the detail stands out from the background) is perceived to be equal to that of the sample task presented simultaneously. Data using typical alphanumeric materials encountered in commercial activities are presented. The investigation indicates that the apparatus and methodology give a good indication of the relative difficulty of real world sample tasks. Procedures for calibrating the task evaluators or the inclusion of a criterion correction factor in order to minimize differences in absolute values between evaluators are recommended.

Numerical Method for Calculating Indoor Airflows Using a Turbulence Model.
 T. Kurabuchi, J. B. Fang, and R. A. Grot. Jan 90, 123p NISTIR-89/4211
 Prepared in cooperation with Tokyo Univ. (Japan). Faculty of Engineering.

Keywords: *Air flow, *Ventilation, *Numerical analysis, *Turbulence, Mathematical models, Navier-Stokes equation, Convection, Flow distribution, Heat flux, Temperature, Pressure.

The report describes a numerical method for simulating indoor air flows in a building using a k-e turbulence method. The model treats three dimensional non-isothermal turbulent flows using the Boussinesq approximation for buoyancy. It solves the resulting nonlinear system of momentum, energy and turbulence equations by an explicit time marching technique to obtain a solution to either a steady state or transient flow. An upwind/central combination scheme with arbitrary specification for the switching parameter is used to approximate the convective terms. This switching parameter can be specified at each point in the flow regime allowing for different strategies in different flow regions. The switching technique includes both the central and hybrid schemes found in the literature. A pressure relaxation method is used to satisfy the Poisson equation for continuity. The model handles a variety of flow, pressure, temperature and heat flux boundary conditions including prescribed inflows, outflows by either prescribing the flow or pressure, wall boundary conditions together with heat flux and temperature and/or heat transfer coefficients specified on the boundary. Volumetric heat sources can also be included. The model has the ability of handling an arbitrary number of obstacles in the flow region.

Environmental Evaluation of the Portland East Federal Office Building Preoccupancy and Early Occupancy Results.
 R. A. Grot, A. Persily, A. T. Hodgson, and J. M. Daisey. Apr 89, 29p NISTIR-89/4066
 Prepared in cooperation with Lawrence Berkeley Lab., CA. Indoor Environment Program. Sponsored by General Services Administration, Washington, DC.

Keywords: *Office buildings, *Ventilation, *Contaminants, Air flow, Air filters, Airborne wastes, Public health, Radon, Organic compounds, *Indoor air pollution, *Sick building syndrome, Air quality standards, Portland(Oregon).

The report describes the results of the preoccupancy and early first year occupancy tests of the Portland East Federal Building. The National Institute of Standards and Technology installed a diagnostic center in the newly constructed federal office building in Portland, OR. The diagnostic center was used to determine the building's air infiltration and ventilation rates, the building envelope lightness, interzone air movement, and the levels of indoor contaminants. The indoor contaminants measured included carbon dioxide, carbon monoxide, respirable particulates, formaldehyde, radon and volatile organic compounds.

 Sponsored by Department of Energy, Washington, DC. Office of Buildings and Community Systems, and Civil Engineering Lab. (Navy), Port Hueneme, CA.
 Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions, v91 pt1B p752-765 1985.

Keywords: Ventilation, Air circulation, Computerized simulation, Reprints, *Space HVAC systems, *Building systems, MODSIM program.

A detailed simulation of a large HVAC system is described. The simulation is intended to demonstrate the capabilities of a new modular simulation program, MODSIM, which has been developed as part of a building system simulation package. The system chosen for the demonstration is a multizone air handler serving two zones. The system is a typical HVAC sub-system and is large enough to demonstrate the capability of MODSIM to carry out detailed simulation of complete building systems under complex operational conditions. Three simulations are presented which demonstrate the system performance during a simplified morning startup situation for different control methods.

Model of a Simple Fan-Resistance Ventilation System and Its Application to Fire Modeling.

J. H. Klotz, and L. Y. Cooper. Sep 89, 37p NISTIR-89/4141
Sponsored by David Taylor Research Center, Bethesda, MD.

Keywords: *Ventilation, *Air circulation, *Fires, Fans, Air conditioning equipment, Mathematical models, Ducts, Intake systems, Smoke, Air flow, Blowers, *Building fires.

The paper describes the model FANRES for predicting transport through a simple fan-resistance ventilation system. The system consists of a fan and a duct with a single inlet and outlet. The fan characteristics in the range of normal fan operation and the duct resistance are assumed to be known and specified. Also assumed to be specified are the pressure and density of the environment, and relative elevation local to the two system end-points. The model predicts the system flow rate for arbitrary end-point conditions and can be used to provide an estimate of flow rate even when end-point environments lead to fan operation in the potentially unstable high-head-pressure region of small-positive-flow and small-back-flow. While the model described here is useful generally in the simulation of flow dynamics in facilities with simple heating ventilating air conditioning (HVAC) systems, its development was motivated by the need to predict the effects of HVAC systems on compartment fire environments. In particular, the FANRES model was developed for use in zone-type, multi-room compartment fire computer models.

Life-Cycle Costing for Energy Conservation in Buildings: Instructor's Guide.

Final rept.
R. T. Ruegg. Aug 89, 179p NISTIR-89/4129
Sponsored by Department of Energy, Washington, DC. Assistant Secretary for Conservation and Renewable Energy.

Keywords: *Public buildings, *Design standards, *Cost analysis, Service life, Architecture, Fuel consumption, *Federal buildings, *Energy conservation, Energy economics, Life-cycle cost, Curriculum.

An Instructor's Guide for an intensive 2-day course on how to use life-cycle costing and related economic methods to make cost-effective decisions in designing and retrofitting Federal buildings for energy conservation. The Guide provides an overview of the course; an agenda; learning objectives; daily detailed lesson plans; exercises and problems with solutions, and paper copies of slides used in the course. The course combines theory with application to teach engineers, architects, and other building professionals how to design and size independent and interdependent building systems for cost effectiveness, allocate a budget among competing projects for maximum net savings, and make decisions under uncertain conditions. Two computer programs for evaluating economic performance are taught in the course.

J. B. Fang, and R. A. Grot. Mar 90, 35p NISTIR-90/4258
Sponsored by Department of Energy, Washington, DC. Office of Buildings Energy R and D.

Keywords: *Buildings, *Thermal measurements, *Heat loss, *Walls, *Thermal resistance, Calorimeters, Fuel consumption, Heat transmission, Model tests, Thermal conductivity, Design standards, Energy efficiency, Energy conservation.

The construction details of a mobile test facility with removable walls and roof used for installation and performance evaluation of the test specimens are described. Descriptions of the overall performance of a newly developed portable calorimeter employed for quantification of the heat flow through exterior walls of a building corner are given. Laboratory tests were conducted using an in-situ thermal resistance measurement technique to evaluate the performance of thermal bridges occurring in a metal-frame, insulated wall construction. The local heat flow rates and thermal resistances under steady-state conditions were measured by means of portable calorimeters, heat flux transducers and thermistors at various locations of the test structure. The measured wall thermal resistance values were compared with the predicted values obtained by the zone and the series/parallel resistance methods. The calorimeter measurement generally gave lower thermal resistance values than the heat flux transducers due to enhanced heat conduction through highly conductive fasteners and framing members.

Fire Experiments of Zoned Smoke Control at the Plaza Hotel in Washington DC.

J. H. Klotz. Feb 90, 76p NISTIR-90/4253
Sponsored by American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA., Bell Atlantic Telephone Co., Arlington, VA., New Jersey Bell Telephone Co., Newark, NJ Fire Administration, Emmitsburg, MD., and Department of Veterans Affairs, Washington, DC.

Keywords: *Fire tests, *Hotels, *Fire protection, *Smoke, *Ventilation, Residential buildings, Fire safety, Fires, Combustion products, Air circulation, Air flow, Mathematical models, Temperature, Experimental data, Pressure gradients.

A series of full-scale tests were conducted to evaluate the current approach to zoned smoke control systems with and without stairwell pressurization. Smoke movement and the performance of smoke control systems were studied with smoke generated from unsprinklered wood fires, sprinklered wood fires, and smoke bombs. As expected, the zoned smoke control system

prevented smoke migration beyond the fire floor. The minimum pressure difference approach to achieve smoke control for zoned smoke control systems was evaluated. The minimum pressure difference approach is based on a tacit assumption of a constant mass flow rate into the zone where the fire is located. To evaluate the assumption, a model was developed for mass flow in the smoke zone. Agreement between experimental results and calculations based on the model was good.

Measurements of Ventilation Rates and Ventilation Effectiveness.

Final rept.
A. K. Persily, and R. A. Grot. 1985, 11p
Pub. in Proceedings of International Symposium on Recent Advances in Control and Operation of Building HVAC Systems, Trondheim, Norway, May 22-23, 1985, p53-63.

Keywords: *Office buildings, *Ventilation, *Flow measurement, Air flow, Measurement, Intake systems, Environmental engineering, Efficiency, Reprints, *Indoor air quality, Energy conservation, HVAC systems.

The ventilation of office buildings has taken on increased importance due to concerns about energy conservation and indoor air quality. Tracer gas techniques have been developed to measure whole building ventilation rates. These measurements have revealed that in many buildings intentional ventilation is similar in magnitude to unintentional air leakage through the building envelope. In some buildings the net ventilation rates are lower than recommendations for minimum outside air intake levels based on ASHRAE Standard 62-1981. Also, due to variations in internal air distribution, specific areas within buildings are ventilated at lower rates than the whole building average. The concept of ventilation effectiveness or efficiency has been developed to quantify air distribution. Ventilation efficiency has been studied in laboratory facilities, but its measurement in actual office buildings requires special procedures.

Post Occupancy Evaluation of Federal Buildings - The Portland Federal Building and Others.

A. I. Rubin. Apr 90, 179p NISTIR-4307
Sponsored by Public Buildings Service, Washington, DC.

Keywords: *Evaluation, *Design, *Public buildings, *Office buildings, Commercial lighting, Ventilation, Office equipment, Acoustics, Human factors engineering, *Indoor air quality, *Thermal comfort.

The report presents an evaluation of the working conditions at the 'old' and new Portland Federal Building, occupied by the Bonneville Power Administration. Assessments were made by questionnaires filled out by employees, and interviews with operational and facility management personnel. Other federal buildings were examined to obtain supplementary information. Interviews were conducted with facility management personnel at the Department of Labor, the Treasury Department, the General Services Administration and the Office of Personnel Management (OPM). A limited questionnaire survey was conducted at OPM. Some of the buildings examined were new ones, while others were being retrofitted. A summary of 'lessons learned' is included, in addition to evaluations of the buildings examined.

Rating Procedure for Mixed Air-Source Unitary Heat Pumps Operating in the Heating Mode.
P. A. Domanski. May 90, 15p NISTIR-90/4298
See also PB89-193247. Sponsored by Department of Energy, Washington, DC. Office of Buildings and Community Systems.

Keywords: Standards, *Residential buildings, Ratings, Capacity, *Heat pumps, Air conditioners, Efficiency, Evaporators, Mathematical models, *Heating, Fans, *Air source heat pumps.

A procedure is presented for determining the heating performance ratings of air-source unitary heat pumps consisting of an outdoor section and an indoor section which were not tested together as a system. The procedure allows calculation of capacity at the 47 F rating point and heating seasonal performance factor, HSPF, using as a reference point performance ratings of the outdoor unit tested under current DOE procedures in conjunction with a different indoor section. The procedure requires as input data the matched system rated performance, the ratio of condensing capacities of mixed and matched indoor coils, and the ratio of powers of mixed and matched indoor fans.

High Technology Office Evaluation Survey: A Pilot Study.
A. I. Rubin. Jun 90, 69p NISTIR-4354
Sponsored by Public Buildings Service, Washington, DC.

Keywords: *Office buildings, *Workplace layout, *Human factors engineering, Noise reduction, Acoustics, Furniture, Design, Office equipment, Commercial lighting, Interior decorating, Air quality, Lighting systems, Thermal comfort, Workstations.

The report provides insights about how offices and workstations are planned and designed in the private and public sectors. Among the issues explored are the quality of the workplace, the effects of technology on design, space allocations, and systems furnishings. The data were collected by a detailed questionnaire survey, administered with the cooperation of the Corporate Architects Committee of the American Institute of Architects (AIA). The respondents were designers and facility managers of major corporations and governmental agencies with broad planning experience and major design responsibilities. The sample is a limited one, including only twenty-two respondents, therefore the findings are indicative of current design practices and experiences. The survey was designed to cover a broad range of topics and provide the opportunity to comment freely about them. As a result, much of the data is in narrative form.

Experimental Study on the Performance of a Combination Appliance for Domestic Hot Water and Space Heating.
S. T. Liu, G. E. Kelly, and C. P. Terlizzi. Aug 90, 32p NISTIR-4356
Sponsored by Department of Energy, Washington, DC.

Keywords: *Space heaters, *Water heaters, *Gas appliances, Heating equipment, Thermal efficiency, Gas heating, Space heating, Performance evaluation, Hot water heating, Heat load, Experimental data.

A Type II combination appliance consisted of a 50-gallon gas-fired water heater and a fan-coil air handling unit was tested in the laboratory to evaluate different methods for the determination of the combined heating seasonal, non-heating seasonal efficiencies and combined annual efficiency. Laboratory tests were conducted in accordance with the ASHRAE/ANSI Standard 103-1988R for boilers and the DOE 10 CFR 430 for domestic water heaters to obtain the steady state and heating seasonal efficiencies of the water heater functioning as a space heating boiler and the energy factor of the heater functioning as a domestic water heater. These efficiency values were used to compute the combined heating seasonal and non-heating seasonal efficiencies by two different calculation methods. A series of tests with part load space heating cycling combined with domestic hot water draws were also conducted to measure the combined efficiencies directly. Comparison of the measured heating seasonal efficiency with those obtained from the two proposed calculation methods showed very good agreement. Recommendation was made to adopt the NIST developed calculation method for the rating of the combination appliance.

Ventilation Characterization of the Consumer Product Safety Commission Combustion Test Chamber Facility.

Final rept.
W. S. Dols. Sep 90, 23p NISTIR-4415
Sponsored by Consumer Product Safety Commission, Washington, DC. Directorate of Engineering Science.

Keywords: *Space heaters, *Test chambers, *Ventilation, Gas heaters, Methane, Kerosene, Air pollution, Exhaust gas, Air flow, Test facilities, *Indoor air pollution, Tracer techniques, Air quality.

The Consumer Product Safety Commission (CPSC) is evaluating pollutant emissions from kerosene and methane heaters using a test chamber. Under an inter-agency agreement with CPSC, the Indoor Air Quality and Ventilation Group of the National Institute of Standards and Technology (NIST) measured the air exchange rate of the chamber under various ventilation system operating conditions, the extent of air mixing within the chamber, and the interior volume of the chamber. The air exchange rate of the chamber was determined using the tracer gas decay method with sulfur hexafluoride as the tracer gas. Carbon dioxide was also used as a tracer gas in order to verify the decay rates obtained with the SF₆ system; however CO₂ could not be used during combustion tests. The effect of pollutant monitoring systems and combustion devices⁵ on air exchange rates was also examined. Based on multi-point concentration measurements during decays, the extent of mixing within the chamber appeared to be adequate to employ the single-zone tracer gas decay method. The interior air volume of the chamber was determined using the constant injection tracer gas technique and yielded a volume very close to the volume based on the physical dimensions of the chamber. Recommendations for an air exchange rate measurement system for the chamber and modifications to be made in order to more effectively utilize the system are made.

Pub. in Proceedings of Conference on Thermal Insulation: Materials and Systems, Dallas, TX., December 2-6, 1984, ASTM STP 922, p541-566 1987.

Keywords: *Residential buildings, *Heating load, *Cooling load, *Thermal insulation, Walls, Thermal radiation, Construction materials, Framed structures, Masonry, Thermal analysis, Computerized simulation, Reprints, *Building materials, Energy consumption, Energy conservation, Energy models.

The space heating and cooling loads for a typical house and a high-solar-gain house containing partition walls and interior furnishings are simulated using a computer program called the Thermal Analysis Research Program (TARP). Separate computer runs are carried out for the following wall constructions: insulated wood frame, insulated masonry with mass on the exterior, and insulated masonry with insulation sandwiched between interior and exterior mass. The reductions in annual space heating and cooling loads achieved in typical houses with masonry wall construction compared with identical houses with lightweight wood-frame wall construction are derived as a function of five climates. Insulation credits for energy conservation standards to account for reductions in space conditioning loads for masonry houses are investigated. The presence of interior mass features was observed to cause the typical house to approach a 'static high-mass limit' that coincided with steady-state theory. Under such a condition, wall mass was found to have a small effect on annual space heating and cooling loads.

Simultaneous Measurements of Infiltration and Intake in an Office Building.

Final rept.
A. K. Persily, and L. K. Norford. 1987, 15p
Sponsored by Department of Energy, Washington, DC.
Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning) Transactions, v93 pt2 15p 1987.

Keywords: *Office buildings, *Measuring instruments, *Air flow, *Ventilation, Leakage, Air intakes, Fans, Heating load, Cooling load, Reprints, *Air infiltration.

Tracer gas decay measuring techniques exist to determine whole building air exchange rates. The paper presents two new measuring techniques to determine simultaneously both the amount of air exchange due to intentional outdoor air intake and the amount due to uncontrolled envelope infiltration. One of these techniques was applied to a new office building as a demonstration of the procedure, and to investigate the air exchange characteristics and mechanical ventilation system performance in this particular building. Using a tracer gas measuring technique in combination with multithermistor airflow-rate measuring systems, intake and infiltration rates were measured under a range of weather conditions and outdoor air intake rates. The results indicate that the outdoor air intake rates for this building are often well below their design values, a significant percentage of the net air exchange rate of the building is due to envelope leakage, and the amount of envelope leakage is dependent primarily on the outdoor air intake rate.

3D Piping IGES Application Protocol, Version 1.0.
M. E. Palmer, and K. A. Reed. Sep 90, 253p NISTIR-4420
Sponsored by Naval Sea Systems Command, Washington, DC., and Department of Defense, Washington, DC.

Keywords: *Piping systems, *Design criteria, Pipes(Tubes), Supports, Distribution systems, Marine engineering, Risers, Manifolds, *Computer aided design, Computer applications, Protocol(Computers).

The 3D Piping IGES Application Protocol (AP) specifies the mechanisms for defining and exchanging 3D piping system models in IGES format. The AP defines three-dimensional arrangement data of piping systems which includes definition data types of geometry (shape and location), connectivity, and material characteristics. The scope of this AP includes only piping system data and not drawings or internal details of equipment. The specified piping model is sufficiently detailed to support the fabrication and final assembly of a piping system. IGES is designed to support a broad range of applications and information, and it is recognized that few implementations will support all of the specification. An application protocol defines a logical subschema of the IGES specification, the usage of the subschema, and the necessary benchmarks for testing implementations. The 3D Piping IGES Application Protocol is the first IGES AP to be delivered to industry and is an important example for the development of STEP (Standard for the Exchange of Product Model Data) application protocols.

Risk Exposure and Risk Attitude of Homeowners in Fire Protection Investment Decisions.

S. K. Fuller. Dec 89, 83p NISTIR-89/4212
Keywords: *Fire detection systems, *Benefit cost analysis, *Risk, *Residential buildings, Fire protection, Economic analysis, Fire alarm systems, Sprinkler systems, Computer applications, Smoke detectors, Analytic hierarchy process.

The report demonstrates that the Analytic Hierarchy Process (AHP) is a promising decision tool for evaluating fire protection systems for homeowners. The study

explores how to include in the decision-making process information on an individual's risk exposure and risk attitude, information which is generally difficult or impossible to quantify. By differentiating between risk exposure and risk attitude, the application goes beyond the AHP's conventional treatment of risk. The AHP is applied to the choice of purchasing smoke detectors, a sprinkler system, or a combination of the two. Two hypothetical cases are assumed, one in which the homeowner is risk-taking and has lower-than-average risk exposure, and one in which the homeowner is risk-averse and has higher-than-average risk exposure. Subjective probabilities of fire, death, injury, and property loss are merged with more easily quantifiable benefit and cost criteria. A method of pairwise comparisons provides the data to calculate priority vectors for the fire protection alternatives.

Automated Maintenance Management Program Part 2: The Integration of Databases and Image Processing Results for the Quantitative Assessment of the Exterior Condition of Metal Buildings.
L. J. Kaetzl, J. W. Martin, and M. M. Hocker. Jan 90, 39p NISTIR-89/4179
See also PB88-192448.

Keywords: *Maintenance management, *Buildings, Decision making, Steel structures, Organic coatings, Algorithms, *Image processing, *Computer applications, Data base management systems, File structures.

The establishment of an automated system for assessing the exterior condition of structures can provide facility managers with an important tool for making decisions. The integration of different forms of knowledge into a coherent system provides the fundamental basis for an expert system. The system can reduce the time required to analyze and interpret information, and provides a historical record of the rate of failure for building structures. The report discusses the feasibility of establishing an automated maintenance management program for making maintenance decisions using computer image processing to obtain quantitative results database technologies and the design and structure of the database for condition assessment are discussed. Image acquisition, processing, storage, and retrieval of images of a water tower are presented as a case study.

Cigarette Ignition of Soft Furnishings.
Final rept.
R. G. Gann, R. H. Harris, J. F. Krasny, R. S. Levine, and H. E. Miltner. 1989, 10p
Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p77-86 1989.

Keywords: *Ignition, *Furniture, *Flammability testing, Tobacco, Flammability, Fire tests, Combustion, Heat transfer, Reprints, *Cigarettes.

Changes in the propensity of cigarettes to ignite upholstered furniture and bedding could reduce fire losses significantly. The paper describes fundamental and empirical studies of the effect on ignition propensity of varying cigarette characteristics. Reduced tobacco density, circumference and paper porosity were especially effective. Energy transfer from the cigarette to the substrate was measured and relationships between cigarette combustion behavior and ignition propensity were explored. Using these data, computer modeling of the cigarette on a substrate manifested key features of the ignition process. A fully-documented technical report is available.

Furniture Flammability: An Investigation of the California Technical Bulletin 133 Test. Part 1. Measuring the Hazards of Furniture Fires.
J. G. Quintiere. Jul 90, 30p NISTIR-4360
See also Part 2, PB90-257692 and Part 3, PB90-257700.

Keywords: *Furniture, *Fire hazards, Measurement, Ignition, Carbon dioxide, Materials, Smoke, Improvement, Flashover.

The hazards due to furniture fires are examined. These include ignition of an adjoining item, flashover, CO toxicity, and reduced visibility as a result of smoke. Theoretical analyses are given to quantify the hazards, and typical parametric values are given for several materials representative of a range of fire performance. Results are presented in terms of conditions at the flame tip, at the onset of flashover, and for a ventilation-limited fire. Critical hazard measurements are identified, and an illustration is given on how to characterize the hazards.

Furniture Flammability: An Investigation of the California Bulletin 133 Test. Part 2. Characterization of the Ignition Source and a Comparable Gas Burner.
T. J. Ohlemiller, and K. Villa. Jun 90, 42p NISTIR-4348
See also Part 1, PB90-256850 and Part 3, PB90-257700.

Keywords: *Ignition, *Furniture, *Flammability testing, Sources, Gas burners, Heat flux, Upholstery, Temperature measurement, Smoke, Comparison, Reproducibility, Chairs.

The California Bulletin 133 upholstery ignition source is based on the use of crumpled newsprint. The present work examined the reproducibility of several aspects of the source when placed on an inert chair mock-up. The tendency of the source to heat the side arms of a chair, the area of the seat back subjected to high heat fluxes, the peak flux there and the flux duration all showed substantial variability. For inherently lesser variability a gas burner is preferred. A gas burner, derived from that developed at the British Fire Research Station, was shaped so as to deposit a similar pattern of heat to that of the CB 133 source. The two sources were tested for comparability both on chair mock-ups and on full-scale chairs made from a wide variety of materials.

See also PB90-256850 and PB90-257692. Prepared in cooperation with California State Dept. of Consumer Affairs, North Highlands. Bureau of Home Furnishings and Thermal Insulation.

Keywords: *Chairs, *Flammability testing, *Ignition, Fabrics, Foam, Sources, Gas burners, Heat flux, Oxygen consumption, Temperature measurement, Calorimeters, Correlation, Fiberglass.

Ten sets of upholstered chairs were obtained. One chair out of each set was tested in the ASTM room, two chairs out of each set were tested in the furniture calorimeter, and four chairs in the different sets varied only in the type of fabric, type of foam, and whether or not there was a fiberglass interliner present. Some of the chairs were ignited with the standard TB133 newspaper ignition source. The rooms were instrumented to measure the total heat release rate of the chairs by oxygen consumption. It was found that (1) similar results were obtained in the TB133 and ASTM rooms, (2) a total heat release rate of 65 Kw in either of the rooms or in the furniture calorimeter was equivalent to the failure criterion of a 111 deg C (200 deg F) temperature rise 25 mm below the ceiling and directly above the burning chair in the TB 133 test and (3) below 600 kW the heat release rates of the chairs measured in the rooms were the same as those in the furniture calorimeter. The combinations of fabric, fiberglass interliner and foam were also tested in the Cone calorimeter.

Evaluation of Exit Signs in Clear and Smoke Conditions.

B. L. Collins, M. S. Dahir, and D. Madrzykowski. Aug 90, 79p NISTIR-4399

Keywords: *Visibility, *Visual perception, *Optical density, Doors, Luminance, Contrast, Color, Smoke, *Exit signs, *Direction signs, Emergency lighting.

The paper provides a short review of the research literature on the visibility of exit signs, directional markings, and emergency lighting. It also presents a study which assessed the visibility of several types of exit signs including conventional and electroluminescent (EL) signs in both clear and smokey conditions. A two-part evaluation was performed. In the first, signs were measured photometrically in clear conditions with two different photometers in a laboratory to determine their luminance under dark conditions and with an ambient room illumination of 54 lx (5 fc). Analysis of these data indicated very wide variations in luminance as a function of sign type. In the second part of the study, the visibility of the signs in both clear conditions and smoke was assessed psychophysically. A total of 21 observers participated in the assessment of visibility. Analysis of the data indicated that overall sign luminance was one of the primary determinants of visibility in smoke conditions, while uniformity was also an important contributor. The data indicated that some EL signs can be effective in clear conditions and in smoke.

Guide Specifications and Reference Specification System.

R. G. Mathey, and J. R. Clifton. Jun 89, 79p NISTIR-89/4094
Sponsored by Naval Facilities Engineering Command, Alexandria, VA.

Keywords: *Design standards, *Construction industry, *Engineering standards, *Cost effectiveness, *Quality assurance, Project planning, Materials specifications, Construction management, Systems management, Management methods.

Guide specifications enable faster, more efficient, and cost-effective preparation of construction project specifications. By editing guide specifications instead of writing new requirements for each project, the produced construction project specifications are also generally of higher and more consistent quality, and should lead to less disputes and litigation. Established national specifications are referenced in guide specifications and this technique has proven extremely effective in communicating material, product, system, and construction requirements. Reference specifications are also used for workmanship standards. Decision rules were developed to assist in the selection of the most appropriate reference specifications. Tiering of referenced documents in guide specifications was assessed with regard to the volume of reference material that the contractor and contract administrator must study and act upon to comply with the terms of the contract. Recommendations on ways to improve Navy guide specifications and to resolve issues dealing with selection of reference documents and with their tiering are presented.

Roles of the National Bureau of Standards in Quality Assurance in Buildings and Other Construction. Final rept.

G. Frohnsdorff, and J. R. Clifton. 1984, 14p
Pub. in Proceedings of Quality Assurance Conference, Dallas, TX., July 18-20, 1983, 14p 1984.

Keywords: *Construction industry, *Quality assurance, Performance standards, Mechanical tests, Quality control, Safety engineering, Design standards, Inspection, Construction materials, *Building technology, *National Institute of Standards and Technology.

Since its founding, the National Bureau of Standards (NBS) has provided technical bases for the national physical measurement system and for much of the measurement system considered in broader terms. In building technology, NBS develops methods of measurement in the areas of structures, building materials, building physics, and building equipment, and proposes performance tests and criteria which, through acceptance by committees of voluntary consensus standards organizations such as ASHRAE and ASTM, may become national standards. These standard measurement and test methods are an essential part of quality assurance systems for buildings and other structures. They support quality assurance at all stages of the building cycle. NBS staff members in the Center for Building Technology work closely with other organizations in the building community to share their research results and maintain awareness of the measurement needs.

EXPOSURE80A: A Computer Program Version of NFPA 80A.

R. L. Smith. Jul 90, 49p NISTIR-4372
Sponsored by Air Force Engineering and Services Center, Tyndall AFB, FL.

Keywords: *Fire protection, *Building codes, Fire prevention, Fire safety, Safety engineering, Exposure, *Computer applications.

The report describes a computer program, EXPOSURE80A, written in Symbolics Common Lisp, that leads the user through NFPA 80A: Recommended Practice for Protection of Buildings from Exterior Fire Exposures. EXPOSURE80A is designed for use by fire protection professionals. It tells the user whether two buildings comply with the recommendations of NFPA 80A and if they do not, it suggests changes that will bring the buildings into compliance. EXPOSURE80A is easier to use than the written version of NFPA 80A since an understanding of 80A is not required. The approach used in EXPOSURE80A provides valuable information about the knowledge required of the user and the appropriate interface for the targeted class of users of an expert system, EXPOSURE, which is described in a separate report.

 National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Building Technology. **Development of Thermal Envelope Design Guidelines for Federal Office Buildings.**
 A. K. Persily. Oct 90, 87p NISTIR-4416
 Contract GSA/PBS-87-03
 Sponsored by Public Buildings Service, Washington, DC.

Keywords: *Office buildings, *Design standards, Leakage, Construction materials, Thermal analysis, Design, Roofs, Walls, Windows, Thermal insulation, *Thermal envelopes, *Energy efficiency, *Energy conservation, *Federal buildings.

Office building envelopes are generally successful in meeting a range of structural, aesthetic and thermal requirements. However, poor thermal envelope performance will occur when there are discontinuities in the envelope insulation and air barrier systems, such as thermal bridges and air leakage sites. These discontinuities result from designs that do not adequately account for heat, air and moisture transmission, with many thermal defects being associated with inappropriate or inadequate detailing of the connections of envelope components. Despite the existence of these thermal envelope performance problems, information is available to design and construct envelopes that do perform well. In order to close the gap between available knowledge and current practice, the Public Buildings Service of the General Services Administration has entered into an interagency agreement with the Center for Building Technology of the National Institute of Standards and Technology to develop thermal envelope design guidelines for federal office buildings. The goal of the project is to transfer the knowledge on thermal envelope design and performance from the building research, design and construction communities into a form that will be used by building design professionals. The report describes the NIST/GSA envelope design guidelines development at the end of the first year of effort on the project.

 Final rept.
 J. G. Gross, and R. G. Kammer. 1990, 7p
 Pub. in Construction Specifier 43, n9 p92-94, 96, 98, 100-101 Sep 90.

Keywords: *Building codes, *Regulations, *Construction industry, United States, International trade, Standards, Construction materials, Market research, Commerce, Competition, Reprints, *European Community, Certification.

The article provides information on the rapidly changing global market for construction products and services. Particularly, the unification of the European Community and activities in the development of the EC 92 internal market are discussed. Standards development processes in the United States and internationally are reviewed. The importance of standards as the basis for regulation and commerce makes these activities extremely important for the U.S. design profession and building product producers. Related testing, certification and product approval requirements are reviewed. Recommendations for the U.S. construction community are provided.

 Final rept.
 H. E. Marshall. 1989, 8p
 Pub. in Jnl. of CIB 17, n6 p342-349 Nov/Dec 89.

Keywords: *Buildings, *Investments, *Economic analysis, Decision making, Risk, Simulation, Benefit cost analysis, Return on investment, Reprints, Life cycle costs.

Traditional economic methods—life-cycle costing, benefit-to-cost ratio, net benefits analysis, adjusted internal rate of return, and discounted payback—are described for evaluating building decisions about accepting or rejecting a given building investment, the economically efficient design or size of a building, and the economically efficient combination of projects competing for a limited budget. Appropriate applications for each method are described. Technically correct formulas for the methods are presented. These economic methods are often applied using 'best-guess' estimates of project input variables as if they were certain estimates. Techniques are described that to some extent account for uncertainty in input variables and in some cases risk exposure and risk attitude. The techniques are conservative benefit and cost estimating, sensitivity analysis, the risk-adjusted discount rate, mean-variance criterion, coefficient of variation, decision analysis, simulation, mathematical/analytical technique, and portfolio analysis. Advantages and disadvantages of each are described. Guidance is provided for selecting the appropriate technique for any given investment problem.

 Final rept.
 D. M. Burch, R. R. Zarr, and B. A. Licitra. 1988, 16p
 Sponsored by Department of Energy, Washington, DC. Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions, v94 pt1 p125-140 1988.

Keywords: *Masonry, *Walls, *Heat transfer, *Dynamic response, Calorimeters, Heat measurement, Transfer functions, Diurnal variations, Energy dissipation, Performance evaluation, Reprints.

A masonry wall, having known heat transfer properties, was installed between the metering and climatic chambers of a calibrated hot box (CHB). Time-dependent excitation functions, including a sol-air diurnal cycle, a four-harmonic diurnal cycle, a step function, and a triangular pulse were generated in the climatic chamber. The metering chamber was maintained at a typical indoor condition and was used as a calorimeter. The transient heat transfer rate at the inside surface of the wall specimen at hourly time steps was determined from an energy balance of the metering chamber. The measured specimen heat transfer rate determined for each of these excitation functions was compared with good agreement to predicted values using an analytical model. For each of the excitation functions, empirical transfer function coefficients (TFCs) for the masonry wall were determined by curve fitting the measured specimen heat transfer rate. The empirical TFCs derived from the diurnal cycle tests successfully predicted the specimen heat transfer rate for the other excitation functions. However, these sets of TFCs were not unique and differed from those obtained from an analytical model.

Keywords: *Fire tests, *Chemical laboratories, *Sprinklers, Sprinkler systems, Burning rate, Fire protection, Temperature, Experimental data.

A series of fire tests in typical chemical laboratories was conducted in order to address the use of quick

response sprinkler technology. For each test, the performance of an automatic sprinkler system in extinguishing a fire originating in an acetone spill was evaluated. The test parameters included standard sprinklers with exposed steel piping, quick response sprinklers with exposed steel piping, quick response sprinklers with exposed plastic piping, quick response sidewall sprinklers and no sprinklers. Measurements of air temperature and the concentration of oxygen, carbon monoxide and carbon dioxide were taken. A free burn test was conducted to characterize the heat release rate of the initial items ignited.

 S. Davis, J. R. Lawson, and W. J. Parker. Oct 89, 46p NISTIR-89/4191
 Sponsored by Carpet and Rug Inst., Dalton, GA., American Fiber Mfrs. Association, Washington, DC, and American Textile Manufacturers Inst., Washington, DC.

Keywords: *Standards, *Flammability testing, *Carpets, Ignition, Combustion, Fire tests, Flame propagation, Air flow, Experimental data, Floor coverings, *ASTM E 648.

The research program investigated the variability of the ASTM E 648 Standard with respect to carpets and to make recommendations for revising the standard to improve the repeatability and reproducibility of the measured results. Several ignition sources and procedural variations were studied to assure that flame propagation away from the point of ignition would occur if the critical radiant flux of the carpet was less than the maximum flux from the panel. This resulted in the replacement of the propane torch point source pilot burner by a propane line burner. A coefficient of variation study was carried out to select one carpet for a parametric study of the test variables. As a result of the parametric study and a subsequent 'proficiency round,' recommendations were made to ASTM Committee EO5 on Fire Standards for revision of ASTM E 648. The most significant changes were the use of the line burner for ignition and a tighter control of the air flow through the chamber.

 Final rept.
 J. F. Krasny, R. H. Harris, R. S. Levine, and R. G. Gann. 1989, 38p
 Pub. in Jnl. of Fire Science 7, n4 p251-288 Jul/Aug 89.

Keywords: *Flammability testing, *Ignition, *Furniture, Tobacco, Fire tests, Upholstery, Fire prevention, Bedding equipment, Reprints, *Cigarettes.

The paper describes some of the results of a two-and-a-half year, Congressionally-mandated effort to identify cigarettes with properties that would reduce their propensity to ignite soft furnishings (upholstered furniture and mattresses). For this purpose, the ignition propensities of 41 specially designed and 5 patented cigarettes were investigated. Several of these experimental cigarettes were found to have considerably lower ignition propensities than current commercial cigarettes. These cigarettes combined low tobacco content (attained by low packing density and low cigarette circumference), and low paper permeability and citrate content. Some of these low ignition propensity cigarettes had tar, nicotine, and CO yields comparable to large-selling commercial brands. The five patented cigarettes also exhibited considerably lower ignition propensity than commercial cigarettes.

Experiments of Piston Effect on Elevator Smoke Control.

Final rept.
J. H. Klote, and G. T. Tamura. 1987, 12p
Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions 93, pt2 p2217-2228 1987.

Keywords: *Elevators(Lifts), *Smoke, *Fires, *Fire tests, Smoke abatement, Numerical analysis, Experimental data, Buildings, Safety engineering, Fire protection, Reprints.

The transient pressures produced when an elevator car moves in a shaft are a potential problem for elevator smoke-control systems. This piston effect can pull smoke into a normally pressurized elevator lobby. The paper presents the results of piston effect experiments under smoke-control conditions. The results of a theoretical analysis and those of the experiments are in good agreement. For most elevators the piston-effect problem can be overcome by designs that prevent smoke from being pulled into elevator lobbies, and equations for the amount of pressurization air needed to accomplish this are presented.

Setting Time and Strength to Concrete Using the Impact-Echo Method.

Final rept.
S. P. Pessiki, and N. J. Carino. 1988, 11p
Pub. in ACI Materials Jnl. 85, n5 p389-399, 10 Sep 88.

Keywords: *Concretes, *Compressive strength, *Setting time, *Impact tests, *Echoes, Monitors, Measurement, Nondestructive tests, Reprints, Impact-echo method, P waves.

Tests were performed to evaluate the feasibility of using the impact-echo method to determine setting time and to monitor strength development of concrete. In the impact-echo method, the test object is subjected to point impact and the surface displacement is monitored at a point adjacent to the impact. From the measured displacement waveform and the thickness of the object, the P-wave velocity is determined. A strong correlation was found between the time of initial setting of mortars sieved from the concrete, as determined by penetration resistance (ASTM C 403), and the time when the P-wave velocity began to increase. Two approaches for using the impact-echo method to define the setting time of concrete are presented. Tests were performed to examine the relationship between P-wave velocity, as determined by the impact-echo method, and the compressive strength of concrete. At early ages (up to about 3 days at standard temperature), the relationship was independent of curing temperature and water cement ratio. It is concluded that the impact-echo method is a promising nondestructive technique for monitoring the development of mechanical properties in concrete from initial setting to ages of several days.

Rational Development of Bench-Scale Fire Tests for Full-Scale Fire Prediction.

Final rept.
V. Babrauskas, and U. Wickstrom. 1989, 10p
Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p813-822 1989.

Keywords: *Fire tests, *Flammability testing, *Standards, Calorimeters, Flames, Flammability, Fires, Heat measurement, Furniture, Upholstery.

National standards for flammability have, in most countries, been established for many years. Thus, they are based on an understanding of fire physics which may be several decades old. In more recent times, however, significant strides have been made in developing test methods which are based on an improved understanding of building fires. The best-possible estimate of the flammability of building products or contents would be, by definition, a full-scale fire experiment. These are recently being standardized, and will serve an important reference function. Because of cost and practical difficulties, however, it is generally desirable to do the majority of product evaluations by bench-scale tests. In the paper the rational bases for achieving validated bench-scale tests for flammability are examined, and a number of recent examples are cited where such a process has been followed. It is also shown that these test results have a current relationship to the full-scale phenomena.

Effect of Temperature and Stress on the Time-to-Failure of EPDM T-Peel Joints.

Final rept.
J. W. Martin, E. Embree, and D. P. Bentz. 1987, 8p
Pub. in Durability of Construction Materials, v3 p1310-1317 1987.

Keywords: *Glued joints, *Stresses, Construction materials, Elastomers, Seams(Joints), Accelerated tests, Ethylene copolymers, Roofing, Weibull density functions, Reprints, Ethylene propylene diene polymers, Temperature dependence, Time dependence, Time to failure.

Creep-rupture experiments were conducted on adhesively bonded EPDM T-peel seams to determine the sensitivity of the time-to-failure distributions to temperature and mechanical stress. Experimental results indicate that time-to-failure distributions are very sensitive to mechanical stress, but not temperature. That is, at a given temperature, as mechanical stress increases, the time-to-failure distributions decrease. However, at a given stress, changes in temperature do not cause a significant change in the time-to-failure distributions, except at the lowest experimental stress level where an increase in temperature may result in an increase in the times-to-failure. The increase at the lowest experimental stress, is due to the formation of fibers between separating seam piles. The change in failure mode at the lowest experimental stress level may limit the use of temperature and stress as acceleration factors.

Thermodynamic Aspects of Concrete Durability.

Final rept.
P. W. Brown. 1987, 8p
Pub. in Pore Structure and Construction Materials Properties, v1 p363-370 1987.

Keywords: *Concretes, Construction materials, Thermodynamic equilibrium, Durability, Deterioration, Freezing, Porosity, Sulfates, Corrosion, Leaching, Acid resistance, Carbonation, Alkali aggregate reactions, Reprints.

The major deterioration processes affecting the durability of concrete are discussed with regard to thermodynamic driving forces. The driving forces are considered in terms of the phase equilibria that determine the conditions under which deterioration processes may occur. The deterioration processes that are considered include: freezing of pore solutions, sulfate attack, acid attack and leaching, carbonation, the alkali-silicate reaction and corrosion. The constraints associated with limiting the number of components in the multi-component systems necessary to rigorously consider the deterioration processes are discussed in detail.

Investigation of the Effects of a Stratified Two Layer Environment on Fire Plume Temperatures.

Final rept.
D. Evans, and J. Morehart. 1987, 6p
Pub. in Proceedings of ASME-JSME Thermal Engineering Joint Conference, Honolulu, HI., March 22-27, 1987, p381-386.

Keywords: *Fire tests, *Temperature measurement, *Plumes, *Boundary layer flow, Experimental data, Mathematical models, Temperature measuring instruments, Jet flow, Ceilings(Architectural), Heat transfer, Fire protection, Fire detection systems, Sprinkler systems, Reprints.

A layer of gas at elevated temperature accumulates below the ceiling of a room during a fire. This layer affects fire plume and ceiling jet flows, heat transfer to the ceiling material, and ultimately detector (suppression system) response time. The paper experimentally examines the effects of a stratified warm gas layer on plume flow temperatures originating from a source located in an ambient lower layer. Measurements of spatial distributions of temperature at steady state are presented for a confined 1.2 m diameter cylindrical ceiling configuration. Encouraging agreement is found between experimental temperature measurements and predictions by two existing models for describing temperatures in this two layer environment.

Manual for the Cement Hydration Simulation Model.

Technical note (Final).
L. Struble, S. Johnson, M. Hartmann, L. Kaetzel, and H. Jennings. Sep 89, 129p NIST/TN-1269
Also available from Supt. of Docs. as SN003-003-02972-6. Prepared in cooperation with Illinois Univ. at Urbana-Champaign, North Carolina State Univ. at Raleigh, and Northwestern Univ., Chicago, IL.

Keywords: *Portland cements, Computerized simulation, Hydration, Mathematical models, Manuals, Graphic methods, Computer systems programs, Construction materials, Calcium silicates, National Institute of Standards and Technology, Tricalcium silicate.

The manual describes the Cement Hydration Simulation Model, a computer-based model developed in the Building Materials Division of the Center for Building Technology, National Institute of Standards and Technology (NIST). The model simulates microstructural changes during hydration of tricalcium silicate, the principal constituent of portland cement. Output of the model may be in the form of two- or three-dimensional images, showing the location and size of each constituent. The model is written in FORTRAN 77. It is interactive and modular. The model is installed on a super-mini computer at NIST, which can be accessed by

other, suitably configured computers. The manual provides documentation, instructions, and examples of input and output using the model.

 Grant 70NANB5H0551
 Prepared in cooperation with Maryland Univ., College Park. Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Fire tests, *Ceilings(Architecture), *Jets, *Unsteady state, Temperature measurement, Velocity measurements, Jet flow, Theses, Numerical analysis, Fires, Experimental data.

An extensive study of small-scale, unconfined, fire-induced ceiling jets was conducted under ceiling transient and steady state conditions. Detailed velocity and temperature measurements of the ceiling jet were made simultaneously using the cross-correlation velocimetry technique from the start of the fire until the ceiling reached steady state. Velocity and temperature profiles were obtained at several radial locations away from the plume impingement point. These measurements were made for transient and steady ceiling jet conditions in the case of the H=1.0 m. All the transient measurements in the H=0.5 m case were limited to temperature measurements. At steady state, however, both temperature and velocity measurements were obtained.

Experimental Investigation of Glass Breakage in Compartment Fires.
 Master's thesis.
 M. J. Skelly. Jun 90, 92p NIST/GCR-90/578
 Grant 60NANB-8-D0829
 Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Window glass, *Fire tests, *Breaking, Thermal stresses, Test facilities, Experimental data, Fires, Buildings, Temperature.

An experimental investigation has been completed which studied the breaking of window glass by fire. Experimental data was collected from two test groups: the first for windows with their edges insulated from the fire (edge-protected) and the second for windows uniformly heated by the fire (edge-unprotected). Results of the edge-protected window tests indicated that the glass breakage was caused by a critical temperature difference between the central heated portion of the pane and the glass edge, which was approximately 90C. When breakage occurred, the cracks spread throughout the glass, joined together and caused at least partial collapse of the pane. Results from the edge-unprotected window tests were quite different. There were relatively few cracks developed and almost no propagation across the glass. Consequently, there was no window collapse in any of these cases.

 Grant 60NANB-8D0848
 Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Fire Research.

Keywords: *Window glass, *Fires, *Thermal analysis, Thermal stresses, Mathematical models, Thermal conductivity, Heating, Heat transfer.

Windows break in fires due to thermal stress from the differential heating of the central portion and the shaded edge. The paper determines the surface temperature history of the glass. Typical property values suggest the range of 50 C-100 C for the breaking temperature. Here the transient, one-dimensional (into the glass normal to the pane), inhomogenous (in-depth radiation absorption) energy equation is solved using an innovative Laplace Transform technique suggested by

Baum. Time varying incident radiative flux and the glass temperatures are included. These equations are solved numerically by using the trapezoidal rule for numerical integration and Newton-Raphson's method for determining the roots of nonlinear equations. Results are presented for typical values of the governing dimensionless parameters.

Report of the CIB W14 Workshop on Fire Modeling (4th); Conseil International du Batiment (CIB) Commission W14 on Fire.
J. G. Quintiere. Jun 90, 83p NISTIR-4338
Proceedings of a workshop held in Gaithersburg, MD on February 12-14, 1990.

Keywords: *Fires, *Models, *Buildings, *Workshops, Flammability, Finishes, Algorithms, Mathematical models, Fire safety, Standards, Fire resistance.

A summary of presentations are presented for the 4th Conseil International du Batiment (CIB) Workshop on Fire Modeling. The scope of the presentations, 47 in number, include reports of recent developments and applications of zone and field models, presentations on specific phenomena needed by computer algorithms, and presentations on the subject of interior finish flammability. The Workshop showed that a variety of models are in international use, that data is lacking to confirm the accuracy of the models for applications beyond their base of development, and that it is becoming evident that the fire growth hazard of interior finish materials can be predicted from small scale test data.

Fundamentals of Enclosure Fire 'Zone' Models, 1989.
Final rept.
J. G. Quintiere. 1989, 21p
See also PB89-176168.
Pub. in Jnl. of Fire Protection Engineering 1, n3 p99-119 Jul/Aug/Sep 89.

Keywords: *Fires, *Models, *Enclosures, Buildings, Vents, Air flow, Mathematical models, Reprints, *Conservation equations.

The conservation laws are presented in control volume form and applied to the behavior of fire in enclosures. The behavior of enclosure fires is discussed and the assumptions for justifying the use of the control volume of 'zone' modeling approach are presented. The governing equations are derived and special solutions are given. Flow through wall vents, room filling, and growing fires are analyzed. The paper is not a review of the literature. It is a theoretical presentation of compartment fire zone modeling, much of which has not been explicitly presented before or integrated into one presentation. The analysis for species in terms of mixture fraction is a distinct new contribution to zone modeling.

Comparisons of NBS/Harvard VI Simulations and Data from all Runs of a Full-Scale Multi-Room Fire Test Program.
Final rept.
J. A. Rockett, M. Morita, and L. Y. Cooper. 1989, 55p
See also PB90-128620.
Pub. in Fire Safety Jnl. 15, p115-169 1989.

Keywords: *Fires, Models, Computerized simulation, Buildings, Fire tests, Proving, Test facilities, Mathematical models, Reprints, Computer applications.

The NBS/Harvard VI multi-room fire model computer code was used to simulate results of previously reported full-scale, multi-room fire experiments. The tests and simulations involved four different compartment configurations made up of two or three rooms connected by open doorways, four different fire types generated by a methane burner located in the room identified as the burn room, and up to four different doorway openings between the burn room and the adjacent space. A total of nineteen different tests were carried

out and simulated. Comparisons between simulated and measured parameters of the fire-generated environments are reviewed. While the computer code is generally found to provide favorable simulations for the entire range of tests, several areas in modeling detail are identified as requiring clarification, research and further improvement. The improvements should be incorporated in future versions of the NBS/Harvard multi-room fire model.

Smoke Measurement Results from the Cone Calorimeter.
Final rept.
V. Babrauskas. 1985, 15p
Pub. in Proceedings of UJNR Joint Panel Meeting on Fire Research and Safety (8th), Tsukuba, Japan, May 13-21, 1985, p420-434.

Keywords: *Soot, *Smoke, *Calorimeters, *Fire tests, *Combustion products, *Thermal measurements, Measuring instruments, Fires, Reprints, Particulates.

The most prevalent apparatus in use for obtaining data on the smoke production tendencies of materials is the NBS Smoke Chamber. Exploratory testing with simple materials in the NBS Smoke Chamber has indicated significant shortcomings in obtaining apparatus-independent data for use in modeling. Most of those difficulties are associated with the fact that this chamber is a static box. Recently a new heat release rate apparatus--the Cone Calorimeter--has been developed at the National Bureau of Standards (NBS), which allows improved heat release rate measurements to be made. Smoke measuring instrumentation has now been developed for use with the Cone Calorimeter, allowing smoke data to be gathered in a dynamic, flow-through environment. Smoke measurements made in the Cone Calorimeter on upholstered furniture specimens are presented and are compared to full-scale test data on the same materials.

Smoke and Soot Data Determinations in the Cone Calorimeter.
Final rept.
V. Babrauskas, and G. Mulholland. 1987, 22p
Pub. in Mathematical Modeling of Fires, ASTM STP 983, p83-104 1987.

Keywords: *Soot, *Smoke, *Calorimeters, *Fire tests, *Combustion products, *Thermal measurements, Standards, Aerosols, Measuring instruments, Irradiance, Fires, Reprints, Particulates.

Two kinds of measurements are often of interest for characterizing aerosols of particulates resulting from fires--direct optical measurements and measurements of the fraction of specimen mass that becomes particulate mass. The former consists of two components, absorption and scattering, but is more typically made for a long time in connection with other-purpose fire tests, such as ASTM E 84 or ASTM E 906, or as separate tests, such as in ASTM E 662. The latter has often been considered the definitive measurement, and is often referenced for regulatory or specification purposes. Recent work at NBS has pointed to a number of shortcomings of this test, including the limited irradiance range, the absence of continuous specimen mass loss measurements, and the small, fixed amount of oxygen available for combustion. This has resulted in the development of both optical and gravimetric soot measuring techniques for the Cone Calorimeter, which is a flow-through system, with adequate irradiance range, load cell, and modern signal manipulation hardware.

Pub. in Proceedings of UJNR Joint Panel Meeting on Fire Research and Safety (8th), Tsukuba, Japan, May 13-21, 1985, p85-98.

Keywords: *Fire hazards, *Toxicity, *Smoke, *Buildings, Mathematical models, Fires, Combustion products, Reprints, Risk assessment.

The ongoing program at the Center for Fire Research to develop a quantitative fire hazard assessment method is described. Three types of models - field, zone, and network - are discussed, along with plans for combining them into a hybrid model which provides sufficient detail for addressing practical problems but does not require large computers. Current capabilities of these models are presented along with plans for near term improvements. Efforts to validate the predictive accuracy of the models and simplify the presentation and analysis of data provided by the models is described. Some thoughts on potential uses of these techniques are presented.

Using High-Resolution Hand-Held Radiometers to Measure In situ Thermal Resistance.
Final rept.
D. M. Burch, and D. F. Krintz. 1984, 10p
Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Conference, v446 p24-33 1984.

Keywords: *Thermal insulation, *Residential buildings, *Radiometers, *Thermal resistance, Thermal measurements, Measuring instruments, Heat flux, Walls, Standards, Field tests, Reprints.

A field study was carried out to investigate the accuracy of using high-resolution radiometers to determine the in situ thermal resistance of building components having conventional residential construction. Two different types of radiometers were used to determine the thermal resistances of the walls of six test buildings located at the National Bureau of Standards. These radiometer thermal resistance measurements were compared to reference thermal resistance values determined from steady-state series resistance predictions, time-averaged heat-flow-sensor measurements, and guarded-hot-box measurements. The study recommends that the ANSI/ASHRAE Standard 101-1981 be modified requiring the heating plant to be operated in a typical cyclic fashion instead of being turned off prior to and during radiometer measurements.

Model for Predicting the Generation Rate and Distribution of Products of Combustion in Two-Layer Fire Environments.
L. Y. Cooper. Sep 90, 53p NISTIR-4403

Keywords: *Combustion products, *Fires, *Buildings, Air flow, Combustion, Mathematical models, Plumes, Smoke, Numerical analysis.

A general model is developed for predicting the generation rates of oxygen, fuel, and any other products of combustion of interest in rooms containing fires. The model is called the generalized global equivalence ratio model. It extends the steady state global equivalence ratio model established from steady-state data of several previous experimental studies. After presenting the details, a concise algorithm is outlined for implementing the model in two-layer zone-type compartment fire model computer codes. With the algorithm in place, such codes could be used to simulate the distribution of products of combustion in single or multi-room fire environments. In an example application, the model is used to simulate the time-dependent environment, including that of steady-state, in some of the above-mentioned experimental studies. For arbitrary experimental conditions and under the assumption of stoichiometric combustion, solutions for concentrations of products of combustion are obtained and presented. In one concise result, the solutions are used to predict the time-to-extinguishment of a burning methane fuel source embedded in an initially ambient-atmosphere upper layer.

Full Scale Simulation of a Fatal Fire and Comparison of Results with Two Multiroom Models.
R. S. Levine, and H. E. Nelson. Aug 90, 106p NISTIR-90/4268

Keywords: *Fires, *Residential buildings, *Computerized simulation, Combustion products, Fire tests, Heat transfer coefficients, Carbon monoxide, Air flow, Safety engineering, Computer applications.

In 1987, a fire in a kitchen in Sharon, PA resulted in the deaths of three persons in upstairs bedrooms, one with a reported blood carboxyhemoglobin content of 91%. Considerable physical evidence remained. The fire was successfully simulated at full scale in a fully instrumented seven room test called SHARON 2. The data collected during SHARON 2 have been used to evaluate the precision of two multiroom computer fire codes: FAST 18 and HARVARD 6.3. A coherent ceiling layer flow occurred during the SHARON 2 simulation and quickly carried high concentrations of carbon monoxide (CO) to remote compartments. Such flow is not directly accounted for in either computer code. However, both codes predict well the carbon monoxide buildup in the sixth room (i.e., the room most remote from the fire). Prediction of the pre-flashover temperature rise was good. Prediction of temperatures after flashover of the room of origin was less successful. Other predictions of conditions throughout the seven test rooms varied from good approximations to significant deviation from test data. Hypotheses are presented as to the reasons for the differences. At least some are believed due to phenomena not considered in the computer codes.

Thermal Bridging in Mechanical Fastened Low-Slope Roofs.
Final rept.
D. M. Burch, P. J. Shoback, and K. Cavanaugh. 1988, 14p
Pub. in Proceedings of Conference on Mathematical Modeling of Roof Systems, Oak Ridge, TN., September 15-16, 1988, p131-144 1988.

Keywords: *Heat transfer, *Fasteners, *Roofs, Thermal insulation, Thermal resistance, Thermal conductivity, Finite difference theory, Heat transmission, Thermodynamic properties, Temperature distribution, Reprints.

The heat transfer through cylindrical metal fasteners with metal caps in low-slope roofs having metal and wood decking is analyzed using finite-difference theory. The metal fasteners consisted of a 4.7-mm (3/16-in)-diameter steel rod with a 76-mm (3.0-in) diameter and 0.56-mm-thick (22-mil) steel cap. For a representative case of 5.4 fasteners/sq m (4.5 fasteners/sq yd), metal fasteners were found to reduce the overall thermal resistance of low-slope roofs with metal decking from 3 to 8% for insulation thicknesses ranging from 25 to 150 mm (1 to 6 in.). The effect of metal fasteners on the overall thermal resistance of low-slope roofs with wood decking was found to be about one-half their effect on roofs with metal decking. The use of plastic instead of metal caps on the metal fasteners reduced the thermal bridging of the individual

metal fastener by 44%. In low slope roofs with more than one layer of insulation, the effect of metal fasteners on the overall thermal resistance was reduced by a factor of three by using metal fasteners to attach only the bottom layer of insulation to the roof deck.

Plaza Hotel Fire Experiments.
Final rept.
J. H. Klotz. 1990, 5p
Pub. in ASHRAE (American Society of Heating, Refrigeration and Air-Conditioning Engineers) Jnl. 32, n10 p25-29 Oct 90.

Keywords: *Fire tests, *Hotels, *Smoke, *Air flow, Combustion products, Experimental data, Fire safety, Commercial buildings, Reprints.

A series of full scale tests were conducted with the objective to evaluate the current approach to zoned smoke control systems. Smoke movement and the performance of a zoned smoke control system were studied with smoke generated from unsprinklered wood fires, sprinklered wood fires, and smoke bombs. The smoke control system was designed using the methods of the ASHRAE smoke control manual and the recommended design pressure differences of NFPA 92A. As expected, the zoned smoke control system prevented smoke migration beyond the fire floor. Concerns about fan temperatures were evaluated, and an approach to deal with fan temperature was developed. The experiments showed that chemical smoke from smoke bombs is very different from hot smoke from flaming fires. With few exceptions, smoke bombs should not be used for acceptance tests.

Algorithm for the Mass-Loss Rate of a Burning Wall.
Final rept.
H. E. Mitter. 1989, 10p
See also PB88-153812.
Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p179-188 1989.

Keywords: *Algorithms, *Burning rate, *Fires, Flames, Temperature, Enclosures, Walls, Mass, Thermophysical properties, Models, Fire safety, Reprints.

A derivation is given for a simple algorithm which yields the quasi-steady burning rate of a vertical panel of non-charring, non-melting material in an enclosure with stratification of temperature and oxygen concentration. The algorithm requires the solution of a transcendental equation. Among the thermophysical data which are needed, are the mean flame temperature and the height-dependent absorption coefficient, $\epsilon(z)$. It is found from experiment that $\epsilon(z)$ is well described by PMMA by a two-parameter expression linear in $1/z$. Comparison with a transient experiment yields good agreement for the mass-loss rate, over much of the range.

Risk of Blistering of Built-Up Roofing Membranes Applied to Polyurethane Foam Insulation.
Final rept.
W. J. Rossiter, and R. G. Mathey. 1987, 18p
Sponsored by Air Force Engineering and Services Center, Tyndall AFB, FL., Naval Facilities Engineering Command, Alexandria, VA., and Office of the Chief of Engineers (Army), Washington, DC.
Pub. in Thermal Insulation: Materials and Systems, ASTM STP 922, p431-448 1987.

Keywords: *Polyurethane resins, *Cellular plastics, *Roofing materials, *Insulating boards, *Foam rubber, Thermal insulation, Construction materials, Asphalts, Busting, Membranes, Facings, Felts, Degassing, Moisture content, Webs(Supports), Reprints.

The paper presents the results of a study to investigate the effect of application of hot asphalt directly onto polyurethane insulation boards. In addition, it discusses causes of blistering and methods for using polyurethane foam insulation boards in built-up roofing

systems so as to reduce the risk of blistering. Polyurethane foam insulation specimens, typical of those used in the late 1970s in the United States for built-up roofing construction, were included in the study. Most of the insulations contained a facing material. Hot asphalt was applied to the insulations with facings to determine the extent of off-gassing. Hot asphalt was also applied to insulations without facings, to facings removed from insulation, and to oven-dried insulations and facings to investigate the effect of the moisture content of the insulations and facings on the off-gassing. In other tests, oven-dried and moist (room dry) felts were used in the preparation of built-up membranes over polyurethane boards. Delamination of the roofing specimens indicated many large voids in the asphalt layer between the polyurethane insulation and the first ply of felt. These voids were considered to increase the risk of blistering in built-up membranes applied directly on the polyurethane foam insulation. The data support previous suggestions to apply a thin layer of rigid insulation to the polyurethane foam before the membrane is applied.

Investigation into the Factors Affecting Infrared Temperature Measurements for Building Applications.
Final rept.
Y. M. Chang. 1987, 8p
Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) International Conference on Thermal Infrared Sensing for Diagnostics and Control (Thermosense IX), Orlando, FL., May 18-20, 1987, p11-18.

Keywords: *Infrared equipment, *Thermal measurements, *Buildings, *Construction materials, Temperature measuring equipment, Calibrating, Temperature distribution, Surface properties, Infrared image tubes, Emissivity, Reprints.

Various factors affecting infrared temperature measurements are discussed. Temperature calibration curves at surrounding temperatures between -20C and 25C are presented for two infrared imaging systems operating in the 2 to 5 micrometers and 8 to 14 micrometers wavelength regions. The calibration curves for the 2 to 5 micrometers system were found to be independent to surrounding temperatures, while the calibration curves for the 8 to 14 micrometers system were found to be strongly dependent to surrounding temperatures. Equations to account for changes in surrounding temperatures are presented. Laboratory measurements of emissivity using both systems at different surrounding temperatures (22C, 4C, and -11C) are given for several typical building materials. The emissivity measurements are used in computing surface temperatures of the materials. Comparisons are made between predicted and measured surface temperatures.

Infrared Inspection Techniques for Assessing the Exterior Envelopes of Office Buildings.
Final rept.
Y. M. Chang, R. A. Grot, and L. S. Galowin. 1987, 21p
Sponsored by General Services Administration, Washington, DC.
Pub. in Thermal Insulation: Materials and Systems, ASTM STP 922, p175-195 1987.

Keywords: *Thermography, *Thermal resistance, *Construction material, *Office buildings, Roofs, Heat loss, Leakage, Infrared equipment, Thermal measurements, Heat flux, Reprints, Energy conservation.

In order to assess the thermal integrity of new and existing office buildings, the National Bureau of Standards (NBS) developed and performed a series of diagnostic tests on eight federal office buildings. These buildings have different sizes, ranging from 1800 sq m to 48,000 sq m of floor area, and are located in various climate zones. Thermographic inspection is one of the diagnostic procedures used to identify the locations of heat loss areas, to determine the extent of deterioration of building materials, and to establish a basis for recommendation of retrofit options. Other test methods applied to these buildings for envelope measure-

ments include heat flow for the thermal resistances, tracer gas for air infiltration, and pressurization tests for building tightness. Three types of thermographic inspections were conducted on these buildings: ground-based infrared surveys, serial infrared surveys, and inspection with a spot radiometer. These buildings were designed to meet the new federal energy guidelines of less than 630 MJ/sq m per year of on-site energy consumption and less than 1200 MJ/sq m per year of off-site energy consumption. The thermographic inspections reveal the existence of several classes of thermal deficiencies in the buildings, which were due to both inadequate building design and poor construction quality. Comparisons of the results from several thermographic techniques are shown. Analysis of thermographic data with examples of thermal defects observed from all inspections is presented. Quantitative comparisons of the wall thermal resistance values measured by the spot radiometer with those from heat flow meter measurements are also included.

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Fire Science and Engineering Div. **Small-Scale Vertical Flammability Testing for Fabrics.** Final rept.

K. M. Villa, and J. F. Krasny. 1990, 13p
Pub. in Fire Safety Jnl. 16, p229-241 1990.

Keywords: *Fabrics, *Flammability testing, *Fire tests, Combustion products, Ignition, Fire resistant materials, Test facilities, Flames, After burning, Reprints, Chars.

Many small-scale vertical flammability tests have been designed to assess 'self-extinguishment' of fabrics after exposure to a small flame, where self-extinguishment refers to the cessation of flaming or glowing of the specimen upon removal of the ignition source. The specimens are held vertically in a U-shaped metal frame and ignited at the bottom. The criteria chosen for these tests are char length, afterflame, afterglow, and melt drip. These tests were first promulgated in the 1930s for use on flame-retardant cellulose and wools. The applicability of the test to char-forming as well as thermoplastic fabrics will be discussed.

Program for Calculating the Maximum Radiation on a Wall.

R. L. Smith. Oct 90, 34p NISTIR-4437
Sponsored by Air Force Engineering and Services Center, Tyndall AFB, FL.

Keywords: *Fires, *Military facilities, *Walls, Heat flux, Heat transmission, Heat transfer, Fire protection, Fire fighting, *Radiative heat transfer, Expert systems.

The report describes a program module of the expert system EXPOSURE. This module, written in Common Lisp, is for calculating the maximum electromagnetic radiation incident upon a building's wall due to the burning of a neighboring building. It is assumed that the burning building has an arbitrary number of rectangular openings emitting radiation. The exposed wall can be considered as being composed of a number of rectangular regions. These regions may be openings or regions of different materials. This program can determine the maximum radiation for each of these regions and for the wall less these regions.

Algorithm and Associated Computer Subroutine for Calculating Flow through a Horizontal Ceiling/Floor Vent in a Zone-Type Compartment Fire Model.

L. Y. Cooper. Oct 90, 54p NISTIR-4402
Sponsored by Naval Research Lab., Washington, DC.

Keywords: *Fire protection, *Fires, *Air flow, *Vents, Thermodynamics, Fire safety, Computer programs, Mathematical models, Algorithms, Openings, Flames, *Flame propagation.

An algorithm and associated computer subroutine is presented for calculating the effects on two-layer compartment fire environments of the quasi-steady flow through a horizontal vent connecting two spaces. The two spaces can be either two inside rooms of a multi-room facility or one inside room and the outside ambient environment local to the vent. The description of the flow through the vent is determined by combining considerations of (1) the unidirectional-type of flow driven by a cross-vent pressure difference and, when appropriate, (2) the exchange-type of flow induced when the fluid configuration across the vent is unstable, i.e., when a relatively cool, dense gas in the upper space overlays a less dense gas in the lower space. The algorithm/subroutine is called VENTCF. The computer subroutine is written in FORTRAN 77. The subroutine is completely modular, and it is suitable for general use in two-layer, multi-room, zone-type fire model computer codes. It has been tested over a wide range of input variables and these tests are described.

Influence of Horizontal Reinforcement on Shear Resistance of Concrete Block Masonry Walls.

C. W. C. Yancey, and C. F. Scribner. Oct 89, 68p
NISTIR-89/4202
Also available from Supt. of Docs.

Keywords: *Concrete blocks, *Walls, *Reinforcing materials, Mechanical properties, Axial stress, Cyclic loads, Compressive strength, Masonry, Cracking(Fracturing), Shear strength, Dynamic loads.

The tests determined the effect of varying the amount and distribution of horizontal reinforcement on the in-plane shear resistance of concrete masonry walls. Thirteen wall specimens were constructed with hollow concrete block, and varying amounts of reinforcement in the bed joints and in grouted bond beams. The walls were subjected to reversed cyclic, in-plane lateral loads and essentially a constant axial compressive load. The blocks had an average gross area unit strength of approximately 1800 psi. Preliminary results from these tests show small amounts of horizontal reinforcement are effective in increasing post-cracking strength; in-plane shear strength does not increase proportionately with increasing amounts of horizontal reinforcement; and bed joint reinforcement placed in alternating courses is as effective in increasing in-plane shear strength as when placed in every course.

Load Duration and Probability Based Design of Wood Structural Members. Final rept.

B. R. Ellingwood, E. M. Hendrickson, and J. F. Murphy. 1988, 16p
Pub. in Wood and Fiber Science 20, n2 p250-265 1988.

Keywords: *Limit design method, *Loads(Forces), *Wood, *Structural members, *Structural timber, Static loads, Snow, Design criteria, Creep rupture strength, Time, Reliability, Probability distribution functions, Hydrostatic pressure, Reprints.

A limit-states design philosophy for wood offers important advantages in design applications over current working stress design methods. Limit-states design can be cast in a load and resistance factor format, with probability based resistance factors matched to the common LRFD load requirements in ANSI A58. A load duration factor lambda, to account for creep rupture in wood, is determined for snow loads. Important elements for evaluating lambda include realistic stochastic models for snow load, distributions of member strength, and load duration models. With the tools, limit state probabilities are calculated using numerical simulation. Reliability analyses are performed using existing design criteria to assess the effects of different load model characteristics, and different member strength distributions and load duration models. Reliability analyses are performed with, and without, load duration effects considered; lambda is computed as the ratio of results from the two analyses.

Structural Analyses

Performance of Structures during the Loma Prieta Earthquake of October 17, 1989.

Special pub. (Final).

H. S. Lew. Jan 90, 204p NIST/SP-778

Also available from Supt. of Docs. as SN003-003-02988-2. Sponsored by Geological Survey, Reston, VA.

Keywords: *Earthquake resistant structures, *Dynamic structure analysis, *Buildings, *Highway bridges, Collapse, Design standards, Building codes, Dynamic response, Failure, Foundations, Fire protection.

Immediately following the magnitude 7.1 Loma Prieta earthquake of October 17, 1989, a team representing the Interagency Committee on Seismic Safety in Construction surveyed the damage to buildings, utilities and transportation structures. The report is based primarily on the data gathered during the site survey and the results of preliminary analyses of structural failures. Most structures designed in accordance with modern codes and standards performed well without serious structural damage. However, there were many concrete and masonry buildings and highway structures in the San Francisco Bay area which were not designed according to modern seismic design codes and which did not perform well. The majority of damaged structures had not been strengthened to increase earthquake resistance. Except for two deaths from landslides and one from fire, the remainder of the 62 deaths from the earthquake was due to partial or total collapse of older structures. The investigation provided the basis for recommendations to improve design and construction practices for buildings and lifeline structures and to mitigate damage to existing structures in future earthquakes.

Probability-Based Criteria for Serviceability Limit States.

Final rept.

B. Ellingwood. 1985, 10p

Pub. in Proceedings of International Conference on Structural Safety and Reliability (4th), Kobe, Japan, May 27-29, 1985, p137-146.

Keywords: *Building codes, Design standards, Structural design, Static structural analysis, Elastic properties, Structural engineering, Mechanical properties, Deformation, Static loads, Vibration, Reprints.

Recent advances in structural code development have taken place within the framework of probability-based limit states design. However, little attention has been directed toward the serviceability limit states, despite their importance in modern design practice. Practical serviceability checking procedures can be developed using principles of probability, statistics and structural reliability. These procedures can be grouped into two broad categories for deformation or damage-related

limit states occurring under essentially static loads, and motion-related limit states due to occupant activities or environmental causes.

Experimental Study of Post-Installed Anchors Under Combined Shear and Tension Loading.

M. K. Johnson, and H. S. Lew. Mar 90, 82p NISTIR-90/4274

Keywords: *Concrete construction, *Anchors(Structures), *Dynamic structural analysis, *Mechanical tests, Dynamic loads, Compressive strength, Shear tests, Tensile strength, Failure, Fractures(Materials), Expansion bolts.

The behavior of post-installed anchors subjected to static combined shear and tension loads was studied experimentally. Twenty-four 1 in. diameter wedge-type expansion anchors were tested in uncracked concrete. Anchors were not preloaded and were located sufficiently far from the edge of the concrete specimens. There were two types of shear failures: steel fracture near the bottom of the anchor at the tapered section for anchors with shallow embedment depths and steel fracture along the shank for more deeply-embedded anchors. Two types of tension failures occurred: steel tensile failure at the threads and cone-shaped tensile failure of the concrete. For specimens failing in shear, anchor capacity depended mainly on embedment depth. A limiting capacity was reached at an embedment depth of approximately 6 in. when steel failure controlled. Anchor deformation was influenced by both load angle and embedment depth.

Evaluation of a Surface Treatment to Improve the Erosion Resistance of Coquina Stone at Castillo de San Marcos.

L. I. Knab, J. R. Clifton, and N. Waters. Mar 90, 41p NISTIR-90/4277

Sponsored by National Park Service, Atlanta, GA.

Keywords: *Erosion, *Masonry, *Building stone, *Surface finishing, Protective coatings, Weathering, Abrasion, Exposure, Deterioration, Waterproofing, Surface properties.

A surface treatment, which was intended to improve the erosion resistance of coquina stone at the Castillo de San Marcos, was evaluated. The commercially-available stone surface treatment was claimed to contain both consolidating and water-repellent agents. Limited, short-term tests intended to simulate two types of erosion and to identify any severe degradation problems were conducted. Erosion of sawn surfaces caused by mechanical abrasion from strokes with a steel brush, and a thin stream of water flow were investigated in the laboratory in different stone orientations. The results showed that, for some test conditions, the erosion resistance of the stone was significantly improved by the treatment. For the other test conditions, however, the erosion resistance of the treated and untreated specimens was not significantly different.

Periodic and Chaotic Motions of a Modified Stoker Column: Experimental and Numerical Results.

G. R. Cook, and E. Simiu. Feb 90, 47p NIST/BSS-168

Also available from Supt. of Docs. as SN003-003-03000-7.

Keywords: *Buckling, *Columns(Supports), *Dynamic structural analysis, *Test facilities, Experimental data, Structural engineering, Failure, Vibration, Equations of motion, Mathematical models, Dynamic tests, Elastic analysis, Nonlinear systems, Displacement, Stiffness.

Records are presented of typical measured motion of a modified forced Stoker column, including periodic motion around a stable fixed point, periodic snap-through motion, and chaotic motion. Characterizations of the recorded chaotic motion include: the auto-correlation function; the spectral density plot; capacity dimensions; and the Lyapunov exponent. Two sets of numerical simulations were performed, in which the

same spring stiffnesses (measured under static conditions) and the same dissipative forces (based on the viscous damping model) were used. The first set, in which the device was modeled as a multidegree of freedom system to account for the distributed mass and stiffness of the springs, yielded chaotic motions qualitatively similar to those recorded in the laboratory. No chaotic motions could be obtained from the second set, which did not reflect the fact that the spring properties are distributed and in which the device was therefore modeled as a one degree of freedom system.

Seismic Performance of 1/3 Scale Post-Tensioned Precast Beam-Column Connections.

Final rept.

G. S. Cheok, and H. S. Lew. 1990, 10p

Pub. in Proceedings of U.S. National Conference on Earthquake Engineering (4th), Palm Springs, CA., May 20-24, 1990, v2 p757-766.

Keywords: *Beams(Supports), *Precast concrete, *Columns(Supports), *Post tensioning, *Cyclic loads, Joints(Junctions), Model tests, Energy dissipation, Grout, Failure, Ductility, Reprints.

A study of the behavior of precast beam-column connections subjected to cyclic inelastic loading was initiated at the National Institute of Standards and Technology. The objective of the study is to develop a moment resistant precast connection that is economical and easily constructed. The experimental program consists of testing both monolithic and precast beam-column connections. The monolithic specimens were designed to 1985 UBC seismic zone 4 criteria. The results from the monolithic specimens provide a reference for comparison with the results from the post-tensioned beam-column tests. The moment resistance of the connection is provided by post-tensioning bars. The effects of fiber reinforced grout between the beam and column are studied. Energy dissipation, ductility, and failure mode will be used to determine the overall behavior of the connections.

Performance of 1/3-Scale Model Precast Concrete Beam-Column Connections Subjected to Cyclic Inelastic Loads.
 G. S. Cheok, and H. S. Lew. Oct 90, 105p NISTIR-4433

Keywords: *Beams(Supports), *Precast concrete, *Joints(Junctions), *Cyclic loads, Concrete structures, Structural analysis, Earthquake resistant structures, Model tests, Displacement, Columns(Supports), Experimental data.

An experimental study of the behavior of precast concrete beam-column connections subjected to cyclic inelastic loading was initiated at the National Institute of Standards and Technology. The study was initiated to provide data for the development of a rational design procedure for such connections in high seismic regions. The objective of the study is to develop a moment resistant precast concrete connection that is economical and easily constructed. Results of the experimental tests of both monolithic and precast beam-column connections are described. The monolithic concrete specimens were designed to 1985 UBC Seismic Zone 2 and 4 criteria. The design of the precast concrete specimens was similar to that for the monolithic specimen designed to UBC seismic zone 4. The results from the monolithic specimens provide a benchmark for comparison with the results from the precast tests.

 Pub. in Jnl. of Performance of Constructed Facilities 3, n1 p16-34, Feb 89.

Keywords: *Office buildings, *Structural analysis, Investigations, Construction, Concrete construction, Steel construction, Design criteria, Loads(Forces), Concretes, Steels, USSR, Reprints.

The National Bureau of Standards conducted a structural assessment of the new U.S. Office Building being constructed in Moscow. The paper reviews the portion of the assessment dealing with the vertical and lateral load resistance of the structural system. The results of field, laboratory, and analytical studies are summarized. The structural assessment, which was based on current U.S. design practice, concluded that the structure was generally adequate for the design loads. However, serious construction deficiencies were noted in the joints of the precast columns and precast shear walls. Companion papers provide background information about the structure and review the findings related to the structure's resistance against progressive collapse and the condition of the brick masonry.

Evaluation of Quarter-Scale Compartment Fire Modeling for Constant and Stepped Heat Inputs.
 Final rept.

H. Dingyi. 1987, 12p
 Pub. in Fire and Materials 11, n4 p179-190 Dec 87.

Keywords: *Fire tests, Fire safety, Flashback, Combustion, Interior decorating, *Building fires.

Quarter-scale tests of ten full-scale room fire tests were conducted by using an existing scaling technique developed at the National Bureau of Standards. The tests confirmed earlier studies which showed that quarter-scale room testing ranked interior finish materials in the same order as did full-scale tests based on their times to achieve room flashover. In general, quarter-scale tests were less severe and took longer time to reach peak room fire buildup because of a lower convection and radiative heat transfer in the quarter-scale room. The tests also generate more CO per unit mass of material and experienced lower combustion efficiencies.

Negatively Buoyant Wall Flows Generated in Enclosure Fires.
 Final rept.

Y. Jaluria, and L. Y. Cooper. 1989, 24p
 Pub. in Progress in Energy and Combustion Science 15, p159-182 1989.

Keywords: *Fires, *Boundary layer flow, *Walls, Heat transfer, Jet flow, Mass transfer, Mathematical models, Experimental data, Fire tests, Combustion, Reprints, *Natural convection, *Building fires.

The paper considers wall flows that arise in enclosure fires. Such flows are generated due to the temperature difference between the wall and the adjacent environment as well as due to the downward turning of the fire-plume-driven ceiling jet at the corners of the compartment. At various stages of fire growth and at several locations, the flow is subjected to an opposing buoyancy force. These flows are termed negatively buoyant and the paper investigates in detail the penetration and heat transfer characteristics of flows relevant to enclosure fires. The transport of mass, momentum and energy in wall flows is determined quantitatively, using available analytical results on boundary layer flows. The significance of wall flow effects in a typical compartment fire is studied. It is shown that these effects are important, since they cause additional transport which is comparable to that due to the fire plume or the flow at the opening, and must be included in a mathematical model for an accurate prediction of the changing environment in the enclosure. Negatively buoyant wall and free jets are studied experimentally to obtain the penetration depth, the entrainment into the flow and the wall heat transfer. The penetration of buoyancy-induced wall flows and of negatively buoyant wall jets in a two-layer stably stratified environment is also studied in detail experimentally.

 Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions, v93 pt2 p2235-2256 1987.

Keywords: *Fire safety, *Smoke abatement, *Elevators(Lifts), Fire tests, Safety engineering, Pres-

General

sure control, Air flow, Ventilation, Design standards, Buildings, Reprints, *Building fires.

Tests were conducted in the experimental fire tower at the National Research Council of Canada to study smoke movement through elevator shafts caused by a large fire and to determine the effectiveness of mechanical pressurization in keeping the elevator shaft and lobbies tenable for evacuation of the handicapped and for use by firefighters. The tests indicated that pressure control is required to cope with loss of pressurization due to open doors. Equations were developed to assist in designing pressure control systems involving either a variable supply air rate with feedback control or relief dampers in the walls of the elevator shaft or lobbies. Tests conducted in the tower indicated that for both methods of pressure control, comparison of measured and calculated values of supply air rates and pressure differences are in good agreement.

 B. M. Levin. 1987, 14p
 Pub. in Proceedings of Joint Panel Meeting of the UJNR Panel on Fire Research and Safety (9th), Norwood, MA., May 4-8, 1987, p280-293.

Keywords: *Fire safety, *Fire hazards, Computerized simulation, Decision making, Human behavior, Residential buildings, Reprints, *Building fires, *Evacuation, Escape time.

EXITT is a discrete event simulation of occupant decisions and actions in a simulated fire. Before the simulation starts, the characteristics of a residence, a fire in

that residence, and the occupants of the residence are entered into the computer. Based on a large set of decision rules, the occupants 'make' decisions which are a function of the smoke conditions in the building, the characteristics and status of the occupants (including their capabilities), and the available travel routes. The occupants investigate the fire, alert and assist others, and evacuate the building. The simulation ends when all of the occupants are either out of the building or are trapped by the smoke.

A project was carried out at The National Institute of Standards and Technology (NIST) to study the feasibility of developing a new-generation, multi-room, compartment fire model computer code, called the Consolidated Compartment Fire Model (CCFM) computer code. The idea was that such a code would consolidate past progress in zone-type compartment fire modeling, and allow readily for integration of future advances with the greatest possible flexibility. The project led to the development of a prototype multi-room CCFM product called CCFM.VENTS. This is a four-part report which documents CCFM.VENTS. The four parts of this report are: Part I: Physical Basis; Part II: Software Reference Guide; Part III: Catalog of Algorithms and Subroutines; and Part IV: User Reference Guide.

Keywords: *Buildings, *Fires, *Mathematical models, Vents, Regions, Subroutines, Systems analysis, *Computer applications, *Computer software, Software engineering, National Institute of Standards and Technology.

A project was carried out at The National Institute of Standards and Technology (NIST) to study the feasibility of developing a new-generation, multi-room, compartment fire model computer code, called the Consolidated Compartment Fire Model (CCFM) computer code. The idea was that such a code would consolidate past progress in zone-type compartment fire modeling, and allow readily for integration of future advances with the greatest possible flexibility. The project led to the development of a prototype multi-room CCFM product called CCFM.VENTS. The report is Part II of a four-part report which documents the above effort. The main objective of the Part II document is to document the design and underlying structure of the CCFM.VENTS computer software. It serves as a guide for those persons interested in extending, modifying, and if necessary, correcting CCFM.VENTS at a later date.

A project was carried out at The National Institute of Standards and Technology (NIST) to study the feasibility of developing a new-generation, multi-room, compartment fire model computer code, called the Consolidated Compartment Fire Model (CCFM) computer code. The idea was that such a code would consolidate past progress in zone-type compartment fire modeling, and allow readily for integration of future advances with the greatest possible flexibility. The project led to the development of a prototype multi-room CCFM product called CCFM.VENTS. The report is Part III of a four-part report which documents CCFM.VENTS. It is a catalog of all the modular algorithms and associated computer subroutines used to simulate the physical phenomena in CCFM.VENTS.

Each physical algorithm entry includes a description of the phenomenon simulated, a concise presentation of the calculation procedure used, identification of all input and output parameters, and a listing of the sub-routine. The catalog entries have been developed and are presented as modular, stand-alone products. The stand-alone design feature allows the catalog entries to be used both in CCFM and in any other modular, zone-type, compartment fire model computer code.

Measuring Economic Performance.
Final rept.

H. E. Marshall. 1990, 19p
Pub. in Performance of Buildings and Serviceability of Facilities, ASTM STP 1029, p93-110 1990.

Keywords: *Economic analysis, *Buildings, *Maintenance management, Risk, Cost engineering, Cost analysis, Interest rate of return, Value engineering, Benefit cost analysis, Mathematical models, Real property, Reprints.

Traditional economic methods--life-cycle costing, benefit-to-cost ratio, net benefits, adjusted internal rate of return, and discounted payback--are described for evaluating building decisions about accepting or rejecting a given building investment, the economically efficient design or size of a building, and the economically efficient combination of projects competing for a limited budget. Appropriate applications for each economic method are described. Technically correct formulas for the methods are presented. These economic methods are often applied using 'best-guess' estimates of project input variables as if they were certain values. Such applications generate single-value, deterministic answers which provide decision makers insufficient information to know their economic risk exposure. Techniques are described that to some extent account for uncertainty in input variables and in some cases risk exposure and risk attitude.

Combustion Product Toxic Potency Measurements: Comparison of a Small Scale Test and 'Real-World' Fires.

Final rept.
E. Braun, R. G. Gann, B. C. Levin, and M. Paabo.
1990, 18p
Pub. in Jnl. of Fire Sciences 8, n1 p63-79 Jan/Feb 90.

Keywords: *Fires, *Combustion products, *Toxicity, *Cotton fabrics, *Polyurethane resins, Chemical properties, Smoke, Fire tests, Environmental impacts, Reprints.

A long range goal of fire science is to be able to predict 'real-world' fire performance from a small set of laboratory scale fire measurements. One material property of primary concern is the toxicity of decomposition products. Several small scale toxicity protocols that measure toxic potency of the smoke from burning materials have been developed. While several attempts have been made to correlate individual protocols with large scale results, no systematic set of criteria for determining the extent of similarity has been defined and tested. In the paper, three criteria have been proposed and tested using one set of materials (cotton fabric and polyurethane foam) in two different large-scale enclosures and three different fire scenarios. Tests were conducted to determine the extent of similarity between the NBS Toxicity Test Protocol and large-scale 'real-world' fire performance.

Energy Prices and Discount Factors for Life-Cycle Cost Analysis 1990.

B. C. Lippiatt, and R. T. Ruegg. May 90, 64p NISTIR-85/3273-4
See also PB87-180253, PB86-223104, PB88-138227 and PB89-153860. Sponsored by Department of Energy, Washington, DC. Assistant Secretary for Conservation and Renewable Energy.

Keywords: *Cost indexes, *Prices, Present worth, Economic analysis, Cost analysis, Discounted cash flow, *Life cycle costs, *Energy expenses, Energy conservation.

This is the 1990 annual edition of energy prices and discount factors for performing life-cycle cost analyses of energy conservation and renewable energy projects. It supports the Federal life-cycle costing methodology as described in NBS Handbook 135 (HB 135) and private sector life-cycle cost analysis as described in NBS Special Publication 709 (SP 709). Tables A, B, and C are revisions of appendices A, B, and C, respectively, of HB 135. Tables A (7%), Ba, and C apply to Federal energy conservation and renewable energy projects. Tables A (10%), Bb, and C apply to Federal projects that require energy price forecasts but are not primarily energy conserving. Tables S, in the last section of the report, are revisions to appendix B, Part I of SP 709 and are provided for the convenience of private sector analysts wishing to make use of Federal energy price forecasts.

Federal Building Life-Cycle Cost (FBLCC) Program (for Microcomputers).

Software.
S. R. Peterson, and W. Bethea. Aug 89, 1 diskette NBS/SW/DK-90/005
Supersedes PB89-151203.

The software is contained on 5 1/4-inch diskettes, double density (360K), compatible with the IBM PC microcomputer. The diskettes are in the ASCII format. Price includes documentation, PB86-223104.

Keywords: *Software, *Buildings, National government, Economic analysis, Benefit cost analysis, Diskettes, *Life cycle costs, *Energy conservation, Energy management, L=BASIC, H=IBM PC.

The Federal Building Life-Cycle Cost (FBLCC) Program provides computational tools and energy price data for performing life-cycle (LCC) analyses of Federal buildings and related subsystems. The method and procedures used in these LCC analyses are based on rules set forth by the U.S. Department of Energy Management Program and U.S. Office of Management and Budget. The FBLCC program (Vers. 2.3) contains the 1989 U.S. Department of Energy's energy price forecasts, as released in January 1990. The FBLCC program includes a number of changes in the Department of Energy's forecasts for the life-cycle cost analysis of Federal buildings. Software Description: The software is written in the BASIC programming language for implementation on an IBM/PC or compatible microcomputer under the MS-DOS operating system. Memory requirement is 64K.

GATT (General Agreement on Tariffs and Trade) Standards Code Activities of the National Institute of Standards and Technology 1989.
Annual rept.

J. R. Overman. Apr 90, 51p NISTIR-4314
See also PB89-191977.

Keywords: *International trade, *Standards, Tables(Data), Regulations, Specifications, Statistical data, *General Agreement on Tariffs and Trade, Certification, Trade barriers, Technical assistance.

The report describes the GATT Standards Code activities conducted by the Standards Code and Information Program, National Institute of Standards and Technology (NIST), for calendar year 1989. It also presents statistics covering the 10 years (1980 through 1989) of the Standards Code's implementation in the United States. NIST responsibilities include operating the U.S. GATT inquiry point for information on standards and certification activities and the technical office for non-agricultural products; notifying the GATT Secretariat of proposed U.S. Federal Government standards-based rules that might significantly affect trade; assisting U.S. industry with standards-related trade problems; and responding to inquiries about proposed foreign and U.S. regulations.

Discount Factor Tables for Life-Cycle Cost Analysis.

S. R. Petersen. Dec 89, 87p NISTIR-89/4203

Keywords: *Cost analysis, Economic analysis, Present worth, Discounted cash flow, Tables(Data), *Life cycle costs, *Discount factors.

The report presents eight types of precalculated discount factors that are useful for life-cycle cost studies. Three sets of discount factor tables are provided. The first set includes six common single-payment and uniform-series discount factors. The second set of tables presents uniform present value factors for a series of payments increasing from period to period at a given rate, rather than remaining constant over the entire study period. The third set of table presents single present value factors for determining the present value of a single payment occurring at a future point in time, to be used when the payment is specified in base-time prices but is expected to increase in value over time at a specified periodic rate. The tables cover discount rates from 1 to 25%, and time periods from 1 to 40 years. Examples of the correct usage of each of these discount factors are provided.

Analytical Use and Applications of the Nuclear Track Technique.

Final rept.

B. S. Carpenter. 1987, 2p

Pub. in Transactions of the American Nuclear Society 55, p159-160 1987.

Keywords: *Chemical analysis, Concentration(Composition), Autoradiography, Geochronology, Geology, Geothermometry, Dosimetry, Bioassay, Bismuth, Boron, Lithium, Nitrogen, Sulfur, Uranium, Reprints, *Nuclear track technique, *Trace amounts, Semiconductors, Doped materials, Uses.

The nuclear track technique (NTT) has been routinely used to determine trace concentrations of uranium, boron, and lithium in a variety of matrices, as well as macro-concentrations (e.g., = or > 500 microg/g) of nitrogen in steels and biological material and sulfur in selective matrices. In addition to the trace element determinations, the NTT has found significant applications in geology as a viable method for geochronology, geothermometry and geological anomalies. Aside from the analytical and geological uses, the NTT has been applied to micromapping the location, distribution and behavior of dopants, such as boron, lithium, oxygen, sulfur, and uranium, in various materials. This is particularly the case in the semiconductor and biomedical areas, as no convenient long lived radioactive nuclides of these elements exists. Other applications of the technique has been in personnel and reactor dosimetry as well as alpha autoradiography which includes the determination of bismuth from the delayed alpha decay of ²¹⁰Po. The technique has also been useful in producing porous microparticles for use as chromatographic materials and as molecular sieves.

Two-Dimensional POMMIE J (CH)-Resolved ¹³C NMR Spectrum Editing Application to Peptide and Carbohydrate Derivatives.

Final rept.

B. Coxon. 1988, 8p

Pub. in Magn. Reson. Chem. 26, n6 p449-456 1988.

Keywords: *Nuclear magnetic resonance, *Carbohydrates, *Peptides, Software(Computers), Reprints, Chemical shift.

A Pulse sequence has been implemented for two-dimensional POMMIE J(CH)-resolved ¹³C NMR spectroscopy and has been used to explore three methods for the automated acquisition of data for two-dimensional spectrum editing. In the first two methods, sets of three, two-dimensional data matrices are acquired in either sequential or interleaved modes, by use of three values $\phi = \pi/6, \pi/2, \text{ and } 5\pi/6$ for the phase shift of the multiple quantum read pulse. Computation of linear combinations of these three data matrices by use of a Pascal program that had been written earlier for two-dimensional DEPT spectrum editing yielded two-dimensional POMMIE J(CH)-resolved CH, CH₂, and CH₃ subspectra. In the third method, these subspectra are constructed directly during acquisition, by rotation of the phase shifts of the multiple quantum read pulse and the receiver. Selected small peptides and carbohydrate derivatives have been used as model compounds for the study, and their ¹H and ¹³C NMR assignments have been confirmed by two-dimensional COSY and heteronuclear CH chemical shift correlation techniques.

Preparation and Certification of Standard Reference Material 1507: 11-Nor-Delta(sup9)-Tetrahydrocannabinol-9-Carboxylic Acid in Freeze-Dried Urine.

Final rept.

N. E. Craft, G. D. Byrd, and L. R. Hilpert. 1989, 5p

Pub. in Analytical Chemistry 61, n6 p540-544, 15 Mar 89.

Keywords: *Carboxylic acids, *Urine, Electrochemistry, Metabolism, Reprints, *Standard reference materials, *Cannabis, *Biological preservation, Mass fragmentography, High performance liquid chromatography.

The National Institute of Standards and Technology (NIST) has prepared and certified SRM 1507, a freeze-dried urine fortified with 11-nor-delta 9-tetrahydrocannabinol-9-carboxylic acid (THC-9-COOH), the major urinary metabolite of marijuana. The certified concentration of 20 + or - 1 ng/mL for the analyte was obtained from the concordant results of analyses of the material by gas chromatography/mass spectrometry (GC/MS) and high-performance liquid chromatography with electro-chemical detection (HPLC-EC). Solid-phase extraction was used to prepare the sample for GC/MS analyses, and liquid-liquid extraction was used for the HPLC-EC analyses. The multistep HPLC method was developed at NIST to circumvent interferences from urinary constituents. The results of a round robin test on this material among five Department of

Defense laboratories involved in drug testing are reported.

Observations Derived from the Application of Principal Component Analysis to Laser Microprobe Mass Spectrometry.

Final rept.

R. A. Fletcher, and L. A. Currie. 1987, 3p

Pub. in Microbeam Analysis, p369-371 1987.

Keywords: *Mass spectroscopy, *Chemical analysis, Organic compounds, Multivariate analysis, Reprints, *Ion microprobe analysis, *Laser spectroscopy.

Laser Microprobe Mass Spectrometry (LMMS) provides a unique means to obtain mass spectral information from nonvolatile organic compounds. Information of this sort has the potential to infer structure and identification of compounds, and origins of microparticles. Because of the relatively low mass resolution of the spectrometer, fragment ion and hence chemical identification is often difficult. Studies are exploring a range of powerful multivariate and pattern recognition approaches such as principal components analysis (PCA) to aid in LMMS experiment design and spectrum interpretation.

Artifacts Observed in Oxygen Profiles of SIMOX Samples by Secondary Ion Mass Spectrometry.

Final rept.

P. Chi, D. S. Simons, and P. Roitman. 1988, 2p

Pub. in Microbeam Analysis, p121-122 1988.

Keywords: *Oxygen, *Mass spectroscopy, *Silicon, *Implantation, Stoichiometry, Silicon dioxide, Charging, Signal processing, Reprints, Ion microprobe analysis, Separation by implantation with oxygen(SIMOX), Depth profiles.

Separation by implantation with oxygen (SIMOX) is a process in which a high dose of oxygen is implanted into a silicon substrate in order to create a stoichiometric SiO₂ layer below the silicon surface. High quality single crystal silicon can be regrown above the buried oxide by a high temperature anneal. When a depth profile measurement of SIMOX material was performed by secondary ion mass spectrometry (SIMS), it was noticed that the oxygen secondary ion signal was not constant in the buried oxide layer. Instead, it tended to increase from the front to back interface, even though Rutherford backscattering spectrometry, Auger electron spectroscopy, and transmission electron microscopy measurements on similar materials have indicated that the buried oxide is homogeneous and stoichiometric SiO₂. Upon investigating the SIMS profiles more carefully, it was found that the changing

oxygen signal was an artifact of the SIMS measurement process, caused by incomplete charge neutralization in the insulating layer.

Concentration-Concentration Histograms: Scatter Diagrams Applied to Quantitative Compositional Maps.

Final rept.
D. S. Bright, D. E. Newbury, and R. B. Marinenko.
1988, 7p
Pub. in *Microbeam Analysis*, p18-24 1988.

Keywords: *Electron probes, *Concentration(Composition), *Histograms, *Quantitative analysis, *Scatter diagrams, Plotting, Mapping, Reprints.

Compositional mapping with the electron microprobe results in arrays of compositional values which are displayed as images with selected gray or color scales to encode the range of compositional values. To establish the spatial correlation of two or more constituents, the composition-composition histogram ('CCH') has been developed to present quantitative compositional mapping data with a straightforward view of the numerical relationships of the constituents. The CCH is the two-dimensional analogy of the usual histogram and is a type of scatter plot. Each pixel in one image is associated with the corresponding pixel in the other image to give a pair of numbers or coordinates. The CCH is the pixel count accumulated in a 256x256 array according to the coordinates. The CCH promises to be useful for detecting inhomogeneities in materials, evaluating sampling and measurement statistics, and selecting phases or features of interest for further analysis.

Ion Implantation Artifacts Detected by Secondary Ion Mass Spectrometry.

Final rept.
D. S. Simons, and P. Chi. 1988, 3p
Pub. in *Microbeam Analysis*, p117-119 1988.

Keywords: *Semiconductor doping, Beryllium, Boron, Silicon, Microanalysis, Reprints, *Secondary ion mass spectroscopy, *Ion implantation, Doped materials, Depth profiles.

Secondary ion mass spectrometry (SIMS) is commonly used to measure the depth distributions of dopants in semiconductors, where the dopant is introduced by high energy ion implantation. Often SIMS is used to study the redistribution of the dopant brought about by sequent thermal processing. In other cases, the extent of ion channeling in a crystalline substrate is of interest, when the incident ion has been intentionally aligned along a high symmetry axis. For these types of studies it is usually assumed that the ion implanter is delivering a pure beam of the specified ion at a well-defined energy and current. The examples presented in the paper will show that this assumption is not always valid, and that SIMS can be a very useful diagnostic tool for detecting unexpected artifacts of ion implantation.

Electron/X-ray Optical Bench for the Measurement of Fundamental Parameters for Electron Probe Microanalysis.

Final rept.
J. Small, D. Newbury, R. Myklebust, C. Fiori, A. Bell, and K. Heinrich. 1988, 4p
Pub. in *Microbeam Analysis*, p263-266 1988.

Keywords: *X ray analysis, *Microanalysis, Quantitative analysis, X ray spectrometers, Goniometers, Electron guns, Reprints, *Electron probe microanalysis, Optical benches.

Since the development of the electron microprobe by Castaing in 1951, quantitative x-ray microanalysis has evolved into one of the most powerful methods of spatially resolved analysis. For most routine analyses, the x-ray generation, absorption, and detection processes are well understood and correction procedures can be

used to perform routine quantitative analyses at an accuracy of 2% relative. There remain, however, several areas of microanalyses for which the electron beam-specimen interaction and the x-ray generation and absorption are not well known. During the past year at NBS the authors have been working on the design and construction of an electron/x-ray optical measurement bench. The system consists of an electron gun, a specimen goniometer which is capable of three-axis orientation, and an x-ray spectrometer mount which can be used to measure x-ray intensities at detector take off angles of 0 to 180 degrees. The authors will use this instrument for the measurement of fundamental parameters relating to improved correction procedures for quantitative analysis.

SEM (Scanning Electron Microscope) Imaging and Analysis of Submicrometer Particles in Air and Water Samples.

Final rept.
E. B. Steel. 1988, 3p
Pub. in *Microbeam Analysis*, p466-468 1988.

Keywords: *Particle size, Backscattering, Micrometers, Air analysis, Water analysis, Substrates, Filters, Asbestos, Fiberglass, Reprints, *Scanning electron microscopy.

The scanning electron microscope (SEM) has seen considerable use in characterizing the particulate populations associated with air and water samples. However, the SEM has limitations with particle visibility and analytical sensitivity as the particle size decreases below a micrometer and into the nanometer range. In this small particle size range, the secondary electron, backscatter electron, and x-ray yield from a particle can be very small compared to a bulk filter sample substrate. The paper describes results from research into various ways of improving imaging and x-ray analysis from these small particles. Many parameters were studied that would effect the imaging of submicrometer particles. Image contrast was measured as a function of types of substrate filters, sample substrate thickness, conductive coatings, accelerating voltage, and CRT raster rate. The particle application used as test specimens were chrysotile and amosite asbestos and a fiberglass. A method of sample preparation was found that enhances the visibility of small particles and allows for improved x-ray sensitivity.

Performance of a 'Conventional' Monte Carlo Program at Low-Beam Energy.

Final rept.
D. E. Newbury, and R. L. Myklebust. 1988, 4p
Pub. in *Microbeam Analysis*, p139-142 1988.

Keywords: Monte Carlo method, Computerized simulation, Electron scattering, Backscattering, Microanalysis, Depth, X rays, Reprints, *Electron trajectories, Scanning electron microscopy.

Monte Carlo electron trajectory simulation is a powerful technique for modeling the interaction of electrons with matter for problems in microscopy, microanalysis, microfabrication. A 'conventional' Monte Carlo simulation, which uses the screened Rutherford cross section for elastic scattering and the Bethe continuous energy loss equation for inelastic scattering, has been tested for simulation at low beam energies. Comparison with experimental data reveals a systematic overestimation of electron backscattering high atomic number materials. Results are presented for calculation of the depth distribution of x-ray production and the lateral spatial distribution of backscattered electrons.

Chromatographic Separations of Serum Proteins on Immobilized Metal Ion Stationary Phases.

Final rept.
S. A. Margolis, A. Fatiadi, L. Alexander, and J. Edwards. 1989, 14p
Pub. in *Analytical Biochemistry* 183, p108-121 1989.

Keywords: *Blood proteins, *Chromatographic analysis, *Chelating agents, *Ion mobility, Anions, Amines,

Halides, pH, Salinity, Reprints, *Protein binding, Isoelectric focusing.

The separation of proteins on stationary phases consisting of a bound organic chelator and a chelated divalent transition metal has been studied as a function of metal ion species; mobile phase composition and pH; and anion and cation concentration. Optimum separation was observed at alkaline pH on chelated nickel stationary phases. The results suggest that ligand exchange is the major mechanism of separation under basic conditions and that hydrophobic effects are the result of the competition of nonnitrogen ions with ammonium ions or amines for ligand binding sites modifying or participating in protein binding. Protein binding studies under weak acidic conditions are also presented although the mechanism responsible for protein binding is unclear.

Fingerprinting of Chemical Species in Microparticles: Correlative Laser and Electron Microprobe Studies.

Final rept.
I. H. Musselman, J. T. Rickman, and R. W. Linton.
1987, 4p
Pub. in *Microbeam Analysis*, p361-364 1987.

Keywords: X ray spectrometers, Molecular structure, Nickel, Particles, Reprints, *Laser microprobe mass spectroscopy, *Scanning electron microscopy.

In a previous study, laser microprobe mass spectrometry (LAMMS) was shown to differentiate among particles of various nickel standards. The identification of compounds such as these nickel species and their distribution between, or within, individual environmental particles by LAMMS alone, however, is complicated by both inherent particle heterogeneity and limitations of the LAMMS technique. Using the complementary techniques of scanning electron microscopy coupled to an energy dispersive x-ray spectrometer and LAMMS, however, the authors have shown that molecular structures may be assigned to nickel-containing particles produced by a fluidized bed roaster in a nickel refinery.

Effects of Sample Geometry on Interelement Quantitation in Laser Microprobe Mass Spectrometry.

Final rept.
I. H. Musselman, D. S. Simons, and R. W. Linton.
1988, 9p
Pub. in *Microbeam Analysis*, p356-364 1988.

Keywords: Geometry, Shape, Thin films, Spheres, Glass, Reprints, *Laser microprobe mass spectroscopy.

Over the past decade, many studies have been conducted to address the prospect of multi-element quantification by laser microprobe mass spectrometry (LAMMS). The present paper assesses the effects of sample geometry on elemental quantification by LAMMS using the relative sensitivity factor approach. The experiments described within address the most important aspects of the laser and spectrometer optimization procedure for quantitative elemental analysis which is discussed in detail by Musselman. These experiments include determining an einzel lens potential for the selective transmission of atomic ions as opposed to cluster ions, correcting ion intensities for detector saturation, and determining a laser energy for the reproducible ionization of all elements present in the sample. Unique from other quantitative studies, data were collected under identical, optimized laser and spectrometer conditions from three distinct geometries (thin film, spheres, and shards) of glass samples bearing the same nominal elemental compositions.

Redetermination of X-Ray Loss Due to Electron Backscatter by Monte Carlo Simulation.

Final rept.

R. L. Myklebust, and D. E. Newbury, 1988, 2p

Pub. in *Microbeam Analysis*, p261-262 1988.

Keywords: *X rays, Electron scattering, Monte Carlo method, Backscattering, Simulation, Losses, Microanalysis, Reprints, Electron microprobe analysis.

Values of x-ray loss due to electron backscatter (1-R) have been recomputed with the aid of a Monte Carlo simulation of electron scattering in solids. The values obtained have been compared to previous computations. The method of calculating R for multi-element specimens by computing the mass concentration average of the R-factors of the pure elements was examined and found to be satisfactory.

Background Correction in Electron Microprobe Compositional Mapping with Wavelength-Dispersive X-Ray Spectrometry.

Final rept.

R. L. Myklebust, D. E. Newbury, R. B. Marinenko, and D. S. Bright, 1987, 3p

Pub. in *Microbeam Analysis*, p25-27 1987.

Keywords: *X ray analysis, *X ray spectroscopy, Microanalysis, Background, Mapping, Correction, Reprints, *Electron microprobe analysis.

Quantitative compositional mapping by electron probe microanalysis requires accurate correction for spectral background if useful maps are to be obtained for minor (1-10 weight percent) and trace (< 1 weight percent) constituents. Previous methods for background correction with wavelength-dispersive x-ray spectrometry relied upon the measurement of a background channel with a spectrometer. A new method is proposed which increases efficiency by eliminating the need for a spectrometer measurement of background at each pixel in an image. The new method takes advantage of the lack of spectrometer defocusing for the background. The composition calculated for the major elements at each pixel combined with the atomic number dependency of the x-ray bremsstrahlung is used to calculate an appropriate background for each pixel. Background correction to better than 0.1 weight percent and comparable to variations expected from counting statistics is demonstrated.

Applications of Compositional Mapping in Materials Science.

Final rept.

D. E. Newbury, 1987, 4p

Pub. in *Microbeam Analysis*, p33-36 1987.

Keywords: *Chemical composition, *Mapping, *Quantitative analysis, Microanalysis, Materials tests, Electron probes, Grain boundaries, X ray analysis, Reprints, Characterization, Image processing.

Quantitative compositional mapping by electron probe microanalysis provides new capabilities for materials characterization. Compositional contrast can be detected to trace levels of 0.1 weight percent or lower. Small changes in concentration can be detected, even when the levels reside on a high background. Compositional images can be modified by a variety of image processing techniques to enhance the visibility of selected concentration ranges of interest. The new capabilities can reveal unexpected structures which might be missed by conventional microanalysis procedures.

Monte Carlo Electron Trajectory Simulations for Scanning Electron Microscopy and Microanalysis: An Overview.

Final rept.

D. E. Newbury, 1987, 5p

Pub. in *Microbeam Analysis*, p110-114 1987.

Keywords: *X ray analysis, Monte Carlo method, Backscattering, Simulation, Reprints, *Scanning electron microscopy, *Electron probe microanalysis, Electron trajectories, Image analysis.

Monte Carlo electron trajectory simulation provides a tool for calculating parameters of images in scanning electron microscopy and quantitative x-ray microanalysis. The basis for the simulation is the use of electric scattering for modeling the angular deviation in the electron trajectory and the Bethe continuous energy loss equation for inelastic scattering. Statistical fluctuations in the trajectories are incorporated through the use of random numbers for the selection of the scattering angle from the allowable range. Applications are presented which illustrate the calculation of backscattered electron compositional contrast, Type II magnetic contrast, and x-ray depth production.

Neutron Microprobe: Prospects and Potential Applications.

Final rept.

R. M. Lindstrom, R. F. Fleming, and H. L. Rook, 1988, 10p

Pub. in *Microbeam Analysis*, p407-416 1988.

Keywords: *Neutron activation analysis, Chemical analysis, Gamma rays, Sensitivity, Depth, Reprints, Neutron capture, Microprobes, Prompt gamma radiation, Neutron probes.

Prompt gamma rays and charged particles emitted during neutron capture have proven to be valuable for nondestructive chemical analysis. Applications have been somewhat limited by the low intensity of available neutron beams. Long-wavelength neutrons from reactor cold sources can be focused into beams of higher intensity. By applying advanced neutron optics, it appears possible to produce a density of neutrons comparable to that in the sample irradiation position of a research reactor, but confined to a small volume which can be intimately surrounded by radiation detectors. The authors anticipate greatly improved detection sensitivities compared with existing thermal neutron instruments.

Inorganic Cluster Ion Formation in the Laser Microprobe.

Final rept.

R. W. Linton, I. H. Musselman, F. Bruynseels, and D. S. Simons, 1987, 4p

Pub. in *Microbeam Analysis*, p365-368 1987.

Keywords: Nickel, Gold, Sulfur, Films, Reprints, *Laser microprobe mass spectroscopy, *Cluster ions, Multi-layers.

Results for Ni/Au/S sandwich films demonstrate that the observation of cluster ions in the laser microprobe mass spectrum is a sensitive function of sample geometry and orientation, laser power density, and ion focusing lens potential. With appropriate selection of the above parameters, extensive ion recombination is observed involving Ni(x)S(y) clusters. The clusters appear to have narrower kinetic energy distributions that also peak at lower energy in comparison to atomic ions. All of these factors complicate the relationship between the laser microprobe spectrum and the inherent molecular structure of the solid sample.

Isotopic Fractionation of Gallium on an Ion Exchange Column.

Final rept.

L. A. Machlan, and J. W. Gramlich, 1988, 3p

Pub. in *Analytical Chemistry* 60, n1 p37-39 1988.

Keywords: *Gallium, *Isotope separation, Mass spectroscopy, Reprints, *Ion exchange chromatography, *Standard reference materials.

Significant isotopic fractionation of gallium has been observed during elution through an anion exchange resin in the thiocyanate form. Two samples of NBS Standard Reference Material 994 (certified (69)Ga/(71)Ga = 1.50676 plus or minus 0.00039) were passed through the ion exchange columns, and fractions were analyzed for isotopic composition and gallium content using thermal ionization isotope dilution mass spectrometry. The results show a depletion of the light isotope in early fractions from the columns, with a steady increase in the light isotope throughout the elution. A materials balance of the product of the isotopic composition and gallium content of each fraction is in agreement with the isotopic composition of the starting material.

Grant NSF-CHE86-09372

Sponsored by National Science Foundation, Washington, DC., and Office of Naval Research, Arlington, VA. Pub. in *Analytical Chemistry* 61, n9 p955-960, 1 May 89.

Keywords: *Liquid chromatography, Polycyclic aromatic hydrocarbons, Solubility, Reprints, *Cyclodextrins.

Dynamic coupled-column liquid chromatography is used to determine both aqueous solubilities and cyclodextrin inclusion complex formation constants for a series of polynuclear aromatic hydrocarbons (PAHs). The method is based on the increase in solubility afforded by cyclodextrins upon complexation. Formation constant (K1) values are determined by using α -, β -, and γ -cyclodextrins at various temperatures. The relative precision of the calculated K₁ values is best for cyclodextrin/PAH complexes with large formation constants. The calculated solubilities are comparable to literature values, and in most cases, formation constant data are reproducible within 10%. The resulting K values confirm that the formation of inclusion complexes is based on the relative sizes of host and guest molecules.

Evaluation of Instrumental Correction Factors for Infrared Absorption Concentration Measurements.

Final rept.

A. Baghdadi, 1989, 3p

Pub. in *Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) - Fourier Transform Spectroscopy*, v1145 p168-170 1989.

Keywords: *Infrared spectroscopy, *Silicon, *Oxygen, *Fourier analysis, Measuring instruments, Reprints.

Infrared spectra obtained in a world-wide round-robin measurement of the oxygen content of silicon wafers were evaluated to determine whether instrumental correction factors could be derived from the spectrum of a silicon wafer polished on both sides. The data showed that each instrument could be characterized by its re-

sponse at the oxygen in silicon absorption band. Three parameters were evaluated for possible use as calibration factors: the transmittance of the polished silicon at 2000/cm, the absorption coefficient of the 610/cm lattice absorption band, and the absorption coefficient of the 739/cm lattice absorption band. However, no quantitatively consistent relationship was found between the measured oxygen content and any of these potential internal calibration factors.

Keywords: *Aromatic polycyclic hydrocarbons, *Nitro compounds, *Diesel fuels, *Exhaust emissions, *Chemical analysis, Liquid chromatography, Electrochemistry, Gas scrubbing, Reprints, Standard reference materials, Fluorescence spectrometry.

Three different approaches to the liquid chromatographic detection of nitro-polycyclic aromatic hydrocarbons in air and diesel particulate extracts are presented, based on differential pulse (LCDPD) and amperometric (LCEC) electrochemical detection and fluorescence detection following on-line reduction to the amine. The particulate extraction/fractionation procedure for each detection approach is discussed. The operational advantages of oxygen removal with a platinum oxygen-scrubber (all three types of detection); the use of modulated pulse detection (LCDPD); and wavelength-programmed fluorescence detection (LCFI) are explored. 1-Nitropyrene is determined in Standard Reference Material (SRM) 1650 Diesel Particulate Matter and in several other 'round robin' samples by all three methods. Results are compared to those obtained by other techniques and by other laboratories. Additionally, 2-nitrofluorene, 9-nitroanthracene, 7-nitrobenzo(a)anthracene, and 6-nitrobenzo(a)pyrene are determined in SRM 1650 by LCFI. The detection limits for 1-nitropyrene (expressed as ng/mL injected) are 170 (LCDPD), 2.0 (LCEC), and 0.6 (LCFI).

Enhancement of Sensitivity in Capillary Supercritical Fluid Chromatography through Optimization of Injection and Detection Techniques.

Final rept.

A. Munder, and S. N. Chesler. 1989, 6p

Pub. in Jnl. of High Resolution Chromatography 12, p669-674 Oct 89.

Keywords: *Capillary tubes, *Test equipment, *Injection, *Sampling, *Detection, Reproducibility, Column packings, Ultraviolet absorbers, Sensitivity, Explosives, Nitro compounds, Phthalates, Reprints, *Liquid chromatography, *Supercritical fluids, *Liquid injection, Flame ionization.

The reproducibility of peak areas as a function of the technique used for sample injection was investigated in capillary supercritical fluid chromatography (SFC). An injection technique has been developed to increase the volume of sample introduced into the capillary column. Using a modified time-split injection technique, long injection duration times were successfully applied to achieve lower detection limits. Because the on-column focusing was performed only by pressure and temperature programming, no instrumental modifications were necessary. Up to 1.0 microliters of sample solution was injected onto 50 micrometer i.d. columns using the technique, with no observable peak splitting. Dual detection using ultraviolet (UV) absorption and flame ionization detection (FID) was performed in series, thereby avoiding the necessity of splitting the column effluent. For the compounds investigated (five nitro-aromatics and one phthalate ester), the absolute sensitivity of the UV detector was significantly greater than that of the FID.

Fourier Transform Infrared (FTIR) Determination of Interstitial Oxygen Concentration of Single-Side-Polished Silicon Wafers.

Final rept.

B. Rennex. 1989, 3p

Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) - Fourier Transform Spectroscopy, v1145 p332-334 1989.

Keywords: *Fourier analysis, *Infrared spectroscopy, *Silicon, Integrated circuits, Algorithms, Reprints.

The paper evaluates a new algorithm developed by the author for calculating interstitial oxygen concentration in silicon wafers, using infrared transmission data. These silicon wafers have a backside-damaged surface and are referred to as being single-side-polished (SSP). This evaluation is carried out for various backside surface types, which are typical of surfaces used by the integrated circuit industry. Accurate measurement of oxygen content is important for reduction of the cost of quality control in the manufacture of integrated circuits. A systematic offset in oxygen concentration is found for (100) causal surfaces of surface category SCI. This offset is small (~1.5%), and it exhibits a small dispersion (sigma=0.9%), when calculated with a new algorithm which features an interpolation procedure for the forward scattering parameter, F. This result is promising for development of a calibration approach for this surface category, which would have a 2 sigma uncertainty of about plus or minus 1.8%.

Microphone Triggering Circuit for Elimination of Mechanically Induced Frequency-Jitter in Diode Laser Spectrometers: Implications for Quantitative Analysis.

Final rept.

R. L. Sams, and A. Fried. 1987, 7p

Pub. in Applied Optics 26, n17 p3552-3558 1987.

Keywords: *Vibration isolators, *Trigger circuits, Timing circuits, Vibration damping, Quantitative analysis, Infrared spectroscopy, Semiconductor lasers, Reprints, *Laser spectrometers, High resolution.

An electronic timing circuit using a microphone triggering device has been developed for elimination of frequency-jitter in diode laser spectrometers employing closed-cycle refrigerators. Mechanical compressor piston shocks are detected by the microphone and actuate an electronic circuit which ultimately interrupts data acquisition until the mechanical vibrations are completely quenched. In this way, laser sweeps contaminated by compressor frequency-jitter are not co-averaged. Employing this circuit, measured Doppler halfwidths were greatly reduced by as much as 20%. The importance of eliminating the mechanically-induced frequency-jitter when carrying out quantitative diode laser measurements is further discussed.

Effect of Phase Length on Column Selectivity for the Separation of Polycyclic Aromatic Hydrocarbons by Reversed-Phase Liquid Chromatography.

Final rept.

L. C. Sander, and S. A. Wise. 1987, 5p

Pub. in Analytical Chemistry 59, n18 p2309-2313 1987.

Keywords: *Column packings, *Liquid phases, *Length, *Separation, *Aromatic polycyclic hydrocarbons, Silanes, Haloalkanes, Polymers, Absorption, Chemical analysis, Reprints, *Liquid chromatography, *Reversed flow, Chain length.

A series of monomeric and polymeric alkyl phases of different phase lengths were prepared by reaction with appropriate mono- and trichlorosilanes. Selectivity changes with alkyl phase length were examined for phases ranging in length from C8 to C30. The retention behavior of polycyclic aromatic hydrocarbons (PAH) was observed to vary significantly with alkyl length. Using PAH probe solutes, phase selectivity of long chain length monomeric phases was found to approach that observed for C18 polymeric phases. Retention behavior is discussed in terms of a schematic representation of bonded phase structure.

CHEMISTRY

Analytical Chemistry

Reversed-phase high performance liquid chromatography coupled to amperometric detection at a Hg/Au-film electrode was used to determine 9 hydrophilic thiols in sediment porewater samples from the Chesapeake Bay. The detection limit is about 2 pmol and the precision is better than 3% at the 100 pmol level. Glassy carbon and bare Au electrodes were also examined, but were found to have higher residual currents and more interferences than the Hg/Au-film. The stability of thiols with respect to oxidation, in both standard solutions and samples, was also investigated under various conditions.

A liquid chromatography system has been interfaced to an inductively coupled plasma mass spectrometer in order to analyze injectable biological products for thimerosal. Thimerosal is a mercury containing antimicrobial agent used as a preservative in these materials. Sample types analyzed ranged from vaccines and toxoids (influenza virus vaccine and tetanus toxoid) to diluents, containing only the preservative in a saline solution. Samples were analyzed quantitatively for thimerosal content and qualitatively for the presence of decomposition products detectable by this method, such as methylmercury chloride, dimethylmercury and mercury(II) chloride. Flow injection was used to confirm that all mercury species in the samples were determined by liquid chromatography.

S. Mayo, J. D. Fassett, H. M. Kingston, and R. J. Walker. 1990, 5p
Pub. in Analytical Chemistry 62, n3 p240-244, 1 Feb 90.

Keywords: *Oxygen, *Silicon, *Vanadium, Mass spectroscopy, Ionization, Impurities, Reprints, Isotope dilution.

The combined analytical capabilities of isotope dilution, laser-induced resonance ionization spectroscopy, and mass spectrometry, integrated in the resonance ionization mass spectrometry technique (RIMS), have been evaluated as a tool for quantitative elemental impurity analysis of SIMOX (separation by implanted oxygen), a new silicon-based material prepared by oxygen implants. The vanadium impurity content was measured in the top crystalline SIMOX film and the oxygen-synthesized buried oxide layer in commercial wafers, resulting in 0.14 microg/g \pm or -20%, or 1.7×10^{15} (sup 15) atoms/cubic cm. A similar analysis on the substrate bulk shows about 30 times lower vanadium impurity levels. The origin of this contamination may be linked to the oxygen implant, although no modeling for it is offered here. The sensitivity of RIMS to vanadium is in the pg/g range. The accuracy of results is limited by the uncertainty in the blank, in view of the low total vanadium content in the specimen.

Pub. in Nuclear Instruments and Methods in Physics Research 29, n1-2 p41-44 1987.

Keywords: *Targets, Carbon 14, Samples, Preparation, Reprints, *Accelerator mass spectroscopy, Iron wool.

A technique has been developed at NBS for the high quality production of Accelerator Mass Spectrometry (AMS) targets with optimization of chemical yields, ion currents, blanks and throughput. The approach encompasses sample combustion to CO₂, catalytic reduction of CO₂ to elemental carbon on high-purity iron wool and 'in situ' formation of a homogeneous iron-carbon bead; all steps are performed in a closed system. The total measurement system blank and variability are considered in light of contributions from combustion, iron wool, reduction, beading and machine blank. Use of this approach provides effective management of large numbers of specialized samples. Chemical yields for 50-700 microgram-C samples deposited on 15 mg iron wool were greater than 90%.

The direct-imaging ion microscope offers the possibility of performing quantitative analysis in parallel for a large array of locations imaged simultaneously on a specimen. Digitization of the television signal offers certain advantages. (1) High secondary ion intensities can be measured. (2) Because each location in the image is measured separately and simultaneously, even if one portion of the image saturates, useful

measurements can be obtained in the unsaturated portion of the image. (3) Real time analog imaging is directly available during the digitization for continuous monitoring of the sample. The work examines TV digitization of secondary ion mass spectrometry (SIMS) images with respect to the accuracy, precision, and dynamic range which can be achieved in measuring isotopic and elemental ratios.

National Bureau of Standards (NML), Gaithersburg, MD. Radiometric Physics Div. **Fluorescence Spectrometry in Analytical Chemistry and Color Science.** Final rept.
K. D. Mielenz. 1987, 20p
Pub. in Anal. Spectrosc. Libr. Adv. Stand. Methodol. Spectrophotom. 2, p49-68 1987.

Keywords: Chemical analysis, Colorimetry, Spectra, Reprints, *Fluorescence spectroscopy.

Fluorescence spectrometry is used extensively in analytical chemistry as well as in color science. Although the objectives of the measurement and the instrumentation and methodologies used are different, it will be shown that the underlying concepts are essentially the same in chemistry and colorimetry, and that theoretical descriptions applicable in one discipline are also objectives and experimental techniques, a unified description of fluorescence measurements will be developed. The starting point for the discussion are radiometric definitions which are useful for the phenomenological characterization of colorimetric samples. The definitions are then reduced to the analogous molecular quantities which are of interest in photochemistry.

National Bureau of Standards (NML), Gaithersburg, MD. Organic Analytical Research Div. **Behavior of Liposomes in Flow Injection Systems.** Final rept.
L. Locascio-Brown, A. L. Plant, and R. A. Durst. 1988, 6p
Pub. in Analytical Chemistry 60, n8 p792-797 1988.

Keywords: *Chemical analysis, Fluorescein, Fluorescent dyes, Lipids, Injection, Bioassay, Fluid flow, Diffusion coefficient, Hydrodynamics, Reprints, *Liposomes, *Fluorescence spectroscopy, Carriers, Column packing.

