Transport Critical Current of Aligned Polycrystalline Y1Ba2Cu3O7-delta and Evidence for a Nonweak-Linked Component of Intergranular Current Conduction.

J. W. Ekin, H. R. Hart, and A. R. Gaddipati. 1990, 11p

Sponsored by Department of Energy, Washington, DC., and Office of Naval Research, Arlington, VA. Pub. in Jnl. of Applied Physics 68, n5 p2285-2295, 1 Sep 90.

Keywords: \*Superconductors, \*Grain structure, Magnetic fields, Direct current, Polycrystalline, Alignment, Reprints, \*High temperature superconductors, \*Yttrium barium cuprates, \*Critical current, Weak links.

A study of grain alignment and its effect on the do transport critical current in fine-grained bulk Y1Ba2Cu3O(7-delta) is reported in magnetic fields from 0.0001 T to 26 T. The data clearly demonstrate that alignment alone significantly reduces the weak-link problem in fine-grained polycrystalline samples with low-aspect-ratio (4:1) grains (unlike melt-grown samples where there has been some ambiguity as to the relative importance of alignment versus large grain growth). Furthermore, the results provide strong evigrowth). Furthermore, the results provide strong evidence that there are two parallel components of inter-granular current conduction, one consisting of weak-linked material, the other behaving like intrinsic intragranular material that is not weak-linked. Field-cooled and force-free J(c) data are also presented, along with detailed measurements of the shapes of the voltagecurrent characteristics.

High T(sub c) Superconductors and the Critical
Current Measurement.

Final rept. L. F. Goodrich, and S. L. Bray. 1990, 11p Pub. in Cryogenics 30, p667-677 Aug 90.

\*Superconductors. Electrical measure-Kevwords: ment, Recommendations, Reprints, \*High temperature superconductors, \*Critical current, Interlaboratory comparisons.

With the introduction of high T(c) superconductors, a number of problems associated with critical current I(c) measurement have arisen. The existing I(c) measurement practices were developed and proved for low T(c) superconductors. There are substantial differences between the two classes of materials. When the ences between the two classes of materials. When the I(c) concept was casually extended to the high T(c) conductors, measurement inconsistency, ambiguity and, in some cases, invalidity followed. A discussion of the underlying philosophy of I(c) measurement is presented, and a number of measurement variables that can influence the measured I(c) are discussed. Many of the problems stem from inadequate reporting practices, and recommendations are given for improving measurement reports.

Final rept.

T. Ishida, and R. B. Goldfarb. 1990, 12p Sponsored by Ministry of Education, Science and Culture, Tokyo (Japan).

Pub. in Physical Review B 41, n13 p8937-8948, 1 May

Keywords: \*Superconductors, Magnetic measurement, Magnetic fields, Magnetization, Reprints, \*High temperature superconductors, \*Magnetic susceptibility, \*Yttrium barium cuprates, Temperature depend-

The authors have examined the complex harmonic magnetic susceptibilities chi(sub n) of the sintered high-critical-temperature superconductor YBa2Cu3O(7-delta). The experimental variables for the measurements of chi(sub n) were the sample temperature, the ac magnetic field amplitude, frequency, and the magnitude of a superimposed dc field H(dc). Results are given.

Madelung Potentials and Valences in the Y1Ba2Cu3O7 Superconductor. Final rept.

H. Ledbetter, and M. Lei. 1990, 3p Pub. in Physica C 166, p483-485 1990.

Keywords: \*Superconductors, Valence, Reprints, \*High temperature superconductors, \*Yttrium barium cuprates. Ewald method.

Using Ewald's method, the authors calculated the ionsite potentials and Madelung energy of Y1Ba2Cu3O7(orthorhombic, Pmmm, No. 47). They considered the effects of copper-ion and oxygen-ion valences. Among seven suggested copper-oxygen ion-charge configurations, only two give a low electrostatic bonding energy to agree with oxygen vacancies on O(1) sites. Only one configuration gives a realistic bulk modulus. The authors perturbed this configuration by equalizing the Cu(1)-Cu(2) valences and introducing a hole into the CuO2 plane at the oxygen sites. This configuration also agrees well with observation.

## **Solid State Physics**

Keywords: \*Superconductors, Electron phonon interactions, Shear modulus, Bulk modulus, Modulus of elasticity, Poisson ratio, Critical temperature, Bismuth oxides, Lead oxides, Strontium oxides, Calcium oxides, Polycrystalline, Reprints, \*High temperature superconductors, Young modulus, Debye temperature, Kresin model, Temperature dependence, Curvates

For polycrystalline (Bi-Pb)2Sr2Ca2Cu3O10, the authors report the 5-295-K elastic constants: shear modulus (G), Young modulus (E), bulk modulus (B), and Poisson ratio (nu). Both G and E show nearly normal temperature variation. During cooling, B softens between 215 and 65 K. The Poisson ratio decreases abruptly at 215 K and decreases almost five percent in the 295-5-K region. In its temperature dependence, this compound resembles YBa2Cu3O7. However, it shows much lower elastic stiffness. Corrected to the void-free state, the authors calculate a Debye temperature of 312 K, versus 436 K for YBa2Cu3O7. The Poisson ration, 0.20, agrees well with that of YBa2Cu3O7, 0.21. The authors use Kresin's model to interrelate Debye temperature, critical temperature, and electron-phonon interaction parameter for four classes of copper-oxide superconductors.

Break Junction Tunneling Spectroscopy of SingleCrystal Bismuth-Based High-Temperature Super-

conductors. Final rept. J. Moreland, C. K. Chiang, and L. J. Swartzendruber.

1990, 7p Pub. in Advances in Cryogenic Engineering (Materials) 36, p619-625 1990.

Keywords: Electron tunneling, Energy gap, Single crystals, Reprints, \*High temperature superconductors, \*Superconducting junctions, Bismuth strontium calcium cuprates, Break junctions.

The authors have measured the tunneling spectra of some high temperature superconducting crystal break junctions at 4 K. The samples were thin plates of Bi2SrCa2Cu2O5 compound. The tunneling spectra (conductance versus voltage) were not typical of BCS superconductor tunneling electrodes. The spectra of higher-resistance break-junction settings (R > 1 M ohm) show a tunneling gap on top of a linearly increasing conductance background signal. 'Harmonic' dip features in the spectra of lower resistance break junction settings (R < 1 M ohm) indicated tunneling between multiple particles in the vicinity of the primary (highest resistance) contact of the junction. The dips occurred at about the same current but shifted in voltage when the resistance of the break junction was continuously adjusted to new settings.

Final rept. R. L. Peterson, 1990, 4p Pub. in Jnl. of Applied Physics 67, n11 p6930-6933, 1

Keywords: \*Type 2 superconductors, \*Superconductors, Magnetic anisotropy, Magnetic hysteresis, Magnetization, Grain size, Single crystals, Reprints, \*High temperature superconductors, Critical current, Bean

A critical-state calculation of the magnetization of hard type-II superconducting grains having anisotropic critical-current densities is given. The analysis shows how the critical-current densities should be deduced from magnetization measurements for various grain morphologies. A universal curve of the magnetization hysteresis versus one of the grain dimensions is presented, showing that the hysteresis does not change linearly with grain size. Applications to single crystals and to bulk materials are made.

Calculation of Energy of Low-Angle Grain Boundaries.

Final rept. Pub. in Philosophical Magazine A-Defects and Mechanical Properties 55, n4 p499-511 1987.

Keywords: \*Grain boundaries, Reprints, Crystal dislocations, Elasticity.

Various techniques for calculating the linear elastic energy of low-angle grain boundaries are reviewed. The dependence of both elastic and inelastic contributions on boundary-plane orientation (n) and axis of rotation (u) is considered in detail. Particular attention is devoted to the treatment of the elastic contribution near the dislocation cores. The differences in elastic near the dislocation cores. The differences in elastic energy between the recent calculations of Rey and Saada (1977) and Bonnet (1981) with the classic calculation of Read and Shockley (1950) are explained by the differing treatments used by these authors for the region near the cores. The elastic energy for low-angle grain boundaries composed of three sets of parallel, equally spaced dislocations is calculated, within an easily understood convention for handling the region the cores, for the first time. The dependence of the total energy, elastic plus core, on (n) and (u) is given.

Keywords: \*X ray diffraction, Quantitative analysis, X ray analysis, Reprints, \*Reference intensity ratio.

The Reference Intensity Ratio (RIR) is a general, instrument-independent constant for use in quantitative phase analysis by the X-ray powder diffraction internal standard method. When the reference standard is co-rundum, RIR is known as I/I(c); These constants are collected in the Powder Diffraction File (1987), can be calculated, and can be measured. Recommended methods for accurate measurement of RIR constants are presented, and methods of using these constants for quantitative analysis are discussed. The numerous, complex constants in Copeland and Bragg's method introduced to account for superimposed lines can be simply expressed in terms of RIR constants and relative intensities. This formalism also permits introduc-tion of constraints and supplemental equations based on elemental analysis.

The development of the interface between cleaved n-and p-type InP(110) substrates and overlayers of Bi has been studied in the coverage range of 0.01 to 10 monolayers with use of soft-x-ray photoemission spec-troscopy. The attenuation and narrowing of the sub-strate in 4d and P 2p core-level spectra, as well as the strate In 4d and P 2p core-level spectra, as well as the line-shape development of the adatom Bi 5d signal, indicate that the morphology is of the Stranski-Krastanov type, as has been verified previously for 5b and Bi over-layers on GaAs(110). Specifically, the Bi grows in ordered two-dimensional patches that merge at 1 monolayer coverage, and beyond the coverage the deposited adatoms form three-dimensional clusters. The band bending as measured from energy shifts of the In 4d and P 2p spectra approaches midgap near 0.3 monolayer coverage, but between 0.3 and 1.0 monolayer the band bending for both doping types exhibits a reversal

An approach to measure semiconductor structures for nondestructive submicrometer metrology in the scanning electron microscope (SEM) at low accelerating voltage is described, using the collection and meas-urement of only the backscattered electron signal rather than the more commonly used secondary elec-tron signal. In this technique, the backscattered electron signal is collected using a high-efficiency micro-channel-plate electron detector system with the front face of the detector biased negatively to reject the low-energy secondary electrons thus collecting only the backscattered electrons. The advantage of using the backscattered electron signal is discussed, as well as a comparison to measurements using the secondary electron signal. The potential of this technique for application to accurate SEM metrology and standards development is also discussed.

Keywords: \*High temperature superconductors, \*Superconductors, Strontium additions, Crystal defects, Doped materials, Polycrystalline, Reprints, \*Lanthanum strontium cuprates, Lanthanum cuprates.

The authors have discovered that the apical oxygen with a 2.35-A La-O bond length is removed when La is substituted by Sr in polycrystalline La(2-x)Sr(x)CuO4 under normal preparation conditions. This apical oxygen can be partially filled by oxygen annealing. It is reasoned that a defect oxygen is trapped at an interstitial site near the Sr atom. The authors present evidence that this defect oxygen is intrinsic to Sr doping, independent of processing conditions. The authors propose that this defect oxygen serves as a mechanism for hole doping similar to that in the superconducting oxygen-rich La2CuO(4+y).

1989, 13p Pub. in Proceedings of International Symposium on High Temperature Superconducting Compounds: Processing and Related Properties, Las Vegas, NV., February 27-28, 1989, p597-609.

Keywords: \*High temperature superconductors, \*Superconductors, Fracture strength, Phase transformations, Microcracks, Toughness, Strains, Reprints, \*Yttrium barium cuprates.

Mechanical reliability is an important aspect of the technological application of high-temperature ceramic superconductors. The paper discusses the strength and fracture behavior of Ba-Y-Cu-O superconducting ceramics, and, more importantly, the influence that the microstructures of these materials impart to the mechanical properties. The sintering conditions are seen to have a profound influence on the microstructure development in these materials. In addition, large internal strains can develop on cooling from the sintering temperature. These strains result either from the phase transformation that occurs during oxygenation or from anisotropy in the thermal expansion. Since strain-relief by plastic deformation or diffusion is generally not active below the sintering temperature in these materials, these strains are most easily accommodated by microcracking. Such microcracking was seen to have a profound influence on the strength behavior.

Pub. in Specific Heat of Solids, Chapter 1, p1-89 1988.

Keywords: \*Specific heat, Lattice vibrations, Band theory, Superconductors, Spin waves, Spin glass state, Kondo effect, Reviews, Reprints.

A review of the theory describing the contributions of the lattice vibrations, conduction electrons and various magnetic excitations to the specific heat of solids is presented. The lattice contribution is described in terms of a number of models based on the harmonic approximation, namely, the simple Einstein and Debye models and the more realistic Born-von Karman model. The effect of anharmonicity of the lattice vibra-tions and of the formation of lattice vacancies on the specific heat at elevated temperatures is also considered. The contribution of the conduction of the conduction electrons in their normal state is described in terms of the free electron model and deviations from free electron behavior due to band structure and many-body enhancement effects are also discussed. The results for the specific heat of superconducting-The results for the specific heat of superconducting-state electrons as predicted by classical thermody-namics and BCS theory are described. Discussions of theoretical results describing magnetic contributions include the topics: spin-wave specific heat, specific heat in the critical temperature region, Schottky anom-alies and, the Kondo and spin-glass effects. An exten-sive list of references is included.

Possible 'Proximity Matrix' Route to High Current Conductors.

Final rept.

Moreland, Y. Li, J. W. Ekin, and L. F. Goodrich. 1990, 9p

Sponsored by Department of the Navy, Washington,

Pub. in Advances in Cryogenic Engineering (Materials), v36 ptA p413-421 1990.

Keywords: \*High temperature superconductors, \*Superconducting films, \*Yttrium barium cuprates, \*Silver coatings, Electrical conductivity, Vacuum deposition, Proximity effect, Powder(Particles), Reprints.

The conductance of point contacts between the surfaces of superconducting YBa2Cu3O(7-delta) thin films is very low. This is probably due to a native insulating surface layer. The conductance of these point contacts can be markedly increased by vacuum de-positing and subsequently annealing a thin layer of Ag into the surface of the films. The authors believe that what might be described as a normal-metal superconducting 'proximity matrix', is formed at the surface of the Ag coated YBa2Cu3O(7-delta) films. In the paper, they describe their efforts to adapt this method to YBa2Cu3O(7-delta) powder. In particular, they have developed a procedure for vacuum deposition of very thin Ag coatings onto the surface of YBa2Cu3O(X) powder grains. The Ag-treated powder is then pelletized, sintered, annealed, and cut to form small conducting bars for electrical transport testing.

A multiple technique approach is used to study YBa2Cu3O7 grown on SrTiO3 as a function of post-deposition annealing temperature. X-ray diffraction data are used to determine the relative amounts of aaxis and c-axis oriented growth. These results are compared to the surface morphology of the films observed by SEM. Secondary ion mass spectrometry (SIMS) is used to study the diffusion of substrate elements into the YBCO films as a function of post-deposition annealing temperature. The data obtained from all these techniques are correlated to determine an optimized temperature for post-deposition annealing. The results of the study show that the desired c-axis oriented growth can be obtained with minimal diffusion of substrate elements into the film at annealing temperatures of 750 C.

Amorphization and Conductivity of Silicon and Germanium Induced by Indentation.

D. R. Clarke, C. M. Kroll, P. D. Kirchner, R. F. Cook, and B. J. Hockey. 1988, 4p Pub. in Physical Review Letters 60, n21 p2156-2159,

23 May 88.

Keywords: \*Germanium, \*Silicon, Transmission electron microscopy, Electrical conductivity, Indentation, Reprints, \*Amorphization.

The authors report the observation, by transmission electron microscopy, that single crystal silicon and ger-manium is converted to an amorphous state at room temperature directly under both Vickers and Knoop indentations. The effect is seen for crystal orientations of (brackets: 001), (brackets: 011) and (brackets: 111), and with applied loads between 0.1 N and 0.5 N. They also observe that the materials become electrically conducting under load and that the process is reversible on subsequent unloading and reloading. Furthermore, the transformed phase is found to make ohmic contact to the surrounding, untransformed, semiconductor.

Micromagnetic Calculations of 180 deg Surface Domain-Wall Magnetization Profiles with Comparison to Measurements.

Final rept.

J. L. Blue, and M. R. Scheinfein. 1990, 3p See also PB91-107557. Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Applied Physics 68, n12 p6504-6506, 15

Keywords: \*Domain walls, Scanning electron microscopy, Mathematical models, Ferromagnetism, Magnetization, Permalloys, Comparison, Reprints, Landau-Lifshitz-Gilbert equation, Surface magnetism, Micro-

The authors compare measurements of magnetization profiles across 180 deg surface domain walls in a permalloy ferromagnet with calculations from micro-magnetic models. The models were solved both by re-laxation and by a time-evolution calculation. The measurements were made using scanning electron microscopy with polarization analysis. The authors obtain good agreement without postulating any surface ani-sotropy effect. This is the first successful comparison between experiment and a time-evolution calculation of domain walls.

Final rept.

D. Newbury. 1989, 40p
Pub. in SEM Microcharacterization of Semiconductors, Chapter 2, p29-68 1989.

Keywords: \*Electron beams, \*Semiconductors, Scanning electron microscopy, Beam interactions, Elastic scattering, Monte Carlo methods, Electron trajectories, Mathematical models, Analytic functions, Inelastic scattering, Reprints.

A quantitative description of electron beam - specimen interactions with solids forms the basis for developing models by which scanning electron microscope images of semiconductor materials and devices can be calculated. Elastic and inelastic scattering processes are considered, including both discrete and continuous energy loss descriptions. These processes can be described by analytic functions, and by considering both elastic and inelastic scattering, simulation of individual electron trajectories by Monte Carlo calculations is possible. Applications to specific problems of interest to semiconductor science and technology are described, including spatial resolution at interfaces, details of contrast in charge collection microscopy (electron beam induced conductivity), and energy deposition in solids.

Structural and Magnetic Properties of Er Thin Films and Er/Y Superlattices: Magnetoelastic Effects.

Final rept

J. A. Borchers, M. B. Salamon, R. W. Erwin, J. J. Rhyne, and R. R. Du. 1991, 14p Pub. in Physical Review B 43, n4 p3123-3136, 1 Feb

Keywords: \*Erbium, \*Yttrium, Thin films, Superlattices, Molecular beam epitaxy, Magnetic properties, X ray scattering, Magnetization, Neutron diffraction, Comparison, Interfacial tension, Ferromagnetic materials, Magnetoelastic waves, Strain tests, Reprints.

Crystalline erbium thin films and Er/Y superlattices with varying Er-layer thicknesses have been grown by molecular-beam epitaxy. The magnetic and structural

properties of these samples have been analyzed by x-ray-scattering, bulk magnetization, and neutron-diffraction techniques. From a comparison of the data for the two systems, the importance of interfacial strain relative to artificial modulation in shaping the magnetic behavior has been determined. Though the basic nature of the erbium magnetic order is not qualitatively altered in either the thin films or superlattices, the conical ferromagnetic phase is suppressed in all of the samples considered. The enhanced critical fields exhibit a sustantial dependance on Figures this tasks. hibit a systematic dependence on Er-layer thickness. These effects appear to follow directly from the epitaxial basal-plane strain which is measurable in films over 14,000 A thick. The strain, along with a 'clamping' of the Er thermal expansion to the Y lattice, leads to a reduction of the magnitude of the magnetoelastic energy that drives the ferromagnetic transition. The dependence of the magnetoelastic energy on the epitaxial strain is described by a model which accounts for the elastic coupling of the erbium lattice to the yttrium.

Sis of Magnetic Microsoft States Final rept.

M. H. Kelley. 1990, 18p
Sponsored by Department of Energy, Washington, DC.
Pub. in Australian Jnl. of Physics 43, p565-582 1990.

Keywords: \*Electron-atom collisions, Electron scattering, Ferromagnetic materials, Magnetic storage, Microstructure, Reprints, \*Electron spin polarization, Secondary electrons, Sodium atoms.

Two experimental programs are discussed which exploit the use of polarized electrons for studies of fundamental processes and physical properties. In one program, collisions between spin-polarized electrons and optically pumped sodium atoms provide a very detailed characterization of the spin-dependent interactions important in low-energy electron-atom collisions. The reportant in low-energy electron-atom collisions. The results of these measurements provide a critical test for the reliability of state-of-the-art electron scattering calculations. In the second program, the spin polarization of secondary electrons ejected by high-energy electron impact is used to determine the magnetic structure of ferromagnetic materials with very high spatial resolution (about 60 nm). The ability to perform such studies with high resolution has been exploited both in studies of the basic magnetic properties of ferromagnetic properties of ferromagnetic properties of ferromagnetic properties. studies of the basic magnetic properties of ferromagnetic materials and in studies of how these basic properties affect the magnetic structure and performance of devices used for magnetic information storage.

Keywords: \*Domain walls, Scanning electron microscopy, Bloch wall, High resolution, Nickel rich permalloy, Magnetic films, Single crystals, Iron, Reprints, Surface magnetism, Neel wall.

High-spatial-resolution magnetization maps of ferromagnetic surfaces are generated with use of scanning electron microscopy with polarization analysis (SEMPA). The structure of surface Neel walls is measured by SEMPA and compared directly to the results of micromagnetics simulations. The authors find that the surface magnetic properties observed with SEMPA can be modeled using standard micromagnetic theory using only bulk parameters. Surface-domain-wall magusing only bulk parameters. Surface-domain-wall magnetization profiles were measured, using two different probe diameters in each case, for an Fe(100) single crystal and for Permalloy films with thicknesses of 0.12, 0.16, 0.20, and 0.24 micrometer. The micromagnetic simulations show the 180 deg wall of the bulk turning over into a Neel wall at the surface with the magnetization in the plane of the surface. The Neel wall extends from the surface into the bulk over a depth approximately equal to a Bloch-wall width.

Development of a Three-Dimensional Finite Element Program for Large Strain Elastic-Plastic Solids.

Final rept.

J. H. Chiou, J. D. Lee, and A. G. Erdman. 1990, 15p Pub. in Computers and Structures 36, n4 p631-645

Keywords: \*Plastic properties, \*Three dimensional models, \*Computer calculations, Mathematical models, Elastic properties, Plastic deformation, Strain rate, Finite element method, Numerical solution, Reprints.

