NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ was established by an act of Congress March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau consists of the Institute for Basic Standards, the Institute for Materials Research, the Institute for Applied Technology, the Institute for Computer Sciences and Technology, and the Office for Information Programs.

THE INSTITUTE FOR BASIC STANDARDS provides the central basis within the United States of a complete and consistent system of physical measurement; coordinates that system with measurement systems of other nations; and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. The Institute consists of the Office of Measurement Services, the Office of Radiation Measurement and the following Center and divisions:

Applied Mathematics — Electricity — Mechanics — Heat — Optical Physics — Center for Radiation Research: Nuclear Sciences; Applied Radiation — Laboratory Astrophysics² — Cryogenics² — Electromagnetics² — Time and Frequency².

THE INSTITUTE FOR MATERIALS RESEARCH conducts materials research leading to improved methods of measurement, standards, and data on the properties of well-characterized materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; and develops, produces, and distributes standard reference materials. The Institute consists of the Office of Standard Reference Materials, the Office of Air and Water Measurement, and the following divisions:

Analytical Chemistry — Polymers — Metallurgy — Inorganic Materials — Reactor Radiation — Physical Chemistry.

THE INSTITUTE FOR APPLIED TECHNOLOGY provides technical services to promote the use of available technology and to facilitate technological innovation in industry and Government; cooperates with public and private organizations leading to the development of technological standards (including mandatory safety standards), codes and methods of test; and provides technical advice and services to Government agencies upon request. The Institute consists of the following divisions and Centers:

Standards Application and Analysis — Electronic Technology — Center for Consumer Product Technology: Product Systems Analysis; Product Engineering — Center for Building Technology: Structures, Materials, and Life Safety; Building Environment; Technical Evaluation and Application — Center for Fire Research: Fire Science; Fire Safety Engineering.

THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides technical services designed to aid Government agencies in improving cost effectiveness in the conduct of their programs through the selection, acquisition, and effective utilization of automatic data processing equipment; and serves as the principal focus within the executive branch for the development of Federal standards for automatic data processing equipment, techniques, and computer languages. The Institute consists of the following divisions:

Computer Services — Systems and Software — Computer Systems Engineering — Information Technology.

THE OFFICE FOR INFORMATION PROGRAMS promotes optimum dissemination and accessibility of scientific information generated within NBS and other agencies of the Federal Government; promotes the development of the National Standard Reference Data System and a system of information analysis centers dealing with the broader aspects of the National Measurement System; provides appropriate services to ensure that the NBS staff has optimum accessibility to the scientific information of the world. The Office consists of the following organizational units:

Office of Standard Reference Data — Office of Information Activities — Office of Technical Publications — Library — Office of International Relations — Office of International Standards.

THE UNIVERSAL COLOR LANGUAGE

Kenneth L. Kelly

Preface to 1976 Edition

The ISCC-NBS Color Names Dictionary (NBS Circular 553) has gone through six previous printings and has sold nearly 14,000 copies. In the years since this Dictionary became available in January 1956, a number of significant advances have been made in this field of colorimetry. The importance of the Centroid numbers became increasingly clear, so they were added to the appropriate color-name blocks in the color-name charts in section 13 of the 1963 (4th) and subsequent printings. Otherwise the Color Names Dictionary remains exactly the same.

The demand for colors to illustrate the color-name blocks was voiced even before publication in November 1955. However, due to the high cost of developing precise colors and the lack of funds, the development of the ISCC-NBS Centroid Colors was delayed until 1965. At that time, they were published with financial assistance from the Color Marketing Group. These colors were produced by the Toby Color Card Company of St. Louis, and the Munsell Color Company of Baltimore supervised the final production, thus assuring that the Centroid Colors would meet the very stringent tolerances specified for them. The Centroid Color Charts became the first Supplement to the Color Names Dictionary.

When the Centroid Color Charts were received in early 1965, there were fewer than 100 copies of the Color Names Dictionary in stock at the Government Printing Office. Since it would have required some time to update the Dictionary, it was reprinted without change (5th printing, 5/12/65). The necessary revisions including a description of the Centroid Colors were then incorporated into a paper entitled A Universal Color Language (UCL), also published in 1965. That paper is the second Supplement to the Color Names Dictionary.

Since the Color Names Dictionary is still the basic document in this field of color and is now out of stock, it is being reprinted (7th printing) and updated by revising The Universal Color Language and publishing it along with the Dictionary. The Color Names Dictionary, The Universal Color Language and the Centroid Color Charts form a complete unit and are most useful when purchased together. For the first time all three items can be purchased from the Office of Standard Reference Materials, National Bureau of Standards. In addition, this volume containing the UCL and the Color Names Dictionary can be purchased from the Superintendent of Documents, Government Printing Office.

The National Bureau of Standards is again happy to acknowledge the cooperative nature of this project and to express its appreciation to all those who have made it possible.

The Universal Color Language

by Kenneth L. Kelly

Abstract

The Universal Color Language (UCL) has been revised and will be published together with the 7th printing of the Color Names Dictionary. It serves as the means of updating the Dictionary. The UCL brings together all the well known color-order systems and methods of designating color. It interrelates them in six correlated levels of fineness of color designation, each higher level indicating a finer division of the color solid. It follows closely the original requirements for the ISCC-NBS Method of Designating Colors stated in the Color Names Dictionary. They were: a) accurate enough to satisfy a scientist, b) usable enough to satisfy a manufacturer and c) simple enough to be understood by the average person on the street. The first requirement is satisfied by levels 6 and 5, the second by levels 5, 4 and 3, and the third by levels 3, 2 and 1. The UCL is being increasingly used by science, education, art and industry. Instructions are included for the application of the UCL at each level.

Key words: Color; colorimetry; color names; color designations; color-order systems.

1. Introduction

Hardly a day goes by without the need for each of us to verbally describe at least one color. The degree to which the other person understands our description depends on a number of factors. Did I use the common language of the street? Are we from the same geographic area? Do we both work in the same trade or occupation? Are we of the same ethnic group? How accurately must the color description be understood?

If we are discussing the physical attributes of the "redhead" that just walked by, the accuracy of color description is relatively unimportant. However, if we are discussing the color of the carpet to be installed in a large office building involving a considerable amount of money, then the color description as well as the lighting and viewing conditions under which the description applies must be very carefully specified and controlled.

If we allow ourselves to dream about an ideal color language, it must be able to:

- 1) Be understood by the public at least in a general way;
- 2) Describe a color with different degrees of accuracy;
- 3) Use color names or numeral and/or letter designations interchangeably;
- 4) Specify color tolerances around a standard color;
- 5) Describe the color in terms of the best known color-order systems or collections of color samples;
- 6) Describe colors with the even greater accuracies that will be demanded in the future;
- 7) Correlate visual descriptions with instrumental measurements of a color; and
- 8) Provide meaningful translation of exotic or promotional color names.

A color language which is designed to meet these requirements will be described and its development and applications will be discussed.

2. Method of Color Designation

The Inter-Society Color Council (ISCC) [25]¹

and the National Bureau of Standards (NBS) cooperated for many years in the development of the ISCC-NBS Method of Designating Colors and a Dictionary of Color Names, usually shortened to the Color Names Dictionary (CND)² [18, 23]. This publication describes the selection of the ISCC-NBS hue names and modifiers descriptive of the lightness and saturation of a color [sec. 4.2 and 5, CND] which form the basis of the ISCC-NBS Method. This publication also describes the method by which the psychological color solid³ [sec. 4.1, CND; 37-fig. 1], dimensioned according to the Munsell (fig. 2) scales of hue (red, yellow, purple-fig. 3), value (lightness-light, dark, very dark-fig. 4) and chroma (saturation-grayish, strong, vivid-fig. 5) [sec. 4, CND; 3, 29, 30, 42], is divided into 267 blocks. To each of these blocks is assigned the appropriate ISCC-NBS color name. The hue, value and chroma boundaries of each color-name block were adjusted so that the color ranges embodied in each color-name block reflected common usage of that ISCC-NBS color name [sec. 5, CND], figure 6. These 267 color-name blocks are described in 31 color-name charts [sec. 13, CND]. Thus it is possible, given the Munsell notation⁴ of a color, to determine the ISCC-NBS color name most descriptive of this color by assigning to it the color name of the color-name block in which this Munsell notation plots.

¹ Figures in brackets [] indicate the literature references at the end of this paper (sec. 13).

² The Color Names Dictionary [ref. 23] is frequently referenced in this paper. The abbreviation CND will be used to cite this source.

³ Such a color solid is a very convenient way to arrange and thereby to visualize colors according to their hue, value or lightness and chroma or saturation. Any non-fluorescent or non-retroreflective surface color, for instance, can be represented by a point in the color solid at its proper hue, value and chroma.

⁴ All Munsell notations determined from the Munsell Book of Color up to and including the 1929 Edition, were called Munsell Book notations. After the publication in 1943 of the OSA study of the Spacing of the Munsell Colors³², all Munsell notations determined on the basis of the respaced colors in the 1943 Report were called Munsell renotations. This was to distinguish them from Munsell Book notations. After all Munsell colors were brought into conformity with the 1943 Report, and after sufficient years had lapsed that the term Munsell renotation had become of academic interest only, the term Munsell renotation has been replaced by Munsell notation.

FIGURE 1. *A photograph of a color solid constructed of Munsell samples affixed on ten constant-hue charts or fans. Note that the hue changes as the solid is rotated about its vertical axis. This color solid was constructed at the National Bureau of Standards under the author's supervision.*

CAUTION: Since all the colors in this Figure are photographs of Munsell colors, they are approximations of them and so should never be used in place of the actual samples.

FIGURE 2. A photograph of the glossy edition of the *Munsell Book of Color*³⁰ with one constant hue chart extended. A single color chip with its Munsell notation is shown in the small insert.

CAUTION: Since all the colors in this Figure are photographs of Munsell Colors, they are approximations of them and so should never be used in place of the actual samples.

FIGURE 3. A photograph illustrating the hue circle with five generic Centroid Colors: red, yellow, green, blue and purple.

CAUTION: Since all the colors in this Figure are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

FIGURE 4. A photograph illustrating the value or lightness scale with five Centroid Colors: very light green, light green, moderate green, dark green and very dark green.

CAUTION: Since all the colors in this Figure are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

FIGURE 5. A photograph illustrating the chroma or saturation scale with five Centroid Colors: gray, grayish green, moderate green, strong green and vivid green.

CAUTION: Since all the colors in this Figure are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

The ability of the ISCC-NBS Method to describe colors with different levels of accuracy was applied many times during the development of this method. For instance, the Munsell Notation of a paint chip or a finely ground drug sample [1, 45] can be determined by a trained observer under good lighting and viewing conditions (sec. 6.1.2, CND) to one half of a hue step, to one tenth of a value step and to three tenths of a chroma step. This accuracy is more than that necessary to determine the appropriate ISCC-NBS color name descriptive of the color of the drug sample, for instance. Now, suppose that the ISCC-NBS color name of this drug sample were "light yellowish brown". The same drug sample could be described less accurately as simply "yellowish brown". It could be described with still less accuracy by the simple generic hue name "brown". Thus we can see that three levels of accuracy of color designation are possible with color names alone (see table 1).

Now let us consider another type of example. Mrs. Smith has just told us she bought a "green" sofa. This color name tells us only that this color falls somewhere in the green part of the color solid; that is, it is not a red, yellow, blue or purple. Let us call this most basic type of color designation level 1. If, however, she had said it was a yellowish green, then we would have known also that it was not a plain green or a bluish green. Let us call this finer type of color designation level 2. If she had gone further and described the color of her new sofa as a light yellowish green, then we would have had a very good idea of its color. Let us call this still more specific type of color designation level 3. (Naturally, we are assuming in this discussion that all the people involved have normal color vision.)

Thus it can be seen that through the use of the ISCC-NBS Method of Designating Colors, three correlated levels of accuracy of color description can be delineated using color names alone. So, the ISCC-NBS Method not only supplies the basis of what we will call The Universal Color Language, but it also supplies the first three levels of increasing fineness of color designation of this language. A color designation can be a color name, numbers, letters or a combination of two or of all three of these.

However, even three levels of fineness of color designation are not sufficient to meet the demands of science, art and industry. The usefulness of *color names* is limited to levels 1, 2 and 3. Where still greater accuracies of color designation are required—that is, where the color solid is divided into larger and larger numbers of smaller and smaller blocks—letters and/or numbers will be required to designate these colors.

An obvious choice to be used in level 4, the next level of accuracy higher than level 3, is the Munsell Book of Color [3, 22, 30, 32] containing just over 1500 color standards. In response to the demands for still greater accuracy, the visually interpolated Munsell notation was the logical selection for level

5. This is the level used in most applications of the Munsell Book of Color in science, education, art and industry. The practical limit of visual interpolation among these color standards has been reached in level 5. As a result, the next higher level of accuracy of color designation, level 6, must be based on instrumental measurements. A spectrophotometer is the preferred instrument but certain colorimeters can be used at this level of accuracy provided the conditions of measurement are carefully controlled. (See sec. 10, level 6). The results from these instrumental measurements can be expressed in the CIE coordinate system (x , y , Y or X , Y , Z) [2, 17, 19, 38] or in a more finely interpolated Munsell notation determined mathematically from the CIE coordinates.