The hydrodynamic behavior and stability of liposomes in flow injection analysis have been examined, in order to evaluate their usefulness as analytical reagents in continuous flow systems. It was found that liposomes containing the fluorescent self-quenching dye, carboxyfluorescein, are stable in the flow system and do not release their trapped contents even at flow rates of 2 mL/min. Differences in concentration profiles for solution and liposome samples have been examined under conditions of induced radial mixing in a knitted delay tube and a packed bead column. No aspects of liposome behavior have been observed that are not explained by their small diffusion coefficient. Under conditions of appropriate assay formats, liposomes will be

important signal enhancement tools for flow injection analysis.

Liquid Chromatography Element-Specific Detection Systems for Analysis of Molecular Species.
Final rept.

K. J. Irgolic, and F. E. Brinckman. 1986, 18p
Pub. in the Importance of Chemical 'Speciation' in Environmental Processes, p667-684 1986.

Keywords: *Environmental surveys, *Chemical analysis, Mass spectroscopy, Atomic spectroscopy, Absorption spectra, Performance evaluation, Laboratory equipment, Reprints, *Liquid chromatography, Biological effects.

Systems for the separation of inorganic compounds of environmental interest are described. They consist of a high-pressure liquid chromatograph linked to a graphite furnace atomic absorption or inductively coupled plasma spectrometer as the element-specific detector. The possibility of correlating the elution rates of compounds from columns with their biological activity is discussed.

Detection: Overview of Historical, Societal, and Technical Issues.
Final rept.

L. A. Currie. 1988, 62p
Pub. in ACS (American Chemical Society) Symposium Series Detect. Anal. Chem., v361 p1-62 1988.

Keywords: *Chemical detection, *Hazardous materials, *Social psychology, Measurement, Chemical analysis, Hazards, Errors, Regulations, Reprints, Social factors.

Practical societal needs and basic scientific advances frequently rely on Measurement Processes possessing specified detection capabilities with acceptable probabilities of false positives and false negatives. The first part of the overview introduces the basic concept of (chemical) detection, together with its applicability to selected societal problems such as the detection of natural hazards and the implementation of certain regulations. Basic scientific measurement issues related to assumptions and their validity, and hypothesis testing in relation to analyte detection are next introduced. Part two comprises a brief historical review, highlighting major contributions to the concept and realization of detection in chemical applications primarily over the last two decades. The current state-of-the-art in chemistry is then considered. Part three is the most extensive, as it seeks to expose most of the technical issues involved in deriving meaningful detection decisions and detection limits, considering the overall Chemical Measurement Process.

Physicochemical Applications of Supercritical Fluid Chromatography.

Final rept.

T. J. Bruno. 1987, 9p
Pub. in Proceedings of Symposium on Energy Engineering Sciences (5th), Argonne, IL., June 17, 1987, p52-60.

Keywords: *Chromatography, Diffusion coefficient, Reprints, *Supercritical fluid chromatography.

Supercritical fluid chromatography is a technique which offers many unique advantages and opportunities when implemented as a physicochemical measurement technique. A logical intermediary between gas chromatography (G.C.) and high performance liquid chromatography (H.P.L.C.), supercritical fluid chromatography (S.F.C.) finds a natural place in thermophysics research. In the paper, a brief overview of S.F.C. is given (with reference to a newly constructed instrument), followed by a general description of the measurements made possible by this tool. In addition, some preliminary measurements are presented.

Spectroscopic Library for Alternative Refrigerant Analysis.
Special pub. (Final).

T. J. Bruno. Aug 90, 192p NIST/SP-794
Also available from Supt. of Docs. as SN003-003-03036-8. Sponsored by Department of Energy, Washington, DC. Office of Buildings and Community Systems.

Keywords: *Refrigerants, *Mass spectra, *Infrared spectra, Chemical analysis, Air pollution abatement, Halogen organic compounds, Chemical reactions, Decomposition reactions, Physical properties, Safety, *Environmental chemical substitutes, Air pollution detection, Ozone layer.

The Special Publication contains infrared and mass spectra for a wide range of chlorofluoro-bromo ethanes and ethylenes that are relevant to research on alternative refrigerants. Alternative refrigerants are working fluids that are thought not to contribute significantly to atmospheric ozone depletion. In addition to the spectroscopic data, some physical property and safety information is included for each fluid as well. Not all of the compounds covered in the publication can be used as refrigerants. Indeed, some of them are in fact solids under ambient conditions, and others are fully halogenated, thus making them unfavorable from an ozone depletion standpoint. The study of all of these materials is important, however, since many will be found as impurities or reaction/decomposition products of refrigerant fluids. The publication provides a signal source for some particularly useful analytical information needed in the identification of these compounds.

Determination of Serum Uric Acid by Isotope Dilution Mass Spectrometry as a New Candidate Definitive Method.
Final rept.

P. Ellerbe, A. Cohen, M. J. Welch, and E. White V. 1990, 5p
Pub. in Analytical Chemistry 62, n20 p2173-2177, 15 Oct 90.

Keywords: *Uric acid, *Mass spectroscopy, Blood serum, Accuracy, Precision, Anion exchanging, Chemical reactions, Gas chromatography, Reprints, *Isotope dilution, Calibration standards.

A new isotope dilution mass spectrometric method for uric acid is described. A known weight of (1,3-(15)N2) uric acid is added to a known weight of serum, and the mixture is allowed to equilibrate. The serum is put through an anion-exchange resin, and the isolated uric acid is converted to the tetrakis(tert-butylidimethylallyl) derivative of uric acid. For measurement, the derivative is injected into a gas chromatograph interfaced with a low-resolution, magnetic sector mass spectrometer. Isotope ratio measurements are made from the abundances of the (M-tert-butyl)(+) ions at m/e 567 and 569. Bias is investigated by measuring the uric acid level in the same samples under different chromatographic conditions and with different ionization tech-

niques. Uric acid was determined in three lyophilized human serum pools by this method. For Standard Reference Material (SRM) 909, four sets of six samples each were prepared. For Candidate SRM 909a, which consisted of two pools, each with a different level of uric acid, six sets of two samples of each level were prepared. The coefficient of variation for a single measurement ranged from 0.34% to 0.42%, while the relative standard error of the mean ranged from 0.06% to 0.14%. The combination of high precision and absence of significant bias in the results qualifies this method as a candidate definitive method as defined by the National Committee for Clinical Laboratory Standards.

Tunable Diode Laser Absorption Spectrometry for Ultra-Trace Measurement and Calibration of Atmospheric Constituents.
Final rept.

A. Fried, and R. Sams. 1987, 11p
Pub. in Sampling and Calibration for Atmospheric Measurements, ASTM STP 957, p121-131 1987.

Keywords: *Hydrogen chloride, *Nitrogen dioxide, *Nitrogen oxide(NO), *Ozone, *Infrared spectroscopy, Reprints, *Tunable lasers, Atmospheric chemistry, Trace gases.

There has been an ongoing quest for development of ever more sensitive and selective detection methods for studying various gas molecules of atmospheric importance. Both laboratory and ambient studies often require instrumentation capable of measuring ultra-trace concentrations of such gases at, and below, the part-per-billion range. Concurrently, accurate calibration standards, particularly those verified by independent techniques, are also required. The sensitive, selective and versatile technique of infrared tunable diode laser absorption spectrometry is especially well suited for ultra-trace gas measurements. This combination which is not shared by many other measurement techniques, results from the fact that diode laser spectrometers can be operated in an absolute mode as well as a more sensitive relative mode. In the paper, the authors discuss these capabilities and present specific examples for the measurement and calibration of ultra-trace levels of the important atmospheric gases NO2 and HCl. In addition, The authors further discuss the application of tunable diode laser absorption spectrometry in the verification of NO2 permeation standards using the gas-phase titration reaction between NO and O3.

Precision and Accuracy of Mass Flow Measurement in the NIST-Boulder Nitrogen Flow Facility.
Final rept.

S. E. McFaddin, J. A. Brennan, and C. F. Sindt. 1989, 12p
Sponsored by Gas Research Inst., Chicago, IL.
Pub. in Proceedings of International Conference on Mass Flow Measurement: Direct and Indirect, London W1, England, February 21-22, 1989, 12p.

Keywords: *Mass flow, *Nitrogen, *Accuracy, *Precision, Flow measurement, Chemical laboratories, Boulder(Colorado), Condensing, Vaporizing, Cryoscopy, Reprints.

The mass flow measurement facility at the National Institute of Standards and Technology (NIST) in Boulder, Colorado, U.S.A., has been upgraded and an analysis of the precision and accuracy has been performed. The facility uses nitrogen as the process fluid which circulates through two flow measurement test sections. The first test section is used to test cryogenic flowmeters and operates at temperatures between 80 and 90 K and at pressures between 0.1 and 0.8 MPa. The second test section is used to test gas flowmeters and operates near ambient temperature and pressures between 3.8 and 4.1 MPa. The gas, at a density of 48 kg/cu m, is converted back to liquid, at a density of 800 kg/cu m, and the mass is measured with a load cell. The paper describes the operation and capabilities of this nitrogen mass flow measurement facility. The precision and accuracy of mass flow measurement in both the gas and liquid test sections are documented. Per-

formance of several flowmeters in the gas and liquid test sections are shown.

Anomalous Behavior of Selected Methyl-Substituted Polycyclic Aromatic Hydrocarbons in Reversed-Phase Liquid Chromatography.
Final rept.

S. A. Wise, L. C. Sanders, R. Lapouyade, and P. Garrigues. 1990, 12p
Pub. in *Jnl. of Chromatography* 514, p111-122 1990.

Keywords: *Aromatic polycyclic hydrocarbons, Chemical analysis, Molecular structure, Chromatographic analysis, Isomerization, Reprints, *Liquid chromatography, *Anomalous dimension.

In the reversed-phase liquid chromatographic separation of polycyclic aromatic hydrocarbons (PAHs) on C18 phases, methyl-substituted PAHs are expected to elute after the unsubstituted parent PAH based on the increase in hydrocarbonaceous contact area of the methyl-substituted PAHs. However, the authors have observed that several methyl-substituted PAHs elute prior to the parent compound, e.g., 1-methylperylene, 1-methylpicene and 13-methylpicene. To investigate this anomalous retention behavior, the retention characteristics of all methyl-substituted isomers of chrysene, picene and perylene were compared on a series of sixteen commercially prepared C18 phases. The anomalous retention behavior was observed only on polymeric C18 phases (i.e., those prepared using trifunctional silanes) whereas the methyl-substituted PAHs elute after the parent PAH, as would be expected, on monomeric C18 phases (i.e., those prepared using monofunctional silanes). The early elution of some of these methyl-substituted isomers is related to the non-planarity of these PAHs due to the presence of the methyl group in the so-called 'bay-region' of the PAH structure. The non-planarity of these methyl-PAHs can be characterized by the dihedral angle of distortion between the aromatic rings.

Atom Probe Field-Ion Microscopy Applications.
Final rept.

P. P. Camus. 1990, 12p
Pub. in *High Temperature Science* 26, p131-142 1990.

Keywords: Chemical analysis, Mass spectrometry, Reprints, *Field ion microscopy, *Ion microscopy, *Atom probes, Time-of-flight mass spectrometers, Uses.

Field-ion microscopy is a real-space atomic resolution microscopy that has the unique ability of serial sectioning a specimen in a controlled manner. Thus, the true three-dimensional structure of defects and particles may be obtained. Atom probe analysis is a powerful chemical analysis technique that possesses both high spatial (<2nm) and depth (0.2 nm) resolutions. Light elemental analyses are routine because there is no mass limitation for this mass spectrometric technique. The paper first presents a general description of the physics of these techniques, followed by a selected review of applications.

Pub. in *Fresenius Jnl. Analytische Chemie* 338, n4 426-429 1990.

Keywords: *Chemical analysis, *Bile pigments, Blood analysis, Impurities, Blood serum, Sample preparation, Stereochemistry, Molecular isomerism, Reprints, *Standard reference materials, Bilirubin, High performance liquid chromatography, Thin layer chromatography.

The process used to certify Standard Reference Material (SRM) 916a Bilirubin is described. The certification involved the use of various analytical techniques to detect or quantitate impurities, as well as to characterize the SRM itself. Bilirubin (BR) is believed to exist, in human serum, as the IX alpha isomer. Samples pre-

pared commercially, including this SRM, also contain the III alpha and XIII alpha isomers which are believed to be formed during purification. For the SRM, the three isomers were measured by HPLC and TLC. 1H NMR was used to detect and quantitate chloroform in the BR. Biliverdine and mesobilirubin were not detected. Impurities insoluble in chloroform, the residue from the ashing of BR, and volatiles were measured, in addition to non-acidic impurities and impurities more acidic than BR. The absorptivity of BR in chloroform was measured. A pink fluorescent impurity was detected and measured by TLC. From these analyses, a best estimate of the total amount of impurities was determined, and the BR was issued as SRM 916a with a certified purity of 98.3 + or - 0.3%.

Sponsored by Department of Energy, Washington, DC. Carbon Dioxide Research Div.
Pub. in *Proceedings of ASMS Conference on Mass Spectrometry and Allied Topics (38th)*, Tucson, AZ., June 3-8, 1990, p71-72.

Keywords: *Carbon dioxide, *Mass spectrometry, Isotope effect, Reprints, *Isotope dilution, Fractional abundance ratios.

Isotope dilution mass spectrometry (IDMS) can provide concentration and isotopic information of high quality for analytes in a variety of matrices. However, the IDMS technique has been underutilized for gaseous analytes, and many effects on analytical precision and accuracy are not well understood. The authors have recently developed manometry-based gas IDMS for the analysis of CO₂-in-air. Here, the authors report results from that study to understand the practical isotopic effects that occur when blending isotopically different pools of a molecular analyte, and the use of multiple fractional abundance ratios as a way to monitor these isotopic effects.

Pub. in *Jnl. of the American Chemical Society*, v108 n4 p3913-3919 1986.

Keywords: *Alkyl radicals, *Cyanides, Carbon, Chemistry, Electron acceptors, Hydrogen, Ions, Protons, Sources, Stability, *Isocyanides.

The present paper consists of three parts. The first part presents the experimental results and a qualitative discussion of some aspects of the results and a qualitative discussion of some aspects of the results. The second part deals with alkyl ion affinities. For this purpose we note that protonated isocyanides may be considered alkylated hydrogen cyanides, i.e., HCN-R(+). We, therefore, use the present data to derive the alkyl cation affinities of HCN, i.e., the bond-dissociation energies D (R-NCH(+)). These results are compared with the alkyl cation affinities of other lone-pair donors, specifically, H₂O, NH₃, and HNC. The point of interest here is whether the alkyl cation affinities correlate with

stabilities of the ions as measured by the hydride affinities of R+. The last part presents a theoretical examination of the trends observed in the experimental data. Specifically, we look into the following questions: (1) Why is the proton affinity of RNC higher than that of the corresponding RCN isomer and why are these differences independent of R. (2) What bond length changes occur in RNC upon protonation and what are the origins of these changes. (3) What is the source of the alkyl substituent effect on the observed proton affinities. Keywords: Protons; Affinities; Cyanides; Iso-cyanides; Alkyl compounds; Effects.

Final rept.

F. P. Schwarz. 1988, 8p

Pub. in *Biochemistry* 27, n22 p84 29-8436, 1 Nov 88.

Keywords: *Ribonuclease, Temperature, pH, Nucleic acid denaturation, Reprints, *Differential scanning calorimetry, *Cytidine monophosphate, *Uridine monophosphate, Enthalpy.

Differential scanning calorimetry (DSC) measurements were performed on the thermal denaturation of ribonuclease α and ribonuclease α complexed with an inhibitor, cytidine or uridine 3'-monophosphate, in sodium acetate buffered solutions. Thermal denaturation of the complex results in dissociation of the complex into denatured ribonuclease α and free inhibitor. Binding constants of the inhibitor to ribonuclease α were determined from the increase in the denaturation temperature of ribonuclease α in the complexed form and from the denaturation enthalpy of the complex. Binding enthalpies of the inhibitor to ribonuclease α were determined from the increase in the denaturation enthalpy of ribonuclease α complexed with the inhibitor. For the cytidine inhibitor in 0.2 M sodium acetate buffered solutions, the binding constants increase from 87 + or - 8 M(-1) (pH 7.0) to 1410 + or - 54 M(-1) (pH 5.0), while the binding enthalpies increase from 17 + or - 13 kJ/mol(-1) (pH 4.7) to 79 + or - 15 kJ/mol(-1) (pH 5.0). For the uridine inhibitor in 0.2 M sodium acetate buffered solutions, the binding constants increase from 104 + or - 1 M(-1) (pH 7.0) to 402 + or - 7M(-1) (pH 5.5), while the binding enthalpies increase from 16 + or - 5 kJ/mol(-1) (pH 6.0) to 37 + or - 4 kJ/mol(-1) (pH 5.0). The binding constants and enthalpies of the cytidine inhibitor in 0.05 M sodium acetate buffered solutions increase respectively from 328 + or - 37/M(-1) (pH 6.5) to 2200 + or - 364 M(-1) (pH 5.5) and from 22 kJ/mol(-1) (pH 5.5) to 45 + or - 7kJ/mol(-1) (pH 6.5).

Gas Phase Reactions of Phenyl Radicals with Aromatic Molecules.

Final rept.

A. Fahr, and S. E. Stein. 1988, 5p

Pub. in *Jnl. of Physical Chemistry* 92, n17 p4951-4955 1988.

Keywords: *Benzenes, *Aromatic polycyclic hydrocarbons, *Gases, *Reaction kinetics, Chemical analysis, Toluene, Phenols, Cycloalkane hydrocarbons, Reprints, *Phenyl radicals.

Relative rates of reactions of phenyl radicals with a series of aromatic and polycyclic aromatic compounds are reported. Most studies were done in static reactors at 450 C using diphenyldiketone (benzil) as the phenyl radical source. Reactions with the following molecules are reported: benzene, toluene, p-xylene, 1,3,5-trimethylbenzene, phenol, bromobenzene, naphthalene, biphenyl, anthracene, 9-methylanthracene and triphenylene. For reactions with substituted benzenes, H-abstraction is the dominant reaction. Relative rates of phenylation at different sites do not closely follow established trends for rates of radical attack. It is proposed that these deviations are primarily due to a dependence of the degree of reversibility on the phenylation site.

Tracking Chemical Transformations of Particles in the Raman Microprobe.

Final rept.

E. S. Etz. 1987, 5p

Pub. in *Microbeam Analysis*, p158-162 1987.

Keywords: *Raman spectra, *Electron probes, *Aerosols, Particle interactions, Chemical reactions, Reaction kinetics, Carbon dioxide, Ammonia, Water, Air pollution, Sulfates, Uranium oxides, Oxidation, Lithium oxides, Lithium hydroxide, Reprints.

Chemical transformations of microparticles are conveniently studied in the Raman microprobe. The analysis can be performed under ambient conditions, without the constraints of an evacuated sample chamber, permitting the analyst to study compositional changes undergone by reactive particles. Furthermore, Raman microspectroscopy provides for molecular speciation, thus discerning compositional transformations that would ordinarily not be detected by any of the elemental microprobe techniques. The attributes have allowed the study of various types of particle systems which undergo rapid, moderately fast, and slow, long-term chemical modifications when in contact with the reactive components of ambient air. Discussed are examples from various areas of NBS research related to the study of sulfate aerosols with relevance to atmospheric reactions, characterization of microparticle transformations in the lithium oxide/hydroxide system, and investigation of the long-term stability of uranium oxide reference materials. The chemical transformations in the particle systems are governed by the reactivities to concentrations of H₂O, CO₂ and NH₃ in ambient air.

Reactions between Silicon and Nitrogen. Part 2. Microstructure.

Final rept.

H. M. Jennings, B. J. Dalgleish, and P. L. Pratt. 1988, 11p

Pub. in *Jnl. of Materials Science* 23, n7 p2573-2583 1988.

Keywords: *Chemical reactions, *Silicon, *Nitrogen, *Silicon nitrides, *Microstructure, Impurities, Gas flow, Single crystals, Surface chemistry, Reprints, Temperature dependence.

The silicon nitride that forms as a result of reaction between solid silicon and nitrogen has several morphologies and occurs in the two phases, alpha and beta. Reasons are proposed to account for certain reaction conditions to particular microstructural features of the product. The reaction conditions considered were temperature, addition of other gases to the nitrogen, and whether or not the gas is flowing over the reacting surface. Both the morphology and the phase composition of each microconstituent in the product were examined. The observations were made using high purity single crystal silicon slices and purified nitrogen at temperatures below the melting point of silicon.

Rate Constants for One-Electron Oxidation by the CF(sub 3)O(sub 2)-, CCl(sub 3)O(sub 2)-, and CBr(sub 3)O(sub 2)- Radicals in Aqueous Solutions.

Final rept.

R. E. Huie, D. Brault, and P. Neta. 1987, 9p

Pub. in *Chemico-Biological Interactions* 62, n3 p227-235 1987.

Keywords: *Oxidation tests, *Radiolysis, *Free radicals, *Peroxy organic compounds, Spectrophotometry, Kinetics, Alcohols, Substrates, Toxicity, Chemical analysis, Solutions, Water, Reprints, Cytochrome P-450, Porphyrin.

The peroxy radicals CF₃O₂, CCl₃O₂, and CBr₃O₂ were produced by radiolysis of aerated aqueous-alcohol solutions of CF₃Br, CCl₃Cl, CCl₄, or CBr₄. Kinetic spectrophotometric presence of various substrates: urate, ascorbate, xanthine, hydroquinone, p-methoxyphenol, phenol, and chlorpromazine. Absolute rate constants for one-electron oxidation of these substrates by the alkylperoxy radicals were found to vary from 10(sup 5) to 10(sup 9)/M/s, depending to some extent on the order of reactivity of CF₃O₂, which may have deleterious effects on biological systems. Its likely environmental precursor, CF₂Br, which is used as a fire extinguisher and a refrigerant, was found to be reduced by a ferrous porphyrin model for cytochrome P450, only very slowly and thus is not expected to have major toxic effect if inhaled.

Formation and Decay of Zinc Tetrakis(N-methyl-4-pyridinio)porphyrin pi-Radical Cation in Aqueous Solutions Containing Azide Ions and Polyelectrolyte.

Final rept.

G. S. Nahor. 1988, 8p

Sponsored by Department of Energy, Washington, DC. Pub. in *Jnl. of Physical Chemistry* 92, p4359-4366 1988.

Keywords: *Reaction kinetics, *Porphyrins, *Zinc organic compounds, Cations, Free radicals, Solutions, Electrolytes, Inorganic azides, Radiolysis, Reprints, Porphyrin/zinc tetrakis(N-methyl-4-pyridinio), Osmolar concentration.

The formation and decay of the pi-radical cation of zinc tetrakis(N-methyl-4-pyridinio)porphyrin (ZnTMPyP4+) were studied by using the pulse radiolysis technique. The radical cation (ZnTMPyP5+) was produced in N₂O-saturated, aqueous solutions containing azide ions. Its formation and decay kinetics were monitored by following its absorbance at 700 nm. The formation kinetics and the initial absorbance were found to depend on both ZnTMPyP4+ and azide concentrations. The decay kinetics were second order with respect to (ZnTMPyP5+) and depended on (N₃ minus), (ZnTMPyP4+), and the ionic strength. The results are explained by multicomplexation of ZnTMPyP5+ with azide and by a decay via an equilibrium process involving the ZnTMPyP5+/N₃ minus complexes, ZnTMPyP4+, and the dication ZnTMPyP6+. When a negatively charged polyelectrolyte, poly(styrenesulfonate) (PSS), was added, a decrease in the rate of the ZnTMPyP5+ formation was observed as well as a decrease in the initial absorbance. These results are related to the binding of the porphyrin to the oppositely charged polyelectrolyte. A slight increase in the decay rate was also observed, which was interpreted by dynamics of the binding process, or aggregation. Optimal conditions are suggested for utilization of ZnTMPyP4+ in the photooxidation of water.

Hydrogen insertion compounds of V9Mo6O40 have been synthesized and investigated using incoherent inelastic neutron scattering (IINS) vibrational spectroscopy. IINS spectra of H(x)V9Mo6O40 (x = 7.8 and 17.5) confirm that in both phases H is present in coordinated hydroxyl groups. There is no evidence for the presence of coordinated water in contrast to the hydrogen insertion compounds of MoO3 and V2O5.

Flash Photolysis Resonance Fluorescence Investigation of the Gas Phase Reactions of Hydroxyl Radicals with a Series of Aliphatic Ketones Over the Temperature Range 240-440 K.

Final rept.

T. J. Wallington, and M. J. Kurylo, 1987, 5p

Pub. in Jnl. of Physical Chemistry 91, n19 p5050-5054 1987.

Keywords: *Fluorescence, *Ketones, *Aliphatic hydrocarbons, *Photolysis, Temperature, Reprints, *Gas phase.

Absolute rate constants have been determined for the gas phase reactions of OH radicals with a series of aliphatic ketones using the flash photolysis resonance fluorescence measurement technique. Experiments were performed over the temperature range 240 - 440K at total pressures (using Ar diluent gas) between 25-50 torr. The rate constant data for acetone (k1), 2-butanone (k2), and 3-pentanone (k3) were used to derive the Arrhenius expressions: $k_1 = (1.7 \text{ plus or minus } 0.4) \times 10^{10} (\text{sup } -12) \text{ exp } (-600 \text{ plus or minus } 75) / \text{T} / \text{cubic cm/molecule/s}$; $k_2 = (2.3 \text{ plus or minus } 1.1) \times 10^{10} (\text{sup } -12) \text{ exp } (-170 \text{ plus or minus } 120) / \text{T} / \text{cubic cm/molecule/s}$; and $k_3 = (2.8 \text{ plus or minus } 0.3) \times 10^{10} (\text{sup } -12) \text{ exp } (10 \text{ plus or minus } 35) / \text{T} / \text{cubic cm/molecule/s}$. These results are discussed in terms of reactivity trends for C-H bonds located in the alpha, beta, and gamma positions with respect to the carbonyl group.

Pub. in International Jnl. of Chemical Kinetics 19, n8 p725-739 1987.

Keywords: *Reaction kinetics, *Benzene, *Ethane, Temperature, Reprints, *Gas phase, *Halogenated aromatic hydrocarbons, *Hydroxyl radical.

Absolute rate constants for the gas phase reactions of OH radicals with ethane, benzene, fluorobenzene, chlorobenzene, bromobenzene, iodobenzene, and

hexafluorobenzene have been measured over the temperature range 234-438K using the flash photolysis resonance fluorescence technique. At elevated temperatures and under pseudo-first-order reaction conditions, non-exponential hydroxyl radical decays were observed for benzene and the monosubstituted halo-aromatics. For ethane and hexafluorobenzene, exponential decays were observed over the complete temperature range and the data were fit by the Arrhenius expressions: $k_1 = (8.4 \text{ plus or minus } 3.1) \times 10^{10} (\text{sup } 12) \text{ exp } (-1050 \text{ plus or minus } 100) / \text{T}$ and $k_7 = (1.3 \text{ plus or minus } 0.3) \times 10^{10} (\text{sup } -12) \text{ exp } (-610 \text{ plus or minus } 80) / \text{T}$ respectively. The results are compared with previous literature data and the mechanistic implications are discussed.

Gas Phase Reactions of Hydroxyl Radicals with a Series of Aliphatic Ethers Over the Temperature Range 240-440 K.

Final rept.

T. J. Wallington, R. Liu, P. Dagaut, and M. J. Kurylo,

1988, 9p

Pub. in International Jnl. of Chemical Kinetics 20, n1 p41-49 1988.

Keywords: *Chemical reactions, *Ethers, *Aliphatic hydrocarbons, Temperature, Pressure, Fluorescence, Reprints, *Gas phase.

Absolute rate constants have been determined for the gas phase reactions of OH radicals with a series of aliphatic ethers using the flash photolysis resonance fluorescence technique. Experiments were performed over the temperature range 240 - 440K at total pressures (using Ar diluent gas) between 25-50 torr. The kinetic data for dimethylether (k1), diethylether (k2), and dipropylether (k3) were used to derive the Arrhenius expressions: $k_1 = (6.7 \text{ plus or minus } 1.5) \times 10^{10} (\text{sup } -12) \text{ exp } (-300 \text{ plus or minus } 70) / \text{T} / \text{cubic cm/molecule/s}$; $k_2 = (5.6 \text{ plus or minus } 1.7) \times 10^{10} (\text{sup } -12) \text{ exp } ((270 \text{ plus or minus } 100) / \text{T}) / \text{cubic cm/molecule/s}$; and $k_3 = (11 \text{ plus or minus } 3) \times 10^{10} (\text{sup } -12) \text{ exp } ((150 \text{ plus or minus } 80) / \text{T}) / \text{cubic cm/molecule/s}$. At 296K, the measured rate constants (in units of $10^{10} (\text{sup } -13) / \text{cubic centimeter/molecule/s}$) were: $k_1 = (24.9 \text{ plus or minus } 2.2)$, $k_2 = (136 \text{ plus or minus } 9)$, and $k_3 = (180 \text{ plus or minus } 22)$. Room temperature rate constants for the OH reactions with several other aliphatic ethers were also measured. These were (in the above units): di-n-butylether, (278 plus or minus 36); di-n-pentylether, (347 plus or minus 20); ethyleneoxide, (0.95 plus or minus 0.05); propyleneoxide, (4.95 plus or minus 0.52); and tetrahydrofuran, (178 plus or minus 16).

Spatial Distribution of a-Si:H Film-Producing Radicals in Silane rf Glow Discharges.

Final rept.

D. A. Doughty, and A. Gallagher, 1990, 7p

Pub. in Jnl. of Applied Physics 67, n1 p139-145, 1 Jan 90.

Keywords: *Chemical radicals, *Glow discharges, *Silane, Glass fibers, Films, Substrates, Reprints, *Amorphous silicon, Silyl radicals.

Film growth on glass fibers (40 micrometers diameter) is used to probe the distribution of SiH4 decomposition products that produce alpha-Si:H films in silane rf glow discharges. The film thickness on fibers spanning the electrodes is measured versus position to map the spatial variation of the film-precursor (radical) density. The optical emission from the discharge, which is shown to be essentially equivalent to the distributed source of SiH4 decomposition products, is compared to the density maps. The comparison shows that the SiH3 radical dominates deposition, that the SiH3 is produced in the optically bright regions of the discharge, and that H atoms react rapidly with SiH4 before diffusing significant distances in the discharge. The perturbative nature of the probes on the discharge environment is also addressed.

The problems involved in preparing well-defined metal oxide surfaces are well known. The authors are investigating low power rf oxygen plasma treatment as a method for producing metal oxide surfaces of controlled stoichiometry and structure. The effects of exposing a 300 K oxygen deficient SnO2(110) - 4X1 surface to an oxygen plasma (0.1 Torr) have been examined using low-energy electron diffraction (LEED), x-ray photoemission spectroscopy (XPS), ultraviolet photoemission spectroscopy (UPS), ion scattering spectroscopy (ISS), and surface conductivity measurements. Results from the plasma-exposed surface have been compared to those obtained from a thermally oxidized (1 Torr O2, 700 K)SnO2(110) surface.

Gallagher, 1990, 9p

Contract DB-4-04078-1

Sponsored by Solar Energy Research Inst., Golden, CO.

Pub. in Jnl. of Applied Physics 67, n10 p6220-6228, 15 May 90.

Keywords: *Silane, Glow discharges, Chemical radicals, Reprints, *Amorphous silicon, *Silicon films, *Surface reactions.

A sensitive and straightforward technique is developed to measure the surface reaction probability beta for radicals that produce alpha-Si:H films in silane glow discharges. This technique is used to measure beta for both rf and dc discharges under a variety of conditions. Under conditions in which device-quality alpha-Si:H film is produced, $\beta = 0.37 \pm 0.04$. There is no discernible temperature dependence of beta between 20 and 250 C. This relatively large value of beta is inconsistent with previous ideas that a small beta was necessary to produce high-quality film. It is concluded that although beta is correlated with film quality it does not determine film quality. The authors propose that the ability of the film-producing radical to diffuse on the surface determines film quality.

Steady State Coupled Transport of Nitric Acid through a Hollow Fiber Supported Liquid Membrane.

Final rept.
R. D. Noble, and P. R. Danesi. 1987, 6p
Pub. in ACS (American Chemical Society) Symposium Series in Liquid Membrane 347, p56-61 1987.

Keywords: *Nitric acid, *Membranes, Separation, Water, Extraction, Mathematical models, Liquid phases, Reprints, *Supported liquid membranes, Aqueous solutions, Hollow fibers.

Nitric acid removal from an aqueous stream was accomplished by continuously passing the fluid through a hollow-fiber-supported liquid membrane (SLM). The nitric acid was extracted through the membrane wall by coupled transport. The system was modeled as a series of (SLM)-continuous stirred tank reactor (CSTR) pairs. An approximate technique was used to predict the steady state nitric acid concentration in the system. The comparison with experimental data was very good.

Photochemistry of Diacetylene.

Final rept.
S. Glicker, and H. Okabe. 1987, 4p
Pub. in Jnl. of Physical Chemistry 91, n2 p437-440 1987.

Keywords: *Photochemistry, Far ultraviolet radiation, Metastable state, Quantum efficiency, Reprints, *Diacetylene, Absorption coefficients, Satellite atmospheres, Titan.

The photochemistry of diacetylene has been studied at 147.0, 184.9, 228.8 and 253.7nm. The quantum yields of products and of reactant disappearance were measured in pure C₄H₂, C₄H₂ and N₂ mixtures, and C₄H₂ and D₂ mixtures. The primary photochemical process has been deduced from the photolysis of C₄H₂ and D₂ mixtures. Three dissociative processes are found important at 147.0 nm in addition to the excited state reactions; they are in order of decreasing importance, C₄H₂ + h(ν) -> C₄H + H, C₄H₂ + h(ν) -> C₂H₂ + C₂, and C₄H₂ + h(ν) -> 2C₂H + h(ν) -> 2C₂H. At longer wavelengths, reactions involving excited metastable states become predominant. The long wavelength photochemistry of diacetylene may play an important role in the formation of the stratospheric haze layer in Titan's atmosphere. Absorption coefficients of C₄H₂ have been measured in the 190 to 260 nm region.

Interfacial Electron Transfer Reactions between Platinum Colloids and Reducing Radicals in Aqueous Solution.

Final rept.
A. Harriman, G. R. Millward, P. Neta, M. C. Richoux, and J. M. Thomas. 1988, 5p
Pub. in Jnl. of Physical Chemistry 92, n5 p1286-1290 1988.

Keywords: *Reduction(Chemistry), *Oxidation, *Electron transfer, *Platinum, *Interfaces, *Colloids, *Free radicals, Voltammetry, Electrode potentials, Diffusion coefficient, Electrochemistry, Electron microscopy, Absorption spectra, Pyridines, Pulse analyzers, Reaction kinetics, Radiolysis, Reprints, *Aqueous solutions.

Cyclic voltammetry has been used to evaluate redox potentials, diffusion coefficients and heterogeneous electrochemical rate constants for reducing radicals derived from various N-methyl-bipyridinium ions, N-methylpyridinium ions, aryl ketones and p-nitrobenzoic acid in aqueous solution. The absorption spectra, rates of formation and stabilities of the radicals have been determined by pulse radiolytic techniques. All the above radicals transfer an electron to colloidal Pt particles (characterized by high resolution electron micros-

copy) and the bimolecular rate constants for such interfacial reactions have been measured under pulse radiolytic conditions. The magnitude of the rate constants is found to depend upon a number of factors related to both mass transfer and surface processes.

films, Plasmas(Physics), Reprints, *Nickel sulfides, *Sulfur 34, Electron microprobe analysis.

The analysis of natural abundance NiS particles mounted on an isotopically enriched (34)S film using a transmission geometry laser microprobe mass spectrometer provides a means for observing recombination reactions in the laser-induced plasma. It is apparent that (34)S from the isotopically enriched thin film is extensively combining in the plasma with nickel from the NiS particle. In addition, the data suggest that the recombination phenomenon occurs to a similar extent for the three cluster ions NiS(+), NiS₂(+), and Ni₂S(+). One exception for the NiS₂(+) case is the (58)Ni(34)S(34)S(+) ion which has a much larger contribution to recombination by the (34)S film. It probably reflects Ni attachment to (34)S(34)S dimers which are formed almost exclusively by contributions from the (34)S film.

Keywords: *Sulfur dioxide, *Air pollution, Free radicals, Photochemical reactions, Oxidation, Reprints, *Acid rain, Aqueous solutions.

A major mode of oxidation of SO₂ in atmospheric droplets involves a free radical chain. The free radical chain contributes both to the acidification of precipitation and to other possible chemical effects of atmospheric SO₂. The article reviews present understanding of the aqueous-phase radical chemistry of SO₂ and discusses some of the important reactions in that complex chain.

Reactions of Iron Porphyrins with CF₃, CF₃O₂, and CBr₃O₂ Radicals.

Final rept.
D. Braut, and P. Neta. 1987, 5p
Pub. in Jnl. of Physical Chemistry 91, n15 p4156-4160 1987.

Keywords: *Porphyrins, Metal containing organic compounds, Spectrophotometry, Iron organic compounds, Reaction kinetics, Free radicals, Alcohols, Radiolysis, Haloalkanes, Linolenic acid, Reprints, Iron ions, Peroxy radicals, Pulsed irradiation, Carbenes.

The reactions of ferric and ferrous deuteriochlorophyllin (PFe(+3), PFe(+2)) with alkyl and peroxy radicals derived from CF₃Br and CBr₄ were studied by kinetic spectrophotometric pulse radiolysis in aqueous solu-

hol solutions. The fenous compound reacts with CF3 radical at nearly diffusion controlled rate ($k=2 \times 10(\text{sup } 9)/\text{M/s}$) to form a metal-carbon bonded complex. The $\text{PFe}(\text{+}3)\text{CF}_3$ adduct subsequently reacts with another $\text{PFe}(\text{+}2)$ ($k=5 \times 10(\text{sup } 6)/\text{M/s}$) presumably to form the carbene intermediate $\text{PFe}(\text{+}2)\text{CF}_2$ which further hydrolyzes. The final products are $\text{PFe}(\text{+}3)$ and $\text{PFe}(\text{+}2)\text{CO}$. CF_3 radicals react also with $\text{PFe}(\text{+}3)$ ($k=4.5 \times 10(\text{sup } 8)/\text{M/s}$) to yield an oxidized product. The initial product undergoes a slow reaction ($k=2.8 \times 10(\text{sup } 3)/\text{s}$) ascribed to ligand exchange. CF_3 radicals do not react with $\text{PFe}(\text{+}3)$ on the pulse radiolysis time scale ($k < 10(\text{sup } 6)/\text{M/s}$). The peroxy radicals CF_3O_2 and CBr_3O_2 oxidize $\text{PFe}(\text{+}3)$ with reaction rate constants of 3.9×10 (sup 8) and 2.8×10 (sup 8)/M/s, respectively. The rate constant for the reaction of linolenic acid with CF_3O_2 radicals and CBr_3O_2 radicals are 6.9×10 (sup 6) and 1.2×10 (sup 6)/M/s, respectively.

The influence of boron ion implants on the optical and physical properties of Photochemically deposited SiO_2 films on $\text{Hg}_{0.7}\text{Cd}_{0.3}\text{Te}$ and silicon has been investigated. The distributions of the boron atoms between the SiO_2 film and substrate have been determined by a nondestructive neutron depth profiling method. The implants produce an apparent densification of SiO_2 films, which is accompanied by an increase in refractive index and changes in the infrared vibrational spectra for these films.

Pub. in Radiation Physics and Chemistry 33, n4 p361-370 1989.

Keywords: *Chemical radicals, Photolysis, Radiolysis, Reprints, *Sulfur oxide radicals, Rate constants.

Pulse radiolysis and laser-flash photolysis have been used to generate the radicals $\text{SO}_2(1-)$, $\text{SO}_3(1-)$, $\text{SO}_4(1-)$, and $\text{SO}_5(1-)$. Optical adsorption spectra for these radicals and rate data on their self-reactions have been derived. The decay of SO_2 , SO_3 , and SO_4 follow simple second-order kinetics; the decay of SO_5 is slow and not second-order when the radical is generated by pulse radiolysis, but is second-order when generated by O_2 reacts rapidly with O_2 and a rate constant was derived. SO_3 also reacts rapidly with O_2 and

a rate constant was derived for this reaction. The rate constant for the reaction of H with SO_2 was determined.

Experimental and ab initio dissociation energies of the $(\text{H}_2\text{O})_n(\text{CH}_3\text{CN})_m\text{H}^+(\text{+})$ ions are reported. The experimental energies range from 10-35 K cal/mol. The portion is best stabilized by placing the maximum number of acetonitrile molecules close to the protonated center in such a way that the maximum number of acetonitrile molecules close to the protonated center in such a way that the formation of a network of strong hydrogen bonds is still possible. Other results from this work are: distinct solvent shells can be distinguished in these complex ions; mixtures of several isomeric structures are unlikely for $n < \text{or} = 4$; when a water of an acetonitrile molecule clusters with $(\text{H}_2\text{O})(\text{CH}_3\text{CN})\text{H}^+(\text{+})$, the proton is transferred from the acetonitrile to the water; although electrostatic interactions make the dominate contribution to the bonding in these systems, polarization and charge-transfer effects contribute also; there is a cooperativity effect among the hydrogen bonds that lead to extensive change in geometry and charge distribution also; there is a cooperativity effect among the hydrogen and the relative complexation energies along a series of reactions correlate with many properties of the electron donor and with several properties of the electron donor and with several properties of the proton donor.

The techniques of solid state nuclear magnetic resonance, fluorescence spectroscopy, electron spin reso-

nance, and x-ray diffraction were applied to characterize aspects of the solid state structures of rigid rod polymers and their blends with flexible polymers. NMR and fluorescence spectroscopies were used to investigate the degree to which the rigid rod - flexible polymers blends exist as phase separated systems. It was found that these materials form primarily phase segregated structures, a condition which limits the reinforcing potential of rigid rod polymers in molecular composites. Most specimens also reinforcing potential of rigid rod polymers in molecular composites. Most specimens also exhibited NMR signals indicative of mobile, and presumably lower molecular weight, species. It is postulated that these mobile species are either water or residual acid from which the materials are processed. Information regarding the location of the mobile species in the structures exhibited by rigid rod polymers and their blends with flexible polymers is deduced from NMR. Electron spin resonance measurements confirmed that free radicals are generated during mechanically stressing rigid rod polymer fibers. The as-processed fibers contained appreciable levels of free radicals and annealing at elevated temperatures caused a decrease in the free radical concentration by a factor of three. X-ray diffraction experiments were conducted at elevated pressure in a diamond anvill cell. The observed diffraction pattern is suggestive of the formation of a more ordered structure at elevated pressures. Keywords: PBT(Poly(Benzobisthiazole)); ABPBI (Poly(2,5(6) Benzimidazole)); Nylon 6.

Effects of orbital alignment on the near resonant energy transfer process from Calcium ($4s5p1P_1$) to Calcium ($4s5p3P_J$) induced by collisions with rare gases are studied in a crossed molecular beam. A linearly polarized, pulsed ultraviolet laser is used to introduce the initial orbital alignment, and the relative energy transfer cross sections as a function of alignment are monitored by time-gated fluorescence detection. Differential results are observed with several rare gases; a rare large, 50% enhancement in the rate is observed for the perpendicular vs. parallel approach with helium and neon. A smaller, but opposite effect is observed for xenon and no effect of alignment occurs with krypton.

Preliminary results of a high resolution spectroscopic study of the pressure dependence of the Raman vibrational Q-branch spectrum of pure CO are reported. Measurements are made at room temperature over the pressure range 0.5 to 6 atm. The technique of quasi-cw inverse Raman spectroscopy utilizing a pulsed single-frequency laser source is employed. This approach gives enhanced sensitivity compared to earlier work which employed cw lasers, allowing extension of that work to higher accuracy, higher J states,

and higher pressure. The goal of this work is to test the accuracy of a modified exponential-gap rate law model which is used to predict the pressure dependent spectra. The line broadening and shifting of the vibrational Q branch in pure HD has been measured for transitions $J = 0$ to 3 at room temperature over the density range 0.8 to 10.6 amagat. The shifting and broadening coefficients have been determined with an uncertainty of ± 0.002 /cm/amagat, which now provides a discriminating test for various semiclassical and quantum theoretical calculations. The line broadening coefficients are compared with linewidth data from other spectroscopic branches and with measurements of the rates of state-to-state rotational energy transfer. Use of an exponential gap law for the rates of rotational energy transfer allows estimates to be made of the contributions to the linewidths from rotationally inelastic, elastic vibrational dephasing, and elastic reorientation processes. This analysis suggests that rotational energy transfer occurs approximately 30% faster in $v = 1$ than in $v = 0$. Reprints. (AW)

Multiphoton vibrational excitation of deuterated hydrazoic acid, DN3, by a CO2 laser ($I=10$ GW/sq.cm.) leads to dissociation forming DN in both X 3 Sigma(-) (spin forbidden) and a 1 Delta (spin allowed) electronic states. Under collisionless conditions, the nascent DN fragments were probed via laser induced fluorescence, to determine initial product state distributions. The DN(X 3 Sigma(-) molecules are formed predominantly in the symmetric F1 and F3 spin-rotation states with little population ($< 6\%$) in the antisymmetric F2 levels. There is no significant population ($< 3\%$) in excited DN 3-Sigma(-) vibrational levels. The distribution of rotational states is Boltzmann-like, characterized by a rotational temperature of about 920 K for the F1, F3 states and 500 K for F2 levels. Doppler profiles showed a large kinetic energy release of about 100 cm total in the triplet channel. The DN(1 Delta) products are formed preferentially in the symmetric Delta(A'), e-labeled lambda doublet levels: Delta(A')/Delta(A) = 1.44. The DN(1 Delta) is formed with no vibrational excitation ($< 2\%$); the rotational states are populated Boltzmann-like with a rotational temperature of 425 K. Doppler profiles give a total kinetic energy of about 1500/cm in this channel. The observed DN(3 Sigma-) spin- and DN(1 Delta) Lambda-doublet selectivities reflect the symmetry properties of a planar transition state and that the low degree of DN(3 Sigma-) rotational and vibrational excitation is also expected from the transition state geometry. Vibrational and rotational Raman spectra of gases can provide an excellent measure of pressure, temperature, or species concentration when the detailed dependences of the spectra on these variables are known. While spontaneous Raman scattering serves an important role in such measurements, the improved immunity to background, the highly directional signal, and strong (for major species) signal strength of the coherent Raman techniques have made them the method of choice in many applications. Coherent anti-Stokes Raman spectroscopy (CARS) of vibrational Q-branch spectra, in particular, has become an important diagnostic probe in many combustion processes. The J and temperature dependence of the self-broadening coefficients for the Raman Q-branch lines of pure Carbon monoxide have been experimentally determined for Q(J) transitions with $J=0-38$ and for temperatures in the range 400-1500 K. It is shown that a fitting law, based on a modified exponential energy-gap model for the rates of state-to-state rotationally inelastic collisions, can account for the observed J dependence. The two parameters that determine the J dependence are found to be essentially independent of temperature. A temperature scaling function, recently proposed for N2, is added to the basic rate law, and accurate predictions of both the J and the T dependence of these coefficients and those previously reported at 298 K are obtained. This rate law model, used in conjunction with a relaxation matrix description of the Q-branch spectrum, is shown to give good agreement with the observed, partially collapsed spectrum at 2.8 atm and 295 K. Discharge sampling coupled with matrix isolation has provided a useful tool for obtaining the spectra of small molecular ions. The technique was first used in this laboratory for a study in which excited argon atoms and their resonance radiation interacted with acetylene outside the discharge region and the products were trapped in an excess of argon. In addition to the consistently good yield of HC2 which was stabilized in these experiments, prominent absorptions of C2 appeared. An application of the technique to HCC13 led to the appearance of very prominent absorptions of HCC12, which was shown to undergo photoinduced proton transfer to the argon matrix on subsequent filtered mercury-arc photolysis. Many subsequent studies have been reviewed by Jacox and by Andrews. Common to these studies is the requirement that ions be formed at an energy below 11.8 eV, the position of the highest member of the first group of excited energy levels of the argon atom. Reprints. Keywords: Air, *Carbon monoxide, Coefficients, Collisions, Computations, Diagnosis(General), *Diatomic molecules, Diffusion coefficient, Experimental data, Functions, *Hydrogen, *Line spectra, Low pressure, Molecules, Optical properties, Shape, Shifting, Velocity, *Collision broadening, Molecular properties, Relaxation, Nitrogen, Deuterium, Cross sections, Spectrometry, *CARS(Coherent Anti Stokes Resonance Raman Spectrometry), Coherent anti stokes resonance raman spectrometry, J Dependence, T Dependence, Line broadening, Line shifting coefficients, Energy gap rate law, Line shape, Dephasing cross sections, Optical diffusion coefficients.

The J-, and T-dependence of line broadening and line shifting coefficients are reported for the A-branch spectra of Carbon Monoxide and various hydrogen diatomics. Experimental studies verify our ability to predict, using an energy-gap rate law description of the relaxation matrix equation, the collisionally narrowed A branch of self-broadened Carbon Monoxide. Line shifting is determined experimentally and accounted for by semi-classical calculation. This calculation also is shown to be very accurate for self-broadening in Carbon Monoxide and is used to predict line broadening in CO:N2 from 295 to 1500K. The Q-branch line shape function for the hydrogen diatomics is studied for a range of collision partners and temperatures. In the low pressure, Dicke narrowed regime, the basic line shape function is understood; however, there is no reliable basis for prediction of the (in some cases complex) optical diffusion coefficient. In the pressure broadened regime, anomalous, asymmetric lineshapes are reported for the H2(D2): Air system. These are ascribed to inhomogeneous broadening associated with the speed dependence of dephasing cross-sections. This lineshape is shown to collisionally narrow and symmetrize with increasing H2(D2) concentration. The J-dependence of the line broadening for the hydrogen diatomics is described. (AW)

Although the mass spectrometric detection of molecular ions is common place, relatively little is known about their structures and the properties of their chemical bonds. Studies of the vibrational and electronic spectra of these species are exceptionally well suited to obtaining this information. Such studies would have the bonus of providing a basis for the development of non-intrusive, in situ laser probes for molecular ions in the lower ionosphere and in such important chemical reaction systems as those of chemical vapor deposition and microcircuit etching. Because of their great chemical reactivity, it has been difficult to maintain sufficiently high ion concentrations for molecular spectroscopic study. Reprints. (jes)

The spectroscopy of the O4(+) and O4(-) cluster ions is of considerable interest and importance. Both species are formed by the overlap of antibonding orbitals on the neutral and charged O2 species. Mass spectroscopic studies indicate that the resulting bond has considerably stability. Yang and Conway found that the O2 + O2(+) reaction to form O4(+) is exothermic by approx. 10 kcal/mol. When a relatively concentrated Neon:Diatomic oxygen sample is codeposited at approx. 5 K with a beam of excited neon atoms, prominent infrared absorptions appear which are assigned to O4(+) and O4(-). Absorptions of O3 and O3(-) are also present, and their product distributions in isotopic substitution experiments indicate that O-atom production and reaction is a minor channel in this experimental system. Detailed isotopic substitution experiments require that both O4(+) and O4(-) possess two equivalent O2 units. Analysis of the isotopic shifts strongly favors a planar trans configuration (C(2h)) for both molecules. Several combination bands of O4(+) are observed, and give evidence regarding the position of v1(a(g)), which is infrared inactive, and regarding perturbations by combinations of low-frequency fundamentals. The mechanism of photodestruction of the ions in this system is also considered. Reprints. (aw)

Structure and Reactivity of Chemisorbed Species and Reaction Intermediates: Progress Report, 1 December 1987-30 November 1988.

T. E. Madey. 1 Aug 88, 11p DOE/ER/13663-T2
Contract AI01-87ER13663

Portions of this document are illegible in microfiche products.

Keywords: *Catalysis, *Nitrogen Fluorides, *Phosphorus Fluorides, *Platinum, *Ruthenium, *Tungsten, Additives, Adsorption, Chemical Bonds, *Chemisorption, Crystal Structure, Inelastic Scattering, Kinetics, Molecular Structure, Progress Report, Reaction Intermediates, Spectroscopy, Structural Models, Surfaces, ERDA/360602, ERDA/400201.

The areas of work supported under this contract by DOE during the period 12/1/87-11/30/88 have a common theme: the structure and reactivity of chemisorbed species and reaction intermediates of importance to catalysis. A variety of tools have been used to study the structure and chemistry of surface species, and to develop models and concepts of broad utility in chemisorption and catalysis. Results of the research conducted or completed in the last year are described in this report, along with plans for next year. Results, summarized below, are presented in detail: I. Surface Reactions and Catalysis Over Well-Characterized Surfaces. This includes: Adsorption and surface reactions over model thin-film catalysts, e.g., monolayer films of Pt on tungsten; Inelastic Incoherent Neutron Scattering (IINS) as an in situ probe of surface chemistry over high area metal powders. II. Structure and Reactivity of Chemisorbed Species. The aims of this effort include determination of (a) the structure and reactivity of small molecules on single-crystal metal surfaces and the influence of surface "additives" (promoters and poisons) on structure, and (b) the structure and surface chemistry of adsorbed halogen-containing species. 2 figs. (ERA citation 14:006193)

The areas of work have supported a common theme: the structure and reactivity of chemisorbed species and reaction intermediate of importance to catalysis. A variety of tools have been used to study the structure and chemistry of surface species, and to develop models and concepts of broad utility in chemisorption and catalysis. Adsorption of carbon monoxide, ammonia, hydrogen, and sulfur are discussed. Results of the research conducted or completed in the last year, as well as plans for the coming year, are summarized in this report. The results will be presented in three sections: (a) Surface Molecular Structure and Reactivity as Studied Using Electron Simulated Desorption Ion Angular Distribution (ESDIAD) and High Resolution Electron Energy Loss Spectroscopy (HREELS); (b) Neutron Inelastic Scattering Studies of Adsorption and Reaction on Catalysts; and (c) Reaction Kinetics at High Pressures over Single Crystal Catalysts.

Keywords: *Ions, Acetates, Affinity, Alkoxides, Anions, Chemical Bonds, *Chemical Reaction Kinetics, Entropy, Equilibrium, Ethanol, Ferrocene, *Mass Spectroscopy, Progress Report, Pyrolysis, Solvation, Sulfur Fluorides, Sulfur Ions, Temperature Dependence, EDB/400201, *Organic compounds, *Chemical reaction mechanisms.

Essentially all of the completed/in progress studies during the last reporting period have involved the NIST pulsed electron beam high pressure mass spectrometer. Three distinct areas of research are recognizable; (i) determinations of binding energies and entropies for association and cluster ions, which is accomplished by measuring the temperature dependence of the equilibrium A(sup +) or A(sup -) + B (leftrightharpoon) A(sup +)(center dot)B or A(sup -)(center dot)B, (ii) measurement of the temperature dependence of biomolecular rate constants and unimolecular rate constants for the thermal decomposition (pyrolysis) of protonated organic molecules, and (iii) evaluation of proton affinities and gas phase acidities via measurement of variable-temperature equilibria of the type AH(sup +) + B (leftrightharpoon) BH(sup +) + A and A(sup -) + BH (leftrightharpoon) AH + B(sup -). The various systems and classes of molecules chosen for study were those deemed most likely to provide fundamental new information on ion kinetics, ionic stabilities and ionic reaction mechanisms. The key results of some representative projects are summarized.

Laser studies of chemical dynamics at the gas-solid interface. Progress report, January 1987-Jun 1989.

R. R. Cavanagh, and D. S. King. 1990, 14p DOE/ER/13150-T3

Contract AI05-84ER13150

Sponsored by Department of Energy, Washington, DC. Portions of this document are illegible in microfiche products.

Keywords: Gases, *Interfaces, Solids, Chemical Reactions, *Chemisorption, Laser Radiation, Platinum, Progress Report, Ruthenium, EDB/400201, *Surface reactions, Nitrogen oxide(NO), Carbon monoxide, Ammonia.

The DOE funded research program "Laser Studies of Chemical Dynamics at the Gas-Solid Interface" has taken a detailed, microscopic view of molecules desorbed from surfaces in order to gain an understanding of energy flow and interaction potentials and how these control chemical reactivity at interfaces. Successful completion of these experiments required technical expertise both in surface science and laser-based molecular dynamics, a collaborative situation that exists in the NIST center for Atomic, Molecular and Optical Physics. During the three year period covered by this progress report, our goal was to use state-resolved techniques to examine a single chemisorption system in detail, and to observe how changes in the interaction potential or method of surface excitation are manifest in the desorption dynamics. The system chosen was NO/Pt(111). Studies were undertaken in which the effects on the NO-Pt interaction potential of coadsorbates--both weakly (CO) and strongly (NH(sub 3)) interacting-- could be examined. In addition, attempts were to be made to study non-equilibrium dynamics by using pulsed laser heating. 18 refs.

Review of Model Sensor Studies on Pd/SnO2(110) Surfaces.

T. B. Fryberger, and S. Semancik. Jun 90, 13p
In NASA, Langley Research Center, Low-Temperature CO-Oxidation Catalysts for Long-Life CO2 Lasers p277-289.

Keywords: Gas sensor systems, *Palladium, *Tin oxides, *Adsorption, *Catalysts, Crystal surfaces, Gas analysis, Gas detectors, Additives, Reprints.

Studies performed at the National Institute of Standards and Technology on the model gas sensor system, Pd/SnO2(110), are reviewed. Adsorption and interfacial effects play a primary role in the gas sensing process, as they do in catalysis. For this reason, researchers have used a variety of surface sensitive techniques in the research, including x ray and ultraviolet photoelectron spectroscopies (XPS and UPS), low energy electron diffraction (LEED), and ion scattering spectroscopy (ISS). By combining these complementary techniques with in situ gas response (conductance) measurements, researchers were able to correlate directly sensor activity with the composition and structure of the Pd/SnO2 interface. Although the intent of this work is to develop an understanding of gas sensing mechanisms, its relevance to Pd/SnO2 catalytic systems is obvious.

Method and Apparatus for Supercritical Fluid Extraction Solution Separation.

Patent.

T. J. Bruno. Filed 21 Feb 90, patented 9 Oct 90, 8p
PB91-100438, PAT-APPL-7-482 589
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Patents, *Liquefied gases, *Solvent extraction, Carbon dioxide, Test equipment, Methodology, Oils, Nozzle flow, Solutions, *PAT-CL-585/834, *Separation processes, Supercritical gas extraction.

A method and apparatus for the separation of a desired product from a supercritical fluid extraction solution employ a restrictor nozzle, a coarse-pore sintered-glass enclosure member and a collecting means for collecting an oil suspension of the desired product. The supercritical fluid extraction solution is decompressed by passing through the restrictor nozzle. The resulting decompressed fluid stream is directed at the enclosure member which is saturated with an oil in which the desired product is soluble. Solutes including the desired product are dissolved in the oil, and the oil is collected. The method and apparatus are particularly suitable for use in separating beta-carotene from a carbon dioxide solvent.

Microcomputer Programs for Size Exclusion Chromatography.

Final rept.
B. Dickens, and F. McCrackin. 1989, 4p
Pub. in Computer Applications in Applied Polymer Science II, Chapter 3, p25-28 1989.

Keywords: *Molecular weight, *Size screening, *Chromatographic analysis, Automation, Process control, Distribution functions, Elution, Polymers, Reprints, Computer applications.

An implementation of automatic processing in a system of computer programs to perform size exclusion chromatography on IBM-compatible microcomputers is described. The programs allow identifying vials in an auto-injector, data collection from two detectors, and manual and automatic processing to compare chromatograms and calculate molecular weight averages. Chromatograms may be compared in terms of elution volume, log hydrodynamic volume and/or log molecular weight. The programs also perform chromatographic column calibration and various house-keeping activities. The user may assign each specimen to a class and thus determine the type of chromatogram matching and automatic processing for that specimen.

Intramolecular Dynamics in Molecule-Surface Collisions: Excitation, Dissociation, and Selectivity of Reactivity.

Final rept.
J. W. Gadzuk. 1987, 28p
Pub. in Surface Science 184, n3 p483-510 1987.

Keywords: Excitation, Dissociation, Scattering, Reprints, *Molecular collisions, *Surface reactions, Molecular dynamics.

Excitation of internal vibrational modes of molecules scattered from surfaces are considered here. Emphasis is placed upon a mechanism which follows if either charge transfer between the solid and molecule occurs or alternatively, if the intra-molecular geometry varies with molecule-surface separation. The excitation is studied in terms of both analytic quantum wave-packet dynamics over simplified model potential energy surfaces and numerical classical trajectories over more realistic surfaces. Conditions under which the analytic models provide realistic descriptions of the collision dynamics are determined. Finally, the theoretical model is applied to several problems of experimental relevance. In particular translational to vibrational energy transfer is studied molecules, dissociatively scattered diatomic molecules, and selectivity in the fragmentation distributions of scattered polyatomic molecules.

Crystal Structure of Ba3V4O13.
Final rept.
B. M. Gatehouse, L. W. Guddat, and R. S. Roth. 1987, 6p
Pub. in Jnl. of Solid State Chemistry 71, n2 p390-395 1987.

Keywords: *Crystal structure, Monoclinic lattices, X ray diffraction, Reprints, *Barium vanadates.

Ba3V4O13 crystallizes in the monoclinic system with unit-cell dimensions (from single crystal data) $a = 16.100(3)$, $b = 8.947(3)$, $c = 10.173(3)$, $\beta = 114.39(2)$ deg and space group $C2/c$, $z = 4$. The structure was solved using Patterson and Fourier techniques. The structure was refined by full-matrix least-squares methods, using 1604 ($l =$ or > 3 sigma (l)) unique counter-measured reflections, to a convention R of 0.028 (R_w 0.041). The structure comprises $Ba(2+)$ and $(V4)13(6-)$ ions. The $V4O13(6-)$ polyanion consists of four corner-shared vanadium tetrahedra in a U-shaped arrangement for which the torsion angle between the vanadium atoms is 56.07(6) deg. Other known $E4O13(n-)$ anions ($E=Al, Si, P$ or Cr) comprising corner-shared tetrahedra all have torsion angles that are > 172 deg.

Surface Conductivity Changes in SnO(sub 2)(110): Effects of Oxygen.

Final rept.

J. W. Erickson, and S. Semancik. 1987, 11p

Pub. in *Surface Science* 187, n2-3 pL658-L668 Sep 87.

Keywords: *Tin oxides, *Surface chemistry, *Conductivity, *Oxygen, Chemical analysis, Defects, Reprints, Temperature dependence, Vacuum spectroscopy, Ultra-high vacuum.

Sheet conductivity measurements have been used to monitor the effects of temperature and exposure to oxygen on the (110) surface of tin dioxide. The electronic property is a sensitive measurement of changes in composition and structure at and just below the surface, in the space-charge layer. Three surface structures characterized by low-energy electron diffraction (LEED) and other techniques were studied using a retractable four-point conductivity probe under ultra-high vacuum (UHV) conditions and at gas pressures up to 10 Torr. The observed conductivity changes are discussed in the context of the distribution and concentration of oxygen atoms in the space-charge layer.

pH Theory and Measurement.

Final rept.

R. A. Durst, W. F. Koch, and Y. C. Wu. 1987, 24p

Pub. in *Ion-Selective Electrode Review* 9, n2 p173-196 1987.

Keywords: *pH meters, Measurement, Buffers(Chemistry), Thermodynamics, Rain, Activity coefficients, Reprints, *Standard Reference Materials, Ion selective electrodes.

One of the most widely performed analytical measurements in chemical laboratories is that of pH using the glass electrode. In order to insure the consistency of the measurements, the National Bureau of Standards (NBS) has recommended an operational scale of pH, maintained in terms of the pH(S) of a series of standard solutions. Certified samples of buffer materials, from which the standard reference solutions of reproducible pH can be prepared, as well as solutions in the case of rainwater, are issued by the National Bureau of Standards as Standard Reference Materials. The report is concerned primarily with a discussion of the method used at NBS for the assignment of pH(S) values to these standard solutions, a description of the NBS measurement facilities for pH, and a summary of the characteristics of the buffer materials. A brief discussion of the IUPAC pH scale is included as well as a discussion of the types of electrodes used and the calibration of pH instrumentation.

Transpiration Mass Spectrometry of Liquid LiF: Vaporization Thermochemistry and Electron Impact Fragmentation.

Final rept.

D. W. Bonnell, J. W. Hastie, and K. F. Zmboj. 1988, 12p

Pub. in *High Temperatures-High Pressure* 20, n3 p251-262 1988.

Keywords: *Transpiration, *Mass spectroscopy, *Liquid phases, *Lithium fluorides, *Vaporizing, *Thermochemistry, Vapor pressure, High temperature tests, Electron beams, Ionizing radiation, Knudsen gages, Mathematical models, Thermogravimetry, Dimerization, Thermodynamics, Reprints.

A detailed study of the vapor thermochemistry of the LiF system has been carried out using a variety of techniques, including transpiration mass spectrometry (TMS), Knudsen effusion mass spectrometry (KMS) and Knudsen cell thermogravimetric analysis (TGA). Using the expansion cooled molecular beam from the TMS technique, it was possible to determine the extent of temperature dependent electron impact ionization fragmentation and to model the process. Phase analysis indicates that at high temperature (KMS conditions), the source of LiF(+) is the neutral precursor Li2F2, whereas in the cooled beam, LiF is the predominant source of LiF(+). Intercomparison of TGA-, KMS- and TMS-derived partial pressure data indicate excellent agreement with the accepted partial pressure extrapolation of the monomer over liquid LiF, and good agreement with the dimer and trimer. Ionization cross-sections for LiF monomer and dimer species were significantly lower than predicted by current empirical estimation methods.

Usefulness of Various Computer Algorithms for Locating Spots and Arrays in Electron Diffraction Patterns.

Final rept.

D. S. Bright. 1988, 8p

Pub. in *Microbeam Analysis*, p25-32 1988.

Keywords: *Electron diffraction, Pattern recognition, Algorithms, Reprints, *Image processing, Flying spot digitizers.

The search for regular arrays of spots in electron diffraction patterns is an image analysis problem with some typical stages: acquire, process and store the image; segment the image into spots; measure the spot locations; recognize the patterns and extract the data. Image processing algorithms that work at the pixel by pixel level representation of the image are used for the earlier stages of the problem, whereas algorithms using more abstract information are used for the final stages. Methods are recommended for each stage, and some alternatives are also presented. Topics covered include selection of thresholds, the top hat filter, the gradient, location diffraction spot centers, the linear Hough transform, symbolic representation of spots, and the search for and the measurement of basis vectors.

State-Resolved Evidence for Hot Carrier Driven Surface Reactions: Laser Induced Desorption of NO from Pt(111).

Final rept.

S. A. Buntin, L. J. Richter, D. S. King, and R. R. Cavanagh. 15 Nov 89, 18p

Contract DE-AL05-84ER13150

Sponsored by Department of Energy, Washington, DC. Pub. in *Jnl. of Chemical Physics* 91, n10 p6429-6446, 15 Nov 89.

Keywords: *Nitrogen oxide(NO), *Platinum, *Desorption, Resonance, Reprints, Laser induced desorption, Surface reactions.

State-specific diagnostics are used to characterize the laser-induced desorption of NO from Pt(111). Two desorption channels are observed; one is consistent with thermal activation, while the other is driven by adsorbate interactions with hot carriers. For this latter channel, the observed dependence of the desorption yield on the wavelength of the incident laser pulse (1907, 1064, 532, and 355 nm) and the wavelength dependence of the kinetic energy distributions establish the nonthermal nature of the excitation process. The inverted spin-orbit population, the non-Boltzmann rotational state distributions, and the vibrational state population are interpreted in terms of a desorption mechanism involving a temporary ion resonance.

Collisional Electron Detachment and Decomposition Cross Sections for SF(sub 6)(1-), SF(sub 5)(1-), and F(1-) on SF(sub 6) and Rare Gas Targets.

Final rept.

Y. Wang, R. L. Champion, L. D. Doverspike, J. K. Oithoff, and R. J. Van Brunt. 1989, 7p

Sponsored by Department of Energy, Washington, DC. Pub. in *Jnl. of Chemical Physics* 91, n4 p2254-2260, 15 Aug 89.

Keywords: Sulfur hexafluoride, Rare gases, Reprints, *Sulfur fluorides, *Electron detachment, *Ion-molecule collisions, Total cross sections, Negative ions, EV range 10-100, EV range 100-1000.

Absolute total cross sections for collisional electron detachment and collision-induced dissociation (CID) have been measured for binary collisions of SF6(1-) and SF5(1-) with rare gas and SF6 targets for laboratory collision energies ranging from about 10 up to 500 eV. The cross sections for electron detachment of SF6(1-) are found to be surprisingly small, especially for the SF6 target, for relative collision energies below several tens of electron volts. Specifically, detachment onsets are found to occur at around 30 and 90 eV for the rare gas and SF6 targets, respectively. The CID channel which leads to F(1-) as a product is observed to dominate detachment for relative collision energies below 100 eV. The results for the SF5(1-) projectile are remarkably similar to those exhibited for SF6(1-). The role of long-lived excited states in the reactant SF6 ion beam is discussed.

Microwave Spectrum and Structure of the H2O-SO2 Complex.

Final rept.

K. Matsumura, F. J. Lovas, and R. D. Suenram. 1989, 8p

Pub. in *Jnl. of Chemical Physics* 91, n10 p5887-5894, 15 Nov 89.

Keywords: *Sulfur dioxide, *Water, *Microwave spectra, Dipole moments, Rotational spectra, Molecular structure, Deuterium compounds, Reprints, *Complexes, Van der Waals forces, Dimers.

The microwave spectrum of H2O-SO2 has been observed with a pulsed beam, Fabry-Perot cavity, Fourier-transform microwave spectrometer. In addition to the normal isotopic form, the authors have observed the spectra of H2O-(34)SO2, HDO-SO2, and D2O-SO2. The geometry obtained from fitting the derived moments of inertia has the planes of the two monomer units tilted approximately 45 degree from the parallel orientation with the oxygen atom of the water closest to the S atom of SO2, giving an S-O distance of 2.824(16) A and a center-of-mass distance R(c.m.) = 2.962(5) A. The (SO2)2 species was also produced with the same nozzle expansion conditions as used for H2O-SO2.

**Influence of Iron on the Reaction between Silicon
 and Nitrogen.**
 Final rept.
 H. M. Jennings. 1988, 4p
 Pub. in Jnl. of Materials Research 3, n5 p907-910 Sep/
 Oct 88.

Keywords: *Iron, *Chemical reactions, *Silicon, *Nitro-
 gen, Silicon nitrides, Phase diagrams, Reaction kinet-
 ics, Reprints.

The ways in which iron may affect the reaction be-
 tween silicon and nitrogen are summarized and con-
 sidered both in terms of possible mechanisms of the
 nitridation process and also in terms of the phases pro-
 duced by the reaction. Some new results are reported
 that indicate that, in addition to removing an oxide
 layer on the silicon, or forming an alloy with the silicon,
 iron somehow modifies the behavior of the nitrogen.

**Raman Spectroscopy of Single Optically Levitated
 Droplets.**
 Final rept.
 T. R. Lettieri, R. E. Preston, and M. I. Bell. 1985, 3p
 Pub. in Proceedings of Chemical Research and Devel-
 opment Center's 1984 Scientific Conference on Ob-
 scuration and Aerosol Research, CRDC-SP-85007,
 p255-257 1985.

Keywords: *Raman spectroscopy, *Drops(Liquids),
 Laser beams, Argon lasers, Aerosols, Silicones,
 Phthalates, Evaporation, *Levitation, Characterization.

Spontaneous Raman scattering has been observed
 from single aerosol droplets optically levitated by an
 argon ion laser-beam. All of the Raman bands of bulk
 liquid silicone oil and dioctyl phthalate were present in
 spectra taken of droplets of the same liquids. It sug-
 gests that chemical characterization of individual drop-
 lets may be possible without the undesirable effects of
 a supporting substrate. The droplet spectra also con-
 tained unexplained, size-dependent sharp features su-
 perimposed on the Raman peaks. The new technique
 may have applications in chemical characterization
 studies of evaporating multicomponent droplets, drop-
 lets in chemically reacting flows, and other transient
 processes involving single liquid droplets.

 L. Iglesias, M. I. Cabeza, F. Rico, and V. Kaufman.
 1988, 16p
 Pub. in Physica Scripta 37, n6 p855-870 1988.

Keywords: *Energy levels, *Atomic structure, Spectro-
 graphs, Hartree-Fock approximation, Wave functions,
 Electron transitions, Reprints, *Molybdenum ions.

The spectrum of doubly ionized molybdenum (Mo III)
 was produced in a sliding-spark discharge and record-
 ed photographically in the 1100-3250 Å spectral region
 using the NBS 10.7-m normal-incidence vacuum spec-
 trograph. The level system was revised and extended
 to include 54 levels of the 4d(sup 4) and 4d(sup 3)5s
 even configurations and 66 levels of the 4d(sup 3)5p
 odd configuration. A total of 682 lines have been clas-
 sified as transitions between the levels. The observed
 level system was interpreted by means of relativistic
 Hartree-Fock calculations and least-squares paramet-
 ric fits.

 Sponsored by Office of Naval Research, Arlington, VA.
 Pub. in Chemical Physics Letters 162, n4-5 p404-408,
 20 Oct 89.

Keywords: *Surface energy, *Force, *Viscosity,
 *Water of hydration, *Silicon dioxide, *Sheets, Meas-
 urement, Test equipment, Aqueous electrolytes,
 Sodium chloride, Reprints, Israelachvili apparatus.

A method of preparing silica surfaces for use in the
 Israelachvili surface force apparatus is described. Two
 silica sheets were immersed in aqueous solutions of
 NaCl to study both the surface forces between them
 and the viscosity of the intervening aqueous film. The
 force shows a short-range hydration repulsion, indicat-
 ing a modified water structure at the silica interface,
 but the viscosity does not differ from the value of bulk
 water.

**Theoretical Study of the Three-Body Absorption
 Spectrum in Pure Rare Gas Fluids.**
 Final rept.
 B. Guillot, R. D. Mountain, and G. Birnbaum. 1988,
 11p
 Sponsored by Paris-6 Univ. (France). Lab. de Physique
 Theorique des Liquides.
 Pub. in Molecular Physics 64, n4 p747-757 Jul 88.

Keywords: *Rare gases, *Three body problem, Qua-
 drupole moment, Absorption spectra, Far infrared radia-
 tion, Liquefied gases, Helium, Krypton, Reprints,
 Atomic collisions, Molecular dynamics, Jansen model.

The three-body induced dipole resulting from ternary
 collisions among identical atoms is calculated within
 the framework of the one effective-electron model of
 Jansen. It is found that at short and intermediate
 range, the main contribution comes from dipoles in-
 duced by exchange quadrupole moments (EQID).
 Moreover, a rough estimate shows that the long-range
 dispersion contribution to the three-body dipole is ne-
 gligible for (He)3 but becomes significant for (Kr)3. In

order to investigate the nature of a spectrum due to
 triplet interactions, a molecular dynamics simulation
 taking into account only the EQID mechanism is per-
 formed to generate the translational absorption spec-
 trum in gaseous and liquid krypton. In the liquid, the
 correlation function exhibits two time scales; a fast
 decay corresponding to the mean duration of ex-
 change quadrupoles, and a slower decay, lasting sev-
 eral ps, which is associated with translational diffusion.
 A very rough estimate of the expected absorption in
 liquid krypton is also given.

**Hydrogen Evolution Cathodes with AB(sub 5)-
 Catalyzed Coatings.**
 Final rept.
 D. E. Hall, J. M. Sarver, and D. O. Gothard. 1988,
 15p
 Sponsored by INCO Alloys International, Inc., Hunting-
 ton, WV.
 Pub. in International Jnl. of Hydrogen Energy 13, n9
 p547-561 1988.

Keywords: Electrolysis, Intermetallics, Cathodes,
 Nickel, Hydrides, Reprints, *Hydrogen production,
 Electrocatalysts, Scanning electron microscopy.

AB5-catalyzed hydrogen evolution cathodes were
 made with coatings containing particles of AB5 and
 nickel, plus an inert binder. The effects of coating com-
 position and catalyst particle size on hydrogen evolu-
 tion were determined. Raising the binder content of
 the cathode coating increased the overpotential due to
 catalyst masking, as confirmed by scanning electron
 microscopy. Replacing half of the AB5 in the coating
 with nickel, which is much less catalytically active for
 the hydrogen evolution reaction, had a relatively small
 effect on the overall cathode efficiency. Reducing the
 AB5 particle size to increase catalyst surface area re-
 duced the overpotential slightly. The AB5-catalyzed
 cathodes showed stable overpotentials during electro-
 lyses of up to 7000 hours, and were not adversely af-
 fected by extended open circuit exposure or reverse
 polarity tests. They showed high resistance to
 common electrocatalyst poisons. Scanning electron
 microscopy and energy dispersive x-ray spectrometry
 showed that this was due to the AB5-catalyst's tend-
 ency to resist contaminant deposition from solution.

 Final rept.
 A. Harriman, M. C. Richoux, P. A. Christensen, S.
 Mosseri, and P. Neta. 1987, 14p
 Pub. in Jnl. of the Chemical Society, Faraday Trans-
 actions 1 83, n9 p3001-3014 1987.

Keywords: *Reduction(Chemistry), *Oxidation, *Col-
 loids, *Radiolysis, Water chemistry, Manganese
 oxides, Gamma irradiation, Catalysts, Hydrogen,
 Oxygen, Dissociation, Photochemical reactions, Com-
 parison, Reprints, *Ruthenium oxides.

Colloids of RuO2/2H2O and MnO2 have been pro-
 duced by chemical and radiolytic methods. The col-
 loids slowly aggregate upon standing in water over
 several weeks but radiolysis gives much smaller par-
 ticles. The colloids are active in catalyzing water oxida-
 tion under chemical and photochemical conditions al-
 though there is some corrosion. The chemically
 formed RuO2 colloids are quite efficient catalysts for
 water reduction to H2 but the radiolytically formed col-
 loids do not promote H2 formation. Colloidal MnO2 is a
 poor catalyst for both H2 and O2 generation and it
 tends to aggregate under operating conditions. The
 RuO2/2H2O colloids obtained by gamma radiolysis
 are selective for oxidation processes. They are stable
 and catalyze O2 formation with high efficiencies. Such
 materials appear to be the best catalysts available for
 use in model systems for the photodissociation of
 water.

Kinetic Measurements of the Gas Phase HO(sub 2) + CH(sub 3)O(sub 2) Cross-Disproportionation Reaction at 298K.

Final rept.

M. J. Kurylo, P. Dagaut, D. M. Neuman, and T. J. Wallington. 1987, 6p

Pub. in Chemical Physics Letters 139, n6 p513-518 1987.

Keywords: Disproportionation, Chemical radicals, Chemical reactions, Combustion, Photolysis, Vapor phases, Reaction kinetics, Reprints, *Methylperoxy radicals, Atmospheric chemistry.

Flash photolysis kinetic absorption spectroscopy was used to investigate the gas phase reaction between hydroperoxy and methylperoxy radicals at 298K, HO₂ + CH₃O₂ -> products. Due to the large difference between the self reactivities of the two radicals, first or second order kinetic conditions could not be maintained for either species. Thus, the rate constant for the cross reaction was determined from computer modeled fits of the radical absorption decay curves recorded at wavelengths between 215 and 280 nm. The procedure yielded a value for k(1) at 298K independent of total pressure (using N₂) between 25 and 600 torr, and of the partial pressure of water vapor (up to 11.6 torr). No effect of water vapor could be found on the rate constant for the self reaction of methylperoxy radicals as well.

Photon Stimulated Desorption Induced by Core Exciton States in MgO.

Final rept.
R. L. Kurtz, S. A. Flodstrom, R. Nyholm, F. Senf, and R. Stockbauer. 1987, 2p
Pub. in *Jnl. of Vacuum Science and Technology A* 5, n4 p1111-1112 1987.

Keywords: *Magnesium oxides, Excitons, Reprints, *Photon stimulated desorption, *Oxygen ions, *Hydrogen ions 1 plus.

Photon stimulated desorption of O(1+) and H(1+) from MgO(100) and MgO(111) has been observed using photon energies over the O K-edge. O(1+) and H(1+) desorption apparently arises from the decay of different O core-exciton states as well as the states produced by interband transitions. The exciton states manifest themselves as a pre-edge structure. The O excitonic levels are interpreted in terms of their related atomic origin. Electron yield data from partially oxidized Mg implies that these states are localized in the near surface region.

Comparison of Direct and through Water Binding of Platinum Amines to the Phosphate Anion.

Final rept.
M. Krauss, H. Basch, and K. J. Miller. 1988, 5p
Pub. in *Jnl. of the American Chemical Society* 110, n14 p4517-4521 1988.

Keywords: *Water, *Chemical bonds, *Platinum, *Amino compounds, *Anions, *Energy levels, Comparison, Mathematical models, Molecular orbitals, Hydrogen bonds, Heat of hydration, Electrostatics, Mechanisms, Reprints, *Self consistent fields, *Phosphates.

The recently determined crystal structure for cis-Pt(NH₃)₂ bound to d(pGpG) has directed attention to the importance of Pt ammine binding to the phosphate moiety. Molecular mechanics (MM) modeling with kinked oligomer duplex models demonstrates that both 'direct' and 'through-water' binding conformations to phosphate are possible. The intrinsic energetics of the binding is modeled for the Pt(NH₃)₂(2+) - H₂O - H₂PO₄(-) complex with valence self-consistent-field molecular orbital calculations. The model geometries were guided by MM calculations to allow the anionic oxygen of the phosphate group to approach the ammonia ligand through a hydrogen bond or by axial approach towards the Pt atom. The 'through-water' complex is constructed to allow for an intervening water molecule that is hydrogen bonded both to the cation and anion. The energetics of 'direct' and 'through-water' conformations are found to be competitive. Two strong ionic hydrogen bonds to water from the cationic ammine and the phosphate anion in the 'through-water' complex are sufficient to offset the reduction in the ionic binding caused by the larger separation in the charged species. The binding of water to Pt(NH₃)₂(2+) and H₂PO₄(-) is also reported for a variety of conformations.

Structures and Heats of Formation of C(sub 4)H(sub 7)(1+) Ions in the Gas Phase.

Final rept.
S. G. Lias, and P. Ausloos. 1987, 17p
Pub. in *International Jnl. of Mass Spectrometry and Ion Processes* 81, p165-181 1987.

Keywords: *Molecular structure, *Heat of formation, *Ions, *Butadienes, *Gases, *Alkyne hydrocarbons, *Thermodynamic equilibrium, Acetonitrile, Chemical reactions, Protons, Isomerization, Reprints, Affinity, Butyne.

The proton affinities of 1,3-butadiene and 2-butyne have been derived from equilibrium constant determinations to 190 + or - 1 kcal/mol, and 188 + or - kcal/mol, respectively. Based on the results, the heats of formation of the 1-methylallyl ion (CH₃CHCH=CH₂(+)), and the 2-butenyl ion (CH₃CCHCH₃(+)) are 202 and 213 kcal/mol, respectively. The proton affinity of 1,2-butadiene has been determined to be 189 kcal/mol, leading to a (stationary electron convention) value for the heat of formation of the corresponding C₄H₇(+) ion of approximately 215 kcal/mol, indicating that the ion has the same struc-

ture as protonated 2-butyne. The 2-butenyl ion reacts with CH₃CN by proton transfer with a rate constant of 5-7 x 10¹⁰(sup -10) cu cm/molecules. A competing reaction is a collision-induced rearrangement to the lower-energy 1-methylallyl structure. The latter ion reacts with CH₃CN with a rate constant of 0.5 x 10¹⁰(sup -10) cu cm/molecules. Based on the difference in reactivity, it is possible to ascertain that under the conditions of the ICR experiment (40 eV ionizing electrons, 10 (sup -6) torr), about 85-90% of the fragment C₄H₇(+) ions formed in cyclopentane initially have the 1-methylallyl structure, while the fragment ions in the linear and branched pentenes and in the butenes originate predominantly with a higher energy structure which may be either CH₃CCHCH₃(+) or CH₂C(CH₃)=CH₂.

Growth of a Coherent Precipitate from Supersaturated Solution.

Final rept.
V. J. Laria, W. C. Johnson, and P. W. Voorhees. 1988, 10p
Pub. in *Jnl. of Materials Research* 3, n2 p257-266 1988.

Keywords: *Supersaturation, *Precipitation(Chemistry), *Coherence, *Solutions, *Grain growth, Diffusion, Elastic properties, Interfaces, Reprints, *Coherent production.

A treatment of diffusion limited growth of a coherent precipitate into supersaturated solution is presented. The precipitate has a spherical morphology and may have different elastic constants than the matrix phase. It is found that the growth kinetics are strongly affected by dilatational coherency strains and by compositionally induced strains in the matrix phase. Analytic and numerical solutions to the time dependent problem are obtained and are compared to the quasi-stationary solution. The transformation strain, the partial molar volumes of the components, the elastic constants in each phase, the interfacial compositions and the far-field composition must all be specified to determine the parabolic growth coefficient. In contrast, the growth coefficient is determined solely by a reduced supersaturation parameter in the absence of stress. The elastic effects tend to perturb the interfacial concentration of the matrix in the direction of the far-field concentration and reduce the effective driving force for growth. At the same time, compositionally induced strains increase the diffusive flux and tend to increase the growth rate.

Thermodynamic Perturbation Theory for Multi-component and Polydisperse Mixtures.

Final rept.
J. M. Kincaid, R. A. MacDonald, and G. Morrison. 1987, 12p
Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences.
Pub. in *Jnl. of Chemical Physics* 87, n9 p5425-5436 1987.

Keywords: *Thermodynamics, Perturbation theory, Critical point, Mixtures, Fluids, Reprints.

A general perturbation method is described that can be used to solve the equilibrium and critical-point conditions for model systems described by an analytic Helmholtz free energy. The general technique is developed within the framework of continuous or polydisperse systems; it may be applied to systems with discrete components, as well as to systems described by a continuous distribution of components. The expansion is based on the assumption that the microscopic parameters characterizing the system may be expressed as those of a reference system plus a series of small corrections. Explicit formulae for the first- and second-order solutions to the equilibrium and critical-point conditions are given.

Cd I Isoelectronic Sequence: Wavelengths and Energy Levels for Xe VII through Eu XVI.

Final rept.
V. Kaufman, and J. Sugar. 1987, 5p
Pub. in *Jnl. of the Optical Society of America B: Optical Physics* 4, n12 p1919-1923 1987.

Keywords: *Energy levels, *Wavelengths, *Xenon, *Europium, Atomic structure, Frequencies, Spectrographs, Spectroscopy, Spectral emittance, Reprints, *Isoelectronic atoms, Electronic structures.

Low-inductance triggered spark spectra of Xe through Eu were observed with the NBS 10.7 m normal and grazing-incidence vacuum spectrographs. Transition arrays of the Cd I isoelectronic sequence were identified, as well as those of the Rh I, Pd I and Ag I sequences previously reported. Energy levels and fitted radial integrals were derived. Perturbations due to configuration crossings arising from the contraction of the 4f shell were revealed in these analyses.

Stopped-Flow Studies of the Mechanisms of Ozone-Alkene Reactions in the Gas Phase: Trans-2-butene.

Final rept.
R. I. Martinez, and J. T. Herron. 1988, 5p
Pub. in *Jnl. of Physical Chemistry* 92, n16 p4644-4648 1988.

Keywords: *Ozone, *Chemical reactions, *Butenes, Reaction kinetics, Mass spectroscopy, Reprints.

The reaction of ozone with trans-2-butene has been studied in the gas phase at 294 K and 530 Pa (4 torr) using a stopped-flow reactor coupled to a photoionization mass spectrometer. The concentrations of reactants and products were determined as a function of reaction time. A mechanism is proposed to account for the observed products: CH₃CHO, H₂CO, CO₂, CH₄, CH₃C(O)-C(H)(OH)CH₃, H₂C=C=O, H₂O, 2-butanone and 2,3-epoxybutane, CH₃C(O)-C(O)CH₃, and HC(O)-C(O)H. This work again indicates that the simple 'hot' ester hypothesis needs to be critically reconsidered for gas-phase ozonolysis.

Determination of the Indium Freezing-Point and Triple-Point Temperatures.

Final rept.
B. W. Mangum. 1989, 7p
Pub. in *Metrologia* 26, p211-217 1989.

Keywords: *Indium, *Melting points, Temperature, Resistance bridges, Reprints, *Triple point.

The freezing-point temperatures of two samples of 99.9999% pure indium in cells constructed such that the indium was in contact only with Teflon were measured with four standard platinum resistance thermometers and two resistance bridges, one bridge operating at 400 Hz and the other with square-wave dc. Although nominally of the same purity, one sample was purer than the other, with a difference in freezing-point temperature of 0.2 to 0.4 mK, the value depending on the bridge used for the measurements. The temperature, t(sub 68), of the purer sample as determined from dc measurements is (156.6342 plus or minus 0.0004) C and as determined from ac measurements is (156.6345 plus or minus 0.0004) C. The pressure dependence was determined to be (4.92 plus or minus 0.05)mK/(std. atm). Consequently, the triple-point temperatures are (4.92 plus or minus 0.05)mK lower than the freezing-point values. The indium freezing-point temperature would be a suitable defining fixed point for a temperature scale.

Resonance Enhanced Multiphoton Ionization Spectra of the SiCl Radical between 430 and 520 nm.

Final rept.

R. D. Johnson, E. Fang, and J. W. Hudgens. 1988, 4p

Pub. in Jnl. of Physical Chemistry 92, n13 p3880-3883 1988.

Keywords: *Silicon chlorides, *Chemical radicals, Visible spectrum, Vibrational spectra, Reprints, *Multiphoton ionization, *Multi-photon processes, Rydberg states.

The resonance enhanced multiphoton ionization spectra of the SiCl radical observed between 430 to 520 nm is reported. Bands involving transitions to the C doublet Pi(r) and D doublet Sigma(+) states are analyzed. The C doublet Pi(r) state exhibits vibrational levels to v' = 6, higher than previously observed, as well as hot bands to v'' = 6. The (S⁷)Cl isotope shift has been measured for these levels, confirming the vibrational assignments. Two vibrations of the E-state are also observed.

Infrared and Microwave Study of Angular-Radial Coupling Effects in Ar-HCN.

Final rept.

G. T. Fraser, and A. S. Pine. 1989, 8p

Pub. in Jnl. of Chemical Physics 91, n6 p3319-3326, 15 Sep 89.

Keywords: *Infrared spectroscopy, *Microwave spectroscopy, *Argon, *Hydrogen cyanide, *Complex compounds, *Angular momentum, Intermolecular forces, Quadrupole moment, Vibrational spectra, Hydrogen bonds, Distortion, Asymmetry, Stretching, Reprints, *Coupling constants, *Radial distribution.

Microwave and infrared spectra of Ar-HCN have been obtained using an electric-resonance optothermal spectrometer. The microwave measurements extend to higher J the previous results of Leopold et al. and Klots et al., allowing the determination of higher-order centrifugal distortion constants for the quasilinear, highly nonrigid complex. A Pade approximate fit to the microwave data indicates a significant rotation-induced asymptotic increase in the zero-point center-of-mass separation between the Ar and the HCN, above that expected from pure radial distortion. It results from the large coupling between the angular and radial degrees in the intermolecular potential forcing the centrifugal alignment of the HCN. Infrared spectra are reported for the C-H stretching fundamental v₁ and the combination band v₁ + v₅(sup 1)5, where v₅ is the van der Waals bending vibration. The band-origin difference between the two bands gives v₅ = 7.8 reciprocal cm, in rough agreement with the 10 reciprocal cm harmonic value predicted from the microwave-determined nuclear quadrupole coupling constant. The complexation-induced red shift of the C-H stretching vibration is 2.69 reciprocal cm and the vibrational predissociation linewidths are < 10 MHz(FWHM). The vibrationally excited complex predissociates before striking the bolometer detector, implying that the predissociation lifetime is less than 1 ms.

Analysis of the Microwave and Far Infrared Spectrum of the Water Dimer.

Final rept.

L. H. Coudert, and J. T. Hougen. 1990, 19p

Pub. in Jnl. of Molecular Spectroscopy 139, p259-277 1990.

Keywords: *Microwave spectra, *Infrared spectra, Far infrared radiation, Hydrogen bonds, Reprints, *Water dimer.

The radiofrequency, microwave, and far infrared spectrum of the water dimer has been analyzed using an IAM-like treatment developed in two previous papers and slightly extended. It was assumed for the analysis that four large amplitude motions are feasible in the water dimer, two of them being interconversion motions during which the hydrogen-bond acceptor monomer becomes the donor monomer and vice versa. The present global analysis of 173 transitions made possible the determination of 22 parameters in the theoretical formalism corresponding to the various tunneling motions, including the angles describing the J and K dependence of the tunneling splittings. In addition, the seven asymmetric rotor parameters A, B, C, D(1), D(k), d(1), and d(2) were determined, corresponding to constants with contributions from the various tunneling motions removed.

Vibrational Predissociation Dynamics of the Nitric Oxide Dimer.

Final rept.

M. P. Casassa, J. C. Stephenson, and D. S. King.

1988, 4p

Pub. in At. Mol. Processes Short Intense Laser Pulses 171, p367-370 1988.

Keywords: Reprints, *Nitric oxide, *Predissociation, Van der Waals forces, Laser induced fluorescence, Picosecond pulses, Lifetime, Time dependence, Dimers.

Details of experimental measurements of the total energy distribution and time dependence of the vibrational predissociation of the nitric oxide dimer are presented. Energy disposal measurements indicated the fragments to exhibit low average rotational energy, full equilibration of the lambda doublet species, approximately equal populations in both spin-orbit states, no significant degree of alignment, and isotropic flux distribution, and kinetic energies of 400/cm per fragment. Although approximately 75% of the available energy goes into fragment translation, picosecond laser pump-probe experiments showed that nu(1) decayed exponentially with a 880 ps lifetime. Excitation of nu(4) at 1789/cm gave a 39 ps predissociative lifetime.

Solid-State (13)C NMR Investigation of Methyltin(IV) Compounds. Correlation of NMR Parameters with Molecular Structure.

Final rept.

T. P. Lockhart, and W. F. Manders. 1987, 6p

Pub. in Jnl. of the American Chemical Society 109, n23 p7015-7020 1987.

Keywords: *Nuclear magnetic resonance, *Molecular structure, Linear regression, Reprints, *Organotin compounds.

Solid-state (13)C NMR data are reported for 52 methyltin(IV) compounds. The dependence of NMR parameters(chemical shift and tin-carbon J coupling, (I)J((119)Sn,(13)C)) on molecular structure has been investigated with reference to the x-ray structures known for many of the compounds. (13)C chemical shifts of the tin-methyls generally increase (are more deshielded) in the series: tetra- penta- hexa- hepta-coordinated methyltin(IV) and tri- di- mono-methyltin(IV) compounds, although there is considerable overlap between several of these groups. (I)J((119)Sn,(13)C) values were determined for 30 compounds whose x-ray structures are known; a linear regression of the data for 28 compounds yields the equation: (I)J((119)Sn,(13)C) = 10.7 (Me-Sn-Me angle) - 778 (r - 0.975). A Fermi contact term-tin hybridization model is used to rationalize the general behavior; changes in the effective nuclear charge of tin may be responsible for the several poorly behaved compounds that have been identified. Cases have been found in which more than one (I)J((119)Sn,(13)C) value exists for the methyls in di- and trimethyltin(IV) compounds. This appears to arise in cases where the tin atom bonds to different methyls with substantially different hybrid orbitals.

Polarization Effects in Molecular X-Ray Fluorescence.

Final rept.

D. W. Lindle, P. L. Cowan, R. E. LaVilla, T. Jach, R. D. Deslattes, R. C. C. Perera, and B. Karlin. 1987, 3p

Pub. in Jnl. de Physique 48, nC-9 p761-763 1987.

Keywords: *X ray fluorescence, Synchrotron radiation, Reprints, *Linear polarization, K shell, Chloromethane, Chlorotrifluoromethane, Dichlorodifluoromethane.

Highly polarized x-ray fluorescence has been observed following K-shell excitation of several Cl-containing molecules. Monochromatic synchrotron radiation with a high degree of linear polarization was used to resonantly excite Cl 1s electrons in CH₃Cl, and the Freons, CF₃Cl, CF₂Cl₂. The subsequent Cl K(beta) fluorescence was found to be strongly linearly polarized. The direction of polarization of the K(beta) fluorescence is determined in part by the symmetry of the valence-orbital electron involved in the fluorescence decay which fills the Cl 1s hole. The results illustrate that the core-level resonance lifetimes are short

enough to preclude substantial disorientation of the molecule prior to fluorescence decay. Measurements of this type may prove to be a sensitive probe of orbital symmetry in more complicated molecular systems, condensed matter, and adsorbates.

Dynamically-correct branching ratios can be measured in a XQQ tandem mass spectrometer (MS/MS) under single-collision conditions when the key MS/MS parameters are properly selected to correct for reaction-induced mass discrimination within the rf-only quadrupole mass filter (Q2). The energy dependence of the cross section, $\sigma(E)$, for the reaction $N_2(1+) + SF_6 \rightarrow N_2 + SF(x)(1+)$ ($x=1-5$) was measured in the NBS triple quadrupole (QQQ) tandem mass spectrometer. For P approx = 0.02-0.13 mtorr and E approx = 5-60 eV (LAB) (the range of collision energies used for collisionally-activated dissociation (CAD)), the authors measured identical $\sigma(E)$ from both the rate of reactant ion decay and the rate of product ion formation.

Absolute Cross-Section Measurements in XQQ In-Struments: Ar(1+)(N(sub 2),Ar)N(sub 2)(1+).
Final rept.
R. I. Martinez, and S. Dheandhanoo. 1988, 16p
Pub. in International Jnl. of Mass Spectrometry and Ion Processes 84, n1-2, p1-16, 6 Jun 88.

Keywords: *Nitrogen, Mass spectrometers, Cross sections, Dissociation, Reprints, *Ion-molecule collisions, *Charge transfer, *Argon ions, Energy dependence, EV range 01-10, EV range 10-100.

The energy dependence of the cross section, $\sigma(E)$, for the asymmetric near-resonant charge transfer reaction $Ar(1+)(N_2,Ar)N_2(1+)$ was measured in the authors' triple quadrupole (QQQ) tandem mass spectrometer. For P approx = 0.04-0.35 mtorr and E approx = 5-60 eV (LAB) (the range of collision energies used for collisionally activated dissociation (CAD)), the authors measured identical $\sigma(E)$ from both the rate of reactant ion decay and the rate of product ion formation; i.e., the authors' instrument is kinetically well behaved. Moreover, the authors' $\sigma(E)$ complements that of other workers over the energy range of 0.04 to 100 eV. Hence, the authors' instrument can be used to measure absolute cross sections for the CAD of ions. This is essential if generic, instrument-independent CAD spectral databases are to be developed.

Glycine Permeation through Na(1+), Ag(1+) and Cs(1+) - Forms of Perfluorosulfonated Ion Exchange Membranes.
Final rept.
M. Jin, S. K. Sikdar, and S. D. Bischke. 1988, 16p
Pub. in Separation Science and Technology 23, n14-15 p1293-1308 1988.

Keywords: *Glycine, *Permeability, *Ion exchange resins, *Sulfonates, Liquid saturation, Flux(Rate), Reprints, *Membrane transport, *Sodium ions, *Silver ions, *Cesium ions, Fick laws, Sulfonic acid esters.

Counterions in perfluorosulfonated ion exchange membranes controlled permeation behavior of glycine. The $Na(+)$ -form of the membrane exhibited saturation kinetics of the Michaelis-Menten type, i.e., the flux rapidly increased with concentration, and reached a limiting flux at a concentration of about 2 mol/L. The $Cs(+)$ -form exhibited markedly lower fluxes which were nearly Fickian. For the $Ag(+)$ -form, however, the fluxes increased rapidly and nonlinearly at low concentrations, but attained Fickian linearity at high concentrations. Ionization of the metal substituents, believed to lead to an interaction of the transport species with the membrane, appeared to cause departure from the Fickian behavior.

Search for Tricriticality in Binary Mixtures of Near-Critical Propane and Normal Paraffins.

Final rept.
C. J. Peters, H. J. van der Kooij, J. L. de Roo, J. de Swaan Arons, J. S. Gallagher, and J. M. H. Levelt Sengers. 1989, 13p
Pub. in Fluid Phase Equilibria 51, p339-351 1989.

Keywords: *Critical point, *Propane, *Mixtures, *Chemical equilibrium, *Alkanes, Liquid phase, Vapor phase, Solubility, Reprints.

The paper reports on three-phase equilibria liquid + liquid + vapor of binary mixtures of near-critical propane and higher normal paraffins. Special attention has been given to locate the (pseudo-)binary first showing partial miscibility in the liquid phase. For that purpose the three-phase equilibria liquid + liquid + vapor, including critical endpoints, have been determined experimentally in the binaries $C_3 + C_{32}$, $C_3 + C_{34}$, $C_3 + C_{36}$, $C_3 + C_{38}$, $C_3 + C_{40}$, $C_3 + C_{44}$, $C_3 + C_{46}$ and $C_3 + C_{50}$. Extrapolation of the results obtained shows that for a carbon number between 29 and 30 tricriticality has to be expected. In order to model the measured three-phase equilibrium data, an algorithm has been developed on the basis of the simplified perturbed hard chain theory. The calculations are still in progress.

Damped Dispersion Interaction Energies for He-H(sub 2), Ne-H(sub 2), and Ar-H(sub 2).
Final rept.
M. E. Rosenkrantz, and M. Krauss. 1985, 10p
Pub. in Physical Review A-General Physics 32, n3 p1402-1411 1985.

Keywords: Intermolecular forces, Hydrogen, Helium, Neon, Argon, Damping, Reprints, *Van der Waals forces.

The van der Waals interactions energy between two closed-shell systems can be approximated as the sum of the Hartree-Fock (HF) and dispersion interaction energies. The dispersion energy is given as a power series in $R \supset (-n)$ when the interaction potential is expanded in the multipole operators of the asymptotic systems. The series is convergent only if the overlap of the systems is explicitly considered. The present paper will describe the calculation of the induced-dipole-induced-dipole dispersion interaction including the anisotropic damping due to change overlap. The He-H₂, Ne-H₂ and Ar-H₂ systems were considered and the van der Waals potential were constructed with use of available HF interaction potentials.

Pub. in Jnl. of Chemical Physics 91, n11 p6566-6578, 1 Dec 89.

Keywords: Spin orbit interactions, Infrared spectroscopy, Magnetic fields, Chemical radicals, Reprints, *Methylene radicals, High resolution, Tunable lasers.

The symmetric and antisymmetric stretch spectra (a tilde) singlet A(1) CH₂ are measured with Doppler-limited resolution by infrared flash-kinetic spectroscopy between 2600 and 3050/cm. The spectra are significantly perturbed by spin-orbit interactions between near-resonant levels of (X tilde) triplet B(1) in both lower and upper levels of the transitions, and by Coriolis interaction between symmetric and antisymmetric stretch states. The triplet character of the perturbed levels is detected by observing broadening of M(J) structure in a magnetic field about 1 kG. The levels that are likely to be perturbed by triplet methylene are identified using the experimentally observed and theoretically calculated triplet B(1) energy level structure. The term values of the remaining symmetric and antisymmetric stretch levels are simultaneously fit to Watson's Hamiltonian including Coriolis coupling. The analysis provides the remaining information needed to determine the equilibrium rotational constants and, therefore, the equilibrium structure of this fundamentally important carbene.

NBS (National Bureau of Standards) Triple Quadrupole Tandem Mass Spectrometer.

Final rept.

R. I. Martinez. 1987, 4p

Pub. in Review of Scientific Instruments 58, n9 p1702-1705 1987.

Keywords: *Mass spectrometers, Cross sections, Dissociation, Reprints, *Tandem mass spectrometers, Molecular collisions.

A detailed description is provided of a triple quadrupole (QQQ) tandem mass spectrometer (MS/MS) which is kinetically well behaved and can be configured to use either a molecular beam target (Type A) or collision chamber (Type B) configuration. Its unique capabilities are being used to explore design criteria essential for absolute cross-section measurements, and for the development of standardized operating conditions for generic, instrument-independent spectral databases for collisionally-activated dissociation (CAD).

Grant NSF-PHY86-04504

Sponsored by National Science Foundation, Washington, DC.
Pub. in Jnl. of Chemical Physics 91, n8 p4593-4596, 15 Oct 89.

Keywords: *Chemical reaction, *Reaction kinetics, *Cryogenics, *Hydrogen, *Helium, *Ions, Dissociation, Reprints, Temperature dependence, Radiative transfer, Charge transfer.

The rate coefficients for radiative (RCT) and dissociative (DCT) charge transfer from He⁺ to H₂ at temperatures equal to or between 15 and 40 K were measured. The radiative charge transfer reaction was found to be essentially independent of temperature, while the rate coefficient for the dissociative reaction increases with increasing temperature in the temperature range. The results were compared with others and sources of uncertainty unique to the experiment were considered.

Alignment Effects Involving Multiple Pathways: Electronic Energy Transfer of Sr 5s6p (1)P(sub 1) with Rare Gases.

Final rept.

L. J. Kovalenko, R. L. Robinson, and S. R. Leone. 1989, 15p

Grants NSF-PHY86-04504, NSF-CHE83-08403

Sponsored by National Science Foundation, Washington, DC.
Pub. in Jnl. of the Chemical Society, Faraday Transactions 2 85, n8 p939-953 1989.

Keywords: *Strontium, Atomic energy levels, Electron transitions, Alignment, Helium, Xenon, Reprints, *Atom-atom collisions.

Orbital alignment effects and branching fractions have been measured for collisionally induced electronic energy transfer from the Sr5s6p singlet P(1) state to seven near-resonant states: 5s6p triplet P(2,1,0), 4d5p singlet D(2) and 4d5p triplet F(4,3,2). The measurements were carried out in a crossed-beam experiment using a pulsed, linearly polarized laser which propagates perpendicular to the initial average relative velocity vector of the collision partners. The results show remarkably high specificity in both the formation of product states and the alignment effects into each state.

Mechanism of Collisionally Induced Transitions among Fine-Structure Levels: Semiclassical Calculations of Alignment Effects in the Na-He System.

Final rept.

L. J. Kovalenko, S. R. Leone, and J. B. Delos. 1989, 13p

Sponsored by National Science Foundation, Washington, DC., and Office of Naval Research, Arlington, VA.

Pub. in Jnl. of Chemical Physics 91, n11 p6948-6960, 1 Dec 89.

Keywords: *Sodium, Cesium, Helium, Atomic energy levels, Electron transitions, Alignment, Cross sections, Reprints, *Atom-atom collisions.

To gain insight into the mechanism of Na(3p) doublet P(3/2) --> doublet P(1/2) fine-structure transitions induced by collision with He, the authors monitor the expectation values of the orbital- and spin-angular momentum vectors, l and s, as a function of time along the trajectory, using a semiclassical formalism. In a typical collision, (s) remains nearly space-fixed while (l) precesses about the rotating internuclear axis. Thus, in the interaction region, the projection of (l) onto the internuclear axis, (lambda), remains nearly constant, and the molecular alignment of the orbital is preserved. It is shown how equations of motion for the classical analogues of these expectation values agree qualitatively with the quantum equations of motion. A qualitative comparison is also made with the Cs-He system for which the spin-orbit coupling is much stronger.

Translational and Internal State Distributions of NO Produced in the 193 nm Explosive Vaporization of Cryogenic NO Films: Rotationally Cold, Translationally Fast NO Molecules.

Final rept.

L. M. Cousins, R. J. Levis, and S. R. Leone. 1989, 12p

Sponsored by Army Research Office, Hanscom AFB, MA.
Pub. in Jnl. of Chemical Physics 91, n9 p5731-5742, 1 Nov 89.

Keywords: *Nitrogen oxide(NO), Solidified gases, Cryogenics, Films, Reprints, *Rotational states, Vibrational states, Multiphoton ionization, Multilayers, Time-of-flight method, Multi-photon processes.

The authors report the translational, rotational, and spin-orbit state distributions of fast NO molecules which are generated by the 193 nm laser vaporization of 30 K multilayer NO films. Rotational distributions in

nu = 0 are obtained by laser multiphoton ionization for five different velocities ranging from 900 to 2200 m/s, corresponding to translational energies (E(t) = 0.14 to 0.71 eV. In every case, the average molecular rotational energy is more than 10 times smaller than the component of translational energy normal to the surface.

Keywords: *Helium, *Thermophysical properties, *Thermodynamic properties, Tables(Data), Temperature, Density, Viscosity, Conductivity, Entropy, Enthalpy, Acoustic velocity, Energy levels.

Tabular summary data of the thermophysical properties of fluid helium are given for temperatures from 0.8 to 1500 K, with pressures to 2000 MPa between 75 and 300 K, or to 100 MPa outside of this temperature band. Properties include density, specific heats, enthalpy, entropy, internal energy, sound velocity, expansivity, compressibility, thermal conductivity, and viscosity. The data are calculated from a computer program which is available from the National Institute of Standards and Technology. The computer program is based on carefully fitted state equations for both normal and superfluid helium.

Standard Reference Data is a program office in the Technology Services, National Institute of Standards and Technology. Standard Reference Data develops and disseminates publications and databases of critically evaluated physical, chemical, and materials properties of substances. These publications and databases are available through NIST and private publications, on magnetic tape, PC diskettes, and from on-line retrieval systems. Standard Reference Data is responsible for management and coordination of the program. Work is carried out through a decentralized network of data centers and projects referred to as the National Standard Reference Data System (NSRDS). This volume summarizes the activities of the program for the year 1989.

Pub. in Proceedings of Symposium on Frequency Standards and Metrology (4th), Ancona, Italy, September 5-9, 1988, p287-291 1989.

Keywords: *Mercury, *Spectroscopy, *Ions, Doppler effect, Quantum theory, Reprints.

A single Hg⁺ ion that is confined in an rf (Paul) trap can be laser cooled so that the amplitude of its motion is much less than a wavelength (the Dicke limit) for optical transitions. Recently, the technique of optical sideband cooling was used to reach the zero point of

motion. This realizes for the first time the fundamental limit of laser cooling for a bound atom and the ideal of an isolated atomic particle at rest in space to within the quantum mechanical limits imposed by the surrounding apparatus. In both limits, Doppler effects become negligible to all orders, the interrogation time is long and the fundamental shot noise detection limit of a single atom is readily attained.

J. F. Ely, and J. W. Magee. 1989, 11p
Pub. in Proceedings of Annual Convention of the Gas
Processors Association (68th), San Antonio, TX.,
March 13, 1989, p89-99.

Keywords: *Thermophysical properties, *Carbon dioxide, *Mixtures, *Gases, Transport properties, Measurement, Density(Mass/Volume), Specific heat, Equation of state, Mathematical models, Reprints, Temperature dependence, Pressure dependence, Comparative evaluation, Isochoric processes.

Comprehensive isochoric (p,Vm,T) measurements have been performed for six carbon dioxide-rich mixtures and pure carbon dioxide (CO₂). The nominal range of state points studied include those with densities from 1 to 24 mol/cu dm, temperatures from 220-400 K, and pressures to 35 MPa. In addition, direct measurements of the saturated liquid density and isochoric heat capacity of pure CO₂ have been performed. The measurements, combined with the studies of other investigators, have allowed the development of an accurate predictive equation of state model (DDMIX) for CO₂-rich mixtures. In the report the mixture measurements and present comparisons of the measurements with DDMIX are summarized. In addition, a new TRAPP-like model for the prediction of transport properties which is used in DDMIX is described.

the Formaldehyde Dimer.**

Final rept.
F. J. Lovas, R. D. Suenram, L. H. Coudert, T. A.
Blake, K. J. Grant, and S. E. Novick. 1990, 8p
Pub. in Jnl. of Chemical Physics 92, n2 p891-898, 15
Jan 90.

Keywords: *Rotational spectra, *Molecular structure, *Formaldehyde, Torsion, Deuterium, Hydrogen, Isotopic labeling, Microwave spectra, Fourier transformation, Dipole moments, Stark effect, Stereochemistry, Reprints, Dimers.

The microwave spectra of (H₂CO)₂ and (D₂CO)₂ have been observed with a pulsed beam, Fabry-Perot cavity, Fourier transform microwave spectrometer. Both species exhibit a-type spectra which are split by internal rotation of each monomer unit and an interchange of donor-acceptor bonding roles analogous to the water dimer. The geometry obtained from fitting the derived moments of inertia has the planes of the two monomer units perpendicular in a nearly antiparallel orientation of the CO groups with a center-of-mass distance of 3.046(17) Å. The shortest carbon to oxygen distance (2.98 Å) and hydrogen to oxygen distance (2.18 Å) between the monomer units are indicative of a dual bond interaction to form a ring structure.

Keywords: *Crystallography, Chemical properties, Physical properties, Utilization, Data retrieval, Reprints, *Data base management, Evaluated data.

The NBS Crystal Data Center builds, evaluates and disseminates a large scientific database of evaluated

crystallographic, chemical and physical data. NBS CRYSTAL DATA, with information on all classes of crystalline materials, currently contains more than 115,000 entries and is expanding at the rate of approximately 7,000 entries per year. The data items in each entry have been critically evaluated, represented according to rigorous rules and transformed to standard forms. Additional data items have been derived from the literature data and strict adherence to specified formats has been ensured by extensive computer evaluation of the Database. As a result, all of the information in the Database can be accessed and used. Searches and statistical analyses can be carried out using a database management system and independent computer programs, and printed products can be prepared using typesetting software. NBS CRYSTAL DATA has been used extensively in industrial and academic laboratories. For example, the Database has played a vital role in the design of technologically important materials such as superconductors and lasers.

Relationship between the Carbon-Number of N-Paraffins and Their Solubility in Supercritical Solvents.

Final rept.
C. J. Peters, J. de Swaan Arons, A. H. Harvey, and
J. M. H. Levelt Sengers. 1989, 8p
Pub. in Fluid Phase Equilibria 52, p389-396 1989.

Keywords: *Supercritical flow, *Alkanes, *Solubility, *Solvents, *Carbon, Methane, Carbon dioxide, Natural gas liquids, Condensing, Molecular structure, Dew, Reprints, Carbon number.

A relationship is postulated between the solubility of liquid n-paraffins in supercritical solvents, such as methane and carbon dioxide, and the carbon number of the solute. The predictions of the simplified perturbed-hard-chain equation of state suggest that, at fixed temperature and pressure, the logarithm of the mole fraction of the solute varies linearly with the carbon number. A relation of this type is very useful for predicting supercritical solubility of long n-alkanes and retrograde condensation of natural gas. The thermodynamic considerations that lend support to the hypothesis are presented and agreement with available experimental data is shown.

Magnetic Microstructure of Thin Films and Surfaces: Exploiting Spin-Polarized Electrons in the SEM and STM.

Final rept.
D. T. Pierce, M. R. Scheinfein, J. Unguris, and R. J.
Celotta. 1989, 10p
Pub. in Materials Research Society Symposia Proceedings 151, p49-58 1989.

Keywords: *Thin films, *Microstructure, *Magnetic storage, *Magnetic domains, *Surface properties, Electrons, *Magnetic materials, Reprints, *Polarization(Spin alignment), *Scanning electron microscopy, *Transmission electron microscopy.

Magnetic microstructure, that is the configuration of domains and domain walls in a magnetic material, is of both fundamental interest and of crucial importance for device applications. For example, the ultimate density of magnetic information storage is limited by the sharpness of a domain boundary. The magnetic microstructure of a thin film or surface depends sensitively on its physical structure which is strongly affected by sample preparation or growth. High resolution magnetization imaging is necessary to determine the domain configuration that occurs for a particular sample preparation and the changes that take place under external perturbations such as applied magnetic field, stress or temperature.

Progress and Pitfalls in Quantitative Surface Analysis by Auger-Electron Spectroscopy and X-ray Photoelectron Spectroscopy.

Final rept.
C. J. Powell. 1989, 11p
Pub. in New Developments and Trends in Surface Science, p1-11 1989.

Keywords: *Quantitative analysis, *Surface chemistry, *X ray analysis, Error analysis, Accuracy, Reprints, Auger electron spectroscopy, Photoelectron spectroscopy.

Auger-electron spectroscopy (AES) and x-ray photoelectron spectroscopy (XPS) are in widespread use for solving many types of scientific and technological problems. Most surface analyses made to date have been qualitative, but there is a growing demand for quantitative analyses, particularly with the availability now of data systems for commercial instruments. Although adequate repeatability is often achieved in analyses of AES and XPS, there are unfortunately many sources of systematic error that make credible accuracy statements very difficult. The principal systematic errors are associated with the complex morphology of typical specimens, with parameters of instrument performance, and with limitations of current methodology and data. The paper contains an overview of the pitfalls that exist in making quantitative surface analyses by AES and XPS and the progress that has been made in overcoming them.

Broadening and Shifting of the Raman Q-Branch of HD.

Final rept.
G. J. Rosasco, A. D. May, W. S. Hurst, L. B. Petway,
and K. C. Smyth. 1989, 10p
Pub. in Jnl. of Chemical Physics 90, n4 p2115-2124
1989.

Keywords: *Hydrogen, *Raman spectra, Deuterium compounds, Energy transfer, Reprints, Line broadening, Vibrational states, Rotational states.

The line broadening and shifting of the vibrational Q-branch in pure HD has been measured for transitions J=0 to 3 at room temperature over the density range 0.8 to 10.6 amagat. The shifting and broadening coefficients have been determined with an uncertainty of plus or minus 0.002/cm/amagat, which now provides a discriminating test for various semiclassical and quantal theoretical calculations. The line broadening coefficients are compared with linewidth data from other spectroscopic branches and with measurements of the rates of state-to-state rotational energy transfer. Use of an exponential gap law for the rates of rotational energy transfer allows estimates to be made of the contributions to the line widths from rotationally inelastic, elastic vibrational dephasing, and elastic reorientation processes. This analysis suggests that rotational energy transfer occurs approximately 30% faster in v=1 than in v=0.

Gibbs-Thomson Equation for a Spherical Coherent Precipitate with Applications to Nucleation.

Final rept.
C. Rottman, P. W. Voorhees, and W. C. Johnson.
1988, 6p
Pub. in Scripta Metallurgica 22, n2 p293-298 Feb 88.

Keywords: *Precipitates, *Spheres, *Nucleation, Metals, Thermodynamic equilibrium, Interfaces, Surface chemistry, Shape, Coherence, Reprints, *Gibbs-Thomson equation, Radii.

The conditions necessary for thermodynamic equilibrium at the precipitate-matrix interface of a coherent spherical precipitate are derived and are corrected to the equilibrium conditions of Johnson and Alexander for a spherical precipitate in an isotropic matrix. These conditions were used to derive the dependence of the interfacial precipitate and matrix concentrations on precipitate radius (Gibbs-Thomson equation) for such a precipitate. In addition, the relationships are used to calculate the critical radius for the nucleation of a coherent misfitting precipitate.

Study of Vibronic Coupling in the tild C State of CO(+)(sub 2).

Final rept.

P. Roy, T. A. Ferrett, V. Schmidt, A. C. Parr, S. H. Southworth, J. E. Hardis, R. Bartlett, W. Trela, and J. L. Dehmer. 1987, 4p
Pub. in Jnl. de Physique 48, nC-9 p765-768 1987.

Keywords: *Carbon dioxide, Synchrotron radiation, Molecular energy levels, Reprints, Photoelectron spectroscopy, Forbidden transitions.

The authors have studied the issue of vibronic coupling in the vibrationally-resolved photoionization to the (C tilde) doublet Sigma (g)(+) state of CO2(1+) in the photon-energy range h(nu)=20-28.5 eV. The measurements use the SURF-II synchrotron radiation source at the National Bureau of Standards and high-resolution hemispherical electron analyzers equipped with area detectors. The angular distribution asymmetry-parameters (beta) for the allowed (C tilde)(0,0,0) and forbidden (c tilde)(1,0,1) (19,747 eV: binding energy) peaks are found to be quite different. However, similarities between the (C tilde)(1,0,1) curve and that for the (B tilde) state suggest that vibronic coupling to the (B tilde)(doublet Sigma(u)(+)) state of CO2(1+) is the explanation for the intensity of the (C tilde) state forbidden band.

Determination of Column Selectivity Toward Polycyclic Aromatic Hydrocarbons.

Final rept.

L. C. Sander, and S. A. Wise. 1988, 5p
Pub. in Jnl. of High Resolution Chromatography and Chromatography Communications 11, n5 p383-387 1988.

Keywords: *Column packings, *Aromatic polycyclic hydrocarbons, Absorption, Water pollution, Polymers, Liquid phases, Thickness, Separation, Chemical analysis, Reprints, *Reversed flow, *Liquid chromatography.

An empirical test is described for the evaluation of column selectivity in reversed-phase liquid chromatog-

raphy. Using a test mixture of three polycyclic aromatic hydrocarbons (PAH), overall column selectivity toward PAH was assessed for various commercial C18 columns. Retention behavior was correlated to phase type (i.e., monomeric and polymeric surface modification chemistry) for custom synthesized phases. A classification scheme is proposed in which commercial columns are grouped into three classes based on retention behavior: monomeric-like, polymeric-like and intermediate phase selectivity toward PAH. Correlation of retention behavior (using the test mixture) with more general column properties (e.g., phase thickness) is discussed.

High Resolution Infrared Spectrum of (28)SiH(sub 3)D from 1450 to 1710 cm(-1).

Final rept.

R. D. Schaeffer, R. W. Lovejoy, W. B. Olson, and G. Tarrago. 1988, 16p
Pub. in Jnl. of Molecular Spectroscopy 128, n1 p135-150 1988.

Keywords: *Infrared spectra, *Silane, Deuterium compounds, Fourier transformation, Rotational spectra, Labeled substances, Isotopic labeling, Reprints, Silicon 28.

The v2 and 2v6 infrared bands of (28)SiH3D have been recorded between 1450 and 1710/cm with 0.005/cm apodized spectral resolution using a Fourier transform spectrometer. Line assignments were made from J = 0 to 25 and K = 0 to 15 for the v2 band, from J = 0 to 20 and K = 0 to 13 for the 2v6(sup 0) band, and from J = 0 to 20 and K = 0 to 8 for the 2v7(sup 2) band. Very strong perturbations were observed in all three components of the triad system, including l-type interactions between 2v6(sup 0) and 2v6(sup 2) and Fermi interactions between v2 and 2v6. Observed transitions were fit using ground state constants, obtained from ground state combination differences, and upper state energy levels, obtained by diagonalizing an energy matrix including Fermi resonance terms between v2=1 and v6=2. Molecular coefficients and the method of determination are reported.

Systematics of Wetting at the Vapor-Liquid Interface.

Final rept.

J. W. Schmidt. 1988, 8p
Pub. in Jnl. of Colloid and Interface Science 122, n2 p575-582 1988.

Keywords: *Wetting, Surface chemistry, Air, Fluorohydrocarbons, Alcohols, Interfacial tension, Measurement, Mixtures, Carbinols, Transition temperature, Reprints, *Liquid-vapor interfaces.

The transition temperatures, Tw, from incomplete wetting to complete wetting at the air-liquid interface above five binary mixtures of a normal chain alcohol with the fluorocarbon perfluoromethylcyclohexane (C7F14) have been measured. Consolute temperatures Tc, contact angles and surface tensions were measured for each mixture. Tw decreases monotonically as the alcohol chain length increases from 1 (methanol) to 6 (n-hexanol). The mixture water (chain length-O) + C7F14 is anomalous with the lowest Tw (only an upper bound was obtained). From the measurements and a regular solution free energy, the lengths of the prewetting lines and the discontinuity in the derivative of the vapor-liquid surface tension at T - Tw were calculated and ranged from 38K (for ethanol + C7F14) to 99K (for n-hexanol + C7F14). The calculated discontinuities in the derivative ranged from 0.008 dy/cm K (for ethanol + C7F14) to 0.039 dy/cm K (for n-hexanol + C7F14) and are roughly correlated with the lengths of the prewetting lines.

Universal Adsorption at the Vapor-Liquid Interface Near the Consolute Point.

Final rept.

J. W. Schmidt. 1990, 6p
Pub. in Physical Review A 41, n2 p885-890, 15 Jan 90.

Keywords: Polarimetry, Adsorption, Reprints, *Methylcyclohexane, *Perfluoromethylcyclohexane, Liquid-vapor interfaces, Ellipsometry.

The ellipticity of the vapor-liquid interface above mixtures of methylcyclohexane (C7H14) plus perfluoromethylcyclohexane (C7F14) has been measured near the consolute point T(c)=318.6K. The data are consistent with a model of the interface that combines a short-ranged density-versus-height profile in the vapor phase with a much longer-ranged composition-versus-height profile in the liquid. The one parameter model profile fits the data well for reduced temperatures t=(T-T(c))/T(c) > 0.0007. The model predicts a maximum ellipticity at t=0.0007, which occurs at t=0.0002 in the experiment. The value of the free parameter produced by fitting the model to the data is consistent with results from two other simple mixtures and a mixture of a polymer and solvent. The experiment combines precision ellipsometry of the vapor-liquid interface with in situ measurements of refractive indices of the liquid phases, and it precisely locates the consolute point.

Separation of Hydrophilic Thiols Using Reversed-Phase Chromatography with Trihaloacetate Buffers.

Final rept.