In recent years the progress in computational mechanics has made it possible to adopt more sophisticated constitutive models for solving complicated plasticity problems. For the formulation of elastic-plastic theory at finite strain, E. H. Lee decomposed the deformation gradient into a product of the elastic and plastic parts instead of assuming that the strain rate is the combination of the elastic and plastic strain rates. A finite ele-ment model has been formulated based on E. H. Lee's theory. Accordingly, a three-dimensional general pur-pose finite element software package has been developed. The simple tension problem and the simple shear problem are solved as examples so that the numerical solutions and the exact analytical solutions can be compared. Finally, a tensile test of a thin-walled aluminum alloy tube is solved and compared with the experimental data. The good agreement between the finite element solution and the experimental data demonstrates the validity and applicability of the proposed numerical model.

XPS and Auger Forward Scattering in Epitaxial Films.

Final rept. W. F. Egelhoff. 1987, 1p Pub. in Physics Today, pS-69 Jan 87.

Keywords: \*X ray photoelectron spectroscopy, \*Interfaces, \*Epitaxy, Forward scattering, Auger electrons, Thin films, Copper, Nickel, Reprints.

Very recently, a phenomenon long known in angle-re-solved x-ray photoelectron spectroscopy (XPS) has been reinterpreted. The new interpretation is that XPS peak intensities are enhanced at angles corresponding to axes connecting the photoemitting atom to its immediate neighboring atoms. These enhanced intensities thus identify the bond axes present near the surface. In the paper, examples are presented of the great power of the 'XPS searchlight' effect as a new tool for studying epitaxy and interfaces.

Models for Oxygen Ordering and Diffusion in
Ba2YCu3Ox and Ba2YCu3-yMyOx (M = Fe, Co, AI, Ga). Final rept.

A. Santoro. 1990, 4p Pub. in Materials Research Society Symposia Proceedings, v169 p185-188 1990.

Keywords: \*High temperature superconductors, Vacancies(Crystal defects), Twinning, Substitutes, \*Superconductors, Reprints, \*Yttrium barium cu-

One of the most important aspects of the structure of Ba2YCu3O(x) is the local arrangement of the oxygen atoms on the basal plane of the unit cell for compositions comprised between x=6.0 and x=7.0 (the 'basal plane' is defined by the copper atoms forming the Cu-O2 chains). The paper discusses, from a geometric point of view, models of vacancy formation and ordering in the pure compound, and possible configu-rations of the oxygen atoms in metal doped materials. These models take into account the existence of twinning in samples of composition 6.5 < or = x < or =7.0, are consistent with the observed movement of the twin walls occurring when the oxygen stoichiometry is varied and explain the symmetry and the composition of the metal doped compounds. As the oxygen atoms plane of the structure, in what follows one needs to consider only the atomic configuration on the plane and one may ignore all the other atoms in the unit cell.

Ion-Induced Radiation-Enhanced Diffusion of

Silver in Nickel. Final rept.

D. Marton, J. Fine, and G. P. Chambers. 1989, 5p Pub. in Materials Science and Engineering A115, p223-227 1989.

Keywords: \*Silver, Auger electron spectroscopy, Metal films, Thin films, Nickel, Reprints, \*Radiation enhanced diffusion, Multilayers.

Radiation-enhanced diffusion (RED) was observed during the Auger electron spectroscopy sputter depth profiling of multilayered Ag/Ni thin films. Broadening of the thin (4 nm) silver layers occurred during sputter profiling and resulted in silver Auger intensity profiles for each of these five layers which were asymmetric, exhibiting a steep leading edge followed by a more slowly decreasing tail. These findings can be interpreted in terms of interface broadening due to two main factors: (1) surface roughening--symmetric broadening; (2) RED of silver--asymmetric broadening. With the model, it has been possible to separate these factors and to determine the rate of RED.

101,499 PB91-175612 Not available NTIS National Inst. of Standards and Technology (NML), Gaithersburg, MD. Surface Science Div. Electron Attenuation Lengths at SiO2/Si Interfaces.

J. A. Yarmoff, S. A. Joyce, E. Cartier, and F. R. McFeely. 1990, 7p Pub. in Jnl. of Electron Spectroscopy and Related Phenomena 52, p221-227 1990.

Keywords: \*Silicon dioxide, \*Electron transport, Electron phonon interactions, Kinetic energy, EV range 1-10, EV range 10-100, Photoemission, Interfaces, Reprints, Attenuation length.

The attenuation length, lambda, was measured as a function of kinetic energy for low energy electrons (8-70 eV) traveling through SiO2 with the use of corelevel soft x-ray photoemission. Two oxides of different thickness were compared, and the extra attenuation resulting from the additional oxide on the thicker sample was used to determine the attenuation length. The curve resulting from an analysis which employs an exponential attenuation model displays a minima at an electron kinetic energy of about 35 eV, which is a result of scattering from the bulk plasmon. Below 35 eV, lambda increases and reaches a local maxima at about 20 eV, at which point lambda begins to decrease again. The decrease in lambda at low electron energies arises in part from electron-phonon scattering. This is confirmed by the shape of the bulk Si 2p photoemission peak observed on the thicker oxide sample, which is distorted by the phonon-induced loss processes.

Magnetic Ordering of Er in Powder and Single
Crystals of ErBa2Cu3O7.

T. W. Clinton, and J. W. Lynn. 1991, 4p Pub. in Physica C 174, p487-490 1991.

Keywords: \*High temperature superconductors, \*Superconductors, Temperature measurement, Powder(Particles), Single crystals, Reprints, \*Erbium barium cuprates, \*Magnetic ordering.

A comment is made on the article '2D and 3D Magnetic Ordering of Er in ErBa2Cu3O(x) (6 = or < x = or < 7), by Maletta, et al. We point out that our originally published Meissner Effect data conclusively shows that our sample is fully superconducting, contrary to their assertion. Secondly, we note that our tempera-ture measurements are done via a standard four-probe resistance measurement, which gives a correct value for the resistance of the calibrated thermometer, while their resistance measurements yield values which are systematically high, thus providing an incorrect temperature scale. Hence their own thermometry is in error rather than ours, contrary to their assertion.

X-ray Photoelectron Forward Scattering Studies of Surface Segregation in Epitaxial Cu-Ni-Ni(100)

Sandwich Structures.

Final rept. W. F. Egelhoff, 1989, 5p Pub. in Jnl. of Vacuum Science and Technology A 7, n3 p2060-2064 1989.

Keywords: \*Surfaces, Electron scattering, Metal films, Photoelectrons, Separation, Epitaxy, Copper, Nickel, X-rays, Reprints, Multilayers

The forward scattering of the Cu 2p(3/2) core level photoelectrons by overlying Ni lattice atoms which occurs in the photoemission process has been used to follow the segregation of Cu to the surface in epitaxial Ni-Cu-Ni(100) sandwich structures. When 1-monolayer of Cu is covered by 1-2 monolayers (ML) of Ni, surface diffusion processes constitute the mechanism by which the segregation occurs, whereas if 1 ML Cu is covered by 10 ML Ni or more, the segregation involves the usual bulk (vacancy) diffusion mechanism.

Magnetic Hysteresis of High-Temperature
YBa2Cu3Ox-AgO Superconductors: Explanation of Magnetic Suspension.

Final rept. C. Y. Huang, Y. Shapira, E. J. McNiff, P. N. Peters, B. B. Schwartz, M. K. Wu, R. D. Shull, and C. K. Chiang. 1988, 6p Pub. in Modern Physics Letters B 2, n7 p869-874 Aug

Keywords: \*High temperature superconductors, \*Superconducting composites, Magnetic hysteresis, Flux pinning, Magnetization, Levitation, Silver oxides, Reprints, \*Yttrium barium cuprates.

The authors have measured the magnetization M of superconducting YBa2Cu3O(x)-AgO composites with T(c) approximately equal to 92 K as a function of an applied magnetic field H at 77 and 87 K. A very pronounced M-H hysteresis loop occurs even at 87 K, indicating the presence of extremely strong pinning with ters. The results of these measurements, together with a simple model, explain quantitatively why these superconductors could be suspended below a magnet.

Superconducting Thin Films of Bi-Sr-Ca-Cu-O Obtained by Laser Ablation Processing. Final rept.

B. F. Kim, J. S. Wallace, L. J. Swartzendruber, J. Bohandy, L. H. Bennett, F. J. Adrian, E. Agostinelli, W. J. Green, K. Moojani, R. D. Shull, and T. E. Phillips. 1988, 3p

Pub. in Applied Physics Letters 53, n4 p321-323 1988.

Keywords: \*High temperature superconductors, \*Superconducting films, Electrical resistivity, Thin films, Reprints, \*Bismuth strontium calcium cuprates, Laser ablation, Microwave absorption.

Thin films of Bi-Sr-Ca-Cu-O, deposited on (100) cubic zirconia by laser ablation from a bulk superconducting target of nominal composition BiSrCaCu2O(x), have been investigated by dc resistance and magnetically modulated microwave absorption measurements. The latter technique reveals important features regarding the phase purity of superconducting samples that are masked in the dc resistance measurements. The su-perconducting behavior of the films, as a function of the substrate temperature during deposition and the post-deposition annealing conditions, is discussed.

Pub. in Proceedings of Topical Conference on High Tc Superconducting Thin Films, Devices and Applications of the American Vacuum Society, Atlanta, GA., September 1988, 853-860. tember 1988, p53-60.

Keywords: \*High temperature superconductors, \*Superconducting films, Temperature dependence, Partial pressure, Stoichiometry, Substrates, Oxygen, Sputtering, Thin films, Reprints, \*Yttrium barium cuprates.

The study was carried out to determine the effect substrate temperature, target to substrate angle, and the partial pressure of oxygen in the sputtering atmosphere on the stoichiometry. Films were deposited by planar magnetic sputtering of stoichiometric 1:2:3 pressed and sintered targets on MgO, ZrO2(Y) and ZrO2 coated Al2O3 substrates. DEX and WDS were used to determine the chemical composition of the thin used to determine the chemical composition of the fining. X-ray diffraction was used to identify the structure after film crystallization at 1175K and oxidation at 800K. The partial pressure of oxygen appears to have the most profound effect on the stoichiometry by lowering the barium content. Negative ion resputtering of the growing film apparently also slows film growth rate. Films deposited on alumina circuitboard with a ZrO2 barrier layer have demonstrated transitions to superconducting behavior at 95K when the stoichiometric ratio is preserved.

New materials with enormous practical interest are now being produced in industry by far more sophisticated processing methods than those used a decade ago. The structure of these advanced materials is not in a 'stable' state normally found in nature. Even traditional structural materials used for familiar industrial components are virtually all frozen configurationally from states that are metastable or unstable before freezing. Moreover, some materials contain non-equilibrium atomic level dispersions of impurities and topologically metastable structures. In the areas of electronics and electrooptics, materials have already been made with structural control at the atomic level. The wide use of single crystals and single crystal layers as industrial materials requires precise information on atomic behavior during modern processing, such as Czochralski growth and chemical vapor deposition.

Success with such 'high-tech' materials requires the knowledge of new ways to arrange atoms in order to achieve the desired properties.

Keywords: Monochromatic radiation, Synchrotron radiation, Gallium arsenides, Single crystals, Topography, Reprints, \*Diffraction imaging.

Streaking images restricted to the direction of the dif-Streaking images restricted to the direction of the direction (scattering) vector have been observed on transmission through undoped GaAs. These disruption images (caused by the reduction of diffraction in the direction of observation) appear both in the forward and in Bragg diffracted directions in monochromatic synchrotron radiation diffraction imaging. This previously unobserved phenomenon can be explained in terms of the effective volume of planar defects or platelets which affects the absorption coefficient in anomalous transmission. Such regions of the crystal look perfect despite the presence of imperfections when the scattering vector is not perpendicular to the normal of the platelets.

Fundamental information about the structure of the va-Fundamental information about the structure of the varience band and the chemical valence states of the various constituents of the La-Sr-Cu, Y-Ba-Cu, Bi-Sr-Ca-Cu and Ti-Ca-Ba-Cu oxides have been obtained using photoelectron spectroscopy. These results show that the one-electron theories do not adequately describe the electronic structure of these superconductors. The atomic origins of the features observed in the valence bands have been investigated by studying photoemission resonances and changes in excitation cross-sections with photon energy. Results to date suggest that these materials have varying densities of states at the Fermi level, valence bands composed of O 2p and Cu 3d states, and display no significant changes in the band structure associated with the superconducting behavior when the temperature is lowered below T(c). In addition, the complex surface chemistry of these oxides make it essential to study the surface stoichiometry and the interaction of simple molecules. O2 and CO are found to interact only weakly with the surfaces of the materials studied to date, while H2O and CO2 react strongly, forming hydroxides and carbon-

Keywords: \*High temperature superconductors, \*Superconductors, Neutron scattering, Inelastic scattering, Electron tunneling, Phonons, Reprints, \*Neodymium cerium cuprates, Density of states.

Inelastic-neutron-scattering techniques have been used to measure the generalized phonon density of states in superconducting Nd(1.85)Ce(0.15)CuO4. There is reasonable agreement at low energies between the authors' measurements and recent pointcontact-tunneling density-of-states measurements reported by Huang et al., which suggests that phonons play a major role in pairing in the electron-superconductor systems. The correspondence at higher energies, however, is not particularly good, but probably reflects the difficulty in obtaining quantitative tunneling data.

The authors report the structural and electronic properties of Cs adsorbed on room-temperature GaAs and InSb (110) surfaces as observed with scanning tunneling microscopy. Cs initially forms long one-dimensional (1D) zigzag chains on both surfaces. Additional Cs adsorption on GaAs(110) results in the formation of a 2D overlayer consisting of five-atom Cs polygons arranged in a c(4x4) superlattice. The tunneling gap measured over these insulating structures narrows with the transition from 1D to 2D, with metallic characteristics observed following saturation with a second Cs overlaver.

The development of thin-film dielectrics compatible with the epitaxial growth of YBa2Cu3O(7-delta)(YBCO) is crucial to the fabrication of multi-layer device and circuit structures. The authors have investi-gated the YBCO/SrTiO3(STO) system by fabricating YBCO/STO bilayers and simple YBCO/STO/YBCO crossover structures. The thin films were deposited in crossover structures. The thirl milms were deposited in situ by pulsed laser deposition and analyzed using x-ray diffraction and scanning electron microscopy. The film interfaces were characterized by secondary ion mass spectrometry (SIMS) depth profiling. They have developed photolithographic and wet-etching processes for patterning the crossovers which are compatible with these materials. The crossover structures were characterized by resistance and insulator pinhole density as well as the superconducting properties of the patterned top and bottom YBCO electrodes (critical temperature, T(c) and critical current density, J(c)). Using SrTiO3 as the insulating layer, they have made crossovers with good isolation between layers (>100 Megohm) and high J(c) even in the top electrode (J(c)(76 K) > 100,000 A/cm squared.

Keywords: \*Yttrium iron garnets, Ferromagnetic resonance, Ultrahigh frequency, Spin waves, Line width, Thin films, Damping, Reprints.

Subsidiary absorption butterfly curves of spin-wave instability threshold versus static in-plane field have been obtained for yttrium iron garnet (YIG) thin films at 3 GHz. The butterfly curves have been found to be rather anomalous, typically displaying a pronounced dip and a very low minimum threshold. These anomalous features are attributed to the overlap of the subsidiary absorption field region with ferromagnetic resonance (FMR). First-order instability theory was extended to include the uniform mode response near rended to include the uniform mode response near FMR. The extended theory yields good fits to the data for reasonable values of the YIG FMR linewidths. The theoretical analysis also shows a predicted flip in the azimuthal propagation angle phi(sub k) for the unsta-ble spin waves in the region of FMR overlap. With increasing field, there are predicted discontinuous changes in phi(sub k) from 90 deg. to 0 deg. and back to 90 deg. in the region of FMR.

The technique of soft x-ray fluorescence spectroscopy (SXE) is complimentary to that of photoemission spectroscopy (PES). SXE probes the local partial density of states (PDOS), selects dipole allowed symmetries, and is not necessarily surface sensitive. PES on the other hand, averages over the DOS and can be used to measure the dispersion of the energy bands. PES is also very surface sensitive. The authors present measurements on the high T(c) superconductors, the quasi-crystalline phase of AIMn, and the LiAI intermetallic alloy. These measurements provide insight for theoretical modeling. In the case of the high T(c) compound and the intermetallic compound, the measurements are in good agreement with the theory. However, for the quasicrystals, the measurements provide new insights to challenge theory.

A report of work in progress to determine the feasibility of imaging the magnetization of ferromagnetic samples with the scanning tunneling microscope (STM) is presented. A vacuum system was designed to test several different proposals as well as to prepare and characterize thin films of magnetic materials by conventional means, including STM. This was begun with an attempt to detect spatially resolved spin-polarization of secondary electrons emitted from the sample when operating the STM in the scanning field emission mode. Results are currently inconclusive, but encouraging. A weak spin-polarization signal has been observed corresponding to one of the in-plane components of magnetization. However, topographic feedth-rough has not been fully eliminated as a possible spurious source of contrast.

Group and Phase Sound Velocities in an Eu1Ba2Cu3O7 Superconductor and Related Perovskite Oxides.

Final rept.

H. Ledbetter, C. M. Fortunko, and S. Lin. 1990, 5p Pub. in Proceedings of Ultrasonics Symposium, Hono-lulu, Hl., December 4-7, 1990, p1215-1219.

Keywords: \*Acoustic velocity, \*Superconductors, Barium titanates, Strontium titanates, Phase velocity, Group velocity, Ultrasonic radiation, Reprints, \*Europium barium cuprates.

A material's longitudinal sound-wave velocity relates strongly to the electron-lattice interaction, which affects both conductivity and superconductivity. Measuring phase velocity versus frequency, v(omega), reveals dispersion, which may arise from various sources. To measure v(omega) accurately over a large frequency range, the authors used a modified amplitude-spectrum, pulse-echo method. Specifically, they used a buffer rod whose elastic impedance differed substantially from that of the specimen. Also, they used very broadband ultrasonic transducers and a broadband receiver with large dynamic range. They established the validity of their measurement method by measuring BaTiO3 and SrTiO3 polycrystals. They then used the method to measure the longitudinal-wave velocities in an Eu1Ba2Cu3O7 superconductor, both at 295 and 76 K. Against expectation, they found no remarkable dispersion.

Keywords: \*Crystal field, Time-of-flight method, Neutron scattering, Inelastic scattering, Magnetic mo-ments, Heusler alloys, Reprints, \*Holmium palladium stannides, \*Erbium palladium stannides, Magnetic superconductors.

Neutron inelastic scattering measurements have been taken with triple-axis and time-of-flight techniques to determine the crystal field levels of the rare-earth ions in the cubic Heusler alloys HoPd2Sn and ErPd2Sn. The observed excitations have been identified as crystal field in origin by their dispersionless character as well as by the temperature and wave-vector dependence of the intensities. Analysis of the data shows that the energies and intensities can be understood on the basis of a crystalline electric field with cubic point symmetry, with Lea, Leask, and Wolf parameters of W = 0.0287(4) meV, x = 0.3248(8) for HoPd2Sn, and W = -0.0450(4) meV, x = 0.3022(6) for ErPd2Sn. The crystal field parameters for the other rare-earth elements have also been calculated by scaling to the values determined for HoPd2Sn.

Pub. in Proceedings of Scanning '91, Atlantic City, NJ.,
April 8-12, 1991, pl-21 1990.

Keywords: \*Scanning electron microscopy, \*Semiconductors, Microchannel electron multipliers, Electron scattering, Backscattering, Metrology, Reprints, Sec-

An approach to measure semiconductor structures for nondestructive submicrometer metrology in the scan-ninng electron microscope (SEM) at low accelerating voltage is described, using the collection and meas urement of only the backscattered electron signal rather than the more commonly used secondary electron signal. In the technique, the backscattered electron signal is collected using a high-efficiency microchannel-plate electron detector system with the front face of the detector biased negatively to reject the low-energy secondary electrons thus collecting only the backscattered electrons. The advantage of using the backscattered electron signal is discussed, as well as a comparison to measurements using the secondary electron signal. The potential of the technique for application to accurate SEM metrology and standards development is also discussed.

Inverse Correlation between the

nescence Excited by Electrons and by Visible Light in Chemical-Vapor-Deposited Diamond Films.

Final rept. L. H. Robins, E. N. Farabaugh, A. Feldman, and L. P. Cook. 1991, 6p Pub. in Physical Review B 43, n11 p9102-9107, 15 Apr

Keywords: \*Cathodoluminescence, \*Photoluminescence, Chemical vapor deposition, Raman spectra, Thin films, Reprints, \*Diamond films.

Diamond films grown by filament-assisted or microwave-plasma-assisted chemical-vapor deposition

(CVD) were characterized by photoluminescence (PL), cathodoluminescence (CL), and Raman spectroscopies. The laser-excited PL spectra of these films in and near the carbon Raman region (1100-1800/cm from the 514.5-nm laser line, or 2.18-2.28 eV) are broad and featureless; CL spectra measured within a wider spectral range (1.5-3.5 eV) shows several distinct components. Because of its correlation with the Raman band of sp2-bonded carbon, the visible-laser-excited PL in the carbon Raman region is attributed to sp2-bonded carbon clusters. The spectrally integrated CL intensity is found to vary from specimen to specimen approximately inversely with the intensity of the laser-excited PL. The inverse correlation is especially strong for one component of the CL, a broad band at 2.85 eV. To explain these results, it is proposed that the luminescence centers in these CVD diamond films can be classified into two types with differing excitation and recombination properties. Rate equations are derived for the luminescence kinetics of such a system of two types of recombination centers.

Optically Detected Magnetic Resonance Study of Antisite-to-Acceptor and Related Recombination Processes in as-Grown InP-Zn.

Final rept.

L. H. Robins, T. A. Kennedy, and P. C. Taylor. 1988,

Pub. in Physical Review B 38, n18 p3227-3236 1988.

Keywords: \*Indium phosphides, Electron spin resonance, Magnetic resonance, Point defects, Doped materials, Photoluminescence, Zinc, Reprints, Antisites.