While levels 4, 5 and 6 are not expressly described in the ISCC-NBS Method of Designating Colors, they are logical extensions of this Method. Remember that the boundaries of the color-name blocks in the color-name charts [sec. 13, CND] are defined in Munsell terms. Remember also that the appropriate ISCC-NBS Color Name description of a color is determined through a visually or instrumentally determined Munsell notation.

Through the determination of the Munsell notations of the individual color samples in two well known collections of color standards (the 9th Standard Color Card of America [7, 41] and the Horticultural Colour Chart [6, 33]), fig. 7, these collections can be used in place of the Munsell Book of Color in visually determining the ISCC-NBS Color Names in level 3. By the same use of equivalent Munsell notations, it is possible to use four other color-order systems in place of Munsell in level 4. These are Maerz and Paul, 1st Edition [26, 34], Plochere [28, 40], Ridgway [12, 43] and the Color Harmony Manual, 3rd Edition [10, 11, 16, 34, 44], figure 8.

3. The Universal Color Language

It is difficult to trace the origin of the name The Universal Color Language [14, 15, 21, 23] except to state that it coincided with the development and extension of the ISCC-NBS Method of Designating Colors.

Although reference has already been made to the concept of six levels of color designation, historically the notion of levels evolved during the solution of ISCC Problem 23, the Historical Expression of Color Usage [14, 21]. The Color Marketing Group (CMG) was formed in June 1962 [8, 21]. They adapted this method to the statistical analysis of color trends—the changing patterns of color usage in the various industries in which product color is an important marketing factor. That level is used which is appropriate to the degree of accuracy of color designation needed in the particular application, the accuracy increasing with the level number. The higher levels represent a finer division of the whole color solid into a greater number of smaller blocks of color.

Level of Fineness of Color Designation	Color Name Designations			Numeral and/or Letter Color Designations		
	Level 1 (least precise)	Level 2	Level 3	Level 4	Level 5	Level 6 (most precise)
Number of Divisions of Color Solid	13	29	267*	943-7056*	≈100,000	≈5,000,000
Type of Color Designation	Generic hue names and neutrals (See circled designations in diagram below)	All hue names and neutrals (See diagram below)	ISCC-NBS All hue names and neutrals with modifiers (NBS-C553)	Color-order Systems (Collections of color standards sampling the color solid systematically)	Visually interpolated Munsell notation (From Munsell Book of Color)	CIE (x,y,Y) or Instrumentally Interpolated Munsell Notation
Example of Color Designation	brown	yellowish brown	light yellowish brown (centroid #76)	Munsell 1548* 10YR 6/4**	9½ YR 6.4/4¼ **	x = 0.395 y = 0.382 Y = 35.6% or 9.6YR 6.4 _s /4.3**
Alternate Color-Order Systems Usable at Given Levels			SCCA 216* (9th Std.) 70128 HCC 800* H407	M&P 7056* (1st Ed.) 12H6 Plochere 1248* 180 0 5-d Ridgway 1115* XXIX 13 "b" CHM 943* (3rd Ed.) 3 gc		
General Applicability						

* Figures indicate the number of color samples in each collection.

** The smallest unit used in the Hue, Value and Chroma parts of the Munsell notation in Levels 4 (1 Hue step, 1 Value step and 2 Chroma steps), 5 (½ Hue step, 0.1 Value step and ¼ Chroma step) and 6 (0.1 Hue step, 0.05 Value step and 0.1 Chroma step) indicates the accuracy to which the parts of the Munsell notation are specified in that Level.

FIGURE 8. Photographs of the four color-order systems which can be used in place of the Munsell Book of Color in Level 4: Maerz and Paul, 1st edition, Plochere, the Color Harmony Manual, 3rd edition and Ridgway.

CAUTION: Since all the colors in this Figure are photographs of the colored samples in the different systems, they are approximations of them and so should never be used in place of the actual samples.

It was approximately 1963 that the name The Universal Color Language (UCL) was coined in discussions with the Executive Secretary of the Color Marketing Group. The name indicates the very wide range of applications available depending on the demands of the user, including variable levels of accuracy and the use of varying types of color designations (color names or letter and/or number designations). It must be borne in mind that the UCL describes only the color of an object. It does not describe any of the other appearance attributes, such as gloss or texture. When these other appearance attributes are likewise standardized and reduced to a language, then the UCL will become part of the larger, more inclusive Universal Appearance Language (UAL).

The UCL is being increasingly used in science, education, art and industry. It has the open-ended flexibility to add level 7 when a still more accurate designation of color is needed. By the same token, it can also add intermediate levels such as 2B or 2C between levels 2 (29 blocks) and 3 (267 blocks). Such an intermediate level can be made to contain perhaps 80 to 150 color designations, if this number is required for a special purpose. As a special dividend, the UCL has the unique ability to translate for the first time the special color names of the well-known color-order systems and collections of color standards into the ISCC-NBS color names, or from one of these special color languages into one of the others. These special color languages include Ridgway (ornithology, geology, botany, biology), Plochere (interior decorating), Color Harmony Manual, 3rd edition ("mass market", items on the market shelf), Maerz and Paul, 1st edition (historical color names), the Nickerson Color Fan (flower colors) [35, 36], Dade (biology) [9, 12, 43], the 9th Standard Color Card of America (fashion, flag colors), and the Horticultural Colour Chart (flower colors). When a new color-order system, such as the Natural Color System of Sweden, is published and the individual colored samples are assigned Munsell notations, it will likewise be possible to translate these new designations into the ISCC-NBS color names or into one of the special color languages listed above.

It is important to remember that in each level (a) the whole color solid is divided into a stated number of blocks, (b) the boundaries of each color-name block are accurately specified and (c) all six levels are related through the UCL. Table 1 summarizes the six levels of accuracy of color designation and their applications. One arrow indicates the direction to go for greater accuracy of color designation. The other arrow indicates the direction taken in the statistical combination or "roll-up" technique used in statistical studies of color trends by the Color Marketing Group.

The UCL has resulted from a massive cooperative effort by organizations and individuals all interested in realizing the utmost benefits from color in every field of application. To use a mechanical simile, it can be likened to a bridge over which color informa-

tion flows in both directions between the salesman and the customer, or between the scientist and the manufacturer or management. The UCL is the second Supplement to the Color Names Dictionary.

4. The ISCC-NBS Centroid Colors

The ISCC-NBS Centroid Colors [15, 20] (fig. 9) were developed to illustrate the center (center-of-gravity or centroid) of each of the 267 color-name blocks [sec. 13, CND]. These standard colors are in the form of one-inch square glossy paint-on-paper samples affixed on a variable gray background so that each color is seen on a background of approximately its own lightness. Under each Centroid Color is the abbreviation of the appropriate ISCC-NBS color name plus the corresponding Centroid or color-name-block number (fig. 10). These color samples illustrate the central or most typical color of each of the color-name blocks. With a set of Centroid Colors, we can now see directly what the average person is supposed to mean when he uses one of the ISCC-NBS color names. Since the block number, the corresponding ISCC-NBS color designation and the Munsell notation of each of the Centroid Colors are listed in the table attached to each set of these charts, the Centroid Colors form an extremely useful and inexpensive set of special color standards. The ISCC-NBS Centroid Color Charts form the first Supplement to the Color Names Dictionary.

4.1 Other Advantages and Applications of the Centroid Colors

Another advantage associated with the Centroid Colors is the use of the Centroid number as an abbreviation of the ISCC-NBS color designation. This number (ranging from 1 to 267) requires only three columns on a computer punch card, such as an acquisition or inventory card. It is also possible to code the color of an item on a single data-processing card at each of the six levels. In fact this has already been done on a commercial basis by the Color Marketing Group.

Another advantage results from the color-name-block structure of the ISCC-NBS Method of Designating Colors. Since the hue, value and chroma boundaries of each color-name block enclose the ranges of color best described by that ISCC-NBS color name, these boundaries can be considered color-name tolerances around each ISCC-NBS color name. To put it another way, each such boundary separates the ranges of color best described by the contiguous ISCC-NBS color names.

Each level of the UCL will now be discussed separately and in the detail required to apply it to color problems which can be solved with the accuracy of color designation inherent in that level.

5. Level 1

In level 1, the whole color solid is divided into just 13 large color-name blocks. As a result, each of

FIGURE 9. A photograph of a set of the ISCC-NBS Centroid Color Charts showing the charts for the hues red, yellow, green, blue and purple opened out.

CAUTION: Since all the colors in this Figure are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

Green

FIGURE 10. A photograph of the Green ISCC-NBS Centroid Color Chart. A single color sample with its Centroid number and equivalent ISCC-NBS color-name abbreviation is shown in the small insert.

CAUTION: Since all the colors in this Figure are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

these blocks will contain a relatively large range of color. This is why it is called the least precise level in The Universal Color Language. On the other hand, it is the easiest level for the average person to understand, since the color names describing each block are only generic (basic) hue names (red, yellow, blue), and the neutrals (white, gray and black). Although this level is called the least precise, the boundaries of these blocks are specified just as accurately as those of the smaller blocks in the higher-numbered levels. The ten generic hue names and three neutrals and their abbreviations are listed in table 2 and circled in the round diagram in table 1. Thus, we can describe any color in this level of accuracy by using one of these generic hue names or white, gray or black. As an example, we could describe a certain carpet as a brown (Br) carpet.

6. Level 2

In level 2, the whole color solid is divided into 29 blocks; four of the level 1 blocks remain unchanged while 9 are divided into two or three parts. The 13 color names or designations used in level 1 are still applied to the appropriate 13 of the 29 blocks, while each of the 16 new blocks is assigned an intermediate hue name. These new intermediate hue names each fall between two of the generic hue names in level 1; they are listed in table 3. They are shown but not circled in the round diagram in table 1. In this level we can describe our brown carpet a little more accurately by calling it a yellowish brown (yBr) carpet.

7. Level 3

In level 3, the whole color solid is divided into 267 color-name blocks, as shown in the color-name charts in section 13 of the Color Names Dictionary. Each of the blocks in level 2 described by a generic or intermediate hue name is divided again. To each of these subblocks is assigned the generic or intermediate hue name of the original level 2 block and one or more appropriate modifiers describing its lightness and saturation. These modifiers are shown in figure 11 below and in figure 2 on page 3 of the Color Names Dictionary. The part of the color solid called gray is divided into three parts named light gray, medium gray and dark gray. This level constitutes the ISCC-NBS Method of Designating Colors, which uses the full set of 267 color-name blocks in the Color Names Dictionary. Now we can describe our yellowish brown carpet still more accurately as a light yellowish brown (l.yBr) carpet (color-name block or Centroid #76).

This level of accuracy of color designation is suited for a variety of scientific and industrial applications [2, 14, 21]. These designations have been used in descriptions of the colors of drugs and chemicals [1, 23, 45], in qualitative chemical analysis [27, 39], in dermatology [5], in photogrammetry [4], and in the descriptions of mica [13], building materials [24], soils [31] and flags [7, 21]. The ISCC-NBS color names, together with the Centroid Color Charts, are well suited for use in statistical studies of color trends in industrial usage, and in planning

lines of merchandise intended to have coordinated colors. In addition to these color names being used to designate the colors of manufactured items, chips of the Centroid Colors can also be used as the physical standards upon which the colors of these or other items can be based.

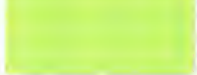

8. Level 4

Level 4 of our correlated series is exemplified by the Munsell Color System and its associated set of color standards, the Munsell Book of Color (see fig. 2). There are about 1500 color standards in the book which have been prepared with great care to illustrate visually equally-spaced scales (colors separated by visually equal steps) of hue, value and chroma. It is generally agreed that the perceived equality of the differences between adjacent samples in the book is good, but not perfect. The boundaries of the ISCC-NBS color-name blocks are specified in the Munsell system. The Munsell Book of Color can be used as a color-appearance system and lends itself to interpolation among and extrapolation beyond its colored samples. In this fourth level, other sufficiently detailed color-order systems can be used in place of the Munsell System. These other color-order systems include: Maerz and Paul (1st edition); Ridgway; Plochere; and the Color Harmony Manual (3rd edition). The number of divisions of the whole color solid in this level, 943 to 7056, refers to the number of colors in these color-order systems. A color-order system is a collection of color standards which samples the color solid systematically. Our light yellowish brown carpet can now be more accurately described by the Munsell notation 10YR 6/4, that is, 10YR designates the hue of the carpet and 6/4 designates its lightness and saturation respectively (for more details see pages 6 and 7, CND).

9. Level 5

Level 5 is illustrated by the visually interpolated Munsell notation. Since the spacing of the samples in the Munsell Book of Color is nearly uniform, it is possible through comparison of a color with the colored standards in the Munsell scales of hue, value and chroma to visually interpolate its Munsell notation. An experienced observer can interpolate reliably to a tenth of a value step, to a quarter of a chroma step, and to anywhere from one hue step at chroma/2 to as little as one-quarter of a hue step at chroma/10 and above. It is estimated that the maintenance of these accuracies is equivalent to the division of the whole color solid into about 100,000 small blocks. Since the color standards in the other color-order systems listed above are not arranged in visually equally spaced steps along clearly defined scales, interpolation among contiguous standards can be carried out but not as conveniently nor as accurately as within the Munsell system. This is the level which is most used in visual matching and in color tolerance specifications. In this level, the color of our light yellowish brown carpet can now be very accurately specified as $9\frac{1}{2}$ YR 6.4/4 $\frac{1}{4}$. (see table 1, note**).