D. Shea, and W. A. MacCrehan. 1988, 15p
Pub. in Jnl. of Chromatography 457, p111-125 Dec 88.

Keywords: *Separation, *Chromatography, *Halogen organic compounds, *Thiols, *Buffers(Chemistry), *Acetates, Column packings, Absorption, pH, Ionic mobility, Cysteine, Liquid phases, Vapor phases, Reprints, Reversed flow, Hydrophilicity, Retention, Ionic strength, Ion pairs, Gas chromatography, Liquid chromatography.

The reverse-phase retention behavior of several neutral and cationic hydrophilic thiols using trihaloacetic acid pairing agents is studied. Retention for cationic compounds increases with the size of the halogen substituent of the trihaloacetic acid. The effect of pH, ionic strength, pairing ion and counter ion concentration on retention of cysteine and other thiols is measured. The formation of mobile-phase ion-pairs is proposed as the mechanism of retention enhancement.

Two Photon Resonance Enhanced Multiphoton Ionization Spectroscopy of Gas Phase O(sub 2) a(sub 1)Delta(sub g) between 305-350 nm.

Final rept.

R. D. Johnson, G. R. Long, and J. W. Hudgens. 1988, 1p
Pub. in Jnl. of Chemical Physics 89, n6 p1079 1988.

Keywords: *Oxygen, *Electronic spectra, *Spectrum analysis, Mass spectroscopy, Ionization, Molecular energy levels, Reprints, *Multi-photon processes, Rydberg states.

The resonance enhanced multiphoton ionization (REMPI) spectrum of O2 a(sub 1)delta(sub g) between 295 micrometers and 350 micrometers is reported. The spectrum is compared to the REMPI spectrum of ground state molecular oxygen in the same electronic energy region and a number of differences in the respective spectra are observed. Detection limits for O2 a(sub 1)delta(sub g) by REMPI is calculated to be 5x10 to the 9th power/molecules/cubic cm in the ion source of the mass spectrometer.

Rare Gas Interaction Energy Curves.
 Final rept.
 M. Krauss, R. M. Regan, and D. D. Konowalow.
 1988, 5p
 Pub. in Jnl. of Physical Chemistry 92, n15 p4329-4333 1988.

Keywords: *Rare gases, *Atomic energy levels, Hartree-Fock approximation, Van der Waals equation, Dispersion relations, Perturbation theory, Reprints, *Atomic models, *Dimers, *Atomic interactions, Self-consistent field, Interatomic forces.

Interaction energy curves for all the heteronuclear rare gas dimers including He to Xe are calculated as the sum of the exchange repulsion and the attractive interatomic correlation energy between the atoms. The self-consistent-field (SCF) method represents the repulsion and a perturbation method is used to calculate a dispersion energy which takes account of the overlap of the atoms. The effect of overlap is to reduce or damp the dispersion energy. The hybrid model yields binding energies that are in the range of 75% to 90% of experimental values. The differences are due to slow convergence of the damped dispersion energy and to the difficulty in obtaining Hartree-Fock limit energy curves within 1/cm accuracy. The comparable accuracy for the binding energies over a range of atoms for He to Xe suggests that the model correctly represents the dominant energy terms. The model is generally applicable since it depends on the polarization behavior of the fragments for the dispersion calculation and SCF energies which can be more accurately calculated in routine calculation.

 Pub. in Lubrication Engineering 45, n1 p9-15 1989.

Keywords: *Oxidation, *Fuels, *Lubricants, *Chemiluminescence, *Lubricating oils, Laboratory equipment, Design criteria, Performance evaluation, Continuous sampling, Chemical properties, Fuel storage, Lubrication systems, Reprints, *Stability tests, Fuel tests, Lubricating properties, Lubricant tests.

Chemiluminescence is a rapid, versatile and nonintrusive technique for continuous monitoring rates of oxidation. It is ideal to observe the oxidation properties of a lubricating base oil and additive package combination under storage and service conditions directly or by simulating engine conditions. In the paper, a chemiluminescence apparatus is designed with the sole purpose to study the oxidation stability of lubricants or fuel. The effects of the general parameters to optimize the apparatus have been examined. These parameters include temperature, film thickness, atmosphere control, sample introduction, spectral bandpass, the use of energy transfer agent, and the surface catalytic effect. Preliminary experimental results are very promising and show that the apparatus and CL method are versatile and suitable for oxidation studies.

Biological Thermodynamic Data for the Calibration of Differential Scanning Calorimeters: Heat Capacity Data on the Unfolding Transition of Ribonuclease A in Solution.
 Final rept.
 F. P. Schwarz, and W. H. Kirchoff. 1988, 29p
 Pub. in Thermochemica Acta 128, p267-295 1988.

Keywords: *Thermodynamics, *Specific heat, *Differential scanning calorimetry, Enthalpy, Pancreas, Reprints, *Pancreatic ribonuclease.

Extensive measurements of the heat-capacity changes accompanying the unfolding transition of bovine pancreatic ribonuclease A in buffered aqueous solutions have been performed in a differential scanning calorimeter over a range of experimental conditions. The concentration of ribonuclease A varied from about 1 mass % to 2 mass %. The pH varied from 1.8 to 5.0 at two glycine-HCl buffer concentrations: 0.1 M and 0.2 M. Measurements were made on ribonuclease A obtained from various commercial sources. The heat capacity data were corrected for the thermal lag of the instrument and fit by least squares to a two-state model to determine the transition enthalpy and temperature, the baseline heat-capacity change, and the cooperativity of the transition. The transition temperature T_m and enthalpy ΔH_m determined from the fit of a two-state model to the transition profile increased linearly with pH from $311.9 + 0.5K$ and $308.2 + 6.4 \text{ kJ/mol}$ at $pH=2$ to $335.4 + .6 K$ and $408.9 + 6.6 \text{ kJ/mol}$ at $pH=4$, where the uncertainties represent two standard deviations based on a linear least squares fit of ΔH_m and T_m to pH. Values of T_m and ΔH_m were independent of the commercial source of ribonuclease A. T_m was independent of the buffer concentration but showed a slight dependence on the concentration of ribonuclease A.

Mechanisms of Condensation of Biaryl Hydrocarbons.
 Final rept.
 V. P. Senthinathan, and S. E. Stein. 1988, 8p
 Pub. in Jnl. of Organic Chemistry 53, n13 p3000-3007 1988.

Keywords: *Reaction kinetics, *Pyrolysis, *Condensation reactions, *Aromatic hydrocarbons, Free radicals, Naphthalene, Anthracene, Isomerization, Dissociation, Reprints, *Chemical reaction mechanisms.

Results of kinetic studies of the condensed phase thermal reactions of the following biaryl hydrocarbons are reported; 1,1'-binaphthyl, 1,2'-binaphthyl, 1-phenylanthracene and 9-phenylanthracene. Condensation generally occurred in parallel with both isomerization and dissociation and rates depended on concentrations of hydrogen donors. In order to simplify mechanisms, detailed studies used donors capable of providing just one H-atom. These donors were xanthene, fluorene and diphenylmethane. A mechanism is proposed in which the key intermediates of all reactions are radicals created H-atom transfer to the biaryls. In the condensation of naphthyl-containing biaryls, it is suggested that reactions are initiated by H-transfer to a remote position. According to this model, the resulting radical then cyclizes by simple intramolecular radical attack.

Characterization of Ultrathin Pt Overlayers Deposited on a W(110) Surface.

Final rept.
 S. M. Shivaprasad, R. A. Demmin, and T. E. Madey. 1988, 5p
 Pub. in Thin Solid Films 163, p393-397 Sep 88.

Keywords: *Platinum, *Tungsten, Thin films, Electron diffraction, Desorption, Surface chemistry, Crystal growth, Carbon monoxide, Annealing, Catalysts, Metal films, Reprints, Characterization, Auger electron spectroscopy, Temperature programmed desorption, Low energy electron diffraction.

The growth of Pt overlayers (sub-monolayer to multiple layer coverages) on a clean W(110) surface are studied by Auger Electron Spectroscopy (AES) and Temperature Programmed Desorption (TPD). Based on Auger peak amplitudes, thermally evaporated Pt appears to grow in the Frank-van der Merwe mode on W(110), at least for the first few layers. Annealing of Pt deposited at 90K shows distinct changes in Auger ratios and adsorption states of molecular CO, providing evidence for changes in the electronic and structural properties of the overlayers. TPD of CO combined with the AES measurement suggest that annealing induces either agglomeration of the Pt atoms into large islands with a small cluster density, or the formation of a surface Pt/W alloy. Annealing above 1500K produces a stable monolayer of Pt on the W surface for all initial Pt coverages 1 monolayer. Preliminary low Energy Electron Diffraction (LEED) studies are consistent with the observed trends in the structure of the Pt-overlayers on W(110).

Resonance Structure in the Vibrationally Resolved Photoelectron Branching Ratios and Angular Distributions of the $2\pi(-1)$ Channel of NO.
 Final rept.
 S. H. Southworth, J. L. Dehmer, J. E. Hardis, and A. C. Parr. 1987, 6p
 Pub. in Jnl. of Chemical Physics 87, n9 p5125-5130 1987.

Keywords: *Nitrogen oxide(NO), Synchrotron radiation, Angular distribution, Reprints, Photoelectron spectroscopy, Branching ratio, Vibrational states, Autoionization, Rydberg states.

The authors report on vibrationally resolved measurements of photoelectron angular distribution and branching ratios for $\text{No}(1+)$ using synchrotron radiation over $h(\nu) = 11.5-26 \text{ eV}$. Normally weak vibrational levels are strongly enhanced below 18 eV, and the photoelectron asymmetry parameters and branching ratios display a vibrationally dependent, broad spectral structure over $h(\nu)$ approximately = 11-18 eV. These observations may reflect the presence of the expected shape resonance; however, various interchannel coupling mechanisms may also be involved. Resonance structure in the photoelectron asymmetry parameters is also observed in the $h(\nu)$ approximately = 19-22 eV region. The structure is likely associated with Rydberg excitations.

Calculation of the Anisotropy of Equilibrium Surface Composition in Metallic Solid Solutions Using the Embedded Atom Method.
 Final rept.
 D. A. Steigerwald, and P. Wynblatt. 1988, 17p
 Pub. in Surface Science 193, n1-2 p287-303 1988.

Keywords: *Solid solutions, Chemical equilibrium, Chemical composition, Metals, Mathematical models, Embedding, Separation, Enthalpy, Crystal structure, Anisotropy, Reprints, *Surface composition, Embedded atom method.

A new model is developed to account for the anisotropy of the equilibrium surface composition of dilute alloys. The anisotropy is assumed to result from the existence of a distribution of different surface sites, each of which may possess a unique enthalpy of segregation. The model relies on the hypothesis that any given surface, with an orientation parallel to a plane having Miller indices (kkl), may be synthesized from atoms distributed among terrace, step, and kink sites.

The types and surface densities of surface sites in a given (kk1) surface are evaluated by means of an existing microfacet notation. An enthalpy of segregation for a surface composed of specified fractions of terrace, step, and kink sites. The model is compared and contrasted with other approaches which have been used to evaluate the anisotropy of surface composition.

E. J. Tierney, J. M. Bellama, G. Eng, F. E. Brinckman, and R. B. Johannesen. 1988, 9p
Pub. in *Jnl. of Chromatography* 441, n2 p229-237 1988.

Keywords: *Tin organic compounds, Separation, Logarithm functions, Numerical analysis, Linear systems, Experimental design, Reprints, *High performance liquid chromatography, *Surface area, *Molecular liquids.

Various organotin compounds were separated using a reverse bonded C-18 column with a 93% methanol - 7% water mobile phase. Both holistic total surface area (TSA) calculations and assembly of molecular TSA's from addition of 'mean functional groups and atom' TSA values were employed in the study. A significant linear correlation was obtained between the natural logarithms of the capacity factor and the TSA values for both fluxional and rigid organotin systems. Although the two systems could not be intercorrelated, tie-lines could be drawn between them. The use of these tie-lines enable the predictions of unreported compounds.

Correlation between Gas Phase and Solution Phase Reactivities of Hydroxyl Radicals Towards Saturated Organic Compounds.

Final rept.
T. J. Wallington, P. Dagaut, and M. J. Kurylo. 1988, 5p
Pub. in *Jnl. of Physical Chemistry* 92, n17 p5024-5028 1988.

Keywords: *Organic compounds, *Vapor phases, *Liquid phases, *Reaction kinetics, Comparison, Linear systems, Liquid saturation, Photolysis, Reprints, *Hydroxyl radicals, *Chemical reaction mechanisms, Resonance fluorescence.

The gas phase and aqueous solution phase reactivities of hydroxyl radicals (OH) with a wide variety of organic compounds are compared. When kinetic data are available for the same reaction occurring in both phases, this comparison provides useful information about the reaction mechanism. Through this comparison the authors can demonstrate a linear correlation between the gas/solution phase OH reactivities for numerous saturated organic compounds. The empirical relationship can be used together with mechanistic information to estimate the OH reactivity in one phase from the measured rate constant in the other. In order to develop and extend the correlation, they have used the flash photolysis resonance fluorescence technique to measure rate constants for the gas phase reactions of OH radicals with methanol-d₄; ethanol-d₆; 2-chloroethanol; 2,2,2-trichloroethanol; 2,2,2-trifluoroethanol; acetone-d₆; 1,1,1-trifluoroacetone; and 1,2-butylene oxide at 298 K. The results are reported herein.

Gas-Phase Reactions of Hydroxyl Radicals with the Fuel Additives Methyl Tert-Butyl Ether and Tert-Butyl Alcohol Over the Temperature Range 240-440 K.

Final rept.
T. J. Wallington, P. Dagaut, R. Liu, and M. J. Kurylo. 1988, 3p
Pub. in *Environmental Science and Technology* 22, n7 p842-844 1988.

Keywords: *Reaction kinetics, *Butanols, Fuel additives, Exhaust emissions, Photolysis, Air pollution, Reprints, *Hydroxyl radicals, *Atmospheric chemistry, *Ether/methy-butyl, Resonance fluorescence.

Methyl-tert-butylether (MTBE) and tert-butylalcohol (TBA) are widely used as motor fuel additives to increase the octane number and to reduce CO emissions. Since their reaction with hydroxyl radicals (OH) is a major loss process for these oxygenated species in the atmosphere, the authors have conducted a flash photolysis resonance fluorescence study of the kinetics of the reactions of OH radicals with MTBE and TBA and report the results of these measurements here. Experiments were performed over the temperature range 240-440K at total pressures (using Ar diluent gas) between 25-50 torr. The implications of these results for the atmospheric chemistry of MTBE and TBA are discussed.

Sputtering-Induced Surface Roughness of Metallic Thin Films.

Final rept.
D. Marton, and J. Fine. 1990, 12p
Pub. in *Thin Solid Films* 185, p79-90 1990.

Keywords: *Metal films, Thin films, Surface roughness, Sputtering, Interfaces, Nickel, Chromium, Silver, Light scattering, Reprints, Depth profile, Auger electron spectroscopy.

Changes in surface microtopography which often occur during sputter depth profile analysis can significantly affect the measured depth resolution of interfaces. To understand better the importance of the roughening effect on interface analysis, correlated measurements of surface roughness obtained while Auger sputter depth profiling thin metallic multilayered systems (Ni/Cr, Ag/Ni and chromium oxide/Cr) with the observed Auger interface widths. The r.m.s. roughness of the surfaces was measured, in situ, using optical total integrated scattering (TIS) techniques. The surface roughness increases with sputtered depth as well as with the energy of the impacting ions. The TIS measurements of r.m.s. roughness are in good agreement with the interface widths obtained from the Auger depth profiles and with the predictions of a statistical sputtering model. At elevated temperatures, 373 and 473 K, a slight decrease is observed in the surface roughness of Ag/Ni thin films, probably as a result of surface diffusion: such materials sputtered at yet higher temperatures (576 and 673 K) become rougher, probably because of recrystallization processes.

Precision, Accuracy, and Uncertainty in Quantitative Surface Analyses by Auger-Electron Spectroscopy and X-ray Photoelectron Spectroscopy.

Final rept.
C. J. Powell, and M. P. Seah. 1990, 29p
Pub. in *Jnl. of Vacuum Science and Technology A* 8, n2 p735-763 Mar/Apr 90.

Keywords: *Surface chemistry, *Quantitative analysis, *X ray spectroscopy, Performance evaluation, Error analysis, Reprints, *Auger electron spectroscopy, *Photoelectron spectroscopy.

A quantitative surface analysis by Auger-electron spectroscopy (AES) or x-ray photoelectron spectroscopy (XPS) requires a series of operations that typically includes instrument setup, specimen positioning, data acquisition, data manipulation, and data analysis. These operations involve a sequence of measurements which are combined and/or compared with other data to yield an analysis. The final result has an estimated uncertainty that reflects the sum of the separate random and systematic errors in the various measurements and sources of data. The authors identify the major steps in typical analyses and comment on the major sources of error leading to estimates of uncertainty. Systematic errors generally exceed those of a random nature and are associated with the complex morphology of typical specimens, with parameters of instrument performance, and with limitations of current methodology and data. They review general measurement principles for surface analysis, the development of a suitable analytical strategy, and identify and discuss many of the sources of error. The discussion is specific to AES and XPS but many of the issues are relevant to other techniques of surface analysis. Finally, two examples are presented to illustrate the sources and magnitudes of some of the errors and the final uncertainties in some common examples of surface analyses.

Crossover from Singular Critical to Regular Classical Thermodynamic Behavior of Fluids.

Final rept.
Z. Y. Chen, P. C. Albright, and J. V. Sengers. 1990, 17p

Contract DE-FG05-88ER13902
Sponsored by Department of Energy, Washington, DC.

Pub. in Physical Review A 41, n6 p3161-3177, 15 Mar 90.

Keywords: *Thermodynamics, Free energy, Critical point, Carbon dioxide, Steam, Ethylene, Fluids, Reprints.

A procedure is presented for constructing a thermodynamic free energy for fluids in the critical region that incorporates the crossover from Ising-like singular behavior near the critical point to regular classical behavior far away from the critical point. The procedure is based on an approximation of the solution of the renormalization-group theory of critical phenomena, modified to include effects from a cutoff wave number for the crossover to the classical limit. As an illustration, the authors show how the procedure can be applied to a truncated classical Landau expansion. The results are compared with experimental thermodynamic-property data for carbon dioxide, steam, and ethylene in the critical region.

Microwave Spectrum and Electric Dipole Moment of Ne-HF.
Final rept.

G. T. Fraser, and R. D. Suenram. 1990, 6p
Pub. in Jnl. of Molecular Spectroscopy 140, p141-146 1990.

Keywords: *Hydrogen fluoride, *Neon, *Microwave spectroscopy, *Dipole moments, Electric moments, Complex compounds, Hydrogen bonds, Rotational spectra, Reprints, *Fourier transform spectrometers, Van der Waals forces.

Rotational spectra of (20)Ne-HF and (22)Ne-HF have been measured using a pulsed-nozzle Fourier-transform microwave spectrometer. The $J = 2-1$ and $1-0$ transitions were observed, yielding $B(\text{sub } 0) = 4514.0949(15)$ MHz, $D(\text{sub } J) = 0.59889(19)$ MHz, and $\mu = 0.3882(21)$ D for (20)Ne-HF and $B(\text{sub } 0) = 4318.53739(93)$ MHz, $D(\text{sub } J) = 0.54021(12)$ MHz, and $\mu = 0.3917(13)$ D for (22)Ne-HF. The measured dipole moments provide an estimate of $\langle (P(\text{sub } 1)\cos\Theta) \rangle = 0.21$ which can be related to the anisotropy of the Ne-HF intermolecular potential.

Neutron Scattering Studies of Potassium-Ammonia Layers in Graphite.
Final rept.

H. Zabel, and D. A. Neumann. 1988, 6p
Pub. in Canadian Jnl. of Chemistry 66, n4 p666-671 1988.

Keywords: *Graphite, *Neutron scattering, *Ammonia, *Molecular structure, *Potassium, Dynamic properties, Mathematical models, Diffusion, Molecular rotation, Ions, Reprints, *Clathrates.

Neutron scattering investigations of the structural and dynamical properties of ammonia molecules in the stage 1 compound $\text{KC}_{24}(\text{NH}_3)_{4.3}$ are discussed. The K-NH₃ intercalate layers represent the two-dimensional analogue of the well known metal-ammonia solutions. At room temperature the intercalate liquid structure factor can be described by a model in which the K-ions are surrounded on the average by four NH₃ molecules, and the remaining molecules are essentially free. Quasi-elastic neutron scattering revealed two independent rotational motions of the NH₃ molecule, one associated with the rotation about the C₃ symmetry axis and the other one about the K-ions. Above 200K also translational diffusion becomes noticeable. The phonon dispersion of the (OOq) longitudinal modes show clear signs of a phonon-libron coupling which causes the acoustic branch to split.

Heterodyne Frequency Measurements on OCS Near 61.76 THz (2060 cm⁻¹).
Final rept.

J. S. Wells, M. Schneider, and A. G. Maki. 1990, 7p
Sponsored by National Aeronautics and Space Administration, Washington, DC, Office of Atmospheric Research.
Pub. in Jnl. of Molecular Spectroscopy 140, p170-176 1990.

Keywords: *Infrared spectroscopy, *Demodulation, Calibrating, Frequencies, Spectrum analysis, Reprints, *Carbon oxysulfide, *Fourier transform spectrometers, *Heterodyning.

Heterodyne measurements have been made on the $10(\text{sup } 0)0-00(\text{sup } 0)0$ and $11(\text{sup } 1)0-01(\text{sup } 1)0$ bands of $(16)\text{O}(12)\text{C}(32)\text{S}$ and $(16)\text{O}(13)\text{C}(32)\text{S}$ and the $10(\text{sup } 0)0-00(\text{sup } 0)0$ band of $(16)\text{O}(12)\text{C}(34)\text{S}$. These measurements were combined with earlier frequency measurements and Fourier transform measurements to obtain accurate calibration frequencies for the regions 1985 to 2085 and 2550 to 2600/cm.

Unstable Periodic Orbits, Recurrences, and Diffuse Vibrational Structures in the Photodissociation of Water Near 128 nm.
Final rept.

K. Weide, K. Kuhl, and R. Schinke. 1989, 10p
Pub. in Jnl. of Chemical Physics 91, n7 p3999-4008, 1 Oct 89.

Keywords: *Water, Absorption spectra, Reprints, *Photodissociation, Vibrational states, Periodic orbits.

The photodissociation of H₂O in the second absorption band (Chi tilde->Beta tilde) is investigated in a completely time-dependent approach. The Schrodinger equation is solved by a time-dependent close-coupling method expanding the two-dimensional wave packet in terms of free rotor states. The vibrational degree of freedom of the OH fragment is fixed and only motion on the Beta tilde-state potential-energy surface is considered. The existence of unstable periodic orbits leading to a recurrence of the autocorrelation function gives, for the first time, a consistent explanation of the diffuse structure in the absorption spectrum of H₂O in the second band.

Heterodyne Frequency Measurements of (12)C(16)O Laser Transitions Near 2050 cm⁻¹.
Final rept.

M. Schneider, J. S. Wells, and A. G. Maki. 1990, 7p
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Jnl. of Molecular Spectroscopy 139, p432-438 1990.

Keywords: *Carbon monoxide, *Infrared spectroscopy, *Demodulation, Calibrating, Frequencies, Spectrum analysis, Tables(Data), Doppler effect, Molecular vibration, Molecular rotation, Reprints, *Laser spectroscopy, *Fourier transform spectrometers, *Heterodyning.

New heterodyne frequency measurements of $(12)\text{C}(16)\text{O}$ laser transitions were made in the 1995 to 2082/cm (59.81 to 62.39 THz) region. Frequencies of 23 transitions (with lower vibrational quantum numbers, ν double prime, ranging from 1 to 4) were measured. New constants for these low-lying vibrational levels were determined by fitting these data (along with sub-Doppler measurements by Pollock et al., rotational transition measurements, and FTS measurements from Guelachvili et al. to the Dunham expression. Frequency calibration tables calculated from these new constants are reported. These tables provide accurate transition frequencies for the CO laser stabilized to the Doppler-broadened gain profile.

Rotational Distributions in the Photodetachment of IHI(1-) and in the I + HI Reaction: The Influence of IHI Transition State Resonances.
Final rept.

G. C. Schatz. 1989, 7p
Grant NSF-CHE87-15581
Sponsored by National Science Foundation, Washington, DC.
Pub. in Israel Jnl. of Chemistry 29, p361-367 1989.

Keywords: *Molecular rotation, *Molecular energy levels, *Hydrogen iodide, Ionization, Chemical reactions, Spectrum analysis, Reprints, *Photodetachment, *Franck-Condon principle, Rotational states, Coupled channel theory, Resonance scattering.

Franck-Condon factors which determine IHI-photodetachment spectra have been calculated using a three-dimensional coupled-channel reactive scattering program. These Franck-Condon factors show peaks as a function of energy that are in reasonable agreement with measured spectra due to Neumark and co-workers. Some of these peaks are due to IHI transition state resonances and others are due to direct scattering reactive threshold effects. An analysis of the rotational distributions associated with the Franck-Condon factors indicates that when direct scattering is dominant, the distributions peak at the rotational state which is nearest to its effective reaction threshold. At energies where IHI transition state resonances are important, the rotational distribution changes, thus providing a characteristic signature of resonance formation. The I + HI bimolecular rotational distributions are also considered, and they also show important differences between direct and resonant energies.

National Inst. of Standards and Technology (NML), Gaithersburg, MD. Atomic and Plasma Radiation Div. **Spectrum and Energy Levels of Six-Times-Ionized Molybdenum (Mo VII)**.

Final rept.
J. Reader, and U. Feldman. 1990, 13p
Sponsored by Department of Energy, Washington, DC., and Naval Research Lab., Washington, DC.
Pub. in Jnl. of the Optical Society of America B 7, n3 p253-265 Mar 90.

Keywords: Ultraviolet spectroscopy, Hartree-Fock approximation, Quantum numbers, Energy levels, Ionization, Reprints, *Molybdenum ions.

The spectrum of the krypton-like ion Mo VII was observed from 140 to 2274 Å with sliding-spark discharges on 10.7-m normal- and grazing-incidence spectrographs. Experimental energies were determined for all levels of the $4s(2)sp(6)$, $4s(2)4p(5)4d$, $4f$, $5s$, $5p$, $5d$, $5f$, $5g$, and $4s(4)p(6)4d$ configurations. A few levels of the $4s(2)4p(4)d(3)$ configuration were also found. A total of 399 lines were classified as transitions between 86 observed levels. The observed configurations were theoretically interpreted. The energy parameters determined by least-squares fits to the observed levels are compared with Hartree-Fock calculations. A revised value of the ionization energy was obtained by using the energy of the $4p(5)5g$ configuration together with an isoelectronically extrapolated value of the effective quantum number $n^*(5g)$. The adopted limit is $1\ 013\ 340 \pm$ or $-200/cm$ (125.64 + or - 0.02 eV).

Modified Leung-Griffiths Model for Vapor-Liquid Equilibria: Application to Polar Fluid Mixtures.

Final rept.
J. C. Rainwater, and J. J. Lynch. 1989, 11p
Sponsored by Department of Energy, Washington, DC.
Pub. in Fluid Phase Equilibria 52, p91-101 1989.

Keywords: *Mathematical models, *Critical point, Revisions, Polarization (Charge separation), Methyl alcohol, Butanols, Ethyl ether, Reprints, *Liquid-vapor equilibrium, *Binary-fluid systems, *Binary mixtures, *Leung-Griffiths model, Freons.

The Leung-Griffiths model as modified by Moldover and Rainwater has proven successful for correlation of critical-region vapor-liquid equilibria (VLE) surfaces of many binary nonpolar fluid mixtures. In this work the model is applied to four binary mixtures of polar fluids: diethyl ether + n-butanol and methanol + n-butanol as measured by Kay and Donham and the refrigerant mixtures R13B1 + R114 and R22 + R114 as measured by Uematsu, Watanabe and co-workers. The model provides accurate correlations of the polar mixtures, although the number of required adjustable parameters is in some cases larger than that needed for a nonpolar mixture with an equivalent critical locus.

Stimulated Desorption from CO Chemisorbed on Cr(110): Sensitivity to Bonding Changes.

Final rept.
N. D. Shinn, and T. E. Madey. 1988, 4p
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Proceedings of International Workshop on Desorption Induced by Electronic Transitions (DIET III) (3rd), Shelter Island, NY., May 20-22, 1987, p216-219 1988.

Keywords: *Carbon monoxide, *Desorption, Chemical bonds, Chemisorption, Chromium, Surfaces, Sensitivity, Reprints, *Electron stimulated desorption.

Electron stimulated desorption (ESD) experiments using a time-of-flight pulse counting method have revealed a correlation between the binding states of carbon monoxide on the Cr(110) surface at 90K and the positive ion yield. Consistent with previous qualitative observations using the electron stimulated desorption ion angular distribution method, negligible $CO(1+)$ and $O(1+)$ desorption signals were measured from the alpha (1) CO molecular binding state which saturates at 1/4 monolayer. For $\theta(CO) > 0.25$, terminally-bonded molecular CO (the alpha (2) CO binding state) co-exists with the alpha (1) CO state and both $CO(1+)$ and $O(1+)$ ions are observed. In addition, a decrease in the $O(1+)$ yield near saturation coverages ($\theta(CO)$ approx = 0.35) of the mixed alpha (1) CO + alpha (2) CO adlayer is attributed to intermolecular interactions which reduce the ion desorption probability for the ESD-active alpha (2) CO species.

Pub. in Preprints of Papers - American Chemical Society, Division of Fuel Chemistry 32, n3 p448-455 1987.

Keywords: *Shock tubes, Decomposition, Reaction kinetics, Heat of formation, Vinyl compounds, Free radicals, Heat of dissociation, Reprints, *Phenylbutene.

1-Phenylbutene-2(1-PHB-2) has been decomposed in single pulse shock tube experiments. Acetylene formation is used as a measure of the rate of cleavage of the benzyl-vinyl C-C bond. The rate expression for the reaction has been found to be $k(1-PHB-2 - benzyl + propenyl) = 2.4 \times 10^{sup 16} \text{Exp}(-43780/T) /s$. The A-factor for the process is unexpectedly large. It may be indicative of a larger than usual combination rate constant for vinyl radicals. Possible sources of experimental errors are considered. The results are consistent with a bond dissociation energy for the primary vinyl C-H bond in propylene of 475 + or - 10 kJ/mol.

Influence of Surface Structure on Mechanisms of Stimulated Desorption.

Final rept.
R. L. Kurtz, R. L. Stockbauer, and T. E. Madey. 1988, 6p
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Proceedings of International Workshop on Desorption Induced by Electronic Transitions (DIET III) (3rd), Shelter Island, NY., May 20-22, 1987, p109-114 1988.

Keywords: *Titanium dioxide, *Rutile, *Desorption, Surfaces, Reprints, *Photon stimulated desorption, Electron stimulated desorption.

There have been many studies of the mechanisms and of the structural influences in stimulated desorption, however few investigations have considered their simultaneous interplay. The authors' recent studies of stimulated desorption from TiO_2 surfaces have shown that there is a significant interaction between both of these aspects. In the context of desorption from this maximal-valent oxide, for which the Knotek-Feibelman mechanism has been proposed, it will be shown that the geometric structure can determine the probability that an electronic excitation will result in ion desorption.

Ellipsoidal Mirror Analyzer for the Study of Photon Stimulated Desorption.
 Final rept.
 R. Stockbauer, R. L. Kurtz, and T. E. Madey. 1988, 4p
 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Proceedings of International Workshop on Desorption Induced by Electronic Transitions (DIET III) (3rd), Shelter Island, NY., May 20-22, 1987, p126-129 1988.
- Keywords: *Electrostatic analyzers, Synchrotron radiation, Surfaces, Titanium, Reprints, *Photon stimulated desorption, *Ellipsoidal mirror analyzers.
- The authors' studies over the past few years have concentrated on elucidating the mechanisms of ion desorption from surfaces using synchrotron radiation. While the cylindrical mirror analyzer has served them well over the years, it is limited in its ability to measure the angular distribution and mass of ions desorbed from a surface following photon impact. For this reason, they embarked on a project several years ago to design and construct a new charged particle analyzer without these limitations. The analyzer selected for this purpose was the ellipsoidal mirror analyzer design developed by Eastman, et al. The analyzer has the ability to measure simultaneously, the kinetic energy, emission angle, and mass of the desorbing ions. A description of the analyzer, several unique features, and its intended uses are given in detail.

Electrophoretic Response of Submicron Particles to Alternating Electric Fields.
 Final rept.
 A. K. Gaigalas, S. Woo, and J. B. Hubbard. 1990, 11p
 Pub. in Jnl. of Colloid and Interface Science 136, n1 p213-223 Apr 90.
- Keywords: Alternating current, Electric fields, Light scattering, Polystyrene, Latex, Spheres, Reprints, *Electrophoretic mobility, Aqueous solutions.
- Electrophoretic light-scattering (ELS) experiments were carried out to study the translational motion of submicron polystyrene latex spheres (0.198 micrometer radius) under the influence of alternating electric fields in aqueous solution. The motion was measured by observing the autocorrelation of photons scattered by the moving particles. In all cases, the homodyne detection mode was used. For electric field frequencies from 50 Hz to 1 KHz (the highest frequency for which a Doppler shift could be seen), the magnitude of the particle's electrophoretic response decreased with increasing frequency. The observed low-frequency dispersion in the apparent electrophoretic mobility is anomalously large and cannot be explained by conventional electrohydrodynamic theories. For frequencies below 50 Hz, the response was highly nonlinear and large second harmonic components were observed in the motion of the particles. Electroosmotic perturbations due to the coupling of the electric field to the space charge near the surfaces of the ELS cell are estimated.

 Pub. in Proceedings of International Workshop on Desorption Induced by Electronic Transitions (DIET III) (3rd), Shelter Island, NY., May 20-22, 1987, p160-166 1988.
- Keywords: *Titanium dioxide, *Rutile, *Desorption, Particle trajectories, Surfaces, Reprints, *Photon stimulated desorption, *Electron stimulated desorption, *Oxygen ions.
- Electron and photons can stimulate positive ion desorption from surfaces provided that: the positive ion is formed by electronic transitions initiated by the incident electron or photon, repulsive forces act to expel the particle, and the positive ion escapes without neutralization or re-capture by the solid. A microscopic mechanism has been proposed by Knotek and Feibelman to explain positive ion desorption from ionic insulators. The prototypical system for this mechanism is O(1+) desorption from TiO₂. Since the Ti cation is maximal valent, i.e., a filled 3p shell and no 3d electrons, a Ti core hole that is produced by electron or photon impact can only be filled by an inter-atomic Auger decay process that involves O valence electrons. There is a finite branching ratio for two Auger electrons to be ejected from a single oxygen center, resulting in the formation of O(1+). This O(1+) ion can be expelled from the surface by repulsive Coulomb forces. Since the repulsive forces are relatively well known, the nuclear motion can be predicted. In the article, the authors discuss classical trajectory calculations of O(1+) desorption from TiO₂.

Magnitude of Secondary Electron Contributions in Photon Stimulated Desorption.

Final rept.
 D. E. Ramaker, T. E. Madey, R. L. Kurtz, and H. Sambe. 1988, 4p
 Pub. in Proceedings of International Workshop on Desorption Induced by Electronic Transitions (DIET III) (3rd), Shelter Island, NY., May 20-22, 1987, p182-184 1988.

Keywords: *Desorption, Surfaces, Reprints, *Photon stimulated desorption, *Secondary electrons, Electron stimulated desorption.

Recent reports on the extent of secondary electron contributions in electron/photon stimulated desorption (ESD/PSD) appear to be contradictory. JAEGER et al. suggested that secondary electrons provide the dominant contribution to the H(1+) yield from NH₃/Ni and called the process x-ray induced ESD(XESD). Others have concluded that the XESD process is the dominant mechanism in the PSD of N(1+) and O(1+) ions from mixed condensed gases such as N₂ and O₂ and in the PSD of H(1+) ions from OH/YbO-Sm. On the other hand, considerable evidence exists in the literature for the dominance of the direct photon excitation mechanisms. The evidence usually comes from observed differences between the ion yield and the secondary electron yield or from the absence of any clear structure or 'turn on' at certain core levels. The paper presents a re-examination of the three systems mentioned above where a dominant XESD effect has been postulated to determine the validity of the conclusions previously reached.

Proposed Dynamic Pressure and Temperature Primary Standard.

Bi-monthly rept.
 G. J. Rosasco, V. E. Bean, and W. S. Hurst. 13 Oct 89, 15p
 Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n1 p33-47 Jan-Feb 90.

Keywords: *Primary standards, *Pressure sensors, *Temperature measuring instruments, Measurement, Dynamic tests, Thermodynamic equilibrium, vibrational spectra, Rotational spectra, Lasers, Trnsducers, Raman Spectra, Frequencies, Molecular relaxation.

Diatomic gas molecules have a fundamental vibrational motion whose frequency is affected by pressure in a simple way. In addition, the molecules have well defined rotational energy levels whose populations provide a reliable measure of the thermodynamic temperature. Since information concerning the frequency of vibration and the relative populations can be deter-

mined by laser spectroscopy, the gas molecules themselves can serve as sensors of pressure and temperature. Through measurements under static conditions, the pressure and temperature dependence of the spectra of selected molecules is now understood. As the time required for the spectroscopic measurement can be reduced to nanoseconds, the diatomic gas molecule is an excellent candidate for a dynamic pressure/temperature primary standard. The temporal response in this case will be limited by the equilibration time for the molecules to respond to changes in local thermodynamic variables. Preliminary feasibility studies suggest that by using coherent anti-Stokes Raman spectroscopy it is possible to measure dynamic pressure up to $10(\text{sup } 8) \text{ Pa}$ and dynamic temperature up to 1500 K with an uncertainty of 5%.

Spectroradiometric Determination of the Freezing Temperature of Gold.

Bi-monthly rept.

K. D. Mielenz, R. D. Saunders, and J. B. Shumaker.

28 Nov 89, 19p

Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n1 p49-67 Jan-Feb 90.

Keywords: *Gold, *Temperature measurement, Spectroradiometers, Freezing, Melting points, Thermodynamic properties, Irradiation, Blackbody radiation, Infrared detectors, Standards, Silicon, *Calibration standards, Laser heating, Planck radiation formula.

A direct spectroradiometric determination of the temperature of freezing gold was performed by measuring the spectral radiances of a gold blackbody relative to those of a laser-irradiated integrating sphere which was calibrated with absolute silicon detectors and an electrically calibrated radiometer. The measurements were performed at three laser wavelengths near 600 nm , and the temperature of the blackbody was calculated by substituting the measured spectral radiances into Planck's radiation formula. The result obtained $T_{\text{Au}} = (1337.33 \pm 0.34) \text{ K}$, is 0.25 K below the gold-point assignment in the International Practical Temperature Scale of 1968 (IPTS-68) and has been adopted in September 1990 as the new gold-point value in the International Temperature Scale of 1990 (ITS-90). The effect of the change in the gold-point assignment on pyrometric, radiometric, and photometric measurement services provided by the National Institute of Standards and Technology is assessed.

Report on the Session of the Consultative Committee on Thermometry (17th).

Bi-monthly rept.

B. W. Mangum. 4 Nov 89, 9p

Held in Sevres, France on September 12-14, 1989.

Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n1 p69-77 Jan-Feb 90.

Keywords: *Temperature measurement, Standards, Thermodynamic properties, Platinum, Resistance thermometers, Radiometry, Reproducibility, *Temperature scales, International organizations.

The article summarizes the results of the 17th Session of the Consultative Committee on Thermometry of the International Committee of Weights and Measures (Comite Consultatif de Thermometrie of the Comite International des Poids et Mesures) that met in Sevres, France, September 12-14, 1989. That session was devoted exclusively to the completion of the International Temperature Scale of 1990, described herein, and to the implications of its adoption.

New Assignment of Mass Values and Uncertainties to NIST Working Standards.

Bi-monthly rept.

R. S. Davis. 6 Jan 90, 14p

Included in Jnl. of Research of the National Institute of Standards and Technology v95 n1 p79-92 Jan-Feb 90.

Keywords: *Mass, *Primary standards, Probability theory, Statistical analysis, Platinum, Iridium, Comparison, Calibration standards, US NBS, US NIST.

For some time it had been suspected that values assigned to NIST working standards of mass were some 0.17 mg/kg larger than mass values based on artifacts representing mass in the International System of Units (SI). The relatively small offset, now confirmed, has had minimal scientific or technological significance. The discrepancy was removed on January 1, 1990. The report documents the history of the discrepancy, the studies which allow its removal, and the methods in place to limit its effect and prevent its recurrence. For routine calibrations, it is believed that the working standards now have a long-term stability of 0.033 mg/kg (3 sigma) with respect to the national prototype kilograms of the United States. It is provisionally admitted an additional uncertainty of 0.09 mg/kg (3 sigma), systematic to all NIST mass measurements, which represents the possible offset of our primary standards from standards maintained by the Bureau International des Poids et Mesures (BIPM). The systematic uncertainty may be significantly reduced after analysis of results from the 3rd verification of national prototype kilograms, which is now underway.

Hydrogen Transfer from 9,10-Dihydrophenanthrene to Anthracene.

Final rept.

R. Billmers, R. L. Brown, and S. E. Stein. 1989, 12p. Pub. in International Jnl. of Chemical Kinetics 21, n6 p375-386 1989.

Keywords: *Anthracene, *Phenanthrene compounds, Free radicals, Reaction kinetics, Chemical reactions, Photochemical reactions, Thermodynamic properties, Catalysts, Synthesis (Chemistry), Reprints, *Hydrogen transfer.

Kinetic studies of the transfer of hydrogen from 9,10-dihydrophenanthrene to anthracene were done at 350 C in the liquid phase. Principal products were phenanthrene and 9,10-dihydroanthracene. At low extents of reaction, the 9,10-dihydroanthracene product catalyzed the reaction by acting as a radical initiator. At high extents of reaction the product inhibited reactions by diverting intermediate radicals back to reactants. A quantitative kinetic model based on literature rate and thermodynamic data fits the observations well. A key reaction in the mechanism involves the transfer of an H-atom from a radical (9-hydrophenanthryl) to a molecule (anthracene). The derived rate constant for the exothermic process ($7.5 \times 10^5 \text{ M}^{-1} \text{ s}^{-1}$) is considerably faster than that for the related, but thermoneutral H-transfer between anthracene units ($120 \text{ M}^{-1} \text{ s}^{-1}$). The values are consistent with a three step process involving addition, intramolecular H-transfer and dissociation.

Effects of Particle Size Distribution on the Kinetics of Hydration of Tricalcium Silicate.

Final rept.

P. W. Brown. 1989, 4p

Pub. in Jnl. of the American Ceramic Society 72, n10 p1829-1832 1989.

Keywords: *Calcium silicates, *Cements, Reaction kinetics, Particle size distribution, Hydration, Fineness, Heat measurement, Heat of hydration, Calorimeters, Reprints.

The hydration rates of two finenesses of tricalcium silicate, each with known particle size distributions, were measured by isothermal calorimetry for a period of 28 days. The data were integrated, normalized, and represented as a-time curves as a basis for comparison with kinetic models of hydration. Agreement with kinetic models was found to be strongly influenced by the effect of particle size distribution. However, the rate limiting mechanisms appear to be independent of par-

ticule size distribution. No single kinetic model was adequate to describe C3S hydration over the first 28 days. A kinetic model that assumes initial surface area control with diffusion control dominating subsequently provided an excellent fit to the experimental data.

Density Dependence of the 5 micrometers Infrared Spectrum of NH₃.

Final rept.

C. Chapados, G. L. Bjoraker, and G. Birnbaum. 1990, 8p

Pub. in Jnl. of Quantitative Spectroscopy and Radiative Transfer 43, n4 p319-326 1990.

Keywords: *Ammonia, *Infrared spectra, Hydrogen, Mixtures, Reprints, Infrared absorption, Density dependence.

Measurements of dilute mixtures of NH_3 in H_2 were made in the window region $1900\text{-}2100 \text{ cm}^{-1}$ of the NH_3 spectrum to determine its behavior with increasing pressure of H_2 . The spectra of pure H_2 , pure NH_3 , and mixtures of the two, in the total pressure range from 2.38 to 8.17 atm at 309 K , were obtained with a 975 cm^{-1} White cell. Synthetic spectra were calculated using precise line strengths, line positions, and a Lorentz profile. The experimental and calculated spectra are in reasonably good agreement, except that the former is superimposed on a rather flat background not given by the calculation. A possible mechanism for this background is suggested.

Measuring Surface Forces to Explore Surface Chemistry: Mica, Sapphire and Silica.

Final rept.

R. G. Horn, and D. T. Smith. 1990, 10p

Grant N0014-88-F-0034

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Non-Crystalline Solids 120, p72-81 1990.

Keywords: *Surface chemistry, *Ceramics, *Silicate minerals, Silicon dioxide, Mica, Sapphire, Measurement, Surface energy, Interfacial tension, Reprints, Liquid-solid interfaces, Solid-solid interfaces, Fluid films, Squeeze films, Surface reactions, Solid-solid interfaces.

Measurements of the forces acting between two solid surfaces separated by a thin liquid film are discussed. By investigating the forces in a range of different liquids and solutions, it is possible to acquire an understanding of the surface properties of the solid material. The surface of mica has been studied extensively in this way, and the results obtained are reviewed to illustrate how the surface force measurements can give surface chemical information. Recent measurements on two other materials, sapphire and silica, which are of greater practical interest are also discussed.

**Dynamical Aspects of Anisotropic Correlations in
 Supercooled Liquids.**
 Final rept.
 R. D. Mountain, and D. Thirumalai. 1990, 8p
 Grant NSF-CHE86-57396
 Sponsored by National Science Foundation, Washing-
 ton, DC.
 Pub. in Jnl. of Chemical Physics 92, n10 p6116-6123,
 15 May 90.

Keywords: *Supercooling, Liquids, Mixtures, Spheres,
 Anisotropy, Reprints, Molecular dynamics, Correlation
 functions, Binary alloys, Relaxation.

The dynamics of anisotropic correlation functions for
 the supercooled liquid states of soft-sphere mixtures is
 examined using molecular dynamics. Two measures of
 the local anisotropy are considered. These dynamic
 functions, which are representations of local coopera-
 tive motions, exhibit considerable slowing down long
 before the glass transition temperature is reached. It is
 clear that the decay of these functions over the time
 interval considered here cannot be fit by a single expo-
 nential function. By analogy with the behavior ob-
 served in supercooled molecular liquids, it is suggest-
 ed that these correlation functions provide a measure
 of alpha relaxation processes in these binary alloys.

 Pub. in Surface Science 226, p226-236 1990.

Keywords: *Indium, *Desorption, Adsorption, Silicon,
 Spin orbit interactions, Reprints, *Surface reactions,
 Laser induced fluorescence, Heteroepitaxy, Binding
 energy, Sticking coefficients.

The adsorption and desorption characteristics of In on
 Si(100) are investigated. Laser-induced fluorescence
 is used to probe specific spin-orbit states of the de-
 sorbing or scattered in atoms. The sticking coefficients
 of both In(doublet P(1/2)) and In(doublet P(3/2)) are
 determined to be unity (> 0.9). State specific desorp-
 tion measurements show that the two spin-orbit states
 have the same desorption parameters. This indicates
 that both spin-orbit states originate from the same
 'bath' of In atoms on the surface. Isothermal desorp-
 tion measurements, also using Auger spectroscopy,
 find that at surface temperatures below 820 K, and for
 coverages theta < 0.5 ML, In desorbs by a half order
 mechanism. This is in contrast to the results of Knall et
 al. (Surf. Sci. 209 (1989) 314) who observe a first order
 behavior. The 1/2 order desorption indicates two-di-
 mensional In islands on the surface.

 Column packings, Separation, Tests, Methodology,
 Chemical analysis, Selectivity, Shape, Solutes, Re-
 prints, *Liquid column chromatography, Calibration
 standards, Reversed flow, Isomers, Liquid-solid inter-
 faces.

A simple empirical test is described for the evaluation
 of column selectivity in reversed-phase liquid chroma-
 tography. The test is based on the relative retention of
 three carefully selected polycyclic aromatic hydrocar-
 bon (PAH) probes. Trends in the retention behavior of
 the solutes are discussed for a variety of chromatogra-
 phy parameters, including column phase type, sub-
 strate pore size, bonded phase length and ligand cov-
 erage, and column temperature. Models for solute re-
 tention are presented based on the separation of iso-
 mers and other structurally similar PAHs. Routine uses
 of the Column Selectivity Test Mixture in manufactur-
 ing and laboratory applications are described.

**Photodissociation of Vibrationally Excited Water
 in the First Absorption Band.**
 Final rept.
 K. Weide, S. Hennig, and R. Schinke. 1989, 8p
 Pub. in Jnl. of Chemical Physics 91, n12 p7630-7637,
 15 Dec 89.

Keywords: *Water, Adsorption spectra, Reprints,
 *Photodissociation, Excited states, Vibrational states.

The authors investigate the photodissociation of highly
 excited vibrational states of water in the first absorp-
 tion band. The calculation includes an ab initio poten-
 tial energy surface for the A tilde-state and an ab initio
 X tilde -> A tilde transition dipole function. The bend-
 ing angle is fixed at the equilibrium value within the
 ground electronic state. Most interesting is the high
 sensitivity of the final vibrational distribution of OH on
 the initially prepared vibrational state of H2O. At wave-
 lengths near the onset of the absorption spectrum the
 vibrational state distribution can be qualitatively un-
 derstood as a Franck-Condon mapping of the initial H2O
 wave function. At smaller wavelengths final state inter-
 action in the excited state becomes stronger and the
 distributions become successively broader. The calcula-
 tions are in satisfactory accord with recent measure-
 ments of Vander Wal and Crim.

 T. J. Bruno, and S. L. Outcalt. 1990, 9p
 Pub. in International Jnl. of Thermophysics 11, n1
 p109-117 1990.

Keywords: *Hydrogen, *Fugacity, Comparison, Test
 chambers, Membranes, Butanes, Reprints, *Binary
 mixtures, *Temperature dependence, Semipermeabi-
 lity, Gas pressure.

The fugacity coefficients of hydrogen in binary mix-
 tures with isobutane were measured using a physical
 equilibrium technique. This technique involves the use
 of an experimental chamber which is divided into two
 regions by a semipermeable membrane through which
 hydrogen, but not isobutane, can penetrate. Measure-
 ment of the gas pressures inside and outside of the
 membrane allows a direct measurement of the hydro-
 gen component fugacity at a given temperature, binary
 mixture mole fraction, and mixture pressure. Results
 are reported at 120, 140, 160, and 180 C. In each
 case, the total pressure of the mixture was maintained
 at an average value of 3.40 MPa. The general qualita-
 tive features of the data are discussed, and compari-
 sons are made with predictions obtained from the Red-
 lich-Kwong and the Peng-Robinson equations of state.

 Final rept.
 W. F. Egelhoff. 1987, 9p
 Pub. in Proceedings of Symposium on Physical and
 Chemical Properties of Thin Metal Overlayers and
 Alloy Surfaces, Boston, MA., December 3-5, 1986,
 p189-197 1987.

Keywords: *Surface chemistry, *Metal films, X ray
 spectroscopy, Epitaxy, Meetings, Thin films, Molecular
 structure, Segregation process, Crystallography, For-
 ward scattering, Copper, Nickel, Gold, Substrates, Dif-
 fusion, Reprints, Photoelectron spectroscopy, Auger
 electron spectroscopy, Electronic structure, Solid-solid
 interfaces.

Forward scattering of XPS and Auger electrons by
 atoms in a crystalline lattice produce beams of en-
 hanced intensity radiating out from the surface at

angles corresponding to the internuclear axes present in the top few atomic layers. The effect has been applied to analyze the mechanism of surface segregation in ultrathin metal films, to analyze the interdiffusion at the interfaces of ultrathin films, and to assess the effects of substrate contamination on the growth of epitaxial films. The systems studied are Cu, Ni, and Co on Ni(100).

Predictive, Exact Shape Factor Extended Corresponding States Model for Mixtures.

Final rept.

J. F. Ely, 1990, 10p

Sponsored by Department of Energy, Washington, DC. Pub. in *Advances in Cryogenic Engineering* 35, p1511-1520 1990.

Keywords: *Cryogenics, *Equations of state, Thermodynamics, Air, Mathematical models, Mixtures, Intermolecular forces, Diffusion, Molecular structure, Shape, Reprints, Potentials, Predictive equations, Correlation functions.

In the early 1970s, Leland and co-workers developed the principle of extended corresponding states that allow more accurate predictions of single phase fluid properties of structured molecules by making the effective intermolecular potentials functions of the thermodynamic state. This is accomplished through molecular shape factors. Early applications of the method were limited by the lack of accurate, wide-range equations of state which could be used to determine state dependence of the effective intermolecular potentials. Recent work has, however, provided a broad base of experimental data and correlations which enable accurate determination of the shape factors. In the paper, extended corresponding states using exact shape factors are discussed and applications of the method to cryogenic systems are presented. The later predictions are obtained using the computer program DDMIX which is available through the NIST Office of Standard Reference Data.

Energy Transfers in the Quasielastic Scattering of 70-1250-eV Electrons by Surfaces.

Final rept.

N. E. Erickson, and C. J. Powell. 1989, 4p

Pub. in *Physical Review B* 40, n10 p7284-7287, 1 Oct 89.

Keywords: *Vapor deposited coatings, *Metals, Polycrystalline, Accuracy, Elastic scattering, Quantum interactions, Sputtering, Electron scattering, Surface energy, Copper, Gold, Silver, Phonons, Reprints, Energy transfer, Electron spectrometers, Quasi-elastic scattering, Calibration.

Energy transfers of up to about 200 meV have been observed in the quasielastic scattering of 70-1250-eV electrons by sputtered surfaces of polycrystalline copper, silver, and gold. The experiment consisted of measuring shifts in positions of elastic peaks with a double-pass cylindrical mirror analyzer for different voltages applied to the cathode of the electron gun. The shifts are believed due to changing cross sections for phonon excitations with electron energy. The results are significant in the use of the elastic peak technique for high-accuracy calibrations of the energy scales of electron spectrometers.

Field-Space Conformal Solution Method.

Final rept.

J. R. Fox, and T. S. Storvick. 1990, 12p

Sponsored by Department of Energy, Washington, DC. Div. of Chemical Sciences.

Pub. in *International Jnl. of Thermophysics* 11, n1 p49-59 Jan 90.

Keywords: *Equations of state, Binary systems(Materials), Thermophysical properties, Critical point, Boiling points, Conformal mapping, Vapor pressure, Thermodynamic equilibrium, Reprints, Thermodynamic activity, Liquid-vapor equilibrium, Mathematical manifolds.

A radical extension of the principle of corresponding states to mixtures is proposed. All previous methods are based upon the application of 'mixing rules' which are explicit in the compositions of the resultant, or target, mixture. In the present development the relations are functions of field variables alone, specifically the activities of the reference system. It has a profound effect upon the basic machinery of the transformations. For example, when the new method is used to map the properties of a binary fluid mixture onto those of a pure fluid (and in contrast to the description of a mixture by one-fluid theory with van der Waals mixing rules), the dew-bubble-point surface of the mixture is mapped onto the vapor pressure curve of the pure fluid, and the critical line of the mixture is mapped onto the critical point of the pure fluid. Thus, there is no separate 'pseudocritical' locus. The principal technical advantage of such a development is numerical; calculation of the location of vapor-liquid coexistence and critical manifolds is enormously simplified.

Critical Behavior of a Conducting Ionic Solution Near Its Consolute Point.

Final rept.

M. L. Japas, and J. M. H. Levelt Sengers. 1990, 9p

Pub. in *Jnl. of Physical Chemistry* 94, n13 p5361-5368 1990.

Keywords: *Electrical resistance, *Critical point, Temperature, Ions, Dissociation, Reprints, *Ammonium bromide/tetrapentyl, *Consolute point, *Ion recombination, Consolidation, Aqueous solutions.

Measurements are reported of the coexistence curve and electrical conductivity of the partially miscible aqueous solution of tetra-n-pentylammonium bromide near its consolute point, which was located at $T(\text{sub } c) = 404.90 \pm 0.01 \text{ K}$ and approximately 0.03 in mole fraction. The compositions of coexisting phases were measured over three decades of temperature, from 21 to 0.01 K from the consolute point. The conductivity was measured in the supercritical regime, from high dilution to compositions exceeding the critical. The degree of dissociation was estimated to be higher than 20% at the critical composition. In the data analysis, attention was given to the assessment of experimental error and proper weight assignment, and also to asymptotic range and choice of order parameter. No evidence of classical behavior was found. This finding is in contrast to several recent reports of effectively classical critical behavior in ionic solutions similar to the authors; but it is in accordance with earlier measurements in very weak electrolytes. They present reasons why their conclusion differs from these recent results; an explanation is given why nonclassical behavior might be expected in systems of this type.

Onset of Nucleate and Film Boiling Resulting from Transient Heat Transfer to Liquid Hydrogen.

Final rept.

B. Louie, and W. G. Steward. 1990, 10p

Sponsored by Air Force Wright Aeronautical Labs., Wright-Patterson AFB, OH.

Pub. in *Advances in Cryogenic Engineering* 35, p403-412 1990.

Keywords: *Cryogenics, *Liquid hydrogen, Film boiling, Nucleate boiling, Heat transfer, Thin films, Carbon, Platinum, Metals, Phase diagrams, Reprints.

The Chemical Engineering Science Division (Boulder, Colorado) of the National Institute of Standards and Technology has investigated transient heat transfer to liquid hydrogen. Thin carbon films and Pt foils submerged in liquid hydrogen received stepped power inputs of 1 to 42 W/sq cm, and the onset of nucleate or film boiling was obtained for each power level. The critical heat flux was found to be approximately 8 W/sq cm, with the transition to film boiling occurring in times less than 1/1000 s. Premature film boiling can be related to the positive temperature coefficient of resistance and the narrowness of the Pt heaters.

Rotational Spectrum of the CH Radical in Its $\sigma(0)$ State, Studied by Far-Infrared Laser Magnetic Resonance.

Final rept.

T. Nelis, J. Brown, and K. M. Evenson. 1990, 10p

Contract NASA-W-15047

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in *Jnl. of Chemical Physics* 92, n7 p4067-4076, 1 Apr 90.

Keywords: Rotational spectra, Free radicals, Metastable state, Far infrared radiation, Reprints, *Methylidyne radicals, Laser magnetic resonance.

The CH radical has been detected in its alpha quartet $\sigma(0)$ state by the technique of laser magnetic resonance at far-infrared wavelengths. Spectra relating to different spin components of the first three rotational transitions have been recorded. The molecule was generated either by the reaction of F atoms with CH₄, with a trace of added oxygen or by the reaction of O atoms with C₂H₂. The observed resonances have been analyzed and fitted to determine the parameters of an effective Hamiltonian for a molecule in a quartet $\sigma(0)$ state. The principal quantities determined are the rotational constant $B_{\text{sub } 0} = 451\,138.434(94) \text{ MHz}$ and the spin-spin parameter $\lambda_{\text{sub } 0} = 2785.83(18) \text{ MHz}$. Proton hyperfine parameters have also been determined.

Vapor + Liquid Equilibria and Coexisting Densities of (Carbon Dioxide + n-butane) at 311 to 395 K.

Final rept.

V. G. Niesen. 1989, 9p

Pub. in *Jnl. of Chemical Thermodynamics* 21, p915-923 1989.

Keywords: *Carbon dioxide, *Butanes, Gases, Thermodynamic equilibrium, Phase diagrams, Density(Mass/volume), Vapor phases, Liquid phases, Measurement, Test equipment, Densitometers, Vibration, Reprints.

An experimental phase-equilibrium apparatus has been modified with the addition of vibrating-tube densitometers to allow the simultaneous measurement of (vapor + liquid) equilibrium and saturated phase densities. The equipment operates from 300 to 400 K and at pressures to 14 MPa. Both the vapor and liquid phases are recirculated. Measurements have been obtained on (carbon dioxide + n-butane) at 311.09, 344.43, and 394.6 K at pressures up to the critical. The measured phase compositions and densities agree within experimental uncertainty with previously reported results.

Radical Concentration Measurements in Hydrocarbon Diffusion Flames.

Final rept.

K. C. Smyth, and P. J. H. Tjossem. 1990, 13p

Pub. in *Applied Physics B* 50, p499-511 1990.

Keywords: *Diffusion flames, Concentration(Composition), Absorption, Reprints, *Hydroxyl radicals, *Hydrogen atoms, *Oxygen atoms, Laser induced fluorescence, Multiphoton ionization.

Absolute OH radical concentrations and relative H-atom and O-atom profiles have been measured in a laminar, co-flowing methane/air diffusion flame burning at atmospheric pressure. Laser absorption and laser-induced fluorescence methods were used to probe the A(doublet $\Sigma(0^+)$) \leftarrow X(doublet $\Pi(\text{sub } i)$) transition in OH radical. Establishing absolute H-atom and O-atom concentrations is discussed in terms of partial equilibrium considerations and detailed flame structure calculations.

Nonintersecting Random Walk in the Presence of Nonspherical Obstacles.

Final rept.
E. A. Di Marzio. 1990, 5p
Pub. in Physical Review Letters 64, n23 p2791-2794, 4 Jun 90.

Keywords: *Random walk, Molecules, Reprints, Excluded volume problems, Scaling laws.

The statistics of a self-avoiding walk of N steps on a lattice in a field of asymmetric obstacles is developed. The obstacles are modeled by rigid rods of asymmetry ratio r oriented preferentially and/or by stretched flexible molecules. Each obstacle consists of N segments, each one of which occupies one lattice site. The size, shape, and entropy of the molecule represented by the self-avoiding walk are obtained. The scaling law deviates from the conventional no-obstacles limit ($\nu=0.6$) only for large concentrations of obstacles. However, the molecule is elongated even for a small concentration of obstacles. Because the formulas are so easily obtained and extended, the method promises to be widely applicable.

Rotational and Tunneling Spectrum of the H₂S.CO₂ van der Waals Complex.

Final rept.
J. K. Rice, L. H. Coudert, K. Matsumura, R. D. Suenram, and F. J. Lovas. 1990, 13p
Pub. in Jnl. of Chemical Physics 92, n11 p6408-6419, 1 Jun 90.

Keywords: *Hydrogen sulfide, *Carbon dioxide, Microwave spectra, Rotational spectra, Dipole moments, Molecular structure, Reprints, *Complexes, Dimers.

The rotational spectra of (H₂S)(CO₂) complex and two deuterated forms have been observed using a pulsed-beam Fourier-transform microwave spectrometer. For each of the three complexes the authors assign a-type and c-type transitions which are split into a 'weak' and a 'strong' intensity component. The analysis based on that previously used for the (H₂O)₂ complex and modified for application to (H₂S)(CO₂) complex allowed assignment of internal rotation, inversion tunneling states of the H₂S and CO₂ units in the complex. Rotational constants were determined for the ground tunneling state of each species.

Molecular Dynamics Investigation of Deeply Quenched Liquids.

Final rept.
J. X. Yang, H. Gould, W. Klein, and R. D. Mountain. 1990, 14p
Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Chemical Physics 93, n1 p711-723, 1 Jul 90.

Keywords: *Crystal growth, *Nucleation, Drops(Liquids), Supercooling, Simulation, Reprints, Molecular dynamics, Lennard-Jones potential.

Molecular dynamics simulations of homogeneous crystalline nucleation in systems of 1300 particles

have been performed as a function of quench depth for the Lennard-Jones, $r_{sup}(-12)$, and $r_{sup}(-6)$ potentials. The authors observe that the nucleating droplet is spatially asymmetric, has a layered structure, and is ramified for deep quenches. The initial growth of the droplet occurs by the addition of layers until the droplet becomes sufficiently large to be characterized by a crystalline close-packed structure. The authors also observe that the time lag between the time of formation of the nucleating droplet and the time of release of latent heat is a nonmonotonic function of quench depth. The results for deep quenches are interpreted as evidence for the influence of a pseudospinodal.

Critical Exponent for the Viscosity of Carbon Dioxide and Xenon.

Final rept.
R. F. Berg, and M. R. Moldover. 1990, 13p
Contract NASA-C-86129D
Sponsored by National Aeronautics and Space Administration, Washington, DC.
Pub. in Jnl. of Chemical Physics 93, n3 p1926-1938, 1 Aug 90.

Keywords: *Viscosity, *Carbon dioxide, *Xenon, Critical temperature, Fluid flow, Reduced gravity, Viscometers, Reprints, *Critical exponent, Temperature dependence.

The viscosities (η) of carbon dioxide and xenon have been measured near their critical points and the critical exponent γ characterizing the asymptotic divergence, η approximately equal to $(T-T(\text{sub } c))(\text{sup } -\gamma)$, has

been determined. This agreement between experiments is the first evidence that pure fluids and binary liquids are in the same dynamic universality class. The torsion oscillator viscometer operated at low frequency and low shear rate to avoid systematic errors caused by critical slowing down. Far from $T(\text{sub } c)$ the analysis accounted for the crossover from critical to noncritical temperature dependence, where the latter was obtained from previously published correlations. Corrections for gravitational stratification were included close to $T(\text{sub } c)$.

Pressure Synthesis of p-Nitroaniline Condensation Products.

Final rept.
S. Block, and G. J. Piermarini. 1988, 5p
Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Multifunct. Mater., v878 p21-25 1988.

Keywords: *Condensation reactions, *Phase diagrams, *Synthesis(Chemistry), Nitroaryl compounds, Dimerization, X ray diffraction, Infrared spectroscopy, Mass spectroscopy, High pressure tests, Reprints, *Aniline/nitro, Fourier transform spectrometers, Hyperbaric conditions, Optical microscopy, Semiconductors, Chemical reaction mechanisms, Hyperbaric chambers.

Theoretical calculations by R. Bardo predict that under high pressure, p-Nitroaniline (PNA) forms semiconducting condensation products which possibly may be retained at ambient conditions. A combination phase-reaction P,T diagram has been determined in order to evaluate the correctness of the prediction and to indicate synthesis routes. The data were obtained by a combination of optical microscopy, x-ray diffraction, and Fourier transform infrared (FTIR) spectroscopy coupled with a diamond anvils high pressure cell. The results show, (1) a reversible crystallographic transition occurs at about 4.0 GPa; (2) a reversible transition at about 1.0 GPa and 140 C which effects the optical properties of the material also occurs; (3) the melting point increases to 245 C at 1.0 GPa and (4) irreversible chemical reactions begin to be significant above 280 C and 1.0 GPa. The reaction products were investigated by mass spectrometry. A series of dimers with N or N-N linkages are formed under pressure at moderate temperatures. If temperatures at pressure are excessive, i.e., above 360 C, then the PNA reacts to form an amorphous material stable when heated to over 350 C.

Isochoric (p,Vm,T) Measurements on CO₂ and on (0.982 CO₂ + 0.018 N₂) from 250 to 330 K at Pressures to 35 MPa.

Final rept.
J. F. Ely, W. M. Haynes, and B. C. Bain. 1989, 17p
Pub. in Jnl. of Chemical Thermodynamics 21, p879-894 1989.

Keywords: *Carbon dioxide, *Nitrogen, Equations of state, Density(Mass/volume), Reprints, *PVT data, *Isochoric processes, Gas mixtures, Corresponding states.

Comprehensive isochoric (P, V(sub m), T) measurements have been performed for pure CO₂ and for (0.982CO₂ + 0.018N₂). Based on these and other experimental results from the literature, a 32-term equation of state of the form suggested by Jacobsen and Stewart has been developed for pure CO₂. This equation was then used to demonstrate the effect of a small amount of N₂ on the (P, V(sub m), T) surface of CO₂-an effect which can be as great as 100% in the amount-of-substance density at fixed temperature and pressure. Finally, the equation of state for pure CO₂ was used in a conformal-solution model to calculate the mixture amount-of-substance densities which had been obtained in the study. In general the results of this calculation were very good--the model reproduced the experimental results to within an r.m.s. deviation of 0.26%.

Measurement of the Heat of Fusion of Molybdenum by a Microsecond-Resolution Transient Technique.

Final rept.

J. L. McClure, and A. Cezairliyan. 1990, 8p
Pub. in International Jnl. of Thermophysics 11, n4 p731-737 Jul 90.

Keywords: *Heat of fusion, *Molybdenum, *Refractory metals, *Pulse heating, Temperature measurement, Resolution, Reprints.

A microsecond-resolution pulse-heating technique was used for the measurement of heat of fusion of molybdenum. The method is based on rapid resistive self-heating of the specimen by a high-current pulse from a capacitor discharge system and measuring current through the specimen, voltage across the specimen, and radiance temperature of the specimen as functions of time. Melting of the specimen is manifested by a plateau in the temperature versus time function. The time integral of the power absorbed by the specimen during melting yields the heat of fusion. Measurements gave a value of 36.4 kJ/mol for the heat of fusion of molybdenum with an estimated maximum uncertainty of + or - 6%.

Group-Theoretical Formalism for the Large-Amplitude Vibration-Rotation Problem in Methylamine-d1.

Final rept.

M. Oda, N. Ohashi, and J. T. Hougen. 1990, 29p
Pub. in Jnl. of Molecular Spectroscopy 142, p57-84 1990.

Keywords: *Methylamine, Group theory, Deuterium compounds, Hamiltonian functions, Reprints, Rotational states.

A group-theoretical formalism suitable for analyzing high-resolution spectra of monodeuterated methylamine, CH₃NHD, is presented. This formalism, which treats simultaneously the methyl-group internal rotation, the amino-group inversion, and the overall rotation, is derived using extended-group ideas, and represents a modification of the formalism previously derived for treating normal methyl amine. The modification is necessary primarily because the H and D atoms in the asymmetric amino group are expected to move different distances during the inversion motion. All matrix elements satisfying delta K = 0, + or -1, and + or -2 selection rules, and arising from operators linear or quadratic in components of the total angular momentum, are given in a form appropriate for carrying out a global fit of spectroscopic data.

State-Resolved Laser Probing of As₂ in a Molecular-Beam Epitaxy Reactor.

Final rept.

R. V. Smilgys, and S. R. Leone. 1990, 6p
Contract AFOSR84-0272
Sponsored by Air Force Weapons Lab., Kirtland AFB, NM.

Pub. in Jnl. of Vacuum Science and Technology B 8, n3 p416-421 May/June 90.

Keywords: Reprints, *Molecular beam epitaxy, *Arsenic dimers, Laser induced fluorescence, Vibrational states, Rotational states, Epitaxial growth.

Results are presented on the first state-resolved optical detection of As₂ in a molecular-beam epitaxy (MBE) reactor. Using the technique of laser induced fluorescence (LIF), the gas phase populations of vibrational and rotational states of As₂ emanating from a commercial As₄ oven-cracker source are probed. A Boltzmann fit of the populations of the first four vibrations indicates that these states are thermalized to the source temperature. Likewise, the rotational manifold of each vibration is consistent with thermalization at the same temperature. The method is capable of being an *in situ* real-time MBE diagnostic. Optical detection may provide complementary information to reflection high-energy electron diffraction (RHEED) that would not otherwise be available. Future applications of this technique may lead to new insights into epitaxial growth processes.

Thermodynamic Property Formulation for Air. 1. Single-Phase Equation of State from 60 to 873 K at Pressures to 70 MPa.

Final rept.

R. T. Jacobsen, W. P. Clarke, S. G. Penoncello, and R. D. McCarty. 1990, 9p
See also PB90-254723.

Pub. in International Jnl. of Thermophysics 11, n1 p169-177 1990.

Keywords: *Thermodynamic properties, *Air, Liquefied gases, Equations of state, Specific heat, Acoustic velocity, Density(Mass/volume), Reprints.

A revised interim formulation for the thermodynamic properties of air has been developed for calculating properties of the vapor and estimating properties for the liquid at temperatures as low as 60 K. The formulation incorporates separate equations for the calculation of bubble-point and dew-point pressures and densities and for the ideal-gas heat capacity. A new fundamental equation of state is given for vapor and liquid states of air based upon available experimental data and predicted values of isochoric heat capacity for the liquid using corresponding states methods. The fundamental equation for air is explicit in nondimensional Helmholtz energy. The terms of the fundamental equation were selected from a larger set of 75 proposed terms using a least-squares fitting procedure. Representative graphical comparisons of calculated property values to experimental measurements are given. The estimated accuracy of calculated densities is generally + or - 0.2% except near the dew and bubble lines. Calculated heat capacities for the liquid must be considered only as estimates until substantiated by experimental measurements.

Near-Threshold Vibrational Excitation of HF by Electron Impact.

Final rept.

G. Snitchler, D. Norcross, A. Jain, and S. Alston. 1990, 4p
Contract DE-AL05-86ER53237, Grant NSF-PHY86-04504

Sponsored by National Science Foundation, Washington, DC., and Department of Energy, Washington, DC. Pub. in Physical Review A 42, n1 p671-674, 1 Jul 90.

Keywords: *Hydrogen fluoride, Differential cross sections, Electron scattering, Excitation, Reprints, *Electron-molecule collisions, Vibrational states, Excited states.

Exchange effects are included exactly in these vibrational close-coupling calculations using a new separable representation, and short- and long-range interactions using a parameter-free correlation-polarization potential. Differential cross sections are similar to measurements, but differ as to the location of the threshold peaks, the relative importance of rotationally elastic versus inelastic transitions, and the validity of a critical assumption made in the electron-beam energy calibration. Polarization at intermediate distances is critical and the angular distribution of scattered electrons is anisotropic both near and well above threshold.

Chemisorption of Chlorosilanes and Chlorine on Si(111) 7x7.

Final rept.

L. J. Whitman, S. A. Joyce, J. A. Yarnoff, F. R.

McFeely, and L. J. Terminello. 1990, 10p

Pub. in *Surface Science* 232, p297-306 1990.

Keywords: *Surface chemistry, *Chemisorption, *Silicon, *Chlorine, *Silanes, Desorption, Reaction kinetics, Etched crystals, Chemical vapor deposition, Photoemission, X ray analysis, Reprints, Temperature effects, Synchrotron radiation, Auger electron spectroscopy.

The chemisorption of SiCl₄, Si₂Cl₆, and chlorine on Si(111) 7 x 7 has been characterized using soft X-ray photoemission with synchrotron radiation, thermal desorption spectroscopy, and Auger electron spectroscopy.

SiCl₄ dissociatively chemisorbs on room temperature Si(111) 7 x 7 with an extremely low sticking coefficient, with only SiCl remaining on the surface. In contrast, Si₂Cl₆ chemisorbs with about 500 times greater probability and then partly dissociates into SiCl_x (x = 1,2,3) fragments. A monolayer of Cl deposited directly also contains SiCl, SiCl₂, and SiCl₃ surface species, but they are created via reaction with substrate Si atoms and have lower Si2p core level binding energies. Upon heating the surface all the adsorbed Cl is removed via desorption of silicon chlorides, primarily SiCl₂, indicating that SiCl₄, Si₂Cl₆, and chlorine will etch Si(111) 7 x 7 if an additional reactant is not available to remove the surface Cl. Interestingly, the different reactivities of SiCl₄ and Si₂Cl₆ upon adsorption can be explained by the dynamics of different adsorption mechanisms.

Vibrational Relaxation at Surfaces.

Final rept.

R. R. Cavanagh, J. D. Beckerle, M. P. Casassa, E. J. Heilweil, and J. C. Stephenson. 1990, 11p

Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.
Pub. in *Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Picosecond and Femtosecond Spectroscopy from Laboratory to Real World*, v1209 p86-96 1990.

Keywords: Carbon monoxide, Platinum, Adsorbates, Energy transfer, Transient response, Vibration, Reprints, *Surface reactions, Vibrational relaxation.

Time-resolved techniques are applied to issues of vibrational energy transfer at surfaces. Primary attention is given to the relaxation of vibrationally excited diatomic adsorbates on metals. The sensitivity of the vibrational decay rate to the number of metal atoms in the solid is demonstrated. Preliminary results for the transient response of CO on Pt(111) are also reported. This latter measurement demonstrates the recently developed capability of monitoring adsorbate energy transfer processes at well defined surface sites. The observations appear to be consistent with relaxation through the excitation of electron/hole pairs in the substrate.

Laser-Induced Desorption: State-Resolved Evidence for Carrier Driven Processes.

Final rept.

R. R. Cavanagh, S. A. Buntin, L. J. Richter, and D. S. King. 1990, 9p

Contract DE-A105-84ER13150

Sponsored by Department of Energy, Washington, DC. Pub. in *Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Laser Photoionization and Desorption Surface Analysis Techniques*, v1208 p2-10 1990.

Keywords: *Desorption, Nitrogen oxide(NO), Substrates, Platinum, Silicon, Vibration, Reprints, *Laser induced desorption, Semiconductors.

Laser induced molecular desorption which is mediated by optically generated substrate carriers is considered. State-specific diagnostics are combined with desorption-laser wavelength dependence studies to clarify the excitation and desorption dynamics involved. Results from NO desorption from both metallic and semiconductor substrates are presented, along with theoretical models of the desorption processes.

Pumping and Probing: Vibrational Relaxation in Time Domain Spectroscopy.

Final rept.

J. W. Gadzuk. 1990, 7p

Pub. in *Applied Physics A* 51, p108-114 1990.

Keywords: *Adsorption, *Surfaces, Reprints, Vibrational relaxation, Time domain, Clusters.

Various aspects of experiments on vibrational relaxation of molecules adsorbed on metals are considered. The necessity for time-domain pump-probe con-

figurations is established. Since existing experiments to date have been carried out on small metal clusters special attention here is given to the role of quantum size effects and the resulting role of the discrete electron-hole pair excitation spectrum on the observed energy/vibrational relaxation times.

D. A. Neumann, J. M. Nicol, J. J. Rush, N. Wada, Y. B. Fan, H. Kim, S. A. Solin, T. J. Pinnavaia, and S. F. Trevino. 1990, 6p

Pub. in *Materials Research Society Symposium Proceedings*, v166 p397-402 1990.

Keywords: *Montmorillonite, *Vermiculite, *Clays, Neutron scattering, Inelastic scattering, Reprints, *Alkylammonium ions, MeV range 10-100, MeV range 100-1000.

Incoherent, inelastic neutron scattering has been used to study the vibrational spectra of tetramethylammonium montmorillonite and trimethylammonium vermiculite in the energy range 20-140 meV. For both systems, peaks are observed due to the internal modes of the intercalate and to the excitations of the hydroxyl groups within the host layers. For the montmorillonite sample, it is found that the steric constraints imposed on the tetramethylammonium ion by the bounding clay layers contribute an additional 28 meV to the rotational barrier of the methyl groups. This additional barrier is shown to be strongly related to the volume that the tetramethylammonium ion occupies. For the trimethylammonium vermiculite sample, normal mode analysis of the internal modes of the intercalated ion shows that the N-H bond is parallel to the c-axis of the host.

Pub. in *Conference Record of the IEEE (Institute of Electrical and Electronics Engineers) Symposium on Electrical Insulation*, Toronto, Canada, June 3-6, 1990, p248-252.

Keywords: *Sulfur fluorides, *Decomposition reactions, Adsorption, Surface chemistry, Reaction kinetics, Stainless steels, Gas chromatography, Mass spectroscopy, Moisture content, Catalysis, Reprints.

Recent findings indicate that S₂F₁₀ is unstable with respect to decomposition on a surface. The paper reports the first results of a study investigating the mechanisms and rates of surface decomposition of S₂F₁₀ under various conditions. Initial results indicate that surface decomposition rates on stainless steel increase with increased water content, temperature, and surface-to-volume ratio, and with decreased gas pressure. The implications of these results for the preparation and storage of S₂F₁₀ samples are discussed. Additionally, the use of this surface decomposition mechanism to enhance the detection sensitivity of small concentrations of S₂F₁₀ in SF₆ using a gas chromatograph/mass spectrometer (GC/MS) is investigated. Detection sensitivities of 1 ppm by volume (ppm) of S₂F₁₀ in SF₆ are routinely achievable using this new technique.

Pub. in Jnl. of Chemical Physics 93, n6 p3856-3862, 15 Sep 90.

Keywords: *Vibrational spectra, Infrared spectra, Reprints, *Molecular ions, *Nitrogen ions, Matrix isolation, Excited states, Solid neon, Photodecomposition.

When a Ne:N₂ = 100 or 200 mixture is codeposited at 5 K with a beam of neon atoms excited by a microwave discharge, a weak to moderately intense infrared absorption appears at 2237.6/cm which is assigned to the N₄(1+) molecular ion. The analysis of the infrared spectra of the nitrogen-15 substituted species of N₄(1+) supports the conclusion from earlier ab initio calculations and electron spin resonance observations that N₄(1+) has a linear, centrosymmetric ground-state structure. For the N₄(1+) species with noncentrosymmetric isotopic substitution, the in-phase end-atom stretching fundamental becomes infrared active and has also been observed. Although the anion responsible for overall charge neutrality of the deposit has not been definitively identified, secondary photolysis studies provide some information regarding its properties.

Global Thermodynamic Behavior of Fluids in the Critical Region.

Final rept.

Z. Y. Chen, A. Abbaci, S. Tang, and J. V. Sengers. 1990, 15p

Contract DE-FG05-88ER13902

Sponsored by Department of Energy, Washington, DC. Pub. in Physical Review A 42, n8 p4470-4484, 15 Oct 90.

Keywords: *Thermodynamic properties, *Fluids, Equations of state, Critical point, Free energy, Carbon dioxide, Ethane, Steam, Reprints.

In a preceding publication (Z. Y. Chen, P. C. Albright, and J. V. Sengers, Phys. Rev. A 41, 3161 (1990)) a procedure for constructing a thermodynamic free energy of fluids was proposed that incorporates crossover from singular behavior at the critical point to regular behavior far away from the critical point. In the present paper this procedure, based on an approximate solution of the renormalization-group theory of critical phenomena, is further extended so that it can be used in conjunction with a six-term classical Landau expansion. The resulting thermodynamic free energy yields a satisfactory representation of the thermodynamic properties of fluids in a large range of temperatures and densities around the critical point, as is demonstrated by a comparison with experimental thermodynamic-property data for carbon dioxide, steam, and ethane.

Effects of Extinction on X-ray Powder Diffraction Intensities.

Final rept.

J. P. Cline, and R. L. Synder. 1987, 10p
Pub. in Advances in X-ray Analysis, v30 p447-456 1987.

Keywords: *X ray diffraction, *Powder(particles), *Extinction, Particle size, Quantitative analysis, Spray drying, Reprints.

The effects of particle size on integrated intensity measurements of X-ray powder diffraction were investigated. Six sets of two phase mixtures were spray dried to eliminate preferred orientation. Variables between each series included particle size and absorption contrast, the variable within each series was the relative quantity of the phases present. Data were collected at four wavelengths and were reduced to the reference intensity ratio (RIR). The RIR data indicated a reduction in diffracted intensity occurred varying directly with the particle size of the phase being examined. An early Zachariasen theory for the effects of primary extinction accounted for the trends observed.

Optothermal-Infrared and Pulsed-Nozzle Fourier-Transform Microwave Spectroscopy of Rare Gas-CO₂ Complexes.

Final rept.

G. T. Fraser, R. D. Suenram, and A. S. Pine. 1988, 11p

Pub. in Jnl. of Chemical Physics 88, n10 p6157-6167 1988.

Keywords: Carbon dioxide, Infrared spectroscopy, Microwave spectroscopy, Reprints, *Complexes, *Argon complexes, *Krypton complexes, *Neon complexes, Van der Waals forces.

Sub-Doppler infrared spectra of Ne-CO₂, Ar-CO₂, and Kr-CO₂ have been recorded near approx. 3613 and 3715/cm, in the region of the 2(nu sub 2, sup 0) + (nu sub 3)/(nu sub 1) + (nu sub 3) Fermi diad of CO₂, using anoptothermal molecular-beam color-center laser spectrometer. In addition, pulsed-nozzle Fourier-transform microwave spectra are reported for the ground vibrational states of the complexes. The infrared and microwave spectra are consistent with T-shaped complexes as shown originally by Steed, Dixon, and Klemperer for Ar-CO₂. The infrared band origins for the Ar and Kr complexes are red shifted. For Ne-CO₂, blue shifts are observed. The lower Fermi components are free of perturbation, whereas the upper components of Ar-CO₂ and Kr-CO₂ are perturbed. For Ar-CO₂ the perturbation is strong, shifting the positions of the Q-branch lines of the Ka=1-0 sub-band by as much as 500 MHz.

Laser-Excited Hot-Electron Induced Desorption: A Theoretical Model Applied to NO/Pt(111).

Final rept.

J. W. Gadzuk, L. J. Richter, S. A. Buntin, D. S. King, and R. R. Cavanagh. 1990, 17p

Contract DE-A105-84ER13150
Sponsored by Department of Energy, Washington, DC. Pub. in Surface Science 235, p317-333 1990.

Keywords: *Nitrogen oxide(NO), Platinum, Adsorbates, Surfaces, Reprints, *Laser induced desorption, Molecular dynamics, Hot electrons.

The authors present a theoretical model for stimulated desorption due to the interaction of energetic substrate carriers with molecular adsorbates. The model is based on the premise that optically excited hot electrons scatter into an unoccupied valence electron resonance of the adsorbate, thus forming a temporary negative molecular ion which then experiences an enhanced attraction towards the substrate. Neutralization of the ion returns the adsorbed molecule to one of the continuum states of the molecule/substrate potential energy surface, possibly in an internally excited state. The consequences of such a model are worked out using semiclassical wave packet dynamics which, in the short time limit relevant to the present situation, can be brought to an analytic realization. The model provides considerable insight into recent experiments on the laser-induced desorption of NO from Pt(111).

Grazing-Angle X-ray Standing Waves.

Final rept.

T. Jach, and M. J. Bedzyk. 1990, 4p

Pub. in Physical Review B 42, n8 p5399-5402, 15 Sep 90.

Keywords: *Iodine, *X ray fluorescence, Standing waves, Substrates, Germanium, Impurities, Reprints, Grazing incidence, Surface reactions, Adatoms.

The authors have observed fluorescent radiation from surface adatoms of I on Ge(111) using x-ray standing waves created in the grazing-angle geometry. The authors demonstrate that standing waves which are determined by the real part of the x-ray wave vectors provide accurate atomic positions of adatoms or impurities parallel to the surface. The effect of changing evanescence due to the imaginary part of the wave vectors is directly visible in the standing-wave signal detected from the substrate. When combined with x-ray standing-wave results normal to the surface obtained from diffraction in the Bragg geometry, the measurements reveal that I reacted chemically with the (111) surface of Ge binds to the atop site of the Ge atom.

Influence of Adsorbed Potassium on Electron Stimulated Desorption of PF₃ on Ru(0001).

Final rept.

S. A. Joyce, J. A. Yarmoof, T. E. Madey, and P. Nordlander. 1990, 2p

Sponsored by Department of Energy, Washington, DC. Pub. in Vacuum, p738-739 1990.

Keywords: *Potassium, *Chemisorption, Chemical bonds, Rubidium, Adsorption, Reprints, *Phosphorus fluorides, Electron stimulated desorption, Low energy electron diffraction.

The authors have studied the coadsorption of PF₃ and K on Ru(0001) using LEED, TDS and ESDIAD (electron stimulated desorption, ion 3 angular desorption) of positive ions, negative ions, and metastable species. In the absence of potassium, both positive and negative ion ESDIAD show highly anisotropic, off-normal fluorine ion emission (F(1+), F(1-)) from PF₃ demonstrating that PF bonds are inclined away from the surface normal. In the presence of K, ESDIAD patterns of F(1+), F(1-), and metastable F(*) show normal emission, suggesting a reorientation or chemical reaction which results in fluorine bonding perpendicular to the surface. The yields of the various fluorine species vary strongly with potassium coverage; the results are interpreted in terms of a charge transfer model which includes the lateral anisotropy of the surface potential due to the presence of coadsorbed K.

Generalized Corresponding States and High-Temperature Aqueous Solutions.

Final rept.
J. M. H. Levelt-Sengers, and J. S. Gallagher. 1990, 10p
Pub. in *Jnl. of Physical Chemistry* 94, n20 p7913-7922 1990.

Keywords: *Electrolytes, Dielectric properties, Compressibility, Phase diagrams, Thermodynamic properties, Phase transformations, Nitrogen, Argon, Carbon dioxide, Sodium chloride, Reprints, *Aqueous solutions, *Corresponding states, High pressure, High temperature.

The limited scope of the law of corresponding states having been recognized since the turn of this century, scientists have devised several ways in which to generalize the principle. The generalization to nonspherical molecules led to Pitzer's acentric factor, which is widely used in engineering applications. Another generalization is that due to Rowlinson, Leland, and others and permits mapping of the properties of a fluid or fluid mixture onto those of a reference fluid. Several applications of this latter method to high-temperature aqueous electrolyte and nonelectrolyte systems are presented here. The purpose is to provide an alternative to the more traditional excess Gibbs free energy formulations, for applications where the solvent compressibility is large and the dielectric constant low. In all cases studied, simultaneous descriptions are obtained for many properties in the sub- and supercritical regime, such as phase boundaries, critical lines, Henry constants, and partial and apparent molar properties, including their infinite-dilution limits. The agreement with experimental data is semiquantitative. Advantages and drawbacks of the method are discussed.

Nitrogen Valence Electronic Structure in the Strong Chemisorption Limit: Molecular Adsorption on Cr(110) and O/Cr(110).

Final rept.
N. D. Shinn. 1990, 12p
Sponsored by Office of Naval Research, Arlington, VA., Department of Defense, Washington, DC., and Department of Energy, Washington, DC.
Pub. in *Physical Review B* 41, n14 p9771-9782, 15 May 90.

Keywords: *Nitrogen, *Chemisorption, Synchrotron radiation, Adsorption, Chromium, Surfaces, Chemical bonds, Work functions, Cryogenics, Oxygen, Reprints, Photoelectron spectroscopy, Chemical dissociation, Photoemission, Electronic structure.

Nitrogen adsorption and dissociation on clean and oxygen-dosed Cr(110) surfaces have been studied with angle-integrated synchrotron-radiation ultraviolet photoelectron spectroscopy (UPS) and work-function measurements. Consideration of the results in comparison with other nitrogen chemisorption studies shows that the bonding of nitrogen to Cr(110) is not well described by the usual sigma-donation and pi-backbonding concepts. A bonding geometry with both nitrogen atoms coordinated to chromium atoms is proposed in spite of the absence of surface hollow sites usually invoked to account for such a species.

Fugacity Coefficients of Hydrogen in (Hydrogen + 2-Methylpropane): Pressure Dependence.

Final rept.
T. J. Bruno, and S. L. Outcalt. 1990, 11p
Sponsored by Gas Research Inst., Chicago, IL.
Pub. in *Jnl. of Chemical Thermodynamics* 22, p873-883 1990.

Keywords: *Fugacity, *Hydrogen, *Butanes, Gas laws, Thermodynamics, Pressure, Reprints, *Binary mixtures, *Fugacity coefficient.

The fugacity coefficients of hydrogen in (hydrogen + 2-methylpropane) were measured with a physical-equilibrium technique at pressures of (5.13, 6.78, 10.17, and 13.50) MPa, all at a temperature of 403.15K. The physical-equilibrium technique involved the use of an experimental chamber that was divided into two separate regions by a semipermeable membrane through which hydrogen, but not 2-methylpro-

pane, could permeate. Measurement of the gas pressures on each side of the membrane, in addition to a measurement of the binary-mixture composition and the system temperature, allowed the calculation of the fugacity and fugacity coefficient of hydrogen in the mixture. The qualitative features of the measurements are discussed, and comparisons are made with predictions obtained from the Redlich-Kwong and Peng-Robinson models.

Pub. in *International Jnl. of Thermophysics* v9, n6 p1091-1100 Nov 88.

Keywords: *Specific heat, *Entropy, Adiabotic conditions, Thermodynamics, Reprints, *Barium tetrafluorostannate, Calorimetry, Low temperature, Fast ion conductors.

The heat capacity of the fast ion conductor BaSnF₄ was measured over the temperature range 7 < T < 345K using adiabatic calorimetry. Our results show that a phase transition is not present. However, an anomalous rise in the molar heat capacity, C(p,m), occurs in the region 210 < T < 310K; the entropy change of this rise amounts to delta/R=0.112. The anomaly coincides with the temperature range where a break in the slope of the electrical conductivity has been observed, which results in a threefold decrease in the activation energy required in the temperature region above the break at 272K. Standard molar thermodynamic functions are presented at selected temperatures from 5 to 345K.

Melting Curve of Tetrahydrofuran Hydrate in D₂O.

Final rept.
H. J. M. Hanley, G. W. Meyers, J. W. White, and E. D. Sloan. 1989, 7p
Pub. in *International Jnl. of Thermophysics* 10, n4 p903-909 Jul 89.

Keywords: *Melting points, *Hydrates, *Heavy water, Crystal structure, Phase diagrams, Temperature measurement, Reprints, *Tetrahydrofuran.

Melting points for the tetrahydrofuran/D₂O hydrate in equilibrium with the air-saturated liquid at atmospheric pressure are reported. The melting points were measured by monitoring the absorbance of the solution. Overall, the melting-point phase boundary curve is about 2.5K greater than the corresponding curve for the H₂O hydrate, with a congruent melting temperature of 281 + or - 0.5K at a D₂O mole fraction of 0.936. The phase boundary is predicted to within 5% if the assumption is made that the THF occupancy in the D₂O and H₂O hydrates is the same. The authors measure an occupancy of 99.9%. The chemical potential of the empty lattice in D₂O is estimated to be 5% greater than in H₂O.

Effective Core Potentials and Accurate Energy Curves for Cs₂ and Other Alkali Diatomics.

Final rept.
M. Krauss, and W. Stevens. 1990, 7p
Pub. in *Jnl. of Chemical Physics* 93, n6 p4236-4242, 15 Sep 90.

Keywords: *Diatomic molecules, *Alkali metals, *Dissociation energy, Cations, Spectroscopic analysis, Ground state, Energy levels, Reprints, *Excited states, *Effective core potentials.

Energy curves of Cs₂ that correlate to the ground (SS) and first excited asymptote (SP) are calculated using compact effective potentials (CEP) and core polarization potentials (CPP) which reduce the alkali atom to a single valence electron. Dissociation energies and equilibrium internuclear separations are in good agreement with experimental values. The long-range properties of the energy curves are analyzed to determine the region where the chemical interactions begin. Analogous energy curves and spectroscopic constants are obtained for the Rb₂ molecule. The ground state singlet and triplet energy curves are also determined for K₂. For completeness, the ground state spectroscopic constants are also reported for the Li and Na neutral and cation homonuclear diatomic molecules to illustrate the accuracy of the CEP and CPP for all the alkali atoms. Both doublet and quartet energy curves of the homonuclear anions also were examined. The dissociation energies and electron detachment energies of the doublet ground state for Rb₂(-1) and Cs₂(-1) are in good agreement with experiment. An assignment of the photoelectron spectra of Cs₂(-1) is possible from the electronic structure of the ground state and the excitation energies of the neutral states. Quartet excited states of Cs₂(-1) are calculated to be bound relative to the triplet Sigma(sub u)(+) neutral state but are metastable with respect to the ground singlet Sigma(sub g)(+) state. The accuracy of the ionic energy curves shows that the CEP and CPP are transferrable to the ionic systems.

Physical & Theoretical Chemistry

The thermodynamic properties of ten halogenated hydrocarbons are collected from a variety of sources, including unpublished data. Considered are the triple point, normal boiling point and critical point parameters, and the temperature dependence of the vapour pressure, saturated liquid density and ideal gas heat capacity. Also considered are the single-phase p-V-T data. The saturation and ideal gas data are fitted to simple correlations. The fluids, which are potential alternatives to the fully halogenated chlorofluorocarbons, are R23, R32, R125, R143a, R22, R134a, R152a, R124, R142b and R123.

Elastic Effects during Late Stage Phase Transformations.

Final rept.

P. W. Voorhees, W. C. Johnson, and V. J. Laraja. 1986, 17p

Sponsored by National Science Foundation, Washington, DC., and Office of Naval Research, Arlington, VA. Pub. in Proceedings of International Seminar Solute-Defect Interaction Theory and Experiment, Kingston, Canada, August 5-9, 1985, p409-425 1986.

Keywords: *Crystal defects, *Precipitation(Chemistry), *Texture, Thermodynamics, Surface energy, Stresses, Elastic properties, Solutes, Solutions, Residual stress, Surface roughness, Reprints, *Liquid-Solid interfaces, *Liquid-Liquid interfaces, Ostwald ripening, Gibbs-Thomson Equation.

The effect of elastic stress on coarsening in two-phase crystalline solids is examined using the recently developed thermodynamic description of curved interfaces in solids. For a system consisting of two coherent precipitates, it is shown that the elastic fields can induce a small precipitate to grow and a large precipitate to shrink, in contradiction to classic Ostwald ripening theory. It is shown that during precipitate growth the local concentration at the interface can depend strongly on the matrix supersaturation. The Gibbs-Thomson equation is derived for a growing spherical precipitate. It is shown that capillarity in such a solid is considerably different from that in a fluid-fluid system. Finally, the relationship between the misfit of a coherent precipitate and the surface energy is derived. It is shown that decreasing the misfit of the precipitate does not necessarily decrease the interfacial energy and that the sign of the change in surface energy with misfit depends explicitly on the signs and magnitudes of the surface residual stress and surface elastic constants.

Investigations of Selectivity in Reversed-Phase Liquid Chromatography on Chemically Bonded C18 Phases.

Final rept.

S. A. Wise, L. C. Sander, and W. E. May. 1986, 22p
Pub. in Proceedings of Silanes, Surfaces, and Interfaces Symposium, Snowmass, CO., June 19-21, 1985, p349-370 1986.

Keywords: *Silanes, *Silicon dioxide, *Adsorbents, Surface properties, Synthesis(Chemistry), Aromatic polycyclic hydrocarbons, Polymers, Selectivity, Interfaces, Reprints, *Liquid chromatography, *Separation processes, Liquid-solid interfaces.

Octadecylsilane (C18) phases were prepared on a number of different silica substrates to investigate the factors that affect selectivity in reversed-phase liquid chromatography. The following factors were evaluated: (1) bonded phase type (monomeric and polymeric), (2) pore diameter and surface area of the silica substrate, and (3) C18 surface coverage. The greatest selectivity for the separation of polycyclic aromatic hydrocarbon (PAH) isomers was achieved for polymeric C18 phases prepared on wide-pore (150 Å diameter) silica and selectivity generally improves as the C18 surface coverage increases. The effects of solute shape and planarity have also been examined. PAH isomers were found to have significantly different retention characteristics on polymeric phases as compared to monomeric phases.

Photon Stimulated Desorption of Fluorine from Silicon Etched by XeF₂.

Final rept.

J. A. Yarnoff, S. A. Joyce, C. W. Lo, and J. Song. 1990, 10p

Pub. in Desorption Induced by Electronic Transitions, DIET IV, Springer Series in Surface Sciences, v19 p65-74 1990.

Keywords: *Silicon fluorides, *Fluorine, Etched crystals, Reprints, *Photon stimulated desorption, *Photoemission, Soft x-rays, Xenon fluorides.

The authors have measured soft x-ray photoemission and photon stimulated desorption (PSD) from silicon surfaces which were etched by XeF₂. These surfaces are covered with a layer approximately 20 Å thick composed of a mixture of silicon fluoride reaction intermediates. The relative intensities of both photoemission and PSD spectral features arising from each of the various SiF_x species depends strongly on the structure of the overlayer. Since photoemission measurements probe the entire reaction layer and PSD is sensitive to only the very outermost atomic layer, a comparison of these data can reveal structural details. The implications of these results on the structure of the reaction layer are discussed.

Vapor-Liquid Equilibrium of Carbon Dioxide with Isobutane and n-Butane: Modified Leung-Griffiths Correlation and Data Evaluation.

J. C. Rainwater, H. Ingham, and J. J. Lynch. 1990, 17p

Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n6 p701-718, Nov/Dec 90.

Keywords: *Carbon dioxide, *Butanes, *Liquid-vapor equilibrium, Binary mixtures.

The Leung-Griffiths model as modified by Moldover and Rainwater is used to correlate high-pressure vapor-liquid equilibria of mixtures of carbon dioxide with n-butane and isobutane. Model correlations are compared against 10 independent experimental sources for these mixtures. Agreement is generally very good and comparable to mutual experimental discrepancies. The utility of the model as a data evaluation technique is demonstrated in that small suspect regions have been identified in certain data sets and the model predictions have been confirmed by subsequent measurements that agree with the model better than the earlier data.

Correlation of Cure Monitoring Techniques.

Final rept.

S. S. Chang, F. I. Mopsik, and D. L. Hunston. 1987, 12p

Pub. in Proceedings of International SAMPE (Society for the Advancement of Material and Process Engineers) Technical Conference (19th), p253-264 1987.

Keywords: *Curing, *Epoxy resins, Composite materials, Monitors, Process control, Mechanical properties, Viscosity, Thermal analysis, Dielectric properties, Fluorescence, Ultrasonic tests, Heat of reaction, Measurement, Viscous flow.

The mechanical properties of a finished composite or resin product depend strongly on the curing path followed during processing. To monitor the cure, a large number of properties which change with the degree of cure can be monitored. The properties may be sensitive to changes at the sub-molecule level to the bulk material level. Some of the methods, e.g., dielectric fluorescence and ultrasonic measurement techniques, may be suitable for on-line monitoring and process control. It is important to correlate the methods with flow characteristics during processing as obtained from viscosity measurements, and with the degree of cure as determined from thermal measurements. For an example, six different cure monitoring methods are used to follow cure in a model system and the results compared. The common traits, differences, and specific features are discussed in detail.

Heat of Reaction and Curing of Epoxy Resin.

Final rept.

S. S. Chang. 1988, 20p

Pub. in Jnl. of Thermal Analysis 34, n1 p135-154 1988.

Keywords: *Heat of reaction, *Curing, *Epoxy resins, Composite materials, Heat measurement, Process control, Monitors, Thermodynamics, Reaction kinetics, Imidazoles, Bisphenol-A, Differential thermal analysis, Reprints.

The heat of reaction and kinetics of curing of DGEBA type of epoxy resin with catalytic amounts of EMI have been studied by differential power-compensated calorimetry as a part of the program for the study of process monitoring for composite materials. A method of determination of heat of reaction from dynamic thermoanalytical instruments was given according to basic thermodynamic principles. The complicated mechanism, possibly involving initial ionic formation, has also been observed in other measurements, such as by time-domain dielectric spectroscopy. The behavior of commercially available DGEBA resin versus purified monomer DGEBA were compared. The melting point of purified monomeric DGEBA crystals is 41 deg C with a heat of fusion of 81 J/g. The melt DGEBA is difficult to crystallize upon cooling. The glass transformation of purified DGEBA monomer occurs around -22 deg C with a delta Cp of 0.60 J/K/g.

Behavior of Primary Radicals during Thermal Degradation of Poly(Methyl Methacrylate).

Final rept.

T. Kashiwagi, A. Inaba, and A. Hamins. 1989, 24p

Pub. in Polymer Degradation and Stability 26, p161-184 1989.

Keywords: *Free radicals, *Thermal degradation, *Polymethyl methacrylate, Plastics, Polymers, Cleavage, Molecular weight, Mass spectroscopy, Carbon monoxide, Carbon dioxide, Carbinols, Methane, Anions, Reaction kinetics, Reprints.

The behavior of the primary radicals formed from the random scission of anionically polymerized poly(methyl methacrylate) PMMA during thermal degradation is investigated by a theoretical and experimental study. It is proposed that the primary radical rearranges to form the polymer molecule with the unsaturated bond at a chain end. Two different degradation paths for this rearrangement are proposed via beta scission at the C-C bond of the pendant group instead of beta scission, as previously thought, at the backbone C-C bond. The products from the proposed degradation paths are CO, CO₂, CH₃OH, and CH₄.

The products for anionically polymerized PMMA samples with three different values of initial molecular weight are measured by a mass spectrometer. The quantities of CO and CO₂ are observed to decrease with an increase in initial molecular weight. This confirms that the two proposed degradation paths for the thermal degradation of PMMA are quite plausible.

Thermoreversible Gelation of Isotactic Polystyrene: Thermodynamics and Phase Diagrams.

Final rept.
J. M. Guenet, and G. B. McKenna. 1988, 5p
Pub. in *Macromolecules* 21, n6 p1752-1756 Jun 88.

Keywords: *Gelation, *Phase diagrams, *Polystyrene, *Thermodynamics, Molecular weight, Decalin, X ray diffraction, Microscopy, Chirality, Cooling, Heating, Reprints.

The thermodynamics of thermoreversible gelation of isotactic polystyrene in cis-decalin, trans-decalin and 1-chlorodecane was investigated. The gel formation and the gel melting were studied as a function of various parameters such as the cooling or heating rate and the polymer molecular weight. The temperature-concentration phase diagrams were established both from the cooling and the heating experiments. It is found that in both situations the shape of the phase diagram is the same with the same solvent but differs whether cis-decalin or trans-decalin is considered. The phase diagrams correspond to various types of compound: congruently melting compound in cis-decalin and compound characterized by a singular point in trans-decalin. In addition, it is shown from optical microscopy experiments and X-ray diffraction experiments that the threefold helical form reappears beyond 50% in trans-decalin but does not in cis-decalin.

Bubble Formation from a Sparger in Polymer Solutions-II. Moving Liquid.

Final rept.
A. K. Ghosh, and J. J. Ulbrecht. 1989, 9p
Pub. in *Chemical Engineering Science* 44, n4 p969-977 1989.

Keywords: *Polymers, *Bubbles, Rheology, Fermentation, Mixing, Chemical reactors, Photographic techniques, Reprints.

Bubble formation from orifices submerged in a continuous phase of viscous, shear-thinning and viscoelastic liquids has been investigated. A high-speed photographic technique was used to determine the bubble profile and the final bubble size. The experimental part of the investigation has afforded an insight into the dynamics of gas-liquid motion during the formation period of the bubble and the detachment criteria in polymeric liquids. A theoretical analysis has been developed by combining dimensional analysis and a force balance and a rheological equation to determine the bubble growth rate and the final bubble size. The role of the pseudoplasticity of the continuous phase on the size and shape of the bubble has been evaluated.

N. Ding, E. Amis, R. Salovey, and R. Briber. 1989, 8p
Pub. in *Jnl. of Polymer Science* 27, pTC p489-496 1989.

Keywords: *Polymers, *Crystallization, Suspending(Mixing), Quenching(Cooling), Toluene, Polyoxyethylene, Nucleation, Light scattering, Reprints, Transmission electron microscopy.

An alternative method has been developed to prepare suspensions of polymer crystals. The crystals are formed by rapidly freezing a clean toluene solution of poly(ethylene oxide) (PEO) to low temperature. When the frozen solution is warmed to room temperature, it provides a suspension of uniform and stable particles. The particles have been used as seeds for nucleating solution-grown PEO crystals. The diameters of the

seeds are measured by dynamic light scattering to be 0.16-0.8 micro m for solutions with concentrations ranging from 5 to 400 ppm. Transmission electron micrographs show the seeds to be clusters of square PEO lamellae. A possible mechanism for the seed formation is discussed.

Aging Effects and the Dependence of Modulus on Concentration in Isotactic Polystyrene/Cis-Decalin Gels.

Final rept.
G. B. McKenna, and J. M. Guenet. 1988, 3p
Pub. in *Polymer Communications* 29, n3 p58-60 Mar 88.

Keywords: *Aging tests(Materials), *Modulus of elasticity, *Compressive properties, *Concentration(Composition), *Resins, *Polystyrene, *Decalin, *Gels, Heat treatment, Polymers, Gelation, Reprints, Temperature dependence, Isotactic polystyrene.

Thermoreversible gels were formed by quenching solutions of isotactic polystyrene in cis-decalin. The room temperature modulus in compression of the gels was measured as a function of temperature of gel formation, aging time at temperature, and concentration of polystyrene in the gel. The results show that for gels formed at -20 C and -10 C, the modulus is independent

of aging time. Above zero degrees the modulus increases with increasing aging time. The shape of the log modulus-log concentration is independent of T(a) and T(gel), but the magnitude of the modulus depends upon both T(c) and T(gel).

Glass Formation and Glassy Behavior.

Final rept.
G. McKenna. 1989, 52p
Pub. in *Comprehensive Polymer Science - The Synthesis, Characterization, Reactions and Applications of Polymers*, Chapter 10, p311-362 1989.

Keywords: *Polymers, *Glass transition temperature, Thermodynamic properties, Kinetics, Molecular weight, Chemical composition, Entropy, Free energy, Molecular theory, Aging tests(Materials), Reprints.

The thermodynamics and kinetics of the glass transition are reviewed. The glass transition event is recognized as a kinetically observable phenomenon with a possible underlying second order thermodynamic transition influencing behavior. A discussion of thermodynamic transitions in the Ehrenfest sense is made and the glass transition related to it. It is pointed out that PVT experiments in glasses, due to kinetic effects, cannot be used to elucidate the thermodynamic nature of the glass transition event. Discussions of the configurational entropy theory of the glass transition and the free volume models are used to show the important molecular parameters which determine the glass transition temperature, e.g., molecular weight, cross-linking, composition of copolymers and blends. The kinetics of volume recovery in glasses is also presented within the framework of the modern phenomenological theories of the Narayanaswamy-Moynihan-KANF types. The Ngai coupling model is explained and the Robertson, Simha, Curro free volume is examined. Brief comments are made about physical aging and computer simulation.

Morphological Partitioning of Chain Ends and Methyl Branches in Melt Crystallized Polyethylene by ¹³C NMR.

Final rept.
E. Perez, and D. L. Vanderhart. 1987, 17p
Pub. in Jnl. of Polymer Science 25, n8 p1637-1653 Aug 87.

Keywords: *Polyethylene, Microstructure, Separation, Nuclear magnetic resonance, Spectroscopy, Molecular structure, Crystallization, Melts, Polymers, Vinyl resins, Solids, Reprints, Carbon 13, Ethylene propylene diene copolymer.

The partitioning of methyl and vinyl ends between the crystalline and noncrystalline regions of polyethylene has been investigated using ¹³C NMR in the solid state. The polyethylene samples, which were crystallized from the melt, varied in molecular weight, polydispersity, crystallization rate and comonomer content. For the limited set of samples considered, the ratio of crystal to overall end concentration is independent of those variables. The ratio takes the value of 0.75 and 0.60 for the methyl and vinyl ends, respectively. When the crystalline fraction of the samples is taken into account, 50-75% of the total saturated ends and 42-63% of the total vinyls reside in the crystal. For an ethylene/propylene copolymer, 21-27% of the methyl branches were determined to be in the crystal. The level of incorporation puts methyl branches in a position intermediate between chain ends and ethyl branches.

Proton MAS NMR Method for Determining Intimate Mixing in Polymer Blends.

Final rept.
D. L. VanderHart, W. Herman, W. F. Manders, and R. S. Stein. 1987, 3p
Pub. in Macromolecules 20, n7 p1724-1726 1987.

Keywords: *Polymers, *Mixtures, *Nuclear magnetic resonance, Spectroscopy, Blends, Polystyrene, Deuterium compounds, Isotopic labeling, Protons, Hydrogen, Reprints, *Magic angle spinning(Free index).

A very simple proton NMR method is described for probing intimacy of mixing in polymer blends on a distance scale less than 1 nm. The method requires that one of the polymer constituents be nominally (98-99%) perdeuterated, and the other fully protonated; moreover, both polymers should be in a temperature range where they are relatively immobile. The dilute nature of the proton spins in the perdeuterated polymer implies that the spectrum of its residual protons

will be broken up into centerbands and spinning sidebands at rather low magic-angle spinning (MAS) frequencies. At these same frequencies, no such narrowing will be visible in the protonated homopolymer. In a blend of these two polymers, intimate mixing is probed via the attenuation of the narrowed centerband arising from the protons in the deuterated polymer. The narrowed resonances can be easily distinguished atop the broad resonance from the protonated polymer. In a mixture of deuterated (30%) and protonated (70%) atactic polystyrenes, which are expected to mix intimately, attenuation of the aromatic centerband at a MAS frequency of 2.2 kHz is found to be 85% compared to that expected for a totally phase-separated mixture. The experiment can be carried out using a high resolution spectrometer, although MAS capability is, of course, required.

Viscosity and Molecular Weight Distribution of Ultra-High Molecular Weight Polyethylene Using a High Temperature Low Shear Rate Rotational Viscometer.

Final rept.
H. L. Wagner, and J. G. Dillon. 1988, 16p
Pub. in Jnl. of Applied Polymer Science 36, n3 p567-582 1988.

Keywords: *Viscosity, *Molecular weight, *Polyethylene, Polymers, Plastics, Shear rate, Viscometers, Crystallization, Reprints, High temperature, Rotating cylinders, Fractionation.

To obtain accurate measurements of the limiting viscosity number (LVN) or the intrinsic viscosity of solutions of ultrahigh molecular weight polyethylene (UHMWPE), a low shear floating-rotor viscometer of the Zimm-Crothers type was constructed to measure viscosities at elevated temperatures (135 C) and near zero shear rate. The zero shear rate measurements for UHMWPE whole polymer and UHMWPE fractionated by hydrodynamic crystallization were compared with viscosity measurements at moderate and high shear rates (up to 2000/s) carried out in a capillary viscometer. The limiting viscosity number of UHMWPE decreases, as expected, with shear rate. The high shear rate data could not be extrapolated to yield the correct zero-shear rate viscosities. Fractionation of UHMWPE gave 10 fractions ranging in LVN from 9 to 50 dL/g. A tentative integral molecular weight distribution for the whole polymer was calculated on the basis of the Mark-Houwink equation, but because it had been previously established only for lower molecular weight polyethylenes, it may not be accurate. A correlation was found between the LVN's for the fractions in the two types of viscometers.

Monitoring the Quality of Mix of Polymer Melts with Particulate Fillers Using Fluorescence Spectroscopy.

Final rept.
A. J. Bur, J. Shibata, T. K. Trout, F. W. Wang, and C. L. Thomas. 1989, 7p
Sponsored by Office of Naval Research, Arlington, VA. Pub. in Polymer Engineering and Science 29, n24 p1759-1765 Dec 89.

Keywords: *Melts, *Polybutadiene, Fillers, Elastomers, Polymers, Aluminum oxide, Mixing, Monitors, Reprints, Fluorescence spectroscopy.

Fluorescence spectroscopy has been employed to monitor the mixing of polymer melts with filler material. The polymer melts were low molecular weight polybutadiene and PBAN, a terpolymer consisting of 85% butadiene, 11% acrylonitrile, 4% acrylic acid, and the filler material was aluminum oxide. To carry out the fluorescence observations, a dopant chromophore was mixed into the polymer melt at very low concentrations, 10(sup -4) to 10(sup -6) molar or 11 to 0.11 ppm by weight. The mixing experiments were carried out using a small laboratory mixer which had glass walls for viewing the fluorescence spectra from the dopant chromophore. Fluctuations in fluorescence intensity were observed to decrease as a function of mixing time indicating that the spatial distribution of the fluorescent chromophores was becoming more uniform. Concerning the mixing of polymer melt and filler, it is hypothesized that uniform mixing of ingredients is

achieved when fluorescence intensity as a function of time is constant. In order to obtain quantitative support for the hypothesis, a fluorescence microscope was used to measure fluorescence intensity and optical transmittance from microscopic regions of well-mixed and poorly mixed specimens.

Analysis of the Corrections to the Normal Force Response for the Cone and Plate Geometry in Single Step Stress Relaxation Experiments.

Final rept.
L. J. Zapas, G. B. McKenna, and A. Brenna. 1989, 23p
Pub. in Jnl. of Rheology 33, n1 p69-91 1989.

Keywords: *Stress relaxation tests, Experimental design, Rheological properties, Viscoelasticity, Conical bodies, Plates, Force, Stress analysis, Reprints, *Polybutylene.

An analysis and experimental results on a polyisobutylene solution are presented for the transient response in single step stress relaxation experiments in a cone and plate geometry. The experimental deviations from unity of the ratio of the first normal stress difference to the product of the strain times the shear stress are accounted for by including three important corrections in the analysis. First, it is shown that the finite time required to apply the step introduces corrections to the normal stresses which are greater than those for the shear stress. Second, the machine compliance introduces errors in the normal force by causing an increased gap separation which subsequently relaxes as the normal force relaxes. Third, the constrained geometry of the cone and plate results in the compliance corrections being 'magnified' by some 1600 times, leading to large corrections and apparent violations of the universal relation at long times. Experimental results for extension and compression in a parallel plate geometry are presented for different gap settings and used to demonstrate that the constrained cylinder problem in viscoelastic fluids is similar to that observed in elastic bodies.

Concentration Fluctuations in Mixtures of Linear and Star-Shaped Polymers.

Final rept.
T. P. Russell, L. J. Fetters, J. C. Clark, B. J. Bauer, and C. C. Han. 1990, 6p
Pub. in Macromolecules 23, n2 p654-659 1990.

Keywords: *Polystyrene, *Vinyl ether resins, Polymers, Phase diagrams, Blends, Transparency, Neutron scattering, Haze, Reprints, Poly(Vinyl methyl ether), Temperature dependence.

Mixtures of linear poly(vinyl methyl ether) (PVME) with four-armed star polystyrene (PS*) were studied to evaluate the effect of chain topology on the critical fluctuations in homogeneous polymer mixtures. It was found that the cloud point curve of the PS*/PVME mixtures were elevated by approximately 10 C over that of the corresponding linear mixtures. Use of deuterated PS* elevated the cloud point by another approximately 10 C. Small-angle neutron scattering (SANS) on mixtures of the deuterated PS* with PS* was used to evaluate the single chain structure factor of the PS*. The agreement between the theories of Benoit and Burchard for branched molecules and the experimental structure factor was excellent. Using the structure factor the concentration fluctuations in the homogeneous mixtures was investigated by SANS as a function of concentration and temperature. The inverse of the intensity at zero scattering vector, S(0)(sup -1), extrapolated linearly with the inverse temperature to yield the spinodal temperature Ts. The correlation length was found to be depend upon T-T(0))/T8(sup -v) where v = 0.5. The bare correlation length was found to depend upon composition in a manner similar to a previous study. Finally, the Flory-Huggins interaction parameter was found to vary with 1/T and to depend upon composition.

Structure of the Polymer-Solvent Interface.

Final rept.

D. G. Miles, and J. W. Schmidt. 1990, 5p

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in *Jnl. of Chemical Physics* 92, n6 p3881-3885, 15 Mar 90.

Keywords: *Polymers, Polarimetry, Polystyrene, Cyclohexane, Solvents, Molecular weight, Refractivity, Reprints, Liquid-liquid interfaces.

The first measurements of ellipticities from the liquid-liquid interface between polymer and solvent mixtures near the consolute points are reported. When scaled according to theory the ellipticities of high molecular weight polystyrene + solvent mixtures are consistent with those from simple, low molecular weight mixtures. The universal value of the scaled ellipticity is approximately 20% lower than that predicted by present theories.

Chain Dimension Determination of Deuterated Polybutadiene by Small-Angle Neutron Scattering on the Basis of Random Phase Approximation.

Final rept.

S. Sakurai, H. Hasegawa, T. Hashimoto, and C. C. Han. 1990, 5p

Pub. in *Polymer Communications* 31, p99-102 Mar 90.

Keywords: *Polybutadiene, Synthetic elastomers, Polymers, Neutron scattering, Markov chains, Deuteration, Random walk, Measurement, Isotopil labeling, Molecular structure, Reprints.

The chain dimension of a deuterated polybutadiene (DPB) which is mixed in the matrix of a protonated polybutadiene was measured by using the small-angle neutron scattering technique. The Kuhn's statistical segment length for the particular DPB with 20% 1,2-unit, 36% cis-1,4-unit, and 44% trans-1,4-unit was determined by two methods, the Zimm's method and the random phase approximation (RPA) calculation analysis. 6.88 Å is the more reliable statistical segment length for the DPB, which was obtained by the latter method. The advantages and shortcomings of both Zimm's method and RPA analysis for measuring single chain properties in bulk are also discussed.

Apparatus for Simultaneous Small Angle Neutron Scattering and Steady Shear Viscosity Studies of Polymer Melts and Solutions.

Bi-monthly rept.

A. I. Nakatani, H. Kim, and C. C. Han. 3 Oct 89, 8p

Included in *Jnl. of Research of the National Institute of Standards and Technology*, v95 n1 p7-14 Jan-Feb 90.

Keywords: *Vinyl ether resins, *Plastics, *Polymers, *Test equipment, *Polystyrene, Neutron scattering, Shear rate, Melts, Solubility, Blends, Binary systems (Materials), Deuterium, Process variables, Viscosity, Measurement, Small angle scattering.

The design and construction of an apparatus for studying the simultaneous small angle neutron scattering (SANS) and steady shear viscosity behavior of polymer melts and concentrated solutions is discussed. Successful operation of the device is demonstrated on a blend of 20 weight percent deuterated polystyrene and 80 weight percent poly(vinylmethylene). The effects of shear on the critical behavior of the blend are observed in the SANS behavior as a function of temperature and shear rate and indicate shear induced mixing behavior for the range of shear rates examined. The steady shear viscosity results alone are insufficient for detecting the transition from one to two places. The examination of shear effects in polymer blends is important for understanding the critical behavior of binary systems. Technologically, knowledge of the phase behavior of polymer blends under shear are important for the design and improvement of commercial blend processing.

Phase Behavior of Polymer Blends.

Final rept.

C. Han. 1990, 12p

Pub. in *Rubber Chemistry and Technology* 63, n1 p98-109 Mar/Apr 90.

Keywords: *Polymers, *Polystyrene, *Polybutadiene, *Vinyl ether resins, Blends, Elastomers, Deuteration, Neutron scattering, Phase diagrams, Heat of mixing, Isotopic labeling, Molecular weight, Molecular structure, Reprints, Temperature dependence.

Both deuterated polystyrene/poly(vinyl methyl ether) and deuterated polybutadiene/protonated polybutadiene blends have been studied by the small angle neutron scattering technique as a function of temperature, composition, molecular weight and microstructure (in the PBD/PBH case). It can be shown that the binary interaction parameter of the polymer blends can be obtained effectively and accurately. The free energy of mixing can be obtained and the phase diagram can be predicted. In the polybutadiene/polybutadiene case, UCST behavior has been observed and individual pair interaction parameters can be separated out. With the use of copolymer theory, phase behavior can be predicted.

Shear Stabilization of Critical Fluctuations in Bulk Polymer Blends Studied by Small Angle Neutron Scattering.

Final rept.

A. I. Nakatani, H. Kim, Y. Takahashi, Y. Matsushita,

A. Takano, B. Bauer, and C. C. Han. 1990, 16p
Pub. in *Jnl. of Chemical Physics* 93, n1 p795-810, 1 Jul 90.

Keywords: *Vinyl ether resins, *Polystyrene, *Polybutadiene, Neutron scattering, Binary systems (Materials), Shear rate, Deuterium, Isotopic labeling, Viscosity, Reprints, *Polymer blends, Temperature dependence, Small angle scattering.

The small angle neutron scattering (SANS) technique has been used to study the concentration fluctuations of binary polymer mixtures under shear. Two different polymer systems, deuterated polystyrene/poly(vinylmethylene) and deuterated polystyrene/polybutadiene, have been studied as a function of temperature and shear rate. Due to the small wavelength of the incident neutron radiation compared with light, the shear dependence of concentration fluctuations in the one-phase region and in the strong shear limit has been obtained from the q dependence of the scattering structure factor for the first time. From a detailed analysis of the scattering structure factor $S(\text{sub } q)$ a crossover value of the wave number $q(\text{sub } s)$ has been obtained as a function of temperature and shear rate. The crossover wave number represents the inverse of the lowest fluctuation mode which is not affected by shear. The temperature, viscosity, and shear rate dependence of the experimentally determined $q(\text{sub } s)$ agree well with a simple rotatory diffusion model and also the dynamic mode-mode coupling analysis of Kawasaki and Ferrell. The apparent spinodal temperature as a function of shear rate is shown to be consistent with the prediction of Onuki.

Small Angle Neutron Scattering Studies of Blends of Protonated Linear Polystyrene with Crosslinked Deuterated Polystyrene.

Final rept.

R. M. Briber, and B. J. Bauer. 1990, 9p

Pub. in *Materials Research Society Symposia Proceedings*, v171 p203-210 1990.

Keywords: *Polystyrene, Neutron scattering, Deuterium, Crosslinking, Isotope effect, Isotopic labeling, Thermodynamic properties, Synthesis (Chemistry), Free energy, Reprints, *Polymer blends, Small angle scattering.