The paramagnetic state of the phosphorus-on-indium The paramagnetic state of the phosphorus-on-indium antisite has been observed by optically detected magnetic resonance (ODMR) in as-grown zinc-doped indium phosphide. The antisite resonance is seen both as an enhancing ODMR signal on the antisite-acceptor photoluminescence (PL) at 0.8 eV and as a quenching ODMR signal on the shallow-donor-acceptor PL at 1.37 eV. The dependence of the ODMR on microwave power, microwave modulation frequency, and photoexcitation intensity is examined, and a rate equation model is developed for the important recombination processes. The experimental results suggest that the antisite-acceptor recombination rate is approximately 40,000/s; the antisite electron spins are unthermalized, but recombine with spin-thermalized holes; and the antisite concentration may be greater than 2 x 10 to the 15th power/cc. Two other resonances are also observed, the shallow donor resonance at g=1.217 and an unidentified broad resonance at g=2.0.

Photoluminescence Excitation by Band-Gap Opti-cal Absorption in Chemical Vapor Deposition Diamond Films.

L. H. Robins, P. J. H. Tjossem, K. C. Smyth, P. Y. Barnes, E. N. Farabaugh, and A. Feldman. 1991, 7p Pub. in Jnl. of Applied Physics 69, n6 p3702-3708, 15

Keywords: \*Photoluminescence, Chemical vapor deposition, Laser spectroscopy, Thin films, Excitation, Reprints, \*Diamond films.

Photoluminescence excitation (PLE) spectra at photon been obtained for diamond films grown by the filament-assisted chemical vapor deposition (CVD) method. The PLE intensity was observed to increase abruptly with photon energy above 5.5 eV. This increase coincides with the onset of phonon-emissionassisted interband absorption, which was observed independently by diffuse transmittance measurements. A lower-energy PLE threshold at about 5.25 eV, which coincides approximately with the onset of phonon-absorption-assisted interband absorption, was observed in the spectrum of a gem-quality natural diamond, but not in the spectra of the CVD-grown films. Emission spectra of the luminescence excited by above-bandgap photons have features similar to luminescence spectra of the same specimens excited by 20-keV electrons. The spectrally integrated intensities of the luminescence excited by above-band-gap photons and by electrons were found to vary from specimen to

## Solid State Physics

specimen in a linearly related manner, suggesting that similar recombination processes occur in both cases.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 27, n2 p1616-1618 Mar 91.

Keywords: \*High temperature superconductors, \*Superconducting films, Strontium titanates, Magnesium oxides, Thin films, Microstructure, Morphology, Annealing, Substrates, Silver, Reprints, \*Yttrium barium cuprates, Lanthanum aluminates, Laser ablation.

The morphology of silver layers deposited and annealed on laser ablated YBa2Cu3O(7-delta) films has been examined. Silver was found to dewet the YBa2Cu3O(7-delta) (001) surface on annealing in oxygen and nitrogen. This dewetting behavior may be kineticly inhibited by using either thick silver layers or short anneals and low temperatures. Silver layers for the Appendix of the property thick was studied on films do nm to 2.5 micrometers thick were studied on films de-posited on SrTiO3, LaAlO3 and MgO substrates. Anneal times were varied from 6.5 min to 15 hrs at temperatures from 200 to 700 C.

Effect of an Electric Field on the Morphological
Stability of the Crystal-Melt Interface of a Binary
Alloy. 3. Weakly Nonlinear Theory.
Final rept.

Final rept.

A. A. Wheeler, G. B. McFadden, S. R. Coriell, and D. T. J. Hurle. 1990, 11p See also PB90-193541.

Pub. in Jnl. of Crystal Growth 100, n1-2 p78-88 Feb 90.

Keywords: Binary alloys, Crystal growth, Electric fields, Electromigration, Electroepitaxy, Stability, Reprints, \*Crystal-melt interface.

The effect of a constant electric current on the crystalmelt interface morphology during directional solidifica-tion at constant velocity of a binary alloy is considered. A linear temperature field is assumed, and thermoelectric effects and Joule heating are neglected; electromigration and differing electrical conductivities of crystal and melt are taken into account. A two-dimensional weakly nonlinear analysis is carried out to third order in the interface amplitude, resulting in a cubic amplitude equation that describes whether the bifurcation from the planar state is supercritical or subcritical. For wavelengths corresponding to the most dangerous mode of linear theory, the authors calculate the demarcation between supercritical behavior as a function of processing conditions and material parameters. The bifurcation behavior is a sensitive function of the magnitude and direction of the electric current and of the electrical conductivity ratio.

Scanning Tunneling Microscopy Study of Clean
and Cs-Covered InSb(110).

L. J. Whitman, J. A. Stroscio, R. A. Dragoset, and R. J. Celotta. 1991, 5p

Sponsored by Office of Naval Research, Arlington, VA. Pub. in Jnl. of Vacuum Science and Technology B 9, n2 p770-774 Mar/Apr 91.

Keywords: \*Indium antimonides, Scanning tunneling microscopy, Crystal defects, Surfaces, Coatings, Cesium, Reprints.

Scanning tunneling microscopy has been employed to study clean and Cs-covered InSb(110) surfaces. Atomic-resolution images of both the filled and empty electronic state densities have been obtained. The surface relaxation determined from these images is in good agreement with that predicted by structure calculations. A variety of surface defects have been ob-served, with the most common appearing to be simple Sb vacancies. Adjacent In and Sb vacancies (Schottky defects) have also been observed. The perturbation of the surface surrounding these defects is asymmetrical along (in brackets: 001), as might be expected due to the asymmetry in the surface. Surprisingly, the perturbation is also asymmetrical along (in brackets: 1,-1,0), where symmetry is expected. Cs adsorbed on room-temperature InSb(110) forms one-dimensional zig-zag chains along (in brackets: 1,-1,0), similar to those previously observed on GaAs(110).

Sponsored by Carnegie-Mellon Univ., Pittsburgh, PA.
Pub. in Jnl. of Crystal Growth, p419-441 1989.

Keywords: \*Crystal growth, \*Two-dimensional calcula-tions, \*Anisotropy, \*Kinetics, Single crystals, Rates(Per time), Morphology, Mathematical models, Liquid-solid interfaces, Fourier transformation, Heat flow, Cooling, Surface tension, Stability, Computation, Quasi-steady states.

A model of the free growth of a two-dimensional single crystal of pure material from an undercooled melt is presented. Quasi-steady-state heat flow and anisotropic interfacial properties couple in the model, governing the morphology of the evolving crystal-melt interface. The evolution of an initially slightly perturbed circular crystal as it grows from the linear into the nonlinear regime both in the absence and in the presence of anisotropic interfacial growth kinetics is studied. The calculations show that in the absence of kinetic anisotropy, splitting of the tip of an initial perturbation occurs. For an initial shape consisting of two Fourier components, a resonant growth effect of the high frequency Fourier component occurs for special initial configurations. Furthermore, the overall rate of crystal growth is shown to be only of the heat extracted from the system and is virtually independent of the interface shape; this is a consequence of the quasi-steady state approxima-tion to heat flow. In the presence of anisotropic growth kinetics, tip stabilization may be observed for certain initial conditions. However, a resonant growth effect can still act to destabilize the tip even in the presence of anisotropic interfacial growth kinetics.

Keywords: \*High temperature superconductors, Electrical measurement, Critical current, Niobium stannides, Reprints, Switching voltages, Yttrium barium cuprates, Niobium titanium, Weak links.

Switching voltages can occur in four-wire current transport measurements of sintered high-T(c) superconductors. These switching voltages are irreversible shifts in the voltage-current characteristic of the superconductor that result in multiple branches. The voltage along these branches can be very nonlinear as a func-tion of current and can be positive or negative in polari-ty relative to the current direction. These voltages can interface with the correct determination of resistivity and critical current density. Experimental data on unaligned sintered Y1Ba2Cu3O(7-delta) which illustrate the complex nature of the voltages and the confusion they can create are presented. Models based on weak links and H(c1) and on other effects, are discussed as are observations on NbTi and Nb3Sn based superconductors.

A hierarchy of dielectric sphere models is presented to account for the shift in binding energy with particle size for a core hole at the center of a jellium sphere of radius R. It is shown that the classical final state interaction between the screening charge deficit at the cluster surface and the localized core hole is indeed very important as recently suggested in the literature, so that for a wide range of R the relaxation energy shift is only weakly dependent on metal dielectric proper-ties. The breakdown of the simple classical rule ob-served below R 20au requires further study both theo-retically and under more controlled experimental conditions.

Keywords: \*Silicon, Ionization cross sections, Electron transitions, Conduction bands, Valence bands, Doped materials, Photoionization, Silver, Platinum, Gold, Phonons, Reprints, Lattice relaxation.

Photoionization cross-section spectra from deep centers in silicon doped with technologically important 4d-and 5d-transition elements were analyzed by the Ridley and Amato lattice coupling model to determine threshold energy and lattice relaxation parameters corresponding to optically induced transitions involving either band. The average optic phonon energy is 50 meV. Electron transitions to the conduction band from the silver, platinum, and gold acceptor centers have, respectively, threshold energies (in meV) E(To) = 550, 226, and 570. For silver and gold, the Huang-Rhys parameter S could not be determined because of a mixture of both allowed and forbidden transitions; for platinum, S = 0.3. Electron transition data from the donor centers of these elements to the conduction band are not available or insufficient to allow analysis of the threshold region.

Keywords: \*High temperature superconductors, \*Semiconductor devices, \*Circuit interconnections, \*Electric contacts, \*Superconductors, Gallium arsenides, Silicon, Reprints, Yttrium barium cuprates, Ohmic contacts.

Development of high temperature superconductor -semiconductor contacts with very low contact resistivi-ties is required for microelectronic applications such as circuit interconnects or superconductor - semiconduc-tor - superconductor (S/Semi/S) proximity effect de-vices. Several thin-film depositon methods have been developed for forming very low resistance contacts to

high temperature superconductors. Such a contact could potentially be part of a superconductor - semi-conductor contact that relies on an intervening normal metal, spanning superconductor and semiconductor interfaces. Presently the authors are surveying materials commonly used to make ohmic contacts to Si and GaAs for their compatibility with high-temperature superconductors. Prime material characteristics necessary for potential contact structures are (1) low chemical reactivity of the intervening materials with high-temperature superconductors, (2) limited interdiffusion of multilayer constituents, and (3) stable, low contact resistivity, ohmic I-V characteristics.

7. Moreland, and P. Rice. 1991, 4p Pub. in IEEE (Institute for Electrical and Electronics Engineers) Transactions on Magnetics 27, n2 p1198-1201 Mar 91.

Keywords: \*Images, \*Tunnel effect, Cryogenics, Superconductors, Magnetic forces, Resolution, Superconducting junctions, Superconducting films, Reprints, \*Tunneling stabilized magnetic force microscopy, Magnetic force microscopes, Flux lattice, Bitter patterns, Yttrium barium cuprates.

The authors have recently demonstrated an imaging technique referred to as tunneling stabilized magnetic force microscopy or TSMFM. TSMFM is performed using a scanning tunneling microscope (STM) with a flexible, magnetic, tunneling tip in place of the usual rigid tunneling tip. TSMFM images are therefore comparation of the control of the c binations of topography and the magnetic forces be-tween the tip and the sample. Room temperature TSMFM images of magnetic bit tracks on a hard disk ISMFM images of magnetic bit tracks on a hard disk have 100 nm resolution and are comparable to Bitter patterns made using a ferrofluid. They have built a low temperature STM with the hope of getting TSMFM images of the flux lattice in superconductors. Preliminary TSMFM images of a YBa(2)Cu(3)O(x) (YBCO) film (T(c) - 88 K) in a 50 mT field show that relatively large magnetic forces are acting on the flevible tin large magnetic forces are acting on the flexible tip while scanning at 48 K.

Properties of YBa2Cu3O7-delta Thin Films Grown on Off-Axis-Cut MgO Substrates.

S. E. Russek, B. Jeanneret, D. A. Rudman, and J. W. Ekin. 1991, 4p
Pub. in IEEE (Institute of Electrical and Electronics En-

gineers) Transactions on Magnetics 27, n2 p931-934 Mar 91.

Keywords: \*High temperature superconductors, \*Superconducting films, Transition temperature, Magnesium oxides, Crystal growth, Thin films, Substrates, Reprints, \*Yttrium barium cuprates, Sputtered films.

A series of YBa2Cu3O(7-delta) films has been reactively sputtered on off-axis-cut MgO substrates. All the films were oriented with the c axis normal to the substrate regardless of substrate orientation, indicating that growth dynamics is a major factor influencing film orientation on non-lattice-matched substrates. As the substrate orientation is moved off the (100) direction the films showed a decrease in transition temperature and showed properties indicative of an increased den-sity of weak links. The films grown on high-angle substrates showed better properties than the films grown on low-angle substrates. Films grown on (110) MgO were as good as films grown on (100) MgO.

Keywords: \*Crystal growth, \*Crystal defects, X ray diffraction, Synchrotron radiation, Czochralski method, Bridgman method, Mercury iodides, Gallium arsenides, Reduced gravity, High resolution, Electrooptics, Lead tin tellurides, Triglycine sulfates.

Irregularities in three crystals (useful in electrooptic detector research) grown in space and in four terrestrial crystals grown under other wise comparable conditions have been observed in high resolution diffraction imaging. The images provide important new clues to the nature and origins of irregularities in each crystal. For two of the materials, mercuric iodide and lead tin telluride, more than one phase (an array of non dif-fracting inclusions) was observed in terrestrial sam-ples; but the formation of these multiple phases appears to have been suppressed in directly comparable crystals grown in microgravity. The terrestrial seed crystal of triglycine sulfate displayed an unexpected layered structure, which propagated during directly comparable space growth. Terrestrial Bridgman regrowth of gallium arsenide revealed a mesoscopic structure substantially different from that of the original Czochralski material. A directly comparable crystal is to be grown shortly in space.

J. Geist, J. R. Lowney, C. R. James, and A. M. Robinson, 1991, 7p Pub. in Jnl. of Applied Physics 70, n1 p236-242, 1 Jul

Keywords: \*Carrier density, One-dimensional calcula-

tions, Charge carriers, Mathematical models, Diffusion theory, Iterative methods, Semiconductors, Tests, Re-

Simple analytic expressions for the one-dimensional, majority-carrier concentration in a uniformly doped, semi-infinite semiconductor with a charge-accumulat-ed front surface are derived. These expressions are based on the assumption that the effective intrinsic carrier concentration depends only upon the concentration of the majority dopant. Within the framework of this assumption, the expressions derived here are rig-orously accurate for intrinsic material, and are accurate to well within 100 parts per million (ppm) for doping concentrations above one trillion/cc. The results of calculations of the majority-carrier concentration carried out using these expressions and using a widely available one-dimensional semiconductor device modeling program are compared to illustrate how these expressions are used for testing the accuracy of iterative solutions of the drift-diffusion equations in the presence of surface fields.

The authors compare quantitative results from two methods of solving the micromagnetics equations for 180 deg domain walls. The first method solves the Landau-Lifshitz-Gilbert equation by time integration of the stiff differential equations. The second method uses a relaxation scheme to determine the equilibrium domain wall magnetization configuration. They compare results from these calculations for various damping parameters and discretization mesh densities, and also compare their results with domain wall measure-ments made using scanning electron microscopy with polarization analysis. They conclude that equilibrium domain wall microstructure is insensitive to the damp-ing parameter used in the time method of solution for domain walls in magnetically soft iron and Permalloy. For large damping parameters, the approach to equilibrium is the same for the time method and the relax-ation method. Further, they can obtain metastable equilibrium states with both methods.

D. A. Steigerwald, I. Jacob, and W. F. Egelhoff. Pub. in Surface Science 202, n3 p472-492 1988.

Keywords: \*Iron, \*Epitaxial growth, Metal films, Thin films, Superlattices, Agglomeration, FCC lattices, Magnetism, Substrates, Copper, Reprints.

The epitaxial growth of ultrathin films of pseudomorphic fcc-Fe on Cu(100) has been studied with several structure sensitive techniques. It has been found that structure serisive teamiques. It has been found in the growth is not via a Frank-van der Merwe (layer-by-layer) mechanism, as proposed by several others, but rather exhibits Fe agglomeration, and at or slightly above 300 K, Cu surface segregation. This manner of growth is shown to be consistent with the generally recognized parameters which affect thin film growth. Several adsorbed gas species are found to strongly affect the growth process and the resulting film morphology. The conditions for growth of the best quality Fe films, sandwiches, and superlattices on Cu(100) are presented and are contrasted with the conditions which have been used in previous studies.

Keywords: \*Gallium arsenides, \*Crystal defects, X ray diffraction, Synchrotron radiation, Monochromatic radi-

ation, Grain boundaries, High resolution, Anomalies,

Novel streak-like disruption features restricted to the plane of diffraction have recently been observed in plane of diffraction have recently been observed in synchrotron radiation diffraction from undoped, semi-insulating gallium arsenide crystals. These features were identified as ensembles of very thin platelets (or interfaces) normal to the various 110 directions, and a structural model consisting of antiphase domain boundaries was proposed. The other principal characteristics observed in high resolution monochromatic synchrotron radiation diffraction images are: (quasi)cellular structure, linear low angle subgrain boundaries in 110 directions, and stripes in a 110 direction, as well as systematic differences in the acceptance. boundaries in 110 directions, and stripes in a 110 direction, as well as systematic differences in the acceptance angle for various diffractions. When these detailed structures are considered together, a unifying picture of these features emerges. That is, the presence of ensembles of thin 110 antiphase platelet regions or boundaries is generally consistent not only with the streak-like diffraction features but with all other observations of defects as well. For the forma-tion of such regions, the authors propose two mechanisms, operating in parallel, that appear to be consist-ent with the various defect features observed by a variety of techniques.

The Mossbauer effect of oxygen-depleted YBa2Cu3O(7-x) and PrBa2Cu3O(7-x) doped with 3% (57)Fe has been investigated at room temperature. A (57)Fe has been investigated at room temperature. A manifold of quadrupole-split spectra has been found, wjose parameters are in general agreement with those found by other workers. In addition, the Mossbauer spectra show that a fraction of the Fe sites develop magnetic order at room temperature when the oxygen content is reduced. It is demonstrated that the observed asymmetries in the Mossbauer spectra can be the result of a preferential alignment of the platelike crystallites that arises during the normal sample preparation process. The tendency to bond with the oxygen ration process. The tendency to bond with the oxygen atoms is presumed to be responsible for the discrete-ness of the Mossbauer spectra as a function of oxygen depletion.

The paper reports on irregularities found in three crystals grown in space, in four crystals grown entirely on the ground, and compares the two sets. Irregularities have been observed in mercuric iodide, lead tin telluride, triglycine sulfate, and gallium arsenide by high resolution synchrotron x-radiation diffraction imaging. Radiation detectors made from mercuric iodide crystals grown in microgravity have been reported to perform far better than conventional detectors grown from the same material under full gravity. Effort is now underway to reproduce these 'space' crystals, optimize their properties, and extend comparable superiority to other types of material.

Related Properties.
M. Lei, and H. Ledbetter. Aug 91, 100p NISTIR-3980

Keywords: \*High temperature superconductors, \*Superconductivity, Electron phonon interactions, Elastic properties, Debye temperature, Bulk modulus, Barium titanates, Strontium titanates, \*Yttrium barium cuprates, Kresin model, Born model.

Using both measurements and modeling, the elastic and related properties of some oxides and oxide superconductors were studied. The polycrystal elastic constants were measured using a MHz-frequency pulse-echo method between 295 and 4 K and corrected to the void-free state by using a model for a composite material containing spherical particles. The elastic moduli of the high-T(c) superconductor Y1Ba2Cu3O7 (YBCO) were compared with that of oxides, especially the perovskites BaTiO3 and SrTiO3, oxides, especially the perovskites BaTiO3 and STTiO3, which are crystal-structure building blocks for the YBCO superconductor. The bulk moduli were also calculated using a Born ionic model with two energy terms: electrostatic (Madelung) and ion-core-repulsion. The calculated bulk modulus of YBCO, 98 GPa, agrees well with measurement, 101 GPa. Based on monocrystal measurements combined with analysistheory, elastic stiffnesses C(ij) for orthorhombic YBCO were estimated. The bulk modulus obtained from the estimated C(ij) by the Voigt-Reuss-Hill averaging method agrees with the monocrystal measurement. From the measured polycrystalline elastic constants, the Debye characteristic temperatures were calculated.

Theoretical Model for the Tunneling-Gap Anisotropy Observed in Layered Copper-Oxide High-Temperature Superconductors.

R. C. Casella. 1991, 3p Pub. in Solid State Communications 78, n5 p377-379

Keywords: \*High temperature superconductors, \*Superconductors, Band theory, Single crystals, Reprints, \*Bismuth strontium calcium cuprates, Tunneling gap anisotropy.

A two-band model, in which the pair constituents in one band are linked via double intermediate boson (IB) exchange with a third fermion in the other band, is invoked to understand the tunneling-gap anisotropy observed in Bi2Sr2CaCu2O8 single crystals. The coordinates of the two IBs and of the third fermion are integrated out, leading to effective pair correlations. The theory is presently in agreement with the data and subject to further experimental test via more precise measurements. Within the model, present data imply that the IB cut-off omega > 0.3 eV. The observed broad i.r. excitation centered at approximately 3000/ cm is taken as a candidate for the (possibly composite) IB. Experimental implications are discussed in a general context.

beam epitaxy, \*Magnons, Monomolecular films, FCC lattices, Copper, Substrates, Anisotropy, Polishing, Surface finishing, Etching, Smoothing, Brillouin effect, Light scattering, Measurement, Ferromagnetic resonance, Reprints, \*Ultrathin films.

Brillouin light scattering and ferromagnetic resonance have been used to measure the magnetic field dependence of the magnon frequency at room temperature for 3 monolayer thick films of fcc Fe(001) grown by means of molecular beam epitaxy on Cu(001) substrates. These films exhibit a strong uniaxial magnetic anisotropy which causes the magnetization to be oriented perpendicular to the film plane in zero applied field. Four specimens were grown on copper substrates prepared using a chemical polishing technique which avoided the use of abrasives; this treatment greatly reduced the density of etch pits on the copper surface. The uniaxial anisotropies found for these specimens were very consistent and comparable to that previously measured for the best film grown on a mechanically polished copper substrate. There is evidence that substrate smoothness is improved, and hence that the uniaxial anisotropy is increased, when the substrate is covered with a few monolayers of epitaxial copper before the iron films are grown.