TABLE 2. List of generic hue names and neutrals and their abbreviations comprising Level 1 of the UCL. Each hue name is illustrated by an appropriate Centroid Color.

Color name	Abbreviation	Centroid Color	Color name	Abbreviation	Centroid Color
Pink	Pk		Green	G	
Red	R		Blue	B	
Orange	O		Purple	P	
Brown	Br		White	Wh	
Yellow	Y		Gray	Gy	
Olive	OI		Black	Bk	
Yellow Green	YG				

CAUTION: Since all the colors in this Table are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

TABLE 3. List of intermediate hue names and their abbreviations used in Levels 2 and 3 of the UCL, each illustrated with an appropriate Centroid Color.

Color name	Abbreviation	Centroid Color	Color name	Abbreviation	Centroid Color
Reddish orange	rO		Reddish purple	rP	
Orange yellow	OY		Purplish red	pR	
Greenish yellow	gY		Purplish pink	pPk	
Yellowish green	yG		Yellowish pink	yPk	
Bluish Green	bG		Reddish brown	rBr	
Greenish blue	gB		Yellowish brown	yBr	
Purplish blue	pB		Olive brown	OIBr	
Violet	V		Olive green	OIG	

CAUTION: Since all the colors in this Table are photographs of Centroid Colors, they are approximations of them and so should never be used in place of the actual samples.

Munsell Value (Lightness)

white (Wh)	-ish white (-ish Wh)	very pale (v.p.)	very light (v.l.)	
light gray (l. Gy)	light -ish gray (l. -ish Gy)	pale (p.) light grayish (l. gy.)	light (l.)	brilliant (brill.)
medium gray (med. Gy)	-ish gray (-ish Gy)	grayish (gy.)	moderate (m.)	strong (s.) vivid (v.)
dark gray (d. Gy)	dark -ish gray (d. -ish Gy)	dark grayish (d. gy.)	dark (d.)	deep
black (Bk)	-ish black (-ish Bk)	blackish (bk.)	very dark (v.d.)	very deep (v. deep)

Munsell Chroma (Saturation)

FIGURE 11. Scheme of the hue modifiers, the “-ish” grays and the neutrals with their modifiers. Abbreviations are given in parentheses.

10. Level 6

Level 6, the level in which the greatest presently meaningful accuracy of color identification is now possible, is illustrated by two methods of color designation which are related within the UCL. The first or basic method of color designation is the CIE method in which the color is specified in terms of chromaticity coordinates x , y and daylight reflectance Y (or in tristimulus values X , Y and Z). It is common in careful colorimetric work to specify these coordinates to three figures. This degree of accuracy is realizable through instrumental measurement of a color and is equivalent to the division of the whole color solid into about 5,000,000 very small blocks. The spectrophotometer is the preferred instrument for these measurements since not only will it produce the accuracy required in this level, but it can also warn of the possible presence of the condition known as metamerism [19] in which excessive changes in color can result from changes in illuminant. Some colorimeters can also be used to make measurements in this level provided that (a) the unknown being measured and the standard against which it is being measured do not form a metameric pair and (b) the fit of the tristimulus filters to the \bar{x} , \bar{y} and \bar{z} functions are sufficiently close.

The second method of color designation in level 6 which must be based on instrumental measurements is exemplified by non-visual (computed) interpolation of the Munsell notation in which the hue is interpolated to a tenth of a hue step, the value to a twentieth of a value step and the chroma to a tenth of a chroma step. The ideal Munsell standards were specified in the 1943 paper [32] in terms of CIE specifications. There is a one-to-one equivalence between Munsell notations and CIE specifications. Now the color of the light yellowish brown carpet can be specified with the greatest currently useful accuracy as 9.6YR 6.4₅/4.3, or $x=0.395$, $y=0.382$ and $Y=35.6\%$.

If, however, a standard and the unknowns are of exactly the same chemical composition, differing only in the amounts of the individual colorants used, it is possible with a color-difference colorimeter to specify the chromaticity coordinates meaningfully to one in the fourth place. Such measurements were performed in the latter 40's by the author using a Hunter Color Difference Meter, but then were only possible when the color-difference colorimeter was powered by a storage battery (to avoid line voltage fluctuations). This degree of accuracy could be considered equivalent to level 7 in our correlated series of levels of increasing accuracy of color designation. This level of accuracy was necessary to coordinate instrumental measurements with visual estimates by trained observers of color differences between submitted samples of a face powder and the standard.

11. Variable Accuracy

Now, let us summarize the six levels of fineness of color designation in reverse order. For maximum accuracy, a color should be measured instrumentally

and the results expressed numerically either in terms of the CIE method or in the equivalent Munsell notation (level 6). If this accuracy is not required, a visually interpolated Munsell notation may suffice (level 5). In level 4, the color notation is expressed in terms of the nearest sample of either the Munsell or one of the other color-order systems described earlier. If one wants a quick understandable color name such as that for a moist soil sample before its color changes due to drying, a description in terms of the ISCC-NBS color names can be obtained visually from the Munsell notation or from the Centroid Color Charts (level 3). There are other collections of color samples smaller than the Munsell Book of Color, which could be used in level 3. These alternate systems include the ninth edition of the Standard Color Card of America and the Horticultural Colour Chart.

If one is interested in the color of a thin section of a sample under the microscope [sec. 6.4, CND] where the thickness of the section is not easily controlled, the hue name of the color in question is usually sufficient (level 2). Level 1 is useful when a quick approximate designation of a color is sufficient or when color changes or color trends are being plotted.

To assist in correlating the color designations derived from the many collections of color samples mentioned in this paper, there are listed alphabetically in section 15 of the Color Names Dictionary all of the color names used in the listed color-order systems and in several of the well-known collections of color samples with their equivalent ISCC-NBS color designations. In section 14 of the Color Names Dictionary, the same color names are listed in a different arrangement, each under its equivalent ISCC-NBS color name and block number. Opposite each of these color names in section 14 is listed the numeral or letter designation used to identify the illustrating color sample. All of these color names with their identifying number and/or letter designations equivalent to each ISCC color name, are further divided according to each color-order system or collection of color standards, such as: Mairz and Paul, Plochere, Ridgway, — — — — —, Other Sources. Thus, it is possible to get from this listing a color name in one color-order system which is synonymous or nearly synonymous with a color name in one of the other color-order systems. Here it should be emphasized that the color-name-block or centroid numbers, besides being shorthand designations of the block names or Centroid Colors, are most useful in that they tie together (a) the color names in the dictionary part of the CND [sec. 15], (b) the synonyms and near synonyms part [sec. 14], (c) the color-name blocks in the color-name charts [sec. 13] and (d) the Centroid Color Charts themselves.

12. Summary

This article has described a method or language of designating colors in simple, easily understood but accurately defined color designations in definite,

correlated levels of accuracy of color designation. At each level, the whole color solid is divided into a definite number of blocks whose boundaries are accurately specified and to each of which is assigned one of these color designations. The levels are defined in terms of the number of color designations available in each one. Of course, the more color designations in a level, the smaller the block in the color solid corresponding to each designation.

On the basis of the number of color designations used, any old, current or future color-order system, collection of color samples or color-designation system, can be assigned to one of the levels. The necessary prerequisite is, of course, that each color designation of the new color-order system or method of color designation must be specified in terms of one of the presently utilized color-order systems. These color-order systems include Munsell (level 6), Color Harmony Manual (3rd edition) (level 4) or the CIE numerical color designation system (level 6). Once this relationship is established, it is possible to translate one of the new color designations into the nearest equivalent(s) in any of the others. It is also possible to use the Centroid Color Charts for this translation in levels 3, 2 or 1.

The coordination of all established methods of color designation and measurement by this system, and the potential for including new methods in the future, justify the name "The Universal Color Language" for the total integrated system.

THE COLOR NAMES DICTIONARY

Kenneth L. Kelly and Deane B. Judd

Preface

Ever since the language of man began to develop, words or expressions have been used first to indicate and then to describe colors. Some of these have persisted throughout the centuries and are those which refer to the simple colors or ranges such as red or yellow. As the language developed, more and more color names were invented to describe the colors used by art and industry and in late years in the rapidly expanding field of sales promotion. Some of these refer to the pigment or dye used, as Ochre Red or Cochineal, or a geographical location of its source such as Naples Yellow or Byzantium. Later when it became clear that most colors are bought by or for women, many color names indicative of the beauties and wiles of the fair sex were introduced, as French Nude, Heart's Desire, Intimate Mood, or Vamp. Fanciful color names came into vogue such as Dream Fluff, Happy Day, Pearly Gates, and Wafted Feather. Do not suppose that these names are without economic importance; for a dark reddish gray hat for Milady might be a best seller if advertised as Mauve Wine whereas it probably would not if the color were called Paris Mud. Some color names, such as Blue Turquoise or Golden Poppy, are at the same time self-explanatory and also suited to the promotion of the sales of fabrics. Other color names are not what they seem, for how would one know that African Green is in reality a blue or that blue Fox will turn out to be a reddish gray? Literature is indeed richer because of such color names as Cold Morn, Folly, Kitten's Ear, Languid Lavender, Risigal, Teen Age Pink, and Zedoary Wash, and their precise meanings deserve to be systematically listed.

The purpose of this dictionary is to assist the scientist, businessman, and layman to understand the different color vocabularies used in the many fields of art, science, and industry. Some of these vocabularies are very similar, in fact they borrow from one another, while others are nearly or completely unintelligible to workers in another field. The dictionary will serve not only as a record of the meanings of the 7,500 individual color names listed but it will also enable anyone to translate from one color vocabulary to another. As an example, what is the meaning of Griseo-Viridis? This dictionary shows that Griseo-Viridis (biology) = Serpentine (fashion) = Mint Green (mass market), or in ordinary language, a light green.

The terms by which this dictionary defines color names are those of a refinement of the method of designating colors outlined by the Inter-Society Color Council and developed at the National Bureau of Standards. The Inter-Society Color Council (ISCC) consists of delegates from 20 societies of national scope interested in color, and of individual members. The present member bodies of the ISCC are:

American Association of Textile Chemists and Colorists	National Association of Printing Ink Makers
American Ceramic Society	Optical Society of America
American Institute of Architects	Packaging Institute
American Institute of Decorators	Society of Industrial Designers
American Oil Chemists' Society	Society of Motion Picture and Television Engineers
American Psychological Association	Tanners' Council of America
American Society for Testing Materials	Technical Association for the Graphic Arts
Federation of Paint and Varnish Production Clubs	Technical Association of the Pulp and Paper Industry
Gravure Technical Association, Inc.	Textile Color Card Association of the United States, Inc.
Illuminating Engineering Society	
Industrial Designer's Institute	

The ISCC-NBS method of designating colors was published in the Journal of Research of the National Bureau of Standards **23**, 355 (1939) RP1239. The Inter-Society Color Council approved the refinement of this method and encouraged the Bureau to compile the dictionary; most of the data upon which the translation of the individual color names into ISCC-NBS equivalents is based were supplied by its individual members who also helped to check the voluminous tables. The particular contributions of these and other individuals are acknowledged at appropriate places in the text. The Bureau is glad indeed of this opportunity to point out the cooperative nature of this project.

A. V. ASTIN, *Director.*

The ISCC-NBS Method of Designating Colors and A Dictionary of Color Names

Kenneth L. Kelly and Deane B. Judd

In 1939 there was published a Method of Designating Colors as a solution of the problem proposed by the first chairman of the Inter-Society Color Council, E. N. Gathercoal, who said: "A means of designating colors in the United States Pharmacopoeia, in the National Formulary, and in general pharmaceutical literature is desired; such designation to be sufficiently standardized as to be acceptable and usable by science, sufficiently broad to be appreciated and used by science, art and industry, and sufficiently commonplace to be understood, at least in a general way, by the whole public." This method was developed with the assistance of the American Pharmaceutical Association following plans outlined in 1933 by the Inter-Society Color Council. As a result of suggestions of the member bodies and individual members of the ISCC, a revision of the proposed system was made and approved by the Council in June 1949 and recommended for use in general color description. The revised ISCC-NBS color designations are defined in Munsell terms by 31 name charts, one for each of 31 ranges of Munsell hue. The ISCC-NBS equivalents of 7,500 color names previously defined by reference to 11 different sets of material standards have been determined and listed both alphabetically and by ISCC-NBS color designation to form a dictionary of color names.

1. History

In 1932 the first chairman of the Inter-Society Color Council (ISCC), E. N. Gathercoal, proposed that the Council develop "a means of designating colors in the United States Pharmacopoeia, in the National Formulary, and in general literature . . . such designation to be sufficiently standardized as to be acceptable and usable by science, sufficiently broad to be appreciated and used by science, art and industry, and sufficiently commonplace to be understood, at least in a general way, by the whole public." This problem originally was referred by the ISCC to its Committee on Measurement and Specification which, under the chairmanship of I. H. Godlove, presented several reports surveying available methods of color designation. The 1933 annual report of this committee [22]¹ included the outline of a recommended system of color designations. These recommendations were approved by the Council and followed by the authors in developing this system of color designations, in setting the color boundaries, and in working out methods of applying the system to drugs and chemicals in various forms. The Inter-Society Color Council in 1939 formally approved by letter ballot [20], and recommended to the National Formulary Revision Committee and to the United States Pharmacopoeial Convention, the method described in NBS Research Paper RP1239 [27].