Small angle neutron scattering (SANS) has been used to study the scattering function and thermodynamics of blends of linear protonated polystyrene (PSH) and crosslinked deuterated polystyrene (PSD). Two series of samples were synthesized. In both cases the sam-

ples were made by dissolving the linear PSH in deuterated styrene monomer containing a small amount of divinyl benzene as a crosslinker which was then polymerized to form the PSD network around the linear PSH chains. The samples were all made at a concentration of 50/50 by weight PSD/PSH. A special effort was made to keep the samples single phase so that SANS could be used to study the thermodynamics of the system and compare with theory. This entailed working at relatively low crosslink densities (<1 mole % crosslink units). Series 1 is a set of samples with the same crosslink density varying the length of the linear chain. Series 2 is a set of samples containing the same length linear chain varying the crosslink density systematically. By extrapolating $S(q)$ obtained from SANS to $q=0$ the zero angle scattering, $S(0)$, was obtained. $S(0)$ is inversely proportional to the second derivative of the free energy with respect to composition, $\Delta(\text{sup } 2)(\Delta\text{elta } f/\text{kt})/\Delta(\text{phi})(\text{sup } 2)$. Assuming additivity of the free energies of mixing and elasticity, the portion of the zero angle scattering due to elasticity is calculated.

Phase Behavior and Gelation of a Rod-Like Polymer in Solution and Implications for Microcellular Foam Morphology.

Final rept.

C. L. Jackson, and M. T. Shaw. 1990, 16p

Pub. in *Polymer* 31, p1070-1084 Jun 90.

Keywords: *Polymers, *Glutamates, *Liquid crystals, Gelation, Freezing, Benzene, Water, Dioxanes, Isotropy, Foam, Cellular materials, Rods, Reprints, Phase separation (Materials).

The phase separation and gelation of the rod-like macromolecule, poly(γ -benzyl-L-glutamate), were studied in an effort to understand the mechanism by which microcellular materials are made via thermally induced phase separation processes. Previous workers have studied similarly prepared materials from molecules which exist as random coils in solution. The microcellular materials were formed by lowering the solution temperature until phase separation and solvent freezing occurred. The solvent was removed by vacuum sublimation. An emphasis was placed on dilute isotropic solutions (<5 wt%) which yield low-density materials or 'foams'. Both one- (e.g. benzene) and two-component (e.g. dioxane/water) solvent systems were employed. The morphology produced by liquid-liquid phase separation and gelation was an open-celled, fibrous structure, which resembles a three-dimensional lattice. The cell diameters were in the range of 1-10 micrometers and the fibers which comprise the struts were 0.2 to 2.0 micrometers thick. Various experimental observations are discussed in terms of the theories and proposed mechanisms of phase separation in solutions of rod-like macromolecules. Calculations of the spinodal for the Flory theory of rod-like particles were also made to assess the possibility of placing the isotropic solutions into an unstable region.

Aspects of the Crystallization and Morphology of Poly(Phenylene Sulfide).

Final rept.

F. A. Khoury. 1990, 4p

Pub. in *Proceedings of SPE Annual Technical Conference and Exhibits* (48th), p1261-1263 1990.

Keywords: *Polymers, *Crystallization, Carbon fibers, Nucleation, Graphite, Polyacrylonitrile, Surface finishing, Spherulites, Shear modulus, Acrylic fibers, Lamellar structure, Reprints, *Poly(Phenylene sulfide).

A working model, embodying the preferential growth of lamellae parallel to the b-axis direction, and branching or interlamellar splaying hinged about the a-axis in the lamellae, is proposed for the precursor structures which have been observed to develop in the early stages of growth of PPS spherulites in bulk polymer at crystallization temperatures in the range 270C-280C. The manifestation of transcrystallization at temperatures in the range 270C-280C has been used as a criterion for comparing the ability of various carbon fibers to nucleate crystallization in PPS. Whereas the originally surface treated PAN-based low modulus (AS4),

and intermediate modulus (IM7) fibers did not induce trans-crystallization at these temperatures, all the higher modulus PAN-based (HMS4, HMU) and pitch-based (P75S, P100S, P120S) fibers did cause its occurrence. With the exception of the HMU fibers, all the other high modulus fibers were originally surface treated in production. Whether other factors, in addition to differences in graphitic order and crystallite size underlie the differences observed in the present study between nucleating ability of the higher modulus fibers as compared to the AS4 and IM7 fibers, remains an open question.

Small-Angle X-ray Characterization of Polymers.

Final rept.

J. D. Barnes, and F. I. Mopsik. 1988, 4p

Pub. in Proceedings of Annual Technical Conference and Exhibits of the Society of Plastics Engineers (46th), p1178-1181 1988.

Keywords: *Polymers, Microstructure, Reprints, X ray scattering, X ray cameras, Small angle scattering.

The paper describes the use of a digital small-angle X-ray camera at the National Bureau of Standards to characterize microstructure in polymeric materials. The camera is designed to detect scattering from structural elements in the size range from 3 to 100 nm. Entities that can be characterized using this facility include: phase diagrams of polymer blends, orientation texture developed by deformation, and sizes and shapes of multiphase domains. The camera uses a two-dimensional position sensitive detector, so that it is especially useful for cases where the scattering is anisotropic. The facility is supported by hardware and software for graphic display, image analysis, and mathematical modelling. The facility is available to scientists and engineers from outside NBS on the basis of Guest Worker and Industrial Research Associate agreements.

Formation and Melting of Solvent Crystals in Thermoreversible Polymer Gels.

Final rept.

C. L. Jackson, and G. B. McKenna. 1990, 3p

Pub. in Polymer Preprints 31, n2 p607-608 1990.

Keywords: *Solvents, *Polymers, *Gels, *Polystyrene, Decalin, Crystallization, X ray diffraction, Melting, Heat of fusion, Differential thermal analysis, Calorimeters, Reprints, *Thermoreversible materials, Isotactic.

Low-temperature studies of solvent crystallization in thermoreversible gels of isotactic-polystyrene (i-PS) in cis-decalin were made by wide angle x-ray scattering (WAXS) (100-240 K) and differential scanning calorimetry (DSC) (140-290 K). In the concentration range of 10-25% i-PS, it appears that two classes of solvent are present in the gel. The first class freezes into a small crystallites which shows a significant line broadening by WAXs, and a reduction in the bulk melting point by DSC. The second class is apparently unable to crystallize and is present as an adsorbed liquid, glass or highly disordered crystal which shows essentially no peaks in WAXS, and no measurable heat of fusion by DSC. At 30 wt.% i-PS in the gel, only the second class of solvent was observed by WAXS as evidenced by a broad amorphous peak. Although the results do not refute the formation of a polymer-solvent compound in the system as hypothesized earlier by Guenet (Macromolecules 1986, 19, 1961.), if such a compound exists it is highly disordered, since no new WAXS peaks were observed.

Effects of Melt Viscosity and Thermal Stability on Polymer Gasification.

Final rept.

T. Kashiwagi, A. Omori, and H. Nanbu. 1990, 15p

Pub. in Combustion and Flame 81, p188-201 1990.

Keywords: *Polymers, *Polymethyl methacrylate, *Combustion products, *Gasification, *Polystyrene, Melt viscosity, Thermal degradation, Thermal stability,

Radiant flux density, Molecular weight, Mass transfer, Time dependence, Burning rate, Plastics, Reprints.

The effects of melt viscosity and thermal stability of a polymeric material on gasification rate under external radiant fluxes from 1.7 to 3.9 W/sq cm are studied. The effects of melt viscosity are determined by using two different initial molecular weight polystyrene (PS) samples (about a factor of 2 difference in molecular weight); the combined effects of thermal stability with melt viscosity are determined by using two different initial molecular weight polymethylmethacrylate (PMMA) samples (about a factor of 4 difference in molecular weight). The results show that thermal stability affects gasification rate but that the transport process of the in-depth degradation products through the molten polymer to the sample surface does not significantly affect gasification rate except at low external radiant flux. The global heat of gasification is sensitive enough to differentiate the effects of thermal stability of the sample, but its value also depends on external radiant flux; in addition, it decreases with an increase in exposure time. It indicates that the global heat of gasification is not a unique quantity for a polymeric material.

Self-Diffusion Measurements of a Probe in Various Bulk Polymers: A Temperature Dependence.

Final rept.

D. A. Waldow, H. Kim, C. C. Han, Q. Tran-Cong, and M. Yamamoto. 1990, 2p

Pub. in Polymer Preprints 31, n2 p145-146 1990.

Keywords: *Polymers, *Photochemical reactions, Probes, Rayleigh scattering, Measurement, Diffusion, Transition temperature, Dimerization, Reprints, *Self diffusion (Solid state), *Matrix materials, Forced vibration, Temperature dependence.

The temperature dependence of a photobleachable molecular probe in various polymer matrices has been studied using forced Rayleigh scattering (FRS). The probe molecule, a cyclophane derivative, is demonstrated to be a suitable probe for the FRS experiment due to the characteristics of the photodimerization reaction. The dynamic range of the FRS experiment enabled the measurement of the self diffusion coefficients over a range of nearly eight orders of magnitude. The temperature dependence of the self diffusion is well described by the Williams, Landel, Ferry (WLF) equation for all the polymer matrices studied. In addition, the data from the individual polymer matrices can be shifted by T_g and $\log(D(\text{sup } \theta))_{\text{sub } \theta}$ to construct a universal curve which is well described by the WLF equation with a single $C(\text{sup } g)_{\text{sub } 1}$ and $C(\text{sup } g)_{\text{sub } 2}$.

X-ray Analysis of a Liquid Crystal Phase Diacetylene Polymerization.

Final rept.

M. A. Schen, R. Briber, and J. Cline. 1990, 2p

Pub. in Polymer Preprints 31, n2 p151-152 Aug 90.

Keywords: *Polymerization, *Liquid crystals, *Acetylene, Phase diagrams, Microstructure, X ray diffraction, Scattering, Order disorder transformations, Reprints, *Diacetylene compounds, *Thermotropism, Temperature dependence, Temperature effects, Monomers, Smectite.

Recently the laboratory has been examining the characteristics of polymerizable rigid rod-like diacetylene monomers which show thermotropic liquid crystal phase behavior. The communication describes recent small angle and wide angle x-ray scattering results collected at room temperature and at elevated temperatures for a symmetrically disubstituted diacetylene monomer, 1,6-bis(4-oxybenzylidene,4'-n-octylani-line)2,4-hexadiyne, designated 1-OBOA, and its polymer. Based on scattering results and optical dark field microscopy, the monomer is seen to exhibit the smectic G or H phase in the region of 132C to 143C and the smectic C type in the region of 143C to 178C the material goes isotropic. Evidence for crystal phase polymorphism below 132C is also seen. Polymerizations conducted within the disordered smectic C and isotropic phases result in polymers devoid of small or wide angle scattering peaks and is taken to be amorphous. Polymer obtained from polymerization in the ordered

smectic G or H phase is nearly devoid of wide angle reflections but show an intense small angle reflection at a d-spacing slightly larger than in the nascent monomer, indicating that the polymer is two-dimensional disordered but still exhibits a layer-like microstructure in the third dimension.

Characterization of Branching Architecture Through 'Universal' Ratios of Polymer Solution Properties.

Final rept.

J. F. Douglas, J. Roovers, and K. F. Freed. 1990,

13p

Pub. in Macromolecules 23, n18 p4168-4180 1990.

Keywords: *Polymers, *Solutions, Hydrodynamics, Monte Carlo method, Interactions, Molecular structure, Reprints, Branching ratio, Characterization.

Experimental and Monte Carlo data for the dilute-solution properties of 'lightly branched' polymers (stars, combs, rings, etc.) are compared with the renormalization group predictions of Douglas and Freed. The comparisons focus on 'universal' dimensionless ratios of the mean dimensions of lightly branched polymers, relative to those of linear polymers having the same molecular weight. Complications associated with hydrodynamic solution properties and with the effect of ternary interactions are briefly discussed. Dimensionless ratios involving the polymer second virial coefficient, A_2 , are also tabulated and compared with theory.

Shear Induced Phase Behavior of Polymer Blends by Small Angle Neutron Scattering.

Final rept.

A. I. Nakatani, H. Kim, and C. C. Han. 1990, 6p

Pub. in Materials Research Society Symposium Proceedings, v166 p479-484 1990.

Keywords: *Phase transformations, Shear rate, Shear flow, Neutron scattering, Solutions, Binary systems (Materials), Polystyrene, Polybutadiene, Synthetic elastomers, Rheology, Vinyl ether resins, Reprints, *Polymer blends, Small angle scattering.

The phase behavior of polymer blends and solutions can be changed dramatically by a flow field using a variety of flow geometries. Unlike simple binary fluids which require extremely high shear rates to produce only small shifts in the phase boundary, polymer phase behavior may be influenced by as much as 10 degrees with the application of much lower shear rates. However, there is a large body of conflicting data concerning the nature of these shear effects in polymers. The effects of shear on the phase behavior of polymer blends by small angle neutron scattering (SANS) are reported. Experiments were conducted using a specially constructed, concentric cylinder apparatus for in situ studies of concentrated polymer solutions and melts. Two separate systems will be discussed: (1) a blend of polystyrene and polybutadiene; (2) a blend of polystyrene and poly(vinylmethylether). Both systems exhibit shifts in the phase behavior which indicate shear induced mixing in agreement with previous results obtained by other techniques. The results will be interpreted within the context of existing theories of shear induced phase behavior.

Combined SANS-SAXS Study of Blends of Styrene-Butadiene Block Copolymer with Deuterated Polybutadiene.

Final rept.

S. Nojima, R. J. Roe, D. Rigby, and C. C. Han. 1990,

8p

Pub. in Macromolecules 23, n19 p4305-4312 1990.

Keywords: *Copolymers, *Styrene butadiene resins, *Synthetic elastomers, Molecular structure, Neutron scattering, Polymers, X ray analysis, Deuteration, Micelles, Interfaces, Polybutadiene, Electron density (Concentration), Reprints, Polymer blends, Small angle scattering.

The structure of the blends containing styrene-butadiene diblock copolymer ($M(\text{sub } n) = 21,000$, styrene content 76.6% by weight) and deuterated polybutadiene ($M(\text{sub } n) = 1980$) has been studied by the combination of small-angle neutron and X-ray scattering techniques. Blends containing 3, 10, 20, 30, 40, and 50 wt % of the block copolymer were studied at temperatures spanning from room temperature to about 200 C. The small-angle neutron scattering arises as a result of the contrast in the scattering length density between the deuterated polybutadiene and the hydrogenated block copolymer, while the small-angle X-ray scattering arises as a result of the electron density contrast between the styrene and butadiene components. The structural information obtained by the techniques includes the mean distance between micelles (or microdomains), the thickness of the interfacial region, and the specific interfacial area. With blends of copolymer concentrations (3 and 10%) the effective radius of the micelle core, and the hard-sphere radius, (i.e., the radius of the nearest approach of neighboring micelles), were also determined.

Pub. in *Macromolecules* 23, n20 p4452-4455 1990.

Keywords: *Polystyrene, *Vinyl ether resins, Phase transformations, Light scattering, Decomposition, Mixtures, Separation, Reprints, *Phase separation kinetics, Strand breaks.

The phase separation of mixtures of four-armed star polystyrene with linear poly(vinyl methyl ether) was investigated by time-resolved light scattering. It was found that the kinetics of phase separation was essentially the same as that of the corresponding mixtures of linear polymers. The effect of chain topology was evident only when the molecular weights of the individual arms were large. This resulted in a reduced rate of phase separation. The linearized Cahn-Hilliard-Cook theory of spinodal phase separation qualitatively described the features of the experiments; however, the scattering vector dependence of the amplification factor deviated from the expected behavior.

Fluorescence Properties of a Rod-Like Polymer and Its Model Compound.
Final rept.
F. W. Wang, B. M. Fanconi, E. J. Heilweil, and R. E. Lowry. 1987, 1p
Pub. in *Abstracts of Papers of the American Chemical Society* 194, p71 Aug 87.

Keywords: *Fluorescence, *Polymers, Emission spectroscopy, Thiazoles, Rods, Chloroform, Methane, Sulfonic acids, Solvation, Solvolysis, Polyamide resins, Thin films, Reprints, *Fluorescence spectroscopy, Trifluoroacetic acid.

Steady-state and picosecond fluorescence measurements have been carried out on solutions of poly(p-phenylenebisthiazole) (PBT) and its model compound 2,6-diphenylbenzo(1,2-d:4,5-d')bisthiazole (hereafter referred to as t-bisthiazole). The emission spectrum of PBT in methane sulfonic acid remains practically the same at different excitation wavelengths. Fluorescence measurements of t-bisthiazole in mixed solvents of chloroform and trifluoroacetic acid showed that its excitation and emission spectra as well as its fluorescence lifetime are affected by protonation of its nitrogen atoms. Comparison of the fluorescence spectra of a PBT film and PBT/nylon film indicates that PBT molecules in the PBT/nylon film are aggregated.

The solution that surrounds hydrating cement particles contains dissolved species which are important in the overall process. A method, based on the Gibbs-Duhem equation for a three component system, has been developed for computing the composition of one phase from values for its equilibrium solubility in a second phase. The method has been used to compute the CaO:SiO₂ ratio for two types of calcium silicate hydrate (C-S-H) gel, one of which is thought to form from hydrating tricalcium silicate (Ca₃SiO₅), and the other by precipitation from appropriate solutions. The results agree well with measured values reported in the literature. They have also been used to help define the probable composition of the C-S-H layer which forms on tricalcium silicate surfaces during the early stages of hydration when the reaction is slow. The free energies of formation have been estimated for two types of C-S-H formed from CaO, SiO₂, and H₂O. These results provide insight into the structure and composition of C-S-H, which is the most abundant product in portland cement systems.

Integrating Knowledge for the Identification of Cracks in Concrete Using an Expert System Shell and Extensions.
L. J. Kaetzl, J. R. Clifton, and D. P. Bentz. Dec 89, 34p NISTIR-89/4206

Keywords: *Concrete durability, *Cracking(Fracturing), Data acquisition, *Expert systems, Data bases, Knowledge bases(Artificial intelligence), Knowledge representation, Image processing.

An expert system has been developed for identifying the probable causes of cracks in concrete based on their shape and pattern, density and location. The system uses three forms of knowledge: facts and rules of thumb, databases, and digital imaging capabilities. Knowledge contained in the system is obtained from experts in the field, photographs taken of actual con-

crete failures and the classification of the failures into a database format. A PC based expert system shell and computer programs written specifically for the integration and use of knowledge were used to implement the expert system. The paper discusses the acquisition of the three forms of knowledge, its representation in the expert system environment and extensions developed to process information and enhance the user's interface. The potential for the use of speech recognition for recording conditions of field sites, and storage of large volumes of information using optical disk technology are discussed.

Frost-Resistance of Concrete.
J. R. Clifton. Jan 90, 22p NISTIR-90/4229

Keywords: *Frost action, *Concretes, Service life, Field tests, Mathematical models, Weathering, Damage, Aggregates, Forecasting.

Freezing of water in the pores of concrete is one of the major degradation processes of concrete. It results in cracking and reduced service life. Concrete exposed to frost conditions may rapidly degrade or be durable for decades. The report reviews the major factors affecting the frost resistance of concrete and test methods for evaluating the service life of concrete. Mathematical models which describe the mechanisms of frost damage and methodologies for predicting the durability of concrete exposed to frost conditions are reviewed to determine the relevance to service life predictions.

Serial Sectioning of Hardened Cement Paste for Scanning Electron Microscopy.
P. Stutzman. Mar 90, 24p NISTIR-90/4235

Keywords: *Cements, Inspection, Surfaces, Sequential sampling, Surface preparation, Knoop hardness, Polishing, Microstructure, Indentation hardness tests, *Serial sectioning, *Cement pastes, Scanning electron microscopy, Pastes, Thin plates.

Serial sectioning is a technique of making and examining thin sections of material to obtain information on three-dimensional structures from a series of two-dimensional images. Procedures were developed to make serial sections of hardened cement paste by the removal of thin layers by polishing. Backscattered electron imaging of the remaining paste block was used to record the paste microstructure after each section was removed. Procedures developed cover the polishing practice, the removal of thin layers by polishing, the estimation of layer thickness, and the location and alignment of specific regions for imaging.

Selection of Siliceous Aggregate for Concrete.
J. R. Clifton, and L. Knab. Jun 90, 22p NISTIR/4327
Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.

Keywords: *Alkali aggregate reactions, *Concretes, Aggregates, Alkalies, Dissimilar materials bonding, Cements, Concrete structures, Masonry, Silicate cements, Corrosion environments, Durability, Radioactive waste disposal, Low-level radioactive wastes.

Alkali-aggregate expansive reactions are one of the potentially serious degradation problems that could affect the structural stability of underground concrete structures for disposing of low-level radioactive waste (LLW). It appears that all aggregates react to some degree with alkalis in cement. In the majority of cases the reactions are beneficial (e.g., increasing the bond between aggregate and hydrated cement paste) or innocuous. In some cases, however, the reactions result in the formation of expansive products which can cause serious cracking of the concrete. The report deals with the selection of siliceous aggregates to avoid deleterious alkali-aggregate expansions. Current practices used to prevent expansive alkali-silica reactions and the standard test methods used to identify reactive aggregates are first discussed. Then the re-

Construction Equipment, Materials, & Supplies

sults of a study on using a new alkali-silica reactivity test to select siliceous aggregates for use in the concrete of LLW storage structures are presented. It is recommended that siliceous aggregates, selected for constructing underground vaults for disposal of LLW, have an expansion of less than 0.10% using the new test.

Permeability, Diffusivity, and Microstructural Parameters: A Critical Review.
 Final rept.
 E. J. Garboczi. 1990, 12p
 Pub. in Cement and Concrete Research 20, n4 p591-601 1990.

Keywords: *Cements, *Permeability, *Diffusivity, *Porous materials, *Transport properties, Microstructure, Concretes, Porosity, Rheological properties, Reprints.

It is important to understand the rates of diffusion of ionic species and the viscous flow of fluids in the pore structure of cementitious materials on the basis of microstructural parameters, as these rates control the rate at which degradation processes can proceed. Significant progress has been made in the related area of the diffusivity and permeability of sedimentary rocks in the last decade or so. The article has the following two purposes: to provide a critical review of popular theories linking microstructure and transport coefficients of porous materials, and to explore the applications of new concepts, developed for analyzing transport in sedimentary rocks, to understand transport processes in cementitious materials.

Flaw Detection in Concrete by Frequency Spectrum Analysis of Impact-Echo Waveforms.
 Final rept.
 N. J. Carino, M. Sansalone, and N. N. Hsu. 1986, 31p
 Pub. in International Advances in Nondestructive Testing 12, p117-146 1986.

Keywords: *Concretes, *Nondestructive tests, Impact tests, Spectrum analysis, Concrete slabs, Thickness, Reprints, Impact echo method, Fast Fourier analysis, Frequency domain, Time domain.

Using a technique referred to as the impact-echo method, transient time domain waveforms obtained from the impact of a steel sphere on a concrete slab containing artificial flaws are recorded and analyzed in the frequency domain. It is shown that frequency spectrum analysis can be used to determine the thickness of plate structures and to locate internal flaws. The Fast Fourier Transform technique is used to compute the frequency content of input pulses and theoretical and experimental surface displacement waveforms. The effects on the frequency spectrum due to changes in the duration of the impact and due to changing the spacing between impact point and receiving transducer are studied. It was found that for accurate location of flaws within concrete using an impact-echo technique, the ultrasonic pulse-velocity method should not be used to determine the compression wave velocity in a test object.

Statistical Characteristics of New Pin Penetration Test.
 Final rept.
 N. J. Carino, and R. C. Tank. 1989, 9p
 Pub. in Cement, Concrete, and Aggregates, v2 n2 p100-108 1989.

Keywords: *Concretes, *Compression tests, *Compressive strength, Compressive properties, Mechanical properties, Penetration, Hardness tests, Water cement ratio, Standard deviation, Reprints.

Researchers at the University of Saskatchewan have developed a new test for estimating the in-place strength of concrete. The method, known as the pin penetration test, involves driving a small pin into the concrete surface using a spring-loaded driver. The penetration of the pin creates a small indentation whose depth is measured. The pin penetration is inversely related to the strength of concrete. The paper provides information about the within-test variability of the method and about the correlation relationship between compressive strength and pin penetration. Test results show that a standard deviation with a value of about 0.015 in. (0.038 mm) describes the within-test variability. The correlation relationship is non-linear for compressive strengths between 1000 and 5800 psi (6.9 to 40.0 MPa) and depends on the water-cement ratio of the concrete. For compressive strength less than about 4000 psi (27.6 MPa), the correlation relationship is not strongly dependent on water-cement ratio, and a straight line adequately represents the relationship. However, the correlation relationship obtained in the study differs from that reported by others.

Detecting Delaminations in Concrete Slabs with and without Overlays Using the Impact-Echo Method.
 Final rept.
 M. Sansalone, and N. Carino. 1989, 10p
 Pub. in ACI Materials Jnl. 86, n2 p175-185 Mar/Apr 89.

Keywords: *Concrete slabs, *Reinforced concrete, *Nondestructive tests, Wave propagation, Defects, Delaminating, Bituminous concretes, Stress waves, Corrosion, Pavements, Reprints, *Impact-echo method.

The report demonstrates the feasibility of detecting delaminations in reinforced concrete slabs using the impact-echo method, a nondestructive testing technique based on transient stress wave propagation. The results of two laboratory studies are discussed. One study involved detecting artificial delaminations embedded at unknown locations in a reinforced concrete slab. All the artificial delaminations in the slab were located. The second study was aimed at showing the feasibility of detecting delaminations in reinforced concrete slabs with asphalt concrete overlays. Two reinforced concrete slab specimens with corrosion-induced delaminations were tested. Prior to overlaying the slabs with asphalt concrete, the depths of delaminations as determined by impact-echo testing were verified by drilling at selected points. After the asphalt concrete overlays were applied, the slabs were retested. It was found that the impact-echo method could successfully locate the delaminations in the slabs through the asphalt concrete overlays.

User's Guide to CMMAP: Cement Microstructure Modelling and Analysis Package.
 D. P. Bentz, and E. J. Garboczi. Oct 90, 58p NISTIR-4442

Keywords: *Cements, *Microstructure, Diffusivity, Hydration, Permeability, Porosity, Mathematical models, Images, Computerized simulation, User manuals(Computer programs).

A collection of modelling and analysis programs dealing with cement microstructure has been assembled into a single package. The manual describes the custom user interface, CMMAP, which allows the user to access and execute the assembled software. Specific programs exist to create starting microstructures, simulate hydration, and analyze both starting and hydrated microstructures. Available analyses include evaluation of diffusion coefficients, simulation of mercury intrusion porosimetry, and assessment of the connectivity of phases within a cement microstructure. The menu-based interface program is described in detail and several examples are presented which demonstrate the capabilities of CMMAP.

Keywords: *High strength concretes, *Water cement ratio, *Moisture content, *Concrete durability, *Porosity, Plasticsizers, Permeability, Frost protection, Admixtures, Frost penetration.

High-performance concrete with water-to-cement ratio (w/c) of or below 0.38, when hydrated to the maximum possible level, should not contain any freezable water. Therefore, non-air-entrained concrete with such w/c should be immune to freezing. However, laboratory freezing and thawing studies on non-air-entrained concretes containing silica fume have given conflicting results. Reasons for the conflicting results are explored in the report by analyzing relationships between w/c, capillary porosity, and freezable water in concretes with low w/cs. The effects of adding silica fume to concrete on potential frost damage is also discussed.

Preliminary Performance Criteria for the Bond of Portland-Cement and Latex-Modified Concrete Overlays.
 L. I. Knab, M. M. Sprinkel, and O. J. Lane. Nov 89, 114p NISTIR-89/4156

Prepared in cooperation with Virginia Transportation Research Council, Charlottesville, and Iowa Dept. of Transportation, Ames. Sponsored by Tri-Service Building Materials Committee, Washington, DC., and Naval Facilities Engineering Command, Alexandria, VA.

Keywords: *Concrete pavements, *Bridge decks, *Portland cement, *Bonding strength, Mechanical properties, Compressive strength, Shear strength, Loads(Forces), Bond stress, Comparisons, Performance evaluation.

Preliminary bond-strength performance criteria were developed for screening and selecting portland-cement concrete (PCC) and latex-modified concrete (LMC) materials to be overlaid on PCC pavements and PCC bridge decks subjected to normal civilian truck and automobile traffic. The criteria were developed based on direct shear bond test results from field cores from pavements and bridge decks which were considered to have performed satisfactorily, and laboratory- and field-cast specimens with PCC and LMC overlay materials. The criteria consist of minimum

direct shear bond strength levels and corresponding minimum compressive strength levels. A direct shear "guillotine"-type performance bond test method, developed at the Brookhaven National Laboratories, was specified using laboratory-cast specimens.

Keywords: *Calibrating, *Profilometers, Graphs(Charts), Surface roughness, Measuring instruments, Performance evaluation, *Pavement surface texture, Profile measurement.

An extensive series of measurements was made of the performance of a particular model of an inertial road profiling system (IRPS), including evaluation of the noncontact height sensors, the accelerometers used to establish the inertial reference frame, the distance encoder, the associated instrumentation, and the software used to convert the raw data into road elevation profiles. A field program was carried out which included rod-and-level surveys of several roads which were also profiled using the IRPS. The IRPS was also equipped with a commercial response-type road roughness measurement (RTRRM) system, with accelerometers to measure the vertical vibration of both the axle and the body of the vehicle, and with a linear potentiometer to measure the relative displacement between the axle and the body of the vehicle. Separate laboratory measurements were made to characterize the performance of the commercial RTRRM. Data collected with the RTRRM and with the auxiliary accelerometers and the linear potentiometer were compared with single-number ratings of road roughness as computed from the profiles measured using the IRPS.

Energy Transfer Mechanism in SPT (Standard Penetration Test).
Final rept.
F. Y. Yekel. 1989, 6p
Pub. in Jnl. of Geotechnical Engineering, American Society of Civil Engineers 115, n9 p1331-1336 Sep 89.

Keywords: *Boring, *Soil tests, *Penetration resist-ance, Soil mechanics, Soil properties, Energy transfer, Field tests, Drilling, Penetration, Reprints.

A rigid-hammer model is used to investigate the effect of the blow count in the Standard Penetration Test on the energy transmission characteristics of the test and the correlation between the blow count and the soil resistance at sampler penetration. It is shown that the percentage of the impact energy used to advance the sampler decreases with an increase in blow count and increases somewhat with increasing drill rod size, and that several penetration cycles are required to transmit the energy at low blow counts. The effect of the blow count on the energy loss associated with short drill rod lengths is also investigated. It is shown that the energy loss associated with the short-rod effect is less than that predicted when total energy rather than useable energy is considered, and that the energy loss decreases with an increase in blow count.

Keywords: *Air flow, *Flame propagation, *Fire tests, Combustion, Flames, Mathematical models, Experimental data, Velocity, Turbulence.

A research program is being carried out to study the mechanisms controlling the spread of fire in a forced gas flow. Particular emphasis is given to the case when the gas flow is concurrent with the direction of fire spread. The research tasks completed during the reporting period include an experimental study of the effect on the flame spread rate of the turbulence intensity of a concurrent air flow, and a theoretical analysis of the effect of a prescribed gas velocity profile on the flame spread rate predictions. The results of the experiments show that for flames spreading over thick PMMA sheets, the flame spread process is significantly affected by the turbulence intensity. For a fixed flow velocity, the flame spread rate decreases as the turbulence intensity is increased. This appears to be mainly due to the shortening of the flame length. Schlieren images of the process indicate that the decrease of the flame length may be the result of the intense entrainment of cold air in the flame at the higher turbulence intensities. The results of the theoretical analysis indicate that the gas velocity profile influences strongly the flame spread rate predictions.

Enthalpies of Combustion of Triphenylphosphine and Triphenylphosphine Oxide.

Final rept.

D. R. Kirklin, and E. S. Domalski. 1988, 12p

Sponsored by Chemical Research, Development and Engineering Center, Aberdeen Proving Ground, MD.

Pub. in Jnl. of Chemical Thermodynamics 20, n6 p743-754 1988.

Keywords: *Enthalpy, *Combustion, *Oxidation, *Phosphines, *Thermodynamics, Crystals, Carbon dioxide, Phosphoric acids, Heat measurement, Reprints, Combustion heat, Formation heat, Fusion heat, Vaporization heat.

The enthalpies of combustion of crystalline triphenylphosphine and triphenylphosphine oxide were determined at 298.15 K in an aneroid adiabatic rotating bomb calorimeter. The molar enthalpies of combustion and formation for the reactions with oxygen at 298.15 K are: $-10,295.33 \pm$ or -2.08 kJ/mol and $(207.88 \pm$ or $-3.52)$ kJ/mol respectively for triphenylphosphine and $(-9,971.90 \pm$ or $-1.90)$ kJ/mol and $(-115.55 \pm$ or $-3.42)$ kJ/mol respectively for triphenylphosphine oxide. The completeness of the combustion reactions were verified by determinations for carbon dioxide through absorption in Ascarite. Ion chromatography was used to analyze the bomb solution quantitatively for the nitrate, orthophosphate, pyrophosphate, and triphosphosphate ions. The enthalpies of fusion and melting temperatures were determined using differential scanning calorimetry. The values obtained for the enthalpies of fusion at the melting temperatures for triphenylphosphine and triphenylphosphine oxide are $(19.69 \pm$ or $-0.18)$ kJ/mol at 353.6 K and $(24.23 \pm$ or $-0.29)$ kJ/mol at 430.1 K, respectively. Second-order group contribution values were derived for calculating enthalpies of formation at 298.15 K from the experimental results on triphenylphosphine and triphenylphosphine oxide.

Sponsored by Swankin and Turner, Washington, DC.

Keywords: *Diffusion flames, *Radiant flux density, *Turbulence, Reaction kinetics, Combustion products, Mathematical models, Temperature, Test facilities, Combustion, Mie scattering, Mixtures.

A theoretical and experimental study of the structure and radiation properties of turbulent diffusion flames is described. Generalized state-relationship correlations, giving the mass fractions of major gas species as functions of local fuel-equivalence ratios, were developed for hydrocarbon/air diffusion flames. Instantaneous soot volume fractions and temperatures were measured in the fuel-rich (underfire) region of turbulent non-premixed acetylene, propylene, ethylene and propane flames burning in still air. Mixture fraction properties in turbulent carbon monoxide/air diffusion flames were measured in order to provide information needed to exploit the laminar flamelet concept for radiation predictions. A two-point Mie scattering system was developed to yield Favre- and time-averaged mean and fluctuating values, probability density functions, temporal spectra and correlations, and spatial correlations of mixture fractions. The continuum radiation properties of the underfire region of luminous acetylene and propylene flames burning in still air were studied. Instantaneous radiation intensities at 1000 and 2300 nm, where gas-band radiation is absent, were measured for paths passing through the axis of the flames; and reduced to yield mean and fluctuating values, probability density functions and power spectral densities of spectral radiation intensities.

Soot Particle Formation in Laminar Diffusion Flames.

Final rept.

R. J. Santoro, and J. H. Miller. 1987, 11p

Pub. in Langmuir 3, n2 p244-254 Mar/Apr 87.

Keywords: *Diffusion flames, *Soot, Combustion products, Reaction kinetics, Laminar flow, Combustion, Oxidation, Acetylene, Benzene, Experimental data, Temperature, Reprints.

Soot formation processes in laminar diffusion flames are described. Experimental results obtained at the National Bureau of Standards are reviewed and show that fuel molecules are rapidly converted to acetylene and other key precursors (such as the vinyl radical) in flame positions adjacent to, and on the fuel rich side of the high temperature reaction zone. These molecules react rapidly to form small aromatic species, such as benzene, and eventually small soot particles. The soot particle inception process occurs in times on the order of about one millisecond. Once formed, particles may grow rapidly by surface chemistry if they travel through flame regions with high concentrations of growth species such as acetylene. A systematic variation of the fuel flow rate shows that the final size that a particle, as well as the volume fraction occupied by soot particles, is determined by particle residence time in this growth region. During the time that surface growth is occurring, particle agglomeration leads to a decrease in total soot particle number concentration. As particles continue along streamlines they eventually cross the high temperature reaction zone where they may be oxidized.

Effect of Fuel Structure on Pathways to Soot.

Final rept.

M. Frenklach, D. W. Clary, W. C. Gardiner, and S. E. Stein. 1986, 10p

Pub. in International Symposium on Combustion (21st), p1067-1076 1986.

Keywords: *Soot, *Reaction kinetics, *Combustion products, Chemical reactions, Diffusion flames, Combustion, Pyrolysis, Benzene, Ethylene, Molecular structure.

The influence of fuel structure on chemical reaction pathways leading to soot was investigated using detailed kinetic models for the conditions of shock-tube

pyrolysis of 1,3-butadiene, benzene and ethylene. It was found that reaction pathways to soot relax to the previously identified acetylene-addition mechanism in each case. Fuel molecular structure influences the growth process only at its early stages, first by providing more efficient reaction partners for the formation of aromatic molecules and second by affecting the generation of hydrogen atoms. The model explains the relative sooting tendencies of these fuels for shock tube pyrolysis conditions and agrees with recent observations in laminar diffusion flames.

National Inst. of Standards and Technology (NIST), Gaithersburg, MD. Center for Chemical Engineering, Silica Particle Synthesis in a Counterflow Diffusion Flame Reactor.

Final rept.

M. R. Zachariah, D. Chin, H. G. Semerjian, and J. L. Katz. 1989, 12p

Pub. in Combustion and Flame 78, p287-298 1989.

Keywords: *Silicon dioxide, *Diffusion flames, *Combustion products, *Particle size distribution, *Optical measurement, Burning rate, Dimensional measurement, Particle size, Light scattering, Temperature, Reaction kinetics, Reprints.

Silica particle formation was studied in a counterflow diffusion flame, under different operating conditions, in order to investigate the effect of process variables on particle formation. The counterflow geometry provides a one-dimensional flow field, along the stagnation streamline, which greatly simplifies interpretation of the particle formation process. Silane has been used as the source of silicon in hydrogen/oxygen/argon flames. Silica particle characteristics (size, number density, volume fraction) have been determined using dynamic light scattering and angular dissymmetry measurements. The effects of silane loading, temperature, equivalence ratio, and momentum ratio have been investigated. The results indicate that temperature plays a significant role in the formation process, by controlling the chemical kinetic rates and through physical changes in particle morphology. In cooler flames ($T =$ approximately 2000 K), significantly more surface growth is observed. Increasing flame temperatures tend to enhance homogeneous nucleation, leading to smaller particles in higher numbers. Results obtained in higher-temperature flames ($T =$ approximately 2500 K) suggest that, when the chemical kinetic rates increase substantially, particles of composition other than SiO_2 can also nucleate, which may then grow by silica deposition. It was also observed that, under conditions where particles were hot enough, sintering effects produced more spherical structures. The level of silane loading is seen to affect the final particle size obtained as well as the growth regimes that particles encounter prior to ejection from the reactor.

Ignition and Lateral Flame Spread Characteristics of Certain Composite Materials.

T. Ohlemiller, and S. Dolan. Jan 89, 30p NISTIR-89/4030

Sponsored by David W. Taylor Naval Ship Research and Development Center, Annapolis, MD.

Keywords: *Composite materials, *Flammability testing, Ignition time, Honeycomb structures, Vinyl resins, Armor plate, Mathematical models, Flame propagation.

The Lateral Ignition and Flame Spread (LIFT) apparatus was used to obtain information on the ignition and lateral flame spread characteristics of two types of composite materials. The first type was a honeycomb sandwich panel; three different facings were tested with the material. The second type of material was a composite armor. There was a substantial variation in the ignitability of the various material combinations with a vinyl-faced honeycomb panel being the most ignitable and the composite armor being the least ignitable. The ignition behavior of the facings of all materials was correlated by a simple predictive model. Only the vinyl-faced honeycomb panel showed significant normal flame spread under the conditions examined though some flame advancement was seen with the others. All of the materials exhibited worse flammability properties at the edges as compared to the facings.

A theoretical and experimental study of the structure
 and radiation properties of turbulent diffusion flames is
 described. Generalized state-relationship correlations,
 giving the mass fractions of major gas species as functions
 of local fuel-equivalence ratios, were developed for
 hydrocarbon/air diffusion flames. Instantaneous soot
 volume fractions and temperatures were measured in
 the fuel-rich (underfire) region of turbulent non-premixed
 acetylene, propylene, ethylene and propane flames
 burning in still air. Mixture fraction properties in
 turbulent carbon monoxide/air diffusion flames were
 measured in order to provide information needed to
 exploit the laminar flamelet concept for radiation
 predictions. A two-point Mie scattering system was
 developed to yield Favre- and time-averaged mean and
 fluctuating values, probability density functions, temporal
 spectra and correlations, and spatial correlations of
 mixture fractions. The continuum radiation properties
 of the underfire region of luminous acetylene and
 propylene flames burning in still air were studied. Instantaneous
 radiation intensities at 1000 and 2300 nm,
 where gas-band radiation is absent, were measured for
 paths passing through the axis of the flames; and
 reduced to yield mean and fluctuating values, probability
 density functions and power spectral densities of
 spectral radiation intensities.

**Concentration Measurements of OH- and Equilibrium
 Analysis in a Laminar Methane-Air Diffusion
 Flame.**
 Final rept.
 K. C. Smyth, P. J. H. Tjossem, A. Hamins, and J. H.
 Miller. 1990, 15p
 Pub. in Combustion and Flame 79, p366-380 1990.

Keywords: *Methane, *Flames, Soot, Laminar flow,
 Free radicals, Thermodynamic equilibrium, Fuels,
 Measurement, Concentration(Composition), Air,
 Diffusion flames, Reaction kinetics, Reprints, *Hydroxyl
 radicals, Laser induced fluorescence.

Absolute concentration measurements of hydroxyl
 radical have been made in a laminar, co-flowing methane-
 air diffusion flame using laser absorption and laser-
 induced fluorescence methods. The maximum OH
 radical concentration is found to be $1.8 \pm 0.2 \times 10$
 $(\text{sup } 16)/\text{cu cm}$ (mole fraction = 5.0×10 (sup -3))
 at a temperature of 2080 K, which is twice the value
 calculated assuming local total equilibrium but less
 than half that predicted from partial equilibrium ($\text{O}_2 +$
 $\text{H}_2 = 2\text{OH}$ radical). Evidence is presented that in
 general partial equilibrium does not exist for the fast,
 bimolecular chain branching and radical shuffle reactions
 in the flame. The overall chemical production-destruction
 rate profile of OH radical has been determined, as well
 as the rates of hydrogen abstraction reactions by hydroxyl
 radical to form the vinyl and ethynyl radicals. The
 results are used to identify the most rapid routes for
 the production of radical species important in
 chemical growth processes.

 Pub. in Proceedings of ASME (American Society of
 Mechanical Engineers) Winter Annual Meeting on
 Heat Transfer in Combustion Systems, San Francisco,
 CA., December 10-15, 1989, p1-11.

Keywords: *Flames, *Temperature measurement,
 Radiation, Flux(Rate), Heptanes, Methane, Heat transfer,
 Turbulence, Two phase flow, Combustion, Reprints.

Measurements and predictions of temperatures and
 radiation for large two-phase, non-premixed flames
 burning heptane or crude oil and methane in air are
 reported. Analysis involves the locally-homogeneous
 flow approximation (LHF), a k-e-g turbulence model
 and the conserved scalar formulation. State relationships
 for the mixtures are estimated from those of the
 individual fuels. Radiative heat fluxes are obtained
 using the discrete transfer method and narrow band
 analysis. Methane/air flames are studied as a base-
 line. The analysis underpredicts the temperatures by
 ten percent and the heat fluxes by thirty percent for the
 two-phase flames.

Performance Testing for the Corrosivity of Smoke.
 Final rept.
 J. D. Ryan, V. Babrauskas, T. J. O'Neill, and M. M.
 Hirschler. 1990, 15p
 Pub. in Characterization and Toxicity of Smoke, ASTM
 STP 1082, p75-88 1990.

Keywords: *Smoke, *Corrosive gases, *Performance
 tests, Combustion products, Acidity, Corrosion tests,
 Corrosion, Fire tests, Gas analysis, Reprints.

It has traditionally been assumed that smoke corrosivity
 is directly correlated to the emission of acid gases.
 The results of recent experiments have shown that
 materials which do not release acid gases can, nevertheless,
 cause corrosion of metal surfaces, as deter-

mined by metal loss. In addition, for electrical equipment
 there are two other types of related nonthermal
 damage from combustion products which must be
 considered, viz., ohmic bridging and degradation of
 contacts. Laboratory tests proposed to date to measure
 the corrosive effects of combustion products all
 have significant deficiencies: some methods are not
 performance-based at all and are merely tests for pH.
 In others, unrealistic specimen heating or unrealistic
 exposure targets are used. To facilitate the development
 of a better test, a series of criteria have been
 developed. A specific test method was evolved from
 these criteria. The method is performance-based and
 incorporates realistic fire heating conditions.

Time Dependent Simulation of Turbulent Combustion.
 Final rept.
 H. R. Baum, D. M. Corley, and R. G. Rehm. 1987, 4p
 Pub. in Chemical Physics Processes Combustion,
 p82/1-82/4 1987.

Keywords: *Diffusion flames, *Time dependence,
 *Eddies, *Turbulence, Turbulent flow, Combustion,
 Mathematical models, Simulation, Vortices, Mixing,
 Reprints.

The purpose of the work is the development of a
 mathematical model of diffusion controlled gas phase
 combustion appropriate for use in a large eddy simulation
 of turbulent reacting flows. The basic idea is that while
 the large eddy simulation of necessity is highly dependent
 upon the geometrical and physical boundary conditions
 prescribed by the macroscopic problem of interest,
 the combustion phenomena are influenced primarily
 by local conditions near the fuel/oxidizer interface.
 Thus, by focusing attention on regions near the
 interface, a combustion model applicable to a wide
 variety of scenarios can be developed. In order to
 carry out such a research program, two basic tasks
 must be accomplished. First, the large eddy simulation
 must be capable of tracking a coarse-grained representation
 of the interface, so that a local frame of reference
 for the combustion analysis can be established.
 Second, a solution to the combustion problem
 containing the local values of the large scale coarse-
 grained variables as ambient parameters must be
 obtained.

Combustion & Ignition

Keywords: *Halohydrocarbons, *Fire resistant materials, *Flammability testing, Air pollution, Materials replacement, Methodology, Substitutes, Selection, *Flame retardants, *Fireproofing, *Halons, Ozone depletion, Global warming, Trifluorobromomethane, Difluorobromochloromethane.

The signing of the Montreal Protocol in 1987 demonstrated an international consensus that a variety of fully halogenated organic chemicals (halocarbons) were damaging stratospheric ozone. The current halogenated fire suppressants, or halons, were among the chemicals whose production is restricted by the Protocol. The likelihood of major reductions or a total ban on their production by the turn of the century is driving a search for alternative chemicals. No such search has been conducted since the late 1940s, when the U.S. Army conducted the study that led to today's predominant halogenated fire suppressants: halons 1301 (CF3Br) and 1211 (CF2ClBr). Halon 2402 (C2F4Br2) is in use to a lesser degree, as are halons 1001 and 1011. The project corresponds to a first step in a government/industry program to identify and qualify candidate replacements for halons 1301 and 1211 that will satisfy the needs of the major users for existing applications. Nine screening procedures have been defined for characterizing potential candidates for replacing halons, particularly 1211 and 1301, now in use for fire suppression applications.

Keywords: *Toxicity, *Fire safety, *Flammability testing, *Combustion, Animals, Reprints, *Health hazards, *Fire gases, Risk assessment, Test methods.

An N-gas model involving a reduced dependence on animal testing is proposed both for obtaining fire toxicity data for hazard modeling and for premarketing screening of commercial products and materials. Current toxicity measures rely almost exclusively on animal testing. The proposed new approach is based on obtaining the time-dependent generation rates of a limited number of important toxic species using a suitable combustion apparatus, such as the Cone Calorimeter. The new approach will not entirely eliminate the need for animal testing, since a check-test will still be necessary, but it promises to substantially reduce the need for animals.

Production of the currently-used halogenated fire suppressants (halons) will be curtailed because of their contribution to stratospheric ozone depletion. The report, one of the first efforts toward identifying alternatives, documents the rationale for and selection of a set of approximately one hundred gases and/or liquids, covering a range of chemical and physical principles thought to affect flame suppression capability and stratospheric ozone depletion. An Appendix provides extensive information on each of the selected chemicals. Also included in the report are an introduction to combustion concepts, fire suppression mechanisms, test approaches for flame suppression effectiveness, and the mechanisms by which the current commercial halons can decrease stratospheric ozone.

Keywords: *Fuel tanks, *Hydrogen, *Monitors, *Fuel storage, *Sloshing, Measuring instruments, Flowmeters, Oscillations, Pressure, Temperature, Density.

The results of a survey of instrumentation suitable for use with slush hydrogen systems are presented. Both tank gauging and flow instrumentation are considered. The unique characteristics of slush hydrogen that dictate special instrumentation techniques are discussed. Pressure and temperature sensors, methods of measuring tank bulk density and transfer line of flow density, mass and volume flowmeters, liquid and slush level gauging, and visual access techniques for vessels and transfer lines are discussed. Finally, recommendations are given for slush instrumentation to be used in the near term, and a second category lists instrumentation or instrumentation techniques that require development for possible long-term use. Information concerning the NASA-MSFC slush hydrogen flow facility, the NBS slush hydrogen flow facility, and a review of techniques to control thermal acoustic oscillations are given in the appendices.

 Portions of this document are illegible in microfiche products.

Keywords: *Atomization, Aerodynamics, Combustion Properties, Flame Spraying, Flow Rate, *Fuel Injection Systems, *Kerosene, Nozzles, *Sprays, ERDA/421000.

Results are presented on the internal structure of a kerosene fuel spray, generated with an air-assist type nozzle. Effects of atomization air flow rate and combustion air swirl on droplet transport processes have been investigated. Spatially-resolved measurements have been obtained on mean droplet size, number density and velocity, at different combustion air swirl and atomization air flow rates. An ensemble light scattering technique, based on measurement of the polarization ratio, and laser velocimetry have been used for these measurements. The results indicate that as atomization air flow rate increases, the spray becomes confined to a narrower spray angle; in addition, mean droplet size decreases and number density increases significantly along the spray centerline. Larger droplets are found generally on the spray boundary, and smaller ones near the spray centerline. In all cases, there is a gradual increase in mean droplet size along the spray centerline with axial distance. Under burning conditions the flame plume becomes short and intense, with fewer droplets penetrating through the flame envelope. Combustion air swirl and atomization air have a significant effect on the transport of droplets and on combustion characteristics of spray flames. 20 refs., 9 figs.

Vortex Shedding Flowmeters for High Velocity Liquids.

Final rept.
 J. D. Siegwirth. 1989, 13p
 Sponsored by National Aeronautics and Space Administration, Huntsville, AL. George C. Marshall Space Flight Center.
 Pub. in International Jnl. of Heat and Fluid Flow 10, n3 p232-244 1989.

Keywords: *Flowmeters, *Liquid oxygen, Water, Reprints, *Space shuttle main engine, Vortex shedding.

The ability of the vortex shedding flowmeter to measure the liquid oxygen (LOX) flow in the ducts of the space shuttle main engine (SSME) has been examined. The LOX flow velocities are several times higher than the velocities found in conventional meter installations; in one duct the LOX flow velocity exceeds 50 m/s. The straight sections of these ducts seldom exceed ten diameters let alone the 25 diameters recommended in installation specifications for commercially available meters. A number of meter designs have been tested at the high flow velocities in the work substituting water for LOX. The test results suggest that a vortex shedding flowmeter could be used to measure LOX flow in these ducts without any flow conditioning.

Keywords: *Telecommunications, *Requirements, Standards, Coding, Modems, Federal Standard 1008, *Coding and modulation, *Duplex 600 and 1200 bit/second modems, *Analog transmission channels, Federal Information Processing Standards Publication 136.

The standard establishes coding and modulation requirements for duplex 600 bit/s and/or 1200 bit/s modems owned or leased by the Federal Government for use over analog transmission channels terminated by 'two-wire' circuits. It is based upon CCITT provisional Recommendation V.22. The standard is to facilitate interoperability between telecommunication facilities and systems of the Federal government.

Interoperability and Security Requirements for Use of the Data Encryption Standard in the Physical Layer of Data Communications.

3 Aug 83, 7p FEDSTD-1026
Also available from Supt. of Docs. Prepared in cooperation with National Communications System, Arlington, VA. Sponsored by General Services Administration, Washington, DC.

Three ring vinyl binder also available, North American Continent price \$7.00; all others write for quote.

Keywords: *Telecommunications, Requirements, Standards, Security, Data processing, Federal Standard 1026, *Interoperability and security requirements, *Data Encryption Standard, *Data communications, Federal Information Processing Standards Publications 139.

The standard specifies interoperability and security related requirements for using encryption at the Physical Layer of the Open Systems Interconnection (OSI) Reference Model in telecommunication systems conveying Automatic Data Processing (ADP) and/or narrative text information. The algorithm used for encryption is the Data Encryption Standard (DES), described in Federal Information Processing Standards Publication 46. Requirements contained in the standard relate to the interoperation of Physical Layer Data Encryption Equipment, or their interoperation with associated Data Terminal Equipment or Data Circuit-terminating Equipment. The standard is to facilitate the interoperation of Government data communication facilities and systems that require cryptographic protection using the Data Encryption Standard (DES) algorithm and is also to prevent the disclosure of plain text.

Keywords: *Telecommunications, *Requirements, Standards, Algorithms, Security, Protection, Federal

Standard 1027, *General security requirements, *Data Encryption Standard, Federal Information Processing Standards Publication 140.

The standard specifies the minimum general security requirements that are to be satisfied in implementing the Data Encryption Standard (DES) algorithm in a telecommunication environment. The DES itself specifies an algorithm used for cryptographically protecting certain U.S. Government information. (The algorithm is described in Federal Information Processing Standards Publication 46). The requirements defined in the standard affect the security of equipment implementing the DES algorithm. The standard addresses the following security objectives: To prevent inadvertent transmission of plain text; To prevent theft, unauthorized use, or unauthorized modification of DES cryptographic equipment while installed; To prevent unauthorized disclosure or modification of key variables while in DES cryptographic equipment; To provide interoperability between key variable loaders and DES cryptographic equipment, and facilitate the use of standardized keying material for U.S. Government applications of the DES algorithm; and to prevent data encryption when a critical cryptographic failure condition exists, and to generate an alarm upon detection of a critical cryptographic failure.

Architectures for Future Multigigabit Lightwave Networks.

W. E. Burr, Mar 90, 69p NISTIR-90/4240

Keywords: *Fiber optics, *Network synthesis, *Optical communication, Voice communication, Video signals, Data transmission, Digital techniques, Switching theory, *Network analysis theory, Pulse communication, *Passive optical networks, Packet switching.

Architectures for future fiber optic networks for voice, video and data applications are considered. Broadband Integrated Services Digital Network (B-ISDN) will be introduced for these applications sometime after 1995. B-ISDN will be based on fast switching of rather small (48-byte) packets. The packet switches themselves will probably be electronic and will take advantage of the ability of semiconductor electronic technology to build very complex, regular, repetitive structures. Packet switching provides a flexible, efficient means of sharing bandwidth limited communications resources. Developing fiber optic technology, however, offers another revolutionary alternative, the Passive Optical Network (PON), based on the realization that the inherent bandwidth of the fiber is immense and using optical frequency division multiplexing to exploit this. The PON has significant advantages over centralized packet switching in some applications (particularly video distribution), is simpler, facilitates the addition of new services, can be begun and extended in small increments, and requires much less initial investment in the network. However, the PON depends upon the commercial development of several components, such as tunable lasers and coherent receivers, which have so far been proven only in laboratories.

Ku-Band Satellite Two-Way Timing Using a Very Small Aperture Terminal (VSAT).

Final rept.

D. A. Howe, 1987, 12p

Pub. in Proceedings of Annual Frequency Control Symposium (41st), Philadelphia, PA., May 27-29, 1987, p149-160.

Keywords: *Spacecraft communication, *Time measurement, Phase measurement, Frequency stability, White noise, Signal to noise ratio, Phase angle, Accuracy, Reprints, *Superhigh frequencies, Earth terminals, Noise measurement.

The National Bureau of Standards (NBS) Boulder Laboratory has recently completed installation of a 6.1 meter Ku-band satellite earth station and has acquired two 1.8 meter portable earth terminals and commercial spread-spectrum modems. This equipment was procured for the purpose of doing two-way time transfer experiments in collaboration with other time-keeping laboratories. Each portable earth terminal, often called VSAT for 'very small aperture terminal' is a complete Ku-band earth station with 70 MHz input and outputs. The VSAT can provide full duplex capability to transmit to and receive from a geostationary satellite of the fixed satellite service (FSS). Thus, two-way time comparisons can be done directly between NBS and a portable VSAT through a Ku-band satellite. Phase measurements have been performed of earth station and VSAT facilities in various loop-around schemes using a satellite simulator. Absolute phase delay measurements show reproducibility to better than 1 ns over a 16-day sample time. This suggests the potential for accuracy to this level given an appropriate calibration.

Gateway between MHS (X.400) and SMTP.

Final rept.

D. Tang, M. Anzenberger, P. Markovitz, and M. Wallace, 1988, 8p

Pub. in Proceedings of Computer Standards Conference on Computer Standards Evolution: Impact and Imperatives, Washington, DC., March 21-23, 1988, p7-14.

Keywords: Coding, Decoding, Constraints, Optimization, Reprints, *Gateways, *Electronic mail, *Protocols, *Department of Defense, Communications networks, Open system interconnection(OSI) protocols, Architecture(Computers).

The MHS/SMTP electronic mail gateway is one of two jointly proposed application layer gateway projects being developed for the Defense Communications Agency. The Message Handling System (MHS) is defined in the Consultative Committee for International Telephone and Telegraph (CCITT) X.400 Series of Recommendations, October, 1984. The Simple Mail Transfer Protocol (SMTP) is specified by RFC821 and RFC822 (where RFC is 'request for comments'), the military standards developed for mail handling in the Department of Defense (DoD) networks. This gateway will allow DoD and Open Systems Interconnection (OSI) users to interoperate during the period that DoD is migrating to the use of OSI protocols. Based on the analysis of the two protocols, a set of gateway requirements was defined, and an architecture was selected to satisfy the requirements. The paper includes: a summary of both sets of protocols, the gateway requirements, the gateway architecture, the mapping mechanisms for service elements, the Protocol Data Unit (PDU) encoding/decoding scheme, and the major constraints and problems encountered in the study. The paper begins with a general overview, and will progress towards a detailed set of instructions for designing an optimal gateway.

Wavelength Measurement System for Optical Fiber Communications.

Technical note.

G. E. Obarski, Feb 90, 46p NIST/TN-1336

Also available from Supt. of Docs. as SN003-003-03017-1.

Keywords: *Optical communication, Near infrared radiation, Helium neon lasers, Semiconductor lasers, *Wavelength measurement, *Lambdameters, Single mode, Optical fibers, Distributed feedback lasers, Instability, Red(Color).

A wavelength standard in the form of a lambdameter for measurement of single-mode sources used in optical fiber communication is described. The sources of interest are mainly diode laser emitting at 1.3 and 1.5

micrometers, but the system can be used in the near IR and red regions of the spectrum. Accuracy in wavelength measurement is verified to be less than 0.1 ppm at the 0.63 micrometer HeNe line by comparing separately each of two adjacent modes from a HeNe laser that is frequency-stabilized by a polarization technique, with a single mode from a second similarly frequency-stabilized HeNe laser. Wavelength instability of a commercially packaged 1.52 micrometer distributed-feed-back diode laser was measured to be in the range + or - 1 ppm.

Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v7A p501-508 1988.

Keywords: *Capacitors, *Mathematical models, *Arrays, *Detectors, Electrostatic probes, Numerical analysis, Dielectrics, Surface defects, Fatigue(Materials), Crystal defects, *Finite element method.

The electrostatic field equations governing the behavior of a capacitive array sensor are solved using a two-dimensional finite element method. The response of the probe to surface flaws in conductors and dielectrics is examined by calculating the change in the probe's admittance as it is scanned across the flaw. The change in admittance, delta Y, is obtained by evaluating a line integral involving the electrostatic potential and its normal derivative. Results of parametric studies are reported showing the relative effects of the specimen's dielectric constant and flaw size on probe signals.

Impact of Atmospheric Non-Reciprocity on Satellite Two-Way Time Transfers.
Final rept.
J. Jespersen. 1989, 7p
Pub. in Proceedings of Annual Symposium on Frequency Control (43rd), Denver, CO., May 31-June 2, 1989, p186-192.

Keywords: Communication satellites, Ionospheric propagation, Frequency standards, Time lag, Reprints, *Time transfers, *Atmospheric effects, Reciprocity, Two way.

In the two-way time transfer method, no knowledge is necessary concerning the locations of the slave and the master clock stations relative to the satellite, nor does one need any knowledge of the atmospheric delay. In this method, signals are exchanged back and forth, via a satellite transponder, between the master and slave stations. Because of the two-way signal exchanges, the path delay cancels out in the relevant calculations leaving only the difference in the clock readings at the master and slave stations. However, the cancelling of path delay is critically dependant on the assumption that the signal path delay from master to satellite to slave is equal to the delay from slave to satellite to master--that is, the paths are reciprocal. In actual practice this is hardly ever the case.

Final rept.

F. L. Walls. 1989, 5p

Pub. in Proceedings of Symposium on Frequency Standards and Metrology (4th), Ancona, Italy, September 5-9, 1988, p145-149 1989.

Keywords: *Frequency standards, *Frequency stability, Oscillators, Reprints.

The perceived frequency stability of passive frequency standards is determined in short-term by the performance of the local oscillator used to probe the reference resonance. Previous analyses of this problem were limited to simple servos and the use of the Allan or two-sample variance for determining fractional frequency stability. Under these conditions the fractional frequency stability of the local oscillator could only approach that of the inherent stability of the reference resonance as $\tau(\text{sup } -1)$. This paper shows that using more complex servos and a more general method of measuring fractional frequency, it is often possible for the frequency stability of the local oscillator to approach that of the reference as $\tau(\text{sup } -2)$. This new approach becomes much more important as the fractional frequency stability of passive references significantly exceeds that of available (or low cost) local oscillators.

F. L. Walls, J. Gary, A. O'Gallagher, R. Sweet, and L. Sweet. Sep 89, 35p NISTIR-89/3916

Keywords: *Frequency stability, Metrology, Computer applications, Computer calculations, Allan variance, Interactive systems, Time domain, Frequency domain, SIGINT system.

The report describes the use of SIGINT, a new interactive software package which facilitates the calculation of time domain frequency stability in terms of the Allan variance as a function of measuring time from frequency domain data. Except for the graphic output, the code is written in standard FORTRAN 77 and runs on AT compatible computers that have a math co-processor. It also runs on many other systems; however, calls to an available graphics library will need to be substituted for those that are included in this version. The program uses either a user defined function for the input noise or default functions that describe the noise types commonly found in oscillators, amplifiers, frequency multipliers, frequency dividers, and general signal processing equipment. These default functions make it simple to analyze the time domain frequency stability as a function of measuring bandwidth using realistic first-, second-, or third-order low-pass filters or the simplified infinitely sharp cutoff parameter. The default functions are also set up to examine the effect of various servo parameters on the performance of a frequency source locked to a frequency reference.

Final rept.

D. W. Allan, and T. K. Pepler. 1988, 4p

Pub. in Proceedings of Annual Frequency Control Symposium (42nd), Baltimore, MD., June 1-3, 1988, p465-467.

Keywords: *Frequency stability, Cesium frequency standards, Atomic clocks, Time, Reprints, Satellite-borne instruments, Global positioning system.

In anticipation of cross-link ranging in GPS and the establishing of GPS ensemble time, the authors investigated the frequency stability characteristics of the clocks in the constellation. Once those characteristics were ascertained they then optimally combined the clock readings in the NBS time scale algorithm to generate a GPS space clock ensemble. Frequency drifts of a few parts in 10 to the 16 power per day were observed in the GPS cesium beam frequency standards on board the space vehicles. The GPS space clock ensemble frequency stability reached about 2 parts in 10 to the 14 power. Not only is this comparable to some of the best clock ensembles at major timing centers throughout the world, but the calculated time dispersion for autonomous GPS performance has significant implications. The reference for the analysis was the NBS time scale.

Time and Frequency Div.**Effect of Humidity on Commercial Cesium Beam Atomic Clocks.**

Final rept.

J. E. Gray, H. E. Machlan, and D. W. Allan. 1988, 6p

Pub. in Proceedings of Annual Symposium on Frequency Control (42nd), Baltimore, MD., June 1-3, 1988, p514-518.

Keywords: *Atomic clocks, *Humidity, Test chambers, Frequency stability, Cesium, Random noise, Reprints, Annual variations.

Because a dependence of the frequency of commercial cesium beam clocks on humidity has been observed by others, NBS chose to control the humidity in one of the environmental chambers for the NBS clock ensemble. On 9 February 1988 the relative humidity was changed from a few percent to 48%. All of the clocks underwent a change in frequency. The resulting frequency changes were of different sign and of varying magnitudes among the clocks. In some, the changes were an order of magnitude larger than the flicker noise FM levels associated with the corresponding clocks. The implications of such changes are quite significant in the generation of International Atomic Time (TAI) and of Universal Coordinated Time (UTC). The possibility of annual variations in the time scales of the principal timing centers as well as in TAI and UTC will be discussed.

Keywords: *Time standards, *Time measurement, Spacecraft communication, Linear regression, Communication satellites, Comparison, Reprints, Space

communication, Global positioning system, Time transfer.

The time scales of the U.S. Naval Observatory in Washington, D.C. and the National Bureau of Standards in Boulder, Colorado were compared during the same time periods by the common view mode using the satellites of the Global Positioning System (GPS) and by the two-way mode using a U.S. domestic communications satellite. Data collected over a 3-month period showed residuals from a linear regression of 10 nanoseconds for the two-way technique and 30 nanoseconds for common view GPS. The two-way technique achieved better than 500 ps of precision with less than 2 minutes of data. Absolute calibration of either technique was not attempted during the measurement period.

Pub. in Proceedings of Annual Frequency Control Symposium (41st), Philadelphia, PA., May 27-29, 1987, p144-148.

Keywords: Frequency standards, Spacecraft communication, Ephemerides, Errors, Reprints, *Time transfer, *Frequency transfer, Global positioning system, Weighting functions.

There is now a global network of timing centers with frequency standards having stabilities of a few parts in 10 to the 14 power which are monitoring the GPS. It has been shown that by taking differences of the common-view time differences between two timing centers and between pairs of satellites, one can arrive at a statistically optimum estimate for a weighting factor for each common-view path. With this approach, GPS common-view measurement noise of a few parts in 10 to the 14 power is achievable for an integration time of 1 day. Using the above weighting factors, the paper develops an algorithm for estimating a weighted linear error of the differential ephemeris plus propagation errors for each satellite. This can be done between any pair of timing centers which have receivers and clocks with adequate stability. As most of the time transfer receivers operate at the L1 frequency (1.575 GHz), this technique reveals information regarding the accuracy of the ionospheric models broadcast at this frequency as part of the GPS data word. Once the individual satellite's differential propagation and ephemeris errors are estimated, the statistical properties of each can be combined to obtain a statistically weighted estimate of the common-view measurement variations limiting the comparison of the clocks between the two remote sites.

The book is for the person who needs information about making time and frequency measurements. It is written at a level that will satisfy those with a casual interest as well as laboratory engineers and technicians who use time and frequency every day. It includes a brief discussion of time scales, discusses the roles of the National Institute of Standards and Technology (NIST) and other national laboratories, and explains how time and frequency are internationally coordinated. It also describes the available time and frequency services and how to use them. It discusses the accuracies that can be achieved with the different services, and the pros and cons of using various calibration methods.

NISTIR-90/3938

Keywords: *Law enforcement, *Transmitter receivers, *Electric fields, *Very high frequencies, *Ultrahigh frequencies, *Portable equipment, *Walkie talkies, *Electrical measurement, *Health hazards, *Hand held.

The report contains the results of tests conducted on typical transceivers in the four frequency bands used by the law enforcement community: 30-50, 150-174, 400-520, and 806-866 MHz. The fields were measured at distances likely to be encountered in practice. Electric field strengths were measured at a number of points near 5-W personal transceivers. The points were located on cylinders of revolution around the antenna with radii of 7, 9.5, 12, 14.5, 17, and, in some cases, 27, 37, and 47 cm. At shorter distances, these measured values exceeded the exposure limits suggested in ANSI Standard C95.1-1982.

New 'Filtered Allan Variance' and Its Application to the Identification of Phase and Frequency Noise Sources.
Final rept.
J. Gros Lambert, J. J. Gagnepain, F. Verotte, and F. Walls. 1989, 5p
Pub. in Proceedings of Annual Symposium on Frequency Control (43rd), Denver, CO., May 31-June 2, 1989, p326-330.

Keywords: *Noise generators, *Simulation, *Phase, *Reprints, *Noise(Electrical and electromagnetic), *Allan variance, *Identification, *Frequency, *Fractals.

In part one different digital noise generators are described. In part two these noise sources are used to generate sample series which simulate frequency samples as given by a counter. Applying the Allan variance to the samples of six generators yields the expected theoretical slopes. It is well known that both white phase and flicker phase noises give in time domain when using Allan variance the same characteristic in log-log plot slope, which corresponds to τ (sup -2). In the present work a new method is used. It consists in filtering the f (sup -1) and f (sup 0) phase noise (simulated by the previous noise generators) by means of a digital filter in time domain (using the Z transform), which yields f (sup -3) and f (sup -2) noises, which thus can be identified by Allan variance. The combination of the digital filter and the Allan variance corresponds to a new variance, which is described and compared to the well known 'Modified Allan Variance'.

Biases and Variances of Several FFT (Fast Fourier Transform) Spectral Estimators as a Function of Noise Type and Number of Samples.

Final rept.
F. L. Walls, D. B. Percival, and W. R. Ireland. 1989, 6p
Pub. in Proceedings of Annual Symposium on Frequency Control (43rd), Denver, CO., May 31-June 2, 1989, p336-341.

Keywords: *Spectrum analysis, *Variance(Statistics), *Oscillators, *Amplifiers, *Bias, *Reprints, *Noise(Electrical and electromagnetic), *Fast Fourier transforms, *Mixers(Electronics).

The authors theoretically and experimentally investigate the biases and the variances of Fast Fourier transform (FFT) spectral estimates with different windows (data tapers) when used to analyze power-law noise types (f (sup 0), f (sup -2), f (sup -3), and f (sup -4). There is a wide body of literature for white noise but virtually no investigation of biases and variances of spectral estimates for power-law noise spectra commonly seen in oscillators, amplifiers, mixers, etc. Biases (errors) in some cases exceed 30 dB. The experimental techniques introduced here permit one to analyze the performance of virtually any window for any power-law noise. This makes it possible to determine the level of a particular noise type to a specified statistical accuracy for a particular window.

Coming to OSI: Network Resource Management and Global Reachability.

Final rept.

S. Wakid, P. Brusil, and L. LaBarre. 1987, 1p

Pub. in Data Commun. 16, n13 p137-138, 141-142, 145-146, 149-150 Dec 87.

Keywords: *Computer networks, Reprints, *Protocols, *OSI, Communication networks, Computer architecture, Resource management, Distributed processing.

As computers proliferate in the workplace, there is an increased need for workers to share information and processing resources distributed both within their local environment as well as across several other islands of workers and/or computers. The need to share distributed information and processing resources is currently being satisfied by interconnecting computers by means of communications systems composed of potentially concatenated LAN and WAN subnets. The paper discusses how the OSI architecture and its management framework satisfy the communication needs of distributed processing users, viability of VLSI implementations of OSI protocols, and how user communities currently dependent on non-OSI protocols can transition to OSI-based networking. Examples of how OSI and non-OSI suites can co-exist and cooperate are given.

Workloads, Observables, Benchmarks and Instrumentation.

G. E. Lyon, and R. D. Snelick. Apr 90, 24p NISTIR-90/4275

Sponsored by Defense Advanced Research Projects Agency, Arlington, VA., and Department of Energy, Washington, DC.

Keywords: *Tests, *Models, Measurement, Trees(Mathematics), *Computer performance evaluation, Computer architecture.

Main emphasis is upon a compact user-level summary that captures the performance variabilities of a system. A dependency tree provides a clear, static declaration of the relationships among a very limited number of major system resources that explain most performance variance. The approach is especially effective with hardware instrumentation that decouples workload from observation, for otherwise a compact set of observables may be unavailable. The tree supports simple predictions and promotes more meaningful comparisons of workloads. Accounting for the sources of performance variation shown in the tree can inspire new methods of assessment; a 'time dilation' technique illustrates this for loosely-coupled systems with local clocks.

Emulation Through Time Dilation.

J. K. Antonishek, and R. D. Snelick. May 90, 14p

NISTIR-4331

Proceedings of the Distributed Memory Computing Conference (5th), Charleston, SC., April 1990. Sponsored by Defense Advanced Research Projects Agency, Arlington, VA., and Department of Energy, Washington, DC.

Keywords: Models, Computerized simulation, Computation, *Multiprocessors, *Computer performance evaluation, Hypercube computers, Computer communications, Computer calculations, Time dilation.

Computation and communication are the primary dichotomy of loosely-coupled multiprocessor resources. Modeling and simulation are the techniques used to estimate machine performance based on the speed of these resources. The accuracy of the resulting performance estimates is often questionable, since such techniques cannot usually take into account all of the system detail: They become intractable in effort. Any real, hardware implementation of a multicomputer immediately fixes the speed of its resources, and can only yield a single point on the performance curve. The authors have implemented a third technique, called time dilation, to evaluate the performance of loosely-coupled multiprocessors by varying the ratio of computation speed to communication speed. This technique requires a high-speed clock and a test multicomputer system. Time dilation provides a way to measure accurately the performance of a given program on a variation of the physical transport system of a real machine.

Multiprocessor Performance-Measurement Instrumentation.

Final rept.

A. Mink, R. Carpenter, G. Nacht, and J. Roberts.

1990, 13p

Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Pub. in Computer 23, n9 p63-75 Sep 90.

Keywords: Computer systems hardware, Parallel processors, Reprints, *Multiprocessors, *Computer performance evaluation, Computer architecture, Very large scale integration.

The paper focuses on multiple-instruction-stream, multiple-data-stream (MIMD) multiprocessor systems, both loosely-coupled and tightly-coupled. The premise is that multiprocessor performance measurement requires some level of hardware support to reduce perturbation to the executing processes. Basic elements of performance measurement data acquisition are event detection (triggering) and data capture (sampling). An overview of various approaches to triggering and sampling is reviewed. Two implementations of multiprocessor performance measurement instruments, a hybrid tool and a hardware tool, are summarized and their limitations discussed. A concluding discussion of current efforts is presented which is to combine the beneficial aspects of two previous tools into a VLSI chip set that has a wider range of utilization since it will be more cost effective to integrate into machines than circuit boards.

Hybrid Performance Measurement Instrumentation for Loosely-Coupled MIMD Architectures.

Final rept.

J. Roberts, J. Antonishek, and A. Mink. 1990, 7p

Pub. in Proceedings of Conference on Hypercubes, Concurrent Computers, and Applications (4th), Monterey, CA., March 6-8, 1989, v1 p237-243 1990.

Keywords: Parallel processors, Measurement, Reprints, *Computer performance evaluation, *Multiprocessors, Computer systems performance, Computer architecture.

The event trace measurement concept is reviewed, along with a previous design of a hybrid measurement tool which acquires this class of measurement on a tightly-coupled shared-memory MIMD architecture. A number of issues must be considered when applying this type of measurement tool to loosely-coupled, distributed-memory machines because of their architectural differences. A discussion of these issues is presented which includes synchronization, and centralized vs. distributed functions. Based on this discussion, a design of a hybrid measurement tool for a loosely-coupled multiprocessor is described that incorporates several new features not found in the original design.

Rept. for 8 Jul 88.
8 Jul 88, 69p Rept no. NBS-88VSOF535-3

Keywords: *Compilers, Identification, Length, Numbers, *Standardization, Test and evaluation, Validation, Value, *Ada programming language.

This Validation Summary Report describes the extent to which a specific Ada compiler conforms to the Ada Standard. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability. An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard. Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report. This information is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. (kr)

Ada Compiler Validation Summary Report: Certificate Number: 880719S1.09154, Naval Underwater Systems Command, ADAUYK43 (ALS/N Ada/L), Version 1.0, VAX 11/785 Host and AN/UYK-43 Target.

19 Jul 88, 108p AVF-NBS88VUSN525-3

Keywords: *Compilers, High level languages, Standardization, Test and evaluation, Validation, *Ada programming language, *Validation summary reports.

This Validation Summary Report describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability. An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard. Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report. The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. (kr)

Keywords: *Ada programming language, *Compilers, Facilities, Standardization, Test and evaluation, *Validation summary reports.

All the dependencies observed during the process of testing this Ada compiler are given in this report. The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent, but is permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution. Keywords: Ada programming language; Ada compiler validation summary report; Ada compiler validation capability; Ada validation testing; Ada validation office; Ada validation facility; Ada joint program office. Keywords: *Ada Programming Language, *Compilers, Standardization, Test and evaluation, *Validation summary reports.

This Validation Summary Report describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability. An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada

Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard. Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report. The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results.

FIPS PUB 156 PC A99
National Inst. of Standards and Technology (NCSL), Gaithersburg, MD.

Information Resource Dictionary System (IRDS); Category: Software Standard; Subcategory: Data Management Applications. American National Standard for Information Systems.

Final rept.

A. H. Goldfine. c5 Apr 89, 801p

Also available from Supt. of Docs. Also pub. as American National Standards Committee, New York rept. no. ANSI-X3.138-1988. Prepared in cooperation with American National Standards Committee, New York, and Computer and Business Equipment Manufacturers Association, Washington, DC.

Three ring vinyl binder also available: North American Continent price \$7.00; all others write for quote.

Keywords: *Data management, Standards, Specifications, American National Standard Information Resource Dictionary System, Federal Information Processing Standards Publication 156, *Computer software, Information resource management.

The publication announces the adoption of the American National Standard Information Resource Dictionary System (IRDS), ANSI X3.138-1988, as a Federal Information Processing Standard (FIPS). The IRDS specifies a computer software system that provides facilities for recording, storing, and processing descriptions of an organization's significant data and data processing resources. The IRDS includes the func-

tions performed by data dictionary systems or information repositories. The standard specifies two user interfaces: the full syntax and semantics of a Command Language, and the semantics of a menu-driven Panel Interface. The purpose of the standard is to promote portability of valuable information resources within and among Federal agencies. The standard is the reference authority for use by implementors in developing information resource dictionary systems, and for use by other computer professionals in understanding the precise syntactic and semantic rules of the standard.

Computer Systems as Scientific Theories: A Popperian Approach to Testing.

Final rept.

J. C. Cherniavsky. 1987, 12p

Pub. in Proceedings of Annual Pacific Northwest Software Quality Conference (5th), Portland, OR., October 19-20, 1987, p297-308.

Keywords: *Tests, *Computer program verification, Computer program reliability, Computer software.

Karl Popper developed a theory of scientific discovery based upon the testability of the theory. A theory was scientific if it were possible to choose experiments that could refute the theory. The author borrows from Popper and presents a theory of testing that is based on the careful choice of test cases. He shows that well-tested programs are as correct as programs subjected to mathematical proof. In demonstrating this, he draws on recent work in the development of theory of distinguishability.

Knowledge-Based Front-End Input Generating Program for Building System Simulation.

Final rept.

S. T. Liu, and G. E. Kelly. 1988, 11p

Sponsored by Civil Engineering Lab. (Navy), Port Hueneme, CA.
Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions, v94 pt1 p1074-1084 1988.

Keywords: Computerized simulation, Reprints, *Pre-processors, *Input output processing, *Knowledge bases(Artificial intelligence), Front end processors, Data base management, Prolog programming language, National Institute of Standards and Technology.

A knowledge-based input preprocessor for building system simulation programs was developed at the National Bureau of Standards for the modular, dynamic building and HVAC systems simulation program HVACSIM+. The complexity of the HVACSIM+ program requires the user to have extensive knowledge of all the inputs, outputs, and parameters required by each component module in order to set up a data input file that will correctly link the multiple inputs and outputs of the user selected component modules from the HVACSIM+ library. The data input process is very te-

dious and time-consuming. The paper describes the development of a front-end program to generate the required data to link the multiple inputs and outputs of the user selected component modules. A microcomputer based language, Prolog, was used to program the data base of the input and output requirements of each component module in HVACSIM+ and to perform correct linking of those variables. A data base editing program was developed that would delete, insert, and re-link a component module in an already generated data file.

Unrestricted Algorithms for Mathematical Functions.

Final rept.

F. W. J. Olver. 1985, 12p

Sponsored by Army Research Office, Research Triangle Park, NC., and National Science Foundation, Washington, DC.

Pub. in Proceedings of International Conference on Special Functions: Theory and Computation, October 10-12, 1984, Torino, Italy, p237-248 1985.

Keywords: *Algorithms, *Functions(Mathematics), Exponential functions, Logarithm functions, Numerical precision, Reprints, Floating point arithmetic.

An unrestricted algorithm is one that will accept any values of the input variables, including any specified accuracy in the output. The construction of unrestricted algorithms for mathematical functions renews interest in the problems of combatting overflow and underflow and controlling error propagation. To help solve these problems a new form of computer arithmetic is proposed, together with a modification and generalization of the conventional definitions of absolute and relative error. Progress with the construction of unrestricted algorithms for elementary and transcendental functions is reviewed briefly.

NIST (National Institute of Standards and Technology) Network Common Memory User Manual.

D. Libes. Feb 90, 21p NISTIR-90/4233

Keywords: Computer networks, Computer systems programs, *Memory(Computers), *Distributed data bases, User manuals(Computer programs), Distributed computer systems.

The manual describes how to use the NIST Network Common Memory System (CMS). The CMS provides a common memory that may be shared among processes distributed across a local area network. Unlike other shared memory systems, CMS accesses variables by name rather than by address. These and other features make the system more comparable to a primitive distributed database than a shared memory system. CMS currently runs on Berkeley UNIX systems but can be supported on any POSIX-like system which provides a stream protocol at the transport layer. Interfaces exist for usage from C and Franz Lisp.

Packet-Oriented Communication Using a Stream Protocol or Making TCP/IP on Berkeley Unix a Little More Pleasant to Use.

D. Libes. Feb 90, 11p NISTIR-90/4232

Keywords: Computer systems programs, Standards, Computer networks, *Protocols, *Computer communications, Packets(Communication).

The only DoD protocols supporting the Transport Layer in the OSI Model are UDP and TCP. UDP is packet-oriented while TCP is stream-oriented. It is often useful to mix characteristics of both. The paper describes a software package that stimulates the useful properties of UDP while using TCP. Also included are some functions for easier establishment of connections than by using TCP/IP primitives. In addition, some observations gained during the experience of implementing this on a 4.2BSD UNIX system are described.

Secure Data Network System (SDNS) Network, Transport, and Message Security Protocols.

C. Dinkel. Mar 90, 89p NISTIR-90/4250

See also PB90-188061. Sponsored by National Security Agency/Central Security Service, Fort George G. Meade, MD.

Keywords: *Secure communication, Pulse communication, Data transmission, Computer programming, *Computer security, *Computer networks, *Protocol(Computers).

The Secure Data Network System project, known as SDNS, implements computer to computer communications security for distributed applications. The internationally accepted Open Systems Interconnection (OSI) computer networking architecture provides the framework for SDNS. SDNS uses the layering principles of OSI to implement secure data transfers between computer nodes of local area and wide area networks. The publication includes four security protocol documents developed by the National Security Agency (NSA) as output from the SDNS project. SDN.301 provides the framework for security at layer 3 of the OSI Model. Cryptographic techniques to provide data protection for transport connections or for connectionless-mode transmission are described in SDN.401. Specifications for message security service and protocol are contained in SDN.701. Directory System Specifications for Message Security Protocol are covered in SDN.702.

NISTIR-90/4292

Held in Gaithersburg, Maryland on May 3, 1989. Sponsored by Data Administration Management Association, Washington, DC. National Capital Region, Federal Data Management Users Group, Washington, DC., and Association for Federal Information Resources Management, Washington, DC.

Keywords: *Standards, *Meetings, Models, Systems engineering, Information systems, *Data base administrators, *Data management, Data structures, Data integrity, Resource management.

The document represents the proceedings of a one-day symposium held at the National Institute of Standards and Technology on May 3, 1989. It includes the following papers: Data Architecture: The transition from Business Model to Data Model; Standards: Role of Data Standards in Establishing a Data Quality Program; Techniques: Bridging the Gap between the Strategic Plan and Systems Development; Standards: Using Standards to Support Data Sharing; Techniques: Data Integration Issues in Systems Development; and The Data Administrator: Achieving Excellence.

Object Database Management Systems: Concepts and Features.

Special pub. (Final).

C. E. Dabrowski, E. N. Fong, and D. Yang. Apr 90, 64p NIST/SP-500/179

Also available from Supt. of Docs. as SN003-003-03007-4.

Keywords: Programming languages, Models, *Object database management systems, *Data base management systems, Object-oriented programming, Data bases, Data structures.

The last decade has seen the emergence of object concepts and their infusion into information systems technology. This phenomenon began with the advent of programming languages that included object concepts. More recently, object concepts have been merged with database management system technology, resulting in the production of some object database

Computer Software

management systems. As a result, the term object database management system (ODBMS) is now becoming a recognized and important topic in the database community. The purpose of the report is to provide managers and software analysts a state-of-the-art review of object concepts and to describe features associated with object database management systems.

Automatically Running Command Files at Any Future Time.

Final rept.

J. Levine. 1986, 6p

Pub. in RSX Multi-Tasker, pRSX-6-RSX-10 1986.

Keywords: Reprints, *File management systems, Job shop scheduling, Command files, Indirect command processor.

It is often useful to be able to run indirect command files late at night or on a certain day each month. The note describes a task that can submit an indirect command file at any time in the future. The author uses this task to perform certain operations at 01:00:00 on the first day of every month, but the principle may be easily adapted to other situations.

Guide to Software Acceptance.

Special pub. (Final).

D. R. Wallace, and J. C. Cherniavsky. Apr 90, 42p

NIST/SP-500/180

Also available from Supt. of Docs. as SN003-003-03008-2. Prepared in cooperation with Georgetown Univ., Washington, DC.

Keywords: Guidelines, Verifying, Requirements, Acceptability, Quality control, Tests, Criteria, Methodology, Management planning, *Software acceptance, *Computer software, Life cycles(Software), Data processing security, Computer interfaces.

Software acceptance is a life cycle process which includes acceptance of interim and final software products for both new and maintained software systems. The guide assists buyers in understanding acceptance issues relative to a basic life cycle model and some of its variants. The guide identifies six categories (functionality, performance, interface quality, overall software quality, security, and software safety) for which acceptance criteria must be defined. The guide identifies issues to be considered when establishing acceptance criteria. Finally the guide directs managers in planning and implementing a software acceptance program, with emphasis on the final software acceptance testing.

U.S. Government Procurement of Open Systems Products and Services.

Final rept.

J. F. Heafner. 1988, 3p

Pub. in Computer Standards and Interfaces 7, n1-2 p209-211 1988.

Keywords: *Government procurement, Standards, Purchasing, Computer networks, Reprints, *Open systems, Computer communications, Protocols, OSI.

The United States Government has helped with the development of open systems for the past eight years, with the expectation of its widespread use. Open systems now stand on the threshold of products and use. As a leader in the phase of its development, the government has prepared a procurement standard for the purchase of Open Systems Inc. products and services. The paper describes the procurement document.

Fourth Generation Software Tools for Prototyping.

Final rept.

E. N. Fong, and D. K. Jefferson. 1984, 11p

Pub. in Proceedings of International Computer Symposium, Taipei, Taiwan, December 12-14, 1984, 10p.

Keywords: *Computer programming, *Programming languages, Prototypes, Experimentation, Reprints, *Software engineering, User requirements, Software tools.

A new generation of computer languages has been developed to reduce the barriers between end-users and computers. The phenomenon is described in the report as 'fourth generation software tools for prototyping.' The report consists of two main parts: the first part introduces the concept of prototyping with a fourth generation language, and the second part describes an experiment using two such software tools.

PHIGS Validation Tests (Version 1.0): Design Issues.

Special pub. (Final).

J. Cugini, M. T. Gunn, and L. S. Rosenthal. Jul 90,

21p NIST/SP-500/181

Also available from Supt. of Docs. See also PB90-265216.

Keywords: *Standards, *Computer graphics, Testing, Validation, Programmers Hierarchical Interactive Graphics System, PHIGS system, Computer software.

Conformance testing for the Programmer's Hierarchical Interactive Graphics System (PHIGS) standard presents certain novel difficulties, especially the indirect effect of many functions, and the inaccessibility to the program of visual effects. The model of logic inference offers a way to organize a system of the complexity needed to overcome these problems. This complexity makes the use of certain database concepts quite valuable in allowing users to comprehend the system. Special emphasis is placed on allowing the user to associate each test case with some specific requirement in the standard. Test output consists of a set of formatted messages that enable the user to assess test results rapidly and accurately.

CHAOS: A SUN-Based Program for Analyzing Chaotic Systems.

Final rept.

J. W. Aronson. 1990, 10p

Pub. in Computers in Physics, p408-417 Jul/Aug 90.

Keywords: *Computer graphics, Power spectra, Reprints, CHAOS computer program, C programming language, Mathematical manifolds, Bifurcation(Mathematics), Fractal dimensions, Poincare maps, Nonlinear analysis.

CHAOS is a C-based program on SUN workstations, designed for studying nonlinear dynamics. It furnishes easy access to graphical and numerical procedures through the SUN windowing system. Among the graphical tools of CHAOS are the drawing of basins, basin boundaries, bifurcation diagrams, unstable manifolds, and point sets. The program can plot in 2D and 3D as well as on the surface of a cylinder, sphere, or torus. On the numerical side, CHAOS can compute fractal and correlation dimensions, Lyapunov exponents, Poincare maps, power spectra, and periodic orbits. The program allows for the quick and easy addition of new systems of equations.

Program Generator for Efficient Evaluation of Fourier Series.

Final rept.

B. R. Miller. 1989, 8p

Pub. in Proceedings of ACM-SIGSAM International Symposium on Symbolic and Algebraic Computation, Portland, OR., July 17-19, 1989, p199-206.

Keywords: *Fourier series, Computer programming, Algorithms, Fortran, Reprints, *Automatic programming, Numerical solution.

Many fields require the evaluation of large multi-variate Fourier series, but the naive method of calling sine and cosine for each term can be prohibitive where computing resources are constrained or the series are extremely large (30,000 terms). Although the number of such calls can be reduced by using trigonometric identities, such a reduction is usually not possible by hand. Indeed, even when it is carried out by computer, care must be taken to generate compact programs and avoid generating large numbers of intermediate terms. The author describes an algorithm for automatically generating very efficient Fortran programs directly from the mathematical descriptions of the series to be evaluated. The resulting Fortran programs are 5-7 times faster than the naive version and sometimes significantly more compact.

Residual Hermite Normal Form Computations.
Final rept.
P. D. Domich. 1989, 12p
Sponsored by Universite Catholique de Louvain, Louvain-la-Neuve (Belgium).
Pub. in ACM Transactions on Mathematical Software
15, n3 p275-286 Sep 89.

Keywords: *Algorithms, Computation, Congruences, Chinese remainder theorem, Reprints, *Foreign technology, *Hermitian polynomial, *Computer calculations, Hermite normal form.

The paper extends the class of Hermite normal form solution procedures that use modulo determinant arithmetic. Given any relatively prime factorization of the determinant value, integral congruence relations are used to compute the Hermite normal form. A polynomial-time complexity bound that is a function of the length of the input string exists for this class of procedures. Computational results for this new approach are given.

Optimizing Precompiler for Finite-Difference Computations on a Vector Computer.
Final rept.
J. Gary, and L. Fosdick. 1989, 14p
Pub. in Parallel Computing 10, n1 p51-64 Mar 89.

Keywords: Optimization, Finite difference theory, Reprints, *Precompilers, *Vector processing, Fortran 8X programming language, CYBER 205 computers.

The paper is concerned with techniques for translating array expressions, as found in FORTRAN 8X, into very efficient vector expressions on a machine in which long vectors are needed for high performance. It describes the application of these techniques in a precompiler for the CYBER 205 which requires a vector length of 1000 to achieve 90% of the asymptotic speed. The precompiler does not vectorize FORTRAN 77 DO loops, instead it vectorizes and optimizes programs written in the explicit array syntax of the proposed FORTRAN standard (FORTRAN 8X). The opti-

mization of the vector code is intended to be most effective for algorithms commonly used in finite-difference approximations of partial differential equations. Finite-difference schemes frequently evaluate the same expression over the interior of a multidimensional rectangular array. In these computations the precompiler is able to vectorize arithmetic operations over the entire array, rather than over individual dimensions, thus generating relatively long vectors. This vectorization is done, whenever possible, without using expensive gather operations. When gather operations must be used the precompiler attempts to minimize them by making one gather serve for several operands through the use of masks and offsets.

SNMPLIB: A Simple Network Management Protocol Function Library for IBM PC Compatible Computers.
R. Crosson. Nov 90, 72p NISTIR-4467

Keywords: *Computer networks, *Data base management systems, *Input output routines, Protocols, Compatibility, *Simple Network Management Protocol library, Software tools, Microsoft C programming language, IBM PC, Personal computers, Ethernet interfaces, Network interconnections, Cost engineering.

Many Simple Network Management Protocol applications exist, but few general purpose packages run on a personal computer. SNMPLIB is a library of function calls written in Microsoft C version 5.0 for IBM PCs and compatibles. Its data structures and functions are described. With SNMPLIB a user can write a program to dynamically monitor operational variables of compatible networked devices and take action when those variables cross threshold values. The network input/output routines work with any Ethernet interface for a PC or a compatible for which a packet driver has been installed, making the application somewhat independent of the Ethernet interface used in the computer. A sample application program, SNMPPMON, is supplied which monitors user specified variables in user specified devices and writes their values to the PC's display. The SNMPLIB and SNMPPMON have been compiled on a Sun Microsystems workstation and successfully used there with a similar, but Sun Ethernet interface specific, set of input/output functions.

Gaithersburg, MD. Factory Automation Systems Div.
Voila: A System for Looking at Processes.
S. Ressler, and S. N. Clark. Oct 89, 16p NISTIR-89/
4196

Keywords: *Computer graphics, *Control systems, Visualization, Man computer interface, Smalltalk-80 programming language, Finite state machines.

The ability to visualize data is becoming an increasingly important research field in its own right. The paper presents one approach to the problems of visualization in the context of illustrating and observing a control system. Specifically, the application domain is a real-time control system developed at NBS primarily for the control of factory floor applications. The user interacts with the system via multiple levels of detail selection only those portions of the system the user wishes to view. The implementation environment for the system was primarily Smalltalk-80 which provided a high degree of extensibility and flexibility. Integration of existing control system development tools into a visualization environment was a key goal of the project.

Cell as Part of a Manufacturing System.
A. Jones, and A. Saleh. May 90, 33p NISTIR-4308

Keywords: *Process control, *Automatic control, *Manufacturing, Fabrication, Equipment, Data proc-

essing, Production control, Planning, Feedback control, Research projects, *Computer aided manufacturing, Robotics, Cell control, US NBS.

A new approach to the design, implementation, and integration of cell controllers in a manufacturing system is described. (Workstations are managed by the cell controller). It combines techniques from control theory, operations research, and computer science. The cell controller can be (1) modified to fit both the physical definition of a cell and the capabilities of other controllers in the system, and (2) easily integrated into any shop floor control system which meets the interface requirements.

System Factors in Real-Time Hierarchical Control.
J. Michaloski, and T. Wheatley. Aug 90, 21p NISTIR-4386

Keywords: *Robots, Hierarchies, *Multiprocessors, *Real time, *Control systems, *Concurrent processing, Architecture(Computers).

Robot control needs multi-processor architectures to satisfy timing constraints. The paper outlines hierarchical control as a concurrent real-time design methodology that provides system partitioning across multiple processors. The paper then studies specific multi-processor architectural factors affecting the concurrent hierarchical model. As a part of the concurrent real-time control methodology, the paper will present design principles to manage problems such as real-time constraints, interprocessor communication and synchronization. The paper is organized as follows. The first section discusses task decomposition in conjunction with the theory of concurrent hierarchical control. The second section analyzes the effect of real-time requirements on concurrent hierarchical control. The third section discusses the effect of architectural factors on concurrent hierarchical control especially communication and synchronization. The final section analyzes the transition from design to implementation with a look at work at NIST and elsewhere.

Information Processing Standards

National Inst. of Standards and Technology (NCSL),
Gaithersburg, MD.
Database Language SQL. Category: Software Standard. Subcategory: Database.
Final rept.
L. J. Gallagher. 2 Feb 90, 166p
Available from Supt. of Docs. Supersedes FIPS PUB 127.
Three ring vinyl binder also available; North American Continent price \$7.00; all others write for quote.

Keywords: Data processing, *Federal information processing standards, *Structured Query Language, *SQL database language, Computer software.

The publication announces adoption of American National Standard Database Language SQL with Integrity Enhancement, ANSI X3.135-1989, and American National Standard Database Language Embedded SQL, ANSI X3.168-1989, as the Federal Information Processing Standard for Database Language SQL (FIPS SQL). The Publication is a revision of FIPS PUB 127 that offers new conformance alternatives, new programming language interfaces, a new integrity enhancement option, clarification and correction of existing specifications, and additional considerations for use in procurements. The revision supersedes FIPS PUB 127. The purpose of FIPS SQL is to promote portability of database application programs and programmers among different installations. The standard is used by implementors as the reference authority in developing a FIPS conforming relational model database management system and by application programmers to help write SQL conforming applications.

FIPS PUB 157 PC E18
National Inst. of Standards and Technology (NCSL), Gaithersburg, MD.

Guideline for Quality Control of Image Scanners; Category: Hardware Standard; Subcategory: Calibration, Validation, and Testing. Recommended Practice for Quality Control of Image Scanners: Standard.

Final rept.

L. A. Welsch, J. Baronas, and T. Bagg. c13 Sep 89, 32p
Also available from Supt. of Docs. Prepared in cooperation with Association for Information and Image Management, Silver Spring, MD. Three ring vinyl binder also available; North American Continent price \$7.00; all others write for quote.

Keywords: *Quality control, *Image scanners, Guidelines, Standards, Calibration, Validation, Testing, American National Standard for Information and Image Management, Federal Information Processing Standards Publication 157, Digital image scanners, Monochrome image scanners, *Document processing.

The Guideline announces the adoption of the American National Standard for Information and Image Management-Recommended Practice for Quality Control of Image Scanners, ANSI/AIIM MS44-1988, as a Federal Information Processing Standards Publication Guideline. MS44 provides procedures and physical test objects that can be used by document processing system analysts, designers, and operators for calibrating monochrome, digital image scanners. In addition, MS44 procedures and test objects are designed to be used to maintain an acceptable image quality level through periodic testing of scanners and other system components, i.e., displays, typesetters, laser printers, accompanying software systems, etc. MS44 procedures and test objects can also be used to set scanner parameters to match specific characteristics of documents being scanned so that the system produces optimum image quality. The test objects that are included with this Guideline are recommended for use when implementing the Guideline. Using reproductions of these test objects will not provide meaningful results. The Guideline includes MS44 Appendices A through F which cover producing custom test objects, scanning low contrast materials, preparing continuous tone images for scanning, issues of using line/space resolution test targets on digital systems, and thresholding/enhancement scanning characteristics.

User Interface Component of the Applications Portability Profile. Category: Software Standard. Subcategory: Application Program Interface.

Federal information processing standards.

D. R. Kuhn. 29 May 90, 630p

Also available from Supt. of Docs.

Three ring vinyl binder also available, North America Continent price \$7.00; all others write for quote.

Keywords: *Standards, *Windowing, Interfaces, Computer graphics, *Federal information processing standards, *Man computer interface, *Application programs(Computers), *Software engineering, Portable Operating System Interface(POSIX), Computer program portability, Application program interface, Open systems interconnections.

The publication announces the adoption of the X Protocol, Xlib Interface, Xt Intrinsic and Bitmap Distribution Format specifications of the X Window System, Version 11, Release 3 (X Window System is a trademark of the Massachusetts Institute of Technology (MIT)) as a Federal Information Processing Standard. This standard is for use by computing professionals involved in system and application software development and implementation. This standard is a part of a series of specifications needed for application portability. The Appendix to the standard contains a reference model for network-based bit-mapped graphic user interface standards. The standard covers the Data Stream Encoding, Data Stream Interface, and Subroutine Foundation layers of the reference model. It is the intention of NIST to provide standards for other layers of the reference model as consensus develops within industry. The standard addresses the user interface functional area of the Applications Portability Profile that was announced in FIPS 151, POSIX: Portable Operating System Interface for Computer Environments.

000,743

FIPS PUB 21-3 PC E19
National Inst. of Standards and Technology (NCSL), Gaithersburg, MD.

COBOL. Category: Software Standard. Subcategory: Programming Language.

Final rept.

K. A. Miles. 12 Jan 90, 910p

Also available from Supt. of Docs. Supersedes FIPS PUB 21-2.

Three ring vinyl FIPS binder also available, \$7.00 N.A.C. Others write for quote.

Keywords: Data processing, *Federal information processing standards, *Cobol programming language, Information processing, Computer software.

The standard announces the adoption of American National Standard Programming Language, COBOL, ANSI X3.23-1985 and X3.23A-1989, as amplified herein, as a Federal Information Processing Standard (FIPS). The revision supersedes FIPS PUB 21-2 and reflects the addition of an Intrinsic Function facility to the COBOL specifications. The American National Standards define the elements of the COBOL programming language and the rules for their use. The purpose of the standards is to promote portability of COBOL programs for use on a variety of data processing systems. The standards are used by implementors as the reference authority in developing processors and by users who need to know the precise syntactic and semantic rules of the standard language.

Proposed Integration Framework for Step Standard for the Exchange of Product Model Data).

W. F. Danner. Apr 90, 29p NISTIR-90-4295

Keywords: *Product development, *Standards, Specifications, Standardization, Mathematical models, Product data exchange specification, Standard for the exchange of product model data, Protocols.

The paper presents a proposed integration framework for product data modeling. The framework provides for the representation of functional, programmatic, and physical product data across all phases of a product's life cycle. It provides a single coherent approach to product data modeling for the specification of application views. Most importantly, it creates an open system that encourages the innovative use of information. The framework has as its major feature an integrated product information model with four conceptual levels. A generic product data model is the key element of the framework. It is composed of application-independent facts common to all products. The generic product data model meets the requirements of multiple application areas by providing for the interpretation of generic facts in specific contexts. It also provides a logical structure for the integrated product information model which is used by application models to fulfill user requirements.

NIST (National Institute of Standards and Technology) STEP (Standard for the Exchange of Product Model Data) Documents Configuration Management System User's Guide.

S. Katz, G. Rinaudot, and S. Ressler. Apr 90, 21p
NISTIR-90/4303

Keywords: *Documents, *Records management, Information retrieval, *Standard for the exchange of product model data, *Configuration management, Control systems, On line systems, Product data exchange specification.

The brief User's Guide is intended to help ISO members access NIST's on-line version of the STEP documents. The STEP documents are now under a preliminary configuration control system on the TANDEM computer at NIST. The User's Guide explains how to access the TANDEM from a PC and how to use the Configuration Management System's commands to read, edit and re-enter the portions of the STEP documents under control.

Measurements of a Transport Implementation Running Over an IEEE 802.3 Local Area Network. Final rept.

S. Heatley, and D. Stokesberry. 1988, 10p
Pub. in Proceedings of Computer Networking Symposium, Washington, DC., April 11-13, 1988, p34-43.

Keywords: Performance evaluation, Standardization, Measurement, Implementation, Reprints, *Local area networks(LAN), *Open system interconnection(OSI) standards, *Transport(Computers), Throughput, Protocols, Computer software, Computer networks.

In the recent past, there has been a great deal of effort to develop Open System Interconnection (OSI) standards, to implement the standards, to test conformance of implementations to the standards, and to demonstrate interoperability between products. Now, as users procure systems that implement the OSI protocols, there is increasing interest in their performance. The paper assesses the performance of a typical commercially available implementation of the lower four OSI layers (transport, network, data link and physical). One-way delay and throughput measurements are reported for the Intel 310 microcomputer system running the iNA960 implementation of OSI Transport over an IEEE 802.3 CSMA/CD local area network. The minimum one-way delay versus message size for various combinations of the lower four OSI layers is shown. The results show the tradeoff between delay and the services offered by the protocols. The maximum throughput for the Transport Class 4 service is reported and the main factors affecting maximum throughput are discussed. The discussion is not specific to this implementation; it is also applicable to other implementations.

More Effective Federal Computer Systems: The Role of NIST (National Institute of Standards and Technology) and Standards.

Final rept.
S. M. Radack. 1990, 13p
Pub. in Government Information Quarterly 7, n1 p37-49 1990.

Keywords: *Standards, *Guidelines, *National government, Telecommunication, Compatibility, Information centers, Computer systems hardware, Reprints, *Computer communications, *National Institute of Standards and Technology, Computer software, Computer security, Interfaces(Computers), Federal information processing standards.

Since the mid-1960s, standards have been important tools for improving the Federal government's use of computer and related telecommunications systems. The National Institute of Standards and Technology (NIST) has been charged with developing standards, guidelines, and technical methods that are needed by Federal government organizations. The merging of computer and telecommunications technologies and the increasing complexity of systems will make standards for the interconnectivity of systems, portability of computer software, and the protection of computer information important NIST initiatives for the future.

QDES User's Guide. National PDES Testbed Report Series.

S. N. Clark. Jul 90, 41p NISTIR-4361

Keywords: *Standards, *Editing, *Manufacturing, Product management, Specifications, Testbeds, Windowing techniques, *PDES(Product Data Exchange Specification), *Computer aided manufacturing, User manuals(Computer programs), *STEP, Smalltalk, Product models, Geometric modeling, QDES(Quick and Dirty Editor for STEP).

The Product Data Exchange Specification (PDES) is an emerging standard for the exchange of product information among various manufacturing applications. The neutral exchange medium for PDES product models is the STEP physical file format. The National PDES Testbed at NIST has developed QDES, a window-based editor for STEP product models. The editor, written in Smalltalk-80, is schema-driven; in the Testbed context, an Express information model is used to describe the objects to be manipulated; QDES itself thus has no a priori knowledge of its domain. The document describes the operation of the editor. A tutorial is included.

Naming Forum: Proceedings of the IRDS Workshop on Data Entity Naming Conventions.

J. J. Newton. Jul 90, 138p NISTIR-4374

Keywords: *Meetings, Guidelines, Standardization, *Federal information processing standards, *Data management, Naming conventions, National Institute of Standards and Technology.

As part of the Federal Information Processing Standard (FIPS) Information Resource Dictionary System (IRDS) project, NIST has sponsored a series of workshops intended to produce guidance to the developers and users of the IRDS standard. The publication summarizes the major points discussed during speaker's presentations and general discussions at the IRDS Workshop - Naming Convention Forum held at NIST on 16-17 November, 1989. The purposes of the workshop were to bring together data administrators concerned with naming conventions for a networking and discussion session, and to provide guidance to the X3H4.4 Task Group in the development of requirements for a Naming Convention Verification Module for the X3H4 IRDS standard. After presentations by NIST X3H4 representatives, nine speakers described their implementations of naming conventions. In addition, a demonstration of the WIS/DIM system's automated assistance for naming was presented.

Graphics Standards in the Computer-Aided Acquisition and Logistic Support (CALS) Program, Fiscal Year 1989. Volume 1. Test Requirements Document, Extended CGM (CGEM).

Rept. for Oct 88-Sep 89.
D. R. Benigni. May 90, 340p NISTIR-4329
See also PB90-228016. Sponsored by Office of the Secretary of Defense, Washington, DC.

Keywords: *Computer graphics, *Standards, Tests, Military procurement, Conformity, Logistics, Computer programming, *CALS(Computer Aided Acquisition and Logistic Support), CGEM(Extended Computer Graphics Metafile), Department of Defense.

The computer-aided Acquisition and Logistic Support (CALS) Program is a Department of Defense (DoD) Industry strategy to transition from paper-intensive acquisition and logistic processes to a highly automated and integrated mode of operation for the weapon systems of the 1990s. The volumes document the accomplishments of the Graphics Software Group of the National Institute of Standards and Technology (NIST) in support of computer graphics standards for CALS in FY89. They provide a progress report on continuing graphics standards efforts related to the Computer Graphics Metafile (CGM) standard. The reports are divided into two volumes: 1, Test Requirements Document and Extended CGM (CGEM); and 2, MIL-D-28003 Revisions and CGM Registration. Volume 1. Completion of the first milestone toward the establishment of a comprehensive CGM (and MIL-D-28003) Test Method and ultimately a Testing Service, namely the creation of a Test Requirements Document, is detailed. The Test Requirements Document will provide the basis for developing conformance tests to determine compliance both with CGM and MIL-D-28003. Progress to inject CALS requirements into the Extended CGM (CGEM) is also detailed.

Design Issues for Conformance Testing of the PHIGS Standard.
 J. Cugini, and L. S. Rosenthal. Aug 90, 16p NISTIR-4384

Keywords: *Standards, *Computer graphics, Tests, *Programmers Hierarchical Interactive Graphics System, *PHIGS standard.

Conformance testing for the Programmer's Hierarchical Interactive Graphics System (PHIGS) standard presents certain novel difficulties, especially the indirect effect of many functions, and the inaccessibility to the program of visual effects. The model of logical inference offers a way to organize a system of the complexity needed to overcome these problems. This complexity makes the use of certain database concepts quite valuable in allowing users to comprehend the system. The problem of inaccessible effects can be addressed only by careful design of the user interface, so as to minimize the operational difficulty and subjectivity inherent in testing such features.

National PDES Testbed Strategic Plan 1990. National PDES Testbed Report Series.
 C. R. McLean. Oct 90, 83p NISTIR-4438
 Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC. Computer-aided Acquisition and Logistic Support Program.

Keywords: *Standards, *Strategy, *Test beds, Products, Specifications, Manufacturing, Programs, *National Institute of Standards and Technology, *Standard for the Exchange of Product Model data, *Product data exchange, *Product data exchange specifications, Computer aided acquisition and logistics support, Product data sharing, Computer aided manufacturing.

The document presents a long range strategic plan for the National PDES Testbed project at the National Institute of Standards and Technology (NIST). The Testbed was initiated in 1988 under the sponsorship of the U.S. Department of Defense Computer-aided Acquisition and Logistic Support (CALS) program. A major goal of the Testbed is to provide technical leadership in a national effort to implement a complete and useful specification for the exchange of Product Model Data (STEP). The STEP efforts is led by the International Organization for Standardization (ISO) TC184/SC4. The plan also outlines a number of supporting project threads that have been established for the Testbed: initiation of the Testbed, development of configuration management systems and services, development of testing systems to validate the proposed standard, specification and testing of application protocols, construction of a prototype STEP-based manufacturing cell, establishment of a product data exchange network, development of conformance testing systems, and management/technical support activities.

Development Plan: Product Data Exchange Network. National PDES Testbed Report Series.
 S. Frechette, and K. Jurens. Sep 90, 29p NISTIR-4431
 Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC. Computer-aided Acquisition and Logistic Support Program.

Keywords: *Standards, *Manufacturing, Project planning, Validation, Test beds, Test facilities, Networks, Development, Planning, *Standard for the Exchange of Product model data, *Product data exchange, *STEP, Computer aided acquisition and logistic support, Computer aided manufacturing, National Institute of Standards and Technology.

The National PDES Testbed (NPT) project of the National Institute of Standards and Technology in Gaithersburg, MD was established to support development and validation of the emerging Standard for the Exchange of Product Model Data (STEP). National PDES

Testbed staff have begun the development, of a Product Data Exchange Network (PDEN) which will help accelerate the development, testing, and validation of STEP and help ensure that STEP will function as intended in actual manufacturing environments. The document outlines a plan for the development of such a Product Data Exchange Network. The Product Data Exchange Network will consist of manufacturing facilities and research centers from industry, academia, and government linked electronically via modems or computer networks. The intent of this network is to accelerate the development, validation, and implementation of the STEP standard by distributing development, testing, and validation activities throughout a broad spectrum of manufacturing enterprises. The National PDES Testbed at NIST will serve as headquarters for the Product Data Exchange Network.

NIST Step Class Library (Step into the Future).
 M. J. McLay, and K. C. Morris. Sep 90, 24p NISTIR-4411

Keywords: *Standards, *Input output routines, *Software libraries, Implementation, Manufacturing, Validation, Test beds, Prototypes, *Product data exchange, *Standard for the Exchange of Product Model Data, EXPRESS programming language, Software tools, Computer aided design, Computer aided manufacturing.

The paper describes a C++ class library that implements the Standard for the Exchange of Product Model Data (STEP). The STEP class Library (SCL) is under development at the National Institute of Standards and Technology as part of the National PDES Testbed and provide the core set of STEP functions for tools that are used to validate the STEP information models and for STEP based application prototypes. The library also lowers the economic barrier to developing STEP based applications. The current version of the library provides a STEP compliant file exchange mechanism, consequently, users of the class library will not have to create an input/output mechanism for STEP. The paper provides an introduction to STEP and the specification language, Express, in which it is written. The supporting classes that provide the STEP compliant input/output mechanism and the mapping between the Express specification and the C++ classes are described. The paper concludes with descriptions of some applications that use the class library and a discussion of future directions for the class library.

Development Plan: Step Production Cell. National PDES Testbed Report Series.
 J. E. Fowler. Sep 90, 33p NISTIR-4421
 Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC. Computer-aided Acquisition and Logistic Support Program.

Keywords: *Standards, *Machining, *Manufacturing, *Controllers, Components, Validation, Test beds, Development, Project planning, *Standard for the Exchange of Product model data, *Product data exchange, *Computer integrated manufacturing, Production cells.

The Standard for The Exchange of Product model data (STEP) is an emerging international standard addressing the problems of data exchange for a variety of manufacturing enterprises. NIST has established the National PDES Testbed specifically to address the development and testing of STEP, and to serve U.S. industry in their use of the standard. The STEP Production Cell is a machining system based on STEP data exchange. The system uses STEP data as the primary source for controlling part manufacturing. The STEP Production Cell demonstrates how STEP is used in a typical, small batch manufacturing system. The system serves to validate STEP technology in a manufacturing scenario. The plan for developing the STEP Production Cell over the next four years is described in the document.

Information Processing Standards

National Inst. of Standards and Technology, Gaithersburg, MD.

Development Plan Validation Testing System. National PDES Testbed Report Series.

M. J. Mitchell. Sep 90, 39p NISTIR-4417
Sponsored by Assistant Secretary of Defense (Production and Logistics), Washington, DC. Computer-aided Acquisition and Logistic Support Program.

Keywords: Standards, *Validation, Test beds, *Standard for the Exchange of Product model data, *Validation Testing System, *Software tools, Application protocol, STEP, PDES, Product Data Exchange, Computer aided acquisition and logistics support.

The paper describes the plan for the development of the Validation Testing System (VTS) which will provide techniques and systems to engineers for validating and ensuring the internal consistency of the STEP specification. Unlike most standards activities which start from baselines with proven feasibility, Product Data Exchange using STEP (PDES) is a development activity, containing a dynamic set of concepts which have not stabilized. Major portions of STEP are yet to be completed and in some cases haven't been started. Given this dynamic nature it becomes critical to create quality assurance mechanisms that can provide technical feedback to standards activities. The major goal of the Standards Testing Center of the National PDES Testbed is to ensure that the quality of the specification is high and that PDES will indeed work. The VTS will be an integrated computing environment for evaluating the quality of the specification.

Verifying and Validating for Maintainability.
Final rept.
D. R. Wallace, and T. Daughtrey. 1988, 6p
Pub. in Proceedings of Computer Standards Conference 1988 - Computer Standards Evolution: Impact and Imperatives, Washington, DC., March 21-23, 1988, p41-46.

Keywords: *Standards, Validity, Proving, Reprints, *Computer program verification, *Computer software maintenance, Computer software management.

An IEEE standard for software verification and validation plans may improve the maintainability of software. The standard specifies the format and content of software verification and validation plans for both new and existing software. It requires that planning for software verification and validation include the software verification and validation tasks to be performed during software maintenance, regardless of when the plan is written. The paper contains descriptions of the standard, of software maintenance from a software verification and validation perspective, and two examples of improved software maintainability from application of the standard.

State Occupancy Information for Performance Comparisons.
G. E. Lyon. Oct 90, 17p NISTIR-4418
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.

Keywords: *State estimation, *Multiprocessing, Algorithms, Comparisons, Time sharing, *Distributed processing, *Memory devices, *Hypercubes, *Computer systems design, *Computer performance evaluation, *Concurrent processing, Parallel processing, Application programs(Computers).

A state occupancy view of performance removes time as an overwhelming concern. While transient behavior not incorporated explicitly into a state is lost, occupancies still capture general performance details. Emphasis is upon comprehensive results that are nonetheless simply compared. Summaries are defined by the resolution of the chosen state-space, rather than the amount of collected data. The hypercube and other distributed-memory systems bring both opportunities and challenges to a state-based approach. Certainly processor and communication activities are more easily identified and more independent with distributed-memory than with shared-memory. But isolated nodes also entail problems in capturing global observation states. However, many hypercube application codes are homogeneous across nodes, a fact that makes partial states quite useful. Three paradigms illustrate homogeneous applications with communication dependencies that are strong (global), moderate

(local), or weak (uninhibiting and random). The three performance summaries are compact and accurate.

Pattern Recognition & Image Processing

Decoding Bar Codes from Image Data.
M. D. Garris, and C. L. Wilson. Sep 89, 29p NISTIR-89/4177
Sponsored by Bureau of the Census, Suitland, MD.

Keywords: *Decoding, Algorithms, Scanning, Histograms, Average, Computer programs, *Bar codes, *Image processing.

Image storage technology using direct decoding of bar codes in scanned images can simplify paper handling and improve the transmission and storage of forms. Software was developed to provide portable 'C' programs which demonstrate the feasibility to directly decode bar codes from raster images. Three distinct decoding algorithms were developed and tested: A scan method was developed which decodes a single scan line without any prior image processing or enhancements. The method minimizes the processing time necessary to decode a bar code, but is susceptible to noise within the scan line; A global histogram averaging method was developed to ensure reliability. The method takes into account information from the entire image maximizing reliability at the expense of processing time; A hybrid method was designed which samples the original bar code into a collection of representative scan lines. The scan lines are then averaged together providing noise reduction while maintaining efficiency. These methods are fully portable and can be incorporated in a wide range of image applications.

Framework for Representing and Reasoning about Three-Dimensional Objects for Vision.
Final rept.
E. L. Walker, M. Herman, and T. Kanade. 1987, 13p
Sponsored by Defense Advanced Research Projects Agency, Arlington, VA.
Pub. in Proceedings of Workshop on Spatial Reasoning and Multi-Sensor Fusion, St. Charles, IL., October 5-7, 1987, p21-33.

Keywords: Reasoning, Models, Geometry, Pattern recognition, Reprints, *Computer vision, *Three dimensional bodies, *Knowledge bases(Artificial intelligence), Object-oriented programming, Robotics.

The capabilities for representing and reasoning about three-dimensional objects are essential for knowledge-based, 3D photo-interpretation systems that combine domain knowledge with image processing, as demonstrated by such systems as 3D Mosaic and Acronym. Three-dimensional representation of objects is necessary for many additional applications such as robot navigation and 3D change detection. Geometric reasoning is especially important, since geometric re-

Pattern Recognition & Image Processing

relationships between object parts are a rich source of domain knowledge. A practical framework for geometric representation and reasoning must incorporate projections between a 2D image and a 3D scene, shape and surface properties of objects, and geometric and topological relationships between objects. In addition, it should allow easy modification and extension of the system's domain knowledge and be flexible enough to organize its reasoning efficiently to take advantage of the current available knowledge. The authors are developing such a framework, called the 3D FORM (Frame-based Object Recognition and Modelling) System. The system uses frames to represent objects such as buildings and walls, geometric features such as lines and planes, and geometric relationships such as parallel lines.

Merging 3-D Symbolic Descriptions Obtained from Multiple Views of a Scene.

Final rept.

M. Herman, 1987, 8p

Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) - Intelligent Robots and Computer Vision, v726 p292-298 1987.

Keywords: Algorithms, Reprints, *Scene analysis, Image reconstruction, Computer vision, Geometric modeling, Polyhedrons, Three dimensional.

An algorithm is presented for merging three-dimensional symbolic descriptions of static polyhedral scenes obtained from multiple viewpoints. The 3-D descriptions are assumed to be partial because of occlusions. The merging algorithm treats the topology of the descriptions (i.e., connections between vertices, edges, and faces) separately from the geometry (i.e., physical dimensions and relative locations). The paper describes one part of a larger project whose goal is to obtain an integrated symbolic description of a scene from range data obtained from multiple viewpoints.

Spatial Light Modulator for Texture Classification.

Final rept.

J. Haggerty, and M. Young, 1989, 4p

Pub. in Applied Optics 28, n23 p4992-4995, 1 Dec 89.

Keywords: *Pattern recognition devices, Fourier transformation, Hybrid computers, Remote sensing, Power spectra, Texture, Reprints, Light modulators, Optical processing, Light valves, Robot vision.

The paper describes a hybrid computer-optical processor devoted to the analysis of texture. Textures are displayed on a spatial light modulator and their power spectra are calculated optically by a Fourier optical technique. A video camera and a computer with a frame digitizer process the power spectra. The authors define a multidimensional feature space and associate each texture with a point in this feature space. After a training set, the system can distinguish several textures. This hybrid computer is a step toward real time texture classification because of the nearly instantaneous optical Fourier transformation.

Closed-Form Massively-Parallel Range-from-Image-Flow Algorithm.

D. Raviv, and J. S. Albus, Oct 90, 15p NISTIR-4450
Prepared in cooperation with Florida Atlantic Univ., Boca Raton.

Keywords: Algorithms, Motion, Space perception, *Computer vision, *Image processing, Parallel processing.

The authors provide a closed-form solution for obtaining 3D structure of a scene for a given six degree of freedom motion of a camera. The solution is massively parallel, i.e., the range that corresponds to each pixel is dependent on the spatial and temporal changes in intensities of that pixel, and on the motion parameters of the camera. The measurements of the intensities are done in a priori known directions. The solution is for the general case of camera motion. The derivation is based upon representing the image in the spherical coordinate system, although a similar approach could be taken for other image domains, e.g., the planar coordinate system. They comment on the amount of computations, errors and singular points of the solutions. They also suggest a practical way to significantly reduce and implement them.

Also available from Supt. of Docs. as SN003-003-02966. Library of Congress catalog card no. 89-600756. Proceedings of the Workshop on Data Integrity (2nd), Gaithersburg, MD., January 25-27, 1989.

Keywords: *Computer systems, *Meeting, *Data integrity, Data processing security, Computer communications, Operating systems(Computers), Data base management systems, Computer information security, Integrity framework.

The report contains the proceedings of the second invitational workshop on computer integrity issues and is the second response to the Clark/Wilson paper entitled 'A Comparison of Military and Commercial Data Integrity Policy.' The NIST Computer and Telecommunications Security Council established a Working Group on Data Integrity as the subject of the second workshop. The Planning Committee outlined the scope of the workshop as discussions of (1) Integrity Framework Elements, (2) Implementation Requirements and Approaches, and (3) Implementation/Models in the light of the agreed upon integrity framework. The five discussion groups covered: Operating Systems and Systems, Telecommunications, System Services, Applications, and Implementations/Models. No consensus was reached on the definition of data integrity but consensus was reached on quality oriented (1) Policy and Objectives and (2) Mechanisms.

P. Mansbach. Jan 90, 15p NISTIR-89/4190

Keywords: *Multiprocessors, *Communication, Multiprocessing, Operating systems(Computers), Real time, GRAMPS, Robot vision, Optical disks, Memory(Computers).

GRAMPS is an operating system designed for use by a number of independent functionally-divided processors which communicate via common (shared) memory. It achieves high speed, simplicity, and ready adaptability to users' individual needs by being primarily a single-tasking system, and adding processor boards when concurrent operation of processes is required. It thus trades software cost for known hardware cost. Three mechanisms of asynchronous data communication between processors are provided. These include a set of Unix-compatible calls, so a program can be debugged in a Unix environment and simply re-linked to run on a target board. GRAMPS allows individual processors to be stopped and restarted, without interrupting the other processors, and allows single processors to be run in isolation. The operating system includes a fast downloader, a monitor (in PROM), and an array of debugging tools. GRAMPS provides an extremely fast system for single-tasking multiple-processor applications, and some multi-tasking capability as well. It is currently running on Motorola 680x0 microprocessors, and has also run on Intel 8086's.

Keywords: *Information systems, *Security, Guidelines, *Computer information security, *Data processing security, Risk assessment, Contingency plans, Accreditation, US FAA.

The Federal Aviation Administration's publication, 'Automated Information System Security Accreditation Guidelines,' provides procedures for the preparation of documentation required for security accreditation of automated information systems. It has been designed to make the accreditation process as straightforward as possible for any system, whatever its purpose or level of complexity. The accreditation process requires the identification of the data processing activities in the data processing installation and the completion of the forms in this guideline to develop a security profile of the system, conduct a risk assessment and document contingency plans. A Designated Approving Authority

General

then signs the accreditation statements that formally accept the risks to each data processing activity.