Interpretation of Field Ion Microscopy (FIM) images of Asymmetrical Specimens of 1,2,3-Type High-Tc Superconductors. Final rept.

H. B. Elswijk, H. A. Fowler, and A. J. Melmed. 1988,

5p Pub. in Jnl. de Physique 49, nC-6 p489-493 1988.

Keywords: \*High temperature superconductors, \*Field ion microscopy, \*Superconductors, Image analysis, Asymmetry, Reprints, Yttrium barium cuprates.

Field Ion Microscopy (FIM) specimens of '1,2,3'-type high-Tc superconducting materials, typically have an asymmetrical shape. This results from the anisotropic properties, which are involved in the preparation techniques. As a consequence of this shape, the magnification and resolution depend on the direction in the FIM image. Assuming that the elliptical poles in published micrographs are due to tip shape, the authors calculate an asymmetry in the magnification as large as a factor of four. Therefore, the current image interpretation is revisited quantitatively, keeping in mind the magnification asymmetry. The strong effect enhances the striped appearance of the images, and has not been fully recognized so far.

Yoon. 1991, 5p
Pub. in Materials Research Society Symposia Pro-

ceedings, v216 p59-63 1991.

Keywords: \*Mercury cadmium tellurides, Temperature dependence, Energy gap, Carrier density, Nonlinear analysis, Reprints, Magnetoabsorption.

Intrinsic carrier concentrations of narrow-gap Hg(1-x)Cd(x)Te alloys (0.17 = or < x = or < 0.30) have been calculated as a function of temperature between 0 and 300 K by using the new nonlinear temperature dependence of the energy gap obtained previously by two-photon magneto-absorption measurements for samples with 0.24 = or < x = or < 0.26. The authors report here experimental values for E(sub g) (x, T) for samples with x = 0.20 and 0.23 obtained by one-photon magneto-absorption measurements. These data confirm the validity of the new E(sub g) (x, T) relations to the confirmation of tionship for these x values. In this range of composition and temperature, the energy gap of mercury cadmium telluride is small, and very accurate values are needed for the gap to obtain reliable values for the intrinsic carrier density. Large percentage differences exist be-tween their new calculations and previous values for n(sub i) at low temperatures. Even at 77 K, differences approaching 10 percent exist, confirming the importance of using the new n(sub i) results for materials and device characterization and a proper understanding of device operation in long-wavelength materials.

Keywords: Reywords: Samarium compounds, Cuprates, \*Copper ions, Antiferromagnetism, Neutron diffraction, Single crystals, Ceramics, Comparison, Praseodymium compounds, Neodymium compounds, Tetragonal lattices, Neel temperature, Spin waves, Reprints, Samarium cuprate.

Neutron diffraction techniques have been used to study the magnetic order of the Cu ions in a single crystal of Sm2CuO4. The measurements revealed the development of long-range magnetic order of the Cu moments at T(sub N) = 280 + or - 1 K, with a relatively simple antiferromagnetic configuration of spins as found in Nd2CuO4 and Pr2CuO4. However, the spin directions in Sm2CuO4 are rotated by 90 degrees from the spin directions in Nd2CuO4 and Pr2CuO4. The detailed spin structure can be either collinear or noncol-linear, and in these tetragonal systems it is not possible to distinguish between them with the present neutron diffraction data on multidomain samples. Measurements demonstrate that there are no spin reorientations below the Neel temperature, in contrast to the behavior found for Nd2CuO4.

Kinematic Theory of Ballistic Electron Emission
Spectroscopy of Silicon-Silicide Interfaces.

M. D. Stiles, and D. R. Hamann. 1991, 5p Pub. in Jnl. of Vacuum Science and Technology B 9, n4 p2394-2398 Jul/Aug 91.

Keywords: \*Cobalt silicides, \*Nickel silicides, \*Silicon, \*Interfaces, Electronic structure, Electron transport, Band theory, Epitaxy, Reprints, Ballistic electron emission spectroscopy.

The electronic structure of the materials being measured has a strong effect on the spectroscopy of the interface between them measured by ballistic electron emission microscopy (BEEM). Specific calculations for CoSi2/Si(111) and NiSi2/Si(111) based on the calculated band structures of the materials illustrate some of the observable effects due to band structures, particularly of the overlayer. The BEEM spectra for CoSi2/Si(111) show a delayed onset due to a mismatch of the states near the conduction band mini-mum in the Si. The spectra for NiSi2/Si(111) show structure due to a decrease in the density of states in the NiSi2 at about 1.8 eV above the Fermi level.

Theory of Orientation Textures Due to Surface
Energy Anisotropies.

Final rept. J. E. Taylor, and J. W. Cahn. 1988, 3p Pub. in Jnl. of Electronic Materials 17, n5 p443-445

Keywords: \*Crystallization, \*Nucleation, \*Surface energy, Epitaxy, Anisotropy, Substrates, Orientation, Liquid-solid interfaces, Free energy, Surfactants, Wetting, Electronics, Texture, Reprints, Wulff construction.

The effect of surface free energy on the orientation of nuclei on a substrate is examined. In general, the orientation of the nuclei is not determined by minimizing the nucleus-substrate interfacial free energy alone: all interfacial anisotropies must be considered. That orientation preferences should result from anisotropies in the substrate-nucleus interfacial free energies is obvious, but it was found that strong orientation effects are present even if the energy is assumed to be independent of the nucleus orientation, provided that the nutrient-nucleus interfacial free energies are anisotropic. Furthermore, varying the magnitude of even an isotropic nucleus-substrate energy will change the orientation of the nuclei. The theory points to some simple rules for prediction of nucleation orientations.

PB91-132217 PC A09/MF A01 National Inst. of Standards and Technology (MSEL), Boulder, CO. Materials Reliability Div. Study of Static and Dynamic Fracture Using Strain

J. R. Berger, and J. W. Dally. Sep 90, 188p NISTIR-3952

Keywords: \*Strain measurement, \*Fractures(Materials), \*Crack propagation, Cracking(Fracturing), Strain gages, Strain measuring instruments, Pressure vessels, Algorithms, Least squares method, Accuracy, Steels.

The analysis of strain fields surrounding both stationary and propagating cracks is presented. Series expansions of the static and dynamic strain fields are developed. Gage orientation angles are then studied to optimize the strain response. The orientation angles are found to be dependent on gage type and material. Algorithms are developed which use the temporal or spatial strain variations to extract fracture parameters. The accuracy of the parameter determinations is shown to be excellent, and limits are placed on the validity of the developed methods. The methods are then applied to the analysis of a large scale crack arrest test conducted in a pressure vessel steel. The behavior of the crack-tip position with time and the propagation toughness with time, temperature and position are determined. From this information, details of the conditions at crack arrest are extracted. The prop-agation toughness-crack-velocity relation is then con-

Mechanism for High Strain-Rate Shear Band Formation.

Final rept.

Pub. in Shock Compression of Condensed Matter 1989, p345-348 1990.

Keywords: \*Torsion tests, Mathematical models, Viscoplasticity, Shear properties, Strains, Reprints.

Two numerical simulations of a model of the highstrain-rate torsion test are discussed, one with isothermal temperature boundary conditions, the other with adiabatic boundary conditions. It is shown that a moving boundary of rigid unloading, starting from isothermal ends of the thin-walled tube, caused by heat conduction, is a plausible mechanism for shear band formation during the test.

Applied J-integral values for a surface cracked tensile panel are experimentally evaluated by measuring strain and displacement quantities along an instrumented contour located on the longitudinal symmetry plane. Nonlinear, 3-D, finite-element analyses are employed to obtain corresponding estimates of the contour and area integral contributions to a 3-D J-integral. Finite element results indicate that the area integral contribution is negligibly small on the symmetry plane; the fracture driving force is thus adequately characterized by the experimental contour values. Detailed comparisons of the experimental and numerical results (crack mouth opening displacement, J-values, and strains along the contour) reveal that the one-quarter symmetric, finite element model accurately predicts

the panel response for overall (gauge length) strains approaching 1.6 times the material yield strain, beyond which the observed deformation patterns exhibited globally asymmetric shear bands. An enriched finite element model for linear elastic fracture mechanics is developed for a mixed variational statement. The independent approximations for the displacement and stress components are enriched by adding the near-field analytic expressions for a cracked body to the polynomial approximations of a conventional element. This allows for an accurate representation of the stress and displacement fields near the crack tip and also results in the direct calculation of the appropriate stress intensity factors. The accuracy of the formulation is demonstrated through several numerical examples.

Keywords: \*Mechanical oscillators, \*Thermal noise, Gravitational wave detectors, Suspension devices, Pendulums, Anelasticity, Reprints.

The fluctuation-dissipation theorem is applied to the case of low-dissipation mechanical oscillators, wose losses are dominated by processes occurring inside the material of which the oscillators are made. In the common case of losses described by a complex spring constant with a constant imaginary part, the thermal noise displacement power spectrum is steeper by one power of omega than is predicted by a velocity-damping model. The author constructs models for the thermal noise spectra of systems with more than one mode of vibration, and evaluate a model of a specific design of pendulum suspension for the test masses in a gravitational-wave interferometer.

A numerical study of a one-dimensional model of the high strain-rate torsion test shows that a moving boundary of rigid unloading, starting from the ends of the thin-walled tubular specimen, is a plausible mechanism for adiabatic shear band formation during the test. Even though the dimensionless thermal diffusivity parameter is very small, the moving boundary is due to heat transfer from the specimen through its ends, which are assumed to be isothermal heat sinks. The mathematical model is based on a physical model of thermoelastic-plastic flow and a phenomenological Arrhenius model for the plastic flow surface. The numerical technique used is the semi-discretization method of lines.

Recent experimental studies have shown that strain gages can be employed to determine either static or dynamic stress intensity factors, with relatively simple experiments. The paper describes an analysis method for determining stress intensity factors associated with a propagating crack. The analysis is based on a three parameter representation of the strain field near the crack tip. An algorithm is developed where triangulation is used to precisely locate the crack tip position. The algorithm also includes an iteration scheme which permits an accurate determination of two key parameters in the series representation of the strain field. The new method of analysis is demonstrated in a dynamic experiment with a high strength 4340 alloy steel.

The National Bureau of Standards is working to develop a nondestructive test method for finding flaws within heterogenous materials, such as concrete. The method, which is referred to as the impact-echo method, involves introducing transient stress waves into a test object by mechanical impact (point source) and monitoring reflections of the waves from internal defects and external boundaries using a displacement transducer (point receiver) which is located close to the impact point. The impact-echo test is a simple procedure; however, successful interpretation of recorded surface displacement waveforms requires an understanding of the interaction of transient stress waves with internal defects. To develop a basis for the

#### Structural Mechanics

method, Green's function solutions, finite element solutions, and experimental studies of transient stress wave propagation in solid plates and in plates containing flaws have been carried out. The abstract will discuss some significant findings of the finite element studies.

Keywords: \*Dynamic structural analysis, \*Greens function, Large space structures, Timoshenko beams, Integral equations, Reprints, III posed problems, Deconvolution.

The paper presents the mathematical and computational basis of a method for experimentally identifying the dynamic behavior of linear structural systems. The method consists of exciting the structure with specific pulses and reconstructing the dynamic Green's func-tions by deconvolution of the measured response. The reconstruction procedure involves the solution of an illposed integral equation in the presence of noise. Inverse Gaussian functions, which have mathematical properties that render the deconvolution problem tractable, are used as probing pulses. Two examples are presented for which dynamic Green's functions are reconstructed from synthetic response data: (1) a non-dispersive medium consisting of a mechanical slider with free body motion, and (2), a network that may be representative of a large orbiting structure, with rigidly connected torsional members and Timoshenko beams. It is shown that residual effects of noise that may be detectable in the reconstructed Green's functions, are effectively smoothed out when these functions are used to predict the response to forces such as may be induced by control systems. Finally, an ex-ample is presented of deconvolution implemented in slow motion.

Impulse Response Functions for Elastic Structures with Rigid Body Degrees of Freedom. Final rept.

E. Simiu, and G. Cook. 1989, 14p Sponsored by Air Force Office of Scientific Research, Bolling AFB, DC.

Pub. in Jnl. of Sound and Vibration 135, p275-288, 8 Dec 89.

Keywords: \*Dynamic response, \*Greens function, \*Degrees of freedom, \*Elastic analysis, Manipulators, Structural analysis, Functions, Fourier transformation,

Many body problem, Robotics, Structural engineering, Reprints.

A procedure based on the theory of generalized functions is developed which allows the calculation of dy-namic Green's functions for discrete and continuous elastic systems with rigid body degrees of freedom. For any given degree of freedom the procedure divides the Fourier transform of the dynamic Green's function into two parts. The first part contains the singularity due to the rigid body degree of freedom. Its time domain counterpart is obtained in closed form. The second part exhibits no singularities, and its time domain counterpart is obtained by numerical integration using a Fast Fourier Transform routine. The procedure is applied to two systems for which closed form solutions are also obtained: a system consisting of two point masses connected by an elastic spring which slide without friction on a horizontal plane, and a nondispersive mechanical slider with elastic deformations due to shear strain. The agreement between the results yielded by the proposed procedure and the closed form solutions is shown to be excellent. The procedure is then used to caluclate the dynamic Green's function for the tip displacement of a dispersive medium consisting of a flexible robot manipulator with the mechanical properties of a Timoshenko beam.

Buckling and Post-Buckling Behavior of Elliptical Plates: Part 1. Analysis.

Final rept.

H. Chai. 1990, 8p See also Part 2, PB92-116581.

Pub. in Jnl. of Applied Mechanics 57, p981-988 Dec

Keywords: \*Structural analysis, \*Composite structures, \*Plates, \*Elliptical configuration, \*Buckling, Calculation methods, Polynomials, Ritz method, Delaminating, Stress analysis, Displacement, Deformation, Loads(Forces), Substrates, Reprints.

A polynomial series expansion for displacements is used in conjunction with the Rayleigh-Ritz energy method to produce buckling and post-buckling stress solutions for an elliptically-shaped surface layer that has been delaminated from the main load-bearing body. Plate deformations are induced by a combined in-plane displacement field applied to the plate boundary and normal pressure. Convergence of the plate so-lution is assessed by systematically increasing the number of displacement terms in the series expansion. The convergence of membrane and bending stresses at the plate boundary was generally slow and nonuniform. The degrees-of-freedom necessary for a satisfactory solution typically increase with increasing com-plexity or magnitude of the plate deformations. By em-ploying as many as 77 displacement terms, practically exact stress solutions are obtained for a wide variety of basic delamination plate problems. The proposed so-lution procedure is highly efficient and economical, and it may be easily extended to other plate geome-tries of loading conditions.

Final rept. H. Chai. 1990, 6p See also Part 1, PB92-116573. Pub. in Jnl. of Applied Mechanics 112, p989-994 Dec

Keywords: \*Composite structures, \*Delaminating, \*Buckling, Elliptical configuration, Stress analysis, Structural analysis, Graphic methods, Substrates, Membrane structures, Bend tests, Loads(Forces), Displacement, Plates, Reprints.

The large-deflection plate solution developed in Part I is used here to study the buckling and post-buckling deformation and stress characteristics of an elliptically-shaped surface layer that has been delaminated from a large material body. The economical, yet accu-rate nature of the solution, together with available graphic routines, has made it possible to present, figuratively, a comprehensive description of the plate behavior. The conditions for a layer-substrate overlap and the variations of membrane and bending stresses along the plate boundary are emphasized. Deformations were induced either by a normal pressure or a biaxial displacement field applied to the plate boundary. The problem variables are plate size and shape, details of load biaxiality, and load level.

Keywords: \*Standards, Force(Mechanics), Interlaboratory comparisons, Static loads, Transducers, \*Force measurement, \*Force standards, Deadweight machines, US NIST.

A comparison of force measurements performed at the National Institute of Standards and Technology, USA, and at the Physikalisch-Technische Bundesanstalt, Germany is reported. The focus of the study was the intercomparison of the forces realized by the two Institutes rather than the measurement process. The transfer standards used in the comparison consisted of force transducers and associated readout instru-mentation. The results of the intercomparison reveal that over a range of 50 kN to 4.5 MN, the forces realized at NIST and at PTB compare favorably. For forces up to 900 kN the agreement is within + or - 40 ppm; above 900 kN the agreement is within + or - 100 ppm.

Measurement Service C.1 from the National Institute of Standards and Technology (NIST) publication SP 250 provides calibrations for customer-owned ionization chambers so that they may be used to determine absorbed dose to water in (60)Co gamma-ray beams. The calibrations are based on calorimetric measurement of absorbed dose to graphite in a graphite phantom. Transformation of the calibrations to a water phantom is made with a specially-designed graphite ionization chamber, and requires knowledge of photon mass attenuation coefficients and the perturbation of the graphite chamber in the water medium. The determination of these quantities is described in detail, along with the operational techniques normally used to transfer the calibration to customer-owned chambers. Appendix A lists experimental data used to test the photon-fluence scaling theorem. Appendices B, C, and D describe international comparisons of the chamber calibrations, and Appendix E shows a sample calibration report.

Keywords: \*Magnetic recording, Metal films, Iron, Reprints, Surface magnetism, Imaging techniques, High resolution, Scanning tunneling microscopy, Magnetic

The authors have used a scanning tunneling microscope (STM) to record and image magnetic regions on the surface of a hard disk. The usual rigid STM tip was replaced by a compliant magnetized Fe film tip. As a result, tunneling images were combinations of the surface topography and variations in the magnetic force between the Fe film tip and the disk surface. The authors believe that the recording process relied on maintaining the proximity of the magnetized Fe film tip near the disk surface. Apparently, the magnetic field was focused near the Fe film tip with sufficient intensity to change the surface magnetization of the disk. The authors have recorded spots on the disk within a 500 nm X 500 nm area. These spots were subsequently imaged with the same STM tip. Their best magnetic image resolution was 20 nm. The compliance of the Fe film tips was such that image contrast due to variation of the magnetic force on the tip corresponded to z motions of the piezoelectric translator as large as 50 nm.

Thermal Conductivity of a Moderately Dense Gas.

C. A. Nieto de Castro, D. G. Friend, R. A. Perkins, and J. C. Rainwater, 1990, 8p

Pub. in Chemical Physics 145, p19-26 1990.

Keywords: \*Thermal conductivity, \*Gases, Nitrogen, Argon, Reprints, Lennard-Jones potential, Virial coefficients, Density dependence.

Recent extensive measurements of the thermal conductivity of argon and nitrogen have enabled us to evaluate the first density correction as a function of temperature and to compare it with a theoretical pre-diction. The prediction follows from a previously pub-lished microscopically based theory, which includes effects due to collisional transfer, collisions among three molecules, and monomer-dimer collisions. The first density correction was evaluated for a Lennard-Jones interaction potential. An ad hoc modification of the theory accounts for contributions to the thermal conductivity from internal degrees of freedom. The comparison shows good agreement over a wide range of temperatures.

Thermal Conductivity and Heat Capacity of Gaseous Argon. Final rept.

H. M. Roder, R. A. Perkins, and C. A. Nieto de

Castro. 1989, 24p Pub. in International Jnl. of Thermophysics 10, n6 p1141-1164 Nov 89.

Keywords: \*Argon, \*Thermal conductivity, \*Thermal diffusivity, \*Specific heat, Gases, Reprints, Transient hot wire technique.

The paper presents new absolute measurements of the thermal conductivity and of the thermal diffusivity of gaseous argon obtained with a transient hot-wire instrument. The authors measured seven isotherms in the supercritical dense gas at temperatures between 157 and 324 K with pressures up to 70 MPa and densities up to 32 mol/L and five isotherms in the vapor at temperatures between 103 and 142 K with pressures up to the saturation vapor pressure. The instrument is capable of measuring the thermal conductivity with an accuracy better than 1% and thermal diffusivity with an accuracy better than 5%. Heat capacity results were determined from the simultaneously measured values of thermal conductivity and thermal diffusivity and from the density calculated from measured values of pres-sure and temperature from an equation of state. The heat capacities presented in the paper, with a nominal accuracy of 5%, prove that heat capacity data can be obtained successfully with the transient hot wire technique over a wide range of fluid states. The technique will be invaluable when applied to fluids which lack specific heat data or an adequate equation of state.

Interferometer.

Final rept. R. T. Stebbins, and P. L. Bender. 1990, 14p

Pub. in AIP Conference Proceedings 202, Physics and Astrophysics from a Lunar Base, NASA Workshop (1st), Stanford, CA., May 19-20, 1989, p188-201 1990.

Keywords: Angular resolution, Sensitivity, Reprints, \*Gravitational wave antennas, Laser interferometers, Lunar bases, Lunar surface.

A moon-based laser interferometer for detecting gravitational radiation could detect signals in the band 0.1 to 10,000 Hz. A preliminary evaluation of the noise budget for an optimistic antenna design is reported here and compared to that for other planned gravita-tional wave interferometers. Over most of the frequency range, the sensitivity is controlled by the thermal noise in the test mass suspensions. As pointed out by others, the most important role of a lunar antenna would be the improved angular resolution made possible by the long baseline to terrestrial antennas.

Space Marching Difference Schemes in the Nonlinear Inverse Heat Conduction Problem.

A. S. Carasso. 21 Nov 90, 41p NISTIR-4482

Keywords: \*Conduction, \*Gun barrels, Nonlinear differential equations, Finite difference theory, One-dimensional calculations, Mathematical models, Heat transfer, Fourier analysis, Error analysis, III posed problems, Inverse problems.