Since 1939, a number of suggestions for revision of this system of color names have been received, especially from Margaret Hayden Rorke, Managing Director of the Textile Color Card Association (TCCA), which have aided the authors in

making the present revision. An ISCC committee consisting of Beck, Clark, Foss, Godlove, Granville, Judd (Chairman), Kelly, Nickerson, Reimann, Rorke, and Stearns was formed in 1947 to study these suggestions and make recommendations as to name and boundary changes. The changes which are embodied in this revision have been approved by letter ballot [21] for use wherever applicable by all of the 19 Member Bodies and the Individual Member Group of the ISCC.

2. Scope

The color designations have been extended to apply under the recommended conditions of lighting and viewing not only to opaque surfaces such as prepared powder samples or solids but also to clear or cloudy liquids or solids, microscopic structures and fluorescent samples. The gamut of color names has been extended to cover the colors of clear and cloudy light-transmitting samples by substituting colorless for white, faint pink for pinkish white, faint yellow for yellowish white, faint green for greenish white, faint blue for bluish white, and faint purple for purplish white [20].

It must be remembered that the Munsell rennotations and the ISCC-NBS color names used in this system are determined under the conditions of average daylight (CIE source C), 45° illumination, and normal viewing (see section 6.1.2). In determining Munsell approximate rennotations by comparison with the Munsell scales, the sample must be about the same size as the Munsell chips and must be viewed on a white or light gray background. These conditions will be referred to in this paper as "recommended conditions of lighting and viewing" or simply

¹ Figures in brackets indicate the literature references on pages 13 and 14.

as "the ordinary observing conditions". Under these conditions the ISCC-NBS color names agree well with common usage. Use of other light sources (such as incandescent-lamp light or light from the mercury arc) will yield object colors not correctly described by these names.

In contradistinction to the color-name charts published in RP1239 [27] which were based on Munsell book notations, the charts in this revision are based on Munsell renotations. However, the color names resulting from the use of these charts with Munsell book notations will be sufficiently appropriate for all usual purposes. If the precise designation is desired, the conversion from notation to renotation may be read from Final Report of the OSA Subcommittee on the Spacing of the Munsell Colors as in section 6.1.3 [42] and the color name obtained in the usual way.

3. Applications

Aside from the use of the ISCC-NBS system of color names in the National Formulary and the United States Pharmacopoeia for which they were originally developed [29], they are finding increasing use in fields where extreme accuracy or sales appeal are not needed but where a simple, definite, easily understood color designation is desired. Publications in the fields of ceramics [45], chemistry [33, 50], dermatology [2], dyestuffs [46], lights [28], mica [17], interior and exterior painting [3], paper [26], plastics [5, 6], rocks [40], soils [43, 47, 51, 55], stone [31], textiles [54], and general description [1, 18, 25], will give some idea of the type of applications for which these names are used.

4. Logic of Designations

To fulfill the requirements of the problem stated by E. N. Gathercoal, especially comprehension by the public, it was decided to use the simplest color designations possible but to define the individual color ranges so designated as accurately as possible. The hue names were chosen for simplicity and descriptiveness: red, orange, yellow, green, blue, violet, purple, pink, brown, and olive. Adjectival forms of these hue names are used in the compound designations such as reddish orange, greenish yellow, purplish red. These hue names are preceded by appropriate modifiers (light, dark, pale, deep and so on) also chosen for simplicity and easy understanding. Therefore, the designations for all but very grayish colors consist of a hue name preceded by appropriate modifiers. The designations for very grayish colors consist of a noun (white, gray, or black) with modifiers appropriate to the lightness and hue of the colors, such as dark reddish gray or yellowish white.

4.1. The Color Solid

In order to understand the color-name blocks used in this system, it will be best to visualize the psychological color solid as shown in figure 1. Imagine a grapefruit set on the table so its pithy core is vertical. Imagine also that the top of this core is white

FIGURE 1. Dimensions of the color solid.

and that the bottom is black with the intermediate grays in between. Next imagine the spectrum hues stretched around the equator of this grapefruit with the nonspectrum violet to red region filled in with the proper purple colors. Then fill this solid with all colors that a surface may have, thinking of each surface color as a point, with the light colors near the top of the solid and dark ones near the bottom. Grayish colors will naturally be near the core with the more saturated colors near the peel. In such a solid, lightness will be measured up from the base plane of the table, or black, to the top of the core, or white. Saturation will be measured outward from the core with the strongest colors on the peel, and hue will be measured by angle around the core. Further imagine that all colors falling on one of the vertical planes intersecting in the black-white axis will be of the same hue, all samples falling in one of the horizontal planes through the solid will be of the same lightness, and all colors falling on concentric cylinders about the black-white axis will be of the same saturation.

A. H. Munsell envisioned a system of color standards [10, 13, 30, 35, 36, 48, 49] embracing all colors organized on this plan. Under ordinary observing conditions, the "Munsell value" of a sample correlates closely with the lightness of the color perceived to belong to the sample, while the "Munsell chroma" correlates well with the saturation of the color perceived to belong to the sample [19, page 47].

Now imagine this Munsell color solid with the primary hues evenly spaced around the equator giving the closed series red, yellow, green, blue, purple and red, with their intermediates. The hue half-way between each two of these primary hues is given a

two-word name making five additional Munsell hues: yellow-red, green-yellow, blue-green, purple-blue, and red-purple. These ten are called the major hues and to each one is assigned, consecutively on the equator of the solid, ten divisions numbered from one to ten (see pages 31 to 34), giving a 100-point hue scale with each major Munsell hue placed at the middle of its 10-point spread, or at division 5, as 5R, 5YR, 5Y, 5GY, and so forth. In this way, there are 10 steps between each major hue indicating graduated steps of hue around the hue circuit. Ten secondary Munsell hues are included in the system, namely: 10R, 10YR, 10Y and so on, one between each adjacent pair of major hues. These secondary hues fall on the number ten positions of each set of ten hue divisions. Therefore, each major Munsell hue is understood to be at division five whereas each secondary hue is understood to be at division ten of the preceding major hue. The Munsell Color Company has now produced similar charts that come at 2.5 and 7.5 or midway between each pair of adjacent primary and secondary charts [13]. Each of these charts consists of colored rectangles all of the same Munsell hue arranged in rows and columns, light colors near the top of the chart, dark near the bottom, grayish colors to the left and strong to the right.

The Munsell scale of value exhibits 10 visually equal steps ranging between black (represented by the notation N 0/) and white (N 10/), the intermediate chips being dark to light grays. The Munsell value of a color is the same as that of the gray sample in the same row of the constant-hue charts, and is recorded in front of a shilling mark, thus 6 value is written 6/.

Munsell chroma is the degree of difference of a color from a gray of the same value and is indicated by steps numbered outward from the neutral axis. Therefore all samples in any vertical column of the constant-hue charts have the same Munsell chroma. Munsell chroma notations follow the shilling mark, thus 2 chroma is written /2. Colors of one Munsell hue are therefore represented in the solid by points falling in a single one of the vertical planes intersecting at the black-white axis. Colors of one value are represented by points in any one horizontal plane; and colors of one chroma are represented by points in any one of the series of right circular cylinders concentric about the black-white axis.

The complete notation is written in the order: Hue Value/Chroma or H V/C with a space between the H and the V/C; for example, 5R 6/3 means a red of value 6 and chroma 3, and 6YR 6.8/6.6 means a yellow-red (orange) of value 6.8 and chroma 6.6 whose hue departs from the 5YR chart toward the 7.5YR chart by two-fifths of the hue difference between those charts.

4.2. Basic Plan of Forming the Designations

The hue name of the color designation is intended to indicate a range of hue represented by an angle around the neutral axis in the color solid, and other words in the designation are to indicate ranges of value and chroma for this hue range. The system of modifiers is indicated in figure 2 together with the

Lightness (Munsell Value)	white	very pale (v.p.)	very light (v.l.)	brilliant (brill.)	vivid (v.)
	light gray (l. Gy.)	pale (p.)	light (l.)		
	medium gray (med. Gy.)	light grayish (l. gy.)	moderate (m.)	strong (s.)	
	dark gray (d. Gy.)	dark grayish (d. gy.)	dark (d.)	deep	
	black (Bl.)	blackish (bl.)	very dark (v.d.)	very deep (v.deep)	
	-ish white (-ish white)				
	-ish gray (-ish Gy.)				
	-ish gray (-ish Gy.)				
	-ish gray (-ish Gy.)				
	-ish black (-ish Bl.)				

Saturation (Munsell Chroma)

FIGURE 2. Scheme of the hue modifiers, the "-ish" grays and the neutrals with their modifiers. Abbreviations are given in parentheses.

approved abbreviations. Deviations from the moderate range in value are indicated by the terms light and dark; deviations in chroma by the terms grayish, strong and vivid; and deviations in both by the terms light grayish or pale, dark grayish, blackish, brilliant and deep. The whole color designation, hue name and modifiers, therefore defines a block of the color solid bounded by vertical planes of constant hue, horizontal planes of constant value, and cylindrical surfaces of constant chroma. The color solid is divided into 262 such blocks including the grays and "-ish" grays with 5 cylindrical blocks for black, grays, and white making 267 color-name blocks in all.

4.3. Divisions of the Hue Circle

The 1933 recommendations by I. H. Godlove included a 20-point division of the hue circle for colors of moderate saturation, a 10-point division for weak colors and a 5-point division for very weak colors. These recommendations were followed closely at first with the thought that each color designation should refer to about the same fraction of the Munsell hue circuit. However, it was soon evident that deviations from this plan were necessary to make the designations accord with usage at that time in the National Formulary and the United States Pharmacopoeia, and more recently with usage in the textile industries and by the general public. Most of these improvements were achieved by introducing the terms pink, orange, brown, and olive

and the elimination of the double terms blue-green, purple-blue, and red-purple.

Unlike the terms green and blue, which are hue names applying to all lightnesses and saturations, the term yellow is commonly used to designate not only a certain hue range but also a high lightness range within this hue range. Dark colors of the same hue as yellow are commonly called olive or olive brown. Common usage limits the term orange even more strictly; it is taken to refer not simply to a range of yellow-red hues but also to a medium-lightness range and a high saturation range. Colors of the same hue but of lower lightness and saturation than the orange range are called browns.

To follow common usage in this respect, there is included a series of hue names applicable to dark colors only, as follows: reddish brown, brown, yellowish brown, olive brown, olive, and olive green. As a further concession to common usage, there is also included the following series of hue names applicable to very light colors only: purplish pink, pink and yellowish pink. The chief series of hue names to which these two subsidiary series have been fitted follows closely the 20-point division recommended by I. H. Godlove but now consists of 17 hue ranges resulting from the changes recommended by the present committee. The terms brownish pink and brownish orange have been added. The chief series now includes the names red, reddish orange, orange, orange yellow, yellow, greenish yellow, yellow green, yellowish green, green, bluish green, greenish blue, blue, purplish blue, violet, purple, reddish purple, and purplish red. The total number of designations has been reduced from 319 in 1939 to 267 in the present revision.

4.4. Some Unavoidable Disadvantages

A frequent objection to this system of color designations is that each designation refers to a group of distinguishable colors rather than to a single color. Since there are about ten million surface colors distinguishable in daylight by the trained human eye and less than 300 color designations in this system, it is obvious that the average color range denoted by a single designation must contain nearly 40,000 distinguishable colors. If it is important to make distinctions among some of these thousands of colors bearing by this system identical designations, resort must be had to one of the many numerical systems of color specification available. Preeminent among these is the colorimetric coordinate system recommended in 1931 by the International Commission on Illumination (CIE) [16, 24, 53].

A corollary to this objection is that there are many pairs of easily distinguishable colors which receive by this system the same designation, while there are also many pairs that can scarcely be distinguished which receive different designations. This property is, of course, an unavoidable result of dividing the color solid into an arbitrary number of blocks, one for each of the 267 designations. Analogous disadvantages result from identifying the time of events according to date; two events occurring on the same

date may be separated by many hours, but on the other hand two scarcely separable midnight events may have to be assigned different dates. Just as identifying the time of an event by giving the date has proved to be useful, so it is with a system of color designations such as this.

5. Definition of the Color Ranges

The definitions of the boundaries of the 267 color name blocks or ranges have been carried out by the subcommittee of the Inter-Society Color Council in terms of the Munsell notations [41, 42] which approximate more closely the ideal psychological color system than does the 1929 edition of the Munsell Book of Color.

The subcommittee checked the color boundaries by observation of all of the color standards obtainable for which Munsell notations were available. These included the chips of the Munsell Book of Color [42], some of the chips of the Maerz and Paul Dictionary of Color [44], the ninth edition of the Standard Color Card of America published by the Textile Color Card Association of the United States Inc. [54], and the Color Harmony Manual [11].

The boundaries for the color-name blocks found by the subcommittee to accord with common usage are given in 31 color-name charts (pages 16 to 31). They are more complicated than those of the original ISCC-NBS system and differ importantly from one level of Munsell value to another. The changes of the boundaries with Munsell value are shown in seven constant-value charts (pages 31 to 34) on which the Munsell hue is indicated in the 100-point scale. The chart for value 4.75 refers to colors of medium lightness and shows 17 hue ranges, the other constant-value charts refer to lighter or darker colors than the first chart as indicated by their respective value notations. The value levels of these charts were picked so that every different hue or chroma boundary in the 31 color-name charts would show on one of them. The hues are indicated on these constant-value charts by the abbreviations shown in table 1.