Range from Triangulation Using an Inverse Perspective Method to Determine Relative Camera Pose.
 K. Chaconas. Aug 90, 22p NISTIR-4385

Keywords: *Range finding, Stereophotography, Triangulation, Inverse perspective method, Scene analysis, Charge coupled devices, Three dimensional, Robot vision.

The document describes a technique to obtain three-dimensional range from two arbitrarily-placed, stationary cameras. The method uses an inverse perspective algorithm to determine the position of each of the cameras with respect to a set of four coplanar points. Using the two transformations obtained, the relationship between the two cameras is determined. Subsequently, the range to a corresponding feature point that appears in both of the camera images can be calculated using triangulation.

Department of Justice Simplified Risk Analysis Guidelines.
 E. Roback. Aug 90, 61p NISTIR-4387
 Sponsored by Department of Justice, Washington, DC. Justice Management Div.

Keywords: Guidelines, Information systems, Automation, Data processing security, *Risk assessment, *Department of Justice, *Computer security.

The intent of the Simplified Risk Analysis Guidelines (SRAG) is to simplify the risk analysis process. The SRAG expedites the risk analysis process for the system under evaluation by initially determining if minimum security requirements applicable to the Department of Justice (DOJ) are met, which eliminates a number of threats and losses from evaluation. The SRAG is based on Automated Information System (AIS) security policies, regulations, circulars, and guidelines applicable to the DOJ as well as a review of a number of risk analysis methodologies developed by Government agencies and contractors. The SRAG approach divides systems requiring risk analyses into three categories: PCs; mainframes, minicomputers, and other remotely accessed AISs; and application systems. Each of these categories is further divided depending on whether nonsensitive, sensitive, or classified information is processed, or whether an application is nonsensitive or sensitive. The Appendix includes detailed information required to conduct a risk analysis, and a number of tables and work forms for use in conducting and documenting the risk analysis.

Computer Security and Privacy Plans (CSPP) Review Project: A First-Year Federal Response to the Computer Security Act of 1987 (Final Report), 1989.

D. M. Gilbert. Sep 90, 191p NISTIR-4409
 Portions of this document are not fully legible. Prepared in cooperation with National Computer Security Center, Fort George G. Meade, MD.

Keywords: *Data processing security, Information systems, Guidelines, Implementation, Planning, Reviewing, *Computer security, *Computer Security Act of 1987, *Federal agencies, National Institute of Standards and Technology, National Security Agency, Computer privacy, Unclassified sensitive information.

The goal of the Computer Security Act of 1987 (Public Law 100-235) (the Act) is to prompt federal agencies to take measures to improve the security and privacy of sensitive information in federal computer systems. The Act requires federal agencies to prepare and submit for review security plans for all computer systems that contain sensitive information. The Act provides that the plans be submitted to the National Institute of Standards and Technology (NIST) and the National Security Agency (NSA) for review and comment. The report describes the Computer Security and Privacy Plan (CSPP) review effort that was conducted in response to the Act by a joint team from NIST and NSA in 1989. The report also discusses future directions for implementing the Act.

Calibration Technique for Heat Flux Sensors Used in Fire Experiments and Standard Fire Tests.
 Final rept.
 K. Steckler, K. Tu, and W. Twilley. Apr 90, 33p DOT/FAA/CT-89/26
 Contract DTF A03-88-A-00020

Keywords: *Calorimeter, Heat flux, Calibration, Radiometer, Accuracy, Alignment, *Detectors, *Fires, Flux density.

A means for calibrating total heat flux gauges using a comparative (substitution) technique has been established. An apparatus consisting of a reference radiometer, a stable infrared radiant heater capable of producing flux levels up to 3.7 W/cm², and a precision alignment mechanism has been constructed. The reference radiometer was characterized by the Radiometric Physics Division of The National Institute of Standards and Technology at flux levels in the range 0.8 mW/cm² to 0.9 W/cm². Its accuracy was found to be within 3 percent over this range which spans 3 orders of magnitude. As the radiometer is a highly linear thermocouple-based device having a self-calibration feature, this accuracy is expected to hold up to 4.2 W/cm², the upper limit of this device. Although the overall accuracy of calibrations performed in the new apparatus must still be established, it is expected to be within 3 to 5 percent.

Iterative Seismic Inversion.
 Final rept.
 S. J. Norton. 1988, 12p
 Pub. in Geophysical Jnl. 94, n3 p457-468 Sep 88.

Keywords: *Seismic detection, *Algorithms, *Iteration, Scattering, Least squares method, Reprints, *Image processing, Conjugate gradient method.

Two well-known iterative algorithms, steepest descent and conjugate-gradient descent, are used to solve the nonlinear seismic inversion problem from reflection data by minimizing the mean-square error between the measured data and data generated by the estimated model. The approach offers great flexibility, both in incorporating a priori information and in its ability to weight the measurements in an optimal fashion based on error statistics, which serves to regularize an otherwise ill-conditioned inversion. The descent algorithms have superior global convergence properties and avoid the need to invert a large matrix containing second-derivative information. For the special case of monochromatic plane-wave illumination and far-field detection, Weston has obtained an exact expression for the gradient, correct to all orders in the perturbation. Weston's result is generalized to the time domain and to point sources and receivers. The exact gradient improves both the rate and stability of the conjugate-gradient descent algorithm, as illustrated here in a one-dimensional example of the nonlinear inverse-scattering problem.

Planar Near-Field Codes for Personal Computers.
 L. A. Muth, and R. L. Lewis. Oct 89, 52p NISTIR-89/
 3929
 Sponsored by Aerospace Guidance and Metrology
 Center, Newark AFB, OH.

Keywords: *Computer programs, *Antennas, *Metrology,
 Data management, Computer applications,
 Modules(Electronics), Computer software, *Planar
 Near-Field codes.

The author developed planar near-field codes, written
 in Fortran, to serve as a research tool in antenna me-
 trology. The author describes some of the inner work-
 ings of the codes, the data management schemes,
 and the structure of the input/output sections to
 enable scientists and programmers to use these codes
 effectively. The structure of the codes is seen to be
 open, so that a user can incorporate a new application
 into the package for future use with relative ease. The
 large number of subroutines currently in existence are
 briefly described, and a table showing the interdepend-
 ence among these subroutines is constructed. Some
 basic research problems, such as transformation of a
 near field to the far field and probe position error cor-
 rection, are carried out from start to finish, to illustrate
 use and effectiveness of these codes. Sample outputs
 are shown.

**Near-Field Gain of Pyramidal Horns from 18 to 40
 GHz.**
 D. A. Hill, and R. L. Ehret. Nov 89, 19p NISTIR-89/
 3924

Keywords: *Horn antennas, *Electromagnetic fields,
 Field strength, Electromagnetic radiation, Anechoic
 chamber, Directional antennas, Microwave equipment,
 Field emission, *Near fields, *Pyramidal bodies, An-
 tenna radiation patterns.

Generating a standard electromagnetic field requires
 knowledge of the gain of the transmitting antenna.
 Using the two-antenna method, the near-field gain of
 pyramidal horns has been measured at frequencies
 from 18 to 40 GHz. The discrepancy between the
 measured and theoretical near-field gain is typically
 within +/- 0.3 dB for distances from 0.5 to 4 m from
 the horn aperture. An accurate laser alignment of the
 horns was necessary to obtain this level of agreement.

**Antenna Far-Field Pattern Accuracies at Millimeter
 Wave Frequencies Using the Planar Near-Field
 Technique.**
 Final rept.
 M. H. Francis. 1989, 6p
 Pub. in Proceedings of Annual Meeting and Symposi-
 um of the Antenna Measurement Techniques Associa-
 tion (11th), Monterey, CA., October 9-13, 1989, p11-
 16-11-21.

Keywords: *Antenna radiation patterns, Electrical
 measurement, Millimeter waves, Far field, Accuracy,
 Reprints, Planar near field technique, Extremely high
 frequency.

In recent years there has been an increasing demand
 for antenna calibrations at millimeter wave frequen-
 cies. Because of this the National Institute of Stand-
 ards and Technology (NIST) has been developing
 measurement capabilities at millimeter wave frequen-
 cies. The development of gain and polarization meas-

urement capabilities have been previously reported.
 The paper reports on the development of the capability
 to measure an antenna pattern which has been
 achieved during the last year. Measurement accura-
 cies of better than 4 dB have been achieved for side-
 lobes which are 40 dB below the mainbeam peak.
 NIST is now providing a new measurement service for
 antenna patterns in the 30-50 GHz frequency range.

 Pub. in Proceedings of Annual Meeting and Symposi-
 um of the Antenna Measurement Techniques Associa-
 tion (11th), Monterey, CA., October 9-13, 1989, p12-
 24-12-28.

Keywords: *Antenna scanners, *Electric controllers,
 Data acquisition, Millimeter waves, Far field, Control
 circuits, Logic circuits, Electrical measurement, Re-
 prints, Planar near field technique.

The National Institute of Standards and Technology
 (NIST) has developed a multi-axis controller and soft-
 ware data acquisition system that has improved probe
 position accuracies in near-field scanning. This ex-
 tends the usefulness of the NIST planar near-field
 scanner to higher frequencies. The system integrates
 programmable power supplies into an existing planar
 measurement system with new software that controls
 the power supplies and the data acquisition. It provides
 the higher positioning accuracy required for millimeter
 wave measurements at a reasonable cost.

**Iterative Technique to Correct Probe Position
 Errors in Planar Near-Field to Far-Field Transfor-
 mations.**
 Final rept.
 L. A. Muth, and R. L. Lewis. 1989, 4p
 Pub. in Proceedings of International Symposium on
 Antennas and Propagation, Tokyo, Japan, August 22-
 25, 1989, p901-904.

Keywords: *Antenna radiation patterns, Integral equa-
 tions, Taylors series, Far field, Position(Location),
 Errors, Correction, Tests, Reprints,
 Probes(Electromagnetic), Iterative methods, Succes-
 sive approximation method, Near field.

A general theoretical procedure was developed to take
 into account probe position errors when planar near-
 field data are transformed to the far field. If the probe
 position errors are known, one can represent the
 measured data as a Taylor series, whose terms con-
 tain the error function and the ideal spectrum of the
 antenna. Then one can solve for the ideal spectrum in
 terms of the measured data and the measured position
 errors by inverting the Taylor series. A more general
 solution can also be written by formulating the problem
 as an integral equation and using the method of suc-
 cessive approximations to obtain a general solution.
 An important criterion that emerges from the condition
 of convergence of the solution to the integral equation
 is that the total averaged position error must be less
 than some fraction of the Nyquist rate for the antenna
 under test.

 7p
 Pub. in Proceedings of Annual Meeting and Symposi-
 um of the Antenna Measurement Techniques Associa-
 tion (11th), Monterey, CA., October 9-13, 1989, p1-30-
 1-36.

Keywords: *Antennas, *Circular polarization, Electrical
 measurement, Reprints.

A new measurement technique that is used to meas-
 ure the polarization properties of dual port, circularly
 polarized antennas is described. A three antenna tech-

nique is used, and high accuracy results are obtained
 for all three antennas without assuming ideal or identi-
 cal properties. The technique eliminates the need for a
 rotating linear antenna, reduces the setup time when
 gain measurements are also performed, and reduces
 errors for antennas with low axial ratios.

 Stiles, and E. McFarlane. 1989, 6p
 Pub. in Proceedings of Annual Meeting and Symposi-
 um on Antenna Measurement Techniques Association
 (11th), Monterey, CA., October 9-13, 1989, p1-24-1-
 29.

Keywords: *Antennas, Electrical measurement, Bore-
 sights, Alignment, Error analysis, Tests, Reprints, Near
 field, Uncertainty.

The paper describes the results of electrical bore-sight
 measurement comparisons between the far-field and
 two near-field ranges. Details are given about the near-
 field alignment procedures and the near-field error
 analysis. Details of the far-field measurements and its
 associated errors are not described here, as the near-
 field technique is of primary interest. Results demon-
 strated a maximum uncertainty between the different
 ranges of 0.018 deg. An analytical error analysis that
 predicted a similar level of uncertainty was also per-
 formed. The error analysis can serve as the basis for
 estimating uncertainty in other near-field measure-
 ments of antenna bore-sight.

 86 and 88 Mar 90.

Keywords: *Microwave antennas, *Metrology, Antenna
 radiation pattern, Extrapolation,
 Polarization(Waves), Amplification, Transmitters, Re-
 ceivers, Accuracy, Reprints.

In the past, few antenna measurements above 30 GHz
 have been done by the National Institute of Standards
 and Technology (NIST). Recently, NIST has devel-
 oped the capability to do antenna measurements at
 frequencies from 30-65 GHz. The extrapolation tech-
 nique is used to determine the gain and polarization
 properties of antennas and probes with gains up to
 about 30 dB. The planar near-field technique is used
 for antennas with higher gains as well as for determin-
 ing far-field antenna patterns for frequencies up to 50
 GHz. The report describes the problems and the solu-
 tions for providing measurement capability at these
 frequencies. The problems that arise are primarily due
 to the small wavelengths at these frequencies requir-
 ing: much better accuracies in the manufacture of
 flanges, an improved technique for making insertion
 loss measurements, and improved probe positioning
 accuracy.

**Microstrip Patch Antenna as a Standard Transmit-
 ting and Receiving Antenna.**
 Final rept.
 M. Kanda. 1990, 4p
 Pub. in IEEE (Institute of Electrical and Electronics En-
 gineers) Transactions on Electromagnetic Compatibil-
 ity 32, n1 p5-8 Feb 90.

Keywords: *Microwave antennas, Antenna radiation
 pattern, Engineering standards, Experimental design,
 Impedance matching, Reprints, *Microstrip transmis-
 sion lines, *Antenna design.

The paper discusses the possibility of employing a mi-
 crostrip patch antenna as a standard transmitting or
 receiving antenna. The intrinsic properties of the sub-

Antennas

strate used for the antenna are determined by careful impedance measurements. Experimental results indicate that the transmitting characteristics of a microstrip antenna can be theoretically determined from its geometry. The microstrip patch antenna discussed is physically small (20-cm square for 450 MHz) and can be well matched to a 50-ohm power delivery system (SWR = 1.17).

Calibration and Meaning of Antenna Factor and Gain for EMI Antennas.

Final rept.
E. B. Larsen. 1986, 8p
Pub. in Item 1986 (Interference Technology Engineers' Master), p114-120 1986.

Keywords: *Metrology, *Antennas, *Amplification, Electromagnetic fields, Calibrating, Methodology, Reprints, *Antenna factor, Electromagnetic measurement.

The gain of an antenna is most commonly measured by comparing its output in a locally generated field to that of a 'standard' receiving antenna, whose gain is accurately known. This approach is called a 'relative' gain measurement. If the gain is determined without using another antenna having known gain, the procedure is called an 'absolute' gain measurement. The three techniques for determining absolute gain and antenna factor are described.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Antennas and Propagation AP-34, n12 p1425-1429 Dec 86.

Keywords: *Antennas, *Insertion loss, Linear systems, Dipoles, Computation, Reprints, Monopoles.

It is demonstrated that the insertion loss between pairs of thin, linear antennas may be calculated using fairly simple equations that are generally considered to be good engineering approximations. Although the insertion loss calculation does not involve antenna gain directly (some measurements are actually made in the near-field where gain is not defined), the result is precisely the quantity obtained using the antenna gains in Friis's transmission formula, assuming the mismatch losses are zero. Therefore, the antenna gain product is implicit in the more general insertion loss equations. The particular measurement of insertion loss used here yields a quantity called site attenuation by electromagnetic compatibility engineers. A close agreement between measured and calculated data provides confidence in the site attenuation calculations when the site is essentially perfect, and provides confidence in the gain product of the antenna pair calculated using basically the same equations as those used for insertion loss.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Phase modulation, Telecommunication, Navigation, Frequency measurement, Time measurement, Oscillators, *Phase noise, *Noise measurement, PAT-CL-307-529.

A phase modulator for use in a two-oscillator phase noise measurement system is placed in the line from either the reference oscillator or the device under test. The phase modulator couples a small portion of the input signal to an amplitude modulator and phase shifter to shift the small signal by exactly 90 degrees. The small signal portion is then coupled back into the input signal such that small variations in the coupled signal result in phase modulation and not amplitude modulation which would undermine the calibration of the instrument. The phase modulator described can also be used with known devices of many types to correct the added phase noise of components, e.g., power amplifiers.

Systematic Errors in Power Measurements Made with a Dual Six-Port ANA.

Technical note.
C. A. Hoer. Jul 89, 55p NIST/TN-1332
Also available from Supt. of Docs. as SN003-003-02963-7.

Keywords: *Network analyzers, *Bolometers, *Error analysis, Electronic test equipment, Telecommunication, Electric analyzers, Numerical analysis, Efficiency, Microwave equipment, Power measurement.

The purpose of the report is to determine the systematic error in measuring power with a dual 6-port Automatic Network Analyzer. Most of the report concentrates on developing equations for estimating systematic errors due to imperfections in the test port connector, imperfections in the connector on the power standard, and imperfections in the impedance standards used to calibrate the 6-port for measuring reflection coefficient. These are the largest sources of error associated with the 6-port. For 7 mm connectors, all systematic errors which are associated with the 6-port add up to a worst-case uncertainty of +/- 0.00084 in measuring the ratio of the effective efficiency of a bolometric power sensor relative to that of a standard power sensor.

Coaxial Intrinsic Impedance Standards.

Technical note.
R. T. Adair, and E. M. Livingston. Oct 89, 31p NIST/TN-1333
Also available from Supt. of Docs. as SN003-003-02987-4.

Keywords: *Impedance, *Network analyzers, *Calibrating, Electric analyzers, Electronic test equipment, Transmission lines, Microwaves, Standards, Scattering parameters.

The paper discusses how impedance standards are derived from the basic definition of impedance, constructed and used in metrology with coaxial air-line systems. Basic transmission line equations are reviewed with emphasis given to intrinsic or derived standards for obtaining the impedance in low-loss transmission line systems. A brief description is given of how impedance standards are used to calibrate the vector automatic network analyzer, and specifically, the six-port system automatic network analyzer used at the National Institute of Standards and Technology for calibration services in the radio frequency, microwave, and millimeter wave areas. Measurement uncertainties are given for 7 mm coaxial devices measured with the National Institute of Standards and Technology six-port system. The resolution of the six-port system is several orders more precise than that of the present impedance standards from which it is calibrated. Required improvements in the physical dimensions of air-line standards which permit the automatic network analyzer's capability to be more fully utilized are given.

Pub. in Jnl. of Applied Physics 63, n8 p2479-2491 1988.

Keywords: Josephson junctions, Electromagnetic noise, Reprints, *Mixers (Electronics), Superconducting junctions, Quantum effects, Gain.

The authors have made a systematic study of the gain and noise in SIS mixers employing Ta-based, Nb-based and Pb-alloy-based tunnel junctions. These junctions displayed both weak and strong quantum effects at a signal frequency of 33 GHz. The effects of energy gap sharpness and subgap current were investigated and are quantitatively related to mixer performance. Detailed comparisons are made of the mixing results with the predictions of the Tucker theory. Mixer performance was with a novel test apparatus which is accurate enough to allow for the first detailed tests of theoretical noise predictions. It was found that the Tucker theory underestimates the mixer noise temperature by a factor of about 2 for all of the mixers.

High-Current Very Wide-Band Transconductance Amplifier.

Final rept.
O. B. Laug. 1990, 6p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 39, n1 p42-47 Feb 90.

Keywords: *Broadband amplifiers, *Transconductance, Resistors, Bandwidth, Voltage amplifiers, Circuits, Electric potential, Broadband, Electric current.

A new design approach for a high-current, very wide-band transconductance amplifier is described. The approach is based on paralleling the input and output of complementary unipolar current-mirror cells. Each cell

has a fixed current gain determined by the ratio of two resistors. A differential input voltage-to-current circuit drives the cell array. The design has the advantage of avoiding the need for a single low-resistance current-sensing resistor and the attendant problems inherent in such resistors. Although the concept is still under development, a prototype of the cell-based transconductance amplifier was implemented with ten positive and ten negative current cells to gain some experimental familiarity with the approach in addition to providing verification of computer simulation results. The prototype transconductance amplifier is dc coupled, has a 3-dB bandwidth of about 750 kHz, and can deliver up to 35-A rms at 100 kHz with an output compliance voltage of 5-V rms. Other important characteristics such as output-load regulation and dc offsets are discussed.

Glimpse at Long-Term Effects of Momentary Overvoltages on Zinc Oxide Varistors.

Final rept.
F. D. Martzloff, and T. F. Leedy. 1989, 6p
Pub. in Ceramic Transactions 3, p306-311 1989.

Keywords: *Overvoltage, *Surges, *Varistors, Reliability, Circuit protection, Power supply circuits, Voltage regulation, Voltage regulators, Variable resistors, Life(Durability), Zinc oxides.

Because the prime function of varistors is the diversion of high energy surges, most of the attention is directed toward selecting the appropriate device rating to ensure long life under surge conditions. Some attention is also given to matching steady-state rating of the device to the power system voltage. However, during abnormal (and not well defined) power system conditions, the line voltage can reach values that will cause substantial current in the varistor. Until the effects of these momentary overvoltages are better identified and understood, there will be risk of near-term failure at worst and accelerated aging at best.

Keywords: *Mathematical models, *Voltage dividers, *Surges, *Measurement, Convolution integrals, Numerical analysis, Graphs(tables), Reprints.

A method to determine the suitability of a divider system for making measurements of high voltage transients is described. The method involves the convolution of the experimentally determined step response of the divider with various analytic waveforms which represent ideal waveforms expected in the experimental arrangement. The result of the convolution is compared, both graphically and in terms of relevant parameters such as peak amplitude and front time, with the original waveform. The procedure allows the distortion introduced by the convolution calculation to be seen clearly. The numerical implementation of the method is easily run on a personal computer.

Superconducting Tunnel Junction Receiver for 345 GHz.

Final rept.
E. C. Sutton, W. C. Danchi, P. A. Jaminet, and R. H. Ono. 1990, 18p
Sponsored by Army Research Office, Research Triangle Park, NC., National Aeronautics and Space Administration, Washington, DC., and National Science Foundation, Washington, DC.
Pub. in International Jnl. of Infrared and Millimeter Waves 11, n2 p133-150 1990.

Keywords: *Receivers, Electron tunneling, Far infrared radiation, Reprints, Superconducting junctions, Mixers(Electronics), Tunneling(Electronics), Noise temperature.

The authors discuss the design, fabrication, and testing of a quasi-particle tunnel junction receiver for use at 345 GHz. The design employs small area Nb/Nb-oxide/PbInAu edge junctions in order to keep the device capacitance small and maintain a modest value for omega (R sub N) C. For optimum noise performance and beam properties, the mixer is contained in a waveguide mounting structure. The best sensitivity was obtained at 312 GHz where a double sideband (DSB) noise temperature of 275 K was measured. Noise temperatures of 400 K (DSB) or better were obtained out to 350 GHz.

Protecting Computer Systems against Power Transients.

Final rept.
F. D. Martzloff. 1990, 5p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Spectrum 27, n4 p37-40 Apr 90.

Keywords: *Power supply circuits, *Computers, *Surges, Overvoltage, Overcurrent, Electromagnetic interference, Transient response, Circuit protection, Reprints.

Computers have emigrated from the sheltered life of computer rooms to the tougher environment of offices, factories, and homes where they encounter interfering or damaging transients. The article outlines general causes and remedies, and how to deal with surges and maintain the integrity of a small computer system. Small computer systems, especially the stand-alone type, can be protected in a do-it-yourself mode. More complex systems may need the help of a specialist. Two case histories illustrate the problems and solutions; steps required to determine protection needs are described, with generic guidance on selecting an appropriate protective device.

Power Quality Site Surveys: Facts, Fiction, and Fallacies.

Final rept.
F. D. Martzloff, and T. M. Gruzs. 1989, 15p
See also PB89-171656.
Pub. in Proceedings of International Power Quality Conference (1st), Long Beach, CA., October 15-20, 1989, p492-505.

Keywords: *Power supply circuits, *Surges, *Quality, *Site surveys, Overcurrent, Overvoltage, Circuit protection, Reprints, *Electronic equipment.

The quality of the power supplied to sensitive electronic equipment is an important issue. Monitoring disturbances of the power supply has been the objective of various site surveys, but results often appear to be instrument-dependent or site-dependent, making comparisons difficult. After a review of the origins and types of disturbances, the types of monitoring instruments are described. A summary of nine published surveys reported in the last 20 years is presented, and a close examination of underlying assumptions allows meaningful comparisons which can reconcile some of the differences. Finally, the paper makes an appeal for improved definitions and applications in the use of monitoring investments.

Precision Power Amplifier for Power/Energy Calibration Applications.

Final rept.
O. B. Laug, 1987, 7p
See also PB87-201687.
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement IM-36, n4 p994-1000 Dec 87.

Keywords: *Power amplifiers, Precision, Design, Reprints, Calibration, MOSFET, High voltage.

A precision power amplifier for use in power/energy calibration applications is described. The amplifier was primarily designed to boost the output amplitude of a digital generator to provide the nominal 120- or 240-rms voltage component of a 'phantom' calibration power source. The amplifier has a fixed gain of 40 and can provide a maximum output voltage swing of 970 V peak-to-peak or 340-V rms at 100-mA rms. The bandwidth is from dc to 150 kHz and at 60 Hz the observed no-load short-term amplitude and phase instabilities are + or - 5 ppm and + or - 5 micro rad, respectively. The amplifier design uses high-voltage N-channel MOSFET's in the output driver stage together with a unique circuit topology of opto-isolators between the low-level input stage and the high-level output stage.

Standards for Waveform Metrology Based on Digital Techniques.

B. A. Bell. 1990, 28p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n4 p377-405 Jul-Aug 90.

Keywords: *Standards, Analog to digital converters, Digital to analog converters, Electrical measurement, Waveform generators, Digital techniques, Sampling, *Waveform metrology, Calibration.

Over the last decade the use of digital synthesis and sampling techniques for generating and measuring electrical waveforms has increased dramatically with the availability of improved digital-to-analog (D/A) and analog-to-digital (A/D) converters and related devices. With this evaluation has come the need for physical laboratory standards and test methods to support the performance specifications of digital devices and the instruments in which they are used. The article describes the research and development at NIST of several laboratory standards and test systems that use 'digital technology' for characterizing data converters and for implementing various waveform synthesis and sampling instruments.

100 GHz SIS Quasiparticle Mixer with 10 dB Coupled Gain.

Final rept.
A. V. Raisanen, D. G. Crete, P. L. Richards, and F. L. Lloyd. 1987, 2p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) MTT-S International Microwave Symposium, Las Vegas, NV., June 9-11, 1987, p929-930.

Keywords: Extremely high frequencies, Josephson junctions, Microwave equipment, Reprints, *Mixers(Electronics), Superconducting devices, Quasi particles, SIS (Superconductors).

The authors have tested a superconducting quasiparticle mixer for 85-110 GHz which gives much larger coupled gain than has been previously observed. When operated with a negative dynamic resistance of about 2000 ohms, the maximum coupled gain was $(G \text{ sub } M)(\text{DSB}) = 12.5 \pm \text{or} - 2.5 \text{ dB}$ ($G \text{ sub } M(\text{SSB}) = 9.5 \pm \text{or} - 2.5 \text{ dB}$). The associated mixer noise temperature was 15.9 K (DSB). Large gain was also observed with large positive dynamic resistance, giving the lowest mixer noise temperature of 12.4 K (DSB).

High Current, Very Wide Band Transconductance Amplifier.

Patent.
O. B. Lang. Filed 21 Sep 89, patented 23 Oct 90, 10p PB91-100784, PAT-APPL-7-410 387
Supersedes PB90-238627.

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Transconductance, *Amplifiers, *Patents, Broadband amplifiers, Electron tube amplifiers, Resistors, *High current, PAT-CL-330-255.

A high-current, very-wide-band transconductance amplifier includes a differential voltage to current converter and a plurality of complementary unipolar current

mirror cells. The differential voltage to current converter isolates the input voltage terminal from the common side of the output load current terminal. A plurality of positive current mirror cells are connected in parallel and a plurality of negative current mirror cells are connected in parallel to avoid the need for a single low resistance current sensing resistor and the fabrication problems inherent in such resistors.

Quantum Efficiency Stability of Photodiodes.

Final rept.
R. Korde, and J. Geist. 1987, 7p
Pub. in Applied Optics 26, n24 p5284-5290 1987.

Keywords: *Photodiodes, *Quantum efficiency, Ultraviolet radiation, Stability, Moisture, Reprints.

The stability of the quantum efficiency of inversion layer, phosphorus diffused (n on p) and boron diffused (p on n) photodiodes has been investigated. Unsatisfactory silicon-silicon dioxide interfaces, latent recombination centers in the diffused layers and moisture absorption by the device were identified as possible causes of instability. The major result of this work is the demonstration that n on p photodiodes are inherently more stable than p on n types in the ultraviolet and blue spectral regions, but that stable p on n devices can also be produced with sufficient care.

Gallium Arsenide (GaAs)-Based Photoconductive Switches for Pulse Generation and Sampling Applications in the Nanosecond Regime.

Final rept.
B. A. Bell, A. G. Perrey, and R. A. Sadler. 1989, 6p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 38, n1 p92-97, 1 Feb 89.

Keywords: *Photoconductors, *Electric switches, *Pulse generators, Photoconductivity, Signal generators, Gallium arsenides, Electrooptics, Switching circuits, Optical communication, Reprints.

The paper describes the design of a set of optoelectronic switches having an interdigitated electrode structure and implemented with high resistivity GaAs photoconductive substrates. A theoretical analysis is developed for determining the pulsed light ON state resistance (peak conductance), OFF state (dark) resistance, and the associated capacitances for the various designed gap geometries. Data are provided on the processing steps used in successfully fabricating a working set of switches based on the theoretical design. A test apparatus is used to make measurements of the pulsed light conductance of these devices having nominal gap spacings of 5, 10, 20, and 40 micrometers.

Planar Silicon Photosensors: An Overview.

Final rept.

J. Geist, and A. R. Schaefer. 1990, 8p
 Pub. in Proceedings of International Forum on ASIC
 and Transducer Technology (3rd), Banff, Alberta,
 Canada, May 20-23, 1990, p32-38.

Keywords: *Photodetectors, *Semiconductor devices,
 *Technology assessment, Silicon, Accuracy, Preci-
 sion, Integrators, Complexity, Structural design, Re-
 prints.

Planar silicon photosensor technology, which is suit-
 able for integrating photosensors and circuits, is ad-
 vancing in four roughly orthogonal directions. These
 are (1) the accuracy with which the photosensor output
 signal can be related to the incident radiation, (2) the
 level of integration as measured by the number of pho-
 toensors in a system, (3) the level of integration as
 measured by the complexity of the processing of the
 photosensor output signals before presentation to a
 human observer or another system, and (4) the com-
 plexity of the photosensor structure. A brief overview
 of each of these areas accompanied by illustrative re-
 sults is presented.

**Measurement Standards to Support Photonics
 Technology.**

Final rept.

D. Franzen. 1990, 4p

Pub. in Proceedings of IEEE (Institute of Electrical and
 Electronics Engineers) Instrumentation and Measure-
 ment Technology Conference, San Jose, CA., Febru-
 ary 13-15, 1990, p326-328.

Keywords: *Standards, Primary standards, Optical
 measurement, Fiber optics, Reprints, *Photonics, Op-
 tical detectors, Optical fibers, US NIST.

Standards to support the emerging photonics/
 lightwave technology industry can be classified into
 two groups: physical primary standards maintained by
 national standards laboratories and standard meas-
 urement procedures agreed upon by domestic and
 international voluntary standards bodies. The meas-
 urement of absolute optical power leads the prioritized
 list of primary standards needs. The progress at NIST
 toward the development and distribution of optical
 power and other primary standards is reviewed. Stand-
 ard measurement procedures to characterize fiber,
 cables, sources, detectors, and lightwave systems
 have been the focus of domestic and international
 standards bodies for the past decade. The interaction
 between NIST and these standards groups to evaluate
 the precision and accuracy of several test methods will
 be reported.

**Surface-Field-Induced Feature in the Quantum
 Yield of Silicon Near 3.5 eV.**

Final rept.

J. Geist, J. L. Gardner, and F. J. Wilkinson. 1990, 6p
 Pub. in Physical Review B 42, n2 p1262-1267, 15 Jul
 90.

Keywords: *Photodiodes, *Silicon, Quantum efficien-
 cy, Energy gap, Ionization, Reprints, EV range 1-10.

A broad feature near 3.5 eV was observed in the inter-
 nal quantum-efficiency spectra of various silicon pho-
 todiodes. This appears to be the first time this feature
 has been reported. The feature was clearly resolved in
 spectra from photodiodes with strong surface fields at
 the oxide-silicon interface, but was small enough to
 preclude observation in a previously published spec-
 trum of field-free silicon. The feature is attributed to a
 local maximum in the quantum yield for electron-hole
 pair production that is expected at direct transitions in
 the vicinity of the Gamma point in the silicon Brillouin
 zone. Qualitative arguments suggest that the magni-
 tude of the feature increases with increasing surface
 field due to field-assisted impact ionization, and in the
 case of depleted surfaces, also due to band-gap nar-
 rowing in the surface-depletion region.

**Holographic Stereogram Displays from Computer-
 Generated Polygonal Models.**

Final rept.

T. R. Lettieri, J. C. Boudreaux, O. Manuar, H. Bandy,
 and C. Carew. 1987, 8p

Pub. in Proceedings of SPIE (Society of Photo-Optical
 Instrumentation Engineers) Display System Optics,
 v778 p61-67 1987.

Keywords: *Stereoscopy, *Holography, *Three dimen-
 sional display systems, Reprints, Geometric modeling,
 Computer aided design, Computer aided manufactur-
 ing, AMPLE system.

Holographic stereograms, which have potential use as
 3-D optical displays, have been made from stereo
 pairs of computer-generated, shaded, polygonal-solid
 models. The reconstructed virtual images from this
 type of hologram are more realistic than those from
 similar holograms made using simple wire-frame com-
 puter models. To generate the shaded polygonal
 models, the Automated Manufacturing Programming
 Language Environment (AMPLE) system, developed
 at NBS, was used. The computer images from AMPLE
 were photographed directly from a CRT screen onto
 35 mm slide film, with the CRT image rotated by 10
 deg about a vertical axis between adjacent photos in
 order to make the stereo pairs. A focused-image, white
 light hologram system was then used to convert the
 stereo 35 mm slide pairs into the final stereograms.

Low-Contrast Thermal Resolution Test Targets: A New Approach.

J. Geist, and D. B. Novotny. 1990, 16p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n6 p631-646, Nov/Dec 90.

Keywords: *Infrared imagery, *Infrared photometry, *Radiometry, Image resolution, Thermal radiation, Computer programs, *Thermal resolution targets, Thermal imaging.

A new type of thermal resolution test target optimized to minimize the effects of lateral thermal gradients at low thermal contrast is described. This target consists of thin-film inconel heater strips over an etched silica substrate bonded to an aluminum heat sink. A simple, finite-difference model is used to study how variations in target construction and materials affect the generated thermal resolution test pattern. The construction, testing, and use of this type of target to extend the lower end of the contrast range of a conventional target are described.

Calibrated Optical Fiber Power Meters: Errors Due to Variations in Connectors.

Final rept.
X. Li, and R. L. Gallawa. 1988, 8p
Pub. in Fiber and Integrated Optics 7, n3 p241-248 1988.

Keywords: *Fiber optics, *Power meters, *Errors, *Electric connectors, Optical communication, Calibrating, Measuring instruments, Power measurement, Error analysis, Adaptors, Reprints.

Potential errors in the measurement of optical fiber power when using a calibrated power meter with con-

nectors of various types and from different vendors is discussed. Data is given on the error and standard deviation due to biconic connectors from a limited number of vendors. The authors speculate that the error is due to reflecting surfaces on the connector end. To confirm the hypothesis, they tested two connectors whose reflective ends have noticeable differences. The data illustrates the differences seen among connectors. The data indicates that a user should expect measurement error in most cases. A call for caution based on the results was issued.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Industry Applications 26, n1 p151-159 Jan/Feb 90.

Keywords: *Transmission lines, *Power lines, *Transient response, *Electromagnetic pulses, Standards, Tests, Reprints.

According to a new standard of the International Electrotechnical Commission (IEC), a fast-transient test must be applied to the connecting cables of electronic equipment. The purpose of the test is to demonstrate equipment immunity to fast transients resulting from switching. Tests and simulations of the propagation and attenuation of these fast transients in typical connecting cables are described, placing the IEC requirements in perspective.

Transparent Thin Film Thermocouple.
Patent.
K. G. Kreider, and M. Yust. Filed 19 Dec 89, patented 13 Nov 90, 7p PB91-110635, PAT-APPL-7-452 439

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Thermocouples, *Patents, Temperature measuring instruments, Thermoelectricity, Thin films, Sputtering, Indium oxides, Indium tin oxides, PAT-CL-136-201.

A transparent thin film thermocouple, and a method of manufacturing, comprises a positive element of indium tin oxide (ITO) and a negative element of indium oxide (In₂O₃) formed on a surface by reactive sputtering with the elements being electrically joined to form a hot junction for conversion of heat into electricity.

Influence of Pressure and Humidity on the Medium and Long-Term Frequency Stability of Quartz Oscillators.

Final rept.
F. L. Walls. 1988, 5p
Pub. in Proceedings of Annual Symposium on Frequency Control (42nd), Philadelphia, PA., May 31-June 2, 1988, p279-283.

Keywords: *Humidity, *Frequency stability, *Pressure, *Crystal resonators, Oscillators, Frequency control, Environments, Atmospheric density, Moisture content, Precipitation (Meteorology), Quartz resonators, Reprints.

The medium- and long-term frequency stability of most quartz-crystal-controlled oscillators is degraded by various environmental effects. The most important of these are acceleration, temperature, load change, humidity and possibly pressure. The paper shows data which indicate that the medium- and long-term frequency stability of some oscillators can be improved by controlling the moisture and pressure around the oscillator. Measurements on four different quartz-crystal-controlled oscillators of three different designs yielded improvements of 2 to 5 in frequency stability for measurement times of 1 to 11 days. The frequency stability of one oscillator, with very low drift, improved to $3 +$ or $- 1 \times 10^{-13}$ for measurement times from 0.03 s to 21 days. Supplemental experiments indicate that the probable cause for these improvements is the stabilization of frequency changes due to moisture that corresponds to a fractional change in frequency of about 10^{-9} for a 100 percent change in the relative humidity at room temperature. If these improvements can be routinely obtained in other precision quartz-crystal-controlled oscillators, then they may become useful for some applications generally thought to require atomic standards.

Numerical Modeling of Capacitive Array Sensors Using the Finite Element Method.

Final rept.
P. R. Heyliger, J. C. Moulder, P. J. Shull, M. Gimple, and B. A. Auld. 1988, 8p
Pub. in Review of Progress in Quantitative Nondestructive Evaluation 7A, p501-508 1988.

Keywords: *Mathematical models, *Capacitors, *Detectors, Surface defects, Electric fields, Dielectrics, Electric conductors, Electron probes, Numerical analysis, Reprints, *Finite element method.

The electrostatic field equations governing the behavior of a capacitive array sensor are solved using a two-dimensional finite element method. The response of the probe to surface flaws in conductors and dielectrics is examined by calculating the change in the probe's admittance as it is scanned across the flaw. The change in admittance, ΔY , is obtained by evaluating a line integral involving the electrostatic potential and its normal derivative. Results of parametric studies are reported showing the relative effects of the specimen's dielectric constant and flaw size on probe signals.

Classical Phase Diffusion in Small Hysteretic Josephson Junctions.

Final rept.
J. M. Martinis, and R. L. Kautz. 1989, 4p
Grant N00014-88-F-0077
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Physical Review Letters 63, n14 p1507-1510, 2 Oct 89.

Keywords: *Josephson junctions, Microwave frequencies, Brownian movement, Simulation, Reprints, Phase diffusion, Critical current.

The existence of classical phase diffusion in hysteretic junctions is demonstrated by quantitative agreement between experimental and simulated I-V curves. The simulations are based on a circuit that accurately models both the junction and its external shunting impedance at microwave frequencies. It is shown that the bias current at which the junction switches from the phase-diffusion state to the voltage state is sensitive to dissipation at microwave frequencies.

Pub. in Metrologia 26, p229-234 1989.

Keywords: *Engineering standards, *Electrical resistivity, Comparison, Accuracy, Methodology, Capacitors, Resistors, Transport properties, Quantum electronics, Measurement, Reprints.

Ohm representations of the National Measurement Laboratory in Australia and the National Institute of Standards and Technology in the United States have been compared by four different methods. The methods involved the transport and intercomparison, over a fifteen-month time period, of three 1 ohm resistors on two occasions, one 10 k ohm resistor, three 10 pF capacitors on two occasions, and one quantized Hall device. The excellent agreement of the comparisons of the ohm representations omega(NML) and omega(NIST) obtained by the four methods provides rigorous tests of the accuracies of fifteen different measurement systems used at the two laboratories. The weighted mean of the difference between omega(NML) and omega(NIST) was found to be (1.3664 + and - 0.0081) ppm for 1 January 1986.

Special Test and Evaluation Methods Used for a Nine-Axis Accelerometer.
J. D. Ramboz. Oct 89, 39p NISTIR-89/4195
Contract DOT-HS-01709
Sponsored by National Highway Traffic Safety Administration, Washington, DC.

Keywords: *Accelerometers, *Miniaturization, Measuring instruments, Crash tests, Vibration, Transducers, Graphs(Charts), Sensitivity, Performance tests, Rotating bodies, Calibrating.

The test methods used to characterize and evaluate the performance of a miniature nine-axis accelerometer are discussed. A special transducer containing nine separate linear accelerometers were examined. The intended application for this type of device is to derive angular acceleration data for dynamic head motion measurements relating to automobile crash studies. The accelerometers, amplifiers, multiplexer, frequency modulation telemetry transmitter and power supply are all to be molded into an athletic orthodontic mouthpiece and data will be obtained from measurements taken from boxer's head motions. The transducer parameters tested include axial and transverse linear vibration sensitivities, equivalent acceleration noise, effects of power supply voltage variations, and mouthpiece vibration transmissibility. Special test apparatus described includes a dual centrifuge and a dual spin-axis rate-table. Test philosophy and some test results are used to illustrate how apparently conflicting test results can be used to explain transducer performance under test conditions of combined environments.

Calibration Procedures for Inductance Standards Using a Commercial Impedance Meter as a Comparator.
Y. M. Chang, and S. B. Tillett. Nov 90, 28p NISTIR-4466

Keywords: *Standards, Electrical measurement, Electrical impedance, Comparison, *Inductance standards, *Calibration, Maxwell-Wien bridges, Impedance measurement.

Procedures for calibrating customers' inductance standards using a commercial impedance meter to compare them with NIST inductance standards by a substitution method are reported. These procedures are based on a six-month evaluation of the meter by measuring a group of six NIST inductance standards of different values at a frequency of 1 kHz. For each inductance standard, the results of measurements with the meter and the Maxwell-Wien bridge, which is used to realize the henry at NIST, are analyzed to determine the stabilities of the standards and the impedance meter as well as to estimate the random transfer uncertainty of the meter measurements. Values of inductance obtained using the Maxwell-Wien bridge are compared with corresponding values of inductance obtained with the meter by substituting customers' inductance standards with the six NIST standards over a period of six months. The statistical analyses used to assure that measurements made using such procedures are in control are described, as well as future plans to expand the substitution technique to include other values of inductance standards at various frequencies.

Fabrication of Ultrasmall Nb-AIOx-Nb Josephson Tunnel Junctions.
Final rept.
J. M. Martinis, and R. H. Ono. 1990, 3p
Contract N00014-88-F-0077
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Applied Physics Letters 57, n6 p629-631, 6 Aug 90.

Keywords: *Josephson junctions, Aluminum oxide, Niobium, Capacitance, Fabrication, Reprints.

The authors describe a fabrication process to make Nb-AIO(x)-Nb edge junctions with areas as small as 0.0022 square micrometers and with current densities from 10 to 24 000 A/sq cm. The junction conductance was low for voltages below the superconducting

energy gap which indicates good quality tunnel barriers. Coulomb gap measurements obtained when the junctions were in the normal state were used to find the junction capacitance. Junction capacitance as small as 0.18 fF has been measured.

Report on an Interlaboratory Electromigration Experiment.
H. Schafft, T. Grant, J. Mandel, and J. Shott. Jun 86, 12p

Keywords: *Integrated circuits, *Metallizing, Separation, Failure(Mechanics), Ionic current, Reproducibility, Chips(Electronics), Wafers, Profilmeters, *Electromigration, *Very large scale integration, Kelvin resistance.

Electromigration is a metallization failure mechanism that is of concern for Very Large Scale Integration reliability. Ambiguities exist in the electromigration characterization of metallizations. These ambiguities are, in general, due to the different test structures and measurement methods used and to the incomplete reporting of the results from such characterizations. An interlaboratory experiment has been organized to address this problem. The purpose of the experiment is to assess the reproducibility of electromigration characterizations and to establish the technical base needed to develop guidelines for the design of electromigration test structures, for methods to measure the median time to failure of metallizations, and for reporting characterization measurements.

Electrical Characterization of Beta Silicon Carbide MIS (Metal-Insulator-Semiconductor) Capacitors with Thermally Grown or Chemical-Vapor Deposited Oxides.
Final rept.
J. J. Kopanski, and D. B. Novotny. 1989, 2p
Sponsored by National Aeronautics and Space Administration, Cleveland, OH. Lewis Research Center.
Pub. in Proceedings of Fall Meeting of the Electrochemical Society, Extended Abstracts, Hollywood, FL., October 15-20, 1989, p722-723.

Keywords: *Capacitors, *Silicon carbides, *Vapor deposition, Oxides, Oxide coatings, Silicon inorganic compounds, Semiconductor devices, Coating processes, *MIS(Semiconductors).

Metal-Insulator-Semiconductor capacitors were fabricated on beta silicon carbide single crystals. The insu-

lating layers were thermally grown oxides or chemical-vapor-deposited oxides. Various oxidation conditions and post-deposition densification treatments were investigated. Capacitors were characterized by capacitance-voltage measurements. The effects of measurement frequency, voltage sweep rate, illumination, and temperature (to 300C) on the C-V response were determined. Interface trap distributions were estimated from the high-frequency capacitance. Oxide fixed charges were 5 to 9 x 10 sup 11/sq cm and interface trapped charge density at mid-gap levels was 0.5 to 2.0 x 10 sup 11/sq cm/eV.

Selected-Area Channeling Pattern and Defect Etch Study of Silicon Implanted with Oxygen.

Final rept.

P. Roitman, and G. E. Davis. 1988, 3p

Sponsored by Defense Nuclear Agency, Washington, DC.

Pub. in Microbeam Analysis, p456-458 1988.

Keywords: *Silicon, *Oxygen, *Defects, *Chemical etching, Thin films, Silicon dioxide, Semiconducting films, Reprints, *Ion implantation, *SIMOX, *Electron channeling, Scanning electron microscopy.

Silicon films on buried oxide layers formed by oxygen implantation have been studied using selected area channeling patterns and chemical etching. Neither technique provides the detailed information on defect morphology available from cross sectional TEM, but both techniques appear capable of providing useful information on defect densities. Sample preparation is certainly easier for both than for TEM, and the channeling pattern approach is non-destructive. There is some promise that they can be extended to the case of lower defect densities, although it is not clear how far. The analysis of the channeling pattern data and the correlation of that analysis with film quality needs to be more firmly established.

Relationship between Accelerating Voltage and Electron Detection Modes to Linewidth Measurement in an SEM (Scanning Electron Microscope).

Final rept.

M. T. Postek, W. J. Keery, and R. D. Larrabee. 1988, 9p

Pub. in Scanning 10, n1 p10-18 Jan/Feb 88.

Keywords: *Integrated circuits, *Dimensional measurement, *Line width, *Metrology, Electron scattering, Backscattering, Reprints, *Scanning electron microscopy, *Very large scale integration, *VHSIC(Circuits), *Very high speed integrated circuits, Secondary electrons.

The basic premise underlying the use of the scanning electron microscope (SEM) for linewidth metrology in semiconductor research and production applications is that the video image acquired, displayed, analyzed, and ultimately measured accurately reflects the structure of interest. However, it has been clearly demonstrated that image distortions can be caused by the detected secondary electrons not originating at the point of impact of the primary electron beam and by the type and location of the secondary electron detector. These effects and their contributions to the actual image or linewidth measurement have not been fully evaluated. The basic intent of this work is to demonstrate the magnitude of the errors introduced by beam/specimen interactions and the mode of signal detection at a variety of beam acceleration voltages and to discuss their relationship to precise and accurate metrology.

Sponsored by National Science Foundation, Washington, DC., and Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Proceedings of KTI Microelectronics Seminar, San Diego, CA., November 6-7, 1989, p123-136.

Keywords: *Lithography, *Mathematical models, Integrated circuits, Microelectronics, Simulation, Algorithms, Reprints, *Microlithography, *Photoresists, Three-dimensional calculations.

A three dimensional planar substrate positive photoresist simulation process in optical microlithography is presented. The system includes components for the calculation of the aerial image, the exposure-bleaching of the resist material, and the dissolution process. Standard computational techniques are being employed for the aerial image. The exposure model uses a continuum approximation of the Berning's field equation in conjunction with a suitably chosen WKB approximation. The local mathematical equivalence of the solent diffusion system to the front propagation described by the eikonal system is employed by the dissolution algorithm. The algorithm does not produce shock waves or discontinuities in the developed profiles.

Interface Trap Effects on the Hot-Carrier Induced Degradation of MOSFETs (Metal Oxide Semiconductor Field Effect Transistors) during Dynamic Stress.

Final rept.

J. S. Suehle, T. J. Russell, and K. F. Galloway. 1987, 7p

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science NS-34, n6 p1359-1365 1987.

Keywords: *Dynamic hardness tests, *Static hardness tests, Degradation, Reprints, *MOSFET, Radiation hardening, Interface traps.

Foundry and hardened n-channel MOSFETs were stressed with dynamic AC pulses and with static DC voltages. The pre-rad hot-carrier induced degradation is much more severe in the dynamic case than in the static case for the hardened devices. The data suggest that the pre-radiation hot-carrier degradation is strongly influenced by the relative density of interface traps and by the pulse structure. The post-radiation hot-carrier degradation is mainly influenced by the amount of radiation induced fixed oxide charge.

Investigation of Photoconductive Picosecond Microstripline Switches on Self-Implanted Silicon on Sapphire (SOS).

Final rept.

P. Polak-Dingles, G. Burdge, C. H. Lee, A. C.

Seabaugh, R. T. Brundage, M. I. Bell, and J. Albers. 1987, 3p

Pub. in Proceedings of Topical Meeting on Picosecond Electronics and Optoelectronics Conference, Incline Village, NV., January 14-16, 1987, p79-81.

Keywords: Electrical resistivity, Radiation damage, Photoconductivity, Reprints, *SOS(Semiconductors), Amorphous silicon, Microstrip devices, Ion implantation, Picosecond time, Silicon ions, Raman effect.

Silicon and sapphire switches, damaged by implantation with 270 keV Si ions at fluence levels of 10 to the 12th power to 2 x 10 to the 15th power per sq cm, have been characterized by picosecond cross-correlation, Raman, and resistivity measurements. Response times as short as 9 ps were measured for an implant dose of 10 to the 14th power. Raman measurements indicate amorphous silicon is not formed until the dose reaches 2 x 10 to the 15th power per sq cm, but there is no further decrease in response time at the higher doses. The resistivity peaks at the same dose level the minimum response time is observed, and then decreases for higher dose. The mobility decreases monotonically with increasing implant dose. The authors found that the optimum implantation condition is one that produces heavy damage in the material without fully amorphizing the silicon. Amorphization decreases the on/off ratio of the device through reduction of both dark resistance and mobility, without increasing the speed of the device.

Semiconductor Measurement Technology: Thermal Resistance Measurements.

Special pub. (Final).

F. F. Oettinger, and D. L. Blackburn. Jul 90, 79p

NIST/SP-400/86

Also available from Supt. of Docs. as SN003-003-03035-0.

Keywords: *Integrated circuits, *Field effect transistors, *Thermal resistance, Electrical measurement, Computerized simulation, Infrared radiation, *Bipolar transistors, *MOSFET, *Very large scale integration, Infrared inspection.

The Special Publication reviews the thermal properties of power transistors and integrated circuits and discusses methods for characterizing these properties. The discrete devices discussed include bipolar transistors and metal-oxide-semiconductor field-effect-transistors. Measurement problems common to these devices, such as deciding the reason for requiring a particular measurement, adequate reference temperature control, selection of a temperature-sensitive electrical parameter, and separation of electrical and thermal effects during measurement are addressed. Due to the inherent difficulties in measuring and analyzing the thermal properties of active integrated circuits, an approach using specifically designed thermal test chips for evaluation of new die-attachment and packaging schemes is finding wide acceptance in the industry. In this Special Publication, indirect (i.e., electrical) measurements, direct (e.g., infrared) measurements, and computer simulation techniques for thermally characterizing integrated circuits are discussed in terms of their usefulness in characterizing VLSI packages.

Physics for Numerical Simulation of Silicon and Gallium Arsenide Transistors.

Final rept.

H. S. Bennett, and J. R. Lowney. 1990, 17p

Pub. in Solid-State Electronics 33, n6 p675-691 1990.

Keywords: Computerized simulation, Semiconductor doping, Charge carriers, Energy bands, Gallium arsenides, Reprints, *Silicon transistors, *Gallium arsenide transistors, Bipolar transistors, Metal oxide semiconductors.

The motivation for using computers to simulate the electrical characteristics of transistors is discussed. The authors' work and that of others in the area of device physics and modeling is described. The authors compare conventional device physics with an alternative approach to device physics that is more directly traceable to quantum-mechanical concepts. The authors then apply this new approach to quasi-neutral regions, space-charge regions, and regions with high levels of carrier injection. The limits for using theoretical results from uniform media in numerical simulations of devices with large concentration gradients are discussed. New calculations of the effective intrinsic carrier concentrations for gallium arsenide and silicon are also given. The authors conclude with examples of applying quantum-mechanically-based device physics to energy band diagrams for heterojunction bipolar transistors, MOS capacitors, and homojunction bipolar transistors.

Fabrication of Thin, Freestanding, Single-Crystal, Semiconductor Membranes.

Final rept.

K. C. Lee. 1990, 10p

Pub. in Jnl. of the Electrochemical Society 137, n8 p2556-2574 Aug 90.

Keywords: *Membranes, Single crystals, Semiconductor films, Microwave equipment, Gallium arsenides, Silicon, Etching, Dissolving, Wafers, Reviews, Reprints.

Freestanding, single-crystal, semiconductor membranes with thicknesses in the range of a few tens of nanometers to tens of micrometers are of increasing technological interest today. Their applications range from high speed electronic devices to electromechanical devices and pressure sensors. The review paper identifies two general classes of techniques for producing such thin membranes: dissolution of single-crystal wafers, and direct growth of single-crystal membranes. Numerous specific techniques in each general class are discussed. The discussion of each technique includes a brief explanation of the reason why it works, a description of the actual experimental implementation, an analysis of the range of thickness that can be produced, and the crystalline and electrical quality of the membranes. Unusual difficulties with implementing a technique, or special advantages of a technique are also noted. Since this review is intended to aid in the selection of a technique for producing thin semiconductor membranes when one has a particular application in mind, note is made of those applications for which the membranes produced with each technique are particularly well suited.

New Method of Extracting the Channel Length from the Gate Current of p-Channel MOSFETs.

Final rept.

J. S. Kim. 1990, 12p

Pub. in Solid-State Electronics 33, n8 p1097-1107 1990.

Keywords: *Metal oxide transistors, Electrical measurement, Electron tunneling, Carrier mobility, Field effect transistors, Capacitance, Resistance, Accuracy, Gates(Circuits), Experimental data, Semiconductors(Materials), Reprints, *MOSFET.

A new method for determining the channel length of p-channel MOSFETs is proposed and experimentally tested. The method is based on the relationship between the channel area and the body-to-gate current in the Fowler-Nordheim tunneling regime. The new method provides an alternative to conventionally used techniques, namely, the channel-conductance and the gate-capacitance methods, since it circumvents measurement interferences due to the parasitics encountered in these methods.

Semiconductor Technology for the Non-Technologist, Second Edition.

R. I. Scace. Sep 90, 39p NISTIR-4414

Keywords: *Semiconductor devices, Integrated circuits, Processing, Assembling, Process control, Transistors, Semiconductor diodes, Thyristors, Silicon, Reviews, *Semiconductors, Uses.

The properties of semiconductor materials, the methods of processing them, and the solid-state products made from them are described in terms intended to be understandable by the lay person. The semiconductor industry has grown at a rate of 21% per year compounded for the last twenty years, and its products have declined in unit cost by a factor of five in current dollars (a factor of ten in constant dollars) in the same period. This very satisfactory but anomalous behavior has attracted the interest of many who are not familiar with the technology of the industry, yet who need to have some understanding of it. The report is intended to help meet that need.

Turn-Off Failure of Power MOSFET's.

Final rept.

D. L. Blackburn. 1987, 7p

See also PB86-132610.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Power Electronics PE-2, n2 p136-142 Apr 87.

Keywords: *Metal oxide transistors, *Field effect transistors, Failure, Reprints, *MOSFET, Bipolar transistors, Second breakdown, Turn-off.

Experimental results of the failure of power MOSFET's during inductive turn-off are discussed. The electrical characteristics of these devices during failure are shown to be identical to those of a bipolar transistor undergoing second breakdown. Other comparisons of the power MOSFET failure and bipolar second breakdown are made. A nondestructive measurement system is used that allows repeated measurements of the failure characteristics as a function of various parameters to be made on a single device. It is shown that commercially available power MOSFET's do not fail as a result of dV/dt currents. Drain voltage slew rates up to 22 V/ns were studied. Other measurements show that the drain voltage at which failure occurs increases with temperature, the critical current above which failure occurs decreases with temperature, and the magnitude of the load inductance has no effect on the failure. The results of the study are consistent with the theory that activation of the parasitic bipolar transistor initiates the power MOSFET failure during turn-off.

Performance Trade-Off for the Insulated Gate Bipolar Transistor: Buffer Layer versus Base Lifetime Reduction.

Final rept.

A. R. Hefner, and D. L. Blackburn. 1987, 14p

See also PB87-134896.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Power Electronics PE-2, n3 p194-207 Jul 87.

Keywords: Mathematical models, Performance, Reprints, *Bipolar transistors, One-dimensional calculations, Tradeoffs, Lifetime.

A one-dimensional analytic model for the insulated gate bipolar transistor (IGBT), which includes a high-doped buffer layer in the low-doped bipolar transistor base, is developed. The model is used to perform a theoretical trade-off study between IGBT's with and without the buffer layer. The study is performed for devices of equal breakdown voltages, and the critical parameters chosen to 'trade-off' are turn-off switching energy loss (related to turn-off time) and on-state voltage, both at a given current. The results of the model predict that for equal breakdown voltages an optimized device with a buffer layer has less switching energy loss for a given on-state voltage than an optimized device with no buffer layer.

M. I. Bell, and D. A. McKeown. 1990, 4p
Contract DNA-IACRO-88-800
Sponsored by Defense Nuclear Agency, Washington, DC.
Pub. in Review of Scientific Instruments 61, n10 p2542-2545 Oct 90.

Keywords: *Optical reflectometers, *Reflectometers, Silicon dioxide, Thin films, Performance, Design, Reprints, *Semiconductors, Ellipsometry, Multilayers, Silicon on insulator, Ion implantation.

The design and performance of a high-precision optical reflectometer are described. This instrument has been optimized for measuring the specular reflectivity of thin films and multilayer structures of interest in semiconductor technology. Its design emphasizes high spectral and spatial resolution, photometric accuracy, and stray light rejection. Use of a spectrometer drive linear in wavenumber (energy) and a flexible data acquisition system facilitates data analysis. The performance of the reflectometer is demonstrated using a set of specimens consisting of silicon-dioxide layers on silicon substrates for which the oxide thicknesses had been determined by ellipsometry. Excellent agreement is obtained between the thicknesses derived from the reflectivity spectra and those determined ellipsometrically.

M. Gaitan, I. D. Mayergoyz, and C. E. Korman. 1990, 8p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electron Devices 37, n4 p1031-1038 Apr 90.

Keywords: *Metal oxide transistors, *Field effect transistors, Fixed points(Mathematics), Mathematical models, Reprints, *MOSFET, *Threshold voltage.

Simulation results are presented for a MOSFET with position and energy (potential) dependent interface trap distributions which may be typical for devices subjected to interface trap producing processes such as hot-electron degradation. The interface trap distribution is modeled as a Gaussian peak at a given position along the channel while the energy dependence is derived from C-V measurements from an MOS capacitor exposed to ionizing radiation. A novel fixed-point technique is used to solve the two-dimensional boundary-value problem. The technique is shown to be globally convergent for arbitrary distributions of interface traps. A comparison of the convergence properties of the Newton and fixed-point methods is presented, and it is shown that for some important cases the Newton technique fails to converge while the fixed-point technique converges with a geometric convergence rate.

Pub. in Proceedings of MRS Symposium on Electronic Packaging Materials Science IV, San Diego, CA., April 24-28, 1989, v154 p401-413.

Keywords: *Integrated circuits, *Reliability(Electronics), Gold intermetallics, Microelectronics, Metal films, Failure, Yield, Reprints, *Very large scale integration, *Wire bonds, Aluminum intermetallics, Silver intermetallics.

Materials problems have always been a significant cause of wire bond failures in microelectronics. However, modern VLSI materials, processing, and packaging methods combined often result in new or masked versions of old failure mechanisms. The paper describes the classical Au-Al intermetallic compound

problem as described by a new two-dimensional finite element diffusion model, and demonstrates that diffusion in poor welds is more rapid than in bulk couples. Failures resulting from modern bonding material couples (e.g., Cu-Au, Al-Ag, etc.) can result in bond failures superficially resembling Au-Al type failures. Failures resulting from bonds made to contaminated gold electroplated films are described, and a new failure model resulting from hydrogen in these films is shown.

Pub. in Jnl. of Applied Physics 68, n7 p3456-3460, 1 Oct 90.

Keywords: *Photoconductivity, Film resistors, Thin films, Silicon dioxide, Reprints, Photoinduced transient spectroscopy, Silicon films.

Photoinduced transient spectroscopy (PITS) was used to measure the persistent photoconductive (PPC) response in n-type separation by implanted oxygen (SIMOX) film resistors. A broadband, single-shot, flashlamp-pumped dye laser pulse was used to photoexcite interband electrons in the film, and the excess carrier population decay was measured at temperatures in the 60-220-K range. The PPC signals exhibit nonexponential character and the conductivity transients are recorded as a function of temperature for variable periods up to 30 s. The photoconductive data are analyzed by using the Queisser and Theodorou potential barrier model, and a logarithmic time-decay dependence is confirmed for the first time in SIMOX material. The hole-trap density at the conductive-film-buried-silica interface is calculated to be in the high 10 to the 15 power/cc to low 10 to the 16 power/cc range. The sensitivity of PITS is demonstrated to be appropriate for characterization of the SIMOX interface structure and for material qualification.

Pub. in Jnl. of Applied Physics 64, n5 p2754-2756 1988.

Keywords: Annealing, Wafers, Reprints, *Silicon on insulator, Ion implantation, Oxygen ions, Ellipsometry.

Silicon-on-insulator formed by high-dose and high-energy oxygen ion implantation in silicon, SIMOX, has been characterized nondestructively by multiple-angle ellipsometry using a He-Ne laser at 632.8 nm. A multilayered model exhibiting two interlayers, one between the top silicon and the buried oxide and the other between the buried oxide and the substrate silicon, offers a good representation of SIMOX. The distinction between low-temperature furnace anneal (1150 C) and high-temperature rapid thermal anneal (1150 C + 1350 C) on as-implanted wafers is manifested in terms of the optical properties of these transition regions. It is shown that the agreement between the theoretical model and the experimental results improves for the high-temperature annealed SIMOX.

The National Institute of Standards and Technology has begun a program supporting on-wafer scattering parameter measurements. In contrast to many previous NIST endeavors, the program seeks to transfer methodology into industrial measurement laboratories. The subject of the paper is the development of calibration techniques and algorithms, rather than physical standards, for the measurement of on-wafer scattering parameters. In particular, the authors discuss a TRL-based method which uses transmission lines as standards, but includes redundant measurements to improve calibration accuracy and bandwidth.

The National Institute of Standards and Technology has devised an improved version of the Doppler shift

General

method to measure the scattering levels of different sizes and types of microwave absorber. The technique is useful as an inexpensive and simple method for measuring individual absorber pieces with good accuracy and sensitivity. The system does not require a large anechoic facility nor a sophisticated measurement system for gating out background scattering. Reflectivity levels on the order of -80 dB can be measured and relative changes of 1 dB can be detected. Sample results for absorber with and without fire retardant salts and different sizes are presented.

It is known that sulfur hexafluoride (SF6), used as an insulating gas in HV apparatus, will oxidize in electrical discharges in the presence of oxygen or water vapor to

form various reactive and stable by-products. In order to meaningfully interpret experimental data on rates of oxidation and by-product formation in discharges, it is necessary to apply theoretical chemical kinetics models that utilize rates for numerous gas-phase processes as functions of gas temperature and/or electric field-to-gas density ratio (E/N). Current knowledge about the fundamental collision processes involving electrons, ions, free radicals, and molecules needed to understand the gas-phase discharge chemistry in SF6 is reviewed. Implications of the fundamental rate data reviewed here to recently proposed chemical-kinetics models of corona and glow-type discharges in SF6 are discussed.

Development of Standards for Superconductors.
Final Report. January 1988-December 1989.
L. F. Goodrich, R. B. Goldfarb, and S. L. Bray. Jan 90, 137p NISTIR-90/3935
Sponsored by Department of Energy, Washington, DC.

Keywords: *Superconductors, *Standards, Electrical measurement, Power supplies, Magnetization, Hysteresis, Superconducting wires, AC losses, Critical current, Reference materials, Niobium stannides, Interlaboratory comparisons, Circuit diagrams, Ripples.

A cooperative program with the Department of Energy, the National Institute of Standards and Technology, other national laboratories, and private industry is in progress to develop standard measurement practices for use in large-scale applications of superconductivity. The report describes research for the period January 1988 through December 1989. It contains the results of critical current studies on a large conductor Reference Material (RM), the effect of power-supply current ripple, the measurements of large conductors, and an interlaboratory comparison (round robin) of Nb3Sn wires. Short-range variations in magnetic hysteresis loss in multifilamentary Nb3Sn were studied. The results of participation in several interlaboratory comparisons are described.

Center for Electronics and Electrical Engineering: 1990 Program Description.
R. M. Powell. Apr 90, 35p NISTIR-90/4281

Keywords: *Electrical engineering, *Research management, *Center for Electronics Electrical Engineering, Organizational structure, Programs.

The report describes selected projects of measurement development that Center for Electronics and Electrical Engineering (CEEE) is addressing during fiscal year 1990. The report indicates the directions that these projects will take in the next few years. The report also describes selected accomplishments

during fiscal year 1989. Because of the size of CEEE and the scope of its work, only a representative sampling of these projects and accomplishments can be described in a document of this length. The report also outlines new programs of measurement development that CEEE has defined for future years.

Pressure Effects on Partial Discharges in Hexane under DC Voltage.
Final rept.
M. O. Pace, A. L. Wintenberg, T. V. Blalock, E. F. Kelley, and G. J. FitzPatrick. 1989, 6p
Sponsored by Department of Energy, Washington, DC. Electric Energy Systems Program.
Pub. in Proceedings of Annual Report Conference on Electrical Insulation and Dielectric Phenomena, Leesburg, VA., October 29-November 1, 1989, p87-92.

Keywords: *Electric discharges, *Hexane, Dielectric breakdown, Experimental data, Life(Durability), Photographic techniques, Dielectric properties, Electrical potential, Direct current, Reprints, *Pressure effects.

The pressure dependence of partial discharges (PD) has been experimentally investigated at a needle electrode in hexane from subatmospheric pressure (near hexane vapor pressure) to several atmospheres. Each PD produces a phase transition in the liquid near the needle which is photographed in synchronism with a characteristic pattern of current pulses. An image preserving optical delay allows photography to commence just before or at inception of the discharge. Individual current pulses comprising a characteristic pattern are resolved. The cathode event consists of a short pressure-insensitive inception phase, a pressure-sensitive growth at a decreasing rate, and finally a detachment and dissipation, sometimes with noticeable contraction before detachment; increased pressure reduces the growth rate and lifetime. The accompanying characteristic current pulse pattern always ceases during the growth of the PD. For the anode event, less extensive data similarly show slowing of growth with increased pressure and a (different) characteristic current pulse pattern.

Need for Research in Electronics Assembly Technology.
H. T. Bandy. Jul 90, 32p NISTIR-4368
Sponsored by Harry Diamond Labs., Adelphi, MD.

Keywords: *Electronics, *Production engineering, *Assembling, Technology assessment, Standardization, Process control, Precision, Statistical quality control, Flexibility, Technology innovation.

The National Institute of Standards and Technology assisted the Harry Diamond Laboratories in an effort to develop plans for a new program of research in electronics assembly technology. The need for research was investigated in the domains of precision engineering, system integration, and process control. Rather than engineering design problems, the emphasis was on principles, techniques, and standards that could help eliminate obstacles to widespread adoption of state-of-the-art technology in assembly plants. Current popular assembly methods as well as emerging new trends were studied. Research projects are recommended in the areas of (1) flexibility of equipment, (2) precision handling of components, (3) equipment interfaces, (4) equipment programmability, and (5) statistical process control.

Electric and Magnetic Dipole Radiation in a Random Medium.
Final rept.
D. A. Hill. 1990, 15p
Pub. in Electromagnetics 10, p279-292 1990.

Keywords: *Electromagnetic radiation, Magnetic dipoles, Far field, Reprints, Electric dipoles, Born approximation.

Electric and magnetic dipole radiation are studied for a medium where random, small-scale inhomogeneities are confined to a spherical shell region. Numerical results are presented for both the far-field pattern and the total radiated power. When the random inhomogeneities are located in the near field of the source, an electric dipole radiates a larger incoherent field than a magnetic dipole because of the electric dipole's larger reactive electric field.

Magnetic Dipole Excitation of an Insulated Conductor of Finite Length.

Final rept.

D. A. Hill. 1990, 7p

See also PB89-171664.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Geoscience and Remote Sensing 28, n3 p289-294 May 90.

Keywords: Magnetic dipoles, Electric conductors, Characteristic impedance, Reprints, *Induced current.

Excitation of currents on an insulated conductor of finite length with arbitrary terminations is studied for a magnetic dipole source. For matched terminations, the results agree closely with previous results for an infinitely long conductor, but other terminations produce end reflections that cause standing waves. Specific calculations are presented for a vertical magnetic dipole source, because this source produces the appropriate horizontal electric field and could be used in a borehole-to-borehole configuration. Numerical results for the induced current and secondary magnetic field indicate that long conductors produce a strong anomaly over a broad frequency range for any type of termination.

Propagation along a Two-Wire Line Located at the Air-Earth Interface.

Final rept.

D. A. Hill, and L. R. Anderson. 1990, 4p

Sponsored by Army Belvoir Research Development and Engineering Center, Fort Belvoir, VA.
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Geoscience and Remote Sensing 28, n3 p400-402 May 90.

Keywords: *Transmission lines, Electromagnetic wave transmission, Characteristic impedance, Dielectric properties, Reprints.

A simple quasi-static expression has been derived for the propagation constant of a two-wire transmission line located at the air-earth interface. A numerical solution of the mode equation shows that the quasi-static approximation is valid when the wire separation is much less than a free-space wavelength. The quasi-static approximation can be used to determine the complex dielectric constant of the earth from measurements of either the propagation constant or the characteristic impedance of the transmission line.

Calibration of dc Voltage Standards at NIST.

B. F. Field. 1990, 17p

Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n3 p237-253 May-Jun 90.

Keywords: *Standards, Avalanche diodes, *Voltage standards, *Calibration, Josephson effect, Standard cells.

The document describes the procedures used at NIST to calibrate dc voltage standards in terms of the NIST volt. Three calibration services are offered by the Electricity Division: Regular Calibration Service (RCS) of client standard cells at NIST; the Volt Transfer Program (VTP) a process to determine the difference between the NIST volt and the volt as maintained by a group of standard cells in a client laboratory; and the calibration of client solid-state dc voltage standards at NIST. The operational procedures used to compare these voltage standards to NIST voltage standards and to maintain the NIST volt via the ac Josephson effect are discussed.

Also available from Supt. of Docs.

Keywords: *Dielectrics, Electrodynamics, Microwave frequencies, Metrology, Anisotropy, Losses, *Reference materials, Hilbert transformation, Temperature dependence, Permittivity, Relaxation.

Dielectric reference materials are analyzed with respect to fundamental requirements of linearity, homogeneity and isotropy. Generalized frequency- and temperature-dependent dispersion relations are presented which allow the prediction of broadband dielectric behavior from limited measurement data, determination of valid modal field structure in cavity or waveguide fixtures, and identification of discrepancies and errors in measurement data. An approach for examining the influence of deviations of sample homogeneity on a precisely specified electromagnetic field structure is outlined, and sufficient conditions for isotropic, uniaxial, or biaxial anisotropic dielectric behavior are reviewed in terms of a material's chemical lattice physics. These characteristics direct the choices of suitable reference materials useful for confirming or improving the accuracy of dielectric measurements.

Comparison of Theoretical and Experimental Data for the Near Field of an Open-Ended Rectangular Waveguide.
Final rept.

D. I. Wu, and M. Kanda. 1989, 6p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electromagnetic Compatibility 31, n4 p353-358 Nov 89.

Keywords: *Electromagnetic fields, Far field, Comparison, Reprints, Open ended waveguides, Rectangular waveguides, Near field.

A comparison between theoretical and experimental data on the radiating near field of an open-ended waveguide (OEG) is presented. Two theoretical methods are examined. The first one is an approximation based on simple plane wave equations with the electric field expressed in terms of the gain of the OEG. The gain equation is an empirical equation obtained from scaled measured data. The second approach is based on far-field-to-near field transformations. Its purpose is to provide an alternate method for computing the fields as well as to provide a means of assessing the accuracy of the first approach. Theoretical data computed using both methods are presented along with measured data obtained in the anechoic chamber. The discrepancy between the two theoretical approaches is typically less than 0.5 dB (while the discrepancy between the theoretical and experimental results is small) and increases with the distance between the OEG and the field point.

Keywords: Signal processing, Frequency response, Radio frequencies, Errors, Reprints, *Sampling voltage trackers, Test methods.

An equivalent time sampling and digitizing system is described, together with test methods for characterizing its dynamic performance. Time base errors, linearity errors, step response parameters, and frequency response are considered, and typical measurement results are included. The system is capable of state of the art measurements at rf frequencies.

Characterizing Square and Triangular Waveforms.
Final rept.

G. N. Stenbakken. 1987, 3p
See also PB87-201653.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement IM-36, n4 p961-963 Dec 87.

Keywords: *Waveforms, Error analysis, Squares(Geometry), Triangles, Measurement, Sampling, Reprints.

A method has been developed for determining the parameters and errors of square and triangular waveforms, relative to idealized waveforms, even when the waveforms are highly distorted. The method is based on measurements obtained by sampling the waveform. Then, an idealized waveform is fitted to the sampled data using a least squared error algorithm. The errors in the waveform are defined as the deviations between the data samples and the ideal waveform. Also, the parameters of the measured waveform are defined as the corresponding parameters of the fitted ideal waveform.

Keywords: Griffiss Air Force Base, Rome Air Development Center, Electromagnetic shielding, Electromagnetic pulses, Radio frequencies, Electrical measurement, Test facilities, Weapons systems, Performance evaluation, Graphs(Charts), *Reverberation chambers, *Electromagnetic susceptibility.

The report describes measurement procedures and results from evaluating a small reverberating chamber located at Rome Air Development Center (RADC), Rome, New York. The chamber was developed for measuring and analyzing the electromagnetic susceptibility/vulnerability (EMS/V) of weapon systems and the radio frequency (rf) shielding effectiveness of enclosures and materials. A brief description of the facility is given, including instrumentation for its evaluation and calibration by the National Institute of Standards and Technology (NIST). Work was done earlier at NIST to evaluate the RADC large reverberating chamber. A follow-on project to construct and evaluate a small chamber is discussed in the report. Conclusions are that the chamber can be used at frequencies down to 500 MHz for cw testing, and for pulsed rf immunity testing with pulse widths as short as 0.3 microsec. Estimates of measurement uncertainties are given.

Electrical Fast Transient Tests: Applications and Limitations.

Final rept.
F. D. Martzloff, and T. F. Leedy. 1989, 8p

See also PB90-271529.
Pub. in Conference Record of the IEEE (Institute of Electrical and Electronics Engineers) Industry Applications Society Annual Meeting, Part 2, San Diego, CA., October 1-5, 1989, p1625-1632.

Keywords: Transmission lines, Power lines, Process control, Tests, Reprints, *Transients.

The Technical Committee TC 65 of the International Electrotechnical Commission (IEC) has promulgated a new document requiring demonstration of the immunity of industrial process control equipment to fast transients occurring in power and data lines. These fast transients contain high-frequency components, intuitively expected to suffer greater attenuation than the lower frequency components as they propagate along the lines. Quantifying this intuitive expectation provides a perspective on the severity of the situation and helps defining realistic test requirements. To that end, the paper describes specific measurements conducted for typical low-voltage power line configurations; modeling of the attenuation provides a tool for understanding the significance of the line parameters and extends the usefulness of results to general cases.

Superconducting Inductance Bolometer with Potential Photon-Counting Sensitivity: A Progress Report.

Final rept.
J. E. Sauvageau, and D. G. McDonald. 1988, 8p
Pub. in Proceedings of International Conference on Optical Radiometry, London, England, April 12-13, 1988, p39-46.

Keywords: *Bolometers, Inductance, Sensitivity, Prototypes, Reprints, Superconducting devices, Microstrip devices, Temperature dependence.

The bolometer is based on the temperature dependence of the inductance of a superconducting microstrip line. As the device is superconducting, it has no Johnson noise. It can be impedance matched to an optimized SQUID preamplifier, the quietest of all amplifiers, and its bias current is relatively unrestricted by self heating. It is shown theoretically that this device can have a sensitivity comparable to that of an optical photon counting detector, or a NEP(sub e) of 5.4×10^{-18} to the -18 power W/square root of (Hz). The authors' experimental prototype device is designed to test the theory of operation, but not at the highest levels of sensitivity.

Also available from Supt. of Docs. as SN003-003-03055-4. Sponsored by Army Electronic Proving Ground, Fort Huachuca, AZ. Electromagnetic Environmental Effects Div.

Keywords: *Electromagnetic compatibility, *Test facilities, Radio frequencies, Electrical measurement, Performance evaluation, Transmission lines, Vulnerability, Graphs(Charts), *Reverberation chambers, TEM cells, Scale models.

The report summarizes the measurement and evaluation of a 1/10 scaled model TEM/reverberating chamber developed as a single, integrated facility for testing radiated electromagnetic compatibility/vulnerability (EMC/V) of large systems over the frequency range, 10 kHz to 40 GHz. The facility consists of a large shielded enclosure configured as a transverse electromagnetic (TEM), transmission line-driven, reverberating chamber. TEM mode test fields are generated at frequencies below multimode cutoff, and mode-stirred test fields are generated at frequencies above multimode cutoff. Both the chamber's cw and pulsed characteristics are measured and analyzed. The report also discusses the basis for such a development including the theoretical concepts, the advantages and limitations, the experimental approach for evaluating the operational parameters, and the procedures for using the chamber to perform EMC/V measurements. A full-scale chamber that will provide a test volume of 8 m x 16 m x 30 M is proposed. Some projections of the full-scale chamber's estimated characteristics and operational parameters are also given.

Software Techniques to Improve Data Reliability in Superconductor and Low-Resistance Measurements.

L. F. Goodrich, and A. N. Srivastava. 1990, 15p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n5 p575-589 Sep/Oct 90.

Keywords: *Electrical measurement, *Superconductivity, Computer applications, Figure of merit, Critical current, Electrical resistivity, Reliability(Electronics), Temperature dependence, Data editors, Outliers.

Software techniques have been developed to take low-amplitude data in various patterns, assign a figure of merit to a set of data readings, edit data for erroneous readings (or other experimental variations), and to alert the experimenter if the detected errors are beyond the scope of the software. Erroneous voltage readings from digital voltmeters, intermittent electrical connections, and an array of similar variations in data have been detected through the use of a data editor. The fixed-limit data editor removes readings that are inconsistent with the distribution of the majority of the data readings. The frequency of erroneous readings from a particular digital voltmeter ranges from 1 error per 100,000 readings to 1 error per 100 readings. The magnitude of the error can be as large as 3% of full scale with a zero volt input to the voltmeter. It may be necessary to have multiple meters measuring voltages in the same circuit in order to generate these erroneous readings. The software techniques described here have been used in a variety of measurements, such as resistance-versus-temperature measurements made on cryoconductors or superconductors, and voltage-versus-current measurements made on superconductors to determine the critical current.

Keywords: *Surges, *Power transmission lines, *Electric fields, *Dielectrics, Dielectric breakdown, Kerr cells, Kerr electrooptical effect, Power lines, Chemical detection, Graphs(Charts), Electric corona, Mathematical models, Electric discharges, *Gaseous dielectrics, *Liquid dielectrics, Resistive high voltage dividers.

The report documents the technical progress in four investigations which make up the project 'Support of Research Projects for Electrical Energy Systems,' funded by the U.S. Department of Energy and performed by the Electricity Division of the National Institute of Standards and Technology (NIST). Specifically these investigations include: (1) an evaluation and critique of techniques for measuring ambient magnetic fields in support of epidemiological and in vitro studies of biological field effects; (2) development of techniques for detecting the toxic gas S2F10 in SF6 and measuring its production rate from corona discharges in SF6; (3) optical and electrical measurements of pre-breakdown partial-discharge phenomena in dielectric liquids; and (4) development of improved electro-optical methods for measurement and characterization of fast, transient high-voltage impulses. The work discussed in the report is part of an ongoing research activity at NIST.

Coupling, Propagation, and Side Effects of Surges in an Industrial Building.

Final rept.

F. D. Martzloff. 1990, 11p

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Industry Applications 26, n2 p193-203 Mar/Apr 90.

Keywords: *Electromagnetic wave transmission, *Surges, *Power lines, Measurement, Data transmission, Electromagnetic interference, Data links, Industrial buildings, Reprints.

Measurements were made in an industrial building to determine the propagation characteristics of surges in the ac power wiring of the facility. The surges, of the unidirectional type or the ring-wave type described in American National Standards Institute/Institute of Electronics and Electrical Engineering Standard C62.41-1980, were injected at one point of the system and the resulting surges arriving at other points were

measured. The results show how unidirectional surges couple through transformers and produce a ring wave component in the response of the system. An unexpected side effect of these surges, applied to the power lines only, was the apparent damage suffered by the data line input components of some computer-driven printers.

Pub. in Fuel 67, n1 p45-57 Jan 88.

Keywords: *Chemical analysis, Molecular weight, Gas chromatography, Aromatic hydrocarbons, Aliphatic hydrocarbons, Nuclear magnetic resonance, Reprints, *Coal extracts, High performance liquid chromatography, Mass fragmentography, Polycyclic hydrocarbons.

A two-step pyridine and then tetrahydrofuran solvent extraction procedure at room temperature under nitrogen gas flow was used to extract two different U.S. coals, PSOC-592 (Illinois No. 5) and PSOC-521 (Rock Springs No. 7, Wyoming). Aliphatic and aromatic hydrocarbons were separated using neutral alumina column chromatography. The aromatics were then fractionated according to the number of aromatic carbons by high performance liquid chromatography (HPLC). These neutral compounds were identified by gas chromatography (GC) and gas chromatography/mass spectrometry (GC/MS). n-Alkanes (C17-C31), pristane, phytane, hopanes (17 alpha H, 21 beta H), and moretanes (17 beta H, 21 alpha H) were found in aliphatic fractions of both coal extracts. Low-Molecular-weight (2-4 rings) polycyclic aromatic hydrocarbons (PAH) were the major compounds in the aromatic fraction of the PSOC-592 coal extract. However, pentacyclic triterpenoid-like hydroaromatic hydrocarbons were the major components in the extract of the PSOC-521 coal. A number of new compounds were identified for the first time. Complementary structural information was obtained from (1)H and (13)C NMR analysis of the isolated fractions.

Microbial Metal Leaching and Resource Recovery Processes.

Final rept.

G. J. Olson, and F. E. Brinckman. 1989, 8p

Pub. in Frontiers in Bioprocessing, p412-419 1989.

Keywords: *Biodegradation, Ores, Reprints, *Metal leaching, *Biotechnology, *Resource recovery.

Microbiologically catalyzed reactions are important in copper recovery from dump leaching operations in the western United States and are also commercially employed in uranium bioleaching in Canada. There is strong interest worldwide in extending bioleaching technologies to strategic and precious metal-containing ores and wastes. Microorganisms important in ore leaching are also being considered for precombustion removal of sulfur from coal or demetalation of other fossil fuel sources essential to environmentally acceptable energy sources. Controlled bioprocessing schemes, employing bioreactors and optimized conditions, are near for precious metal-containing ores. However, knowledge is still incomplete regarding key fundamental mechanisms of microbial metal ore dissolution, genetics of ore leaching bacteria, microbial ecology of the ore leaching environment, and the full range of metals transformations catalyzed by microorganisms. NBS research therefore aims at investigating critical microbial adhesion and its importance in bioleaching, dissolution pathways of strategic metal-containing ores and wastes by microorganisms, iron ore beneficiation and development of quantitative standards for metal ore bioleaching.

Keywords: *Orifice flow, *Natural gas, *Orifice meters, Mathematical models, Test facilities, Flow meters, Gas meters, Venturi meters, Reynolds number, Gas flow, Experimental data.

The report describes the data acquisition systems and procedures used in the American Petroleum Institute (API)-sponsored orifice discharge coefficient project performed in natural gas flows and conducted at the test loop of the Natural Gas Pipeline Company of America (NGPL) in Joliet, Illinois. Measurements of orifice discharge coefficients for 6- and 10-inch diameter orifice meter runs were made using critical venturis for mass flowrate measurement with associated measurement of pressures and temperatures. Eleven venturis were calibrated at the Colorado Engineering Experiment Station, Inc. (CEESI). Measurements of absolute and differential pressure and temperature for venturi and orifice meter conditions were made using an automated data acquisition system. Temperature and pressure measurements were directly related to U.S. national measurement standards. Daily calibration of absolute and differential pressure transducers using pressure working standards was designed into the measurement procedures. Collected over a 2-year period, the database contains tests on 44 orifice plates in 8 beta ratios for two meter sizes (6- and 10-inches). The database contains 1,345 valid test points.

As part of the Department of Energy/Oak Ridge National Laboratory Building Equipment Research program, the National Institute of Standards and Technology constructed an experimental, easily reconfigurable, water-to-water, breadboard heat pump apparatus in order to compare pure R22 to nonazeotropic refrigerant mixtures. Performance of the heat pump charged with a range of compositions of the binary mixtures R22/R14 and R13/R12 were compared to R22. The advantage claimed for mixtures in this application is improved thermodynamic efficiency as a result of gliding refrigerant temperatures in the evaporator and condenser in low lift, high glide applications typical of air conditioning. 9 refs., 24 figs., 4 tabs.

An automated, microcomputer controlled instrumentation system developed for in-situ measurements of the earth temperatures and soil thermal conductivities at different depths and for calculating the heat losses from the underground district heating pipes is described. Step-by-step use and operation procedures of the developed heat loss measuring system and computer software package are presented. The heat loss rates and locations of underground pipes are calculated from the measured values of soil thermal conductivity and the earth temperatures around the pipes using the non-linear least squares method. The thermal probe technique was used to estimate the heat loss rates and the depths of buried steam supply and condensate return pipes installed at the James Madison University, Harrisonburg, Virginia.

Quantification of Heat Losses through Structural Supports for Shallow Trench Heat Distribution Systems.

J. B. Fang. Oct 89, 106p NISTIR-89/4134
Sponsored by Tri-Service Building Materials Committee, Washington, DC.

Keywords: *Heat loss, *District heating, *Pipes(Tubes), *Supports, Distribution systems, Mathematical models, Heat transmission, Thermal insulation, Heat transfer, Structural members, Finite element method.

Shallow trench heat distribution systems generally contain numerous structural supports which are often in direct contact with hot carrier pipes and form highly conductive heat flow paths, and are major sources of heat loss. Quantification of the heat loss caused by thermal bridges due to pipe supports and prediction of thermal fields were achieved using three finite element computer models of two-dimensional, steady-state heat conduction within a rectangular concrete trench containing two insulated pipes with and without pipe supports, and the surrounding earth. The theoretical basis, computational scheme, and the data input and outputs of the developed computer programs for sample calculations are described. Two trench pipe support systems studied include the horizontal anchoring and the vertical supports. The thermal bridges due to structural supports contribute approximately 17 times more to total heat loss compared to similar pipes with no pipe supports.

Thermal Analysis of Directly Buried Conduit Heat Distribution Systems.

J. B. Fang. Aug 90, 97p NISTIR-4365
Sponsored by Tri-Service Building Materials Committee, Washington, DC.

Keywords: *District heating, *Thermal analysis, *Pipes(Tubes), *Distribution systems, *Military facilities, Heat loss, Heat transmission, Thermal insulation, Computer programs, Heat transfer, Mathematical models, Finite element method.

The calculations of heat losses and temperature field for directly buried conduit heat distribution systems were performed using the finite element computer programs. The finite element analysis solved two-dimensional, steady-state heat transfer problems involving two insulated parallel pipes encased in the same conduit casing and in separate casings, and the surrounding earth. Descriptions of the theoretical basis, computational scheme, and the data input and outputs of the developed computer programs are presented. Numerical calculations were carried out for predicting the temperature distributions within the existing high temperature hot water distribution system and two insulated pipes covered in the same metallic conduit and the surrounding soil. The predicted results generally agree with the experimental data obtained at the test site.

Initial Laboratory Evaluation of a Single Solution Circuit Cycle for Use with Nonazeotropic Refrigerants.

M. Buschmeier, W. Mulroy, and D. Didion. Oct 90, 46p NISTIR-4406
Contract DE-AC05-84OR21400

Prepared in cooperation with Hanover Univ. (Germany, F.R.). Sponsored by Department of Energy, Washington, DC., and Oak Ridge National Lab., TN., and Martin Marietta Energy Systems, Inc., Oak Ridge, TN.

Keywords: *Thermal cycling tests, *Air conditioning, Refrigerants, Mixtures, Heat pumps, Heat transfer, Graphs(Charts), Technology assessment, *Single solution circuit, Nonazeotropic refrigerant mixtures, Laboratory tests.

Tests were conducted at the National Institute of Standards and Technology (formerly National Bureau of Standards) to evaluate a single solution circuit cycle for use with nonazeotropic refrigerant mixtures. The single solution circuit cycle incorporates a liquid refrigerant pump in parallel with a compressor. This allows separate control of refrigerant composition to match load and of refrigerant temperature change (glide) in the two-phase region to match the heat source or sink temperature glide. Load matching by composition shifting to match light loads was found to be an inefficient air conditioning mode control strategy. Nonlinearity of enthalpy vs. temperature in the two-phase region of the tested nonazeotropic refrigerant mixture (R22/R11) limited the efficiency gains possible by glide matching to a 19% improvement over pure R22. The cycle did function as intended, allowing glide matching over a wide composition change. It is felt that with a more linear refrigerant, substantial efficiency gains over the normal vapor compression cycle would be possible for applications in which the heat source and sink glides vary substantially with load.

NBS (National Bureau of Standards) Life-Cycle Cost (NBSLCC) Program (for Microcomputers).

Software.
S. Petersen, and R. T. Ruegg. Jan 90, 1 diskette NBS/SW/DK-90/006

The software is contained on 5 1/4-inch diskettes, double density (360K), compatible with the IBM PC microcomputer. The diskettes are in the ASCII format. Price includes documentation, PB86-180253.

Keywords: *Software, *Buildings, *Economic analysis, Forecasting, Prices, Diskettes, *Life cycle costs, *Energy conservation, L=BASIC, H=IBM PC.

The diskette provides the NBSLCC programs and related files referenced in NBS SP 709, Comprehensive Guide for Least-Cost Energy Decisions. The National Bureau of Standards Life-Cycle Cost (NBSLCC) programs perform economic analysis of buildings, building systems and components with special emphasis on energy conservation projects. The NBSLCC program (Vers. 2.32) contains the 1989 U.S. Department of Energy's energy price forecasts, as released in January 1990. The NBSLCC program has had a number of enhancements, including color screens and highlighted menus that make it easier for the user to decide what to do next. Several small bugs were removed from the program. Software Description: The software is written in the BASIC programming language for implementation on an IBM/PC or compatible microcomputer under the MS-DOS operating system. Memory requirement is 64K.

Energy Prices and Discount Factors for Life-Cycle Cost Analysis 1991. Annual Supplement to NIST Handbook 135 and NBS Special Publication 709.

Annual rept.
B. C. Lippiatt, and R. T. Ruegg. Oct 90, 62p NISTIR-85/3273-5
See also PB86-223104, PB87-180253, PB88-138227, and PB90-219858. Sponsored by Federal Energy Management Program, Washington, DC., and Department of Energy, Washington, DC. Federal Energy Management Program Staff.

Keywords: *Cost analysis, *Prices, Residential buildings, National government, Fuels, Present worth, Economic analysis, Electric appliances, Tables(Data), *Life cycle costs, *Energy supplies, Energy conservation, Energy policy.

The 1991 annual edition of energy prices and discount factors supports the Federal life-cycle costing methodology by updating the energy price projections and discount factors that are described, explained, and illustrated in NIST Handbook 135 (HB 135). The data are provided as an aid to implementing life-cycle cost evaluations of potential energy conservation and renewable energy investments in existing and new federally owned and leased buildings. It supports private-sector life-cycle cost analysis by updating the energy price indices that are described, explained, and illustrated in NBS Special Publication 709 (SP 709). It also supports the Energy Conservation Mandatory Performance Standards for New Federal Residential Buildings (10 CFR 435) by providing a table of factors for updating appliance label values.

A simple, inexpensive, accurate method of measuring surface reaction probabilities (beta) of depositing species has been developed. This method has been applied to low-power silane discharges, obtaining beta = 0.4 for typical, high-film-quality deposition conditions. Explaining this result will require further developments, such as introducing more than one type of surface bond, in current deposition models. A method has also been developed to measure the spatial distribution of depositing species between the electrodes of a deposition discharge. This method has been applied to low-power, RF silane discharges under conditions in which excellent a-Si:H film quality is obtained. This has unmistakably verified rapid H reactions with SiH sub 4, and the dominance of SiH sub 3 deposition, and several other conclusions of the "standard model" reported here. In particular, it supports the predictions of the model regarding the cause of film-quality deterioration at high powers, partly the result of a loss in SiH sub 3 deposition by SiH sub 3 + SiH sub 3 reactions. 10 refs., 3 figs. Comparison of Experimental and Calculated Performance of Integral Collector-Storage Solar Water Heaters.
Final rept.
A. H. Fanney, and S. A. Klein. 1987, 7p
Pub. in Solar Energy 38, n5 p303-309 1987.

Keywords: *Experimental data, Hot water heating, Performance evaluation, Predictions, Comparison, Re-

prints, *Solar water heaters, Solar collectors, Thermal energy storage equipment.

Experimental measurements of the monthly performance of an integral collector-storage solar water heater for a one-year period are compared with performance predictions using the method of Zollner et al. The prediction method requires two parameters which were obtained from indoor experiments with a solar simulator. The experimental measurements are also compared with predictions in which the two parameters were obtained from short-term outdoor tests.

The United States Federal Nonnuclear Energy Research and Development Act of 1974 (Public Law 93-577) established a comprehensive national program for research and development of all potentially beneficial energy sources and utilization technologies. One part of the Act directs the National Bureau of Standards (NBS) to evaluate all promising nonnuclear energy-related inventions, particularly those submitted by independent inventors and small companies, for the purpose of obtaining direct grants for their development from the Department of Energy (DOE). NBS established the Office of Energy-Related Inventions (OERI) do to these evaluations.

Keywords: *Combustion Control, *Furnaces, Air Pollution Abatement, Carbon Dioxide, Carbon Monoxide, Combustion Kinetics, Efficiency, Flue Gas, Fuel-Air Ratio, Hydrocarbons, Industry, Nitrogen Oxides, Opacity, Operation, Oxygen, Sulfur Dioxide, ERDA/400800, ERDA/010800, ERDA/500200.

This study evaluated O sub 2 and CO monitoring systems used for combustion controls to provide reliable data on their performance, operating range and accuracy. The study concentrated on three in-situ O sub 2 and two in-situ CO monitoring systems which are applicable to furnace and boiler controls. The project provides technical information for cost/benefit analysis of combustion control systems and to help expedite implementation of combustion control technology by industry. The evaluation of the stack gas monitoring systems was carried out for ranges of furnace operating parameters such as fuel to air mixture ratio, burner firing rate, heat extraction rate, fuel type, combustion air preheat temperature, and cyclic operating conditions, which are based on information gathered from typical operational practices of representative industrial furnaces and boilers. The experiments were performed in the NBS experimental furnace under both natural gas and No. 2 fuel oil fired conditions. An on-line gas sampling/analysis system was used as a reference system for comparative evaluation of the stack gas monitors. The system is set up to determine the level of CO, CO sub 2, O sub 2, NO/NO/sub x/ and total hydrocarbons in the stack gases. (ERA citation 10:046905)

Comparison of the Chromotropic Acid and Pararosaniline Methods for Measuring Formaldehyde Concentrations of Pressed-Wood Product Emissions.

Final rept.

S. Silberstein. 1990, 5p

Sponsored by Consumer Product Safety Commission, Washington, DC.

Pub. in American Industrial Hygiene Association Jnl. 51, n2p102-106 1990.

Keywords: *Formaldehyde, *Chemical analysis, *Wood particle boards, Concentration(Composition), Comparison, Performance evaluation, Test chambers, Reprints, *Air pollution detection, *Indoor air pollution, Chromotropic acid, Pararosaniline.

Formaldehyde concentrations of particleboard emissions in special measuring chambers were determined by both the chromotropic acid and pararosaniline methods, and the results were compared. Airborne and formalin-based calibration methods were compared also. An additional experiment was done to consider the possibility that aspects of the measuring

system other than the calibration could bias results obtained from either analytical method. Synthetic formaldehyde atmospheres were substituted for pressed-wood products in the measuring chambers, and the concentrations were measured by both the chromotropic acid and pararosaniline methods. Formaldehyde concentrations determined by chromotropic and pararosaniline methods agreed both on synthetic formaldehyde atmospheres and on emissions from five lots of particleboard from four different manufacturers.

Development of Multicomponent Parts-per-Billion-Level Gas Standards of Volatile Toxic Organic Compounds.

Final rept.

G. C. Rhoderick, and W. L. Zielinski. 1990, 12p

Pub. in Monitoring Methods for Toxics in the Atmosphere, ASTM STP (American Society for Testing and Materials Special Technical Publication) 1052, p63-74 1990.

Keywords: *Gas analysis, *Hazardous materials, *Standards, Waste disposal, Calibrating, Concentration(Composition), Performance evaluation, Gravimetric analysis, Microanalysis, Reprints, *Air pollution detection, *Volatile organic compounds, *Air quality, *Incineration, *Air pollution sampling, Toxic substances, Trace amounts.

The demand for stable, low-concentration multicomponent standards of volatile toxic organic compounds for quantifying national and state measurements of ambient air quality and hazardous waste incineration emissions has markedly increased in recent years. In response to this demand, a microgravimetric technique was developed and validated for preparing such standards; these standards ranged in concentration from several parts per million (ppm) down to one part per billion (ppb) and in complexity from one organic up to 17. Studies using the gravimetric procedure to prepare mixtures of different groups of organics, including multicomponent mixtures in the 5 to 20 ppb range, revealed a very low imprecision. The procedure is based on the separate gravimetric introduction of individual organics into an evacuated gas cylinder, followed by the pressurized addition of a precalculated amount of pure nitrogen. Additional studies confirmed the long-term stability of these mixtures. The uncertainty of the concentrations of the individual organics at the 95% confidence level ranged from less than 1% relative at 1 ppm to less than 10% relative at 1 ppb. Over 100 primary gravimetric standards have been developed, validated, and used for certifying the concentrations of a variety of mixtures for monitoring studies.

Comparison of Liquid Chromatography with Fluorescence Detection and Gas Chromatography/Mass Spectrometry for the Determination of Polycyclic Aromatic Hydrocarbons in Environmental Samples.

Final rept.

S. A. Wise, L. R. Hilpert, G. D. Byrd, and W. E. May.

1990, 18p

Pub. in Polycyclic Aromatic Compounds 1, n1-2 p81-98 1990.

Keywords: *Environmental surveys, *Chemical analysis, *Aromatic polycyclic hydrocarbons, Gas chromatography, Mass spectroscopy, Fluorescence, Comparison, Sediments, Particles, Reprints, Standard reference materials, Liquid chromatography, Water pollution detection, Air pollution detection, Sediment-water interfaces.

Liquid chromatography (LC) with fluorescence detection and gas chromatography/mass spectrometry (GC/MS) have been compared for the determination of polycyclic aromatic hydrocarbons (PAHs) in a variety of environmental samples. Three sets of data are presented in the paper in which LC/fluorescence and GC/MS were used for the analysis of the same samples. These three data sets include the comparison of results from: certification measurements for three natural matrix Standard Reference Materials (SRMs), an international round robin for the determination of PAHs in air and diesel particulate samples, and the analysis of four marine sediment reference materials. The re-

Air Pollution & Control

sults from these studies indicate that the two techniques generally provide comparable results for the measurement of PAHs in environmental samples (in the range of 0.1 to 300 micrograms), with differences in the two techniques between 5-20%. However, at low levels, anthracene and perylene are best measured using LC/fluorescence because of their selective and sensitive fluorescence detection characteristics. In contrast, GC/MS provides more accurate results for the determination of benzo(ghi)perylene because of its low-fluorescence sensitivity.

Gas sampling and subsequent analysis was carried out in a prototype Navy Firefighter Trainer to determine whether toxic species would be released to the environment by the Trainer. The Trainer uses propane gas for fires, and makes artificial smoke by vaporizing the smoke agent, butylated triphenyl phosphate, in hot air. There was concern that the smoke agent would react with the propane flame to form toxic products. No evidence of reaction or toxic species beyond those to be expected from a clean propane flame was found.

Pub. in Atmospheric Environment 24A, n3 p467-474 1990.

Keywords: Atmospheric composition, Fly ash, Aerosols, Coal, Comparison, Reprints, *Tracer techniques, Isotope applications.

A theoretical comparison has been made between intentional elemental and intentional isotopic tracers for the study of the fate of emissions into the atmosphere. The use of an elemental tracer requires a very large signal to background ratio because the latter cannot be determined while the tracer experiment is in progress. It is shown that the variation in the ambient background is the major source of uncertainty for the elemental tracer. The use of a stable isotopic tracer is definitive because the isotopic composition of the background is constant and can be measured in real time during the isotopic analysis of the sample. It is concluded that stable isotopic tracers are inherently superior to elemental tracers; however, this conclusion now needs to be demonstrated in an actual field experiment.

Research has shown that burning can be an effective means to remove oil from the surface of the water. The combustion characteristics of crude oil have been measured in large laboratory tests using a nominal one meter diameter pool fire. The work reports on progress mid-way through a 2 1/2 year research program. The objective of the research is to develop measurement equipment and calculations that can be used to characterize oil spill burning at operational scale during field trials of the technology. Field scale measurement techniques for fire radiation, smoke yield, particulate sampling, plume trajectory are described. Progress in the calculation of particulate deposition downwind of the burn site is presented.

Pub. in Environmental Science and Technology 24, n9 p1418-1427 1990.

Keywords: *Aromatic polycyclic hydrocarbons, *In situ combustion, Burning rate, Crude oil, Water pollution control, Combustion products, Smoking, Concentration(Composition), Reprints, *Environmental impact assessments, *Oil spills, *Air pollution sampling, Cleanup operations.

The work involved an investigation of some of the factors necessary to assess the environmental impact of an in situ burn: the fraction of an oil layer that can be burned, the quantity of smoke, and the concentrations of 18 polycyclic aromatic hydrocarbons (PAHs) in the smoke, crude oil, and burn residue. While burning the crude oil produced less total PAHs than were in the original crude oil, the concentrations of PAHs with five or more rings were 10-20 times greater in the smoke than in the oil. By consuming much of the oil spill and reducing the amount of PAHs in the water, and by dispersing the combustion products over a larger area, in situ burning can mitigate the local environmental impact of an oil spill. There appears to be a range of conditions, such as in Arctic ice fields, where in situ burning might be the most viable cleanup method.

Pub. in Materials Research Society Symposium Proceedings, v199 p157-166 1990.

Keywords: *Membranes, *Asbestos, Particle size, Electron microscopy, Replicating, Reliability, Reprints, Air sampling, Laboratory tests.

For studies of particles suspended in air or water, material is commonly deposited onto membrane filters. Submicrometer particles collected in or on the surface of the filters can be prepared for analysis by transmission electron microscopy by extraction replica methods. To identify the problems and artifacts generated during the preparation process, evaluations were made of replicas prepared internally at NIST and prepared by laboratories involved in the analysis of air-collected asbestos. Problems or artifacts that could affect the counting and analysis of asbestos particles were identified and characterized. Results of evaluations of replicas prepared by eighteen laboratories in an interlaboratory study are summarized.

Effects of Systematic Error, Estimates and Uncertainties in Chemical Mass Balance Apportionments: Quail Roost II Revisited.

Final rept.
D. H. Lowenthal, R. C. Hanumara, K. A. Rahn, and L. A. Currie. 1987, 10p
Pub. in Atmospheric Environment 21, n3 p501-510 1987.

Keywords: *Error analysis, Aerosols, Multivariate analysis, Reprints, *Mass balance, *Simulation test data, Emission factors.

The Quail Roost II synthetic data set II is used to derive a comprehensive method of estimating uncertainties for chemical mass balance (CMB) apportionments. Objective diagnostic procedures are applied to data set II to identify collinear sources and evaluate the effects of collinearity on source-strength estimates and their uncertainties. All sources contributing to a series of aerosol samples must be considered when calculating uncertainties for source strengths estimated by CMB apportionments. Covariance in source-strength estimates can be due to collinearity and systematic errors in source specification and composition. Unless covariances as well as variances of source-strength estimates for a series of samples are used to propagate errors, estimated uncertainties may be unrealistically low.

Toxic Potency of Fire Smoke: Measurement and Use.

Final rept.
B. C. Levin, and R. G. Gann. 1990, 9p
Pub. in Fire and Polymers: Hazards Identification and Prevention, ACS Symposium Series No. 425, Chapter 1, p9-11 1990.

Keywords: *Toxicity, *Smoke, *Fires, *Hazards, Chemical properties, Combustion products, Measurement, Gas analysis, Models, Exposure, Reprints, N-gas model.

Accurate measurement of the toxic potency of smoke is a key to reducing human life loss in fires. The paper summarizes the approaches taken in measuring toxic potency and highlights four needed issues still to be researched. Direct comparison of only toxic potency values is not a valid means of determining the fire safety of materials and is not sufficient for evaluating fire hazard. The paper describes the N-Gas Model (a new method of assessing toxic potency) and two approaches (in which toxic potency is one of the factors) for assessing fire hazard: (a) HAZARD I, a comprehensive tool for calculating the outcome of a fire, and (b) a fire hazard index for comparing the contributions of alternative materials to the toxicity component of fire hazard.

pollution sampling, Comparative evaluations, Marine environments.

Di- and tributyltin compounds present in marine and estuarine waters at sub-parts per billion (less than micrograms/liter) levels were determined using two different chemical speciation procedures. Generally, good analytical agreement was obtained from split samples independently analyzed by a simultaneous hydride generation-dichloromethane extraction procedure followed by gas chromatographic separation and flame photometric detection (GC-FPD, performed at the National Bureau of Standards) and by a hydride generation procedure followed by purge and trap collection with boiling-point separation and atomic absorption detection (HG-AA, performed at the Naval Ocean Systems Center). Sea water samples containing tributyltin at sub-p.p.b. levels can be stored frozen (-20 C) in polycarbonate containers for up to 2-3 months without any serious loss of analyte.

Preliminary Radon Progeny Measurements in Three Federal Office Buildings.

Final rept.
S. Silberstein, and R. A. Grot. 1990, 8p
Pub. in Environmental Radon: Occurrence, Control and Health Hazards, p201-208 1990.

Keywords: *Radon, *Office buildings, Comparison, Houses, Reprints, *Indoor air pollution, *Air quality, *Daughter products, *Air pollution sampling, Federal agencies.

The National Institute of Standards and Technology conducted preliminary radon progeny measurements of three Federal buildings as part of an indoor air quality study. Progeny levels in two buildings in the Washington metropolitan area were extremely low compared to levels commonly found in houses. The progeny levels of a Portland building were closer to typical house levels. The results suggest that measurements of additional buildings would be promising in finding construction and operating methods that could be applied to lower radon progeny levels of residences.

Review of Current Research and Activities Involving Characterization, Abatement and Disposal of Lead-Containing Paint Films.

M. E. McKnight. May 90, 14p NISTIR-90/4285

Keywords: *Paints, *Waste disposal, Regulations, Research projects, Abatement, Measurement, Maintenance standards, Decontamination, Air pollution, *Lead paint poisoning, *Solid wastes, Characterization, Domestic wastes.

In response to a recent regulation for abating lead-based paint in housing and other environmental regulations, research projects and other activities are being conducted to provide information on procedures for carrying out abatement and maintenance of lead-containing paint films in a safe and cost-effective manner. Relevant Federal regulations, and current research projects and other activities addressing the issues are reviewed.

Development of Test Methods to Determine the Compatibility of Liquid Hazardous Materials with Polyethylene Packagings.

Final rept. 18 Jun 89-18 Dec 89.
J. M. Crissman. May 90, 52p NISTIR-4346
Contract DTRS-57-89-X-00121
Sponsored by Department of Transportation, Washington, DC. Research and Special Programs Administration.

Keywords: *Hazardous materials, *Packaging materials, *Polyethylene, Materials handling, Transport properties, Transportation, Plastics, Polymers, Permeability, Peroxy organic compounds, Compatibility, Methodology, Tests, Tables(Data), Hydrocarbons, *Liquid waste disposal, Transport regulations, Packaging rules.

The report describes work done for the Department of Transportation, Office of Hazardous Materials Transportation to develop test methods which can be used to determine whether a liquid hazardous material may be shipped in a specific type of polyethylene packaging. Current federal regulations require that each prospective lading be tested individually in proposed polyethylene packagings and do not make provision for liquids which may be unstable at 21 C. One area being explored is the possibility of dividing the liquids into groups and authorizing the transportation of all the liquids in the group based on tests done using one standard liquid from that group. The feasibility of basing compatibility tests on the use of standard liquids is assessed and recommendations are made as to the conditions under which such a scheme can be used. An empirical scheme known as the 'Permachor' method for ranking the permeability of liquid hazardous materials is proposed.

Chlorine Mass Balance in the Combustion of Refuse-Derived Fuel.

Final rept.
K. L. Churney, A. E. Ledford, T. J. Buckley, and E. S. Domalski. 1988, 10p
Pub. in Proceedings of Biennial National Waste Processing Conference on Technical Communication: A Key to the Future (13th), Philadelphia, PA., May 1-4, 1988, p47-56.

Keywords: *Chlorine, Combustion products, Calcium oxides, Calorimeters, Thermochemistry, Reprints, *Refuse derived fuels, *Mass balance, Municipal wastes, Waste utilization.

Chlorine mass balance studies have been carried out in the combustion of municipal solid waste (MSW) using the combustor of the NBS multikilogram capacity flow calorimeter. This arrangement allows for a more accurate examination of the combustion chemistry of MSW than is possible in a real-world incinerator. The changes in the distribution of chlorine between the volatile and the nonvolatile combustion products caused by the addition of lime to the MSW are discussed.

Burning, Smoke Production, and Smoke Dispersion from Oil Spill Combustion.

D. Evans, G. Mulholland, D. Gross, H. Baum, W. Walton, and K. Saito. Oct 89, 58p NISTIR-89/4091
Also available from Supt. of Docs. Prepared in cooperation with Kentucky Univ., Lexington. Sponsored by Minerals Management Service, Reston, VA.

Keywords: *Smoke, *Combustion, *Crude oil, *Water pollution, Energy transfer, Assessments, Burning rate, Toluene, Decanes, Vaporizing, Fuels, Estimates, Fires, Measurement, Dilution, *Oil spills, Particulates, Downwind.

The combustion of crude oil layers floated on water were studied to assess the potential of using combustion to mitigate oil spills. Burning rates for n-decane,

Water Pollution & Control

toluene and Alberta Sweet crude oil were measured in a 1.2 m diameter pool. These were used to estimate the energy transfer rate required to vaporize the fuel as part of an energy balance at the liquid surface. Smoke emission per unit of fuel consumed was dramatically reduced in the case of burning oil layers thin enough to cause boiling in the supporting water layer. A new aging/dilution facility is described that allows for measurement of optical properties and sedimentation velocities as the smoke ages. These characteristics are important in estimating smoke properties downwind of the oil spill fire. A formulation is presented that will provide for estimates of downwind particulate deposition of the fire smoke for a steadily burning oil spill.

Hospital Energy Analysis Toolkit (HEAT): User Manual.
 Final rept.
 S. F. Weber, and B. C. Lippiatt. Sep 90, 23p NISTIR-4408, NIST/SW/DK-90/012A
 For system on diskette, see PB90-504036. Sponsored by Public Health Service, Rockville, MD.

Keywords: *Cost effectiveness, Benefit cost analysis, Heating, Cooling, Documentation, *Hospital administration, *Energy conservation, Decision support system.

The Hospital Energy Analysis Toolkit (HEAT) is a menu-driven microcomputer software program designed to help facility managers of existing hospitals evaluate the cost effectiveness of specific Energy Saving Methods (ESMs). The program estimates the energy savings and cost effectiveness of specific ESMs in a user-defined hospital environment. Hospitals are defined in terms of an unlimited number of actual functional space zones, each modeled after one of 21 prototype zones. For each defined zone, the user specifies the floor area, and for some zones the user specifies the types of heating and cooling systems, the percentage of space being actively used, and the window orientation. The user also defines an Energy Saving Plan by specifying the current and planned status of each energy parameter applicable to the particular zone. HEAT then computes and reports the energy and economic savings resulting from the Plan. A benchmarking function lets users compare current energy use of the entire hospital with national norms to see whether further analysis is warranted. HEAT offers easy-to-use menus and function keys, on-line help screens, and data validation.

Measuring Medical Cost and Life Expectancy Impacts of Changes in Cigarette Sales.
 Final rept.
 B. C. Lippiatt. 1990, 18p
 Sponsored by Consumer Product Safety Commission, Bethesda, MD.
 Pub. in Preventive Medicine 19, n5 p515-532 Sep 90.

Keywords: *Tobacco, *Smoking, *Sales, *Economic models, Economic analysis, *Cigarettes, *Health economics, *Life expectancy, *Health care costs.

A change in cigarette sales triggers changes in medical-care costs and in years of life expectancy. Changes in sales result from changes in excise tax policy, agricultural policy, cigarette design, smoking behavior, or anti-smoking laws. The model uses data on medical costs, life expectancy, cigarette price elasticity, and smoking demographics to estimate medical-cost and life-year impacts for any change in cigarette sales. It takes into account the medical costs incurred by quitters over their extra years of life, the asymmetry of impacts for increases and decreases in sales, and the delayed medical effects for ages not yet subject to the health risks of smoking. For example, a 1% decrease in U.S. cigarette sales increases life expectancy in the United States by 1.45 million years and increases medical-care costs by \$405 million for ages 25 to 79. This amounts to only \$280 in added medical costs for each extra year of life. By generating aggregate health impacts at the margin, the model becomes a valuable tool for evaluating programs that affect smoking.

Reference data in support of energy programs.
 Final report.
 Progress rept.
 M. W. Chase. 19 Mar 90, 13p DOE/ER/13494-T1 Contract A101-86ER13494
 Sponsored by Department of Energy, Washington, DC. Portions of this document are illegible in microfiche products.

Keywords: *Research Programs, Chemistry, Data Base Management, Data Processing, Education, Fracture Mechanics, Grants, Information Systems, Materials Testing, Optimization, Physics, Planning, Progress Report, Recommendations, Resource Management, *Standards, Technology Transfer, EDB/990300.

The Standard Reference Data (SRD) of the National Institute of Standards and Technology conducted a program for compilation and evaluation of physical, chemical, and materials properties data relevant to energy research and development. This report provides a description of the manner in which the program was run and a report of the results. The basis for DOE support for this program on reference data was the realization that data from the results of basic and applied research need to be compiled and evaluated in order to: (a) more effectively transfer research results into development and process design, (b) build a body of reliable data on which estimation and prediction methods can be based, and (c) provide guidance to researchers about gaps in available data and areas in which further research is needed.

pH Sensors Based on Iridium Oxide.
 Formal rept. Sep 87-Jun 89.
 M. J. Tarlov, K. G. Kreider, S. Semancik, and P. Huang. Mar 90, 22p
 Also available from Supt. of Docs. Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.

Keywords: *Indium oxides, *Thin films, *pH, *Measurement, Stability, Sensing films, Reactive sputter deposition.

Results are presented on the pH-potential response of d.c. magnetron reactively sputtered iridium oxide films. The films exhibit a nearly Nernstian response to pH, no hysteresis effects, and minimal response to ionic interferences. Sensitivity to certain redox species is observed, however. In addition, methods are discussed for preparing model iridium oxide sensor surfaces for ultrahigh vacuum surface analytical studies. Stoichiometric IrO₂-like surfaces are shown to be relatively inert to gas phase water. However, hydroxylation of IrO₂-like surfaces can be induced by rf water plasma treatment.

 This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Surface roughness, *Light scattering, *Microscopes, *Patents, *Scanning scattering microscopes, TIS method, PAT-CL-250-571.

A method and apparatus produce two-dimensional micrographs of the overall surface microtopography of a given specimen by using a photodetector to measure the off-specularly reflected light from a focussed light beam which is projected through a hemispherical mirror onto the specimen surface as the specimen surface is scanned by the focussed beam of light. Scanning can be accomplished either by moving the specimen surface as a result of moving the sample holding member or by moving the focused beam of light by means of a light beam deflection device.

Report of the National Conference on Weights and Measures (74th).
 Special pub.
 A. D. Tholen, C. S. Brickenkamp, and A. Heffernan-Turner. Sep 89, 254p NIST/SP-771
 Held in Seattle, Washington, July 16-21, 1989. Also available from Supt. of Docs. as SN003-003-02977-7. Library of Congress catalog card no. 26-27766.

Keywords: *Standards, *Measurement, *Meetings, Abstracts, Flow measurement, Specifications, Metrology, Regulations, Calibrating.

The 74th Annual Meeting of the National Conference on Weights and Measures (NCWM) was held at the Westin Hotel in Seattle, Washington during the week of July 16 through 21, 1989. The theme of the meeting was 'National Uniformity Benefits Everyone.' The Conference set standards for equipment and sales practices in the area of cash/credit pricing of retail motor fuel, and also adopted a specification that permits the use of electronic data audit trails to be used for security assurance. Sweeping changes to the Uniform Weights and Measures Law and the Uniform Weighmaster Law were also adopted; if a State chooses to adopt these new standards, a system of administrative hearings and civil penalties could serve as an alternative to criminal prosecution.

 Pub. in Advances in Cryogenic Engineering, v34 p67-73 1988.

Keywords: *Thermal conductivity, *Thermal insulation, *Thermal measurements, *Calorimeters, Cryogenics, Reprints, Computerized control systems.

Modern temperature, pressure and flow sensors along with a high speed digital control system have been incorporated into an existing thermal conductivity apparatus (ASTM C745). The system has also been modified to include the use of liquid helium as the refrigerant, if desired. The apparatus can be used to study thermal conductivity in the temperature range from 4K to room temperature. Preliminary results on insulating materials indicate that the system update has significantly improved the precision and operational characteristics of the apparatus. Basic principles of operation, sources of system error and the reduction of system error by application of digital control and modern sensors are discussed. Preliminary data are presented.

Surface Phenomena and Their Influence on Ultra-high Vacuum Gauges.
 Final rept.
 T. E. Madey. 1987, 1p
 Pub. in Jnl. of Vacuum Science and Technology A 5, n5 p3249 1987.

Keywords: *Vacuum gages, *Ionization gages, Pressure measurement, Ultrahigh vacuum, Surface chemistry, Reprints, *Surface reactions.

To a surface scientist, a hot filament ionization gauge is a remarkably complex device whose operational properties are determined by a wide range of surface processes. The hot filament itself is a rich source of surface chemistry, including thermal desorption of gases, gas-solid reactions, and atomization of gases. Its electron emission characteristics are controlled by fractional monolayers of impurities, and its life-time is limited by surface reactions and the formation of volatile products. Electron bombardment of the grid of the gauge can lead to heating of the grid, causing thermal desorption, or to electron stimulated adsorption and desorption (ESA and ESD). ESD can be particularly vexing, giving rise to spurious ion signals that result in apparent pressures 10x to 100x greater than true pressures. Other surface phenomena which affect gauging include sputtering, charging, photoemission (the x-ray limit), secondary electron emission, and electron-induced polymerization.

Residual Currents in Several Commercial UHV Bayard-Alpert Gauges.

Final rept.
A. R. Filippelli. 1987, 8p
Pub. in Jnl. of Vacuum Science and Technology A 5, n5 p3234-3241 1987.

Keywords: *Vacuum gages, Ultrahigh vacuum, Hydrogen, Reprints, *Bayard-Alpert ionization gages, Commercial equipment, Residual currents, Pressure dependence.

Residual currents have been determined for several commercial UHV Bayard-Alpert gauges, including two modulated gauges, by comparison against an extractor gauge. Residual currents in the modulated gauges were also determined by the modulation method (Red-head mode I) and these results are compared with those of the first method. Residual current modulation factors were estimated by combining the results of these two methods. One notable aspect of this work is the finding that residual current values can differ by more than a factor of 10 among nominally identical gauges. Another interesting and somewhat surprising feature of these measurements, which were performed in H2 at pressures in the range 4 x 10 to the -9 power to 4 x 10 to the -5 power Pa, is that there was no evidence of hysteresis in the response of any of the gauges to changes in the H2 pressure.

NBS (National Bureau of Standards)/Industry Collaboration on Instrumentation Development.

Final rept.
P. L. Heydemann. 1987, 8p
Pub. in 'Innovation: Key to the Future,' NCSL Workshop and Symposium Technical Presentations, Denver, CO., July 12-16, 1987, p1-1-1-8.

Keywords: *Measuring instruments, *Industry, Reprints, *National Institute of Standards and Technology, Coordinated research programs, Government industry relations.

The U.S. instrumentation industry and the National Bureau of Standards may have a common interest in the development of new measuring instrumentation. NBS needs this instrumentation to carry out its own mission in support of industry and commerce. The instrumentation industry needs new commercial products to maintain its competitive position in the market. Both could gain from close cooperation. NBS has the facilities and the multidisciplinary staff to carry out fundamental and applied research. Industry knows how to engineer a new instrument for production. In the paper the legal situation that governs industry/government collaborations, and the possible organization of collaborative research and development projects will be briefly reviewed. Some of the technical work that might be accomplished under such agreements will be explored. The possibility of joining forces in the development of a few specific types of instruments that are of interest to the metrological community will be closely examined.

R. C. Veale, and R. J. Hocken. 1989, 4p
Pub. in Quality, pQ-3, Q-4, Q-6, Q-8 Dec 89.

Keywords: *Standards, Performance evaluation, Test facilities, Measuring instruments, Reprints, *ANSI B89.1.12, *Coordinate measuring machines.

The B89.1.12 Standard for the performance evaluation of Coordinate Measuring Machines has contributed significantly both to the public acceptance and the improved performance of coordinate measuring machines in the United States. Work is now underway to update the Standard. In addition, two new American National Standard Institute (ANSI) groups have been formed to deal with the problem of making CMM data conform to ANSI Y14.5 specifications.

Metrological Electron Microscope for the Certification of Magnification and Linewidth Artifacts for the Semiconductor Industry.

Final rept.
M. T. Postek, W. J. Keery, and S. Jones. 1989, 8p
Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers)-Integrated Circuit Metrology, Inspection, and Process Control III, v1087 p38-45 1989.

Keywords: *Dimensional measurement, *Electron microscopes, *Standards, *Semiconductors(Materials), Units of measurement, Electron microscopy, Electron optics, Metrology, Length, Reprints.