The Lax-Richtmyer theory is used to study the error amplification properties of 18 space marching finite difference schemes, for the 1-D nonlinear inverse heat conduction problem. A non-dimensional parameter Omega, involving the time step Delta t, the effective thermal diffusivity alpha, and the distance I from the sensor to the active surface, provides a measure of the numerical difficulty of the inverse calculation. All 18 schemes are unstable and blow-up like 10(sup lambda Omega), where the constant lambda depends on the particular numerical method. However, there are substantial differences in the lambda's, and some newly constructed algorithms, employing forward time differences at nonadjacent mesh points, are shown to produce relatively low values of lambda. Using synthetic noisy data, a nonlinear reconstruction problem is considered for which Omega = 25. This problem simulates heat transfer in gun barrels when a shell is fired. It is shown that while most of the 18 schemes cannot recover the thermal pulses at the gun tube wall, two of the new methods provide reasonably accurate results. A tendency to underestimate peak values in fast, narrow thermal pulses, is also noted.

Adjustment of the Fundamental Physical Constants: A Report of the CODATA Task Group on Fundamental Constants, 1986.

E. R. Cohen, and B. N. Taylor. 1986, 39p Sponsored by Rockwell International, Thousand Oaks, CA. Science Center Pub. in CODATA Bulletin, n63 39p 1986.

Keywords: \*Fundamental constants, Least squares method, Adjusting, Correction, Reprints.

The paper summarizes in some detail the 1986 leastsquares adjustment of the fundamental physical constants carried out by the authors under the auspices and guidance of the CODATA Task Group on Fundamental constants, and gives tables of recommended values of the constants for international use resulting from the 1986 adjustment. The 1986 CODATA set of values entirely replaces its immediate predecessor, that recommended for international use by CODATA in 1973. The latter was based on the 1973 least-squares adjustment of the fundamental constants which was also carried out by the authors under the auspices and guidance of the Task Group.

Final rept.
P. L. Cowan. 1990, 7p
Pub. in Physica Scripta T31, p112-118 1990.

Keywords: \*X ray spectra, Synchrotron radiation, X ray absorption, X ray fluorescence, Emission spectra, Excitation, Reprints.

While X-ray emission spectroscopy is a relatively old technique, it takes on important new characteristics when samples are selectively excited by a carefully prepared beam of X-rays. The method is made practical by the availability of synchrotron radiation sources and it extends the capabilities of the traditional technique. Both the energy and the polarization of the excitation X-rays can have significant effects on the emission X-rays can have significant effects on the emission of the excitation X-rays can have significant effects on the emission of the excitation X-rays can have significant effects on the emission of the excitation of the excitat sion spectra. Selective control of these parameters can provide specific information on both the electronic structure and the atomic structure of molecules or solids. Examples of the new types of studies include: satellite free X-ray emission, multi-vacancy excitation, polarized X-ray excitation and emission, and state selective excitation of neutral atoms and molecules.

Keywords: \*Uranium 238, \*Uranium 233, \*Fission cross sections, \*Electrofission, MeV range 100-1000,

The coincident electrofission (e,e'f) cross sections of (233,238)U were measured in the excitation range 150-550 MeV. The probability of fission was found to be near unity in the delta resonance region (250-550 MeV), but less than unity in the quasifree scattering region (150-250 MeV). The data are analyzed with a model based on the quasifree and delta reaction mechanisms. An excitation energy of 25 MeV is found for the residual nucleus in the quasifree region and over 40 MeV in the delta region.

R. L. Kautz. 1989, 20p Contract N00014-85-F-0085 Sponsored by Office of Naval Research, Arlington, VA. Pub. in Structure, Coherence and Chaos in Dynamical Systems, p207-226 1989.

Keywords: \*Chaos, Josephson junctions, Thermal noise, Attractors, Stability, Reprints.

In dissipative systems, chaotic trajectories are locally unstable in that they show a sensitive dependence on initial conditions but globally stable in that they are represented by attractors. The global stability of the chaotic state is examined in the neighborhood of an interior crisis using the rf-biased Josephson junction as an example. A measure of global stability is developed by considering the response of the system to thermal noise. In the presence of noise, the system occasionally escapes from the region of state space containing the attractor and the temperature dependence of the average escape time is characterized by an activation energy. The activation energy is a useful measure of the global stability of the chaotic state, being analogous to the barrier height for a particle in a potential

Close-Coupling Calculation for the (2)(Sigma sub u)(+) State of (H sub 2)(-). Final rept.

T. Gorczyca, and D. W. Norcross. 1990, 7p Grant NSF-PHY86-04504

Sponsored by National Science Foundation, Washington, DC

Pub. in Physical Review A 42, n9 p5132-5138, 1 Nov

Keywords: \*Hydrogen, Molecular structure, Negative ions, Bound state, Reprints.

The authors demonstrate the utility of the close-coupling approximation, usually applied to scattering problems, for calculations of molecular bound states. Their primary test case is the doublet Sigma (sub u)(sup +) state of H2(1-). While limited to Hartree-Fock accuracy, their analysis of this resonant state within the bound region parallels closely the results from more precise quantum-chemical calculations. Specifically, the crossing between the neutral and negative-ion curves occurs at an internuclear separation of 3.025 a.u. in their calculation, in good agreement with a multireference configuration-interaction approach of previous authors. The shape and total energy of the anion

curve, when corrected for by the correlation energy of the target at the crossing, is also in good agreement with earlier results. The method is then extended into the unbound or resonant-state region by studying the shape-resonance behavior of scattering eigenphase

Office of Basic Energy Sciences.
Pub. in Proceedings of the Winter Meeting on Statistical Physics Lectures on Thermodynamics and Statistical Mechanics (17th), Oaxtepec, Mexico, January 5-8, 1988, p109-124.

Keywords: \*Non-Newtonian fluids, Couette flow, Structure factors, Reprints, Molecular dynamics.

Non-Newtonian behavior in a sheared simple fluid is reviewed briefly. The author points out that such behavior is more often associated with fluids of very complex structure, such as polymers. The concept of the Maxwell relaxation time is introduced and it is shown that the product of the time and a shear rate is a key parameter that indicates if a fluid will display non-New-tonian characteristics, regardless of molecular structure. The author discusses the distorted structure factor of a dense two-dimensional soft disk liquid undergoing Couette flow. The structure factor is determined experimentally by light scattering from the output of a nonequilibrium molecular dynamic simulation. The distorted pair correlation function is also discussed.

Keywords: \*Helium, \*Lamb shift, Quantum electrodynamics, Electron transitions, Metastable state, Laser spectroscopy, Atomic energy levels, Tests, Reprints.

The authors have measured the wave number of the (4)He 2 singlet S -> 3 singlet P transition by Doppler-free spectroscopy in a metastable helium beam. The result, 19931.924794(45)/cm, represents an order of magnitude improvement over previous measurements and provides a sensitive test of two-electron QED effects. The result shows an unexpectedly large deviation from theoretical prediction. The authors derive improved term values for a number of low-lying helium levels. All levels with n=2 show significant deviations from theory that are correlated with the size of calculated two-electron contributions to the Lamb shifts.

Optical Potential Approach to Electron and Positron Scattering from Noble Gases. 2. Neon. Final rept.

K. Bartschat, R. P. McEachran, and A. D. Stauffer. 1990, 7p Pub. in Jnl. of Physics B: Atomic and Molecular Phys-

ics 23, p2349-2355 1990.

Keywords: \*Electron-atom collisions, \*Positron-atom collisions, \*Neon, Electron scattering, Differential cross sections, Total cross sections, Optical models,

The authors have extended their previous work on an optical potential method to electron and positron scattering from neon. In addition, they have modified the approach to include the diagonal potentials previously neglected. This required the use of a numerical form of the Green function. Comparison with recent experimental measurements with positrons indicates the ne-cessity of including absorption effects at higher energies, although these effects appear to be smaller for neon than they were for argon. At energies just above the inelastic excitation thresholds, however, the picture is not so clear at the moment.

The volume presents the contributions of the participants in the Sixth International Swarm Seminar, held August 2-5, 1989, at the Webb Institute in Glen Cove, New York. The Swarm Seminars are traditionally held New York. The Swarm Seminars are traditionally held as relatively small satellite conferences of the International Conference on the Physics of Electronic and Atomic Collisions (ICPEAC) which occurs every two years. The 1989 ICPEAC took place in New York City prior to the Swarm Seminar. The focus of the Swarm Seminars has been on basic research relevant to understanding the transport of charged particles, mainly electrons and ions, in weakly ionized gases. This is a field that tends to bridge the gap between studies of field that tends to bridge the gap between studies of fundamental binary atomic and molecular collision processes and studies of electrical breakdown or discharge phenomena in gases. Topics included in the 1989 seminar ranged the gamut from direct determinations of charged-particle collision cross sections to use of cross sections and swarm parameters to model the behavior of electrical gas discharges.

Experiments at NIST, whose goal is to realize frequency standards of high accuracy using stored ions, are briefly summarized. In one experiment, an rf oscillator is locked to a nuclear spin-flip hyperfine transition in (9)Be(1+) ions which are stored in a Penning trap and sympathetically laser-cooled. Uncertainty in Doppler shifts is estimated to be less than  $5 \times 10$ (sup -15). In a second experiment, a stable laser is used to probe an electric experiment, a stable laser's used to proble the electric quadrupole transition (frequency = 1.07 x 10(sup 15) Hz) in a single laser-cooled (199)Hg(1+) ion stored in a Paul trap. The measured Q value of the transition is approximately 10(sup 13).

Photoionization and Collisional Ionization of Excited Atoms Using Synchrotron and Laser Radiations.

Final rept. F. J. Wuilleumier, D. L. Ederer, and J. L. Picque.

1987, 90p Pub. in Advances in Atomic and Molecular Physics 23, p197-286 1987.

Keywords: \*Excited states, \*Photoionization, Laser radiation, Synchrotron radiation, Autoionization, Atoms, Reprints, Collisional ionization.

The article is devoted to a description of various ionization processes which may be studied in excited atoms. Some of these processes are: photoionization, autoionization, and collisional ionization. The development of the field has been accelerated by combining tunable lasers, which excite the atomic species, with synchrotron radiation, which probes the excited atoms. The authors concentrate on the two-step photoionization in free atoms where one electron is promoted to an outer orbital and another is promoted either to a highly excited state which subsequently autoionizes, or to a continum state.

PB91-161976 Not available NTIS National Inst. of Standards and Technology (NEL), Gaithersburg, MD. Statistical Engineering Div. Cross-Validation Procedure for Stopping the EM

Algorithm and Deconvolution of Neutron Depth Profiling Spectra.

K. Coakley, 1991, 7p Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science 38, n1 p9-15 Feb 91.

Keywords: \*Neutron spectra, \*Image reconstruction, Stopping rules(Mathematics), Iterations, Reprints, Emission tomography, EM algorithm, Deconvolution, Depth profiles.

The iterative EM algorithm is used to deconvolve neutron depth profiling spectra. Because of statistical noise in the data, artifacts in the estimated particle emission rate profile appear after too many iterations of the EM algorithm. To avoid artifacts, the EM algorithm. rithm is stopped using a cross-validation procedure. The data are split into two independent halves. The EM algorithm is applied to one half of the data to get an estimate of the emission rates. The algorithm is stopped when the conditional likelihood of the other half of the data passes through its maximum. The roles of the two halves of the data are then switched to get a second estimate of the emission rates. The two estimates are then averaged.

1990

Keywords: \*Mercury ions, \*Ion storage, \*Quantum optics, Trapping(Charged particles), Photons, Reprints, Laser cooling, Ion traps.

Quantum jumps in laser-cooled, trapped, mercury ions were observed. These quantum jumps were used to infer some quantum properties of the electromagnetic field, such as photon antibunching and sub-Poissonian photon statistics. A single mercury ion was cooled to the ground (zero-point) energy in the harmonic effective potential of the trap.

Uncertainty and Accuracy in Physical Measure-

Richards Special pub. (Final). H. H. Ku. Dec 90, 14p NIST/SP-805 Also available from Supt. of Docs.

Keywords: \*Uncertainty, \*Accuracy, Measurement, Recommendations, Standards, Calibration.

The formulation of the 'uncertainty' of a reported value always involves a certain degree of arbitrariness, de-pending primarily on how the value is going to be used. Currently there are at least two schools of thought on the subject: physicists interested in detecting differences among result are in favor of the recommendations of the International Bureau of Weights and Measures (BIPM/CIPM 1981), whereas those involved in calibration work and routine measurements follow the orthodox method (see e.g., NBS Special Publication 644). In the note, the suggestion is made to use the word 'accuracy/inaccuracy' for standards that follow BIPM's recommendation, and the word 'uncertainty' for standards that follow the orthodox method. It is believed that the use of different terms for distinct pur-poses will resolve some of the basic difficulties facing international groups who are attempting to write their own standards

Anomalous Magnetoresistance in Al/Al-Alloy Composite Conductors.

Final rept. F. R. Fickett, and C. A. Thompson. 1990, 8p Sponsored by Wright Research and Development Center, Wright-Patterson AFB, OH.

Pub. in Advances in Cryogenic Engineering (Materials), v36 p671-678 1990.

Keywords: \*Magnetoresistance, Electric conductors, Composite materials, Aluminum, Cryogenics, Anomalies. Reprints.

The transverse magnetoresistance of several composite conductors containing a large single filament of pure aluminum in a matrix of Al-Fe-Ce has been measured at 4 K to fields of 10 T. The magnetoresistance (delta R/R) of the composite is very large, rising to 55 in the 'worst' case. Previous measurements on pure polycrystalline aluminum have always shown a rapidly saturating behavior with a very small linear component; delta R/R rarely exceeds a value of 5-6. In addition, the magnetoresistance of the composite samples shows a structure as the field is rotated around the current axis.

Keywords: \*Quantum mechanics, \*Conservation laws, \*Plancks constant, Fundamental constants, Invariance, Tests, Reprints.

The possibility that different realms of physics are described by distinct quantization constants is considered. From the consistency of existing data, the authors infer limits on the differences between hypothetically distinct quantization constants for different elementary particles. Since the existence of multiple Planck constants implies violations of space-time symmetries, these limits may be viewed as precise tests of fundamental conservation laws, including the conservation of linear momentum and energy.

Keywords: \*Synchrotron radiation sources, \*X-ray detection, \*PIN diodes, Silicon diodes, Photodiodes, Performance, Reprints, Beamlines.

Much of the X-ray work on synchrotron-radiation beam lines is still done using ion chambers as detectors. Silicon PIN photodiodes offer considerable advantages over ion chambers for many applications. In addition to greater efficiency over a wide energy range (1-20 keV), they possess a flat configuration, large areas, an absence of bias requirements, high dynamic range, and compatability with ultrahigh vacuum. The researchers have characterized the properties of several commercial PIN photodiodes at X-ray energies, have had diodes commercially produced which were specialized for use in synchrotron beam lines, and have produced new photodiode devices for synchrotron-radiation applications. The performance of these devices was reviewed over extended periods of time in beam-line control and as detectors in experiments.

Keywords: \*Gravitational wave antennas, \*Lunar observatories, Laser interferometry, Lunar bases, Reprints

A Laser-Interferometer Gravitational-Wave Observatory (LIGO) is planned for operation in the United States, with two antennas separated by several thousand kilometers. Each antenna would incorporate laser interferometers with 4 km arm lengths, operating in vacuum. The frequency range covered initially would be from a few tens of Hz to a few kHz, with possible extension to lower frequencies later. Similar systems are likely to be constructed in Europe, and there is a possibility of at least one system in Asia or Australia. It will be possible to determine the direction to a gravitational wave source by measuring the difference in the arrival times at the various antennas for burst signals or the phase difference for short duration nearly periodic signals. The addition of an antenna on the Moon, operating in support of the Earth-based antennas, would improve the angular resolution for burst signals by about a factor 50 in the plane containing the source, the Moon, and the Earth.

Saran Carbon Cryogenic Regenerator for Liquid

Final rept. L. V. Munukutla, J. A. Jones, and R. Radebaugh, 1988, 10p

Pub. in Proceedings of Interagency Meeting on Cryocoolers, Monterey, CA., August 17, 1988, p109-118.

Keywords: \*Carbon, \*Regenerators, \*Liquid helium, Cryogenics, Adsorption, Heat exchangers, Thermal conductivity, Reprints.

A promising solution to the problems of regenerator ineffectiveness in the 4K to 15K region is the use of saran carbon with adsorbed helium as the regenerator material. Preliminary measurements indicate that this material has a higher volumetric specific heat than any other known material in the 4K to 15K temperature range. Furthermore, the estimated thermal conductivity of saran carbon is low enough to permit its use as a continuous matrix between the hot and cold ends of the regenerator, but it does not adversely affect the longitudinal conduction heat loss along the regenerator length. An NBS computer regenerator program has been used to show that a saran carbon/ adsorbed helium, parallel-plate geometry regenerator is likely to be superior to any other known regenerator for cooling in the 4K to 15K temperature region.

Spin-Dependent Electron-Impact Excitation of Sodium. Final rept.

Number 1990, H. L. Zhou, B. L. Whitten, G. Snitchler, D. W. Norcross, and J. Mitroy. 1990, 6p Contract DE-Al05-86ER53237

Sponsored by Department of Energy, Washington, DC. Office of Basic Energy Sciences.
Pub. in Physical Review A 42, n7 p3907-3912, 1 Oct

Keywords: \*Electron scattering, \*Sodium, Atomic energy levels, Electron spin, Excitation, EV range 01-R matrix, Reprints.

The spin-dependent cross sections for electron excitation of the 3p level of sodium at energies just above threshold are studied using the R-matrix approach. In addition to the total cross section for excitation, the authors present results for the excitation cross sections as a function of the change in the spin and orbital angular-momentum projection of the target. Calculations were made in the four-(3s,3p,4s,3d), five-(+4p,4d) approximations, for electron energies ranging from threshold to 4.0 eV. The results are compared with other calculations and with the recent experimental results of Han, Schinn, and Gallagher (Phys. Rev. A 38,535 (1988)).

Of What Use Is Basic Research.

Final rept.

. B. Lucatorto. 1987, 1p Pub. in Candela Wavelength, p5 1987.

Keywords: \*Racetrack microtrons, \*Beam steering, Linear accelerators, Electron accelerators, Electron beams, MeV range 10-100, Design, Reprints.

In the NBS-Los Alamos racetrack microtron (RTM), the 17 MeV electron beam, which has made one pass through the RTM linac, is deflected 180 deg in one end magnet and is returned to the same end of the (standing wave) linac for a second pass. A pair of dipole magnets on the linac axis compensate for the beam displacement caused by the end magnet so that the beam enters the linac on axis. These two magnets are designed to have equal field integrals in order to produce a pure displacement. Matching the field integrals was complicated by the quite different widths of the two magnets which have different beam clearance requirements. In addition, the wider magnet contains a quadrupole coil for beam steering. Design considerations are presented. Magnetic field measurements show that critical design goals have been achieved.

Keywords: \*Argon, \*Krypton, \*Xenon, \*Auger effect, Photoelectron spectroscopy, Autoionization, Angular distribution, Reprints.

Angle-resolved electron spectroscopy with the help of synchrotron radiation has been used to study resonate Auger processes near the core shells of Ar2p, Kr3d and Xe4d. Results for the lowest energy resonances have received special attention: argon (Ar2p(3/2)->4s) at a photon energy of 244.4 eV, krypton (Kr3d(5/2)->6p) at 91.2 eV, and xenon (Xe4d(5/2)->6p) at 65.1 eV. The angular distribution parameters, beta, are evaluated for each of the resolved Auger peaks. Most striking is the occurrence of large negative beta values for some of the higher kinetic energy peaks. The results are most apparent under high electron resolution. The beta values near -1 are justified in terms of the angular-momentum transfer theory, which predicts beta = -1 for parity unfavored transitions. Results on the Auger spectra are also given at lower kinetic energies, for shake-up states, and for higher energy resonances, especially those involving vacancies in the core shells of the lower spin states.

PB91-187310 Not available NTIS National Bureau of Standards (NML), Gaithersburg, MD. Quantum Metrology Group. Unusual Degree of Angular Anisotropy in the Res-

onant Auger Spectrum of Kr. Final rept.

J. A. Carlson, D. R. Mullins, C. E. Beall, B. W. Yates, J. W. Taylor, D. W. Lindle, B. P. Pullen, and F. A. Grimm. 1988, 4p

Pub. in Physical Review Letters 60, n14 p1382-1385

Keywords: \*Krypton, \*Auger effect, Photoemission, Anisotropy, Excitation, Reprints.

The angular distribution parameter, beta, has been measured for the resonant Auger spectra in Kr following 3d->5p excitation. Unusually low values, close to 1, were seen for two bands. From optical spectroscopy data these bands are assigned to the final states 4p(4)(triplet P)5p(quartet P(5/2), quartet P(3/2). Accordinated D(5/2).

PB91-187393 Not available NTIS National Inst. of Standards and Technology (NML), Gaithersburg, MD. Quantum Metrology Div. Angular Distributions of Electrons in Resonant Auger Spectra.

Final rept. J. W. Cooper. 1989, 3p

Pub. in Physical Review A 39, n7 p3714-3716, 1 Apr

Keywords: \*Auger electrons, Angular distribution, Auger effect, Argon, Reprints.

Recent measurements have shown that the angular distribution of Auger electrons observed in near threshold resonant excitation with energy resolution adequate to partially resolve the multiplet structure corresponding to final core states exhibited a marked change in the angular distributions as a function of final electron energy. A method of calculating these angular distributions is proposed which extends the formalism developed for treating angular distributions in photoeffect via a separation into parity favored and unfavored components. As an example of the use of the method, calculations are presented for the 2p-4s resonant Auger process in Argon and compared with recent experiments.

Final rept.

P. L. Cowan. 1990, 14p Pub. in Proceedings of International Conference on X-Ray and Inner-Shell Processes (15th), Knoxville, TN., July 9-13, 1990, p696-709.

Keywords: \*Molecular gases, \*X-rays, Angular distribution, Polarization, Anisotropy, Reprints.

X-ray emission from selectively excited core hole states in molecular gases can exhibit strong polarization and anisotropic angular distributions. These ef-

fects are attributable to the creation of an aligned ensemble of excited molecules within the otherwise ran-domly oriented molecular gas. This alignment can be created because the resonant excitation probability of core hole states can be strongly dependent upon the instantaneous molecular orientation. This effect presents a novel opportunity for studying molecular symmetries and the structure of matter in disordered phases.

Relativistic and Correlation Effects in the 2s3p Configuration of Beryllium-Like Ions.

Final rept. Y. K. Kim, A. W. Weiss, and W. C. Martin. 1988, 10p Sponsored by Department of Energy, Washington, DC. Office of Fusion Energy.