TABLE 1.—Abbreviations for the hue names used in the ISCC-NBS system

Name	Abbreviation	Name	Abbreviation
red	R	purple	P
reddish orange	rO	reddish purple	rP
orange	O	purplish red	pR
orange yellow	OY	purplish pink	pPk
yellow	Y	pink	Pk
greenish yellow	gY	yellowish pink	yPk
yellow green	YG	brownish pink	brPk
yellowish green	yG	brownish orange	brO
green	G	reddish brown	rBr
bluish green	bG	brown	Br
greenish blue	gB	yellowish brown	yBr
blue	B	olive brown	OIBr
purplish blue	pB	olive	OI
violet	V	olive green	OIG

These constant-value charts show at a glance for all Munsell chromas what ranges of Munsell hue are referred to by the various hue names of this system; this information is of course obtainable, though less conveniently, from the color-name charts themselves.

6. Color Designations From the Munsell Book of Color for Diverse Types of Specimens

The procedure for comparing a specimen with the Munsell Book of Color depends importantly on specimen type, whether the specimen is solid or liquid, opaque or transparent, large or small, flat or of irregular shape, and so on.

6.1. Dry Opaque Powders (Grain Size Less Than 1 mm)

6.1.1. *Preparation of Sample.* The sample is placed slightly heaped up in a clean holder (see fig. 3) at least 2 mm deep. Over this is placed a clear colorless coverglass about 1 mm in thickness which is pressed down with a rotary motion and held in place by friction between the holder and the cover-glass mount.

For very fine powders, the pressure exerted upon the sample by the holder becomes critical and may require that a special holder be designed. In the measurement of the colors of cosmetic powders, for instance, color changes many times greater than the allowable tolerances may result from inadvertent pressure on the sample.

6.1.2. *Lighting and Viewing Conditions.* Since the color designations conform to usage only for specimens viewed in daylight, this source is to be

FIGURE 3. *Preparation of an opaque powder sample for comparison with the Munsell color scales.*

Note the friction ring that fastens the cover glass to the holder. (Courtesy Munsell Color Co., Inc.)

used in the color-comparison work. A table placed by a window so that light reaches the table top from the operator's left or right chiefly from the sky and chiefly at angles centering on 45° from the horizontal is recommended. A north window is best because no special precautions are usually required to eliminate direct sunlight. A canopy of black cloth, preferably black velvet, should be hung above the sample on the side opposite the operator in such a position as to be imaged in the mirror surface of the cover glass; such an arrangement eliminates errors from unwanted admixture of ceiling light reflected from the cover glass. The sample and standard placed on the table top are viewed nearly along the perpendicular to the surfaces, that is, just enough off perpendicular to avoid having the operator's face mirrored in the cover glass. Illumination at 45° and perpendicular viewing are recommended by the CIE [53]. A skylight or source of artificial daylight (fig. 4) located above the sample may also be used, but in such an arrangement the angle of view should be approximately at 45° from the horizontal, and the black cloth should be hung vertically beside the sample opposite the observer. Perpendicular illumination with viewing at 45° gives results equivalent to the recommended CIE method.

It is important that the illumination of sample and working standards be closely the same both in amount and quality; otherwise different Munsell notations will be found by interchanging them. Even with closely uniform illumination it is good practice to make this interchange as a check during the comparison.

In any computations involving the spectral energy distribution of the source, that of standard source

FIGURE 4. *Macbeth daylight unit mounted to give even illumination over a large area.*

C recommended by the CIE [53] as representative of average daylight is to be used.

6.1.3. *Determination of a Munsell Notation or Renotation.* Select the two adjacent Munsell constant-hue charts between which the hue of the sample falls. Place these on each side of the sample and cover each with a small neutral gray shield, or if using the large triple-aperture shield (shown in fig. 5), place them under the holes in the side flaps and the sample under the central opening. The Munsell hue, value, and chroma notations for a sample are found by interpolation or extrapolation among the standards of the Munsell charts; most operators prefer to estimate first the value, then the chroma, and finally the hue. This is done as follows: look at the three colored rectangles (1 sample and two standards) and see whether the sample is lighter or darker than the standards. Move the chart whose hue is nearer to that of the sample up and down from one value level to another and find the two values between which that of the sample falls. Next estimate to the nearest *tenth* of a value step the value of the sample relative to these two levels. Record this number in front of a shilling mark as, for example, 3.0/ or 6.2/.

Then move the charts sideways so as to present successively colors of the same Munsell hue and value but of different chroma, and by similar interpolation determine the Munsell chroma of the color. In this comparison pay chief attention to the Munsell standards having values nearest that of the sample, and secondary attention to those next nearest. Although all Munsell samples of the same chroma notation are intended to yield in daylight color perceptions of the same saturation, sometimes a slightly different estimate of chroma will be obtained by comparison with the standards of the next nearest value. In such an instance, report an average notation for chroma. Note that there are two chroma

steps between each two adjacent columns of Munsell samples. Estimate the chroma to the nearest *fifth step* and record this number after the value notation and the shilling mark, as, for example, 3.0/6.0 or 6.2/4.6.

Now with the corresponding Munsell standards of value and chroma closest to those of the sample showing through the apertures of the shield, estimate the hue of the sample relative to that of the two Munsell charts. Remember that each two adjacent charts are two and a half hue steps apart. Record the hue estimated by this interpolation to the nearest *one-half step* in front of the value/chroma designation and separated from it by a space; for example, 7Y 3.0/6.0 or 9.5YR 6.2/4.6. If the value and chroma of the sample do not correspond very closely to those of any of the Munsell standards, it is advisable to repeat the interpolation for hue with the next closest pair of standards and take an average notation for the hue.

Check the Munsell notation, particularly hue and value, with the charts interchanged.

For most color descriptions, the ISCC-NBS color names derived from the Munsell book notations as determined above are sufficiently applicable. If greater accuracy is demanded, determine the chromaticity coordinates, x , y and daylight reflectance Y corresponding to this Munsell notation from figures 2 to 8 in the paper by Kelly, Gibson, and Nickerson [30]. From these values, determine the Munsell renotation from figures 1 to 9 of the paper by Newhall, Nickerson, and Judd [42].

6.1.4. *The Color Designation.* After the Munsell notation for the sample has been determined, select the color-name chart referring to the Munsell hue of the sample (see Munsell hue designation near the upper right hand corner of the color-name chart). Plot the value and chroma of the sample on this chart and record the name of the block in which this point falls as the color designation of the sample. If, however, the point falls on a hue, value, or chroma boundary, the names of all of the blocks touching the point apply to the sample. Any one, two or all of the names may be used as the designation of the sample depending on the type of name desired.

Different degrees of precision of designation are possible under this system. For more precise designation than is possible by color names alone, specification by the Munsell notation itself can be used. For the colors of solids, powders and some colored liquids or glasses, the complete color designations (hue name and modifiers) defined herein should be used. For the colors of microscopic structures, most liquids and most chemical tests, the hue names alone are sufficient. Where two or more hue names are used, they should be arranged in sequence according to the Munsell hue sequence (red-yellow-green-blue-purple-red).

6.1.5. *An Example.* Suppose that the hue of the sample falls between the 7.5YR and 10YR charts and that its value falls between the 7 and 8 value levels, but nearer the 7, and is estimated as 7.2. Suppose further that its chroma is found to be

FIGURE 5. A triple-aperture shield with sample aperture in center and apertures for Munsell standards on each side.

At upper right is shown a double-aperture shield for liquids, with vials and holder (section 6.3.2), and at upper left the pocket edition of the Munsell Book of Color. (Courtesy Munsell Color Co., Inc.)

closer to 4 than 6, and is estimated as 4.6. Now compare the sample with the two Munsell 7/4 standards. Suppose that its hue is seen to be nearer to that of the 10YR chart than the 7.5YR chart, say 4/5 of the hue difference between the charts or 2 hue steps from the 7.5YR and one-half hue step from the 10YR chart, or at 9.5YR. Now interchange the positions of the charts and check the Munsell notation. If these are found to be unchanged, the final notation is 9.5YR 7.2/4.6. If for greater accuracy the Munsell renotation is desired, it may be found by the method outlined in 6.1.3 above.

The color name corresponding to the Munsell notation is found by selecting from the color-name charts the one that contains 9.5YR (page 21, see hue designation 8YR-1Y near the upper right-hand corner). Plot 7.2 value and 4.6 chroma on this chart. It falls in the block named light yellowish brown (see point \odot plotted on chart 8YR-1Y, p. 21); so this is the color designation of the sample. The Munsell renotation corresponding to this notation is 9.3YR 7.4/4.5 and the color designation is the same.

6.2. Opaque Solids

6.2.1. *Comparison with Munsell Color Standards.* Hold the sample in the fingers, or in tweezers if the sample is small, a short distance above the chart or charts and move it about for comparison with the Munsell color standards. Care should be taken not to cast a shadow on the standard with which the sample is being compared (see fig. 6). The amount of handling required for the comparison, and consequent soil and wear on the standards, will be diminished if the charts are arranged in hue sequence on the table or desk. If the sample is large and flat, it will facilitate the comparison if a small neutral gray shield with the usual sized rectangular opening is placed over the surface.

6.2.2. *Lighting and Viewing Conditions.* The samples are to be illuminated at 45° by daylight (see section 6.1.2) and viewed along the perpendicular to the surface. Since the samples are held above the plane of the color standards, it is important that the illumination on the two horizontal planes be as nearly the same in amount and quality as possible. Care should be taken to hold the surface of the sample in the horizontal plane and close to the plane of the standards; errors in Munsell value by as much as a whole step are possible through inadvertent tilting or raising of the sample surface. If a source of artificial daylight such as in figure 4 is used giving a diffused even illumination over a large area from above, or if the comparison is made out of doors by diffuse light from a large part of the sky, the position of the sample with respect to the light source is less critical.

For minimizing the troubles due to uneven illumination on samples such as rods (pencils, twigs, roots) having approximately cylindrical surfaces, it is recommended that the axis of the cylinder be held horizontal and pointed in the direction of the light source so that neither side of the sample is shaded.

For samples having glossy surfaces the use of a black canopy or curtain will be required as described in section 6.1.2.

The color of such a sample may be designated either by giving the average color found for the sample or by giving the color names corresponding to the complete color range. This range may be in hue, lightness, or saturation, or a combination of two or all of these. Color ranges involving chiefly variations in lightness and saturation can often be conveniently indicated by the unmodified name, such as orange, by which is meant the color range covered by the designations light orange, brilliant orange, moderate orange, strong orange, vivid orange, and deep orange (see charts covering Munsell hues 2YR to 7YR).

6.2.3. *Nonmetallic Samples With Matte Surfaces.* Proceed as in 1 and 2 above. The recommended angles of illumination and viewing need not be as strictly followed, because the appearance of a matte surface does not change importantly with small variations in these angular conditions.

6.2.4. *Glossy Surfaces Having No Regular Detailed Structure.* Samples of vitreous enamel and smooth paint films are often found with glossy surfaces having no regular detailed structure. Proceed as in 1 and 2 above, giving particular attention to the prescribed angles of illumination and viewing. The characteristic color of the sample is obtained only when specularly reflected light is prevented from reaching the eye of the observer.

6.2.5. *Glossy Surfaces Made Up of Cylindrical Elements.* Samples of satin-finish textiles and glossy brush-marked paint films may be considered as made up of cylindrical elements. Proceed as in 1 and 2 above. It is not always possible to prevent light from being specularly reflected from such glossy surfaces into the eye of the observer; but by so orienting the sample in its own plane that the specular component is reduced to a minimum, the most characteristic color of the sample is usually obtained. Some textiles require more than one angle of view or illumination to bring out the characteristic color or colors; changeable silks are extreme examples of such textiles.

FIGURE 6. Comparison of opaque solid with the Munsell color standards.

The opaque solid shown is a leaf, held by tweezers above the color standards.

6.2.6. *Metallic Surfaces.* The characteristic color of a metallic surface is obtained from the specularly reflected light. Proceed, therefore, as in 1 and 2 above, but obtain, in addition, the hue name for the specularly reflected light. These two names may possibly yield a useful designation of the color of the metallic surface, but they will not correspond well with common usage which involves color terms that apply characteristically to metallic appearance, such as silver, brass, gold, copper and so on.

6.3 Liquids and Nonpowdered Solids

6.3.1. *Opaque Solids and Liquids.* The color designation of a precipitate can be obtained in the test tube if the liquid in which it is suspended is itself not strongly colored, otherwise on a filter paper; the hue notation is usually sufficient. Opaque liquids should be placed in a clear glass vial, test tube, or bottle, and the Munsell notation of the color obtained by holding it above the charts as for opaque solids (section 6.2.1).

6.3.2. *Clear Liquids.* To obtain the Munsell notation of the color of a clear liquid, put it in a clear glass vial with a flat bottom to a depth of 1 cm (bottom of the meniscus); place the vial in the holder (figs. 5 and 7) which has a rectangular opening in the bottom and hold it about 8 inches above the white shield illuminated by natural or artificial daylight. Look down through the liquid at the rectangular

FIGURE 7. Vial, vial holder, and shield for liquids. The vial is shown being placed in the holder.

opening (fig. 8) and compare this color with those of the proper Munsell charts under the shield. By moving the shield around and exposing successive pairs of Munsell standards, the comparisons required in section 6.1.3 for obtaining the Munsell notation are made. The color designation is obtained from the color-name charts as before.