The National Institute of Standards and Technology has, for several years, been developing a metrological electron microscope system traceable to national standards of length. The metrology instrument will certify standards for the calibration of the magnification of scanning electron microscopes (SEM) and for the certification of artifacts for SEM linewidth measurement. These artifacts are not only directed to instruments used in the semiconductor community but will also be useful for the various other applications to which the SEM is currently being used. The SEM-based metrology system now operational at the Institute will be described as well as its design criteria and procedures for its characterization. The design and criteria for new lithographically produced SEM low-accelerating-voltage magnification standard to be calibrated on this system will also be presented.

Heat Capacity, Cp, of Fluids from Transient Hot Wire Measurements.

Final rept.
H. M. Roder, and C. A. Nieto de Castro. 1987, 2p
Pub. in Cryogenics 27, n6 p312-313 1987.

Keywords: *Specific heat, *Thermal measurements, *Thermal measuring instruments, Thermal diffusivity, Thermal conductivity, Thermophysical properties, Gases, Liquids, Thermodynamic properties, Equations of state, Reprints.

The authors report the first measurements of the thermal diffusivity that cover a wide range of thermodynamic states including the dilute gas, the dense gas, the compressed liquid, and near critical conditions. The specific heat is obtained from simultaneous measurements of thermal conductivity and thermal diffusivity in a transient hot wire instrument, while the density is obtained from an equation of state. Values for the specific heat, CP, of argon were obtained at two temperatures, 172 and 275 K, with pressures to 70 MPa. For these temperatures the densities range from the dilute gas to 2.2 times critical density while the specific heat varies by a factor of 7 from the dilute gas value

Measurement of Thermal Conductivity and Thermal Diffusivity of Fluids Over a Wide Range of Densities.

Final rept.
H. M. Roder, and C. A. Nieto de Castro. 1989, 12p
Pub. in Thermal Conductivity 20, p173-184 1989.

Keywords: *Fluids, *Density, *Thermal measuring instruments, *Thermal measurements, *Thermal conductivity, *Thermal diffusivity, Gases, Argon, Thermophysical properties, Specific heat, Thermodynamic properties, Reprints.

A transient hot wire apparatus was revised to make simultaneous measurements of thermal conductivity and thermal diffusivity of fluids for a wide range of densities. In addition, the theory of the method had to be revised to allow correct evaluation of the thermal diffusivity. The authors illustrate the new method and theory with data for argon along 6 isotherms between 172 and 325 K with pressures up to 70 MPa and densities up to 30 mol/L. For thermal conductivity, the precision is about 0.3% and the accuracy better than 1.0%. For thermal diffusivity the accuracy is estimated to be 5%. From the two variables measured and from the density taken from the equation of state values of the specific heat, CP, of the fluid were obtained. The actual status of the application is described and present limitations are analyzed.

Precision Engineering and Experimental Physics: William A. Rogers, the First Academic Mechanician in the U.S.
Final rept.
C. J. Evans, and D. J. Warner. 1988, 11p
Pub. in the Michelson Era in American Science 1870-1930, p2-12 1988.

Keywords: *Precision, *Measurement, *Gratings(Spectra), *Biographies, Length, Measuring instruments, History, Reprints, *Rogers, William A.

Although largely ignored by historians both of science and of technology, William A. Rogers (1832-98) is a significant figure in the evolution of fine mechanics and precision measurement in the USA in the latter part of the 19th century. He developed practical length standards for both science and industry and contributed to their dissemination in the USA. He built comparators, linear and circular dividing engines, and diffraction grating ruling engines. His designs and his publications demonstrate an excellent fundamental understanding of fine mechanism and precision instrumentation. The paper has three main themes; first it outlines Rogers' career, highlighting his major technical achievements. Secondly, it indicates Rogers' influence on both science - through his collaboration and interactions with Rowland, Morley and Michelson - and industry. Finally, it provides one possible explanation for American domination of the diffraction grating ruling art.

See also AD-A198 227. Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Technometrics 30, n2 p137-141 1988.

Keywords: *Calibrating, *Confidence limits, Regression analysis, Statistical analysis, Nonparametric statistics, Reprints.

The standard multiple use calibration procedure due to Scheffe insists that with probability (1-delta), at least (1-alpha) of the calculated confidence intervals contain the true unknown. The procedure is fairly difficult to use because it relies on tables which are not generally available. The authors consider a different requirement, namely that with probability (1-delta) the expected proportion of intervals containing the true unknown be at least (1-alpha). Intervals which satisfy this re-

quirement use only standard t- and F-distribution tables. As is intuitively clear, the resulting intervals are generally much shorter than those constructed to satisfy Scheffe's requirement. An example is given to illustrate the techniques.

Pub. in Thin Solid Films 187, p133-140 1990.

Keywords: *Test equipment, *Thin films, *Gold, *Metal films, Crystal growth, Diffusion, Reaction kinetics, Surface chemistry, Supersaturation, Reprints, *Reflection electron microscopy, Morphology.

The morphology of gold thin films, grown on amorphous substrates which were held at fixed temperatures was studied with reflection electron microscopy (REM). The grazing incidence geometry of the technique permitted the observation of nucleated growth, anisotropic growth, and columnar growth with high resolution. The observed growth is compared with the kinetics predicted by diffusion constants. In addition, whisker growth was observed under conditions of high effective supersaturation that can be distinguished from previously reported whisker growth. The features observed with REM are virtually invisible when examined by high resolution scanning electron microscopy.

Space Balls: Or Estimating the Diameter Distribution of Monosize Polystyrene Microspheres.
Final rept.
S. Schiller. 1988, 6p
Pub. in Proceedings of Symposium on the Interface, Computing Science and Statistics (20th), Fairfax, VA., April 1988, p737-742.

Keywords: *Dimensional measurement, Polystyrene, Diameters, Simulation, Reprints, *Microspheres, Standard reference materials.

Polystyrene microspheres, with nominal diameters in the range of 3 to 30 micrometers, were manufactured in space on the shuttle Challenger and are certified by the National Bureau of Standards as Standard Reference Materials; they provide an important tool for calibrating instruments that are used to examine very small particles. In order to be useful, their diameter distributions must be well-characterized. One measurement technique proposed is to form closely packed hexagonal arrays on a microscope slide with the spheres, measure the row lengths, and impute the diameters from these. The obvious diameter estimate is the row length divided by the number of spheres in the row. However, because the diameters are not identical, there are always air gaps in these arrays which inflate the diameter estimates. These air gaps cannot be measured by the microscope, nor can they be modelled mathematically. The approach to this estimation problem is to simulate arrays of the spheres and determine the behavior of the air gaps. Modelling of the diameters in terms of row lengths is done using the simulation results and tested on data from actual photomicrographs.

 Also available from Supt. of Docs. as SN003-003-03038-4.

Keywords: *Standards, *Metrology, *Directories, Organizations, Europe, Measurement, Regulations, Quality assurance, *European Community.

The publication contains information on organizations which participate in standards-related activities. The organizations listed in the directory are European organizations involved in standards-related activities. The volume describes the work of these organizations in these areas and other information of interest. Because the standards situation in Europe is changing rapidly due to the formation of the European Single Market, some organizations have recently undertaken new activities or made changes in some of their prior activities to participate more effectively in the endeavor. Some of these changes may not be reflected in their entries. The volume is designed to serve the needs of federal agencies and standards writers for information on European organizations involved in standardization and related activities. It may also be useful to manufacturers, engineers, purchasing agents, and others interested in the European standards activities.

Planning Model for Unifying Information Modeling Languages for Product Data Exchange Specification (PDES).
 J. Tyler. Jan 90, 12p NISTIR-90/4234

Keywords: *Data bases, Information systems, Abstracting, Semantics, Communications networks, *Information modeling, *Product Data Exchange Specification, Modeling languages.

The paper describes a mechanism for resolving issues surrounding the use of multiple information modeling paradigms. Several diverse modeling languages have been used to define and formalize the information needed to fully represent the multiple disciplines needed for a complete product model. This prompted a committee of the IGES/PDES Organization to undertake a research project to unify these divergent paradigms. Some intermediate results of the project are discussed including the Planning Model, which is intended to serve as a baseline for future development of a neutral repository for storing semantics.

Keywords: *Communication networks, *Information systems, Information processing, Network analysis, Secure communications, Architecture, Protocols, Performance evaluation, Open Systems Interconnection, Network management, Expert systems.

The report examines current and proposed network management systems to determine both user and functional requirements for network management. It then compares the derived functional requirements to the emerging standards being developed by the ISO and others to determine where and how the requirements are being met by these emerging standards. The examination of requirements is generally restricted to those that are necessary for interoperability. These are organized and examined in six broad areas: Architecture, and the management functional areas of configuration management, fault management, security management, performance management and accounting management. The report also contains a discussion of requirements that transcend these areas and a discussion of future requirements beyond the scope of current standardization. Examples include automated network management and a standard operator interface. Finally the report also contains a discussion of applying OSI management to the emerging Integrated Services Digital Network (ISDN) technology.

Keywords: *Data management, *Information systems, Data processing, Data base management, Models, Computer information security, Policies, Dictionaries, *Data administration, Information resources management, Computer aided software engineering.

The guide provides a reference model for the various activities performed by Information Resource Management, Data Administration, Data Modeling Tools Administration, and Database Administration. The functions of Data Administration are discussed in detail. Data Administration is responsible for defining an information architecture, and for establishing policies for naming conventions, information modeling techniques and methodologies, data element specification, system information integration, and data protection. The importance of the Three Schema Architecture is described. Computing tools useful for Data Administration, such as data dictionary systems and computer-aided software engineering (CASE) tools, are addressed. The guide stresses the useful features of these computing tools. Use of the Information Resource Dictionary System (IRDS) Standard, approved by the American National Standards Institute (ANSI) and a Federal Information Processing Standard (FIPS), is discussed.

Computer-Generated Graphical Analysis of Citation Searches.
Final rept.
M. L. Nelson. 1990, 6p
Pub. in Proceedings of National Online Meeting, New York, NY., May 1-3, 1990, p309-314 1990.

Keywords: *Information retrieval effectiveness, *Graphic methods, *Computer graphics, Atomic spectroscopy, Performance evaluation, Images, Human factors engineering, Reprints, *Citation searches, Data bases.

Online citation searches were performed for a number of publications on the subject of atomic spectroscopy. The searches were requested by a National Institute of Standards and Technology physicist who is a member of the U.S. National Research Council Committee on Line Spectra of the Elements. This committee surveys data needs for diverse groups of data users and coordinates data compilation and evaluation activities. The references found in the searches were retrieved

by electronic mail and entered into a personal computer. The source journal titles were analyzed in spreadsheet/graphics programs. The resulting color and black and white images provided a quick and effective method of evaluating the citation search results. They will be used for comparison with the more subjective data on data usage which the Committee had compiled from questionnaires.

FTAM Interoperability Tests.
C. A. Edgar. Aug 90, 113p NISTIR-4435

Keywords: *Tests, Computer networks, Standards, Computer programs, *File management systems, *Computer program transferability, FTAM(File Transfer Access and Management), Computer program verification, Protocols.

The File Transfer, Access and Management (FTAM) standard enables users to transfer, access and manage large groups of information in a consistent manner within an open environment. The document defines FTAM interoperability tests designed to test the interoperability between FTAM implementations supplied by different vendors. Implementations are assumed to be based on the FTAM International Standard (IS 8571). Interoperability testing tests the ability to perform overall operations between two or more vendor specific implementations. The complexity of OSI protocols makes exhaustive testing impractical on both technical and economic grounds. Furthermore, there is no guarantee that a system which has passed a set of interoperability tests will interoperate with other systems or conform to any specification. Rather, passing the tests provides a level of confidence that the system will likely interoperate with other systems and should behave in a consistent manner in representative instances of communication.

Keywords: *Standards, Product development, *Computer aided design, *Computer aided manufacturing, *Software tools, PDES(Product Data Exchange Specification), National Institute of Standards and Technology, Data bases.

The Product Data Exchange Specification (PDES) is an emerging standard for the exchange of product information among various manufacturing applications. A software toolkit for manipulating PDES data has been developed at the National PDES Testbed at the National Institute of Standards and Technology (NIST). The toolkit includes software for processing PDES information models, defined in the Express language, and PDES product models, stored as STEP physical files. The components of the NIST PDES Toolkit are discussed, as are several applications which have been built using the Toolkit.

Recommended Technical Specifications for Procurement of Systems for a Cleaning and Deburring Workstation.

F. M. Proctor, and R. Russell. 21 Jun 89, 15p NISTIR-89/4115

Keywords: *Cleaning, *Deburring, Equipment specifications, Automation, Computer systems hardware, Computer systems programs, *Automated Manufacturing Research Facility, *Workstations, Robotics, Computer aided manufacturing.

The manual provides the recommended technical specifications for systems modeled after the Cleaning and Deburring Workstation of the Automated Manufacturing Research Facility. These specifications are functional only; they do not list the manufacturers of equipment, but only describe the function and capabilities of the various component systems.

RCS Application Example: Tool Changing on a Horizontal Machining Center.

Final rept.
J. Fiala, and A. Wavering. 1987, 10p
Pub. in Proceedings of International Conference on Robotics and Factories of the Future (2nd), San Diego, CA., July 28-31, 1987, p715-724.

Keywords: *Manipulators, *Tooling, *Machining, Automation, Reprints, Automated Manufacturing Research Facility, Robotics, Real time systems, Control systems, Workstations, Programming.

A large six-axis manipulator performs material handling tasks for a horizontal machining center in the National Bureau of Standards' Automated Manufacturing Research Facility. The manipulator is controlled by the Real-time Control System (RCS), a hierarchical control system developed by the Robot Systems Division at NBS. The manipulator is used to load and unload parts for the machine and, recently, to change tools on the machine. The paper describes the development of tool changing as a new RCS application, including the creation of new commands to be sent to RCS from a workstation controller and the techniques used to program manipulator movements. The integration of force sensing to monitor tool insertion and removal as well as the addition of a changeable end effector for handling tools are discussed.

Concept for a Reference Model Architecture for Real-Time Intelligent Control Systems (ARTICS).

Technical note.
J. Albus, R. Quintero, R. Lumia, M. Herman, R. Kilmer, and K. Goodwin. Apr 90, 30p NIST/TN-1277
Also available from Supt. of Docs. as SN003-003-03011-2.

Keywords: *Automation, *Standards, Technology transfer, Models, Computer systems hardware, Computer systems programs, Systems engineering, *Robotics, *Control systems, Computer architecture, Real time systems, Protocols, Computer aided manufacturing.

The paper presents a concept for the development of a reference model open-system architecture for real-time, sensory interactive, intelligent machine systems. Central to this notion is a desire to accelerate technological development, technology transfer and commercialization of world class control system products in the field of robotics, intelligent machines and automation. A plan is outlined whereby a reference model Architecture for Real-Time Intelligent Control Systems (ARTICS) can be defined through the cooperative efforts of industry, academia and government. As envisioned ARTICS would be a series of evolving guidelines specifying an infrastructure of hardware components, software components, interfaces, communications protocols and application development tools. An ARTICS reference model would make it possible for industry to develop and market a diverse line of control system components which could be interchangeable and realizable on many different vendors' intelligent machine systems platforms.

Keywords: *Hot working, *Forging, Quenching(Cooling), High strength steels, Low alloy steels, Simulation, *Computer aided manufacturing, Thermomechanical treatment, Control systems.

The report describes a computer-controlled hot-deformation apparatus suitable for thermomechanical-processing (TMP) simulation of forging and steel plates. The apparatus was designed and built at the National Institute of Standards and Technology, and has the following main features: a servohydraulic load frame with a 250 kN capacity in tension or compression; a variable-actuator traveling speed up to 55 mm/s; a multiple-strike capability with controllable displacements and strain rates; a maximum heating rate of 150 c/s with a 10 kW induction heater (for a cylindrical steel specimen 9 mm in diameter and 18 mm in height); a maximum cooling rate of 25 c/s with helium-gas cooling; and vacuum to 1.33 x 10 sup (-3) Pa (1 x 10 sup (-5) Torr) within 25 min. Source codes of the computer programs that perform system control, data acquisition, and data analysis are included in the report. The apparatus has been used to perform the direct-quenching simulation of the ASTM A710 plate steel, and forging simulation of the directly cooled microalloyed AISI 1522 and 1141 steels. Results of the studies are presented.

In the course of the National Bureau of Standards' program in measurements and standards for automated manufacturing and robotics, a tactile sensing array with a high degree of conformability has been developed. The array consists of a pneumatically controlled matrix of displacement pins which provides a deformable grasping surface, and a corresponding array of optoelectronic proximity sensors which determine workpiece orientation and geometry. Regulation of air flow into the finger to control grasping stiffness permits the sensing and handling of very delicate or complex objects. Additional features of the design include programmable array rigidity, zero mechanical hysteresis, and gripper mounted packaging. (AW)

Extending the Standard for the Exchange of Product Data to Represent Two-Dimensional Apparel Pattern Pieces.
Y. T. Lee. Jun 90, 28p NISTIR-4358
Sponsored by Defense Logistics Agency, Alexandria, VA.

Keywords: *Standards, Patterns, Prototypes, *Clothing industry, *Computer aided manufacturing, *STEP(Standard for the Exchange of Product Data), National Institute of Standards and Technology, File structures.

An Apparel Pattern Information Model (APIM) is introduced to demonstrate the feasibility of extending the emerging international Standard for the Exchange of Product Data (STEP) to include the exchange of apparel pattern data. The paper focuses on a representation of two-dimensional (flat) patterns. It shows how this representation is capable of capturing the same information that can be expressed in one widely-used, but proprietary, format.

Mathematical Decomposition and Simulation in Real-Time Production Scheduling.
Final rept.
W. Davis, and A. Jones. 1987, 5p
Pub. in Proceedings of European Simulation Multi-Conference, Vienna, Austria, July 7-10, 1987, p88-92.

Keywords: *Production control, *Scheduling, Real time operations, Production engineering, Industrial engineering, Decomposition method, Simulation, Algorithms, Reprints, *Computer aided manufacturing.

The paper discusses an on-line, real-time production scheduling algorithm for automated manufacturing systems. Decomposition theory is used to transform a multi-criteria, production scheduling problem from a block angular structure into a two-level hierarchical structure. The top level, called the supreal, considers a list of jobs, due dates, precedence constraints, and objectives. It generates a set of potential scheduling rules and evaluates those rules using an on-line, distributed simulation package. The supreal outputs a list of tasks with proposed start and finish times to each of the lower level systems under its control. Each lower level system, called an infimal, then uses a similar simulation approach to sequence those tasks and generate actual start and finish times. These times, together with status on all other tasks, provide the feedback needed by the supreal to close the control loop.

Distributed Data Bases on the Factory Floor.
Final rept.
C. M. Furlani, D. Libes, E. J. Barkmeyer, and M. J. Mitchell. 1989, 9p
Pub. in Computerization and Networking of Materials Data Bases, ASTM STP 1017, p126-134 1989.

Keywords: Automation, Reprints, *Computer aided manufacturing, *Distributed data bases, Automated Manufacturing Research Facility, Data base administrators, Control systems.

A major facility for manufacturing research exists at the National Institute of Standards & Technology (NIST). The Automated Manufacturing Research Facility (AMRF) serves as a test bed and demonstration facility in support of research by workers from NIST, industry, academia, and other government agencies. The AMRF has been designed as a 'data driven' control system. This permits it to handle a broad range of parts for automated manufacturing, but requires an effective interface between the data generated in a manufacturing system and the control modules that use the data. To meet this requirement, a distributed data system, the Integrated Manufacturing Data Administration System (IMDAS), has been developed. It is designed to provide the control systems of the AMRF access to the data necessary to support the design, planning, manufacturing, and inspection of parts.

QDES Administrative Guide: National PDES Testbed.
S. N. Clark. 21 May 90, 19p NISTIR-4334

Keywords: *Windowing techniques, *Editing, Standards, Manufacturing, Guidelines, QDES, PDES, Computer aided design, STEP models, Smalltalk programming language, Product data exchange, Data base administrators.

The Product Data Exchange Specification (PDES) is an emerging standard for the exchange of product information among various manufacturing applications. The neutral exchange medium for PDES product models is the STEP physical file format. The National PDES Testbed at NIST has developed QDES, a window-based editor for STEP product models. The editor, written in Smalltalk 80, is schema-driven: in the Testbed context, an Express information model is used to describe the objects to be manipulated; QDES itself thus has no a priori knowledge of its domain. The document describes administrative procedures for QDES. Some architectural issues are also presented.

Damage-Enhanced Creep in a Siliconized Silicon Carbide: Mechanics of Deformation.

Final rept.
T. J. Chuang, and S. M. Wiederhorn. 1988, 7p
Sponsored by Department of Energy, Oak Ridge, TN.
Pub. in Jnl. of the American Ceramic Society 71, n7
p595-601 Jul 88.

Keywords: *Damage, *Creep tests, *Silicon carbides, *Deformation, *Continuum mechanics, Tension, Compression, Bending, Loads(Forces), Silicone coatings, High temperature tests, Flexural strength, Reprints.

Continuum mechanics methods were adopted to analyze the creep deformation of a siliconized silicon carbide at elevated temperatures. All major loading modes including tension, compression and bending are considered. In tensile creep, deformation was accompanied by cavitation damage at stresses in excess of a temperature dependent threshold level, resulting in a bilinear power-law creep behavior. On the other hand, a single power-law equation is adequate to characterize the creep behavior in compression, since no damage is found at all levels of applied stress. For transient creep under bending, it was found that time-dependent neutral axes for stress and strain do not coincide, although they do converge towards a single axis at steady state. The underlying mechanisms for both tension and compression creep can be attributed to interaction of SiC particles and nonlinear viscous flow of silicon phase; creep damage in tension further enhances deformation from $n = 4$ to 10 where n is stress exponent. Nucleation rather than growth of cavities is regarded as the limiting process responsible for the accelerated creep meaning the material possesses a high degree of tolerance against damage.

Creep Deformation of Ceramics in Four Point Bending.

Final rept.
K. Jakus, and S. M. Wiederhorn. 1988, 5p
Sponsored by Department of Energy, Oak Ridge, TN., and National Science Foundation, Washington, DC.
Pub. in Jnl. of the American Ceramic Society 71, n10
p832-836 1988.

Keywords: *Creep properties, *Deformation, *Ceramics, *Bending, High temperature tests, Flexural strength, Aluminum oxide, Loads(Forces), Curvature, Measurement, Reprints.

Flexural testing was investigated as a method of studying the creep of ceramic materials at elevated temperatures. Three techniques were used to evaluate the steady state creep exponent: two of them were based on the measurement of the surface curvature of a flexure specimen after testing; the third was based on the more conventional technique of measuring displacement rate as a function of applied load and exposure time. Applied to a grade of commercial vitreous bonded alumina, the techniques yielded disparate results for the steady state creep exponent. The discrepancy in results is believed to be a consequence of the fact that ceramics tend to creep more readily in tension than in compression, leading to a shift in the neutral plane for stress and strain in flexural specimens, which results in an extended primary creep. A local enhancement of creep under the loading points of the test specimens was observed in the materials tested; the creep enhancement was attributed to contact stresses at the loading points.

Brittle Fracture Behavior of Ceramics.

Final rept.
S. W. Freiman. 1988, 11p
Pub. in American Ceramic Society Bulletin 67, n2
p392-402 1988.

Keywords: *Ceramics, *Brittle fracturing, *Brittleness, Crack propagation, Failure, Fractures(Materials), Toughness, Fracture properties, Microstructure, Reprints.

The paper reviews the brittle fracture process in ceramic materials. A fracture mechanics approach is used to separate the crack growth resistance of the material from the driving forces and the flaw severity. Fracture surface analysis is shown to be a useful tool in understanding failures of actual components. Effects of environmentally enhanced crack growth are discussed both from a fundamental point of view as well as in the reliability of ceramic structures. Toughening mechanisms in ceramics are reviewed and the fracture process discussed in terms of the direct affects of ceramic microstructure.

Pub. in Selection and Use of Wear Tests for Ceramics, ASTM STP 1010, p1-23 1988.

Keywords: *Ceramics, *Wear, *Friction, *Tribology, Wear tests, Wear inhibitors, Wear resistance, Lubricants, Standards, Test facilities, Reprints.

Technical ceramic materials offer tremendous potential in a wide variety of engineering applications. Their unique blend of physical, chemical, and mechanical properties provide innovative design opportunities for advanced concepts such as low-heat rejection engines, high-efficiency gas turbines, high temperature bearings, and high-speed, high-precision cutting tools. Unfortunately, many of the critical friction and wear (tribological) properties of advanced ceramics are not well defined or understood. Research in materials science of advanced ceramics is developing very rapidly. As materials change and new materials are constantly being developed, the evaluation of these materials for tribological applications becomes a critical issue. The paper explores several important considerations in friction and wear testing of ceramic materials. Detailed test sample characterization is required to define the materials pair. Sample preparation, selection of load and speed, environmental control, and contamination effects are crucial to the meaningful tribological evaluation of ceramic materials. Specific examples are given using a modified four-ball wear tester with alumina specimens.

Socioeconomic Barriers in Computerizing Materials Data.

Final rept.
J. Rumble. 1989, 11p
Pub. in Computerization and Networking of Materials Data Bases, ASTM STP 1017, p216-226 1989.

Keywords: *Materials, *Information systems, Reprints, *Socioeconomic factors, Data bases, Data base management, Technology utilization, On line systems.

While the computer technology, both hardware and software, exists to allow easy and comprehensive access to computerized data on engineering materials, only a few data bases are publicly available today. The reason for this is a set of barriers based on socioeconomic factors that are only partly recognized. In the paper, the use of materials data is examined to identify some of these socioeconomic barriers. They primarily arise from three factors: complex usage patterns, a relatively new computer audience combined with an exploding computer technology, and a lack of understanding of the positive impact of computerized materials data. Ways to overcome these barriers are suggested.

Metal Transfer in Gas Metal Arc Welding: Droplet Rate.

Final rept.
S. Liu, and T. A. Siewert. 1989, 7p
Pub. in Welding Jnl. 68, n2 p52-s-58-s Feb 89.

Keywords: *Gas metal arc welding, *Weld metal, Welding current, Filler metal, Electric current, Drops(Liquids), Process control, Reprints.

The study reports the changes in droplet-transfer mode and rate during gas metal arc welding as the voltage is varied at a series of current levels. Statistical analysis of the arc current and voltage data showed that during operation outside the optimum range, the welding arc was unstable and the current output was very irregular with varying cycle time between each droplet transfer. At the maximum droplet-transfer rate, the droplet-transfer cycle time was very consistent and revealed a narrow rate range, which correlated with the high stability and lower spatter at these optimum operating conditions.

Computerization of Welding Data: Proceedings of the Conference and Workshop.

Special pub. (Final).
T. A. Siewert, J. E. Jones, and H. G. Ziegenfuss. Mar 90, 108p NIST/SP-781
Held in New Orleans, Louisiana on October 19-21, 1988. Also available from Supt. of Docs. See also PB88-236807. Prepared in cooperation with American Welding Inst., Louisville, TN., and American Welding Society, Miami, FL.

Keywords: *Meetings, *Welding, Information systems, Artificial intelligence, *Computer applications, Data bases, Computer software, Expert systems.

The publication comprises the proceedings of an October 1988 conference on computerization of welding data. A written summary of each speaker's presentation is included in its appropriate conference session. Overview of Computers and Databases: Databases for technology; Review of the 1986 Workshop-Computerization of welding information; On-line access to worldwide sources of materials performance data; ASM International's Materials Properties Data System; Application of artificial intelligence to welding; Welding Applications Software: Computerized software for welding engineers; Computer applications in welding; Welding Case Studies: Update on procedure qualification records and welding procedure specifications; Computers in welding--from breadboards to desktops; Weld Improvement Program: Weld and Welder Tracking System; and Expert systems for diagnosing problems in welding power sources.

Review of the 1986 Workshop: Computerization of Welding Information.

Final rept.
T. A. Siewert. 1988, 8p
Pub. in Proceedings of Conference and Workshop on Computerization of Welding Information (2nd), Knoxville, TN., August 5-6, 1986, p9-16 1988.

Keywords: *Meetings, *Welding, Welding rods, Welding machines, Weldments, Weld metal, Heat affected zone, Fillets, Welding fluxes, Reprints, *Data bases.

The report deals with whether national welding productivity could be improved through the development of welding databases. The participants included forty-two welding engineers, welding managers, and computer scientists. Introductions to various topics by specialists in these areas were followed by group discussion. These groups identified the most useful topics for welding databases, in descending order of importance, to be: (1) General welding procedures, (2) Properties of the weld, heat-affected zone, and base metals, (3) Procedure qualification records, (4) Welding variables. For each of these topics, the participants identified potential users, content, and sources of information. The participants concluded that: (1) A significant portion of the data needs can be met by existing information, but this information should be carefully screened and reviewed before inclusion in databases, (2) Databases should be accessible to the greatest number of potential users, (3) Databases should use the latest computer technology and be upgradable to new technology as it becomes available.

Role of the National Institute of Standards and Technology as It Relates to Product Data Driven Engineering.
H. M. Bloom. Jul 89, 39p NISTIR-89/4078

Keywords: Industrial engineering, *Product development, Competition, Productivity, Automation, *Product Data Exchange Standard, National Institute of Standards and Technology, Technology utilization, Information management.

The various activities of the National Institute of Standards and Technology (NIST) in the development of a Product Data Exchange Standard (PDES) will be discussed. The NIST activities will be described in terms of the unique position that the agency has in the area of standards and technology development in the United States. The NIST has an active role in participating in the formal development of the PDES standard. In addition, NIST is engaged in research and development programs involving information technologies necessary for implementing PDES and engineering technologies that make use of product data. Specific applications such as mechanical part fabrication are being used to provide a testbed for the validation and verification of PDES. The paper addresses how PDES can be used to implement needed technologies such as concurrent engineering that will improve American Industrial competitiveness. The combination of PDES implementations with concurrent engineering is called 'Product Data Driven Engineering'.

Three Dimensional Modeling of Optical Microlithography for Positive Photoresists.
Final rept.
E. Barouch, B. Bradie, H. Fowler, and S. V. Babu. 1990, 9p
Pub. in Microlithography News I, n5 p16-24 May/June 90.

Keywords: *Lithography, Mathematical models, Simulation, Reprints, *Microlithography, *Photoresists, Three-dimensional calculations, WKB approximation.

A three dimensional planar substrate positive photoresist simulation process in optical microlithography is presented. This system includes components for the

calculation of the aerial image, the exposure-bleaching of the resist material, and the dissolution process. Standard computational techniques are being employed for the aerial image. The exposure model uses a continuum approximation of the Berning's field equation in conjunction with a suitably chosen WKB approximation. The local mathematical equivalence of the solvent diffusion system to the front propagation described by the eikonal system is employed by the dissolution algorithm. The algorithm does not produce shock waves or discontinuities in the developed profiles.

Advanced Deburring and Chamfering System.
Final rept.
K. N. Murphy, and F. M. Proctor. 1990, 6p
Pub. in Proceedings of International Symposium on Robotics and Manufacturing (3rd), British Columbia, Canada, July 18-21, 1990, 6p.

Keywords: *Deburring, *Chamfering, Force, Robots, Reprints, *Robotics, *Computer aided manufacturing, Real time systems, Control systems, Automated Manufacturing Research Facility.

A second-generation automated deburring cell is currently under development at the National Institutes of Standards and Technology. This cell will be capable of automatically generating, from part geometry and machining information, a series of robot paths for deburring aerospace parts made from superalloys. In order to compensate for the inaccuracy of robots when following computed coordinates, an actively-controlled end effector will be used to precisely position a rotary file in response to forces sensed at the part edge.

Reference Standard Block for Use in Nondestructive Test Probe Calibration and Method of Manufacture Thereof.
Patent.
T. E. Capobianco, W. P. Dube, and K. W. Fizer. Filed 18 Jul 89, patented 16 Oct 90, 9p PB91-100974, PAT-APPL-7-381 553
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Nondestructive tests, *Eddy current tests, *Patents, Fatigue(Materials), Airframes, Cracks, *Reference standard blocks, *Probes(Electromagnetic), *Calibration, Metal fatigue, PAT-CL-324-202.

A reference standard and a method for manufacturing a reference standard for use in calibrating an eddy current probe is disclosed. The reference standard is produced from a block of metal that is deformed by an indentation tool to provide a notch of prescribed dimensions. The reference standard is compressed along an axis substantially transverse to the longitudinal axis of the notch to substantially close the notch. A family of reference standards formed in this manner can be produced to calibrate an eddy current probe prior to use of the probe in evaluating metal components such as aircraft framework for the presence of fatigue cracks and the like.

Metrology in Microlithography.
Final rept.
D. Nyysönen. 1987, 53p
Pub. in VLSI (Very Large Scale Integration) Electronics Microstructure Science, v16 p265-317 1987.

Keywords: *Metrology, *Electron microscopy, *Optical microscopes, Dimensional measurement, Accuracy, Reprints, Very large scale integration, VHSIC(Circuits).

The advent of VLSI and VHSIC technologies has had enormous impact on the requirements for accuracy and precision of dimensional metrology. Accurate and precise measurements are needed to improve yield, to ensure that lithographic and critical dimension measurement systems meet specifications, to establish control of fabrication processes, and to relate measurements to theory or to serve as input data to modeling or simulation programs. The push to micrometer and submicrometer feature sizes on larger and larger wafers requires dimensional measurement systems with precision and accuracy which can take up only a small fraction of the error budget of 10% or less allowed in process control. By the gauge maker's rule, the measurement system tolerance must be three to ten times less than the tolerance on the part being manufactured. The book chapter discusses some of the unique requirements which metrology places on optical and scanning electron microscope measurement systems and provides a framework for realistically evaluating the capabilities of a given dimensional-measuring system in the context of the purpose for which the measurement system is to be used.

Intercomparison of AC Voltage Using a Digitally Synthesized Source.

Final rept.
N. M. Oldham, W. F. Bruce, C. M. Fu, A. Cohee, and A. G. Smith. 1990, 4p
Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 39, n1 p6-9 Feb 90.

Keywords: *Electrical measurement, *Standards, *Alternating current, Electric potential, Comparison, Consistency, Reprints.

An ac voltage intercomparison was conducted by the National Institute of Standards and Technology (NIST) to determine the consistency of ac voltage measurements made at various standards laboratories. The transport standard used for this purpose was an NIST-developed digitally synthesized sinusoidal voltage source whose rms value was calculated by measuring the dc level of each of the steps used to synthesize the sine wave. The uncertainty of the calculated voltage at approximately 7-V rms is typically within + or - 10 parts per million (ppm) from 15 Hz to 7.8 kHz. The approach incorporates a technique of determining ac voltage with reference to a measured standard dc voltage, which is independent of the traditional thermal voltage converter approach. Preliminary measurements made at each of the participating laboratories agree with the calculated value to within + or - 20 ppm. The results indicate that at 7 V, in the low audio-frequency range, the ac voltage measurement techniques implemented at these laboratories are near the state-of-the-art.

Applications of Capacitive Array Sensors to Non-destructive Evaluation.

Final rept.
P. J. Shull, J. C. Moulder, P. Heyliger, M. Gimple, and B. A. Auld. 1988, 7p
Pub. in Review of Progress in Quantitative Nondestructive Evaluation 7A, p517-523 1988.

Keywords: *Nondestructive tests, *Capacitance, Measuring instruments, Dielectrics, Conductors, Ceramics, Epoxy resins, Electrical measurement, *Robotics.

Capacitive array sensors have recently been developed for robotic applications such as proximity and feature detection. The authors describe recent studies performed at NBS Boulder exploring applications of capacitive arrays to nondestructive evaluation. Capacitive sensors can be used on either conductors or insulators, a decided advantage over inductive sensors. On metals the capacitive sensor only responds to surface flaws, but on dielectrics it responds to both surface and subsurface defects. The depth of field penetration into dielectric materials can be controlled by varying the spacing of the active elements electronically. The authors studied the response on a miniature (2.5 x 4.5 mm) nine-element capacitive array to a variety of simulated and real flaws in conductors and dielectrics. Applications of the sensor to thickness monitoring of thermal barrier coatings, flaws in ceramics, and dielectric cure monitoring of epoxy resins were explored.

Conduct and Administration of U.S. Participation and Leadership in International Standardization, Testing, and Certification in the Decade of the 1990s.

D. L. Peyton. Mar 90, 18p NIST/GCR-90/572
Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD. Technology Services.

Keywords: *United States, *Tests, *Standardization, Recommendations, Evolution(Development), Quality assurance, Standards, *Certification, *International cooperation.

Based on 22 years' experience in domestic and international standards activities, the author reviews the evolution of the U.S. standards system. The study addresses new factors in considering the future roles of the U.S. Government and the private sector to improve the present health and efficacy of the national approach to standardization, testing, certification, quality assurance, and laboratory accreditation. The consen-

sus view is to separate standardization from other related activities, and for strong governmental participation in private sector policy, planning and programs where there is a substantial public interest. Congressional action is recommended to establish an infrastructure to deal with complex testing and certification issues affecting trade competition, probably in the form of a quasi-governmental corporation. Two National Commissions should be established for separate study of standardization and of testing, certification, and related areas.

Standard Reference Materials for Eddy Current Nondestructive Evaluation: Research Material 8458.

Final rept.
F. R. Fickett, and T. E. Capobianco. 1990, 7p
Pub. in Proceedings of Measurement Science Conference, Anaheim, CA., February 8-9, 1990, 7p.

Keywords: *Eddy current tests, *Nondestructive tests, *Standards, Electrical properties, Eddy currents, Electromagnetic testing, Cracks, Calibrating, Cracking(Fracturing), Fatigue(Materials), Reprints.

Eddy current nondestructive evaluation (NDE) is widely used in the world of transportation, and especially in evaluation of the structural integrity of aircraft. Small cracks, subsurface cracks, and cracks forming in places where access is difficult, such as bolt holes, can only be detected in the field by the use of electromagnetic methods. A large number of commercial instruments and their associated probes are available for this purpose. For optimum performance, these instruments must be calibrated. This is usually accomplished by measuring artificial flaws in the form of drill holes, spark-cut (EDM) notches, or saw slots of varying dimensions in aluminum alloy plates. The problem with such calibrations is that these 'standard' flaws bear little resemblance to an actual fatigue crack. The authors discuss the present situation in this field and describe research now underway at NIST to develop flaw Standard Reference Materials (SRM's) and Research Materials (RM's) that more closely approximate the behavior of actual fatigue cracks.

NISTIR-4322

See also report for 1988, PB89-193296. Sponsored by Naval Research Lab., Washington, DC. Navy Manufacturing Technology Program.

Keywords: *In-process quality control, *Automation, Verification inspection, Process control, Surface roughness, Light scattering, Real time operations, Controllers, Inspection, Monitors, Machine tools, *Quality in automation project, QIA project, Progress report, Sensors.

The project's purpose is to develop a quality assurance program that demonstrates 'deterministic metrology' in an automated manufacturing environment using commercially available and affordable equipment within the project in detail. A vertical machining center and a CNC turning center are both undergoing pre-process characterization. A prototype of the 'real time error corrector' hardware is currently under test. High speed on-machine probing of test parts at speeds of up to 100 in/min has been demonstrated. A system architecture and programming language environment has been selected. A commercial coordinate measuring machine has been installed and is currently undergoing characterization. Several methods of real-time surface texture analysis are under consideration. One of these methods is the use of optical scattering analysis. Once the initial experiments have been completed and the system components have been procured and tested, the entire system will undergo testing using standard test parts.

State Weights and Measures Laboratories: State Standards Program Description and Directory.

Special pub. (Final).
G. L. Harris. Jun 90, 70p NIST/SP-791
Also available from Supt. of Docs. as SN003-003-03024-4. Supersedes PB85-178879.

Keywords: *Laboratories, *Standards, *Directories, Units of measurement, States(United States), Tolerances(Mechanics), Measurement, *State services, *Weights and measures, National Type Evaluation Program, Calibration, Certification, State Standards Program.

In support of its mission to promote uniform standards of measurement throughout the country, the National Institute of Standards and Technology (NIST) received funding in 1965 to provide new standards of mass, length, and volume to State weights and measures laboratories. This program, called the (New) State Standards Program, also provided the equipment needed to perform calibrations in these measurement areas. Part I describes the certification program whereby NIST certifies State weights and measures laboratories. Part II is the directory of State weights and measures laboratories and lists the services they provide to State and local weights and measures agencies as well as to industry. The directory is intended to assist potential users of the laboratory services in locating and obtaining needed measurement services.

Building a PC-Based Knowledge Base for Improving NDE (Nondestructive Evaluation) Reliability.

Final rept.
J. T. Fong, and B. Bernstein. 1988, 23p
Pub. in Proceedings of International Conference on Pressure Vessel Technology (6th), Beijing, China, September 11-15, 1988, v2 p1349-1371.

Keywords: *Nondestructive tests, *Data processing, Reliability, Prototypes, Pipes(Tubes), Pressure vessels, Ultrasonic tests, Reprints, *Expert systems, Data bases, Knowledge bases(Artificial intelligence), Personal computers, Fracture mechanics.

The paper describes a design and partial implementation of a prototype expert system for processing nondestructive evaluation (NDE) data contributed by inspectors of critical structures, components, and weldments such as pressure vessels and piping in chemical and electric power generating plants. The system is designed to integrate the analysis, database, and graphics features of a software in a personal computer (PC) environment to assist the user in: building a knowledge base on selected NDE methods; estimating and improving the reliability of NDE procedures using the knowledge base; and processing specific NDE data with expert-assisted analysis and interpretation for decision support. When fully implemented, the prototype system is designed to serve as the NDE input module to probabilistic fracture assessment codes such as PRAISE for piping and VISA-II for pressure vessels.

Minimum Cost Inspection Intervals for a Two-State Process.

Final rept.
H. K. Iyer, and D. F. Vecchia. 1990, 13p
Pub. in Jnl. of Quality Technology 22, n3 p210-222 Jul 90.

Keywords: *Process control, *Product inspection, Probability theory, Control charts, Quality assurance, Sampling, Reprints.

Any automated process can be said to be in state 0 (operating properly) or, if a malfunction occurs, to be in state 1 (not operating properly). Periodic inspection is necessary to make sure that the process is in state 0. The authors derive the minimum cost inspection interval for such a process with failure probability p, based on costs of inspection, repair, and nonconforming items. The authors also consider the case of an unknown failure probability and suggest a sequential procedure for estimating p and, simultaneously, the optimum inspection interval. Results of a simulation study show that the proposed methods work quite well.

Dosimetry for Low-Energy Electron Machine Performance and Process Control.
 Final rept.

W. L. McLaughlin. 1990, 9p
 Pub. in Proceedings of Conference RadTech '90 North America, Chicago, IL., March 25-29, 1990, v2 p91-99.

Keywords: *Dosimetry, *Curing, Electron beams, Process control, Quality control, Reprints, Film dosimetry, Radiochromic films.

There are methods of dosimetry especially suited to electron beam curing, which can be used routinely in the real world of on-line industrial processing. They must be used properly, however, in order to provide assurance to those responsible for meeting process cure specifications, from the chemists to the QC and machine engineers. Dosimetry provides a relatively simple and inexpensive means of testing machine performance, including cure yield (k-factor), depth uniformity versus voltage, and longitudinal uniformity, even when there may be other geometrical, electrical, and atmospheric, as well as chemical, variability affecting cure efficiency. Improvements are being made in providing better dosimeters, calibrations, and wider response ranges with independence of response on atmospheric, thermal, spatial, dose rate, and read-out conditions. In fact, there is a recently published ASTM

Standard Practice E1275 on thin-film dosimeters, as well as several presently being developed on dosimetry for electron beam facilities, calorimetry as a reference standard, and estimation of dosimetry uncertainties.

The 75th Annual Meeting of the National Conference on Weights and Measures (NCWM) was held during the week of July 9 through 13, 1990. The theme of the meeting was 'Progress Through Consensus Among Consumers, Regulators, and Industry.' In the authors address to the delegates, Chairman Fred Gerck of New Mexico reflected on the progress made by the NCWM in the past year. In the address, Conference President John Lyons, Director, National Institute of Standards and Technology, provided a history of the founding of the National Bureau of Standards and the NCWM. In a keynote address, Congressman Tim Valentine noted the challenges to be met by the NCWM in the future. The Conference set standards for equipment and sales practices in the area of cash/credit pricing of retail motor fuel and compressed gas cylinders. Progress in training program development and standards for moisture loss were also reported upon. Special meetings included those of the Metrologists, the Associate Membership Committee, the Retired Officials Committee, the Scale Manufacturers' Association, the American Petroleum Institute, the Industry Committee on Packaging and Labeling, the State regional weights and measures associations, and the National Association of State Departments of Agriculture Weights and Measures Division. Reports by the standing and annual committees of the Conference comprise the major portion of the publication, along with the addresses delivered by Conference officials and other authorities from government and industry.

Transient Sources for Acoustic Emission Work.
 Final rept.

F. R. Breckenridge, T. M. Proctor, N. N. Hsu, S. E. Fick, and D. G. Eitzen. 1990, 18p
 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Proceedings of the International Acoustic Emission Symposium (10th), Progress in Acoustic Emission V, Sendai, Japan, October 22-25, 1990, p20-37.

Keywords: Greens function, Sound generators, Waveforms, Sources, Reprints, *Acoustic emissions, Transients.

The paper is a compilation of information about the following types of sources: pencil, capillary, capacitive transducer, conical transducer, ball impact, spark, and high explosive. Force waveforms and other relevant data concerning the sources are given and comments made on their relative merits. The ideal source would be infinitesimal in size, have a simple force waveform such as a step or delta function, and would have a relatively large amplitude which could be determined from a priori considerations. None of the sources considered in the paper approach perfection in all of these respects. Hence, the choice of a source for a particular purpose will involve tradeoffs based on the particular merits of each source.

 Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v5A p271-293 1986.

Keywords: Nondestructive tests, Ultrasonic radiation, Elastic waves, Reprints, *Acoustic emissions, Fracture mechanics, Crystal dislocations, Elastodynamics, State of the art.

Acoustic emission refers to the ultrasonic signals (elastic waves) emitted by materials undergoing microscopic changes of stress state. This naturally generated ultrasound is distinctly related to the source process (dislocation motion, fracture, and some phase changes). For example, the waveform of an acoustic emission from a crack propagation increment contains information about the location, growth distance, velocity, and orientation of the crack. Acoustic emission then is of interest as a naturally occurring phenomenon for the characterization of deformation and fracture mechanisms. It is also of interest as a possible passive monitoring technique for detecting, locating, and characterizing defects in structures. The current state-of-the-art of these applications is reviewed here in the context of an emerging science base, and future trends are discussed.

Survey of Industrial, Agricultural, and Medical Applications of Radiometric Gauging and Process Control.
 J. H. Hubbell. 1990, 11p
 Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n6 p689-699, Nov/Dec 90.

Keywords: *Process control, *Radiometry, *Metrology, Electrons, Gamma rays, Neutrons, Density, Albedo, Moisture, Mineral industry, Agriculture, Forestry, Medical equipment, Buildings, Thickness gages, Bibliographies, Surveys.

Photon and particle radiations (gamma rays, x rays, bremsstrahlung, electrons and other charged particles, and neutrons) from radioactive isotopes, x-ray tubes, and accelerators are now widely used in gauging, production control, and other monitoring and metrology devices where avoidance of mechanical contact is desirable. The general principles of radiation gauges, which rely on detection of radiation transmitted by the sample, or on detection of scattered or other secondary radiations produced in the sample, are discussed. Examples of such devices currently used or at least shown to be feasible in industrial, transportation, building, mining, agricultural, medical, and other metrology situations are presented, drawing from a total of 146 selected technical and review paper reference sources here cited.

Requirements for Implementing Real-Time Control Functional Modules on a Hierarchical Parallel Pipelined System.
 T. E. Wheatley, J. L. Michaloski, and R. Lumia. 31
 Jan 89, 10p
 In JPL, California Inst. of Tech., Proceedings of the NASA Conference on Space Telerobotics, Volume 5 p163-172.

Keywords: *Artificial intelligence, *Computer programs, Control systems design, *Robotics.

Analysis of a robot control system leads to a broad range of processing requirements. One fundamental requirement of a robot control system is the necessity of a microcomputer system in order to provide sufficient processing capability. The use of multiple processors in a parallel architecture is beneficial for a number of reasons, including better cost performance, modular

Robotics/Robots

growth, increased reliability through replication, and flexibility for testing alternate control strategies via different partitioning. A survey of the progression from low level control synchronizing primitives to higher level communication tools is presented. The system communication and control mechanisms of existing robot control systems are compared to the hierarchical control model. The impact of this design methodology on the current robot control systems is explored.

Manipulator Primitive Level World Modeling.
 Technical note (Final).
 L. Kelmar. Dec 89, 38p NIST/TN-1273
 Also available from Supt. of Docs. as SN003-003-02978-5.

Keywords: *Manipulators, Mathematical models, Kinematics, Dynamics, Torque, Force, *Control systems, Robotics, Hierarchies.

The document describes the interfaces and functions of a World Modeling module at the second level of a hierarchical manipulator control system. The World Modeling modules maintain an internal model of the world by continuously updating the model based upon sensory input. At the second level of the control system, the Primitive Level World Modeling module supports the Level 2 Sensory Processing module and the Primitive Task Decomposition module. The document contains detailed descriptions of the interfaces between the module and the rest of the control hierarchy. It also discusses the function of the support processes within the module.

Manipulator Servo Level World Modeling.
 Technical note (Final).
 L. Kelmar. Dec 89, 33p NIST/TN-1258
 Also available from Supt. of Docs. as SN003-003-02979-3.

Keywords: *Manipulators, Mathematical models, Kinematics, Dynamics, Servomechanisms, Automatic control equipment, *Control systems, Robotics, Hierarchies.

The document describes the interfaces and functions of a World Modeling module at the lowest level of a hierarchical manipulator control system. The World Modeling modules maintain an internal model of the world by continuously updating the model based upon sensory input. At the lowest level of the control system, the Level 1 World Modeling module interfaces to and supports the Data Acquisition Sensory Processing module and the Servo Task Decomposition module. The document contains detailed descriptions of the interfaces between the Level 1 World Modeling module and the rest of the control hierarchy. The document also discusses the function of the support processes within the module. It does not attempt to provide an exhaustive list of the computations and models required by World Modeling in support of all possible devices and sensors in a manipulator control system. Rather, it aims to elucidate the classes of support processes for both Sensory Processing and Task Decomposition, considering control of a manipulator (the most complex device) as an example.

Optimal Control of a Flexible Robot Arm.
 Final rept.
 J. D. Lee, and B. L. Wang. 1988, 9p
 Pub. in Computers and Structures 29, n3 p459-467 1988.

Keywords: *Manipulators, *Automatic control, Robots, Dynamics, Control theory, Reprints, *Robotics.

The work is a computer simulation of the control of flexible robot arm. The dynamic equations for a single-link flexible robot arm have been derived rigorously. The arm has two degrees of freedom in rotation and one in translation so that the workspace is three-dimensional. The payload is simulated by attaching additional mass to the arm at a specified location. The governing equations of the plant and the measurements

are nonlinear. The process of control is divided into two stages: coarse control and fine control. Based on the optimal control theory, a linear observer is constructed for fine control. The numerical results are presented here.

Testing.
 Final rept.
 K. Lau, N. Dagalakis, and D. Myers. 1988, 17p
 Pub. in International Encyclopedia of Robotics: Applications and Automation, v3 p1753-1769 1988.

Keywords: *Robots, *Tests, *Performance evaluation, Measurement, Standards, Methodology, Reprints, Robotics.

The rapid increase in the number and sophistication of robots in industry has prompted the need for standard test procedures, terminologies, and methodologies to measure and describe robot performance. However, in spite of the recent international effort pursued by many standards committees, research laboratories and industries, the majority of robot users still suffer from the lack of standard techniques and definitions for robot testing. This is largely due to the complexity of most robot designs and their wide range of intended applications. For instance, non-uniform and large workzone, lack of linear travels, multi-degree of freedom motions, uneven payload and speed are typical properties of most modern robots. The chapter gives an overview of some of the major tests and ideas developed for robot measurements. The test objectives are classified into three main categories: performance measurements, parameter measurements and environmental measurements.

Prediction-Based Vision for Robot Control.
 Final rept.
 M. O. Shneier, R. Lumia, and M. Herman. 1987, 10p
 Pub. in Computer 20, n8 p46-55 1987.

Keywords: *Robots, Mathematical models, Reprints, *Computer vision, Predictions, Sensory feedback.

The design and implementation of a model-driven sensory processing system is described. The system was developed for an industrial robotics environment, and makes use of vision and range sensing to construct an internal representation of its environment. To a large extent, sensing is driven by predictions, which are based on the current state of the internal representation. After processing and matching, sensed information is used to update the representation, which can then produce new predictions. This results in a feedback loop, which serves the internal representation into registration with the world. Initial input to the system consists of generic geometric models of those parts expected to appear in the world during a task, together with initial positions for each part. The system uses two internal representations, an object-based representation, and a spatial representation. A path planning module that interfaces with the sensory system is also described.

 Sponsored by NATO Advanced Research Workshops, Il Ciocco (Italy).

Pub. in Proceedings of NATO (North Atlantic Treaty Organization) Advanced Workshop on Robots and Biological Systems, Il Ciocco, Tuscany, Italy, June 26-30, 1989, p1-17.

Keywords: *Robots, *Artificial intelligence, Systems engineering, Models, Reprints, *Control systems, Computer communications.

Intelligent behavior requires a control system architecture that ties together actuators, sensors, sensory processing, task decomposition, world modeling, goal selection, and value judgments into an integrated system. A hierarchically layered architecture with horizontal communications within layers is proposed. Intelligent cooperative behavior requires common goals, common strategies, agreed upon division of labor, and a common view of the world. To the extent that all individuals in a population are working on the same top level input command, they share a common goal. To the degree that all have similar task vocabularies and control programs resident in their task decomposition modules, there exists a basis for common strategy. To the extent that all agree on the structure of the command tree, there exists a basis for division of labor. To the degree that individuals have the same information resident in their world model, they share a common view of the world. When all these exist simultaneously, there exists the basis for intelligent cooperative behavior. Communication is a mechanism for maintaining a common goal, strategy, division of labor, and world view.

NASREM implementation of Position Determination from Motion.
 K. Chaconas, L. Kelm, and M. Nashman. 16 Jan 90, 18p NISTIR-90/4293
 See also PB90-203134.

Keywords: *Manipulators, *Position finding, *Motion, Position(Location), Tracking(Position), Algorithms, *Control systems, Three dimensional motions, Image processing.

The document describes a NASREM implementation of a system which determines three-dimensional position from motion. The system performs real-time image processing to extract the two-dimensional centroid of a moving object. It then employs an inverse perspective algorithm to transform the centroid of the moving object on a planar surface to a three-dimensional position. The position is used by the control system for a robot manipulator which tracks and catches the moving object.

Implementation of a Jacobian-Transpose Algorithm.
 J. Fiala, and A. Wavering. Apr 90, 27p NISTIR-90/4286

Keywords: *Robots, *Control theory, *Manipulators, Mathematical models, Multiprocessing, Algorithms, Servomechanisms, Computer programming, *Jacobi matrix method.

The document describes an implementation of a Cartesian servo algorithm on a seven degree-of-freedom manipulator. In the basic algorithm the servo error is computed in Cartesian coordinates and transformed to joint-space torque commands by use of the transpose of the Jacobian relating the two coordinate systems. The control algorithm is described mathematically and in terms of the computational processes operating in a multiprocessing system to achieve the control. Two applications of the algorithm are described: compliant motions for contact of the arm with the environment, and ping-pong ball catching using real-time visual feedback.

Quantitative Approach to Camera Fixation.
 D. Raviv. May 90, 30p NISTIR-4324
 Color illustrations reproduced in black and white. Sponsored by National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Robot Systems Div.

Keywords: *Robots, *Cameras, Equations of motion, *Computer vision, Robotics, Image processing.

The paper deals with quantitative aspects of camera fixation for a static scene. In general, when the camera undergoes translation and rotation, there is an infinite number of points that produce equal optical flow for any instantaneous point in time. Using a camera-centered spherical coordinate system, it is shown how to find these points in space. For the case where the rotation axis of the camera is perpendicular to the instantaneous translation vector, these points lie on cylinders. If the elevation component of the optical flow is set to zero then these points form a circle (called the Equal Flow Circle or simply EFC) and a line, i.e., all points that lie on this circle or line are observed as having the same azimuthal optical flow. A special case of the EFCs is the Zero Flow Circle (ZFC) where both components of the optical flow are equal to zero. A fixation point is the intersection of all the ZFCs. Points inside and outside the ZFC can be quantitatively mapped using the EFCs. In a set of experiments using simulated as well as real data, the authors show how the concept of the EFC and ZFC can be used to explain the optical flow produced by points near the fixation point, and to explicitly map the space while fixating. It is also shown experimentally that points near the fixation point may change the sign of their optical flow as the camera moves.

Model-Driven Determination of Object Pose for a Visually Servoed Robot.

Final rept.
 W. S. Rutkowski, R. Benton, and E. W. Kent. 1987, 10p
 Pub. in Proceedings of IEEE (Institute for Electrical and Electronics Engineers) International Conference on Robotics and Automation, Raleigh, NC., March 31-April 3, 1987, v3 p1419-1428.

Keywords: *Robots, *Detectors, Motion, Algorithms, Guidance, Models, Reprints, Sensors, Robotics.

The National Bureau of Standards robot sensory system utilizes multiple hierarchical levels of sensory interpretation that interact with matching levels of world modeling. At each level, the world-modeling processes generate hypotheses about the sensory data based on a prior knowledge, prior sensory input, and knowledge of robot motion. The sensory-interpretative processes use these hypotheses to facilitate their analyses of new data. The results of the analyses are used by the world-modeling processes to correct their models of the environment. This interaction requires the development of real-time algorithms for the analysis of sensory data that can usefully employ guidance from models. The authors present an algorithm for accomplishing this at the level of object location and pose determination. Its desirable features include the ability to deal with underconstrained problems, the ability to employ all the data in a structured-light image, and robustness in the face of several types of error and noise.

Technique for the Detection of Robot Joint Gear Tightness.

Final rept.
 N. G. Dagalakis, and D. R. Myers. 1985, 9p
 Contract N00014-83-K-0236
 Sponsored by Office of Naval Research, Arlington, VA.
 Pub. in Jnl. of Robotic Systems 2, n4 p415-423 1985.

Keywords: *Robots, *Joints(Junctions), *Gears, Adjusting, Systems analysis, Models, Reprints, *Robotics.

A new technique for the examination of gear tightness in robot joint drive systems is presented. A single robot joint is subjected to random excitation while the rest of the joints are constrained. The corresponding link motion is monitored by two accelerometers mounted on the link. The transfer function of the translational component of link acceleration is then obtained. From the half peak magnitude bandwidth of the first resonant frequency it is possible to determine whether the joint gears under testing have a tight or loose meshing. Tests were performed on the wrist rotation joint of an industrial robot in two steady state positions with the end effector loaded and unloaded.

 R. J. Hocken, and G. Morris. 1986, 9p
 Pub. in CIRP Annals 35, n2 p495-503 1986.

Keywords: *Robots, *Manufacturing, *Automation, Cost effectiveness, Reprints, *Automatic programming, Off line systems, Robotics.

Although robots have been used in manufacturing for some years, their true economic value and efficiency of operation will only be realized when appropriate systems are developed that will enable rapid and possibly even automatic programming of industrial robots for a diversity of tasks. In the early years when robots were used only for such simple tasks as pick-and-place and spot welding in high-volume applications, teach-mode programming with playback of the taught positions was sufficient. Now, however, as the use of robots expands into the small batch domains and the variety of tasks is increased, the labor-intensive nature of these programming systems plus the loss of machine time necessary for program validation greatly limits those applications to which robots can be applied to economic advantage.

Inspection of Single-Point Diamond Turning Tools at Low Accelerating Voltage in a Scanning Electron Microscope.
 Final rept.
 M. T. Postek, and C. J. Evans. 1989, 8p
 Pub. in Scanning Microscopy 3, n2 p435-442 1989.

Keywords: *Diamond bits, *Diamond drills, *Turning(Machining), *Tools, *Product inspection, Surface finishing, Polishing, Electrical measurement, Reprints, *Scanning electron microscopy.

Single crystal diamond tools used in the machining process have been inspected in both the optical microscope and scanning electron microscope. Attention was focused on surface characteristics related to the specific polishing process and its relationship to cutting-edge structure. The need for tool inspection is discussed as well as the drawbacks with the inspection techniques presently used. Low accelerating voltage (<2.5 keV) inspection of uncoated diamond tools for machining is shown to be a viable method for the determination of polishing flaws that grossly reflect in the surface quality of the finished part.

Electronics Design of the Infrared/Ultrasonic
Sensing for a Robot Gripper.
 R. Bostelman. Nov 89, 29p NISTIR-89/4223

Keywords: *Robotics, *Ultrasonic radiation, *Infrared detectors, Manufacturing, Servomechanisms, Automatic control equipment, Bionics, Sound ranging, Optical detection, *Mechanical arms, Proximity sensing, Automated Manufacturing Research Facility.

The following paper is an overview of the electronics design of the Infrared/Ultrasonic Sensing Robot Gripper (Instrumented Gripper) designed, built and tested at the National Institute of Standards and Technology (NIST) in Gaithersburg, Maryland. The gripper is for use in the Automated Manufacturing Research Facilities (AMRF) Cleaning and Deburring Workstation (CDWS) at NIST. The paper begins with a System Description followed by the design of the Sensor Circuitry and the power. The Sensor Circuitry includes the sensor interface (to the sensor and the system) through the rectification and/or interpretation circuitry and finally to the output circuitry. The paper explains the experiments performed and their results in detail. Future considerations for the system follow and explain some applications for the Instrumented Gripper and further sensing ideas.

 Final rept.
 E. C. Teague. 1989, 5p
 Pub. in Jnl. of Vacuum Science and Technology B 7,
 n6 p1898-1902 Nov/Dec 89.

Keywords: Metrology, Line width, Vibration isolators, Surface roughness, Precision, Design, Reprints, *Coordinate measuring machines, Scanning tunneling microscopy, Atomic force microscopy, Molecular measuring machine project.

At NIST, a high risk project has been undertaken to build an ultrahigh accuracy planar coordinate measuring machine capable of positioning and measuring to atomic scale accuracies over an area of 2500 sq mm. The design goal is to obtain a point-to-point spatial resolution of 0.1 nm of the distance between any two points within a 50 mm x 50 mm x 100 micrometer volume; with a net uncertainty for point-to-point measurements of 1.0 nm. Maximum specimen size will be 50 mm x 50 mm x 12 cubic mm. The approach has been to design the machine such that it can incorporate a probe, based on either a scanning tunneling microscope or an atomic force microscope, into a highly stable core mechanical structure. A spherical core structure, with crossed linear slideways for the probe and specimen carriages, was chosen for its high mechanical stiffness and ease of temperature control. Presented in the paper are: a summary of the precision instrument design fundamentals incorporated into the authors design; details of the overall mechanical design, X-Y drive systems, the metrology reference system, X-Y heterodyne interferometer, vibration isolation systems; and a report on the status of construction.

Implementing Fast Part Probing and Error Compensation on Machine Tools.
 K. W. Yee, and R. J. Gavin. Oct 90, 15p NISTIR-4447

Keywords: *Machine tools, *Error correction codes, Manufacturing, Coders, Real time, Computer aided control systems.

A device has been constructed to facilitate fast probing and real-time error compensation on computer-numerical-control (CNC) machine tools without intrusion into the machine-tool controller. The device, interfaced to a PC computer, is inserted between the position feedback elements and the controller. Fast probing using a touch-trigger probe is achieved by providing high-speed access by the PC to the probe-trip positions. The device performs error-compensation by modifying the position-feedback signals going to the controller. Pulses from the 'encoder' are added or subtracted to alter the position count in the controller. The correction values are calculated by the PC using a model previously developed at NIST for predicting, in real-time, machine-tool geometric and thermal errors.

Wear Surface Analysis of Silicon Nitride.
 Final rept.
 D. C. Cranmer. 1988, 6p
 Sponsored by Aerospace Corp., Los Angeles, CA.
 Pub. in Lubrication Engineering 44, n12 p975-980
 1988.

Keywords: *Wear, *Surface properties, *Silicon nitrides, X-ray analysis, Microstructure, Oxidation, Interfaces, Stresses, Ceramics, Reprints, Tribology, Scanning electron microscopy, Photoelectron spectroscopy.

Wear surfaces of air-exposed Si3N4 have been characterized using a combination of scanning electron microscopy (SEM) and x-ray photoelectron spectroscopy (XPS). SEM shows the surface microstructure and major elements present and XPS shows the surface species present and the chemical states (i.e., oxide, oxynitride, nitride). The results indicate that oxidation of silicon nitride during wear is related to the distance slid and that the mechanical stresses at the interface enhance the formation of oxide rather than oxynitride.

Microspectroscopy Applications in Tribology.
 Final rept.
 B. E. Hegemann, S. Jahanmir, and S. M. Hsu. 1988,
 3p
 Pub. in Microbeam Analysis, p193-195 1988.

Keywords: *Microanalysis, *Infrared spectroscopy, Wear, Fourier transformation, Raman spectroscopy, Lubrication, Friction, Surface roughness, Chemical analysis, Ceramics, Reprints, *Tribology.

Fourier transform infrared (FTIR) and Raman spectroscopy are techniques which are applicable for an understanding of tribological processes which are frequently studied by wear tests, such as the four-ball wear test, where friction and/or wear of materials under lubrication are monitored under different speed and load conditions. In such a test, the apparent contact area is often in the dimensional range of 0.1-1 mm. Within such a contact, the tribochemical reactions be-

tween lubricant molecules and substrate material surfaces take place. Due to the minute amount of reaction product and the complexity of the chemical composition, which may not be homogeneous across the contact zone, chemical information has been difficult to obtain. In the paper, the applicability of microspectroscopy techniques for a detailed post mortem chemical analysis of wear test specimens is explored. In particular, investigations of the use of micro-FTIR spectroscopy to post mortem four-ball wear test specimen analysis is presented. As both metal and ceramic substrates are of tribological interest, the differences in applying micro-FTIR analysis to each case is subsequently examined. New efforts in developing a time-resolved micro-Raman spectroscopy technique for tribochemical analysis is also presented.

Lubricated Wear Behavior of Composition Modulated Nickel-Copper Coatings.
 Final rept.
 A. W. Ruff, and N. K. Myshkin. 1989, 5p
 Sponsored by Office of Naval Research, Arlington, VA.
 Pub. in Jnl. of Tribology-Transactions of the ASME
 (American Society of Mechanical Engineers) 111, n1
 p156-160 1989.

Keywords: *Wear, *Lubrication, *Nickel alloys, *Copper alloys, *Metal coatings, *Electrodeposited coatings, Steels, Cylinders, Alkanes, Oleic acid, Glycerol, Ethanol, Electric contacts, Electrical measurement, Sliding friction, Reprints, *Tribology, Nickel coatings.

A study has been completed of the lubricated wear behavior of electrodeposited composition modulated nickel-copper alloys having two different layer spacings, 10 nm and 100 nm, under lubricated sliding conditions against type 52100 bearings steel. The alloys were prepared as coatings about 20 micrometers thick on steel cylinders. A standard crossed-cylinder wear test geometry was used. Three liquids were used: pure paraffin oil both with and without the addition of oleic acid, and a solution of 0.6 glycerine and 0.4 ethanol. Electrical measurements of the contact resistance were made to assist in interpretation of the nature of the boundary lubrication film present during sliding. Wear data and friction coefficient values were obtained, and are compared with values that were previously measured under dry wear conditions.

 Pub. in Proceedings of ASME (American Society of
 Mechanical Engineers) International Computers in
 Engineering Conference and Exhibition, Managing
 Engineering Data: The Competitive Edge, New York, NY.,
 August 9-13, 1987, p133-144.

Keywords: *Information systems, Prototypes, Systems engineering, Reprints, *Tribology, Data bases.

A computerized database with validated numerical data, and 'best judgment values' by experts will aid in establishing tribology as an interdisciplinary science where information on lubricant chemistry, materials, mechanics, surface science, interface contact, surface topography, elastohydrodynamics, fluid mechanics, heat transfer, and mechanical designs are available. Computerization will advance the quality of research as well as identify the critical linkages in tribological systems research. The computerized tribology information system is being developed as a self-sustaining activity with government providing the initial funding for research and prototype construction. Current databases do not go beyond the establishment of bibliographic databases, and many technical challenges exist in data architecture, computer system software design, entry module design and data communication and standardization. Success in the program will have significant impact on other similar programs around the world.

Considerations in the Standardization of Generic Wear Measurements.

Final rept.
 P. J. Blau. 1988, 11p
 Pub. in Proceedings of Meeting of the Mechanical Failures Prevention Group (41st), Patuxent River, MD., October 28-30, 1986, p61-71 1988.

Keywords: *Wear tests, *Friction, *Standards, Measurement, Metrology, Terminology, Reprints, *Tribology.

Measurements and standards development in basic and applied wear science are complex problem areas because of the diversity and complexity of the forms of wear. No single unit or combination of basic units can serve the needs of the tribology community. The terminology of tribology is clouded with ambiguities and many glossaries do not even agree on the definitions of the basic terms in the field. Physical quantitative measurements of wear can be greatly affected by both the materials and the testing methods involved in wear experiments. The development of tribology as an interdisciplinary field continues to provide significant challenges for measurement and standardization methodology.

Oxidative Degradation Mechanisms of Lubricants.
 Final rept.
 S. M. Hsu, C. S. Ku, and P. T. Pei. 1986, 22p
 Sponsored by Department of Energy, Washington, DC. Pub. in Aspects of Lubricant Oxidation, ASTM STP 916, p27-48 1986.

Keywords: *Lubricants, *Degradation, Oxidation, Durability, Wear, Environmental impacts, Catalysts, Viscosity, Experimental facilities, Reprints.

Lubricant degradation under in-service conditions can be often traced to oxidation. Environmental effects under in-service conditions are often recognized to affect the oxidation pathways of lubricants. In the study, environmental factors such as metal catalysts, fuel components, and oxides of nitrogen are studied systematically in a simple oxidation test. The test consists of bubbling air into the oil sample at 175C. Periodic samples were withdrawn and analyzed. Results show that the environmental factors not only have significant influence on the rate of oxidation, but also on the oxidation pathway of how lubricants degrade. The acid number increase was found to be an important parameter in monitoring the lubricant degradation mechanisms.

Pulse Tube Refrigeration: A New Type of Cryocooler.
 Final rept.
 R. Radebaugh. 1987, 6p
 Pub. in Japanese Jnl. of Applied Physics 26, Supplement 26-3, p2076-2081 1987.

Keywords: *Stirling cycle, *Refrigerators, *Cryogenics, Cooling systems, Coolers, Refrigerating, Low temperature research, Enthalpy, Flow models, Reprints.

A variation of the Stirling cryocooler, known as pulse tube refrigeration, requires only one moving part - a pressure wave generator at room temperature. The Stirling cryocooler requires in addition a moving displacer at low temperatures to cause a phase shift between pressure and mass flow rate that leads to a refrigeration effect. The paper generalizes the Stirling cycle and shows how instantaneous heat transfer or flow through an orifice can cause a similar phase shift without a moving displacer. Temperatures as low as 60 K have been achieved in a one stage device where an orifice is used for the phase shifting. The heat transfer mechanism for phase shifting does not yield as low a temperature, but it is semireversible and was used by Wheatley to convert heat energy to acoustic energy, which in turn drove a thermoacoustic refrigerator with no moving parts. The paper compares the various pulse tube refrigerators and the Stirling refrigerator using a newly developed enthalpy flow model. Some generalizations of these concepts to systems other than gas systems are made.

Heat Transfer in a Compact Tubular Heat Exchanger with Helium Gas at 3.5 MPa.
 D. A. Olson, and M. P. Glover. Jun 90, 66p NISTIR-3941
 Sponsored by National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.

Keywords: *Heat transfer, *Heat exchangers, Helium, Friction factor, Heat flux, Reynolds number, Mathematical models, Test facilities, Radiant heating, Experimental data, Turbulent flow.

The authors constructed a compact heat exchanger consisting of circular tubes in parallel brazed to a grooved base plate. This tube specimen heat exchanger was tested in an apparatus which radiatively heated the specimen on one side at a heat flux of up to 54 W/cm sq, and cooled the specimen with helium gas at 3.5 MPa and Reynolds numbers of 3000 to 35,000. The measured friction factor of the tube specimen was lower than that of a circular tube with fully developed turbulent flow, although our uncertainty was high due to entrance and exit losses. The measured Nusselt number, when modified to account for differences in fluid properties between the wall and the cooling fluid, agreed with past correlations for fully developed turbulent flow in circular tubes.

Micromechanics of Fracture in Structural Adhesive Bonds.
 Final rept.
 D. L. Hunston, A. J. Kinloch, and S. S. Wang. 1989, 13p
 Pub. in Jnl. of Adhesion 28, n2-3 p103 1989.

Keywords: *Adhesion, *Construction joints, *Epoxy resins, Adhesive bonding, Surface energy, Crack propagation, Deformation, Toughness, Stress analysis, Bonded joints, Fracture strength, Motion pictures, Reprints, Fracture mechanics, Micromechanics.

The high mode-I fracture surface energies, G(sub IC), of structural adhesives can be attributed to their ability to form large crack-tip deformation zones prior to failure. It has been suggested that the feature also controls the dependence of the adhesive bond G(sub IC) on bond thickness. The proposed explanation asserted that the physical constraint of the adherends and the nature of the crack-tip stress field in an adhesive joint alter the size and shape of the deformation zone, and this in turn changes the fracture behavior, i.e. smaller zones giving lower G(sub IC)'s. To examine the hypothesis, motion pictures were taken of fracture specimens during loading, and the stress whitening that occurred at the crack tip was used to judge the relative dimensions of the deformation zone. The experiments were conducted for bulk samples and bonded joints of different bond thicknesses. The results generally support the hypothesis that the variations in adhesive G(sub IC) as a function of bond thickness can be directly correlated with changes in the size of the deformation zone. Moreover, the movies furnish a clear picture of the deformation zone's growth patterns during loading, and this provides a critical test for future modelling efforts.

Keywords: *Graphite, *Blackbody radiation, *Refractory materials, Melting point, Temperature measurement, Thermophysical properties, Brightness, Radiance, High temperature tests, Pulse heating, Surface temperature, Reprints, Triple point.

Measurements of the radiance temperature of graphite at 655 nm have been performed in the vicinity of its triple point by means of a rapid pulse-heating technique. The method is based on resistively heating the specimen in a pressurized gas environment from room temperature to its melting point in less than 20 ms by passing an electrical current pulse through it and simultaneously measuring the radiance temperature of the specimen surface every 120 microseconds by means of a high-speed pyrometer. Results of experiments performed on two different grades of POCO graphite (AXM-5Q1 and DFP-1) at gas pressures of 14 and 20 MPa are in good agreement and yield a value of 4330 + or - 50 K for the radiance (or brightness) temperature (at 655 nm) of melting graphite near its triple point (triple-point pressure, approximately 10 MPa). An estimate of the true (black-body) temperature at the triple point is made on the basis of the result and literature data on the normal spectral emittance of graphite.

Results of a study program on the toughness properties of monophase ceramics are summarized. In situ observations of crack propagation in alumina and other monophase ceramics show crack interface bridging to be the principal source of increasing toughness with crack size, i.e. R-curve behavior. Fracture mechanics models describing this behavior, in the particular context of strength, are developed. Results of strengths tests confirming the essential predictions of the theory are presented. Results of wear and fatigue tests are also described. The model has strong implications concerning the controlled processing of ceramics for optimum toughness and strength properties. An ultraclean ceramic processing laboratory has been designed and constructed at the National Institute of Standards and Technology (NIST). This facility is currently being used to produce powders and ceramic samples with controlled levels of impurities and dopants. The laboratory contains a variety of equipment for ceramic powder processing. Included are: a rotary evaporator for drying solutions with minimum agglomeration, a Class 100 drying oven (300 deg C maximum temperature) that can be purged and used in an inert atmosphere, an electronic balance (0.01 mg sensitivity), an ultra-sonic disrupter for solution deagglomeration, a 12-ton press for sample compaction, and two controlled atmosphere furnaces (900 and 1,700 deg C maximum temperatures, respectively). NIST's Ultra-Clean Ceramic Processing Laboratory is available to industrial and academic researchers for cooperative research programs. It is also available for short-term proprietary research.

Role of Interfacial Grain-Bridging Sliding Friction in the Crack-Resistance and Strength Properties of Nontransforming Ceramics.
 Final rept.
 S. J. Bennison, and B. R. Lawn. 1989, 13p
 Sponsored by Air Force Office of Scientific Research,
 Arlington, VA.
 Pub. in Acta Metallurgica 37, n10 p2659-2671 1989.

Keywords: *Grain boundaries, *Sliding friction, *Crack propagation, *Toughness, *Ceramics, Interfaces, Aluminum oxide, Mathematical models, Residual stress, Impact strength, Indentation, Microstructure, Reprints, Fracture mechanics.

A grain-bridging model of crack-resistance or toughness (R-curve or T-curve) properties of nontransforming ceramics is developed. A key new feature of the fracture mechanics treatment is the inclusion of internal residual (thermal expansion mismatch) stresses in the constitutive stress-separation relation for pullout of interlocking grains from an embedding matrix. By providing a physical account of the underlying micromechanics of the bridging process the analysis allows for predetermination of the material factors in the constitutive relation, thereby reducing parametric adjustments necessary in fitting the theoretical toughness curve to experimental data. The applicability of the model is illustrated in a case study on indentation-strength data for a 'reference' polycrystalline alumina with particularly strong T-curve characteristics. From theoretical fits to the data the constitutive relation, and thence the entire T-curve, can be deconvoluted. The 'parametric calibration', apart from demonstrating the plausibility of the model, allows for quantitative predictions as to how the toughness and strength characteristics of ceramics depend on such microstructural variables as grain size and shape, grain boundary energy, level of internal stress and sliding friction coefficient.

 Pub. in Jnl. of the American Ceramic Society 72, n9
 p1760-1763 1989.

Keywords: *Cyclic loads, *Fatigue life, *Aluminum oxide, *Ceramics, *Crack propagation, Bridging, Reprints.

The behavior under cyclic tension-tension loading of an alumina ceramic with pronounced crack-bridging (R-curve) characteristics is studied. Tests on disk specimens with indentation cracks reveal no failures below the static fatigue limit. Theoretical predictions of the stress-lifetime response, based on the premise that environmentally assisted slow crack growth is the sole factor determining lifetime, are consistent (within experimental scatter) with the data. The results indicate that there is no significant cyclic degradation from potential damage to the bridges, at least in the short-crack region pertinent to strength properties.

 Sponsored by Office of Naval Research, Arlington, VA.
 Pub. in Jnl. of Non-Crystalline Solids 102, n1-3 p82-87 1988.

Keywords: *Glass fibers, *Silicon dioxide, *Failure, *Silica glass, Vickers hardness, Defects, Residual stress, Reliability, Indentation hardness tests, Reprints, Fracture mechanics.

It is well established that subthreshold Vickers indentations closely simulate the response of naturally occurring flaws in high quality glass fibers. Accordingly, the inert strength of bare fused silica fibers with Vickers

ers subthreshold flaws is studied as a function of indentation load. The strengths are significantly higher than the strengths predicted by simple extrapolation of data from postthreshold indentation flaws. A simplistic fracture mechanics model, incorporating residual stresses associated with the contact impression is developed to explain the results. The residual contact stresses are shown to control the flaw instability. The model gives relations for the subthreshold inert strength as a function of load and for the threshold indentation size. The relations are shown to be consistent with both present and earlier silica glass data.

Laser-Induced Vaporization Mass Spectrometry of Refractory Materials: Apparatus and the BN System.

Final rept.
J. W. Hastie, D. W. Bonnell, and P. K. Schenck. 1988, 26p
Pub. in High Temperature Science 25, n2 p117-142 Apr 88.

Keywords: *Vaporizing, *Mass spectrometry, *Refractory materials, Equipment, *Boron nitrides, Thermochemistry, High temperature tests, Thermodynamic equilibrium, Gas sampling, High pressure tests, Reprints, *Laser heating.

Thermochemical vaporization data for refractory materials at temperatures beyond about 2000 K are virtually non-existent. Such data are especially lacking under conditions where the gas or vapor pressure exceeds the experimental collision-free regime of about 10(sup-4) atm. The main measurement limitations of material containment, temperature attainment and control, gas-dynamic sampling, and species specificity can, in principle, be overcome through a coupling of laser vaporization with high temperature, high pressure-sampling mass spectrometry. Such a coupled approach has been developed and demonstrated on the BN system at temperatures around 2900 K and pressures in the vicinity of an atmosphere. The results obtained support the extrapolation of the thermodynamic functions provided by the JANAF Thermochemical Tables for the observed vapor species, BN, B₂, B₃, and N₂, referenced to BN solid. The species also appear to be in local thermodynamic equilibrium, even for relatively short laser pulse times of 7 ns. However, no evidence was found for the expected equilibrium phase of liquid boron. As a consequence, the decomposition temperature of BN appears to be much higher under the rapid laser heating conditions used than the JANAF prediction for a completely equilibrated system.

Effects of chemical inhomogeneities and single crystal seeds on grain normal and discontinuous grain growth were investigated in both undoped and MgO-doped Al₂O₃. The chemical impurities in the samples were evolved at a lower temperature than the sintering temperature and measured by SEM/EDS to determine the correlation between the distribution of impurity and the microstructure in Al₂O₃. A feature of the study was the use of clean room processing and firing procedures to maintain sample composition. As the local concentrations of chemical impurities (i.e., Si, Ca) increased, the grain boundary-grain boundary dihedral angle distribution widened, with many angles of 180 degrees, the grain-size distribution widened, and pore-boundary separation was enhanced. Discontinuous grain growth was observed in regions of undoped Al₂O₃ containing the largest Ca and Si concentrations. It is suggested that doping with MgO solute reduces

the effects of impurities on grain growth by increasing the bulk solubility of impurities, especially Si, and by narrowing the distribution of grain boundary-grain boundary dihedral angles.

Ceramic Thermochemistry and Kinetics from Laser-Induced Vaporization Mass Spectrometry.

Final rept.
J. W. Hastie, D. W. Bonnell, and P. K. Schenck. 1987, 1p
Pub. in Jnl. of the Electrochemical Society 134, n8B pC470 1987.

Keywords: *Mass spectrometry, *Ceramics, *Thermochemistry, *Vaporizing, *Kinetics, *Laser beams, Graphite, Boron nitrides, Thermodynamic equilibrium, Reprints, Pulsed lasers, Laser heating.

Use of high powered pulsed lasers as a heat source, together with time-resolved mass spectrometric detection, for ceramic vaporization studies is described. Two example cases, graphite at temperatures in the region of 4100 K and boron nitride at 2900 K are considered in detail. In both cases, the total species pressures were found to be in the region of an atmosphere. Under conditions where post-vaporization modifications, such as cluster formation and photolysis are essentially absent, the species distributions agree with a local equilibrium model using the JANAF thermodynamic functions. Measured velocity distribution profiles are used to determine the significance of electron impact fragmentation, impurities, and plume-expansion dynamics on the results.

Determination of Fiber/Matrix Interfacial Properties of Ceramic and Glass Matrix Composites.

Interim rept. 1 Jan 86-1 Jan 88.
D. C. Cranmer. Feb 90, 76p NISTIR-89/4079
Contracts N00014-86-F-0096, N00014-C-0096
Sponsored by Strategic Defense Initiative Organization, Washington, DC. Innovative Science and Technology.

Keywords: *Ceramics, *Borosilicate glass, Crack propagation, Surface properties, Silicon carbides, Toughness, Compression tests, Indentation, *Matrix materials, *Ceramic matrix composites, *Fiber reinforced composites, *Interface stability.

The work described is primarily related to the development and use of several techniques for determining the fiber/matrix interfacial properties of ceramic and glass matrix composites. The specific techniques utilized are the double cleavage drilled compression (DCDC), indentation push-in, indentation push-out, and single fiber pull-out tests. The DCDC test provides direct experimental observation of the crack-fiber interactions. The indentation techniques and the pull-out test provide information on the debond strength of the fibers from the matrix and interfacial frictional stress required to pull the fibers out of the matrix. The emphasis has been on understanding what happens at the interface, and has focused on several model systems including SiC monofilament reinforced glasses (borosilicate, soda-lime-silica), and SiC fiber reinforced glass-ceramic. Measurements have been made of the interface properties as well as on the increase in toughness as a crack approaches the reinforcing fibers. Some of the effects of interface chemistry on the properties have also been considered.

The primary impediments to the growth of the advanced ceramics industry are lack of reliability and

high cost of ceramic components and devices. Fine powders from which advanced ceramics are made are crucial in determining the cost and final properties of a product. For this reason, the Division has developed a strong capability in the synthesis, characterization and processing of powders. Improvements in the reliability of advanced ceramics, whether for structural or functional applications, require a mechanistic understanding of the modes of failure to which a ceramic is susceptible. To further the impact in this area the Division has focused their efforts on the understanding of microstructural features which control brittle fracture and high temperature creep. Efforts in the functional ceramic field have included, for electronic applications, the continuation of processing-property studies on piezoelectric materials as well as a major effort on high T (sub c) superconducting ceramics. The microstructural features which limit the application of high temperature superconductors have been addressed as part of the NIST superconductivity initiative. Research in the optical materials area has included the development of techniques of deposition and analysis of diamond films which are expected to find application as protective coatings on a variety of detector windows.

Porosity in Spinel Compacts Using Small-Angle Neutron Scattering.

Final rept.
K. G. Frase, and K. A. Hardman-Rhyne. 1988, 16p
Pub. in Jnl. of the American Ceramic Society 71, n1 p1-16 Jan 88.

Keywords: *Spinel, *Porosity, *Neutron scattering, *Compacting, *Sintering, Densification, Agglomerates, Voids, Nondestructive tests, Green strength, Reprints.

Unfired Spinel (MgAl₂O₄) compacts and sintered materials with small hard agglomerates (<5 micrometers) were studied using small angle neutron scattering (SANS) techniques. The SANS results were compared with those from mercury porosimetry and gas adsorption. The results from green state samples are consistent with interconnected 'ink-bottle' type porosity. In the latter stages of densification the average void size is significantly larger than that found in the unfired compact. The presence of the hard agglomerates affect the observed SANS scattering much more in the partially densified samples than in the unfired compacts. It is demonstrated that the use of multiple SANS techniques to study large voids (>0.1 micrometers) and large pore fractions (45%) is a sensitive, nondestructive diagnostic probe for the evaluation of porosity during sintering.

Ceramics, Refractories, & Glass

Keywords: *Neutron diffraction, *Powder(Particles), *Orthorhombic lattices, *Barium oxides, *Yttrium oxides, *Copper oxides, *Crystal structure, Reprints.

The structure of orthorhombic Ba₂YCu₃O_{6.5} has been refined with neutron diffraction profile analysis. The space group of the compound is Pmmm, and the lattice parameters are a = 3.8468(1), b = 3.8747(1), and c = 11.7466(5) Å. The oxygen sites at (0,0,z), (1/2,0,z), and (0,1/2,z) are fully occupied, while the sites at (0,1/2,0) are 50% full and the sites at (1/2,0,0) are vacant. A comparison of bond distances in this sample and in other compositions in the system Ba₂YCu₃O (6.0 < or = delta < or = 7.0) shows that the environment of the Ba atoms and of the Cu atoms at (0,0,0) and (0,0,z) change significantly with the amount of oxygen in the unit cell.

Theory of Chemically Induced Kink Formation on Cracks in Silica. 2. Force Law Calculations.
 Final rept.
 K. Masuda-Jindo, V. K. Tewary, and R. M. Thomson. 1987, 7p
 Pub. in Jnl. of Materials Research 2, n5 p631-637 Sep/Oct 87.

Keywords: *Silicon dioxide, *Ceramics, *Crack propagation, *Chemical reactions, Mathematical models, Hydrolysis, Computation, Loads(Forces), Chemical bonds, Molecular orbitals, Reprints, *Fracture mechanics, *Lines of force.

The paper is the second of a pair on a theory of chemically assisted fracture. In it, a simple bond orbital model of the force laws to be used in fracture is developed. In the bond orbital model, only a few of the atoms in the vicinity of the bond to be broken are considered. Interactions with the rest of the system, which is assumed to be Newtonian, are not included. Numerical accuracy is not required, but qualitative features of the force laws are believed to be valid. The silica bond is shown to rise quickly to a high peak, after which it develops a relatively long tail. When the bond is attacked by water, modeling by the same technique indicates that the bond has a 'snapping' characteristic which is important in the theory developed in the first paper. For bonds with smooth 'back sides' the barriers to crack motion are shown to be low, but barriers are expected to be observable when the bond snaps. A tight binding treatment of a one dimensional chain has also been included to investigate the effect of including band effects in the force law. The effects are found to be small compared to the simple bond breaking of the bond orbital calculation.

Phase Diagrams for Ceramists Volume 6.
 Final rept.
 R. S. Roth, J. R. Dennis, and H. F. McMurdie. 1987, 515p
 Sponsored by American Ceramic Society, Inc., Westerville, OH.
 Pub. in Phase Diagrams for Ceramists Volume 6, 515p 1987.

Keywords: *Ceramics, *Phase diagrams, Oxides, Reviews, Reprints.

The volume supplements the five previous collections entitled 'Phase diagrams for ceramists.' The sixth compilation contains 697 commentaries and 1084 diagrams on oxides, mainly from literature published since 1975. Approximately 5,000 references, known to contain ceramic phase diagrams and published between 1975 and 1983, were collected by the staff of the Ceramics Division at the National Bureau of Standards. The diagrams pertaining to oxide systems were segregated for publication in the current volume, and the chemical systems assigned. The large number of diagrams, and the length of the commentaries, prevented the inclusion of all diagrams of appropriate chemistry in the current volume. Those which are not included will be published in future volumes.

Theory of Chemically Induced Kink Formation on Cracks in Silica. I. 3-D Crack Green's Functions.
 Final rept.
 R. M. Thomson, V. K. Tewary, and K. Masuda-Jindo. 1987, 12p
 Pub. in Jnl. of Materials Research 2, n5 p619-630 Sep/Oct 87.

Keywords: *Silicon dioxide, *Chemical attack, *Crack propagation, Greens function, Activation energy, Atomic energy levels, Water, Corrosion, Atomic theory, Reprints, Fracture mechanics.

The paper is the first of a pair on a theory of chemically assisted fracture. It includes the Green's function analysis for a three dimensional crack with a kink on it. Equations are developed for the activation energy for the motion and nucleation of such kinks using information to be found in the second paper regarding the force laws appropriate for water attack of silica. The most general conclusion is that lattice trapping barriers to crack motion (including chemical effects) are associated with a narrow core region of the crack, which is in turn connected to the nature of the interatomic force laws of the material (including modifications of the force laws induced by chemical reactions). Further, it was found that the force law must have a severely 'snapping' characteristic in order to assure a narrow core, a feature not to be expected except under certain types of external chemical attack of the crack. Additional results are that the energy to nucleate a kink pair in silica under water attack is in the neighborhood of 2 ev., and that the motion energy is of order 0.01 ev. Motion energies are expected to be considerably smaller than formation energies, in general.

 Pub. in Jnl. of the American Ceramic Society 71, n7 p602-608 Jul 88.

Keywords: *Silicon carbides, *Creep properties, Damage, Cavitation, Tension, Stress analysis, Ceramics, Reprints, Reaction bonding, Compression.

The creep behavior of a commercial grade of reaction bonded silicon carbide was characterized at a temperature of 1300 C. Creep occurred more easily in tension than in compression. At a given applied stress, the steady state creep rate in tension was found to be at least twenty times that obtained in compression. In both tension and compression, the stress exponent for steady state creep was found to increase with increasing applied stresses. At low applied stresses, the stress exponent was approximately equal to 4, suggesting some kind of dislocation mechanisms are operating in the two-phase composite. At high stresses, the stress exponent was approximately equal to 11. In tension, the increase in the stress exponent was attributed to damage accumulation in the form of cavities. An effective threshold stress for cavitation of less than 100 MPa was suggested. In compression, however, the cause of the increase of stress exponent with stress cannot be attributed to cavitation. A simple mechanistic model is proposed which is capable of describing all major features of the asymmetric creep.

 Pub. in Jnl. of Materials Research 5, n2 p241-244 Feb 90.

Keywords: *Yttrium oxides, *Barium oxides, *Superconductors, X ray diffraction, Bulk modulus, Elastic properties, Compressibility, High pressure tests, Ceramics, Transition temperature, Barium titanates, Strontium titanates, Reprints, *Cuprates.

Using several measured and calculated physical properties, it is argued that the high-Tc metal-oxide superconductor Y₁Ba₂Cu₃O₇ is elastically soft compared with BaTiO₃ or SrTiO₃. It is concluded that the bulk modulus equals approximately 107 GPa, despite several high-pressure x-ray diffraction studies that report values up to approximately 200 GPa. Part of the argument uses an ionic-crystal-model calculation of the bulk modulus.

Pub. in *Jnl. of the American Ceramic Society* 71, n2 pC64-C67 1988.

Keywords: *Barium oxides, X ray diffraction, Phase diagrams, Chemical equilibrium, Lattice parameters, Strontium, Calcium, Crystal symmetry, Ceramics, Reprints, *Cuprates, Synthesis(Chemistry), Diffraction patterns.

A compound of composition 2BaO:CuO was synthesized during the phase equilibria study of the BaO-Y₂O₃-CuOx system. Phase characterization has been carried out by using X-ray powder diffraction. The crystal symmetry was found to be compatible with that of Ca₂CuO₃ and Sr₂CuO₃. It is orthorhombic with space group Immm and lattice parameters a = 12.9655(14), b = 4.1007(3), c = 3.9069(5) Å, V = 207.72(3) Å³. The experimental pattern shows good agreement, in general, with the intensity values calculated by assuming it to be isostructural with Sr₂CuO₃. Some intensity discrepancy for the HOO reflections might be due to preferred orientation.

Ten compounds are found in the BaO-Y₂O₃-CuOx system. High temperature (approximately 950-1000 C) phases identified as Ba₄Y₂O₇, Ba₂Y₂O₅, Ba₃Y₄O₉, BaY₂O₄, Y₂Cu₂O₅, BaCuO(2+x), Ba₃YCu₂O_z, Ba₂YCuO₅ and Ba₂YCu₃O(6+x) are formed in the temperature range. In addition, a new compound with composition of 2BaO:CuO, which possibly has a melting point below 950 C, was prepared at 940 C. A summary of the crystallographic data of the 10 phases is given. In particular, results of x-ray studies pertaining to four compounds, Ba₂YCu₃O(6+x), which is currently the most promising high T_c superconductor material, Ba₂CuO₃, Ba₂Y₂O₅, and Ba₃YCu₂O_z are reviewed.

Low Temperature Chemical Approaches to Superconductive Materials: A Challenge in Chemical Synthesis.

Final rept.
J. J. Ritter. 1988, 6p
Pub. in *Ceram. Trans.* 1, n2 pA79-84 1988.

Keywords: *Superconductors, *Ceramics, Copper oxides, Reprints, *High temperature superconductors, *Yttrium barium cuprates, *Synthesis(Chemistry), Precursor.

The synthesis of Ba-Y-Cu oxide ceramic powders is an essential factor in the development of superconductive devices. While the major effort in the superconductor research is supported with powders synthesized by conventional high temperature techniques, the problem of generating precursors to these materials by low temperature routes presents a significant challenge. Results from four different chemical approaches ranging from the precipitation of Y-Ba-Cu hydroxycarbonates to reactions between Y-Ba alkoxides with Cu(OH)₂ are given. All of these systems progress through an intermediate triphasic mixture of BaCO₃, CuO and Y₂O₃ before being converted to YBa₂Cu₃O(6+x) between 800 and 950 deg. Superconductive behavior is measured in each case after annealing the specimens in O₂ at about 600 deg. The benefits of ideal and practical low temperature processing are discussed.

Quantitative Characterization of the Microstructure of Hardened Tricalcium Silicate Paste Using Computer Image Analysis.

Final rept.
D. P. Bentz, and H. M. Jennings. 1987, 8p
Pub. in *Pore Structure and Construction Materials Properties*, v1 p49-56 1987.

Keywords: *Cements, Calcium silicates, Microstructure, Curing, Computerized simulation, Mathematical models, Construction materials, Phase diagrams, Microporosity, Epoxy resins, Reprints, Tricalcium silicate,

Image analysis, Scanning electron microscopy, Pastes.

Quantitative characterization of the microstructure of cement paste is necessary in relating physical properties to microstructure and verifying simulation models. Such quantification can be achieved using computer image analysis. Digitized images of micrographs of polished sections of epoxy-impregnated hardened tricalcium silicate paste obtained using a SEM backscatter electron detector are divided into four phases (pores, calcium hydroxide, calcium silicate hydrate, and anhydrous material) based on the level of grayness of each phase. Discrete phases (e.g. calcium hydroxide and anhydrous material) traditionally have been characterized by their number, location, and size distribution. Conversely, the numerical description of phases that are continuous across large portions of a micrograph (e.g. pores and calcium silicate hydrate) is much less developed. New techniques are presented for evaluating the connectivity of a complex pore structure and the ability of different sized particles to move through it. The analytical procedures developed here for tricalcium silicate paste should be applicable to other multiphase materials.

Structural Phase Transition Study of Ba₂YCu₃O₇(sub 6+x) in Air.
Final rept.
W. Wong-Ng, L. P. Cook, C. K. Chiang, L. J. Swartzendruber, L. H. Bennett, J. Blendell, and D. Minor. 1988, 8p
Pub. in Jnl. of Materials Research 3, n5 p832-839 Sep/Oct 88.

Keywords: *Ceramics, *Barium oxides, *Yttrium oxides, *Copper oxides, Phase transformations, Quenching(Cooling), Crystal structure, Order disorder transformations, Air, Superconductivity, Orthorhombic lattices, Tetragonal lattices, X-ray diffraction, Liquid helium, Meissner effect, Reprints, Barium yttrium cuprates, Scanning electron microscopy.

A structural phase transition study of Ba₂YCu₃O₇(6+x) (x equals 0 to 1) has been conducted on a series of 13 quenched samples. The samples were prepared from an orthorhombic material by annealing at temperatures from 400 to 1000 C in air, followed by rapid quenching. All quenches were performed by using a liquid nitrogen cooled copper cold well with a continuous flow of cooled helium gas. Various measurements including x-ray diffraction, thermogravimetric analysis, Meissner effect, and scanning electron microscopy were carried out in order to correlate the nature of the phase transition with crystallographic data, superconductivity, and annealing temperature. The phase transition from Ba₂YCu₃O₇ to Ba₂YCu₃O₆ appears to involve two orthorhombic regions: region A with a less than b approximately equals c/3 below approximately 600 C and region B with cell parameters of a less than b less than c/3 from approximately equals 600 to 708-720 C. The transformation from orthorhombic to tetragonal takes place in the temperature range of 708-720 C. The transition appears to be second-order, order-disorder type.

Pressure Sintering and Transformation Toughening of Zinc Sulfide.
Final rept.
S. Block, G. J. Piermarini, V. Bean, and A. Raynes. 1990, 6p
Sponsored by Office of Naval Research, Arlington, VA. Pub. in Materials Science and Engineering A127, p99-104 1990.

Keywords: *Sintering, *Ceramics, *Zinc sulfides, *Fracture strength, Toughness, Pressure, Bonding, Phase transformations, Thin films, Diamonds, Hardness, Vapor deposition, Cadmium compounds, Yttrium compounds, Gallium compounds, Phosphides, Selenides, Iodides, Compacting, Nickel compounds, Thallium compounds, Reprints.

Several techniques to increase the fracture toughness of ZnS, including pressure sintering, transformation toughening and pressure bonding to a diamond film, were evaluated. The primary method used was pressure sintering, i.e. room temperature compaction fol-

lowed by sintering at a relatively low temperature (less than Tm/2 where Tm is the melting point). Pressure sintering produces superior ZnS compacts with a hardness of 2.89 GPa and a fracture toughness of 1.59 MPa m^{1/2} compared with 2.17 GPa and 0.87 MPa m^{1/2} for conventionally produced chemical-vapor-deposited material. The hardness and fracture toughness of CdY₂S₄, GaP-doped zinc sulfide and selenide compacts processed by pressure sintering were also evaluated. The mineral form of NiS (millerite) significantly toughens ZnS, but the ZnS-NiS compact is no longer transparent in the infrared region.

Neutron Diffraction Study of the 'Brown Phase' BaNd₂CuO₅.
Final rept.
J. K. Stalick, and W. Wong-Ng. 1990, 4p
Sponsored by Electric Power Research Inst., Palo Alto, CA.
Pub. in Materials Letters 9, n10 p401-404 Jun 90.

Keywords: *Crystal structure, *Ceramics, Neutron diffraction, Phase diagrams, Barium oxides, Neodymium oxides, Copper oxides, Yttrium oxides, Lanthanum oxides, Tetragonal lattices, Solid solutions, Reprints.

A neutron Rietveld refinement study of the 'brown phase' BaNd₂CuO₅ shows that the material is isostructural with the La analog, but adopts a totally different structure from that of the 'green phase' BaR₂CuO₅ formed for R=Y and most lanthanide elements. BaNd₂CuO₅ is tetragonal, space group P4/mbm(126), with Z=2 and refined cell parameters a=6.7015(1) and c=5.8211(1)Å. The BaNd₂CuO₅ framework is built from edge- and face-sharing BaO₁₀ and NdO₈ polyhedra, while in the green phase structure the smaller R(sup 3+) ion is surrounded by seven oxygen atoms. The square-planar CuO₄ groups are isolated in the structure.

Overview of the Structural Ceramics Database (Release No. 1)(for Microcomputers).
Model-Simulation.
30 Apr 90, 1 diskette NIST/SP-787, NIST/SW/DK-90/013
System: IBM PC and compatibles; MS DOS 2.1 or higher operating system, 640K. Language: Runtime Demo. The software is contained on one 360K, 5 1/4 inch diskette, double density. File format: ASCII. Documentation is on diskette.

Keywords: *Models-simulation, *Software, *Ceramics, *Mechanical properties, *Thermodynamics properties, Silicon carbides, Diskettes, Man computer interface, Interactive systems.

The National Institute of Science and Technology (NIST) Structural Ceramics Database (SCD) is a computerized, user-friendly database of materials properties for advanced ceramics intended for high temperature structural applications. Version 1.0 contains thermal and mechanical property data for silicon carbides and silicon nitrides. A computerized overview of the user-friendly features has developed to illustrate the capability of the SCD and their use in a typical interactive application. The overview allows the user either to participate actively in the overview by pressing the appropriate keys or to view the overview passively as the program proceeds automatically. In either case, the overview is designed to proceed in the correct sequence regardless of what keys the user presses.

Role of Grain Size in the Strength and R-Curve Properties of Alumina.
Final rept.
P. Chantikul, S. J. Bennison, and B. R. Lawn. 1990, 9p
Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.
Pub. in Jnl. of the American Ceramic Society 73, n8 p2419-2427 Aug 90.

Keywords: *Aluminum oxide, *Ceramics, Grain size, Microstructure, Strength, Indentation hardness tests,

Toughness, Mathematical models, Interfaces, Mechanical properties, Crack propagation, Reprints, Fracture mechanics, R-curve.

An investigation of the interrelationships between strength, crack-resistance (R-curve) characteristics, and grain size for alumina ceramics has been carried out. Results of indentation-strength measurements on high-density aluminas with uniform grain structures in the size range 2 to 80 micrometers are presented. The primary role of grain size in the toughness characteristic is to determine the scale of grain pullout at the bridged interface. It is shown that the strength properties are a complex function of the bridged microstructure. The analysis confirms the usual negative dependence of strength on grain size for natural flaws that are small relative to the grain size, but the dependence does not conform exactly to the -1/2 power predicted on the basis of classical 'Griffith-Orowan' flaws. The analysis provides a self-consistent account of the well-documented transition from 'Orowan' to 'Petch' behavior.

Flexural Behavior of Strain-Softening Solids.
Final rept.
T. J. Chuang, and Y. W. Mai. 1989, 17p
Pub. in International Jnl. of Solids Structures 25, n12 p1427-1443 1989.

Keywords: *Flexural strength, *Beams(Supports), Solids, Ceramics, Crack propagation, Tensile properties, Bending, Concretes, Rocks, Reprints, *Strain softening, Performance prediction, Fracture mechanics.

The flexural behavior of a beam is investigated in an attempt to establish a correlation between the tensile and bending properties of strain-softening solids. Given the complete uniaxial stress-strain relations, including the post-peak tension-softening portion, it is possible to predict the flexural behavior in moment-curvature and load-deflection relations. The results indicate that strain-softening gives rise to enhanced bending strength in agreement with experimental data. Conversely, given the bending responses together with the softening characteristics the complete tensile behavior can be determined. Since bending experiments are easier to perform than uniaxial tensile tests, this well-defined correlation provides a feasible means to obtain the entire tensile behavior of strain-softening solids such as concrete, rocks and ceramics.

Creating a Materials Data Base Builder and Producing Publications for Ceramic Phase Diagrams.
Final rept.
H. M. Ondik, and C. G. Messina. 1989, 11p
Pub. in Computerization and Networking of Materials Data Bases, ASTM STP 1017, p304-314 1989.

Keywords: *Ceramics, *Phase diagrams, Reprints, *Data base management.

The Ceramics Phase Diagrams Data Center faced several problems in the early stages of developing a computer data base to distribute to the ceramics user community. The Data Center had to create and store data files containing full scientific notation, provide for transferring data to undesignated computer(s) from the computer on which the files were created, and provide for installation of the data on undetermined Data Base Management System(s) for user access. The solution was incorporated in programs developed in the National Institute for Standards and Technology (NIST) Office of Standard Reference Data and expanded under the support of the American Ceramic Society. All information is expressed using only printable ASCII characters and is stored in dynamic arrays with all fixed length parameters encoded as program variables. Bibliographic and some chemical data for the next several volumes of Phase Diagrams for Ceramics are currently being stored in this form. The data are being manipulated to produce material in typeset form for the published volumes. They have also been transferred with no loss of information to a prototype data base for rapid retrieval.

Fracture of Polycrystalline Ceramics.

Final rept.
S. W. Freiman, and P. L. Swanson. 1990, 12p
Pub. in Deformation Processes in Minerals, Ceramics
and Rocks, Chapter 3, p72-83 1990.

Keywords: *Ceramics, *Crack propagation, Failure,
Polycrystalline, Stresses, Microstructure, Fracture
strength, Reprints, *Fracture mechanics, Performance
prediction.

Catastrophic failure in polycrystalline ceramics results from stressed cracks growing to critical dimensions which can span a range of size scales. As critical flaw dimensions increase in size from a scale less than characteristic microstructure dimensions to a size which encompasses many grain diameters, the resistance to fracture increases, in certain polycrystals, by a factor of 5 to 10. This increase represents the difference between the fracture resistance of the polycrystal and that of its individual constituent single crystals. The paper (1) briefly reviews several microstructural mechanisms suggested to be responsible for both the high fracture energy of polycrystals and the rising resistance to fracture with crack extension (R-curve behavior), (2) shows how relatively small variations in grain size and shape affect the R-curve, or fracture toughness - crack size relationship, (3) presents the results of in-situ microscopy observations of subcritically-propagating cracks which lend support to crack-interface traction as an important fracture resistance mechanism, and (4) examines the complicating influence that the traction mechanism has on prediction of time-dependent failure from flaws propagating under the influence of stress-enhanced chemical reactions.

Fracture Toughness Behavior of a Silicon Carbide Whisker-Reinforced Alumina Ceramic at Selected Porosities.

Final rept.
R. F. Krause, and E. R. Fuller. 1987, 18p
Sponsored by Department of Energy, Washington, DC.
Pub. in Proceedings of Fossil Energy Materials Program
Conference, Oak Ridge, TN., May 19-21, 1987,
p38-55.

Keywords: *Fracture strength, *Silicon carbides, *Ceramics, *Aluminum oxide, Toughness, Whisker composites, Porosity, Mathematical models, Crack propagation, Indentation, Flexural strength, Reprints, *Fracture mechanics, *Ceramic matrix composites.

The fracture roughness behavior of a silicon carbide whisker-reinforced alumina ceramic has been characterized at porosities ranging from 0.6 to 11.5%. The composite material consisted of alumina that was hot pressed with 25 weight percent silicon carbide whiskers. Controlled flaws of increasing size were produced on polished surfaces of specimens by Vickers indentation loading from 2 to 200 N. The flexural strength measured as a function of indentation load indicates that the resistance to fracture of these materials increases as a function of crack extension. The results are analyzed in terms of a fracture model containing ligamentary tractions in the wake of the crack.

Crack Velocity Functions Thresholds in Brittle Solids.

Final rept.
K. T. Wan, S. Lathabai, and B. R. Lawn. 1990, 10p
Sponsored by Office of Naval Research, Arlington, VA.
Pub. in Jnl. of the European Ceramic Society 6, p259-268 1990.

Keywords: *Environmental tests, *Ceramics, *Crack propagation, Velocity measurement, Mica, Glass, Sapphire, Humidity, Equations, Mass transfer, Partial pressure, Reprints, *Brittle materials, *Fracture mechanics, Crack closure, Temperature dependence, Thermal energy.

A unifying treatment of environment-sensitive crack velocity functions for intrinsically brittle solids is pre-

sented. The formalism is soundly based on the concept of thermal activation barriers, but is phenomenological in that it does not attempt to identify the explicit underlying physical and chemical processes responsible for these barriers. Equations prescribing the v-G (crack velocity versus mechanical energy release rate) characteristics at specified chemical concentrations (partial pressures) and temperatures are thereby presented. The equations incorporate the familiar three velocity regions into a composite function: region 1, chemically assisted fluctuations over stress-enhanced energy barriers; region III, similar but in the absence of environmental species; region II, a connecting flow-limited transport branch. Data for selected brittle solids, principally mica but also glass and sapphire, in moist environments are used to illustrate the formalism.

Characterization of Epitaxial Fe on GaAs(110) By Scanning Tunneling Microscopy.

Final rept.
R. A. Dragoset, P. N. First, J. A. Stroschio, D. T. Pierce, and R. J. Celotta. 1989, 6p
Pub. in Materials Research Society Symposia Proceedings 151, p193-198 1989.

Keywords: *Epitaxy, *Iron, *Gallium arsenides, *Microscopy, Magnetic properties, Metal films, Body centered cubic lattices, Thickness, Surface roughness, Temperature, Clustering, Reprints, Characterization, Scanning tunneling microscopy.

Iron on GaAs(110) comprises an interesting system not only due to small lattice mismatch, 1.4%, but also because of the magnetic properties of the overlayer. In the present work, scanning tunneling microscopy (STM) was used to investigate bcc Fe films in the 0.1 Angstroms to 20 Angstroms thickness range, grown at 300 K and 450 K substrate temperatures. STM images show Volmer-Weber growth with the formation of 3-D Fe islands 20-30 Angstroms in diameter for 0.1-1 Angstroms deposition at 300 K, increasing to 40-50 Angstroms for thicker films. Iron island sizes at low coverage and thin film roughness at higher coverages both show significant dependence upon growth temperature.

Methods for Measuring Lead Concentrations in Paint Films.

M. E. McKnight, W. E. Byrd, W. E. Roberts, and E. S. Lagergren. Dec 89, 123p NISTIR-89/4209
Sponsored by Department of Housing and Urban Development, Washington, DC.

Keywords: *Quantitative analysis, *Lead(Metal), *Paints, Methodology, Test equipment, X ray fluorescence, Accuracy, Precision, Field tests, Sampling, Microscopy, Atomic spectroscopy, Tables(Data), Interlaboratory comparisons.

Recent legislation required the U.S. Department of Housing and Urban Development (HUD) to establish procedures to abate lead-based paint in existing HUD-assisted housing. The legislation also required HUD to assess the accuracy, precision, reliability, and safety of methods for measuring lead content of paint films and to investigate the availability of testers and samplers. The National Institute of Standards and Technology was requested to carry out the assessment. With regard to accuracy and precision of field measurements, it was concluded that: chemical spot tests when carried out by an experienced analytical chemistry technician can detect the presence of lead in paint films having concentrations in excess of 1 mg/sq cm about 90% of the time; the estimate of the precision of a field measurement procedure using lead-specific portable X-ray fluorescence (XRF) analyzers for lead concentrations near 1 mg/sq cm is + or - 0.6 mg/sq cm and the estimate of the bias is 0.2 mg/sq cm; this results in a 95% confidence interval of + or - 1.4 mg/sq cm; and based upon very preliminary measurements using the latest version of the spectrum analyzer portable XRF, the 95% confidence interval for field measurements is estimated to be + or - 0.5 mg/sq cm. In addition to field methods, standard laboratory procedures can be used to measure the lead content of paint samples to within a few percent of the quantity present over a wide range extending from less than 0.1 to over 10 mg/sq cm. Sample collection and sample dissolution procedures were also investigated.

Screening Procedures for Detecting Lead in Existing Paint Films: A Literature Review.

M. E. McKnight, and W. E. Byrd. Jan 90, 24p
NISTIR-89/4044

Keywords: *Nondestructive tests, *Lead(Metal), *Paints, Detection, Measurement(Materials), Residential buildings, Thin films, Chemical analysis, X ray analysis, X ray fluorescence.

Recent legislation required the U.S. Department of Housing and Urban Development (HUD) to establish procedures to eliminate, as far as practicable, the hazards of lead-based paint poisoning in any existing HUD-controlled housing. Thus, HUD promulgated a regulation which requires abatement to eliminate lead-based paint poisoning hazards in housing in which the concentration of lead in paint equals or exceeds 1 mg/sq cm. The legislation also required HUD to review test methods for measuring lead in paint. The National Institute of Standards and Technology was tasked with the requirement. The first phase of the task, the subject of the report, was to review the literature for screening methods for measuring or detecting lead in paint. To facilitate the review, criteria were developed for potential test methods. A test method must be: capable of detecting lead concentrations of 1 mg/sq cm but not concentrations less than 0.06%, non-hazardous, suitable for use as a nondestructive field method suitable for use by non-technical personnel, and sufficiently reliable and precise. No method reported in the reviewed literature met all of the requirements.

National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Center for Building Technology. **Potential Methods for Measuring and Detecting Lead in Existing Paint Films: A Literature Review.** W. E. Byrd, and M. E. McKnight. Jan 90, 46p NISTIR-89/4205

Keywords: *Nondestructive tests, *Paints, *Lead(Metal), Detection, Measurement, Coatings(Materials), Residential buildings, Thin films, Chemical analysis.

Recent legislation required the U.S. Department of Housing and Urban Development (HUD) to establish procedures to eliminate, as far as practicable, the hazards of lead-based paint poisoning in any existing HUD-controlled housing. Thus, HUD promulgated a regulation which requires abatement to eliminate lead-based paint poisoning hazards in housing in which the concentration of lead in paint equals or exceeds 1 mg/sq cm. The legislation also required HUD to review test methods for measuring lead in paint. The National Institute of Standards and Technology was tasked with the requirement. The review is the subject of the report. Test methods were evaluated based on the following criteria: safety, reliability, accuracy, precision, detection limit, ease of use, and technical skill required to make a measurement, nondestructive, and cost of an analysis. Methods were separated into two categories: field test methods and laboratory test methods. The laboratory test methods were also separated by whether the sample needed to be in solution or could be analyzed as a solid. None of the potential test methods met all of the desired criteria.

Comparison of the NIST (National Institute of Standards and Technology) and European Gold Coating Standards.
 C. R. Beauchamp, H. G. Brown, and D. S. Lashmore. Jan 90, 12p NISTIR-89/4162

Keywords: *Gold coatings, *Standards, *Europe, *United States, Measurement, Thickness, X ray fluorescence, Electrodeposited coatings, Sputtering, Tables(Data).

Gold coating standards produced by the National Institute of Standards and Technology (NIST) are compared with those produced by the Community Bureau of Reference (BCR) of the Commission of the European Communities. The nominal mass per unit area for the standards produced at NIST are 1.5, 3, 6, 14 mg/sq cm and the BCR standards are 1, 1.5, 6, 10 mg/sq cm. The comparison is in response to questions raised by BCR regarding the accuracy of NIST standards, especially in the range of 14 mg/sq cm. The reproduction of NIST certified thicknesses has been accomplished well within claimed deviation of 5%. The surfaces of both NIST's and BCR's standards are scratched due to extensive handling. Sputtered BCR samples become rough and develop large pits as they become thicker. It appears that difficulties arise when using energy dispersive instruments incorporating a requirement for the measurement of an infinitely thick standard. The deviations for the BCR samples were reproduced within 1.3% when using NIST standards. It should not be interpreted as meaning the BCR standards are this accurate since actual certified values were not provided for the comparison. Deviations of the measurements are generally larger when using energy dispersive measuring techniques. All NIST standards are certified using wavelength dispersive measuring techniques.

Simulation of Diffusion in Pigmented Coatings on Metals Using Monte-Carlo Methods.
 Final rept.
 D. P. Bentz, and T. Nguyen. 1990, 7p
 Pub. in Jnl. of Coatings Technology 62, n783 p57-63 Apr 90.

Keywords: *Coatings(Materials), Corrosion, Metals, Pigments, Protective coatings, Coating processes, Mathematical models, Diffusion theory, Monte Carlo method, Random walk, Organic compounds, Water, Oxygen, Computerized simulation, Reprints, Solid-solid interfaces.

The degradation of many organic coating systems is controlled by processes occurring at the coating-substrate interface. The degradation processes require that species, such as H₂O, O₂, or ions, diffuse from the atmosphere, through the coating, to the interfacial region. The paper presents a two-dimensional model for the diffusion of the species through a pigmented coating. The model is implemented via digitized Monte-Carlo simulations of the random walk behavior of individual species within the coating layer. The model has been developed to include a variety of parameters such as coating thickness, pigmentation (pigment volume concentration, pigment particle geometry, pigment absorption characteristics, etc.), and pinholes at the coating-atmosphere interface.

Quality Assurance Tests for Adhesion of Paint on Tactical Rigid Wall Shelters.
 H. Watanabe, L. W. Masters, and J. F. Seiler. Apr 90, 47p NISTIR-90-4276
 Sponsored by Army Natick Research Development and Engineering Center, MA.

Keywords: *Paints, *Aluminum, *Adhesion, Tactical warfare, Military facilities, Sandwich panels, Structural forms, Shelters, Rigid frames, Quality assurance, Tests, Bond strength, Portable equipment, Pull-off tests.

The document was prepared at the request of the U.S. Army Natick Research, Development and Engineering Center to provide assistance in identifying or developing a better method(s) for assuring the adequacy of paint adhesion on aluminum-faced sandwich panels of portable rigid wall shelters. The preferred requirements developed for the quality assurance tests are that the tests be quantitative, reliable, suitable for in-situ testing, low cost, and non-destructive. Currently available methods were surveyed. Both destructive and non-destructive techniques were examined. Among them, a button pull-off test was found to be most advantageous. Preliminary laboratory experiments using a button pull-off test to measure the bond strength of painted specimens provided by a shelter manufacturer showed the average bond strength of the exterior and the interior paints to be 7.27 Mpa (1050 psi) and 9.29 Mpa (1350 psi), respectively.

 Sponsored by Bureau of Engraving and Printing, Washington, DC.

Keywords: *Coatings(Materials), *Electrodeposited coatings, Wear tests, Metal coatings, Printing plates, Accelerated tests, Chromium, Nickel, Phosphorus, Silicon carbides, Abrasion tests, Electrochemistry, Cobalt.

Analysis of premature plate failure resulted in a number of recommendations to address a series of problems that were identified in the plating process of printing plates. An accelerated wear tester was developed and applied to rank electrodeposited coatings for wear. Composite coatings of nickel-phosphorus-silicon carbide exhibited a factor of 10 increase in wear performance over the current chromium technology. Various chromium coatings exhibited a factor of 1.2 to 2 increase in abrasive wear performance. A new pulse plated duplex chromium coating exhibited the factor of two increase over the presently used chromium coating. In situ wear testing of chromium plated wiper blades exhibited a factor of two increase over the presently used chromium coatings. In situ wear testing of chromium plated wiper blades exhibited a 10 to 15 fold increase in the blade life compared to the currently used unplated blades.

Using the Computer to Analyze Coating Defects.
 Final rept.
 D. P. Bentz, and J. W. Martin. 1987, 8p
 Sponsored by Tri-Services Building Materials Committee, Washington, DC.
 Pub. in Jnl. of Protective Coatings and Linings 4, n5 p38-45 May 87.

Keywords: *Coatings(Materials), *Nondestructive tests, Defects, Protective coatings, Construction materials, Pattern recognition devices, Paints, Corrosion, Surface properties, Blistering, Finishes, Reprints, *Computer aided mapping, Computer vision, Image processing, Building materials.

The application of computer image processing as a non-destructive technique for quantifying the condition of painted surfaces in both the laboratory and field is demonstrated. Visual images obtained using a video or infrared thermographic camera were used to depict the condition of coated surfaces. Existing visual standard photographs were evaluated to demonstrate that computer image processing can image and quantify a wide variety of defects including blisters, corrosion, cracking, chalking, and flaking. Laboratory specimens were imaged to demonstrate the method's ability to detect early coating failure, to evaluate coating system performance, and to provide fundamental information useful in predicting the service life of coating systems. Defects on the exterior envelop of buildings were quantified to demonstrate the ability of the method to perform condition assessments and to provide information which should prove useful in scheduling maintenance and in evaluating the field performance of building materials.

 C. R. Beauchamp. 1987, 10p
 Pub. in Proceedings of AESF Annu. Tech. Conf. (74th), 10p 1987.

Keywords: *Electrodeposited coatings, *Metalized fibers, Metal coatings, Liquid metals, Alloys, Meetings, Mathematical models, Compositions, Forecasting, Electric potential, Electric current, Surface chemistry, Differential equations, Coating processes, Motion, Chemical analysis, Reprints, Liquid-solid interfaces.

A mathematical model that ties the alloy deposition parameters into a single tool that enables the prediction of the composition of an alloy deposited onto a moving fiber is to be presented. Potential distribution on the resistive fiber and in the solution are computed enabling the current distribution to be predicted. The differential equations are coupled at the fiber-solution interface by heterogeneous reactions. Integration of the partial currents with respect to residence time enables the calculation of the composition of the deposit.

W. Wu. Filed 20 Sep 89, patented 27 Nov 90, 10p
PB91-119610, PAT-APPL-7-409 854

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Composite materials, *Bonding strength, *Interfaces, *Patents, Thermal stresses, *Polymer matrix composites, *Thermal testing, PAT-CL-73-801.

A method and apparatus for characterizing bonding properties in composites use thermal energy to cause controlled debonding of interface and/or interply bonds. Debonding events resulting from the controlled debonding are detected and used to characterize the interface and/or interply properties of the composition.

Final rept.

S. K. Datta, H. M. Ledbetter, Y. Shindo, and A. H. Shah. 1988, 12p

Sponsored by Office of Naval Research, Arlington, VA., and Natural Sciences and Engineering Research Council of Canada, Ottawa (Ontario).
Pub. in Wave Motion 10, p171-182 1988.

Keywords: *Wave propagation, *Attenuation, *Elastic waves, *Composite materials, *Reinforcing materials, *Phase velocity, Particles, Inclusions, Interfaces, Ultrasonic tests, Lead(Metal), Epoxy resins, Silicon carbides, Aluminum, Quantum theory, Plane waves, Reprints.

The study considered effective-plane-wave propagation, both longitudinal and shear, through a medium containing a random distribution of spherical inclusions. It was assumed that the particles and matrix are separated by a thin layer of elastic material with different properties. For some systems, measurable effects for the thin layers were predicted. Especially considered were Pb-epoxy and SiC-Al.

Final rept.

J. A. Simmons, E. Drescher-Krasicka, H. N. G. Wadley, M. Rosen, and T. M. Hsieh. 1988, 9p

Pub. in Review of Progress in Quantitative Nondestructive Evaluation 7B, p893-901 1988.

Keywords: *Composite materials, *Interfaces, *Ultrasonic tests, Titanium, Wave propagation, Nondestructive tests, Steels, Aluminum, Reprints, Solid-solid interfaces, Characterization, Poynting theorem.

The current status of a SDIO/ONR Research program directed at developing experimental techniques for characterizing the interface zone on composites through the use of ultrasonic interface waves is reported. The theoretical framework, using one-dimensional scattering through viscoelastic media, is summarized. Energy flow and group velocity are described in terms of the Poynting vector fields. The experimental confirmation of the existence of leaky, Stoneley, and possibly divergent waves are given for the titanium/steel system with planar interface. The detection of energy emitted by a leaky wave running along a cylindrical interface is described for the aluminum/steel system. A new shift in apparent leaky wave position due to surface curvature is presented.

Contract N00014-86-F-0096

Sponsored by Strategic Defense Initiative Organization, Washington, DC. Innovative Science and Technology.

Pub. in Thermal and Mechanical Behavior of Metal Matrix and Ceramic Matrix Composites, ASTM STP 1080, p124-135 1990.

Keywords: *Composite materials, *Silicon carbides, *Borosilicate glass, Fibers, Comparison, Friction tests, Stress analysis, Methodology, Measurement, Indentation, Fiber composites, Reprints, *Ceramic matrix composites, Solid-solid interfaces, Fiber pull-out test, Indentation push-out test.