Pub. in Jnl. of the Optical Society of America B 5, n10 p2215-2224 1988.

Keywords: Multicharged ions, Oscillator strengths, Excited states, Relativistic effects, Energy levels, Correlation, Reprints, \*Beryllium-like ions.

Relativistic and correlation effects cause several inversions of the 'triplet' and 'singlet' J=1 levels in the 2s3p configuration of Be-like ions. The authors have studied these effects in the range of atomic number Z = 6 - 54 using both relativistic and nonrelativistic multiconfiguration wave functions. Theoretical predictions of energies of these levels with respect to the 2s(2) singlet S(0) ground level are compared with experimental data, and the authors conclude that overall, the predictions for the ions having Z = or > 12 are probably more accurate than the available measurements. Calculated oscillator strengths for these resonance transitions are also reported. Near cadmium (Z = 48), the authors confirm still another inversion due to the complete dominance of relativistic effects, which has been reported earlier in the literature.

Observation of Atoms Laser-Cooled Below the Doppler Limit. Final rept.

P. D. Lett, R. N. Watts, C. I. Westbrook, W. D. Phillips, and P. L. Gould. 1988, 4p Sponsored by Office of Naval Research, Arlington, VA.

Pub. in Physical Review Letters 61, n2 p169-172, 11

Keywords: Temperature measurement, Cryogenics, Reprints, \*Ultracold atoms, Sodium atoms, Laser cool-

The authors have measured the temperature of a gas of sodium atoms in 'optical molasses' to be as low as 43 + or - 20 (micro)K. Surprisingly, this strongly vio-lates the generally accepted theory of Doppler cooling which predicts a limit of 240 (micro)K. Several comple-mentary measurements of the ballistic motion of atoms released from the molasses were used to determine the temperature.

K. P. Lieb, H. G. Borner, M. S. Dewey, J. Jolie, S. J. Robinson, S. Ulbig, and C. Winter. 1988, 5p Pub. in Physics Letters B 215, n1 p50-54, 8 Dec 88.

Keywords: \*Chromium 54, Interacting boson model, Neutron capture, Thermal neutrons, Doppler broadening, Lifetime, Reprints,

The double crystal spectrometer GAMS4 in combination with the ILL high flux reactor has been used to determine the lifetimes of the 3074 keV (2 sub 3, sup +) and 3720 keV (1,2)+ states in (54)Cr. The initial recoil energy of about 0.5 keV imparted by the primary gamma-radiation after thermal neutron capture in (53)Cr produces Doppler broadened line shapes of the secondary transitions. The large (2 sub 3, sup +)(2 sub 1, sup +) M1 strength of B(M1) = 0.39(6) (mu sub n) squared suggests the (2 sub 3, sup +) state to be of mixed symmetry within the Interacting Boson model

Ground State Configuration of Sulfur-Like Ions. Final rept.

E. B. Saloman, and Y. K. Kim. 1989, 18p Pub. in Atomic Data and Nuclear Data Tables 41, n2 p339-356 1989.

Keywords: \*Energy levels, Forbidden transitions, Multicharged ions, Transition probabilities, Ground state, Reprints, \*Sulfur-like ions.

Theoretical energy levels have been calculated for the terms of the ground state configuration of all the sulfur-like ions of atomic number Z=16-92. Transition probabilities have been obtained for the M1 and E2 transitions are supported by the M2 and E2 transitions. tions within the configuration. The calculations were by

means of a multiconfiguration-Dirac-Fock technique which included perturbatively the Breit interaction and the Lamb shift for the K-, L-, and M-shell electrons. Results are presented which use experimental and semi-empirical fits to the term energies for ions with atomic numbers up to Z = 42. Above Z = 42, purely theoretical results are given. It is shown that the agree-ment between the authors' theoretical results and the semi-empirical values of the term energies improves rapidly as Z increases, with all values in excellent agreement by Z = 42.

Experimental Stark Widths and Shifts for Spectral Lines of Neutral and Ionized Atoms: A Critical Review of Selected Data for the Period 1983 through 1988. Bimonthly rept.

N. Konjevic, and W. L. Wiese, c1990, 79p

ington, DC. 20036-9976.

Prepared in cooperation with National Inst. of Standards and Technology, Gaithersburg, MD.
Included in Jnl. of Physical and Chemical Reference
Data, v19 n6 p1307-1386 Nov/Dec 90. Available from American Chemical Society, 1155 16th St., NW, Wash-

Keywords: \*Line spectra, \*Stark effect, Neutral atoms, Positive ions, Line width, Line broadening, Spectral shift, Reviews, Tables(Data).

A critical review of the available experimental data on Stark widths and shifts for spectral lines of non-hydrogenic neutral atoms and positive ions has been carried out. The review covers the period from 1983 through the end of 1988 and represents a continuation of earlier critical reviews up to 1982. Data tables containing the selected experimental Stark broadening parameters are presented with estimated accuracies. Guidelines for the accuracy estimates have been developed during the previous reviews and are summarized. data are arranged according to elements and spectra, and these are presented in alphabetical and numerical order, respectively. Comparisons with comprehensive calculations based either on the semiclassical theory, or--for multiply ionized atoms--on the modified se-miempirical approximation, are made whenever possible, since the comparison with theory has often been a principal motivation for the experiments.

PC A04/MF A01 PB91-194399 National Inst. of Standards and Technology, Gaithersbura, MD. Stopping Power of Fast Charged Particles in

Heavy Elements. H. Bichsel. Apr 91, 74p NISTIR-4550

Prepared in cooperation with Bichsel (Hans), Seattle,

Keywords: \*Stopping power, Proton bombardment, Charged particles, Excitation, Bethe-Bloch theory.

The stopping power formula from Bethe's theory contains terms which are known only approximately and must be estimated with the use of experimental data. These terms include a material constant, the mean excitation energy of the medium, and the shell-, Blochand Barkas-corrections. In an analysis of measured proton and alpha-particle stopping powers and ranges, modifying parameters have been introduced into these corrections, and the mean excitation energy was simultaneously adjusted, so as to get the closest possi-ble agreement with experimental results. Such an analysis is reported here for elements with atomic numbers  $Z=\sigma r>57$ . The modification parameters introduced for the shell corrections have a simple relation to atomic energy levels. The Bethe theory with the adopted mean excitation energies and proposed adjustments of the shell- and Burkas- corrections predicts stopping powers that are in close agreement with experimental values, within the experimental uncertainties. This agreement was obtained for protons with kinetic energies above about 0.5 MeV, and for heavier ions of charge z at energies above (z - 1.5) MeV/u.

#### General

Model for the Non-Perturbative QCD (Quantum

Chromodynamics) Vacuum. M. Danos, D. Gogny, and D. Iracane. Apr 91, 34p NISTIR-4555

Prepared in cooperation with CEA Centre d'Etudes de Bruyeres-le-Chatel, Montrouge (France).

Keywords: \*Quantum chromodynamics, states, Meissner-Ochsenfeld effect, Bose-Einstein condensation, Lagrangian functions, Quarks, Gluons.

By treating the high-momentum gluon and the quark sector as an in principle calculabe effective Lagran-gian, the authors obtain a non-perturbative vacuum state for QCD as an infrared quark-gluon condensate. This vacuum is removed from the perturbative vacuum by an energy gap and supports a Meissner-Ochsenfeld effect. It is unstable below a minimum size and it also suggests the existence of a universal hadronization time. This vacuum thus exhibits all the properties required for color confinement.

Prospects for Electromagnetic Manipulation and Trapping of Antihydrogen.

P. D. Lett, P. L. Gould, and W. D. Phillips, 1988, 14p Pub. in Hyperfine Interactions 44, n1-4 p335-348 1988.

Keywords: \*Antimatter, Storage, Reprints, \*Antihydrogen, \*Atom traps, Laser cooling.

The storage and handling of atomic antimatter pre-The storage and handling of atomic antimatter presents special problems because contact with the walls of any material container is prohibited. Laser cooling and trapping and magnetic trapping techniques for neutral atoms are therefore especially appealing. Here the authors review the basic principles of electromagnetic trapping and laser cooling for neutral atoms, and briefly describe a number of already-demonstrated laser and magnetic traps. They discuss limits on the temperatures achievable by laser cooling, as well as some special problems in the laser cooling of hydrogen/antihydrogen. In particular, they present some gen/antihydrogen. In particular, they present some new results for the case of pulsed cooling.

Final rept.

E. Marx. 1989, 3p Pub. in Bell's Theorem, Quantum Theory and Conceptions of the Universe, p127-129 1989.

Keywords: \*Quantum electrodynamics, Klein-Gordon equation, Relativistic effects, Quantum mechanics, Wave functions, Charged particles, Antiparticles, Reprints, Probability amplitudes.

The wave function for a spinless charged particle in an electromagnetic field is decomposed into two probability amplitudes, one for a particle and one for an antiparticle. The particle amplitude is specified at the initial time and the antiparticle amplitude at the final time. Time reflection invariance indicates that the preparation of the antiparticle state at the final time should be carried out by observers composed of antiparticles. A model of elementary particles shows how relativistic quantum mechanics can be used to describe all reactions.

Anomalous Lgamma2,3 X-ray Emission Spectrum

of Xe.

M. Ohno, and R. E. LaVilla. 1988, 5p Pub. in Physical Review A 38, n7 p3479-3483 1988.

Keywords: \*Xenon, \*X ray spectra, Emission spectra, Greens function, Fluorescence, Reprints.

The L(gamma 2,3)(2s(sup -1)-> 4p(sup -1)) x-ray emission spectrum (XES) of gaseous xenon was measured in fluorescence with a high resolution vacuum double crystal spectrometer. The spectrum was also calculated by the Green's function method. The agreement is excellent. It is shown that the spectrum can be interpreted essentially in terms of the spectral function of the 4p hole. The effects of the initial 2s hole state on the final 4p hole state are small. The spectrum shows that the quasi-particle picture of a 4p hole in xenon breaks down due to strong 4p(sup -1) <--> 4d(sup -2) 4(n, epsilon)f super Coster-Kronig processes.

Pub. in Proceedings of Yamada Conference (24th) on Strongly Coupled Plasma Physics, Lake Yamanaka, Japan, August 29-September 2, 1989, p177-187 1990.

Keywords: Laser induced fluorescence, Beryllium ions, Reprints, \*Ion plasmas, Penning traps, Laser cooling.

The authors have observed spatial correlations with up to 15,000 Be(1+) ions in a Penning trap with Gamma

> 100. These correlations are strongly affected by the boundary conditions and take the form of concentric shells as predicted by computer simulations. In the paper the authors briefly describe the experimental confinement geometry and the laser cooling of the ions. Experimental techniques for observing the shell structure are described. The relatively large spacings between the ions permit the shells to be directly viewed by imaging the Be(1+) laser-induced fluorescence onto a photon-counting camera. Diagnostic techniques capable of measuring the ion diffusion are then discussed. Qualitative observations of the ion diffusion are compared with theoretical predictions.

PB91-202903 Not available NTIS National Inst. of Standards and Technology (NEL), Boulder, CO. Electromagnetic Technology Div Enhanced Flux Creep in Nb-Ti Superconductors After an Increase in Temperature.

Final rept. R. W. Cross, and R. B. Goldfarb. 1991, 2p Sponsored by Department of Energy, Washington, DC. Pub. in Applied Physics Letters 58, n4 p415-416, 28 Jan 91.

Keywords: \*Superconducting super collider, \*Superconducting cables, Superconducting magnets, Temperature dependence, Magnetization, Relaxation, Reprints, Flux creep, Niobium titanium.

The magnetic fields of Superconducting Super Collider (SSC) dipole magnets change with time when the magnets are operated at constant current. The decay of the field is thought to be a consequence of flux creep in the Nb-Ti filaments in the superconducting cables. However, measured magnetic relaxation of small samples of SSC cable as a function of time is unlike the large decays that are observed in the fields of the actual magnets. The authors have made relaxation measurements on sample SSC conductors at 3.5 and 4.0 K after field cycling. The decay at both temperatures was 2.8% in 50 min. However, the relaxation measured after a temperature increase from 3.5 to 4.0 K was 4.8% in 50 min. A likely reason for the greater magnetization decay is that, after an increase in temperature, the Nb-Ti is in a supercritical state, with shielding currents flowing at a density greater than the new critical current density. This causes enhanced flux creep. The authors suggest that a small temperature rise during the operation of SSC magnets may contrib-ute to the unexpectedly large magnetic field decay.

#### General

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 27, n2 p1796-1798 Mar 91.

Keywords: \*Superconducting super collider, \*Superconducting cables, \*Magnetometers, Superconducting magnets, Magnetic hysteresis, Magnetization, Hall effect, AC losses, Reprints, Flux creep.

The authors constructed a Hall probe magnetometer to measure the magnetization hysteresis loops of Su-perconducting Super Collider magnet cables. The in-strument uses two Hall-effect field sensors to measure the applied field H and the magnetic induction B. Magnetization M is calculated from the difference of the two quantities. The Hall probes are centered coaxially in the bore of a superconducting solenoid with the B probe against the sample's broad surface. An alternative probe arrangement, in which M is measured directly, aligns the sample probe parallel to the field. The authors measured M as a function of H and field cycle rate both with and without a dc transport current. Flux creep as a function of current was measured from the dependence of ac loss on the cycling rate and from the decay of magnetization with time. Transport currents up to 20% of the critical current have minimal effect on magnetization and flux creep.

\*Probes(Electromagnetic), Keywords: beams, Charged particles, Real time, Density, Re-

The authors have developed a real-time charged particle beam probe which can be used both as a beam diagnostic (beam tuning) and to quantitatively determine the three-dimensional density distribution of a beam. The probe consists of a microchannel plate, an aluminized phosphor screen deposited on a fiber-optic faceplate, a flexible fiber-optic bundle, and a charge injection device (CID) in tandem. Digital or analog video output of the CID is fed into a computer or oscilloscope, respectively, for analysis or observation. The probe can be moved continuously along the beams' paths to obtain 'pictures' of the beam at any desired interval thus giving three-dimensional form factors. Either beam singly or both beams simultaneously may be observed on the monitor facilitating the task of beam adjustment for optimum overlap. The digital beam adjustment for optimum overlap. The digital output is used for quantitative computation of the beam overlaps. The device is linear with beam intensity, but the performance degrades with time due to beam damage of the microchannel plate.

Measurements of Velocity-Changing Collision Ker-

Final rept

K. E. Gibble, and A. C. Gallagher, 1991, 15p

Grant NSF-PHY86-04504 Sponsored by National Science Foundation, Washing-

ton, DC. Pub. in Physical Review A 43, n3 p1366-1380, 1 Feb

Keywords: \*Atomic collisions, Line broadening, Ground state, Rare gases, Rubidium, Reprints, \*Colli-

Measurements of velocity-changing collision (VCC) kernels are obtained using velocity-selective optical pumping. This is the first measurement of the shape of an elastic VCC kernel over the full thermal range of velocity changes. Since ground-state collisions are studied (quintet 5(1/2)) Rb and He, Ne, Ar, Kr, or Xe),very low buffer-gas pressures can be used, and therefore pressure broadening (dephasing collisions) does not obscure the effects of VCC's. The data are deconvolved to eliminate the effects of the natural linewidth and are then extrapolated with respect to buffer-gas pressure to determine the single-collision limit. For small initial velocities, the measured kernels are consistent with a hard-sphere model for large velocity changes, but differ significantly for small velocity changes. The measured VCC kernels for large initial velocities and large velocity changes do not exhibit the agreement with the hard-sphere kernel. This implies that information about the inter-atomic potential can be obtained from a measurement of VCC kernels. The authors also show the inadequacy of the much-used Keilson-Storer kernel (J. Appl. Math. 10, 243 (1952)).

PB91-203125 Not available NTIS National Inst. of Standards and Technology (NML), Boulder, CO. Quantum Physics Div. Squeezed Quantum States of Relic Gravitons and

Primordial Density Fluctuations.

Final rept. L. P. Grishchuk, and Y. V. Sidorov. 1990, 9p Pub. in Physical Review D 42, n10 p3413-3421, 15 Nov

Keywords: \*Gravitons, Gravitational waves, Particle production, Quantum mechanics, Black holes, Cosmology, Reprints.

The close relationship between the theory of particle creation in external fields and the theory of quantummechanical squeezed states is clarified. It is shown that relic gravitons (and other primordial perturba-tions), created from zero-point quantum fluctuations in the course of cosmological evolution, should now be in strongly squeezed states. The statistical properties of the stochastic collection of relic gravitational waves are investigated. Some other examples of particle creation, and in particular Hawking's process of black-hole evaporation, are considered in the context of the theory of squeezed states.

PB91-203257 Not available NTIS National Inst. of Standards and Technology (NML), Gaithersburg, MD. Ionizing Radiation Div. NIST High-Dose Calibration Services. Final rent

Final rept.

Pub. in Nuclear Instruments and Methods in Physics Research B40-41, pt2 p1173-1177 Apr 89.

Keywords: \*Radiation doses, \*Dosimeters, \*Calibration, Gamma rays, Measurement, Reprints, Traceability, 1975 lity, US NIST.

There is a need for standardization of high-dose measurements used in the radiation processing industry in order to provide measurement assurance and traceability to national standards. NIST provides dosimetry calibration services to this industry. One of these services involves the administering of known absorbed doses of gamma rays to customer-supplied dosi-meters. The dosimeters are packaged to provide ap-propriate electron equilibrium conditions and are irradiated in a standard (60)Co calibration facility; this provides a calibration of the response of that batch of dosimeters. Another service consists of supplying to a customer calibrated transfer dosimeters for irradiation with the customer's in-house radiation source. The irradiated transfer dosimeters are then returned to NIST for analysis and the results reported to the customer, thereby providing a calibration of the dose rate of the customer's source.

M. Kanda, and J. Randa. 1991, 6p

Pub. in Proceedings of the International Zurich Symposium and Technical Exhibition on Electromagnetic Compatibility (9th), Zurich, Switzerland, March 12-14, 1991, p337-342.

Keywords: \*Electromagnetic fields, \*Field strength, \*Estimating, Statistical analysis, Finite element \*Estimating, Statistical analysis, Finite element method, Directional measurement, Reprints, National Institute of Standards and Technology.

The problem of measuring and characterizing complicated multiple-source, multiple-frequency electromagnetic environments is becoming more important and more difficult as electrical devices proliferate. The paper reviews three general approaches to the problem which have been investigated at the National Institute of Standards and Technology (NIST). The three approaches are: a statistical treatment of the spatial distribution of electromagnetic field intensities: a nudistribution of electromagnetic field intensities; a numerical computation using a finite-element (or lattice) form of the electromagnetic action functional; and use of a directional probe to scan a volume. All three methods are still in the development stage, but each appears promising.

Spectrum-Averaged Cross-Section Measurement

of (103)Rh(n,n)(103m)Rh in the (252)Cf Fission Neutron Spectrum.

Final rept.

560 1989.

O. P. Lamaze, F. J. Schima, C. M. Eisenhauer, and V. Spiegel. 1988, 5p Pub. in Nuclear Science and Engineering 100, n1 p43-

47 Sep 88.

Keywords: \*Rhodium 103 target, \*Neutron cross sections, Neutron scattering, Fission neutrons, Inelastic scattering, Dosimetry, Californium 252, Reprints.

Because of the close correspondence of the (103)Rh(n,n') differential cross section and the kerma muscle response function for neutrons, rhodium is an attractive neutron kerma monitor. In support of its use as a neutron monitor, the spectrum averaged cross section, sigma(bar), has been measured for a (252)Cf fission neutron spectrum. Pairs of rhodium foils were irradiated on opposite sides of a thinly-encapsulated (252)Cf neutron source. The neutron fluence incident on the foils is determined by the source strength, average foil distance, and length of time of the irradiation. Corrections are made for neutron scattering, satura-tion of activity, and attenuation of the x-rays in the foil during counting. The x-rays were detected with an intrinsic germanium x-ray detector. The results of five separate irradiations yield a value of sigma(bar)(star)P(Kx)=62.3 + or - 19mb, A dscussions of systematic uncertainties is given.

A summary is presented of the procedures used to certify NBS Standard Reference Material 1960, nominal 10 micrometer 'space beads'. Three independent micrometrology techniques were used, with the results agreeing to about 0.1%. Center distance finding, a method based on optical microscopy, gave a value of 9.89 + or - 0.04 micrometers which was chosen as the certified mean diameter. Two supporting measurements, made using metrology electron microscopy and resonance light scattering, yielded mean diameters of 9.886 + or - 0.029 micrometers and 9.898 + or -9.000 + 07 - 0.029 micrometers and 9.898 + 07 - 0.029 micrometers, respectively. The main peak of the size distribution for this material is nearly Gaussian, with a certified standard deviation of 0.09 micrometrs, excluding outlying particles. The SRM 1960 microsspace shuttle 'Challenger', making the material the first commercial product to be made in space.

T. R. Lettieri, and G. G. Hembree. 1989, 7p Pub. in Jnl. of Colloid Interface Science 127, n2 p566-572 1989.

Keywords: \*Microspheres, \*Dimensional measurement, Transmission electron microscopy, Light scattering, Particle size, Calibration, Certification, Diameters, Reprints, \*Standard reference materials, Micrometrology.

The article summarizes the procedures used at the National Bureau of Standards (NBS) in the certification of a new submicrometer particle-sizing Standard Refer-ence Material (SRM 1691). The mean diameter of the polystyrene microspheres was accurately measured using two independent micrometrology techniques.

One technique, transmission electron microscopy, measured the particles dried and in a vacuum, and gave a result of 0.269 + or - 0.007 micrometer for the certified mean diameter. The supporting method, quasi-elastic light scattering, yielded a value of 0.276 + or - 0.007 micrometer for the diameter of the microspheres in liquid suspension. Descriptions of the experimental techniques, data analyses, and sources of error are discussed in the paper. The calibrated microspheres are now available from NBS for use as a primary length standard in the submicrometer size range. Applications include microcontamination measurement in semiconductor processing, atmospheric sampling, and electron-microscope calibration.

Effect of Mechanical Deformation on Nb-Ti Filament Proximity-Effect Coupling at the Edges of SSC Cables.