If only the hue name of the liquid is desired, it may be determined by holding the test tube, beaker or vial containing the liquid above the white shield as in 6.2.1 above. Certain changes must be made in the regular color names to adapt them to the description of the colors of nonopaque media. These consist of making the substitutions shown in table 2.

TABLE 2. Color designations for opaque and clear samples

Opaque samples	Clear samples
white.....	colorless.
pinkish white.....	faint pink.
yellowish white.....	faint yellow.
greenish white.....	faint green.
bluish white.....	faint blue.
purplish white.....	faint purple.

6.3.3. *Clear Solids (Crystals, Glasses, Resins).* The color designations of clear solids may be obtained if the faces of the sample are nearly parallel, smooth, and free from dust or scum. Estimate the hue notation of the color of the sample when held over the white shield as in section 6.3.2. If the size of the crystals is less than 1 mm, proceed as for an opaque powder as in 6.1. If the full color designation is desired, it may be obtained as in 6.3.2.

6.3.4. *Cloudy Solids or Liquids.* Sometimes the color designations of cloudy samples, that is, samples which both transmit some light and reflect some, can be obtained by transmitted light (6.3.3) but usually they are more easily specified by reflected light like opaque samples as in 6.2.

FIGURE 8. Method of using vial holder. Munsell charts of the proper hues are placed under the shield so that the standards corresponding in value and chroma appear in the rectangular opening.

6.3.5. *Fluorescent Solids or Liquids.* The color of the fluorescence of a solid or liquid is determined by holding it or the test tube or vial directly in front of a vertical black velvet cloth so that the sample is illuminated by natural or artificial daylight chiefly in directions perpendicular to the line of sight. Any light incident upon the sample from the back should be avoided because it will produce a mixture of fluorescence and body colors in unknown proportions. The fluorescence color will appear the strongest on the side toward the light source. The Munsell charts should receive light from the same source and should be held slightly tilted beside the sample to facilitate the comparison. The hue notation is sufficient.

6.4. Microscopic Specimens

6.4.1. *Mounting.* Unless otherwise specified, the sample whether powdered or sectional is to be mounted in a colorless medium such as water.

6.4.2. *Lighting.* A frosted Mazda lamp is used for illumination and is placed above and to one side of the microscope base where it will illuminate both the substage mirror of the microscope and the Munsell charts (figs. 9 and 10). The proper daylight filter (blue glass) for the light-source used must be placed in the eyepiece of the comparison ocular or the Abbé-type camera lucida, whichever is used.

6.4.3. *Determination of Munsell Notation.* When using a comparison ocular (fig. 9), place one end over the ocular of the microscope and support the other end by a condenser clamp. If an Abbé-type camera lucida is used (fig. 10), it must be modified somewhat to give a split field. To do this, cut out

FIGURE 9. *Microscope and comparison ocular.*
The Munsell charts are placed on the table under the open end of the ocular.

of a circular piece of tin foil just large enough to slip into the ocular tube of the microscope, a semicircle as shown in the accompanying diagram (fig. 11). This shield is placed on top of the ocular micrometer with the cut edge extending from back to front and constituting the dividing line. Next, place a piece of black velvet or cloth on the table beneath the reflecting mirror of the camera lucida so that its outer edge coincides with the vertical edge of the shield in the ocular tube. This cloth must cover everything on the table visible in the upper half of the reflecting mirror. Slip an envelope of black paper or cloth down over the top half of the reflecting mirror until its lower edge also coincides with the dividing line.

Now place a mount consisting of a slide, a sample (for instance a thin section), a coverglass and liquid

FIGURE 10. *Microscope and modified Abbé-type camera lucida,*
showing position of black velvet used to block out one-half of
the comparison field and one-half of the inclined mirror.

FIGURE 11. *Tinfoil cut to block out half of microscope field*
when placed on the ocular micrometer.

FIGURE 12. *Microscope field, using a comparison ocular.*
Note that the Munsell 5R chart appears inverted in the field of the microscope.

on the microscope table and a suitable reflectance standard such as an N 9.6/ Munsell paper, a magnesium oxide reflectance standard, or a magnesium carbonate block under the open end of the ocular or camera lucida. Move the slide so that the sample is out of the field of view, adjust the substage condenser, the substage iris diaphragm, or both, of the microscope until the brightness of the slide-liquid-coverglass image on the one side matches that of the image of the reflectance standard on the other. This adjustment should be repeated for each mount studied.

Now move the slide until the sample image touches the dividing line in the middle of the field (fig. 12). Place the appropriate Munsell charts on the table in place of the reflectance standard, and make the comparison for hue as in section 6.1.3 except that when the camera lucida is used, the inner edge of the chart must be slipped under the outer edge of the black cloth. The camera lucida has the advantage over the comparison ocular in that it does not invert the image of the Munsell chart, and also it is less expensive.

6.4.4. *The Color Designation.* Since the value and chroma vary greatly with the thickness of the sample or with the amount of dye absorbed by it, it is sufficient to determine only the hue of the sample. Estimate the hue to the nearest *half-step* but judge the value and chroma only accurately enough to determine into which part of the color-name chart the point representing the sample will fall. For example, if the Munsell hue of the sample is 5G, the sample will receive the color name green regardless of the value or chroma; but if the Munsell hue were found to be 3R, samples whose values are above 6.5 would receive the color name pink, but others whose values are below 5.5 would receive the color name red. If the whole color name is desired, proceed as in section 6.1.3.

7. Color Designations From Chromaticity Coordinates and Daylight Reflectance

Color designations may be obtained from chromaticity coordinates (x , y), daylight reflectance Y , derived from spectrophotometric or colorimetric measurements by plotting the (x , y) values on the value

chart or charts of the set of Munsell renotation—(x , y) charts [42] corresponding to reflectance Y , and reading the corresponding Munsell renotation. The color designation is then derived in the usual manner from the color-name charts.

8. Description of the Dictionary of Color Names

The different branches of science, technology, and commerce make use of more or less different color vocabularies some of whose color names (such as Testaceous, Samurai, and Araby) are confusing, or even unknown, to persons in another branch or to the layman on the street. Actually, Testaceous, Samurai, and Araby all refer to grayish reddish orange colors; and, in a similar way, the meanings of all the color names in these vocabularies may be indicated more conveniently and precisely than has hitherto been possible simply by giving for each the ISCC-NBS color designation. As stated by E. N. Gathercoal, these designations are intended to be "sufficiently commonplace to be understood, at least in a general way, by the whole public." From this basis sprang the idea of including, with the description of the ISCC-NBS method, a Dictionary of Color Names which owes to this method its unique descriptive quality.

This dictionary of color names is comprised of two parts: section 14 is a correlation of all of the color names studied with the ISCC-NBS color designations, and section 15, the dictionary proper, is an alphabetical list of these color names with their corresponding ISCC-NBS color designations. From the former, the color names corresponding to an ISCC-NBS color designation or approximately to each other may be found within the limits of the block-type structure of the ISCC-NBS system. From the latter, the meaning of any one of these color names may be found in terms of the ISCC-NBS system.

9. Listing by Source of Color Name and by ISCC-NBS Designation

Section 14 is a correlation of all of the different color names found in 14 recognized systems of color nomenclature with the 267 ISCC-NBS color designations, each of which has been assigned a serial number to facilitate cross referencing. In other words, each color name listed under an ISCC-NBS color designation is described by a colored sample whose Munsell notation or renotation would fall in the same ISCC-NBS color-name block. Any two color names under one ISCC-NBS designation are approximately equivalent. Other color names nearly equivalent to a given name may be found listed under the ISCC-NBS color designations of adjacent blocks. After each color name in section 14 are given the code numbers or letters identifying the sample by means of which the name is defined, or, if several samples of similar colors are used in the definition, the identification of only one of them is given. The color names in Federal Specification TT-C-595 were collected from a number of federal agencies; so, for identification purposes, the abbreviation of

the agency is given in parentheses after the color name. An explanation of these abbreviations is given on pages 36 and 84.

A short description of each of these color-name systems follows with such points of its development or use as are necessary to make clear its part in the dictionary.

9.1. American Association of Textile Chemists and Colorists and the Society of Dyers and Colourists

In 1947 E. I. Stearns, Chairman, Committee on Color of the AATCC, and F. T. Simon prepared a table specifying the 1939 ISCC-NBS equivalents of the 88 color names to be used in the forthcoming second edition of the British Colour Index [58]. The ISCC-NBS equivalents on the present revised system were derived from this table and were checked by Dr. Stearns. Since there is a Colour Index color name for each part of the color solid, many of these 88 names necessarily refer to large ranges of color.

9.2. Biology

In the past, various writers such as Wharton [61], Saccardo [57], and Ridgway [56] had tried to develop a system of color terminology for use by biologists. Ridgway's outstanding early work has been considerably used. H. A. Dade of The Imperial Mycological Institute [7] has made a further attempt to bring order to this field by using Ridgway's colored samples and notations and applying to them a much smaller set of color terms. To do this, he laid out a color space according to Ridgway's notation and indicated the color range of each color term by marking off the corresponding Ridgway block. The color terms are all in Latin. In order to get the ISCC-NBS equivalents, it was first necessary to translate the Ridgway notations into Munsell notations using the work of D. H. Hamly, University of Toronto [15], and thence obtain the ISCC-NBS color designations.

9.3. Federal Specification TT-C-595

As early as 1920, E. F. Hickson, later Chief of the Paint Section at the National Bureau of Standards, envisioned a federal color card which would show samples of all of the many colors of paints used by the Federal services and thus facilitate their procurement. Many years of effort by Mr. Hickson culminated in the promulgation in 1950 of Federal Specification TT-C-595, Colors; (for) Ready-Mixed Paints [9], a joint project of the National Bureau of Standards and the Federal Supply Service of the General Services Administration. The Munsell notations of the 187 colors in TT-C-595 were determined by us by visual comparison of the colors with the scales of the Munsell Book of Color under the recommended conditions of lighting and viewing.

9.4. Horticultural Colour Chart

Recognizing the need for an up-to-date chart of named colors for use in describing the colors of flowers, Robert F. Wilson, Secretary of the British Colour Council, developed in 1938 the Horticultural Colour Chart which has been issued in two volumes by The British Colour Council in collaboration with The Royal Horticultural Society [4].

The color system is based on a hue circle of 64 saturated colors, supplemented by tints (admixture of more white pigment), shades (admixture of less white pigment), and tones (produced by adding gray pigment) making 200 named colors. All of these full colors, tints, shades, and tones are shown in the Horticultural Colour Chart not only printed solid but also in three dilutions with the white of the paper by screen-plate printing. The ISCC-NBS designations corresponding to these names were found from Munsell notations of the solid printings. These Munsell notations were supplied by Dorothy Nickerson, U. S. Department of Agriculture, some found by her by visual comparison with the Munsell scales, others based on spectrophotometric curves supplied through the courtesy of W. E. Knowles Middleton, National Research Council of Canada.

9.5. Maerz and Paul Dictionary of Color

No introduction is needed for the Maerz and Paul Dictionary of Color [32]; this monumental work has become a by-word in the field of color. The Munsell notations of the colored samples on the first twenty of the 56 color charts were published by Dorothy Nickerson in 1947 [44]. The Munsell notations of the named samples in the remaining 36 charts were determined by us by visual comparison of the colors with the scales of the Munsell Book of Color under the recommended conditions of lighting and viewing. Although the second edition had been published by the time this work was started, it was decided to use only the first edition because the extensive research on color names was expressed originally in terms of the color plates of the first edition, the colors of which are only approximately reproduced in the second edition. A considerable study was necessary to list all of the different color names both from the charts in the front of the book and also from the lengthy index.

Many of the color names listed in Maerz and Paul consist of a specific name followed by a generic name given in brackets, thus: Canary [Yellow]. In our listing of these names we have copied the brackets as well as the names. There are a number of interesting color names in the index which are not assigned colored samples. This is due, according to the authors, either to the lack of a definite description of the associated color in the literature or to the fact that the color name describes a range of color. These color names are necessarily omitted from the present dictionary.

9.6. Molded Urea Plastics and Polystyrene Plastics

The equivalent ISCC-NBS color designations for the color names of the 17 molded urea plastics and for the 12 polystyrene plastics were taken directly from the two publications of the Department of Commerce based on measurements of these samples at the National Bureau of Standards; Colors for Molded Urea Plastics [5] and Colors for Polystyrene Plastics [6]. The names are based on Munsell notations, and have been checked by Fred G.

Clark, Bakelite Company. The five transparent polystyrene samples were omitted.

9.7. Plochere Color System

In 1948 Gladys and Gustave Plochere published in Los Angeles, California, a book entitled *Plochere Color System, A Guide to Color and Color Harmony* [52]. Associated with the book are 1,248 cards, 3 by 5 inches, each illustrating a different color made by admixing one or more of nine basic pigments with black and white. Each color is assigned a number, a code designation indicative of the color, the paint formula, and a color name. W. E. Knowles Middleton of the National Research Laboratories of Canada has determined the Munsell notations [34] of these 1,248 colored samples and from these the corresponding ISCC-NBS color designations were obtained. These designations were checked by Mr. Plochere.