Several experimental methods including indentation push-in, indentation push-out, and single-fiber pull-out tests were employed to measure the strength of the fiber/matrix bond in two continuous fiber reinforced ceramic matrix composites. The composite systems examined were a silicon carbide (SiC) monofilament reinforced borosilicate glass matrix and a SiC fiber tow reinforced glass-ceramic matrix. Single-fiber pull-out test results gave debond strengths (Tau sub d) of 11.1 + or - 3.2 MPa and interface frictional stresses (Tau sub f) of 3.6 + or - 0.7 MPa for the SiC/borosilicate system. In the push-out test, Tau sub d for the SiC/borosilicate system appears to be about 10 MPa while (taus) between 1 and 55 MPa were obtained in the SiC/glass-ceramic composite. The push-in test gave values of Tau sub f between 2 and 34 MPa for the SiC/glass-ceramic system. Variability in tau within a specimen is due to differences in bonding between the fibers and matrix at various locations. The discrepancies in tau both within a test and between test methods are explained in terms of fiber/matrix bonding and test geometry. The most versatile test method appears to be the indentation push-out test.

National Bureau of Standards (IMSE), Gaithersburg, MD. Ceramics Div.**Fracture Resistance Behavior of Silicon Carbide Whisker-Reinforced Alumina Composites with Different Porosities.**

Final rept.

R. F. Krause, E. R. Fuller, and J. R. Rhodes. 1990, 9p

Pub. in Jnl. of American Ceramic Society 73, n3 p559-566 Mar 90.

Keywords: *Whisker composites, *Composite materials, *Ceramics, *Silicon carbides, *Aluminum oxide, Porosity, Fracture strength, Crack propagation, Defects, Indentation, Reprints, *Ceramic matrix composites.

Fracture resistance behavior was characterized for SiC-whisker-reinforced alumina composites with porosities ranging from 0.6% to 11.5%. The composites were hot-pressed from an Al₂O₃ powder with 25 wt% SiC whiskers. Strengths of individual specimens were measured in four-point flexure either for natural flaws or for Vickers-indentation flaws as a function of radial crack size. Indentation crack sizes were controlled with indentation loads which varied between 2 and 200 N. A novel method of analysis of the measurements indicates that the fracture resistance of the composites increases as a function of crack extension, a rising R curve. This behavior is interpreted in terms of tractions from both crack-bridging whiskers and interlocking grains, which develop in the wake of the crack tip as it extends. A decrease in porosity raises the level of fracture resistance, but has a negligible effect on the relative steepness of the R curve. The sizes of natural flaws which causes failure in flexure testing were also estimated from analysis of the data.

Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD. Office of Technology Evaluation and Assessment.

Available from National Institute of Standards and Technology, Gaithersburg, MD. 20899. Diana Snouffer. Phone: (301) 975-3579.

Keywords: *Composite materials, *Molding techniques, Fabrication, Injection molding, Manufacturing, Contact molding, Bag molding, Compression molding, Thermoplastic resins, Filament winding, Sheets, Pultrusion process, Transfer molding, *Polymer matrix composites, *Resin matrix composites.

The monograph deals with a spectrum of composites processing technologies that represent a wide range of technological maturity. Some of the processes (contact/vacuum bag molding, compression molding, and injection molding) have been used for many decades. Others (thermoplastic sheetforming) are at the other end of the maturity spectrum and are still in the development stages. Others yet are seeing a revolution in applications as new materials become available (thermoplastic filament winding and pultrusion) or as new concepts in design are realized (RTM, S-RIM). The objective of the monograph is to encourage industrial competitiveness of small companies by pointing out potentials for invention, a wide range of opportunities from improving existing technologies to developing entirely new ones.

See also PB86-238417.

Pub. in Materials Science and Engineering 89, p53-61 1987.

Keywords: *Composite materials, *Dissimilar materials bonding, *Silicon carbides, *Ceramic fibers, Residual stress, Thermal expansion, X ray diffraction, Particles, Thermal stresses, Reprints, *Metal matrix composites, *Aluminum alloy 6061.

SiC and aluminum alloy 6061 possess very different thermal expansion coefficients: 3.3 x 10 sup 6/K and 22.5 x 10 sup 6/K respectively. Thus, large internal strains and stresses in composites are expected because the two constituents form interfacial bonds at high temperatures and are cooled to ambient temperatures. From a simple elastic model, a hydrostatic tensile stress in the aluminum matrix and a hydrostatic compressive stress in the SiC particles were expected. Using conventional back-reflection diffraction geometry with Cu K alpha radiation, the unit-cell dimensions for two situations were determined in the final composite.

Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v68 p1129-1136 1987.

Keywords: *Metal fibers, *Boundary layer, Ultrasonic radiation, Mechanical tests, Stainless steels, Aluminum, Phase velocity, Reprints, *Metal matrix composites, *Solid-solid interfaces, Ultrasonic interface waves.

It is well understood that the crucial factor controlling the mechanical properties in fiber reinforced composites is the quality of the interface between the matrix and the fibers. As opposed to polymer matrix composites, interfaces in metal matrix composites cannot be tested by optical methods. One of the few possibilities for direct characterization in this case arises from the propagation of guided ultrasonic interface waves of Stoneley or leaky type along the interface. The paper

Composite Materials

presents a study of ultrasonic interface waves along cylindrical interfaces of differing radii in a model metal matrix composite system using aluminum as the matrix material and stainless steel for the fibers. Velocity changes as a function of curvature are compared with theory and used as an indicator of the quality of the bond between the matrix and the fibers.

 Pub. in Proceedings of Conference on Nondestructive Testing and Evaluation of Advanced Materials and Composites, Colorado Springs, CO., 12p 1987.

Keywords: *Fiber composites, *Aluminum, Ceramic fibers, Silicon carbides, Measurement, Single crystals, Crack propagation, Shear strength, Crystal growth, Nondestructive tests, Reprints, *Acoustic emission, *Metal matrix composites, Solid-solid interfaces, Fracture mechanics.

Single crystals of aluminum which contain a single axial fiber of SiC were fabricated and tested. Different solidification times were used to vary the interfacial (and fiber) properties, as SiC is known to react with molten Al to produce interfacial Al₄C₃. Specimens without fibers were also made. Comparison of the number of acoustic emission (AE) events to the number of fractures indicates that in the rapidly grown material all AE was due to fiber fractures whilst only half the events in the slowly grown samples were due to fiber fracture. The other half correspond to interfacial fracture since the room temperature ductility of polycrystalline Al₄C₃ is presumably quite limited. Thus there is a change from the single mode of (axial fiber) fracture in the rapidly grown material to bimodal (axial and interfacial) fracture in the slowly grown material. Composite properties and failure mechanisms thus depend significantly on processing conditions and acoustic emission is an important tool for determining the modes of failure.

Fiber-Reinforced Composites: Models for Macroscopic Elastic Constants.
 Final rept.
 S. K. Datta, and H. M. Ledbetter. 1990, 15p
 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Dynamic Elastic Modulus Measurements in Materials, ASTM STP 1045, p120-134 1990.

Keywords: *Fiber composites, *Elastic theory, Ultrasonic tests, Mathematical models, Boron, Aluminum, Chromium, Magnesium, Anisotropy, Stiffness, Reprints, Metal matrix composites.

Considering uniaxial-fiber-reinforced composites, selected models for calculating macroscopic elastic constants from the constituent elastic constants (fiber and matrix) and the phase geometry are reviewed. Especially, the transverse-isotropic case with five independent elastic-stiffness constants, C_(ij) is the focus. Also, wave-scattering ensemble-average methods developed by Bose and Mal (1974) and by Datta and Ledbetter (1983, 1984) are discussed. The model results are compared with measurements made by pulse-echo dynamic (MHz) methods. As examples, B/Al and Cr/Mg are considered; the latter fibers possess high elastic anisotropy.

Measuring the Extent of Rust on Steel After Abrasive Blasting: A Feasibility Study.
 M. E. McKnight, D. P. Bentz, and W. Roberts. Mar 90, 21p NISTIR-90/4257
 Sponsored by Tri-Service Building Materials Committee, Washington, DC.

Keywords: *Rust, *Steels, *Abrasive blasting, Feasibility, Measurement, Corrosion, Service life, Coatings, Surface finishing, Surface roughness, Emissivity, Graphs(Charts), Iron oxides, Metal cleaning, Video tapes, Imaging techniques, Thermography, Infrared imagery.

The service life of a coating on steel is known to depend upon the condition of the surface prior to painting. Factors used to assess surface preparation include extent of rust remaining on the surface, roughness, and concentration of inorganic contaminants. The report is only concerned with assessing the extent of rust. Presently, the extent of rust is determined using standard definitions and visual standards, a subjective procedure. Since a more objective procedure is desirable, video imaging and infrared thermographic techniques were assessed. It was concluded that infrared thermography does not provide the basis for a simple, sensitive method for assessing the extent of rust but the video imaging shows promise to meet the need.

 Pub. in Scripta Metallurgica et Materialia 24, n2 p291-296 1990.

Keywords: *Nickel alloys, *Aluminum containing alloys, *Intermetallics, Corrosion resistance, Ductility, Crack propagation, Polycrystalline, Fracture properties, Stress corrosion, Reprints, Aqueous solutions, Boron additions, Fracture mechanics.

Polycrystalline nickel aluminide, Ni₃Al, can be made ductile through microalloying additions of boron. The resulting intermetallic alloy offers high strength and ductility, making it a promising structural material for both high and low temperature applications. While ductile Ni₃Al was developed primarily for high temperature applications, it is also being considered for many low temperature applications such as forging dies, pump impellers and metal matrix composites. Before ductile nickel aluminide can be used in many of the applications, the corrosion and stress corrosion cracking characteristics of the materials must be understood. However, published information on the corrosion of Ni₃Al is limited. As a result an investigation into the aqueous corrosion and stress corrosion cracking behavior of ductile Ni₃Al was initiated.

Degradation of Organic Protective Coatings on Steel in Corrosive Environments.
 Final rept.
 T. Nguyen, and W. E. Byrd. 1987, 8p
 Pub. in Durability of Construction Materials, v3 p1091-1098 1987.

Keywords: *Protective coatings, *Steels, Organic coatings, Degradation, Corrosion resistance, Infrared spectroscopy, Polymers, Polyurethane resins, Polybutadiene, Fourier transformation, Curing, Crosslinking, Elastomers, Reprints.

Organic coatings are widely used as a means of prolonging the service life of steel substrates. Although highly polymeric, the coatings are frequently susceptible to degradation that reduces their effectiveness as a protective barrier. The degradation in corrosive environments of one-component polyurethane and polybutadiene coatings on polished, cold-rolled steel was studied using reflection/absorption FTIR microscopy (FTIR-RA). Coatings of approximately 2 micrometers were applied uniformly to the substrates using a spin coater. After curing at ambient conditions, the coated specimens were exposed to an aerated 40 C and 80% RH environment. FTIR/RA spectra were taken at times up to 30 weeks. The results show considerable changes in the structure of the coatings. For polyurethane, besides changes in intensities of the amino, carbonyl and isocyanate groups, some of the hydrogen-bonded amino groups became dissociated. On the other hand, polybutadiene degraded extensively with the formation of various oxidized products and loss of material. Polybutadiene also crosslinked during exposure, which resulted in extensive crazing and cracking of the coating.

 U. Bertocci, J. L. Fink, D. E. Hall, P. V. Madsen, and R. E. Ricker. 1990, 9p
 Pub. in Corrosion Science 31, p471-478 1990.

Keywords: *Corrosion resistance, *Nickel alloys, *Aluminum alloys, Electrochemical corrosion, Passivity, Pitting tests, Chlorides, Sulfuric acid, Reprints.

The electrochemical behavior of ductile nickel aluminide has been examined in alkaline, acidic and neutral solutions. Conditions for passive behavior, as well as for passivity breakdown, have been defined. The experimental results are compared with those obtained with the pure constituent metals, Ni and Al. Pitting has been observed not only in chloride-containing solu-

tions, but in sulfuric acid in a certain potential range. The pitting is believed to be caused by a potential-dependent transition from the passive to the active state. The corrosion resistance of nickel aluminate appears to be similar to that of pure nickel.

Effect of Oxygen Transport and Resistivity of the Environment on the Corrosion of Steel.
 Final rept.
 E. Escalante, T. Oka, and U. Bertocci. Sep 90, 39p
 NISTIR-90/4266
 Sponsored by Nuclear Regulatory Commission, Washington, DC.

Keywords: *Corrosion, *Containers, *Packaging, *Stainless steels, Mass transfer, Oxygen transport mechanisms, Electrical resistivity, Graphs(Charts), Diffusion coefficients, *Radioactive waste management, Yucca Mountain, High level radioactive wastes, Spent nuclear fuels.

The study is directed at investigating the rate of corrosion and its spatial distribution, that develop under conditions where transport of oxygen and conductivity of the environment are controlled over a wide range, including low conductivity as expected in the Yucca Mountain environment. The results indicate that the corrosion rate of steel is directly related to the rate of oxygen transport over several orders of magnitude, and increasing conductivity by one order of magnitude increases corrosion rate by a factor of two or three. Of greater significance is the result that indicates that as conductivity of the environment decreases, and corrosion rate decreases, the degree of localized attack increases.

Effect of Soil Resistivity and Soil Temperature on the Corrosion of Galvanically Coupled Metals in Soil.
 Final rept.
 E. Escalante. 1986, 10p
 Pub. in Galvanic Corrosion, ASTM STP 978, p193-202 1986.

Keywords: *Rusting, *Underground corrosion, *Galvanic corrosion tests, *Zinc, Hydrogen embrittlement, Oxygenation, Electrochemistry, Reprints, *Stainless steel-301, Soil temperature, Soil resistivity.

Galvanic corrosion current measurements carried out on stressed 301 stainless steel coupled to zinc at six underground test sites over a period of four years indicate that the galvanic current is controlled by soil resistivity or oxygen availability in the soil. In well aerated soils, resistivity plays a dominant role, but in poorly aerated soils, oxygen controls the corrosion process. Furthermore, at a depth of approximately 1 meter, soil resistivity is strongly influenced by soil temperature, and only slightly affected by soil moisture. Finally, 301 stainless steel in a half hard or full hard condition is susceptible to hydrogen embrittlement failure in soil when exposed to potentials capable of causing hydrogen evolution.

 Pub. in Materials and Structures 22, n127 p71-79 Jan 89.

Keywords: *Corrosion products, *Surface chemistry, *Steels, Electron microscopy, Roughness, Thermal stresses, Humidity, Reprints, Temperature dependence, Image analysis.

Thermal-wave electron microscopy, which employs heat flow to probe variations in the thermal properties of solid materials, can provide micro-level resolutions of surface and subsurface features of opaque samples. The application of the technique to image and assess corrosion on polished and rough steel samples was investigated. Effects of phase detection, modulation frequency, surface roughness and grinding direction on the contrasts and resolutions of thermal-wave electron and SEM images of KHSO₄ and humidity-in-

duced and natural corrosion on steel surfaces were determined. The excellent contrasts between the corrosion products and surface topographic features of the images obtained by the thermal-wave electron microscopy permits the use of image analysis to quantitatively assess the extent of corrosion on rough steel surfaces.

 Pub. in Proceedings of International Conference on Environmental Degradation of Engineering Materials (3rd), University Park, PA., April 13-15, 1987, p321-327.

Keywords: *Environmental tests, *Stress corrosion, *Crack propagation, *Aluminum alloys, *Lithium alloys, *Copper alloys, Grain boundaries, Precipitation(Chemistry), Microstructure, Intergranular corrosion, Reprints.

Stress corrosion crack (SCC) growth resistance of Al-Li-Cu alloys was studied. Two alloys (Al-2Li-3Cu and Al-3Li-1Cu), having different (Li/Cu) ratios, were selected for the study to observe the differences in the SCC behavior. The compositional and microstructural differences between these two alloys differ significantly, but the SCC growth behavior are similar. It is described that the mechanistic aspects of the behavior are similar, even though in both the alloy systems the type and morphology of the matrix and grain boundary (gb) microstructures and their subsequent interaction with the environment are different. In both the Al-Li-Cu alloys, the gb precipitates play a significant role in the SCC characteristics. Attempts are made to separate these contributions by using reversion techniques in Al-Li-Cu alloy, where some of the matrix precipitates are dissolved leaving behind the gb precipitates.

Elastomers

Pub. in Proceedings of Materials Research Society Symposium, Boston, MA., November 27-December 2, 1989, p469-474 1990.

Keywords: *Polybutadiene, *Elastomers, Polymers, Deuterium, Isotopic labeling, Microstructure, Meetings, Hydrogen, Neutron scattering, Solubility, Binary systems(Materials), Reprints, *Polymer blends, Small angle scattering.

Deuterated polybutadiene and protonated polybutadiene (PBD/PBH) blends with various microstructures have been studied by the small-angle neutron scattering experiments. Correlation length, zero-wavenumber structure factor, and interaction parameter have been obtained. All PBD/PBH blends exhibit UCST behavior. With the use of random copolymer theory, the interaction parameter, has been successfully separated into interaction parameters between the same isotope labeled 1,2-unit and 1,4-unit, opposite isotope labeled 1,2-unit and 1,4-unit, and opposite isotope labeled 1,2-unit with 1,2-unit or 1,4-unit with 1,4-unit, respectively.

Small-Angle Neutron Scattering Study for Characterizing the Water Sorbed in High Speed Spun Poly(Ethylene Terephthalate) Filaments.

Final rept.
H. Hasegawa, T. Hashimoto, M. Fukuda, H. Kawai, and C. C. Han. 1989, 8p
Pub. in Jnl. of the Society of Fiber Science and Technology 45, n11 p447-454 1989.

Keywords: *Neutron scattering, *Moisture content, *Adsorptivity, *Monofilaments, *Spun yarns, *Polyethylene terephthalate, Surface properties, Vapor pressure, Reprints, *Small angle scattering, Characterization, High speed.

Small-angle neutron scattering (SANS) from a particular specimen of high-speed spun poly(ethylene terephthalate) (PET) filaments at a spinning rate of 9000 m/min was investigated under three different conditions, i.e., dried in vacuum, or moistened with D2O or H2O at saturated vapor pressure at 30 C. The results of the SANS experiments strongly suggests that there must be specific regions where the sorbed moisture is condensed to form clusters. The results did not necessarily deny the existence of the moisture sorbed in the amorphous region of PET with less interaction than in the liquid state, as suggested from a good linear relationship between the degree of non-crystallinity and the moisture up-take obeying the Henry's solution law for a series of high-speed spun filaments. The SANS from such a phase of moisture dissolved uniformly in the amorphous region is too weak in its contrast to be consistent with the detected scattering intensities. Moisture sorption in the particular specimen may be described as follows: with increase in the vapor pressure, at first the moisture is uniformly dissolved in the amorphous region of PET to a certain extent (solution component), and then the moisture is condensed in localized regions such as voids to form the water clusters (condensation component).

Noncontact Ultrasonic Sensors for High Temperature Process Control.

Final rept.
G. A. Alers, and H. N. G. Wadley. 1987, 17p
Pub. in Proceedings of Conference on Intelligent Processing of Materials and Advanced Sensors, Orlando, FL., October 5-9, 1986, p85-101 1987.

Keywords: *Ultrasonic tests, *Detectors, *High temperature tests, *Process control, *Steel making, Microstructure, Stainless steels, Nondestructive tests, Switched lasers, Magnetic transducers, Electroacoustic transducers.

Ultrasound has been used to infer much about the internal condition of materials (temperature, grain size, texture, porosity, defects, residual stress etc.). To date, the determination has been confined to studies under laboratory conditions. If ultrasonic techniques could be developed that could survive the high temperature aggressive environment of a materials processing facility, the possibility exists of developing a family of process control sensors to directly probe microstructure and process variables. The paper reports on the results of a joint AISI/NBS/Magnasonics program to investigate the feasibility of using a Q-switched laser as a source of ultrasound and an Electromagnetic Acoustic Transducer (EMAT) for its detection on hot steel bodies. A variety of permanent magnet EMAT designs have been evaluated. Direct transmission experiments on both plain carbon and austenitic stainless steels heated to as high as 980 C (1800F) confirmed for several of the EMATs, adequate signal-to-noise ratios and bandwidths for sensor purposes.

Also available from Supt. of Docs. as SN003-003-02981-5. Library of Congress catalog card no. 89-600773. Report on a workshop held in Gaithersburg, MD, on August 29-30, 1989. Prepared in cooperation with Department of Energy, Washington, DC., American Iron and Steel Inst., Washington, DC., Inland Steel Co., East Chicago, IN., Timken Co., Canton, OH., and ARMCO, Inc., Middletown, OH.

Keywords: *Steels, *Aluminum, *Copper, *Meetings, Processing, Process control, Mathematical models, Detectors, Research projects.

The industry-led workshop highlighted the recent important advances in sensing, modeling, and process control, identified areas of application in primary metals production, and developed a strategy for implementation of research results. Industry, university, and government participants assessed information provided by researchers and operating staff from industry and developed a research agenda for coupling the advancing state of materials processing in the primary metals industries.

Ultrasonic Method for Measuring Internal Temperature Distributions in Steel or Aluminum.

Final rept.
H. N. G. Wadley, S. J. Norton, F. A. Mauer, and B. E. Droney. 1986, 18p

Sponsored by American Iron and Steel Inst., Washington, DC.

Pub. in Proceedings of the Aluminum Association Workshop on Sensors, May 13-14, 1986, p73-90.

Keywords: *Ultrasonic waves, *Nondestructive tests, *Steels, *Aluminum, *Temperature distribution, *Heat measurement, Cooperation, Process control, Detectors, Algorithms, Thermal analysis, Reprints, American Iron and Steel Institute, National Institute of Standards and Technology, Temperature dependence, Time-of-flight spectrometers.

The temperature dependence of ultrasonic velocity is being used for sensing the internal temperature distribution in steel as a part of a collaborative effort between the National Bureau of Standards (NBS) and the American Iron and Steel Institute (AISI) to develop advanced process control sensors. Reconstructions of the temperature distribution are based on non-contacting measurements using a Q-switched Nd:YAG laser to generate an ultrasonic pulse and an electromagnetic acoustic transducer (EMAT) to detect its arrival. Time-of-flight (TOF) measurements are made for a number of paths sampling a cross section of the body. It was found that in order to minimize the number of measurements required it is important to incorporate a priori heat flow information into the tomographic algorithms used to reconstruct the temperature. To date, manual measurements have been used to demonstrate the feasibility of the method. Full automation of the measurements using a laboratory microcomputer is underway and will permit data for reconstructing a temperature profile to be obtained in a few seconds.

Low-Temperature Magnetic-Elastic Anomalies in FCC (Face-Centered-Cubic) Fe-Cr-Ni Alloys.

Final rept.
H. Ledbetter. 1989, 5p
Pub. in Physica B 161, p91-95 1989.

Keywords: *Austenitic stainless steels, Magnetic permeability, Face centered cubic lattices, Low temperature tests, Ultrasonic tests, Measurement, Cryogenics, Phase transformations, Neel temperature, Interstitials, Abnormalities, Elastic properties, Reprints, *Chromium-Nickel steels, Carbon additions, Nitrogen additions, Temperature dependence, Ducastelle model, Magnetic susceptibility.

Using ultrasonic methods, the complete elastic constants of several polycrystalline face-centered-cubic Fe-Cr-Ni alloys were measured at low temperatures: 4-295 K. The alloys represent nine interstitial (carbon-plus-nitrogen) compositions. Dc magnetic susceptibility was also measured. Upon cooling, a paramagnetic-antiferromagnetic (Neel) phase transition occurs. The Neel transition temperature depends strongly on interstitial content. Both composition and temperature effects were fitted to Ducastelle's 3d-electron model, which contains two terms, band-structure and repulsive energies.

X-ray Diffraction Studies of Amorphous (Fe(sub 1-x)Ni(sub x))(sub 77)Si(sub 10)B(sub 13) Alloys.

Final rept.
S. C. Yu, J. W. Lynn, and B. W. Lau. 1987, 6p
Pub. in Jnl. of Non-Crystalline Solids 94, n2 p203-208 Nov 87.

Keywords: *Nickel steels, *Iron alloys, Atomic structure, X ray diffraction, Reprints, Amorphous state, Silicon additions, Boron additions, Diffraction patterns.

The atomic structures of single roll-quenched amorphous (Fe_(1-x)Ni_x)₇₇Si₁₀B₁₃ (atomic fraction, 0 LT or = x LT or = 1) alloys have been studied by X-ray diffraction. Interference functions, atomic distribution functions, and radial distribution functions were calculated from the data. The nearest neighbor distance decreases from 2.540 + or - 0.005 A for x = 0 (Fe₇₇Si₁₀B₁₃) to 2.490 + or - 0.005 A for x=1 (Ni₇₇Si₁₀B₁₃), while the average coordination number of 12.50 + or - 0.15 is independent of x. The results are consistent with the measured densities of the sample, which are found to increase with increasing Ni content.

Keywords: *Steels, Mechanical properties, Toughness, Crack propagation, Tank cars, Microscopy, Charpy, Notch strength, Impact tests, Low temperature tests, Tables(Data), Tensile strength, Ductility, Microstructure, Grain size, Fracture mechanics, J integral.

Mechanical property and fracture toughness tests were conducted on two steels from -80 F to +73 F. The two steels examined were normalized and inclusion shape controlled AAR (Association of American Railroads) TC128 grade B steel and control-rolled and inclusion shape controlled A 8XX grade B steel. The tensile properties of the A 8XX steel were better than a A 8XX steel. However, the notch toughness, as determined by Charpy V-notch, NDT temperature, and J-integral tests, of the AAR TC 128 grade B steel was better than that of the A 8XX grade B steel. Unstable cleavage fracture was the predominate mode of failure of the A 8XX steel at low test temperatures. Metallographic investigations also showed that the ferrite/pearlite grain size of the AAR TC128 steel was more uniform and finer than that of the A 8XX steel.

Determination of the NDT (Nil-Ductility Transition) Temperature and Charpy V-Notch Impact Properties of AAR (American Association of Railroads) TC128 Grades B Steel and A 8XX Grade B Steel.
G. E. Hicho, and J. H. Smith. Apr 90, 31p NISTIR-4300, REPT-20
Sponsored by Federal Railroad Administration, Washington, DC. Office of Research and Development.

Keywords: *Steels, Impact tests, Ductility, Tank cars, Nondestructive tests, Transition temperature, Grain size, Microstructure, Graphs(Charts), Tables(Data).

Charpy V-notch impact tests and the nil-ductility transition (NDT) temperature were redetermined for two steels. The two steels examined were normalized and inclusion shape controlled AAR (American Association of Railroads) TC128 grade B steel and control-rolled and inclusion shape controlled A 8XX grade B steel. The notch toughness, as determined by Charpy V-notch impact test, and the NDT temperature of the AAR TC128 grade B steel was found again to be better than that of the A8XX grade B steel. Metallographic investigations showed that the ferrite/pearlite grain size of the AAR TC128 grade B steel was more uniform and finer than that of the A 8XX grade B steel. Charpy V-notch impact results and NDT temperatures, presented in an earlier report were confirmed. Plate chemistry and test specimen orientation were also confirmed.

Austenitic Stainless Steels with Emphasis on Strength at Low Temperatures.

Final rept.
R. P. Reed. 1988, 33p
Pub. in *Alloying*, p225-256 1988.

Keywords: *Austenitic stainless steels, Low temperature tests, Strength, Phase transformations, Martensite, Reprints, Nitrogen additions.

The structure and properties of austenitic stainless steels are reviewed, with emphasis on their low-temperature behavior. Austenite, ferrite, body-centered cubic and hexagonal closed-packed martensite, stacking-fault energy, carbides, and sigma phase are described. Recent international development of higher strength, tougher austenitic stainless steels is summarized. The chapter also includes discussions of the effect of martensite phase transformations on the stress-strain characteristics, nitrogen strengthening, and strengthening theory based on lattice-parameter and elastic-property data, all at low temperatures.

S. Yukawa. Apr 90, 77p NIST/SP-780
Sponsored by Occupational Safety and Health Administration, Washington, DC.

Keywords: *Storage tanks, *Pressure vessels, *Steels, Regulations, Safety engineering, Design criteria, Crack propagation, Visual inspection, Nondestructive tests, Tanks(Containers), Fracture mechanics, Recommendations.

The document presents a technical overview and information on metallic pressure containment vessels and tanks. The intent of the document is to provide OSHA (Occupational Safety and Health Administration) personnel and other persons with information to assist in the evaluation of the safety of operating pressure vessels and low pressure storage tanks. The scope is limited to general industrial application vessels and tanks constructed of carbon or low alloy steels and used at temperatures between -75 and 315 C (-100 and 600 F). Information on design codes, materials, fabrication processes, inspection and testing applicable to the vessels and tanks are presented. The majority of the vessels and tanks are made to the rules and requirements of ASME Code Section VIII or API Standard 620. The causes of deterioration and damage in operation are described and methods and capabilities of detecting serious damage and cracking are discussed. Guidelines and recommendations formulated by various groups to inspect for the damages being found and to mitigate the causes and effects of the problems are presented.

High Temperature Lubricants from Biodeuterated Materials Produced by Algae.
Final rept.
R. A. Neihof, R. G. Munro, and M. M. Ross. 1987, 1p
Pub. in *Abstracts of Papers of the American Chemical Society* 194, n8 Aug 87.

Keywords: *Deuteration, *Biological products, *High temperature lubricants, *Algae, Stabilization, Lubricating oils, Performance evaluation, Hydrocarbons, Reprints.

Biodeuteration has been shown to be an effective means of enhancing the oxidation stability and antiwear performance of a lubricating hydrocarbon base oil. Substitution of deuterium for hydrogen in a compound results in a kinetic isotope effect which has been shown to be responsible for increasing the oxidation resistance of lubricant base stocks. In the investigation a biotechnological approach was applied to the production of deuterated compounds suitable for lubricant synthesis. From algae grown in heavy water (D sub 0) and supplied only with mineral salts, carbon dioxide, and light, it was possible to isolate fatty acids which were over 98% deuterated and constituted 50-60% of the dry weight of the organisms. By appropriate choices of organism and growth conditions, fatty acids could be obtained with suitable deuterocarbon chain length and double bond density for the synthesis of a variety of lubricants. Performance of the deuterated base oil relative to the undeuterated oil was evaluated using a set of tests.

Production of Microporous Finely Divided Matrix Material with Nuclear Tracks from an Isotropic Source and Product Thereof.

Patent.
B. S. Carpenter, C. Horvath, and C. R. Vogt. Filed 22 May 86, patented 16 May 89, 6p PB90-145855, PAT-APPL-6-866 334
This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$1.50.

Keywords: *Patents, *Porosity, *Neutron irradiation, *Physical radiation effects, Composite materials, Polymers, Glass, Dielectric properties, Fission products, Isotropy, Uranium 235, Etching, Powder(Particles), Oxides, *Microporosity, *Fission tracks, *Matrix materials, Uranium 238, Thorium 232, Lithium 7, Boron 10, Particle tracks.

The present invention relates to the production of a finely divided matrix material having substantially uniform porosity about the surface thereof and having micropores of controlled size and number density. The

microporous matrix material is produced with charged particle tracks resulting from an isotropic source, a portion of which tracks break the surface of the matrix material, followed by etching the latent tracks to produce pores of the desired size. The isotropic source must be selected such that it emits charged particles capable of leaving a damage track in the matrix material and includes selected nuclides which emit protons, tritons, alphas and fission fragments such as U-235, U-238, Th-232, L-7, B-10 and the like. Neutrons are selected as the irradiation source to trigger the isotropic source because of their high penetrability such that bulk quantities of matrix material can be subjected to very uniform radiation.

Materials Characterization Using Neutrons.
 Final rept.
 R. F. Fleming. 1986, 4p
 Pub. in Proceedings of NCSL Workshop and Symposium on 25 Years of Measurement Progress, Gaithersburg, MD., October 6-9, 1986, p35-1-35-4.

Keywords: *Materials, *Neutron irradiation, Radioactivation analysis, Neutron reactions, Neutron absorption,

Neutron activation analysis, Nondestructive tests, Physical radiation effects, Gamma rays, Reprints, Characterization.

Neutrons offer unique advantages for materials characterization in that they interact with only the nuclei in a sample and so are completely insensitive to the details of the electron distribution. The use of neutrons to measure the total number of atoms of a particular element in a sample by radioactivation (neutron activation analysis) has been available for fifty years. An analogous method exploiting the instantaneous radiation emitted when the nucleus absorbs a neutron (prompt gamma activation analysis) has become widely available during the last ten years. More recently, techniques have been developed which use neutron induced reactions to map the distribution of atoms within the sample nondestructively. Some advantages and disadvantages of each of the approaches are discussed. The impact on these techniques of the advent of intense beams of cold neutrons is presented.

Comparison of Methods for Determining Wear Volumes and Surface Parameters of Spherically Tipped Sliders.
 Final rept.
 E. P. Whitenon, and P. J. Blau. 1988, 19p
 Pub. in *Wear* 124, n3 p291-309, 15 Jun 88.

Keywords: *Wear, *Sliding, *Surface properties, *Surface defects, *Dimensional analysis, Sliding friction, Measurement, Surfaces, Friction, Reprints.

The purpose of the paper is to investigate some of the methods of determining the wear volume and geometric surface parameters of a scar resulting from sliding either a sphere or spherically tipped pin on a nominally flat surface. There are several broad classes of methods for making this type of measurement. In the paper the authors briefly describe these classes in general and then use abrasive wear data to illustrate three specific techniques in detail: two dimensional analysis done either manually or with an image analyzer, three dimensional analysis where the X,Y,Z points came from a stylus type profiling instrument, and three dimensional analysis where the X,Y,Z points were estimated from a two dimensional projection obtained from a specially programmed image analyzer.

Study of Meteorological Processes Important in the Degradation of Materials through Surface Temperature.
 Technical note (Final).
 S. C. Saunders, M. A. Jensen, and J. W. Martin. Apr 90, 47p NIST/TN-1275
 Also available from Supt. of Docs. Prepared in cooperation with Scientific Consulting Services, Pullman, WA.

Keywords: *Service life, *Mathematical models, *Protective coatings, Degradation, Weathering, Materials, Surface temperature, Meteorological data, Statistical analysis, Diurnal variations, Computer programs, Fourier analysis, Stochastic processes, Exposure, Environmental tests, SIMUL computer program, Energy balance.

One of the greatest impediments in forecasting the service life of a material exposed outdoors is the uncontrolled and non-predictable nature of the ambient factors comprising its environment. This contributes to the difficulty of establishing the cause-and-effect relationship between these factors and the rate of material degradation. To surmount these difficulties it is necessary to characterize quantitatively each of the factors comprising the exposure environment which are thought to be important in the material's degradation. The selection and quantification of these factors must accommodate not only the periodicity of the diurnal cycle but its statistical fluctuation. The objective of the research is to develop a general mathematical model, through Fourier analysis, characterizing the diurnal variation in the primary factor, material temperature. This factor is felt to be important in the degradation of a wide range of materials and protective systems, including coated steel panels. The steps taken and problems encountered in developing such a model are outlined. It is concluded that the simulated data generated

from the model display virtually the same stochastic behavior as does the real data and that, if appropriate meteorological records are available, it will be possible to characterize and reproduce the statistical behavior for any locality, season and panel orientation.

Mechanisms of Galling and Abrasive Wear.
 Final rept.
 L. K. Ives, M. B. Peterson, and E. P. Whitenon. 1987, 25p
 Sponsored by Oak Ridge National Lab., TN.
 Pub. in Proceedings of Fossil Energy Materials Program Conference, Oak Ridge, TN., May 19, 1987, p397-421.

Keywords: *Galling, *Abrasion, *Copper aluminum alloys, Crystal structure, Fossil fuels, Sliding friction, Crystal defects, Valves, Reprints, Energy conversion, Stacking faults, Laboratory tests.

Galling is a severe form of wear which has been recognized as a serious problem affecting the operation of control valves and other components used in fossil energy conversion systems. Recent results obtained in a program of research aimed at advancing the basic understanding of the process of galling are presented. The galling test method and a method which has been developed to measure quantitatively the amount and character of galling damage are described. Data on the galling behavior of pure metals, experimental alloys, and commercial alloys are presented. The influence of hardness, crystal structure, stacking fault energy and other materials properties are discussed.

Environment-Induced Cracking of Copper Alloys.
 Final rept.
 U. Bertocci, E. N. Pugh, and R. E. Ricker. 1989, 13p
 Pub. in Environment-Induced Cracking of Metals Proceedings, p273-285 1989.

Keywords: *Stress corrosion, *Copper zinc alloys, Cracking(Fracturing), Ammonia, Brasses, Reprints, Aqueous solutions.

The path of stress corrosion cracking (SCC) in alpha-phase copper alloys can be intergranular (IGSCC) or transgranular (TGSCC), but there is no consensus as to whether these correspond to two different mechanisms. Since research into the mechanism(s) of environment-induced cracking of copper alloys has focused overwhelmingly on alpha-brass in aqueous ammonia and since both forms of cracking are observed in this system, the paper deals primarily with this system. The characteristics of IGSCC in brass are consistent with cracking occurring by the film-rupture (or slip-dissolution) mechanism. TGSCC, on the other hand, is thought to proceed by discontinuous cleavage, with an average crack velocity on (110) planes of, typically, 10 to the 7th power m/s. The mechanism by which the environment induces brittle failure in the ductile face-centered cubic metal has not been established, but several have been proposed. Hydrogen embrittlement is an attractive mechanism in that it can account for the kinetics of propagation and for the repeated crack arrests. However, modeling of the chemistry within the crack indicates that hydrogen discharge is unlikely for copper-zinc in aqueous ammonia and impossible for copper-gold in ferric chloride. An alternative mechanism for TGSCC proposes that a thin epitaxial film, such as an oxide or dealloyed layer, forms at the crack tip and triggers brittle fracture.

Hydrogen Embrittlement of Ductile Nickel Aluminum during Corrosion in Aqueous Solutions.
 Final rept.
 R. E. Ricker, M. R. Stoudt, and J. L. Fink. 1990, 8p
 Pub. in Hydrogen Effects on Materials Behavior, p499-506 1990.

Keywords: *Hydrogen embrittlement, Ductility, Stress corrosion, Cracking(Fracturing), Acidity, Alkalinity,

Nickel alloys, Reprints, *Intermetallic compounds, Nickel aluminate, Aqueous solutions.

Ductile nickel aluminate, Ni₃Al+B, is an intermetallic alloy with high strength and ductility making it a promising structural material for both high and low temperature applications. However, the susceptibility of this material to embrittlement by hydrogen absorbed during normal corrosion processes in aqueous environments may limit the application of this material. As a result, a study was undertaken which was focused on evaluating the possibility that hydrogen could be absorbed into Ni₃Al from aqueous solutions during corrosion and cause embrittlement (stress corrosion cracking). The results demonstrate that ductile nickel aluminate can absorb hydrogen during free corrosion in low pH solutions and during polarization in neutral and alkaline solutions. Absorbed hydrogen was found to significantly reduce ductility and to promote intergranular fracture.

Sponsored by Department of Energy, Washington, DC., Environmental Protection Agency, Washington, DC., and American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Atlanta, GA.
Pub. in ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Transactions 95, pt2 p263-283 1989.

Keywords: *Refrigerants, *Thermodynamic properties, Equations of state, Liquid saturation, Vapor pressure, Specific heat, Measurement, Temperature, Critical point, Interfacial tension, Reprints.

The thermodynamic properties of R134a and R123 are formulated using a modified Benedict-Webb-Rubin (MBWR) equation of state fit to experimental measurements of the critical point, vapor pressure, saturated liquid and vapor volumes, superheated pressure-volume-temperature (p-V-T) behavior, and second virial coefficients derived from p-V-T and sound speed measurements. The heat capacity of the ideal gas reference state is determined from sound speed measurements on the low density vapor. Surface tensions are also presented. The experimental methods and results are summarized, compared to the property formulation and, where possible, compared to other sources in the literature. Tables and diagrams of the thermodynamic properties of R134a and R123, prepared using the MBWR equation of state, are presented.

Experimental Evaluation of Two Nonazeotropic Refrigerant Mixtures in a Water-to-Water, Breadboard Heat Pump.

M. Kauffeld, W. Mulroy, M. McLinden, and D. Didion.
Jun 90, 64p NISTIR-90/4290
Prepared in cooperation with Oak Ridge National Lab., TN., and Martin Marietta Energy Systems, Inc., Oak Ridge, TN. Sponsored by Department of Energy, Washington, DC.

Keywords: *Refrigerants, *Mixtures, *Heat pumps, Heat exchangers, Thermodynamic properties, Enthalpy, Air conditioning, Refrigerating, Refrigerating machinery, Temperature, Test facilities.

An experimental, water-to-water, breadboard heat pump apparatus, that is one which could easily be re-configured, was constructed for comparison of pure R22 to the mixture R22/R114 and R13/R12. Three evaporator configurations were extensively studied. In all cases, the best mixture outperformed R22. The best efficiency with R22/R114 was 32% higher and with R13/R12 was 16% higher than the best efficiency measured with R22. Other observations were, first, mixtures can take advantage of heat exchanger efficiency that, in a gliding temperature application, a pure refrigerant is incapable of utilizing. Secondly, heat exchange between the condensed and evaporating refrigerant is beneficial to some mixed refrigerants. Finally, mixtures exhibit nonlinearity of enthalpy versus temperature in the two phase region which has significant impact on both heat exchanger and cycle design.

Pulsed Ultrasonic Velocity Method for Determining Material Dynamic Elastic Moduli.

Final rept.
G. V. Blessing. 1990, 11p
Pub. in Dynamic Elastic Modulus Measurements in Materials, ASTM STP 1045, p47-57 May 90.

Keywords: *Ultrasonic tests, *Nondestructive tests, *Dynamic modulus of elasticity, Velocity measurement, Sonic tests, Materials, Precision, Steels, Grain size, Reprints, Elastodynamics, Pulse techniques.

Material dynamic elastic moduli can be readily obtained from a knowledge of the material's sound velocity(s) and density. One well-established ultrasonic technique for making the velocity measurements is the pulsed-wave transit-time technique. It is a versatile and potentially very accurate technique that can also assess the material elastic homogeneity and anisotropy. Here the many measurement and material factors affecting the precision of the method are addressed. A specific example of the effect of grain size on measurements in steel is presented in some detail.

Sponsored by Department of Energy, Washington, DC. Pub. in Conference Record of the International Conference on Conduction and Breakdown in Dielectric Liquids (10th), Grenoble, France, September 10-14, 1990, p430-435.

Keywords: *Polyethers, *Fluorine organic compounds, *Dielectric breakdown, Liquids, Measurement, High voltage, Gases, Electric discharges, Reprints, *Dielectric materials.

The perfluorinated polyethers are subjected to electrical measurements to determine suitability as liquid dielectrics. Measures of the breakdown strength and streamer inception voltage are obtained under electrical impulse stress. The breakdown strength is nearly independent of polarity. Under high magnification photography the cathode-originated streamers are seen to have a subsonic mode of growth. The transition to fast growth occurs on time and spatial scales shorter than those reported in liquid hydrocarbons. The gas phase electrical properties and the high heat of vaporization of this material are considered as mechanisms for this behavior.

Surface Forces at Crack Interfaces in Mica in the Presence of Capillary Condensation.

Final rept.
K. T. Wan, and B. R. Lawn. 1990, 11p
Sponsored by Office of Naval Research, Arlington, VA. Pub. in Acta Metall. Mater. 38, n11 p2073-2083 1990.

Keywords: *Mica, Crack propagation, Brittleness, Adhesion, Mathematical models, Capillarity, Condensates, Coherence, Interfacial tension, Humidity, Reprints, *Fracture mechanics, Performance prediction, Liquid-solid interfaces.

A fracture mechanics model for brittle cracks with capillary condensation is developed. The model is based on an integration of intersurface forces, comprising solid-liquid-solid forces within the capillary and solid-vapor-solid forces without. The work of adhesion thus contains terms from the two regions of the adhesion zone, plus a term from the surface tension of the meniscus. Three interface types are considered: virgin, corresponding to first propagation of the crack through the bulk solid; healed-matched, corresponding to repropagation after crack retraction of a partial cleavage; and healed-misoriented, where the cleavage halves are first fully separated and rotated before closure. Notwithstanding the possibility that a layer of environmental molecules may become trapped on interfacial closure, thereby reducing the intrinsic cohesion, it is predicted that the work of separation for healed-matched interfaces has the same dependence on partial pressure of interactive environmental species as for virgin interfaces, provided lattice coherence is maintained between the matching surfaces. A different dependence is predicted for healed-misoriented surfaces, because of the loss of such coherence, in which case the greater part of the adhesion comes from the liquid surface tension. Results of equilibrium cleavage experiments on mica in water vapor confirm the predictions. The strongly increasing work of adhesion observed for virgin and healed-matched surfaces with diminishing relative humidity is indicative of a long-range, Coulombic component of bonding in the pristine mica structure. Implications of the results in the general description of brittle fracture, and of contact adhesion, are discussed.

Optimum Refrigerants for Non-Ideal Cycles: An Analysis Employing Corresponding States.

Final rept.
M. O. McLinden. 1990, 11p
Pub. in Proceedings of ASHRAE-Purdue CFC and IIR-Purdue Refrigeration Conference, West Lafayette, IN., July 17-20, 1990, p1-11.

Keywords: *Refrigerants, *Thermodynamic cycles, Refrigerators, Specific heat, Thermodynamic proper-

ties, Compressors, Thermal efficiency, Heat transfer, Ideal gas, Reprints, Vapor compression refrigeration cycle, Working fluids.

The principle of corresponding states is used to evaluate the effects of the thermodynamic characteristics of the working fluid on the performance of refrigeration cycles. The desired characteristics, expressed in terms of the critical temperature and ideal gas heat capacity using propane as the reference fluid, are examined for various departures from the theoretical (ideal) vapor compression cycle. These departures from the ideal cycle approximate a refrigerator. Cycle performance and the resulting conclusions regarding the optimum refrigerant are strong functions of the assumptions made in modeling the cycle. The baseline cycle for the comparisons includes compressor efficiency and heat transfer limitations in the condenser and evaporator. These results indicate that modifications to the basic vapor compression cycle should be considered for more complex refrigerants such as the two-carbon HFCs and HCFCs.

The development of acceptable toughness and creep strength in high temperature intermetallic alloys is closely related to the formation of proper distributions of second phase particles. Phases are needed both to arrest crack growth at low temperatures and to resist creep at high temperatures. The possibility of developing new processing strategies for high temperature intermetallic compounds is being investigated. In particular rapid solidification and/or rapid solid state quenching followed by controlled heat treatment may provide new and unusual microstructures of multiphase materials. This report describes research performed in the Metallurgy Division at NIST to: (a) develop predictive models for solubility extension and metastable phase formation of intermetallic compounds by rapid solidification, (b) analyze the kinetics of decomposition of metastable phases involving ordering and (c) improve the phase diagram modeling of systems involving ordered phases. Keywords: Physical properties; Reaction kinetics; Molecule molecule interaction; Metal alloys. (KT)

Standard Flaws for Eddy Current Probe Characterizations.
 Final rept.
 T. E. Capobianco, S. J. Ciciora, and J. C. Moulder. 1989, 5p
 Pub. in Review of Progress in Quantitative Nondestructive Evaluation, v8A p985-989 1989.

Keywords: *Aluminum, *Flaw detection, *Eddy current tests, Nondestructive tests, Electromagnetic testing, Cracking(Fracturing), Fatigue(Materials), Inspection, *Calibration standards.

Calibration procedures for eddy current inspections often involve the use of artifact standards containing manufactured flaws. The manufactured flaw is assumed to be a good approximation of the type of flaw being sought during the inspection. These manufactured flaws are most often produced by electrical discharge machining (EDM), milling or the controlled growth of fatigue cracks. With simple amplitude display inspection equipment this type of artifact is usually sufficient, but as more sophisticated inspection equipment is developed some drawbacks to the commonly accepted practice are becoming evident. Instruments that are sensitive to eddy current signal phase as well as amplitude can show considerable differences in phase between a relatively wide EDM notch or milled slot and a real fatigue crack. The use of controlled growth fatigue cracks can also cause problems when forces at the crack's tip drive the crack faces together, making electrical contact.

Ultrasonic Methods of Texture Monitoring for Characterization of Formability of Rolled Aluminum Sheet.
 Final rept.
 A. V. Clark, G. V. Blessing, R. B. Thompson, and J. F. Smith. 1988, 9p
 Pub. in Review of Progress in Quantitative Nondestructive Evaluation 7B, p1365-1373 1988.

Keywords: *Ultrasonic tests, *Texture, *Roll forming, *Aluminum, *Metal sheets, Nondestructive tests, Formability, Monitors, Reprints, Characterization, Orientation distribution coefficients.

Texture is an important process variable which is known to influence properties such as formability. Texture can be quantified by determining the orientation distribution coefficients (ODC). For rolled steel and aluminum alloy sheet, three ODC influence ultrasonic velocity. One ODC, omega 400, relates to the average formability on deep drawing, whereas the ODC omega 420, and omega 400, relate to the tendency to form two and four 'ears' on deep-drawing. Consequently, ultrasonic measurements offer the promise of both off-line and on-line texture monitoring. Results of off-line ultrasonic measurements on sheets of an aluminum alloy used for can manufacture are reported. Measurements of omega 420 and omega 440 were made with several ultrasonic systems. Measurements of ODC made with different methods are in good agreement. In addition, a good correlation between ODC and a measure of formability was obtained. Extension of the technique to on-line texture monitoring will also be discussed.

Acoustic Emission Studies of Electron Beam Surface Modification of Aluminum.
 Final rept.
 R. B. Clough, H. N. G. Wadley, and R. Mehrabian. 1988, 11p
 Pub. in Metallurgical Transactions B-Process Metallurgy 19, n3 p493-503 1988.

Keywords: *Surface finishing, *Aluminum alloys, *Electron beams, *Irradiation, Copper containing alloys, Solidification, Thermal cycling tests, Crack propagation, Aging tests(Materials), Nondestructive tests, Reprints, *Acoustic emission.

Acoustic emission from carefully designed stationary pulsed electron beam heating experiments has been monitored in pure Al and a binary Al-4.5 wt % Cu alloy to explore the use of the technique for in-situ characterization. A three-fold correlation was made between heat flow theory, acoustic emission, and post solidification metallographic observations. By calibrating the acoustic emission system it has been possible to deduce the dipole strength of the sources responsible for acoustic emission. Comparison with estimated values for candidate sources during surface modification indicate only slip (in course grained material) and microfracture are detectable. The incidence of these during a thermal cycle reflects the evolution of thermal and solidification stresses accompanying surface modification. It has been found that cracking in Al-4.5 wt. % Cu alloys is a significant source of acoustic emission. The incidence of cracking has been found to depend upon the substrate properties. Soft underaged material cracks much less than peak-aged material, suggesting that the contraction stresses can be accommodated by adjacent matrix slip.

Plate-Like Rigid Inclusions and the Ductile-Brittle Transition.
 Final rept.
 I. H. Lin. 1988, 5p
 Pub. in Proceedings of ASM (American Society for Metals) International Conference on Inclusions and Their Influence on Material Behavior, Chicago, IL., September 25-30, 1988, p173-177.

Keywords: *Ductile brittle transition, *Inclusions, *Metals, Mathematical models, Crack propagation, Embrittlement, Dislocations(Materials), Fractures(Materials).

A simple dislocation-crack-inclusion model is proposed to study inclusion embrittlement. Previously, the elastic interaction among screw dislocations, a plate-like rigid inclusion, and a crack under antiplane shear strain was derived. The results of the previous work are applied to dislocation emission and crack-tip breakaway. When an inclusion is very close to the crack tip, the total image force on a dislocation is enlarged and a ductile-to-brittle crossover of the intrinsic character of cracks may be induced. The breakaway of a shielded crack, triggered by void nucleation at the inclusion, is discussed.

Nonplanar Interface Morphologies during Unidirectional Solidification of a Binary Alloy. 2. Three-Dimensional Computations.

Final rept.
G. B. McFadden, R. F. Boisvert, and S. R. Coriell. 1987, 8p
Pub. in Jnl. of Crystal Growth 84, n3 p371-388 Sep 87.

Keywords: *Crystal growth, Aluminum alloys, Chromium alloys, Finite difference theory, Interfaces, Reprints, *Directional Solidification(Crystals), Three-dimensional calculations, Numerical solution, Binary alloys.

Three-dimensional steady-state solutions for non-planar interface morphologies are computed numerically using finite differences. A linear temperature field is assumed, corresponding to the case of equal thermal properties in the crystal and melt, with no latent heat release. The solute field in the melt and the unknown crystal-melt interface position are obtained self-consistently. The stability of the computed steady-state solutions is suggested by the behavior of the it-

erative scheme used in the calculation: successive iterates may be viewed as evolving in a time-like manner as determined by an artificially time-chromium alloy with distribution coefficient greater than one, steady-state solutions corresponding to two-dimensional bands and three-dimensional nodes are obtained, as well as solutions with rectangular interface planforms. The results are compared to qualitative predictions from weakly nonlinear expansion results.

Mesh Monitor Casting of Ni-Cr Alloys: Element Effects.

Final rept.
O. Okuno, J. A. Tesk, and R. Penn. 1989, 7p
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Dental Materials 5, p294-300 Sep 89.

Keywords: *Casting, *Chemical composition, *Elements, *Nickel chromium alloys, Dental materials, Equations, Reprints, *Mesh monitor, *Mesh generation, Molybdenum additions, Silicon additions, Niobium additions, Boron additions, Aluminum additions, Beryllium additions.

A mesh monitor has previously been used for quantitative evaluation of the casting of dental alloys. A castability value, C_v , was defined. For curve-fitting, a transformed castability value, C_v, t , was used. A series of alloys was selected so that effects of major elements on C_v, t and, hence, on C_v could be determined. Compositions were chosen so that correlated effects would be avoided. Assuming a linear dependence on the concentrations of individual elements, the following equation may be used to describe C_v, t : $C_v, t = K_0(Ni/Cr) + K_1(Mo) + K_2(Si) + K_3(Nb) + K_4(B) + K_5(A1) + K_6(Be) + K_7(Be \times Si)$ where each term employs an elemental concentration in weight percent (Ei), and a coefficient, K_i , for the i th term. Because E_i 's are constant for each alloy, $K_i = f_i(TA, TM) = g_i(TC, TM)$. The temperature-dependent coefficients, K_i , were determined for seven elements and for the (Ni/Cr) ratio. It was also found that Si and Be produce a synergistic effect. The results help to understand the casting behavior of Ni-Cr dental alloys; the approach may be useful in the design of dental alloys.

Electrodeposition of an Aluminum-Manganese Metallic Glass from Molten Salts.

Final rept.
G. R. Stafford. 1989, 5p
Pub. in Jnl. of the Electrochemical Society 136, n3 p635-639 Mar 89.

Keywords: *Electrodeposition, *Aluminum manganese alloys, *Metals, *Fused salts, Aluminates, Chlorine inorganic compounds, Electric potential, Chemical composition, Intermetallics, Phase diagrams, Reprints, Manganese ions, Metallic glasses.

The electrodeposition of binary aluminum-manganese alloys from chloroaluminate molten salts is reported. The manganese content of the electrodeposit varies from 7 to 30 wt% and is dependent upon deposition potential and the relative concentrations of $Al_2Cl_7(-1)$ and $Mn(+2)$ in the melt. At low cathodic overpotentials the deposition process, with respect to alloy composition, is kinetically controlled. At more cathodic potentials, it becomes mass transport limited in $Mn(+2)$ and then $Al_2Cl_7(-1)$. The most uniform and brightest deposits are obtained at a constant potential of -0.3 V/Al. The potential dependence of alloy composition allows one to create homogeneous, graded and modulated structures from a single electrolyte. The structure of the as-deposited alloy appears to be that of a metallic glass above 27 wt% manganese and a mixture of glass and supersaturated aluminum below 27 wt%. Upon heating to 400 C, the glass structure converts to the orthorhombic Al_6Mn intermetallic while the supersaturated phase converts to Al_6Mn and aluminum. The ability to electrodeposit intermetallic compounds on a near atomic scale presents interesting possibilities for high temperature alloys.

Crystallographic Texture in Rolled Aluminum Plates: Neutron Pole Figure Measurements.

Final rept.
R. C. Reno, R. J. Fields, and A. V. Clark. 1988, 7p
Pub. in Review of Progress in Quantitative Nondestructive Evaluation 7B, p1439-1445 1988.

Keywords: *Crystal structure, *Aluminum, *Metal plates, Neutron diffraction, Ultrasonic tests, Nondestructive tests, Orientation, Polarization(Waves), Texture, Microstructure, Reprints, Neutron pole figures, On-line measurement systems.

Neutron pole figures have been used to determine the crystallographic texture in rolled aluminum plates that were characterized with ultrasonic techniques. The orientation distribution coefficients determined by neutron diffraction are in good agreement with the ones derived from ultrasound measurements, thus confirming the efficacy of ultrasound as an on-line monitoring technique.

Interfaces: The Next NDE Challenge.

Final rept.
H. N. G. Wadley. 1988, 12p
Pub. in Review of Progress in Quantitative Nondestructive Evaluation 7B, p881-892 1988.

Keywords: *Interfaces, *Nondestructive tests, Measurement, Test equipment, Metals, Ceramics, Composite materials, Thin films, Grain boundaries, Gallium arsenides, Low alloy steels, Reprints, Metal matrix composites.

Interfaces play a central role in controlling the properties of structural and electronic materials. As the performance of materials is extended, it becomes increasingly important to be able to measure and then optimize local properties of interfaces. The measurement techniques needed do not exist today, though the basis for new ones has emerged from the QNDE research of the past decade. As expertise in bulk materials characterization matures, the next challenge for QNDE will come from the need to measure interface properties.

A fully time-dependent linear stability analysis of the morphological stability of a planar interface during directional solidification of a binary alloy at constant ve-

Nonferrous Metals & Alloys

locity in the presence of an electric field was performed. The work takes into account the electromigration of solute and the differing electrical conductivities of solid and liquid for a model in which the temperature gradient is constant. Results are compared with the constitutional supercooling criterion and show possible substantial differences. A modified constitutional supercooling criterion is derived which is valid over a large range of conditions. Under certain conditions, the onset of instability may be time dependent.

Newbury. 1987, 12p

Pub. in Jnl. of Microscopy 148, n3 p241-252 1987.

Keywords: *Aluminum alloys, *Lithium alloys, Microstructure, Microanalysis, Reprints, Ion microprobe analysis, Secondary ion mass spectroscopy, High resolution.

Samples of aluminum-lithium alloys have been observed by scanning ion microscopy and analyzed by secondary ion mass spectrometry. The high signal to noise ratio of the positive secondary lithium ion opens up the possibility of both high resolution imaging and microanalysis of lithium distributions in aluminum and other materials. Some of the problems encountered due to sample preparation are discussed and ion images of both the artifacts and the true lithium distribution are shown.

Molecular Wedge in Brittle Cracks.

Final rept.

R. M. Thomson. 1988, 4p

Pub. in Scripta Metallurgica 22, n3 p385-388 1988.

Keywords: *Crack propagation, *Brittleness, Metals, Interfacial tension, Chemical attack, Penetration, Environmental tests, Reprints, *Fracture mechanics, Molecular models, Crack tips.

When external atmospheres compound 'large molecules' interact with a crack tip, the molecules are drawn into the tip region by surface tension. An opposite force on the molecules due to the elastic interaction with the crack walls tends to eject the molecules from the crack. The molecules will penetrate to that point where the forces balance. Estimates are made for penetration for a variety of materials.

Effect of Interstitial Elements on Phase Relationships in the Titanium-Aluminum System.

Technical rept. Nov 81-Sep 87.

R. M. Waterstrat. Oct 88, 59p NISTIR-88/3856

Contracts N00014-82-C-0061, N00014-86-K-0476

Prepared in cooperation with American Dental Association Health Foundation, Chicago, IL. Sponsored by Office of Naval Research, Arlington, VA.

Keywords: *Titanium alloys, *Aluminum alloys, *Phase diagrams, *Interstitials, *Trace elements, Neutron diffraction, High temperature tests, Test equipment, Order disorder transformations, Oxygen additions.

An apparatus has been designed and constructed for neutron diffraction studies on polycrystalline samples in a high vacuum at temperatures up to approximately 1500 C or higher. Neutron diffraction data have been obtained from titanium-aluminum alloys containing 12 to 45 atomic percent aluminum at temperatures ranging from 900 C to over 1300 C. Unusually high background intensities were observed in single-phase alpha-Ti alloys containing 14 and 16 atomic percent aluminum between 900 C and 1000 C. It suggests the existence of atomic short-range order as reported by previous investigators. Addition of 1 atomic percent oxygen to such alloys was found to eliminate the short-range ordering behavior and replace it with an extended alpha-Ti plus alpha 2-Ti3Al two-phase region.

Effect of Anisotropic Thermal Conductivity on the Morphological Stability of a Binary Alloy.

Final rept.

S. R. Coriell, G. B. McFadden, and R. F. Sekerka.

1990, 8p

Sponsored by National Aeronautics and Space Administration, Washington, DC., and National Science Foundation, Washington, DC.

Pub. in Jnl. of Crystal Growth 100, p459-466 1990.

Keywords: *Crystal growth, *Tin alloys, Orientation, Thermal conductivity, Anisotropy, Microstructure, Morphology, Solidification, Interfaces, Stability, Dispersions, Perturbation theory, Reprints, *Binary alloys, *Bismuth additions.

A linear morphological stability analysis of a planar interface during unidirectional solidification of a binary alloy for the case of a crystal having an anisotropic thermal conductivity was performed. A dispersion relation was calculated and shows that the onset of instability depends on the orientation of the growth direction with respect to principal crystallographic axes and on the orientation of the wavevector of the perturbation. The onset of instability can be either oscillatory (travelling waves) or non-oscillatory in time. For growth along a principal axis of the crystal there is an exchange of stabilities, and the onset of instability is non-oscillatory. For a uniaxial crystal, the dispersion relation in detail was explained and numerical results given for the case of an alloy of 0.78 at% bismuth in tin. For low growth velocities the onset of instability is non-oscillatory and occurs for perturbations having a wavevector that lies along a principal crystallographic axis.

Effect of Surface Tension Anisotropy on Cellular Morphologies.

Final rept.

G. B. McFadden, S. R. Coriell, and R. F. Sekerka.

1988, 19p

Pub. in Jnl. of Crystal Growth 91, p180-198 1988.

Keywords: *Crystal growth, *Interfacial tension, *Liquid metals, Anisotropy, Solidification, Microstructure, Theories, Stability criteria, Phase transformations, Reprints, *Binary alloys, Liquid-solid interfaces, Morphology.

Morphological stability theory predicts the conditions for which a planar crystal-melt interface is unstable for directional solidification of a binary alloy at constant velocity. For conditions near the onset of instability, a three-dimensional weakly nonlinear analysis to second order was carried out in the interface deformation, taking into account the effects of latent heat generation and anisotropy of the crystal-melt surface tension.

The growth of a cubic crystal in the (001), (011), and (111) directions was considered. Linear stability theory predicts that, for growth in the (011) direction (two-fold axis), two-dimensional bands are preferred. For growth in the (001) direction (four-fold axis), weakly-nonlinear theory predicts steady-state solutions having six-fold symmetry. For growth in the (111) direction (three-fold axis), steady-state solutions with six-fold symmetry are only possible for a particular alignment of the hexagonal array with respect to the crystal axes; otherwise, the solutions only have three-fold symmetry. In the second-order theory developed here, all small-amplitude solutions are unstable. If the subcritical solution branch regains stability at larger amplitudes, the small-amplitude solutions would indicate whether this branch would correspond to stable cells or nodes. For an alloy with distribution coefficient less than unity, and with the thermal conductivity of the crystal greater than that of the melt, the theory predicts solute patterns with nodes near the onset of instability, except possibly at very high growth velocities.

X-ray Diffraction Studies of Ni-Cr-Based Amorphous Alloys.

Final rept.

S. C. Yu, and J. W. Lynn. 1990, 3p

Pub. in Japanese Jnl. of Applied Physics 29, n5 p902-904 May 90.

Keywords: *Metals, *X ray diffraction, *Alloys, *Nickel alloys, *Chromium alloys, Crystal structure, Reprints, *Amorphous materials, Phosphorus additions, Carbon additions, Boron additions, Cobalt additions.

The structures of the amorphous alloys with atomic percent compositions Ni64.21Cr14.22P17.22Co.35(MBF 65) and Ni67.33Cr14.31B18.11Co.25(MBF 80), which have similar Ni-Cr-C components, have been studied and compared by X-ray diffraction. The interference functions, atomic distribution functions, and radial distribution functions were calculated from the X-ray diffraction intensity data. The nearest-neighbor distances and coordination numbers were determined to be 2.52 + or - 0.01 A, 12.50 + or - 0.10 for MBF 65, and 2.48 + or - 0.01 A, 12.75 + or - 0.11 for MBF 80, respectively. The observed nearest-neighbor distance is in good agreement with a simple contact-distance packing model using the calculated atomic radii and a coordination number of twelve. The results are compared with the same composition of Ni in amorphous Ni-P and Ni-B alloys.

Morphological Stability during Alloy Solidification.

Final rept.

S. R. Coriell, and G. B. McFadden. 1989, 13p

Pub. in Morphology and Growth Unit of Crystals, p335-347 1989.

Keywords: *Crystal growth, *Metals, Melt, Surface energy, Solides, Interfaces, Aluminum alloys, Silver alloys, Solidification, Segregation process, Microstructure, Convection, Fluid flow, Reprints, Morphology, Liquid-solid interfaces.

A number of topics related to the morphology of crystals growing from the melt and to the resultant solute distribution in the crystal are reviewed. Grain boundary groove shapes in a temperature gradient provide a direct measurement of the crystal-melt surface free energy; recent calculations of groove shapes indicate the role of anisotropic surface free energy. During directional solidification solute inhomogeneities transverse to the growth direction can arise from nonplanar crystal-melt interfaces and from fluid flow in the melt. Cellular interface shapes and solute distributions in the absence of convection have been calculated for aluminum-silver alloys. The effects of thermosolutal convection on solute inhomogeneity in semiconductor and metallic alloys have been determined by numerical computations. Strong coupling between hydrodynamic and morphological instabilities can occur; an example is the traveling helical waves which occur in cylindrical samples of succinonitrile.

Interfacial Free Energy and Interfacial Stress: The Case of an Internal Interface in a Solid.
Final rept.
J. W. Cahn. 1989, 4p
Pub. in Acta Metallurgica v37, n3 p773-776 1989.

Keywords: *Surface energy, *Interfacial tension, Alloys, Anisotropy, Lattice parameters, Metallography, Reprints.

When the order parameter affects the lattice parameter a stress arises in the antiphase boundary between two domains of an ordered phase. Near the critical point this stress raises the magnitude of the free energy of the interface and narrows its width. It also gives rise to some anisotropy, but does not change the exponents of the critical behavior for energy and width. The interfacial stress on the other hand is much more anisotropic, can be positive or negative with a magnitude that approaches zero with a classical exponent of 0.5 or 0.0 according to modern critical theory. Thus the ratio of stress to free energy diverges.

Coherent Phase Diagrams.
Final rept.
W. C. Johnson, and P. W. Voorhees. 1988, 8p
Pub. in Bulletin of Alloy Phase Diagrams 9, p208-315 1988.

Keywords: *Phase diagrams, Thermodynamics, Equilibrium, Coherence, Alloys, Reprints, Phase stability.

Phase equilibria in coherent solids is significantly different from that in fluids or incoherent solids. For example, Gibbs' phase rule is not applicable, the field lines on a phase diagram do not correspond with the equilibrium phase compositions, phase compositions in a two-phase field depend on the bulk alloy composition and for a given set of imposed thermodynamic variables, several equilibrium states may exist. These conditions raise serious questions as to the usefulness of coherent phase diagrams. Herein, the authors discuss the use of phase stability diagrams to convey equilibrium information. The importance of phase stability diagrams lies in their ability to display graphically the equilibrium states of a two-phase coherent system in much the same fashion that Gibbs free energy vs. composition curves do for a fluid system.

Magnetic Susceptibility of Inconel Alloys 718, 625, and 600 at Cryogenic Temperatures.

Final rept.
I. B. Goldberg, M. R. Mitchell, A. R. Murphy, R. B. Goldfarb, and R. J. Loughran. 1990, 8p
Pub. in Advances in Cryogenic Engineering Materials, v36 p755-762 1990.

Keywords: Magnetization, Cryogenics, Reprints, *Inconel 718, *Inconel 625, *Inconel 600, *Magnetic susceptibility, Space shuttles, Spin glass.

In June 1988, the Discovery Space Shuttle mission was delayed because of a malfunctioning hydrogen fuel bleed valve system. The problem was traced to the linear variable differential transformer (LVDT) which produced erroneous readings for the valve position. Near liquid hydrogen temperatures, Inconel 718 used in the armature of the LVDT became strongly magnetic. The AC magnetic susceptibility of three samples of Inconel 718 of slightly different compositions, one sample of Inconel 625, and one sample of Inconel 600 were measured as a function of temperature. Inconel 718 behaves as a spin glass. Its susceptibility reaches a maximum between 15 and 19 K, near the liquid hydrogen boiling point, 20 K. The susceptibility increases by an order of magnitude as the iron content increases by 1.2% and the nickel content decreases by 1.5%. The nominal composition is 12-20% iron and 50-55% nickel. Inconel 625, which contains about 4% iron, was paramagnetic. Inconel 600 exhibited spin glass properties below 6 K, short-range ferromagnetism between 6 and 92K, and paramagnetism above 92K.

Fracture of Epoxy and Elastomer-Modified Epoxy Polymers.
Final rept.
W. D. Bascom, and D. L. Hunston. 1982, 26p
Pub. in Adhesion 6, p185-210 1982.

Keywords: *Fractures(Materials), *Epoxy resins, *Elastomers, Adhesives, Viscoelasticity, Toughness, Construction materials, Reprints, Resin matrix composites, Matrix materials.

Rubber modified epoxies represent a class of materials that are of interest for both scientific and practical reasons. They have a two phase morphology that gives them fracture energies much higher than normal epoxies but with a minimum sacrifice in other properties relative to epoxy. As a result, they are extensively used in structural adhesives and are increasingly being considered as composite matrix resins. The paper reviews studies conducted over the last 15 years aimed at understanding how and why the materials fail in bulk samples, in adhesively bonded joints, and as matrix resins in composites. The topics covered include the mechanisms of toughening, the viscoelastic aspects of the failure behavior, and the influence of geometric variables such as bond thickness and the fiber-fiber spacing in the composites. The paper outlines both what has been found and what questions remain to be answered.

Effects of Initial Molecular Weight on Thermal Degradation of Poly(Methyl Methacrylate) 1 - Model 1.
Final rept.
A. Inaba, T. Kashiwagi, and J. E. Brown. 1988, 20p
Pub. in Polymer Degradation and Stability 21, n1 p1-20 1988.

Keywords: *Molecular weight, *Thermal degradation, *Polymethyl methacrylate, Mathematical models, Polymerization, Plastics, Reaction kinetics, Weight measurement, Activation, Reprints.

The relationship between changes in the degree of polymerization and the conversion was obtained experimentally with three anionically polymerized PMMA samples with different initial degrees of polymerization

(315, 1250 and 5690). Kinetic constants for random scission initiation and average zip length were determined by the combined use of the experimental data with theoretically calculated relationships. The theoretical model is based on the same depropagation rate via beta scission from both primary and tertiary radicals generated from random scission at backbone C-C bonds. Although the theoretically calculated activation energies for global reaction based on weight loss rates agree reasonably well with the experimentally determined data, the theoretical results show inconsistency in the predicted value of average zip length and also do not agree well with the experimentally determined weight loss rates with temperature under dynamic heating conditions. It is suspected that the assumption of the equal reactivity of the two radicals is incorrect.

Thermal Expansion of Tungsten in the Range 1500-3600 K by a Transient Interferometric Technique.
Final rept.
A. P. Miller, and A. Cezairiyan. 1990, 11p
Pub. in International Jnl. of thermophysics 11, n4 p619-628 Jul 90.

Keywords: *Tungsten, *Thermal expansion, Temperature measurement, Optical interferometers, Optical measurement, High temperature tests, Reprints, Standard reference materials.

The linear thermal expansion of tungsten has been measured in the temperature range 1500-3600 K by means of a transient (subsecond) interferometric technique. The tungsten selected for these measurements was the standard reference material SRM 737 (a standard for thermal expansion measurements at temperatures up to 1800 K). The basic method involved rapidly heating the specimen from room temperature up to and through the temperature range of interest in less than 1 s by passing an electrical current pulse through it and simultaneously measuring the specimen temperature by means of a high-speed photoelectric pyrometer and the shift in the fringe pattern produced by a Michelson-type interferometer. The linear thermal expansion was determined from the cumulative shift corresponding to each measured temperature.

Keywords: *Galling, *Metals, Sliding friction, Surface properties, Measurement, Crystal structure, Crystal defects, Damage, Hard surfacing, Wear, Graphs(Charts), Twinning, Silver, Cobalt, Copper, Nickel, Stainless steels.

The report presents the results of an extensive investigation of the process of galling (a form of severe damage at sliding surfaces). Three areas were emphasized: the elucidation of the mechanism of galling, the quantitative characterization and measurement of the amount of damage associated with galling, and the determination of relationship between galling and materials properties. On the basis of a review of the literature and experiments on a variety of different metals it was concluded that the primary event in the process of galling is that of prow or wedge formation. A method based on surface topography was developed to measure quantitatively the amount and character of galling. By studying a range of pure metals and selected experimental alloys it was demonstrated that among the most important properties influencing galling are crystal structure and stacking fault energy. Hardness and strength do not in general correlate with galling severity, but it was shown that hardening steels by heat treatment is an effective means of reducing the damage due to galling. Carburizing and nitriding were also shown to diminish significantly the damage due to galling.

The report summarizes the FY 1989 activities of the Metallurgy Division of the National Institute of Standards and Technology (NIST). The activities center upon the structure-processing-properties relations of metals and alloys and on methods of measurement; and also include the generation and evaluation of critical materials data. Efforts comprise studies of metals processing and process sensors; advanced materials, including metal matrix composites, intermetallic alloys and superconductors; corrosion and electrodeposition; mechanical properties; magnetic materials; and high temperature reactions. The work described also includes two cooperative programs with professional societies (the Alloy Phase Diagram Program with ASM International, and the Corrosion Data Program with the National Association of Corrosion Engineers); two with trade associations (the Temperature Sensor Program with the Aluminum Association, and the Steel Sensor Program with the American Iron and Steel Institute); and several with industry including the Powder Atomization Consortium with three companies.

The National Institute of Standards and Technology's Standard Reference Data Program manages a network of data centers that prepare evaluated databases of physical and chemical properties of substances. Databases are available in printed form, on magnetic tapes, diskettes, and through on-line computer networks. The document provides a comprehensive list of the products available from the National Standard Reference Data System for the years 1987-1989, including indexes qualified by author, material, and property terms. Ordering information and current prices can be found at the end of the document.

The impact of computers on materials sciences is rapidly increasing. One of the keys to effectively using the new technology is to develop a new system to manage computerized materials property data, to improve the quality, and to make them more accessible and more easily manipulated. In the paper, the computerization of materials data will be discussed from the viewpoints of the benefits to be achieved and of the challenges to be met. Among the foremost challenges is the need to make a substantial national commitment to coordinate the joint development of a private sector/federal computerized materials data system.

Keywords: Algorithms, Accuracy, Exponential functions, Arithmetic, *Square roots, Logarithm functions, Numerical analysis, Error analysis, Reprints.

In previous works the authors introduced a new form of computer arithmetic, called level-index arithmetic, the main purpose of which is to eradicate the problems of overflow and underflow associated with the floating-point and fixed-point systems. In order to implement the new arithmetic in multiple precision, unrestricted algorithms are needed to evaluate exponentials and logarithms. By an unrestricted algorithm we mean one in which the user may demand any accuracy in the function values for arguments of any magnitude. An unrestricted algorithm for the exponential function was described previously. This paper we construct an unrestricted algorithm for computing square roots. This is a necessary preliminary in the construction of an unrestricted algorithm for the logarithmic function. At the same time this paper a quite similar algorithm for forming reciprocals: the direct division process that is used for low-precision work is inefficient for multiple-precision calculations.

Defining a Faceted Generalized Cylinder by Projections of Cross Sections.
 Final rept.
 M. Roche. 1989, 6p
 Pub. in Computers and Graphics 13, n3 p349-354 1989.

Keywords: *Cross sections, *Projection, *Cylinders, Models, Coordinates, Reprints.

Traditionally a faceted model of a generalized cylinder has been defined using a three-dimensional curve with local coordinate systems along the curve to position cross sections. The local coordinate systems along the curve are given by the Frenet trihedron which is used to position the given cross section. An alternative to this construction procedure would be a technique that projects cross sections from one construction plane to another. The projection technique could be used in defining many objects in the class of generalized cylinders. The technique uses a mitered development along with a polygonal approximation of the defining axis curve.

TWODQD: An Adaptive Routine for Two-Dimensional Integration.
 Final rept.
 D. K. Kahaner, and O. W. Rechar. 1987, 20p
 Pub. in Jnl. of Computational and Applied Mathematics 17, n1-2 p215-234 1987.

Keywords: *Numerical integration, *Functions(Mathematics), Subroutines, Integral calculus, Orbits, Reprints, *Computer calculations, Two dimensional models, Quadratures.

The paper presents an adaptive subroutine that computes an approximation to the integral of a function $f(x,y)$ over a two dimensional region made up of triangles. Lyness Jespersen rules form the basis for a local quadrature module that is used to estimate the integral and the error over each triangle. The triangle with the largest error is subdivided and the local quadrature module is applied to each sub triangle to obtain new estimates of the integral and the error. The process is repeated until either an error tolerance is satisfied, the number of triangles exceeds an input parameter MAXTRI, the number of integrand evaluations exceeds an input parameter MEVALS, or the subroutine senses that round off error is beginning to contaminate the result.

ODRPACK: Software for Weighted Orthogonal Distance Regression.
 Final rept.
 P. T. Boggs, J. R. Donaldson, R. H. Byrd, and R. B. Schnabel. 1989, 17p
 Pub. in ACM (Association for Computing Machinery) Transactions on Mathematical Software 15, n4 p348-364 Dec 89).

Keywords: *Regression analysis, Errors, Least squares method, Curve fitting, Algorithms, Reprints, *Computer applications, Computer software.

The paper describes ODRPACK, a software package for the weighted orthogonal distance regression problem. The software is an implementation of an algorithm for finding the parameters that minimize the sum of the squared weighted orthogonal distances from a set of observations to curve or surface determined by the parameters. It can also be used to solve the ordinary non-linear least squares problem. The weighted orthogonal distance regression procedure can be applied to curve and surface fitting and to measurement error models in statistics. The algorithm implemented is an efficient and stable trust region (Levenberg-Marquardt) procedure that exploits the structure of the problem so that the computational cost per iteration is equal to that for the same type of algorithm applied to the ordinary non-linear least squares problem. The package allows a general weighting scheme, provides for finite different derivatives, and contains extensive error checking and report generating facilities.

Impulse Response Acquisition as an Inverse Heat Conduction Problem.
 Research rept.
 A. S. Carasso. 1990, 17p
 Grant N00014-88-F-0005
 Sponsored by Office of Naval Research, Arlington, VA. Pub. in SIAM Jnl. on Applied Mathematics 50, n1 p74-90 Feb 90.

Keywords: Conduction, Linear systems, Perturbation theory, Wave propagation, Volterra equations, Reprints, *Impulse response, Time invariant systems, Inverse problems, Deconvolution, Numerical solution.

The impulse response of a linear time-invariant system can be obtained by deconvolution of the response to a physically realizable, smooth approximation to the Dirac delta-function. As shown in (SIAM J. Appl. Math., 47(1987), pp. 892-927), it is advantageous to synthesize infinitely divisible probe waveforms and recover the system's impulse response by solving the related Cauchy problem for a generalized diffusion equation. The present paper is concerned with perturbations of the originally designed pulse shape, caused by amplifiers, transducers, and other interfacing devices, that may destroy infinite divisibility. It is shown that in a large number of cases a simple linear transformation of the noisy output data can be found that converts the deconvolution problem with the perturbed pulse back into one for which the diffusion theory applies. The search for this transformation is accomplished in the Fourier domain by comparing the perturbed pulse with the designed pulse. As a by-product, it is shown how to construct a rich variety of probe shapes, including waveforms with large negative oscillations, that can be related to a diffusion process.

Fast Fourier Transforms for Direct Solution of Poisson's Equation with Staggered Boundary Conditions.
 Final rept.
 U. Schumann, and R. A. Sweet. 1988, 15p
 Pub. in Jnl. of Computational Physics 75, n1 p123-137 1988.

Keywords: Partial differential equations, Finite difference theory, Fourier transformation, Approximation, Algorithms, Reprints, *Poisson equation, Fast Fourier transforms, Computational grids, Matrix decompositions, Computer applications.

The paper describes pre- and postprocessing algorithms used to incorporate the fast Fourier transform (FFT) into the solution of finite difference approximations to multi-dimensional Poisson's equation on a staggered grid where the boundary is located midways between two grid points. All frequently occurring boundary conditions (Neumann, Dirichlet or cyclic) are considered, including the combination of staggered Neumann boundary condition on one side with non-staggered Dirichlet boundary condition on the other side. Experiences from implementing these algorithms in vectorized coding in Fortran subroutines are reported.

Evaluation of the Integral $\int_0^\infty I_0(kr) \int_0^\infty I_0(k'r) r^2 dr$ squared dr.
 L. C. Maximon. Jun 90, 30p NISTIR-4355

Keywords: *Integral equations, *Bessel functions, Delta function, Step functions, Legendre functions, Wave equations.

The integral $\int_0^\infty I_0(kr) \int_0^\infty I_0(k'r) r^2 dr$ squared dr, in which the spherical Bessel functions $\int_0^\infty I_0(kr)$ are the radial eigenfunctions of the three-dimensional wave equation in spherical coordinates, is evaluated in terms of distributions, in particular step functions and delta functions. It is shown that the behavior of $\int_0^\infty I_0(kr)$ is very different in the cases $l-l'$ even (0, + or - 2, + or - 4, ...) and $l-l'$ odd (+ or - 1, + or - 3, ...). For $l-l'$ even it is expressed in terms of the delta function, step functions, and Legendre polynomials. For $l-l'$ odd it is expressed in terms of Legendre functions of the second kind and step functions; no delta functions appear.

Tables of the Inverse Laplace Transform of the Function $e^{\beta \sup(-s)}$ (\sup sup beta)).

M. Dishon, J. T. Bendler, and G. H. Weiss. 1990, 34p
Prepared in cooperation with General Electric Co., Schenectady, NY. Research and Development Center, and National Institutes of Health, Bethesda, MD. Div. of Computer Research and Technology.
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 v4 p433-467 Jul-Aug 90.

Keywords: *Laplace transformation, Numerical analysis, Approximation, Tables(Data), *Inverse Laplace transforms.

The inverse transform, $g(t) = L \sup(-1)(e^{\beta \sup(-s)}$ (sup beta)), $0 < \beta < 1$, is a stable law that arises in a number of different applications in chemical physics, polymer physics, solid-state physics, and applied mathematics. Because of its important applications, a number of investigators have suggested approximations to $g(t)$. However, there have so far been no accurately calculated values available for checking or other purposes. The authors present tables, accurate to six figures, of $g(t)$ for a number of values of β between 0.25 and 0.999. In addition, since $g(t)$, regarded as a function of β , is unimodal with a peak occurring at $t = t_{\text{sub max}}$ with both tabulate and graph $t_{\text{sub max}}$ and $1/g(t_{\text{sub max}})$ as a function of β , as well as giving polynomial approximations to $1/g(t_{\text{sub max}})$.

Asymptotic Approximation of Integral Manifolds.

Final rept.

D. E. Gilsinn. 1987, 12p

Pub. in SIAM (Society for Industrial and Applied Mathematics) Jnl. on Applied Mathematics 47, n5 p929-940 Oct 87.

Keywords: *Nonlinear differential equations, Van der Pol differential equation, Fixed points(Mathematics), Approximation, Reprints, Mathematical manifolds, Transformations(Mathematics), Integral manifolds, Asymptotic methods.

Multi-degree of freedom nonlinear differential equations can often be transformed by means of the method of averaging into equivalent systems with only high order terms. They are called normal systems. Under appropriate small order of perturbation conditions, normal systems have unique surfaces of solutions called integral manifolds. They generalize the notions of periodic and almost periodic solutions for single degree of freedom systems. In parametric form, the integral manifolds satisfy a certain system of partial differential equations. Conversely, an N -th order asymptotic integral manifold is defined as a formal solution of that system of partial differential equations, up to order N in the perturbation parameter. In the main result a system of integral equations is written for the remainder terms. By a contraction argument the system of integral equations has a fixed point, which added to the N -th order asymptotic integral manifold forms an integral manifold for the normal system. By uniqueness this is the integral manifold sought. This implies that the unique integral manifold for the normal system can be written as a formal series plus high order error terms.

Optimal 3-Dimensional Methods for Linear Programming.

P. D. Dornich, P. T. Boggs, J. R. Donaldson, and C. Witzgall. Dec 89, 25p NISTIR-89/4225

Keywords: *Linear programming, *Algorithms, Optimization, Ordinary differential equations, Iteration, Tests, Method of centers.

Interior point algorithms for solving linear programming problems are considered. An optimal 3-dimensional method is developed that, at each iteration, solves a subproblem based on minimizing the cost function on low-dimensional cross sections of the feasible region. The generators for the original 2-dimensional subproblems are derived from either a discrete or a continuous version of Huard's method of centers. The generators for the optimal 3-dimensional subproblem included the dual affine search direction, and two higher-order search directions. One of the higher order directions is a third order correction to the Newton recentering direction, and the other is a correction to the dual affine direction that is motivated by the use of rank-one updates of the second derivative information. Numerical results are presented for the optimal 3-dimensional method that indicate almost a 23% reduction in CPU time compared to the best dual affine implementation.

Computational Examination of Orthogonal Distance Regression.

Final rept.

P. T. Boggs, C. H. Spiegelman, J. R. Donaldson, and R. B. Schnabel. 1988, 33p

Pub. in Jnl. of Econometrics 38, n1-2 p169-201 1988.

Keywords: *Data smoothing, *Statistical analysis, Errors, Monte Carlo method, Reprints, *Parameter identification, Ordinary least squares, Orthogonal distance regression.

Classical or ordinary least squares (OLS) is one of the most commonly used criteria for fitting data to models and for estimating parameters. This is true even when a key assumption for its use, namely that the independent variables are known exactly, is violated. Orthogonal distance regression (ODR) extends least squares data fitting to problems with independent variables that are not known exactly. The paper presents the results of an empirical study designed to examine whether ODR provides better results than OLS when there are errors in the independent variable. It examines a variety of functions, both linear and nonlinear, under a variety of experimental conditions. The results

indicate that, for the data and performance criteria considered, ODR never performs appreciably worse than OLS and sometimes performs considerably better. This leads to the conclusion that ODR is appropriate for a wide variety of practical problems.

Orthogonal Distance Regression.

P. T. Boggs, and J. R. Donaldson. Nov 89, 18p
NISTIR-89/4197

Keywords: *Error analysis, Mathematical models, Algorithms, Least squares method, Covariance, Confidence limits, Computerized simulation, *Maximum likelihood estimates, Computer calculations.

Orthogonal Distance Regression (ODR) is the name given to the computational problem associated with finding the maximum likelihood estimators of measurement error models in the case of normally distributed errors. The authors examine the stable and efficient algorithm of Boggs et al. for finding the solution of the problem when the underlying model is assumed to be nonlinear in both the independent variable and the parameters. They also describe the associated public domain software package, ODRPACK. They then review the results of a baseline simulation study that compares ODR with ordinary least squares (OLS). They also present the new results of an extension to the study. Finally they discuss the use of the asymptotic covariance matrix for computing confidence regions and intervals for the estimated parameters. The conclusions are that ODR is better than OLS for the criteria considered, and that ODRPACK can provide effective solutions and useful statistical information for nonlinear ODR problems.

Some Thoughts on Variable-Selection in Multiple Regression.

Final rept.

J. Mandel. 1989, 5p

Pub. in Jnl. of Quality Technology 21, n1 p2-6 1989.

Keywords: *Linear regression, *Regression analysis, Mathematical prediction, Reprints, *Variable selection, Goodness of fit.

The practice of variable-selection in multiple linear regression is examined both logically and statistically in terms of the major objectives of regression analysis. It is argued that in addition to goodness-of-fit considerations, due attention should be given to determining the domain, in the space of regressors, in which the regression equation can be used as a prediction device. Such a domain has been called the 'effective prediction domain' (EDP). It is shown that failure to do so can result in serious misuse of the regression equation, especially when regressors have been omitted.

Survey Sampling Methods.

Final rept.
K. Eberhardt. 1990, 39p
Pub. in Handbook of Statistical Methods for Engineers and Scientists, Chapter 9, pp. 1-9.39 1990.

Keywords: *Sampling, *Statistical analysis, Methodology, Cluster sampling, Randomization, Stratification, Ratios, Mathematical prediction, Least squares method, Reprints.

The chapter gives a general overview of survey sampling methodology, that is, methods for sample selection and inferences about finite populations. The basic analytical methods covered include: estimation of a population mean, total or proportion, ratio estimation, determination of sample size, and evaluation of sampling uncertainty in an estimate. The following specific sampling techniques are described: simple random sampling, stratified sampling, post stratification, balanced sampling, single-stage cluster sampling, and two-stage cluster sampling. The theoretical background of the methodology is outlined in terms of both classical randomization-based sampling theory and model-based linear least-squares prediction theory.

Variances Based on Data with Dead Time between the Measurements.
Technical note.
J. A. Barnes, and D. W. Allan. Mar 90, 47p NIST/TN-1318
Also available from Supt. of Docs. See also PB89-174049. Prepared in cooperation with Austron, Inc., Boulder, CO.

Keywords: *Variance(Statistics), Frequency stability, Dead time, Bias, Data sampling, Measurement, Tables(Data), *Allan variance.

The accepted definition of frequency stability in the time domain is the two-sample variance (or Allan variance). It is based on the measurement of average frequencies over adjacent time intervals, with no 'dead time' between the intervals. In 1974 a table of bias functions which related variance estimates with various configurations of number of samples and dead time to the Allan variance was published. The tables were based on noises with pure power-law spectral densities. Often situations occur that unavoidably have dead time between measurements, but still the conventional variances are not convergent. Some of these applications are outside of the time-and-frequency field. Also, the dead times are often distributed throughout a given average, and this distributed dead time is not treated in the 1974 tables. The paper reviews the bias functions $B_1(N,r,\mu)$, and $B_2(r,\mu)$ and introduces a new bias function, $B_3(2,M,r,\mu)$, to handle the commonly occurring cases of the effect of distributed dead time on the computed variances. Some convenient and easy-to-interpret asymptotic limits are reported. A set of tables for the bias functions are included at the end of the paper.

Keywords: *Variance(Statistics), *Confidence limits, Reprints.

The variance component in the one-factor components-of-variance model is of interest in many fields of application. The paper shows that the lower bound of the confidence coefficients for a widely used confidence interval on the variance component is $1 - \alpha$ instead of the previously known result of $1 - 2\alpha$.

Exact Moments of the Symmetric Cubic Assignment Statistic.
Final rept.
H. K. Iyer, and D. F. Vecchia. 1989, 13p
Pub. in Commun. Statist.-Theory Meth. 18, n12 p4309-4320 1989.

Keywords: Allocation models, Permutations, Approximation, Reprints, *Assignment models, Pearson distributions.

Hubert (1987, Assignment Methods in Combinatorial Data Analysis) presented a class of permutation, or random assignment, techniques for assessing correspondence between general k-dimensional proximity measures on a set of 'objects.' A major problem in higher-order assignment models is the prohibitive level of computation that is required. The authors present the first three exact moments of a test statistic for the symmetric cubic assignment model. Efficient computational formulas for the first three moments have been derived, thereby permitting approximation of the permutation distribution using well-known methods.

Exact Distribution-Free Tests for Equality of Several Linear Models.
Final rept.
D. F. Vecchia, and H. K. Iyer. 1989, 22p
Pub. in Communications in Statistics, Theory and Methods 18, n7 p2467-2488 1989.

Keywords: *Statistical tests, *Mathematical models, Permutations, Nonparametric statistics, Linear regression, Stochastic processes, Reprints.

Exact tests for the equality of several linear models are developed using permutation techniques. Two cases of the linear model, characterized by either stochastic or nonstochastic predictors, are considered: the linear regression model (LRM) and the general linear model (GLM). A general class of test statistics using the volume of simplexes as the basic unit of analysis is proposed for this problem. The resulting class of statistics is shown to be a natural generalization of the multi-response permutation procedure (MRPP) test statistics which have been shown to comprise many of the statistics used in both parametric and nonparametric analysis of the standard g-sample problem. In the LRM case, exact moments of all orders are derived for the permutation distribution of any test statistic in the general class. Moment-based approximation of significance levels is shown to be computationally feasible in the simple LRM.

The catalog of mathematical and statistical software is made available to computer users at the National Institute of Standards and Technology by its Center for Computing and Applied Mathematics. The edition includes descriptions of 5069 software modules comprising 40 software packages implemented on six different computer systems. The catalog is divided into five parts: a classification scheme for mathematical and statistical problems, a list of software modules organized according to the problems they solve, a more detailed list of software modules in alphabetical order, a description of each software package and its implementations, and a keyword index to the problem classification scheme.

Engineering of Binding Affinity at Metal Ion Binding Sites for the Stabilization of Proteins: Subtilisin as a Test Case.
Final rept.
M. W. Pantoliano, M. Whitlow, J. F. Wood, M. L. Rollence, B. C. Finzel, G. L. Gilliland, T. L. Poulos, and P. N. Bryan. 1988, 7p
Pub. in Biochemistry 27, n22 p8311-8317 1988.

Keywords: *Metal containing organic compounds, Ions, Volumetric analysis, X ray diffraction, Mutation, Reprints, *Calcium-binding proteins, *Binding sites, *Subtilisins, Serine proteases, Osmolar concentration.

A weak $Ca(2+)$ binding site in the bacterial serine protease subtilisin BPN' (EC 3.4.21.14) was chosen as a model to explore the feasibility of stabilizing a protein by increasing the binding affinity at a metal ion binding site. The existence of this weak $Ca(2+)$ binding site was first discovered through a study of the rate of thermal inactivation of wild-type subtilisin BPN' at 65 C as a function of the free $Ca(2+)$. Increasing the $Ca(2+)$ in the range 0.10-100 mM caused a 100-fold decrease in the rate of thermal inactivation. The data were found to closely fit a theoretical titration curve for a single $Ca(2+)$ specific binding site with an apparent $\log K = 1.49$. A series of refined X-ray crystal structures ($R < 0.15, 1.7 A$) of subtilisin in the presence of 0.0, 25.0, and 40.0 mM $CaCl_2$ has allowed a detailed structural characterization of this $Ca(2+)$ binding site. Negatively charged side chains were introduced in the vicinity of the bound $Ca(2+)$ by changing Pro 172 and

Biochemistry

Gly 131 to Asp residues through site-directed and random mutagenesis techniques, respectively. These changes were found to increase the affinity of the Ca(2+) binding site by 3.4- and 2-fold, respectively, when compared with the wild-type protein (ionic strength = 0.10). X-ray studies of these new variants of subtilisin revealed the carboxylate side chains to be 6.8 and 13.2 Å, respectively, from the bound Ca(2+).

Structure of Insulin: Results of Joint Neutron and X-ray Refinement.
Final rept.
A. Wlodawer, H. Savage, and G. Dodson. 1989, 9p
Pub. in Acta Crystallographica B45, n1 p99-107 1989.

Keywords: *Insulin, *Molecular structure, *Neutron diffraction, *X ray diffraction, Least squares method, Temperature, Hydrogen, Swine, Crystals, Solvents, Reprints.

Neutron diffraction data for porcine 2Zn insulin were collected to 2.2Å resolution from a single crystal deuterated by slow exchange of mother liquor. A joint neutron/x-ray restrained least squares refinement was undertaken using the neutron data, as well as the 1.5Å resolution x-ray data collected previously. The final R-factors were 0.182 for the x-ray data and 0.191 for the neutron data. Resulting atomic coordinates were compared with the initial x-ray model, showing the totals rms shift at 0.36Å for the protein and 0.6Å for the solvent. Temperature factors for both crystallographically independent molecules were analyzed and their differences were correlated with the crystal packing. Protonation of certain individual amino acids were analyzed. Amide hydrogen exchange was investigated in a refinement of atomic occupancies. Regions of unexchanged amide groups were found in the center of the B helices. Solvent structure was compared in the two models, with some indication of differences due to deuteration.

Two-dimensional gel electrophoresis (2DGE) and image processing were used to quantify protein and carbohydrate heterogeneity in human plasma fibronectin (FN) and its enzymatically produced domains. After a 30 minute thermolysin digest of FN, the do-

maines were identified in 2DGE by their known isoelectric points and molecular weights, which were compared to domain standards purified by hydroxyapatite, gel exclusion and heparin-Sepharose chromatography. Three individual species were observed in the cell binding domain which may correspond to the heterogeneity known to result from alternative splicings of the fibronectin gene. In addition, the carbohydrate heterogeneity in the gelatin binding domain was analyzed by 2DGE and isoelectric focusing (IEF) before and after treatment with N-glycanase and neuraminidase to remove selected carbohydrate moieties.

Liposome-Based Flow Injection Enzyme Immunoassay for Theophylline.
Final rept.
T. G. Wu, and R. A. Durst. 1990, 9p
Pub. in Mikrochimica Acta I, p187-195 1990.

Keywords: *Enzymes, Antibodies, Reprints, *Immunoassay, *Theophylline, *Liposomes, Flow injection analysis.

Preliminary results are presented on the development of a sensitive, quantitative immunoassay based on a regenerable, flow injection analysis system incorporating a double-amplification approach. The double amplification is achieved by means of liposome-encapsulated peroxidase enzyme molecules which are released subsequent to a competitive immunological reaction with analyte molecules for immobilized antibodies. The released peroxidase enzymatically cleaves, from an organofluorine substrate, fluoride ions which are then potentiometrically measured. The entire process is carried out in a flow injection analysis system. The competition between the analyte molecules (theophylline) and the theophylline-derivatized liposomes for immobilized antibody sites in flow-through immunoreactor column results in unbound liposomes being carried downstream where they are ruptured in the presence of hydrogen peroxide and p-fluorophenol. The peroxidase molecules released react enzymatically to produce fluoride ions which are measured with an ion-selective electrode.

Separation of Amino Acids Using Composite Ion Exchange Membranes.
Final rept.
B. K. Dutta, and S. K. Sikdar. 1990, 11p
Pub. in Annals of the New York Academy of Sciences 589, p203-213, 20 May 90.

Keywords: *Ion exchanging, *Membranes, *Amino acids, Thin films, Permeameters, Sulfonic acids, Mass transfer, Water, Composite materials, Polymers, Reprints, *Separation processes, Perfluorosulfonic acid.

A new composite ion exchange membrane for separating amino acids from aqueous solutions was made by casting a thin (10 microns) perfluorosulfonic acid (PFSA) film on a highly porous thin (20 microns) polytetrafluoroethylene support. A stirred permeation cell was used to measure transport rates of amino acids from single- and multi-component aqueous solutions. For comparison, permeation data were also collected using a commercial PFSA membrane about 170 microns thick. The amino acid fluxes for the composite membrane were greater by an order of magnitude, 10(sup-7) vs. 10(sup-8)mol/sq cm-s.

Physical Phenomena and the Microgravity Response.
P. Todd. Aug 89, 14p
In NASA, Ames Research Center, Cells in Space p103-116.

Keywords: *Cells (Biology), Cytology, *Diffusion, Acceleration (Physics), Inertia, Protein crystal growth, *Chemical reaction kinetics.

The living biological cell is not a sack of Newtonian fluid containing systems of chemical reactions at equilibrium. It is a kinetically driven system, not a thermodynamically driven system. While the cell as a whole might be considered isothermal, at the scale of individual macromolecular events there is heat generated, and presumably sharp thermal gradients exist at the submicron level. Basic physical phenomena to be considered when exploring the cell's response to inertial acceleration include particle sedimentation, solutal convection, motility electrokinetics, cytoskeletal work, and hydrostatic pressure. Protein crystal growth experiments, for example, illustrate the profound effects of convection currents on macromolecular assembly. Reaction kinetics in the cell vary all the way from diffusion-limited to life-time limited. Transport processes vary from free diffusion, to facilitated and active transmembrane transport, to contractile-protein-driven motility, to crystalline immobilization. At least four physical states of matter exist in the cell: aqueous, non-aqueous, immiscible-aqueous, and solid. Levels of order vary from crystalline to free solution. The relative volumes of these states profoundly influence the cell's response to inertial acceleration. Such subcellular phenomena as stretch-receptor activation, microtubule re-assembly, synaptic junction formation, chemotactic receptor activation, and statolith sedimentation were studied recently with respect to both their basic mechanisms and their responsiveness to inertial acceleration. From such studies a widespread role of cytoskeletal organization is becoming apparent.

 Mar 89.

Keywords: *Cholesterol, *Blood chemical analysis,
 *Clinical medicine, Laboratories, Reprints, *Reference
 values.

The effective utilization of cholesterol risk guidelines
 by physicians requires reliable and accurate patient
 serum cholesterol values. Each clinical or office labo-
 ratory's serum cholesterol analyses should be trace-
 able to the National Reference System for Cholesterol
 (NRS/CHOL), an accuracy-based national system for
 cholesterol standardization. The NRS/CHOL is a reali-
 ty that is progressively becoming the way in which ac-
 curacy of cholesterol results can be ensured. Proof of
 traceability to NRS/CHOL within each segment of the
 clinical laboratory will soon be the norm that makes a
 sound conceptual reference system into an everyday
 reality, reaching into many thousands of working sites
 that measure cholesterol in patient serum samples. It
 is possible to reach the national analytical goal for cho-
 lesterol so that 'results from any clinical laboratory in
 the United States can be interchanged with those of
 any other clinical laboratory within defined limits of ac-
 curacy and precision required to meet the needs of
 medical practice'.

 Droz, F. Mattos de Cabrera, and S. Kaye. 1990, 18p
 Pub. in Jnl. of Forensic Sciences 35, n1 p151-168 Jan
 90.

Keywords: *Blood chemical analysis, *Cyanides,
 *Fires, Toxicology, Puerto Rico, Carbon monoxide,
 Reprints, *Carboxyhemoglobins, *Fire victims.

Ninety-seven people died from a fire that occurred in
 the Dupont Plaza Hotel in Puerto Rico on 31 Dec 1986.
 All, except four who died later in the hospital, were
 found dead at the scene. All of the fatalities at the
 hotel (except for eight) were burned beyond recogni-
 tion. Blood from seventy-eight of the victims was
 screened for carboxyhemoglobin at the Institute for
 Forensic Sciences in Puerto Rico and was then sent to
 the National Institute of Standards and Technology,
 Gaithersburg, Maryland, for analysis of carboxyhe-
 moglobin and cyanide concentrations. The blood data
 indicated that carbon monoxide and hydrogen cya-
 nide, singly or combined, were probably not responsi-
 ble for the majority of the deaths that occurred in the
 badly burned victims. On the other hand, the signifi-

cantly higher carboxyhemoglobin in the nonburned vic-
 tims indicated that carbon monoxide alone or com-
 bined with hydrogen cyanide probably played a major
 role in the cause of their deaths.

 Final rept.
 P. Lumbruso, and C. E. Dick. 1987, 7p
 Pub. in Medical Physics 14, n5 p752-758 Sep/Oct 87.

Keywords: *Radiography, X ray spectra, Computerized
 simulation, Attenuation, Contrast, Predictions, Re-
 prints, *Biomedical radiography, *X-ray radiography,
 Imaging techniques.

A systematic study has been carried out to assess the
 x-ray attenuation effects of various elements when
 used as radiographic contrast enhancing media. The
 study examines the effects of solutions of molecules
 with effective atomic numbers from 40 to 92 on the
 signal contrast ratio of radiographic images formed
 with various input x-ray spectra on suitable phantoms.
 A variety of x-ray spectra were used including monoener-
 getic spectra, constant potential x-ray tube spectra,
 and CT spectra. In addition, a computer model was
 used to predict the effects studied. In general, the
 computer model is able to accurately predict the re-
 sulting signal contrast ratio for a given combination of
 contrast media, input x-ray spectra, and phantom com-
 position. From these data and calculations it may be
 possible to design new contrast media which are tai-
 lored to specific diagnostic imaging tasks.

 Pub. in Jnl. Orth. Surg. ROC 7, p46-52 1990.

Keywords: *Bones, *Minerals, *Osteoporosis, Diagno-
 sis, Reprints, Risk factors.

The bone mineral ratio (BMR) of trabecular to compact
 bone is proposed as a parameter for identification of
 asymptomatic population at risk of osteoporosis. The
 calculation indicates that, both in male and female
 groups, BMR is not significantly different between
 young and older normal subjects and decreases sig-
 nificantly for osteoporotic patients. This is indicative of
 preferential bone loss in trabecular bone and suggests
 that BMR should be a sensitive parameter for early di-
 agnosis of osteoporosis.

 Final rept.
 J. G. Harman, A. Peterkofsky, and K. McKenney.
 1988, 6p
 Pub. in Jnl. of Biological Chemistry 263, n17 p8072-
 8077 1988.

Keywords: *Escherichia coli, *Leucine, *Arginine,
 *Mutation, Amino acids, Substitution reactions, In vitro
 analysis, In vivo analysis, Deoxyribonucleic acids, Re-
 prints, *Protein kinases, *Cyclic AMP receptors, Bac-
 terial gene expression, Allosteric pathways.

Mutant forms of the Escherichia coli cAMP receptor
 protein (CRP) that activate CRP-dependent promoters
 in the absence of the normal allosteric effector (cAMP)
 have been described. A previous report detailed the
 properties of three CRP mutants. One protein, 220
 CRP, has amino acid substitutions at positions 127 and
 170 and has low CRP activity in vivo. A second protein,
 CRP 222, has the amino acid substitutions present in
 220 CRP and a third substitution (arginine for leucine)
 at position 195. CRP 222 has high CRP activity in vivo
 and high apparent affinity for lacP DNA relative to the
 220 CRP in vitro. To evaluate the effect of amino acid
 substitution at position 195 on CRP activity two mutant
 crp alleles, crpR195 and crpP195, have been con-
 structed. These studies show that the effects of multi-
 ple mutations in CRP can be both cumulative and inter-
 active and that the properties of CRP mutants with
 multiple mutations cannot be predicted from those of
 proteins having isolated mutations.

**Deletion Analysis of the DNA Sequence Required
 for the In Vitro Initiation of Replication of Bacterio-
 phage.**
 Final rept.
 S. Wickner, and K. McKenney. 1987, 5p
 Pub. in Jnl. of Biological Chemistry 262, n27 p3163-
 3167 1987.

Keywords: In vitro analysis, Reprints, *Phage lambda,
 *Gene deletion, *Virus replication, *Base sequence,
 *Viral DNA, Base pairs, Templates.

Supercoiled DNA containing the replication origin of
 bacteriophage lambda can be replicated in vitro. This
 reaction requires purified lambda O and P replication
 proteins and a partially purified mixture of Escherichia
 coli proteins. The lambda origin region has four re-
 peats of a 19 base-pair sequence to which O protein
 binds. In vitro replication of RF I DNAs prepared from
 cells infected with these two M13 ori lambda phage
 was dependent on lambda O and P proteins and a
 crude protein fraction from uninfected E. coli; with
 these conditions there was no replication of M13mp8
 RF I DNA. Deletions were made from the left and the
 right ends of the lambda origin DNA and determined
 the deletion endpoints by DNA sequencing. RF I DNAs
 prepared from cells infected with phage carrying ori
 lambda deletions have been tested for their ability to
 function as templates for O and P dependent replica-
 tion in vitro. The results show that lambda DNA be-
 tween nucleotide positions 39072 and 39160 is re-
 quired for efficient O and P dependent replications.
 This 89 base-pair piece of DNA includes only two of
 the four 19 base pair O protein binding sites (the two
 right most) and the adjoining adenine and thymine rich
 region to the right of the O binding sites.

**Vector Averaging Method for Locating Small Dif-
 ferences between Nearly Identical Protein Struc-
 tures.**
 Final rept.
 I. T. Weber. 1987, 6p
 Pub. in Jnl. of Applied Crystallography 20, p388-393
 Oct 87.

Keywords: Comparison, Vectors, Reprints, *Protein conformation.

When two similar protein structures are compared it is often difficult to analyze or even identify smaller differences, especially if the proteins are large. A method is described in which the refined coordinates of two nearly identical protein structures are compared by a vector averaging of the differences in atomic coordinates over several consecutive residues. The technique detects regions of the protein where all the atoms move in the same direction. The magnitude and direction of the resultant average vector give the local conformational difference between the two structures. Regions with such correlated movements have been identified in several different protein structures.

I. T. Weber, and T. A. Steitz. 1987, 16p
Pub. in Jnl. of Molecular Biology 198, n2 p311-326 1987.

Keywords: *Genes, Crystallography, Reprints, *Catabolism, *Protein conformation, *Adenosine cyclic monophosphate.

The structure of a dimer of the E. coli catabolite gene activator protein has been refined at 2.5 Å resolution to a crystallographic R-factor of 20.7%. The two subunits are in different conformations and each contains one bound molecule of the allosteric activator, cAMP. An amino terminal domain is linked to the smaller carboxy terminal domain by a 9 residue hinge region that exists in different conformations in the two subunits, giving rise to approximately a 30 deg rotation between the positions of the small domains relative to the large domains. The amino terminal domain contains an anti-parallel beta roll structure in which the interstrand hydrogen bonding is well determined. The beta roll can be described as a long antiparallel beta ribbon that folds into a right handed supercoil and forms part of the cAMP binding site. Each cAMP molecule is in an anti conformation and has ionic and hydrogen bond interactions with both subunits.

Small Angle Neutron Scattering Method for In Situ Studies of the Dense Cores of Biological Cells and Vesicles: Application to Isolated Neurosecretory Vesicles.

Final rept.
S. Krueger, J. W. Lynn, J. T. Russell, and R. Nossal. 1989, 10p
Pub. in Jnl. Appl. Cryst. 22, p546-555 1989.

Keywords: *Neutron scattering, *Cells(Biology), Crystallization, Reprints, *Neurosecretory systems, Cell membrane.

Small-angle neutron scattering was used to study the structure of the dense cores of intact neurosecretory vesicles (NSV). Contrast-variation techniques were used to minimize the scattering due to vesicle membranes and emphasize that due to the cores. By examination of a suspension of NSV membranes along with

the intact NSV, residual membrane scattering was suppressed. The resultant scattering is inconsistent with model calculations which assume that the dense state of the vesicle cores is achieved by random dense packing or crystallization of small globular particles. Rather, the data suggest that the core constituents exist in a disordered state, forming aggregates with radii of gyration significantly larger than 100 Å.

Neutron and Light-Scattering Studies of DNA Gyrase and Its Complex with DNA.

Final rept.
S. Krueger, G. Zaccari, A. Wlodawer, J. Langowski, M. O'Dea, A. Maxwell, and M. Gellert. 1990, 10p
Pub. in Jnl. of Molecular Biology 211, p211-220 1990.

Keywords: *Neutron scattering, *Light scattering, *Molecular structure, Escherichia coli, Reprints, *DNA gyrase, *Superhelical DNA, DNA binding proteins.

The solution structure of Escherichia coli DNA gyrase, an enzyme that catalyzes the ATP-dependent supercoiling of DNA, has been characterized by small-angle neutron scattering (SANS) and dynamic light-scattering (DLS). The enzyme and its complex with a 172 base-pair fragment of duplex DNA, in H₂O or (2)H₂O solvent, were studied by contrast variation and the measurement of hydrodynamic parameters as a function of scattering angle. The complex was also measured in the presence of 5'-adenylyl-beta gamma-imidodiphosphate (ADPNP), a non-hydrolyzable ATP analog that is known to support limited supercoiling. The values of the radius of gyration, R_g = 67 Å, from SANS and the hydrodynamic radius, R_h = 64 Å from DLS predict a larger than expected volume for the enzyme, supporting the notion of channels or cavities within the molecule. In addition, several classes of models were rejected based on SANS data obtained in (2)H₂O at larger scattering angles. The best fit to both the SANS and DLS data is obtained for oblate, inhomogeneous particles approximately 175 Å wide and 52 Å thick. Such particles provide a large surface area for DNA interaction.

Autoregulation of the Yeast Copper Metallothionein Gene Depends on Metal Binding.

Final rept.
C. F. Wright, D. H. Hamer, and K. McKenney. 1988, 5p
Pub. in Jnl. of Biological Chemistry 263, n3 p1570-1574 1988.

Keywords: *Genes, *Yeasts, *Copper, *Proteins, Amino acids, Mutation, Reprints, *Metallothionein, *Gene expression regulation, Genetic transcription, Fungal proteins.

The yeast CUP1 gene product, copper metallothionein, acts to repress the basal transcription of its own structural gene. By creating a series of truncation and amino acid substitutions in CUP1, we show that the ability of the protein to autoregulate is directly correlated to its ability to bind and detoxify copper. These results support a model in which metallothionein controls the level of free intracellular copper available to interact with positive transcription factors. In addition, mutations in chemically equivalent cysteine residues were functionally dissimilar, suggesting that partial sites in the molecule are critical for the formation of the sulfur-metal cluster.

Structure of Phosphate-Free Ribonuclease A Refined at 1.26 Å.

Final rept.
A. Wlodawer, L. A. Svensson, L. Sjolin, and G. L. Gilliland. 1988, 13p
Pub. in Biochemistry 27, n8 p2705-2717 1988.

Keywords: *Molecular structure, *Phosphates, X ray diffraction, Least squares method, Cattle, Reprints, *Ribonuclease A.

The structure of phosphate-free bovine ribonuclease A has been refined at 1.26 Å resolution by a restrained

least-squares procedure to a final R factor of 0.15. X-ray diffraction data were collected with an electronic position-sensitive detector. The final model consists of all atoms in the polypeptide chain including hydrogens, 188 water sites with full or partial occupancy, and a single molecule of t-butanol. Thirteen side chains were modeled with two alternate conformations. Major changes to the active site include addition of two waters in the phosphate-binding pocket, disordering of Gln11 and tilting of the imidazole ring of His19. The structure of the protein and of the associated solvent was extensively compared with three other high resolution, refined structures of this enzyme.

Structure of Form III Crystals of Bovine Pancreatic Trypsin Inhibitor.

Final rept.
A. Wlodawer, W. Gallagher, G. L. Gilliland, J. Nachman, and C. Woodward. 1987, 12p
Pub. in Jnl. of Molecular Biology 198, n3 p469-480 1987.

Keywords: *Molecular structure, *Pancreas, X ray diffraction, Cattle, Crystals, Least squares method, Phosphates, Hydrogen bonds, Reprints, *Trypsin inhibitors.

The structure of bovine pancreatic trypsin inhibitor (BPTI) has been solved in a new crystal form III: The crystals belong to space group P21212 with a = 55.2 Å, b = 38.2 Å, c = 24.05 Å. The structure was solved on the basis of coordinates of forms I and II of BPTI by molecular replacement, and the X-ray data extending to 1.7 Å were used in a restrained least squares refinement. The final R factor was 0.16 and the deviation of bonded distances from ideality 0.020 Å. Root mean square discrepancy between Ca coordinates of forms III and I are 0.47 Å, while between forms II and III the discrepancy is 0.39 Å. These deviations are about a factor of three larger than the expected experimental errors, showing that true differences exist between the three crystal forms. Two residues (Arg 39 and Asp 50) were modeled with two positions for their side chains. The final model includes 73 water molecules and one phosphate bound to the protein. Sixteen waters occupy approximately the same positions in all three crystal forms studied to date, indicating their close association with the protein molecule. Temperature factors also show high correlation between the three crystal forms.

Effect of a Camp-Independent Mutation on Crystal Structure of Catabolite Gene Activator Protein.

Final rept.
I. T. Weber, M. C. Vaney, G. L. Gilliland, J. G. Harman, and A. Peterkofsky. 1987, 10p
Pub. in UCLA Symposia on Molecular and Cellular Biology, New Series, v69 p65-74 1987.

Keywords: *Mutations, *Crystals, Escherichia coli, X ray diffraction, Fourier analysis, Amino acids, Reprints, *Cyclic AMP, *Gene expression, Phenotype.

E. coli NCR91 synthesizes a mutant form of the catabolite gene activator protein in which Ala 144 is replaced by Thr. This mutant has a CAP phenotype; in the absence of cAMP it is able to express genes that normally require cAMP. CAP91 has been purified and crystallized with cAMP under the same conditions as crystals of the wild type CAP-cAMP complex. X-ray diffraction data were measured to 2.4 Å resolution and the wild type CAP phases were used to determine the CAP91 structure. A difference Fourier showed two Ala to Thr substitutions in the dimer and a motion of one Cys 178. The CAP91 coordinates were refined to an R factor of 0.186 and the changes compared with the wild type included concerted motions distal to the mutation site. The effect of adenosine on the CAP91 structure has been tested.

Binding of Substituted cis-Pt(II)-Diammines to Duplex DNA.

Final rept.
S. L. McCarthy, R. J. Hinde, K. J. Miller, J. S. Anderson, and H. Basch. 1990, 7p
Pub. in Biopolymers 29, p785-790 1990.

Keywords: *Metabolism, *Deoxyribonucleic acids, Computerized simulation, Reprints, *Cisplatin, Nucleic acid conformation, Cell survival, Nucleic acid heteroduplexes.

The results of a study of the binding to DNA of substituted cis-Pt(II) diammines, (cis-DP) are presented. Computer modeling of a series of cis-Pt(NH₂R)₂(+2)-where R=H, CH₃, cyclopropyl, cyclobutyl, and cyclopentyl-to N7(G) atoms of two adjacent intrastrand guanine bases in a square planar complex in a pentamer duplex of DNA were performed. The stability of the complexes is studied by calculating the relative conformational energy of the cis-DP-DNA complexes with molecular mechanics (MM) and the intrinsic binding energy, which is the relative binding energy for ligand replacement in the presence of the substituents R with quantum mechanics. In the model, the receptor site geometry and the conformation of the DNA is changed little in the accommodation of the series of monosubstituted diammines. These diammines bind to one family of DNA conformations, denoted as IC in a previous study, and this suggests that a common conformational feature in the DNA may exist to explain the smooth trend in activity. The slight increase in van der Waals energy resulting from an increasing number of atoms in the substituents is countered by a larger decrease in the ligand replacement energy as the substituent increases in size.

Crystal Structures of Bacterial Glutaminase-Asparaginases.

Final rept.
R. W. Harrison, I. T. Weber, H. L. Ammon, K. C. Murphy, A. Wlodawer, G. L. Gilliland, and J. Roberts. 1987, 11p
Pub. in Protein Structure, Folding, and Design 2, p83-92 1987.

Keywords: *Glutaminase, *Bacteria, *Crystals, Pseudomonas, Escherichia coli, Peptides, Electrons, Reprints, *Protein conformation, *Asparaginase, Acinetobacter glutaminasificans, Vibrio succinogenes, Amino acid sequence.

The crystal structures of amidohydrolases from Acinetobacter glutaminasificans (AgGA), Pseudomonas 7A (PGA), Vibrio succinogenes (VsA) and E. coli (EcA) are under investigation. AgGA crystallizes in space group I222 with one subunit in the asymmetric unit. The structure was determined by multiple isomorphous replacement techniques at 4-5 Å resolution coupled with phase improvement and extension by density modification techniques. The peptide backbone has been traced in 3.2 Å electron density maps. Peptide sequences are now available for AgGA and refinement based on predicted sequences is in progress; the connectivity is not yet fully established. The AgGA subunit consists of two domains: the amino-terminal domain folds into a 5-stranded beta-sheet surrounded by 5 alpha-helices; the carboxy-terminal domain contains 3 alpha-helices and less regular structure.

Structure of Hydroxyl Radical-Induced DNA-Protein Crosslinks in Calf Thymus Nucleohistone In vitro.
Final rept.
E. Gajewski, A. F. Fuciarelli, and M. Dizdaroglu. 1988, 15p
Pub. in International Jnl. of Radiation Biology 54, n3 p445-459 1988.

Keywords: *Deoxyribonucleic acids, *Histones, Molecular structure, In vitro analysis, Cattle, Thymus gland, Ionizing radiation, Reprints, *DNA-binding proteins, *Cross-linking reagents, *Hydroxyl radical, Chromatin, Mass fragmentography, Radiation dose-response relationships.

Hydroxyl radicals are known to produce DNA-protein crosslinks in chromatin in vivo and in vitro. Here, DNA-

protein crosslinks formed between aliphatic amino acids and thymine in calf thymus nucleohistone exposed to hydroxyl radicals in N₂O-saturated aqueous solution were investigated. Hydroxyl radicals were generated by ionizing radiation. Aliphatic amino acids are the predominant types of amino acids in the core histones of calf thymus, and thus are likely to form crosslinks with DNA. For identification, hydroxyl radical-induced crosslinking of thymine to aliphatic amino acids in model systems, i.e., an aqueous mixture of thymine and a single amino acid were first investigated. Samples were analyzed for possible thymine-amino acid crosslinks by gas chromatography-mass spectrometry. Using this approach, structure of such crosslinks was elucidated and information on their gas chromatographic and mass spectral properties was obtained. Gas chromatography-mass spectrometry with selected-ion monitoring was then used to identify DNA-protein crosslinks in acidic hydrolysates of calf thymus nucleohistone exposed to hydroxyl radicals in buffered aqueous solution. DNA-protein crosslinks involving thymine and the amino acids Gly, Ala, Val, Leu, Ile and Thr were identified.

Keywords: *Mutations, *Cells(Biology), Humans, In vitro analysis, Mutagens, In vivo analysis, Reprints, *DNA damage, DNA probes, Biotechnology, Recombinant DNA, Chromosome aberrations, Flow cytometry, Affinity labels, Chromosome deletion, Translocation(Genetics).

Most physical and chemical methods for analyzing cell damage have been developed for cells damaged in vitro. In many cases, these methods can be transferred, with minor modifications, to the analysis of cell damage in vivo. Molecular end points for cell damage include: chemical modifications of DNA, chromosome aberrations, point mutations, gene deletions/translocations, malignant transformation, and reproductive death. For each of these end points, in vivo methods of analysis have been developed, including centrifugation and electrophoresis of unlabeled DNA, use of probes to detect DNA damage, characterization of severe chromosome damage by flow cytometry, somatic mutant cell identification by image analysis and flow cytometry, electrophoresis of cellular proteins, and flow cytometry, image analysis, and electrophoresis for detecting cell population shifts. In most cases, problems of sensitivity, specificity, and analysis of large cell populations had to be solved to apply these methods in vivo.

Pub. in Jnl. of Dental Research 69, p595-600 Feb 90.

Keywords: *Dentistry, *Dental caries, *Fluorides, Reprints, *Dental enamel, Hydroxyapatites.

The cariostatic effects of tooth-bound fluoride reported in the recent literature are reviewed. Several treatment procedures which can increase the tooth-bound fluoride content are described. Based on the information, it is suggested that effectiveness of currently used topical fluoride treatments may be significantly increased by (1) including in the regimen a dicalcium-phosphate-dihydrate-forming treatment so that a portion of the

lable fluoride is re-incorporated as tooth-bound fluoride, and (2) employing application methods which ensure the effective delivery of treatment agents to the fissures, and to approximal and cervical surfaces where most caries occurs.

Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Jnl. of Dental Research 69, p522-528 Feb 90.

Keywords: *Quantitative analysis, *Fluorides, Microanalysis, Volumetric analysis, Accuracy, Electrodes, Teeth, Enamels, Measurement, Etching, Reprints, Caries, Plaque formation.

A variety of techniques is described for measuring fluoride in volumes of from 0.005 to 5 microliters including: (1) micropipette procedures for transference and dilution of samples, (2) construction of miniature and micro fluoride-selective electrodes, and (3) methods for adapting standard electrodes for micro- and semi-micro volumes. The described techniques have a number of advantages, including speed of analysis, high accuracy, and adaptability to many types of fluid samples. Recent studies involving use of the procedures include the analysis of fluoride in: (1) plaque fluid samples from single sites before and after topical fluoride administration, (2) tooth mineral samples recovered by acid-etch or microdrill biopsy of enamel, and (3) fluid recovered from the interior of the tooth during simulation of the caries process.

Microbiology

magnetotacticum, *Magnetosomes, X ray scattering, Small angle scattering.

Small angle neutron and X-ray scattering were used to study the magnetic and structural properties, respectively, of intracellular magnetite crystals (magnetosomes) in the bacterium, *Aquaspirillum magnetotacticum*, grown in pure culture. An average of twenty magnetite particles of diameter 400-500 Å are arranged in a chain that longitudinally traverses each cell. Behaving like magnetic dipoles, the bacteria orient in the geomagnetic field. Small angle X-ray scattering measurements revealed that bacteria grown in the presence of large amounts of iron contained magnetosomes with diameters averaging approximately 400 Å. Those grown under iron-starved conditions contained particles with slightly smaller diameters.