Final rept.
T. W. Petersen, and R. B. Goldfarb. 1991, 2p Sponsored by Department of Energy, Washington, DC. Div. of High Energy Physics.

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Magnetics 27, n2 p1809-1810 Mar 91.

Keywords: \*Superconducting super collider, \*Superconducting cables, Superconducting magnets, Magnetic fields, Proximity effect, Time dependence, Magnetic fields, Proximity effect, Proxim netization, Deformation, Reprints, Niobium titanium.

Magnetization as a function of transverse magnetic field and time was measured for short strands extracted from the centers and edges of five Nb-Ti Rutherford cables designed for use in Superconducting Super Collider dipole magnets. The multifilamentary strands all had 6-micrometer diameter filaments. Edge samples, which had severe mechanical deformation, showed small magnetic coupling losses at low fields, compared to no coupling losses for undeformed center strands. Sharp strand bends at cable edges decreases the interfilament spacing to the order of the coherence length in the normal matrix material which increases the effective filament diameter and hysteresis loss at low fields. Microscopic studies of the cables' cross sections confirmed smaller interfilament separations in these samples. Flux creep measurements, represented by the time dependence of magnetization, showed little difference between edge and center samples. This indicates that the proximity-coupled matrix in edge samples is not a significant source of flux creep.

Evidence for Surface alpha Particle Clusters in

(nat)AG(197)Au from the (e,alpha) Reaction. W. R. Dodge. Jun 91, 57p NISTIR-4495

Keywords: \*Alpha particles, \*Cluster model, \*Gold 197 target, \*Silver, \*Electron reactions, MeV range 100-1000, MeV range 10-100, Electroproduction, Protons, Graphs(Charts).

The (nat) Ag and (197) Au (e,p) and (e, alpha) energy and angular distributions were measured at 6 electron bombarding energies between 50 and 115 MeV at the National Institute of Standards and Technology. The (nat) Ag and (197) Au (e,p) angular distributions exhibit an asymmetric component which increases from 0 to 50% as the proton energy increases from the proton (e, alpha) angular distributions exhibit an asymmetric component which increases from 0 to 30% as the alpha energy increases from the alpha particle Cou-lomb barrier to 26 MeV. The authors conclude that the asymmetric component of the proton and alpha particle yields are the result of direct or semidirect processes rather than resonance processes and hence, be-cause of the short mean free paths of alpha particles in nuclear matter, give evidence for the existence of alpha particle clusters in the nuclear surface.

Transmission Properties of a Counter-Rotating

Pair of Disk Choppers. Final rept.

J. R. D. Copley. 1991, 10p Pub. in Nuclear Instruments and Methods in Physics Research A303, p332-341 1991.

Keywords: \*Neutron choppers, Time-of-flight spectrometers, High resolution, Crosstalk, Design, Reprints.

Counter-rotating pairs of disk choppers are used to provide pulsed neutron beams for thermal neutron scattering experiments. An important advantage of this type of device, compared with the single disk chopper, is that each disk can be equipped with several slots. A choice of slot widths is then made possible, simply by changing the relative phasing of the two disks. The resolution of an instrument with counter-rotating chopper pairs can therefore be altered without having to modify the incident wavelength or the speed of the choppers. A potential problem, when there are several slots in each disk, is that there will be 'cross talk', i.e. neutrons will be transmitted by a pair of slots other than the intended combination. The author examines that the interded combination. The author examines the transmission properties of a counter-rotating pair of choppers, and describes methods to determine whether or not cross talk can occur. An important conclusion is that the axial separation between the two choppers must be included in the analysis; this separa-tion, which is generally small (of order several cm), sig-nificantly increases the potential for unwanted cross talk. The author briefly discusses the implications of cross talk in the design of a high resolution time-offlight spectrometer.

Keywords: Quantum mechanics, Ion storage, Reprints, \*Quantum Zeno effect, \*Zeno effect, Laser cooling, Penning traps.

Various interpretations of quantum mechanics are valid insofar as they predict the same experimental results. Some invoke 'wave-function collapse' and some do not. An interpretation based on the collapse postulate provides a simple explanation for a recent experimental demonstration of the quantum Zeno effect (Itano et al., Phys. Rev. A-41, 2295 (1990)), but other interpretations are also valid.

Notched and unnotched sheet specimens of four alunoticined and unnotched sheet specimens of four aluminum alloys were fatigue tested to evaluate potential use in the Superconducting Super Collider. Alloys 7075-T6, 7475-T761, 2219-T87, and 2090-T8E41 were tested in axial fatigue at a stress ratio of 0.1. The unnotched specimens were tested at 295, 76, and 4 K, whereas notched specimens were tested at 76 K only. The fatigue strengths of these alloys were compared with a practical interest in a life of 100,000 cycles. Fatigue strengths with static tensile strengths for notched and unnotched specimens.

9p Pub. in Physical Review C 39, n5 p1963-1971 1989.

Keywords: \*Antimony 132, Nuclear energy levels, Nuclear structure, Fission products, Lifetime, Reprints.

New information is presented on the decay of 40-s (132)Sb. A second beta-fed 1+level was identified in (132)Sb. A second beta-fed 1 + level was identified in Sb; it lies at an energy of 2268 keV and is fed by a relatively strong 0.83% beta-decay branch. Four gamma rays were identified that form a weakly populated cascade from a level at 483 keV. Coincidence data demonstrate that the 254-keV level in this cascade is the 102-ns isomer identified previously by Clark et al. A 96-keV, isomeric gamma ray has also been observed that is placed in the decay of the 4.1-min, 8-isomer in (132)Sb. It may also be the 96-keV transition that is associated with the 1.8 microsec isomer identified in the A=132 chain by Clark et al. The splitting of the levels in the proton-neutron multiplets is discussed the levels in the proton-neutron multiplets is discussed and compared with the results of several recent shell model calculations.

Keywords: \*Plasma spectra, Isoelectronic sequence, M1-transitions, Soft x rays, Reprints, \*Phosphorus-like

Phosphorus like spectra Cu XV to Mo XXVIII have been identified in tokamak- and laser-produced plasmas in the wavelength range of 83 to 163 A. These were obtained with the TEXT tokamak at the University of Texas and the 1-GW Nd:glass laser at the National Institute of Standards and Technology, using 2.2- and 10.7-m grazing-incidence spectrographs, respectively. Wavelength measurements were made with an uncertainty of  $\pm$  or  $\pm$  0.005 A. All the classified lines arise from the 3s(2)3p(3)-3s(2)3p(2)3d array. They were identified through detailed comparisons with Hartree-Fock calculations of wavelengths and relative intensi-ties along the isoelectronic sequence. All spectra from Cu to Mo were observed, except for Rb and Sr, whose Cu to Mo were observed, except for Rb and Sr, whose wavelengths are predicted by interpolation with an uncertainty of + or - 0.02 A. By means of previously observed magnetic-dipole (M1) lines within the 3s(2)3p(3) ground configuration and comparisons with published Dirac-Fock calculations, all the energy levels of the configuration were determined with an uncertainty of + or - 10 to/100 cm for Co to Mo. These levels were used to predict all the M1 wavelengths. A correction to the Co XIV ground configuration is made by means of a previously published list of M1 lines.

Keywords: \*Argon, \*Atomic energy levels, \*Transition probabilities, Atomic spectra, Electron transitions, Reprints, \*Atomic transition probabilities, \*Atomic life-

While the atomic transition probabilities and radiative lifetimes of neutral argon have been the subject of numerous experiments and calculations, the results exhibit numerous discrepancies and inconsistencies. The authors present for the first time a unified set of atomic transition probabilities, which is consistent with essentially all recent results, sometimes after critical re-analysis. The data consistency and scale confirmation has been achieved in two ways: (1) The authors have carried out some lifetime/branching ratio measurements for a principal 5p level and the associated 4s-5p transitions. These measurements have very closely confirmed the accuracy of the results of recent independent emission experiments. (2) The authors have critically re-analyzed and revised the literature data for the 4s-4p transitions, as well as utilized the results of a similar critical analysis for the 4s-5p transition array, to establish complete sets of absolute data for these arrays. They have found these data to be mutually consistent from cross-correlation checks between the two arrays using recent literature data. Finally, they have proposed renormalization factors for other argon transitions based on the analysis.

Keywords: \*International system of units, \*Metric system, \*Units of measurement, Primary standards, Translations, \*Foreign technology, International Bureau of Weights and Measures.

The booklet is the United States of America edition of the English-language translation of the sixth edition of Le Systeme International d'Unites (SI), the definitive reference on the SI published in 1991 by the International Bureau of Weights and Measures (BIPM) in the French language. The USA edition conforms in sub-stance with the English-language translation that fol-lows the French-language text in the BIPM publication. That translation was a joint effort of the BIPM, the National Institute of Standards and Technology (NIST) in the United States, and the National Physical Laboratory (NPL) in the United Kingdom. However, to make the booklet helpful to the broadest community of users in the USA, it was necessary to follow current Federal policy, to recognize present USA practices as they are found in the literature of the authors domestic volun-tary standards organizations such as ASTM and IEEE, and to use American spelling of certain words. Thus, the USA edition differs from the English-language version in the BIPM publication in the following details: (1) the dot is used instead of the comma as the decimal the dot is used instead of the comma as the decimal marker; (2) the American spellings 'meter', 'liter', and 'deka' are used instead of 'metre', 'litre', and 'deca'; (3) a small number of footnotes are added for explanatory purposes and to identify USA practices that differ from those suggested in the BIPM publication; (4) in a few instances, American rather than British spelling or usage is followed for a few common words; and (5) the index has been moderately expanded.

Keywords: \*Superconducting magnets, \*Superconducting cables, Superconducting wires, Superconducting super collider, High energy physics, Time depend-ence, Magnetic fields, Critical current, Eddy currents, Magnetization, AC losses, Niobium titanium, Flux

The report is a collection of papers describing magnetic measurements on multifilamentary Nb-Ti superconductor wires and cables as a function of magnetic field and time at liquid-helium temperatures. The papers deal with ac losses and interfilament coupling by prox-imity effect and eddy currents. Flux creep was investi-gated under different experimental conditions. A Hallprobe magnetometer, which was used to measure magnetization and flux creep in the presence of a transport current, is described. A method for increasing the critical current of superconducting cable by controlling twist pitch is demonstrated. A critical-state model for the magnetization of superconductors was developed for samples with field-dependent critical current density and rectangular cross section.

Criteria for the Operation of Federally-Owned Secondary Calibration Laboratories (Ionizing Radiation)

Special pub. (Final). E. H. Eisenhower. Aug 91, 66p NIST/SP-812 Also available from Supt. of Docs. as SN003-003-

Keywords: \*Ionizing radiation, \*Survey monitors, \*Dosimeters, \*Calibration, \*Laboratories, Performance standards, Gamma rays, X rays, Beta particles, Alpha particles, Neutrons, Criteria, Secondary laboratories, Accreditation.

The document contains standards of performance for laboratories that calibrate instrumentation used to measure ionizing radiation. Such standards are useful for the development of a secondary level of calibration laboratories that can provide a high-quality link between the National Institute of Standards and Technology and those who make routine measurements at the field level. The standards may also be used as criteria on which a decision is based regarding accreditation of a particular laboratory. They were developed by representatives of federally-owned laboratories that perform calibrations of the type addressed by the document. The first major part contains general criteria that must be satisfied by all laboratories seeking accreditation. It includes requirements relating to management and staff, physical aspects of the laboratory, calibrations facilities and equipment, operational procedures, accuracy and quality assurance, and records and reports. Five subsequent major parts establish criteria for calibration of survey instruments, irradiation of personnel dosimeters, calibration of sources, calibration of instruments for diagnostic levels, and calibration of reference-class instruments. The types of radiation covered include gamma rays, x rays, beta particles, neutrons, and alpha particles. An appendix describes the proficiency tests administered by NIST to secondary laboratories as a prerequisite for their accredita-

Pub. in IEEE (Institute of Electrical and Electronics Engineers) Transactions on Instrumentation and Measurement 40, n2 p126-128 Apr 91.

Keywords: \*Frequency standards, \*Atomic clocks, Hyperfine structure, Beryllium ions, Beryllium 9, Ground state, Ultrahigh frequency, Doppler effect, Reprints, Laser cooling, Penning traps, Ion traps.

A 303-MHz hyperfine transition in the ground state of (9)Be(1+) was used as a basis of a frequency standard. The ions were stored in a Penning ion trap. Linewidths as narrow as 900 micro Hz were obtained. The frequency stability was measured to be better than 3 x 10 to the -12 power/square root of tau. The inaccuracy in the second-order Doppler shift was reduced to 5 parts in 10 to the 15th power by laser cooling. An apparent pressure shift with an unexpectedly large value was discovered which limits the accuracy of the current experiment to approximately 1 part in 10 to the 13 power.

Dosimetry of a Nearly Monoenergetic 6- to 7-MeV Photon Source by NaI(TI) Scintillation Spectrome-

K. C. Duvall, S. M. Seltzer, C. G. Soares, and B. W. Rust. 1988, 5p

Pub. in Nuclear Instruments and Methods in Physics Research 272, n3 p866-870 Nov 88.

Keywords: \*Gamma dosimetry, \*Nal detectors, Scintillation counters, MeV range 01-10, Radiation protection, Fluorine 19 target, Proton reactions, Spectra unfolding, Calibration, Kerma, Reprints.

The dosimetry of a nearly-monoenergetic 6- to 7-MeV photon source developed at the National Bureau of Standards (NBS) for radiation protection instrument calibration has been carried out by Nal(TI) scintillation spectrometry. The approach uses calculated 3-inch x inch Nal(TI) detector-response functions that been shown to be reasonably accurate up to 20 MeV. A least-squares fit of the appropriate response functions to a selected region of the pulse-height distribution determines the primary 6- to 7-MeV photon fluence. The uncertainty in the fluence determination is based on the chi squared of the fit, the statistics of the data, and the uncertainty in the response functions. The air kerma delivery due to the primary photons at a reference point in the photon field is calculated from the primary photon fluence.

Keywords: \*Photographic film dosemeters, \*Film dosimetry, \*Dosimeters, Temperature dependence, Gamma radiation, Polymeric films, Reprints, Radiochromic dyes, Radiation processing.

Three types of transparent radiochromic films, two forming a blue image and one a red image, are now widely used in high dose dosimetry. These are FWT-60-00, a free standing nylon base film (nominal aborbed dose range: 1-50 kGy) which is usually measured at 605 and 510 nm wavelengths, GafChromic dosimetrs and sea and sea before the forming dose. simetry media, a coated polyester film (nominal dose range: 0.05-30 kGy), which is measured at a variety of visible wavelengths from 675 down to 400 nm, and Riso B3, a free standing polyvinylbutyral base film (nominal absorbed dose range 1-200 kGy) which is measured at a single wavelength, 554 nm. Each of these film types is also supplied in other forms for spe-cial applications and different useful dose ranges, so that the systems are now able to measure doses and make radiographic images (without development) over a wide dynamic range, namely 10 to 200,000 Gy, with reasonable precision, nominally + or - 3% at 95% confidence limits, without appreciable dose rate dependence. The high resolution radiographic images can be used for archival dose distribution records.

The National Institute of Standards and Technology (NIST) Special Publication replaces National Bureau of Standards (NBS) Letter Circular LC1132 published April 19, 1982. It reprints the Department of Commerce, NIST, Federal Register notice of December 20, 1990 titled 'Metric System of Measurement; Interpreta-tion of the International System of Units for the United States' (the International System of Units, abbreviated SI, is the modernized metric system); the Department of Commerce, Office of the Secretary. Federal Register notice of January 2, 1991 titled 'Metric Conversion Policy for Federal Agencies'; and Executive Order 12770 issued by the President of the United States on July 25, 1991 titled 'Metric Usage in Federal Govern-ment Programs.' The first Federal Register notice re-states the Department of Commerce's interpretation of the International System of Units for the United States that was last published by the Department in 1982; the second revises the Code of Federal Regulations (CFR) to remove the voluntary aspect of the conversion to the metric system of measurement for Federal agencies; and the Executive Order provides Presidential authority and direction for the use of the metric system of measurement by Federal departments and agencies in their programs. Also included is a diagram that shows graphically how the 19 SI derived units with special names are derived in a coherent manner from the SI base and supplementary units.

Jun 91, 51p NIST/GCR-91/592 Contract NIST-525BNB1C6678 Sponsored by National Inst. of Standards and Technology (BFRL), Gaithersburg, MD.

Keywords: \*Fire safety, \*Cost estimates, US NIST, Residential buildings, Commercial buildings, Research management, Economic analysis, Insurance, Con-

The report provides an estimate of the total annual dollar costs of establishing and maintaining fire safety in 20th-Century United States. The cost of fire safety estimate is needed to serve as a basis for evaluating the benefits and appropriateness of current and pro-posed fire research programs of NIST. This was a rela-tively modest effort to obtain a first-order estimate of these costs and much of what is reported in these two reports is anecdotal. Nonetheless, the central conclusions one comes to in reading them are that the burden of fire on our society is substantially greater than previously realized and that significant reductions in this burden may be readily achievable through the continued development of fire science and the rapid transfer of fire research results. These findings are particularly relevant as the U.S. economy and its manufacturing infrastructure adjust to the competitive challenges of the global marketplace.

Keywords: \*Robotics, \*Teleoperators, \*Remote manipulator system, Space maintenance, Automatic control, Control systems design, Computer vision, Automation, Space station servicing, Space telerobotics, Flight telerobotic servicer.

The document identifies near term technology developments which would have significant impact on the evolution of the FTS toward autonomous operation. Analysis of anticipated FTS tasks is used to identify operations that might be performed autonomously rather than in a purely teleoperated fashion. Alternative techniques for automating these operations are then described. A discussion of FTS long term evolution is included as an appendix.

Recommended Fine Positioning Test for the Development Test Flight (DTF-1) of the NASA Flight

Telerobotic Servicer (FTS).

N. Dagalakis, A. J. Wavering, and P. Spidaliere. Feb 91, 124p NISTIR-4478

Prepared in cooperation with National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.

Keywords: \*Spacecraft maintenance, \*Telerobotics, \*Positioning, \*Flight tests, Robots, Robot sensors, Robot arms, Standards, Off line systems, Computer programming, DTF-1(Development Test Flight), NASA(National Aeronautics and Space Administration), FTS(Flight Telerobotic Servicer).

The purpose of the report is to propose test procedures for the NASA DTF (Development Test Flight)-1 positioning tests of the FTS (Flight Telerobotic Servicer). The unique problems associated with the DTF-1 mission are discussed, standard robot performance tests and terminology are reviewed and a very detailed description of flight-like testing and analysis is presented. The major technical problem associated with DTF-1 is that only one position sensor can be used, which will be fixed at one location, with a working volume which is probably smaller than some of the robot errors to be measured. Radiation heating of the arm and the sensor could also cause distortions that would interfere with the test. Two robot performance testing committees have established standard testing procedures relevant to the DTF-1. Due to the technical problems associated with DTF-1 these procedures cannot be applied directly. These standard tests call for the use of several test positions at specific locations. Only one position, that of the position sensor, can be used by DTF-1. Off-line programming accuracy might be impossible to measure and in that case it will have to be replaced by forward kinematics accuracy.

Keywords: \*Heat exchangers, \*Heat transfer, Friction factor, Channel flow, Heat transfer coefficient, Reynolds number, Turbulent flow, Experimental data, Heat Temperature distribution. Nusselt number. Helium, Mass flow, National Aerospace Plane.

Development of a National Aerospace Plane (NASP) which will fly at hypersonic speeds, requires novel cooling techniques to manage the anticipated high heat fluxes on various components. The author has constructed a compact heat exchanger consisting of 12 parallel, rectangular channels in a flat piece of com-mercially pure nickel. The channel specimen was ra-diatively heated on the top side at heat fluxes of up to W/sq cm insulated on the back side, and cooled with helium gas flowing in the channels at 3.5 to 7.0 MPa and Reynolds numbers of 1400 to 28,000. The measured friction factor was lower than that of the accepted correlation for fully developed turbulent flow, although our uncertainty was high due to uncertainty in the channel height and a high ratio of dynamic pressure to pressure drop. The measured Nusselt number, when modified to account for differences in fluid properties between the wall and the cooling fluid, agreed with past correlations for fully developed turbulent flow in channels. Flow nonuniformity from channel-to-channel was as high as 12% above and 19% below the mean flow.

Station Freedom.
T. J. Ohlemiller, and K. M. Villa. Jun 91, 79p NISTIR-4591, NASA-CR-187115
Sponsored by National Aeronautics and Space Administration, Cleveland, OH. Lewis Research Center.

Keywords: \*Spacecraft construction materials, \*Space stations, \*Flammability testing, Reduced gravity, Test methods, Fire tests, Ignition, Comparison, Space hazards, NASA, Graphs(Charts), US NIST.

The NASA Upward Flame Propagation test, which measures response to a well-defined laminar flame at the bottom of a test sample, is currently used to screen for flammability all materials intended for use in the interior of manned spacecraft. The response of a series of materials was compared in the test and in the standard NIST flammability tests (Cone Calorimeter for rate of heat release and LIFT tests for ignitability and lateral flame spread). The goal was to see if these differing flammability assessment approaches provide comparable information on the potential hazards of a material. At the present, a firm relation between the behavior in the NASA test and in the NIST tests has not been established. Recommendations are given for future testing.

Orbit Determination and Gravitational Field Accuracy for a Mercury Transponder Satellite.

Final rept. M. A. Vincent, and P. L. Bender. 1990, 5p

Grant NAGW-822

Sponsored by National Aeronautics and Space Administration, Washington, DC.

Pub. in Jril. of Geophysical Research 95, nB13 p21,357-21,361, 10 Dec 90.