9.8. Ridgway Color Standards and Nomenclature

Robert Ridgway, an eminent ornithologist, published in Washington, D. C. in 1912 a book of *Color Standards and Color Nomenclature* [56], and stated that "the motive of this work is THE STANDARDIZATION OF COLORS AND COLOR NAMES." It contains 53 colored plates and 1,115 named colors and was developed after many years study for the use of biologists, botanists, entomologists, geologists, mineralogists, ornithologists, pathologists, and zoologists for the proper and lasting specification of the colors of natural objects. D. H. Hamly, formerly of the Department of Botany of the University of Toronto, Canada, determined the Munsell notations of these colors [14, 15] and from these the corresponding ISCC-NBS color designations were obtained. These designations were checked by Professor Hamly.

9.9. Rock-Color Chart

In 1948 the National Research Council issued a *Rock-Color Chart* [40] developed by a committee whose chairman was E. N. Goddard, representing the U. S. Geological Survey, the Geological Society of America, the American Association of Petroleum Geologists, the Society of Economic Geologists, and the Association of American State Geologists. The color terms used in the *Rock-Color Chart* were based on the revised ISCC-NBS color designations in so far as the revision had progressed by 1948 with minor modifications to adapt the names to rock colors. Dr. Goddard supplied the ISCC-NBS designations for each color term used in the *Rock-Color Chart* for inclusion in the present dictionary. It will be noted that the two sets of color designations are very similar, the chief difference being that the boundaries between moderate and grayish colors have been shifted to somewhat lower Munsell chromas to accord with the meanings of the color names in geology.

9.10. Postage-Stamp Color Names

For many years the late Wm. H. Beck of Baltimore had worked for a simplification and standardization of the color names used in the *Scott Stamp Catalog* to describe the colors of stamps. Toward this end,

he had prepared a number of very extensive exhibits showing the large ranges of color covered by some of these color names. One of these exhibits was a reproduction of the *Munsell Book of Color* in stamps in which there were mounted about 4,000 stamps selected by him from those in the *Scott Stamp Catalog* to exemplify the color names which he judged to be of the most importance in the field of philately. Mr. Beck supplied both the Munsell notations of the stamps and their color names read from the *Scott Stamp Catalog*, and the latter have been checked by O. L. Harvey of Washington, D. C. The ISCC-NBS designations were read and checked by us. Only those color names were included in this dictionary whose meaning was exemplified by at least two of the 4,000-stamp collection. The color names listed are defined by the color of the stamp as a whole, but some of the names are apparently intended to refer to a solid printing of the ink used because the ISCC-NBS names indicate much lighter colors than would ordinarily be meant (for example, the stamp-color name black is applied to light gray stamps).

9.11. USDA Soil Color Charts

Ever since the early 1920's, the problem of color names descriptive of the many soil colors under wet and dry conditions has plagued the soil scientist. Finally the Munsell notations were determined for 250 selected soil samples and ISCC-NBS color designations were applied to them [47]. A considerable study was made of these names resulting in a paper by Rice, Nickerson, O'Neal and Thorp [55] including a set of color charts with 56 named color chips [37]. The color designations used were much the same as the ISCC-NBS except that they were applied to more restricted and somewhat different hue ranges. Red soils, for instance, would be called reddish brown or brown according to the color terminology used in other fields. It was soon learned that the 56 color chips were not enough and that some changes would have to be made in the color names. The next revision contained 202 Munsell samples [38] and the present form has 240 [39, 51]. Further changes were made in the original color names to make them accord more closely with usage in the field. The ISCC-NBS designations were taken from a table supplied by Edward H. Templin, chairman of the Soil Color Committee of the U. S. Soil Survey, and are based on Munsell notations. The ISCC-NBS designations were checked by Dorothy Nickerson, U. S. Department of Agriculture, and Blanche R. Bellamy, Munsell Color Company.

9.12. Descriptive Color Names Dictionary

Helen D. Taylor, Lucille Knoche, and Walter C. Granville published in 1950 the booklet *Descriptive Color Names Dictionary* [59] as a supplement to the third edition of the *Color Harmony Manual* [23], 1948. The booklet is intended to fill the "need for a systematized listing and color specification of the words commonly used to describe the color of general merchandise for the mass market". The colorimetric coordinates of the samples of the *Color Harmony Manual*, both matte and glossy sides, were deter-

mined from measurements made on a G. E. spectrophotometer equipped with a GAF-Librascope Tristimulus Integrator [8, 12]. The specular component of the reflected radiant energy was excluded. Munsell renotations were determined by Mr. Granville for both sides of the chips. Synonyms were limited to those in which the two color names were applied to only one colored chip. Only one colored chip is listed to illustrate each ISCC-NBS equivalent to a TKG color name, and wherever possible one whose ISCC-NBS equivalent applied to both the glossy and matte sides was chosen. The letters g, m, or gm refer to the glossy side, to the matte side, and to both sides of the chip, respectively. The ISCC-NBS designations were read by us and checked by Mr. Granville.

9.13. Textile Color Card Association of the United States

The color cards of the Textile Color Card Association of the United States, Margaret Hayden Rorke, Secretary and Managing Director [60], are widely used in the textile and allied industries and by many procuring agencies of the Federal Government. The Textile Color Card Association issues both seasonal and standard color cards. The seasonal cards provide a color forecasting service to textile manufacturers and promote color coordination among the trades; the standard cards present colors for which there is a popular and continuing demand. Most important of the color cards is the Standard Color Card of America, the current ninth edition containing 216 colors. Preeminent among the many special sets of color cards issued by the Association for use of the Federal Government is the United States Army Color Card showing 22 official colors for the arms and services. The colors of the Standard Color Card of America and the United States Army Color Card were measured at the National Bureau of Standards during a four-year research project financed by the TCCA, and the results have been published [54]. The ISCC-NBS color designations given in the present dictionary were obtained directly from the Munsell renotations contained in this publication, and have been checked by Mrs. Rorke.

10. Description of the Alphabetical List of Color Names

Section 15 is the heart of the color names dictionary. It is an alphabetized list of the color names from all of the sources studied. Each color name is followed by a letter (A, B, F, and so on) identifying the source, by the corresponding ISCC-NBS color designation abbreviated according to figure 2 and table 1, and finally by a number showing where to find the designation in section 14. Synonymous color names (those defined by reference to the same colored sample) are indented under the main color name, such as Foliage Green under Absinthe [Green]. Where a synonymous color name is found in the table, it will be followed by a reference to the main color name, such as Acajou (same as Laurel Oak). Where more than one ISCC-NBS color designation is used to describe a color name, it indicates either that more than one colored sample was used to define

that color name such as Acruvigeus, or that the Munsell notation of the single colored sample used to define that color name, such as Acacia (M), fell on a color-names boundary. TT-C-595 agency abbreviations are given at the beginning of sections 14 and 15.

Many of the color names consist of two or more words. The color name is alphabetized according to the first word unless that word is clear, artificial, genuine, imitation, transparent, dusky or any of the ISCC-NBS modifiers. In these cases, the name is alphabetized according to the second word. If the word following the one alphabetized is a color name itself, the name is cross indexed as, Almond, Burnt (see Burnt Almond), or Brown, Dark Red (see Dark Red Brown).

The spelling of several color names varies from one source to another. Gray is spelled with an "e" in Maerz and Paul (except for Chicadee Gray, Fashion Gray, and Pearl Gray), Horticulture, and in one color name in the Ninth Standard Color Card, Pearl Grey. It is Wistaria in M, R, and T but Wisteria in P and H; it is Wedgwood, the correct spelling, in M and T but Wedgewood in R. M has Ochre and Ocher but R has Ocher only, M spells it Castilian but P Castillian and M has both Daffodil Yellow and Daffodile [Yellow]. In section 15 the spelling of each color name is reproduced exactly from the original source; thus, there is a lengthy list of various grays, and also a separate long list of various greys.

11. Summary

The ISCC-NBS system of color designations has been revised and extended to apply not only to the colors of drugs and chemicals for which it was originally developed, but now to the colors of all opaque, clear, cloudy or fluorescent samples whether viewed by reflected or transmitted light and to microscopic structures. Its simplicity of terminology has recommended its use in a number of fields of color description and a further application may be seen in the translations given in the Dictionary of Color Names. This method is dedicated to everyone who has found it difficult to make his color descriptions intelligible, in the hope that it will eventually find sufficiently wide use that it will serve as a common denominator in the varied color terminology used in science, art and industry.

13. Color Name Charts

Pages 16 to 31.

How to use the color-name charts

GIVEN: Munsell renotation of sample.

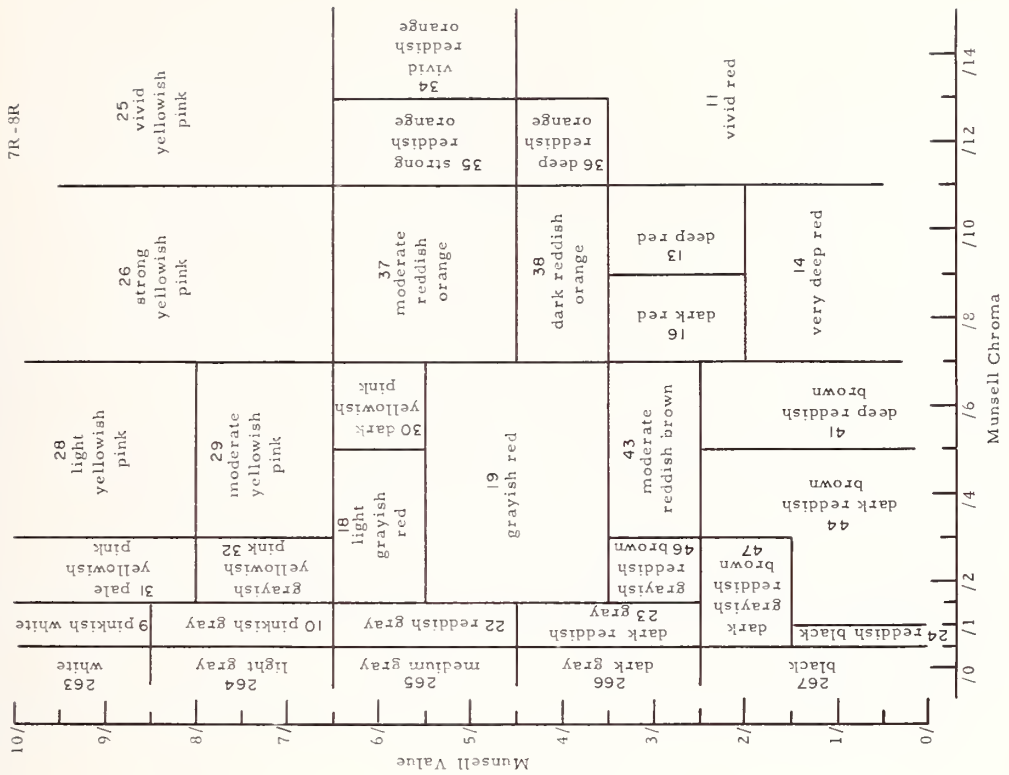

REQUIRED: The color designation.

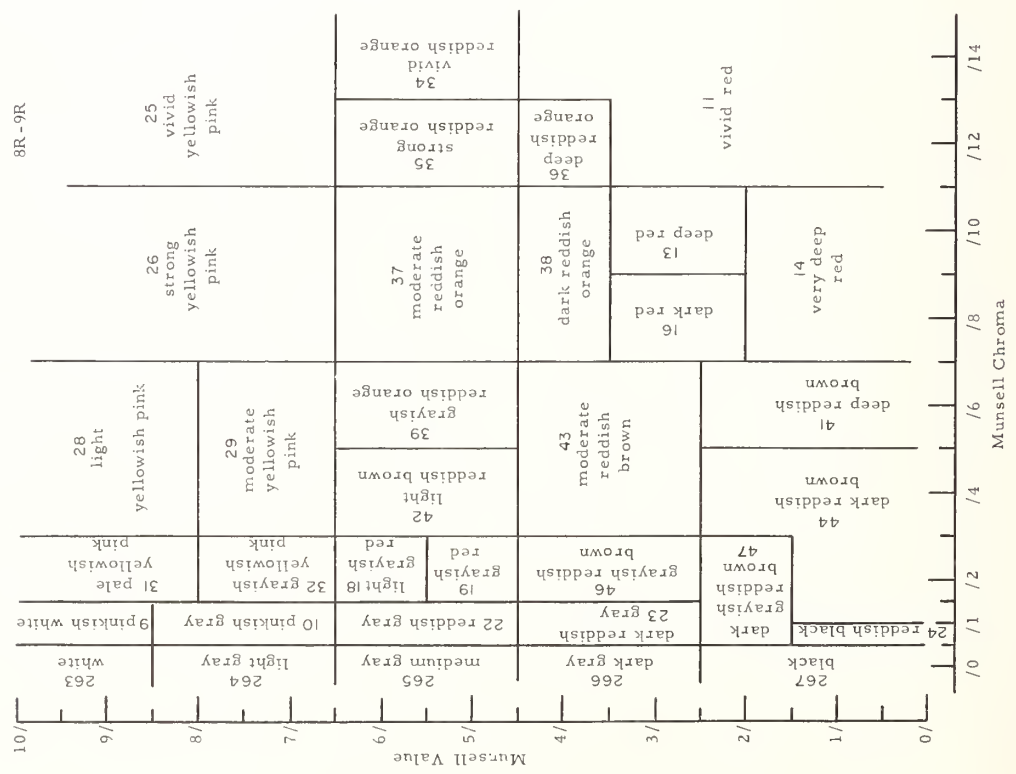

FIRST: Turn to the particular name chart containing the Munsell hue of the renotation (see upper right-hand corner of name chart), or if the hue falls on two successive charts, use both of them.