 Pub. in *Jnl. of Forensic Sciences*, p1303-1310 Nov 89.

Keywords: *Ionizing radiation, *Body fluids, *Blood, Deoxyribonucleic acids, Enzymes, Viral proteins, Reprints, *Human Immunodeficiency Virus(HIV), Forensic medicine.

A method to use ionizing radiation to inactivate HIV (Human Immunodeficiency Virus) in human body fluids was studied in an effort to reduce the risk of accidental infection to forensic science laboratory workers. Experiments conducted indicate that an X-ray absorbed dose of 25 krad was required to completely inactivate HIV. This does not alter forensically important constituents such as enzymes and proteins in body fluids. The method of inactivation of HIV cannot be used on body fluids which will be subjected to deoxyribonucleic acid (DNA) typing.

Mechanistic and Physiological Consequences of HPr(ser) Phosphorylation on the Activities of the Phosphoenolpyruvate: Sugar Phosphotransferase System in Gram-Positive Bacteria. Studies with Site-Specific Mutants of HPr.
 Final rept.
 J. Reizer, S. L. Sutrina, M. H. Saier, G. C. Stewart, A. Peterkofsky, and P. Reddy. 1989, 10p
 Pub. in *European Molecular Biology Organization Jnl.* 8, n7 p2111-2120 1989.

Keywords: *Mutations, *Phosphorylation, *Phosphotransferase, Catalysis, Amino acids, Reprints, *Gram-positive bacteria, *Phosphoenolpyruvate.

The bacterial phosphotransferase system (PTS) catalyzes the transport and phosphorylation of its sugar substrates. The protein-kinase-catalyzed phosphorylation of serine 46 in the phosphocarrier protein, HPr, inhibits PTS activity, but neither the mechanism of this inhibition nor its physiological significance is known. Site-specific HPr mutants were constructed in which serine 46 was replaced by alanine (S46A), threonine (S46T), tyrosine (S46Y) or aspartate (S46D). The purified S46D protein exhibited markedly lower V_{max} and higher K_m values than the wild-type. S46T or S46A protein for the phosphoryl transfer reactions involving HPr(His-P). Interactions of HPr with the enzymes catalyzing phosphoryl transfer to and from HPr regulated the kinase-catalyzed reaction. These results establish the inhibitory effect of a negative charge at position 46 on PTS-mediated phosphoryl transfer and suggest that HPr is phosphorylated on both histidyl and seryl residues by enzymes that recognize its tertiary rather than its primary structure. In vivo studies showed that a negative charge on residue 46 HPr strongly inhibits PTS-mediated sugar uptake, but that competition of two PTS permeases for HPr(His-P) is quantitatively more important to the regulation of PTS function than serine 46 phosphorylation.

Enhanced Root Fluoride Uptake by Monocalcium Phosphate Monohydrate Gels.
 Final rept.
 S. Takagi, L. C. Chow, and C. T. Schreiber. 1990, 5p
 Sponsored by American Dental Association Health Foundation, Chicago, IL.
 Pub. in *Caries Research* 24, p18-22 1990.

Keywords: *Fluoride, Calcium fluorides, Reprints, *Tooth root, *Monocalcium phosphate monohydrate, *Pharmacokinetics, Dental enamel.

Application of monocalcium phosphate monohydrate (MCPM) gel, which produces small amounts of dicalcium phosphate dihydrate in enamel, was previously shown to increase the enamel reactivity with fluoride (F). The study was conducted to determine whether the MCPM gel treatment is also effective in enhancing F uptake by root surfaces of human teeth. The results show that samples receiving daily treatments with MCPM gel for 10 min followed by immersion in a 1 ppm F solution for 5 days acquired a significantly greater amount of F compared to the controls which had the same exposure to the F solution. Because the F solu-

tion was undersaturated with respect to calcium fluoride (CaF₂), the F incorporated into the root is apparently apatitic and not CaF₂. The experimental treatment should be feasible in the clinical situation since only a short treatment time was required and delivery of the MCPM gel to specific sites was relative easy.

Theoretical Studies of cis-Pt(II)-Diammine Binding to Duplex DNA.
 Final rept.
 S. L. McCarthy, R. J. Hinde, K. J. Miller, J. S. Anderson, H. Basch, and M. Krauss. 1990, 14p
 Sponsored by National Foundation for Cancer Research, Bethesda, MD., and Rensselaer Polytechnic Inst., Troy, NY.
 Pub. in *Biopolymers* 29, p823-836 1990.

Keywords: *Deoxyribonucleic acids, *Antineoplastic agents, Ligands, Hydrogen bonds, Water, Quantum theory, Reprints, *Nucleic acid heteroduplexes, *Cis-platin, Nucleic acid conformation, Binding sites, Cell survival.

The binding of cis-Pt(II) diammine (cis-DP) to double-stranded DNA was studied with several kinked conformations that can accommodate the formation of a square planar complex. Molecular mechanics (MM) calculations were performed to optimize the molecular fit. These results were combined with quantum mechanical (QM) calculations to ascertain the relative energetics of ligand binding through water vs direct binding of the phosphate to the ammine and platinum, and to guide the selection of DNA conformations to model complex formation. Based on QM and MM calculations, models are proposed that may be characterized by several general features. A structure involving hydrogen bonding between each ammine and distinct adjacent phosphate groups, referred to as closed conformation (CC), has already been reported. This is also found in the crystal structure of small dimers. Alternative conformations that may be important in platination of duplex DNA are reported. They are characterized by an intermediate conformation (IC), involving hydrogen bonding between one ammine and phosphate group, and an open conformation (OC), without ammine phosphate hydrogen bonding.

Assessment of Loosely-Bound and Firmly-Bound Fluoride Uptake by Tooth Enamel from Topically Applied Fluoride Treatments.
 Final rept.
 B. Sieck, S. Takagi, and L. C. Chow. 1990, 5p
 Sponsored by American Dental Association Health Foundation, Chicago, IL.
 Pub. in *Jnl. of Dental Research* 69, n6 p1261-1265 Jun 90.

Keywords: *Calcium fluorides, Compositions, Biopsy, Reprints, *Dental enamel, *Pharmacokinetics, Hydroxapatites.

The amounts of loosely-bound fluoride (F) deposited on human enamel by two topical F treatments were measured with use of a constant-composition F washing method. Enamel biopsies conducted before treatment and after the washing were used for determination of the firmly-bound F uptake. The results showed that (1) the washing system did not remove F from untreated enamel surface, (2) a four-minute application of an acidulated phosphate fluoride (APF) gel deposited 27.2 (2.4) (mean, S.E.) micro g of loosely-bound F per sq cm of enamel surface and 186 (111) ppm of firmly-bound F in the outer 10 micro m of enamel, and (3) a four-minute application of a pH-2.1 dicalcium phosphate dihydrate (DCPD)-forming solution followed by APF produced 44.9 (3.1) micro g/sq cm of loosely-bound F and 1280 (354) ppm of firmly-bound F in the outer 10 micro m of enamel.

Motion, Depth, and Image Flow.
 Final rept.
 J. S. Albus, and T. H. Hong. 1990, 10p
 Pub. in Proceedings of IEEE (Institute of Electrical and
 Electronics Engineers) International Conference on
 Robotics and Automation, Cincinnati, OH., May 13-18,
 1990, p1161-1170.

Keywords: *Visual perception, *Motion, *Space percep-
 tion, *Images, Reprints, *Eye movements.

Motion relative to a surface is perhaps the most funda-
 mental of visual perceptions. Image flow can be
 caused either by motion of objects in the world, or by
 motion of the eye through the world. If knowledge
 exists of eye motion, dense range maps can be com-
 puted locally for all stationary object pixels. Range
 from image flow can be computed either by gradient
 methods or by correlation methods. The former are
 simple but subject to quantization noise. The latter are
 complex but much more accurate. If eye rotation is
 known, image flow due to eye translation can be sepa-
 rated from flow due to rotation, and moving objects
 can be segmented from a stationary background.

**Quantitative Measurement of Radiation-Induced
 Base Products in DNA Using Gas Chromatogra-
 phy-Mass Spectrometry.**
 A. F. Fuciarelli, B. J. Wegher, E. Gajewski, M.
 Dizdaroglu, and W. F. Blakely. 1989, 14p Rept no.
 AFRR1-SR89-30
 Pub. in Radiation Research, v119 n219-231 1989.

Keywords: Accuracy, Calibration, *Deoxyribonucleic
 acids, Exposure(Physiology), Intensity, Internal, Ioniz-
 ing radiation, Ions, Measurement, Modification, Pur-
 ines, Pyrimidines, Quantitative analysis, *Radiation ef-
 fects, Reprints, Standards, Chemical bonds, Methyl
 radicals, Silicon, Amines, Hydroxyl radicals, Hydroxyur-
 acil, Thymine, Glycol, Dihydrothymines, Azathymines,
 Diaminofornamidopyrimidines, Hydroxyguanines,
 Azaacenes, *Gas chromatography, Mass spectrom-
 etry, *DNA damage.

Gas chromatography-mass spectrometry with select-
 ed-ion monitoring was used to study radiation-induced
 damage to DNA. Quantitative analysis of modified
 purine and pyrimidine bases resulting from exposure to
 ionizing radiation using this technique is dependent
 upon the selection of appropriate internal standards
 and calibration of the mass spectrometer for its re-
 sponse to known quantities of the internal standards
 and the products of interest. The compounds 6-azath-
 ymine and 8-azaadenine were found to be suitable in-
 ternal standards for quantitative measurements of
 base damage in DNA. For the purpose of calibration of
 the mass spectrometer, relative molar response fac-
 tors for intense characteristics ions were determined
 for the trimethylsilyl derivatives of 5-hydroxyuracil,
 thymine glycol, and 5,6 dihydrothymine using 6-azath-
 ymine, and for the trimethylsilyl derivatives of 4,6-dia-
 mino-5-formamidopyrimidine, 8-hydroxyguanine using
 8-azaadenine. Accurate measurements of the yield of
 radiation-induced modifications to the DNA bases is
 also dependent upon two chemical steps in which the
 purines and pyrimidines are released from the sugar-
 phosphate backbone and the derivatized to make
 them volatile for gas chromatography. The complete-
 ness of these reactions, in addition to assessing the
 stability of the modified DNA bases in acid and their
 trimethylsilylated derivatives over the time necessary
 to complete the experimental analysis, was also exam-
 ined.

Radiochromic Solutions for Reference Dosimetry.
 Final rept.
 M. Farahani, J. H. Liang, and W. L. McLaughlin.
 1990, 7p
 Pub. in Applied Radiation and Isotopes 41, n1 p5-11
 1990.

Keywords: *Dosimetry, *Radiobiology, *Radioche-
 mistry, *Methyl sulfoxide, Irradiation, Dose rate, Re-
 prints, *Hexa(hydroxyethyl)pararosaniline nitrile, *Tri-
 ethyl phosphate, Dose-response relationships, Radi-
 ation absorption analysis.

A chemical radiochromic dosimeter using hexa(hydroxyethyl)pararosaniline nitrile(HHEV-CN)
 dissolved in an aerated mixture of triethyl phosphate
 and dimethyl sulfoxide can be used over a wide ab-
 sorbed dose range as a stable reference dosimeter,
 with useful characteristics, both for steady-state and
 pulsed radiation fields. Solutions of the leuco dye at 2-
 mM concentration, containing small amounts of acetic
 acid, p-nitrobenzoic acid and polyvinylbutyral, show
 high precision and a linear response for absorbed
 doses up to 4 kGy. When the leuco dye concentration
 is increased to 100 mM, the response is also linear,
 and absorbed doses as low as 0.5 Gy can be read with
 a precision of 1.3% (95% confidence limits). The radi-
 ation chemical yield is constant with changes in ab-
 sorbed dose rate, but it increases with concentration of
 the leuco dye up to 10(sup-1) molarity. The radiation
 chemical yields for dye formation are: for 2-mM solu-
 tion, G(dye) = 0.015 micro mol/J; for 100-mM solu-
 tion, G(dye) = 0.28 micro mol/J. The uncertainties for
 these measured values are plus or minus 2.6% (95%
 confidence limits). The molar linear absorption coef-
 ficient at 605-608 nm wavelength is 1.0 x 10(sup-5)L/
 mol/cm, the uncertainty (95% confidence limits) being
 plus or minus 2.2%. This dosimeter solution may be
 used in small sealed glass ampoules or plastic vials
 and is useful for measuring x- and y-ray doses of inter-
 est in food irradiation and in clinical radiology.

**Post-Irradiation Dosimetry of Meat by Electron
 Spin Resonance Spectroscopy of Bones.**
 Final rept.
 M. F. Desrosiers, and M. G. Simic. 1988, 3p
 Pub. in Jnl. of Agricultural and Food Chemistry 36, n3
 p601-603 1988.

Keywords: *Gamma irradiation, *Dosimetry, *Bones,
 Exposure, Chickens, Meat, Reprints, Electron spin res-
 onance, Dose-response relationships.

Electron Spin Resonance (ESR) spectroscopy was
 used to measure the production of free radicals in
 chicken bones induced by (60)Co gamma-rays. It was
 found that the radiation-induced ESR signal in bone
 could easily be distinguished from the endogenous
 ESR signal. Long term (4 months) stability studies at
 20 C showed no decay of the radiation-induced ESR
 signal. A linear relationship was observed between the
 radiation-induced ESR signal intensity and the ab-
 sorbed dose (1-5 kGy). It was concluded that ESR
 measurements of bones can be used to determine
 whether the bone-containing meat has been irradiated
 and also at what dose. The measurements clearly indi-
 cate feasibility of post-irradiation dosimetry of meats.

**Effects of Track Structure on Neutron Microdosi-
 metry and Nanodosimetry.**
 Final rept.
 R. S. Caswell, and J. J. Coyne. 1989, 9p
 Sponsored by Department of Energy, Washington, DC.
 Office of Health and Environmental Research.
 Pub. in Nucl. Tracks Radiat. Meas. 16, n2-3 p187-195
 1989.

Keywords: Tissues(Biology), Energy transfer, Particle
 tracks, Reprints, *Neutron dosimetry.

The process by which neutrons transfer their energy to
 tissue is described, including the deposition of energy
 by secondary charged particle tracks in small sites;
 that is, microdosimetry and nanodosimetry. Three ap-
 proximations are considered in order of increasing
 amounts of information on track structure: the contin-
 uous slowing-down approximation, the straggling ap-
 proximation, and the delta-ray approximation. Al-
 though simple approximations sometimes work quite
 well, much work remains to be done for very small
 sites, and for the inclusion of the effects of 'passers'
 in the calculations.

**Difficulties Encountered with Some Intermediate-
 Atomic Number Radiation Protection Dosimeters
 Irradiated on-Phantom in Low-Energy Photon
 Beams.**
 Final rept.
 C. G. Soares, E. L. Bright, and M. Ehrlich. 1988, 14p
 Pub. in Health Physics 54, n4 p431-444 Apr 88.

Keywords: *Photons, Lead(Metal), Cesium 137, Phan-
 tom, Reprints, *Personnel dosimetry, *Thermolu-
 minescent dosimetry.

During a measurement-assurance study done with a
 particular type of personnel dosimeter, unexpectedly
 poor results were obtained for a reliable participant
 who irradiated several of the dosimeters simultane-
 ously on-phantom in a low-energy bremsstrahlung beam.
 The dosimeters incorporated low- and higher-Z ele-
 ments, with the higher-Z elements under lead filters.
 Five different types of dosimeters were studied in
 greater detail by irradiating them on- and off-phantom,
 with their geometric centers displaced up to 10 cm
 along the vertical and horizontal axes through the
 center of the beam cross section. Two low-energy
 bremsstrahlung beams and a cesium-137 gamma-ray
 beam were used. Variation of response to low-energy
 photons with on-phantom location was observed to
 some degree in all higher-Z dosimeter elements cov-
 ered high-Z filters, and possibly in low-Z elements in
 a holder containing a high-Z filter. The reason for the ob-
 served dependence of response upon on-phantom lo-
 cation seems to be insufficient side shielding against
 phantom and filter albedo, as proved for one of the
 dosimeters. Lack of side shielding also makes these
 dosimeters unsuited for meaningful measurements of
 the effective dose equivalent.

Measurement of Absorbed Doses Near Metal and Dental Material Interfaces Irradiated by X- and Gamma-Ray Therapy Beams.

Final rept.
M. Farahani, F. C. Eichmiller, and W. L. McLaughlin. 1990, 17p
Sponsored by American Dental Association Health Foundation, Chicago, IL.
Pub. in Phys. Med. Biol. 35, n3 p369-385 1990.

Keywords: *Dental materials, *Radiation dosage, Alloys, Electrons, Polymers, Reprints, *Radiation scattering, Connective tissue.

Soft-tissue damage adjacent to dental restorations is a deleterious side effect of radiation therapy which is associated with low-energy electron scatter from dental materials of high electron density. The study was designed to investigate the enhancement of dose to soft tissue (or water) close to high electron-density materials and to measure the detailed lateral and depth-dose profiles in soft-tissue-simulating polymer adjacent to planar interfaces of several higher atomic-number materials. Interleaved stacks of calibrated thin radiochromic dosimeter films and tissue-simulating polymer were used for these measurements. Assemblies of these polymer-dosimeter stacks on both sides of the dental materials were irradiated in one fixed direction by collimated (60)Co gamma-ray or 10 MV x-ray beams directed perpendicularly to the material interfaces. In another test, designed to simulate more closely therapeutic treatment conditions, a phantom constructed on both sides of a row of restored and non-restored whole teeth was irradiated in one fixed direction by the collimated photon beams. Results indicate that the dose-enhancement in 'tissue' is as great as a factor of 2 on the backscatter side adjacent to gold and a factor of 1.2 adjacent to tooth tissue, but is insignificant on the forward-scatter side because of the predominant effect of attenuation by the high-density, high atomic-number absorbing material.

The Interagency Committee on Occupational Radiation Protection Measurements is a group of government agency representatives who have a common concern about the quality of measurements of ionizing radiation. Operational problems such as those discussed in the previous two sessions of the Workshop are of interest to the Committee because they may result in measurements with inadequate quality. The Committee is interested in finding solutions for such operational problems and in the development of national programs that will assure adequate measurement quality. It was the existence of problems in a particular area of measurement, and the need for acceptable solutions that resulted in creation of the Committee.

Secondary Standards Laboratories: An Overview.
Final rept.
E. H. Eisenhower. 1985, 10p
Pub. in Proceedings of Workshop on Radiation Survey Instruments and Calibrations, Gaithersburg, MD., July 10-12, 1984, pD.1-D.10 1985.

Keywords: *Radiological laboratories, *Dosimetry, Radiation measuring instruments, Quality assurance, Ionizing radiation, Reprints, *SSDL, Calibration, Accreditation.

The paper is an overview of secondary standards dosimetry laboratories (SSDL) for measurement of ionizing radiation. It outlines the requirements for achievement of status as a secondary laboratory, and the possible function of such laboratories. The particular function of providing calibrations of radiation-measuring instruments is considered in detail, including the description of a measurement quality assurance program. The accreditation of secondary laboratories, and the role of a representative accrediting organization, is discussed. Two examples of accreditation programs are given. The present status of secondary laboratories is described for the state, federal, and private sectors.

Reference Dosimetry and Measurement Quality Assurance.
Final rept.
W. L. McLaughlin. 1989, 7p
Pub. in Applied Radiation and Isotopes 40, n10-12 p945-951 1989.

Keywords: *Dosimetry, *Radiation measuring instruments, Quality assurance, Primary standards, Alanines, Electron beams, Gamma ray spectroscopy, Iron sulfate, Chromates, Spectrophotometry, Reprints, Calibration standards.

Measurements of absorbed dose made by a reference dosimetry system, such as alanine, have been suggested for achieving quality assurance through traceability to primary standards. Such traceability can assist users of radiation worldwide in enhancing quality control in medicine, agriculture, and industry. International and national standards of absorbed dose are still needed for applications of gamma-ray and electron dosimetry at high doses (e.g. radiation therapy, food irradiation and industrial radiation processing). Reference systems, such as ferrous sulfate dosimeters measured by spectrophotometry and alanine measured by electron spin resonance spectrometry, are already well established. Another useful reference system for high doses is supplied as dichromate solutions measured by spectrophotometry. Reference dosimetry, particularly for electron beams, can be accomplished with thin alanine or radiochromic dye film dosimeters.

Effect of Copper Additives on Atmospheric Hydrogen Cyanide and Acute Inhalation Toxicity from the Combustion Products of Flexible Polyurethane.

Final rept.
B. C. Levin, M. Paabo, R. H. Harris, H. M. Clark, M. F. Yoklavich, N. Eller, and L. Highbarger. 1989, 6p
Pub. in Proceedings of Fire Retardant Chemicals Association Meeting, Scottsdale, AZ., October 15-18, 1989, p107-112.

Keywords: *Toxicity, *Copper, *Additives, *Combustion products, *Polyurethane, *Hydrogen cyanide, Respiration, Rats, Reprints.

A flexible polyurethane foam (FPU) was treated in the laboratory with water (control-FPU), water-dispersions of copper dust or cupric oxide, or a solution of copper sulfate to determine if the addition of copper or copper compounds following the formulation of the foam would reduce both the atmospheric concentrations of HCN which evolves during combustion of FPU and the acute inhalation toxicity produced from exposure to this smoke. When thermally decomposed in the NBS Toxicity Test Method apparatus via a two phase procedure previously shown to produce high concentrations of HCN, control-FPU produced maximum HCN concentrations seven to nine times higher than foams post-treated with copper or copper compounds. The control-FPU LC50 for acute 30 min exposures of Fischer 344 male rats was approximately half that of the cupric oxide-treated foam (the most efficient of the post-treatment additives tested).

Toxicological Effects of Different Time Exposures to the Fire Gases: Carbon Monoxide or Hydrogen Cyanide or to Carbon Monoxide Combined with Hydrogen Cyanide or Carbon Dioxide.

Final rept.
B. C. Levin, J. L. Gurman, M. Paabo, L. Baier, and T. Holt. 1987, 18p
Sponsored by Society of the Plastics Industry, Inc., New York, and International Isocyanate Inst.
Pub. in Proceedings of Joint Panel Meeting of the UJNR Panel on Fire Research and Safety (9th), Norwood, MA., May 4-8, 1987, p368-385.

Keywords: *Toxicology, *Carbon monoxide, *Hydrogen cyanide, *Combustion products, *Fires, Rats, Exposure, Reprints, Time factors.

The toxicity of single and multiple fire gases is being studied to determine whether the toxic effects of a material's combustion products can be explained by the toxicological interactions (as indicated by lethality) of the primary fire gases or if minor, more obscure gases need to be considered. LC50 values for Fischer 344 rats have been calculated for carbon monoxide (CO) and hydrogen cyanide (HCN) (as individual gases in air) for 1, 2, 5, 10, 20, 30, and 60 minute exposures plus relevant post-exposure periods using the NBS Toxicity Test Method apparatus. The concentration-time products for the various HCN exposures plus 24 hour post-exposure times are constant, but the concentration-time products for CO decreased for the 1, 2, and 5 minute exposures and then increased for the longer times. In exposures ranging from 5 to 60 minutes, the toxic effects of CO plus HCN were additive and, except for the 5 minute exposures, the presence of 5% carbon dioxide (CO2) decreased the LC50 values of CO. These results will be used in the computer model currently under development in the Center for Fire Research to predict the hazard that people will experience under various fire scenarios.

Toxicological Interactions between Carbon Monoxide and Carbon Dioxide.

Final rept.
B. C. Levin, M. Paabo, J. L. Gurman, S. E. Harris, and E. Braun. 1987, 30p
See also PB88-138888.
Pub. in Toxicology 47, p135-164 1987.

Keywords: *Toxicology, *Carbon dioxide, *Carbon monoxide, Rats, Combustion, Reprints, *Fire gases, Carboxyhemoglobin, Drug interactions, Dose-response relationships.

Fischer 344 male rats were subjected to 30-min individual or combined exposures of carbon monoxide

(CO) and carbon dioxide (CO2). All deaths from CO occurred during the exposures, and the LC50 values were 4600 and 5000 ppm, depending on experimental conditions. Animals exposed to CO2 concentrations ranging from 1.3 to 14.7% for 30 min were neither incapacitated nor fatally injured. The addition of non-lethal concentrations of CO2 (1.7 to 17.3%) to sublethal concentrations of CO (2500 to 4000 ppm) caused deaths of the exposed rats both during and following (up to 24 h) the 30-min exposures. The most toxic combination of these two gases (2500 ppm CO plus 5% CO2) increased the rate of carboxyhemoglobin (COHb) formation 1.5 times that found in rats exposed to 2500 ppm of CO alone. The COHb equilibrium levels were the same. Exposure to both CO and CO2 produced a greater degree of acidosis and a longer recovery time than that observed with either single gas. The results fit a mathematical model indicating a synergistic interaction. Combustion of 11 materials at their LC50 values indicated that CO was probably the primary toxicant in one case and that the combined CO plus CO2 was the cause of the deaths in three other cases.

Pub. in Appl. Organomet. Chem. 2, n2 p171-175 1988.

Keywords: *Toxicity, Fibroblasts, Reprints, *Organotin compounds, Ankirodesmus falcatus, Cultured cells, Neuroblastoma, Daphnia magna, Rhithropanopeus harrisi.

There exists a high correlation between total surface area values and diorganotin toxicity towards several distinct types of organisms. This correlation was found for N2a neuroblastoma cells, 3T3 fibroblasts, Daphnia magna, Rhithropanopeus harrisi, and Ankirodesmus falcatus. In the case of Rhithropanopeus harrisi, a high correlation was also found between TSA and toxicity for triorganotins as well. The study suggests that the relationship between TSA toxicity is a function of the hydrophobicity of the organotin compounds rather electronic or steric effects.

Dietary Intake Studies of Nutrients and Selected Toxic Elements in Human Subjects: Analytical Approaches.

Final rept.
G. V. Iyengar. 1987, 13p
Sponsored by Department of Agriculture, Beltsville, MD.
Pub. in Clinical Nutrition 6, n3 p105-117 May/June 87.

Keywords: *Diets, *Trace elements, *Nutrients, *Food analysis, Humans, Chemical analysis, Public health, Food contamination, Reprints, *Toxic substances, Heavy metals.

Biological trace element research is a multidisciplinary science that requires a combination of biological insight and analytical awareness in planning the studies. Several elements such as cadmium (Cd), chromium

(Cr), mercury (Hg), and lead (Pb) occur in biological and food samples at low concentrations, and, therefore, stringent precautions are necessary to overcome problems of contamination and inaccurate determinations. Every laboratory that attempts to engage in trace level elemental analysis of biomaterials must, as a rule, validate the analytical procedures by analyzing the available biological and dietary reference materials before generating new data. Unless these guidelines are incorporated into the investigations on a routine basis, very little progress can be expected in taking the benefits of biological trace element research studies to solve public health problems.

Metrology for Space Power: Metrology Development and Survey of Space-Based Measurements.

Interim rept.
G. J. FitzPatrick, J. K. Olthoff, E. D. Simmon, and C. P. Fenimore. Sep 90, 76p NISTIR-442
Sponsored by Defense Nuclear Agency, Washington, DC.

Keywords: *Antimissile defense, *Metrology, Aerospace engineering, Fiber optics, Electrooptics, Magneto-optics, Electric current meters, Reliability, Measurement, *Ballistic missile defense, Space based, Sensors.

The report documents the technical progress in the three investigations which make up the project 'SDI Measurement Techniques' funded by the Strategic Defense Initiative Office. The first investigation develops part of the mathematical background needed for assessing the reliability and efficiency of the diagnostics used in the development of pulsed power components and systems. The signature of measurement failure is demonstrated in an electro-optic system. The detection of such failures is the first stage in remotely restoring the integrity of a measurement system. The second investigation assesses the applicability of magneto-optic sensors for measuring microsecond and submicrosecond current pulses. The results of comparative measurements of fiber optic current sensors with conventional detectors is reported here. The third investigation involves the accumulation of existing information necessary to support an effective measurement development program. The results of an in-depth study of existing space-based measurement techniques are reported.

MILITARY SCIENCES

Logistics, Military Facilities, & Supplies

*Weapon systems, CALS(Computer Aided Acquisition and Logistics Support).

The CALS Phase I.2 Conference was held in conjunction with the National Computer Graphics Association's NCGA Integrate '89 in Philadelphia, Pennsylvania, on 20 April 1989; at the Federal Computer Conference and Defense & Government Computer Graphics Conference FCC/DGC West in Anaheim, California, on 27 April 1989; and at the National Institute of Standards and Technology (NIST) on 2 May 1989. Computer-aided Acquisition and Logistic Support (CALS) is a DOD and Industry initiative. CALS addresses the integration and use of automated digital technical information for weapon system design, manufacture, and support. CALS focusses on the generation, access, maintenance, and distribution of the technical data associated with weapon systems. This includes engineering drawings, product definition and logistic support analysis data, technical manuals, training materials, technical plans and reports, and operational feedback data. The CALS program will facilitate data exchange and access, and reduce the duplication of the data preparation effort. CALS provides both the initiative and the framework to integrate the existing islands of automation within DoD and Industry. (KR)

Facilities for Improving Evaluations of Electromagnetic Susceptibilities of Weapon Systems and Electronic Equipment.
M. T. Ma, and M. L. Crawford. Nov 89, 21p NISTIR-89/3928
Sponsored by Naval Sea Systems Command, Washington, DC.

Keywords: *Electromagnetic compatibility, *Magnetic permeability, *Weapon systems, *Electric equipment, *Test facilities, Frequency allocations, Spectrum signatures, Spurious radiation, Magnetic induction, Laboratories, Performance evaluation, Anechoic chambers.

A preliminary design of an improved testing facility for evaluating the electromagnetic susceptibility of weapon systems and electronic equipment is presented. The facility features a combination of the transverse electromagnetic (TEM) cell for low-frequency testing and the reverberating chamber for high-frequency operation. As a system, a coverage of the wide spectrum from 10 kHz to 18 GHz or even to 40 GHz is possible. The TEM/reverberating combination is designed for an input impedance of 50, 75, or 100 ohms to generate a cw electric field up to 200 V/m, or a pulsed electric field up to 50 kV/m with an approximate rise time of 10 ns. The average field for the reverberating mode of operation is described in a statistical sense. Theoretical characteristics for a case study, to meet a given set of requirements, are given.

Characterization of Eddy Current Probes: Results of an Interlaboratory Intercomparison.
Final rept.
T. E. Capobianco, and L. L. Dulcie. 1988, 6p
Sponsored by Army Materials Technology Lab., Watertown, MA.
Pub. in Proceedings of Defense Conference on Non-destructive Testing (37th), Jacksonville, FL., November 1-3, 1988, p211-216.

Keywords: *Nondestructive tests, *Electric measuring instruments, *Eddy current tests, *Standards, Electrical measurement, Electromagnetic testing, *Department of Defense.

NIST recently conducted a round robin involving potential users of a proposed new military standard. The draft standard attempts to establish a test method for characterizing eddy current probe performance. The three objectives of the study were: to assess the ability of potential standard users to implement the specified test; to introduce potential users to the technique; and to expose any shortcomings in the test method documentation. The round robin involved eleven participants representing a spectrum covering military labs to repair depots. Preliminary results from the study were incorporated in the second draft of the standard as a result of meeting the second and third objectives. The paper will concentrate on the fact that the round robin

results show that a significant problem exists with the test method implementation.

Sponsored by Civil Engineering Lab. (Navy), Port Hueneme, CA.
Pub. in Proceedings of International Symposium on Recent Advances in Control and Operation of Building HVAC Systems, Trondheim, Norway, May 22-23, 1985, p39-52.

Keywords: *Military facilities, *Algorithms, *Buildings, Air conditioning, Heating, Control equipment, Computerized simulation, Simulation, Reprints, *Energy management systems, *HVAC systems, Energy consumption.

Repeatable testing of EMCS algorithms is possible using a building emulator. An emulator is a computer with analog and digital input/output capabilities which connects to the EMCS sensors and command points and produces the same signals on the EMCS inputs that an actual building and its equipment would produce in response to commands. A building emulator for EMCS algorithm testing using a building simulation computer program is being built by the United States Navy based on experience with prototypes. A test procedure to use the building emulator is also being developed.

Graphics Standards in the Computer-Aided Acquisition and Logistic Support (CALS) Program, Fiscal Year 1989. Volume 2. MIL-D-28003 Revisions, CGM Registration.
Progress rept. Oct 88-Sep 89.
D. R. Benigni. May 90, 333p NISTIR-4330
Sponsored by Office of the Secretary of Defense, Washington, DC.

Keywords: *Logistic support, *Computer graphics, *Standards, Acquisition, Requirements, Computer applications, Federal information processing standards.

The overall objective of the Department of Defense Computer-aided Acquisition and Logistic Support (CALS) Program is to integrate the design, manufacturing, and logistic functions through the efficient application of computer technology. NIST has been funded since Spring 1986 to recommend a suite of industry standards for system integration and digital data transfer, and to accelerate their implementation. The collection of reports represents the continuing efforts of the Graphics Software Group of NIST/NCSL in FY89 in support of computer graphics standards for CALS, and in particular Computer Graphics Metafile (CGM). It provides a progress report on continuing graphics standards efforts related to the CGM standard, including the Extended CGM (CGEM), Graphics Registration, and the CGM Application Profile for CALS (or MIL-D-28003). In addition, the creation of a Test Requirements Document for MIL-D-28003 is detailed. The Test Requirements Document will provide the basis for developing conformance tests to determine compliance with MIL-D-28003.

System Requirements Analysis for the U.S. Army Rock Island Arsenal Tool Management System.
Final rept.
S. P. Frechette, and C. R. McLean. Aug 90, 125p
NISTIR-4369
Sponsored by Rock Island Arsenal, IL.

Keywords: *Tools, *Tooling, *Maintenance management, *Military facilities, Service life, Industrial management, Production management, Industrial plants, Automatic control, Machining, *Computer-aided manufacturing, *Tool management, *Rock Island Arsenal, Data bases.

The U.S. Army is conducting an extensive manufacturing modernization program at the Rock Island Arsenal

(RIA) in Illinois. Tool management, as it applies to these automated systems, is one area that RIA has identified for additional modernization activities. Engineers at the Rock Island Arsenal and the National Institute of Standards and Technology (NIST) recognize that a consistent and integrated implementation of tool management is critical to the Army's manufacturing program. The purpose of the document is to outline requirements for implementing an automated tool management system at Rock Island. Tool management is not a single, simple activity--it is comprised of a complex and pervasive set of functions. No commercial systems are known to exist which perform all of the functions outlined in the document. The study documents joint efforts by NIST and RIA staff to develop an open architecture for tool management at the Rock Island manufacturing facility.

Fire Induced Flow Field - Theory and Experiment.
Final rept.
H. R. Baum, and B. J. McCaffrey. 1989, 20p
Sponsored by Defense Nuclear Agency, Washington, DC.
Pub. in Proceedings of International Symposium on Fire Safety Science (2nd), Tokyo, Japan, June 13-17, 1988, p129-148 1989.

Keywords: *Fires, *Flow distribution, *Nuclear explosion effects, Nuclear fireball, Fire tests, Fluid flow, Velocity, Temperature, Reprints, Nuclear Winter.

The complete flow pattern induced by unconfined fires is studied theoretically and experimentally. The theoretical development is based on kinematic relationships between the velocity, vorticity, and heat release fields. The flow both inside and outside a single fire plume is related to plume centerline velocity and temperature measurements. Very large area fires, such as those hypothesized in the Nuclear Winter scenario, are represented as ensembles of individual fires of differing strengths distributed over randomly chosen sites within the burning area. The experimental data for fire plumes over a four order of magnitude size range is compared with these calculations and previously developed plume velocity and temperature correlations.

Pub. in Microbeam Analysis, p105-108 1988.

Keywords: *Mapping, *Television cameras, *Ion microscopes, Quantitative analysis, Optical scanners, Optical equipment, Photographic equipment, Field emission microscopes, Spectrometers, Reprints.

Quantitative imaging by secondary ion microscopy can be carried out with digital recording and processing of the ion images through a TV camera which views the channel plate/phosphor screen detector. The signal response of such a system, as calibrated by a pulse counting multiplier detector, is found to be a strong function of applied channel plate voltage and of the elemental ion species. A procedure is described for conversion of the gray level of the ion image into

equivalent multiplier count rate, followed by sensitivity factor correction to yield quantitative results.

Pub. in Jnl. of Geophysical Research 94, nB1 p587-
601, 10 Jan 89.

Keywords: *Yellowstone National Park, *Boreholes,
*Site surveys, Wyoming, Mathematical models, Com-
parison, Revisions, Oceans, Reprints, *Tiltmeters,
*Earth tides, Attitude(Inclination), Finite element
method.

The authors had installed borehole tiltmeters at five sites in Yellowstone National Park, Wyoming, and have used these instruments to measure the spatial variation of the amplitude and phase of the principal semidiurnal tide. The measured tides vary both with position and azimuth and differ from the sum of the body tide and the ocean load by up to 50%. The difference predicted by a finite element model constructed from seismic, refraction, and gravity data has a maximum value of only 12%, although the discrepancy between observations and the model is only marginally significant at some sites. The disagreement between the model and their observations is much larger than they observed using the same instruments at other sites and cannot be attributed to an instrumental effect. They had been unable to modify the model to explain their results while keeping it consistent with the previous observations.

Pyroxene-Melt Equilibria: An Updated Model.
Final rept.
R. L. Nielsen, P. M. Davidson, and T. L. Grove. 1988,
13p
Pub. in Contributions to Mineralogy and Petrology 100,
n3 p361-373 1988.

Keywords: *Mineralogy, *Lavas, *Basalt, *Melts,
*Chemical equilibrium, *Mathematical models, Phase
diagrams, Igneous petrology, Thermodynamics, Crystalline rocks, Regression analysis, Solid solutions, Reprints, *Pyroxenes.

An updated model for pyroxene-melt equilibria at 1 atm. has been developed and calibrated in order to refine calculations of liquid lines of descent, which simulate the effects of igneous differentiation processes. The Davidson and Lindsley (1985) model for activities of components in clino-pyroxene and orthopyroxene solid solutions were combined with the Nielsen and Drake (1979) expressions for component activities in the melt. Pyroxene compositions were projected to quadrilateral compositions with the method of Lindsley and Anderson (1983). The regression constants A(i), B(i), and C(i) were calculated from experimental data that consists of 82 pyroxene-melt pairs, including 33 orthopyroxene-melt pairs. The experiments were all performed at 1 atm. and represent natural compositions ranging from basalts (lunar and terrestrial) to dacites (46-66 wt.% SiO₂). The model is calibrated for 1000 < T(C) < 1300 and proxene 'others' (Ti, Mn, Al, Cr, Na) less than 10 mole %. Using the input data as unknowns, the model expressions reproduce the experimental results to within 10-15 C.

tion, *Surface energy, *Moisture, Brittleness, Inter-
faces, Loads(Forces), Hysteresis, Thermodynamic
equilibrium, Energy levels, Adhesion, Weathering, Re-
prints, Fracture mechanics, Crack closure.

Results of crack growth observations on mica in water-containing environments are described. The study focuses on equilibrium crack states for reversed loading cycles, i.e., for initial propagation through virgin solid and subsequent retraction-repropagation through healed or misoriented-healed interfaces. Departures from the equilibrium states are manifest as steady-state forward or backward crack velocities at specific applied loads. Hysteresis is observed in the forward-backward-forward crack propagation cycle, signifying a reduction in the adhesion energy on exposure of the open interface to environmental species prior to healing. The hysteresis is especially marked for those interfaces that are misoriented before healing, indicating that the structure of the underlying solid substrate as well as of the intervening fluid is an important consideration in the interface energetics. The equilibrium states for different environments can be represented on a simple energy-level diagram, as differences between thermodynamic end-point states. The significance of the diagram in relation to the fundamental atomic structure of interfaces in fracture and other adhesion geometries, including implications concerning kinetics, is discussed.

Pub. in American Mineralogist 73, n7-8 p916-918
1988.

Keywords: *Order disorder transformation, Crystal
structure, Entropy, Clustering, Phase transformations,
Point defects, Hypotheses, Reprints, *Pyroxenes,
*Omphacite.

The GPA (generalized pair approxn. of R.E. Cohen, 1986) fails because its configurational entropy expression is inconsistent with the C2/c and P2/n pyroxene structures, not because additional contributions to the internal energy are required. The generalized point approximation (GPA of P.M. Davidson and B.P. Burton, 1987) succeeds because its configurational entropy expression is consistent with C2/c and P2/n pyroxene structures. An adequate treatment of the short-range order in omphacite pyroxene requires an approximation that is based on clusters larger than pairs.

Developments in Atomic-Absorption, X-ray Fluorescence, and Plasma-Emission Spectrometry for the Analysis of Metals and Ores.
Final rept.
R. L. Watters. 1984, 4p
Pub. in Proceedings of MINTEK 50 International Conference on Mineral Science and Technology, Sandton, South Africa, March 26-30, 1984, v1 p87-90.

Keywords: *X-ray fluorescence, *Spectrometers,
*Emission spectroscopy, *Plasma radiation, *Chemical analysis, *Metals, *Metaliferous minerals, Precision, Accuracy, Reprints, *Absorption spectroscopy.

The routine analysis of metals and ores has traditionally involved either wet-chemical or instrumental spectrometric techniques. Instrumental analysis using the techniques of atomic-absorption spectrometry with electrothermal atomization, X-ray fluorescence, and inductively coupled plasma emission, have replaced the more classical approaches in many laboratories. Recent advances in the techniques have improved the precision and accuracy of the analysis of complex materials, but the attainment of the best accuracy can depend upon the chemical separation of the analyte from the matrix. The paper will discuss some of the developments in each of the fields that have led to improvements in the precision and accuracy of methods for the analysis of metals and ores. Instances where the combination of chemical separation and instrumental analysis might be advantageous will be suggested.

Application of Measurement Error Propagation Theory to Two Measurement Systems Used to Calculate the Position and Heading of a Vehicle on a Flat Surface.

J. A. Horst. Oct 90, 47p NISTIR-4434
Sponsored by Bureau of Mines, Pittsburgh, PA.

Keywords: *Surface navigation, *Position finding, *Coal mining, Dimensional measurement, *Robotics, Angle measurement, Length measurement.

The work applies known results on the propagation of measurement error statistics to two types of measurement systems, an angle measuring system and a length measuring system. Such systems can be used to measure the position and heading of a vehicle (or any rigid object) on a flat surface. For example, one might need to sense position and heading of a vehicle in order to control its motion. The functional relationships to go from angle and length measurements to position and heading are discussed and derived. Measurement error propagation theory is given in a way that can apply to any measurement system. The theory thus described is applied to the two types of measurement systems. Specific examples of these systems are given. The stated examples are currently being used by the US Bureau of Mines (BOM) to measure the position and heading of certain underground coal mining machines in an effort to move equipment operators away from the more dangerous areas of the mine. Simulation results for these specific examples in the form of density maps are given which plot the error in position and heading for various positions (heading constant) of the vehicle.

Estimation of the Rate of Heat Release and Induced Wind Field in a Large Scale Fire.
T. J. Ohlemiller, and D. M. Corley. Oct 90, 58p NISTIR-4430
Sponsored by Defense Nuclear Agency, Washington, DC.

Keywords: *Forest fires, *Fire tests, *Burning rate, *Heat flux, Heat transmission, Estimating, Mathematical models, Combustion, Fire safety, Heat transfer, Convection.

Logging slash on a 486 hectare site in Ontario was burned as part of a Forestry Canada forest management program. A 100 hectare portion of this site was instrumented by several groups interested in large scale fires. The NIST Center for Fire Research utilized Forestry Canada data on mass loading before and after the fire, total burning area as a function of time and burning duration to estimate the spatial and temporal pattern of heat release during the burning of the instrumented section of the fire. Complete information necessary for making this estimate is lacking; the necessary assumptions and their accuracy (when known) are discussed. Heat release rate is reported for three different assumptions regarding the temporal behavior of flaming and smoldering phases of the combustion. This information is utilized in the context of a flow model due to Baum and McCaffrey to calculate the

near-ground flow field induced by this heat release pattern and the results are compared to the point measurements made in the field.

Positioning of GPS (Global Positioning System) Antennas in Time-Keeping Laboratories of North America.

Final rept.
W. Lewandowski, R. J. Douglas, W. J. Klepczynski, W. Strange, J. Suter, and M. A. Weiss. 1989, 7p
Sponsored by National Geodetic Survey, Rockville, MD.
Pub. in Proceedings of Annual Symposium on Frequency Control (43rd), Denver, CO., May 31-June 2, 1989, p218-224.

Keywords: *Antennas, Telecommunication, Time measuring instruments, Time measurement, Electronics laboratories, Navigation satellites, Navigational aids, Position(Location), *Global positioning systems.

One of the problems with the use of the Global Positioning System (GPS) for time transfer is that it is a one-way system. In addition, most of the time-keeping laboratories of the world use only the L1 frequency. However, the use of GPS in the common view approach diminishes the impact of some of the errors such as orbit error, GPS clock error and ionospheric error, in the one-way system, but does not cancel the antenna coordinate error. The Bureau International des Poids et Mesures (International Bureau of Weights and Measures) has developed a method of differential positioning using the data of time comparisons themselves. The principles of the technique and the results of its application to the North American time laboratories are presented in the paper. Work on differential position by geodetic double-frequency receivers, between U.S. Naval Observatory and Maryland Very Long Baseline Interferometry point, are reported.

used in cryogenic structures for the superconducting magnets of fusion energy power plants and prototypes. Its purpose is to facilitate their design and development. The program was developed jointly by the staffs of the National Institute of Standards and Technology and the Office of Fusion Energy of the Department of Energy; it is managed by NIST and sponsored by DOE. Research is conducted at NIST and at other laboratories through subcontracts with NIST. Research results for 1988 are presented in technical papers under four headings that reflect the main program areas: Structural Alloys, Welding, Technology Transfer, and United States-Japan Development of Test Standards. Objectives and research highlights are summarized in the introduction to each program area.

A 2.5 MeV neutron source has been established on the beamline of a 100 kV, 0.5 ma ion accelerator. The ion accelerator provides a 100 kV deuteron beam of about 200 mu a into a 3 mm beam spot at the target position. The neutron source is produced by the D(d,n) sup 3 He reaction with a yield of about 10 sup 7 n/sec. The time-correlated associated particle method (TCAP) is utilized for the neutron fluence determination and for neutron background elimination. The sup 3 He associated particles are detected at 90 degrees behind a thin aluminum foil and the corresponding neutrons are emitted at 73.5 degrees with an energy near 2.5 MeV. Also, the protons from the competing D(d,p)T reaction are monitored at 135 degrees for normalization and diagnostic purposes. A fission chamber containing six uranium tetrafluoride deposits has been de-

Measurement Quality Assurance through a National System of Secondary Laboratories.

Final rept.
E. H. Eisenhower. 1987, 13p
Pub. in Proceedings of NCSL Workshop and Symposium on Innovation, Key to the Future, Denver, CO., July 12-16, 1987, p30-1-30-13.

Keywords: *Ionizing radiation, *Measurement, *Quality assurance, *Laboratories, Standards, Reprints.

The achievement and demonstration of adequate accuracy in measurements of ionizing radiation is becoming increasingly desirable and necessary. Measurement accuracy is commonly interpreted as the agreement between measurement results and the appropriate national standard. The extent of agreement has been difficult to demonstrate because the necessary mechanisms have not existed. Available mechanisms have generally been limited to calibrations, which provide only assumed agreement with the national standard. The growing divergence of one NBS with limited resources and an increasing number of radiation users who need measurement support services will be resolved by a national system of secondary standards laboratories. Those laboratories will operate in accordance with established general criteria, will follow documented procedures for routine quality control and for providing services to customers, and will periodically demonstrate agreement with NBS by participation in a performance test. The secondary laboratories will, in turn, provide services to achieve agreement between themselves and radiation users. This can provide documented evidence of adequate measurement performance at the user level, in terms of agreement with NBS through the secondary level. The paper will describe the basic concepts of measurement quality assurance and its achievement through secondary laboratories. Relevant programs that are operating and under development will be described, as well as plans for additional programs that will constitute the secondary laboratory system.

Sensitive Dichromate Dosimeter for the Dose Range, 0.2-3 kGy.

Final rept.
W. L. McLaughlin, M. Al-Sheikhly, M. Farahani, and M. H. Hussmann. 1990, 8p
Pub. in Radiation Physics and Chemistry 35, n4-6 p716-723 1990.

Keywords: *Dosimeters, *Chromates, Food processing, Reducing agents, Reprints.

The response of aqueous dichromate dosimeters can be enhanced by adding small controlled amounts of organic reducing agents, however, such additives cause instabilities before and after irradiation. A choice is made of combinations of potassium dichromate, silver dichromate, perchloric acid, with the organic agent, acetic acid, to enhance appreciably the radiation chemical yield G(-Cr2O7)(sup -2) and still have sufficient stability for practical use in dosimetry in the food irradiation range. The reduction yield is thereby increased from the reported value for the classic K-Ag dichromate dosimeter (G approximately = 0.04 micromol/J) to G approximately = 0.17 micromol/J. The enhancement allows the dosimeter to be used with good precision down to the upper part of the dose range of the Fricke dosimeter (nearly = to 200 Gy) up to the lower part of the dose range of the conventional K-Ag dichromate dosimeter (nearly = to 3000 Gy). Because of instability of the solutions containing acetic acid, however, there is the limitation that spectrophotometry should not be made until at least three hours after irradiation.

Development of a Stable Tritium (HT) Generation System for Testing Atmospheric HT Monitors.

Final rept.
W. R. Miller, E. E. Hughes, and B. M. Coursey. 1990, 11p
Pub. in Nuclear Instruments and Methods in Physics Research A286, p334-344 1990.

Keywords: *Tritium, Radioactive contaminants, Atmospheric composition, Monitors, Sources, Tests, Reprints, *Gas generators, *Hydrogen tritide, Tritium meters, Calibration.

A stable tritium (HT) generation system that can be used to test atmospheric HT monitors has been developed at the National Institute of Standards and Technology. The system produces HT in air at concentrations between one and ten times the current atmospheric background level (about 8 x 10 to the -10 power microCi per liter of air). This has been accomplished by the precise mixing of two controlled gas flows, one from a gravimetrically prepared argon-tritium mixture of known tritium activity concentration, and the other from a stream of clean (tritium-free) air. The system has a total output flow of about 1 l/min and was designed and evaluated to test atmospheric HT monitors that have an input flow of less than or equal to 0.85 l/min.

Monte Carlo Calculated Response of the Dual Thin Scintillation Detector in the Sum Coincidence Mode.

K. C. Duvall, and R. G. Johnson. 1988, 3p CONF-880546-45
Contract A101-86ER40275
International conference on nuclear data for science and technology, Mito, Japan, 30 May 1988.
Paper copy only, copy does not permit microfiche production.

Keywords: *Neutron Detectors, Efficiency, Monte Carlo Method, Neutron Fluence, Numerical Data, Operation, Proton Recoil Detectors, Response Functions, Solid Scintillation Detectors, ERDA/440101.

The Dual Thin Scintillator (DTS) is a unique neutron detector that is being developed for improved fluence and spectrum measurement. Current attention has been directed towards understanding some details of the detector response in the sum coincidence mode of operation where a peaked pulse height response is exhibited throughout the energy region of interest. As a result of the peaked distribution, the detector efficiency is a weak function of the pulse height bias, allowing the number of recorded events above the bias to be determined with greater certainty. A Monte Carlo code has been used to calculate the sum coincidence pulse height response at several energies within the 1 to 15 MeV region. The detector efficiency as a function of neutron energy has also been calculated. The results of the Monte Carlo calculations, which include the effect of multiple scattering on the shape of the response function and efficiency curve are presented. (ERA citation 14:011659)

Review of Scattering Corrections for Calibration of Neutron Instruments.

Final rept.
C. M. Eisenhauer. 1989, 10p
Pub. in Radiation Protection Dosimetry 28, n4 p253-262 1989.

Keywords: *Neutron scattering, Monte Carlo method, Correction, Reviews, Reprints, *Neutron dosimetry, *Calibration, Radiation doses, Remmeters, Personnel dosimetry.

Scattering corrections are considered that must be made when neutron personnel instruments are calibrated with a point source of neutrons near the center of a calibration room. Three basic types of scatter are considered: scattering from a plane slab, scattering from walls of an enclosed room, and air scatter. In each case one proceeds from an idealized situation, where the correction can be predicted analytically, to an actual calibration room, where predictions must be checked by Monte Carlo calculations or experiment. Calculations show that the postulation of an image source provides a good model for predicting the fluence of neutrons scattered from aluminum and concrete slabs. Calculations also show how the fluence of neutrons scattered from the walls of an enclosed room relates to the case of neutron fluence in a spherical cavity and how the neutron fluence is increased by scattering in the air around source and detector. Finally, calculations are compared with experiments on the response of a neutron dose equivalent monitor.

Neutron Sensitivity of LiF Chip Gamma Dosimeters at Megagray Doses.

Final rept.
D. M. Gilliam, D. Hocken, J. C. Humphreys, and G. P. Lamaze. 1989, 6p
Pub. in Reactor Dosimetry: Methods, Applications, and Standardization, ASTM STP 1001, p206-211 1989.

Keywords: *Dosimeters, *Neutron irradiation, Lithium fluorides, Color centers, Sensitivity, Spectrophotometry, Chips, Tests, Reprints, Thermoluminescent dosimeters, Gamma dosimetry, NBSR reactor.

A lithium fluoride 'chip' gamma dosimeter has been tested for neutron sensitivity by irradiation in the cavity fission neutron field at the NBS reactor. Previous neutron sensitivity tests of these crystals had been made only for the F color center, which saturates at gamma doses of about 0.1 MGy. The present work extends these neutron sensitivity checks to the M, R, and N color centers which are useful for gamma doses in the 0.1 - 10 MGy range. The useful range of these centers was extended by reducing the thickness of the crystal to 1 mm. All irradiations in the Co-60 calibration irradiator were made using the same encapsulation as will be employed in ex-vessel cavity exposures at power plants.

Keywords: *Electron beams, *Dosimeters, Reprints, *Electron dosimetry, *Calorimetry, *Calibration, Film dosimetry, Alanine dosimeters, Intercomparison.

Graphite or metal calorimeters are used to make absolute dosimetric measurements of high-energy electron beams. These calibrated beams are then used to calibrate several types of dosimeters for high-dose applications such as medical-product sterilization, polymer modification, food processing, or electronic-device hardness testing. The calorimeters are used over an absorbed dose range of 100 to 10,000 Gy. Intercomparison studies are reported between National Institute of Standards and Technology (NIST) and UK National Physical Laboratory (NPL) graphite disk calorimeters at high doses, using the NPL 10-MeV linac, and agreement was found within 1.5%. It was also shown that the electron-beam responses of radiochromic film dosimeters and alanine pellet dosimeters can be accurately calibrated by comparison with calorimeter readings.

Keywords: *Dosimeters, Food processing, Ionizing radiation, Standards, Sugars, Calorimeters, Reprints.

During the past two years there have been significant advances in several forms of radiation measurement systems for radiation processing, covering dose ranges of 1-10(sup 6) Gy. Calorimeters as reference standards for both ionizing photon and electron fields have become well-established. In addition to the older ceric-cerous dosimetry solution analyzed potentiometrically, new liquid-phase dosimeters include those analyzed by spectrophotometry, e.g., improved forms of acidic aqueous solutions of K-Ag dicromate and organic radiochromic dye solutions. It has recently been demonstrated that by using certain refined sugars, e.g., D-(-)ribose, optical rotation response in aqueous solutions can be enhanced for dosimetry at doses > 10(sup 4) Gy. There has been expanded development, use, and formulation (rods, tablets, and thin films) of the amino acid, alanine, as a solid-phase dosimeter analyzed by either ESR spectrometry or by glutamine or alanine spectrophotometry of complexes with ferric ion in the presence of a sulfonphthalein dye (xlenol orange). New commercial types of radiochromic plastic dosimeters, e.g., GafChromic, Riso B3, GAM-MACHROME YR, Radix, and Gammex, have been introduced and applied in practice.

 National Inst. of Standards and Technology (NML), Gaithersburg, MD. Ionizing Radiation Div. **Initial Color Development in Radiochromic Dye Films After a Short Intense Pulse of Accelerated Electrons.** Final rept. R. M. Uribe, M. Barcelo, W. L. McLaughlin, A. E. Buenfil, and J. Rios. 1990, 4p. Pub. in *Radiation Physics and Chemistry* 35, n4-6 p724-727 1990.

Keywords: *Dyes, *Electron irradiation, Photochromism, Absorption spectra, Polyamide resins, Optical density, Reaction kinetics, Reprints, *Film dosimetry, radiation detection.

The radiation response of different dye precursors in several host plastics has been investigated after a single short-pulse irradiation with 2.5-MeV electrons. It was observed that in most films the radiation-initiated color development proceeds mainly during the first 300 seconds, after such high dose-rate irradiation (approximately 10(sup 12) Gy/s). Absorption spectra show that the main absorption band increases at the expense of a shorter-wavelength precursor absorption

band, showing an isosbestic point approximately midway between the two absorption bands. It was found that a certain combination of dye precursor and host plastic (namely a polyamide containing an aromatic group) constitutes a film which shows a very fast increase in optical density of the main absorption band, making it suitable for immediate dosimetric analysis in very high dose-rate installations.

 National Bureau of Standards (NML), Gaithersburg, MD. Ionizing Radiation Div. **Niobium as a Neutron Dosimeter.** Final rept. T. G. Williamson, and G. P. Lamaze. 1987, 2p. Pub. in *Transactions of the American Nuclear Society* 55, p553-554 1987.

Keywords: *Pressure vessels, Monte Carlo method, Neutron irradiation, Radioactive contaminants, Fission cross sections, Induced radioactivity, Impurities, X rays, Tantalum, Reprints, *Neutron dosimetry, *Niobium 93, Radioactivation.

The neutron inelastic scattering reaction $(93)\text{Nb}(n,n')(93\text{m})\text{Nb}$ has many desirable features as a fast neutron dosimeter for pressure vessel dosimetry. The cross section, with a threshold near 100 keV, approximates the damage function in many metals, and the product isotope has a half life of 16.1 years which will integrate over a significant fraction of the pressure vessel lifetime. The metal is easily fabricated into thin foils and is stable in the pressure vessel environment. The niobium reaction has not been used extensively because of difficulties in measuring $(93\text{m})\text{Nb}$ activity. Recently niobium foil material with less than 10 ppm tantalum impurity and better measurements of the cross section have become available. In the paper a measurement of the fission spectrum averaged cross section and techniques for counting activated foils will be reported.

McLaughlin, H. M. Khan, W. Warasawas, M. Al-Sheikhly, and B. B. Radak. 1989, 8p. Pub. in *Radiation Physics and Chemistry* 33, n1 p39-46 1989.

Keywords: *Food irradiation, Fiber optics, Quality control, Reprints, *Gamma dosimetry, Optical waveguides.

Two types of liquid-core optical waveguide (OWG) dosimeters are commercially available for dosimetry in the irradiation of foods and other products. Opti-chromic type FWT-70-40M has a useful range of about 10 to 10,000 Gy and type FWT-70-83M about 100 to 10,000 Gy. Within the limits of random uncertainty of the reading of the absorbed dose the response to gamma rays is independent of dose rate over the range 0.1 to 10,000 Gy/h, when measured at the peak of the spectrum (absorption band max. (600 nm wavelength)). Both dosimeter types, when measured at 600 nm, are temperature dependent over the temperature ranges of -40 to 60 deg during irradiation. The dosimeters cannot be used when exposed to temperatures > 60 deg because of bubble formation and loss of light propagation. A special, sensitive OWG dosimeter (50-cm coil), designed for doses down to 0.1 Gy, shows a linear response up to at least 15 Gy, a temperature dependence of response only at temperatures below about 20 deg, and no dose-rate dependence.

ronmental materials, Radioecological concentration, US NRC, International cooperation, IAEA.

Issues involving the definition and practical significance of Detection Limits will be discussed in the light of US and international programs in which the concept plays a central role. The US program relates to the 'Lower Limit of Detection' (LLD) which forms a part of the Technical Specifications for nuclear power reactors, as required by the US Nuclear Regulatory Commission for measurements of effluent and environmental radioactivity. The programs of the International Atomic Energy Agency, which are oriented toward coordinated research and technical cooperation, similarly require common understanding and use of the 'Limit of Detection' (LOD) as a practical and meaningful performance characteristic for measurements of trace elements in bioenvironmental matrices. Efforts to meet the needs of the two programs to formulate realistic and practicable detection limits will be reviewed, with special focus on problems-in-common such as the treatment of the blank, decision criteria, algorithm and assumption dependence, and the reporting of subliminal results.

One important requirement for accurate monitoring of radon in working environments, dwellings, and outdoors is to ensure that the measurement instrumentation is properly calibrated against a recognized standard. To achieve this goal, the U.S. Department of Interior Bureau of Mines (BoM) Radiation Laboratory has participated since 1983 in a program to establish international radon measurement standards. While the National Institute of Standards and Technology (NIST) radium solution ampules are acceptable to all participating laboratories as a primary standard, a method of transferring radon from the NIST source into each laboratory's primary counting apparatus is a critical problem. The Bureau's method transfers radon from the primary solution by bubbling 3 L of air through it into a steel cylinder. After homogenizing the radon concentrations in the cylinder, eight alpha-scintillation cells are filled consecutively and measured in a standard counting system. The resulting efficiency is 81.7 + or - 1.2%.

The ideal facility for assessing the quality of radon measurements at environmental levels consists of: (1) an instrument whose response to radon and its progeny is determined from measurements of a certified or standard (²²⁶Ra source, and (2) a calibration room with a known radon concentration. The linkage between these two elements and additional quality control requirements are discussed here for some Environmental Measurements Laboratory radon measurements programs.

A procedure for the calibration of instruments for the detection of (²²²Rn) in air is described. The method is based on the alpha-spectrometric determination of the concentration in air of (²¹⁸Po) in the calibration chamber. The calibration chamber is described, together with the method of maintaining a high aerosol concentration. The (²¹⁸Po) concentration at steady state in the chamber is found to be 98% of the (²²²Rn) concentration typically. An assessment of the sources of uncertainty in the method presented indicate that the (²²²Rn) concentration in the chamber can be determined with an overall uncertainty of about 7% at the 95% confidence level.

Calibration of Scintillation Cells for Radon-222 Measurements at the U.S. Environmental Protection Agency.

E. L. Sensintaffar, and S. T. Windham. 1990, 3p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n2 p143-145 Mar-Apr 90.

Keywords: *Scintillation counters, Zinc sulfides, Radioactive contaminants, *Radon 222, Calibrations, US EPA, Uncertainty, Indoor air pollution.

Zinc sulfide coated scintillation cells are the primary method for measuring radon-222 at the U.S. Environmental Protection Agency (EPA), Office of Radiation Programs (ORP), Eastern Environmental Radiation Facility (EERF). These cells are used to measure concentrations of radon in exposure chambers that are used to calibrate or test other devices or instruments. Calibrations of individual cells are discussed in the paper.

ICARE Radon Calibration Device.

P. Zettwoog. 1990, 7p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n2 p147-153 Mar-Apr 90.

Keywords: Metrology, Standards, *Radon 222, *ICARE device, *Calibration, French organizations, Daughter products.

An aerodynamic calibration device called ICARE is briefly described. ICARE is currently being used at the Nuclear Research Center of Saclay in France for the certification of instruments employed in measurement of artificial radioactive particulate airborne contamination. ICARE is essentially a blower. To extend ICARE's field of application to the case of instruments employed in measurement of (²²²Rn) and of its decay products, a new line of injection has been designed and is under construction, in the frame of a contract financed by the European Community Commission. The main effort is presently oriented toward the development of a reliable (²²²Rn) source, based on a solid deposit of (²²⁶Ra) on organic fibers, and of a reference method for the measurement of (²²²Rn) activity per unit volume of air. This reference is based on a modified version of standard containers being used in the French reference method for calibrated measurements of (¹³³Xe) and (⁸⁵Kr) by gamma spectroscopy.

NIST Primary Radon-222 Measurement System.

R. Colle, J. M. R. Hutchinson, and M. P. Unterweger. 1990, 11p

Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n2 p155-165 Mar-Apr 90.

Keywords: Ionization chambers, Measurement, *Radon 222, *Calibration standards, Radium 226, US NIST.

Within the United States, the national standard for radon measurements is embodied in a primary radon measurement system that has been maintained for over 50 years to accurately measure radon (²²²Rn) against international and national radium (²²⁶Ra) standards. In turn, all of the radon measurements made at the National Institute of Standards and Technology (NIST) and the radon transfer calibration standards and calibration services provided by NIST are directly related to this national radon standard. This primary radon measurement system consists of pulse ionization chambers and ancillary gas handling and gas purification equipment. The system is currently undergoing a significant upgrading and expansion which will replace the extant outdated system.

Closed-Can Exhalation Method for Measuring Radon.

C. Samuelsson. 1990, 3p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n2 p167-169 Mar-Apr 90.

Keywords: Outgassing, Measurement, *Radon 222, Closed can method, Exhalation.

Results from closed-can radon exhalation experiments must be interpreted bearing the time-dependent radon diffusion theory in mind. A rapid change from the free to final steady-state exhalation rate will take place for all samples that are thin compared with the radon diffusion length. The radon gas accumulating in a closed can corresponds to a free exhalation rate only if the outer volume of air is much larger than the pore volume of the enclosed sample, or the thickness of the sample is much larger than the radon diffusion length.

Standardization of Rn-222 at the Australian Radiation Laboratory.

T. H. Gan, S. B. Solomon, and J. R. Peggie. 1990, 5p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n2 p171-175 Mar-Apr 90.

Keywords: Scintillation counters, Standardization, *Radon 222, *Calibration, Australian organizations, Radium 226, Uncertainty.

The standardization of Rn-222 at the Australian Radiation Laboratory involves the calibration of scintillation cells by two methods using standard Ra-226 solutions traceable to the National Institute of Standards and Technology. One of these methods, namely the injection method, involves direct transfer of Rn-222 into a scintillation cell. In the other method, known as the volumetric method, the Rn-222 is flushed into a large container and the scintillation cell calibrated by sampling from this container. A comparison of the two methods showed that similar results were obtained, with the overall random uncertainty being 3.4% for one standard deviation. Using better estimates of the true calibration factors, the overall random uncertainty was reduced to 1.8% for one standard deviation.

Standardization of Radon Measurements: 2. Accuracy and Proficiency Testing.

J. M. Matuszek. 1990, 5p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n2 p177-181 Mar-Apr 90.

Nuclear Instrumentation

Keywords: Alpha particle detector, Standardization, Accuracy, Measurement, *Radon 222, Charcoal detectors, Electret detectors, Radiation monitoring, Indoor air pollution, Uncertainty.

The accuracy of in situ environmental radon measurement techniques is reviewed and new data for charcoal canister, alpha-track (track-etch) and electret detectors are presented. Deficiencies reported at the 1987 meeting in Wurenlingen, Federal Republic of Germany, for measurements using charcoal detectors are confirmed by the new results. Accuracy and precision of the alpha-track measurements laboratory were better than in 1987. Electret detectors appear to provide a convenient, accurate, and precise system for the measurement of radon concentration. The need for a comprehensive, 'blind' proficiency-testing programs is discussed.

Derivation of Neutron Exposure Parameters from Threshold Detector Measurements.
 Final rept.
 J. A. Grundl. 1989, 10p
 Sponsored by Armed Forces Radiobiology Research Inst., Bethesda, MD.
 Pub. in Reactor Dosimetry: Methods, Applications, and Standardization, ASTM STP 1001, p450-459 1989.

Keywords: Adjusting, Reprints, *Neutron dosimetry, Threshold detectors.

A procedure will be outlined which is appropriate for threshold detector measurements that have limited uncertainty information and/or are benchmark referenced. The derivation focuses on individual detector results and the option of coarse group spectrum adjustment when observed spectral indexes are in modest disagreement with the prediction of an a priori neutron spectrum of unknown accuracy. Characteristics of the procedure include a simple choice of error components, exclusion of intrinsic spectrum interpolations, and an explicit diagnosis of the effect upon the adjustment of individual detector response parameters. A sample problem is worked out in detail.

Quality Assurance and Spent Fuel Shipments for Research Reactors.
 Final rept.
 J. C. Wang, M. Bell, D. Brown, and T. Raby. 1987, 1p
 Pub. in Transactions of the American Nuclear Society 55, p197 1987.

Keywords: *Quality assurance, *Radioactive wastes, *Nuclear research and test reactors, *Shipping containers, Transportation, Regulations, Licenses, Reprints, *Radiation protection laws, *Spent fuel casks, Spent fuel elements, US DOT, US NRC, NBSR reactor.

There is an increasing regulatory concern for spent fuel shipments on the parts of the U.S. Nuclear Regulatory Commission (NRC) and the U.S. Department of Transportation (DOT), demonstrated by the increasing frequency of inspections of shipments, approaching 50%, and the revision of regulations to conform to the International Atomic Energy Agency guidelines for nuclear transportation. The National Bureau of Standards Reactor (NBSR) faced substantially different constraints for a spent fuel shipment in 1987 than in 1978. For the 1987 shipment, a quality assurance (QA) program was developed that assured compliance with Title 10, Code of Federal Regulations, Part 71, Subpart H. A cask was acquired that had already received licensing approval for spent fuel transport. An evaluation was made and approval obtained for the new liner for the cask. A QA plan for the cask user's transport responsibilities was developed. Specific problems such as cask 'weeping' and transport safeguard were addressed.

 Pub. in Proceedings of Topical Conference on Theory and Practices of Radiation Protection and Shielding, Knoxville, TN., April 22-24, 1987, p325-332.

Keywords: *Iron, *Cadmium, *Photofission, *Absorption cross sections, Gamma cross sections, Measurement, Comparison, Computation, Reprints, *Capture, Uranium 238, Thorium 232, Neptunium 237, NBSR Reactor.

Photofission measurements have been made in U-238, Th-232 and Np-237 in iron and cadmium capture gamma ray spectra in cylindrical neutron driven gamma ray sources in the thermal column of the National Bureau of Standards Reactor. The gamma ray source strength was measured with neutron activation foils and by direct counting of activations produced in the metal cylinders. Photofission measurements were made with NBS miniature fission chambers. The integral photofission cross sections were compared with differential measurements by integrating the capture gamma ray spectra with measured cross section shapes. The integral cross sections measured in the capture gamma ray fields are lower than the cross sections calculated from measured differential data.

Models of Transport Processes in Concrete.
 J. M. Pommersheim, and J. R. Clifton. Sep 90, 102p NISTIR-4405
 Prepared in cooperation with Bucknell Univ., Lewisburg, PA. Sponsored by Nuclear Regulatory Commission, Washington, DC. Div. of Engineering.

Keywords: *Transport properties, *Concrete durability, *Service life, Diffusion, Mathematical models, Convection, Concretes, Corrosion, Cement aggregate reactions, Chlorides, *Radioactive waste storage, Low-level radioactive wastes.

An approach being considered by the U.S. Nuclear Regulatory Commission for disposal of low-level radioactive waste is to place the waste forms in concrete vaults buried underground. The vaults would need a service life of 500 years. Approaches for predicting the service life of concrete of such vaults include the use of mathematical models. Mathematical models are presented in the report for the major degradation processes anticipated for the concrete vaults, which are corrosion of steel reinforcement, sulfate attack, acid attack, and leaching. The models mathematically represent rate controlling processes including diffusion, convection, and reaction and sorption of chemical species. These models can form the basis for predicting the life of concrete under in-service conditions.

Keywords: *Steels, *Metal plates, *Pressure vessels, Toughness, Notch tests, Temperature gradients, Reprints, *Crack arrest, *Fracture mechanics, Temperature dependence, Charpy impact test.

Wide-plate crack-arrest tests are being performed at the National Bureau of Standards under the Heavy-Section Steel Technology Program and are designed to provide fracture toughness measurements at temperatures approaching or above the onset of the upper-shelf regime, in a rising toughness region and with increasing driving force. The test specimens are 1 by 1 by 0.1 m and possess a single-edge notch (crack) that initiates in cleavage propagation at low temperature and arrests in a region of increased fracture toughness. The toughness is achieved through a linear transverse temperature profile across the plate. Results obtained using a prototypical reactor pressure vessel steel (A533 grade B class 1 material) exhibit a significant increase in toughness at temperatures near and above the onset of Charpy upper shelf. Additionally, cleavage crack propagation and arrest at temperatures above the onset of Charpy upper shelf have been demonstrated.

Proceedings of Workshop on Power Plant Cable Condition Monitoring, San Francisco, CA., February 16-18, 1988, p25-1 - 25-11 Jul 88.

Keywords: *Nuclear power plants, *Cable insulation, Defects, Aging tests(Materials), Methodology, Reflectometers, Spectrometers, Detectors, Preventive maintenance, Reprints, In-situ testing, Reactor maintenance, In-service inspection.

Several types of test methods have been proposed for detecting incipient defects due to aging in cable insulation systems, none offering certainty of detecting all possible types of defects. Some methods apply direct detection of a defect in the cable; other methods detect changes in electrical or non-electrical parameters from which inferences can be drawn on the integrity of the cable. The paper summarizes the first year of a program conducted at the National Bureau of Standards to assess the potential of success for in situ detection of incipient defects by the most promising of these methods.

Sponsored by Nuclear Regulatory Commission, Washington, DC.
Pub. in Proceedings of Water Reactor Safety Information Meeting (16th), Gaithersburg, MD., October 24-27, 1988, p21-40.

Keywords: *Nuclear reactor materials, *Aging tests(Materials), *Electrical insulation, Dielectric properties, Transmission lines, Reprints, *Time domain spectroscopy, *Electric cables, Physical radiation effects.

The use of Time Domain Spectroscopy, the measurement of dielectric constant and loss using time-domain response, for monitoring the aging of reactor cable insulation is examined. The method is presented, showing its sensitivity, accuracy and wide frequency range. The method's ability to acquire a great deal of information in a short time and its superiority to conventional single frequency data is shown. Different cable samples are examined before and after exposure to radiation and changes with exposure are clearly seen to occur. Also it is shown that a wide range of behavior can be found in different insulation systems. The requirements for performing valid measurements are presented. The need for controlled samples and correlation with other criteria for aging is discussed.

Pub. in Analytical Chemistry 62, n4 p386-389, 15 Feb 90.

Keywords: *Iodine, *Oysters, *Chemical analysis, Mass spectroscopy, Reprints, Iodine 127, Iodine 129, Isotope dilution, Laser resonance ionization, Tissue distribution, Standard reference materials.

The technique of laser resonance ionization mass spectrometry has been combined with isotope dilution analysis to determine iodine in oyster tissue. The long-lived radioisotope, (sup 129)I, was used to spike the samples. Samples were equilibrated with the (sup 129)I, wet ashed under controlled conditions, and iodine separated by coprecipitation with silver chloride. The analyte was dried as silver ammonium iodide upon a tantalum filament from which iodine was thermally desorbed in the resonance ionization mass spectrometry instrument. A single-color, two-photon resonant plus one-photon ionization scheme was used to form positive iodine ions. Long-lived iodine signals were achieved from 100 ng of iodine. The precision of (sup 127)I/(sup 129)I measurement has been evaluated by replicate determinations of the spike, the spike calibration samples, and the oyster tissue samples and was 1.0%.

Contract N00014-89-J-1058

Keywords: *Oceanographic data acquisition, Marine biology, Oceanographic equipment.

Data on the effects of winter conditions on the transport of sediment on the continental shelf off Northern California were collected during the first year of the Sediment Transport Events on Shelves and Slopes (STRESS) Experiment. This experiment was done in conjunction with Shelf Mixed Layer Experiment (SMILE) and Biological Effects on Coastal Ocean Sediment Transport (BECOST) to provide a complete suite of measurements of nearshore dynamics, sediment transport, and biological interactions. This report includes a general description of the work accomplished during the STRESS field season, carried out in

the winter of 1988-1989 off the Northern California coast. Three cruises were completed, one each for deployment, turnaround, and recovery of the instruments. This created two back-to-back sections of data, one from December 4, 1988 to January 23, 1989, and the other from January 29 to March 17, 1989. This report also documents the use of the Benthic Acoustic Stress Sensor (BASS), and the associated acoustic data telemetry link in STRESS. BASS had been used in different configurations previously, but the acoustic telemetry system is new.

Towards an Understanding of Camera Fixation.
 D. Raviv, and M. Herman. Jan 90, 25p NISTIR-89/4217
 Prepared in cooperation with Florida Atlantic Univ., Boca Raton.

Keywords: *Cameras, Robots, Distance, Research projects, Resolution, Optical equipment, *Fixation point, Image processing, Motion stability, Computer vision.

A fixation point is a point in 3-D space that projects to zero optical flow in an image over some period of time while the camera is moving. The paper deals with quantitative aspects of fixation for a static scene. For the case where the rotation axis of the camera is perpendicular to the instantaneous translation vector it is shown that there is an infinite number of points that produce zero instantaneous optical flow. These points lie on a circle (called the Zero Flow Circle or simply ZFC) and a line. The ZFC changes its location and radius as a function of time, and the intersection of all the AFCs is a fixation point. Points inside the ZFC produce optical flow that is opposite in sign to those that are outside the ZFC. This fact explains in a more quantitative way phenomena due to fixation. In particular, points in the neighborhood of the fixation point may change the sign of their optical flow as the camera moves. A set of experiments shows how the concept

of the AFC can be used to explain the optical flow produced by 3-D points near the fixation point.

 Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electron Devices 36, n11 p2452-2457 Nov 89.

Keywords: *Lithography, *Masking, *X ray apparatus, Performance evaluation, Metrology, Reprints, *Scanning electron microscopy.

The paper presents the basic concept and some preliminary experimental data on a new method for measuring critical dimensions on masks used for x-ray lithography. The method uses a scanning electron microscope in a transmitted-electron imaging mode and can achieve nanometer precision. Use of this technique in conjunction with measurement algorithms derived from electron beam interaction modeling may ultimately enable measurements of these masks to be made to nanometer accuracy. Furthermore, since a high contrast image results, this technique lends itself well to automated mask defect recognition and inspection.

These points lie on a circle (called the Zero Flow Circle or simply ZFC) and a line. The ZFC changes its location and radius as a function of time, and the intersection of all the ZFCs is a fixation point. Points inside the ZFC produce optical flow that is opposite in sign to those that are outside the ZFC. In a set of experiments, the authors show how the concept of the ZFC can be used to explain the optical flow produced by 3-D points near the fixation point.

Pinhole Camera Imaging Without Lenses or Mirrors.
 Final rept.
 M. Young. 1989, 8p
 Pub. in the Physics Teacher, p648-655 Dec 89.

Keywords: Gratings(Spectra), Far field, Reprints, *Pinhole cameras, Fresnel diffraction, Near field, Imaging techniques.

The pinhole camera is an interesting and useful device. The pinhole focuses as a result of diffraction, and the camera displays an optimum focal length equal to the square of the pinhole radius divided by the wavelength. The paper discusses the history and the physics of the pinhole camera and some of its relatives, the Fresnel zone plate, cascaded apertures, the pin-spec camera, and the pinhead mirror.

Step and Frequency Response Testing of Waveform Recorders.
 Final rept.
 T. M. Souders, D. R. Flach, and J. J. Blair. 1990, 7p
 Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) Instrumentation and Measurement Technology Conference, San Jose, CA., February 13-15, 1990, p214-220.

Keywords: *Waveforms, *Recording instruments, *Step response, Measurement, Instructional materials, Frequency response, Transition points, Standards, Reprints, Impulse response.

Tutorial material is presented to aid in measuring the step response of waveform recorders, and to compute other parameters which may be derived from it. Parameters considered include impulse response, transition duration, settling time, and complex frequency response. The measurement approaches follow those recommended in the IEEE 'Trial Use Standard for Digitizing Waveform Recorders.' Illustrated examples are given, and guidelines on the choice of step generators are also included.

 Contract N00014-88-L-0006

Keywords: *Acoustic emissions, Acoustics, Calibration, Electroacoustic transducers, Experimental data, Greens function, Impact tests, Inversion, Measurement, Physical properties, Secondary, Simulation, *Sound generators, Sources, Theory, Transducers, Transfer, Ultrasonics, Waveforms.

Progress is described on the design of a system for secondary calibration of acoustic emission transducers. Experimental secondary calibrations indicate that a 3.3 cm thick steel plate is not a suitable transfer block, and that the transfer block should be more like a semi-infinite medium. Simulated acoustic emission sources have been studied theoretically and experimentally. Hertzian impact experiments have been carried out, and source waveforms have been reconstructed from experimental data using an inverse Green's function for the plate. Moderate agreement was obtained between Hertzian theory and the experimental results. Ultrasonics, Physical acoustics, Acoustic emission, Transducers, Calibration.

Pub. in Proceedings of Ultrasonics International Conference, London, UK., July 6-9, 1987, p509-513.

Keywords: *Ultrasonic radiation, *Metrology, *Phase velocity, Detectors, Waveform generators, Longitudinal waves, Secondary waves, Computerized simulation, Greens function, Calibration, Reprints, *Ultrasonic wave transducers.

The paper reports a simple technique in which the echo waveform generated by a point impulse and received by a point normal displacement transducer is used to determine the longitudinal, shear wave, and the Rayleigh wave speeds. A computer program to calculate the Green's function of a plate is used to formulate and extract the wave speed information, select proper source, select test configuration and calibrate transducers. An example of using conical transducers as a point source generator and a point displacement echo detector is given.

Calibration of Vibration Pickups at Low Ultrasonic Frequencies.

Final rept.
M. R. Serbyn. 1989, 4p
Sponsored by Naval Sea Systems Command, Washington, DC.
Pub. in Proceedings of IEEE (Institute of Electrical and Electronics Engineers) Ultrasonics Symposium, Montreal, Quebec, Canada, October 3-6, 1989, p797-800.

Keywords: *Accelerometers, Piezoelectric transducers, Ultrasonic radiation, Sensitivity, Reprints, *Vibration measurement, *Calibration.

The requirements for, and peculiarities of, vibration measurements at low ultrasonic frequencies are discussed in the context of existing practice and needs. A method for calibrating vibration pickups in the frequency range 10-30 kHz is described and illustrated with examples. The method requires two types of measurements: (1) the driving-point impedance of the vibration exciter loaded by the test pickup and a known mass; (2) the voltage ratio of pickup output to driver input. The calibration formula is based on the Moebius transformation of two-port impedances and the product relationship of cascaded systems. The sensitivity of a pickup, in both magnitude and phase, is determined from three sets of observations, using calibrated masses and a programmable impedance/gain analyzer.

Pub. in International Jnl. of Thermophysics 11, n5 p897-910 Sep 90.

Keywords: *Acoustic resonators, *Methane, *Ethane, *Propane, *Carbon dioxide, *Nitrogen, *Sound waves, *Acoustic velocity, Natural gas, Sound transducers, Isotherms, Mixtures, Sound generators, Reprints, *Binary mixtures.

A description of a fixed-path length acoustic resonator which uses electrostatic transducers for sound generation and detection is given. Also, a summary of the measurements on 13 binary and 4 multicomponent gas mixtures of natural gas components is given. Data were obtained at pressures to 10 MPa for five isotherms at 25 K increments from 250 to 350 K. The binary mixtures are primarily methane-rich, with either ethane, nitrogen, carbon dioxide, or propane as the second constituent. The multicomponent mixture compositions represent four naturally occurring natural gas mixtures.

Interaction of a Three-Dimensional Roughness Element with a Laminar Boundary Layer.
Final rept. 1 Jun 82-31 Jan 87.

P. S. Klebanoff, W. G. Cleveland, and K. D. Tidstrom. Mar 87, 120p Rept no. AEDC-TR-87-7
Prepared in cooperation with National Bureau of Standards, Gaithersburg, MD.

Keywords: *Roughness, *Turbulent flow, *Boundary layer transition, Aspect ratio, Reynolds number, Flat plate models, Laminar boundary layer, Steady flow, Unsteady flow, Three dimensional, Evolution(General), Hemispheres, Mean, Velocity, Data bases, Variations, Velocity, Wind tunnel tests.

An experimental investigation is described that is directed toward extending the technical database and furthering our understanding of boundary layer transition induced by three-dimensional roughness elements. The investigation was carried out in an unsteady wind tunnel, principally with hemispherical roughness elements, in a well characterized zero-pressure gradient laminar boundary layer on a flat plate.

Attention was directed toward the following aspects of the behavior of a three dimensional roughness element: (1) the critical Reynolds number of transition and the effect of aspect ratio thereon, (2) eddy generation is steady and unsteady flows, (3) is the fundamental process stability governed, and (4) the evolutionary change in mean velocity and intensity of the velocity fluctuation associated with the transition to fully developed turbulent flow.

Contract AI05-87ER13770
Portions of this document are illegible in microfiche products.

Keywords: *Functional Models, *Porosity, Darcy Law, Data Acquisition, Distribution Functions, Experimental Data, Fiber Optics, Fluid Flow, Heat Exchangers, Heat Transfer, Hydrodynamics, Illuminance, Lasers, Mapping, Materials Testing, Measuring Methods, Natural Convection, Nusselt Number, Performance Testing, Planning, Probes, Rayleigh Scattering, Rhodamines, Task Scheduling, Thermal Equilibrium, Tracer Techniques, ERDA/580000, ERDA/420500, ERDA/426002, *Free convection, Time domain.

In this project the object is to apply the principles of Residence Time Distribution (RTD) analysis to the study of free convection in porous media. The advantages of this technique are that it is non-intrusive, the data are quickly generated, and a large amount of information, distributed in the time domain, is obtained. The disadvantage is that a model must be used to infer the flow pattern from the RTD. It is proposed to apply the same modeling approaches that have been used successfully in mixing tank studies and to interpret the flow patterns in terms of similar mixing tank model parameters. Correlations would then be sought with global parameters of the porous medium like Rayleigh, Peclet and Nusselt numbers. 2 refs., 3 figs.

The 3D transient motion of a buoyancy-driven perfect gas in an enclosure is computed by a Fortran program (BF3D). A combustion model for eventual inclusion in the program is under development. BF3D changes slowly, has a long lifetime, and is run fairly infrequently. Typical runs have large storage and moderate CPU requirements. BF3D runs on large supercomputers but the newer mini-supercomputers appear to be suitable also and may be advantageous for ease of access and usage. Scientific workstations are convenient for development. Comparisons of BF3D on selected supercomputers, mini-supercomputers, scientific workstations and conventional mainframes are presented.

Tomographic Reconstruction of Two-Dimensional Vector Fields: Application to Flow Imaging.

Final rept.
S. J. Norton. 1989, 8p
Pub. in Geophysical Jnl. 97, n1 p161-168 Apr 89.

Keywords: *Two dimensional flow, *Vector analysis, Gradients, Vectors(Mathematics), Numerical analysis, Acoustic measurement, Fluid flow, Boundary layer flow, Fluid dynamics, Reprints, *Tomography.

The problem of reconstructing a two-dimensional vector field $v(x,y)$ from the line-integrals of v is considered. The problem arises in the two-dimensional mapping of fluid flow from acoustic time-of-flight measurements. A vector central-slice theorem is derived, which is a generalization of the well-known central-slice theorem that plays a fundamental role in conventional 'scalar' tomography. When the vector field $v(x,y)$ is decomposed into rotational and irrotational components the vector reconstruction problem simplifies. The authors show that the rotational component can be uniquely reconstructed from the line integrals of v , whereas the irrotational component cannot. When the field is divergenceless, however, the scalar potential is a solution to Laplace's equation and can be determined by the values of v on the boundary of the domain under reconstruction. An explicit formula for the scalar potential from the boundary values of v is derived. Consequently, $v(x,y)$ can be uniquely recovered over the region of reconstruction from the following information: line-integral measurements of v through this region and v measured on the boundary of this region.

Stabilization of Taylor-Couette Flow Due to Time-Periodic Outer Cylinder Oscillation.
B. T. Murray, G. B. McFadden, and S. R. Coriell. Apr 90, 31p NISTIR-90/4283

Keywords: *Couette flow, *Stability, *Bodies of revolution, Rotation, Mathematical models, Differential equations, Numerical analysis, Steady flow, Two dimensional flow, Vortices, Oscillations, Floquet theorem.

The linear stability of circular Couette flow between concentric infinite cylinders is considered for the case when the inner cylinder is rotated at a constant angular velocity and the outer cylinder is driven sinusoidally in time with zero mean rotation. This configuration was studied experimentally by Walsh and Donnelly. The critical Reynolds numbers calculated from linear stability theory agree well with the experimental values, except at large modulation amplitudes and small frequencies. The theoretical values are obtained using Floquet theory implemented in two distinct approaches: a truncated Fourier series representation in time, and a fundamental solution matrix based on a Chebyshev-pseudospectral representation in space. For large amplitude, low frequency modulation, the linear eigenfunctions are temporally complex consisting of a quiescent region followed by rapid change in the perturbed flow velocities.

Summary Report of NIST's (National Institute of Standards and Technology's) Industry-Government Consortium Research Program on Flowmeter Installation Effects with Emphasis on the Research Period November 1988-May 1989.
G. E. Mattingly, and T. T. Yeh. May 90, 60p NISTIR-4310

Keywords: *Flowmeters, *Pipe flow, Flow measurement, Pipelines, Research programs, Turbulence, Orifice meters, Velocity, Orifices.

The report presents results produced in a consortium-sponsored research program on flowmeter installation effects. The objective of the research program is to produce improved flowmeter performance when meters are installed in non-ideal conditions. The objective is being attained via a strategy to (1) measure, understand, and quantify the salient features of non-ideal pipe flows from such pipeline elements as elbows, reducers, valves, flow conditioners, etc. or combinations of these, (2) to correlate meter-factor shifts for selected types of flowmeters, relative to the features of

these non-ideal pipe flows so as to be able to predict meter performance accurately in non-ideal installations, and (3) disseminate the resulting technology through appropriate channels such as publishing the authors' results in pertinent journals and upgrading paper standards for flow measurement.

Dynamics of the Bell Prover, II.

Bi-monthly rept.
F. W. Ruegg, and F. C. Ruegg. 27 Oct 89, 17p
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n1 p15-31 Jan-Feb 90.

Keywords: *Gas flow, *Test equipment, Measurement, Accuracy, Equations of motion, Fluid dynamics, *Calibration standards, *Bell provers.

The bell prover is widely used for gas flowrate measurements by timing a known stroke of the bell as it rises, presumably with a constant speed, from a bath of sealing liquid. A differential equation for the bell motion (from the previous paper of the same title) is used together with the previous equations of motion for the gas and sealing liquid modified here to provide the basis for a computer simulation of the prover performance. Examples of the results of the computations show substantial fluctuations in all of the motions and modified measurement procedures for improved accuracy are discussed. Proposed modifications to the prover itself are shown by the computations to dampen the fluctuations and to improve the measurement accuracy. Only a limited number of changes of the prover design and of the initial conditions were researched for their effect.

Non-Newtonian Molecular Dynamics and Thermophysical Properties.
Final rept.
H. J. M. Hanley, and D. J. Evans. 1990, 19p
Sponsored by Department of Energy, Washington, DC. Pub. in International Jnl. of Thermophysics 11, n2 p381-398 Mar 90.

Keywords: *Non-Newtonian fluids, *Molecular flow, *Thermophysical properties, Computerized simulation, Rheological properties, Molecular structure, Equations of motion, Shear properties, Reprints.

The main theme of the paper is to review computer simulation as a tool to study mechanisms in fluids and to understand better fluid behavior. The relationship between molecular dynamics and thermophysical properties of fluids is reviewed very briefly. The standard simulation algorithms that are available are listed. The authors emphasize, however, the importance of the recent molecular dynamics techniques that incorporate non-Newtonian equations of motion. Two topics are introduced as examples. First, the evidence of a transient solid-like structure observed from simulations of a dense model two-dimensional liquid is reported: the authors speculate that the transient structure influences the density dependence of many thermophysical properties of the real liquid. Second, a discussion of the structure factor of a system under shear, and its relation to the properties of the fluid, is given.

Reflection Matrix for Optical Resonators in FEL (Free Electron Lasers) Oscillators.

S. Riyopoulos, P. Sprangle, C. M. Tang, and A. Ting. Sep 87, 26p
Contract N00014-87-F-0066
Prepared in cooperation with Science Applications Intl. Corp., McLean, VA and Berkeley Research Assoc., Springfield, VA.

Keywords: Angles, Coefficients, Computations, Corrections, Deflection, *Free electron lasers, Functions, Light, Mirrors, Optical properties, Oscillators, Parabolic bodies, Radiation, Ratios, Reflection, *Resonators, Sizes(Dimensions), Sources, Surfaces, *Optical resonators, Matrices.

The transformations of Gaussian radiation beams caused by reflection off mirrors is an important issue for FELs operating as oscillators. The reflected radiation from a single incident Gaussian mode will contain other modes due to the finite mirror size, the deflection of the beam and mismatches in the curvature. A method for analytic computation of the reflection matrix is developed by taking the convolution of the source function at the surface of the mirror with the paraxial propagator. The mirror surface that reflects spherical incoming wavefronts into spherical outgoing is found to be a paraboloid. Integral expressions for the reflection coefficients R superscript (mn) subscript (pq) for any incoming mode $u(mn)$ into the outgoing $u(pq)$ are obtained as functions of the deflection angle ϕ , the reflected beam spot size $W(\phi)$ and the mirror size. The coefficient R superscript (00) subscript (00) for the lowest-to-lowest mode reflection is determined analytically. The spot size $W(0)$ can then be selected, depending on the mirror size, to maximize R superscript (00) subscript (00). The ratio of the mirror size to the spot size is the dominant factor determining the reflection coefficient. The effects of deflecting the light beam enter as small corrections, of first order in diffraction angle $\theta(d) 1. (rh)$

Optical Heterodyne Densitometer.

A. L. Migdall, Y. C. Zheng, J. Hardis, and J. J.

Snyder. Sep 88, 5p

In NASA, Ames Research Center, Second Workshop on Improvements to Photometry p 249-253.

Keywords: Attenuators, *Densitometers, Heterodyning, *Light scattering, Mach-Zehnder interferometers, *Optical measuring instruments, Accuracy, Design analysis, Sensitivity.

Researchers are developing an optical heterodyne densitometer with the potential to measure optical density over an unprecedented dynamic range with high accuracy and sensitivity. This device uses a Mach-Zehnder interferometer configuration with heterodyne detection to make direct comparisons between optical and RF attenuators. Researchers expect to attain measurements of filter transmittance down to 10 to the minus 12th power with better than 1 percent uncertainty. In addition, they intend to extend the technique to the problem of measuring low levels of light scattering from reflective and transmissive optics.

Optical Feedback Locking of Semiconductor Lasers.

Patent.

B. Dahmani, and L. W. Hollberg. Filed 18 Oct 88, patented 6 Mar 90, 14p PB90-198797, PAT-APPL-7-259 088

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$: 50.

Keywords: *Semiconductor lasers, *Frequency stability, *Patents, Stabilization, Line width, Feedback control, Optical resonators, PAT-CL-372-32.

An optical method and apparatus is disclosed for stabilizing the frequency of semiconductor lasers. The basic system includes only the optical elements of a conventional semiconductor laser optically coupled to a separate, external resonator having an optical cavity with a particular resonance frequency. The optical geometry is configured such that the output from the resonator is fed back to the laser only when the laser frequency matches or substantially matches the resonance frequency. In other disclosed embodiments, optical electronic feedback loops are used to modulate the laser injection current to stabilize the frequency and to adjust the phase of the optical feedback signal.

Method and Apparatus for Producing a Photo-pumped VUV Laser in MO6+ Ion-Containing Plasma.

Patent.

U. Feldman. Filed 15 Nov 89, patented 3 Jul 90, 2p

PB90-238320, PAT-APPL-7-436 839

This Government-owned invention available for U.S. licensing and, possibly, for foreign licensing. Copy of patent available Commissioner of Patents, Washington, DC 20231 \$150.

Keywords: *Ultraviolet lasers, *Patents, Optical pumping, Molybdenum ions, Multicharged ions, Vacuum ultraviolet radiation, Plasma, PAT-CL-732-76.

The invention relates to a method and an apparatus for producing a photopumped VUV laser in an Mo(6+) ion-containing plasma comprise photopumping the Mo(6+) ion-containing plasma with radiation from Mo(11+) ions. In one embodiment, the Mo(6+) ion-containing plasma has an electron density of less than about 10 to the 18 power/cc and the Mo(11+) ions are contained in a plasma having an electron density greater than about 10 to the 20 power/cc.

Tunable Far Infrared Laser Spectroscopy.

Final rept.

K. M. Evenson, D. A. Jennings, and M. D. Vanek.

1988, 9p

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Frontiers of Laser Spectroscopy of Gases, p43-51 1988.

Keywords: *Far infrared radiation, *Spectroscopy, Spectral emittance, Electromagnetic radiation, Stimulated emission devices, Carbon dioxide lasers, Spectrum analysis, Calibrating, Reprints.

Tunable far-infrared (FIR) radiation has been generated using CO2 laser difference generation in metal-insulator-metal diodes either from the difference between a fixed frequency CO2 laser and a tunable waveguide laser, or from the difference between two fixed frequency CO2 lasers plus microwave sidebands. Our tunable FIR source is being used to make highly accurate FIR frequency measurements of stable species to serve as frequency and wavelength calibration standards; to measure frequencies of transient species (including molecular ions) for astronomical searches; and to study line broadening and line shape parameters especially for atmospheric spectroscopy applications.

Mode-Locked, Long Cavity, Erbium Fiber Lasers with Subsequent Soliton-Like Compression.

Final rept.

J. B. Schlager, Y. Yamabayashi, D. L. Franzen, and

R. I. Juneau. 1989, 3p

Sponsored by Naval Ocean Systems Center, San Diego, CA.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Photonics Technology Letters 1, n9 p264-266 Sep 89.

Keywords: Near infrared radiation, Infrared lasers, Pulse compression, Reprints, *Erbium lasers, *Fiber lasers, Model locked lasers, Solitons, Picosecond pulses.

Erbium fiber lasers are mode-locked at the fundamental cavity frequency using an integrated-optic intensity modulator driven by a novel pulse generator. Resulting optical pulses at 1536 nm are recorded with a synchroscan streak camera and have durations of 18-80 ps with peak powers over 6 W. The shorter cavities yield nearly transform-limited pulses which are narrowed by soliton-like compression to approximately 5 ps after propagation through an external 14 km fiber.

New Compensation Method for Bulk Optical Sensors with Multiple Birefringences.

Final rept.

K. S. Lee. 1989, 11p

Pub. in Applied Optics 28, n11 p2001-2011, 1 Jun 89.

Keywords: *Optical detection, *Birefringence, *Crystals, *Anisotropy, Tensor analysis, Electromagnetic properties, Optical properties, Electrooptics, Dielectrics, Wave propagation, Fiber optics, Reprints.

The dielectric tensor of an anisotropic crystal with multiple perturbations is presented to include the effects of multiple perturbations. To study electromagnetic wave propagation in anisotropic crystals subject to various influences the perturbed dielectric tensor is substituted into Maxwell's equation. Then, a 2×2 transmission matrix formalism, based on a normal-mode approach, is extended to anisotropic crystals possessing multiple birefringences to develop compensation schemes for ac optical sensors employing the crystal. It is shown that a new compensation method utilizing two analyzers can eliminate the effects of both unwanted linear birefringences and unwanted circular birefringences on the stability of the ac bulk polarimetric optical sensor. The conditions (here referred to as the quenching condition) in which the compensation method becomes important are also derived for both the voltage (or electric field) and current (or magnetic field) sensors.

Keywords: Reprints, *Free electron lasers, Racetrack microtrons, Laser oscillators, Tunable lasers, Picosecond pulses, National Institute of Standards and Technology.

A free-electron laser (FEL) user facility is being constructed at the National Institute of Standards and Technology (NIST) in collaboration with the Naval Research Laboratory. The FEL, which will be operated as an oscillator, will be driven by the electron beam of the racetrack microtron (RTM) that is nearing completion. Variation of the electron kinetic energy from 17 MeV to 185 will permit the FEL wavelength to be tuned from 200 nm to 10 micrometers. The FEL will emit a continuous train of 3-ps pulses at 66 MHz with an average power of 10-200 W, depending on the wavelength, and a peak power of up to several hundred kW. An experimental area is being prepared with up to five stations for research using the FEL beam. Initial operation is scheduled for 1991.

Current Status of Frequency Calibration Tables (0 to 3000 cm⁻¹) for Tunable Diode Lasers from Heterodyne Frequency Measurements.

Final rept.

J. S. Wells, M. D. Vanek, A. G. Maki, M. Schneider,

and A. Hinz. 1989, 16p

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Proceedings of International Symposium on Monitoring of Gaseous Pollutants by Tunable Diode Lasers (2nd), Freiburg, F.R.G., October 17-18, 1988, p122-137 1989.

Keywords: *Frequency measurement, *Carbon disulfide, Nitrogen oxide(N2O), Infrared spectra, Heterodyning, Semiconductor lasers, Tables(Data), Molecular spectroscopy, Reprints, *Carbonyl sulfide, *Nitrous oxides, *Calibration, Tunable lasers.

The research involves the use of heterodyne frequency measurements as well as the analysis and fitting of the infrared spectra of selected molecules. Of major interest are the linear triatomic molecules OCS and N2O, which together cover a sizeable portion of the 0 to 3000/cm region. Some heterodyne frequency measurements can be made by locking a tunable diode laser (TDL) to an absorption feature of OCS, for example, and comparing the TDL frequency directly against a CO2 laser frequency standard. The transfer oscillator techniques and calibration tables resulting from the new frequency measurements on OCS and CS2 are presented. Current status of calibration tables is given for an interim OCS atlas, an N2O atlas, and several other molecules of interest.

Tunable Dye Laser Spectrometry.

Final rept.

A. R. Schaefer, and N. P. Fox. 1987, 19p

Pub. in Advances in Standards and Methodology in Spectrophotometry, p325-343 1987.

Keywords: *Spectrophotometry, *Spectroradiometers, Interference filters, Irradiance, Transmittance, Reprints, *Laser spectroscopy, Continuous wave lasers, Tunable lasers, Dye lasers, Intercomparison.

The method of using a CW dye laser for spectroradiometric and spectrophotometric measurements as developed and practiced at NBS and NPL is described. A

brief review of the development of this concept at NBS is given, followed by a description of the present system and a proof of concept measurement with the NBS High Accuracy Spectrophotometer. The paper goes on to describe several intercomparisons which have relied on the use of dye laser spectrometry. These are an NBS electron storage ring - silicon detector - spectral irradiance scale intercomparison and an improved accuracy intercomparison of two primary radiometric standards: the NPL cryogenic radiometer and the PTB electron storage ring BESSY. Transmittance intercomparisons of NBS and NPS interference filters are also presented. Finally, a brief description is made of suggested proposals of future directions for research.

Calculation of Metameric Reflectances.
Final rept.
J. A. Worthey. 1988, 9p
Pub. in *Color Research and Application* 13, n2 p76-84
Apr 88.

Keywords: *Color, *Illuminating, Reflectance, Luminaires, Reprints, *Metamerism.

Object-color metamerism becomes visually apparent if two objects match under one light, but not under a second. In the present paper, a method if derived by which metameric object colors can be calculated, given the light under which they are to match, and the light under which they are to mismatch. While the method may not give the greatest possible mismatch under the second light, it comes close to doing so. It gives practical guidance for avoiding or achieving metamerism. The method is not primarily a matter of trial-and-error and statistics, but depends on a simple calculation that operates on the spectral power distributions of the two lights, and the sets of color-matching functions under the two lights. For a given person, of course, color-matching functions should remain constant, but the method can as well deal with 'observer metamerism,' meaning the effects of observer difference.

U.S. Investment Strategies for Quality Assurance.
Planning rept. 90-1.
Apr 90, 237p NIST/GCR-90/576
Contract NANB-8C5033
Sponsored by National Inst. of Standards and Technology, Gaithersburg, MD. Technology Services.

Keywords: *Semiconductor devices, *Quality assurance, *Investments, *Fiber optics, Industries, Trends, Case studies, Japan, Surveys, Corporations, Competition, Technology innovation, Optical fibers.

Investment trends and overall industrial strategies for quality assurance are analyzed. Case studies of the semiconductor and optical fiber industries are undertaken. Data collection for the case studies is accom-

plished through analysis of the relevant literature and telephone and mail surveys. Industrial quality is defined in terms of its major components to allow more detailed analysis of the foci of corporate strategies and the shifts in these strategies over time. Adoption of individual components as part of corporate strategy is not related to company size but rather to commitment to competing successfully in global markets. International comparisons of strategies are made. The U.S. optical fiber industry invests relatively more in quality than do its foreign competitors, but the industry defines quality in a narrower, more traditional way compared to the semiconductor industry. The latter has adopted, in response to intense foreign competition, adopted a broader, systems view of quality similar to that of the Japanese. NIST is judged by respondents to play a significant role in providing measurement technology that is relevant for quality-related strategies.

Modeling Refractive Index in Mixed Component Systems.
Final rept.

A. Feldman. 1988, 4p
Pub. in *Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Modeling of Optical Thin Films*, v821 p129-132 1988.

Keywords: *Optical materials, Refractivity, Thin films, Mixtures, Mathematical models, Measurement, Meetings, Optical coatings, Microstructure, Reprints, *Optical models, Predictive equations.

The refractive index of an optical film composed of a mixture of more than one constituent is a function of

the microstructure of the film. Even films that are nominally of a single material have refractive index values that require interpretation on the basis of mixed component models because the values differ significantly from the values in equivalent bulk materials. In the latter case, the film is usually a mixture of bulk material and voids, or bulk material, voids, and adsorbed water. Many models have been used to explain the refractive indices of mixed component systems. The Lorentz-Lorentz model, the Drude model, and the effective media approximation (EMA or Bruggeman model) are the most common models used to estimate isotropic refractive indices of mixtures of isotropic materials. Films composed of anisotropic microstructures, however, require other models such as the Bragg and Pippard model. One use of mixed component models would be to predict the porosity of optical films. Another would be to predict the refractive index of coevaporated films. However, no one model is applicable to all situations. Therefore, the prediction of refractive index becomes difficult. Usually, the model is chosen after the set of measurements has been done.

Bent Planar Waveguides and Whispering Gallery Modes: A New Method of Analysis.

Final rept.
I. C. Goyal, R. L. Gallawa, and A. K. Ghatak. 1990, 8p
Pub. in *Jnl. of Lightwave Technology* 8, n5 p768-774
May 90.

Keywords: Matrix methods, Bending tests, Losses, Reprints, *Optical waveguides, Whispering gallery modes.

A new matrix method is used to analyze bent planar optical waveguides. The method is a modification of an earlier method and may therefore be used with absorbing or leaky structures. The new method is a refinement of the old matrix method inasmuch as a non-uniform refractive index is approximated by a series of linear profiles rather than a series of uniform profiles. The method is used to analyze a bent planar waveguide, yielding bend loss directly. The effect of whispering gallery modes has also been studied. It appears that a whispering gallery explanation given earlier may not be adequate.

Scattered Light and Other Corrections in Absorption Coefficient Measurements in the Vacuum Ultraviolet: A Systems Approach.

R. Klein, W. Braun, A. Fahr, A. Mele, and H. Okabe. 1990, 8p
Prepared in cooperation with Rome Univ. (Italy), and Howard Univ., Washington, DC.
Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n3 p337-344 May-Jun 90.

Keywords: Ultraviolet spectrometers, Light scattering, Data acquisition, Error analysis, Correction, *Vacuum ultraviolet radiation, Absorption coefficients.

A systems approach in which computer automation is applied to a vacuum ultraviolet spectrometer and auxiliary components is described. The errors associated with the measurement of gaseous absorption coefficients in the vacuum ultraviolet are considered. The presence of scattered light introduces large errors particularly at those wavelengths where the source used is characterized by low intensity. In the case of a D2 light source this occurs in the region 120 to 130 nm. Simple considerations explain the variation of the absorption coefficient determinations in the presence of scattered light and lead to an appropriate treatment of the data to eliminate the error. Experimental results are presented illustrating the efficiency and precision obtainable with the present approach.

Scanning System for Measuring Uniformity of Laser Detector Response and Laser Beam Dimensions.

A. L. Rasmussen, W. E. Case, and A. A. Sanders. Apr 90, 101p NISTIR-90/3937

Keywords: *Optical scanners, *Laser beams, Dimensional measurement, Infrared detectors, Computer graphics, Optical measurement, Power measurement, Variability, Computerized control systems, High resolution, Optical detectors, Computer software.

The reliability of detector calibration depends upon the uniformity of detector response and the dimensions of the interacting laser beam. The report describes a computer-controlled scanning system for measuring these parameters. Appendixes A through J present many important details needed to understand and use the system. Appendix J describes the linear detector (ROSY 7-1) that monitors the detector under calibration in the scanning system. The device to be measured is scanned in a plane perpendicular to the axis of a stationary laser beam. Software using output and position data give surface graphics and information, and beam radius and shape. To determine linearity, measurements are made at two or more power densities. The user may determine experimentally the effect of changing beam size on uniformity measurements. Uniformity scans in the report fluctuated more for smaller beams than larger ones. They were smoothed and rounded for beams larger than coordinate steps. The remainder of the report describes system layout and interfacing parts, software, measurement procedures, examples, applications, and conclusions.

Optically Pumped Primary Frequency Standard.
Final rept.

R. E. Drullinger, J. H. Shirley, D. J. Glaze, and L. Hollberg. 1989, 5p
Pub. in Frequency Standards and Metrology, p116-119 1989.

Keywords: *Frequency standards, *Standards, Optical pumping, Reprints, Laser applications, US NIST.

An optically pumped primary frequency standard is being constructed at the National Institute for Science and Technology. To achieve the potential accuracy of this new technology, a thorough reconsideration of all the potential systematic errors has been undertaken. Based on the needs of the optical pumping process and other improved technologies (ovens and cavities), a unique beam tube has been designed and fabricated. The laser performance necessary to allow full realization of the optically pumped clock's potential has been achieved by an optical feedback technique. The design goal includes a total frequency uncertainty of no more than 10 to the -14 power.

Optical Waveguide Attenuation Measured by Photothermal Displacement.

Final rept.
R. K. Hickernell, J. A. Aust, and D. R. Larson. 1989, 3p
Sponsored by Johns Hopkins Univ., Baltimore, MD., and Army Research Office, Research Triangle Park, NC.
Pub. in Proceedings of International Topical Meeting on Photoacoustic and Photothermal Phenomena (6th), Baltimore, MD., July 31-August 3, 1989, p310-311.

Keywords: Near infrared radiation, Absorption, Attenuation, Losses, Reprints, *Optical waveguides, Integrated optics, Photothermal displacement.

The photothermal displacement technique is applied to the study of propagation loss in optical channel waveguides. Thermal expansion of the substrate surface due to the absorption of guided light is probed with a laser beam reflected from the surface. The technique is non-contact, has a high spatial resolution, and is applicable to a wide variety of waveguides, including packaged devices. Attenuation is measured in ion-exchanged glass waveguides at a wavelength of 1.3 micrometers.

Ultra Stable Cavity-Stabilized Lasers with Sub-Hertz Linewidth.

Final rept.
D. Hils, and J. L. Hall. 1989, 13p
Contract NASA-NAGW-822, Grant NSF-PHY86-04504

Sponsored by National Science Foundation, Washington, DC., and National Aeronautics and Space Administration, Washington, DC.
Pub. in Proceedings of International Symposium on Frequency Standards and Metrology (4th), Ancona, Italy, September 1988, p162-173 1989.

Keywords: *Frequency standards, Interferometers, Reprints, *Laser stability, Laser applications, Phase stability.

The authors found that it is readily possible to lock to an interferometer resonance with a noise level of about 50 mHz. Experiments reported elsewhere show that the authors are locking onto the 80 kHz linewidth cavity resonances with an accuracy of 1 or 2 Hz. The long-term stability of these suspended reference interferometers is surprisingly good. The observed length change of about -2 x 10 to the -10 power/day appears to be pure uniform drift which can be predicted with 1% accuracy or better for a day. There is preliminary evidence that, as far as aging is concerned, ULE may be a more attractive interferometer material than Zerodur. Finally, the authors are somewhat disappointed in the first experiments directly heterodyning two such cavity stabilized lasers.

Sulfurlike Spectra of Copper through Molybdenum.

Final rept.
V. Kaufman, J. Sugar, and W. L. Rowan. 1990, 8p
Sponsored by Department of Energy, Washington, DC. Pub. in Jnl. of the Optical Society of America B 7, n7 p1169-1175 Jul 90.

Keywords: *Atomic spectra, Arsenic, Bromine, Copper, Gallium, Germanium, Krypton, Molybdenum, Niobium, Rubidium, Selenium, Strontium, Yttrium, Zinc, Zirconium, Atomic energy levels, Reprints, Laser-produced plasma, Multicharged ions, Isoelectronic sequence.

The sulfurlike spectra of copper through molybdenum have been identified from observations in tokamak and laser-generated plasmas. Wavelengths of electric-dipole transitions of the 3s(2) 3p(4)-(3s3p(5)+3s(2) 3p(3)3d) array in the range 75 to 305 A are given. The wavelength uncertainty is estimated to be + or - 0.007 A. These data have been combined with previously reported wavelengths of magnetic-dipole transitions to determine energy levels for the isoelectronic sequence Cu XIV through Mo XXVII including Pb and Sr for which no observations were made. Ground configuration intervals obtained from magnetic-dipole transitions are compared with Dirac-Fock calculations to predict unknown values and to correct misidentifications. Wavelengths previously classified as chlorine-like in Cu through Zr are now classified as sulfurlike lines. A new set of observed and interpolated wavelengths for that transition is presented for Cu through Kr.

Characterization of a Pt-Ne Hollow Cathode Spectral Line Source.

Final rept.
J. Z. Klose, G. F. Hartig, and W. J. Rosenberg. 1990, 10p
Pub. in Applied Optics 29, n19 p2951-2959, 1 Jul 90.

Keywords: *Spectral lines, *Radiometry, *Standards, Ultraviolet radiation, Radiance, Chromium, Neon, Platinum, Reprints, Hollow cathodes.

A source which produces a rather uniform distribution of spectral lines over the wavelength range from 115 to about 350 nm is being investigated as a secondary radiometric standard for use in space. The source is a sealed lamp with a hollow cathode of platinum and a fill gas of neon. A version of the lamp has already been flown in space but only as a wavelength standard. The following properties were studied: warmup time, stability, emission as a function of current, repeatability, spatial characteristics, impurities, angular dependence, long term behavior, and radiance.

Scratch Standard Is Only a Cosmetic Standard.

Final rept.
M. Young. 1989, 7p
See also PB86-242013.
Pub. in Proceedings of SPIE (Society of Photo-Optical Instrumentation Engineers) Surface Characterization Testing II, v1164 p185-190 1989.

Keywords: *Optical measurement, *Standards, Reprints, *Optical surfaces, *Scratch and dig standards, Laser damage.

The author presents a history of the scratch-and-dig standard for optical surface quality and shows that this standard has since its inception been recognized as a cosmetic standard and not as an objective or performance standard. In addition, the author attempts to dispel the myth that the scratch standard was changed during the 1960s and shows that scratch number cannot be related to scratch width. Finally, the author describes a preliminary aging experiment that suggests that the scratch standards have not aged with time and are, in fact, extremely stable.

Absolute Specular Reflectometer with an Autocollimator Telescope and Auxiliary Mirrors.

Technical note (Final).

T. M. Wang, K. L. Eckertle, and J. J. Hsia. Aug 90, 32p NIST/TN-1280

Also available from Supt. of Docs. as SN003-003-03032-5.

Keywords: *Reflectometers, Infrared spectrophotometers, Reflection, Alignment, Mirrors, Strong method, Uncertainty.

The Strong method for measuring reflectance is used in many laboratories. However, an uncertainty in the angular position of the sample can lead to large errors. A novel use of an autocollimator telescope with two auxiliary mirrors (ACTAM) can reduce this angular uncertainty and lead to more accurate measurement of reflectance. The instrumentation, its adjustment, measurement procedure, results, and uncertainties are discussed. The total uncertainty for the reflectance measurement of a gold mirror was found to be less than 0.0025 over the wavelength region 2 to 22 micrometers.

Categorical Color Rendering of Four Common Light Sources.

Final rept.

R. M. Boynton, L. Fargo, and B. L. Collins. 1990, 9p Sponsored by National Eye Inst., Bethesda, MD.

Pub. in COLOR Research and Application 15, n4 p222-230 Aug 90.

Keywords: *Color, Sodium, Mercury, Tungsten, Incandescent lamps, Comparison, Reprints, Light sources, Metal halides.

Subjects were asked to sort samples from the Optical Society of America (OSA) Uniform Color Scales set into 33 color categories under four separate illuminants: tungsten-incandescent, metal halide, high-pressure sodium, and clear mercury. Sorting required that each color sample be designated as a 'good,' 'acceptable,' or 'poor' example within one of the eleven basic color categories specified by Berlin and Kay. Three indices of the categorical color-rendering capacity of the sources were developed. Assuming tungsten-incandescent as the reference illuminant, all three measures rated the color-rendering quality of the tested illuminants from best to worst in the order listed above, in agreement with the CIE color-rendering index.

Shape of the Silicon Absorption Coefficient Spectrum Near 1.63 eV.

Final rept.

J. Geist, A. Migdall, and H. Baltes. 1990, 7p

Pub. in Applied Optics 29, n24 p3548-3554, 20 Aug 90.

Keywords: *Silicon, Near infrared radiation, Absorption spectra, Energy gap, Reprints, Absorption coefficients, High resolution, Room temperature.

The authors report high precision, high spectral resolution measurements of the absorption coefficient of silicon in the spectral region from 1.61 to 1.65 eV. Their data show a smooth absorption spectrum with no discernible features in this spectral region where structure has been reported previously. Their data and analysis suggest that the second indirect transition in silicon has yet to be detected in absorption coefficient spectra.

Redistributed Spectrum of Scattered Light.

Final rept.

E. L. Lewis, and D. Szebesta. 1990, 8p

Pub. in Physical Review A 42, n3 p1424-1430, 1 Aug 90.

Keywords: *Light scattering, Rayleigh scattering, Fluorescence, Calcium, Argon, Excitation, Reprints, Atom-atom collisions, Redistribution functions.

The spectrum of redistributed light that results from excitation by monochromatic near-resonant incident light

has been observed in calcium perturbed by argon. The two components were found to be well described by the astrophysical redistribution functions R(II) and R(III) for the Rayleigh and fluorescent peaks, respectively. The Doppler width of the Rayleigh component was observed to be (square root of 2) larger than that of the fluorescent component, when observed at right angle to the incident beam, clearly demonstrating the coherence of this part of the scattering. The ratio of fluorescent to Rayleigh intensity was independent of detuning within the range examined, which was well within the impact region, and increased linearly with argon pressure in a manner that is consistent with an identification of the cross section for redistributing collisions with that for line broadening.

ADC Errors in Quantitative FT-IR Spectroscopy.

Final rept.

A. Baghdadi, and W. K. Gladden. 1985, 3p

Pub. in Proceedings of International Conference on Fourier and Computized Infrared Spectroscopy, SPIE 553, p207-209 1985.

Keywords: *Analog to digital converters, *Infrared spectroscopy, Error analysis, Reprints, *Fourier transform spectroscopy.

Analog-to-digital converters (ADCs) are the interface between the analog data actually collected by a Fourier transform infrared (FT-IR) spectrophotometer and the digital computer which processes these data. In the typical case of absorption spectra obtained using a broadband source, interferograms with a very wide dynamic range (typically on the order of one million:1) are required in order to produce spectra with adequate signal-to-noise ratios. This is a very demanding application, especially for a high-speed ADC. A numerical model of the effect of ADC errors, of + or - 1 least significant bit (LSB) shows that they can produce errors as large as 50% on the height of peaks in an absorbance spectrum at low signal levels. The result is consistent with the authors' experimental observations. They tested four ADC circuit boards (all the same model) in their FT-IR spectrometer. At low signal levels, the disagreement between peak heights in spectra collected using the different ADC boards ranged as high as 30%, even though none of them produced the low-wavenumber distortions characteristic of inadequate ADC performance.

Optical Stabilization of Semiconductor Lasers.

Final rept.

L. Hollberg. 1989, 5p

Pub. in Proceedings of Symposium on Frequency Standards and Metrology (4th), Ancona, Italy, September 5-9, 1988, p231-235 1989.

Keywords: *Semiconductor lasers, *Frequency stability, Stabilization, Line width, Reprints, Line narrowing, Optical feedback.

The method of using resonant optical feedback to stabilize the frequency of semiconductor lasers has proved valuable for a number of applications. It is one of a number of possible optical stabilization methods, as opposed to electronic stabilization methods, and

contrasts from other optical methods in that the optical feedback comes from a high Q (quality factor) optical resonator. This technique for frequency stabilization uses commercially available lasers and Fabry-Perot cavities and can reduce diode laser linewidths to as low as 3 kHz. The resonance of the Fabry-Perot cavity serves as the frequency reference which stabilizes the lasers oscillation frequency and narrows its linewidth.

Far Infrared Lasing Frequencies of CH2DOD.

Final rept.

E. C. C. Vasconcellos, and K. M. Evenson. 1990, 5p Pub. in International Jnl. of Infrared and Millimeter Waves 11, n7 p785-789 1990.

Keywords: *Frequency measurement, Far infrared radiation, Optical pumping, Infrared lasers, Deuterium compounds, Reprints, *Methanol lasers, *Laser frequencies.

The authors obtained laser action from the CH2DOD molecule optically pumped by CO2 laser radiation. Eight lasing transitions were identified as originating from CH2DOD; an additional 21 transitions also lased, but were assigned to the CH2DOH molecule, and 2 to CH3OH, even though the isotopic purity of the sample was given as 98%. The relative intensity, relative polarization and frequency of all the lines were measured. The eight lines are distributed between 145.8 and 479.2 micrometers.

Gilbert, and J. J. Bollinger. 1988, 18p

Pub. in AIP (American Institute of Physics) Conference Proceedings 175 on Non-Neutral Plasma Physics, Washington, DC., March 28-29, 1988, p93-110.

Keywords: Atomic spectroscopy, Reprints, *Ion plasmas, Ion traps, Laser cooling, Coupling.

Plasma Physics

Experiments on strongly-coupled nonneutral ion plasmas, performed at the National Bureau of Standards, are summarized. The authors first discuss strong coupling of small numbers (<100) of macroscopic and atomic ions confined in Paul (electrodynamic) traps, in which crystalline structures are observed. They then discuss experiments in which shell structure is observed for up to 10,000 atomic ions confined in static electric and magnetic fields. In their experiments, they have progressed from working with very small numbers of ions up to an intermediate value. Future experiments are suggested, including some where infinite volume behavior might be observable.

ELENDIF: A Time-Dependent Boltzmann Solver for Partially Ionized Plasmas.

Final rept.

W. L. Morgan, and B. M. Penetrante. 1990, 26p

Pub. in Computer Physics Communications 58, p127-152 1990.

Keywords: *Boltzmann equation, *Plasmas(Physics), Electron energy, Ionized gases, Distribution functions, Time dependence, Mixtures, Reprints, *ELENDIF computer program, Electron transport.

ELENDIF calculates the time evolution of the electron energy distribution function in a mixture of partially ionized gases with or without an applied electric field. The code can treat inelastic and superelastic processes, electron-electron and electron-ion collisions, photon-electron (free-free) processes, attachment and recombination, ionization including a distribution of secondary electrons, and an external source of electrons (e.g. an electron beam). The code also computes the mean electron energy, drift velocity, diffusion coefficient, rate coefficients and energy flow rates for the processes being included in the calculation.

Diffusion of Charged Particles in Collisional Plasmas: Free and Ambipolar Diffusion at Low and Moderate Pressures.

A. V. Phelps. 1990, 24p

Included in Jnl. of Research of the National Institute of Standards and Technology, v95 n4 p407-431 Jul-Aug 90.

Keywords: *Gas discharges, Space charge, Afterglows, Boundaries, Walls, *Collisional plasmas, Electron diffusion, Ionic diffusion, Ambipolar diffusion.

The interpretation of measurements of the properties of weakly ionized plasmas in terms of diffusion of electrons and ions is reviewed both critically and tutorially. A particular effort is made to tie together various aspects of charged particle diffusion phenomena in quiescent, partially ionized plasmas. The concepts of diffusion length and effective diffusion coefficient and the treatment of partially reflecting boundaries are developed in the limit of the space-charge-free motion of the electrons or ions. A simplified derivation of the screening length for space charge electric fields is followed by a review of the conventional derivation of diffusion in the ambipolar limit. The role of diffusion in the decay of charged particle densities and wall currents during the afterglow of a discharge is considered. The effects of collapse of the space charge field and of diffusion cooling are reviewed. Finally, the application of the diffusion models to a number of different discharges is discussed.