Keywords: \*Gravitational fields, \*Orbit calculation, \*Mercury(Planet), Mercury spacecraft, Range finding, Circular orbits, Polar orbits, Transponders, Librations,

Covariance studies were performed to investigate the orbit determination problem for a small transponder satellite in a nearly circular polar orbit with 4-hour period around Mercury. With X band and Ka band Doppler and range measurements, the analysis indicates that the gravitational field through degree and order 10 can be solved for from as few as 40 separate 8-hour arcs of tracking data. In addition, the Earth-Mer-cury distance can be determined during each ranging period with about 6-cm accuracy. The expected geoid accuracy is 10 cm up through degree 5, and 1 m through degree 8. The main error sources were the geocentric range measurement error, the uncertainties in higher degree gravity field terms, which were not solved for, and the solar radiation pressure uncertain-

Apparatus for Measurement of Thermal Conductivity of Insulation Systems Subjected to Extreme Temperature Differences. Final rept. W. P. Dube, L. L. Sparks, A. J. Slifka, and R. M. Bitsy. 1990, 7p

Pub. in AIAA Jnl. 29, n1 p114-118 Jan 91.

Keywords: \*Large space structures, Dynamic structural analysis, Greens function, Waveforms, Pulses, Reprints, Deconvolution.

Experimental identification of dynamic behavior in linear structural systems can be achieved by exciting the structure with a specifically synthesized pulse, and reconstructing the relevant dynamic Green's function by deconvolution of the measured response. The reconstruction procedure involves the solution of an illposed integral equation in the presence of noise. The paper underlines the rich variety of infinitely divisible pulse shapes that may be used while still retaining a pulse shapes that may be used while still retaining shape is necessary to allow for possible perturbations caused by interfacing devices that convert electrical voltages into mechanical forces. A numerical experiment, using synthetic noisy data, shows that the reconstruction procedure remains effective even when the probe waveform deviates strongly from the preferred unimodal shape. A dispersive structural network that may be representative of a large space structure is used as an illustrative example.

Static and Dynamic Strength Tests on Electrical Conductor Cables Specified for Airport Landing Structures. Final rept.

R. J. Fields, S. R. Low, and D. E. Harne. 27 Oct 88, 82p NISTIR-88-3884

Sponsored by Federal Aviation Administration, Washington, DC. Navigation and Landing Div.

Keywords: \*Static tests, \*Strength, \*Electric wire, \*Landing aids, Electric conductors, Dynamic tests, Experimental data, Test facilities, Displacement, Strains, Mechanical properties, Fatigue(Mechanical), Wire, Impact tests, Loads(Forces), Mechanical tests.

The report covers a series of static and dynamic tests on electrical conductors specified for use in landing aids on airport runways carried out by NIST for the Federal Aviation Administration. The structures are intended to be frangible so that they will break up readily if impacted, thus minimizing damage to the impacting aircraft. While the structures are frangible, they contain electrical cables which, due to the requirement of electrical conduction, are not frangible. In an actual impact, these cables do not break readily and tend to wrap around the aircraft. The tests authorized by the FAA were carried out to assess the force required to break through various types of FAA specified cables by a simulated aircraft impact. Furthermore, the effectiveness of using break-away connectors was evaluated to determine if they would reduce the total load on an impacting aircraft. In order to correctly design the dynamic test apparatus, it was necessary to know the approximate, expected load levels and cable elongations at fracture. Therefore a series of quasi-static tests were performed on the cables and break-away connectors. The report describes these quasi-static tests as well as the construction and application of the dynamic test apparatus.

Keywords: \*Geographic information systems, \*Data management, \*Airports, Software tools, Data bases, \*Information Resource Dictionary System, \*IRDS system, GIRDS system, Federal information processing standards.

The management of geographic information resources (GIRS) continues to be plagued by problems of monitoring, locating and controlling the array of geographic information in complex organizations. Software tools to support these functions are fundamental to any effort to maintain the integrity of geographic information as it changes. In addition, such tools are desirable when formalizing, then managing the integration of geographic information resources within an organization. One of the major approaches to the problem in the One of the major approaches to the problem in the area of database systems has been the development of the information resource dictionary (IRD) which contains meta-data. An Information Resource Dictionary System (IRDS) is a database of meta-data along with software and procedures for the creation and mainte-nance of the IRD. In 1989 the American National Standards Institute (ANSI) X3.138-1988 IRDS (ANSI-IRDS) was adopted as Federal Information Processing Standard 156 by the United States Government. ANSI-IRDS is intended to support the definition, manage-ment and control of mete-data. The study presents the first known attempt to actually apply ANSI-IRDS in the geographic information management domain.

The report covers research performed by the National Institute of Standards and Technology for the Federal Railroad Administration. The report covers a project by the Materials Reliability Division (formerly the Fracture and Deformation Division) to develop and build a system to detect and measure residual stress in the rims of railroad wheels. Acoustic birefringence is the underlying principle of operation. This is a measure of the relative difference in the propagation times of two shear waves polarized in radial and circumferential di-rections. Measurements employ an EMAT (electromagnetic-acoustic transducer) as an ultrasonic probe. magnetic-acoustic transducer) as an ultrasonic probe. This type of transducer requires little or no surface preparation and no acoustic couplant. The system operates in a pulse-echo mode. A short burst of shear horizontal waves travels through the rim thickness. The rotation of the EMAT determines the orientation of the polarization vector, radial or circumferential. Precise timing of echoes in both directions reveals the degree of birefringence. Changes are due to both stress state and metalluroical texture. Initial tests indistress state and metallurgical texture. Initial tests indicate it may be possible to separate these two.

Keywords: \*Ultrasonic tests, \*Railroad cars, \*Wheels, \*Cracks, Fractures(Materials), Detection, Treads, Nondestructive tests, Accident prevention, Inspection, Signal processing.

The report covers research performed by the National Institute of Standards and Technology (NIST) for the Federal Railroad Administration (FRA). The report covers a project by the Materials Reliability Division (formerly the Fracture and Deformation Division) to develop and build an ultrasonic system to detect cracktype flaws in the tread of railroad wheels. To achieve fully automatic operation, the sensor is built into the rail so testing occurs as the train rolls past. Signal analysis takes place in real time. The ultrasonic probe is an EMAT (electromagnetic-acoustic transducer). As con-

figured here, the EMAT has a small footprint, and, due to its principle of operation, it does not require any acoustic couplant. The system operates in a pitchcatch mode. A short burst of Rayleigh (surface) waves travels around the wheel tread, and an echo indicates a flaw's presence and size. Testing was performed on both a short track in the NIST laboratory and the full-scale facilities of the Transportation Test Center (TTC) in Pueblo, Colorado. The report documents the design, construction, and testing of the system. It is also to serve as an operational guide for the equipment being delivered to the FRA.

Keywords: \*Robot dynamics, \*Control systems, \*Computer vision, \*Ground vehicles, Robots, Optical processing, Automous navigation, Image processing.

The paper deals with a new quantitative, vision-based approach to road following. It is based on the theoretical framework of the recently developed optical flow-based visual field theory. By building on this theory, the authors suggest that motion commands can be generated discrete force the constitution of the constitution ated directly from a visual feature, or cue, consisting of the projection into the image of the tangent point to the reprojection into the image of the tangent point to the edge of the road, along with the optical flow of this point. Using this cue, they suggest several different vision-based control approaches. There are several advantages to using this visual cue: it is extracted directly from the image, i.e., there is no need to reconstitution. struct the scene; for many road following situations this is the only necessary visual cue; only the horizontal component of the optical flow of the tangent point needs to be extracted; it has a scientific basis, i.e., the described techniques are not ad-hoc; and the related computations are relatively simple and thus suitable for real-time applications. For each control approach, they derive the value of the related steering com-

Studies on the Degradation Products of Paper with and without Pollutants in a Closed Environment. 1. Preliminary Results PB91-143313 101.181 PC A03/MF A01

PB91-143321

Outline of a National Plan on High-Performance Concrete: Report on the NIST/ACI Workshop. Held in Gaithersburg, MD on May 16-18, 1990. PB91-143321 100,522 PC A04/MF A01

PB91-143339

Materials Reliability. Technical Activities, 1990. (NAS-NRC Assessment Panel, January 31-February 1, 1991). PB91-143339 PC A05/MF A01

PB91-143347

Near-Field and Far-Field Excitation of a Long Conductor in a Lossy Medium.
PB91-143347 100,722 PC A03/MF A01

PB91-143362

Multimedia Courseware in an Open Systems Environment: A Federal Strategy PB91-143362 100,039 PC A04/MF A01

PB91-144337

Investigation of Simulated Oil-Well Blowout Fires. PB91-144337 101.356 PC AC 101,356 PC A05/MF A01

PB91-144345

Synthesis of Prototype Resins for Use as BEP Intaglio Ink Vehicles Curing by Electron Beam Radiation. PB91-144345 101,182 PC A03/MF A01

PB91-144352

Short-Term Evolution for the Flight Telerobotic Servicer. PB91-144352 101,731 PC A04/MF A01

PB91-144360

Space Marching Difference Schemes in the Nonlinear In-Space Marching Difference School Space Marching Difference School Space Marching Problem. 101,604 PC A03/MF A01

PB91-144378

NIST STEP Working Form Programmer's Reference. National PDES Testbed Report Series (Revised).
PB91-144378 100,998 PC A03/MF A01

PB91-144386

Computer Program for Simulation of HVAC/Lighting Interactions: Initial Report.
PB91-144386 100,889 PC A05/MF A01

PB91-144394

Using the Harvard/NIST Mark VI Fire Simulation. PB91-144394 100,095 PC A03/MF A01 PB91-144402

Thermal Conductivity of a Polymide Film between 4.2 and 300 K, with and without Alumina Particles as Filler. PB91-144402 100,483 PC A05/MF A01

PB91-144410

Effect of Noble Gas Mixtures on the Performance of Regenerative-Type Cryocoolers Analytical Estimate.

PB91-144410 100,890 PC A03/MF A01

PB91-144428

Ignition Characteristics of the Nickel-Based Alloy UNS N07001 in Pressurized Oxygen. PB91-144428 100,536 PC A04/MF A01

PB91-144436

Programmer's Reference Manual for CFAST, the Unified Model of Fire Growth and Smoke Transport. PB91-144436 100,096 PC A06/MF A01

PB91-144444

Working Implementation Agreements for Open Systems Interconnection Protocols.

PB91-144444 100,686 PC A99/MF A04

PB91-146977

Heat Release Rate: The Single Most Important Variable in 100,097 Not available NTIS

PB91-146985

Adsorption of Water and Oxygen on Ag(110): A Study of the Interactions among Water Molecules, Hydroxyl Groups, and Oxygen Atoms.
PB91-146985 100,270 Not available NTIS

PB91-146993

State-of-the-Art in Pressure Metrology. PB91-146993 101,038 Not available NTIS

PB91-147009

Critical Exponent for Viscosity.
PB91-147009 100.271 Not available NTIS

PB91-147017

Orthogonal Distance Regression PB91-147017 16 101,272 Not available NTIS

PB91-147025

Experimental Evaluation of Selected Orifice Flowmeter Upstream Installations. 100,880 Not available NTIS

PB91-147025

PB91-147033

Mechanism for High Strain-Rate Shear Band Formation. PB91-147033 101,575 Not available NTIS PB91-147041

Heat Capacity and Thermodynamic Properties of Deutrated nonium Hexafluorophosphate ND4PF6 from 5.8 K to 100.272 Not available NTIS

PB91-147041 PB91-147058

Heat Capacity of Deuterated Ammonium Tetrafluoroborate ND4BF4 from 7 to 348 K. PB91-147058 100,273 Not available NTIS

PB91-147066

Laser Induced Desorption of Molecules from Surfaces. PB91-147066 100,235 Not available NTIS

PB91-147074

Alternative Refrigerants R123a, R134, R141b, R142b, and R152a: Critical Temperature, Refractive Index, Surface Tension, and Estimates of Liquid, Vapor, and Critical Densities. P891-147074 101,189 Not available NTIS

Calibration Procedures for Infrared Imaging Systems for Building Diagnostics. PB91-147082 100,057 Not available NTIS

PB91-147090

Effect of Logarithmic Singularity on the Free Edge Stress Intensity Factor of Composite Laminates. PB91-147090 101,116 Not available NTIS

PB91-147108 Stabilization Techniques for Spinning Rotor Gage Residual

Drag PB91-147108 100.922 Not available NTIS PB91-147116

Giant Resonances in the Transition Regions of the Periodic Table. PB**91**-147116 101,605 Not available NTIS

PB91-147124

Adjustment of the Fundamental Physical Constants: A Report of the CODATA Task Group on Fundamental Constants, 1986
PB91-147124
101,606
Not available NTIS

PB91-147132 Fundamentals and Applications of Infrared Themography for Nondestructive Testing. for Nondestrue PB91-147132

101,009 Not available NTIS

PB91-147140

Second-Level Post-Occupancy Evaluation Analysis. PR91-147140 100,058 Not available NTIS

PB91-147157

Cryogenic-Temperature Fluorescence Spectra of Polynuclear Aromatic Hydrocarbons of Molecular Weight 302. PB91-147157 100,274 Not available NTIS

PR91-147165

Phase Equilibria in the System TI-Ca-Ba-Cu-O. 1. Stability of the 2122 Phase under Conditions of Oxygen Annealing. PB91-147165 101,465 Not available NTIS

PB91-147173

Selective Excitation of X-ray Emission Spectra.
PB91-147173 101,607 Not available NTIS PB91-147173

PB91-147181

Low-Temperature, Electrically Calibrated SOS Bolometer for Power and Energy Measurements.

PB91-147181 100,787 Not available NTIS PB91-147199

Hydrogen Slush Production with a Large Auger. PB91-147199 100,275 Not available NTIS PB91-147207

Standard Reference Fibers for Calibration of the Optical Time Domain Reflectometer. PB91-147207 101,406 Not available NTIS PB91-147215

Review of Four Compartment Fires with Four Compartment Fire Models. PB91-147215 100,098 Not available NTIS

PB91-147223

High Speed Magnetic Field Sensors Based on Iron Garnets. PB**91**-147223 100,840 Not available NTIS

PB91-147231

Incorporation of Molecular Orientation into Systems of Lamellar Morphology. 1. Effects of Packing Entropy on the Lamellar Thickness of Block Copolymers.
PB91-147231 100,484 Not available NTIS

PB91-147249

Preparation and Properties of Monomolecular Films for Use as Radioactive Source Mounts.
PB91-147249 101,608 Not available NTIS 101,608 Not available NTIS

PB91-147256

Experimental and Numerical Studies of the J-Integral for a 101.576 Not available NTIS

PB91-147264

NBS Research Program in Municipal Solid Waste Combus-PB91-147264 100,916 Not available NTIS

PB91-147272

Study of the Linearity of Transfer Leaks and a Helium Leak Detector. PB91-147272 100,926 Not available NTIS

PB91-147280

Mechanism of Soot Formation in Acetylene-Oxygen Mix-PB91-147280 100.537 Not available NTIS

PB91-147298

Soluble Models in Surface Collision Dynamics. PB91-147298 100,276 Not available NTIS

PB91-147306

Radiant Heat Fluxes from 100-200 MW Natural Gas/Air Diffusion Flames. PB91-147306 100 538 Not available NTIS

PB91-147314

Phase Formation in Electrodeposited and Thermally Annealed Al-Mn Alloys. PB91-147314 101,209 Not available NTIS

PB91-147322

Effect of Coherency Strain on Alloy Formation: Migration of Liquid Films. PR91-147322 101,210 Not available NTIS

PB91-147330

Dihedral Angles in Magnesia and Alumina: Distributions from Surface Thermal Grooves.
PB91-147330 101,058 Not available NTIS

PB91-147348

Metal Reference Line Technique for Obtaining Dihedral Angles from Surface Thermal Grooves. PB91-147348 101,059 Not available NTIS

PB91-147355

Electrofission in the Ouasifree and Delta Regions. PB91-147355 101,609 Not available NTIS

PB91-147363

Limiting versus Apparant Critical Behavior of Henry's Constants and K Factors. PB91-147363 100 277 Not available NTIS

PB91-147371

Stress Intensity Factors by Enriched Mixed Finite Elements. PR91-147371 101,577 Not available NTIS

PB91-147389

Application of Analytical Electron Microscopy to Glass-Bonded Aluminas.
PB91-147389 101,060 Not available NTIS PB91-147397

RIR - Measurement and Use in Ouantitative XRD. PB91-147397 101,466 Not available NTIS PB91-147405

Extension of an Improved One-Fluid Conformal Solution Theory to Real Fluid Mixtures with Large Size Differences. PB91-147405 100,278 Not available NTIS PB91-147413

Dietary Collection Procedures. PB91-147413 101,317 Not available NTIS

PB91-147421

Practical Constraints in Monitoring Micronutrient Intake. PB91-147421 101,318 Not available NTIS PB91-147439

Design of High Strength Cement-Based Materials. Part 2. Microstructure

Uracil Derivatives.

Journal of Physical and Chemical Reference Data, Volume 20, Number 6, November/December 1991. PB92-148162 100,476 Not available NTIS

PB92-148170

New Equation of State and Tables of Thermodynamic Properties for Methane Covering the Range from the Melting Line to 625 K at Pressures up to 1000 MPa. PB92-148170 100,477 (Order as PB92-148162)

PB92-148188

Thermodynamic Properties of the Aqueous Sulfuric Acid System to 350 K.

PB92-148188

100.478 (Order as PB92-148162)

PB92-148196

Solubility of Carbon Dioxide in Water at Low Pressure. PB92-148196 100,479 (Order as PB92-148162)

PB92-148204

Chemical Kinetic Data Sheets for High-Temperature Reac-PB92-148204 100,480 (Order as PB92-148162)

PB92-148212

Atomic Weights of the Elements 1989. PB92-148212 100.481 (Or 100,481 (Order as PB92-148162)

PB92-148220

Isotopic Compositions of the Elements 1989. PB92-148220 100,482 (Order as PB92-148162)

PB92-163864

Modernized Metric System (Chart). PB92-163864 100,939 Not available NTIS

PB92-163872

Brief History of Measurement Systems with a Chart of the Modernized Metric System. 100.940 Not available NTIS PB92-163872

PB92-163880

Metric Conversion Card. PB92-163880 100.941 Not available NTIS

PB92-163898

Metric Measures Up (Ruler). PB92-163898 100,942 Not available NTIS

PB92-937300

Validated Products List (Cobol, Fortran, ADA, Pascal, MUMPS, SQL).
PB92-937300 100,671 Standing Order

REPT-21

Crack Arrest Fracture Toughness Measurements of Nor-malized and Inclusion Shape Controlled AAR TC128 Grade B Steel, and Micro-Alloyed, Control-Rolled, and Inclusion

Shape Controlled A 8XX Grade B Steel. PB91-167346 101,150 PC A03/MF A01

REPT-24

Mechanical Properties and Fracture Toughness of AAR TC128 Grade B Steel in the Normalized, and Normalized and Stress Relieved Conditions.
PB92-108901 101,169 PC A03/MF A01

SERI/TP-214-4409

Scanning tunneling microscopy studies of the surfaces of a-Si:H and a-SiGe:H films. Annual report, 1 December 1989-31 January 1991. DE91002169 100,785 PC A03/MF A01

SR-723-29-89

Summary of Experiments with the Separated Aperture Technique of Dielectric Anomaly Detection. AD-A230 438/4 100,721 PC A02/MF A01

Influence of Filament Geometry on Hot Filament Growth of Diamond Films. AD-A231 818/6 101,448 PC A02/MF A01

WRDC-TR-90-2081

Detection of Excited States by Laser-Induced Fluorescence and Analysis of Energy Transfer.

AD-A227 296/1 100,242 PC A04/MF A01

# NIST Technical Publications

# Periodical

Journal of Research of the National Institute of Standards and Technology - Reports NIST research and development in those disciplines of the physical and engineering sciences in which the Institute is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Institute's technical and scientific programs. Issued six times a year.

# **Nonperiodicals**

Monographs – Major contributions to the technical literature on various subjects related to the Institute's scientific and technical activities.

Handbooks - Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications - Include proceedings of conferences sponsored by NIST, NIST annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series - Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series - Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NIST under the authority of the National Standard Data Act (Public Law 90-396). NOTE: The Journal of Physical and Chemical Reference Data (JPCRD) is published bi-monthly for NIST by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements are available from ACS, 1155 Sixteenth St., NW., Washington, DC 20056.

Building Science Series - Disseminates technical information developed at the Institute on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes - Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NIST under the sponsorship of other government agencies.

Voluntary Product Standards - Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The standards establish nationally recognized requirements for products, and provide all concerned interests with a basis for common understanding of the characteristics of the products. NIST administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series - Practical information, based on NIST research and experience. covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace. Order the above NIST publications from: Superintendent of Documents, Government Printing Office, Washington, DC 20402.

Order the following NIST publications - FIPS and NISTIRs - from the National Technical

Information Service, Springfield, VA 22161.

Federal Information Processing Standards Publications (FIPS PUB) - Publications in this series collectively constitute the Federal Information Processing Standards Register. The Register serves as the official source of information in the Federal Government regarding standards issued by NIST pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NIST Interagency Reports (NISTIR) - A special series of interim or final reports on work performed by NIST for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service, Springfield, VA 22161, in paper copy or microfiche form.

**BUSINESS & ECONOMICS** 

**CHEMISTRY** 

CIVIL ENGINEERING

COMBUSTION, ENGINES & PROPELLANTS

**COMMUNICATION** 

COMPUTERS, CONTROL & INFORMATION THEORY

DETECTION & COUNTERMEASURES

**ELECTROTECHNOLOGY** 

**ENERGY** 

ENVIRONMENTAL POLLUTION & CONTROL

HEALTH CARE

INDUSTRIAL & MECHANICAL ENGINEERING

LIBRARY & INFORMATION SCIENCES

MANUFACTURING TECHNOLOGY

**MATERIALS SCIENCES** 

MATHEMATICAL SCIENCES

**MEDICINE** & BIOLOGY

**MILITARY SCIENCES** 

MISSILE TECHNOLOGY

NATURAL RESOURCES & EARTH SCIENCES

NAVIGATION, GUIDANCE & CONTROL

NUCLEAR SCIENCE & TECHNOLOGY

OCEAN TECHNOLOGY & ENGINEERING

**ORDNANCE** 

PHOTOGRAPHY & RECORDING DEVICES

**PHYSICS** 

PROBLEM-SOLVING INFORMATION FOR STATE & LOCAL GOVERNMENTS

SPACE TECHNOLOGY

TRANSPORTATION

URBAN & REGIONAL TECHNOLOGY & DEVELOPMENT