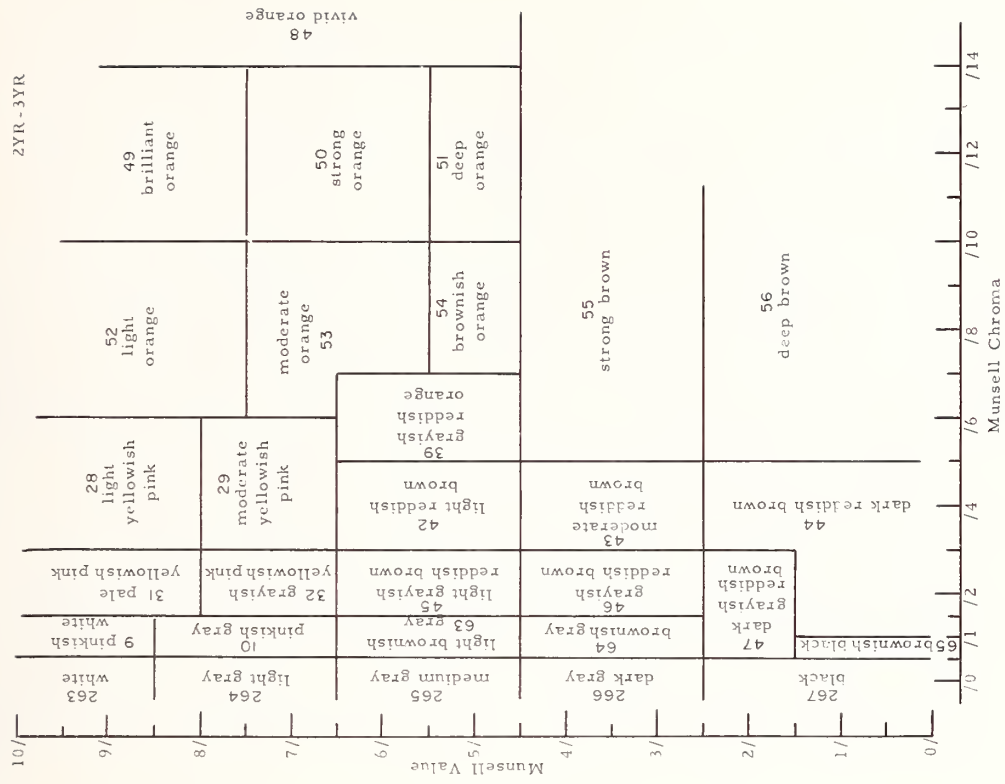

SECOND: Find the point on the chart defined by the Munsell value and Munsell chroma of the renotation; or, if two charts are used, plot the point on both of them.

THIRD: Read the color designation of the block within which the point falls. If it falls on a hue, value, or chroma boundary between blocks, read color designations of all blocks touching the point.

The serial numbers added to each ISCC-NBS color-name block are those mentioned in sections 9 and 10, and may be used to identify a color-name block in place of the color name or its abbreviation.

14. Synonymous and Near-Synonymous Color Names With Their Sample Identifications

Pages 37 to 82.

Abbreviations of Color-Name Sources

The names are listed according to ISCC–NBS color designation from the following sources:

	Maerz and Paul, Dictionary of Color, 1st ed.
	Plochere Color System
	Ridgway, Color Standards and Color Nomenclature
	Taylor, Knoche, Granville, Descriptive Color Names Dictionary
	Textile Color Card Association, Standard Color Card of America and U. S. Army Color Card
A	American Association of Textile Chemists and Colorists and Society of Dyers and Colourists
B	Color Terminology in Biology, H. A. Dade
F	Federal Specification TT–C–595, Colors; (for) Ready-Mixed Paints
H	Horticultural Colour Charts, R. F. Wilson
MUP	Commercial Standard CS147–47, Colors for Molded Urea Plastics
PSP	Commercial Standard CS156–49, Colors for Polystyrene Plastics
RC	National Research Council, Roek-Color Chart
S	Postage-Stamp Color Names, William H. Beek
SC	U. S. Department of Agriculture Soil Color Charts

The following abbreviations designate the branch of the U. S. Government using the color name:

(Agr)	Department of Agriculture
(AN)	Army-Navy (See Army-Navy Aircraft Standard Colors and Army-Navy Aircraft Camouflage Standard Colors)
(BuOrd)	Bureau of Ordnance, Navy Department
(CAA)	Civil Aeronautics Administration, Department of Commerce
(Eng)	U. S. Engineers, U. S. Army
(FS)	Forest Service, Department of Agriculture
(MC)	U. S. Marine Corps, Navy Department
(MA)	Maritime Administration, Department of Commerce
(N)	Navy Department
(PC)	The Panama Canal
(PO)	Post Office Department
(PBS)	Public Buildings Service, General Services Administration
(PR)	Bureau of Public Roads, Department of Commerce
(QM)	Quartermaster Corps, U. S. Army
(SCS)	Soil Conservation Service, Department of Agriculture
(TC)	Transportation Corps, U. S. Army
(Y&D)	Bureau of Yards and Docks, Navy Department
(USA)	U. S. Army (See Supplement to U. S. Army Specification, 3–1, 1943; also U. S. Army Color Card Published by the Textile Color Card Association)

15. Dictionary of Color Names

Pages 85 to 158.

How To Use the Dictionary of Color Names

Meaning of a color name. Look up the name in section 15. It will be followed by the ISCC-NBS designation in abbreviated form:

B=blue	gy.=grayish	pk=pinkish
b=bluish	l.=light	R=red
Br=brown	m.=moderate	r=reddish
br=brownish	med.=medium	s.=strong
brill.=brilliant	O=orange	v.=very or
d.=dark	Ol=olive	vivid
G=green	p.=pale	V=violet
g=greenish	P=purple	Y=yellow
Gy=gray	p=purplish	y=yellowish
	Pk=pink	

See the color-name charts (section 13) for the color range of the designation in Munsell terms.

EXAMPLE. Continental Blue (P). Section 15 shows the ISCC-NBS designation to be dark purplish gray (d.pGy). The color-name charts (section 13) show that its Munsell notation must lie between 9PB and 1R in hue, between 2.5 and 4.5 in value, and between 0.5 and 1.5 in chroma.

Source of a color name. Look up the name in section 15 and note the code letter following it (M, R, P, and so on). The sources and uses of the color names are as follows:

Code letter	Source	Field
M	Maerz and Paul, Dictionary of Color, 1st ed.	General.
P	Plochere Color System	Interior decorating.
R	Ridgway, Color Standards and Color Nomenclature.	Biology, botany.
T	Taylor, Knoche, Granville, Descriptive Color Names Dictionary.	Mass market.
TC	Textile Color Card Association, Standard Color Card of America and U. S. Army Color Card.	Textile sales promotion.
A	American Association of Textile Chemists and Colorists and Society of Dyers and Colourists.	Dyes.
B	Colour Terminology in Biology, H. A. Dade.	Biology.
F	Federal Specification TT-C-595, Colors; (for) Ready-Mixed Paints.	Paint.
H	Horticultural Colour Charts, R. F. Wilson.	Horticulture.
MUP	Commercial Standard CS147-47, Colors for Molded Urea Plastics.	Plastics.
PSP	Commercial Standard CS156-49, Colors for Polystyrene Plastics.	Plastics.
RC	National Research Council, Rock-Color Chart.	Rock colors.
S	Postage-Stamp Color Names, William H. Beck.	Philately.
SC	U. S. Department of Agriculture Soil Color Charts.	Soil colors.

Color range of name. Look up the name in section 15 and note the code letter following it (M, R, P, and so on) denoting its source. If the letter is F, H, M, MUP, P, PSP, R, or TC, the color name is defined by a single color chip and is intended to "pin point" that color. If the letter is A, B, RC, S, SC, or T, the name is defined by two or more color chips, and is intended to denote a range of colors of greater or lesser extent. To find the color range, note all of the ISCC-NBS designations given for the color name in section 15.

EXAMPLE 1. Madonna. Section 15 shows the source code letter M and the ISCC-NBS abbreviations m.B and gy.B. This is a "pin-pointing" name for a color on the border between grayish blue and moderate blue; see the color-name charts.

EXAMPLE 2. Yellow (S). Section 15 shows abbreviations for 27 ISCC-NBS designations including l.Br, l.yPk, v.Y, and v.O. Yellow is used in philately to refer to postage-stamp colors ranging from light brown and light yellowish pink on the one hand, to vivid yellow and vivid orange on the other.

Color-name families. Look up the generic name in section 15. Immediately following the definitions of the name from various sources will be found listed the specific names formed by a preceding adjective or adjectives in the form of cross-index references. These will be followed by all of the color names formed by use of the generic name as an adjective.

EXAMPLE. Blue. Section 15 shows five definitions of the generic name Blue. Then it lists 540 kinds of blue from Blue, Abstract to Blue, Zephyr. Following these are 115 names commencing with blue from Blue Appeal to Bluish White.

Exact synonyms of a color name. Look up the color name in section 15. If it is the key name for the color with less well-known synonyms defined by the same color chip, the synonyms will be found listed immediately after and indented under the key name. If it is a less well-known exact synonym of a key color name, section 15 will show in parentheses the key name preceded by "same as".

EXAMPLE 1. Acacia. Section 15 shows eleven exact synonyms following Acacia, such as Gaude, Luteous, Olde and so on.

EXAMPLE 2. Wod. Section 15 shows "Wod (same as Acacia)".

Near synonyms of a color name. Look up the color name in section 15 and note the key number following the abbreviation for the ISCC-NBS designation. Look up the key number in section 14 (pages 37 to 82). There, classified as to source, will be found all of the color names corresponding to this ISCC-NBS designation.

EXAMPLE. Tabu. Section 15 shows the abbreviated ISCC-NBS designation to be gy.B with the key number 186. Under this key number section 14 shows 75 near synonyms from Maerz and Paul, 32 from Plochere, 32 from Ridgway, 32 from Taylor, Knoche, Granville, 12 from the Standard Color Card, and 27 from the other five sources.

The following abbreviations designate the branch of the U. S. Government using the color name:

(Agr)	Department of Agriculture
(AN)	Army-Navy (See Army-Navy Aircraft Standard Colors and Army-Navy Aircraft Camouflage Standard Colors)
(BuOrd)	Bureau of Ordnance, Navy Department
(CAA)	Civil Aeronautics Administration, Department of Commerce
(Eng)	U. S. Engineers, U. S. Army
(FS)	Forest Service, Department of Agriculture
(MC)	U. S. Marine Corps, Navy Department
(MA)	Maritime Administration, Department of Commerce
(N)	Navy Department
(PC)	The Panama Canal
(PO)	Post Office Department
(PBS)	Public Buildings Service, General Services Administration
(PR)	Bureau of Public Roads, Department of Commerce
(QM)	Quartermaster Corps, U. S. Army
(SCS)	Soil Conservation Service, Department of Agriculture
(TC)	Transportation Corps, U. S. Army
(Y&D)	Bureau of Yards and Docks, Navy Department
(USA)	U. S. Army (See Supplement to U. S. Army Specification, 3-1, 1943; also U. S. Army Color Card published by the Textile Color Card Association)

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, and chemistry. It is published in two sections, available separately:

• **Physics and Chemistry (Section A)**

Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year. Annual subscription: Domestic, \$17.00; Foreign, \$21.25.

• **Mathematical Sciences (Section B)**

Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly. Annual subscription: Domestic, \$9.00; Foreign, \$11.25.

DIMENSIONS/NBS (formerly Technical News Bulletin)—This monthly magazine is published to inform scientists, engineers, businessmen, industry, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on the work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing.

Annual subscription: Domestic, \$9.45; Foreign, \$11.85.

NONPERIODICALS

Monographs—Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series—Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a world-wide program coordinated by NBS. Program under authority of National Standard Data Act (Public Law 90-396).

BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The following current-awareness and literature-survey bibliographies are issued periodically by the Bureau: **Cryogenic Data Center Current Awareness Service.** A literature survey issued biweekly. Annual subscription: Domestic, \$20.00; Foreign, \$25.00.

Liquified Natural Gas. A literature survey issued quarterly. Annual subscription: \$20.00.

NOTE: At present the principal publication outlet for these data is the *Journal of Physical and Chemical Reference Data (JPCRD)* published quarterly for NBS by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements available from ACS, 1155 Sixteenth St. N.W., Wash. D. C. 20056.

Building Science Series—Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. NBS administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series—Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

Order above NBS publications from: Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.

Order following NBS publications—NBSIR's and FIPS from the National Technical Information Services, Springfield, Va. 22161.

Federal Information Processing Standards Publications (FIPS PUBS)—Publications in this series collectively constitute the Federal Information Processing Standards Register. Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NBS Interagency Reports (NBSIR)—A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Services (Springfield, Va. 22161) in paper copy or microfiche form.

Superconducting Devices and Materials. A literature survey issued quarterly. Annual subscription: \$20.00. Send subscription orders and remittances for the preceding bibliographic services to National Bureau of Standards, Cryogenic Data Center (275.02) Boulder, Colorado 80302.
